In my notes accompanying the geological map of Hill End Gold-field, I have described these reefs as lenticular in character; in other words, while following a course which is parallel to the bedding planes of the country rocks, they vary somewhat in thickness, now attaining a width of 8 or 10 inches, and again thinning out to a mere thread. Recent mining operations at Hill End, however, have resulted in the opening up of some of these veins at depths of 500 and 800 feet below the surface, and while their lenticular character has been maintained at these depths, their average width has been found to be quite as great as, if not greater than, it was at their outcrop. This fact alone is strong evidence against their being analogous to the Bendigo reefs, and shows that, on the contrary, they are fairly continuous in depth.

The lodes dipping to the east at Hill End have been the chief gold-producers; those with a westerly dip having been, as a rule, much poorer.

At the southern end of the township, in Emmett and Hughes' Mine, an east and west crosscourse occurs, and this has faulted the whole series of veins to the east—that is to say, that those known as the Hawkins Hill veins, and which extend southwards from the crosscourse, are a considerable distance further east than those running northwards from the crosscourse towards Tambaroora. As the veins approach the crosscourse (both from the north and from the south) they are curved or deflected out of their course, as shown in the following sketch, but they afterwards return to their normal strike of north and south:—

The crosscourse itself was exceedingly rich in free gold down to the water-level, and below that it differed from all the other reefs in this part of the field, in that it contained large quantities of massive and highly auriferous arsenical pyrites. Owing to the difficulty in dealing with the water, this crosscourse has only been worked to a limited depth (between 200 and 300 feet, I believe), and Emmett and Hughes' Mine is now idle.

Starting from the crosscourse the shoots of gold in the veins running southwards are said to have had a southerly dip, while in the veins whose course was northerly from the crosscourse the shoots of gold had, generally speaking, a northerly dip.

Another east and west line of fissure appears to have crossed the veins some little distance to the south of the one just alluded to. The country rocks in its immediate neighbourhood were found to be very soft and decomposed (as I am informed by Mr. Carver), and it is possible that the enrichment of the celebrated Hawkins Hill veins, from which such enormous quantities of gold were extracted in 1872, was due to auriferous solutions percolating this fissure.

All the veins, where they outcrop along the steep western side of Hawkins Hill, are seen to be lying nearly flat, as if affected by landslips. The normal dip in the settled country under the centre of the hill is  $E. 55^\circ$ , but here "slides" can be seen occasionally coming in downwards on the east or hanging wall. These slides are probably the cause of the flatness of the reefs near their outcrop, and mark the eastern limits of the movements which have altered the inclination of the veins, as seen in their outcrops on the western side of the hill. These slides have also faulted the veins in most cases—the extent of the throw being about equal to the width of the reefs—and between the slides rich shoots of gold have been found to occur. Each of the Hawkins Hill veins occurs in a narrow belt of dark-blue slate, and at or near its junction with an adjoining intrusive sill. As already stated, the course of the veins is parallel with the bedding planes of the slates, and they vary in width from a mere thread up to 8 or 10 inches. In the rich claims worked in 1872, the veinstuff or gangue consisted chiefly of mica (Muscovite), in which the gold was thickly studded, but at greater depths the mica had given place to quartz.

Carver and Party have driven a tunnel 600 feet long, from the western side of Hawkins Hill, and have cut the Hawkins Hill veins nearly 500 below the summit. This party received aid to the extent of about £135 from the Prospecting Vote, to enable them to drive this tunnel, and as a result of the assistance twelve men have extracted £10,000 worth of gold from the Hawkins Hill veins in about four years. The most productive vein in this mine was the one known as Paxton's, which has yielded as much as 9 oz. of gold per ton.

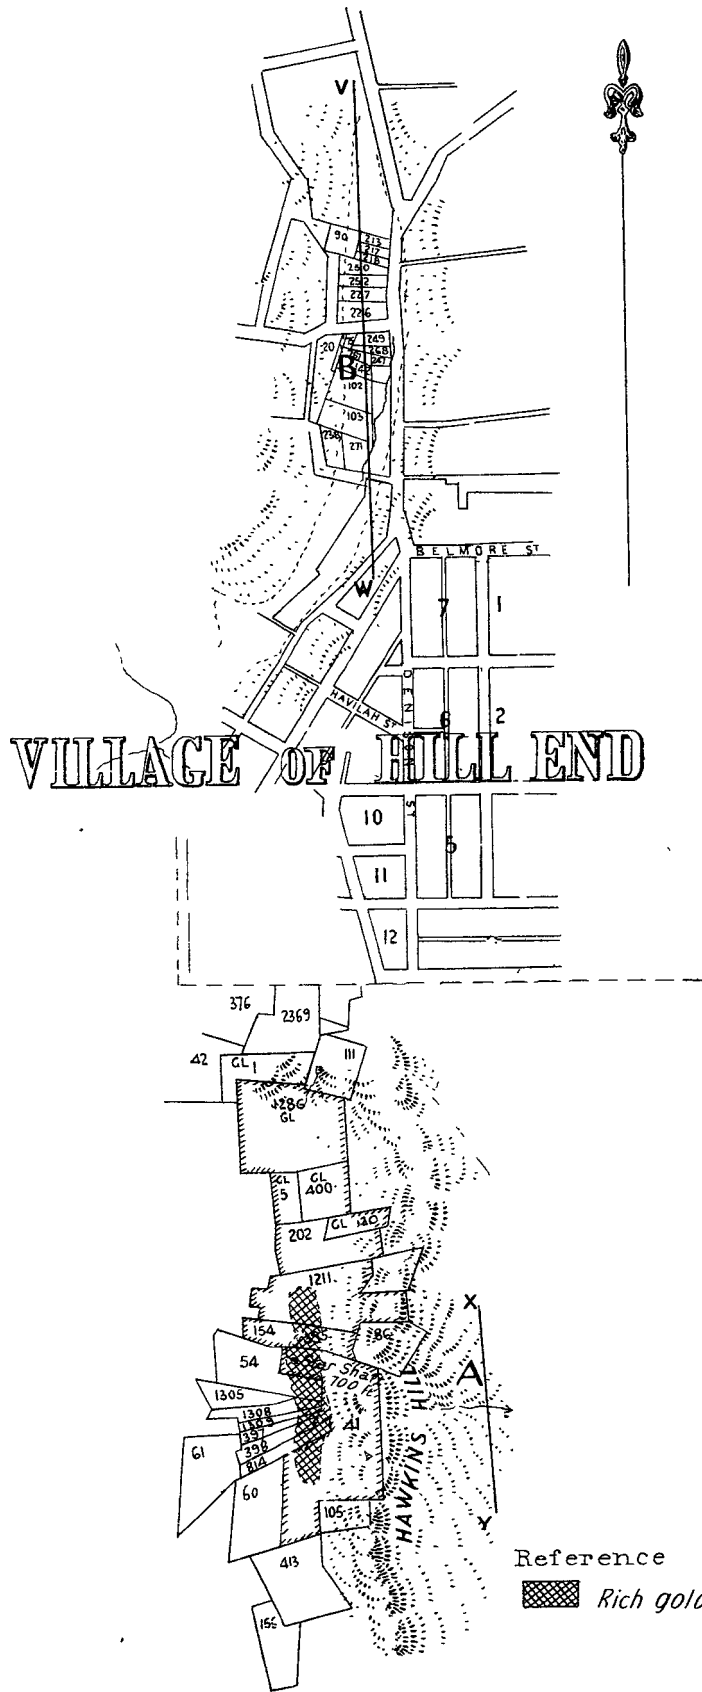

Between 300 and 400 feet below Carver's another tunnel has been driven in from the western side of Hawkins Hill. This has intersected a reef known as the "Amalgamated," and although the productive Hawkins Hill veins have not been met with, a number of clay streaks were observed to the east of the Amalgamated reef, and in about the position which the productive veins should occupy. It is quite possible that these clay streaks represent the productive veins which have pinched out at this point, in accordance with their lenticular character, and which may be expected to "make" again at a still greater depth. If a tunnel were now driven northwards along the amalgamated reef, and if crosscuts, towards the east, were put in from it at intervals, the productive reefs could be prospected immediately below the site of the phenomenal yields of 1872, and at a depth of 800 or 900 feet below the summit of the hill. I cannot, however, recommend that this work be aided from the Prospecting Vote, because the land is all

held

PLAN shewing sites recommended for bores at  
HILL END

Scale 0 8 16 Chains

held under gold-mining lease, and as it could only be regarded as development work, which it is only reasonable to expect should be done by the lessees themselves. The results which have followed the Government aid in Carver's tunnel should be quite sufficient to stimulate others to open out these reefs at the lower levels. At the time of my visit the whole of the Hawkins Hill leases were said to be under offer to an English Syndicate, and if the negotiations be carried to a successful issue it is probable that the work I have referred to will be undertaken.

At the Tambaroora Creek Mine, about  $3\frac{1}{2}$  miles north of Hawkins Hill, a number of peculiarly-arched leaders are connected with the main productive reef. These leaders, which are locally known as "droppers," junction with the main reef on its footwall. Although distinctly arched in sections, they differ materially from saddle reefs, for, instead of conforming with the bedding planes of the country rock, they cut across the latter, and do not succeed one another in regular order.

Cross Section.

Plan.

Plan.

Plan.

Moreover, they approach the main reef at all angles, thus in plan their projection would appear as shown above, "a," "b," and "c" representing "droppers" joining the main reef in three directions, and it is found that those having the general direction shown at "a" are, as a rule, the only rich ones, the others not being worth working. The "droppers" are only a few inches wide, and the maximum height of their arches is about 10 feet. The main reef, which is parallel to the bedding planes of the country rock, is seen to be here bending rapidly round towards the west,\* and it is probable that the "droppers" occupy fissures caused by the crumpling and consequent fracture of the enclosing slates and sills.

To the west of and adjoining the township of Hill End a line of old shafts extending in a northerly direction towards Tambaroora, shows that the reefs having an easterly dip were here highly productive; and further evidence of their richness is seen in the extensive areas of old alluvial workings which trend in all directions from their line of course. As far as I could ascertain, however, these reefs have not been worked to a greater depth than 200 or 300 feet, probably on account of the shoots of gold giving out.

Although I am of opinion that boring at Hill End would not result in the discovery of saddle reefs, much would be done towards reviving the mining industry in this almost deserted gold-field if it could be proved by boring that the shoots of gold recur at greater depths. I think that there is reason for expecting that they may do so; but in the present state of the district it is exceedingly unlikely that the necessary test will be made unless it be undertaken by the Government. Of course there is always the chance, in an operation of this nature, that the drill may intersect the reefs at some point where they are barren, although rich gold may occur in them both above and below the point. Still I can see no other way of settling the question at a moderate cost, and I would therefore suggest that the Prospecting Board should consider the advisability of putting down one, or possibly two bores to the east of the old line of workings just alluded to, and at such a distance from it as would enable the drill to intersect the reefs at 1,000, or 1,500 feet from the surface.

EDWARD F. PITTMAN,  
Government Geologist,

The Under Secretary for Mines and Agriculture.

10th September, 1898.

#### APPENDIX G.

##### Report on the Black Range Alluvial Lead.

I HAVE inspected the Black Range alluvial field, and have also visited the reefs whose denudation has supplied the gold which has been recovered from the upper and shallower portions of the alluvial lead. The principal auriferous reefs are the "Blackfellow's," the "May Day," and several others at the head of Portuguese Gully. The "Blackfellow's" reef was the richest, and is said to have yielded at the rate of 12 oz. per ton near the surface. Payable alluvial deposits were worked for a distance of nearly three-quarters of a mile south of this reef; immediately at the foot of the range the gold was obtained at the surface, but the depth of the lead increased as it trended southwards from the ranges, so that at the most southerly point where payable gold was worked a depth of 90 feet was attained. South of this point mining operations have failed, owing to the difficulty of dealing with the water by means of those appliances, such as whips and whims, which are within the reach of working miners. Moreover, there is no doubt that in several of the shafts which have been sunk and abandoned, as well as in the bores which have been put down for the purpose of locating and testing the lead, what has been regarded locally as "bed rock" is really a false bottom, and therefore it is to be expected that when true bed rock is ultimately reached the water will be found in even greater quantity than it has been hitherto. While small parties of miners have unsuccessfully attempted to prospect the deeper portions of the lead, large areas of the land have been held for a considerable period under "Authorities to Mine," by residents of Albury, who, however, have

\* Vide Diagram on last page.

have not succeeded in raising the necessary capital for so large an undertaking, and it is, I think, clear that unless the Government take some steps to practically demonstrate whether a defined auriferous lead does or does not exist in this locality, there is very little hope of the question being settled in the near future. The evidence available is favourable to the existence of such a lead, and in view of the benefits which would accrue to the mining industry in general, and to this important district in particular, by the development of deep alluvial deposits on the northern side of the Murray, similar to those which have been so successfully worked in Victoria, I recommend that the Government should endeavour to prove the lead by putting down a series of bores along the line shown on the accompanying lithograph.

Before any action in regard to boring is taken, however, I would suggest that all pending applications for gold-mining leases or authorities be refused, and that all existing authorities be cancelled. The land is already reserved (under Section 26 of the Mining Act of 1874) from occupation for residence under any miner's right or business license, and it should be similarly reserved from occupation for mining. The Warden should also be instructed to notify the public that until further notice no applications for gold-mining leases or authorities in respect of alluvial land in that locality will be granted. It would also be advisable to obtain from the owners of the land along the proposed line of bores consent in writing to the boring operations.

In the event of a defined auriferous lead being proved by boring, the question of the subsequent disposal of the land is deserving of careful consideration.

The present occupiers of the land, under "Authority" and "Application for Authority" cannot expect further consideration, inasmuch as they have not complied with the regulations by paying rent and survey fees respectively. It would, therefore, be at the discretion of the Minister, after clearing away their applications or titles, to dispose of the land in such a way as to secure the best results in regard to mining interests generally, and to ask, from future lessees, some satisfactory guarantee that mining operations on a suitable scale will be undertaken without unreasonable delay. I think, therefore, that whatever method be adopted in dealing with future applications for this land the date on which the reserve will be thrown open should be advertised a considerable period in advance, so as to permit of intending applicants raising the necessary capital for working the auriferous deposits. At the same time the fact should not be lost sight of, that for the successful working of this land, it is necessary that a liberal area should be granted to the persons who are to provide the capital.

With regard to the bores, I would suggest that the first be put down at the point A (*vide* lithograph), and the others at intervals of 10 chains in a direct line to the east. Tenders for the bores should be invited by advertisement in the local papers.

E. F. PITTMAN,  
Government Geologist,  
21st October, 1898.

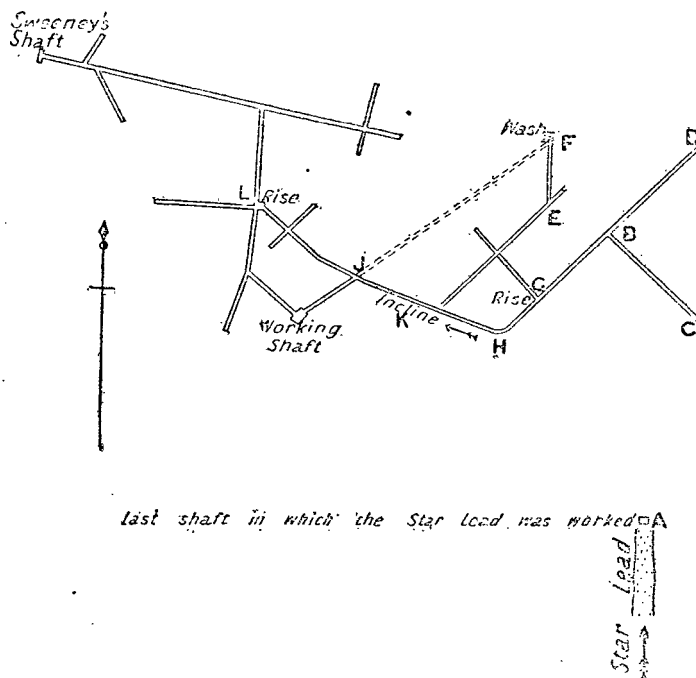

The Under Secretary.

#### APPENDIX 7.

#### Report on the Star No. 1 Lead, Gulgong.

I HAVE made an inspection of the workings of the Star Lead No. 1 Gold-mine at Gulgong, in connection with an application by Mr. R. M. M. Anderson, one of the directors, for a loan of £250 from the Prospecting Vote, and I have the honor to report as follows:—

The accompanying sketch plan shows approximately the underground workings of the mine.

Sketch Plan, showing underground workings of Star Lead No. 1 Gold-mining Company, Gulgong.

The Star Lead was worked with good results in the prosperous days of Gulgong, and was lost somewhere near the point A on the plan. The trend of the lead was northerly. According to Mr. Anderson's letter the present proprietors of the mine have expended about £8,000 during the past three years in more or less fruitless efforts to find the lost lead.

The

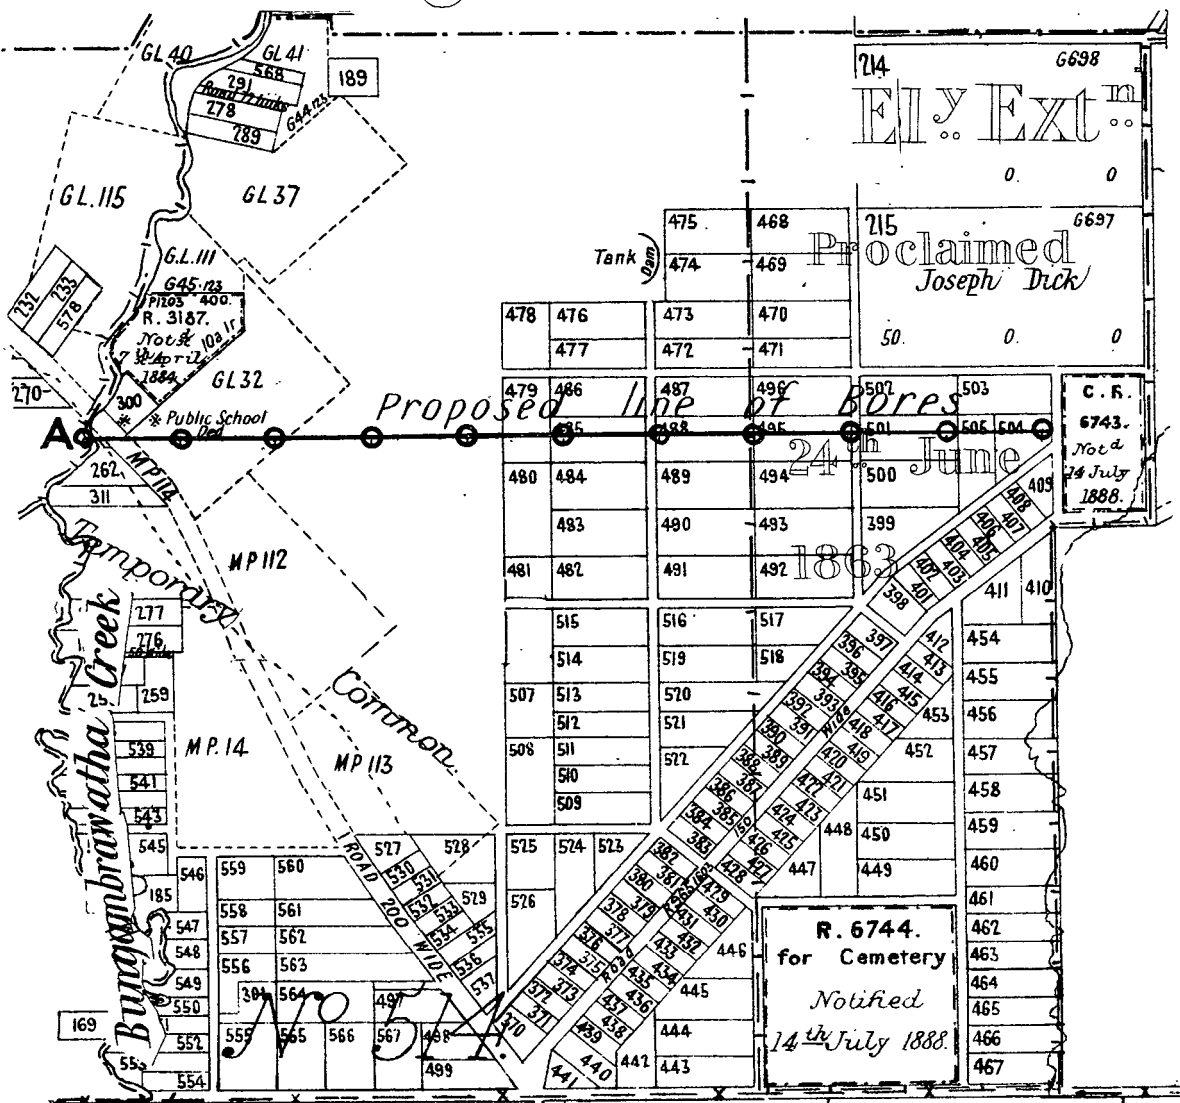

PLAN

Shewing sites for proposed Bores  
Parish of Albury. Co of Goulburn

Scale 0 10 20 30 40 Chains

Black Range

Gold Field

The plan indicates that these workings have been carried out on a rather haphazard system, the drives having been excavated in all directions. Moreover, an inspection of the underground workings reveals the fact that the character of the work done is, in some cases, extremely bad. In one position (at K) the floor of the drive instead of being nearly level, has been allowed to rise so rapidly that quite a steep incline has resulted. Not having levelling instruments with me I was unable to ascertain the total elevation of the drive at the head of this incline, but I should estimate it at, at the least, 7 or 8 feet. In addition to this evidence of bad work, I may mention that little or no provision has been made on the floor for the escape of the water, with the consequence that it is a matter of great difficulty to keep the drives in a fit state for work. It is only right to mention that the faulty work alluded to was carried out before the present manager, Mr. P. Egan, assumed control of the mine.

On the 23rd May last the Prospecting Board, acting on the report of Mr. Geo. Sur. Watt, recommended the granting of aid to the company for 150 feet of driving at the rate of 7s. 6d. per foot. This money was subsequently expended, but the drive, which is marked BC on plan, failed to intersect the lead.

Lately the company have carried drives from B to D, and from E to F. At the point F good-looking wash has been met, having a thickness of at least 6 feet, and it is said that prospects were obtained from this equal to about 7 dwt. of gold per load. The wash dips away rapidly from the floor of the level, and carries a strong body of water. The drive BD has not yet succeeded in striking wash, although water has recently appeared in the face. The manager informs me that he obtained fine wash in several places overhead by putting up bores through the roof of the drive.

It must be mentioned that there is a "rise" or "jump up" 9 or 10 feet high, at the point G, so that the drive EF is on a higher level, by, say, 9 feet, than the drive HD. Again the drive HD is on a higher level (by, say, 8 feet) than the point J, by reason of the incline which was previously alluded to. It is probable, therefore, that the point J is at least 16 feet lower than the floor of the drive at the point F, where the thick body of wash was obtained.

Mr. Anderson asks for a loan of £250 for the purpose of continuing the drive BD in a north-easterly direction. In my opinion the prosecution of this work is not advisable for the following reasons:—

(1.) In view of the discovery of wash in bores put up from the roof of this drive it seems probable that the lead crosses over the drive, as well as over the drive BC, which was put in with Government aid.

(2.) Owing to the tortuous course and uneven floors of the drives between the point D and the working shaft, the mine could not be satisfactorily worked by means of these roadways, even if further prospecting operations resulted in the discovery of the lead beyond D, which is not by any means certain.

(3.) If a lead were discovered beyond D, it might be found to dip below the floor of the drive BD, and in that case the difficulty of dealing with the water would again be fatal.

(4.) So much haphazard prospecting work has been already done without result that a continuance of that system is not justifiable, more especially as a thick body of wash has already been proved to exist at the point F.

In short, I cannot recommend further driving in an unproved direction when a considerable thickness of wash is known to exist at F which can be reached at a much lower level than the drive BD.

The connecting drive between the working shaft and the point J can be extended to F, and thus form a perfectly straight main drive which will be at a lower level than the drive BD by about 8 feet. In addition to obtaining this advantage in depth, which will be of considerable consequence in connection with drainage, this drive will do away with all the tortuous and uneven roadways, and will enable the mine to be more economically worked. The water can be allowed to drain along the side of the drive from F to J, whence it will flow to the rise L, and escape thence to the pump through the lower level.

The adoption of this proposal will involve driving for about 360 feet, but in view of the present unsatisfactory state of the underground workings I am of opinion that it is the most satisfactory step that can be taken.

The recovery of the lost auriferous leads at Gulgong is of the utmost importance, for I feel confident that considerable deposits of gold still await development in this district.

E. F. PITTMAN,

Government Geologist,

28th October, 1898.

The Under Secretary.

#### APPENDIX 8.

##### Report on samples of Ore taken from the Sunny Corner Mine.

In accordance with the Minister's instructions, I visited the Sunny Corner Mine on the 31st October, for the purpose of sampling the ore in the lode, and reporting definitely whether it contains a sufficient proportion of gold to warrant its being regarded as a payable auriferous deposit.

In the course of my examination I visited all the levels which were accessible. I was unable to examine the lowest excavations, as they were full of water.

In all, six samples of lode material were taken by me (the particulars of these are given below), and were assayed by Mr. Mingaye, in the laboratory of the Department.

The samples, with the exception of these numbered 5 and 6, were taken across the full width of the stopes, and are, therefore, representative samples of the face of the ore body in each case.

No. 1 sample, from the new stope, centre block, drive No. 1, yielded:—

Gold ...	...	...	...	...	Nil.
Silver...	...	...	...	...	2 oz. 8 dwt. 11 grs. per ton.
Copper	...	...	...	...	1.55 per cent.

No. 2 sample, from centre block, drive No. 1, 10 feet higher than the last, yielded:—

Gold ...	...	...	...	...	Trace, under 5 grains per ton.
Silver...	...	...	...	...	2 oz. 9 dwt. 13 grs. "
Copper	...	...	...	...	1.11 per cent.

No.

No. 3 sample, from No. 1 stope, drive No. 2, yielded :—

Gold ...	...	...	...	...	Nil.
Silver...	...	...	...	...	4 oz. 18 dwt. 13 grs. per ton.
Copper	...	...	...	...	1·89 per cent.

No. 4 sample, from No. 4 stope, between drives Nos. 3 and 4, yielded :—

Gold ...	...	...	...	...	Trace, under 5 grains per ton.
Silver...	...	...	...	...	7 oz. 18 dwt. 10 grs. „
Copper	...	...	...	...	1·71 per cent.

No. 5 sample was taken from along the full length of No. 9 kiln. This kiln contains a mixture of ore from all parts of the mine. The ore has been partially roasted, and when the mine is working the ore goes from the kiln direct to the furnaces. This sample yielded :—

Gold ...	...	...	...	...	Nil.
Silver...	...	...	...	...	5 oz. 10 dwt. 12 grs. per ton.
Copper	...	...	...	...	1·25 per cent.

No. 6 sample was a specimen, taken at random, of the massive sulphide ore which is characteristic of the mine. It yielded:—

Gold ...	...	...	...	...	Nil.
Silver...	...	..	...	...	2 oz. 2 dwt. 11 grs. per ton.
Copper	...	...	...	...	0·43 per cent.

It is evident that in view of the results of these assays the mine cannot be regarded as payably auriferous. I am well aware that when first opened the Sunny Corner Mine produced from its upper levels considerable quantities of ore which was payably auriferous, and although it has long been known that the ore in the deeper levels was poor in gold, I was extremely surprised to find the assay returns so low in all three metals in the samples taken by me.

In my opinion it would be inequitable to demand £1 per acre rent for the leases covering this mine; and even with a rent of 5s. per acre, it is evident that only the most extraordinary economy in mining and smelting operations will enable the lessees to work the mine at a profit.

E. F. PITTMAN,

Government Geologist,

10th November, 1898.

The Under Secretary.

#### APPENDIX 9.

Report on prospects of obtaining Artesian Water in the Hay District (Lower Riverina).

THE occurrence of underground fresh water in the Western country (Lower Riverina) is very capricious, and it is not at all uncommon to find that of a number of wells put down within a comparatively short distance of one another, some contain fresh and some salt water. As the geological formations underlying this country are, as a rule, entirely hidden by reason of the plains being covered by (Pleistocene) surface deposits of sand and silt, there is no evidence upon which I could advise as to the best localities for sinking. It is to be expected that the fresh water will occur in the sandy deposits, and the salt water in the clays,—the reason of this being that the sands permit of the percolation or circulation of the water, while the clays do not; and it is a well-known fact that underground water which has no outlet or circulation must ultimately become salt, because it is continually dissolving salt from the rocks or clays in which it is stored, and the bluish clays of the Western plains are heavily charged with gypsum (copi) and other salts.

I am afraid that no rule can be formulated that would be of much use, as a guide, to Mr. Davy, and that prospecting is the only means that he can rely upon to obtain his object.

It is probable that in many cases deep wells or bores would meet with fresh water below the clay-beds to which he refers in his letter. This was found to be the case in the Hay bore, where a pumping supply of good water was obtained at a depth of some hundreds of feet.

With regard to the geology of the country under consideration, it may be stated that the upper sediments consist of Pleistocene deposits of sand and clay. These deposits are of lenticular shape and irregular occurrence; that is to say, they thin out to nothing at the edges, and may be of considerable thickness at the centre; moreover, the clays and sands alternate in an irregular manner, so that it is often impossible to decide, from the evidence at the surface, whether clay or sand will be found below.

Underneath these Pleistocene deposits there occurs, along the Lower Darling, a considerable thickness of calcareous sandstone of Eocene (Tertiary) age, and underneath this again is the true bed-rock, which consists of granite in some localities, and Silurian slates in others.

E. F. PITTMAN,

Government Geologist.

#### APPENDIX 10.

Report on the question of Water Supply for Lockhart.

I HAVE made a geological examination of the country in the vicinity of Lockhart, with a view of ascertaining whether there is any probability of obtaining artesian water in that neighbourhood.

Lockhart is a rising township situated about 27 miles west of The Rock railway station. It has sprung into existence owing to the throwing open of a large area of land suitable for wheat-growing, and which has been occupied by homestead selectors. A great impetus has also been given to the town by the favourable report of the Public Works Committee on the proposed railway from The Rock to Lockhart.

The country traversed by me is mostly of a level or undulating nature, and is characteristic of Riverina. About 7 miles east of Lockhart the road crosses a low range in which Palæozoic rocks are seen to outcrop, and this is succeeded by level plains with patches of gilgai country until the township is reached. During the last two or three seasons water has been very scarce about Lockhart, and in 1897 the residents were

were obliged to cart their domestic supply a distance of 20 miles. A well has been sunk close to the town in search of water, and a bore was put down from the bottom of the well, the total depth reached being 216 feet. This well was sunk with Government aid. A small supply of water was obtained, but it was found to be too brackish for domestic purposes.

The spoil-heap of the well shows that the excavation has been for the most part in Silurian rocks (slates and shales), and a resident, who was present when the well was sunk, informed me that these rocks were met with at a depth of about 40 feet.

To the north of Lockhart, and at a distance of about 12 miles, is a range known as Galore, rising about 300 feet above the plain. This range is composed of quartz-grits and conglomerates, apparently of Devonian age, dipping about S. 20° W. at an angle of 5°-10°. The country between Lockhart and Galore is more or less undulating, and the bed-rock is probably within a short distance of the surface all over this area.

My examination of the district has convinced me that there is no probability of artesian water being obtained by boring in the neighbourhood of Lockhart, and I do not think there is any likelihood of a pumping supply of fresh-water being obtained from wells sufficiently close to the settlement to be of value as a source of domestic supply. It is just possible that near the foot of Galore Mountain, and on its southern side, springs of fresh water might be obtained by sinking, owing to soakage of rain water along the bedding plains of the Devonian sandstone, but in the neighbourhood of Lockhart Township the alluvial drifts forming the plains appear to be shallow, and therefore unlikely to contain any considerable supply of fresh water, while any water which may accumulate in fissures in the underlying slates and shales will probably be of a brackish nature, besides being inconsiderable in quantity.

It appears, therefore, that the only practicable method of securing a supply of water suitable for domestic purposes is by conservation in tanks.

I have, &c.,

E. F. PITTMAN,

Government Geologist,

22 November, 1898.

The Under Secretary.

#### APPENDIX 11.

Sir, Geological Survey, Department of Mines and Agriculture, January, 1899.

I have the honor to hand you the following notes on the work performed by me during the past year for insertion in the Annual Report of the Department, reserving my special report on the Copper Mining Industry, and the the distribution of Copper Ores in New South Wales for separate publication in the new issue entitled "Mineral Resources of New South Wales."

Attached to these notes are the following reports:—

1. Report on Bushy Hill, Cooma
2. " " the Coast between Seal Rocks and Smith's Lake Bar.
3. " " G.Ls. 34 and 37, Sunny Corner.

In January I visited the Victorian Border near Delegate to arrange for the disposal of the Border Prospecting equipment, in consequence of the discontinuance of operations. Portions of the plant realised almost cost prices, but the live stock were at a discount owing to the prevailing drought.

Whilst in the district, Mining Reserves at Currowong and Nelbothery were examined, and the boundaries amended. The Currowong Copper Mine on the west end of Black Jack Range, close to Currowong Homestead, was inspected. Copper ore was discovered here about seventeen years ago, and opened to a depth of 30 feet before abandonment. Owing to the recent advance in the value of copper, attention was again being directed to the locality, and prospecting was proceeding at the time of inspection, but so far without discovering any defined ore body.

During inspection of the Nelbothery Gold-field Reserve, the site of the late Nelbothery Gold-slucing Company's operations was visited. In preference to cutting a lengthy race for natural gravity sluicing, a pumping scheme was adopted for raising water to a sufficient elevation to furnish efficient fall and force for hydraulic sluicing, of an immense thickness—40 feet—of stranded drift, at an earlier and higher level of the present river channel. The water was forced through 2-ft. 6-in. and 3-ft. pipes to a reservoir from which it flowed by gravitation through pipes to the drift-bed, where it was distributed through hydraulic nozzles. Judging from the extent of the excavations and the reported time occupied, the effective force of the water must have been enormous. Unfortunately for the company and the district, the results obtained were very disappointing, and compelled abandonment. Perhaps an exaggerated estimate of the value of the drifts arose from the results obtained in the present river banks and bed, and in the small channels falling into it from the drifts or terraces; but the contents of the recent channels were the concentrated results of natural ground sluicing of an immense amount of the older drifts, and proportional enrichment of their gold contents. The powerful pumping machinery has recently been removed.

Reaching Cooma on the 21st, several days were devoted to an examination of the Bushy Hill and Middle Flat gold occurrences which were exciting considerable attention at that time. Several copper lodes were also visited. A separate report on Bushy Hill is appended.

Copper ores occur rather freely distributed in the Cooma District, though not in extensive deposits so far as tested.

The Dartmoor lode occurs in portion 135, parish Bunyan, county Beresford, within about 5 miles of Cooma. It occurs at the junction of Silurian slates and intrusive felsite. A second lode occurs a short distance east, with a more siliceous outcrop. The special feature of the Dartmoor ore is the association of payable silver ore to the extent of from 20 to 40 oz. per ton. Fuller particulars of these lodes, and of all others mentioned in these notes, will be found in my special report on copper.

North-east of Dartmoor, about 1 mile, is another copper deposit, in portion 25, parish of Montague, County Beresford, on the east margin of Middle Flat. The outcrop consists of gossan, with strings and colourations of copper carbonates.

The sulphides were struck with rather heavy water at about 50 feet; the grade, however, was extremely low. Prospecting is still in progress. Limestone is in abundance in close proximity to both this and the Dartmoor lode, but firewood is very scarce.

In

In the Cooma district a number of applications for aid from the Prospecting Vote were also dealt with.

The sedimentary formations in the vicinity of Cooma consists of Silurian slates, schists, and sandstones, and are intruded by numerous quartz felsite dykes. The west side of the town is on granite and gneiss. Extensive basalt downs extend southerly towards Bombala. The slates and limestones yield fossils of Silurian facies.

On the 26th January I inspected portion of the Jugiong Gold-field Reserve, on the Jugiong River, and Cunningham Creek. Near the junction of these streams a large number of miners were profitably engaged working terraces or drifts stranded at a higher and earlier level of the Jugiong River. Several small steam-pumps were in use coping with the inflow of water. No attempt was, however, being made to cope with the continuous flow of water in the present channel so as to work its bed. Considerable attention has been directed to this locality during the last half year in consequence of the inception of the New Zealand system of gold dredging, by Mr. C. L. Garland, on the Macquarie River near Muckerwa. Jugiong River and Cunningham Creek offer every facility for the successful operation of this class of mining, as they run through granite country, and their beds for long distances will be found soft and amenable to the dredge scoops.

Unfortunately for the prospective dredgers the operations of the smaller miners down to the stream banks, have prevented the issue of dredging leases for fear of infringement of existing rights. It is very doubtful whether the present miners with limited means and obsolete appliances can ever successfully cope with the flow of water continuously filtering through the sandy river channel even in driest seasons; hence the issue of dredging leases may be confidently looked for when the higher drifts of the banks have been exhausted of their gold contents.

The area under description affords valuable and instructive warning of the danger of too drastic curtailment or cancellation of Mining Reserves at times when little mining is being carried on. A few years prior to my last inspection a proposal was made to alienate the land; at the time about eight or ten men only were on the reserve, but in view of the objection raised by the Department of Mines the project was abandoned. Since that date over 200 miners have found employment on it at times, and there are in view prospects of years of work.

Considering that the provisions of the Mining on Private Lands Act afford means of entry on to private lands other than agricultural, opposition to alienation of Crown lands reserved for mining purposes may appear contentious, but practical knowledge of the subject justifies the strongest opposition in the interests more particularly of the migratory working miner, to cancellation of Reserves which afford a livelihood as fossicking grounds—if nothing better—for a large number of men and their families, when no better inducements offer. There are Mining Reserves throughout the Colony to which such men periodically return when their funds are exhausted in prospecting other fields. Others again take advantage of the shearing and harvesting seasons, whilst their families remain on the Reserves. A glance at the privileges of unrestricted access, and the disadvantages of the reverse will fully illustrate the wisdom of retaining certain areas. A miner, by virtue of his "right," for which he pays an annual fee, can enter Crown lands without restriction, enclose an area for residential and gardening purposes, keep sufficient stock to carry on his work, and have free use of water and timber. On the other hand, on private land he cannot enter without obtaining authority from the owner or, if he be unwilling, from the local Warden, who often resides at some distance. But first—in the latter case—he must ascertain the number of the portion, parish, and county, and present owner or his agent, all of which must be duly set out on proper forms—a preliminary proceeding not always as simple as it looks in print;—notice must then be served on the owner or his agent, and arrangements made (in the case of alluvial which is the principal class of mining in question) for a meeting of the warden, the owner, and the intending prospector, on the ground; and lastly the latter has to defray, before working, the surface damage based on the Warden's estimate. In certain other forms of alienation, contemplated or optional conversion, authority to enter must be obtained from the Minister for Mines. In addition to these restrictions the privileges of residence, grass, timber, water, &c., are denied him.

During the necessitous years of drought, &c., men flock to the gold-fields, as has been abundantly demonstrated during the past few years, and judging from the large amount of money returned by those assisted by the Department of Mines, and the Labour Bureau to reach the gold-fields, and the substantial increase in the output of gold, the wisdom of keeping certain auriferous areas for unrestricted resort in times of depression or need cannot be gainsaid. A living, if not more, is thus open to many industrious and necessitous men without the stigma attaching to relief work.

These remarks apply equally to Homestead and other leases which prevent unrestricted access, and cancel all residential, grazing, timber, and water rights.

In February I corrected the proofs of a paper on Chromite, its uses and value, and its distribution in New South Wales, being No. 2 of the new issue entitled "Mineral Resources of New South Wales." Afterwards I examined the Yalwal Gold-field Reserve, where metalliferous mining is confined to the Palæozoic rocks in the Yalwal Valley which denudation has exposed beneath the prevailing Carboniferous marine strata. At the head of Conjola Creek in the parish of Little Forest in the Milton Mining District, an occurrence of copper ore was examined in connection with the Prospecting Vote. It is exposed in the bank of the creek, and dips under it; at the outcrop, which is limited to a few feet, a little carbonate of copper is showing coating refractory sulphides. The assay values, both for gold and copper, apart from the difficult situation, discourages any further expenditure in prospecting. Flooded channels prevented any further continuance of the projected southern trip at this time.

Towards the end of February I visited the Armidale, Hillgrove, Wollomombi, and Enmore districts, in connection with proposed alienation of lands within restricted gold-fields, and the distribution of the Prospecting Vote.

The Sunnyside Copper Mine, on the Chandler River, was visited with reference to assistance from the Vote. The lodes occur close together on the river bank, near the foot of Hall's Peak, in the parish of Tiara, County Sandon, about 22 miles from Hillgrove. The country consists of massive intrusions of felsite in Palæozoic slates and quartzites, through which the river has cut a precipitous gorge, about 2,500 feet deep, rendering access to the mine very difficult. A cable tramway, similar to those in use at the Baker's Creek and Sunlight Mines, Hillgrove, will be necessary if the copper lodes prove sufficiently important to warrant the outlay. The lodes occur at or near the junctions of the igneous and sedimentary rocks. Loose shode stones were first discovered here by a Government prospecting party in the slipped shingle

shingle of the steep slopes, but the lode was not discovered at the time. The present owners—Messrs. Keys Bros.—succeeded, after considerable search, in locating it, and also several others in close proximity. The first discovered ore consisted of rich yellow sulphide, coated with carbonate, assaying from 39 to 47 per cent. of copper, and from 10 to 13 oz. of silver per ton. The later discoveries are, to some extent, associated with zinc sulphide. Systematic prospecting is now in progress, under aid from the Prospecting Vote.

At Tilbuster, near Armidale, I was enabled to detect the richest portion of a silver lode (proustite) being summarily discarded over the tip, whilst a poorer but more conspicuous mixture of blende and pyrites was being carefully bagged. An average sample of the ruby silver ore taken from the tip yielded, on assay, over 244 oz. of silver per ton.

At Wollomombi a number of small but rich silver-bearing veins occur in granite at Kessler's Mine. The richer portions, averaging 100 oz. and upwards per ton, are bagged and despatched to the Walleroo Smelting Works, the seconds remain at grass awaiting local treatment. Possibly a means of realising their values will shortly be provided at the Ruby Silver Mine, near Rock Vale, a few miles distant, where, it is understood, a metallurgical plant is to be erected, which should absorb all local supplies of ore, and induce greater outputs and renewed prospecting. Unquestionably, numerous small payable silver veins will be found in this locality when means are available for disposal or treatment of the ores locally. At the present time only the small proportion of high-grade firsts can be profitably despatched to distant custom plants.

In March I visited Tingha, and inspected numerous sites for which prospecting aid was requested, and also visited the Elsmore deep tin lead, the Boggy Camp Diamond Mines, and the Borah Creek Silver, Lead, and Copper Mine near by.

The English company operating at Boggy Camp, under the management of Mr. Barrington Brown, was systematically opening up the diamantiferous drifts, and erecting a washing plant on the South African model.

The drift dips into a ridge under a basalt cover, hence natural drainage is not possible save by adits at low-level, which, from the conformation of the country between the drift outcrop and Cope's Creek, would require to be of considerable length. At present steam power is used for draining the workings. The earlier workings were confined to shallow workings along the outcrops to such depths as the water could be coped with by primitive means.

The washing plant was completed before the close of the year, but before continuous work was inaugurated it was found essential to secure a permanent water supply from the Gwydir River by a pipe line about  $\frac{3}{4}$  of a mile in length. The results of the first washings are reported to have been satisfactory, though no figures have transpired.

The Bingara Diamond Mines were also visited, the Monte Christo alone was being worked, but on a very limited scale only, owing to the drought and consequent scarcity of water for washing purposes.

At Hall's Creek, about 14 miles from Bingara, a reported find of rubies was examined; these proved to be garnets in basalt, which received attention in the Rev. J. M. Curran's paper on the gemstones of New South Wales. (Roy. Soc. N.S.W., Vol. 30, 1897, pp. 214-285.)

At Crow Mountain, Upper Manilla, and Limbri, near Moonbi, applications for prospecting aid were dealt with.

In April Nundle was visited for the purpose of ascertaining whether a prospecting shaft, searching for the Mount Pleasant lead, was in bedrock or not. The material being sunk through was too highly decomposed for microscopic examination, but it possessed all the appearances of a decomposed basalt; the continuation of sinking was, therefore, recommended to the estimated channel-level. If not struck in the shaft, a short drive only should be necessary to reach it.

In May a tour of inspection, &c., was taken through the Monaro table-land as far south as Nimity-belle, thence to the coast, and back to Sydney, *via* Araluen and Braidwood.

At Collinton a proposed new road from the reefs to the railway line was reported on, and the reefs there and at Mickalago examined. Work was proceeding at Collinton, an Adelaide syndicate having secured possession. The lower levels of the old Collinton reef were being opened by shaft below the lowest tunnel level. The small battery on the Murrumbidgee River, close by, was working on stone from higher levels. Evidently the stone subsequently extracted from the shaft did not come up to expectations, for operations ceased shortly afterwards.

At Cooma several further applications for assistance from the Prospecting Vote received attention, and a further examination was made of the Busby Hill gold deposits and the adjacent copper lodes.

At Wagonga, on the South Coast, a number of proposed Homestead leases were inspected, and found opposed to mining interests.

In the vicinity of Wagonga a number of auriferous felsite dykes traverse the sedimentary slates and sandstones; for many years a little desultory prospecting has been done on the outcrops from which fine free gold is obtainable. On a previous occasion I recommended aid to test one of these close to the wharf. At about 40 feet, the free gold gave place to thinly disseminated pyrites. In May of this year, a substantial crushing and cyaniding plant was being erected under the supervision of Mr. J. K. Charlston, and preparation was being made for a thorough test of some of the principal dykes on a large scale. The plant consisting of a 20-head stamper battery, with all necessary adjuncts and cyanide vats, is most advantageously situated to allow of least handling; from the adjacent main shaft to the battery, tailings, and slime-pits there is a natural fall.

The main shaft is in a felsite dyke at its contact with a diorite dyke. Pyrites are disseminated rather sparingly through the stone. Samples were taken representative of the ordinary run of lode-stuff, and of the most pyritiferous, but the results were not at all encouraging; though the proprietors appear satisfied with the prospects, the erection of so costly and extensive a plant seems unwise in the absence of any adequate preliminary bulk tests.

A few miles down the Wagonga River Mr. Tornaghi was erecting his patent ball-mill, to treat stone from another felsite dyke.

A short distance from the stamper battery just described a powerful pumping-plant was being erected for the purpose of hydraulic sluicing a bed of drift at some elevation, which represents the level of an earlier drainage channel, probably at one time connected with similar elevated drifts on the coast at Corunna.

Water for the purpose was being conserved in a small over-shot dam near the drifts, but the supply would not be adequate unless the rainfall was above the average. At

At Moruya prospecting sites were examined, and an opportunity of inspecting the channel of the old Moruya Silver Mine, at the 120-foot level, was afforded by the pumping operations of Mr. F. Guy, sen., who is re-opening the mine. This mine is signalised as being the first opened for silver in the Colony. An interesting feature of the re-opening is the wonderfully preservative effect of the mine-water on timber and iron. The ore is essentially arsenical pyrites, hence the solutions are chiefly arsenical and sulphuric. Though some thirty years have elapsed since the timber and iron were introduced both are in an excellent state of preservation. The iron ladder-clips have in fact been re-forged, and used in the new fittings.

From Wagonga a visit was paid to the new gold discovery near Wandella, on the Tuross River, made by Mr. James Latty, who formed one of the Government Border Prospecting Party last year. On the disbandment of the latter, Mr. Latty directed his attention to the country lying between Wandello and Cobargo, and was successful in discovering four payable reefs, one on private land. The others are situated in the ranges about  $2\frac{1}{2}$  miles from the Wandella Battery, which the discoverer has been able to lease for crushing purposes.

No. 1 Reef strikes N.  $35^{\circ}$  E., and dips S.  $55^{\circ}$  W., in slate country. At surface it was about 9 inches thick, but blanks occur in the channel, the average thickness to 50 feet being about 6 inches; it has been driven on for about 40 feet southerly. The stone is rich, 28 tons crushed prior to inspection yielded 108 oz. of smelted gold.

No. 2 Reef has a parallel course 8 feet distant from No. 1, and a thickness of about 6 inches. It was opened to a depth of 35 feet, but no crushing had then been made from it; in the dolly tests free gold was not visible until the stone had received a preliminary roasting.

A short distance west of the first-discovered reefs, and within the one lease, is a very strong outcrop, known as the "Big Reef," having an approximate N. and S. strike. Its width is considerable; 2 feet of the reef-stone, divided from the main body by a thin "dig," has been taken out by a shallow open cut. Twenty-five tons yielded 22 dwt. of gold per ton. The gold shoot has been traced for about 2 chains. The gold lease embracing the above reefs offers considerable promise. The mine is most advantageously worked and the stone treated by a party of six, five of whom are brothers.

The Government testing operations under the control of the Prospecting Board, in the Araluen Valley, were examined. It is evident that the only chance of virgin ground lies in the direction now being proved. The main channel has undoubtedly been worked throughout its course, the present mining being confined to extensions into the old banks, probably not considered good enough to follow in the earlier and richer days of the field. The greatest drawback is not excessive water, as generally supposed, but rather the thickness of the stripping, which is removed by horse-drays. The soakage water is kept under by steam power chiefly, though one or two water-wheels are in use.

The chief difficulty encountered in the first Government test shaft was the running ground just above the bottom, which oozed through the timbering, and prevented firm packing being possible. A cylinder would be most suitable for such ground.

From Araluen inspections were made of church and school lands at Jembaicumbene, which had recently been brought under the provisions of the Lands Act; and also of a small reserve at the head of Jerrabat Gully, parish Oronmear, county Murray.

In June a reserve at the junction of Cotter and Paddy's River, in the Queanbeyan district, was examined, and a brief inspection made of a copper lode in limestone, which occurs close to the junction.

During June the Gundagai, Carcoar, Blayney, and Orange districts were visited. At Gundagai the old asbestos mine on Jones' Creek and the Mt. Kimo gold-mine were briefly inspected. At the latter a large amount of English capital was being expended in preparation for an extensive mining and treatment plant of most recent design, embracing all modern adjuncts.

The country consists of porphyry, and the lode-stuff also, though the latter appears more felsitic and siliceous under the microscope. Possibly the porphyry regarded as lodestuff, which has a thickness of about 30 feet, may be an independent intrusion of later date. Along its outcrop for a considerable distance some rich patches of gold have been obtained in years gone by; but it is doubtful whether these were from the porphyry itself. The appearances indicate the association of the gold with thin, irregular quartz leaders, outside of which it is extremely doubtful whether gold exists in sufficient proportion to pay for cost of extraction.

Considerable hope was centered in the pyrites, which is very sparingly distributed through the rock, and occasionally in small vugs and nests of crystals; but a particularly pure sample from No. 5 crosscut in the tunnel yielded under 2 dwt. of gold per ton.

The extreme hardness of the porphyry will greatly augment the cost of treatment. Apparently this mine has been restarted on the present extensive scale from estimates based on yields from the rich surface patches along the outcrop in the early workings instead of on adequate bulk tests from stone *in situ*, without which such large outlay is extremely risky.

The following notes on the microscopic character of the so-called lodestuff and the country, by Mr. G. W. Card, A.R.S.M., Curator of the Mining Museum, are of interest:—

"Rock specimens collected from the Kimo Mine by Mr. Carne have been examined, with the following results:—

"*Hanging Wall*.—Nos. 2,888, 2,890, 2,892, 2,894-6.

"2892—From No. 4 shaft—A porphyry showing junction with slate.

"2890—Tunnel entrance—Similar, but no slate.

"2888

"2895—Tunnel face, at 743 feet—Similar, but no slate.

"These are very similar, and are all black. They would be variously described as quartz-felsites, or as porphyries. Plagioclase felspar is sometimes present.

"2894—*Tunnel Face*.—A calcareous, coarse-textured rock, with a tendency to fissility. Under the microscope it shows a development of biotite; and some quartz grains have the appearance of having been crushed. The rock is undoubtedly very highly altered; but its origin is obscure.

"2896—No. 4 shaft.—A soft, earthy, greenish rock.

"2891-2893.—*Lodestuff from Tunnel*.—Quartz-felspar porphyry, crushed and slightly calcareous. These rocks are lighter in colour, more siliceous, and more distinctly felsitic in appearance under the microscope than the hanging-wall rock. It is questionable whether they are identical.

"2889—*Footwall*.—Quite similar to the hanging-wall rock."

In October copper lodes and prospecting sites in the Condobolin, Cugong, Melrose, Yellow Mountain, Bobadah, Nymagee, Mount Allen, Mount Hope, and Euabalong Districts were inspected, also a proposed Public Watering Place Reserve within the Platina Goldfield. The copper lodes will be fully described in a special paper.

In November I was engaged in connection with the initiation of the Colony's representation at the Greater Britain Exhibition, which, however, was abandoned in December on an adverse vote being recorded in the Legislative Assembly.

In December reserves were inspected at Mudgee, Capertee, Wellington, Stuart Town, Burrangong, Forest Reefs, Ophir, and Lewis Ponds. An examination of copper deposits was continued in the Blayney, Cow Flat, and Burruga Districts, which occupied me until the 20th instant, when I entered upon leave of absence.

During the year, in addition to a considerable number of typical rock and mineral specimens from various localities, fossils were collected from Bobadah, Elsmore, near Crow Mountain, Gilgai, near Inverell, and Cooma. The latter are described by the Palæontologist, Mr. W. S. Dun, in my report on Bushy Hill, the only addition being imperfectly preserved Brachiopods—*Rhynchonella*—from Rock Flat; and a coral from the limestone of Middle Flat.

The Bobadah fossils are of more interest, as they establish the Silurian Age of strata, which have usually been regarded as Devonian. Following are Mr. Dun's determinations:—

The fossils collected by Mr. Carne, at Bobadah, indicate rocks of Silurian Age. They are most imperfectly preserved as casts and impressions in a ferruginous rocks:—

Encrinite stems.  
 Cyathophyllum?  
 Pleurodictyum. (Young.)  
 Encrinurus (?) pygidium.  
 Rhynchonella cf. nucula. Sby.  
 " (? cuneata, Dalman.)  
 " (? var. of borealis, Schloth.)  
 Orthis, sp. ind.  
 " probably new species.  
 Spirifera, sp. ind.

Unfortunately the fossiliferous rock had a very limited exposure above the prevailing sandy soil, which prevented a larger and better preserved suite of fossils being obtained.

Close search for palæontological evidence of the age of the limestone beds between Bobadah and Nymagee failed to secure any determinative proof. Fragments of encrinites alone being recognisable.

From the clay beds overlying the important Elsmore Deep Tin Lead, at a depth of 225 feet; the following Tertiary plants were identified by Mr. Dun:—

Cinnamomum?  
 Piper cf. Feistmanteli. Ett.  
 Fagus, cf. Hookeri. Ett.  
 Artocarpidium Gregorii. Ett.  
 Sapotacites, sp. ind.  
 Quercus?

From Smith's Prospecting Site at Gilgai, near Inverell, the following Tertiary plants were also identified:—

Podocarpus præcupressina. Ett.?  
 Pseudopinus Wilkinsoni. Ett. (Very abundant.)  
 Phyllocladus asplenioides. Ett.  
 Bambusites arthrostylinus. Ett.

From portion 33, parish Eumur, county Darling, between Crow Mountain and Upper Manilla, the following Carboniferous limestone fossils were identified:—

Aviculopecten.  
 Spirifera convoluta. Phillips.  
 Bivalves ind.

During the year a very large amount of information has been collected for the preparation of a special paper on the copper industry, which I hope to have ready for submission at an early date.

I have, &c.,

The Government Geologist.

JOSEPH E. CARNE, F.G.S.,  
 Geological Surveyor.

#### APPENDIX 12.

#### Report on Bushy Hill, Cooma.

##### Minute.

In submitting Mr. Geological-Surveyor Carne's report on the recent gold discoveries in the vicinity of Cooma, I might remark that immediately after my return from Western Australia, the first samples of auriferous stone from Bushy Hill were brought to me for inspection, and I was at once struck with their great similarity in appearance and composition to the rocks in which the telluride ores occur at Kalgoorlie. Careful tests, however, have failed to reveal the presence of tellurium in the Bushy Hill ores, and also in ores of similar character from several other localities in this Colony. It is evident, therefore, that the character and appearance of the Kalgoorlie rocks are no absolute guide to the occurrence of tellurides of gold in other localities, and if these interesting minerals should be found to occur in New South Wales it need not necessarily be in rocks similar to those in which they are found at Kalgoorlie.

The gold found in the decomposed surface rocks at Bushy Hill has unquestionably been derived from the pyrites which occurs in the lower portions of the shafts. The first samples of pyritous ores from these mines, which were assayed in the Department, yielded at the rate of 9 oz. of gold per ton, and there seemed to be reason for assuming that the deposit was an extremely rich one. It is evident, however, that

the rich pyrites occurs in chutes or patches, for during a recent inspection of the mines I collected several samples, including some of the pyritous ore, which was indistinguishable in appearance from that previously alluded to, but which, on being assayed, yielded at the rate of only 17 dwt. per ton.

It is evident, therefore, that until more work has been done in these mines, it will be impossible to form an idea of the probable extent of the auriferous deposits, or to explain the causes of the enrichment of the pyrites in certain places.

There is every reason for supposing that, owing to the denudation of the surface of Bushy Hill, auriferous alluvial deposits must exist in the valleys on both sides of it, and I was surprised to see that little or no prospecting had been done there.

The Under Secretary for Mines and Agriculture.

E. F. PITTMAN,  
Government Geologist,  
28th February, 1898.

Sir, Geological Survey, Department of Mines and Agriculture, February, 1898.

I have the honor to report having paid a brief visit to the recent gold discoveries in the neighbourhood of Cooma, for the purpose of noting the geological features of the locality and the mode of gold occurrence.

*Previous mention.*—Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, reported on the gold finds shortly after notification, about the middle of last year.

The earliest discovery was at Middle Flat in private land (portion 78, parish of Bunyan, county of Beresford), about 4 miles north-easterly from the town of Cooma; the latest at Bushy Hill, on the temporary common, within about  $1\frac{1}{2}$  miles of the town in the same direction.

The geological formations represented in the neighbourhood are:—

Igneous ... ..	{	Gneiss.
		Quartz porphyry.
		Quartz felsite.
		Felsite.
		Basalt.
Sedimentary ... ..	{	Schists.
		Claystones.
		Sandstones.

Gneiss is largely developed in the town of Cooma, forming massive outcrops on its western side. The quartz porphyry, quartz felsite, and felsite occur as intrusions in the sedimentary rocks largely developed to the eastward. Basalt forms a comparatively thin capping on the highest points of the treeless downs, being part of the great lava sheet covering the Monaro table-land between Cooma and Bombala and beyond.

The acid intrusives—quartz porphyry, quartz felsite, and felsite—are arbitrarily separated for the purposes of this preliminary notice of the field, according to characteristic field distinctions as they vary from fine-grained homogeneous rocks to coarsely porphyritic.

The Middle Flat quartz reefs occur in typical quartz porphyry. The weathered surfaces of the harder masses are characteristically studded with quartz crystals, as may be especially well seen in an outcrop near the western boundary of portion 78.

The Bushy Hill gold also occurs in quartz porphyry, but here dynamic metamorphism has imparted to it a schistose character, which is intensified by the development of secondary mica along the planes of shearing. Prepared sections of this rock under the microscope demonstrate the effects of tensile strain more abundantly than those of pressure. Individual mineral crystals have been elongated to fracturing point, the fragments being separated by interstitial fillings of felsitic material, as will be seen from the descriptive notes of the sections furnished by the Curator, Mr. G. W. Card, A.R.S.M. (Appended to this report.)

Between Bushy Hill and Cooma the rocks apparently shade from altered porphyry through schists into typical gneiss. Basalt caps these rocks near the railway station.

Between Bushy Hill and Middle Flat sedimentary rocks predominate. Separated from the former by a low saddle on the north-east a massive rugged outcrop of hard silicified quartz felsite forms a distinctive feature of the landscape, which is further enhanced by the presence of a few stunted eucalypts. According to some the local name—Bushy Hill—strictly applies to this ridge; but the discovery of gold on the closely parallel western ridge will definitely locate the name. References in this report will be understood to refer to the site of the gold occurrences only.

From the sedimentary rocks forming the west boundary of the Middle Flat porphyry intrusions a number of marine fossils were obtained, which have been identified by Mr. W. S. Dun, Assistant Palæontologist, as belonging to an acute and fine-ribbed species of *Rhynchonella*, probably of Silurian age. An interesting suite of fossils could, I believe, be obtained from this locality.

About a mile southerly from the Middle Flat Reefs is the Dartmoor copper and silver lode occurring at the junction of a felsite dyke in clay slates.

The most interesting features of the discoveries near Cooma are the nature of the matrix and the mode of gold occurrence at Bushy Hill.

The first indications obtained were in quartz, but prospecting soon demonstrated the latter to be a very insignificant part of the true matrix. Near the first discovery gold was found richly impregnating portions of the country itself, as much as 52 oz. being obtained from 4 tons of surface stone, which had undergone considerable weathering and oxidation. Subsequent discoveries have also all been identical in their mode of occurrence.

From even a cursory examination of the first hand-specimens that reached the Department it was evident that the gold in the oxidised zone had been liberated from pyrites, a fact amply demonstrated by subsequent prospecting. At a comparatively shallow depth unaltered pyrites is making its appearance and cloaking the gold. At 53 feet in No. 1 North pyrites is massively developed, through not homogeneous throughout the thickness of the lodestuff. Layers of country intervene, and in parts predominate as the pyrites become more separate and disseminated.

At 35 feet in the Prospector's shaft pyrites is making mixed with a little copper sulphide. In No. 1 South, at a similar depth, it is also appearing, but, judging from hand specimens, has not yet been met with in concentrated form.

The

The strike of the planes of schistose porphyry is about N. 19° W. Gold is obtained in prospects along the short course of the ridge, which ends northerly at the racecourse and southerly a short distance from No. 1 South, but sufficient data is not yet available on which to base an opinion of the existence of a continuous gold chute through the hill. The indications afforded by the very limited prospecting yet performed lead rather to the conclusion that the auriferous pyrites is likely to occur in short detached seams or impregnations through the country. From concentrated patches remunerative returns are likely to be realised, but in the mass of the auriferous belt it is probable that the pyrites will be too sparingly found either distributed or too poor to pay for raising and concentrating. The latter will form an essential feature of any adequate method of treatment. Reduction of the bulk prior to the necessary, but expensive, chlorination process will be imperative, if operations prove possible on a large scale.

There is every reason to anticipate the presence of other payable deposits parallel to those already discovered, and between the main line and Blackett and Party's on the west, where some rich stone has been obtained at surface, associated with copper ore, hence trenching and crosscutting are recommended.

The keen interest aroused in mining circles by the rich discoveries of gold associated with tellurium in West Australia, and the consequent natural desire to identify a similar association in New South Wales, renders it hazardous to even point to similarity in mode of occurrence of ore bodies, irrespective of contents, for fear of misconception. It is therefore judicious to raise again the note of warning contained in my Wolumla report, that "mere identity or similarity with known metalliferous rocks does not of itself involve similarity, or even presence, of metallic contents. The containing rocks frequently may be the accidental, not the specific, cause of metalliferous deposition, marking, as they do, simply lines of least resistance to earth movements, along which mineral solutions subsequently followed, impregnating the crushed and shattered material resulting from dynamic movement along the planes of weakness."

With the above caution, the amount of similarity of the Bushy Hill gold occurrences to that of Kalgoorlie, West Australia, may be pointed out, prefacing the statement, however, with the important notice that assays prove the vital distinction to be lack of tellurium at Bushy Hill.

The Bushy Hill gold occurs associated with pyrites as impregnations in an intrusive igneous rock-quartz-porphry—which has been rendered schistose by extreme tension and shearing, induced by earth movements. The rich gold and tellurium lodes at Kalgoorlie occur under almost exactly similar conditions, but on an immensely larger scale.

At Bushy Hill all things combine to render systematic, concentrated prospecting not only desirable, but necessary—isolation of the gold chutes, absence of a distinctive gangue, want of defined walls, and probably of strikes also. At least two advantageously situated deep test shafts, with levels following the strike of the country, and crosscuts across the ridge, should precede any attempt to establish a local treatment plant, a hazy idea of which appears to be hovering in the minds of some.

As before stated, gold occurs at Middle Flat in quartz reefs, traversing quartz porphyry. Three parallel reefs outcrop in the Prospector's Claim. The most easterly strikes north 60 degrees east, and is traceable for about 4 chains on the surface. The middle reef, distant about 170 feet from the former, strikes N. 20° E. The western reef has a similar strike at a distance of about 105 feet from the latter.

Each of the reefs dip westerly, the main reef at an angle of 56° from the horizontal. The approximate thickness of each is from 2 to 9 inches.

With the exception of a few holes a couple of feet deep, no prospecting has been done upon the middle and western reefs, though excellent results are reported from dolly tests. Certainly they appear equally worthy of trial as the eastern reef, which is now being tested under aid from the Prospecting Vote.

A shaft in the latter has been sunk to a depth of 50 feet, chiefly on the underlie, and the aid granted is for the purpose of continuing it to the 100-foot level, from which a drive is to extend along the course of the reef.

The veinstone consists of quartz (in parts highly crystalline) carrying a little galena, blende, and chalcopryrite (sulphides of lead, zinc, and copper).

A sample selected by myself yielded, in the Departmental Laboratory, at the rate of 2 oz. 14 dwt. 10 grs. of gold and 2 oz. 5 dwt. 17 grs. of silver per ton. This return, however, represents the better class of stone containing the sulphides.

From the upper levels 7 tons of veinstone, treated at the Clyde Chlorination Works, yielded 1 oz. 8 dwt. of gold per ton, and 5 tons of more carefully picked stone subsequently treated yielded 2 oz. 5 dwt. per ton.

A small gully heads at the reefs on the east, in which alluvial gold has been obtained, derived undoubtedly from the degradation of the former.

The following assays were made in the Departmental Laboratory of samples obtained by me from the field :—

Assay No. 323. Iron and copper pyrites, partly oxidised, from 35-foot level, Prospectors' Claim, Bushy Hill—

Gold...	...	...	...	...	...	...	17 dwt. 10 grs. per ton.
Silver	...	...	...	...	...	...	8 dwt. 17 grs. per ton.

(NOTE.—From this sample a portion showing free gold was removed before assay.)

Assay 324. Pyrites from No. 1 North, from 50-foot level—

Gold...	...	...	...	...	...	...	9 oz. 11 dwt. per ton.
Silver	...	...	...	...	...	...	11 dwt. 10 grs. per ton.

Assay 536. Pyrites from No. 1 North, from lower level—

Gold...	...	...	...	...	...	...	4 oz. 9 dwt. 12 grs. per ton.
Silver	...	...	...	...	...	...	9 dwt. 5 grs. per ton.

Assay No. 327. Schistose crushed porphyry, with disseminated pyrites, from No. 1 South—

Gold...	...	...	...	...	...	...	4 dwt. 8 grs. per ton.
Silver	...	...	...	...	...	...	3 dwt. 6 grs. per ton.

Assay No. 328. Schistose crushed porphyry, with disseminated pyrites, from No. 1 South—Neither gold nor silver.

Assay No. 325. Quartz, with sulphides of lead, zinc, and copper, from Prospectors' Claim, Middle Flat—

Gold...	...	...	...	...	...	...	2 oz. 14 dwt. 10 grs. per ton.
Silver	...	...	...	...	...	...	2 oz. 5 dwt. 17 grs. per ton.

(NOTE.—Portion showing free gold removed before assay.)

The neighbourhood of Cooma offers a most interesting field for geological research and systematic mapping. Within a short radius occur representatives of the acid and basic igneous groups as intrusives and flows, metamorphic, igneous, and sedimentary rocks, and fossiliferous sedimentary, and organically formed rocks (slates, sandstones, limestone, and tripolite), metalliferous impregnations (gold and copper), auriferous quartz veins, and potable mineral springs. This report of a brief visit may serve to indicate some of the special geological features enumerated.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,

Government Surveyor.

The Government Geologist.

#### Appendix.

Sir,

I have the honor to report as follows on some intrusive rocks collected from the district of Cooma by Mr. Carne.

In so doing, I would wish to point out that examinations of this kind, while accurate so far as the determinations go, are in no way exhaustive. Required, as they usually are, for incorporation in reports that they are urgently required, expedition is necessary, and detailed examination is, therefore, not possible.

With the exception of the gneiss that underlies the town of Cooma and its neighbourhood, the specimens now under examination consist of acid intrusives. The gneiss itself would appear to be of much interest, appearing, as it does from the facts adduced below, to be involved in an area of regional metamorphism.

The acid intrusives can be mostly classed as quartz porphyries. They have been collected from Middle Flat, some 4 or 5 miles from Cooma, and intermediate places, and will be dealt with in point of order of distance.

#### Middle Flat.

Specimens 2,722, 2,725, 2,729, 2,723, 2,724.

The existence of three distinct types of acid intrusives is here indicated.

2,729. A dark-coloured porphyritic rock in which quartz and hornblende (in good crystals) are conspicuous to the eye. Under the microscope it is seen that the crystal contents constitute a very large proportion of the mass of the rock, there being very little base. Quartz occurs as large corroded crystals; feldspar, apparently orthoclase, is abundant, but much altered; hornblende occurs as green idiomorphic crystals containing inclusions of apatite.

2,722, 2,725. A lighter-coloured rock from another dyke. It is to some extent pyritous, and has a felsitic texture in places. Macroscopically, quartz is very conspicuous; it is not corroded. Plagioclase is present in small and frequently fresh fragments. A little greenish mica and some calcite occur. Some silicification (secondary) has taken place. 2,722 has a somewhat slabby structure. There are indications that this rock may have undergone some amount of brecciation.

2,723, 2,724. Another dyke of rather typical quartz porphyry. Both specimens are greenish in colour, and contain blebs of quartz, easily noticeable to the naked eye. The quartz is much corroded. Feldspar is abundant, but inconspicuous by reason of the alteration it has undergone. Some pyrites is present in 2,724. In the ground mass of 2,724 a crystal of apatite was detected, and there are other indications that this dyke may have caught up portions of an older mass which contained ferromagnesian minerals.

#### Approaching Bushy Hill.

2,718. A light-coloured quartz-like rock. Under the microscope it is seen to possess a felsitic texture, and to contain a few crystals of quartz. Can be classed as a quartz-felsite.

#### Bushy Hill and Cooma Common.

With the possible exception of 2,722-2,725, there has, so far, been no evidence whatever of dynamic influences, the only changes noticeable being those attributable to chemical action. 2,715 from Bushy Hill shows the clearest indications of dynamic metamorphism, and this action is, if possible, even better shown by 2,716 and 2,717 from Cooma Common.

To the unaided eye these are green rocks, showing a rough schistosity, and containing numerous blebs of quartz. The divisional surfaces have the sheen usually attributed to sericitic mica. Under the microscope it is evident that these rocks are quartz porphyries that have undergone deformation as an effect of crust movements. Quartz is very abundant, and where it still retains its original outline sufficiently intact, exhibits the characteristic corrosion. Generally the original grains of quartz have yielded to a stretching force, which has drawn them out into spindle-shaped or lenticular areas. Sometimes this action has been accompanied by fracturing only, but very generally there has been a certain amount of crushing action as well, which has reduced portions to powder. In this way the apices of the spindle-shaped masses, or the whole area of some of the lenticles is occupied by mosaic of quartz granules.

It would appear as if the strain in this region had a directly-stretching effect, whereby the rock occupies now, perhaps, a greater space than it did originally. This stretching action is beautifully illustrated in 2,716 by both quartz and feldspar crystals. Concurrent with this stretching and crushing has been the development of streaks and films of sericite (?), which wind round the lenticles and crystals, interlacing with each other and giving to the rock its rough schistosity.

An interesting point about the Cooma Common rock is the way in which the pyrites present is invariably associated with magnetite, from which it may, indeed, possibly, be an alteration product.

Crushing has been referred to here, but it is not meant to imply that it has been very severe. As a matter of fact, some of the phenocrysts of quartz are hardly affected in any way, if at all.

GEORGE W. CARD,

Curator and Mineralogist.

The Government Geologist.

## APPENDIX 13.

## Report on the Coast between Seal Rocks and Smith's Lake Bar.

Sir, Geological Survey, Department of Mines and Agriculture, 16 August, 1898.

I have the honor to report having, in accordance with your instructions, visited the coast between Seal Rocks and Smith's Lake Bar, in connection with an application by Mr. J. Windross, of Waratah, for special mining concessions as regards area, rental, and labour conditions, for certain supposed auriferous beaches between the points mentioned.

Applicant accompanied me during inspection, it being his first visit to the site.

The application embraces about 4 miles of the coast by a width of 20 chains, but examination proved that between Seal Rocks and Smith's Lake Bar it consists mainly of high precipitous rocks. Disregarding a few narrow fringes of sand at the foot of the cliffs, which are covered at high water, about 60 chains of the coast-line only are available for the purpose required. The average width of the suitable areas is about  $2\frac{1}{2}$  chains, and the total area about 15 acres; or, if the full width of the application be taken, an area of 120 acres. The latter, however, could not be granted, even if desirable in a mining sense, without damage to the Seal Rocks to Bungwall Road, which traverses the coast within half a chain of the backs of the main beaches.

The restricted area—15 acres—embraces three beaches,—the first and nearest to Seal Rocks has a length of 19 chains; the second, about half a mile distant, a length of 32 chains; and the third, about 2 miles distant from the second, a length of 6 chains. The latter is shut in by high land, rising steeply about 200 feet above sea-level. Here the machine referred to has been erected, but little or no work has been done, owing to the scarcity of a fresh-water supply, which is preferred for working it. A well has been sunk about 15 feet deep at the back of the beach at the foot of the rise, but the quantity of water available is apparently not sufficient for continuous work. Sea water will have to be used on all the beaches if operations are to be on a large scale, as proposed.

A little black sand is visible in thin streaks in the sand of this beach, and four fine particles of gold were shown me in a prospect from the machine site. On the other beaches, however, this characteristic associate of the gold is conspicuous by its absence.

Bordering the beaches landwards for the greater part of their longitudinal extension are accumulations of boulders, which will materially interfere with any mechanical means of working, and add greatly to the manual labour required.

Another difficulty to be encountered is the probability, if not certainty, of high tides or stormy conditions almost completely covering the sphere of operations.

The beach sands between Seal Rocks and Smith's Lake Bar are similar to those farther north between Cape Hawke and the Manning River, but less extensive. The second (32 chains) beach was pegged out by claim-holders a number of years ago, but if any work was done all trace of it has been entirely obliterated. I am strongly of opinion that the beach sands of this locality cannot be profitably worked owing to their poverty in gold.

As regards the "Owen Blakett Patent Gold-saving Machine and Ore Concentrator" erected on the small beach described, no alterations have yet been effected to remedy its admitted defects, at all events for this class of mining. Personally, I am of opinion that it cannot be rendered efficient for this class of work.

As, however, applicant still has faith in the proposed enterprise, and is prepared to spend money in effectively testing both the machine and the beach sands, whatever concessions are possible under the circumstances should, perhaps, be allowed. It will, however, be seen that a correct knowledge of the local physical conditions so modifies the scope of the application as to render the amount of rental and labour necessary to secure fullest protection a matter of little moment.

Two special leases, aggregating about 12 acres, and a prospecting claim by virtue of a miner's right would adequately secure the two larger beaches and the present machine site.

Special leases would be the most suitable form of tenure for the larger beaches because proportional dimensions are not defined under their provisions, thus the area could be reduced to absolute requirements as regards width.

The supposition that the gold extends miles back from the beaches is, in my opinion, entirely erroneous. The beaches are walled in by high land, consisting of Lower Carboniferous rocks; the weathering and denudation of the sandstone members of the series have covered the surface of the country over large areas with loose sandy soil, which has probably been mistaken for the auriferous beach sand.

I have, &c.,

JOSEPH E. CARNE,  
Geological Surveyor,  
Department of Mines and Agriculture.

The Government Geologist.

## APPENDIX 14.

## Report on Gold Leases 34 and 37, Sunny Corner.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 14 July, 1898.

I have the honor to report that, in accordance with your instructions, I inspected gold leases 34 and 37, at Sunny Corner, parish Castleton, county Roxburgh (taken up 20th February, 1895, and 17th November, 1894, respectively), with a view to ascertaining whether any objections exist in the interests of mining to granting a special lease for quarrying purposes for the area embraced by the gold leases and in lieu thereof. The contention of the applicant, J. K. Charleston, is that the reef covered by the leases is not payably auriferous, and only suitable for fluxing purposes in connection with the smelting of Sunny Corner silver ores; the objectors—C. and J. Cook—contending, on the other hand, that it is payably auriferous.

The leases embrace a portion of Bob's Creek and one of its short tributaries. Bob's Creek from a point just above gold lease 37 has been largely worked for gold down its course from the earliest days of mining in the district, and still gives employment to fossickers, some being engaged at the present time just outside the south boundary of gold lease 37. The creek being non-auriferous a short distance above  
the

the site of the lease mentioned is clear evidence of the derivation of its gold contents below that point from the numerous adjacent reefs. In gold lease 73 a quartz reef is being worked just at the north-west corner of gold lease 34, a small battery being erected at the site; this is probably the same or a closely parallel reef to that in the leases under consideration.

In gold lease 9 on the east another reef has been extensively prospected. I understand some 4-oz. stone was obtained from it, but it is not now being worked. Numerous other flat-lying reefs occur in the quartz porphyry, one just at its junction with slate.

The quartz reef traversing porphyry in gold leases 34 and 37 strikes about N. 22° E., with a wavy dip to the eastward at from 20 to 35. In thickness it varies from 4 inches to 2 feet, averaging for about 150 feet in the tunnel about 7 or 8 inches. It is mostly of a kindly banded appearance, the bands being lined with arsenical pyrites. At the tunnel level—which is in the north bank of Bob's Creek in gold lease 37—probably little or no free gold occurs.

From local report and surface evidence the reef was worked for gold to a shallow depth in the early days of the field.

In the presence of the applicant's representative, the objectors, and the Warden's clerk, I carefully sampled the reef by breaking portions across its thickness at intervals of 2 or 3 feet for about 150 feet along its exposure in the tunnel, and from outcrops at surface and a heap ready stacked. The selected material was then broken up and bagged. At the Government Metallurgical Works it was further broken in a stone-breaker, then passed through a small crusher, and afterwards through the Stanfield-Clarkson Rapid Sampler. The assay results of the average sample from about 1 cwt. 1 qr. of reef-stone have just been received, viz. :—

Gold	...	...	...	...	...	...	...	8 dwt. 6 grs per ton.
Silver	...	...	...	...	...	...	...	9 dwt. 6 grs. "

Taking into consideration the strong well-defined nature of the reef, this yield must be considered, if not strictly payable, at least very approximately so under careful and economic treatment. Under any circumstances it must, I think, be regarded as an effectual bar to granting of a special lease for quarrying purposes, which has a currency of fifteen years and carries no labour conditions.

In smelting matte silica is necessary for fluxing purposes; certain classes of Sunny Corner silver ores being deficient in this substance, resort is had to quartz vein-stone; naturally it is to the advantage of the smelters to use stone which is of itself more or less profitable, as in the present instance.

It is, I think, clear that the working of the leases in question by applicant entirely depends upon renewals of operations in the silver leases wherein work has ceased for the past eighteen months. Quite recently suspension of labour conditions was granted in them for two months. I would, therefore, respectfully suggest that matters be equalised by granting a similar period of suspension on gold leases 34 and 37, and that the granting of a special lease be objected to.

I have, &c.,  
JOSEPH E. CARNE,  
Geological Surveyor.

The Government Geologist.

APPENDIX 15.

Goulburn, 3 January, 1899.

Sir,

I have the honor to forward you my progress report for the year 1898.

On the 2nd January I left Sydney for Boorowa, and afterwards inspected the gold-mines at Kenyu.

From 8th January until the end of the month I was absent on leave.

During the month of February, and during the early portion of March, I was engaged in making an inspection of the system of gold-dredging in vogue upon the New Zealand auriferous rivers, and in preparing a report upon the same. This report has been published in pamphlet form. I visited the Cobar Districts during the latter portion of March in connection with proposals to curtail the gold-field reserve, and applications for aid from the Prospecting Vote.

Upon the 18th of April I left Sydney for Clarence Town, and commenced making a detailed examination of the Williams River and Port Stephens ironstone deposits. I was shortly after joined by Mr. L. F. Harper, Field Assistant. During the remainder of the year I have been chiefly engaged with Mr. Harper in mapping and testing the ironstone deposits of the Colony in connection with the memoir which you have instructed me to prepare, showing the extent and value from a smelting point of view of these deposits.

This work will probably necessitate an examination being made of several hundred deposits, and each deposit will have to be sampled and surveyed in order that its composition, dimensions, and position may be determined. So it may be expected that I shall be occupied for some considerable time.

We have practically completed our examination of the Williams River and Port Stephens deposits, and have geologically mapped an area of about 190 square miles within which the ironstone occurs. Unfortunately every one of these deposits was found to contain an excessive quantity of titanium, and it is doubtful, on this account, if the ore could be profitably reduced by ordinary smelting processes.

We have already sampled and mapped several large deposits of brown ore of good quality in the Goulburn District. During the year a considerable quantity of iron ore has been despatched from this district to the smelting works at Dapto and Cockle Creek, where it has been used as a flux.

I propose collecting and sending down to the Geological and Mining Museum for exhibition bulk samples of (say) 56 lb. each from each deposit capable of yielding a large supply of good ore.

From time to time I have had to leave the work in connection with the iron-ore deposits, in order to make inspections having reference to various other geological survey work. During my absence on these occasions Mr. Harper has done much useful work by locating and tracing deposits as a preliminary to our mapping them.

I have, &c.,  
JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist.

## APPENDIX 16.

## Ironstone Deposits near Clarence Town, Williams River District.

Geological Survey, Department of Mines, New South Wales,  
Sydney, 20 June, 1898.

Sir,

I have the honor to hand you, in accordance with your instructions, a preliminary report upon the ironstone deposits occurring in the vicinity of Clarence Town. Accompanying the report will be found a geological sketch map and sections. (This map will be published with the final Report on the Iron Ores of New South Wales.)

*General Geology.*

The ironstone occurs in the Carboniferous formation interstratified with sandstones, conglomerates, shales, claystones, and tuffs (?). The sandstones are very felspathic, and are probably composed almost entirely of material derived from the degradation of acid igneous rocks. In the field one is sometimes at a loss to decide whether some of the rocks should be classed as arkose sandstones, or whether an igneous origin should be assigned to them.

The general dip of the strata at Glen William, where the ironstone is first met with towards the north, is from 25 to 35 degrees in a direction a little east of north. As Clarence Town is approached the direction of dip swings round to the east; in this town it is south-south-east; and in the south-western portion of the parish of Uffington the rocks are found to be dipping at a very low angle towards the south-west.

There is evidence in all portions of the area examined of considerable local disturbances having taken place, and abrupt alterations in dip and strike are frequently met with.

*Glen William Beds.*

I propose, for descriptive purposes, to give this name to an important band of fossiliferous rocks which attain their greatest development in the vicinity of Glen William. These beds are for the most part composed of a bluish-grey siliceous claystone. They also include grits and sandy shales. The claystones are more or less calcareous in places, and near the 5½-mile post upon the Glen William Road a narrow bed of oolitic limestone is interstratified with them.

At Glen William the beds have a thickness of 1,400 feet; opposite the 2½-mile post they have thinned to 1,100 feet; and where they cross the Dungog Road they are only 330 feet thick. At some point between the Dungog Road and Wallaroo Hill they apparently thicken again, but are not sufficiently exposed to justify one in recording exact measurements. We were unable to trace them to the south of the latter-mentioned locality.

*Palæontology.*

The shales and claystones, and occasionally the sandstones and conglomerates, yield abundant fossil remains. Mr. W. S. Dun, Assistant Palæontologist to the Survey, has identified the following forms which were collected by Mr. C. Cullen, Fossil Collector to the Survey, by Mr. L. F. Harper, Field Assistant, and by myself:—

## 1. From Quarry on Glen William Road, about 1½ mile from Clarence Town.

Lepidodendron, sp.	Leptæna rhomboidalis, var. analoga, Phillips.
Zaphrentis, sp. indet.	Spirifera lata, McCoy.
Stenopora, sp.	Spirifera striata, Martin.
Fenestella, indet.	Spirifera, sp. indet.
Crinoid stems.	Productus, sp.
Rhynchonella pleurodon, Phillips.	Aviculopecten (close to the form referred to by De Koninck as <i>A. granosus</i> ).

## 2. From ridge, left-hand side of road from Clarence Town to Glen William, 4¼ miles from Clarence Town.

Trachypora.	Spirifera striata (?).
Cyathophyllum (?).	Orthotetes cremistria, Phillips.
Zaphrentis, sp.	Orthis resupinata, Martin.
Actinocrinus (distorted calyx).	Cardinia, n. sp.
Crinoid stems.	Pterinea, n. sp.
Fenestella multiporata, McCoy (De Koninck).	Murchisonia.
Polyzoan (gen. indet.) <i>a</i> .	Bellerophon (Euphemus).
Polyzoan ( " ) <i>b</i> .	Conularia, sp. indet.
Productus semireticulatus (?).	Conularia, n. sp.
Spirifera, sp. indet.	Orthoceras c.f. martinianum (De Koninck).
Spirifera, young form of <i>S. grandicosta</i> (McCoy).	Orthoceras, sp. <i>a</i> .
	Orthoceras, sp. <i>b</i> .

## 3. From quarry near school-house on Glen William Road, 4¼ miles from Clarence Town.

Lepidodendron veltheimianum, Sternberg (?).	Spirifera, sp. indet.
" " (Knorria stages).	Productus c.f. longispinus.
" (Knorria).	Orbiculoidea nitida, Phillips.
Fenestella, 2 species indet.	Petrinea, sp.
Encrinite stems.	Allorisma, <i>a</i> .
Branching Polyzoan, indeterminate.	Allorisma, <i>b</i> .
Phillipsia, sp., young form.	Indeterminate Gasteropod.
Phillipsia, c.f. dubia, Eth.	

The presence of worm tracks and plant remains in association with marine corals, polyzoa, mollusca, &c., would seem to point to the rocks having been deposited in shallow salt water.

Mr.

when it is lost to view under the alluvium of a gully running up into the range. Between this point and the next one where we found the ironstone outcropping a long distance—100 chains—intervenes. It is possible, however, that isolated outcrops may occur about the dotted line shown upon the accompanying map, though after a careful search we did not succeed in finding them. In some places we found tuffaceous sandstones more or less impregnated with magnetite apparently upon the horizon of the ironstone. The bed can be seen crossing the Dungog Road in a cutting a little south of the 2-mile post, and upon the western side of Stony Creek we found two parallel lines of outcrop distant from one another about 6 chains, which we traced for distances of 11 and 12 chains respectively. Between the two beds a quartz-felsite, sill (?) a chain wide, occurs. Still travelling southwards, we find the ironstone outcropping for the short distance of half a chain upon the top of Wallaroo Hill. It is next seen upon Portion 87, and exposed for a length of 3 chains, and finally upon Portion 54, Parish of Barford, where it forms a prominent ridge running down a precipitous hill-slope. A parallel bed occurs here about 3 chains below the main bed. Only upon the last two outcrops did we find exposed sections which enabled us to accurately measure the width of the bed; elsewhere the apparent width is probably in excess of the actual width. The average thickness along the two outcrops named is about 2 feet.

Samples of the ore which I obtained from various points along the outcrops have been assayed by Mr. J. C. H. Mingaye, Analyst of the Mines Department, as under:—

No. of Outcrop.	Metallic Iron.	Silica.	Phosphoric Acid.	Titanic Acid.
1 and 2 .....	44·25	10·85	.....	Trace.
3 .....	51·96	20·80	0·095	”
5 .....	52·9	11·97	0·381	”
6 .....	42·57	15·35	0·095	”
7 .....	49·77	17·38	0·248	”
9 .....	36·41	28·75	0·192	”
10 .....	48·44	19·62	0·057	”
1 and 2 .....	49·35	9·70	.....	”
1 and 2 .....	48·50	12·70	.....	”

The Prospecting Board have recommended that a sum of money shall be expended in putting a few shallow shafts and trenches upon the beds, and I shall be better able to systematically sample the deposits after this work has been completed. Before concluding I should like to record my indebtedness to Mr. L. F. Harper, Field Assistant, for the assistance he has rendered to me.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist.

#### APPENDIX 17.

#### Ironstone Deposits in the Port Stephens District.

##### *Minute.*

In last year's Annual Report of the Department of Mines a preliminary report on the iron-ore deposits of Seaham was made by Mr. Jaquet, and this report appeared to show that these ores were free from titanitic acid. The more detailed report now submitted by Mr. Jaquet proves that the Seaham ores contain considerable quantities of titanitic acid, which will render them unsuitable for smelting,

E. F. PITTMAN,

Government Geologist.

The Under Secretary.

9/1/99.

Geological Survey Branch, Department of Mines,

New South Wales, 18 November, 1898.

Sir,

I have the honor to hand you a second progress report of the geological survey of the ironstone deposits of the Colony, which is being carried out by Mr. L. F. Harper, Field Assistant, and myself.

We have now practically completed our examination of the ore-bodies in the Port Stephens and Williams River Districts. As an appendix to this report you will find a tabulated statement showing the dimensions, value from a smelting point of view, and quantity of ore in each deposit.

There is also attached a geological map which embraces the area covered by the deposits (about 190 square miles), and which shows the position of each deposit, and its mode of occurrence. This area comprises rocks of Carboniferous age, and numerous igneous intrusions. In this progress report I propose to only briefly refer to these rocks. A more detailed account of them will be given in the memoir upon the iron ores of the Colony, which you have instructed me to prepare.

##### *Sedimentary Rocks.*

The Carboniferous formations consist of arenaceous fresh-water beds which are interstratified with more argillaceous marine beds. The former consist of sandstones, conglomerates, tuffs (?), and bands of cherty shale. They yield in places abundant remains of the fern *Rhacopteris*; hence their name *Rhacopteris* Beds. The marine beds consist of clay-stones, shales, and fine-grained argillaceous sandstones which yield *Lepidodendron*, *Calamites*, and a varied marine fauna.

The occurrence of worm tracks and the association of plant remains with molluscs, corals, cephalopods, &c., points to the marine beds having been formed under shallow water, and the fact that we find these beds interstratified with others of fresh-water origin would seem to indicate that during the Carboniferous Period the land was alternately rising and falling.

##### *Igneous Rocks.*

The igneous rocks consist of basic quartz felsites and andesites, which vary considerably in composition. Some specimens are normal quartz felsites, consisting of felspar crystals in a micro-crystalline base; others contain but little quartz, and perhaps might be described as felspar-porphyrries; others again contain a considerable quantity of hornblende or hypersthene, and are more or less typical andesites. However the field evidence goes to show that the variations are local, and that these rocks are probably the result of one period of eruptive activity. In the vicinity of Booral and Stroud, we found large masses of rhyolite, basic andesite, and basalt. We did not thoroughly investigate these rocks; but there is evidence to show that they have no connection with the quartz felsites, &c. The

The first named group of rocks seem to have been for the most part intruded along paths of weakness in the bedding planes. They appear in fact to be present in the form of sills. However, in some instances, they undoubtedly pass across the bedding planes. Thus we found near the head of Barnes Creek a narrow dyke running across deposit of ironstone No. 25, and passing from the Rhacopteris into the marine beds.

A most interesting occurrence of sills is to be seen in the parishes of Wilmot and Karuah. Here we found two sheets of igneous rock, separated from one another by a band of sandstone and conglomerate about 10 chains wide, running with the strata and parallel to one another from Wallaroo Mountain to a point north of Stony Creek, a distance of 9 miles. Another interesting intrusion occurs in the northern portion of the parish of Karuah, and extends northwards into the Australian Agricultural Company's Port Stephens Estate. It attains a width of 2 miles upon the boundary of the parish, and extends north and south a distance of 7 miles. There is evidence to show that this mass has been intruded between the bedding planes, and that the sedimentary rocks have been forced outwards on either side of the point where it attains its maximum thickness.

Upon the banks of the Karuah River, near Stroud, a seam of coal can be seen outcropping.

#### *Iron-ore Deposits.*

We have examined, mapped, and sampled twenty-five deposits of ore altogether. It is possible that there may be other deposits which have yet to be discovered, and which are not charted upon the geological map. Such deposits, however, would probably prove to be of insignificant extent—it is not likely that any of the larger ones have escaped our notice—and a consideration of their contents would not be likely to materially alter the estimate which we have given of the total quantity of ore in the district.

The ore-bodies closely resemble one another both as regards their mode of occurrence and the character of the ore which they yield. The ore consists of a granular titaniferous magnetite with a fine texture and steel-grey colour. It has associated with it variable quantities of quartz and felspar grains. The sandstones and tuffs in the vicinity of the ore-bodies often contain a considerable quantity of magnetite, and these rocks can be seen in some instances passing by insensible gradations into compact iron ore. Indeed the ironstones may, perhaps, be regarded as sandstones or tuffs in which the magnetite grains occupy a prominent position to the exclusion of the sand and felspar grains.

The deposits are stratified and conformable with the formations which accompany them. They do not, however, extend as a continuous body either in a horizontal or vertical direction for long distances, and they are liable to abrupt alterations in thickness. Thus deposit No. 14 where exposed in a trench is 10 feet wide, and in the next trench, but 11 yards distant along the line of outcrop, it has thinned to 3 feet. Again deposit No. 6, as seen in a trench at the surface, is a compact bed 2 ft. 6 in. thick, and where cut by a shaft at a depth of 25 feet upon the line of dip it is only 3 inches thick.

The ore-bodies, though not continuous, are sometimes found occurring at intervals along one horizon. Thus deposits No. 20 to No. 25, which are situated west of Booral and Stroud, crop out in succession along a certain well-marked band of rocks for a distance of 9 miles. On the other hand, after making a geological survey of the district, I am of opinion that the ore is not confined to one horizon; and that the ore-beds are in some instances separated from one another by several thousand feet of intervening strata.

All the ore-deposits examined by us were situated in the Rhacopteris Beds; in no instance did we observe magnetite in the marine beds.

#### *Estimation of Quantity of Ore in Deposits.*

Owing to the erratic way in which the ore-bodies vary in width, or disappear altogether, it is impossible to estimate with accuracy the quantity of ore which they contain. The estimates given in the tabulated list must only be regarded as rude approximations. The total quantity of iron ore in the Williams River and Port Stephens Districts is estimated in round numbers at 2,000,000 tons. I have assumed that each bed of ore extends as far downwards along the line of dip as it can be traced at the surface along the line of strike. Thus in the case of a bed 200 feet long, and possessing an average width of 2 feet, I should estimate the quantity of ore at (200 x 200 x 2) 80,000 cubic feet.

The specific gravity of several samples was determined as under:—

No. of Deposit.	Specific Gravity.
8	4.233
14	3.968
9	3.880
20	3.923
16	3.903
24	3.875
Average.....	3.963

We have taken 1,000 feet, measured along the dip, as a maximum depth in the case of beds exceeding this distance in length. The estimate of the quantity of ore in deposit No. 16 has been copied from the report of Professor T. W. E. David (Annual Report Department of Mines for 1891, p. 248). I am inclined to the opinion that our estimates are, if anything, too high; at any rate, one would be justified in saying that the area examined is not capable of yielding more than 2,000,000 tons of ore.

In order to enable us to more accurately estimate the dimensions of the various ore-beds, a series of trenches and shallow shafts was sunk with the aid of the Prospecting Vote.

Fresh assays for titanium have recently been made in the laboratory of the Department from portions of the samples collected by us from the Clarence Town and Seaham deposits (Nos. 1 to 11 and 13), with the result that in every instance the sample was found to contain an excessive quantity of the objectionable ingredient.

Having regard to the tabulated list (Appendix 2) showing results of assays taken from twenty-five deposits in the Williams River and Port Stephens Districts, I am of opinion that the whole of the magnetic ore is unfit for treatment by the ordinary processes of smelting.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist.

*Appendix 1:*

## Appendix 1.

Fossils collected by us, and determined by Mr. W. S. Dun, Palæontologist:—

1. From Stony Creek, north-west corner of portion 18, parish Wilmot—  
Asteroalamites scrobiculatus, Schlotheim.
2. Foot of Skid Hill Range, near south boundary, parish Horton—  
Small bivalve, most probably Edmondia.
3. A. A. Company's Port Stephens Estate, east of Booral Wharf, Karuah River—  
Spirifera, internal casts.
4. From near Booral, on road junctioning with Raymond Terrace—Stroud Road, 6 miles from Stroud—  
Rock much fractured with numerous plant fragments. The fern is interminable, but judging by the fragments preserved it is not Permo-Carboniferous.
5. On traverse of 4th August. Near head of Wallaroo Creek, parish of Wilmot—  
Orthis resupinata, Martin.  
Leptæna rhomboidalis, var. analoga, Phillips.  
Orthotetes crenistria, Phillips.
6. Between Limeburner's Creek and Stroud Road, parish of Tarean—  
Rhacopteris inequilatera, Gæppler.  
Lepidodendron Veltheimiamum, Sternberg.
7. Between Ten-mile Creek and Caswell's Creek, parish of Wilmot—  
Lepidodendron Veltheimiamum, Sternberg.
8. East bank, Karuah River, near Booral—  
Rhacopteris septentrionalis, Feistmantel.  
Cardiopteris (?).
9. From about 4 miles south-west of Stroud, on track to Thalaba, A. A. Company's Port Stephens Estate—  
Athyris.  
Fenestella.  
Spirifera.  
Leptodomus (very abundant).  
Euomphalus.  
Crinoid stems.  
Productus sp. indet. close to spinulosus, Sowerby (very abundant).

## APPENDIX 18.

## Deep Lead, near Corang River.

Sir,

31 December, 1898.

I have the honor to inform you that, according to your instructions, I have made an examination of the recently-discovered "deep lead" situated near the Corang River, about 7 miles from Nerriga.

A considerable amount of gold has been won from workings in the shallow portions of the lead; but these workings are practically exhausted, and miners are now directing their attention to tracing the lead into deep ground. Monaghan and Party, after sinking through 64 feet of a fine sediment (locally known as lignite), have struck payable gravel, and having erected a stump-pump, are now raising and stacking wash-dirt. About 600 yards further down the supposed line of lead, Huxley and Party, assisted by a grant from the Prospecting Vote, are sinking a shaft. It is now down over 100 feet, and has not yet penetrated the "lignite." Beyond the site of Huxley and Party's shaft an extensive flow of basalt occurs; and in my opinion it is important that an answer should be given to the question—"Does the deep ground now being worked by Monaghan and Party extend through Huxley's claim and under the basalt?" This can only be done by sinking a shaft or shafts, and in my opinion the circumstances warrant the putting down of a deep shaft. Owing to the great width of the alluvial deposits and the general absence of data, one can only speculate as to the course of the deep ground beyond Monaghan and Party's shaft. However, the site of Huxley and Party's shaft would seem to be well chosen, and the miners upon the field with whom I discussed the matter acquiesced in this view.

Huxley

Huxley and Party are already receiving aid. They have carried their shaft down over 100 feet, and will probably have no difficulty in reaching the top of the gravel. All the circumstances, however, would seem to indicate that a great volume of water will be encountered when the shaft enters the gravel; and, having regard to the depth of the shaft, it would certainly not be possible to keep down this water by means of a bucket and windlass. A steam-pump will be required, and the party have not sufficient means to buy or hire one.

The miners ask, in the event of a heavy flow of water being encountered, that in lieu of granting an increased rate of aid the Government should provide a steam-pump, and keep the shaft unwatered until such time as the bottom has been reached and drives have been carried across the lead as far as the exigencies of ventilation will permit.

I think, having regard to the depth of the ground, and the large quantity of unproved country beyond the shaft which would be available for prospecting, that the request is a reasonable one; but I am not sure whether the Board have any precedent for adopting such a course. In any case nothing can be done in the matter until the shaft enters the gravel and the flow of water is roughly estimated.

The Government Geologist.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

APPENDIX 19.

Kenyu Mine, Burrowa.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 8 January, 1898.

Sir,

I have the honor to inform you that in accordance with your instructions I have examined the mine upon Jas. Russell's conditional lease, referred to in the attached letter of Mr. Thos. Stevenson, and given Messrs. W. Dromgold and Party advice as to the best method of prospecting the same.

The above sketch sufficiently explains the work which has been done.

In the crosscut at 80 feet, at a distance of about 27 feet from the shaft, an irregular reef about 3 feet wide has been cut, which would seem to be the continuation of the reef encountered immediately below the crosscut at 23 feet. This reef is composed of anastomosing quartz veins with included masses of country rock. Assays made in the laboratory of this Department of the quartz have yielded from 8 dwt. to 5 oz. of gold per ton. These assays give one no idea of what the reef is likely to yield *en masse*; and I would advise the owners to drive a short level upon the reef and obtain 10 tons of quartz, and have the same crushed at a battery provided with concentrators. Should the reef be found to contain half an ounce of gold per ton for the full width of 3 feet, the mine might certainly be considered a payable one. In the absence of any levels one can form no idea as to the length of the reef.

The Government Geologist.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

APPENDIX 20.

Sir,

Geological Survey, Department of Mines and Agriculture, 7 January, 1899.

I have the honor to hand you the following report on the work performed by me during the year 1898:—

During January I visited Mudgee, Windeyer, Hill End, Wattle Flat, Parkes, Condobolin, Bobadah, Carlisle, Fifield, Alectown, and Forbes, and dealt with applications for aid from the Prospecting Vote, and examined mining reserves which were proposed to be thrown open for settlement.

From 1st to 7th February I was engaged at the office in writing reports, and on 8th of the same month I left Sydney, and was absent until 5th March.

During that time the following places were visited, where either sites were examined for which aid was applied for, or mining reserves inspected, viz., Young, Woodstock, Burnt Yards, Trunkey, and Fifield.

At the last-named place an effort was made to discover the source of the platinum. This metal occurs at Platina, near Fifield, with gold in alluvial deposits, which are probably of Tertiary age, and at Jack's Look-out in a grit which may be of Pre-Tertiary age. There are large developments of coarse hornblende rocks in the neighbourhood of Fifield and Platina, which may possibly have been the source from which the platinum was derived. All efforts, however, made to detect its presence in these rocks by washing dishes of the decomposed and disintegrated rock were unsuccessful.

While in the vicinity of Fifield I made an examination of a deposit of iron ore at Mount Gobondery, about 7 miles E.N.E. of Fifield. The ore consists of crystallised hematite or specular iron ore, and may at some future time have a considerable economic value.

My report on this deposit forms Appendix 21.

On

On the 9th March I left Sydney for Burragorang and Mount Werong, and examined the silver-mines at these two places in connection with applications for aid, and returned to Sydney on the 15th of the same month. Between the 15th and 29th March I was absent from the office on leave.

From 18th April to 21st May I was in the field and visited the following places, viz., Gundagai, Muttama, Barmedman, Mandurama, Orange, Ophir, Wyagdon, Wattle Flat, Gulgong, Tallewang, Windeyer, Hargraves, Porter's Retreat, and Forbes.

While at Hargraves a few preliminary notes were made on the saddle-reefs, and these appeared in a paper printed in the "Records of the Geological Survey," Vol. V, Part IV.

I again left Sydney on 3rd June, and was away until 21st July, visiting the following places, viz., Eurunderie, Hargraves, Windeyer, Wellington, Stuart Town, Muckerawa, Parkes, Tichborne, Forbes, Cookamidgera, Murga, Rockley, Hill End, Tambaroora, and Lue.

During this second visit to Hargraves I made a more detailed examination of the saddle-reefs; a report was written, and is now being printed in Part II of Vol. VI of the "Records of the Geological Survey."

My visit to Hill End was made in accordance with your instructions to advise as to the best way to sink for the lost reefs. In order to be in a position to do this it was necessary to study the mode of occurrence of the reefs. It was found that the rocks in the neighbourhood of Hill End, which consist largely of slates and intrusive sills, have been thrown into folds, which have an approximately north and south trend. The centre of one of these folds lies to the west of the town, and between that and Bald Hill. In this field two main series of reefs are to be made out—one on the east side of the centre of the fold, whose members dip to the east, and the other on the west side of it, whose members dip to the west. While between the two series, and along the centre of the arch, are seen at intervals flat-lying or gently-arched masses of quartz.

All these reefs lie along the bedding planes of the slates, and are thus conformable with the stratification of the rocks.

To account for these and other features of the reefs I put forward in my report, which forms Appendix 22, the saddle-reef theory as giving a rational explanation of the facts.

No other known theory seems to explain how the spaces (now occupied by the reefs), which dip away on each side, from the centre of the arch, could have been formed.

The whole matter was one of such economic importance, for if the Hill End reefs were saddle-reefs, and a descending series of them occurred as at Bendigo (where saddle-reefs are being worked at a depth of 3,500 feet below the surface), there was a possibility of opening up an extensive gold-field.

To solve this question it was recommended in my report that bores should be put down, and the late Minister approved of this being done.

It has, however, now been decided to put down one or at most two bores on the east side of the rich reefs on Hawkin's Hill, and, therefore, considerably to the east of the centre of the arch, so that no solution will be obtained of the important question whether saddle-reefs occur at Hill End or not.

During the greater part of August I was engaged in the office in writing reports on the saddle-reefs at Hargraves and on the bismuth deposits of the Colony. The latter was published in pamphlet form, and issued as No. 4 of the Mineral Resources.

During September and October I was engaged at Wyalong in making a geological examination of that gold-field, and collecting data for a geological map.

The two following months, with the exception of about a week, have been spent at the office in writing my report on the Wyalong Gold-field.

I have, &c.,

J. ALEX. WATT,  
Geological Surveyor.

The Government Geologist.

See subsequent report of the Government Geologist on this question dated 10th September, 1893.

#### APPENDIX 21.

##### Notes on a deposit of Specular Iron Ore at Gobondery.

Sir,

Geological Branch, Department of Mines and Agriculture, 27 May, 1898.

While in the Fifield District my attention was directed by Mr. C. T. Metcalfe to a deposit of iron ore occurring at the foot of Mt. Gobondery, in the parish of Gillenbine, county of Cunningham. The results of the observations made during a short visit I now beg to submit for your perusal.

The accompanying sketch shows the approximate position of the deposit and its situation with regard to Fifield, from which it is distant about 7 miles in a direct line, and in an E.N.E. direction.

The iron ore occurs at the junction of sedimentary strata (slates, quartzites, marble, &c.), with a large granite mass, which has intruded the slates, &c., and considerably altered them. Little can be said as to the form and size of the deposit, as only natural exposures are visible, while no exploratory work has been done on it; but if we may judge by the bold, well-defined character of the outcrops it should prove of considerable extent.

The

The area over which the hæmatite is exposed at the surface, though not continuously, is about 500 feet in length by 200 feet in width, the several outcrops being separated by soil, which prevents the true form and size of the deposit from being determined.

The largest of the outcrops is that marked A (*vide* plan and section), which assumes the form of a terrace 200 feet long and 45 feet wide, with an abrupt easterly face 8 feet in height. The whole of this area is occupied by massive specular iron ore of good quality, of which there is at least 7,000 tons already naturally exposed.

Another large mass, marked B (*vide* plan and section), occurs 180 feet west of the southern end of the deposit just described. This mass stands 7 feet above the surrounding soil, and is 36 feet long.

There are other outcrops of smaller dimensions, several of which are shown on the plan. Some of these contain ore of good quality, while in others the ore seems to be somewhat siliceous.

At C (*vide* plan) an excavation was made some years ago to determine whether the quartzite and slates, which are there highly charged with oxide of iron and veined by quartz, are gold-bearing. Some of the material, I believe, was found to contain about 2 dwt. of gold per ton.

To roughly determine the quality of the hæmatite, three samples, which were made as representative as possible, were taken, two from deposit A, and the third from B, and the percentage of iron in them determined in the Departmental Laboratory.

No. 1 (S. 1), taken from the southern end of the terrace-shaped deposit A, gave 57·72 per cent. of metallic iron, corresponding to 82·45 per cent. of hæmatite ( $\text{Fe}_2\text{O}_3$ ), with also traces of gold and silver.

No. 2 (S. 2), taken from the northern end of the same outcrop, gave 61·29 per cent. of metallic iron, corresponding to 87·55 per cent. of hæmatite ( $\text{Fe}_2\text{O}_3$ ).

No. 3 (S. 3), taken from outcrop B, gave 58·98 per cent. metallic iron, corresponding to 84·26 per cent. of hæmatite ( $\text{Fe}_2\text{O}_3$ ), with traces of gold and silver.

The average iron contents of the three samples was, therefore, 59·33 per cent., which equals 84·72 per cent. of hæmatite ( $\text{Fe}_2\text{O}_3$ ).

As to the quantity of the ore, there is already about 8,000 tons in sight, while the surface indications lead one to believe that if prospected this would prove a deposit of considerable dimensions.

Before concluding, a word might be said about the possible origin of the deposit. As already mentioned, the deposit seems to lie at the junction of granite, with highly altered sedimentary rocks. Among the outcrops of these latter are several somewhat large blocks of highly crystalline marble, the presence of which suggested to my mind the possibility that the hæmatite may occupy cavities produced by the dissolving out of masses of the marble, or that possibly it may owe its origin to a metasomatic replacement of the carbonate of lime by hæmatite.

Should this genetic association of the marble and hæmatite be a reality it would have a considerable influence on the form and size of the deposit and the quality of the ore.

It was thought advisable to draw attention to this deposit, as those of a similar character already known in this Colony are not numerous or of considerable economic importance, and although the present deposit is in a rather inaccessible part of the Colony, being 25 miles from Bogan Gate Railway Station, on the Parkes-Condobolin line, circumstances may at some future time arise that would lead to a demand for ore of this nature for use within a reasonable distance from Gobondery, when this deposit would assume considerable importance.

I have, &c.,

J. ALEX. WATT,

Geological Surveyor.

The Government Geologist.

#### APPENDIX 22.

##### Preliminary Report on the Quartz Reefs of the Hill End and Tambaroora District.

Geological Survey Branch, Department of Mines and Agriculture,

Sir,

Sydney, 28 July, 1898.

In accordance with your instructions to "visit Hill End, and advise as to the best way to sink for the lost reefs," I proceeded to Hill End and made a brief examination of the general geological features of the district.

Particular attention was directed to ascertaining the mode of occurrence and probable origin of the gold-bearing quartz reefs.

The key to the solution of these problems was furnished by previous observations made in the neighbourhood of Hargraves, a mining township situated about 20 miles nearly due north from Hill End.

As the strike of the Silurian strata over this portion of the Colony is, on the whole, nearly north and south, it was thought that the same series of strata would be found to occur at the two places, and to have been somewhat similarly affected by the forces which have folded and otherwise acted on the rocks.

It has been shown in the case of the Hargraves District that the movements to which the rocks there have been subjected have resulted in the production of saddle-shaped cavities between the strata, which have later become filled with auriferous quartz by the infiltration of mineral-bearing solutions. In this way reefs have been produced which resemble in all their essential features the famous "Saddle Reefs" of Bendigo, in Victoria.

Before the examination of the Hill End Gold-field had proceeded far, it became clear that the phenomena of the Hargraves saddle-reefs were there produced as far as the general facts of their mode of occurrence and origin are concerned, though there are some very noticeable and important differences.

As my visit was such a short one, I do not feel justified in entering upon a detailed description of the reefs, but must limit myself to a general statement of their main features.

#### *Nature of the Rocks.*

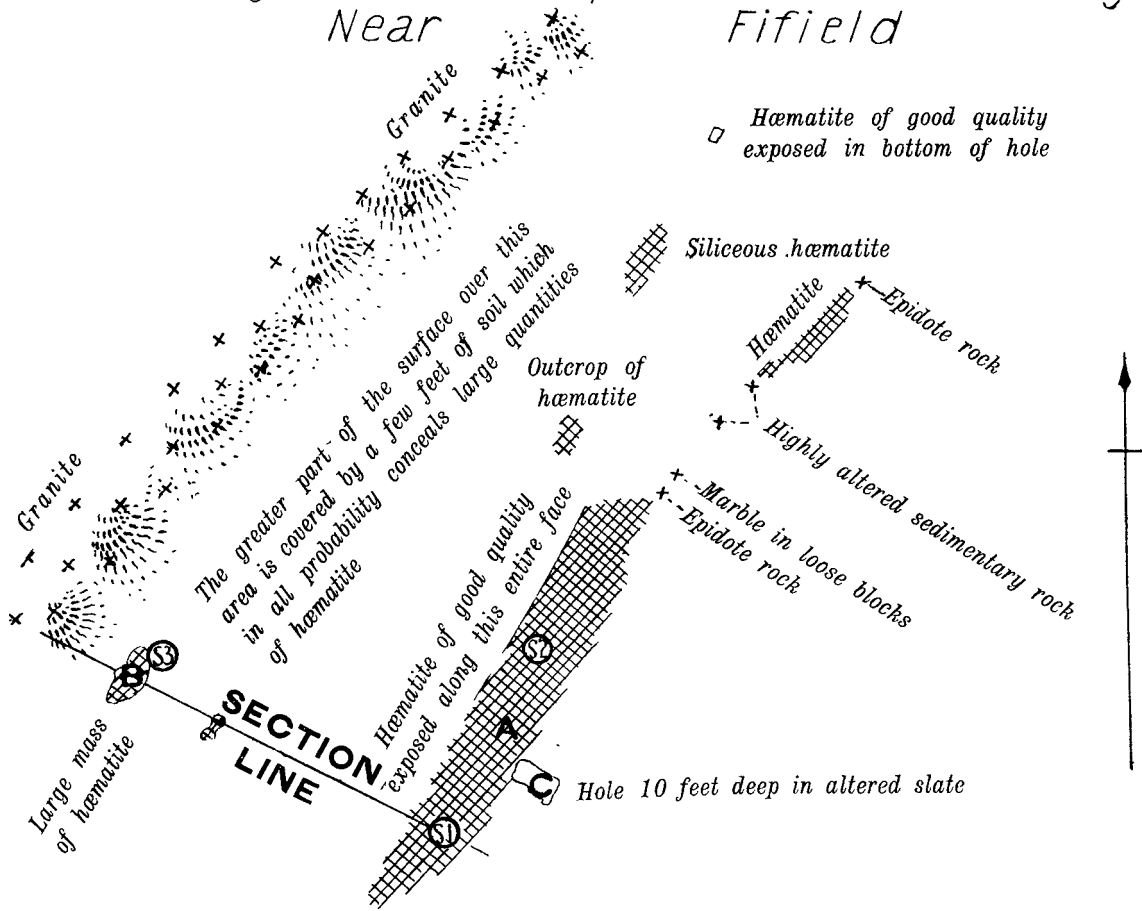

The rocks of the district consist partly of slates and partly of bands of an eruptive rock of granitic composition, which passes in places into a finer-grained felsitic variety. These bands of eruptive rock are of later origin than the slates, into which they have been intruded, chiefly in the form of sills or masses of varying thickness, which have been forced while the material was molten between the bedding planes of the slates, or rather shales, as they most probably were when the intrusion took place, but also partly as dykes which have broken across the bedding planes of the slates. The series of sedimentary strata and intrusive sills were later folded into wide expansive arches and troughs. The centre of one of these arches lies a little to the west of the town.

*Mode of Occurrence of the Reefs.*

The mines that have proved most productive at Hill End are those in which were worked the series of parallel quartz reefs which appeared at the surface on the western slope of Hawkin's Hill.

Nearly a dozen reefs have there been exploited within a width of a few hundred feet. All dip uniformly to the east, and, what is more important, all lie, on the whole, parallel to the original bedding planes of the slate and to the junction planes of the slate and intrusive sills. Other easterly-dipping veins have been worked north of Hawkin's Hill and almost continuously for a couple of miles.

On the west side of the field (*vide* Fig. 1) westerly-dipping reefs are abundantly in evidence; some of them have been profitably worked, but, taken as a whole, they proved very much poorer in value than the easterly-dipping ones.

Between the two series of easterly and westerly-dipping reefs large flat masses of quartz occur at intervals, which, when carefully examined, are found to mark the centre of the arch into which the rocks have been thrown, and to be conformable to the enclosing rocks.

*Probable Origin of the Reefs.*

The above-mentioned facts as to the mode of occurrence of the reefs, together with the close resemblance of the general features of this district to those of Hargraves, where saddle-reefs have been proved to exist one under the other, are sufficient to make it appear extremely probable that the Hill End reefs, as now exposed at the surface, are principally the denuded east and west legs of saddle-reefs which at one time were continuous across the centre of the arch. Further, the gently curving or flat-lying masses of quartz situated between the two series of reefs appear to be the caps of saddle-reefs which owe their appearance at the surface to the denudation of an immense thickness of rocks comprising slates, sills, and the caps of overlying saddle-reefs. It is this process of denudation, of course, that has supplied the gullies with the enormous quantity of alluvial gold which has been obtained from them. The source from which the gold was derived was, in all probability, those portions of the saddle-reefs which have disappeared in this process, leaving the easterly and westerly-dipping reefs as mere remnants of them.

*"Trough Reefs."*

These are trough-shaped reefs, or "inverted saddles," as they are sometimes called, which are well known at Bendigo, though not of much importance there. I have recently found similar reefs at Hargraves.

They resemble in many particulars the saddle reefs, but occur in the synclinal troughs of the rocks instead of in the arches. They are conformable to the strata, are usually thickest in their lowest portions, and taper off as they are traced upwards.

Such reefs occur at Tambaroora, on the east side of the Hill End arch, where they appear to assume unusually important proportions.

At the Red Hill Mine, where the easterly-dipping leg of one of these reefs is being worked, it has already been proved to extend to a depth of at least 400 feet from the surface.

South of the Red Hill Mine an underlying trough reef comes to the surface (*vide* Figs. 2 and 3), and is being followed down by Howard Bros.

*Conclusions to be drawn from the application of the Saddle-reef Theory to the Hill End Gold-field.*

If this theory should furnish the correct explanation of the phenomena presented by the Hill End reefs, the following conclusions, of very great importance to the future prospects of this gold-field, may be legitimately drawn from it:—

- (1.) That the easterly and westerly-dipping reefs will of necessity decrease in size as they are followed down, until they finally pinch out altogether.
- (2.) That saddle-reefs will be found of which there are now no traces whatever at the surface, but which will make their appearance one under the other as the prospecting operations are conducted downwards in the neighbourhood of the centre of the arch.
- (3.) That other arches containing saddle-reefs will be found to the east and west of Hill End.

(1.) This fact is even now to some extent recognised, for some of the reefs have already disappeared or become greatly reduced in size in the deeper workings. Some of them, on the other hand, have already been proved down to a depth of 800 feet from their outcrops without showing any very appreciable diminution in size. This is a very important feature, and distinguishes these legs from reefs of a similar character at Bendigo, where they, as a rule, cut out at about 100 feet below the saddle, and only exceptionally extended downwards 700 or 800 feet from it.

This feature, which is not remarkable when we keep in mind the great breadth of the Hill End arch, as compared to those of Bendigo, should have an important influence favourable to Hill End on the relative persistence in depth of the saddle-reefs of the two places.

(2.) In regard to the probable existence of a series of saddle-reefs below the centre of the arch, it is only reasonable to suppose that, as the circumstances are so similar at Bendigo and Hill End, and as in the former place they have been proved to extend at least to a depth of 3,350 feet from the surface, they will also be found to extend to a considerable depth at Hill End. Moreover, it is highly improbable that denudation has extended so far as to expose the deepest of the Hill End saddle-reefs at the surface.

(3.) Nothing can be more probable than that reefs of a similar nature will be found in parallel arches or troughs on the east and west sides of Hill End. In fact, I have already a suspicion that such reefs have been worked at Stuart Town on the west, and at Sally's Flat on the east, without their true nature being quite understood.

*Bald Hill.*

A few words might be said about the geological structure of Bald Hill, in order to indicate to the miners the apparent uselessness of searching for deep leads or quartz reefs under the basalt, which occupies the surface of the upper portion of Bald Hill.

Several shafts have been sunk round the edge of Bald Hill, which have had basalt on the hanging-wall side and slate on the footwall. In all these cases the junction appears to be dipping very steeply. Moreover, the slates are somewhat disturbed at the junction. A tunnel is now being put into the hill from the east side, the mouth of which is situated about 100 feet below the junction of the basalt and slate. About 170 feet in from the mouth a small dyke of very decomposed vesicular basalt has been met with.

All these facts make it extremely probable that the basalt on Bald Hill is not a portion of a once more extensive sheet of basaltic lava, but is part of the molten material that filled the pipe or neck of a basaltic volcano, whose upper portion has been removed by denudation.

It will, therefore, be readily understood that on this view no alluvial wash or quartz reefs are likely to be found by driving tunnels under the crown of the hill.

*Conclusion.*

Only a general account of the main features and probable mode of origin of the Hill End reefs has been presented. But, perhaps, this is sufficient to direct attention to the bearing that the correctness or incorrectness of such a theory of their origin has upon the opinion which we may form of the future prospects of the field.

For, if we take the old view, and look upon the reefs now being worked on Hawkin's Hill and elsewhere in the neighbourhood of Hill End as the mainstay of the district, and the further exploration of these reefs the only source of hope for the future, the outlook cannot be described as very bright. This is so, for the very obvious reason that some of these reefs that yielded rich stone in the upper levels have, in the deeper workings, either disappeared altogether or decreased considerably in size, while, in many other cases, they have been found to become so poor that they could not possibly be followed down.

But if I am right in applying the saddle-reef theory to this field, and I feel satisfied, in my own mind that I am, as it explains so satisfactorily all the observed phenomena, the possibilities of future development cannot easily be exaggerated.

In this connection it must be remembered that the pioneers of reefing at Bendigo had to face the same problems as those presented by the Hill End Gold-field to-day, and it was not till they had solved these, and proved the existence of saddle reefs recurring one under the other that the permanence of that field was established. The early stages in the development of the Bendigo and Hill End Gold-fields were similar, and it was only when the former entered upon the last and most important stage consequent upon the discovery of the fact that there was a continuous development of reefs one under the other that the mining industry was established there on a permanent footing.

It has now to be proved whether Hill End also is to reach this final stage, that is, whether saddle-reefs will be found to exist in a manner at all comparable to the way they occur at Bendigo.

In Lansell's 180 Mine (Bendigo) such reefs have been worked down to a depth of 3,350 feet, and there are altogether six mines in the same district over 3,000 feet in depth, and twelve over 2,700 feet. In the Lazarus Mine there are between the surface and the 2,200-foot level twenty-four saddle reefs, thirteen of which were auriferous to a profitable degree.

From the quartz reefs of the Bendigo district at least  $4\frac{1}{2}$  million oz. of gold have been obtained since 1862.

An opportunity now presents itself to this Department to do prospecting work of the very first order of importance on a field where the indications are such as to lead one to reasonably entertain hopes of its success.

What effect success would have upon the future of the mining industry in this Colony no one can say.

I beg to propose that a series of bores be put down on different parts of the field. The sites for these, however, must be most carefully selected, after a more detailed examination of the field has revealed the most favourable places for such bores. What I would most respectfully beg to urge, in the event of this suggestion meeting with the approval of the Minister, is that permission be granted to me to return to Hill End, to make a more thorough and detailed examination of the field than was possible during my recent short visit. I should then be in a position to advise where boring could be undertaken with the best possible chance of success.

This is a piece of work of such great importance, and one that might, if successfully carried through, be fraught with such momentous issues, that I would respectfully beg to be allowed to pay a visit to Bendigo, in Victoria, to make myself acquainted with the main characteristics of the saddle-reefs of that district. I would thus be better fitted to interpret similar phenomena at Hill End, and to solve the complex problems that the Hill End district is sure to present during its examination. Bendigo is the only place where the key for the satisfactory solution of them is to be obtained, for there saddle-reefs are typically developed, and have been worked on a most extensive scale, and with highly profitable results.

I have, &c.,  
J. ALEX. WATT,  
Geological Surveyor.

The Government Geologist.

APPENDIX 23.

*Minute.*

I AM inclined to think that Mr. Watt is right in his assumption that the Bald Hill is really a volcanic neck. In the tunnel to which Mr. Le Mesurier refers in the accompanying letter, a basalt dyke has recently been struck, and this is probably an offshoot from the main volcanic pipe. I think that the presence of this dyke in such close proximity to the main body of the basalt is very strong evidence of the Bald Hill being a volcanic crater, and that, therefore, there is no probability of alluvial gold being found in the site which the tunnel is intended to prospect.

The application for aid should, I think, be refused for that reason, but I do not think any good purpose would be served by giving the applicants the impression that saddle-reefs occur at Hill End.

E. F. PITTMAN,  
Government Geologist.

The Under Secretary.

Sir,

Geological Survey Branch, 10 August, 1898.

While recently engaged in making a very cursory examination of the Hill End Gold-field, my attention was drawn to the work then being done by the applicants on the side of Bald Hill.

In a preliminary report which I had the honor to furnish you, mention was made of Bald Hill, and it was pointed out that all the evidence obtainable made it highly probable that Bald Hill marked the site of a basaltic volcano, and that the basalt forming the upper part of the hill was in that case part of the volcanic material that consolidated within the neck of the volcano.

Such

**TRANSVERSE SECTION**

SIG 38

Such being the character of the evidence it becomes highly improbable that either alluvial gold or quartz reefs will be found to occur beneath the basalt.

## Section.

The accompanying sketch section shows my reading of the structure of Bald Hill. The tunnel the applicants are driving is shown. The reef at A was worked to a depth of about 70 feet; to intersect this reef was one of the objects of driving. As the tunnel, when driven far enough, will intersect it very little below the bottom of the old workings, to continue driving it with this end in view would be useless.

Another object, and perhaps the main one, was to prospect for auriferous wash.

The present view of the structure of the hill makes it impossible for wash to occur there, a conclusion supported by the absence of water-worn pebbles on the slopes of the hill.

Under the circumstances it would be a waste of money to assist in driving the tunnel where the prospects of making any valuable discoveries are so remote.

The field presents many problems of much more scientific interest than that presented by Bald Hill, and these should first receive attention.

I refer to those connected with the saddle-reef theory, which has been recently advanced by me to explain the structure of many of the reefs of the Hill End district.

Perhaps a copy of the report referred to above might be sent to Hill End for the information of miners working the reefs of that gold-field.

The present application should, I think, be again refused.

The Government Geologist.

I have, &c.,  
J. ALEX. WATT.  
Geological Surveyor.

## APPENDIX 24.

## Curator's Annual Report.

Sir,

7 January, 1899.

I have the honor to present my progress report for the past year. The abnormal pressure of routine work experienced during the two previous years, more particularly that pertaining to the examination of the mineral specimens submitted by the public, has not been maintained. Owing partly to this circumstance, and partly to improved systematisation—it was possible to spare Mr. Harper for field work. This has not been unaccompanied by inconvenience, especially when one of the other assistants has been away—and I have myself been able to do very little more than keep pace with the routine work. In particular, the need of skilled clerical assistance is often deeply felt, and in the probable event of one or more resignations occurring during the year, I would emphasise the importance of appointing someone expert in the use of the typewriter and able to write a good Civil Service hand.

The statistics of the year are as follow:—

Letters written	...	...	...	3,020
Collections prepared	...	...	...	22 (comprising 4,000 specimens.)
Microscope slides registered	...	...	...	236
Minerals and rocks registered	...	...	...	1,010

*Examination of Ores.*

This, the most important of the duties attached to this office, has been characterised by the number and variety of the specimens submitted to be examined for copper. While very many of these were at once seen to be worthless, a number of rich ores were received, and many of them sent on to the Government Metallurgist to be assayed. A carbonate ore from the May Day Mine, Gilgunnia, assayed up to 33 per cent. of metallic copper. At Hampton, near Jenolan, a patch of rich sulphide ore (bornite and copper pyrites) was prospected. This ore is accompanied by a chloritic gangue which has frequently been taken for green carbonate of copper.

From the interest manifested in telluride of gold, it might have been expected that many specimens supposed to contain that substance would have been submitted, but this has not been the case. In no case was tellurium detected with the exception of the telluride of bismuth from Gundagai, referred to below.

*Silver.*

A large number of samples were received from the Burragorang Silver-field, and selected assay results will be found in one of the Appendices. A scrutiny of these results indicates that on this field silver may be looked for in almost any class of stone. Sample 3,772 is a richly argentiferous copper gossan; 3,390 is quartz carrying 170 oz. of silver to the ton; a crystallised galena (3,774) contained 93 oz.; a fine-grained galena (3,773) nearly 400 oz. The carbonate of lead ores give results varying from nothing up to 2,300 oz. of silver to the ton. The results from Cullen's Creek, Rivertree, may also be noted. Here the silver is found in iron, arsenical, and copper pyrites, or their oxidised products. A lead gossan

gossan (4,366) yielded 332 oz. of silver and  $4\frac{1}{4}$  dwt. of gold per ton. Rich ruby silver ore continues to come in from the Armidale District, and similar stone has been received from Uralla and from the Wollomombi River.

The number of samples sent to the Government Metallurgist to be analysed or assayed was 4,428, which is less than in any year since 1894. To some extent this reduction is due to the strict enforcement of the regulation under which the Department does not undertake to make assays of battery tailings or concentrates. The regulations now in force are as follows:—

The ores or minerals must be from deposits occurring within the Colony of New South Wales.

Each sample must bear a distinguishing mark, in order that it may be identified readily.

Samples must be accompanied by a letter, in which must be stated the distinguishing mark placed upon each sample, and the locality where the deposit occurs.

The samples of ore for assay should weigh about 1lb. each, and should be fairly representative samples of the lode or deposit, and not picked specimens. They should not be crushed, but may be broken up with a view to obtaining an average, provided the pieces are large enough to admit of examination.

Samples of ore, in which free gold is visible to the naked eye, will not be assayed.

Assays for the purpose of checking the work of private assayers will not be made by the Department.

Assays of tailings or concentrates from batteries or other crushing mills will not be made, unless reasons are furnished which appear to the Secretary for Mines and Agriculture sufficient to justify such being made at the expense of the Department.

The Department reserves to itself the right to refuse to make an assay of any sample sent.

As an Appendix will be found a list of those assay results which appear to be of general interest. The whole of the quantitative determinations have been made in the laboratory at Clyde, under the direction of Mr. Mingaye.

#### *Petrological Work.*

While a large number of specimens of country rock, and a great many microscope sections—prepared by Mr. Murton—were examined and reported on, there has been little opportunity for connected work. As having a possible bearing upon the occurrence of telluride of gold an examination in detail was made of the country rock of the Kalgoorlie Gold-field, and the results incorporated in a paper published in the "Records" of this survey (vol. vi, pt. i). I have also had the pleasure of co-operating with my colleague, Mr. Watt, in a general description of the rocks collected by him from the Wyalong Gold-field.

The Petrological Microscope, obtained by exchange with Professor Ward, for a portion of the Mungindi meteorite, arrived early in the year.

The following collections were reported on:—

Rock underlying the subsoil at the Moonbi Tobacco Farm; for the Agricultural Branch.

Country rocks from the "All Nations" Mine, Drake; for the Manager.

Country rocks from the "Post Office" Mine, Stuart Town; for the Manager.

A rock from Coolgardie for Mr. Watkin.

Country rocks from Cooma, collected by Mr. Geological-Surveyor Carne.

Rocks from the Northern Districts, collected by yourself.

Country rocks from Blayney, collected by Mr. Geological-Surveyor Carne.

Country rocks from the Kimo Mine, Gundagai, collected by Mr. Geological-Surveyor Carne.

Rock from the Toorale Bore, for the Superintendent, Public Watering Places.

Rock from Seal Rocks, collected by Mr. Geological-Surveyor Carne.

Rocks from Hill End, collected by yourself.

Country rocks from the Prince of Wales Mine, Gundagai, collected by yourself.

Of these the two first will be found in Appendices 25 and 26.

#### *The Museum.*

The re-registration of the mineral and rock collections is now complete, but little progress has been possible in the work of rendering them of more definite educational value, as outlined in my report of last year. Something has, however, been done in the way of substituting printed for written labels in some of the large show cases. Much remains to be done before I can regard the museum as being at all up to modern requirements.

A definite start has now been made in the collection of mining and geological photographs, from which I am expecting much good to result. The scheme is as follows:—

1. To accumulate and index for ready reference as many photographs as can possibly be obtained.
2. To select duplicates of these for mounting in an album for public use.
3. To frame for exhibition on the walls enlargements of photographs having special educational value.

In pursuance of this plan three enlargements illustrating the remarkable geological features at Bondi are now ready.

Twenty-two collections have been prepared during the year, a duty that has very largely fallen to Mr. Morrison. No effort is spared to render these of real educational value, more especially in the case of those for Public Schools. We are severely handicapped by the lack of suitable duplicate material, and it is quite a usual thing for some common rock or mineral to be omitted altogether. We are dependent entirely on casual aid.

The arrangements for holiday opening have worked satisfactorily: large numbers of country visitors attending. Some important additions have been made to the collections during the year. Of these may be instanced:—

Specimens illustrating the occurrence of ores of nickel and of chromium in New Caledonia presented by Mr. F. D. Power.

Tellurides of gold from Kalgoorlie and Cripple Creek, presented respectively by the Confederated Gold-mines Association and Mr. A. H. Haie.

New South Wales marbles, presented by the Colonial Architect.

Lode specimens from Saxony, sent as an exchange by the Freiberg School of Mines.

Pyrrargyrite and other valuable specimens from the Broken Hill Consols Mine, presented by Mr. G. Smith.

Three typical collections of telluride of gold specimens, prepared at the museum, and accompanied by descriptive labels, are now circulating through the mining districts, where they are exhibited at the Warden's Office. A leaflet dealing with telluride ores has been prepared for free distribution.

I have pleasure in specially acknowledging the assistance I have received from my colleague, Mr. J. E. Carne.

*Staff.*

## Staff.

Mr. Harper's assistance was available during the early part of the year only. Mr. Morrison has, as heretofore, rendered the most efficient help, and I sincerely trust that he may shortly receive the recognition—whether in promotion or in opportunities of gaining further experience in geological work—his services so well merit. Mr. Dobson was away on sick leave for four months, during part of which time I had the assistance of Mr. Ferris. The appointment of G. Baker as boy-attendant at the museum has been satisfactory. He is now competent to direct visitors to particular show cases, and has increased his usefulness by attending evening classes in geology and mineralogy. He writes a good hand, which, at times, I have been glad to avail myself of. The two watchmen, Mr. T. Lyons and Mr. J. Kennerk, share the remainder of the twenty-four hours between them. Mr. Murton has been able to very largely increase the output of rock-slices by using a hand-lathe, armed with diamond splint, instead of the emery-wheel formerly in use. It had been hoped that a quantity of rough marble from Fernbrook and other new localities might have been available for the lapidary, Mr. Gilding, to work up, but efforts to obtain the material were entirely unsuccessful.

As appendices will be found the following:—

Report on rocks from the All Nations Mine, Drake.

” ” Moonbi Tobacco Farm.

List of collections prepared at the Museum.

” ” donations received.

Selected results of the assays made (at the Laboratory at Clyde) during the year.

I have, &c.,

GEORGE W. CARD,

Curator and Mineralogist.

The Government Geologist.

## APPENDIX 25.

Report on some rock specimens from the All Nations Mine, Drake.

WITHOUT exception they all proved to be felsitic in character—both matrix and “pebbles.” The latter are generally irregular in form, sometimes with faceted faces. When rounded they never show a smooth surface, but are always rough. One “pebble” is distinctly sheared, and other indications of movement may be seen on the flattened surfaces. Under the microscope the matrix is seen to be in a condition of extreme brecciation, and to be much altered by the introduction of calcareous and siliceous material. The “pebbles” do not show brecciation and alteration to anything like the same extent, and the junction between them and the matrix is (sometimes, at any rate) quite distinct. The green colouration seems to be confined to the highly brecciated portions, the pebbles, and also occasionally a kernel in the matrix, being pink. It would, therefore, seem probable that the pebbly structure is secondary, arising very probably from the cataclastic action that produced the brecciation. The phenomenon may be regarded as being closely allied to that exhibited by the “Crush-conglomerates” of the Isle of Man, Wisconsin, and elsewhere.

The Government Geologist.

GEORGE W. CARD.

## APPENDIX 26.

Report on a rock from the Moonbi Tobacco Farm.

OBTAINED by Mr. S. Lamb from a depth of 40 feet in a well.

This rock is entirely crystalline. In large parts it is so friable as to readily break up when rubbed in the hands or placed in water; other portions, however, are firmly coherent. This physical difference is due to the varying proportions of two of the constituents—mica and hornblende.

*Mineralogical Constitution*:—The minerals present are—

Quartz.

Felspar—orthoclase, and a variety of plagioclase.

Biotite.

Hornblende.

Sphene.

Apatite.

These minerals are not uniformly distributed, and it is to this that the varying appearance and physical characters of the rock is due. The readily disintegrated portions contain more biotite and felspar and less hornblende; these are lighter in colour, and generally resemble a normal granite. The mica occurs in distinct crystals, of small size but considerable thickness. It is the perfect cleavage of this mica that causes the disintegration of the rock. The denser masses, on the other hand, are dull green in colour, and contain abundance of hornblende with but little mica. Little red-brown crystals of sphene, up to  $\frac{1}{8}$  of an inch in longest diameter, may be seen plentifully scattered throughout the rock. Apatite occurs, as it usually does in granite rocks, in small quantity as microscopic crystals included in the hornblende more particularly.

It will very probably be found to be the case that the patches in which hornblende predominates are generally distributed through the rock, in which case the general chemical composition of the soil would not vary very much. On the other hand, the soil in a district where there was a preponderance of hornblende would be richer in iron, magnesia, and phosphorus than elsewhere.

*Chemical Composition*:—The composition of the minerals present is as follows:—

Quartz	...	...	silica.
Felspar	...	...	silicate of alumina, potash, soda, lime.
Biotite	...	...	silicate of magnesia, iron, alumina, potash.
Hornblende	...	...	silicate of magnesia, iron, alumina, lime.
Sphene	...	...	silicate and titanate of lime.
Apatite	...	...	phosphate of lime.

The soil resulting from the decomposition of this rock might be expected to contain the above elements. The existence of a considerable quantity of titanium is not usual. It is here present in the form of sphene, a fairly stable mineral, but there seems to be no reason apparent why it should not undergo decomposition in the soil. The quantity of phosphorus present will be very minute. Gulgong and Kempsey may be mentioned as districts (among others) where allied rocks containing sphene occur.

For practical purposes the best name for this Moonbi rock would be—*sphene-hornblende-granite*.

The Government Geologist.

GEORGE W. CARD.

APPENDIX 27.

## APPENDIX 27.

Institutions and individuals to whom collections of minerals have been sent during the year, comprising 4,000 specimens.

Barker College, Hornsby.  
 Boulton, J. W., Sydney.  
 Braidwood, Literary Institute.  
 Canowindra, Agriculture and Mining Institute.  
 Cootamundra, School of Arts.  
 Drake, School of Arts.  
 Eden, R. J., Erskineville.  
 Finselbach, Dr., Lismore.  
 \*Geological Survey Museum, South African Republic, Pretoria.  
 Goulburn South, Superior Public School.  
 Granville North, Public School.  
 Greater Britain Exhibition (not completed).  
 Hawkesbury, Agricultural College.  
 \*Howchin, W. (F.G.S.), Adelaide.  
 Millthorpe, School of Arts.  
 \*Morton, Alex., The Museum, Tasmania.  
 \*Parkins, A. J., Elsmore.  
 \*Smith, G., Consols Mine, Broken Hill.  
 St. John's Parochial School, Darlinghurst.  
 Sydney, School of Arts.  
 Sydney University, Geological Department.  
 Under Secretary for Mines and Agriculture, Sydney.

\* Those marked with an asterisk were exchange collections.

## APPENDIX 28.

## DONATIONS to the Mining and Geological Museum.

Donor.	Donation.
Andrews, E. ....	Quartz crystals, stalactitic limonite.
Bensusan, A. J. ....	Pyritous ore, showing bismuth sulphide, structure specimens, auriferous ore.
Blackwood, J. ....	Fibrous gypsum.
Blakemore, G. H. ....	Tetradymite, with free gold in quartz.
Boswell, A. ....	Auriferous pyritous quartz, conglomerate, granite, pyritous quartz showing fahlerz.

Gold, nil.

## 3395. Parish Towring—Apparently a bleached shale :—

Moisture at 100° C.....	·67
Combined water .....	2·97
Silica (SiO <sub>2</sub> ) .....	79·54
Alumina (Al <sub>2</sub> O <sub>3</sub> ) .....	12·53
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> ) .....	1·26
Manganous oxide (MnO) .....	trace.
Lime (CaO) .....	·34
Magnesia (MgO) .....	·61
Potash (K <sub>2</sub> O) .....	1·82
Soda (Na <sub>2</sub> O) .....	·50
Phosphoric anhydride (P <sub>2</sub> O <sub>5</sub> ) .....	·02
Sulphuric anhydride (SO <sub>3</sub> ) .....	·04

100·30

Two small bricks of each, of clay alone, were made, and two of each with the addition of 50 per cent. of clean sand. The bricks were dried for some days, placed in a muffle furnace, and thoroughly burnt; then put in a luted crucible in the coke furnace, and submitted to a severe heat for some hours. The bricks after this treatment showed no signs of fusion having taken place, the sharp edges being retained. The material appears to be useful for the manufacture of a good refractory brick; the percentage of alkali is too high for a first-class article.

## 3396. Parish Towring—Kaolin :—

Moisture at 100° C.....	·60
Combined water .....	4·10
Silica (SiO <sub>2</sub> ) .....	75·08
Alumina (Al <sub>2</sub> O <sub>3</sub> ) .....	15·17
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> ) .....	1·61
Manganous oxide (MnO) .....	trace.
Lime (CaO) .....	·35
Magnesia (MgO) .....	·10
Potash (K <sub>2</sub> O) .....	1·32
Soda (Na <sub>2</sub> O) .....	1·20
Phosphoric anhydride (P <sub>2</sub> O <sub>5</sub> ) .....	·03
Sulphuric anhydride (SO <sub>3</sub> ) .....	·06

99·62

Two small bricks of each, of clay alone, were made, and two of each with the addition of 50 per cent. of clean sand. The bricks were dried for some days, placed in a muffle furnace, and thoroughly burnt; then put into a luted crucible in the coke furnace, and submitted to a severe heat for some hours. The bricks after this treatment showed no signs of fusion having taken place, the sharp edges being retained. The material appears to be useful for the manufacture of a good refractory brick.

The percentage of alkali, however, is too high for a first-class article.

## 3397. Parish of Towring—Clay shale :—

Moisture at 100° C.....	·39
Combined water.....	2·49
Silica (SiO <sub>2</sub> ) .....	78·82
Alumina (Al <sub>2</sub> O <sub>3</sub> ) .....	13·27
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> ) .....	1·53
Manganous oxide (MnO) .....	trace.
Lime (CaO) .....	·26
Magnesia (MgO) .....	·50
Potash (K <sub>2</sub> O) .....	2·93
Soda (Na <sub>2</sub> O) .....	·03
Phosphoric anhydride (P <sub>2</sub> O <sub>5</sub> ) .....	·06
Sulphuric anhydride (SO <sub>3</sub> ) .....	trace.

100·28

Two small bricks of each, of clay alone, were made, and two of each with the addition of 50 per cent. of clean sand. The bricks were dried for some days, placed in a muffle furnace, and thoroughly burnt, then put in a luted crucible in the coke furnace, and submitted to a severe heat for some hours. The bricks after this treatment showed no signs of fusion having taken place, the sharp edges being retained. The material appears to be useful for the manufacture of a good refractory brick.

The percentage of alkali, however, is too high for a first-class article.

## 3632. Six miles from Mount Hope—Drift material, with sub-angular quartz pebbles :—

## Analysis of Fine Clay.

## Quartz and Sand, 68·8 per cent.

Moisture at 100° C.....	·61

## Annual Report of the Assistant Palæontologist and Librarian for the year 1898.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 3 January, 1898.

I have the honor to submit to you the following summary of the palæontological work and work connected with the Departmental Library performed during the past year.

*Publications.*—Vol. V, Part 4, and Vol. VI, Part 1, of the "Records," have been published, and Vol. VI, Part 2, is now going through the press. The English translation of the late Professor De Koninck's "Fossiles Paléozoïques de la Nouvelle Galles du Sud," has been issued as "Palæontology, Memoir, No. 6." A memoir by Mr. W. D. Campbell, L.S., F.G.S., on "The Aboriginal Carvings of Port Jackson and Broken Bay," is also going through the press. During the year a new series—Mineral Resources, Nos. 1–4, have been issued, and a second edition of No. 2 has also been printed.

*Miscellaneous determinations.*

1. Collections of Permo-Carboniferous Fossils from the Maitland District, made and presented by Mr. J. E. Dobson:—
  - (a) From new road-cutting at Harper's Hill, near Lochinvar.—*Stenopora tasmaniensis*, Lonsdale; *Spirifera*, sp. indet., *S. Clarkei*, De Kon. (?); *Aviculopecten (Deltopecten) illawarrensis*, Morris (?); *Aviculopecten*, sp. indet.; *Merismopteria*, nov. sp. *M.*, sp. indet.; *Avicula intumescens*, De Kon; *Aphanais*, sp. indet.; *Modiola crassissima*, McCoy (this is a species of *Merismopteria*). *Eurydesma cordata*, Morris; *E. elliptica*, Dana; *E. globosa*, Dana; *Notomys*, sp. *Pachydomus antiquatus*, J. de C. Sby.; *P. lævis*, J. de C. Sby.; *P. ovalis*, McCoy; *Chænomya*, sp.; *C. Etheridgei*, De Kon., var. *Modiomorpha*, sp. nov.; *Platyschisma oculum*, J. de C. Sby.; *Ptycomphalina (Morrisiana)* (?); *Orthonychia altum*, Dana (?); *Conularia inornata*, Dana. As is the case with most large collections from the Lower Marines of Harper's Hill, there is abundance of new material, particularly as regards structural points. The most noteworthy specimens obtained by Mr. Dobson are those of *Eurydesma*, and the species classed under *Pachydomus*, several of which are well represented by both internal casts and perfect shells in all stages of growth. The genus *Eurydesma* is a particularly important one stratigraphically, as, as far as I am aware, only twice has it been recorded from Upper Marine rocks (Dana, Geology Wilkes' Explor. Exped., p. 700, and Morris, Strzelecki's Phys. Descr. N.S. Wales, 1845, p. 276, both from Illawarra). In our large collections there are no specimens from that district. Outside Australia, *Eurydesma* has been found in the Salt Range of the Himalaya only, associated with several species of well-known New South Wales fossils. Bivalves of the *Pterinea* group are also numerous, as well as forms belonging, as far as I can determine them at present, to new genera. It is extremely probable that the shell so common at Ravensfield, described by De Koninck as *Edmondia nobilissima*, and which occur only as casts, do not belong to that genus at all, but are more closely allied to some of the Lower Marine *Pachydomi*. Among the Gasteropods, *Platyschisma oculum* is the only one occurring in great abundance. Brachiopoda are almost entirely absent from this deposit, and the same condition obtains at Ravensfield.
  - (b) From railway cutting between Lochinvar and Allandale.—*Eurydesma cordata*, Morris; *E. globosa*, Dana; *Pachydomus*, several species; *Platyschisma oculum*, J. de C. Sby.
  - (c) From Rutherford—*Aviculopecten tenuicollis*, Dana; *Aviculopecten*, nov. sp.; *Edmondia nobilissima*, De Koninck; *Spirifera*, sp. indet.; *Goniatites (Agathiceras) micromphalus*, Morris; *Conularia inornata*, Dana.
  - (d) Road-cutting, Farley.—*Martiniopsis subradiata*, G. Sby.; *Spirifera duodecimcostata*, McCoy; *Productus fragilis*, Dana; *Pleurophorus*, *Mytilus Bigsbyi*, De Kon.; *Cardiomorpha gryphoides*, De Kon.; *Astartila*, *Platyschisma*.
  - (e) Railway cutting, Farley.—*Martiniopsis subradiata*, G. Sby.; *Cardinia (recta)*, Dana (?); *Aviculopecten*, *Edmondia* or *Pachydomus*, *Conularia*.
2. Indeterminable *Rhynchonella* from the Upper Silurian of Rock Flat, near Cooma, collected by Mr. J. E. Carne.
3. From Bungonia Caves, limestone collected by Mr. L. Guymmer.—*Favosites gothlandica*, var. *Goldfussi*, D'Orb; *Heliolites*, *Tryplasma*, *Cyathophyllum*, *Pentamerus Knightii*, Sby.
4. Carboniferous shells from Parish Eumer, County Darling, collected by Mr. J. E. Carne.—*Aviculopecten*, *Spirifera convoluta*, Phillips.
- (5.) Tertiary leaves collected by Mr. J. E. Carne at the 225-ft. level, Elsmore Deep Lead:—*Cinnamomum* (?); *Piper* cf. *Feistmanteli*, Ett.; *Fagus* cf. *Hookeri*, Ett.; *Artocarpidium Gregoryi*, Ett.
- (6.) From Little and Smith's Prospecting Site, Gilgai, 6 miles from Inverell on the Tingha-road, also collected by Mr. Carne:—*Podocarpus præcompressa*, Ett. (?); *Pseudopinus Wilkinsoni*, Ett. (very abundant); *Phyllocladus asplenioides*, Ett.; *Bambusites arthrostylinus*, Ett.;
- (7.) Carboniferous Fossils from the Paterson District, collected by Mr. J. E. Dobson:—
  - (a.) Plant-bearing Shales from the road-cutting  $\frac{1}{2}$  mile from Paterson, on the Paterson to Gresford Road, Parish Houghton, County Durham:—*Calamites radiatus*, Brongniart, *Rhacopteris inæquilatera* Goepfert; *R. septentrionalis*, Feistm (?); *R. intermedia*, Feistm; *Archæpteris Wilkinsoni*, Feistm. There are also detached sori of a fern, somewhat similar to the fructification of *Palæopteris*, a genus closely allied to *Rhacopteris*, so that there is some probability that these may be referable to the last mentioned genus. *Cardiopteris* pinnules also occur and are figured in "Records Geological Survey, New South Wales," Vol. VI. Pt. 2 (in the press.)
  - (b.) From P. McMahon's Selection, Portion 101, Parish Barford, County Durham, "Greenhills";—Crinoid stem ossicles, *Fenestella*; *Orthis resupinata*, Martin; Indeterminable strophomenoid shells; *Productus*, *Entolium*, *Gossetina australis*, Eth. fil.; *Loxonema rugifera*, Phillips; *Loxonema* (new species intermediate between *rugifera*, Phillips, and *regium*, De Koninck); *Yvania Konincki*, Eth. fil.; *Euomphalus*, *Bellerophon*. (c.)

- (c.) From road-cutting near 12-mile post from West Maitland, Parish Barford, County Durham:—*Zaphrentis*, *Fenestella*, *Athyris*, sp. indet.; *A.* (*Actinoconchus*) *planosulcatus*, Phillips; *Productus scabriculus*, Martin; *Dielasma hastata* Sby. (?); *Orthotetes crenistria*, Phillips; *Orthis australis*, McCoy; *Gosseletina australis*, Eth. fil.
- (d.) From "Greenhills," Paterson to Dungog Road, 8 miles from Paterson—James Phillips' 112-acre selection, Portion 100, Parish Barford County Durham:—*Zaphrentis*, *Fenestella Griffithides*, *Phillipsia*, *Spirifera* (2 species indet.), *S. crassa*, De Kon.; *S. convoluta*, Phillips; *S. cf. ovalis*, Phillips; *Productus longispinus*, Sby.; *P. scabriculus*, Martin. *Athyris* (*Actinoconchus*) *planosulcata*, Phillips, with lamellar fringes very well preserved; *Orthis resupinata*, Martin; *Leptæna rhomboidalis*, var. *analoga*, Phillips; *Orthotetes crenistria*, Phillips; *Nuculana*, nov. sp. *Leptodus duplicicostata*, Eth. fil. (?); *Entolium*, *Aviculopecten*, *Naticopsis*, sp. nov., *Gosseletina australis*, Eth. fil.; *Loxonema rugifera*, Phillips, *Orthoceras*.
8. Silurian and Devonian Fossils collected by Mr. J. A. Watt, Geological Surveyor, in the Fifield District:—
- (a.) From 10 miles E.S.E. of Fifield, on Portion 11, Parish Gillenboine, County Cunningham, in Limestone:—*Spiriferina* (?), nearly allied to *S. cristata*, var. *octoplicata*, Sby.; *S.* near *S. Jaqueti*, Dun; *Rhynchonella* very closely allied to *R. primipilaris*, v. Buch. *Theca*, *Cyrtoceras*. This limestone is interesting also in containing large numbers of Ostracoda—*Primitia*, *Leperditia*, and apparently also *Isochilina*.
- (b.) From 7½ miles from Bogan Gate Railway Station, on Bogan Gate to Trundle Road, Portion 25, Parish Botfields, County of Cunningham:—Limestone containing—*Favosites gothlandica*, Linn.; *F. gothlandica*, var. *Goldfussi*, d'Orb; *Alveolites*, *Tryplasma*, two species; indeterminate stromatoporoid, *Orthoceras*. In the sandstone occurring here are found *Cyathophyllum*, *Amplexus* (?) and a pygidium of one of the Phacopidae, possibly *Coronura*.
- (c.) From 8 miles S.E. of Fifield, Portion 5, Parish Sebastopol, County Cunningham, in a very friable ferruginous sandstone, the fossils occurring as fragmentary casts only.—*Pleurodictyum megastomum*, McCoy; *Favosites gothlandica*, Linn.; Monticuliporoid corals, Crinoid stem ossicles; *Rhynchonella*, sp. ind.; *R. pugnus*, Martin; *Orthis* (?) *Spirifera*, *Tentaculites*.
- (d.) From 12 miles E.S.E. of Fifield, near 13-mile post, Fifield to Trundle Road, Parish Gillenboine, County Cunningham, in a dense yellow and purple sandstone; fossils preserved as impressions and displacements.—*Favosites* (?); portion of the glabella of a trilobite, probably *Proetus*, *Atrypa*, cf. *lens*, Sby.; *Spirifera Jaqueti*, Dun (?); *Streptorhynchus*, *Orthonota*, *Crenipecten* (?), *Pterinea*, *Actinopteria*, *Tentaculites*, *Orthoceras*. These collections contain genera common to both Upper Silurian and Devonian; but judging by a few of the better preserved forms, I am of opinion that the evidence is more in favour of the beds being newer than the Yass beds, and therefore most probably of Devonian age.
9. Fossils from the Clarence Town and surrounding districts, collected by Messrs. J. B. Jaquet and L. F. Harper.
- (a.) Clarence Town.—Worm tracks. *Spirifera striata*, Martin; *Rhynchonella pleurodon*, Phillips; *Dielasma*, sp. indet.
- (b.) From near Clarence Town.—*Zaphrentis*, crinoid stems; *Fenestella*, *Orthotetes crenistria*, Phillips; *Orthis australis*, McCoy; *Leptæna rhomboidalis*, var. *analoga*, Phillips; *Spirifera*, cf. *striata*, Martin.
- (c.) From Glen William Road, Clarence Town.—Indeterminable plant fragment; *Leptæna rhomboidalis*, var. *analoga*, Phillips; *Spirifera striata*, Martin; *Productus semireticulatus*, Martin; *Orthis resupinata*, Martin; *Conularia*, *Orthoceras*. Worm tracks.—From near 3-mile post—*Knorria*. From Wallaroo Hill, north side; *Orthoceras Martinianum*, De Kon. (?) Eastern slope in Parish Uffington.—Crinoid stems, *Fenestella*, *Orthis resupinata*, Martin; *Allorism*, *Pleurophorus*.
- (d.) From Stony Creek, N.W. corner of Portion 13, Parish Wilmott.—*Asterocalamites scrobiculatus*, Schiltheim.
- (e.) From foot of Skid Hill Range, near S. boundary of Parish Horton.—Small pelecypod, most probably *Edmondia*.
- (f.) From Portion 98, Parish Uffington.—*Rhacopteris inæquilatera*, Goeppert.
- (g.) From near School-house, Glen William Road, 4¼ miles from Clarence Town.—*Lepidodendron*; Emericite stems; *Fenestella*, *Glaucanome*.
- (h.) From the south bank of Williams River, 2 miles below Clarence Town.—*Stigmara*, and indeterminable plant remains.
- (i.) From A.A. Co.'s Port Stephens Estate, E. of Booral Wharf, Karuah River.—Internal casts of *Spirifera lata*, McCoy.
- (j.) From near Booral, on road junctioning with Raymond Terrace and Stroud Road, 6 miles from Stroud.—A much-fractured mudstone with numerous imperfect fern pinnules.
- (k.) From between North Coast Road and Karuah River.—*Rhacopteris*.
- (l.) *Orthis resupinata*, Martin; *Leptæna rhomboidalis*, var. *analoga*, Phillips; *Orthotetes crenistria*, Phillips.
- (m.) From between Limeburner's Creek (7½ miles) Road and Stroud River (13 miles from Raymond Terrace).—*Rhacopteris inæquilatera*, Goeppert; *Lepidodendron veltheimianum*, Sternberg.
- (n.) From between 10-mile Creek and Caswell's Creek, Parish Wilmot.—*Lepidodendron veltheimianum*, Sternberg.
- (o.) From Booral.—*Rhacopteris septentrionalis*, Feistmantel; *Cardiopteris*.
- (p.) From about 4 miles S.W. of Stroud, on track to Thalaba, A.A. Co.'s Port Stephens Estate.—*Athyris*, *Productus* cf. *spinulosus*, Sby. *Spirifera*, *Leptodus*, *Euomphalus*, *Fenestella*, Crinoid stem ossicles.
10. Permo-Carboniferous Plants, collected by Mr. H. G. Stokes, in No. 2 shaft, coal-mine, Bonshaw—*Glossopteris* cf. *communis*, Feistm. *Gangamopteris angustifolia*, McCoy. *G. cyclopteroides*, Feistm., and var. *sub-auriculata*, Feistm.; *G. spathulata*, McCoy (?); *Næggerathiopsis Hislopi*, Bunbury; *N. media*, Dana. (?).
11. Specimen of limestone from the Chillagoe Beds, N. Queensland, collected by Mr. G. Smith, containing *Pentamerus* and *Amplexus*.

12. A large number of Carboniferous and Permo-Carboniferous fossils from the Maitland District, were named for Mr. J. Waterhouse, M.A.
  13. From the Upper Silurian of Bobadah, Mr. J. E. Carne collected a few imperfectly preserved casts and impressions of *Cyathophyllum* (?), *Pleurodictyum*, *Rhynchonella*, cf. *nucula*, Sby.; *R. cuneata*, Dalman (?); and also what is probably a variety of *R. borealis*, Schlotheim. *Orthis*, *Spirifera*, Crinoid stem ossicles, and a pygidium of *Encrinurus* (?).
  14. Carboniferous fossils from Glen William, determined for the Technological Museum—*Spirifera striata*, Martin; *Rhynchonella pleurodon*, Phillips; *Productus undatus*, DeFrance; *P. longispinus*, Sby.; Crinoid stems.
  15. Lower Mesozoic Plants, collected by Mr. Gipps, from Bidden Creek, County Gower—*Teniopteris Daintreei*, McCoy; *Ptilophyllum*, *Alethopteris*, cf. *australis*, Morris, Stems, seed vessels and wood.
  16. Specimens from the cores, obtained by bores for artesian water, at Buiyeroi Bore, at depths of 505 and 510 feet.—*Corimya* and *Cyprina*; Lower Cretaceous.
    - (b.) Finger-post Bore—*Unio*, from a depth of over 2,000 feet.
    - (c) Salisbury Downs—*Teniopteris Daintreei*, McCoy. Brought up by water, and presented by Rev. J. Milne Curran.
    - (d) Buiyeroi Bore, depth of about 750 feet—*Teniopteris Daintreei*, McCoy.
  17. Lower Cretaceous Fossils, from Yandamah, presented by A. Lang, Esq., and of Lower Cretaceous age—*Ammonites*, *Cyprina*, wood-bored by *Teredo*, and *Maccoyella Barklyi*, McCoy.
- During the past year the collector, Mr. C. Cullen, has spent considerable time in the field. Large collections of fossils were from the Upper and Lower Marine Series in the West Maitland and Greta Districts, from the Carboniferous beds around Clarence Town, and from the Upper Silurian limestones, so largely developed around Molong.

#### Museum.

A considerable amount of registration has been performed. It is proposed that the entire collection of fossils on exhibition, as well as those necessary for comparison, and at present stored in trays, be registered in a permanent manner. This is most essential, as many of the fossils have never been passed through the registers, and those that have been numbered are marked with paper tickets, many of which have been rendered illegible by dust and insects. This will entail the handling and cleaning of many thousands of specimens, and will take several years to accomplish. During the year six collections of fossils were named for distribution to institutions and individuals, mainly in exchange. I am now able to report that, owing to the large number of fossils collected during the last two years the Department is in a position to offer far better collections in exchange than heretofore. During the last month of the year I was mainly engaged in preparing a representative collection of New South Wales fossils for the Greater Britain Exhibition. Mr. Cullen has, during the time not spent in collecting and cleaning, been engaged in making casts of type specimens, which form a very valuable addition to our exchange series.

#### Reports, &c.

The following reports or papers were prepared or published during the year:—

1. Annual Report for the year 1897.
2. Additions to the Permo-Carboniferous Flora of New South Wales, No. 2. *Records*, 1898, vi, pt. 4, pp. 46-51.
3. On the Occurrence of a Cyclopteroid Fern, closely allied to the European *Cardiopteris polymorpha* (Goepfert), in the Carboniferous of New South Wales. *Records*, vi, pt. 2. (In the Press).
4. Notes on the Australian *Teniopterideæ*. *Trans. Austr. Assoc. Adv. Sci.*, vol. vii.
5. Contributions to the Palæontology of the Upper Silurian Rocks of Victoria, based on specimens in the collections of Mr. George Sweet, pt. 1. *Proc. R. Soc., Vict.*, 1898 (n.s.), pt. 2, pp. 79-90.
6. On a New Species of *Chonetes* from the Murrumbidgee Limestone. *Records*. (In *litt*).
7. With R. Etheridge, junior,—on the Structure and Method of Preservation of *Receptaculites australis*, Salter. *Records*, 1898, vi, pt. 1, pp. 62-75, fols. 8-10.
8. The Australian Geological Record for the year 1897, with addenda for 1891-96. *Records*, vi, pt. 2. (In the Press).
9. Note on the Occurrence of Sponge Remains in the Permo-Carboniferous of Branxton. *Records*. (In *litt*).

#### Library.

During the year 1773 publications were registered and placed in the Departmental Library, consisting of Societies' Transactions, Reports of State Departments, serial and separate works and pamphlets. This total is made up of 1,558 volumes, or parts of volumes, that have been presented or sent in exchange, and 205 that have been purchased. The Library is now in correspondence with 229 institutions and State Departments, from which exchanges are regularly received, and there are also numerous personal exchanges.

The principal additions to the exchange list are:—

- Colorado College Scientific Society.
- Belgrade—Institute Geologique.
- K. Ungarischen Geologischen Anstalt.
- Brussels—Annales des Mines.
- Barcelona—R. Accademia della Ciencias y Artes.
- Indiana Academy of Sciences.
- Johannesburg—Geological Society of South Africa.
- Leeds—Geological Association.
- Nebraska University Studies.
- London—Colonial Office Reports.
- Kansas University Quarterly.
- Field Naturalists' Society of Victoria.
- Nebraska State Board of Agriculture.
- Paris—Société de Spéléologie.
- San Paulo—Museum Paulista.
- Topeka—Board of Irrigation and Survey.
- „ University Geological Survey.

The following publications have been distributed to correspondents:—

- (1) Records, Geological Survey, V, Part 4.
- (2) " " " VI " 1.
- (3) Annual Report for 1897, to Institutions.
- (4) Mineral Resources, No. 1.
- (5) " " No. 2.
- (6) " " " (2nd edition).
- (7) " " No. 3.
- (8) " " No. 4.
- (9) Palæontology, Memoir No. 6.
- (10) Large numbers of miscellaneous publications and sets of records and memoirs.

During the first four months of the year the registration was performed by Mr. L. F. Harper, and in October the Public Service Board decided that Mr. H. J. Lindeman was to assist in the clerical work connected with the Library, which has considerably increased. Considerable difficulty has also arisen from the overcrowded condition of the book-shelves, and it is hard to see how this can be obviated without a greater amount of wall-space than is at present available. Many of the shelves are now double-banked, and a satisfactory arrangement is impossible under these conditions.

I have, &c.,  
W. S. DUN,  
Assistant Palæontologist and Librarian.

#### APPENDIX 31.

##### Caves.

PROGRESS and other reports on the Limestone Caves for the year 1898 by O. Trickett, C.S., M.S., Vict., L.S., N.S.W.

During the year the many improvements were effected at the Jenolan Caves, namely:—

January—8 garden seats were placed in suitable places.

February—The Engineer's cottage was painted at a cost of £12 4s. 10d.

March—An easy track was cut to the bathing pool at a cost of £16 18s. 6d.

May—The entrance to the Imperial Cave from the Grand Archway was completed at a cost of £45 10s. 6d.

July—A gate was erected at the entrance to the Aladdin Cave, and the formations protected, at a cost of £21 10s. 10d.

August—A dangerous rock in the Wilkinson Cave was supported by concrete and rubble, at a cost of £16 3s.

November—24 Notice Boards were erected in conspicuous places.

December—Water pipes were extended into the Grand Archway.

Two labourers were continuously employed during the year on cave improvement. They are at present engaged on opening up the "Gem of Jenolan" branch of the Jubilee Cave and in completing the construction of a new dam at the intake to turbine pipes.

The cost of constructing the new entrance to the Lucas Cave from the Grand Archway, on which the labourers were engaged during the latter part of 1897, was £171 1s. 6d.

In addition to the above, important improvements were completed during the year by the Public Works Department. These include the erection of a new Accommodation House, stables, coach-house, drainage, fencing, Post and Telegraph Office, Photographic Kiosk, store, cottages for the Caretaker and Photographer, workmen's hut, &c.

The Accommodation House and outbuildings were handed over to Mr. Harry Smith (who was the successful tenderer for the lease), on the 1st July. "Wallace's" buildings were purchased, and are now used as a residence by the Explorer, Mr. J. Wilson.

In order to add to the beauty of the surroundings of the caves, Mr. Maiden, Curator of the Botanical Gardens, has been authorised to lay out new plantations.

Mr. Fitzmaurice, Chief Engineer, Post and Telegraph Department, furnished, in the early part of the year, a report on the extension of the electric light at the caves.

The salaries of two of the guides have been increased subject to certain conditions. The guides and caretaker have been furnished with official caps.

Additional regulations have been framed for the better protection of the caves and their surroundings.

The manuscript and plans for a guide book have been handed to the Government Printer for publication.

In connection with this work, I completed a survey of the caves.

##### *Wombeyan Caves.*

Two labourers were employed in opening up the Wollondilly Cave from the 7th February to the 15th June.

A blacksmith's shop was erected by the caretaker for which the Department supplied material and blacksmithing tools.

For the purpose of exploration, the caretaker has been supplied with rope.

Some fine specimens of dripstone formations were forwarded to the museum.

##### *Yarrangobilly Caves.*

A bathing shed has been provided at the Thermal spring.

A washhouse and forge shed were erected by the caretaker, for which material and tools were supplied by the Department.

Material is now being forwarded for the erection of additional accommodation for the caretaker.

A large number of fruit trees and the necessary gardening tools were forwarded to the caretaker.

*Bungonia*

*Bungonia Caves.*

A road from Bungonia to the caves was gazetted as a public road on the 1st October, 1893. The caretaker has been authorised to cut a track to water.

*Abercrombie Caves.*

A horse-paddock fence was erected at a cost of £50 3s. 10d. The caretaker has been supplied with blacksmithing and other tools.

*Bendithera Caves.*

Owing to the decreasing number of visitors the caretaker's salary has been reduced.

*Wellington Caves.*

The caretaker's cottage was painted at a cost of £7 19s. 3d. The caretaker completed the erection of a chimney, for which material was supplied by the Department.

Several additional boxes of fossils have been received from the caretaker.

*New Caves Discovered.*

The most important of these is the "Junction Cave," Wombeyan Caves, found by the caretaker, Mr. T. M. Chalker, in June. Report herewith.

A beautiful chamber off the Red Cave, Jenolan, was found by Mr. J. Wilson.

Mr. Guymmer, caretaker, Bungonia Caves, reported the discovery of a cave which has not yet been examined.

*Limekiln Caves (near Bathurst).—Report herewith.**Number of Visitors for the year 1898.*

Abercrombie Caves	...	...	...	...	...	907
Bendithera Caves	...	...	...	...	...	31
Bungonia Caves	...	...	...	...	...	356
Jenolan Caves	...	...	...	...	...	2,427 (who paid 7,149 visits).
Wellington Caves	...	...	...	...	...	1,623
Wombeyan Caves	...	...	...	...	...	345 (who paid 525 visits).
Yarrangobilly Caves	...	...	...	...	...	690 (who paid 1,316 visits).
Total	...	...	...	...	...	6,379 visitors.

Three magnesium lamps were purchased from European firms. Two of these are quite unsuitable, the other is now being tested at the Jenolan Caves.

*Magnesium Ribbon used.*

Ribbon issued to caretakers	...	...	...	720 oz.	...	Cost, £74.
Do. used by guides and caretakers	...	...	...	644 "	...	
Amount collected for use of ribbon	...	...	...	...	...	£271 3s. 4d.

Caretaker F. J. Wilson, at the Jenolan Caves, has exercised considerable care in the supervision of the improvements effected and in carrying out the instructions issued to him.

Mr. Chalker, caretaker, Wombeyan Caves, Mr. Bradley, caretaker, Yarrangobilly Caves, and Mr. Sibbald, caretaker, Wellington Caves, have each effected improvements, for which material only was supplied by the Government.

## APPENDIX 29.

M. 98/14,359.

## THE JUNCTION CAVE—WOMBELYAN CAVES.

Sir,

Geological Branch, 26 July, 1898.

In accordance with your instructions, I have the honor to report on the newly-discovered cave at Wombeyan.

It is situated near the junction of the Wombeyan and Mares Forest Creeks,  $\frac{1}{2}$  a mile south of the Accommodation House. It various branches are indicated on the plan herewith.

Between the extreme points of the new cave, its length is about 10 chains in a direct line. Its explored passages total about three times that length.

There are two entrances. The lower one is about 60 feet from the Wombeyan Creek, and about 20 feet above the level of the creek. From this entrance a narrow, difficult, and tortuous passage leads to the centre of the cave. This passage is marked by many ripple-marked terraces. It cannot be made practicable for visitors.

The upper entrance is at about the same level as the creek bed near the Accommodation House. It is about 130 feet above the creek, from which it is distant about 170 feet. From this entrance a drop of 34 feet occurs in the first 50 feet, during which a very small aperture is passed through. A draped "waterfall" formation embellishes a nook in the vicinity. Thirty feet further on the floor is ripple marked, and the walls are ornamented with draped formations. A lofty passage is seen here, which is decorated with graceful dripstones, dotted over with crystals.

B on plan.

on plan.

Q on plan.

An uninteresting passage terminates in a crystalline coated rise. At the top are some stalagmites, while overhead hang grey-coloured stalactites, some with cream-coloured tips, others with tufted tips.

A few feet further on, the passage descends about 25 feet at a very steep angle. This descent is marked by a cream-coloured "waterfall" formation.

For 135 feet the passage traverses muddy caverns. Then the hole is seen which leads to the passage from the lower entrance.

120 feet further, after climbing up a steep ascent over slippery black mud, a point is reached, from which the passages run both north and south.

Taking the northern passage first; at 60 feet is a massive dome-shaped stalagmitic deposit, partly covered with a cream-coloured crystalline deposit, and partly faced by a red and white fluted formation. There are also here some draped stalactites.

- J on plan. This dome-stalagmite stands at the south-western extremity of a superb and grand example of the "diamond waterfall" formations. The latter is cream-coloured and sparkles with innumerable calcite crystals, and is marked by two crystalline basins. It is flanked on either side by beautiful crystalline walls.
- H on plan. Near its foot is a singularly attractive bright white and grey "crystalline waterfall." Above it, on the right, is a little canopy covered recess. Below a mantle of dark-brown is a sub-mantle of white, from which hang a few reed-like stalactites, and some irregular stalactites of the "mystery" type.
- G on plan. Above the recess, a series of tinted "draperies" cover the sloping wall for 40 feet upwards. Northerly a shawl stalactite rests on an ornamental stalagmitic base. In the back ground is a beautiful collection of shawls, pillars, and dome stalagmites, both white and tinted. Some of the shawls are 15 feet long. One of them looks like a white blanket hanging in graceful folds. The border is marked by several reddish bands. In the vicinity are some attractive brown-tinted dripstones, all highly crystallized, and a fine column.
- F on plan. Further on is a marvellously beautiful thin, dark-red column, supported on a uniquely decorated stalagmite, which, in its turn, rests on a crystalline "cascade." Near it, overhead, are some white draperies like a woman's petticoat.
- A on plan. From this point, looking down a long steep crystalline "cascade," is seen the present underground water-way. The waters of the Wombeyan Creek run underground before they reach the Creek Cave, then pass under the Fig Tree Cave, re-appear at the foot of the "cascade" above-mentioned, and are finally seen again, where they rejoin the Wombeyan Creek south-westerly from the "upper entrance."
- M on plan. Returning and travelling southward from the top of the ascent over black mud before mentioned, at about 50 feet, massive draped and terraced crystalline "cascades" are seen surrounded by ornamental pillars and dripstone formations, which fringe overhanging ledges. In the centre of the passage is a small circle of stalactites.
- C on plan. Further on to the left numerous crystalline and cream-coloured grottoes and alcoves are grouped in a semicircle. The passage now narrows, and is beautifully marked by fine slender stalactites 2 to 4 feet long, pendant from the ends of draped forms of dripstone.
- P on plan. (A narrow opening leads down from here to the passage near Q.) The passage now rises rapidly over rough rocks which extend to the left for some distance. Overhead are some very fine isolated semi-transparent stalactites. To the right are a series of large stalactites partly hanging free and partly merging into a base of flowing "draperies."
- One stalagmite has a marked resemblance to a dressed monkey sitting in an easy attitude in an arm-chair. (Here again a series of rocky and steep channels pass downwards to near the passage at Q.) Still travelling upwards, crawling on the way through a low chamber, a very large and dry cavern is entered. It is 116 feet long, and appears to be 70 feet high in one place. Owing to the want of moisture the formations are tarnished. Near the entrance are a stalagmite 8 feet high and a small column broken in the centre through sinkage in the floor. At the southern end of this cavern are massive dull, whitish-brown, terraced and draped walls which are very interesting, but are not particularly beautiful. The new cave, therefore, contains much to be admired in its beautiful pillar and shawl formations, but it is chiefly remarkable for the extensive manner in which it is decorated by the cream coloured crystalline deposits which have been likened to "cascades," "waterfalls," "terraces," and "diamond walls," in other caves.
- I have, &c.,  
O. TRICKETT,  
Licensed Surveyor.
- The Government Geologist.

## APPENDIX 30.

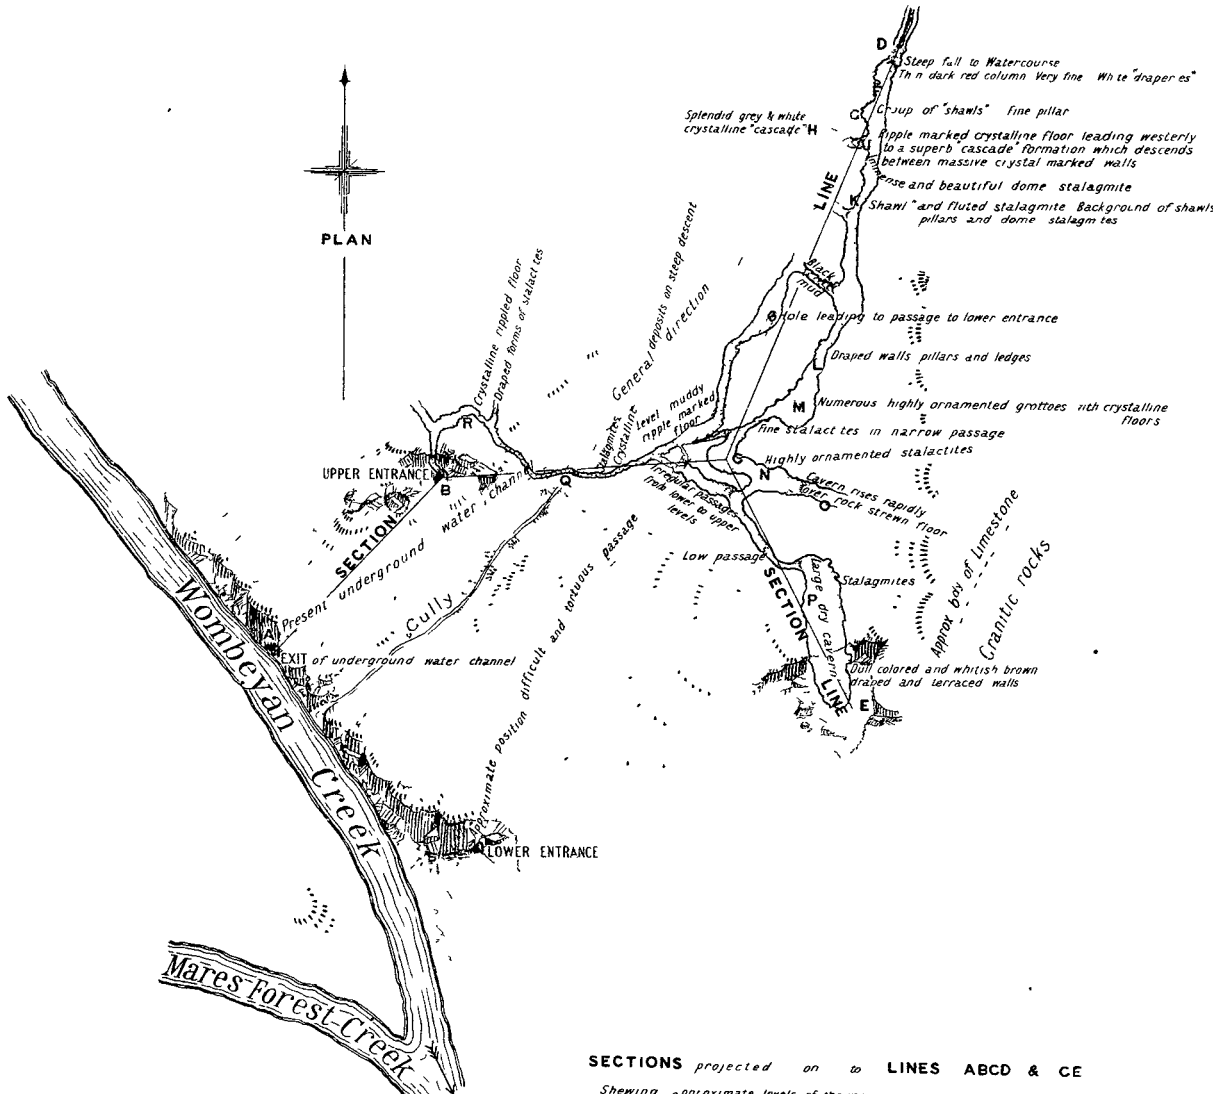

M. 98/17,673.

## LIMESTONE CAVE AT LIMEKILNS.

- Sir, Geological Branch, 16 September, 1898.
- In compliance with your instructions, I have the honor to report on the application of W. F. Hurley, Esq., M.P., for the opening up, and improving of a limestone cave near the Limekilns Post Office.
- The cave is on private property, portion 48, parish of Jesse, county of Roxburgh, 17 miles N.N.E. of Bathurst.
- Its entrance has been improved by excavation and by the erection of a gate. The cave runs northerly for about 400 feet. It is from 8 to 15 feet wide and from 2 to 10 feet high.
- At 80 feet from the entrance, there is a "basin" formation. At 120 feet some small "drapery" formations and stalactites may be seen. There are occasional groups of broken stalactites. The formations are all dull coloured and of little beauty, and in many cases have been mutilated.
- The cave is dirty and uninteresting throughout. An objectionable feature is present in the shape of foul air which was met with at 225 feet.
- I do not think that there is anything to justify the Government in resuming the land for the purpose of improving the cave.
- I have indicated on a sketch herewith, the position of the cave, and also, of the limestone outcrops in some of which are the quarries in the beautiful variegated marble known as the "Fernbrook Marble."
- I have, &c.,  
O. TRICKETT,  
Licensed Surveyor.
- The Government Geologist.

1899.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## NEWCASTLE COAL-MINING COMPANY'S A PIT.

(REPORT OF COURT OF INQUIRY IN CONNECTION WITH.)

*Printed under No. 6 Report from Printing Committee, 19 October, 1899.*

REPORT on the charges brought against Joseph Croft and Herbert Claude Croft, the Manager and Under-manager, respectively, of the Newcastle Coal-mining Company's Colliery (A Pit). A full statement of each case, and the opinion of the Court thereon, made in pursuance of the 1st subsection of the 10th section of the "Coal Mines Regulation Act, 1896."

EARLY in April, 1899, John William Bailey made a complaint to the Minister for Mines concerning certain alleged irregularities at the A pit of the Newcastle Coal-mining Company, and of certain breaches of the "Coal Mines Regulation Act, 1896."

The matter of that complaint was submitted to Mr. Atkinson, Chief Inspector of Coal Mines, for inquiry, consideration, and report. Mr. Atkinson made all due inquiries, and furnished his report [*Annexure V to Exhibit U*] to the Minister. On the 14th April, before so reporting, Mr. Atkinson had, in company with Mr. Dixon, the inspector of the district, an interview at the office of the Newcastle Coal-mining Company at the A pit, with the manager, Joseph Croft, and H. C. Croft, the under-manager, and two of the deputies, Ambrose and Gall.

At that interview Mr. Atkinson asked them all if they had heard that anyone had been burnt at the mine within the last twelve months, and if they had at any time seen gas in the mine? They all denied having heard of any such occurrence, and also denied that they had seen or heard of any gas in the mine. They were then asked if any of them had at any time deceived any Government inspectors, or check-inspectors, when making any inspection, by dishonestly manipulating the ventilation? They all denied knowledge of any such conduct.

That was the first occasion that either the manager or under-manager was interrogated on any of those matters, though they had heard a man (Anthony Weir) had been burnt from Bailey on 29th March. Those denials were given by each in the presence of the other. Under the circumstances, if one denied, all of the others present would most naturally have followed suit.

Further inquiries were made, and eventually a formal investigation was directed by the Minister into those matters in accordance with the 23rd section of the Act. That investigation was duly held in June and July, and the Court, upon the conclusion of the inquiry, reported to the Minister, thereupon the Minister directed an inquiry to be made into the conduct, competency, and fitness of—

1. The manager, Joseph Croft, and
2. The under-manager, H. C. Croft.

Joseph Croft was called upon to answer the charges set out in the statement of the case duly served upon him, a copy of which is attached hereto.

Herbert Claude Croft was called upon to answer the charges set out in the statement of the case duly served upon him, a copy of which accompanies this report.

To inquire into those charges a duly constituted Court was formally opened at Newcastle on the 14th instant.

The Minister was represented by Mr. Edmunds, Barrister-at-law; Joseph Croft and Herbert Claude Croft were represented by Mr. R. W. Thompson, solicitor.

By consent of all parties the cases were heard together.

Also by consent of the parties, as each witness was called and duly sworn the deposition he had made at the Court of Investigation was read over to him and put in evidence, Mr. Edmunds and Mr. Thompson having the right, which they freely exercised, of further examining and cross-examining each witness.

By that means the Court had the advantage of knowing the exact evidence each witness had given at the Court of Investigation before any specific charges had been formulated.

By

By that Court of Investigation inquiries had been made into matters alleged to have taken place in July, 1895. This Court of Inquiry declined to consider those matters or to consider any evidence of any alleged malpractice as to, or interference with, the ventilation of the mine prior to the 1st October, 1896, that being the date the "Coal Mines Regulation Act, 1896," came into force, under the 10th section of which the Court was constituted and the inquiry was being held.

The first charge inquired into was as to whether or not a shiftman named Anthony Weir had been injured by an explosion of gas on 25th September, 1898, and whether that explosion had been duly reported to the inspector of the district in accordance with the requirements of section 29, subsection 1 of the Act.

Exhibit C. In support of that charge, Thomas Abell, a shiftman, working with Weir, deposed that he was "working in the front No. 6 narrow bord on the Sunday night, about 11 o'clock; that Weir was in the back narrow bord, about 40 yards away; that he (Abell) heard a report like a crack of a whip, and saw Weir immediately; he (Weir) was suffering from a shock, his hair was singed, he was white and trembling; his neck and the back of his ears and the top part of his arms were burnt a little."

Exhibit D. That evidence was corroborated by Joseph Fox, who was also working in the No. 6 narrow bords. He said that he saw a small flash of gas immediately before Weir called out "God help me"; "the flash went right across Weir's face; he fell on his knees; his light went out, and one side of his moustache was singed." At the Court of Investigation Fox had described the flash "as about 6 feet long." At this Court he shortened the length to "about 2 feet."

Annexure V. to Exhibit U. Mr. Atkinson's report of the 14th April contains a statement made by Weir to him, not on oath, corroborating the evidence given by Fox and Abell. Weir is reported to have stated that "a small quantity of gas lighted up, and I was slightly burnt about the face and shoulders; my moustache was half burnt off; in consequence of the accident I was off work for one day."

Exhibit X. As Weir was about to leave the Colony he made a statutory declaration on 20th May, and by consent of all parties that declaration was put in evidence. He stated: "I stepped upon the bottom coal, my lamp being on my head alight; there was gas in the place; she lighted; I was burned about the shoulders down the right arm, the moustache burnt and eyebrows; Fox was in the place whilst this occurred; I came round to my mate to warn him; he saw what had happened to me, and said he had heard the report of it; it dinned in his ears; Mr. Rendal came in shortly afterwards, and I reported it to him; he saw me, and said, 'I see you are burnt.' \* \* \* about half-past 3 a.m. I went home and got my wife to put some oil and whiting on the burnt parts."

Exhibit I. Upon that point Rendal stated: "I remember the accident to Weir; about 1 a.m. I was on my round visiting the men, and when I came to Weir and his mate, Weir told me he had been in the back narrow bord, and the gas had ignited slightly \* \* \* ; Weir said that he thought his face was smarting a little, and I told him if that was the case he ought to go home; I had a good look at him, and all I could see was a few hairs burnt on his moustache \* \* \* ; I think Abell said, 'Weir seems a bit shaky; I removed the water-bailer (J. Fox), and I put up a danger mark there \* \* \* ; I was told of the occurrence some time about 1 or 2 o'clock, and saw Bailey some time between 3.30 and 4 a.m.; I told him that this slight occurrence had been reported, and that that place had been fenced off."

That Weir was injured by an explosion of gas was proved and virtually admitted.

Exhibit J. (Wilson.) At that time, and for very many (seventeen) years before that time, William Rendal was the night overman in "A" pit, and he was in charge of the pit on that Sunday night. At about 1 o'clock he knew of Weir's accident; Weir and Abell told him that Weir had been in the back narrow bord, and that gas had exploded. That evidence was not contradicted. It follows, then, that Weir was "personally injured" on the 25th September, 1898, by an explosion of gas, and that fact was known to the officer in charge of the mine a few hours after the injuries were inflicted. It was also generally known by the shiftman in the mine.

Second charge. The second charge inquired into was as to whether John William Taft (wrongly called Albert Taft in the statement of the cases) was overcome by black-damp or other noxious gas in the mine (A pit).

Exhibit G. That he was so overcome was sworn by Taft himself, who deposed that while working with his mate, Albert Turner, as a shiftman in No. 5 district, he felt the air very bad. "On one occasion I was overcome by the bad air; it deprived me of the use of my legs, and my head was ready to burst. I went back to put some tallow in my lamp, and sang out to my mate that I was losing my legs. He came to my assistance, and caught me as I was falling. And I was carried out \* \* \* that happened on a Monday night (18th July, 1898). My mate just laid me aside, and, Rendal, the night overman, came and inquired what was the matter; my mate replied, 'He is down here; he has got no use in his legs.'"

Exhibit G. His mate and Rendal carried him out to the flat. He remained on the floor some fifteen or twenty minutes, when he recovered sufficiently to be assisted to the pit bottom, and thence he was sent home, where he remained during the next day. He further stated: "It would be about 7 p.m. when I fell ill; I vomited a little when I got home. All my limbs were shaking and my teeth chattering. That began when they got me to the flat. I was sweating."

Exhibit H. His evidence was corroborated by his mate, Albert Turner, who was also affected by the bad air, and by the night overman, Rendal, who felt the air "light." Their evidence was not contradicted, though it was suggested that Taft's seizure was not brought about by black-damp or other noxious gas, but was rather in the nature of an epileptic fit; but no evidence was called in support of that suggestion. I have no hesitation in finding that Taft was overcome by some noxious gas in the nature of black-damp, from the manner in which he was affected; and I am strengthened in my opinion by that of the Chief Inspector of Coal Mines, who gave me the benefit of his learning and experience upon the matter, after hearing the evidence of Taft, Turner, and Rendal.

Dr. Haldane's report. So far, then, as that charge is concerned, I find that Taft was overcome by black-damp or by some noxious gas of that nature, and that that was known to the officer-in-charge of the mine so soon as it happened.

Exhibit K. Black-damp was also met with on other occasions by Dobb, a shiftman, who worked with Turner  
Exhibit L. in No. 5 district during Taft's enforced absence, and by Bullerwell many months before Taft's affair. Fire-damp was also detected by Arthur Johns, who was working in No. 6 district back dip heading, from  
Exhibit N. January to March in the present year. He deposed: "I have seen flashes there. \* \* \* I have seen flashes there with the lamp against the roof. I first noticed them in January. The first flash I saw spread

spread for about 2 feet or a yard. \* \* \* It was about 9 or 10 a.m. I saw this flash. I have seen such flashes twice in one shift. The second time, the flame spread about 2 or 3 feet. During the quarter I saw those flashes several times. Gall was the deputy for that district at that time. I reported the matter to him."

Although the evidence of the two last-named witnesses, Bullerwell and Johns, does not in one sense of the word corroborate Weir and Taft, it goes to show that both fire-damp and black-damp were at times met with in the mine. Such evidence becomes of great importance when the evidence given in answer to the charges is considered. One other witness, William Rendal, the night overman and officer immediately next to the under-manager, and who was at times in sole charge of the mine, and whose duty it was to examine for gas on each Sunday night before the shiftmen went to work at 10 p.m., deposed Exhibit I. that on one occasion, at least, he discovered what he described as "a small bit of gas in the back dip heading. \* \* \* That was about six months ago. \* \* \* The miners had been ordered to take only portion of the top band; they had taken a little more of this band than they should have, and they had caused a crack in the roof. On examining the hole it was pointed out my light came in contact with this crack and ignited, but only very slightly. It was an open light."

It was not seriously contended that any of those witnesses had stated other than the truth.

The next witness who deposed to having detected gas in the mine was Bailey. The truth of the whole of his evidence upon that and other points was questioned. His evidence was to this effect: That on being appointed an examining deputy in July, 1898, he was instructed to examine districts 1 and 5, and he continued to examine No. 1 district until 24th September of the same year. The next day, Sunday, he was not in the pit. On the morning of the 26th September he was appointed examining deputy over the No. 6 district also. He was aware of Weir's injury by gas, and that no report of the finding of gas had been made in the book. He thought it necessary, when appointed, to inspect No. 6 district to warn H. C. Croft, the under-manager, that he (Bailey) would have to report gas if he found any. The under-manager, Bailey swore, directed him not to report the finding of gas in the report-book, but to do so verbally to him. Bailey accordingly entered upon his responsible duties with that understanding, and continued without question so to discharge them till 27th March following.

Although on very many occasions, he said, he detected gas, on no occasion did he so report in the report-book, but on each occasion he reported either verbally or by a note to the under-manager. On the 28th March, having made his usual inspection, he reported as usual in the report-book that he had found "all safe." Some little time after so reporting, and above his signature, he added these words: "I found a small quantity of gas carburetted hydrogen in front dip heading, No. 6 district. Removed it and left all safe." Up to that date Bailey had enjoyed the confidence of the under-manager and manager; so soon as he had made that report, he seems to have lost their confidence. Exhibit B.  
Bailey's evidence.

The manager was summoned to the pit by the under-manager. The front dip heading (or back dip heading, as it is usually called) was examined, and as no gas was then found, the manager very unwisely thought fit to write under that report: "I protest against this report, it not being a correct report.—J. Croft, Colliery Manager."

On the next morning (29th March) Bailey again examined Nos. 1 and 6 districts, and though he detected gas in No. 6, he omitted that finding from his report, and reported "all safe." He again inspected on the 30th March, and reported "all safe." On that day he received a letter from the manager (Mr. J. Croft), in which he was disrated from being examining deputy, and was put on the night-shift, without any reduction of wages.

From Bailey's own evidence it would appear that upon 26th September he and the under-manager (H. C. Croft) entered into a deliberate conspiracy to furnish false reports in the report-book of the actual state of things discovered upon Bailey's daily inspections. That not only did he conspire to deceive the miners and other persons employed in those portions of the mine which it was his duty to examine, but he also, by failing truthfully to report, acted in direct contravention of the Act and the special rules of the colliery, and he continued that dishonest course of proceedings from 26th September, 1898, to 30th March, 1899, with one exception.

And it may be gathered from his evidence that he would have continued that course if he had not been disrated, and removed from the position of inspecting deputy for the No. 6 district on the 30th March. Further, in considering what weight should be given to Bailey's evidence, that portion of his evidence in which he swore that he would not have given the Minister any information "had he not been disrated," is worthy of great consideration. Bailey.

Without doubt in giving such information he was actuated by the direct motive of ill-will against his then employers, because he had been disrated.

At the Court of Investigation Bailey swore that he had seen gas from six to ten times; on this occasion he increased that number "from thirty to fifty times," which would be more often than once a week. And out of that number on from twenty to thirty occasions the gas was in quantity so large that he obtained a "permanent blue cap" over the flame of his safety-lamp, but nevertheless he failed to report in the book the presence of gas, although he discovered it in such dangerous quantities. On one occasion 16 cubic feet, on another 25 cubic feet. Special Rule 13.

It is impossible to believe Bailey's evidence. He admitted that until he was in the witness-box that he had never stated to anyone that he had found gas on any number of occasions, and it was only when being examined by the Court that he pledged his oath to having found gas from six to ten times, and, when cross-examined at this Court, he increased that "from thirty to fifty."

It is impossible to believe that gas could have been found in a comparatively non-gassy mine on so many occasions, and in such quantities during three months by Bailey, and that no other person would have detected its presence on at least some occasion.

With reluctance I have to admit that I received no assistance from Bailey's uncorroborated evidence upon the question of the presence of gas in the mine.

For some months, up to the 23rd September, 1898, Edward Wilson had been examining deputy for No. 6 district and other districts, and always found No. 6 free of gas, though he made his inspections with a naked light. On the 24th September, that district was examined by Deputy Ambrose and found to be free, though inspected with a naked light. When Bailey was disrated on the 30th March, John Williams Jones was appointed examining deputy of No. 6, and though he examined with a safety-lamp the headings in No. 6 (eighteen to twenty in number) each morning from that date to the present time, he had not detected any gas. Wilson's  
evidence, Ex-  
hibit J.

The

The next, and perhaps most difficult, question in this part of the case is this: Did the under-manager or manager, or both, know of the accident to Weir and of the accident to Taft?

The answer to that question depends more upon the conclusion one is driven to by the surrounding circumstances than by any direct evidence upon the point. That each of those accidents were known to Rendal, the overman, there can be no doubt.

Exhibit I.

Rendal deposed at the Court of Investigation: "Weir's accident happened about eight or nine months ago. I may have mentioned it to the under-manager. I did not make a formal report of it to him or to the manager. It was the first occurrence of the kind that had taken place while I had been overman. I may or may not have mentioned it to the under-manager."

Exhibit I.

The under-manager (H. C. Croft) denied that Rendal had in any way reported the matter of Weir's accident to him, and the manager (J. Croft) gives similar evidence. Seeing, however, that Rendal thought it necessary to put up a danger-board in the narrow bord on the strength of what Weir had told him about his accident, and had that heading thereafter examined with a safety-lamp; and seeing that that was the first occasion on which there had been any explosion of gas; and seeing that occurrence was generally known to the shiftmen in the A pit, it is impossible to believe that the circumstance was not known, even if not officially reported to the under-manager, with whom he, the overman, was on the best of terms.

Exhibit I.

And if that was reported to the under-manager it would, as a matter of course, come to the knowledge of the manager. The conclusion that it did so reach the under-manager and manager is further forced upon the Court upon reading from Rendal's deposition in answer to a question by the Court at the Court of Investigation: "I came to use the safety-lamp after Weir's accident, because the manager and I thought it better to do so, in order to make sure if ever such a thing occurred again. Bailey used a safety-lamp after this also."

Special Rule 8.

Rendal.

Before the Court of Inquiry, certainly Rendal made an attempt to destroy the value of that piece of evidence by saying: "I cannot understand how that evidence was given by me. I cannot understand how it comes in my evidence at all. I had no conversation with the manager about it at all. It was so small and frivolous that I had no occasion to speak to him about it. I have no recollection of having reported it."

That explanation was not of much weight. In all probability Rendal at the first Court gave the true reason for using the safety-lamp, seeing that then no charge had been made against his manager.

That injury to Weir and the accident to Taft were not reported in accordance with section 29, subsection 1. I have little doubt that the reason why those accidents were not so reported to the inspector of the district by the manager was not that he did not know of them, but because neither accident seemed to him to be of a serious nature. That conclusion I come to from J. Croft's evidence, that "only serious accidents were so reported."

J. Croft.

Since October, 1896, there had been about nine accidents in A pit, brought about chiefly by falls of coal. "Those that were serious were reported to the inspector. About half of those accidents were reported to the inspector, being considered sufficiently serious to report; those that were not serious were not reported."

Department of  
Mines Annual  
Reports, 1896,  
1897, 1898.

I can well understand that if it was the custom of the manager not to report slight accidents brought about by other causes, that he would also forbear from reporting accidents which appeared trivial, even though such accidents were the result of inflammable or noxious gases. The accidents that had been reported since the Act came into force (1st October, 1896) till the date of this inquiry were few in number, and were all of a serious nature.

Joseph Croft, on 29th March, had heard from Bailey of the injury to Weir, and at a later date he heard of Taft's matter from Rendal. He made some slight inquiries into each of those matters, from Fox into Weir's matter, and from Taft. Those inquiries were made before the 12th April, yet for some reason, which I fail to understand, except that he wished to plead entire ignorance of each occurrence, he denied all knowledge, when questioned by the Chief Inspector on the 14th April, as before stated.

The next ground of complaint to be considered is as to whether, or not, the ventilation of the mine was interfered with for the purpose of deceiving the inspectors or the check-inspectors, when inspecting the mine.

The proof of that charge depended upon the evidence of Bailey; to some extent on that of Benjamin Dobb, and to a very slight extent upon that of Alfred Price.

As Bailey's evidence was useless to the Court on the one point as to the presence of gas in the mine, I could not place any reliance upon it to prove this charge.

Price.

The evidence of Alfred Price was explained away; and I have no doubt that when he swore that he had seen "canvas across the road" leading to where men were working in No. 1 pillars that he was mistaken, as he, in fact, admitted. That some canvas was there, there can be no doubt, though I am not satisfied that it was stretched across the road for any improper purpose.

Dobb.  
Exhibit K.

Benjamin Dobb was the other witness, and he stated that he had seen No. 5 overcast partly closed with canvas when the check-inspectors were in the mine; that the under-manager had told him that the check-inspectors were coming, and that he (the under-manager) would place No. 5 overcast all right; and that he (Dobb) would have to see to the removal when they were coming out. If I believed that evidence I should have to find that Dobb and the under-manager had conspired together to commit a fraud on the check-inspectors.

If they had so conspired, Dobb was an accomplice, and I should not be justified in placing reliance upon his evidence unless it were corroborated. Not only was that evidence not corroborated, but from the fact, reported by the check-inspectors in a book kept at the mine for that purpose, that they found on that occasion the usual amount of air going into, and circulating through, all the districts; and their returns generally coincided with the volumes of air found by the district inspector on his visits.

If on the occasion referred to by Dobb, the check-inspectors had found a greater quantity of air than usual, circulating in No. 2, his evidence would to some extent have been corroborated; but that was not so.

Exhibit K.  
Dobb.  
Dixon's  
evidence.  
Annexure W.

He also stated that on the 25th February, 1898, under the instructions of the under-manager, he blocked No. 5 return, whilst the district inspector was in No. 2. From the district inspector's reports it does not appear that he found a greater amount of air circulating through No. 2 than he had found on previous visits, which is no corroboration of Dobb's evidence.

In addition to the fact that Dobb's evidence was that of an accomplice, it was also the evidence of a person who had been disrated, as he thought wrongly, and had left the service of the company. He, equally with Bailey, seems to have been actuated by ill-will to his former employers.

That

That being the only evidence to prove that the management worked a fraud upon the Government inspectors, or upon the check-inspectors, I find those charges not proved.

In considering Dobb's evidence I have not lost sight of the fact that he produced a note-book, in which he swore that he had made entries of the frauds that he had assisted to work upon the inspectors; as I put small faith in his oral evidence, I put even less upon the notes so produced. Dobb's evidence. Annexure S.

The only point remaining refers to the ventilation of certain districts in the A pit during 1898 and 1899.

It was admitted that the volume of air that went into the pit was sufficient for all purposes, and rather in excess of that required by the Act.

It was contended that parts of some of the districts, namely No. 6, No. 5, and the pillar workings in No. 1, were at times without the proper quantity of air.

Because Weir was injured by an explosion of gas in No. 6 heading on 25th September, 1898; it was contended that the air was deficient on such date. I do not hold with that contention. When Weir was injured but three men were working in, or near to, those headings, and the air was adequate, though perhaps the brattice was not sufficiently forward. That was, however, advanced before the miners came to work on that morning.

John Atkinson, a miner, found the air in No. 1 pillars "very hot." "There was a current of air," he says, "coming in, but it was very hot," and, later on, "I have been over twenty years in the Newcastle Coal-mining Company's mine. I have nothing to complain of in respect to the air during the whole of that time. If I had, I certainly should have done so." Exhibit O, p. 116.

From Atkinson's demeanour in the witness-box I quite believe he would have done so.

George Watts, and his mate, Alfred Johns, also complained of the bad air in No. 1 pillars when working there, but at the time they made no complaint to the under-manager, or to the inspectors who visited the place from time to time. Had any such complaint been made, the cause of complaint would have been investigated and most probably the fault, if found to exist, remedied.

I do not find that, on the occasions stated in the charges, the ventilation was so defective as to show that either the manager or under-manager was incompetent or guilty of gross negligence in that respect.

At the Court of Inquiry eighteen witnesses were called to give evidence in support of the charges, and twelve witnesses were called on behalf of the defendants. As most of these witnesses have been examined and cross-examined many times, it may be assumed the Court had all the information possible to be obtained. At the conclusion of the case in support of the charges I inspected the mine, accompanied by the Chief Inspector, the District Inspector, and others.

I was taken through about one-third of the A pit, and was very favourably impressed by all that I had the opportunity of seeing during my inspection, both underground and at the pit's mouth.

Joseph Croft's defence to the charges was that he had not known of the accidents to either Wear or Taft until the 28th March last, when Bailey mentioned Wear's accident (some six months after the event).

I should have placed more reliance upon Joseph Croft's denial if he had not denied all knowledge of Weir's accident to the Chief Inspector on the 14th April, after he (Croft) had heard from Bailey, and after he had made some, almost casual, inquiries into the matter. Doubtless, as I have before stated, the result of these two accidents not being serious, they had passed from his memory.

On behalf of the defence it was proved abundantly, and indeed admitted, that Joseph Croft was a competent, capable, and careful manager, careful of the safety of his men and of the property of his employers, and that H. C. Croft was an energetic and capable under-manager.

The charges now brought against each of them did not allege general incompetence and gross negligence, only that each had shown himself incompetent and grossly negligent in complying with and enforcing perhaps the most important sections of the Coal Mines Regulation Act and the special rules of the colliery.

I, very reluctantly, am driven to the conclusion that in these respects each has shown such incompetence and gross negligence as to show his unfitness under subsection 6 of section 10 of the Act.

The other charges were denied *seriatim* by Joseph Croft. As I found that some of them were not proved to the satisfaction of the Court, I need only dwell upon those denials which did not prevail.

Herbert Claude Croft also met all of the charges by a denial of all knowledge. In his case also that denial would have had more weight if he had not made an attempt similar to that of Joseph Croft to mislead the Chief Inspector about Weir's accident.

That the discipline of the mine was very lax, unfortunately, there can be no doubt. It was part of Rendal's (the overman) duty to inspect those portions of the pit his gangs of shiftmen were to work in each night. No report of any such inspection had been made in any book, or at all, before last April. After Weir had been injured by an explosion of gas in September, 1893, the inspection of A pit was not made with locked safety-lamps. General Rule 4.

After Taft had been overcome by noxious gas that part of the mine was not inspected with a locked safety-lamp; and no report of any such inspection was recorded in a book kept at the mine for the purpose—in fact, there was no such book. General Rule 7.

When Bailey was inspecting No. 6 with a safety-lamp that lamp was not locked, and he was even allowed to remove the bonnet when making an inspection in presence of the under-manager without reproof. Rendal also used an unlocked safety-lamp. H. C. Croft.

From this uncontradicted evidence I can only come to the conclusion that the management seemed to think the very useful and salutary and necessary sections of the Coal Mines Regulation Act, and even their own special rules, did not apply to their mine. Each breach of the Act would be a breach of discipline in a mine conducted in accordance with the Act. The management seemed to have been grossly careless as to whether the provisions of the Act were or were not complied with. They seemed to have considered that they were not bound to report any personal injury though caused by an explosion unless the injury was serious.

The evidence of the manager and under-manager as to the finding fault with Bailey's report, his disrating and ultimate dismissal, shows a peculiar state of discipline. The manager (J. Croft) swore that he was certain that Bailey's report of the 28th March was false, and false to Bailey's knowledge, yet he was allowed to inspect and report on the 29th and 30th March, and then when he was disrated and put on the

the night-shift, it was at the same rate of wages. If the discipline had been such as one would expect to find in such a mine, Bailey should have been discharged so soon as the manager was satisfied the report was false.

J. Croft.  
Exhibit No. 10.

Also so soon as the manager and under-manager became aware of the many times that Rendal, the overman, had committed breaches of the Act he should have been reprimanded, suspended, or discharged.

The manager and under-manager also seem to think that they were justified in withholding information from the Chief Inspector when he was making an examination under the 19th section of the Act, to ascertain whether the provisions of the Act had been complied with. By so doing they committed a breach of that section.

Annexed to this report furnished to the Minister in pursuance of the 10th section, 5th subsection, of the Act are the exhibits and the signed depositions of all the witnesses examined before the Court; also the certificates of each of the defendants.

My opinion of the charges is as follows:—

As to Joseph Croft—

Charges Nos. 1, 2, 3, 4, and 5. I find these charges proved.

Charge 6. I do not find this charge proved, though I find that Joseph Croft, having cause to doubt the correctness of a report made in pursuance of General Rule 4 in the report-book kept for that purpose, improperly wrote a protest on that report.

Charges 7 and 8. I find these charges proved.

Charges 9 and 10. I find these charges not proved.

Charge 11. I find this charge proved; that the discipline of the mine was defective, in so far that the general rules of the Act and the special rules of the colliery were not enforced.

As to Herbert Claude Croft—

Charges Nos. 1, 2, and 4. I find that these charges were proved.

Charges 3, 5, and 6. I find that these charges were not proved.

Charge 7. I find this charge proved. He, as under-manager, was responsible, under the 3rd special rule, for the discipline of that portion of the mine under his charge.

I accordingly have to find that Joseph Croft has shown himself, by incompetence and gross negligence, unfit to discharge his duties as manager.

Since these inquiries were first set on foot I understand that the discipline in the mine has been materially altered, and that the general rules under the Act and the special rules of the colliery are now being complied with. Bearing that in mind, and also that no serious injury has resulted by the lax discipline as before stated, and as it has been proved that Joseph Croft has been a successful manager for a number of years, that he had never before been called upon to answer any charge of any kind, and taking into my consideration that he has about 800 men under his control and in his care, some of them for very many years, and that accidents have been few, although the mine has been a difficult one to develop, many faults and dykes in the coal-seams being frequently met with.

In my opinion the justice of the case under all of the circumstances will be met by my formally suspending the certificate of Joseph Croft for a nominal time, *i.e.*, until the rising of the Court, and by ordering him to pay the costs of this inquiry, which has been rendered necessary by his default. As the more serious charges have not been proved, the amount of those costs should be limited to £60, and I order accordingly.

As it has been proved that Herbert Claude Croft has been an energetic and industrious under-manager, and that the work for which he was responsible has been well performed, though not in accordance with the Act, that he had never before been called upon to answer any other charge. In my opinion the justice of the case under all the circumstances will be met with by formally suspending his certificate for a nominal time, *i.e.*, till the rising of the Court, and by ordering him to pay the costs of this inquiry, which has been rendered necessary by his default. As the more serious charges were not proved, the amount of such costs should be limited to £40, and I order accordingly.

Before closing this inquiry it is my pleasure to state that I received great assistance from Mr. H. Dalrymple Wood, the duly appointed secretary to the Court; and also that Mr. H. F. Roberts proved himself again to be very capable by the accurate and expeditious manner in which he reported in type the evidence of each witness.

I have, &c.,

Mr. Edmunds hands in his appointment to undertake the management of the inquiry on behalf of the Mines Department.

Mr. R. W. Thompson appears for Joseph Croft and Herbert Claude Croft.

On the suggestion of Mr. Edmunds, and with the consent of Mr. Thompson, the case against both defendants is taken together, on the understanding that neither of them shall be prejudiced by such course of proceeding. Both defendants are called upon by His Honor to hand in their certificates. Certificates not in Court, but sent for. [*Certificates put in and marked Exhibits A and B respectively.*]

This deponent, *Thomas Abell*, on his oath, states:—I am a miner, employed at the A pit of the Newcastle Coal-mining Company; I gave evidence before the Court of Investigation on the 27th June last; the signature to the deposition shown me is mine; I have heard that evidence read, and I am satisfied that it is quite correct. [*Deposition put in and marked Exhibit C.*]

*By Mr. Thompson*: I am not prepared to say that Weir had no right to be in the place where he was when burnt; it was the place where he had been directed to work; if he walked along the canch a couple of steps he would be up against the face of the coal; I saw the place where he was supposed to have seen the gas; the canch was of stone; it was right up against the stone that the gas was seen, and not against the coal; I would expect to get inflammable gas out of stone as out of coal, simply because it was there; I am speaking of the canch in the roof, and not that on the floor; the canch on the roof was of stone; there was a hole in the roof left after a blast; I was the man who put it there; I know the sound of the explosion of powder partly confined; the explosion I heard there was not like that; it was not such a solid sound; it did not sound to me as an explosion of some powder that had not exploded when the shot was fired; I have never known of a case of gas coming out of a shot-hole in sandstone in a mine; I have been employed in the A pit ten years; I had been employed in other mines prior to that, and consider myself an experienced practical miner; I had no more reason to find fault with the management of that mine during my ten years' employment than with that of any other mine I had been in.

Taken and sworn at the Court-house, Newcastle, this } THOMAS ABELL.  
14th day of August, 1899, before me,— }  
GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *Joseph Fox*, on his oath, states:—I was examined as a witness before the Court of Investigation in June last; the signature to the deposition produced is mine; I wish to correct my former evidence with regard to the length of the flash in Weir's case; it should have been 2 feet instead of 6 feet; I did not see the manager till the following April; it was then in the office where I was taken by Rendal. [*Deposition put in and marked Exhibit D.*]

*By Mr. Edmunds*: The brattice that night was pretty close up to my tub; it was about 6 yards from the face; it was early in April last that I went to the office and saw Mr. Croft, the manager; I was never asked any questions about Weir's accident by Mr. Herbert Croft; Mr. Joseph Croft asked me what the flare was like, and I told him it was nothing worth speaking of; that was all that was said; I do not remember ever having seen Wilson examine the No. 6 narrow bords at that time.

*By Mr. Thompson*: My tub was about a yard from the edge of the canch; I was about 3 yards from Weir when the flash came and he fell; his head was not far from the roof at the time when he stood up on the canch; he was a taller man than I; I am about 5 ft. 1½ in. high; the flash seemed to come from the stone towards me; it appeared to me that Weir had gone on to the canch to look at the cut-through which had been commenced there.

*By Mr. Edmunds*: The cut-through was in the coal; the bord had gone through the dyke into the coal again; no coal or stone was thrown down by the explosion.

Taken and sworn at the Court-house, Newcastle, this } JOSEPH FOX.  
14th day of August, 1899, before me,— }  
GRANTLEY FITZHARDINGE.

Court now adjourned till 10 a.m. to-morrow.  
Court-house, Newcastle, 14th August, 1899.

This deponent, *Alfred Ashley Atkinson*, on his oath, states:—I am Chief Inspector of Collieries; I produce a plan of the Newcastle Coal Company's A pit [*put in and marked Exhibit E*]; it has been prepared from the record plan kept in the Coal-fields Office, which was compiled from the plans supplied by the management of the colliery. [*Original record plan put in and marked Exhibit E also.*]

*By*

*By Mr. Thompson :* As far as my examinations of the colliery go, I am of opinion that it has been set out in a proper manner; the quantity of air supplied is sufficient for the number of men, boys, and horses working in the mine; a fan would be a method of ventilation better adapted to a shallow colliery such as this.

Taken and sworn at the Court-house, Newcastle, this }  
15th day of August, 1899, before me,— }

A. A. ATKINSON.

GRANTLEY FITZHARDINGE, D.C.J.

Mr. Edmunds tenders in evidence the Special Rules of the Colliery [*put in and marked Exhibit F.*] It is admitted that Joseph Croft has been manager of the mine since before 1895, and that Herbert Claude Croft has been under-manager since the beginning of the year 1898 up to the present.

This deponent, *John William Taft*, on his oath, states:—I am a miner employed at the Newcastle Company's A. Pit; I gave evidence before the Court of Investigation in June last; the signature to the deposition shown me is mine [*witness' evidence at Court of Investigation read to him.*]; that is correct. [*Deposition put in and marked Exhibit G.*] That was either in the month of June or July; I was off work the next day, and was bad too.

*By Mr. Thompson :* Until Mr. Croft spoke to me I never mentioned my illness to him nor to Herbert Croft; I saw any number of people to whom I could have complained besides Rendal; Rendal saw me himself and knew all about it; the place in which I was working was being cleared for the purpose of working the pillars; all the ground was broken there; I never spoke to either of the defendants about matter of complaint; it is a well-known fact that we miners would sooner put up with a little inconvenience like that than make a complaint about it; I have worked in other coal-mines besides the Newcastle; I have been some years a coal-miner; I have worked in the Greta mine and Denton Park, outside of Maitland; I was trained to the work in England; the state of discipline in the Newcastle mine was about the same as in other collieries in which I have worked; it is well known that the air in pillar workings is fouler than in other parts of the mine, owing to the country being broken; to a large extent it is more difficult to ventilate the broken country than the other parts of the mine; brattice will carry the air into the broken workings as well as into the bords; I went back to the same place as where I was taken ill, and put timbering in there; the stopping had been taken down then, and the air was much better; it was in consequence of my complaint that the stopping was taken out so as to permit more air coming to the place; I was away from the colliery nine weeks altogether; that was before my sickness; during that time I was in the Colony of Victoria; I left there in consequence of the bad weather; that would not matter to me when I was working in the pit; I would have made better wages there if I had had my family there, but I could not keep two places going.

Taken and sworn at the Court-house, Newcastle, this }  
15th day of August, 1899, before me,— }

JOHN WILLIAM TAFT.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *Albert Turner*, on his oath, states:—I am a miner working in the Newcastle Company's pit; I gave evidence before the Court of Investigation about a month ago; the signature to the deposition shown me is mine [*deposition put in and marked H.*]; that deposition is quite correct; I was never questioned about the matters in my evidence by either of the defendants: the miners did not start the pillars till we had left—not as we cleared the road; when I said my conscience told me my name was Walker if I complained, I meant that when I was in the pit there was first a jar from one official and then a snarl from another; I do not mean that I have said anything untrue about the matter; all I have said is the truth.

*By Mr. Thompson :* I cannot state when this jarring and snarling commenced; it was since the inquiry held by Mr. Wade; I do not mean that Mr. Joseph Croft "jarred" me in that way; it was the officials that I met in the pit; Mr. Joseph Croft was present in the mine in my place on one occasion; he never "jarred" me; I mean Ambrose and Gall as the officials that "jarred" me; Ambrose said on one occasion that he did not believe that Mr. Croft was anything but a gentleman; I said I did not believe him to be anything else; he has never been anything but a gentleman to me; Ambrose made no reply to my remark, but went away with his tail between his legs; on one occasion Gall said, "Good day, boys, how are you getting on?" we said all right, and he went away; he came back in a few minutes; that was what I called a "jar"; if he had passed us without saying a word I would not have taken that as a "jar"; during my twelve years at the mine I have been away four or five times; I was away for a twelve month altogether; I had to like the place, because my home was there; I am not a bit of a grumbler; if I were more of a grumbler I would get on better; I was trained to the mining in England; the under-bosses in the Newcastle mine treat the men very badly; they tyrannise over them, and bully them; I do not think that is when the men are not up to the mark in their work; they do it out of sheer cussedness; Mr. Joseph Croft is not one of them; I have worked in gassy mines in England; they were also affected with choke damp; further than that, I have been in an explosion; the mines out here are much freer from gases than those in England; the mines out here are not better than those in England, nor are the miners treated better; we do not get half a quarter of the air here; I do not know what quantity of air is allowed to each man, boy, and horse in a mine here nor in England; I can always tell by my breathing what the air is like; I cannot tell within 50 feet of how much air is coming to a place.

Taken and sworn at Court-house, Newcastle, this }  
15th day of August, 1899, before me,— }

ALBERT TURNER

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *William Rendal*, on his oath, states:—I gave evidence before the Court of Investigation held by Mr. Wade some weeks back; the signature to the depositions shown me is mine [*put in and marked I.*]; with the exception of the places mentioned in the margin that deposition is correct [*exhibit "G" in inquiry put in evidence by Mr. Edmunds*]; I wish to correct my former evidence at page 47 of my evidence in this respect; I meant that I started to use the safety-lamp regularly for the purpose of my inspections on a Sunday night; I had used it for other purposes prior to that; there had been a safety-lamp in the pit, which we could use at our own discretion for such purposes of examining

examining when going through the dykes; my former evidence refers to the time we first began to use the safety-lamp regularly for the purpose of inspection; referring to my former evidence at page 106, where I spoke of Weir having been burnt; I never could acknowledge that Weir was burnt; I mean the place where Weir's moustache was singed; then at page 107 I speak of using the safety-lamp, because the manager and I thought it better to do so; I cannot understand how that evidence was given by me; I cannot understand how it comes in my evidence at all; I had no conversation with the manager about it at all; it was so small and frivolous that I had no occasion to speak to him about it; I have no recollection of having reported it; I cannot remember saying at the inquiry, "I came to use the safety-lamp because the manager and I thought it better to do so"; I cannot say whether the Weir incident was well known among the men or not; I am not positive whether I mentioned Weir's incident to Herbert Croft or not; the narrow bords in No. 6 were carefully inspected with a safety-lamp after Weir's incident; there was no other place to be particularly inspected; I used to take the safety-lamp round with me on a Sunday night after that wherever I went; the procedure under general rule 10 was not carried out; no lamp station has been appointed, nor any person appointed to see that the lamps are in proper order before being used; I examine and light the other man's lamp on Sunday night, and see that it is in proper order before he goes on his examination; I also examine my own, and see that it is in proper order before making my examination; I lock it myself; that course of procedure has been adopted and carried out for several months—say six; that refers only to Sunday night.

*By Mr. Thompson:* I have read the part of the Act referring to the use of safety-lamps; it was not necessary to work the coal with safety-lamps in that part of the mine, nor in any part; there is a cabin on the engine flat; the safety-lamps are not kept there, but in a cabin at the pit bottom; my illness during the inquiry was due to an affection of the heart, from which I have suffered for the last twelve months; that affection may have affected my memory at the time I was giving evidence; I felt indications of my illness coming on me before I came to Court that day; I understood the questions put to me fairly till I appealed to Mr. Wade, feeling the swoon coming over me; the special rules lay down that no man has any business to go to any place than that to which he was sent; Taft was working in his ordinary working clothes at the time of his sickness, trousers and flannel shirt; I felt no oppressive sensation when I went in to help Taft out; I was suffering from my present ailment at the time, but not to such an extent as since; I do not feel any ill-effects from the want of air in the mine; it is more excitement that affects me; I have had forty-six years' experience underground, and have been a practical miner before obtaining my present position; it was Bailey's duty to examine the place where Weir met with his accident; I know nothing of Taft outside the mine; I have never seen a man overcome by choke-damp in all my experience; I have never seen men affected by bad air after explosions; from my knowledge of the circumstances, I believe that Mr. Joseph Croft first knew of Taft's matter some time in April last; I may have put Dobb on to work with Turner while Taft was absent one shift; I heard of nothing occurring at that place after Taft returned to it; I did not detect foul air of such extent to affect a man in that place; I have said the air there was light; the state of the discipline in the Newcastle mine will compare favourably with that of any mine in the district; as far as I know the under-managers are not tyrants or bullies; I am working at night and may not hear all that is said, but that is my opinion of them; I never knew Ambrose and Gall to be men of such a class; they may be rough-tongued men, but they are not always the worst; I get ruffled myself at times in consequence of the behaviour of the men; I was ruffled with Weir for going to a place he had not been told to go to; I believe it was at the meeting in the office that Mr. Croft first knew of Taft and Weir's matters; I cannot remember the word "black damp" being mentioned at that meeting; from my knowledge of the two defendants, I can say that each has conducted his part of the business of the mine very well; it was not part of my work to see to the ventilation of the mine; as far as I could see the ventilation was properly carried out; I have heard that Taft and Turner were putting kerosene oil in their tallow for their lamps; I did not observe that their lights burnt any more brightly than mine that night; I was using kerosene in my tallow myself, because in cold weather the tallow becomes harder and the kerosene assists to melt the tallow; I never heard of kerosene being used in the tallow because the air was light; it would be more likely used in the cool air in order to assist the tallow to melt.

*By Mr. Edmunds:* I have been twenty-two years in this Company's mine; I was employed before that in the A.A. Co's. pit; I have no knowledge, except from hearsay, of the discipline in any mine but the Newcastle; the safety-lamp was in the cabin at the pit bottom for some considerable time; I took it from the cabin; it was not handed to me by anybody, but was there for me whenever I wanted it; I received no particular instructions from either of the defendants as to its use; the lamp was there in Mr. Mouter's time; he may have given me some instructions about the use of the lamp; I received no instructions from Mr. Joseph Croft about the use of the lamp; I cannot remember whether Mr. Herbert Croft ever gave me any instructions about it; I believe it was Mr. Mouter who told me to use it when going through the dykes; I have no recollection of any conversation with either of the defendants about my using the safety-lamp; there was no particular lamp-keeper in the mine under special rules 36 and 37; I was lamp-keeper for myself on the Sunday nights for my own purposes.

*By Mr. Thompson:* It was in going through the dykes that we would expect to meet with gas, even in a non-gassy mine; we used the safety-lamp in going through them for more abundant caution.

Taken and sworn at Court House, Newcastle, this }  
15th day of August, 1899, before me, ——— }

W. RENDAL.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *Edward Wilson*, on his oath, states:—I am an inspecting deputy at the Newcastle Coal Company's mine; I gave evidence at the Court of Investigation last month; the signature to the deposition produced is mine; with the exceptions at pages 67 and 71, marked with a pencil in the margin, that deposition is correct [*Deposition put in and marked exhibit J. Exhibit I, in Court of Inquiry, also put in evidence*]; I cannot say when I heard of the accident to Weir; it was long after it had happened; I wish to correct my former evidence as to seeing Jones examining with a safety-lamp; I have not seen him examining with it, but simply carrying it.

*By Mr. Thompson:* Before being appointed deputy I was employed at shift-work; I have never been what is called "on the coal" properly; I was as a necessity of my position a good deal among the men in No. 9 district; I do not remember ever hearing that the inspectors were about to visit the mine;

I have not worked in any mine but the Newcastle; I do not remember ever having been accused of being a tyrant or a bully; I had to see that the men obeyed my instructions to a certain extent; it does not matter to me whether a miner sits down all day as long as he keeps the place all right; I had to look after the shiftmen; I never found the men unruly in the mine; if I wanted to know anything in connection with my work I consulted Joseph Croft, and always found him very civil and willing to instruct me; I found the same with regard to the younger Mr. Croft; such instructions as either of them gave me I took care to obey as far as I could; I have not been in other mines so as to see how they were conducted; the ventilation in No. 9 district was always very good; I never heard any of the men complain about it; that was the part of the mine I had to attend to.

Taken and sworn at Court-house, Newcastle, }  
 this 15th day of August, 1899, before me,— }  
 GRANTLEY FITZHARDINGE, D.C.J.

E. WILSON.

This deponent, *Benjamin Dobb*, on his oath, states:—I was at one time employed in the Newcastle Company's mine; I gave evidence at the Court of Inquiry; the deposition shown me is mine, and bears my signature; the evidence read to me as being given by me before the Court of Inquiry is correct; the notes shown me in the exercise-book and note-book produced were made by me and are the notes referred to by me in my former evidence [*books put in evidence. Witness marks on the smaller plan—Exhibit E—the position of the No. 1 overcast and also the No. 5 main return, the point where he saw the canvas being held up in No. 2 main return, with a circle.*]; the main engine-road was about 6 feet square at that point; the canvas was put up about 50 or 60 yards from the No. 1 air-crossing.

*By Mr. Thompson:* The canvas was put square across the road where I saw Bailey and Newburn holding it up; it was about 6 feet across the road at that point; I did tell Mr. Herbert Croft of what was going on; I told him what I had come across in No. 1 and what I had seen in No. 2; I saw the air blocked in this way on three occasions; I did not tell him of the three occasions; he knew of them; he did it himself on one occasion; he told me that he would do it; he said he "would put it right"; I certainly never told his father of any of these capers; I made the entries in the note-book for convenience sake, and for no other reason; I made the entry about the chain being thrown at me on the same night as it occurred; I made the entries in the note-book two or three days before I came to give evidence before the Court of Inquiry; it was nearly four years after I had made the original entries in the exercise-book; it was three years after their occurrence that I complained to Mr. Joseph Croft of what I noted in the exercise-book; I continued to make those notes in the exercise-book from 17th July, 1895, till 25th February, 1898; I brought that note-book with me to refresh my memory; I have a pretty fair memory, but in a case like that where I wanted to be sure about what I was saying; what I saw Joseph Croft about was being shifted from day work to night work; I was disrated in being taken off the day shift and put on the night shift; I considered that a disrating, because I did not like the night work; my wages were not reduced; I cavilled to work with Jonah Morgan on the coal; he was a grand man and I liked him well; I did not throw Morgan over; he threw me over, if there was any throwing over; I did not go to work, because I had started in another colliery; I did not intend to go to work in the Newcastle pit where I cavilled; I had no intention of going to work there when I cavilled for the place; I did not tell anyone but Herbert Croft of what I had seen in the mine with regard to the interference with the ventilation; I told nobody else till I told Bailey; I had left the colliery a month then; I was getting 8s. a day for the shift work; I do not think it was much easier than working on the coal; the day shift work was much easier than getting coal, but the night shift work was not; I had only to use the light tools in the daytime and heavy tools in the night; I did not speak to Bailey when I saw him stopping the air, because I told young Croft, and thought that was sufficient; I had no business to interfere with either Bailey or Newburn, as they were superior officials to me; I told Herbert Croft of what I had seen in a short time—within a week; I was not a deputy nor a relieving deputy then; I saw this kind of thing going on in the mine for a period extending over three and a half years; although the check inspectors were not my friends they were not my enemies; it seems to me that the men are afraid to confide in their own deputies; I should say that, as far as I am concerned, the men should pick reliable honest men as deputies; there is very little difference between choke-damp and black-damp; choke-damp is called black-damp and *vice versa*; there is really no difference between them; Taft's illness took place about September or October, 1898; it was fairly warm weather; I cannot say that it did not take place in September, 1898, and that a keen cold westerly wind was blowing at the time; I had not used kerosene up to that time, but since then have done so frequently as it is a very good auxiliary; it sets the tallow running more freely; the records of the air-current were not good on account of the obstructions to the air; I mean the obstructions placed by myself and others to prevent the air following its proper course; I knew that in No. 5 there were obstructions to the air in the shape of falls and pools of water; I knew that from those who had travelled that way; I have said that I have read a good deal about gases; judging from Taft's symptoms I should say he was suffering from the effects of choke-damp or some other damp that should not have been there; when I said the air records would be reliable if all the men were honest, I meant the men who ordered the obstruction to be put up and those who assisted in the putting up of the obstructions; I never remember hearing of the intended visit of Mr. Atkinson; I referred to Mr. Dixon as the inspector whose visits were known of beforehand; I knew of his visits about two or three hours before he came; one can see about a quarter of a mile from the mouth of the pit along the road; it would take Mr. Dixon some time to reach the mine and get ready to go down from the point where he could be seen from the mouth of the pit; the falling of the roof in the pillars would not cause a block to the air-course; the shaft is about 300 feet deep; in some places the roof, for a thickness of 30 feet, has fallen; those places are not in the airway; the air was blocked to some extent by the falls; that could not be avoided.

*By Mr. Edmunds:* I mean by that that the falling of the roof could not have been avoided; the pillars were taken out and the roof fell in.

BENJAMIN DOBB.

Taken and sworn at the Court-house, Newcastle, }  
 this 15th day of August, 1899, before me,— }  
 GRANTLEY FITZHARDINGE, D.C.J.

Inquiry adjourned till 9:30 a.m. to-morrow, Court-house, Newcastle, 15th August, 1899.

This

This deponent, *James Bullerwell*, on his oath, states:—I am the under-manager at the New Lambton Colliery; I was formerly employed in the A pit of the Newcastle Coal Company; I gave evidence before the Court of Investigation last month; the signature to the deposition shown me is mine; that deposition is correct, except that Weir's name appears instead of Taft's; I know nothing about Weir's case; I was not examining deputy at the time of Taft's accident; I came on the next quarter; it was in the second right hand that I found the black-damp, not where Taft and Turner were working; it was about 35 yards from where they worked, in another heading. [*Deposition put in, and marked Exhibit L.*]

*By Mr. Thompson*: I did not report it, because I drove it away; it struck me at the time that the black-damp was there on account of the brattice being down; as soon as I repaired it the black-damp disappeared; I was about six months in the employ of the Newcastle Coal Company; during that time I did not find that the minor officials of the mine were bullies or tyrants; I used to work with Bailey as a mate at night; he never appeared to me as a querulous man, always complaining; it was a little time before the last inquiry that he asked me about the black-damp; I have about thirty years' experience of coal-mining altogether; I would expect to find black-damp in any mine under circumstances similar to those under which I found it in the Newcastle pit on that occasion.

*By Mr. Edmunds*: Mr. Herbert Croft was under-manager at the time I found the black-damp; I made no written report of the finding of the gas.

Taken and sworn at Court-house, Newcastle, this }  
16th day of August, 1893, before me,— }

JAMES BULLERWELL.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *John William Bailey*, on his oath, states:—I am a miner; I was lately in the service of the Newcastle Coal Company.

*By Mr. Thompson*: I only knew this inquiry was coming on when I saw it announced in the newspaper; I do not know when that was; I wrote a letter to the *Newcastle Herald*, which appeared on the 9th instant; I think that was before I knew the inquiry was to come on; I did not get notice of this inquiry.

*By Mr. Edmunds*: I was, probably, eight years in the service of the Newcastle Company; in 1895, I was on the night shift. [*Mr. Thompson objects to any evidence concerning anything which may have taken place more than three months prior to the 9th instant, the date of the appointment of His Honor to hold the inquiry.*] About the middle of the year 1895 I was looking after the No. 10 pillars; the number of men there at that time did not require a proper deputy; I was engaged on shift work there; I known Newburn; he was foreman deputy at that time—overman deputy—that is, the chief deputy; he would be next in position to the under-manager; I was always considered under his orders, and bound to obey them; I believe H. Croft was under-manager at that time—the present under-manager; I remember an incident that took place about that time with Newburn; I cannot tell what month it was; I only know it was in 1895; I was sitting at the turn on a certain day—the No. 10 pillars turn—on the No. 2 main road; I was sitting near a fault that ran across; it was about 200 yards from the No. 1 return; it was before dinner, but I cannot state the exact time; Newburn came out from No. 2, and passing by me [*objected to by Mr. Thompson*] ordered me to go with him; I cannot give his words; he had a sheet of canvas with him; I got up and went with him along the main engine road towards the pit bottom some distance; he told me to hold up the end of the canvas there, and make it secure; I did so; the piece of canvas was about 6 feet by 7 feet; there was a slab in the roof at this particular place; we bent the canvas over this slab, and put pieces of stone up to keep it there; I then stood up against the canvas to stop it from blowing out too far; Newburn was doing the same as I was; the canvas went completely across the engine road, and extended from the roof to the floor; this was done at a point in-by from the No. 1 overcast, and out-by from No. 10 pillars; Newburn and I remained there supporting this canvas for half an hour or longer; we did so for at least half an hour; at the end of that time he took down the canvas, and each of us returned to his proper place; during the time we were holding up the canvas someone passed under the canvas, but I cannot recollect who it was; the effect of putting up the canvas at that point would be to give the out-by districts more air, and deprive the in-by districts of that quantity of air; some years after I took part in a proceeding of a similar character; that was done between Nos. 7 and 8 districts; I received instructions on that occasion from Ambrose, the deputy; at that time I was bound to obey Ambrose's orders. [*Evidence objected to by Mr. Thompson, on the ground that it is outside the usual case of a man obeying a lawful order, and that it is a case of a man carrying out an absolutely illegal act*]; I cannot give the date of this occurrence; it happened about six or seven months before my discharge in April last; that would be about October, 1898; I was discharged on the 14th April last; this occurrence took place before dinner; I was at the deputies' box on the No. 6 flat; Ambrose told me to go to a place between Nos. 7 and 8 districts, and put up a piece of canvas there; there was only the one place to go to there between those two districts; he did not tell me what quantity of canvas to put up there; that was the whole of what he said to me; I had to search for a piece of canvas, and that took me some time; when I got to the spot Ambrose was already there, with the canvas partly up; I assisted him to finish putting it up, and we withdrew for a little while; it was secured in the connecting road between the two districts at that time when I got there; the canvas was about half up at the time I got there; it was tacked to a slab in the roof; I assisted to put up the rest of the canvas; that canvas stretched across the whole of the roadway, although a certain quantity of air was getting through; it was practically the size of the roadway; we withdrew after putting it up and waited a while, when Ambrose said to me, "Do you think they have finished now?"; I replied, "I think so"; after that the canvas was taken down; it remained up across the heading for three quarters of an hour—perhaps more; the place where we put up that canvas was an airway; it was the main airway between Nos. 7 and 8; the effect of putting up that canvas would be to deprive the in-by districts of some air, and give a larger quantity to the out-by districts; on another occasion I was instructed by Ambrose, the deputy, to take the boy away from the door [*same objection by Mr. Thompson*]; that was about the 3rd or 10th March last; it was between 9:30 a.m. and 10 a.m.; I was at the deputies' box on the No. 6 flat; Ambrose told me to take the boy away from the door; there was a door near there—a wooden door; it was on the No. 8 heading, about 10 or 12 yards from the main engine road; it had been put there to prevent too much air going into No. 8 district and forced into Nos. 6 and 7; it had to be kept shut to complete the ventilation of Nos. 6 and 7; leaving it open would take air

air from Nos. 6 and 7, and allow it to go into No. 8; there was a boy named Jones at that door; his duties were to keep the door constantly shut except when someone was passing through; I took the boy down the No. 7 headings a distance of about 600 or 700 yards; we remained away about three quarters of an hour; we then returned to a point where I could see the door; the door was open, and Ambrose was coming from it towards me; he told me to take the boy away again; I asked him where I should go, and he replied, "Oh, go anywhere to pass the time away"; I took the boy down to some bords on the left-hand side of No. 7 heading; that was about the same distance from the door as the other point we had gone to; we remained away about three quarters of an hour, when we returned to the door; the door was shut then; Ambrose was there; I had a conversation with Ambrose, but nothing about the matter; those are the only occurrences of that nature that I have seen; I was appointed to the position of inspecting deputy about nine months prior to my discharge; I had to inspect No. 6 pillars, No. 5 pillars, and No. 1 pillars; I was not inspecting No. 5 pillars when Taft and Turner were clearing the roadway there; when I was inspecting No. 5 pillars I think the men were working them; I inspected the working places in the No. 5 pillars for the whole nine months; the ventilation there was not very good; there were traces of black-damp there and very little air getting to the places; it was a warm portion of the workings; the old bords had fallen, and canvas was carried along the whole length of the bord from the top of the fall to the roof; the ventilation in the working places there was not sufficient; I first examined No. 6 district on the 26th September, 1898.

*By Mr. Thompson:* I made that report in pursuance of my duty, and after I had made my examination. [*Mr. Thompson objects to this evidence if contrary to the report in the book. Report-book marked Exhibit I before Court of Inquiry put in evidence as to report of 26th September, 1898.*]

*By Mr. Edmunds:* I had no instructions from the manager, Mr. Joseph Croft, at that time; I had instructions from Mr. Herbert Croft, the under-manager; I received those instructions about a week after Weir's burning; it was on the working-day previous to the 26th September last; I told him when I took over these places that I should have to report what I found; this conversation took place at the furnace in the early morning; I was being told at the time to take over No. 6; Herbert Croft told me I would have to take over these additional places—No. 6; I said, "Well, if I find gas it must go in the report-book"; he said, "No, you must report it to me, and you will be doing your duty"; of course I worked according to those instructions; after that I inspected No. 6 district; I did not see Rendal on the morning of the 26th September last; I used to see him every Monday morning; I did not see him the first Monday morning that I inspected No. 6 district; about a week previous to my taking over No. 6 something took place in the narrow bords of No. 6; when I went down Rendal was at the pit bottom; he said he had got a bit of trouble; I had a conversation with him, and we then went into the No. 6 narrow bords; he had a safety-lamp with him; I saw no mark or danger signal up at those bords when I got there; Rendal and I commenced to put up canvas in the back narrow bord; we put up canvas, extending the brattice towards the face; it was 10 or 12 yards from the face when we got there; we put up two lengths—about 12 feet; I examined the place with the safety-lamp after the canvas had been put up; there was a fairly good current of air there after the canvas had been put up; the extending of the brattice took the air to the carch in close proximity to the face; Rendal tried with the safety-lamp, but did not know how to use it; I used it for him; I tested the place for gas; there was just sufficient gas there to give a blue cap to the flame of the lamp; I was not the inspecting deputy for that part on that day; I made no written report on that occasion; I made a verbal report to Herbert Croft when he came down in the morning; I told him that a man had been burnt in the No. 6 back narrow bord, but that I could not give him any particulars, and advised him to go to Rendal for them; he immediately went through a door between his own cabin and Rendal's; I did not see or hear what took place there; I had no further conversation with Herbert Croft about the matter at that time; I used a safety-lamp in my inspections of No. 6; I was ordered to use it by the under-manager; the lamp I used was kept locked up in the under-manager's box or desk; he gave me a key so that I could unlock the desk and get the lamp myself; I was the only fireman deputy that had a key to that box; every morning that I went down I unlocked the box and got the lamp to make my inspection; the lamp was not locked, nor was there a key for it; I found inflammable gas in No. 6 district; I cannot give the date on which I first observed it; I used to find it on the rise headings in No. 6, and in the dip headings of No. 6; the narrow bords had not been driven to the rise or dip headings at that time; I am not certain whether they had reached the dip headings at that time; they had not reached the dip headings; I found the gas in both headings; I got the blue flame on the flame of the lamp; I always reported the finding of the gas either by note or verbally to the under-manager; when I reported by note I always handed the note to the under-manager; he always destroyed the note; he burnt them in his lamp occasionally; the note stated that I had found gas and removed it; I cannot state how many times I detected gas in that district, but every time the canvas was a bit back I got a trace of gas; that went on to the 28th March last; on that date I made my usual examination of the No. 6 district and found inflammable gas-carburetted hydrogen; I found it in the No. 6 dip headings; technically it was in the front heading, but we understood it at times to be the back heading; the front heading of any place is that which has the fresh air first; the heading in which I found the gas on this occasion was that which had the air first; when I got the indication of the gas I withdrew from the place and went back out-by; I tightened up the canvas along the heading; the canvas was from 8 to 9 feet from the face in the place where I detected the gas; I took the canvas in close to the face; that circulated the air round the place where I had seen the gas; all the gas was removed from that place then; I went back to the cabin and wrote my report in the book; I did not write the whole of the report at once; I first wrote as far as the words "all safe" in the report and signed my name to it; I left the cabin then; I went to have a look at the furnace where I remained for five or six minutes; I then returned to the cabin and finished my report; I took up the book and finished the report; I added the words "I found a small quantity of gas-carburetted hydrogen in front dip heading No. 6 district, removed it, and left all safe"; that would be about 5:30 a.m., perhaps a little earlier; the report is a truthful one of what I found; prior to this occurrence—about three or four months—I got a note from Rendal; I found it in the pillars of the safety-lamp; I received two notes from Rendal; I sent them to the Minister for Mines; I took a copy of the notes; the second note I received from Rendal was dated by me 9/3/99; that note told me to take a few nails into one of the dip headings of No. 6 and put up some canvas as he had found a little there; the first note referred to the finding of gas in those headings; I did what Rendal told me and found gas there on each occasion; I reported the finding of gas to Mr. Herbert Croft.

[*Exhibit*

[*Exhibit G, Rendal's evidence referred to and shown to witness.*] I saw Herbert Croft on the morning of the 28th March last, about ten minutes after I had written my report; he came into the cabin and I had a conversation with him; I said to him, "Look at the report-book"; he looked at it; the deputies had arrived then; he held the report-book open to them and said, "See what he has done"; Ambrose, Gall, and Yardley were the deputies present at the time, S. Jones was also present; Croft held the book towards them so that they could see what was in it; either that day or the next I had a conversation with the manager in the main engine road; I was told he wanted me, and I went to where he was on the No. 6 main engine road; Joseph Croft was there and said to me "Bailey, I want to see you about that report; as you are a little deaf we will go into a quiet place"; Gall and Herbert Croft had joined us then, and the four of us went up to the No. 8 main engine road; Joseph Croft had a copy of the Coal Mines Regulation Act and also a copy of the Special Rules; we sat down and Joseph Croft read General Rule 4 to me, and Special Rule 11, and also, I think, Special Rule 15; when he had finished reading them I asked him to let me read them; while I was reading General Rule 4 I asked him "Have I not done that?" he said, "Don't you consider that you ought to have said something about the roof and sides?" I said, "No, they are sound"; he said, "Do you consider an aperture in the roof a defect?" I said "No"; he said something about there being no gas there, and I said, "How about the man being burnt if there was no gas there?" Gall then said something to the effect that what gas there was there he could blow out; I said, "I don't want any bluff from you, but straight talk"; finally Mr. Croft said, "Well, Bailey, we've been watching the gas as well as you have, and we were not over-anxious about it"; I said, "I was, and could not sleep because of it"; Herbert Croft then said, "Oh, I thought that was because you were studying so much"; I said, "What would be the consequences of erasing the words 'carburetted hydrogen' from the report?" Joseph Croft had a difficulty about pronouncing the words and H. Croft assisted him; Joseph Croft then said, "I want that word kept out"; I then said, "How can I report it then, Mr. Croft?" He replied, "Oh, just put 'a little gas';" I said, "How shall I report the black-damp?" he replied, "Oh, put black-damp"; when I asked him what would be the consequence if I erased the words "carburetted hydrogen" from the report he made no reply; I returned to my work then; when I went down to my work next morning I found the under-manager cleaning the lamp in the cabin; I said good morning to him, and he asked me if I had seen the report-book; I said no, and he told me to have a look at it; I took down the book, and read the words, "I protest against this report, it not being a correct report—J. Croft"; as soon as I read it I said, "Oh, that's it, is it?" he replied yes; I then asked him should I take my own lamp, and he said yes, and told me to go round by the furnace; I went to the furnace, and found Gall there; this would be about 3:30 a.m.; I spoke to Gall, and then went along to my work; the under-manager and Gall followed me round; they overtook me; we all three carried open lights; we first went to No. 1 pillars; they followed me round till I got to No. 6; I examined No. 6 for gas—the rise headings first—with the safety-lamp; we had left our open lamps in the last cut-through, about 15 or 20 yards from the face; my safety-lamp was not locked; Gall and the under-manager stood close to me while I examined in the face for gas; there was just a "puckering" or lengthening of the flame in the lamp, indicating the presence of gas; Gall did not test for gas after me; I said to Herbert Croft, "There is a little trace there"; Gall said, "Where, I can't see it?" I replied, "No, my light has consumed it"; I told him to look for it in the next rise heading; I got about the same indication of gas there also; Gall and Croft said they did not see it; I found no other indications of gas on my inspection; I made my report that morning, "All safe"; the following morning Gall followed me round on my inspection of the No. 6 rise and dip headings; I examined those headings for gas that morning with my safety-lamp; Gall did not examine for gas in them that morning; I reported "All safe" that morning; I found no indication of gas that morning [*report-book put in Exhibit B and D, Bailey's evidence*]; the following morning, 31st March last, I received a letter from the manager; the letter shown me is the same [*letter put in Exhibit F, Bailey's evidence*]; after that I went to Lithgow, and saw the Minister for Mines; after my return I had a conversation with the manager, Joseph Croft; that was on the 13th April last; it took place in the office about 3:50 p.m.; Rendal was there; Rendal had met me at the pit head, and told me to go to the office; I went to the office with him; Joseph Croft spoke to me about having been away, and asked me where I had been; I told him I had seen the Minister and Mr. Atkinson; I said, "If there was no gas there, how could the man be burnt?" I said I could produce my safety-lamp, and show that it had been filled with gas; I told Croft that I had just paid my fees for another term at the Mining school, and asked him if he would allow me to go on the day-shift again; he said he would see about it; I then left, and went down the pit; the next day I had another conversation in the office, about 4 p.m.; Joseph Croft was alone when I went there; he said, "They will be here directly"; he went outside, but came back immediately, and the deputies, Ambrose, Gall, Newburn, and the under-manager came into the office; the manager began to talk about the occurrences that had taken place, and dwelt briefly on the gas; they all wanted to speak at once; I said, "Well, men, I've got no ill-will against you, but I am on my defence; if you'll be quiet I'll tell you what has been done"; quiet being restored, the manager referred to the canvas having been put up; I said, "Yes, I've assisted Newburn to put it up on the No. 2 engine road"; Newburn said it was not true, and that I was a traitor; I then said that Ambrose had kept the door open on the No. 8 engine road; Ambrose said, "It's a lie"; they again got a little noisy and excited; Gall called me a bloody liar; the manager shook his fist at me across the table, and said I was a damned liar; he said, "Well Bailey, you don't go down that mine any more"; I asked him if I was dismissed, and he replied, "Yes; I would not have you about the place"; I heard Joseph Croft give evidence before the Court of Inquiry; I have been a student at the Technical College here, and have obtained a certificate of competency for the position of under-manager; in the course of my studies I studied the question of gases and their indications in a mine; I had that knowledge when I went inspecting No. 6 district; my certificate is dated the 10th August, 1898.

The Court decides that it cannot consider any evidence with relation to occurrences before the 1st October, 1896,\* and evidence relating to such acts is struck out.

By *Mr. Thompson*: I wrote the letter appearing over my name in the *Newcastle Herald* of the 9th August instant; I cannot say whether I had read Mr. Commissioner Wade's report at that time; I will not be responsible for occurrences of recent date; I am responsible for my letter of the 7th August appearing in that paper on the 9th August; I did not expect to be held blameless for what I had done in the

\*Date of commencement of the new Act.

the course of my employment in the mine; I did not like to be blamed for doing wrong acts which I was ordered to do by my superiors; I knew how far to go in those matters; I had to trick my fellow-workmen; I did mind tricking them; I objected to it in a way; for three and a half years I knew of these illegal acts being carried out in the mine; I wrote the whole of the letter in the paper with the exception of the words "*force majeure*"; I think I wrote the words "instant dismissal" instead of them; I was never threatened with instant dismissal; I did not, to my knowledge, mention the interference with the ventilation to Joseph Croft until the meeting in the office on the 14th April last; I said in my letter to the paper that I had found about 16 cubic feet of gas in the mine on the 28th March last; that was carburetted hydrogen; Mr. May saw my letter before I sent it to the paper; he did not write it for me; he did not revise it for me; he did not insert the words "*force majeure*"; concerning the 16 cubic feet of gas, I found it about a yard from the face and 3 inches from the roof; the lamp being shielded would probably go up into the gas a bit; I allowed for a depth of 9 inches of gas; I mean there were 16 solid feet of gas—4 feet x 4 feet x 1 foot; I did not test that particular body of gas in more than one place; it took me about an hour to drive away that gas and render the place safe; I went back to see whether it had been driven out; I never mentioned in my evidence before the Court of Investigation that I had found 16 cubic feet of gas there; I would call that a rather large quantity of gas; I referred to it in my report as a small quantity of gas; I wrote in my letter to the paper that I considered my action with regard to the occurrences in the mine deserved some slight recognition at the hands of the Commissioner; when I commenced to do my duty I stuck to it; I think Mr. Wade should have mentioned my action in his report; I consider the Department of Mines should pay me the wages I lost between the 3rd April and 26th June last, as I lost them in redressing my wrongs and those of my mates; I only refused to give the Minister the name of the boy Jones as a witness; my only reason for refusing his name was that I did not know it; I may have told the Minister that I did not know his name; I showed the gas in the No. 6 heading twice in one morning to Gall and Herbert Croft; I think I have given evidence of that before; I never mentioned before what Joseph Croft said—"finally we have been watching the gas as well as, and we are not over-anxious about it" I did not mention my reply to that to the effect that I could not sleep on account of it; I have never mentioned what Herbert Croft said—"I thought you could not sleep on account of over-studying" [*letter in newspaper of 9th instant put in and marked No. 1 defendant's exhibits*]; I remember saying that I examined the place where Weir was singed; I said, "I believe that I found a slight cap there, but could not swear so"; that was in my evidence before the Court of Investigation; that is the same matter as I referred to in this evidence when I said I was positive I had found the blue cap there; I found gas in both the dip and rise headings in No. 6 and got a blue cap in each place; on both occasions I was able to drive it out by tightening up the brattice; after my examination it was not dangerous to human life, I found gas in the mine in No. 6 every time the canvas was back from the face; that was twenty or thirty times or more; I swore before the Court of Investigation that I did not report these matters of the gas in the book because young Croft had told me not to do so.

*Question*: Did you use your own discretion as to whether you reported gas or not?

*Answer*: I reported it whenever I found it; I found it twenty or thirty times; I reported it that number of times during the nine months; I did not do so in the book but verbally to young Croft; I said in former evidence that there was not sufficient gas on the other two occasions I mentioned to report it; those two occasions were when I found it in the rise headings; on those two occasions I used my own discretion as to reporting or not reporting the gas; I heard of Weir's accident on the morning it occurred; I cannot give the date; I do not think I was ever ordered to suppress my knowledge of the presence of gas in the mine; I swore at the Court of Investigation that I had noticed the blue flame on three or four occasions before the 28th March last; I reported those verbally; I saw the gas the twenty or thirty times I have spoken of in the four places, not in the whole of the mine; those four places were the two rise headings and the two dip headings in No. 6; I said that I could not say whether I had told anybody I had written that report of the 28th March at two different times; I also said I felt I had been signing a lie; I meant it could not be called safe after what I had found; I took exception to the word "found" in the report; what I intended to say was that I had found gas and got rid of it; I will swear that I spoke of more than ten times finding gas in the mine before the Court of Investigation; I did not use the words, "I found gas from six to ten times"; I did say that I said I did not find sufficient gas to report it after that date—the 28th March; I do not remember saying, in answer to Mr. Bruce Smith, before the Court of Investigation, "I cannot remember saying yesterday that I ever saw a blue cap to the flame"; I cannot remember whether I said "I do not remember whether I said anything about that in my evidence yesterday"; I remember saying, "I remember two occasions when the light was affected"; also, "There was no blue flame on either of those occasions"; I added, "That is the reason why I did not report it"; the presence of the blue flame shows that the gas is there in sufficient quantity to be dangerous to some extent; my conscience pricked me after I made the first report of the 28th March; after making the addition describing the quantity of gas found as "small" my conscience did not prick me; I inserted the word small so that the company should see that I was not harsh on them; my conscience never prompted me to inform the company of the interference with the ventilation; I felt that certain dismissal would follow on my report of the 28th March, and made the report as presentable as possible; when I described the quantity of gas as small I meant small by comparison; I had found larger quantities of gas in the mine than that I found on the 28th March; I said nothing of that before the Court of Investigation; I believe I mentioned to the under-manager that I had found a large quantity of gas on other occasions; I found it in the same heading; that was after Weir had been singed; I found as much as 25 cubic feet; I reported it to Herbert Croft verbally; I told him I had found a quantity of gas with a blue cap; I did not mention it to the Court of Investigation, because I was never asked about it; I made no statement to the Crown Solicitor of the evidence I could give; I wrote out a statement of what I could prove and handed it to the Minister for Mines; in that statement I said nothing about having found 16 cubic feet of gas on one occasion and 25 cubic feet on another occasion; I reported when there was a blue cap; it may have been on 18th May that I wrote out my statement for the Minister; I did not examine that part of the mine until after Weir's accident; I used the term "the gassy part of the mine" because it came naturally to me; Mr. May assisted me in getting up my case, if advising and consulting me means assistance; in the face of that I asked the Minister to allow Mr. May to be one of the tribunal to try the case; I thought he would be a good man for the purpose, as he was a practical mining man; I did not consider it improper or indecent to make such a request under the circumstances; I gave as my reason for reporting the gas

gas on the 28th March because the ventilation in the mine was getting worse; that was during the months of January, February, and March last; the temperature of the air driven into a mine in the summer would be different from that in the winter; I do not think there would be a difference of 10 degrees or 15 degrees; I do not think the difference would be more than 6 degrees or 7 degrees; I said that I had never tested the air with an instrument, and that my opinion as to the ventilation was merely guesswork; that is as to the quantity; we might have a sufficient quantity of air, but not of the proper temperature; 100 cubic feet of air per minute for each man, boy, and horse would be sufficient if the mine were not gassy, and the air were carried to the faces; I think it would not be sufficient in a gassy mine; I know that at this time 180 cubic feet for each man, boy, and horse was being supplied to the mine at the time; I had doubts as to the ventilation in No. 8 district on account of the temperature, and the air not getting to the face; it would depend upon whom one was talking to as to the use of the words front and back heading; a number of miners call the leading place the front, while others call the place getting the fresh air first the front; I referred to the heading as back and front because the ventilation had been reversed; I believe it was reversed about the end of the week in which Weir's accident took place; the quantity of gas I found at any time could be got rid of with half an hour's work by putting the canvas up to the face; where the gas was found they were cutting into the solid coal, with cut-throughs about every 35 yards; the place where Weir was burnt was in solid coal, and not in rock; the place where the gas came from when Weir was burnt was in solid coal; there was no rock about there at all; I went to the place with Rendal; I knew the place without being shown it; I did not tell Gall that I had got mixed up between the front and back headings, and had made a mistake; I may have told Gall that I had found the gas in the back heading, although I put the front in my report; I say now that it was in the front heading I found it; I say that without any doubt; it was in the first rise heading I said to Gall, "There's no use your looking for gas, my lamp has consumed it all"; the lamp I had was a fair one; I meant that the light of my lamp had burnt out the gas that was there; I was using a safety-lamp, and the light in it consumed the gas there; the light of a safety-lamp will consume the gas if put into it when the gas is present in small quantities; if present in large quantities it will put out the light of the lamp; on the 21st March the light of my safety-lamp was sucked out by the gas; it would have been put out on the 28th March last if I had held my lamp there long enough; the gas is sucked into the lamp; the gas can get into the lamp, but so split up that it does not explode; I should say that Gall had good eyesight, also young Croft; they may not have seen the gas, because they did not want to see it; I cautioned them when they were going into the next heading that if they wanted to see the gas they would want to look carefully; when I said that my light had consumed the gas I meant that it had burnt up the gas; I have said that Gall and Herbert Croft did not see the gas because they would not see it; I said in my former evidence that I supposed they did not see it because my light had burnt it, and so they could not see it; I have not altered my evidence in that respect, so as to give a more feasible reason for their not seeing the gas; from what has transpired it is my opinion that they would not see it; I said in my former evidence that I was jeered at, and asked why I was dismissed from the Borehole; I do not wish to say why I was dismissed from that mine, although it would be no reflection on my character; I would not mention the circumstances of that affair to the men below; it is a very common thing for the canvas to pull away from the tacks; it is attended to as soon as possible under the circumstances; it is caused in many instances by the action of the atmosphere; it is not a fact that the first time I was sent away with Jones I was sent away to put up brattice; I was putting up brattice while I was away on that occasion for about twenty or thirty minutes out of the forty-five minutes I was away; I had to walk 700 yards one way, and 700 yards back; it would take me five or six minutes to go there, and the same time to come back; having done the work we would linger along the roads on the road back; it would take us twenty minutes to come back; I did that bratticing of my own accord; it was needed, but not urgent; I got the tacks, and all that was necessary in the box where the canvas was; on the second occasion I went away I got some quartz out of some stone fault; Gall did not tell me to go and get that; I brought it back to him for myself; I remember saying that I missed Taft from his shift; I missed him at the pit bottom, because I did not see him coming out; Ambrose was not present at the interview I had with Joseph Croft on the 29th March last on the main engine road; I may have said before the last Court that I did not see him there then; I do not remember Joseph Croft saying, "Bailey, there is something here behind the scenes that I do not understand"; if he said it I did not hear him; my hearing is worse at some times than at others; it was not extra bad that morning; I did not say in reply to Joseph Croft's remark, "Yes, there is; there was a man burnt"; he may have asked me what the man's name was, or who he was; I did not say, "His name is Weir; his friends have been talking about it, and say that I ought to say something about it"; I had told people outside the pit that I had found gas in the mine; I told my family; I told my father about it; I did not tell Mr. May about it; up to the time I entered it in the report-book I had told nobody about it but my family and Dobb; Croft did not say to me, "Whether you found it or not, you would report it?" nor did I reply, "Yes"; at no interview did Joseph Croft say to me, "Well, Bailey, I've lost all confidence in you"; I did not hear him say so; he did not continue, "I am satisfied that there is some collusion going on now behind the scenes"; I know Mr. Keightley, the general manager of the company; I spoke to Mr. Atkinson and Mr. Dixon, both together and separately; that was after I had been dismissed; I told them both of the circumstances of my dismissal; both recommended me to see Mr. Keightley; I did not accept their advice; I preferred to go to the Minister with a deputation; Mr. Atkinson told me to go with some of the men who could support my statements, and if I could prove my statements, the officials would be dismissed, and I reinstated; I think Mr. Atkinson had informed Mr. Croft of my statements; I posted the notes about the finding of the gas to the Minister myself; they were addressed correctly; I posted them at Newcastle; I do not know what prompted me to come to Newcastle to post them, when all my other letters were addressed from Morewether; I put them in the envelope in my father's house in the presence of Dobb and my family; I did not like posting them at all; I did not like parting with them at all, and so took copies of them; Rendal was examined after me in the Court of Investigation; he admitted putting one of the notes in the lamp, without any hesitation; Rendal has not the reputation of being one of the straightest and most honest men in the pit; I do not believe he is a straight honest man; I did not think I was endangering the lives of the men in the mine by assisting in the interference with the ventilation; I remember asking Mr. Atkinson if he had received my notes; they may have gone to him instead of the Minister; he replied, "Why do you ask me that, Bailey?" my ordinary occupation in mines in England was hooking-on at the pit bottom; I have gone with the surveyor at times, and at times have measured the air, at the week

week ends ; I have tightened up the brattice myself when I have found it necessary to do so ; I said in former evidence, " I generally cautioned the deputies to carry the brattice up to the face, and they generally did so, but latterly, in my opinion, they became negligent " ; Gall and Ambrose are the deputies I refer to as having become negligent ; personally, I told Ambrose on one occasion, " For God's sake keep the canvas up to the face " ; I also told him on another occasion to cut short sprags to set from the top of the canch to the band to carry the canvas ; Gall and Ambrose were both my seniors in office and in the pit ; what I said to them was a request, not an order ; there would be men working in the places where I got the blue cap after I had inspected the places ; when I said, at the Court of Investigation, that there were men working in those places I meant that men would be working there after I had inspected those places ; I would leave the places about 5.15 a.m. and the men came in about an hour after—6.15 a.m. ; I never stopped the men from going in in consequence of the gas ; on one occasion, when I found gas, I returned to the place about an hour after, and had just time to fix the place up when the men came ; I mean by that extending the canvas ; I had put up more canvas on that occasion when I first found the gas, but went back an hour after and put up more canvas ; the men were then close on my heels ; that was on the 21st March last ; I told Gall about finding the gas that morning ; he went down and examined it for himself ; I asked him, when he came back, " Have you seen anything ? " and he replied, " Yes, a little " ; I cannot remember whether I said, in my former examination, that I did not know the deputies who came in that morning or whom I told ; I could not have said that, because I did know ; I remembered them at the last examination ; it is a mistake in my former evidence if I said I did not know who the deputies were ; I acted on my own discretion as to reporting the gas on that occasion ; I considered there was not enough gas for the men to see or to be injured by it ; I reported the finding of the gas to Mr. Croft verbally ; I said there was from 7 to 8 per cent. of gas there—carburetted hydrogen ; it was pure and not mixed with the air ; a percentage of gas does not mean pure gas ; I must have said that because I misunderstood the question ; I do not know what that percentage of gas would mean in cubic feet ; I said, in my former evidence, " I had seen a permanent blue flame on my previous inspections and that would be between last March and June, 1898 " ; I had seen a permanent blue flame on twenty or thirty occasions during that time ; I say that others have found gas with a permanent blue cap in the mine besides myself ; Rendal has found gas with a safety-lamp giving a permanent blue cap in dangerous quantities ; if there is only a handful it will give a blue flame ; if there is no blue flame I do not consider there is enough gas there to be dangerous ; I never went to see whether my interference with the ventilation had any ill-effect on the men in the pit ; I would have had to walk a mile and a half to do that ; there were over twenty men in the district when I put up the canvas between 7 and 8, and shut off the air ; I could not calculate the quantity of air they would be deprived of by putting up that canvas ; the air was cut off from No. 7 district ; some of the air would get through notwithstanding the canvas ; I did not do my best to block out the air in each case of interference with the ventilation ; I said in my former evidence that I took no steps to find out whether the men in No. 7 were put to inconvenience through the blocking of the airway ; I have said that the ventilation in the mine was bad generally ; I did not make any complaint to the check inspectors about the ventilation, because it was not my duty to do so ; I have said in evidence that I did not do so because I feared disrating or dismissal ; Dobb was disrated for objecting to do something that was not right ; I have gathered that from Dobb ; I was on friendly terms with the check inspectors at that time ; I knew them by sight ; the black-damp that I have spoken of may have come from the No. 6 old workings, where the air would always be foul ; a proportion of black-damp might scale over the old bords in No. 6 return.

Taken and sworn at Court-house, Newcastle, this }  
16th day of August, 1899, before me,— }

JOHN W. BAILEY.

GRANTLEY FITZHARDINGE, D.C.J.

Court adjourned till 9.30 a.m. to-morrow.

Court-house, Newcastle, 16th August, 1899.

This deponent, *John William Bailey*, recalled on his former oath, states as follows (*to Mr. Thompson*):—I remember being asked yesterday the number of times I had seen gas, and my replying that I had seen it twenty or thirty times ; I may have said before the Court of Investigation that I had seen it on six to ten occasions ; I ought to have said a larger number of times ; I must have said I had seen it from six to ten times before the other Court ; I am not exaggerating when I say I saw it from twenty to thirty times ; I may have been asked as to a certain time only ; I cannot remember the question that I was asked about it ; I believe I said before the Court of Investigation that I might have seen it fifty times ; I used to examine five times one week and six another ; probably I saw the gas every time I examined, but not to give a blue cap ; it only gave the blue cap twenty or thirty times ; it took me nine months to screw up my courage to tell the truth about the matter—that is, to put that report in the book ; I found it necessary to tighten up the canvas probably fifty times ; I always did that myself ; nobody ever saw me tightening up the brattice to get rid of the gas that I know of ; I have told Deputy Ambrose that I have found it necessary to tighten up the canvas to get rid of the gas ; I told Ambrose of that whenever I got a blue cap ; I have said that was from twenty to thirty times ; I did not tell Ambrose that I had had to tighten up the canvas that number of times ; I cannot say how many times I told Ambrose of it ; he went to look at the place when I told him that ; he never told me to " Go to hell out of this " or " Don't come bothering me with your damned nonsense " ; I should think it would be an advantage to know of the presence of a foe in their mine ; certain restrictions might have been imposed upon the management if it was known as a gassy mine ; the gas was always got rid of by tightening up the brattice : I did not think Mr. Keightley was the proper quarter to go to about the matters I complained of, although Mr. Atkinson advised me to do so ; I preferred to get a deputation of the local members to see the Minister and air my grievances ; I do not think I should have ever said a word about it to the Minister or the Members if I had not been discharged ; I have lost money by being discharged, because the Government will not pay me my wages for the time since I was dismissed ; I distinctly say that every time I saw the gas with a blue flame I reported it to young Mr. Croft, either verbally or by note, or both ; I cannot say how many times I gave him a note about it ; I never took notice of the number of times I sent notes to him about the finding of the gas ; I remember his burning one note I gave him ; the last one I handed to him he handed back to me with the remark " What's this ? " he did not read it ; I do not know why I did not keep that note ; I tore it up ; I kept Rendal's two notes ; I knew that young Croft had burnt some notes previously to the one I have spoken

spoken of; he burnt them in his open light; I think I have left a note with some one else to give to young Croft; I do not know whether I told him verbally or gave him a note for Croft; that was S. Jones, the fireman deputy; it was on the 21st March last; I never left word with all the deputies together that I had found gas; I spoke to the deputies about it on the 21st March, about an hour after I had reported it to young Croft; I remember the names of the deputies to whom I reported it; they were Gall and Ambrose; I swore I could not remember their names before the last Court; I should have remembered their names; I also said, "I considered there was fire-damp in that particular place"; that could have been put more definitely, as I knew it was there; if a man had gone into that 25 cubic feet of gas with a naked light there would have been an explosion; I cannot say whether it would have been a dangerous explosion; it would be dangerous for a man to go into that place with such a quantity of gas; I reported it verbally; I did not report it in the book; I suppose I was screwing up my courage to do so at the time; my written report of the 21st March is a lie; the one word "found" is a lie; I did not alter that report on the 28th March, because the day had gone by, and I could not recall it; I have referred to the fact of the men making statements when not on oath; I know it is wrong to tell a lie either on oath or not; it was the fact that the gas was getting worse, and the responsibility consequently greater, that kept me sleepless about this time; it was months before the 21st March last that I first found the gas showing a blue flame to the lamp; there were between sixty and seventy men deprived of air when the door was interfered with; about the same number of men—more—were deprived of air on the second occasion of putting up the canvas in the airways; I should say about seventy men; it was either on the 28th or 29th March that Mr. Croft, senior, spoke to me on the No. 8 engine road: I think it was on the 29th March; the "them" referred to in my former evidence on this point were J. Croft, H. Croft, and Gall; I said before the last Court that I saw the gas in one of the dip headings of No. 6 district on the 21st March last, but could not remember which; I think it was the first dip heading in which I found the gas on that occasion; my impression is that it was the first dip heading in which I found it; my uncertainty as to the place is not brought about by any fear of getting fixed in a corner about it; the two dip headings are similar in appearance; there is no fault in either; a man is liable to mistake the one for the other as far as appearances go; I went to the same place to test for gas once again the same day; I went there every day to that place up to the 30th March last; I cannot say with certainty which heading it was; I do not think that I said I found it in two places on the 21st March, and also on the 28th March; I found it in only one place on the 28th March—the place which I reported; the place in which I found the 25 cubic feet of gas was not one of those which I tried with the safety light in the presence of Gall and H. Croft; we did examine that place; I certainly examined it that day; I did not tell either Croft or Gall that I had found 25 cubic feet of gas in that place on my examination; I can give no reason for not mentioning it to either of them; I used to test for the gas by slowly raising the safety-lamp, and looking for indication of the gas on the flame; sometimes I would blow gently along the roof, and any gas that was there would show itself on the cap of the lamp; I know that carbon monoxide is a poisonous gas, but cannot say much as to its effects upon a human being; it would overcome a man; it is not the same as choke-damp; I do not attribute Taft's illness to carbon monoxide, but to black-damp; I saw Rendal describe Taft's symptoms in the witness-box before the last Court; I heard it said that he had vomited; I agree with Dr. Haldane's description of the symptoms of a man affected with carbon monoxide; I said before the last Court that I had been in Taft's place before his illness; I cannot say when I was in there; I was on that heading at times when they were working there, but cannot say when it was; I found the air there warm; that was not caused by the nature of the place in which the men were working; I think it was caused by black-damp from the old workings; the old headings were in many places blocked up by roof falls; I believe the air in that part could have been made much better; I said before the last Court "the conditions may have changed since that time, but from the nature of the place I should not think so"; I was willing to go with my work in the mine provided the officials kept the places well canvassed; I was not prepared to go on in the same way if I got my salary regularly; the responsibility was getting too great for me; I should have put the report in if I had not been dismissed; it was my duty to put the brattice up in those places, and I have said that I did so on many occasions; a number of different things might have happened after I had left the mine—the brattice knocked down or many other things; what I complain about is that Ambrose and Gall were lax about keeping up the brattice; I am still uncertain whether it was a note or a verbal message that I left with Jones on the morning of the 21st March; if I left a written message with him I would tell him to give it to Mr. Croft; if I told him verbally I would tell him to let Mr. Croft know that I was gone to the dip headings; I cannot say now whether I said anything either verbally or by note to Jones about the finding of the gas; I went away and came back, and reported the finding of gas verbally to H. Croft; I reported it to both S. Jones and H. Croft at different hours; prior to the 28th March last I reported the gas to Jones at the cabin at the pit bottom, when the last note was refused by the under-manager; Jones was in the cabin when I verbally reported the finding of gas to H. Croft; I cannot say when that was, nor how many times it happened; I cannot tell how many times I reported it in Jones' presence; I was always finding it more or less [*deposition of witness before the Court of Investigation put in evidence and marked Exhibit M*]; I swore before the last Court that from my knowledge the ventilating furnace is damped down at the week end; I also said, in answer to the Commissioner, that I was speaking of eleven months prior, and that it had not happened to my knowledge since then; prior to that eleven months it happened every day; the furnace was damped down by the pumpman every night, and brightened up next morning; it was damped down by small coal being put on it; that would decrease the ventilation; I was not a deputy at that time; I used to pass the furnace coming out, as it was the usual route; I am certain I did not say that Weir's friends had been talking over the matter of the gas, and said I should report it; I do not know Weir's friends; I do not know how it appeared in my former evidence that I did not remember them saying it; I am certain Croft did not say to me, "Whether you find it or not."

*By Mr. Edmunds:* I was not the inspecting deputy for No. 5 when Taft was taken ill; I became deputy for that district about nine months before my discharge; Ambrose was deputy for that district at that time of Taft's illness; I know that the rule states that any gas should be reported, no matter in what quantities; it was a Marsaut lamp that I used on my inspections.

*By Mr. Thompson:* I do not know Mr. Parton personally; I may have seen him in the streets; I did not consult with him about any of these matters; I asked for him as one of the tribunal to try these matters, because he was an experienced man in mining; I named him without any communication with him about the case, or causing any communication to be made to him; I recommended him to the

Department of Mines as one of the tribunal to try the case; that is all I did with reference to him; I do not know whether he is a bosom friend of Mr. May; May did not recommend me to nominate Parton. Taken and sworn at Court-house, Newcastle, this }  
17th day of August, 1899, before me,— } JOHN W. BAILEY.

GRANTLEY FITZ HARDINGE, D.C.J.

This deponent, *Arthur Johns*, on his oath states:—I am a miner, working at Newcastle Coal Company's A pit; I gave evidence before the last Court of Investigation; the deposition shown me is mine [*put in and marked Exhibit N*]; that deposition is correct; Codwell is now in Victoria, as far as I know; I heard he had gone about two months ago.

*By Mr. Thompson*: I took no notice of the gas I saw beyond mentioning it to Gall; I did not regard it as dangerous to health; when I spoke to Gall about the brattice he put it up the next morning; if canvas is down, or wanted to be put up, it should be done straight away; the mine was conducted right enough, as far as I was concerned; I have not had more than six mates during the time I have been in the mine; I have worked pretty well all over the mine; I cannot say what the reason was for the ventilation in No. 8 being bad two years ago; I have not been in No. 8 lately; it is working now, I believe; Gall was not a too pleasant official in the mine; I have worked in other pits besides the Newcastle; it would seem that I have disregarded the rules in regard to the flashes of gas.

Taken and sworn at Court-house, Newcastle, this }  
17th day of August, 1899, before me,— }

ARTHUR JOHNS.

GRANTLEY FITZ HARDINGE, D.C.J.

This deponent, *Alfred Price*, on his oath states:—I am employed in the A pit of the Newcastle Coal Company; I am a wheeler there; during the first quarter of this year I was wheeling in No. 1; I was wheeling there for about two years, I think; my work consists in taking the skips from the men at the face with a horse and taking them to the flat, where a train is made up which is taken out by the engine; in the first quarter of this year the men were working the pillars in No. 1; the flat would be about half a mile from the main engine road; about forty skips are taken out in a set; I was wheeling from four men in No. 1 in the first quarter of this year; John Atkinson, Arthur Johns, and George Watts were among them; I remember on one occasion seeing a canvas across the road; that was about half-way through the quarter; it was between 11 a.m. and 1 p.m.; Johns, Watts, and Atkinson were working at the pillars; I saw the canvas about 16 or 18 yards round the turn of No. 1 road; I had gone out to tell the set-rider that a set was ready; I saw a canvas across the road; I went pretty close to it; it was hanging right across the road, from the roof to the floor; it was not hanging exactly straight down as the air was blowing it; the air was moving the canvas towards me as I went to it; that canvas was not up when I went to work that morning; I heard somebody at the canvas; I spoke to him; I thought it was Jarvis, a man who knocks about the roads—a shiftman; I spoke to Jarvis with reference to the canvas [*objected to by Mr. Thompson*]; I told Jarvis to tell Hedley that the set was ready, and asked him what the canvas was there for; he said there was too much air going into No. 1; I asked him if the inspector was in No. 2, and said I would tell him about the canvas interfering with the air; I said it more in fun than otherwise; Jarvis said that if I told the inspector he would get into trouble; I said nothing more to him; I think some of that canvas was up when I left my work that day; I think about half of it; it was nailed up there, or hung up with wires; it was the vertical half that was left up; that half remained there permanently; No. 1 district ceased working after that; I think there were men in there the next quarter, but not the quarter following that; the work was over there about the middle of the year; No. 1 is closed up completely now at the place where that canvas was put up; I do not know the width of No. 1 heading; if the canvas did not remain there permanently from that time it did so from a short time after; all the men going into No. 1 would pass that point coming out.

*By Mr. Thompson*: The canvas was put up on the road where the sets were constantly coming and going; the road there is a single one; the empty skips and the full ones went under that canvas; there were four men working in No. 1 at that time; I had a good knowledge of the amount of ventilation there was in that district; there was plenty air for the men there, as I went towards the canvas; I could feel the strength of it as I went towards the canvas; I use a flare lamp on my cap when wheeling; my lamp was not rendered dull by the putting up of the canvas; I do not think I knocked down that canvas when it was there temporarily; I always found the ventilation of the mine pretty good wherever I went; I chat with the men in the mine about things that go on in the mine; I have never heard them complain of the ventilation as being bad; if I had been spoken to about it I should remember it; from my experience I should say that the air in the roadways is warmer in the summer than in the winter time; Phillips and Davis, Banfield and Beveridge were the last men to work in No. 1 before it was closed up; I would have to go close to them about nine or ten times in a day for my skips.

*By His Honor*: The empty skips came in between 11 a.m. and 1 p.m. that day; the full ones would go out immediately after the empty ones came in.

*By Mr. Thompson*: I have seen the Government inspectors and the check inspectors in the mine at different times; I travel about the mine a good deal more than the miners; I have never heard the men or deputies say that they knew of the visit of an inspector of any sort; I have been all over the mine, except in No. 6, in the course of my duties as a wheeler; I have never known of any alteration in the ventilation of the mine for the purpose of deceiving the inspectors; when I saw the canvas up in No. 1 I thought it was there for that purpose; when it was left there permanently I altered my opinion.

*By His Honor*: When I saw it up first I thought it was there for the purpose of depriving No. 1 of some air and give it to another district.

*By Mr. Thompson*: When it was put up permanently it was hung up with nails with wire rings which hung on the nails.

*By Bench*: When I first saw it I had not seen it before that morning; seeing it there I thought the inspector was in the mine.

*By Mr. Edmunds*: I told the men working in No. 1 about the interference with the ventilation that I had seen; I did not tell the manager, or under-manager, or the deputy (W. Gall).

*By Mr. Thompson*: Nobody passing along No. 2 road could have seen the canvas hanging where it was; none of the men in No. 1 went out to see it when I told them of it; there was plenty air in No. 1 where they were when I told them of the canvas.

*By*

*By Mr. Edmunds* : I daresay the men were having lunch when I told them of it.  
 Taken and sworn at the Court-house, Newcastle, this } ALFRED PRICE.  
 17th day of August, 1899, before me,— }  
 GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *John Atkinson*, on his oath, states:—I am a miner working in the A pit of the Newcastle Company; I gave evidence before the last Court of Investigation; the deposition shown me is mine, and is signed by me; when I went into work that day, there was canvas up at that point, but about half-way across the road; it was there when I was coming out also. [*deposition put in and marked Exhibit O.*]

Taken and sworn at Court-house, Newcastle, this } JOHN ATKINSON.  
 17th day of August, 1899, before me,— }  
 GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *George Watts*, on his oath, states:—I am a miner working in Newcastle Coal Company's A pit; I gave evidence before the Court of Investigation last month; the signature to the deposition shown me is mine; that deposition which has been read to me is correct, except that I wish to point out that there was no smoke in my place when Mr. Dixon was there, as might be inferred from my former evidence at page 113 [*deposition put in and marked Exhibit P.*]; in my opinion the air was only drafting into the pillars in the No. 1; the pillars were worked out 20 yards; there was no brattice there at all where I was working.

*By Mr. Thompson* : I said nothing of any of these matters to anyone but Gall; no alteration was made, even after I had spoken to him; I was not afraid to tell Mr. Dixon of these things when he came in there; I did not do so, because I thought he could see better for himself, and feel better for himself; I cannot say that I was earning wages at the time; I was making less than 7s. a day; there was nobody working inside where we were working; I was the last man in that part; the gob had nothing to do with the pillar; we call the open place in the bord the gob and the muck, and other stuff we get out of the coal we throw to the back, and call gob also; the gob in No. 77 bord in No. 6 was made by the men who were clearing the road to enable us to go in.

*By Mr. Edmunds* : I do not remember seeing a canvas in No. 1 on the day Price speaks of when I was going to work or coming out; I do not remember seeing a brattice there after that nor at any other time.

Taken and sworn at Court-house, Newcastle, this } GEORGE WATTS.  
 17th day of August, 1899, before me,— }  
 GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *Alfred Johns*, on his oath, states:—I am a miner working in the A pit of the Newcastle Coal Company; I gave evidence before the last Court of Inquiry; the deposition is mine, and signed by me [*deposition put in and marked Exhibit Q.*]; the brattice I have spoken of in No. 1 road was put up during the first quarter; the woodwork was put up during that quarter; it was put up after the statement made to us by Price that I have deposed to; I cannot say how long after; I do not remember seeing any brattice up in the No. 1 road at the time Price made his statement to us.

*By Mr. Thompson* : I did not see the brattice that was hung there on wire rings so as to shift it backwards and forwards; I did not continue to work in No. 7 after I had got the pneumonia; I knocked off as soon as I was attacked with the pneumonia; when I went back I asked permission to start on top as a shiftman, and I was allowed to do so; I afterwards worked as a shiftman below; I was altogether about seven years in this colliery; I had worked in other pits in the district; I have felt worse air in the Newcastle pit than in any other I have been in; I went back to it the last time, because it was working well then, and the pit I left was working bad; I mean by that that more work was being done in the Newcastle, and I could earn better wages there than at the other if I worked more days; I have been a miner for about twenty years altogether; I have never worked in England, but gained all my experience in these colonies; I have had occasion to complain to the deputies, and they have spoken very uncivilly to me on those occasion; Gall was one of those of whom I complain in that respect; there is nobody else of whom I complain in that respect; I have known Gall ten or eleven years; on one occasion I complained to Gall about the water not being removed from our place; he said, "If that was beer I could drink it off"; I give that as an instance of his uncivil language towards us; another instance, when we were working in No. 1 pillar we had occasion to complain about the air being hot, and the props being broken in the pillar from the roof, Gall replied, "Oh! that is nothing, there are plenty worse places than this."

Taken and sworn at Court-house, Newcastle, this } ALFRED JOHNS.  
 17th day of August, 1899, before me,— }  
 GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *Henry Jones*, on his oath, states:—I am employed in the A pit of the Newcastle Coal Company; I gave evidence before the last Court of Investigation; the deposition shown me is mine, and is signed by me; that deposition, which has been read to me, is correct [*put in and marked Exhibit R.*].

*By Mr. Thompson* : I knew that Bailey had been dismissed; it was shortly after his dismissal that Mr. Croft sent for me and asked me about these matters; I had not spoken to either the manager or under-manager before the time the manager sent for me; he asked me if I had gone back the second time, and I said no; that was referring to the first time I went away with Bailey; I went away with Bailey twice on one day; that was the first time I went away with him; I went away with him again about three weeks after that; I went away with him on another subsequent occasion; my instructions were to keep the door always shut, except when someone wanted to pass through it; it was shut immediately after they had passed through; Herbert Croft gave me instructions to keep the door shut, in order to keep the air in No. 7; he told me that it would injure the men in No. 7 if I did not keep the door shut; besides Bailey, I went away with Ambrose; I went away with him twice; on each occasion except the one I was assisting in putting up the brattice in the bords.

*By*

*By Mr. Edmunds* : That was not the only time I had a conversation with Mr. Croft; I had a conversation with him on the Monday before I gave evidence before the Court of Investigation; it took place at the "Great Northern Hotel," when Mr. Bruce Smith asked me about going away from the door a second time.

Taken and sworn at Court-house, Newcastle, this }  
17th day of August, 1899, before me,— }

HARRY JONES.

GRANTLEY FITZHARDINGE, D.C.J.

Mr. Edmunds tenders in evidence the check inspector's report of the 14th, 15th, and 16th February, 1898 [*put in and marked Exhibit S*]; also the check inspector's report of the 9th, 10th, and 13th March, 1899 [*put in and marked Exhibit T*].

This deponent, *Alfred Ashley Atkinson*, recalled on his former oath, states as follows:—The deposition shown me is that which I made before the last Court of Investigation; it is signed by me; [*deposition put in and marked Exhibit U*]; [Mr. Edmunds also puts in Haldane's report, page 21, marked Exhibit U, Mr. Atkinson's evidence; also Mr. Atkinson's two reports; Exhibit V, Mr. Atkinson's evidence]; when I visited the mine, on the 12th April last, and saw the officials there, as stated in my report of the 14th April, I asked them if they had ever known of a man being burnt in the mine; each one answered no; my question was not addressed to them singly, but to them all together.

*By Mr. Thompson* : I will not be certain that I did not ask whether any of them knew a man had been badly burnt in the mine within the preceding twelve months; from my inspection I would not call that mine a gassy one; it has come to my knowledge in this Colony, since the Dudley explosion, that in many mines there are small ignitions of gas which the miners take no notice of, and never report; I think I have been in the places referred to by Bailey, to examine for gas; Bailey never told me that he had found 25 cubic feet of gas on one occasion, and 16 cubic feet on another; I gave him opportunity of telling me all he wanted to tell me; I would not necessarily expect to find gas in the mine, taking into consideration the circumstances spoken of by Bailey; I have had personal experience of the appearance and symptoms of persons affected with black-damp; the motion of Taft's arms, as described in evidence, is an unusual thing in connection with a person affected by black-damp; I had no opportunity of examining Taft before I made my report; violent trembling is not an indication of black-damp; carbon mon-oxide generally produces dizziness, inability to walk, and gradually unconsciousness; choke-damp will produce a sleep in which one might die; as far as I could see, on my visits to the mine, I could see nothing very wrong with the discipline in the mine; if the air is properly conducted to the faces, I think the ventilating appliances of the mine are quite sufficient for it, although I think a fan would be a better means of ventilating such a mine; Mr. Dixon uses his own discretion in inspecting the mines; I cannot conceive of any means by which the men or deputies of the mine could know of my visits to the mine beforehand; I am not aware that carburetted hydrogen is being given off, or has been given off in mines without being reported to me or Mr. Dixon; the Dudley inquiry revealed to me that at Dudley and other mines gas had been given off in many instances without being reported; among ordinary safety-lamps the Hebblewhite-Gray is about the most reliable for testing for gas; the Clowe's hydrogen lamp is the most delicate of all in testing for gas; I heard Bailey state that his lamp consumed the gas in a place in the mine; I do not understand the use of the word consumed; if there were a small quantity there and it exploded and there were complete combustion the lamp might use up all the gas there; there would have to be an infinitesimal quantity of gas there though; it would be seen when it exploded; I have heard Bailey speak of the puckering up of the flame of his lamp; I suppose he means by that a flickering of the lamp; it is possible to move the gas in a place by blowing along the roof as Bailey described; I did not consider it at all likely I would get the gas coming out of the floor.

*By Mr. Edmunds* : I made a note of what the officials of the mine told me with regard to the burning of the man; I made that note shortly afterwards; I was making an examination with reference to section 29 of the Act; I was not directing my mind particularly to the extent of the injury; I was only directing my mind to the fact that a man had been burned and the fact not reported; the note I made was, "They stated that no man had been burned"; I think I would have inserted the word "badly" if I had used it; the Dudley inquiry was heard in August, 1898, I think; the omission to report a finding of gas is a very grave evasion of the Act; the reporting of such findings gives the Government inspectors an opportunity of discussing the matter and taking measures to prevent such omissions in the future and thus prevent accidents; after the Dudley inquiry the managers and miners too were particularly asked to report all findings of gas in order to prevent accidents in the future; the Dudley report was sent to all managers for that reason among others, and that duty was pointed out to them in that report.

*By Bench* : I have heard the evidence as to Weir's injuries; in my opinion they were caused by fire-damp explosion; Taft's illness may have been caused by black-damp; different constitutions are differently affected by black-damp.

Taken and sworn at Court-house, Newcastle, this }  
17th day of August, 1899, before me,— }

A. A. ATKINSON.

GRANTLEY FITZHARDINGE, D.C.J.

Court adjourned till 9:30 a.m. to-morrow.  
Court-house, Newcastle, 17th August, 1899.

This deponent, *John Dixon*, on his oath, states:—I am an Inspector of Collieries for this district; I gave evidence before the Court of Inquiry last month; the deposition shown me is mine [*deposition put in and marked Exhibit V*]; I remember the interview in the pit office on the 14th April last between Mr. J. Croft, Mr. H. Croft, and Mr. Atkinson; Mr. Atkinson asked the Crofts if they had ever heard of a man being burnt with gas in the A pit; the answer was given all round, "No." [*Exhibit W., Dixon's evidence, put in evidence; also Exhibit Z, Dixon's evidence.*]

*By Mr. Thompson* : I am aware of the charges that are now made against Mr. Croft and his son; I had known Mr. Croft, senior, prior to the time he took up the management of the Newcastle Company; he was then in a similar position and I was an inspector; he was manager at Brown's collieries at Minmi; there were two collieries he had the management of for Messrs. Brown—Back Creek and Dutton

Dutton Creek; those mines gave off carburetted hydrogen gas; Mr. Croft showed no incompetence there to my knowledge; during his management of the Newcastle coal-mine and since the passing of the new Act he has shown no incompetency to my knowledge; the pit was properly set out, the ventilation was good, and I have always found every officer at his place whenever I have visited the pit; complaints were very few; I have never seen anything to warrant me in charging him with gross negligence in the conduct of the mine; I heard most of Bailey's evidence; I heard him say that he had found gas with a blue cap on twenty or thirty occasions in the mine; I also heard him say he was continually finding gas there during the nine months prior to his discharge, also the districts in which he found it; it is a well-known fact that when the new face of the coal is being broken by the men, gas is more likely to be given off, but at the same time there would be a difference in the examination made by the deputy before the men went in and that made while the mine was in full swing; I have known Mr. H. Croft since he went to the mine; he has had an opportunity of seeing how things are done in the mine; I have always looked upon him as a promising young man; I have always found him at his work; he is most energetic in his duties, and I have always thought that he would make a good mining manager; carburetted hydrogen and fire-damp are the same thing; there is no smell by which it can be detected when it is coming out of the coal unless there is a large body of it; the goaf is the place where everything has come down, and it can be detected all round the mine.

*Question:* From your personal experience of the mine and your examinations, are you of opinion that Bailey's story that he found gas there fifty times within the last nine months, and twenty or thirty times in quantity, giving a blue cap to the light of his lamp, likely to be true? *Question* objected to and disallowed.

For a long time past—twelve months—it has taken me two days to inspect the "A" pit alone; it did not follow that if I went there to-day I would finish my inspection to-morrow; any number of days might elapse between the beginning of my examination and the finishing of it; all accidents that have been reported to me in connection with the mine have always come to me within the specified time—twenty-four hours; scarcity of accident is, I think, an indication of good management and carefulness on the part of the men, especially in such a large colliery as this; I always found all the appliances necessary to provide against accident in good order in the mine; I entirely agree with Mr. Atkinson's method of inspection, and the conclusions he drew therefrom; Inspector Bates has never accompanied me on any of my inspections; I heard the evidence of the door being kept open for an hour and a half; if that were done, No. 8 district would be benefited by the increased volume of air; the other districts would be deprived of a certain quantity of air, but it would be spread over all the rest of the mine, and the difference in those districts would not be appreciable; if I were taking a reading in No. 8, I would notice the difference, I think; I would have a very poor opinion of the manager or under-manager who did such a thing; the stopping of the air in one place would spread it over other parts of the mine, and thus benefit somebody; Turner would not be so likely to go down under the influence of the black-damp as Taft; he is a more resolute man than Taft, and would not yield to the feeling so quickly as Taft; I never, in the course of my experience of the mine, heard, or saw, of gas in the mine until I saw Bailey's report of the 28th March last on the 12th April last; both Taft's and Weir's accidents should have been reported; I advised Mr. Croft to use safety-lamps in making inspections, as they were approaching the fault in No. 6; that was fully two years ago; the mine in that part was very difficult to work owing to the dykes; I examined that part with considerable interest, owing to the dykes; Mr. Croft often asked my advice as to how to work that part of the mine; with 7 or 8 per cent. of gas in the place, things would have been pretty lively if a naked light had got into it; if I were in an atmosphere with that percentage of gas, I would expect my lamp to fill; 25 cubic feet of gas would be a large quantity for men to go to work in; if I were the examining deputy and found that quantity, I would take all care to shift it; 16 cubic feet of gas would be a fairly large quantity; I have never known of a case in which the whole of the gunpowder in a charge has not exploded; I have a theory about the matter as to the possibility of there being complete combustion in one plug, and not in another separated from the first by *débris*; a shot-hole near a fault would be the very place to expect to find gas; I have never seen the place where Weir was burnt; my reports are not published, and are not known outside the Department; the Department does not publish my reports every year; the check inspectors' reports are published in the local newspapers sometimes, not always.

*By Mr. Edmunds:* The 7 or 8 per cent. has no relation to the quantity; it means 7 parts in 100.

Taken and sworn at Court-house, Newcastle, this }  
18th day of August, 1899, before me,— }

JOHN DIXON.

GRANTLEY FITZHARDINGE, D.C.J.

Mr. Edmunds tenders in evidence copies of the statement of the charges against the defendants [*put in evidence and marked Exhibit A 1*].

This deponent, *Thomas Lionel Bates*, on his oath, states:—I am an Inspector of Collieries; I gave evidence before the Court of Inquiry; the deposition shown me is mine, and bears my signature [*deposition read to witness*]; that deposition is correct [*deposition put in and marked W; Bates' reports also put in, "Exhibit Y, Bates' evidence"*]; I kept my intended visits to the mine quiet; I do not think it possible for them to have been known a day or two, or hours even, before I went there; I made that special inspection I spoke of at the request of Mr. Dixon; I do not know why he asked me to make it; I never saw any indication of preparation for my visit on any of my inspections; I did not know Bailey personally, nor Dobb; neither of them ever complained to me about any malpractices in the pit, nor of any accidents [*witness reads from his report the reference to the want of bratticing in his report of 21st November, 1896*]; I do not know that at that time there was a great scarcity of brattice cloth in this district; the matters I drew attention to could be easily remedied as soon as the canvas was available; what I required to be done could be done in a day, or less; the fact that the brattice was not there did not affect the health of the men in the pit at that time; I have never been in the mine since H. Croft has been under-manager; when I reported everything as satisfactory in the mine I included everything in connection with the mine—the ventilation, the treatment of the men, &c.; I did not examine the air in the in-take, because the working-place is the best place to test it, as it is there one can find what the men are getting; I never found the men pinched for air.

*By*

*By Bench* : 324 cubic feet per minute seems to have been my largest reading, and 106 cubic feet the lowest.

Taken and sworn at the Court-house, Newcastle, this }  
18th day of August, 1899, before me,—

THOS. L. BATES.

GRANTLEY FITZHARDINGE, D.C.J.

Mr. Edmunds closes case for the Crown.

Court House, Newcastle, 18th August, 1899.

*Case for the Defence.*

Mr. Thompson argues that no case has been made out against Joseph Croft. The Court decides that a case has been made out.

This deponent, *James Henwood*, on his oath, states:—I am overman at the Dudley Colliery, and reside at Dudley; the position I hold is that, practically, of under-manager; I was at one time employed in the Newcastle Company's pit; for several years I was general man, and was then promoted to the position of deputy overman; I have had about thirty-three years' experience of coal-mining; I have occupied in mining every position from that of a lad to my present position; I have had experience in England as well as here; I have been in gassy mines in England; the colliery I am in now is the colliery at which the explosion occurred a year or so ago; I left the Newcastle Company's employ on the 4th June, 1898; I have no interest whatever now in the Newcastle mine, either as a shareholder, or in any other capacity; the Dudley mine is regarded as a gassy one, and is worked with safety-lamps; I have been in every part of the A pit of the Newcastle mine; during the time I was there I never knew of any inflammable gas being in the mine; I was friendly with the men, who chatted freely with me about matters down below; I thus had abundant opportunity of hearing of any gas in the pit; I never heard of black-damp in the mine; I never heard of the intended visits of the Government inspectors; I never heard that the deputies or any of the men knew they were about to visit the mine; I have seen the check inspectors on the pit-top occasionally before I have gone down the mine; I have been in the mine when they have been doing their work; they performed their work as they ought as far as I could see; I have read in the papers what the charges are alleged against the defendants; I never saw any incompetency on the part of Joseph Croft, nor did I know of any gross negligence on his part as manager of the mine; I was in the employ of the Newcastle from July, 1889, till June, 1898; I was in only one colliery in England; I was there for fourteen years; it was one of the largest collieries in England; I have only been employed in the Newcastle and Dudley mines in this Colony; the men in the Newcastle mine were as well treated as any men in any mine I have been in; I heard no more than the ordinary amount of grumbling among them; there were over 200 men employed there; a grumbler or two is always found among the men in any mine; the method of working the mine was a correct one as far as my experience taught me; if I remember rightly young Croft started work in the B pit shortly after Mr. Croft took charge of the mine; when he was overman, and I deputy overman, I came into direct contact with him; I saw no evidence of direct incompetency on his part; he was a young man, and did not know so much as I did; he was very willing to learn anything I could teach him; I never saw any gross negligence on his part; he appeared to be very energetic in the discharge of his duties; as far as my particular district was concerned I can vouch for the discipline of it; since the passing of the new Act I was never aware of any interference with the ventilation of the mine; matters relating to the mine are freely discussed among the men; I never heard of any trickery with regard to the ventilation of the mine; I never heard of it till the Court of Investigation.

*By Mr. Edmunds*: H. Croft became overman about four years ago; he had not the experience I had; he was put over me; I was an older and more experienced man than he at the time; I know Bailey; he never spoke to me at any time about finding gas in the mine—not all the time I was there; I cannot remember his telling me after I had left that he was finding gas in the mine; I can only remember having one conversation with him since I left the mine; I do not remember his mentioning gas in that conversation; he was out at Dudley once, and told me he had been made a deputy; he did not speak about his work in the mine, but about his position; I do not remember his mentioning the finding of gas in the mine: he did not tell me that he had been ordered not to report it.

*By Court*: I was deputy-overman for districts 6, 7, and 8; H. Croft was overman for the whole A pit.

*By Mr. Thompson*: On one occasion, while in the employ of the Newcastle Company, I tested for gas with a safety-lamp; that was about three and a half years ago; I did so by instructions of Herbert Croft; it was in the No. 6 narrow bords, immediately after passing through a fault and coming into the coal again; the fault there is an intrusive dyke; that is just such a place as would be likely to give off gas; I knew how to use the safety-lamp; I found no gas at all there; I made a thorough test of the place; it was perfectly clear of gas; it was about 6 a.m. when I examined it; the men came in immediately after me; the men had been working there the day before, and there had been time for the gas to come out if there had been any there; I would not expect to get black-damp there, but fire-damp.

*By Bench*: Edward Wilson was examining deputy for that place at that time; I could not say whether he had examined that place before me that morning; no report of the examination was made at that time.

*By Mr. Thompson*: I think I was specially put to that work because of my experience of gas in mines.

Taken and sworn at Court-house, Newcastle, this }  
18th day of August, 1899, before me,—

JAS. HENWOOD.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *William Gall*, on his oath, states:—I was examined before the Court of Investigation held by Mr. Wade; the deposition shown me is signed by me; that deposition, is correct except at page 195, where I said that I had heard of the black-damp on the 14th April; I did not hear of it till I saw it reported in the newspaper: I also first heard of Taft's accident when I read it in the paper [*deposition put in and marked No. 2*].

*By*

*By Mr. Edmunds*: I read of the man being overcome first in the paper on the 23rd May last; Taft's affair first came to my knowledge on the 23rd May last when it was mentioned in the paper by Bailey; If I said previously that I heard of Taft's affair in the office on the 14th April last I was mixing up Taft's case with Weir's which was mentioned on that occasion; my evidence was read over to me but very quickly and I am not sharp at picking things up; my evidence regarding that, was given in reply to Mr. Bruce Smith who appeared for the management before the Court of Investigation; I gave my evidence before Mr. Croft gave his; I did not hear his evidence; I have read some of it; I have not read that he said the first he heard of Taft's affair was when he read it in the paper; I do not know that now; I do not know that Mr. Croft in his evidence contradicted both Rendal and myself on that point; the correction of my evidence on that point was quite spontaneous on my part; it never occurred to me to correct it until I heard it read this morning; I have had no conversation with anyone on that point; I have never heard that Rendal and I differed from Mr. Croft on that point before the Court of Investigation; I have had no conversation with anybody at all since I gave it before the last Court; I am not aware of any discrepancies between my evidence and that of Mr. Croft; I never heard personally from Bailey of Taft's accident; when I referred to the having heard the matter from Bailey recently I was not referring to what I had heard in the office on the 14th April last; I suppose I meant I had seen it in the paper when I said I had heard it from Bailey recently; I call it hearing it from Bailey reading it in the papers; at the time I gave evidence before the last Court, all I knew about it was what I had seen in the paper; I cannot say whether Taft's name was mentioned in the paper nor whether the scene of the accident in the mine was mentioned; all it said in the paper was "another man being overcome by black-damp"; I got to know after that appeared in the paper that Taft was the man referred to in the paper; Taft's name was mentioned after that appeared in the papers; that was how I got to know the name of the man; No. 1 continued to work till about the middle of April, 1899; four men were working there at that time; only four men had been working there for four or five months prior to that; I do not know that Mr. Dixon reports eight men as working in No. 1 on the 18th April last; there would be eight men if he took Nos. 1 and 5 together; an alteration was made in the No. 1 in-take; the number of men was reduced in that part and the check added to as the men were drawn out; less air would be going into No. 1 as each addition was made to the check; that last addition to that check before the final addition was made about a fortnight before the men were taken out altogether; I do not know that the same quantity of air was going into No. 1; I do not know what the air readings were for No. 1 according to the books; if no stoppage were put up the quantity of air would be about the same; if the quantity of air going into the district were about the same, it would go to show that no further stoppage had been put up.

*By Mr. Thompson*: The small lamp produced is that which Bailey broke with his large flare; Mr. Bruce Smith put direct questions to me as to my knowledge of the different matters of which I gave evidence before the Court of Inquiry; I can only account for my mistake as to the time I heard about Taft's illness on the supposition that I mixed his case and Weir's up; I was present at two interviews between Bailey—once at the engine road and once in the office; on neither occasion did Bailey mention anything about having found 25 cubic feet of gas or 16 cubic feet of gas; I have had no talk with Bailey since the interview on the engine road; I have never spoken to him since; at neither interview did Bailey say he wanted to show me two ignitions of gas where he was testing for it; when I went with him to look for gas, I saw no indication of it at all on either occasion; I saw no puckering or flickering of the flame of the lamp; he said he saw it himself; he did not report it in the book; it was twice on the one day in two different places; I saw the report book to satisfy myself that he had not reported either of them; I stood and saw him make the report in the book; the report shown me in the book is the same; I said nothing to him about it when he made that entry; Barnes was the man working in the place where Bailey said he found the gas.

*By Mr. Edmunds*: I inspect with a safety-lamp; I have done so off and on for the last two years, whenever we were approaching a fault; I do not examine with a naked light now; I am not an examining deputy; I go into the men's places during the day while the men are at work; I do not do that as an examining deputy; the front shift deputy makes the examination for my shift; I make the inspection for the second shift; I make that examination under General Rule 4 for the second shift; I have used the safety-lamp continuously since the last inquiry began; before that I sometimes used the naked light, sometimes the safety-lamp.

*By Mr. Thompson*: My shift is a continuous shift; I have not even spoken to you about the alteration in my evidence about Taft's matter; I first came to town in connection with this inquiry to-day; I have not had a chance of giving a statement of my evidence to anybody since the last inquiry.

Taken and sworn at Court-house, Newcastle, this } WILLIAM GALL.  
18th day of August, 1899, before me,—

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *William Ambrose*, on his oath, states:—I am a deputy in the A pit of the Newcastle Coal Mining Company; I gave evidence before the last Court of Inquiry; the signature of the deposition shown me is mine; I wish to correct it at page 207, where the manager asked Bailey about reporting to the Minister about black-damp and gas; I should have said fire-damp instead of black-damp; I said black-damp when I was giving evidence, but it was a mistake; otherwise the deposition is correct [*deposition put in and marked No. 3*].

*By Mr. Edmunds*: I first noticed my mistake with regard to that when I read Mr. Wade's summing up in the papers; I saw in the paper where I had mentioned black-damp; I cannot say it was in Mr. Wade's report; I saw it at the time the inquiry was going on, when my evidence was reported; the inquiry lasted some days after my evidence appeared in the paper; it never struck me to correct my evidence while the evidence was going on; I did not hear Mr. Croft give evidence; I read his evidence in the paper; I cannot say now that Croft said in his evidence that Taft's affair was not mentioned in the office on the 14th April; I believe Rendal has stated that he mentioned Taft's affair to Croft in a conversation with him about April last; it first occurred to me that I had made a mistake with regard to the black-damp when I read about my evidence in the paper; it never occurred to me that I should correct it; I have never spoken to anybody about correcting it; I cannot tell you any other point on which my former evidence differed from Mr. Croft's; I have never examined with a safety-lamp; I began to use a safety-lamp since the last inquiry; prior to that all my examinations were made with a naked light.

*By*

*By Mr. Thompson* : I remember sending Bailey away with the boy from the door three times ; I had not been in communication with any of the deputies, the manager, nor under-manager just prior to sending him on any one of those occasions ; I had not seen either the Government inspector or check inspectors in the mine that day, nor did I expect them to be there ; if I had kept that door open the hour and a half, as deposed to by Bailey, the men in the district would feel the difference in the air ; No. 8 would get a great deal more air by opening that door ; I have never known that district to require such an increase in its supply of air ; on each occasion I have sent the boy away, and stopped at the door myself ; I have had plenty to do in looking after the men on the flat ; if the door were left open as described, and the check inspectors were in the district, they would undoubtedly notice the difference in the air ; it would take from ten to fifteen minutes to put up brattice in a bord ; that is giving plenty of time.

Taken and sworn at the Court-house, Newcastle, this }  
18th day of August, 1899, before me,—

W. AMBROSE.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *Samuel Jones*, on his oath, states :—I am a deputy at the Newcastle Coal Company's mine, and reside at Merewether ; I gave evidence before the last Court of Inquiry before Mr. Wade ; the deposition shown me is mine and bears my signature ; that deposition is correct [*put in and marked No. 4*].

*By Mr. Edmunds* : I am using a safety-lamp now for my inspections ; I believe I began to use it after Bailey had reported the gas, on the 28th May last ; all the other deputies began to use the safety-lamp at the same time.

*By Mr. Thompson* : By every deputy I mean every examining deputy—those who examine the bords in the morning ; I never received a verbal message from Bailey about gas to deliver to young Mr. Croft ; he never gave me a note for him either ; my mate, Jones, is the examiner in the morning ; he was put on in Bailey's place ; he was not an examiner before that but a shiftman ; I was the only deputy of the name of Jones at the time Bailey speaks of ; I have a middling good memory ; I have no recollection at all of receiving a verbal or written message from Bailey for young Croft ; I have been in coal-mines for forty-seven years ; during the time I have been in the Newcastle pit I have had good opportunities of seeing the state of discipline there ; I have been in all parts of the pit ; I started on the coal and was next appointed deputy ; In my districts I have never known a deputy to be a bully or tyrant ; I have never had cause for complaint ; the mine has been well managed according to my ideas ; I have never had complaints made to me by the men which have been left unredressed ; I had as good a chance of knowing when the inspectors were coming ; I never knew when they were coming ; I never knew they were there till I saw them ; the weather has a good deal to do with the state of the air in the mine ; it is hotter in the mine in the warm summer months than at other times ; I have seen Mr. Joseph Croft on the average two or three times a week at the pit, and young Mr. Croft every day ; I have never seen either of them do anything that would give me the idea that he was incompetent ; I have never noticed any gross negligence on the part of either of them ; I have never seen either of them under the influence of drink in the slightest degree ; I was there when they were getting out the pillars ; that is a difficult and dangerous job ; they began to get out the pillars eleven or twelve years ago ; I cannot remember one accident in the pillars during the whole of that time ; I cannot remember who it was first spoke to me about Weir's matter ; I heard it in the pit somewhere, I think ; I heard afterwards that it took place in the back heading of No. 6.

Taken and sworn at Court-house, Newcastle, this }  
18th day of August, 1899, before me,—

SAMUEL JONES.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *William Newburn*, on his oath, states :—I am assistant under-manager of the B pit of the Newcastle Coal Company ; I gave evidence in the inquiry held by Mr. Wade ; the deposition show me is signed by me [*deposition put in and marked No. 5*].

*By Mr. Edmunds* : There was nothing said about a man having been carried out of the mine in the colliery office ; I never heard of it till I read it in the papers ; I suppose I was brought into that conference because Bailey had lodged a charge against me with the manager ; I know of no other reason.

*By Mr. Thompson* : I worked in several pits in England before I came out here ; the Durham mines in which I worked were all gassy ; I was simply a practical miner in them ; I have worked in the Tighe's Hill Colliery, in this Colony, besides the Newcastle ; I was there for about twelve months just after my arrival in the Colony ; I used not to meet Bailey in the cabin in the morning when I was in A pit ; he was not an examining deputy at that time, whatever I ordered Bailey to do with regard to the ventilation of the mine was necessary to be done, and it was my duty to see that it was done ; Bailey worked as a shiftman in No. 10 when I had charge of it ; I do not think I would be laughing while I was putting up canvas in No. 2 ; I was doing my work and looking after Bailey, and I do not consider that is a laughing matter ; I do not know by what means the manager or anyone else could tell when the inspectors were coming to the mine ; I consider Joseph Croft a most careful, diligent, and practical manager ; the mine has been as well set out as any mine in the Northern District ; young Mr. Croft is a diligent young man and well fitted for his position of under-manager ; he has plenty experienced men to assist him ; I have never seen any signs of negligence on the part of either ; during the seventeen years I have been in the mine only one man has complained about my treatment of him ; every time I have had to do anything in the bords to make them safe and comfortable I have done it as soon as the request has been made, or within a very short time after ; I have worked pillars in this mine for ten years ; pillar working is a very dangerous operation in a mine on account of the falls of roof and timber ; I have not had an accident in the pillar workings in ten years ; there were other parts of the mine in which pillars were being worked under other deputies ; I have never heard of an accident in the whole mine during the whole of the pillar workings ; Bailey was very excited when he was at the colliery office on the occasion I have spoken of ; I told him he was telling a lie because he was doing so.

Taken and sworn at Court-house, Newcastle, this }  
18th day of August, 1899, before me,—

W. NEWBURN.

GRANTLEY FITZHARDINGE, D.C.J.

This

This deponent, *Herbert Claude Croft*, on his oath, states:—I am the under-manager of the A pit of the Newcastle Coal Company; I gave evidence before the Court of Inquiry last month; the deposition shown me is signed by me; that deposition is correct with one exception about Bailey using the safety-lamp [*deposition put in and marked No. 6*].

Adjourned till 2 p.m. on Monday next.  
Court-house, Newcastle, 18th August, 1899.

Mr. Edmunds puts in evidence a small plan marked Exhibit X in Dobb's evidence.

This deponent, *John Archibald Neilson*, on his oath, states:—I am a mining engineer residing at Teralba; I have been engaged in coal-mining matters in this district for eighteen or nineteen years; I have had to do with the A and B pits of the Newcastle Colliery as agent for the Merewether Estate for eleven years, and also for seven years as assistant to my father who was formerly agent for the same estate; I have during the course of business had to go down the pit at least four times a year; our relations have been antagonistic during most of the time; I have had opportunity of judging the general equipment and conduct of the mine during the last seven or eight years; it has been part of my business to observe those matters; I consider the discipline of the mine very good; I always found it so; I have always found the ventilation very good, but I was not particularly interested in that; under the system that obtains in this district the mine has been very systematically laid out; the arrangements for getting out the coal are very good; I consider Mr. Joseph Croft a very competent manager; in my opinion he has never shown any signs of incompetency nor negligence; I consider him a most attentive man to his business; I visit the Burwood Colliery in the same way, and used to visit the A.A. Co.'s mine in the same way; I have been in most of the mines in the district; in my opinion the Newcastle Colliery compares favourably in every respect with any mine in the district.

*By Mr. Edmunds*: I am a colliery manager myself; I only speak of the mine as I have found it.

*By Mr. Thompson*: I never found gas in the Newcastle mine nor has it ever been reported to me; that includes the time I was assisting my father as well as during my own term as agent for the Merewether Estate; I have never heard of fire-damp or black-damp in the mine.

*By Mr. Edmunds*: I have read of fire-damp appearing in a mine where it has not been seen for a number of years; it is more likely to be met with where there are dykes with incinerated coal; if a man were burnt with fire-damp and the occurrence not reported to the Government inspector it would involve a breach of discipline; if the manager did not know of it, the official under him who did know it would be guilty of a breach of discipline; it should have been reported in a book; if such a case came under my notice I would report it directly to the Government inspector no matter how late I heard it; I would, as manager, make a full inquiry into the circumstance when it came to my knowledge; if the provisions of the Act as to reporting such a thing are not complied with there is likely to be a danger of accidents; I know that safety-lamps should be used in a mine where inflammable gas has been found within twelve months; if the officials of a mine knew of a man being singed and did not report it they would be guilty of a breach of discipline; if they did not know it it would go to show a want of discipline in the colliery; if a man were overcome at his work and had to be carried out, it should be reported if it were an accident—something happening to him at his work; if it were not reported to the manager there would be neglect on somebody's part; I restrict all my evidence as to the mine to what I have observed there myself.

*By Mr. Thompson*: The man who was burnt as alleged in this case should have reported it to the deputy who should report it to the under-manager, he to the manager, and the manager to the Government inspector; my experience is that slight accidents are not reported. [Mr. Thompson wishes to ask a question as to the opinion of the witness concerning the competency of a manager in such a case a Weir's, Court decides that it would not be assisted by the opinion of the witness.] My experience of choke-damp have been a very heavy head and a nasty gritty mouth.

*By Mr. Edmunds*: I do not remember weak knees as a symptom of choke-damp.

*By Mr. Thompson*: The coal in the Newcastle Colliery is of the same seam as all over the district; some parts of it are gassy, some are not.

*By Mr. Edmunds*: I have never written a protest against a deputy's report in his report book.

*By His Honor*: I understand choke-damp and black-damp to be the same; I agree with Dr. Haldane's description of choke-damp—its ingredients and their proportions; I do not agree with his statement that choke-damp and after-damp are nearly the same.

Taken and sworn at Court-house, Newcastle, this }  
21st day of August, 1899, before me,— }

J. A. NEILSON.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *David Yardley*, on his oath, states:—I am a deputy employed in the Newcastle Colliery; I was examined before Mr. Wade in the previous inquiry; the deposition shown me is mine, and signed by me.

*By His Honor*: I have seen my former evidence reported in the paper; I did not find any error in it.

*By Mr. Thompson*: That deposition is correct [*deposition put in and marked No. 7*]; I was employed in the B pit as well as the A; I was deputy in the B pit for about eighteen months; I had no trappers under me in the B pit; I had some in the A pit; I had one trapper there; on several occasions I sent him away from his door; I have worked in mines in Scotland before coming to this Colony, but not in a gassy mine; I worked in several large collieries in Scotland before coming here; I have only worked in the Newcastle pit in this country; I have worked there for fourteen years; I have been a deputy there about three years; during that time I have had opportunities of observing the general equipment and management of the mine; I have never had cause for complaint against either under-manager or manager during the time I have been there; I have always treated the men under me properly; I have never heard of any of the other deputies being bullies or tyrants; the first I ever heard of the tricks with the ventilation was when Bailey preferred his charges against the management.

*By Mr. Edmunds*: I used to inspect my district (No. 2) during the shift; my shift ended at 4 p.m.; I do not know who did the inspection for the second shift; I used to inspect the places in that district during my shift; no miners came on in the second shift; that is still the case; I have used a safety-lamp on my inspections since the date of Bailey's report, the 28th March last; I am positive about

that ; since Bailey reported gas, I have used the safety-lamp on every inspection of mine when the pit has been idle ; I used to get it in the cabin in the box ; I had a key for the box, so had the under-manager ; Samuel Jones has been inspecting deputy in the morning ; he carried his lamp in along with him ; he did not use the lamp that was in the cabin ; I have never been with Jones on his inspections, and do not know of my own knowledge that he used the safety-lamp ; Jones did not use the lamp I used because I had the key of the cupboard where it was kept ; I had the key of the lamp, too ; it was left in the cupboard.

*By Mr. Thompson :* The report shown me (Bailey's, of 28th March last) is that of which I have spoken ; neither No. 2 nor No. 10 was the district in which the gas was reported by Bailey ; but, since Bailey's report, I have used the safety-lamp on my inspections ; that was done by the order of the under-manager.

Taken and sworn at the Court-house, Newcastle, this }  
21st day of August, 1899, before me,— }  
GRANTLEY FITZHARDINGE, D.C.J.

D. YARDLEY.

This deponent, *John Hetherington*, on his oath, states :—I am an on-setter, employed at the A pit of the Newcastle Colliery ; I have been employed there for sixteen years ; there is no man of the same name employed there to my knowledge.

*Question :* " Did you, at any time, steal a pipe belonging to a man named Dobb ?"  
[ Court decides that this evidence is not material. ]

This deponent, *John Dixon*, recalled on his former oath, states :—The roof of the whole mine for some time past has been very tender ; it has required great caution and skill to prevent accidents ; everybody has treated it very carefully and skilfully ; Mr. Croft has supplied the timber and the deputies and miners have seen it properly put up ; it has been creditable to all concerned in the mine ; I advised Mr. Croft to have the mine inspected with safety-lamps when approaching faults ; that was a good while ago ; I have seen the safety-lamps in the cabin.

GRANTLEY FITZHARDINGE, D.C.J.

JOHN DIXON.

This deponent, *Herbert Claud Croft*, recalled on his former oath, states :—I wish to correct my former evidence in this manner : Bailey first used a safety-lamp about twelve months ago, but they had been in the mine before that ; it was when we were coming to the faults in No. 6 that Bailey used the safety-lamp ; that was when he was transferred from No. 1 to No. 6 district ; that fault is close handy to where Atkinson and his mate were seen working on Saturday last ; I have been once with Mr. Dixon, twice with the Chief Inspector, and once by myself to the place where Bailey said he had found gas, and examined or seen it examined for gas ; I have been there also with the manager and miners ; there was a difference in the place Bailey reported in the book and the place he took us to and showed us ; I tried both headings ; an examination had been made about two hours or two and a half hours before my inspection of that place ; a longer time had elapsed between the prior examination and that made with Mr. Atkinson ; I should say about eight hours ; when Mr. Dixon examined it an examination had been made about four hours previously ; it was between 2 and 3 p.m. that my father examined it ; Bailey would have finished there about 5 or 5.30 a.m. ; I did not gather from Bailey's conversations that he had found gas anywhere else ; I never heard of him finding gas on the 21st March last till he said so in his evidence in court here ; I tried all over the dip headings for gas, and could find none there ; I tried both the front and back dip headings for gas ; I saw Mr. Atkinson try the first place on Saturday last with the hydrogen lamp ; that was not near a fault nor near a dyke ; it was about 4½ cut-throughs away from a dyke or fault ; it was a good distance from where Weir was said to have been burnt ; it was 4½ cut-throughs away from there ; a cut-through is 35 yards ; when I was with Bailey—dogging him, as he says—I had a perfect sight of his lamp ; he got up on the catch to try for the gas ; he tried the side that was nearest to the brattice as well ; he said he saw the gas in the back rise heading first ; Bailey tried for gas in the front dip heading first ; I was sufficiently raised there to see his lamp distinctly ; I saw not the slightest flicker or move of the lamp there ; I am absolutely certain that he used the word " exhumed " there ; if there had been the slightest movement of his lamp to indicate gas there I should have detected it ; he just popped his lamp up on one side of the heading, then stepped across and popped it up on the other ; he said, " There's a slight trace there ;" Gall asked him " Where ?" and Bailey could not show him ; we then went into the front heading, and when he first put up the lamp said there was nothing there ; he put it up on the other side, and said, " There's a slight trace there ;" I could not see it, and said to him " Surely, Bailey, you can show it to me now," but he could not ; I was quite close to him at the time ; I did not even see a slight puckering of the flame ; he did not blow along the roof of the heading to get the gas over the lamp ; if he had done that I could have seen any deflection of lamp flame ; I cannot make out where Bailey found the 25 cubic feet of gas as he described, unless it was in the dip heading where he says he got a permanent blue cap ; it was the dip heading where Mr. Atkinson tried for gas first on Saturday last ; I cannot tell at all where Bailey found the 25 cubic feet of gas ; I should certainly prefer to be out of the way of 25 cubic feet of gas ; it is rather a large quantity of gas ; there is a strong current of air where Mr. Atkinson tried for gas on Saturday last ; no gas could stop there as the air would drive it out ; there are three keys to the cupboard in the cabin ; no mischief can come about if one goes into a place holding gas with an unlocked safety-lamp, unless the flame of the lamp is exposed ; I do not think Bailey took his key with him on our inspection ; it is about two months since that place was worked where the brattice was well up, and Mr. Atkinson tried for gas ; it is still examined as a safe-guard ; nothing has been found there since ; it is examined every morning about 5.30 o'clock ; it had been examined about four and a half hours prior to our going there on Saturday last ; if it had been giving off gas constantly as Bailey said we would have found gas there when we were there on Saturday last ; up to the time Bailey gave evidence in the former inquiry I had never heard of gas being found by him from six to ten times ; I never heard that he had seen it with a permanent blue flame from twenty to thirty times until he gave evidence of it the other day ; he never reported gas to me in my whole life ; he never wrote a note to me ; he never handed me a note ; it was in the rise headings in No. 6 that Gall tried for gas with Bailey ; their lamps were up together at the same time ; I said nothing to prevent Bailey reporting

reporting the discoveries of gas which he says he made on the 29th March last; Bailey has said that he found the gas with a permanent blue flame on twenty or thirty occasions; on none of those occasions have I known him to order the men out of their places and have work stopped; it would take longer than two and a half hours to drive out 25 cubic feet of gas as found by Bailey; I say that from my knowledge, but not from any experience I have had; if the brattice were taken well up to the face, and there were a good current of air, it would likely drive out 25 feet of gas in a couple of hours; it would require a stronger current of air to drive it out, if it had accumulated to that extent; I have seen Bailey many times fall on his knees and pray for people in the mine; if the check inspectors were in B pit to-day I would expect them in A pit to-morrow; it would take them a day and a half to inspect the A pit; the check inspectors' books are in the custody of the clerk; I have had a look at those books, but have not been right through them; the last time the check inspectors were there they sent word to me to bring them through from the B pit to the A pit; I suppose that was because they did not know the road; it was a difficult road to find, as we are making a new permanent road there; Jones never delivered to me either a note or message from Bailey about finding gas; where Mr. Atkinson tried with the hydrogen lamp on Saturday I had been on the 28th March last, and also a couple of days before that; I am pretty intimate with some of the men, and they would be likely to tell me what was going on in the mine; none of them ever gave me the slightest hint of any gas being found in the mine; I was present on the 12th April last, when Mr. Atkinson had the conversation with my father; it took place in the office at the mine; Mr. Atkinson came in about 5 p.m., and asked my father where he kept the report-books; my father said below, and sent me for them; I went down and got them; Mr. Atkinson then asked for the deputies, and they were brought from their homes; Mr. Atkinson asked them did they know of anybody seeing gas in the mine, had they seen it, and also asked me had I seen it; we all answered "No"; he then asked if we knew of anybody having been badly burnt within the last twelve months; everybody replied "No"; he then turned to the manager, and said, "Mr. Croft, I have another question to ask you, 'Do you know that the deputies deceive the Government inspectors when they are in the mine'"; he said before asking the question that it was a very low question he had to ask him; my father said he knew nothing about it at all; the deputies said they knew nothing of it; to the best of my belief, Gall was the first of the deputies to answer that question; at another interview Bailey said Gall was the cause of all the trouble; it would have been my special duty to report the finding of gas to my father; neither I nor my father, nor the shareholders, nor any one else, could have derived any benefit from suppressing such a thing; I have never examined the report-books of any other colliery to see how reports are made in them; I think various text-books show how to report; I have read some of them; I considered it was highly necessary for Bailey to report as to the roof and sides and the state of the ventilation when reporting the finding of gas, especially as it was the first time of gas being reported in a non-fiery mine; I went to the place where Weir was said to have been burnt after I heard of it, in order to examine the shot-hole from which it was said to have come; there was no shot-hole there then; I saw the first place which Mr. Atkinson tried on Saturday last, and saw him put a stick into a hole in the roof; I understood that Weir was burnt about 2 feet out-by that under the lip where it was cutting up; I saw another depression there which was blackened; that was the back end of a shot; I cannot deny that Weir was burnt after hearing the evidence; I knew nothing of it; it was not because I believed Bailey was trying to trick me on the 29th March last that I disbelieved his report; it was the way in which he had made his report that made me doubt its genuineness.

Taken and sworn at Court-house, Newcastle, this }  
21st day of August, 1899, before me,—

HERBERT C. CROFT.

GRANTLEY FITZHARDINGE, D.C.J.

Adjourned till 9-30 a.m. to-morrow.

Court-house, Newcastle, 21st August, 1899.

This deponent, *Herbert Claud Croft*, recalled, on his former oath, states:—There was something in Bailey's manner that caused me to doubt the truth of his report of the 28th March last; his head was hanging down, and his hands trembling; he seemed to wish to avoid me, and I had to follow him about to get him to answer my questions; I asked Rendal why he had not reported the singeing of Weir to me, and he replied, "If a man has to report when a man gets a few hairs singed, things have come to a fine pass"; I replied, "You know, Rendal, that any appearance of fire-damp should be reported; we have never seen it here before, and I think you neglected your duty in not reporting it to me or my father"; when the brattice is not carried right up to the face the air will go a certain distance beyond it—as far as the pressure will carry it—and then will find its way round the back of the canvas; the place which Mr. Atkinson tried the second time on Saturday last would be uninspected from 3 p.m. on a Saturday till between 6 a.m. and 7 a.m. Sunday; with the ventilation provided at that point it was not possible for any such accumulation of gas as mentioned by Bailey to remain there; there was no occasion for brattice in the No. 1 pillars; the amount of air supplied to that place was too large to get through the nearest place and went straight on to where Watts and John were working; in January last, my father tested that place at the cut-through end there, and got 2,000 feet per minute going to four men; there is no foundation for Dobb's statement that I had the No. 1 overcast interfered with; an obstruction would have to be up there to injure anyone in the mine four or five hours at least; the overcast is about 18 feet high and 9 feet wide; I do not know how Dobb would obstruct that, unless he built bricks up in it; I do not know that Dobb would know where No. 1 overcast is; he has not marked its position correctly on the plan marked E; he is 60 or 70 yards out in that; I am within bounds, when I say that that overcast is 9 feet wide; Dobb marked No. 10 overcast on the plan as No. 1 overcast; No. 5 overcast is 4 ft. 6 in. high and about 7 feet wide; there are no means there of stopping up that overcast; there were none at the time Dobb says he stopped it up; there was no brattice about at that time that he could have stuffed it up with; this overcast is an artificial one, made of planking and stringers; to hang canvas in it he would have had to set a bar first; the roof was of stone; it is only the bottom sill that is of wood; there was a big current of air coming over it; if he had placed an obstruction in that overcast it would not have blocked the air which would come through the cut-through—the top one in No. 1—from No. 6 and worked its way round the edge of the goaf, and found its way into the No. 1 return; that is if No. 5 were hermetically sealed; if No. 5 were blocked, as Dobb said, there were no means of blocking up another main in-take so as to block the air off altogether; to cut off the main in-take and main return it would

would be necessary to put a stopping across the main engine road and another across the main return; in several places that we have stopped with jerry and mortar there is a continual leakage of air owing to the shrinkage of the stone, the pressure of the atmosphere, and other reasons; we keep a supply of sand and lime in the mine for the purpose of repairing those stoppings; I have seen as much as 5,000 or 6,000 cubic feet of air out of 40,000 lost between two given points owing to leakage; the leakage is about 10 per cent.; according to our anemometers we always had quite enough air for every man, boy, and horse in the mine; on one occasion the furnace was off for repairs; we tried what the air was then; the fire was drawn on that occasion after the men had ceased work and were out of the pit; the furnace was put out at 1 a.m. on the Friday night and allowed to cool to allow the men to make the repairs; it was re-lit again about 9 o'clock; it was about 8 o'clock when my father tried the air with the furnace out; we found 20,000 cubic feet of air going over the bars on that occasion; we have had bigger readings than that on the bars; in every district there is a draft, even without the fire alight; that is owing to the natural ventilation; the air was not at all disagreeable when the fire was completely out.

*By His Honor:* We had about thirty-two horses in the mine when the fire was out; they suffered no inconvenience on that occasion as far as I could judge; they were perfectly dry.

*By Mr. Thompson:* The fall in No. 6 that Mr. Atkinson showed the Court on Saturday last would allow an escape of air; I remember Dobb saying that I told him the two check inspectors Hardy and Clapton were coming in; it is not true that I told him that; I did not know that they were coming; they are not the check inspectors who sent for me to show them the road from the B pit; Dobb never grumbled to me about being shifted from the day-shift to the night-shift; if he had not been put on the night-shift he would have been discharged altogether, as there was no other work for him; Dobb's work was generally to empty the coals for the furnaceman; he would then be put on the roads to clean them up; his work ceased because the roads were all pretty well cleaned up, and I had a spare water-baler; one of the two men would have had to go if I had not put Dobb on the night-shift; I never had any disagreeableness with Dobb; on one occasion I sent him to clear some stone away, and he did not do as much work as a 2s. 6d. lad would have done; I told Dobb that that would not do me; that if he was paid 8s. for his work, he would have to do 8s. worth of work; that is the occasion referred to by him, when he says I bullied him; he was on the day-shift then, early in 1898; I have no occasion to put any great faith in Dobb; Dobb would be on the day-shift at the time he says I told him to interfere with No. 5 overcast; he would have no right in that place at that time; I would have to take him from the furnace to send him there; I never at any time ordered Dobb to do anything to the ventilation that was not absolutely necessary for the proper ventilation of the mine; I made inquiries as to the statements about the interference with the ventilation; I asked Ambrose about it; I have known Ambrose about five years, and I never found a more truthful, honest man; I never at any time knew when Mr. Dixon was coming into the mine, nor did I ever instruct Dobb or anyone else to do anything to deceive anybody; I had not an opportunity of seeing Taft often after his accident; he never said a word to me about his illness; I only knew Weir slightly; he was a block of a man, about 5 ft. 6 in. high, with a very fresh complexion; he was terribly fat, with rolls of fat about his shoulders.

*By His Honor:* I remember on one occasion he was standing near me, and he was not so tall as I; he was as high as my shoulder, at least higher in fact; I am 5 ft. 10 in. high.

*By Mr. Thompson:* The first fault we came across in the A pit was in the No. 6 narrow bords, about September, 1898; that is as far as I can remember; when I told Bailey to take on the No. 6 places I told him to carry a lamp with him; it was shortly after that that Weir's accident is said to have occurred; if Weir were burnt on the 26th September, 1898, I am certain that Bailey had orders to inspect with a lamp before that date; I believe the 25th September, 1898, was Sunday; I would not see Bailey at all that day; Weir's accident is said to have happened on the night of the 25th September; I gave Bailey his instructions about the lamp either on the Friday or Saturday before that; I am positive it was before the date of Weir's accident; the men were just starting on the fault at the time, the coal having been stripped from it; Rendal was the inspecting deputy at that time; I have noticed lately that Rendal's memory is failing him, so much so that I am compelled to keep a book in which to enter the deputy's duties for him; I heard of Mr. Dixon recommending my father to use the safety-lamp when approaching the faults; he has also advised me when approaching a fault to have a look at it now and then with a safety-lamp; when Bailey was given the position of deputy he did not say to me, "Well, if I find gas I'll have to report it," nor anything like that; I heard Bailey say that he saw the place where Weir was burnt and that the gas came from the coal; I heard Fox say that it came from the shot-hole in the stone; Rendal showed me the place; it was solid stone; it was on the advice of Mr. Dixon that the Sunday shift was reported on after a consultation with Mr. Atkinson; I heard of it in the course of my duties as under-manager; Bailey did not know that Rendal did not make a book report of the Sunday inspection prior to five months ago, so far as I know; 25 cubic feet of gas with a depth of 10 or 11 inches would run a good way along the roof from the face; I followed Bailey with Gall on the occasion referred to by him to ascertain his manner of inspecting, and if there were any truth in his statement; I believe it was in the beginning of this year that I noticed the crack on the glass of the Marsaut lamp; Gall told me about it; it was reported to me as under-manager, I suppose; he told me that it had been cracked through Bailey carrying a too big flame and handling it carelessly; I do not know what Bailey means by the gas being consumed in his lamp; I cannot understand gas outside the lamp being consumed by the flame in the lamp; Gall tested carefully with his lamp at the same time as Bailey on the occasion referred to; the two lamps were quite close together at the time; I saw no pucker in Gall's lamp on either occasion; I have read how to inspect for gas, and have had many practical lessons from many experienced men, including Mr. John Dixon; the place where Gall and Bailey tested for gas on that occasion was in the same state as far as brattice is concerned then as it was on Saturday last, except that the heading has been advanced.

*By His Honor:* Up to two months ago two men had been working there, but since then nobody.

*By Mr. Thompson:* The first time there was a consultation between the manager and Bailey and others there was no charge alleged against me; no charge was laid against me by Bailey on any of those interviews, and I heard nothing of the charges alleged against me till the Court of Investigation; it was John W. Jones who was put on in Bailey's place in No. 6; as far as I know he is a capable and experienced man; I am on duty from 6.40 a.m. till 4.30 p.m., a longer shift than any of the men; I am in the pit every day ten hours; if there is any special need for me I stay longer and also go to the pit when sent for; I had to see the work done by the men during the night when I went on in the morning; Mitchell is still at the mine as far as I know; I do not think the No. 6 narrow headings were going on the

the 25th September, 1893; the accident to Taft happened to him at night-time; I was not there at the time, and had nothing to do with the ventilation at the time of the accident; I had nothing to do with the night-work unless I was specially called in; the inspectors' reports will show that there was always an adequate supply of air for No. 5; there was an inspecting deputy for No. 5 at that time; there was always an adequate supply of air for the men in No. 1; there were 2,000 feet going to four men, and only 400 feet required; as far as I could I enforced, and caused to be enforced, the general rules and the Act, and also the special rules of the colliery; I was never lax in my discipline over the men; I visited the working-places in the mine as often as practicable—one half one day and the other half the next day; it was impossible for me to visit every place in the one day; I always saw that the ventilation appliances were in proper order, and that an adequate supply of pure air was supplied to the men; I always gave immediate attention to any complaints that were made to me; I saw that sufficient timber was sent down the pit every day; the amount of timber required each day is put up in the timber bord by the deputies; the mine has always been well supplied with timber; I carefully and promptly obeyed the orders of the manager as to the use of the naked lights and safety-lamps in the mine; in not suspending Rendal on hearing of Weir's accident I erred on the side of charity towards an old servant; I did not hear of Taft's case till 23rd May last; it is the business of the manager to appoint the deputies; none were appointed on my recommendation that I know of; I kept them up to their work when they were appointed; they are as capable a set of deputies as are to be found in the district; our large output and freedom from accidents is an indication of the capability of the officials of the mine, from the manager down to the deputies; there are many difficulties in the A pit not found in other mines in the district; first, the faulty nature of the roof; that required careful discipline on the part of the deputies, and implicit obedience on the part of the men; the matter of the gas in which Bailey was concerned, and his action with regard to it, are a glaring instance of disobedience on his part; another difficulty we had to deal with was the upheaval of the bottom; that would be due to pressure of some sort; that necessitated a great amount of re-timbering, involving great care in putting it in fresh; the height of the seam was another difficulty; it averages about 7 feet, and meant longer props than usual; the innumerable dislocations of the seam were another source of trouble; the length of the roadways, and then the dip and rise in parts, were more trouble; the roadways have to be carefully attended to every night; the jumps have been so numerous that I cannot give their number; one of the dip jumps seen on Saturday last was about 10 feet; the whole of the coal-bed in the mine is like the waves of the sea, undulating; I ascribe that to some pressure—such as an earthquake; the incinerated coal next to the faults would imply the action of fire or great heat; the two or three creeps in the pit have also had to be carefully watched to prevent them coming in and causing accident; I have never hesitated about going to my father or Mr. Dixon about any matter I was in doubt about; I have always made it a point to ask information of anyone who I thought could give it to me; with the exception of Dobb I have had no unpleasantness with any man in the pit; it was on the 29th March last that I first heard of Weir's accident, six months after it had happened; I did not conceal the same either from the Chief Inspector or the District Inspector; I am pretty well certain that Bailey's lamp was not locked when he made the inspection in No. 6 in my presence; I did not cause the whole of the A pit to be examined with safety-lamps after first hearing of Weir's accident; but after hearing Fox's evidence before the Court of Investigation safety-lamps were carried for inspection purposes by every fireman in the pit; I did not suppress the finding of inflammable gas in the mine by Bailey nor anyone else; I did not know that Bailey had made a statement to the Minister for Mines about the gas until my father called us all together in his office; Mr. Dixon has complimented us on the manner in which our stations are kept in the mine; I did not know of inflammable gas having been found in the mine before Bailey's charges were made; I saw Mr. Dixon on the 12th April last, after hearing of Bailey's charges; I did not mention them to him because I thought he had come there about them and knew about them; I saw that each deputy made his report in the book in accordance with the rules as far as I could; I am positive that Bailey nor any one else gave me any information about gas in the mine till I saw it in the book on the 28th March last; I remember Bailey's appointment to No. 6 as deputy; he had been a deputy in No. 1 for some months prior to that; if Bailey knew of the existence of gas in the mine on the 25th September, 1893, he said nothing to me about it till the 29th March, 1899; I heard him say that he must have seen gas in the mine at least fifty times, and that he had reported it either verbally or by note to me every time; according to that he must have seen it on the average twice a week during the nine months; I never heard a whisper from any of the other men about it; I did not allow Bailey to try the workings for gas with a naked light on the 28th March last; I have never found any difficulty in getting the men to work for me; men that have gone away from the mine have come back there to work during my time.

*By Mr. Edmunds:* The force of the ventilation is brought about by the pressure of the air; that is brought about by the colder air rushing into the place of the rarefied air; I do not know what is meant by calculating the force producing ventilation; I know the formula by which the pressure of the ventilation is arrived at; it is arrived by taking the atmosphere pressure at the downcast and that at the upcast, and subtracting the one from the other; the difference in weight between the column of air in the downcast shaft and the upcast shaft represents the pressure of the ventilation; the quantity going into each split is determined by the regulators, which reduce the area; the quantity of air passing through each split depends, to some extent, upon the resistance offered by each split to the course of the air; the putting of a stopping in No. 5 overcast would not affect the quantity of air going into that district; Nos. 5 and 6 are all one air district; the putting of a stopping there would increase the resistance to the course of the air in that district in comparison with the other districts; it would diminish the air going in that return, but not in the district; the increase of resistance in a return will diminish the quantity of air going in that return, and would relatively increase the volume of air in other places; in this particular case, the air that would be obstructed would get to the district by another route; it would form another circuit of air with a greater length, and, consequently, more resistance; the air adjusts itself to the different parts of the mine proportionately as the circuit offers resistance to it; reducing the volume of air in one district means increasing it in some others; if a place were found with 25 cubic feet of gas in it, it would have to be broken up with a bag; that would take about two hours or two and a half hours; I still adhere to my opinion that it would take two and a half hours to clear out 25 feet of gas under the circumstances described by Bailey; the clearing out of gas in a place bratticed up to the canch would depend upon the volume and velocity of the air passing through that place; on the 28th March last there was passing through

through No. 6 a volume of 10,000 feet of air per minute ; the dip-headings were getting about 7,000 feet per minute ; that volume of air passing through that space would sweep out 25 cubic feet of gas in five minutes, or about that ; the time it would take to get that quantity of gas out would depend upon whether the brattice was brought up to the face or not ; the pressure will force the air a certain distance past the end of the canvas, and then the air will course round the end of the canvas and go down the other side ; between the canvas and the rib the air will be moving all in one direction—towards the face—and then will course round the other side of the brattice ; the whole volume of air will be coursing in the one direction at the sides of the brattice, and beyond it ; I mean that the air will go a certain distance past the end of the brattice, which is the face, and will then turn round the other side of the brattice ; it is the face that turns the air ; on the 28th March last the dip-heading was about 7 ft. 6 in. wide and about 4 ft. 11 in. to 5 feet high ; the height of the canch was 2 feet, leaving the height of the heading on the canch about 3 feet ; 25 cubic feet of gas, a foot deep, and spread over the whole width of the roof, would extend about  $3\frac{1}{2}$  feet from the face ; wherever a rise is met with in the seam, it generally dips again to its former level ; there is a curved surface to the seam all through the mine ; I do not know of any mine in the district with the seam on a perfect plane ; I gave Bailey instructions to do the work of inspecting No. 6 ; I told my father that Bailey had not enough to do in No. 1, and that Wilson had too much, and that I would like Bailey to do No. 6 ; I told Bailey to take the lamp in his inspections of that part of No. 6 which was approaching a fault ; that was not the first time I had had inspections made with the lamp ; I had inspected with it myself, and the deputies occasionally ; when I instructed Bailey to inspect with the lamp was the first time I had had daily inspections made with it ; the first time I saw Bailey use the lamp was on the 29th March last ; I mean that was the first time I had seen him test for gas with a lamp ; I inquired from Rendal what sort of a man he was in his different kinds of work before I put him on as deputy in September, 1898 ; I asked him a few questions as to testing for gas before putting him on ; I was not satisfied as to his fitness for the work of testing for gas, because I had not seen him at work ; I was satisfied only so far as he could tell me of his competency ; we left our lights about 12 or 14 yards from the place where he tested for gas on the 29th March ; I know that Special Rule 78 says that no person shall try the workings for fire-damp with a naked light ; I stood by while Bailey took his bonnet off ; he was not at the face when he took the bonnet off, but near the stantin, sitting down ; I said nothing when he took off the bonnet ; I should say the taking off of the bonnet would make the lamp more active ; I said nothing when he did it, because I was satisfied that no danger could arise from fire-damp, and I wished to notice his procedure ; I did not notice his procedure before I put him on to that work, because I never expected to see gas ; when gas is found in a mine the inspection must be made with locked safety-lamps ; I do not think that every lamp has to be put in charge of a responsible person, because each deputy is responsible for his own lamp ; there must be a responsible person for each individual lamp—the man who is using it ; no particular book was kept in compliance with General Rule 7, unless it was the ordinary report-book that was kept below ; I had no fault of importance to find with Bailey up to the 28th March last ; I came to the conclusion that Bailey had knowingly made a false report with regard to the gas on the 28th March last in the morning ; I told my father of it that evening ; I did not order Bailey to leave the pit when I came to that conclusion ; he continued at his work in the pit all that day ; I let him remain there that day because I did not believe his report was true, and I was on a balance which way to act ; on account of the manner in which Weir's affair had been told to me I would have been telling Mr. Atkinson what I did not believe to be true if I had told him of Weir being burnt ; he asked me if I had heard anything about gas, and the reply was given "No" ; I did not tell him of what I knew of gas in September last, because the affair had been represented to me as such a trivial one that I did not think it worth while speaking about ; since this inquiry I would report the scratching of a man's finger in the mine ; I did not tell Mr. Atkinson about Weir, because he asked if we knew of a man having been badly burnt within the last twelve months ; I took Gall with me on the morning of the 29th March last, because I wanted to have somebody with me as a witness ; I knew that Bailey was to make his inspection then, and do not consider that I was unduly interfering with Bailey in the execution of his duty as a deputy ; Bailey was not interfered with nor obstructed in any manner on that morning ; I wished to go and see the method of inspection, so that, if anything were seen there, I might report it to the manager ; I have said that the air in No. 5 pillars was satisfactory ; I was not there at night-time ; I have tested the air there with my light ; I never saw any black-damp there, and the quantity of air there was quite sufficient to carry any away according to my tests ; I do not think that either Taft or Turner was affected by black-damp ; if Taft, Turner, and Dobb were affected as they have said I should say there was not sufficient air going into that place ; Rendal must know that the inspection with a safety-lamp of No. 6 must have begun before Weir's accident ; the narrow bord would be fenced off on the 24th September, 1898 ; the inspection by Ambrose on that date would not mean an inspection of the narrow bord of No. 6 ; the narrow bords were stopped at that time, and would be fenced off from the point where Ambrose inspected with his naked light ; I know that Rendal sent men into the narrow bord on the night of the 25th September ; my impression is that the men would be going to work on the fault there at that time ; Rendal was sending men in to timber and bale water that night ; Rendal was making the Sunday night inspections at that time in No. 6 ; I do not know that he made his inspection that night with a naked light ; I had given him instructions to inspect every place approaching a fault with a safety-lamp ; it is about twelve months since I first noticed Rendal's weakness of memory ; I have never complained about his unfitness for his work ; Gall was the day deputy for the roads in No. 5 at the time Taft was overcome ; it would be one of the last places he would go to before they went in ; I can remember the deputy reporting Bailey on one occasion for not supplying his men with sufficient sprags ; that was about January last ; except that I cannot recall anything for which he was reported or for which I had to find fault with him ; the brattice that Jarvis put up in No. 1 in-take was completed in the second quarter of this year ; portion of it had been up for seven or eight months before that ; it was put up, and never altered, until it was totally closed off ; it remained unaltered from the beginning of this year till it was completely closed ; I know that No. 1 has had an air current of 4,000 or 5,000 feet of air since September, 1898, till it was closed ; it had an air current in August, 1898, of 11,000 feet ; that indicates that it was in September, 1898, that the brattice was altered.

*By Mr. Thompson :* Bailey has never said where he saw the 25 cubic feet of gas ; assuming it was the place that Mr. Atkinson tried with his lamp on Saturday last, and that the brattice was then as it is now, the air would not allow such a quantity of gas to accumulate there ; it would not require a very great

great force of air to drive out a small quantity of gas; my father assented to my proposal to give Bailey some extra work and Wilson a little less; Bailey says it took him an hour to get rid of the 16 cubic feet of gas by putting up brattice; there must have been a considerable emission of gas on those two occasions Bailey speaks of if what he says be true; I knew that the whole of the mine had been examined with naked lights before the safety-lamps were used, and no suspicion of gas ever entertained; the place examined by Mr. Atkinson on Saturday last was similar in every respect to other places all over the mine which had been examined with the naked light, and no gas ever seen or heard of; Bailey's report of the 9th April last contained no mention of gas; he examined that night, I think, because Rendal was short-handed; the signature to the report of that date in the report-book shown me is Bailey's [*report-book put in and marked Exhibit No. 8*]; Rendal had power to take on a man in that way without consulting me; I would not have agreed to it if he had consulted me.

*By His Honor*: If a shiftman is away the night overman reports it to me if he is one of his shiftmen; Weir's absence after his accident was not reported to me; he was often away; I know that by the time-books; I did not make any inquiries as to the cause of his absence after his accident; Taft's absence was not reported to me; he was not often away; Rendal would not know which of his men are away till he puts them to their work; I would be out of the pit at that time, and would not see Rendal till 4 p.m. next day; no record is kept of the absence of the shiftmen except the time-book, which I see only once a fortnight.

*By Mr. Thompson*: If a shiftman is away two days without sending a doctor's certificate, he would be sent to the manager; if one of Rendal's men were away for two days he would be sent to the manager.

*By His Honor*: Rendal might see the manager on the top and report the absence of a shiftman for two days; he would inform me when he came down the pit.

*By Mr. Thompson*: Bailey never reported in the book the finding of the gas twice on the one day when Gall and I were with him.

HERBERT C. CROFT.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *James Henwood*, recalled, on his former oath, states (to *Mr. Thompson*):—I have already said that I had had considerable experience in gassy mines; the length of time it would take to get rid of 25 cubic feet of gas as found by Bailey would depend upon the means taken to remove it; the proper way to remove it would be by extending the brattice; it should not be removed in a body but dissipated, otherwise it would cause danger in some other part of the mine; it should be done by advancing the brattice bit by bit, and by breaking a hole in the brattice at the top which would carry off the gas in portions; using that method and with a current of 7,000 feet of air it would take from thirty to forty-five minutes to clear 25 cubic feet of gas; if the gas were issuing from the one fissure I should expect to find the gas there again next day, but not if it were coming from a number of smaller fissures; from my knowledge of the A pit I would not expect to find 25 cubic feet of gas accumulated between the time of knocking off work one day and the time of inspection the next day, nor would I expect to find 16 cubic feet accumulated in the same time in that pit; if it were said to come from a solid face of coal I would not expect to find it exuding from one fissure; if the men knocked off work at 4 p.m. and 25 cubic feet of gas were found the next morning about 6 o'clock, I would call it a very large issue of gas; with other auxiliary elements such a quantity if lighted might possibly blow the A pit up; any man with any knowledge of gas should know that 25 cubic feet of gas is a source of very considerable danger; I cannot conceive of a man finding gas with a permanent blue flame twenty or thirty times, and altogether fifty times in the course of five months in the A pit; I cannot understand a man finding gas so often not mentioning it to any of his fellow workmen or the mine officials.

*By Mr. Edmunds*: There were faults in No. 6 when I was in the A pit; that was about four years ago; the bords were standing there then; there was one dyke passed through in 1898 in the left-hand heading, off the narrow bords; there was no dyke met with in the narrow bords in the year 1898 up to the time I left; the narrow bords were worked continuously in 1898 up to the time I left there in June.

*By Mr. Thompson*: The downthrow of 10 feet would be as likely to cause gas as the dyke, but on the opposite side.

*By Mr. Edmunds*: It would require of air thirty times the quantity of the gas to render the 25 cubic feet of gas harmless; it would take from thirty minutes to forty-five minutes to do that by the method I have described with an air current of 7,000 cubic feet of air per minute; I take into consideration the time necessary for the labour to be done in extending the brattice; it would remove at that rate about a cubic foot of gas per minute; the thing cannot be done too slowly to be safe.

Taken and sworn at Court-house, Newcastle, this }  
22nd day of August, 1899, before me,— }

JAS. HENWOOD.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *James Richardson*, on his oath, states:—I am a miner working in the B pit of the Newcastle Coal Company; I gave evidence before Mr. Wade at the last Court of Investigation; the deposition shown me is mine, and signed by me [*deposition put in and marked No. 9*]; the men and boys working in the pit are the persons who are benefited by the ventilation: the check inspectors are elected by the miners only, not the shiftmen or boys; the miners would be working in by the flat.

*By Mr. Edmunds*: I left the A pit two months ago; I worked in No. 6 twelve months or more ago; I have never known Jones to find any indication of fire-damp in No. 6; I never heard of any gas in the mine till the Court of Investigation.

*By Mr. Thompson*: It was my duty as check inspector to report any inflammable gas that was reported to me; we never examined for gas; I put no obstacle in the way of the men making any complaint to me as check inspector; I have worked in the pit altogether three years.

Taken and sworn at Court-house, Newcastle, this }  
22nd day of August, 1899, before me,— }

JAMES RICHARDSON.

GRANTLEY FITZHARDINGE, D.C.J.

Adjourned till 9:30 a.m. to-morrow.  
Court-house, Newcastle, 22nd August, 1899.

His

His Honor points out to Mr. Edmunds that there is a mistake in the charges as regards Taft's Christian name, he being described as Albert Taft instead of John William Taft, and also with regard to date 28th September, 1898, which should be 25th September, 1898. Mr. Edmunds asks that these mistakes be corrected in the charges. His Honor allows the corrections wherever necessary in the statement of the charges.

This deponent, *Joseph Croft*, on his oath, states:—I am manager of the Newcastle Colliery, and reside at Merewether; I was examined in the inquiry before Mr. Wade; the signature to the deposition shown me is mine [*deposition read to witness, put in, and marked Exhibit No. 10*]; I wish to correct my evidence at page 272 in this respect: that the last words used by me on that occasion were "collusion going on"; Weir's name was mentioned at that interview, but prior to those words; I also wish to alter it at page 291, where I am made to say that I sent Bailey to inspect Nos. 1 and 2 on the 9th April last; I did not send Bailey to inspect those districts on that occasion [*witness marks the No. 10 overcast on the plan E with a C*]; X O on that plan indicates the No. 1 overcast and the main in-take for No. 2; X on that, on the main No. 5 return, plan means No. 5 overcast at No. 1 return [*letter marked I in newspaper in Joseph Croft's evidence put in*]; that was the first letter I saw about the matters referred to therein; I have had thirty-three years' experience in mining, beginning at Minmi; there are three tunnels there now; at that time there was only the one pit; I was there about fourteen years before being appointed manager; prior to that I had been a clerk in the office, but not all the time; I had to attend the New Lambton Colliery, also as a clerk; I assisted to develop the tunnels at Minmi; I helped to make the plans and calculations; I had been gradually acquiring more knowledge by my practical experience, and also by studying; during the last ten years I was there I did all the surveying; I studied surveying under Donald McCabe, formerly town clerk and surveyor for Newcastle; after finishing the surveying I was appointed surface manager at Minmi, and then manager; J. and A. Brown were my masters there in the first instance; James Brown used to look after the business of the colliery principally; he was an experienced man; I remained manager of that mine for ten years; New Lambton passed out of the Messrs. Brown's hands during that time; those mines were gassy; I had to deal with that matter as part of my work as manager of those mines; they were troublesome in that respect pretty well all the time I was manager; I thus acquired skill in searching for gas and dealing with it; I cannot say for certain whether it was while I was in charge of those mines that the two men were burnt in one of the mines; I was temporarily in charge of the mine during the absence of John Brown for twelve months, and it was either while he was away or shortly after his return that these accidents happened; the old Coal Mines Act was in force during that time; no complaint was ever made about me while I was manager of that mine so far as I can remember; I was not the only applicant for the position of manager of the Newcastle Colliery; I was selected out of a number of applicants; I used no influence to obtain the appointment, but depended upon my recommendations and general reputation; there were about 400 men employed in the pit at that time; there are about 800 men employed there at present; the A pit has been developed more than the other; that was done in order to bring about a large out-pit; while developing the A pit we had very great difficulties to contend with, in the shape of faults and dykes in all directions; these had a very bad effect on the roof; it was a very bad roof; the whole locality was disturbed by these faults and dykes—roof and floor; the roof required extra timbering through being so rotten; there was not a single accident to a man through falls in the roof during the whole of that time; there have been about twenty accidents in the mine, exclusive of Taft's and Weir's, during the whole ten years I have been manager; that is very much less than compared with other mines in the district; there have been no signs of creeps in the mine since I took charge of it; the floor of the mine used to heave up, and break the timber, causing extra caution and the use of a great deal more timber; I had to depend upon my deputies and men a good deal to see this properly attended to, but mine was the governing spirit throughout the whole of the operations; I have been down the mine, roughly speaking, on an average three times a week during my tenure of office; I went down to inspect the whole of the districts, and to take the air; I understood it was part of my duty to go down and take the air at least once a month; the breaking of the timber would be caused by overhead pressure when the floor heaved up; I had to set out the ventilation for all the new districts, and to make new overcasts to suit the different places; this was open to the Government inspectors and the check inspectors; I have seen the check inspectors' reports in my office; I have not had an opportunity of seeing the Government inspectors' reports; the check inspectors' reports and mine compare equally with regard to the measurements of the air; I have visited several of the pits in this district; I have seen what the ventilation is in them, and consider the ventilation in our mine compares favourably with them all; my method of getting out the coal has been approved by persons who ought to know; the means of getting out the coal are capable of getting out the largest output of coal in the Southern Hemisphere, and are doing so; my company pays a heavy royalty to the Merewether Estate, and it is an object with them to get out as much coal as possible, and as economically as possible; I have never been found fault with by the directors in my management of the colliery; they have always spoken favourably of the manner in which I have worked it; I have heard that at the meetings from directors and shareholders; the haulage system is by "mane and tail," and is approved of; that was the system in use before I took over the management; it was a system adopted by Mr. Ross, the former manager, who has a very high reputation in the district as a manager, and who is now manager of the Wallsend Colliery; I consider that I am quite competent to manage the mine; I have never studied the scientific part of the matter, but have a thorough practical knowledge of all matters in relation to coal-mining; about a third of the A pit was gone through by the party on Saturday last; the pit was then in the usual state it is in; the deputies in the mine are not a disobedient, bullying lot of men; they were selected because they were good men—even Bailey; my son told me that Bailey was looking for work, and he thought he was a good man; Rendal also recommended him to me; the minor matters in connection with the pit are attended to by the under-manager; the next man in position to him is the night-overman, then the deputies; my experience of my men is not that they are an undisciplined, unruly lot, but quite the opposite; Rendal was in the employment of the company before me—Gall and Newburn also; Sam Jones and Wilson also; many of the men who have gone away to better themselves have always come back to me for employment on their return; I have never known any part of the mine to be called a gassy one; putting aside Bailey's evidence, there is not the slightest ground for saying it is a gassy mine; I have tested for gas constantly when coming to faults; I am not aware of any gross negligence that I have been guilty of in my management of the mine; I heard Bailey say the other day that he had found gas with a permanent blue cap on twenty or thirty occasions;

occasions; he did not say that on the former investigation; I heard him say that altogether he had found gas on fifty occasions in the mine; he did not say that on the former investigation; I heard him say he was constantly finding gas; he did not say that before the other Court; I did not know of Weir's accident within twenty-four hours of its happening; it was six months after that I heard of it; I made inquiries into it when I did hear of it; I did not hear of Weir's accident from Mr. Atkinson; I did not report it when I heard it from Bailey and Rendal, because they had not seen it, and that the man had not been hurt; Bailey first told me that a man had been singed; I asked him who, and he said Weir; I then spoke to Rendal about it, and he said it was nothing, and that nobody had been hurt; I only heard of Taft's matter through the newspaper; I inquired into that from Rendal, who was night-overman at the time; I had never had reason to doubt Rendal's truthfulness in any matter; I asked Taft about it also; I saw both Rendal and Taft together in my office; Rendal had told me the day previous about it, and I told him to be at the office the next morning between 8 and 9 o'clock, as I intended to have Taft there; they were together, and I told Taft that I had seen the matter in the paper, and had made inquiries throughout the mine, but could find no man who knew anything about it; that I had ascertained that it had occurred at night-time; that Taft had had the shakes; that Rendal said to him, "Have you been overcome like this before?" that Taft had replied, yes, and then Rendal had asked him whether it had been in this pit, and Taft had replied, no; Taft was sitting on a chair when I asked him what had happened to him; he replied, "I took the shakes," motioning his arms backwards and forwards to indicate the way in which he had been affected; I did not ascertain from Taft that he had been overcome with black-damp; I told him that those were not the symptoms of black-damp; I thought it was black-damp from what I had seen in the newspaper; Taft mentioned no other symptom but the shaking; I asked Taft if his mate's light had burnt clear, and he said it did; I also asked Rendal if Turner's light had burnt clear, and he replied, yes; I never heard until the inquiry that Turner had suffered from a headache on that occasion; from what Taft told me I satisfied myself that he had not been affected by black-damp; I knew of no personal injury to anyone in the mine beyond the singeing of Weir's moustache, nor any more about Taft's matter than what he told me; I had no opportunity of giving notice to the inspector of either of these matters until months after they had taken place; I knew nothing whatever about Weir's matter about the time of its happening—the 25th September, 1898; I did not know that inflammable gases prevailed in that part of the mine, and that it was dangerous; I did not neglect to have a report made by a competent person in a book kept for the purpose; I did not know of the occurrence at the time of its happening; up to the time I had reason to doubt Bailey's truthfulness; I believed him to be a competent person to make an inspection in accordance with the rules of the Act, and to report thereon; I made all the inquiry I could relative to Weir's matter when I heard of it; I did not know where Weir was at the time I made the inquiry, but heard after that he had gone to England; I saw Fox with regard to Weir's matter on the 5th April last, in the presence of Rendal; I said to Fox, "Rendal has told me that you saw nothing, and no one was hurt; are you positive that that was so?" Fox replied, "Yes"; I do not remember anything more than that was said; when Fox came into the office I told him what I had sent for him for; I said, "Rendal has informed me about Weir's matter, and that you have said that you saw nothing, and that nobody was hurt"; he said that was correct; at that time I asked Rendal where Weir's mate was, and Rendal said in his proper place; that would be in the front narrow bord, not where Weir was said to have been; I did not conceal the matter of Weir's accident from the Chief Inspector nor the District Inspector after being informed of it that I am aware of; the inspection of the pit six months after Weir's accident would not give me any information with regard to the accident, as the place had gone on and the conditions been altered to such an extent; there would have been no use in inspecting with a safety-lamp then; when I did hear of the matter I gave instructions as to the inspections to the under-manager and all the deputies; Bailey was not there then; it was after I had heard Fox say at the investigation that he had seen a flash of gas that I gave those instructions; I knew nothing of the gas before that; I had previously given instructions to the under-manager and deputies to inspect with a safety-lamp when approaching faults; on the 25th September, 1893, I was not informed of any explosion of gas on that date; I had no idea of suppressing the truth when Bailey told me of the gas; I was not personally benefited, nor the directors or shareholders by suppressing any report of gas being found in the mine; I understood from Bailey's evidence that he meant he had always found the gas in the No. 6 district—in the headings; it would be most likely that if he had found gas as many times he says he did that some of the men would have come across it at their work; I did not allow Bailey to remain as inspecting deputy for some time after I had satisfied myself that he was telling untruths about the matters; he was disrated, but not dismissed; I allowed him to remain as deputy before finally dismissing him; after satisfying myself that Bailey was telling untruths I dismissed him; it was on the 30th March that I was absolutely satisfied that Bailey had been telling untruths, and had intentionally reported the existence of gas where there was none; I did not dismiss him till the 14th April; the Easter holidays intervened between those dates, and Bailey had also been away from the mine till after the holidays; I did not dismiss him instantly, because I wanted to give the matter every consideration before doing so; up to the 30th March I had not heard of the interferences with the ventilation that Bailey spoke to the Minister for Mines about; I made no inquiries about those matters beyond that at the office on the 14th April; I am certain of that; I did not allow Bailey to act as examining deputy after the day I disrated him—the 30th March; he was not examining deputy to my knowledge after I had disrated him; he was a shiftman under Rendal after I had disrated him; he was a competent man for that position; I did make inquiry from Taft himself as to his illness; Rendal was present at the time I made the inquiry; I did nothing to prevent an adequate supply of air in No. 6 headings on the 25th September, 1898; as far as I know the usual ventilating appliances were at work on that day; the miners are never allowed to work when the furnace is not going; in the month of July, 1898, I kept the No. 5 district ventilated with a sufficient supply of air in the usual manner, and in accordance with the provisions of the Act; my record for that district with 6, 7, and 8 in June, 1898, was 19,450 cubic feet of air per minute; that is one day's record—the date of my inspection; in July, 1898, the record for the same air-course was 22,550 feet per minute; in August, 21,520 feet; that amount of air was split up among the districts I have named; No. 5 would get a sufficient proportion of that amount for the number of men, boys, and horses working there; the air will not permeate as it ought to if the brattice is left down; it was part of the deputy's work to see that the brattice was kept up to the face so as to get the air up; in the first quarter of 1899 the ventilating appliances for the pillar workings of No. 1 were in good order, and working in the usual manner; in January my reading for the air in that district is 4,500 feet, in February 4,150 feet, in March 4,000 feet; there were four men

working there in January last; that would give an abundance of air for them; the same number of men were at work there in February and March last also; it was the duty of the under-manager and the deputies to see directly to the ventilation of the pit; no complaint came to me of the three occurrences I am now called upon to answer; I first heard of the charge of the 25th September, 1898, as a complaint against me when I was served with the statement of charges in this inquiry; I know nothing of the allegations against me contained in the tenth charge until Bailey began to air his grievances; if the interferences with the ventilation as alleged were true, I do not think they would injure the health of the men in the pit nor their comfort; I certainly did not give any order to the under-manager or deputies to meddle with the ventilation while the Government or check inspectors were in the pit; my only object in reducing the ventilation in No. 1 pillars was to give an increased supply of air to the other parts of the mine, as No. 1 did not require so much air, the men having been reduced; there is a scaling of air through that part now; in the first instance the whole of the entrance at the intake was open; there were twenty or thirty men working there then; that would be about two years ago; that part of the pit had been worked before I went to the mine, while Mr. Ross was manager; there were thirty men working there about the time I speak of as that part being worked under my management [*witness goes through Mr. Dixon's reports for that district during 1898*]; it was about September, 1898, that the area of the air-course was reduced at the entrance to No. 1; a passage was left for the skips to go through; so far as I know, no trickery was ever played with the ventilation there by pinning down the canvas, nor in any other manner; nothing was done there to my knowledge, except what I ordered to be done for the proper purposes of ventilation; Mr. Dixon's report shows a sufficient quantity of air for all the people working there; if Mr. Dixon were examining the places in No. 1 he would go in by the main entrance—by the haulage road; I do not know where Mr. Dixon was supposed to have been when the alleged interference with the ventilation took place; the blocking of the ventilation at the point alleged would send more air into No. 2 district; that district always had sufficient air for the persons working there, independent of any air that would be sent into it by such an interference; I carried out the Act with regard to the special rules by posting them up in conspicuous places in the mine and by distributing them amongst the workmen; I enforced, and caused to be enforced, the general rules under the Act; I consider my management of the mine has been very successful; no breach of any law dealing with the mines has ever been alleged against me with the exception of the present matter; since October, 1896, I have examined the A. pit with a safety-lamp for gas between forty and fifty times; I examined in places where I was likely to find gas; I never found the minutest trace of gas in any of them; Bailey never at any time said to me, "What shall I say if I find black-damp?" nor did I answer, "Oh, just say black-damp"; I knew of no other means of recording my protest against Bailey's report; prior to that I had never heard of anything in the mine requiring such a protest; I obtained the words "permanent blue cap" used in my former evidence from Special Rule 13; I do not consider 25 cubic feet of gas a small quantity, but rather a large one; it would extend about a foot deep from the roof, and for 6 or 8 feet back from the face; I heard Henwood's evidence, and agree with it regarding the dangerous properties of the gas and the caution necessary in dealing with it; I have had no personal experience of the effects of inflammable gas, but saw the results of it at Dudley; it was J. W. Jones who succeeded Bailey as examining deputy; he has never reported the finding of gas since he began his duties; if a man is off work for two days he has to send word that he is ill, or else a doctor's certificate, otherwise he has to see me before he can resume work; before these matters of Bailey's came to light I had noticed that Mr. Atkinson and Mr. Dixon were coming to the mine oftener than they had been in the habit of doing; I am certain Ambrose was present in the office on the occasion when Bailey says he was not; he was also present down below at the interview with Bailey; I am quite positive as to that; I read most of the letters that appeared in the papers signed by Bailey and others about that time; I may have read all of them; they were constantly appearing; it was necessary to let the furnace out about half a dozen times a year for the purpose of repairs; none of the miners were allowed to remain in the pit while it was out; I only took the air reading at the furnace while it was out on the one occasion; the first fault met with during my management was in No. 6 narrow bords; there was a fault closer to where Bailey says he found gas than that; the nearest fault to that place is about 22 chains off; the place where he says he found gas had gone altogether out of that part where I expected gas to be found through the proximity of faults; where he found gas, as he says, was strong, hard coal; I would expect gas to be coming off from the face of the coal; the face was being worked; I would not expect to find it only in the two corners of the heading that was being driven; if he found gas as often as he says, it would show great neglect on the part of the person who had examined before him; I have seen Fox twice with regard to Weir's matter—the first time at the office, and also between the A and B pits; what he said on the second occasion was that he had been asked to go into Newcastle about Weir's affair; I said, "Well, I take it that you know no more about it than what you told me, and will have nothing more to say—you told me then that you saw nothing, and that no one was hurt"; he replied, "I still say so"; at the point where No. 1 has since been blocked up there would be two trains passing each day at the time Price spoke of in his evidence; the blue flame on the cap of the lamp would indicate a large quantity of gas, in my opinion; it was Bailey's duty to have withdrawn the men under such circumstances till satisfied that the place was clear; Mr. Atkinson, on the 12th April last, asked me if the deputies had done anything to throw more air into a district when a Government inspector was inspecting; I told him I did not know of any such thing having taken place, and if I heard of a man doing such a thing I would have dismissed him at once; when Bailey made the discrepancy in his evidence and his report as to where he had found the gas I thought that he knew where he had found it, but had inserted the wrong place in the report; at the interview with Mr. Atkinson, in my office, on the 12th April last, he asked did we know of any man having been badly burnt within the last twelve months; I, with the others, answered, "No," and consider that I would have been telling an untruth if I had said otherwise, because the only thing I had heard of in that way was the singeing of a few hairs of a man's moustache; I never heard of anybody in the mine but Bailey making the mistake as to the front and back headings; my attention was called to the fact of his mistake, and that discredited him in my opinion; he said one heading and reported another; the place where he said he had found gas was pointed out to me by the under-manager and Gall; there was a hole in the roof there in the coal; it was at that time 5 or 6 yards from the face; work had been going on there just prior to the time I was shown it, so that men would be going on and eating into the coal after Bailey had examined it; that hole was such a place as I would expect to find gas in; the hole itself was not big enough to contain 25 feet or 16 feet of gas; it was a drill-hole, about 10 inches in length and  $1\frac{1}{2}$  inch in diameter;

it had been put there for the purpose of firing a shot; Bailey was not usually an excitable man as he was on the 28th March last; I had not the least idea that any Court of Investigation would be held when the interview took place in my office; there was nothing on that occasion to warrant the remark, "Think of poor Mr. Croft's wife and family"; there was nothing of that sort said nor anything that could be twisted into such a remark; the recommendation I gave Dobb was a general one to enable him to obtain his certificate; it was a truthful record of what I had found him to be; the leakage of air in the pit was about 10 to 20 per cent; that was not sufficient to make any of the places unwholesome; there was always an ample supply of air for all the working-places; the whole of the A pit was inspected with safety-lamps after the evidence about the finding of gas had been given before the last Court; prior to that it was inspected with naked lights; I would expect that any gas there would have been detected with the naked lights by some one if it had been there in such quantities and so often as Bailey says; I remember Dobb coming to me about being put from the day-shift to the night-shift; I told him I knew nothing about it, as it was a matter to be dealt with by the under-manager; he made no complaint to me when I told him that.

*By Mr. Edmunds:* The books will show when men are absent by showing the time they are off: the time-books will show that, and the pay-sheets also; those records come under my inspection from time to time; I do not, as a rule, make any inquiries as to the cause of absence if it is only for one day; it has always been the custom there not to question a man as to his absence for one day only; it was the rule there when I took over the management; I have always found Rendal discharge his duties in a proper, conscientious manner; I have never known him not to report a breach of the rules except in the cases of Weir and Taft; I know that Rendal at first said that the safety-lamp was used after consultation with me after the Weir occurrence; I had no conversation with him about that matter; I know that is the only point in which he altered his evidence this time from that he gave before Mr. Wade; he and I were in contradiction as to that on the last inquiry; according to my experience of Rendal I consider it exceptional on his part not to have reported Weir's affair to me on the occasion of its happening; it is not possible that he mentioned it to me, and that I have forgotten it; I kept no notes or minutes of the inquiry I made when he told me of it; I knew that under the circumstances I was liable to be charged with a breach of the Act myself; I did take some notes when he was reporting the matter to me; I took down some notes in pencil of what he told me; I also took down what Fox told me; I cannot remember what became of those notes; I do not remember keeping them; I did not examine Abell, because from what I was told I understood he was working in another bord; he was close to the scene and Weir's mate; I cannot say exactly why I did not question Abell about the matter; I had the statement of the night-overman; I asked Fox and Rendal what they had seen, and if they had seen Weir's injuries; I did not ask either if he had looked to see what were his injuries; I did not tell Mr. Atkinson all I knew about Weir when he asked me about it, because I did not consider there had been a burning in his case; I had no intention of suppressing the truth of the matter; I was satisfied as to the falseness of Bailey's report before I wrote the protest on it; that was on the 28th March last; I do not think I would dismiss a man the moment I was satisfied he had made an intentionally false report; it was after I had inquired into the charges he made against the deputies that I dismissed him; I did not want to do things in a hurry; I wanted to make inquiries; I wanted to make a record of my disapproval of his report; I thought I had a right to enter my protest on that report, because I thought it was untruthful; I have read Mr. Wade's report on the Dudley disaster since the last inquiry, and know that he draws attention to the importance of reporting the finding gas in a mine; I have no book at the mine for the purpose of record in compliance with General Rule 7; a blue cap on a lamp shows a certain percentage of gas in a mixture which is reaching the lamp; it may show for an instant or for an hour; it is no indication of the total quantity of gas present at the time; there was no alteration in the brattice in No. 1 which reduced it and then closed it in the first quarter of this year; one in-take supplies Nos. 5, 6, 7, and 8 districts, and the air going to those districts together is only shown in the book with the records of my readings; it would show the proportion of air going to Taft and Turner; canvas was put up to take the air to them; it was put up off the main return; a stopping of the narrow bords was also put up to carry the air into them; the air was carried up to the face in the heading in which they were working by canvas; when I had my first interview with Bailey, on the 29th March last, I had the other deputies present, so that they might hear what was said; Gall and Ambrose were both working in No. 6 district; I recollect that both Gall and Ambrose said Bailey mentioned black-damp to me at the interview, and that they corrected it on this occasion; both of them told me after the last inquiry that they had made a mistake with regard to that matter in their evidence; it was Taft came to me about going to see Mr. Atkinson; I did not send for him; it would not have made any difference to me if I had not seen him between the A and B pits on the occasion referred to; the book shown me is the shiftmen's time-book, which was kept by Rendal; it shows Weir off on the 21st and 26th September last; the same book also shows that Taft was absent on the night of Monday, the 18th July, 1898.

*By Mr. Thompson:* I knew something about gas before the Dudley accident; to ascertain the quantity of gas in a place I would measure the place with a rule; I would test with the safety-lamp in every part of the place to see how far the gas extended in different directions; Bailey never told me he had found 16 feet of gas; he never told me he had found any gas; I was at Dudley the day of the accident, and saw the results of the explosion; Rendal's memory is not so perfect now as it used to be; the notes I made of what Fox and Rendal said were what I had in my hand when I was questioning Bailey as I have spoken of.

*By His Honor:* On the engine-road interview, myself, H. Croft, Ambrose, Gall, and Bailey were present; on the 12th April, Messrs. Atkinson and Dixon, myself, my son, Ambrose, and Gall were present; on the 13th April, Bailey, Rendal, and myself were only present; on the 14th, myself, my son, Ambrose, Gall, Bailey, and Newburn were present; Taft would come on duty about 10 o'clock on the Sunday night, and go off about 6 a.m. next day; if he left before 6 a.m. he would not be entitled to his full pay; he would only be paid for the time he was in the pit; Rendal should have noted it in his time-book if he left before his proper time; a similar note should have appeared against Weir's name when he left; if that book had been kept correctly it would have shown what time each of those men went off.

Taken and sworn at Court-house, Newcastle, this }  
23rd day of August, 1899, before me,—

J. CROFT.

GRANTLEY FITZHARDINGE, D.C.J.

This

This deponent, *John Williams Jones*, on his oath, states:—I am an examining deputy at the Newcastle Colliery, having succeeded Bailey; I have to examine No. 6 district; I have heard that Bailey said he found gas there; I started my duties as examining deputy there on the 1st April last, a Saturday; I started examining with a locked safety-lamp, and have done so since; I have to examine from eighteen to twenty places in that district; I examined every place carefully; I had been told where Bailey said he had found gas; I have tried that place; when I first examined that place it had not been worked for three days; I did not find even a pucker of gas; I have reported the results of my examinations in the proper books; I have been a miner for thirty years—sixteen in the old country and fourteen here; I have had experience of gassy mines in the old country; I have been in five gassy mines there; I have worked in four mines here; I have been a little over two years at the Newcastle Colliery; the Newcastle mine is well set out, properly ventilated, and the means of haulage are very good, according to my experience of mines; I was on the coal in the Newcastle pit pretty well all the time I have been there; I always found the deputies very good to me, and never knew them to be otherwise to any of the other men; I would not describe them as bullies and tyrants; as far as I can see, the deputies agree very well with the overman and superior officials; I have never seen any matters neglected there that should be attended to.

*By Mr. Edmunds*: The dip headings were worked for three months after I became examining deputy, but have been idle for the last two months; the brattice has always been taken well up to the carch; I have never found it more than 3 or 4 feet from the face; I have had no dispute with Ambrose as to the reporting of gas.

Taken and sworn at Court-house, Newcastle, this } J. W. JONES.  
23rd day of August, 1899, before me,— }

GRANTLEY FITZHARDINGE, D.C.J.

Mr. Thompson states that that is his case for each of the defendants.

Court-house, Newcastle, 23rd August, 1899.

Mr. Edmunds puts in evidence without objection on the part of Mr. Thompson an affidavit by Weir, marked *Exhibit X*.

Mr. Thompson puts in evidence a document marked *Exhibit A*, Bailey's evidence, annexed to Bailey's deposition marked "M."

Court adjourned till 9:30 a.m. to-morrow.

Court-house, Newcastle, 23rd August, 1899.

This deponent, *Joseph Croft*, recalled on his former oath, states (*in answer to His Honor*):—None of the twenty accidents referred to by me yesterday were due to gas, but chiefly to falls of the coal; they happened to the miners and shiftmen, but chiefly to the miners; since October, 1893, there have been about nine accidents, all brought about by the same cause; those that were serious were reported to the inspector; about half of those accidents were reported to the inspector being considered sufficiently serious to report; those that were not serious were not reported; I do not think there were more than three during the latter half of 1898; I believe those were reported, but cannot say for certain; there is no book kept at the mine in which those are recorded; they would appear in the Blue Book; accidents reported to the inspectors would probably be reported to the Department; examining deputies in March last were paid 7s. 8d. a day; Bailey was paid that; the night shiftmen were paid some 6s. a day, some 8s. a day, according to their qualifications; Bailey had been a shiftman before being a deputy, and received a daily wage of 7s.; as examining deputy he was paid 7s. 8d. a day; when he was disgraced he continued to get the 7s. 8d. a day.

Taken and sworn at Court-house, Newcastle, this } J. CROFT.  
24th day of August, 1899, before me,— }

GRANTLEY FITZHARDINGE, D.C.J.

*Evidence in reply.*

This deponent, *Joseph Fox*, recalled, states (*in answer to Mr. Edmunds*):—I told Rendal that I saw nothing to speak of; I told Mr. Croft that I saw nothing to speak of; I did not say I had seen nothing; I told him I saw a slight flame coming across the back narrow bord.

Taken and sworn at Court-house, Newcastle, this } JOSEPH FOX.  
24th day of August, 1899, before me,— }

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *William Rendal*, recalled on his former oath, states:—I told Mr. Croft that Fox had told me that he had seen nothing of any importance; I will not swear that Mr. Herbert Croft did not say to me, "You know, Rendal, that any appearance of fire-damp should be reported; we have never seen it here before, and I think you neglected your duty in not reporting it to me or my father"; I would not swear it was not said to me, but I cannot recall it to mind.

Taken and sworn at Court-house, Newcastle, this } WILLIAM RENDAL.  
24th day of August, 1899, before me,— }

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *John William Bailey*, recalled on his former oath, states:—It is not true that Herbert Croft gave me instructions to use the lamp in No. 6 before Weir's accident; I am certain that it was after that accident.

*By Mr. Thompson*: It was in the rise and dip headings of No. 6 that I found the gas twenty or thirty times with a permanent blue cap; that would not be within an area of a few yards; the two rise headings are a considerable distance from the dip headings, probably 300 or 400 yards; I found about half as many in the rise headings as in the dip headings; I found the other half in the dip headings; I do not mean that there were twice as many in the one as in the other, but half in each place—from ten to fifteen in each; I found the gas mostly in the rise headings without the blue cap; at one time that was the worse

worse place of the two; that was immediately after I took over the inspection of No. 6; I always found it in the roof in the rise headings; these emissions of gas occurred over a length of from 80 to 100 yards in the heading—the rise heading; they occurred over a length of between 30 and 40 yards in the dip headings; that would mean that I found it about every 4 yards, because there were two headings; that does not necessarily imply that the place was fairly filled with gas; the men would take out a yard each shift; I must have found the gas once a week; I did not mention these discoveries of gas to the Minister in any of my communications to him, because I was never asked that question; I do not know whether I told him that I had found the gas with a permanent blue cap on twenty or thirty occasions; I did not tell either Mr. Dixon or Mr. Atkinson that I had found the gas with a blue cap on twenty or thirty occasions; I did not tell them that I had so found it on from six to ten occasions; it did not strike me to tell them unless they asked me the question; I was told to use a lamp when I was appointed to No. 6 district; I was told that by Herbert Croft.

Taken and sworn at Court-house, Newcastle, this }  
24th day of August, 1899, before me,— }

JOHN W. BAILEY.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *Alfred Ashley Atkinson*, recalled on his former oath, states (*in answer to His Honor*):—The form of deputies' report book used at this colliery is fixed upon by the colliery.

*By Mr. Thompson*: I cannot say whether the same form is used throughout the district; the distance between the rise and dip headings in No. 6 is about 594 yards; the coal in those headings is similar to what was seen on the inspection last Saturday—good, strong, hard coal; having heard Bailey's evidence, and having examined the mine so many times, I am of opinion that gas may or may not have occurred in as many instances as he says it did; I cannot give any opinion as to whether it was likely or not that the gas occurred as he says it did.

Taken and sworn at Court-house, Newcastle, this }  
24th day of August, 1899, before me,— }

A. A. ATKINSON.

GRANTLEY FITZHARDINGE, D.C.J.

This deponent, *John Dixon*, recalled on his former oath, states:—I have taken from the Departmental reports the reports of accidents in the A pit of the Newcastle Colliery; there was one reported in 1896, after the passing of the Act, in 1897 two were reported, and in 1898 three.

*By Mr. Thompson*: I inquired into those accidents when they were reported to me; in 1896 the accident was caused by a fall of coal; it was a slight accident; none of the accidents reported to me were very serious; the percentage of accidents at that colliery was very small.

*By His Honor*: On the 16th March, 1893, in the Newcastle A pit, a man sustained a compound fracture of the right leg, which was afterwards amputated; on 2nd August, 1898, a wheeler named Ford had his back badly bruised by a fall of timber; that was not serious; on 30th August, 1898, Thomas Shufflebotham, fracture of the right leg near ankle by a fall of shale roof; I do not call that a serious accident; on 25th February, 1897, a man sustained an injury to his foot on the surface; 10th March, 1897, Aquila Pipe sustained a severe flesh wound while ascending the pit in the cage; on 11th November, 1896, Richard Nash, internal injuries by fall of coal.

Taken and sworn at Court-house, Newcastle, this }  
24th day of August, 1899, before me,— }

JOHN DIXON.

GRANTLEY FITZHARDINGE, D.C.J.

## EXHIBIT C.

THIS deponent, *Thomas Abell*, on his oath, states (*to Mr. Curley*):—I am a miner employed at the A pit of the Newcastle Coal-mining Company; I have worked there since 1888; I mean with that company; I worked in the A pit up to yesterday, when I went to the B pit; we cavit all through in the two pits quarterly; during the last nine or twelve months I have worked chiefly with a man named Weir in the A pit; I was doing shift-work generally; that means general work about the mine; I worked chiefly in Nos. 6 and 7 districts; I remember an occurrence when Weir was burnt with a little gas; that was in No. 6 back narrow bord; that would be about September, 1898; that was at night-time—on a Sunday night—about 11 o'clock; I had gone down the mine about 10 o'clock that night; I was close to him at the time, but not with him; I was in the front narrow bord; that would be about 40 yards from Weir; there would be only one pillar between us at the time; I had been in my place about five or six minutes when it happened, or, perhaps, ten minutes; I heard a report like the crack of a whip; I went round to see what had happened, and met Weir coming out to meet me; I met him just at the cut-through; he seemed to be suffering from shock, and his hair was singed; he looked white, and was trembling; I examined him carefully, and found that his neck and the backs of his ears and the top parts of his arms were burnt a little; he had a flannel singlet on; his arms were bare to the elbow; I advised him to go home, but he said he did not want to go home; we then resumed our work; we both returned to my place; when I went down that night I saw the night-boss, Rendal, at the pit bottom; I also saw the fellow shiftman; Rendal told us our work; he said he wanted some timber set in the back and front narrow bords of No. 6; I believe a man name Wilson was the examining deputy for that district—only for the narrow bord; I believe Bailey was the deputy for the district; I did not see Wilson before I went to my working place; I only knew by custom that that place had been inspected before I went in; we supposed that Rendal examined the places were the men were likely to go to work; nobody warned me about going to those places that night; I have never seen any warning put up; there are stations in the colliery; the station for No. 6 was on the No. 6 flat at that time; that was about half a mile or more from the working-faces; it was about midway between the face and the pit bottom; there was a board at that station; I saw it that particular night; I have seen writing on that board; the last date on it that night was not altered till next morning, or some time after we had passed it; I cannot say what date was on the board that night; the usual thing was on the board that night, that such-and-such places had been examined that night, and found all safe, and signed by the examining deputy; Edward Wilson was the deputy whose name was on the board that night; I presume the places Weir and I were in were the last places he would examine that night; I did not see Wilson during the whole of that shift; we were called away from that part while he was there; that is how we did not see him; when Weir came into me that night, Rendal came in during the shift; it might have been an hour and a half or two hours after the accident; I reported the matter to him; Weir told him he had been burnt with some gas in the back narrow bord, and Rendal said he was sorry to hear it; he said that he had stepped on to the canch with the light on his head, and it had gone off; the canch is the bottom coal that is left; Rendal said nothing further about the gas at that time; I continued to work on there, part of the shift, and part in other places; Weir was not at work with me the following shift; I did not feel the aid bad at all when I went into my place that morning; I would get the air before Weir; these places were not dipping or rising, but on the level; I was in Weir's place a couple of hours after his accident; I saw canvas brattice in the place; it was about 10 yards from the face; we were shifted twice during that shift; I have never noticed any black-damp about any of the places where I was working; from my experience of the ventilation in the colliery, I should say it was not too bad—that is, good enough; I had not been told by anybody before that morning that fire-damp had been given off in those narrow bords; I did not ask Rendal if those places had been inspected that night before I went in; I did not hear Weir ask such a question on that occasion; on another occasion I heard him ask such a question: that was when Rendal was off sick, and Gall was in his place; Weir asked Gall if that place had been examined; that was the week following the burning of Weir; Gall replied, "Do you think I've been sitting on my d—— a—— all night?" that was all that was said; I have never heard Weir ask anybody but Gall that question.

*By Commissioner*: The skin on Weir's neck and ears rose up; I did not consider he was seriously injured; he worked for two-thirds of the shift and then went home.

*By Mr. Edmunds*: I reported the matter to Mr. Rendal only; I never had a chance of looking into the deputies' report-book to see what was the state of the mine; it was kept from our view—at least I did not know where it was; I did not know I had a right to look at that book; I never saw it all the years I worked there; I never looked for it nor asked for it; I had an idea where it was kept in the overman's cabin; I never mentioned the burning of Weir to any of the Government inspectors; I have been at work in the pit when Mr. Dixon has made his inspections; I have never seen anything in the nature of interference with his work at the times of his inspections; I have known of nothing to alter the state of the pit during his inspections; there have been several check inspections of the mine since July last; they were competent miners who carried out those inspections.

*By Mr. Bruce Smith*: Weir worked for two-thirds of his shift the night he was burnt; he only left on the pressure of Rendal; he was perfectly willing to go on with his work and finish the shift; he only remained off one shift; I am not aware that I ever told Bailey of this occurrence; I have never met with any case of faulty ventilation in the mine; since I went to work in the mine in 1888 I have never met with gas in it; I have never seen the flame of my lamp affected in any way by gas; Weir told me his lamp had been blown out by the gas; it was burning when he came to me; I have never known of any alteration in the ventilation of the mine in anticipation of a visit from the inspector; I have never known the ventilation to be turned into one particular district during their visits; I have never known beforehand of the visits of the inspectors; it was always the custom to meet the overman at the cabin; we saw nobody at the station, but the board was always there; there was nothing exceptional in not meeting the Deputy Wilson at the station on that particular occasion.

*By Mr. Edmunds*: Fox was in the back narrow bord at the time of the fire.

*By Mr. Smith*: I know that I contributed towards the expense of the check inspections; I never knew where the check inspectors' books were kept; I never asked for them; they reported to the lodge; I have heard the reports of the check inspectors' inspections read out at the lodge meetings.

*By Mr. Edmunds*: The check inspectors' reports are left at the manager's office, and a copy is taken for the lodge; that is read out at the lodge meeting and afterwards published in the newspapers.

*By Commissioner*: All the men in the mine belong to the lodge; they would all have an opportunity of hearing those reports and knowing what they were.

*By Mr. Bruce Smith*: I have never seen Bailey at a lodge meeting.

*By Mr. Curley*: I have seen as few as twenty men at a lodge meeting, and as many as one hundred.

*By Commissioner*: When we got to the cabin we would meet the night overman, who would tell us to go to our work; he would never tell us all was safe; he was never asked the question; we would see the board at the station; all the inspection was supposed to have been done before we left the overman's cabin; there was a cut-through between the two narrow bords about 20 or 30 yards from the face; Weir was in the bord itself; there was a distinct report when Weir was burnt.

*By Mr. Curley*: I have seen the furnace very low on a Sunday night; that was not a regular thing, but I have occasionally seen it that way on a Sunday night; I have not seen it that way on any other night; I did not take particular notice of it on the night Weir was burnt.

*By Commissioner*: I have never seen the furnace out at the "week ends."

*By Mr. Bruce Smith*: It is some three or four years back that I occasionally saw the furnace low on a Sunday night, but since then I have not seen it so.

*By Mr. Curley*: I might say it was a couple of years ago that I saw it low on a Sunday night; I cannot come any nearer.

*By Mr. Bruce Smith*: I did not expect any later notice on the board on the night of Weir's burning than was on it.

*By Mr. Edmunds*: The pit had been idle on the Sunday; it was Rendal's duty to inspect the pit before we went down that night.

THOMAS ABELL.

EXHIBIT

## EXHIBIT D.

COURT resumed at 10 a.m. this 28th day of June, 1899, Court-house, Newcastle.

This deponent, *Joseph Fox*, on his oath, states (*in answer to Mr. Curley*):—I am employed at the Newcastle A pit; I have been so for about ten years; I have not worked in A pit all that time; I worked for three-quarters in the B pit; I have worked in the A pit for the last nine or twelve months; I have been engaged in shifting dirt; when I was working on the coal I was working with a man named Phillips; during the last nine months I have worked with George Evans, Charles Hedley, and George Coote; the latter two have worked with me for about four months; I worked with Evans before that; I went to work with Evans, who was there before me; a man named Bailey left his place, and I took his place; Weir was working there as a shiftman, also Abell; I have worked alongside both Abell and Weir; I noticed a small flash of gas there one night while working near them; it was nothing to speak of though; that was in the back narrow bord, No. 6; I saw the flash myself; Weir was in the bord at the time; I was in the bord, and Weir came to me; I was bailing water at the time below the canch.

*By Commissioner*: I had a naked light at the time.

*By Mr. Curley*: Weir came to me and asked me how I was getting on; I said, "All right"; with that he got on the canch with his light, and I saw a small flash of gas at his light; it was not much of a flash, but very small; I went out just at the time; I went back, and was baling water again, using an open light; the light kept in all the time; just at the time the flash came Weir said, "God help me"; the flash went right across Weir's face, and he fell on his knees; his light went out, and he lit it at mine; one side of Weir's moustache was singed; I looked at him carefully just at the time he said his neck was bad; I looked at it, but could not see anything wrong with it; I could not see any skin broken; I looked at it for a minute or two.

*By Commissioner*: I saw him when he went down on his knees, and again when I had baled a couple of tubs of water.

*By Mr. Curley*: Weir kept working that day, but in another bord to which he was sent; he went to the front bord; he worked there till about 3 o'clock; I afterwards heard that he had gone home; I was in that place that morning before Weir; I had just commenced to bale when he came in; this was about 11 p.m. on a Sunday; it was fully nine months ago; I cannot remember what month it was; I took no notice of the month or date, never thinking anything would come of it; I went down the mine at 10 p.m. that day; I went and harnessed my horse, and away I went after getting my orders from Rendal, whom I saw in the cabin at the pit bottom; he told me to go water-baling in Nos. 6 and 7 districts; I saw no cross-rails in that place to stop me from going in; I consider the station for No. 6 is the little flat where there is a signal-board; I saw the board that night when I went in at the station; Wilson's name was on one board and Bailey's on the other, saying, "All safe"; I took no notice of the date on the board; I have never been warned by any of the mine officials about gas in the mine; I have never noticed any gas before that night since; as soon as I saw Rendal I told him about the gas; I had baled a couple of tubs of water after the flash, and then saw Rendal; it must have been two hours before I saw Rendal; I told him there had been a small flash of gas in the back narrow bord; he told me not to go in there again; he came along with the witness Bailey; Bailey was not with him when I first saw him; Rendal told me not to go in there again; I went to No. 7, and when I returned to No. 6 that place was fenced off with two props; I do not know who fenced it off; I believe it was Bailey; I have been in other parts of the mine besides Nos. 6 and 7; I have been all over the pit.

*By Commissioner*: I have been all over the mine at all hours of the day and night.

*By Mr. Curley*: I have never come across any black-damp in the pit nor seen any men affected by it; I thought the ventilation was very good in the place where I saw the flash of gas in the back narrow bord; I saw the furnace that night; I passed it; I saw no furnace-man there; the fire was burning; I cannot say whether there was a furnace-man there or not; the fire was not so big as it is now, nor as it has been, but it was a very good fire; it was not a small fire nor a big fire; I was often at work on the Sunday nights like that; I have seen a furnace-man at the furnace on the Sunday night; he was Peter McGuinness; I was down the Sunday night prior to this; I did not see any furnace-man then; I was down the Sunday before that again; I saw the furnace-man that time—Peter McGuinness; Rendal always gave me my orders on a Sunday night; I have never seen any other officials in the shape of deputies there on a Sunday night; there were no deputies there on a Sunday night; I have never seen Deputy Wilson there on a Sunday night, because it is 3:30 on Monday morning when he comes down.

*By Commissioner*: I must have had between eight and nine years' experience in the A pit.

*By Mr. Edmunds*: It was Rendal's duty to inspect that place on a Sunday night, before I went in; Bailey and Wilson would go round in the morning; Rendal said nothing about the condition of the mine that night when sending me to work; I cannot say what date was on the board; it might have been Saturday morning's date or Sunday night's; that particular part—the two narrow bords—was portion of Bailey's district for inspection; the work went on on the Monday in those two bords; the miners came down at 6 and 8 on the Monday morning; I do not know whether they went to work in those bords on that morning; they must have just started the cut-through at the face on the Saturday morning; there was another cut-through about 35 yards from the face; there was brattice in the bord; it was about 8 yards from the face, and within 2 or 3 yards of the canch which projected 3 or 4 yards from the face; Weir was between the brattice and the face at the time the gas fired; Weir had been sent to work in the front narrow bord; he had no right to be where he was at the time; I heard Rendal tell him and Abell to timber the front narrow bord; I know we have no right to go anywhere but where we are sent to; I do not know what brought Weir into the back narrow bord; I had been baling for about five minutes when Weir came in there; I was below the canch between the end of the brattice and the face; Weir was between me and the face of the coal when the gas flashed; he was about 3 yards from me at the time, and about 4 feet from the face; the canch was about 2 feet 6 inches from the floor, and the height of the coal from the level of the canch to the roof about 5 feet 6 inches or 6 feet; Weir was about 5 feet 3 inches high; his light was pretty close to the roof when he got on the canch; he stood upright on the canch, which would bring his flare-lamp to within a few inches from the roof; his face was towards the corner of the bord, and about a yard from the face; I had noticed the air coming to me; I thought it was very good; I have to pass the furnace every night, and have observed it from time to time; I cannot say whether it was banked at the "week end"; it has always been burning when I have seen it; the furnace-man might be away when I was passing; he fires up and then goes away to the pump; I only know the one furnace-man who is on my shift; another man comes in his place at 3 a.m.; I think his name is Redpath; I have been there when the Government inspectors have been inspecting the mine; I have been there when Inspectors Bates and Dixon have been inspecting; I have seen them there; I have never known beforehand when these inspections were to be made; as far as I know the men did not know of the intended visits of the inspectors, nor did the management; I have never heard it said that the visits were to be made; I have never known the ventilation to be interfered with on the visits of inspectors; I have known the brattice to be renewed when the horse has pulled it down with the skip while the inspector was there.

*By Mr. Edmunds*: The brattice had been pulled down a few hours before it was brought up; I have never known a brattice to have been down for some time, and then put up on the visit of the inspector; the brattice is often pulled down accidentally; I have never known a canvas screen to be put across the road so as to alter the ventilation.

*By Mr. Bruce Smith*: When I went in that morning I look at the board to see if things were all right; I always looked at that board for that purpose; I depended on the names on the board; it was about 4 a.m. that Bailey came to the bord where Weir had been injured; he would come down the mine about 3:30 a.m.; he came there with Rendal; Weir had gone out then; Weir continued his work for over three hours after his accident; he only missed one shift as a result of the accident; Weir's hair was not burnt that I could see; there was no skin raised on his neck that I could see; I saw no injury to his neck at all; he was not doing any work there; he had not started work at all; he should have been in the front narrow bord where Abell was working; I have no idea why Weir came into the place unless it was to see me; he came in, asked me how I was getting on, then jumped on to the canch; the flash took place immediately; he was not in there many minutes altogether; the only place in the mine where I have ever found the ventilation deficient was in No. 1 district, about seven years ago.

*By Commissioner*: Brattice was not carried to the face in those days, but only across the heading.

*By Mr. Bruce Smith*: After the accident I went to my work; neither Weir nor Abell advised me to leave; I was working with a naked light; Weir went to Abell after his accident, and I followed him; the three of us were there together; neither of them warned me against going back to my work, nor spoke of it as being dangerous; McGuinness might have been at the pump when I did not see him at the furnace; the pump is about 30 or 40 yards from the furnace; I could not see him from the furnace if he were at the pump; he might have been at the furnace five minutes before I passed there, and gone down to the pump.

*By*

*By Mr. Curley:* Weir was about a couple of minutes on the canch when the firing took place; he stepped on to it, had a look where they had commenced to cut through, and went to the corner where the gas fired; he jumped on to the canch; he stood there a couple of minutes before the flash took place; there was dirt on the floor below the canch; he stepped on to the stones then on to the canch; I left the cabin that morning before Weir and Abell; when I got my instructions from Rendal I left at once; I got the instructions at the cabin; I heard the instructions given to Weir and Abell at the cabin; he told them to go to the front narrow board and timber; Rendal mentioned the narrow boards.

*By Commissioner:* The back narrow board had been timbered; I cannot say if the timber required any repairing.

*By Mr. Edmunds:* If timbering had been required in the back narrow board the same men would have to do it, but only when instructed by Mr. Rendal.

*By Mr. Bailey:* I had seen you examine that place on the Monday morning before the burning took place; I can speak definitely about that; I saw no one else in that particular district on that Monday morning; you had your lamp with you; it was an open lamp; I always found the furnace burning; I have noticed the state of the furnace on coming out after my shift during the last five or six months; it was always burning brightly; I cannot say how long it would remain bright; the fire was broken up, so that the air could get through it; it was not caked up; the furnace-man went up at 3 o'clock; I cannot say whether the furnace is the same size now as it was eight years ago; there has not been another furnace put there; it is the same old furnace, as far as I know; I cannot say whether it has been made bigger; the mine has been worked regularly for the last four years; during the eight years the working-places would be getting further from the furnace.

*By Mr. Bruce Smith:* I am quite certain Rendal ordered Weir and Abell to go to the front narrow board that night.

*By Mr. Curley:* I left the cabin before Weir and Abell that night; I heard Rendal tell them to go to the front narrow board; I had left the cabin, but went back for my pin, and heard the order given to them.

*By Commissioner:* I think Weir fell down more from shock than anything else; I saw the flame; it was about 6 feet long; I was standing up before I began to work in the board; it has always been the custom to meet Rendal at the cabin before we went to work; none of the men were allowed to go beyond that point until allowed by Rendal; Rendal was always down before us; I went down with him one night, but I was early; he generally went down between 7 and 8 p.m.; on the night I went down early with him he went ahead, then came back and told me to go ahead; as far as I know he had examined the place where I went to work before he sent me there; I heard no hissing or piping sound from the face before I saw the flash, when Weir was hurt; the roof was slightly hollow just there; we had just passed a bit of a fault, and the miners had cut up to get the full height of the seam; there was a kind of pot in the roof, a very small one; it was not far from where Weir was standing.

*By Mr. Curley:* The height of the seam was between 8 feet and 8 feet 6 inches; the canch was about 2 feet 6 inches high from the floor; I never measured it; the manager never asked me any questions about this flash, nor did the under-manager; I have never been to the colliery office in connection with it; Inspector Atkinson has seen me, but not Inspector Dixon; Mr. Atkinson sent for me about a month ago; he asked me several questions, and I made a statement to him; I mentioned the matter of the flash to the shiftmen who were working that night; McCrennon was one of them; it went from him to the others, and became generally known among the shiftmen; there were about twenty of them at work that night.

*By Commissioner:* I did not make a written statement to Mr. Atkinson; he asked me questions, which I answered, and he wrote something down.

*By Mr. Edmunds:* They had cut through the fault in the narrow board on the night of the accident; it ran across the board in a straight line; it was a very small fault, not more than 3 or 4 feet thick; the dyke was close to the canch where I was baling the water; that was about 4 yards from the face; the country was not much disturbed; there was good coal the other side of the dyke; I did not notice whether the coal had been injured by the dyke; after they got through the dyke they carried the board on; there was a bit of cinder coal between the dyke and the good coal, but not much; from where the good coal gave out and occurred again would not be more than about 4 feet; I remember them cutting through that dyke; it was stone all through the dyke; it was the ordinary stone which is met with in faults in the coal seams.

*By Commissioner:* Weir was in front of that part of the roof where the fault was; he could not have put his lamp into the hole caused by the fault; I did not notice whether there was a hole in the roof besides that.

*By Mr. Bruce Smith:* The defect in the ventilation eight years ago, that I have spoken of, was remedied immediately by the deputy.

*By Mr. Bailey:* There were two deputies' boards in No. 6 district at the time of the burning, one at the big flat and another at the little flat; the figures on the board were 1 8 9, and then some in chalk by the deputies; I do not know in what month the second board was put up, before or after the burning; it was on the left side of the road, facing No. 7; the other board was as you came out of No. 8 district, alongside the deputies' box.

Taken and sworn at Newcastle, this 28th day }  
of June, 1899, before me, — }  
C. G. WADE, J.P.

JOSEPH FOX.

## EXHIBIT E.

[Plan.]

## EXHIBIT F.

SPECIAL RULES for the conduct and guidance of the persons acting in the management of the N.C.M. Co.'s (Ltd.) Colliery, in the district of Newcastle, and all persons employed in or about the said colliery, framed in conformity with the provisions of the Coal Mines Regulation Act, 1893, 60 Victoria No. 12.

### Manager.

1. The manager (or the under-manager when acting for him) shall have the daily supervision of the above colliery, and shall have full command over all other officers and workmen employed in or about the colliery, who are to receive their orders from him, and shall apply to him for instructions as often as may be necessary.
2. He shall comply with the requirements of the Coal Mines Regulation Act, 1896, and shall, to the best of his power, enforce the observation of the said Act, and enforce observation of the General and Special Rules.

### Under-manager.

3. The under-manager shall have the daily supervision and responsible charge of the mine under the direction of the manager, and shall give all necessary instructions to the men and boys in the mine respecting their work; and shall, to the best of his power, see that they comply with the rules and regulations of the colliery, as well as the orders of the manager, and shall visit every working-place in the mine daily, or as often as may be practicable, and see that the air-courses and stoppings are kept in a good state of repair, and that an adequate quantity of fresh air is constantly supplied to the men.
4. He shall give immediate attention to any complaints, and shall inspect, personally, such portions of the mine as are reported to be unsafe or in any way to need his attention.
5. He shall see that a sufficient supply of timber is sent down the mine and into the different districts.
6. He shall see that each miner keeps his working-place sufficiently timbered, and shall suspend at once any miner refusing or neglecting to do so.
7. He shall examine every day the different main and district air currents, and shall see that the furnaces are kept in good repair and carefully attended to.
8. He shall, under the direction of the manager, cause safety-lamps to be used, and naked lights to be excluded where required by the Act.
9. He shall see that the deputies, miners, shifters, and all others under his charge in the mine, strictly and rigidly observe the rules applicable to them, and shall suspend immediately anyone infringing or attempting to infringe any rule, order him out of the mine, and report the same to the manager.

Deputy.

*Deputy.*

10. Each deputy shall be informed by the manager or under-manager as to what portion of the workings is to be under his charge, and all persons working in that portion of the mine will be under his direction, and he shall, in the absence of the manager or under-manager, direct the workmen how and where they shall work, and shall see that the rules applicable to them, as well as the orders of the manager or under-manager, are strictly attended to.

11. The deputy or other competent person appointed for that purpose shall be in the mine within four hours before the workmen commence, to enable him to examine the working-places, &c., carefully, and shall ascertain the condition thereof so far as the presence of gas, ventilation, roof and sides, and general safety are concerned, and shall record the result of such examination without delay in a book to be kept at the mine for the purpose.

12. He shall place cross timbers, or rails, thus X, or a signal board, as a signal of danger at the entrance of every working-place which he may find unsafe, and on his return to the station shall state on his board all places so found unsafe.

13. In any place where there is a dangerous appearance of fire-damp, locked safety-lamps shall be used; and no workman shall be permitted to remain where fire-damp has accumulated in such a quantity as to show a permanent blue cap over the flame.

14. Before safety-lamps are taken into the workings the deputy, or some other competent persons duly appointed for the purpose, shall examine the entire lamp, and if all is right, shall lock it for the miner.

15. Should there be any discharge of gas, or any condition of roof from which the deputy apprehends any danger, he shall instantly report the circumstances to the under-manager.

16. He shall report as soon as possible to the manager or under-manager all accidents, dangers, or defects which may occur in his district of the mine, and he shall also so report any accident, danger, or defect to, or in any machinery or structure in, the mine which may come to his knowledge.

*Wheelers.*

17. The wheelers shall report to the under-manager or deputies if any part of the road or roof has been deranged, or is insecure or dangerous.

18. Any wheeler injuring a door or brattice cloth door, and not immediately reporting the fact, shall be suspended. He shall also report to the under-manager or deputy every morning the quantity and different lengths of timber required for his miners.

19. He shall take in without delay any timber the miners may require, and shall at all times carry out the orders of the manager, under-manager, or deputy, in order to facilitate and promote the work of the mine.

20. Any person neglecting these rules will be liable to instant dismissal or prosecution according to law.

*On-setter.*

21. The on-setter shall, subject to the directions of the manager or under-manager, have the sole control of the pit bottom, and the command of the signal up the pit, and on no account shall he allow any person to interfere with the signals. He shall at all times when sending up skips of coal see that none of the coal projects beyond the side of the skip, and shall pay the greatest attention to the signals when men are going to ride, in order that accidents may be avoided. The signals shall be as given in rule 90.

22. No timber, materials, stones, coal, or other things shall, under any circumstances, be lowered or lifted in a pit while men are being lowered or lifted in it, except such as may be necessary in repairing a pit while the repairs are going on.

23. The on-setter shall not, on any account, allow more than six persons in a single cage, or ten in a double cage at the same time.

24. Any person refusing to leave the cage when ordered to do so shall be immediately suspended.

*Miners.*

25. Any miner after passing through a door must instantly close it; and shall not injure a door or leave it open, break down a stopping or brattice, interfere with or obstruct or damage an air-crossing, or an air-pipe, or remove or go beyond a mark or "danger-signal," without orders from the manager, under-manager, or deputy.

26. Every miner shall securely sprag or uphold the coal whilst holing, and shall securely prop up the roof of his working-place, so that accidents may be avoided; and should he not be provided with a sufficient quantity of timber he shall cease working and report the same to the manager, under-manager, or deputy.

27. The seam of coal must be wrought strictly in accordance with the orders of the manager or under-manager.

28. Every miner shall, in all matters relating to the working of the mine or the safety of the men, obey strictly the orders of the manager, under-manager, or deputy; and no person shall go into any part of the mine other than where he is employed, except by the order of the manager, under-manager, or deputy.

*Door-keepers.*

29. A door-keeper must only open a door for the passage of persons, skips, or animals, and must instantly close the same when they have passed through. He must never allow a door to remain open, or to be propped or fastened back, unless authorised to do so by the manager, under-manager, or deputy.

30. A door-keeper must not leave any door or doors under his charge until the work of his shift is finished, or until another person appointed by the manager, under-manager, or deputy takes his place.

31. Any door-keeper becoming aware of any defect in, or damage to, any door, shall report the same as soon as practicable to the manager, under-manager, or deputy.

*Persons in charge of Ventilating Appliances.*

32. The persons in charge of any ventilating furnace or other ventilating appliance shall not leave the same without the permission of the manager, under-manager, or engine-wright.

33. Furnace-men must pay careful attention to the furnace under their charge; and shall maintain the fire in such a state as constantly to ensure efficient ventilation.

34. The fan and fan-engine shall be carefully attended to by the person or persons in charge thereof, who shall keep the same running at the speed ordered by the manager, so that effect may be given to the provisions of the Act as to ventilation.

35. All persons in charge of ventilating furnaces, fans, fan-engines, or other ventilating appliance, shall immediately report any damage, defect, or derangement therein to the manager, under-manager, or engine-wright.

*Lamp-keepers.*

36. No person, except a person authorised by the manager or under-manager, shall either take himself or give out for use in the mine any safety-lamp.

37. Lamp-keepers must see that every safety-lamp is thoroughly cleaned, properly put together, in safe working order, and securely locked when given out for use in the mine. If any lamp be not returned at the proper time they shall at once report the fact to the manager or under-manager.

38. All persons entrusted with the duty of cleaning any gauze, or other part of any safety-lamp, or with the duty of putting any safety-lamp or parts thereof together, shall at once report any defect therein to the lamp-keeper, or if there is more than one lamp-keeper, then to the head lamp-keeper.

39. Whenever any defective or damaged lamp is received from any person by any lamp-keeper he shall report the fact to the manager or under-manager, and shall cause such lamp to be kept in the state in which he received it until seen by one of them.

40. Every lamp-keeper shall see that all oil, spirit, and other inflammable articles under his charge are carefully and properly stored and used, and that no greasy waste or other refuse is allowed to accumulate in or near the lamp cabin.

*Engine-wright.*

41. The engine-wright, or other competent person appointed for the purpose, shall cause the ventilating-fan or other mechanical ventilating apparatus, together with the engines, machinery, and boilers for driving the same, to be properly attended to.

42. The engine-wright, or other competent person or persons appointed for the purpose, shall have charge of all engines, machinery, and boilers used for raising or lowering persons or minerals, or for pumping water, and of all ropes, chains, appliances, or apparatus connected therewith; and of all guides, ropes, chains, conductors, or other appliances in the shafts, and of all other engines, machinery, and boilers in or about the mine. In case he shall discover any weakness, defect, or want of repair therein, he shall, as soon as practicable, cause the same to be repaired and made good, and shall at once report to the manager the fact of such defect, weakness, or want of repair, and also the steps taken to remedy the same.

43. The engine-wright, or other competent person or persons appointed for the purpose, shall make the examinations and report required by General Rule 5.

44. The engine-wright, or other competent person appointed for the purpose, shall cause every rope used for raising or lowering persons or minerals to be securely attached to the drum, so that when either cage is at the pit bottom there shall be not less than two rounds of rope upon the drum.

45. The engine-wright, or other competent person, whenever a winding rope requires capping, coupling, or splicing, shall superintend the same, and shall see that no spliced rope is used for raising or lowering persons in a shaft.

46. The engine-wright, or other competent person or persons appointed for the purpose, shall see that the fences are fixed and maintained at the top of every shaft, and that the guides, signals, covers, flanges, or horns, appliances, brakes, indicators, fences, valves, gauges, and things required by General Rules 18, 20, 26, 27, 28, 29, 30, 31, 32, and 33, or any of them, are fixed and maintained as therein required; and that the provisions of General Rule 25 are carried out above ground.

47. The engine-wright shall cause bells or other signals to be fixed in every drawing engine-house connected with the drawing pit bottom, and with every entrance for the time being in work between the surface and bottom of the shaft; and shall cause the board required by Special Rules 23 and 67, stating the number of persons authorised to descend or ascend the shaft at one time, to be fixed and maintained on the pit bank.

48. The engine-wright shall cause each working boiler to be cleaned and examined as often as the manager shall so order.

49. The engine-wright shall cause the code of shaft signals used in moving the cages to be fixed and maintained at the top and bottom of each winding shaft, and at every shaft to which the provisions of Special Rule 60 apply, he shall see that the point named in that rule is distinctly marked on the indicator.

*Screen-overseer.*

50. The screen-overseer shall have charge of the platform, banksmen, and screens, check the observance of the rules by the banksmen and on-setters, receive the report of the banksmen as to any defects observed by them and communicate immediately with the engine-wright or manager.

51. Shall see that all fires are extinguished when work in the pit is done, and that the safety-bars are put across the shaft.

52. Shall see that the timber, rails, &c., necessary for each day's consumption are brought over to the pit and sent down when required by the under-manager.

*Engine-drivers.*

53. Every engineman shall attend at such time as the manager may appoint, and as required by General Rule 25.

54. An engineman shall not allow any person to interfere with the engine or machinery under his charge, or to remain in the engine-house unless authorised by those in authority above him. A winding engineman while winding must remain at the handle and must pay particular attention to the indicator and signals, and if he perceives anything wrong must instantly stop his engine and not start it again until the defect is put right or until he receives an order to go on.

55. Every winding engineman before commencing work in his shift, and before any person descends the shaft, shall carefully examine the engine, machinery, drums, ropes, brakes, indicators, and signal apparatus in the engine-house or under his charge, in order to ascertain whether they are safe and in good working order, and shall run the cages at least once up and down the shaft. Where shifts are worked continuously, it shall be sufficient if this rule is carried out at the commencement of the morning shift.

56. Every engineman, unless some other competent person is specially appointed for the purpose, shall keep the engines, machinery, and things connected therewith under his charge, properly cleaned and oiled, and shall see that they are in good and safe working condition. He shall see that the provisions of General Rules 27, 30, 31 and 32 are carried out and observed during his working shift, so far as they relate to engines or machinery under his charge.

57. Every engineman must diligently and carefully attend to the working of the engine and machinery under his charge. He must examine such engine and machinery before commencing work, and if he becomes aware of any weakness or defect, or apprehends any danger, he must, as soon as practicable, inform the manager, under-manager, deputy, or engine-wright. He shall not alter a safety-valve without leave from the manager, under-manager, or engine-wright.

58. Every engineman, in addition to the duty in this respect imposed on the engine-wright, shall see that any ropes attached to the drum of the engine under his charge are securely attached, and so that when either cage is at the bottom of the pit there shall not be less than two rounds of rope upon the drum.

59. Every winding engineman, whenever the engine under his charge ceases working, shall see that the cages are left so as not to impede the ventilation.

60. When men are being raised in shafts where the winding apparatus is not provided with some automatic contrivance to prevent overwinding, the cage shall not be wound up at a speed exceeding 3 miles an hour when and after it has reached a point 10 feet from the top of the shaft, as required by General Rule 27, and such point shall be marked on the indicator.

61. The signals given in Rule 90 shall be carefully observed by the engineman.

*Banksman and assistants.*

62. That the banksman shall, subject to the directions of the manager, under-manager, and engine-wright, and screen overseer have the control of the pit top, and the command of the signals down the pit and to the engineman.

63. That the banksman shall be responsible for the state of the pit top, and shall see that the frames and the surface near the pit mouth are kept free from coals, stones, or dirt.

64. That at least one banksman and one on-setter, or other person appointed by the manager, under-manager, or deputy for that purpose, shall be at their respective posts at the proper time every morning, to give the proper signals, and to see the men and boys carefully into and out of the cages at the top and bottom of the shaft.

65. The banksman must be at the drawing shaft at such times as the manager or under-manager may appoint. He shall not allow a person to descend or ascend until the cages have been once run up and down the shaft, but where continuous shifts are worked it shall be sufficient if this is done at the commencement of the morning shift.

66. That the banksman shall not permit strangers or persons not employed in the mine to descend the pit or remain upon the bank, unless authorised by the manager; and shall caution strangers descending to keep carefully within the cage until they are fairly landed. He shall not allow an intoxicated person to descend the pit.

67. That the banksman or onsetter shall not allow more than six persons in a single cage, or ten persons in a double cage; nor shall any person be allowed to ride with or against coals, slack, dirt, &c. Neither shall any person, unless specially allowed by the manager, under-manager, or deputy, be permitted to carry any tools, implements, props, rails, or such like in his hands whilst so riding; but the same shall be securely placed in the cage, skip, or basket, so that no danger may exist of their falling out during their ascent or descent, or of their coming in contact with anything in the pit; and no person shall be allowed to get upon or off the cage at the pit top unless it be standing upon the catches or keeps, or at a mouthing, without the signal first being given and responded to.

68. The banksman must frequently observe the pit top pulleys, ropes, chains, cages, and landing apparatus during working hours, and whenever he becomes aware of any weakness or defect therein, or in anything belonging to the shaft, or any engine, machinery, or winding tackle, he must immediately inform the engineman, and the manager, under-manager, or engine-wright, or screen overseer, so that it may be repaired.

69. The banksman must report to the manager or under-manager any disobedience on the part of the miners or others.

70. The signals given in Rule 90 shall be carefully observed by the banksman.

*Miners and all other persons employed.*

71. No person acting in a place of trust shall depute anyone to do his work without the sanction of the manager.
72. No swearing or fighting is allowed in or about the mine, and no intoxicating liquors shall be permitted in the mine without the consent of the manager.
73. Any person employed in the mine shall inform the person in charge of the workings of the existence of any choke or fire-damp, of any insecurity of the roof, shaft, or any other part of the workings, or of any air-door being damaged or left open, immediately on its being observed by him,
74. No person shall be permitted to carry a naked light attached to the cap or hat on his head whilst handling explosives, or in charging holes for blasting.
75. A safety-lamp must be frequently examined, and if a lamp shows a blue cap, the person using it must carefully draw down the wick with the prickler, cease working, leave the place, and report the same to the manager, under-manager, or deputy.
76. No person shall place a safety-lamp on its bottom unless it is necessary to do so for the safe performance of any particular work, or unless authorised by the manager, and in all cases the lamp shall be hung or placed at least 2 feet from the swing of the pick, hammer, or other tool.
77. No person shall leave a lighted candle or other light in any part of the mine when leaving his work.
78. No person shall try the wastes or workings for fire-damp with a naked light, and no person shall smoke or take a naked light, tobacco pipe, cigar, cigarette, lucifer matches, or candle, where safety-lamps are ordered to be used.
79. No naked lights shall be allowed or taken beyond any danger signal where gas exists.
80. No person shall wilfully kindle a feeder of gas, or negligently have the gauze of his safety-lamp full of fire, or unlock the lamp, or unscrew the gauze, or blow out the flame, or light tobacco or other substance at the gauze, or damage or improperly use the lamp, or leave it in the works, when he has ceased using it.
81. Any person discovering any stoppage or derangement to ventilation, injury to an air-crossing, door, regulator, sheet stopping, brattice, or air-pipe, or observing any injury to or obstruction of an air-course, shall immediately give notice to the manager, under-manager, or deputy, and to any person or persons whose safety may be endangered thereby.
82. Any person passing through a door or sheet must instantly close the same, unless it is a door or sheet ordered to be kept open. No person shall, without authority, remove any caution-board, notice, or danger signal, or pass any danger signal, caution-board, or fence.
83. In case of a shot missing fire the workman shall place a danger signal at the entrance to his working-place, and shall immediately report the same to the manager, under-manager, or deputy.
84. Every miner or other workman in charge of any working-place, before commencing work, and at intervals during his shift, shall examine his working-place, and in case any danger is observed shall at once report to the manager, under-manager, or deputy.
85. No person shall leave coal, slack, or other material so as to impede the ventilation; nor leave a skip or other obstruction in the air-current.
86. Every horsekeeper shall see that no animal under his care is allowed to go to work while in an unfit state, and shall report to the manager, under-manager, or deputy, any injury received by any animal.
87. No person shall wilfully injure any animal whilst in his charge, or permit it to receive injuries by his wilful act or negligence, and shall report immediately to the horsekeeper or a deputy any injury received by such animal while in his charge.
88. No person shall take a horse on to or travel along any incline or plane, either in the mine or on the surface, which is self-acting or worked by machinery, while it is in motion, without special instructions from an officer of the mine.
89. Every person in charge of any animal shall immediately report to the manager, under-manager, or deputy, in case he finds such animal cannot pass along any road without rubbing against the roof or timbering; and no person shall, unless otherwise authorised, give his horse into the charge of any other person than the horsekeeper at the stables.

*Shaft Signals.*

90. The following signals (with such additions as under special circumstances may be ordered by the manager) shall be carefully observed by the engineman, banksman, on-setter, and other persons employed at this colliery:—

- One knock—To go on.  
 One knock—To stop when the engine is in motion.  
 Two knocks—When any person is going to ascend or descend.  
 One knock—In reply before any person is allowed to get into the cage.  
 Three knocks—To lower slowly.  
 Four knocks—To ascend slowly.

91. Every person when on the pit bank, or while about to descend the shaft, shall obey the orders and directions of the banksman; and every person, while in or about the pit, or while about to ascend the shaft, shall obey the orders and directions of the on-setter.
92. No person shall improperly use any signal, signal wire, or signal apparatus.
93. No person shall get into the cage after the authorised number is in, or if forbidden to do so by the banksman or on-setter.
94. Every person who shall couple or fasten any skip to any other skip, or to any rope or chain, shall see that such coupling or fastening is made secure.
95. All persons employed in the mine shall be under the control of the manager, under-manager, and deputies, and shall at all times obey their lawful commands.
96. Any person committing a breach of any of the foregoing Special Rules is liable to be instantly dismissed.

*End.*

Name of the Mine—N.C.M. Co.'s Colliery. Where situated—Merewether. Name of the Owner—N.C.M. Company (Limited). Name of the manager—J. Croft. Name and address of the Inspector of Mines of the District—J. Dixon, Newcastle.

## CERTIFICATE OF SPECIAL RULES, NEWCASTLE COLLIERY.

J. CROFT, Manager.

I HEREBY certify that the above copy of Special Rules has been shown to my satisfaction to be a true copy of the Special Rules which, at this date, are established under the Coal Mines Regulation Act, 1896, for the above-named mine.

5th day of March, 1897.

JOHN DIXON,  
Inspector of Collieries.

## EXHIBIT G.

THIS deponent, *John William Taft*, on his oath, states (*to Mr. Curley*):—I am a miner working in the B pit of the Newcastle Coal Mining Company; there is another pit called the A pit; I have worked in that since about three and a half years ago; I have worked several quarters in that pit; out of the three and a half years' employment by the Company I have been away nine weeks; I have been principally engaged in getting coal; I have also done shift-work in Nos. 5 and 6 districts; I was opening an old heading in No. 5; the ventilation there was not too good.

*By Commissioner*: I mean by that that it was not sufficient where we were working.

*By Mr. Curley*: That would be about nine or ten months ago; I knew the ventilation was not sufficient, because the lights used to burn dull; my head used to ache sometimes, and I used to go down to the flat when I felt that; Turner was working with me; we used to come out like that every shift; we came out on to the main road; there was better air there; on one occasion I was overcome by the bad air; it deprived me of the use of my legs, and my head was ready to burst; I went back to put some tallow in my lamp, and sang out to my mate that I was losing my legs; he came to my assistance, and caught me as I was falling; I consider that was brought about by the defective air; that happened on a Monday night; Rendal saw me that night; my mate had just laid me aside, and Rendal came up the heading; Turner said

to him, "I'm glad you came in; you can give me a hand to take my mate out"; Rendal asked what was the matter with me, and Turner replied, "He's down here; he's got no use in his legs"; Rendal said, "The best thing we can do is to carry him out, and get him out on the main road"; Turner lifted me on to Rendal's back, and he carried me out on to the main heading; Turner then assisted me; I was placed on the floor, and remained there for fifteen or twenty minutes, when I recovered; I do not know what month that was in; I kept no record of it; when I recovered a bit my mate got my flannel and other clothes on, took hold of my arm, and took me out to the pit bottom; I then went home; I did not go to work the next day; I was only off one shift; I did not go back to the same place to work that night, but to No. 1—to the pillars—the next night; I had spoken to Rendal about the bad ventilation before that happened; Turner had also spoken to him about it; I told Rendal that the air was bad, and that we could not keep a light; I worked nearly the whole quarter in that place while the air was like that; that was in the same place as where I was overcome; the air was bad very nearly the whole of that time; there might be an occasional shift when it was better than at others; Rendal generally saw us once a night; if he wanted us to go anywhere else during the night he would come round and see us again; we never saw anybody else there; we were always on the night-shift; Gall used to come in sometimes; in other parts of the mine I have found the ventilation fairly good, in other parts bad; in the No. 1 pillars the air was not very good; that was about the same time as we were working in No. 5; we were working in odd shifts; Rendal used to tell us to go out of No. 5, and go into No. 1 to set timber, or perhaps he would send one of the shiftmen; No. 8 district used to be bad also; that was over twelve months ago; I was working there driving a heading; that was in the daytime; that was in the A pit; the No. 1 pillars were also in that pit; I have not noticed the ventilation bad in any other places, only in the places where I worked; I have seen the furnace at night-time; I would see it going to my work; it is nearly nine months since I saw the furnace; there was what I would call about half a fire going then, not a full fire; I am still speaking of the A pit; there was no one at the furnace that I saw at that time; I did not take particular notice who was there.

*By Mr. Edmunds:* I did not complain to Rendal on every occasion that I found the air bad; I made several complaints to him; I told him whenever the air was bad; I did not complain to any of the deputies as far as I recollect; I do not know who the deputy was for No. 5; I never looked for his report as I went to work; there was nobody there to tell us whether our working-places were safe; there was a board there to show us the condition of the mine; it was not very often that we looked at it; I think Wilson was the deputy for No. 1; I believe he also went round Nos. 8 and 9, but am not certain; I did not on any of these occasions find the air bad at the commencement of my work; it was good at the commencement of my work; I did not complain to any of the check inspectors, nor to any of my lodge officers; Rendal was the only person I complained to about it; I never bothered about looking at any of the check inspectors' reports; there were too many figures for me to count up; if I had gone to the miners' meeting I might have heard it; we do not bother to go and look at the copy kept at the lodge; the result of the inspections was published in the newspapers, but I never bother to look at them; it is the place of the check inspectors to go and have a look at all these places; I never complained to any of the Government inspectors; I do not know that the Government inspectors would inquire into any complaint, even an anonymous one; I have never known beforehand that the inspectors' visits were to be made; I have never heard it spoken of among the men; I have seen Mr. Dixon there, but did not know beforehand he was coming; I have never seen any interference with the ventilation while the inspection has been going on; I have never known the ventilation to be interfered with at any time.

*By Mr. Bruce Smith:* I do not bother much about things that do not concern me; check inspectors are elected by the lodge; I have voted at such elections occasionally; I have voted for men who have done the check inspection previously, although I knew the air was so bad; I have voted for them because others would not go to some of the places; there was one man last meeting who refused to take the office; I never objected to the nomination of any man as a check inspector; the check inspectors are elected for three or six months; I cannot say how many elections I would go to, but of a dozen; I have not attended a meeting for twelve months at a time; I did not go to the election of the check inspectors, although I was working in such bad air; I never took the trouble to look at the check inspectors' books; I never asked any one to tell what the figures were; I worked for about six months in the bad air out of the three and a half years I was in the mine.

*By Commissioner:* I was working in No. 5 district for three months constantly, except at odd times.

*By Mr. Bruce Smith:* I had my senses when I was overcome by the bad air; I had not them so fully as I have now; I knew all that went on; I walked from the No. 5 heading to the pit bottom and then home; I walked over a mile; when I got round I walked from the No. 1 flat home; it was from fifteen to twenty minutes after I had lost the use of my legs that I walked that distance; my headache did not go away when I reached the fresh air; I was on the floor when I lost the use of my legs; my mate was there also, but he was not affected; before I lost the use of my legs a sensation came over my legs; my head had been aching all the time, from half-past 6; it was simply the headache and the loss of the use of my legs; my breathing was heavy—as if I was going to heave my inside out; a deputation from the lodge sometimes waits upon the management if there is cause for complaint; I never made any complaint to my lodge about the bad air; I have told Gall that the air was not very good; it was about the beginning of June last year that I was overcome as I have described; it was on a Monday night; I was not at work on the next Tuesday; there are not many instances about that time when I was off on a Tuesday; it happened three quarters and about a fortnight ago; it would be between nine or ten months ago, as nearly as I can say; I never troubled myself to look at the deputies' boards; they were for the purpose of letting the men know the condition of the working-places; frequently I would go in without troubling to look at the board; I have seen Mr. Dixon in the mine; I have never seen him in any part of the mine where the air was bad; I have seen him in No. 6 and in the B pit; I have only seen him in one bord; I had no complaint to make about that bord.

*By Commissioner:* He came in the daytime.

*By Mr. Curley:* I can write my name and read a little bit, but not much.

*By Commissioner:* All the time I was working in No. 5 clearing up the headings I worked night-shift; on the night I was overcome I went down about 4 o'clock on the Monday afternoon; it would be about 7 p.m. when I felt ill; I vomited a little when I got home; all my limbs were shaking and my teeth chattering; that began when they got me to the flat; I was sweating; we were clearing away a fall for a road; Turner was working with me all the time; we were working on top of the fall, throwing it aside; it was about 200 yards from where we were working to the floor; there was bratticing across the head of the heading; that was about 200 yards off where we were working; we had a road cleared through as far as we had got; nothing was done after I complained to Rendal and Gall that I know of; I went back to the same place on the Wednesday after my sickness; a stopping had been knocked out then; prior to the sickness it did not occur to me that the air there was dangerous to me.

*By Mr. Curley:* Bailey was working on the night-shift at the time of this occurrence; I left the pit at 1 a.m. when I was working on the night-shift; the man who fired up the furnace used to go out when I did; that is the man I knew as the furnace-man; they used to call him Peter; when the light used to burn dull, as I have described, we used to put kerosene in our tallow; I supplied the kerosene myself.

*By Commissioner:* The light would burn all right then.

*By Mr. Curley:* I was never at the colliery office about being overcome till two or three weeks ago, when I was sent for out of the pit; I went to the office and saw Mr. Croft, senior, Rendal, and Mr. Croft, junior; the elder Mr. Croft asked me a few questions about my sickness; I was in the office about forty-five minutes.

*By Mr. Bruce Smith:* I did not complain then about the ventilation of the mine.

*By Mr. Edmunds:* I have the special rules at home, but have never bothered to read them; I may have heard them read, but have never bothered about them; I know that any person finding any choke-damp had to report it to the person in charge; Rendal was there, and knew about my case.

*By Commissioner:* I know that there are rules about reporting accidents and gas.

Taken and sworn at Newcastle, this 29th day }  
of June, 1899, before me,—

C. G. WADE, J.P.

JOHN WILLIAM TAFT.

[Rendal's evidence; also Bailey's evidence.]

Copy of W.R.'s Report.

I FOUND a little gas in No. 6 B.H.—W.R.

J. BAILEY, take a few nails in with you and put a piece of canvas up back dip H. No. 6, a little there.—W.R.

EXHIBIT

## EXHIBIT H.

THIS deponent, *Albert Turner*, on his oath, states (to *Mr. Curley*) —I am working at the Newcastle Company's mine; I am working in the A pit; I have been six months on the coal since I left shift work; I did shift work in various parts of the pit; I was for twelve months on the shift work before going on the coal; I worked with Taft for three quarters out of the twelve months; I have been fully six months on the coal since doing the shift work; I worked the first nine months of the twelve with Taft on shift work; I worked in Nos 1, 5, and 6 districts; in No 5 we were opening an old heading for pillars; we worked in that heading about three months off and on, the ventilation there was bad; it affected our lights to such an extent that we had to put a cup of kerosene into a 4 lb tin of tallow before we could get it to burn; the air used to affect me a little in the knees sometimes, but I used to take plenty of opening medicine; my knees used to shake from under me; it did not affect my head at all; I could not say that it affected my breathing at that time, but at present I am short-winded; I cannot say that is the result of the bad air I breathed in that old heading; it affected Taft; when it affected him he shouted to me, "Albert, I've lost the use of my legs", I went to him, and saw him hanging to the slabs with his hands; that was within 20 yards of where I was working; he had been only a few seconds away from where I was; he was going for a drink, I was at the spot where we were working at that time; I noticed that Taft had lost the use of his legs, and I sat him down; Rendal was coming up the heading at the time; I shouted to Rendal to come, that "Will was down"; Rendal said, "Put him on my back and I'll carry him"; when he had carried him about half way I said I would take him; I carried him to the main in take of No. 1, and we laid him down; we put all the clothes he had on him, and he recovered himself; he then walked out with my help by catching under his arm; he left the mine; he did not work the next shift, I worked there the next shift with Ben Dobb; the ventilation was bad that night when Dobb was there; I have found the ventilation in other parts where I have been very good in the headings; that was when I was working on shift work; off the headings it varied; some places it would be pretty fair and in others very bad; it was very bad in No 5; it was not bad in other places that I went to, as far as I can recollect; I was generally on the headings; No. 5 was the only place in which I found the ventilation bad; I have worked for the Newcastle Company off and on for twelve years; I have found the ventilation during that time very good on the headings; I have found it bad in the bords on occasions when I have got up any distance; I cannot name any district but No 5 where I found it bad, it was bad in No 8 when one had got up some distance; it was about seven quarters ago that I noticed that; I was driving a heading at that time in No 8; Taft was working with me then; we were working in No 8 back heading: it was in the daytime that we noticed the ventilation bad, we did not work at night time then; I cannot mention any other place in which I found the ventilation bad; I did not speak to Rendal about the matter when I felt the bad effects in my legs; he could see for himself; he had to come up the heading steadily, or else he would have lost his own light; that was on account of the defective ventilation; Bailey was on the same night shift as we at that time; I cannot fix the date of the occurrence to Taft, Taft had been working with me in that particular place about three months when it happened; that heading had no name but what we gave it ourselves—the "Zig zag"; I never saw the under manager in that heading while I was working there; we would not see them because we were on night shift; I have seen the board on the flat; all the writing I have ever noticed on it has been "J Bailey" and the date, if there was anything else on it I could not understand it; I could not read it; I was accustomed to seeing Bailey's name there, and that was how I knew it was there.

*By Mr. Edmunds* Bailey was the examining deputy for that part of the mine in which we were working then; I cannot say that the special rules have been read to me; I have had portions of them read to me; I have never had the 73rd special rule read to me, I was not aware that I had to inform the person in charge of the existence of any choke damp; if I had told anyone in charge of it, "my name was Walker"; I have never seen the Government inspector in No 5; I have seen him in the last three months in No 1 B pit, I have never known beforehand of his intended visits; I have never heard in conversation among the men that he was coming; I have never known the ventilation to be interfered with while he has been down the pit; I do not know that the Government inspector will inquire into any complaint made to him, even anonymously; we were clearing a road in No 5—making a road to enable the men to take out the pillars; it was disturbed country there; everything was down; the roof was down to the rock; I did not notice any faults in that part of the mine; I do not know how the air was supplied to us in that heading in No 5; there was no air there at all, except what came there of its own accord; I could walk right over the top of the fall; there was no work done there in the daytime; Taft and I were the only men working there.

*By Mr. Bruce Smith* I believe I have had a copy of the special rules handed to me; I never asked anyone to read them to me; with the exception of the two places I have mentioned—in Nos 5 and 8—I have never had occasion to complain of the ventilation in the mine during the twelve years I have worked there; Bailey must have known of the condition of the ventilation where the accident to Taft happened; I never knew when the inspector was coming down; I have never noticed any alteration made when he was coming; I continued to work in the place where the accident happened to Taft; I did not work there very long afterwards; there was no repetition of any such thing as happened to Taft; it may have been two or three seconds from the time Taft shouted to me till I went to him; it may have been fifteen or twenty minutes from the time he first called out to me and we started off the main heading with him; I remained with him till I put him in his own house; during all this time Taft was aware of all that was going on; he spoke to both Rendal and me; I know it is the custom for deputations of the men to wait upon the management if they have any cause of complaint; I have never known of any case of any of those men being dismissed from the service of the Company; that is because no man can be got to go on those deputations; I have known of no man in the service of this Company who has been dismissed because he formed one of such a deputation; I have known of such deputations wait upon the management; as sure as a man complains his "name is Walker"; I have never known a man to be dismissed by the management of this Company for complaining in the whole of the twelve years I have worked there.

*By Commissioner* Although I said just now that my name was "Walker" I am still in the employ of the Company.

*By Mr. Bruce Smith* I have not received any intimation of dismissal from the Company; it is my own conscience that tells me my name is "Walker"

*By Commissioner* The stopping at the No 5 heading was taken out the night after Taft's accident; about 7 p m. Dobb spoke to me, and about 8 p m the stopping was taken out; I did not go down the pit again after taking Taft home that night; I did not go down till 4 p m. next day; there was some canvas between the main road and the back heading; it was 140 yards from where we were working; it was not more than 4 or 5 yards from the main road; we had to go through the canvas to go into where were working; the canvas cut the air off from where we were working; it was a canvas hanging; we got the air as it came back after being to men who were further in

*By Mr. Edmunds* The canvas was not on the in take at all; it came to us on the return; when we were working night shift there would be no men further in than we were.

*By Commissioner* The air came back the narrow bord to us; it was not directly turned into our working-place; there was nobody working in that particular place in the daytime

*By Mr. Edmunds* There was nothing to turn the air into where we were working; it reached us of its own accord; I do not know how.

*By Commissioner* I cannot tell how it reached us; we could not feel it; it did not reach us, that I know of.

*By Mr. Curley* Rendal used to come in there every night; he came at different times, but his usual time was from 7 p m. to 8 p m.

Taken and sworn at Newcastle, this 29th day }  
of June, 1899, before me,—

ALBERT TURNER.

C. G. WADE, J.P.

## EXHIBIT I.

THIS deponent, *William Rendal*, on his oath, states —I am night overman under the Newcastle Coal mining Company in the A pit; I have held that position for seventeen years; I am acquainted with some of the special rules of the colliery; my duties are to remove dirt from different places, seeing to the putting up of timber, and so on, for the safety of the miners; I am the sole person in charge of the mine during the night; I go down at 4 p m, and remain down till 1 a m.: I then leave the mine; the next men to come into the mine are those who inspect the mine before the miners come in; they are called deputies, or firemen; they come in at 3 30 a m.; between the time of my leaving and their coming in there is no one practically in charge of the mine; all my men leave with me; on Sunday nights I go down the mine between 7 and

7 30 p.m. ; my shiftmen do not go down with me, but at 10 p.m. ; I do no particular work between 7 p.m. and 10 p.m. on Sunday, except going and examining those places where the men have to go to work ; the places where men have not to go to work are examined ; the places where the men have to go to work are places where dirt has to be removed and where repairs are required ; the whole of the headings and travelling roads must be examined in order to see that they are fit for work the next day ; I examine the headings, the travelling roads, and the places where my men have to go to work ; I do not, as a rule examine the bords ; it is not part of my duty ; I make my examination with a naked light and see that all sides and roofs are safe ; I examine all the main headings and travelling roads with a naked light ; sometimes I am travelling with the current of air, sometimes I meet it ; when I have wanted to go to certain places I have taken with me a safety lamp—a small Clanny ; it was not locked ; I examined the dip headings of No. 6 with that lamp ; I have examined them with that lamp as long as they have been headings—about six or seven months ; I have also examined the rise headings in No. 6 with a safety-lamp ; I began to examine any bords with a safety-lamp ; there are no narrow bords in No. 6 district now ; nine or ten months ago we had narrow bords going ; I made no particular examination of the faces of the narrow bords then ; there were two narrow bords

*By Commissioner* I only inspected certain districts on Sunday nights ; a man named Hardy inspects the other part of the mine ; I examined districts 6, 7, 8, and 9

*By Mr. Curley* I examined those districts from twelve months ago till the present time ; I inspected those places in No. 6 on a Sunday night, where my men had to go to work ; the same applies to No. 7, 8, and 9 ; I was not required to make any mark on the board as I was not an examining deputy ; I examined the places where the men had to go to work with a naked light, but not the faces of the headings where they had not to go to work ; twelve months ago I did not examine with a safety-lamp ; I began to examine with a safety-lamp eight or nine months ago ; I began to use the safety-lamp on account of a slight occurrence that took place ; a man went into a place where he had not been ordered to go ; that was in the back narrow bord in No. 6, his name was Weir

*By Commissioner* I used the safety lamp because Weir went to a place to which he had not been ordered to go, and he says that he saw a small flame of gas there ; it was after I heard that that I took to using a safety-lamp

*By Mr. Curley* That place was in Bailey's district as examining deputy, I had not before that time examined those places with a safety lamp on a Sunday night ; I did not order any man to go to that place on that Sunday night ; I give orders to the men on Sunday night about their work ; on that particular Sunday night Weir and Abell had to go to that district ; they had to go to the front narrow board, and put up some slabs ; they had to work in other places that night ; it was not within their discretion where they should go when they had finished in one place they had been sent to ; they could only go where they were told to go ; there were other places in No. 6 that wanted repairing that night ; there may have been other men in No. 6 that night on my instructions ; I cannot remember all the other men who went to No. 6 that Sunday night, but Fox was one who went as a water baler : Fox had to go into the back narrow bord, but not to the face, as the water was lying back from the face ; I knew he was going in there ; I ordered him to go there ; I had been into that place that night as far as I wanted a man to go to work ; that may have been several yards from the face ; I cannot say how far ; it may have been 10 yards from the face—the commencement of the water, I think it was about 10 yards from the face—the commencement of the water ; I did not inspect the face ; it was not my work to do so ; on that particular Sunday night it was not my work ; it was the work of the inspecting deputy who came in in the morning ; I cannot say whether that place had been inspected on that Sunday morning ; I cannot say whether it was the practice for the examining deputy to inspect that place on a Sunday morning at that time ; it is the practice now ; I had to examine it on the Sunday night even if it had been examined in the morning, because the law says so ; there was such an interval between the inspection in the morning and the time I went down ; there would be no necessity for me to make the inspection on the Sunday night if one had been made previously on the Sunday night ; there was no such inspection on the Sunday night, I call it an inspection if I see that the places in which the men have to work are safe ; I heard of the accident to Weir about 1 a.m. ; I was on my round visiting the men, and when I came to Weir and his mate, Weir told me he had been in the back narrow bord, and that the gas had ignited slightly ; I asked him what right he had there ; I told him I had placed him to work in the front narrow bord ; I think Abell was present ; I asked Weir once or twice what right he had there when I had placed him in the other narrow bord ; I pressed the question, and they made some frivolous excuse which I cannot remember ; I allowed them to work on in the mine ; I did not press Weir to go home later on ; I went back to the district about 4 or 5 a.m., and Weir was still working with Abell ; Weir said he thought his face was smarting a little, and I told him if that were the case he ought to go home ; I had a good look at him, and all I could see were a few hairs burnt on his moustache ; Weir told me first of the occurrence ; Abell may have said something to me about it, but I cannot remember whether he did or not ; I think Abell said, "Weir seems a bit shaky," or something to that effect ; I cannot remember that I asked the water baler anything particular about it at that time ; I did not allow him to go in there again ; I put up a danger-mark there ; I did not make any inspection of the place ; I had only a naked light with me ; it was Bailey's work to examine the face there ; when he went there to inspect it I went with him ; that would be shortly after 3 30 a.m. ; he had a lamp with him and went in and examined the place ; I may possibly have read General Rule 7 of the Act ; I complied with the rule by placing a danger mark at the place so that no one should pass there until the examining deputy came in and inspected it ; I knew where there was a safety-lamp, and could possibly have got it ; I made no inspection with the lamp ; I was told of the occurrence some time about 1 or 2 o'clock, and saw Bailey some time between 3 30 and 4 a.m. ; I told him that this slight occurrence had been reported, and that that place had been fenced off ; Bailey went up and examined this place ; I was near at hand at the time ; I was not right up to the face with him ; I was several yards from him ; he was examining right up at the face with the safety-lamp ; he took the lamp himself ; I did not hand it to him ; I cannot say how long it took him to make that examination at the face ; it would not take him many minutes ; I did not find any report of that examination in the book ; it was not my place to look for it ; if the report was put in the book it would be put there about the time I would be leaving the mine ; I did not ask Bailey to make any report of that examination ; the full height of the seam there was from 7½ feet to 8 feet ; that includes from the floor to the roof ; I examined those places with a safety lamp after this occurrence ; I only did so once a week—on the Sunday night ; I did not leave any note in my lamp after making those examinations ; I did not so leave any pencil note initialled "W R" ; I have so left a note on other occasions than a Sunday night ; what was on the note was this : "To Mr Bailey—I have discovered a small bit of gas in the back dip heading" ; that was about six months ago ; I only left a note like that once ; the miners had been ordered to take only a portion of the top band ; they had taken a little more of this band than they should have ; they had caused a crack in the roof ; on examining the hole that was pointed out my light came in contact with this crack and ignited, but only very slightly ; it was an open light ; I was going round in the ordinary way ; a safety lamp would never have detected it ; Weir's accident happened about eight or nine months ago ; I may have mentioned it to the under-manager ; I did not make a formal report of it to him nor to the manager ; it was the first occurrence of the kind that had taken place while I have been overman ; I may or may not have mentioned it to the under-manager ; I did not report the finding of the gas by myself about six months ago ; it was such a paltry matter, I did not think it worth reporting ; I just mentioned it to Bailey in a friendly manner

*By Commissioner* : I did not think there was any risk about it, but told Bailey of it so that he might make a more careful examination of the place when he went to inspect

*By Mr. Curley* I do not admit that Weir was burnt ; his moustache was slightly singed or burnt, but I do not call that a burn ; I assisted Bailey in that place to put a little more canvas there ; we may have put up 3 or 4 yards more canvas ; that would take me to the face ; I did go up to the face ; that was after Bailey had examined the face ; I did not examine the face with the lamp ; Bailey had the lamp ; I cannot say how many places there were in No. 6 district at that time ; I do not know how many men were working in that district at that time ; I expect there would be half a dozen places in No. 6 district at that time ; I do not know of any man being taken out of the pit suffering from black damp ; I do not know of any man being overcome with black damp in the pit ; I know of a man being overcome with sickness in the pit ; his name was Taft ; that was about ten or twelve months ago ; he was engaged in cleaning up an old heading in No. 5 district to recover pillars ; it happened during the night ; it was not reported to me ; I knew of my own knowledge that the man was sick ; I saw him ; he appeared to be like a man who had the ague ; he was all of a shake when I saw him ; I think he must have been at his work a considerable time when this happened ; I came to see him on my usual rounds ; a man named Turner was working with him at the time,

*By Commissioner* I saw him at first where he was working ; I spoke to him, and he to me ; he was sitting up at the time ; Turner spoke to me first ; he said, "Rendal, my mate, is sick," or "bad," I am not certain which term he used ; I replied to this effect "If he is sick we had better take him out" ; we three then went out on to the narrow bord ; I carried him part of the way, and he walked part of it ; Turner assisted him also ; for some time after being taken out he seemed to have these "shakes" on him (say) for ten minutes ; it was about ten or fifteen minutes from the time I first saw him

him till I left him; he had got up and walked about a mile to the pit bottom; he seemed a bit sick; the ventilation in No. 5 is fair; we have not had what can be called black-damp there; the air may have been a bit light in that particular part; I mean by that that you could not call it so pure as that on the engine-road; I have never known any of the workmen to be affected by reason of defective ventilation; it was during the week that Taft's case happened; there are three men attending to the furnace in the A pit at the present time; at the time of Weir's accident there were two furnace-men employed; one man's shift extended from 7 a.m. till 4 p.m., the other's from 6 p.m. till 3 a.m.; on the Sunday night the one shift started at 7 p.m. and knocked off at 3.30 a.m.; at the time of Taft's sickness there were two furnace-men employed; I have not made it a point to examine the deputies' report-books; I have not examined them; I do not hold any certificate; I have not read many books on mining; I do not know that I have read any books particularly on mining; I have read little sketches here and there, but have never taken up any book on mining and thoroughly studied it; I know of the Dudley disaster that occurred in this district last year; I read portions of the evidence in that case; I have not read the report issued by the Mines Department on that disaster; I have not had a copy of it.

*By Mr. Edmunds:* My hours were from 4 p.m. till 1 a.m., except on Sunday, when I go down between 7 and 7.30 p.m., knocking off about 6.30 a.m. on the Monday; while I am in the pit I take the place of the under-manager; I have charge of the pit; there is not, as a rule, any mining going on when I am down; in exceptional cases a couple of men will be cutting the coal while I am in charge; the only work, as a rule, that goes on while I am in charge is that of the shiftmen getting ready for the following day; I am the person appointed to examine the working-places for the shiftmen before they go to work on Sunday nights only; hewing of coal does not go on, as a rule, on any night of the week; I have also to examine every part of the mine where the men have to work or pass during that shift; the shift for which I examined was the shift of shiftmen; another man and I had to inspect each place where the shiftmen had to go to work; before the miners come in there is another inspection, with which I have nothing to do; I used to make a written report of my Sunday night inspections in the report-book, but that was not done twelve months ago; I began to make those reports about five months ago; during the last five months I have made regular reports in the book; I had no idea that such a slight injury as that sustained by Weir had to be reported to the District Inspector; I had no idea that the burning of a few hairs of his moustache could be called a personal injury; I knew that the law required a personal injury by explosion of gas to be reported by the management; Weir did not come to work the next shift; nobody gave him permission to absent himself from his work; I saw no injury to his arms, neither did he show them to me; I did not look at his arm; I could see nothing wrong with him, and did not think I had to report the matter to the management; I knew Special Rule 16; I did not regard it as an accident or danger looking at the consequences of it; neither the manager or under-manager had instructed me to report all cases of explosion; I could see nothing in Weir's appearance, as far as personal injury was concerned, to warrant me in reporting the matter; I knew that inspections had to be made with a locked safety-lamp where inflammable gas had been found in a mine; I continued to make my inspections with an unlocked safety-lamp; I knew that was not in compliance with the Act; Taft and Turner are still employed in the Company's pit as miners; no doubt the copy of the note read to me [Exhibit G] is a correct copy of the note I left in the lamp; I did not leave two notes, but only one; that is the one about finding a little gas; I have no knowledge of the note instructing Bailey to take in some nails; I have no recollection of leaving a second note in the lamp for Bailey; on my inspections I always make it a point to examine the ventilation, seeing that the current is going its usual course and that the usual quantity of air is passing; on Sunday night I make a report, showing the state of the ventilation; work began in the face of the narrow bords about seven hours after the accident to Weir; the miners came down about 6 a.m.; I did not regard any part of the mine to be dangerous on account of gas; I put up the danger-board in the narrow bord on the strength of what Weir told me; I was supplied with a copy of the special rules of the colliery by the management.

Taken and sworn at Newcastle, this 28th day of }  
June, 1899, before me,—

W. RENDAL.

C. G. WADE, J.P.

Court adjourned till 10 a.m. to-morrow.  
Court-house, Newcastle, 28th June, 1899.

This deponent, *William Rendal*, recalled on his former oath, states (to *Mr. Edmunds*):—I never knew beforehand of the visits of the Government inspectors; I never heard from any conversation among the men that the inspectors were expected.

*By Mr. Bruce Smith:* I have been twenty-two years in the service of this Company; with the exception of the burning of Weir and the little puff of gas I saw about six months ago, I have never seen or heard of gas in the mine; the gas mentioned in the note I left in the lamp referred to that little puff; I have nothing to do with the getting of the coal; on the night I sent Weir and Abell to the narrow bord to timber there were no men getting coal in the mine to my recollection; the men who went down with me were engaged in shift-work; I examined every place where those men had to go to work; at 3.30 a.m. Bailey would come down and examine all the places where the men had to get coal; there was no timbering required in the bord where Weir went to and was injured; I examined up to the point in that bord that Fox would have to go to bale; there would be no shiftmen in the mine between 1 a.m. and 3.30 a.m.; there would be a man left behind to look after the furnace; the date of Weir's accident was the 25th September, 1898; I fix that the date by reference to my time-book; the time-book shows that Weir did not come to work on the following day—a Monday night; it shows that he was off that Monday night and on the previous Sunday; I can find no other record showing that he was about that date off on the Monday night and on the Sunday.

(The witness at this stage became unwell, and was unable to continue his evidence.)

This deponent, *William Rendal*, recalled, on his former oath, states (in answer to *Mr. Bruce Smith*):—I remember going with Bailey on one occasion to put up canvas in No. 6 (referring to Bailey's evidence on pages 3 and 4); this was just after Weir's accident; I placed the canvas up on account of Weir's complaint and accident, in order to carry away any impure air there might be there; that was my only object in putting up more canvas; it was the proper thing to do; I did not do it immediately after hearing of Weir's accident, but placed a danger-mark there; when I met Bailey about 3 a.m. I took him to put up the canvas; the extra canvas was placed there solely for the purpose of better ventilating that place; I have no recollection whatever of telling Bailey that Taft was carried out of the mine; I carried him 15 or 20 yards, and Turner may have carried him the same distance, or perhaps a little further; after we had carried him, he was placed on the ground and covered with coats; that was 4 or 5 yards from the narrow bord; he was helped from the ground after being placed there; he walked from there to the pit bottom; he had assistance, but he could use his legs; he was not carried any more by either of us; the first part of Exhibit G I acknowledge, but I know nothing whatever of the second part, directing Bailey to take in a few nails; beyond that note, I have no recollection of writing any other note about gas at any time; I remember being present at an interview in April last between the manager, Bailey, and myself; I do not know of anyone else that was present on that occasion; it took place in the office on the surface; I do not remember anyone coming in while it lasted; Croft first asked Bailey, "Where were you last night that you were not at work?" Bailey replied, "The Chief Inspector knows why I was not at work last night"; Croft remarked, "Oh! you've seen the Chief Inspector?" Bailey said, "Yes, I've been further than the Chief Inspector; I have seen the Minister for Mines"; Croft said, "Did you go to Sydney?" Bailey replied, "Yes, I went farther than Sydney; I went to Lithgow"; Croft then asked Bailey if he had told the Minister for Mines about some canvas being put up, and he replied, "Yes, I have spoken to the Minister about this canvas business"; Croft then said, "Where was this done?" he replied, "Oh! on the No. 2 engine-road"; Croft said, "Who did it?" Bailey replied, "I did it"; Croft then questioned Bailey about the other things which he had reported, such as the gas, and about Taft; I do not know that he mentioned Taft's name, but he spoke of a man being carried right out of the mine; Bailey replied that he had heard of such a case; this questioning and answering went on for about ten minutes; I then had to go down the mine; the interview had terminated before I left; it terminated, as far as I can recollect, in this way: Croft said to Bailey, "You went to Sydney and told the Minister for Mines that Weir was off some days on account of this accident; how do you know that he was off three or four days?" Bailey replied, "Oh! I heard so"; Croft said, "And you went to the Minister, and told him the man had been off three or four days, because you had heard so?" I do not remember Bailey making any reply to that nor anything further that Croft said; I believe Bailey asked, "Can I go to my work?" Bailey had been off work three days the first week; this conversation took place in the second week; Croft replied that Bailey might go to his work; I then left, and Bailey also; Bailey had never asked my permission to go off for those three days; it is not a usual thing for men to go away from their work for two or three days without asking permission; the men are supposed to send and let me know if they cannot come

come to their work ; there have been cases where men have stayed away without permission ; in such cases the men have been referred to the manager ; while Bailey was off, I got a message I think from his brother to this effect, "John Bailey is not able to attend to his work" ; I took it that Bailey was sick ; I have no recollection of either Taft or Turner telling me at any time that he could not keep a light ; they have complained to me about the air in this way ; when I have gone in, I have said, "Well boys, how are you getting on" ; one or both might reply, "Oh, it's a bit hot" ; they never made any formal complaint that the ventilation was bad ; if they had done so, I would have removed them ; I used to go round and see the men at their places, and would go right into the air in which they were working ; in the whole of my experience in the Newcastle Company's mine ; I have never known a man to be overcome as Taft was that night ; I never even heard of such a thing in the mine ; I never knew when the check inspectors were coming ; they came in the daytime when I was abed.

*By Mr. Edmunds :* That part of No. 5 where Taft and Turner and Dobb and Turner worked was inspected by me on the Sunday night ; it would also be inspected in the daytime during the week ; Taft's affair took place about ten or twelve months ago, to the best of my recollection ; it was after Weir's accident that I began to use a safety-lamp in that part of the mine—the No. 6 narrow bords or dip headings ; the fall in that heading was an old fall, and may have been there for years ; we had crossed four or five old bords in this old heading in clearing it up ; that would mean about 80 yards ; the stuff they cleared they threw into the old bords and laid down their road as they went on ; it was completed right through the heading, a distance of about 112 yards ; there was no work done in that heading during the daytime ; Taft and Turner were the only two men engaged in that work ; the air came to the men over the old bords ; there was no brattice up there at this time ; the air was forced up to the men working the coal at the pillars, and would then naturally take its course over the old bords to where Taft and Turner were ; Taft and Turner were working at a point 70 yards from where the men were working the pillars ; that was by the course the air would take ; the men working the pillars were reducing the distance between them and Taft and Turner each day they worked ; the air was taken to the men working the pillars by canvas up to the face.

*By Commissioner :* The air taken to the men at the pillars could get into different bords, and Taft and Turner might not have got all the air that went to the men at the pillars.

*By Mr. Edmunds :* I cannot say that any particular inspection was made to see what air was getting to Taft and Turner.

*By Mr. Curley :* I do not think Bailey was working under me on the night-shift at the time of Taft's sickness ; I do not remember ever saying a word to Bailey about Taft's affair ; Bailey was the official to inspect Taft's working-place in the morning ; I did not enter the result of my Sunday night inspections at that time because I was not requested to do so ; I did not point out to the manager that it was necessary for me to do this ; he pointed it out to me ; I did not, either at the time of Weir's accident or Taft's sickness, point out to the manager that it was necessary for me to report in the book ; I did not go to the face on my inspections for the water-baler or Weir ; I inspected as far as I thought the man ought to go ; I know the place where Weir was burnt ; when I inspected it that morning for the water-baler I did not put up any cross-rails there on that morning, because I did not see any necessity for them ; Bailey inspected that place on the morning of the 26th September ; I was at a distance when he went up to the face ; I never told Wilson to look out for gas in that place ; I have no recollection of ever mentioning anything of the kind to Wilson ; the under-manager had not warned me about it ; that was the first occasion I had known of what one might term fire-damp in the colliery ; of those two narrow bords, I think the front one, got the air first ; I knew the No. 6 headings ; what was termed the front heading got the air first at that time ; the air continued in those headings like that until they stopped at the boundary.

*By Commissioner :* For the last five or six months I have been making my reports in the book ; that is since the manager spoke to me ; prior to that if I found anything wrong I took care to put it right ; if there was anything wrong, and I could not put it right, I would verbally warn anyone coming after me ; it is only within the last five or six months that I have learnt it was necessary for me to put my report in the book ; prior to that I thought it was only necessary for the man making the inspection for the day-shift to make his report in the book ; I left the note for Bailey about the discovery of the gas in the pillars of the safety-lamp ; I did it as a friendly warning to Bailey ; Bailey never left such a note for me ; I never left such a note for anybody else ; I came to use the safety-lamp after Weir's accident because the manager and I thought it better to do so, in order to make sure if ever such a thing occurred again ; Bailey used a safety-lamp after this also ; neither lamp was locked ; I had no key for my lamp ; there may have been a key there but I never had it ; I was making my usual rounds to look after the men, and see that everything was going on properly, when I discovered the small puff of gas in the roof of which I have spoken ; I cannot say whether it was on my inspection or not that I discovered it ; I suppose my first round would be my inspection ; I cannot say whether I reported this gas to the management or not ; it was inflammable gas ; it was in the same air-district as that in which Weir was burnt, but in a different heading ; I did not go to the canch at all in the place where Fox was working ; the canvas would be 3 or 4 yards from the canch ; sometimes I would be meeting the air with my naked light in making my inspections ; I knew that the air in the place where Taft and Turner were working was what we termed a bit light ; there could not be much difference between the air getting to the men at the pillars and that getting to Taft and Turner ; I never heard any complaint from the men at the pillars ; they were working in the daytime ; a safety-lamp could not have detected the gas I found, because I could not have got a safety-lamp in there, and there was not sufficient there to be detected without the lamp getting to it.

*By Mr. Curley :* Bailey has not made any inspection with me on a Sunday night since this occurrence ; Bailey was supposed to come back with me at night to inspect No. 2 district ; he came back on 6th April last, and went to inspect No. 2 district ; he examined the No. 2 district on the night of the 9th April last.

Taken and sworn at Court-house, Newcastle, this 29th day }  
of June, and 4th day of July, 1899, before me, —

W. RENDAL.

C. G. WADE, J.P.

#### EXHIBIT J.

THIS deponent, *Edward Wilson*, on his oath, states:—I am a deputy—inspecting deputy—at the Newcastle Coal Company's mine ; I have held that position about nine or ten years ; at present I inspect Nos. 7, 8, and 9 districts ; I have inspected those districts since September, 1898 ; before that I was in Nos. 6, 7, 8, and 9 districts ; I cannot say for how long before September, 1898, I inspected those four districts ; I did so for months ; it was some time in September last that I discontinued inspecting No. 6 ; I think Bailey was sent to inspect No. 6 after I had left it ; I was told by the under-manager that somebody else would inspect No. 6 ; he told me there would be more bords working in Nos. 8 and 9 ; I heard of an occurrence that took place in No. 6 ; I heard that a man had been burnt there ; I do not know exactly what it was ; I cannot say from whom I heard it ; different people told me of it ; I believe it was Bailey I heard first speak of it ; I may have heard it spoken of out of the pit, but I do not remember hearing anyone else in the pit speak of it ; when I first heard of it I was not inspecting No. 6 district ; it may have been two or three days, or a week, before I heard of it that I had given up No. 6 ; I inspected No. 6 with a naked light ; I never noticed any fire-damp ; I cannot remember whether anybody had spoken to me about fire-damp in No. 6 ; I know Rendal ; he said nothing to me about it ; nor had the manager or under-manager ; Rendal never handed me any pencil notes when I was inspecting No. 6 ; Bailey did not tell me of the occurrence personally, but I heard him speak of it ; I may have been at the pit bottom when Bailey told Rendal of it, but I did not hear him do so ; I have said that I would rather not be brought into this matter ; I said so to the men in the pit ; I spoke of it in the presence of Bailey ; I said so, because I would have preferred to keep out of the inquiry altogether ; I did not tell Bailey that at the time of the concurrence ; I cannot say how long after it I told him that—whether it was a week, or a month, or a few days ; I cannot remember when I told Bailey that ; it was more than a few weeks back ; it was a few months back, but I cannot say how many ; I cannot tell the exact date it was that I took over Nos. 7, 8, and 9 districts for inspection and gave up No. 6 ; it was some time in September, 1898 ; the 21st September last was the last date on which I inspected No. 6 ; I find by the book that the latest date was the 23rd September last ; I first commenced my inspection of Nos. 7, 8, and 9, without No. 6, on the 28th September last ; I used to enter the mine to inspect at 3:30 a.m. ; when I had completed my inspection, I went to look after No. 9 district ; I made a report when I had completed my inspection ; I did that in the cabin at the pit bottom ; that would be between 5:15 a.m. and 5:45 a.m. ; that is the report in the book ; I did not enter the time of making that report in the book. [*Book now put in and marked Exhibit I.*] I made no other report, except that in the book ; I worked in No. 9 district every day, and not in other parts of the mine ; I was doing deputy work—looking after the wheelers and miners, and laying roads ; my shift ended at noon ; I never knew when the

Government

Government inspector was coming into the mine ; I never heard the deputies talking about the inspectors coming ; I was never told by the manager that they would be coming, nor by the under-manager ; I have seen the Government inspector in the mine ; on those days I have not been told off to do anything special, such as putting up canvas ; I have renewed canvas where it had been torn down ; I have never been told by anybody to do that while the inspector was in the mine ; I knew it was my duty to do it ; I have never seen canvas put up to turn the air from one district to another while the inspector has been in the mine ; I have never done it myself ; I have never known a door to be opened while the inspector has been down, in order to turn the air into the district where he was ; I have never held any doors open for that purpose while he has been down ; I have heard lately of it having been done in the mine ; I have heard it spoken of since this case came up ; I never heard of it before then ; I have never heard any complaints from the men as to the ventilation ; I have only been in No. 9 district, and have heard none there ; I do not remember ever having occasion to warn any men not to go to any particular place on account of defective ventilation ; I have never seen the brattice right up to the face in the places I have inspected ; it has always been from 3 to 5 yards from the face ; I have seen bits of falls in No. 7 heading ; I have never known men to go out on account of defective ventilation ; I cannot state the greatest distance from the face I have seen the brattice on my inspections ; after the occurrence with the fire-damp that I have spoken of, I made my inspections with naked light, in the same way ; I have done so ever since.

*By Mr. Edmunds :* When I ceased inspecting No. 6 the fault in the back narrow bord had nearly been got through ; the fault extended for 8 or 10 feet ; I believe this one was a rise fault ; after getting through the fault it might be necessary to use timber for the roof ; I could not say so for certain ; the roof seemed good when I was there ; on my inspections I always saw that the air was nice and fresh in the working-places ; I cannot say who inspected No. 5, nor who does so now ; I think it is the man in Bailey's place ; I think his name is Jones ; the furnace is attended by a man at night and another by day ; I do not go down the pit on Sunday, but on Monday morning ; I have seen the furnace fires a bit low at times ; I have noticed that on going down in the morning ; it has not been so brisk as through the day ; I cannot say how often that happened ; sometimes when I have gone down I have seen it a bit low, at other times it has been brisk ; I have never seen any black-damp in the mine ; I have never found any fire-damp ; I cannot say that I know No. 5 district ; it is years since I was in there.

*By Mr. Bruce Smith :* I have been about nineteen years in the service of the Company, and have held the position of deputy about nine or ten years ; I do not remember ever having seen any gas or black-damp during the whole of that time ; I know the board upon which the deputies' report is written ; on the 26th September I would place my report on that board as in the book ; I would do it the same day as I wrote the report in the book ; I consider it the same report ; I only wrote the one report in the book and on the board ; as far as I recollect, I have always written the same report on the board as on the book ; Bailey was talking to another deputy and myself when he spoke of the man having been burnt ; I was sitting outside the cabin door at the time, and heard him mention it ; that was the first I had heard of it ; the men have never hesitated to tell me of anything that was amiss ; if ever they have wanted anything remedied they have told me of it, and I have tried to remedy it ; after inspecting Nos. 7, 8, and 9, I am generally employed about No. 9 and the bottom of the pit ; I do not go into Nos. 7 and 8 to work ; when I have seen the furnace rather low it has generally been raked out to clean it between shifts ; I have stirred it up myself at times ; it has always been in full when the men have gone down.

*By Commissioner :* I have seen deputy Jones examining with a safety-lamp during the last nine months ; he goes into No. 6 ; he has used it ever since he has been there ; he has been there since Bailey left in March ; the Jones that was inspecting in September last was another man of the same name ; I have seen Bailey in the mine with a safety-lamp, but not inspecting ; he has been going about his work ; he and Jones are the only two I have seen with safety-lamps there.

*By Mr. Curley :* I cannot say what men worked regularly in the bord in which the rise fault was ; Weir and Abell worked there at times ; I cannot recollect whether I have seen men working at the face in that bord ; I only saw the men working there on Monday morning when they were there ; there may have been other men besides Weir and Abell there.

*By Commissioner :* They were doing shift work when I saw them on the Monday morning.

*By Mr. Curley :* The last time I saw them there they were standing about 20 yards back from the face ; they were not working at the time ; I would see what they had been doing when I went into the bord on my inspections.

Taken and sworn at Court-house, Newcastle, this }  
29th day of June, 1899, before me,—

E. WILSON.

C. G. WADE, J.P.

Court adjourned until 9:30 a.m. to-morrow.

Court-house, Newcastle, 29th June, 1899.

This deponent, *Edward Wilson*, recalled on his former oath, states (*to Commissioner*):—I was inspecting deputy for Nos. 6, 7, 8, and 9 till September last, when I left off No. 6 ; I used to meet the deputies at the cabin in the morning ; I used to see S. Jones and Bailey ; I would see Gall and Ambrose through the day at the cabin ; I stated in my evidence that I had heard Bailey telling one of the deputies about Weir's accident ; Sam. Jones, Bailey, and myself were the only persons present then ; It was Jones he told of the accident.

Taken and sworn at Court-house, Newcastle, this }  
13th day of July, 1899, before me,—

E. WILSON.

C. G. WADE, J.P.

Adjourned till 9:30 a.m. to-morrow.

Court-house, Newcastle, 13th July, 1899.

## EXHIBIT K.

THIS deponent, *Benjamin Dobb*, on his oath, states :—I am a coal-miner employed at the Sea pit of A. A. Company ; I have worked also at the Newcastle Coal Company's mine, in the A pit ; I have not worked in the B pit ; I have worked in mines for thirty years, and at coal-mining for about twenty years ; I hold an under-manager's certificate ; I have held that for about two years ; I have also obtained the Honor Certificate for Mining Knowledge of the Public Instruction Department ; that was about eighteen months ago ; I have made a study of gases in connection with my examinations ; I was examined principally on black-damp, fire-damp, and the different gases which are given off in a mine ; I worked in the Newcastle Company's A mine up to the end of last year ; I was working there for about five and a half years prior to that ; I think I was through the whole of the mine during that period with the exception of one or two portions of the return ; I have noticed black-damp in the mine, both in No. 6 pillars and in Nos. 5 and 1 ; I noticed it through the lamp not burning and my feeling unwell at times ; it was between eighteen months and two years ago that I noticed it in No. 6 ; I did not complain to anyone about it ; I have been engaged in drawing timber, doing deputy's work when the deputy has been off, and laying turns ; from time to time I carried out the examinations prescribed by the Act to be done by deputies ; when the deputies were off I have been round and made the examination in their places ; I worked in No. 6, where the air was bad, from the time the pillars were started till I was placed on the night-shift ; I was not regularly employed there, but only when I was sent ; I might be in Nos. 1, 2, and 6 during the day ; I was what might be called an auxiliary deputy ; I was employed to go wherever I might be sent in the mine ; I first saw the black-damp in No. 5, but mostly at night, when we were drawing timber ; that was between eighteen months and two years ago ; that was timber that had been used on the pillars which had been worked out ; that black-damp would affect the men working there ; I noticed the black-damp for a period of eight or nine months in No. 5 ; I know a man named Turner ; I have worked with him on the night-shift in No. 5 ; I found the ventilation there bad ; there was not sufficient air to take away the impurities ; the impurities consisted of black-damp ; I judged it was black-damp by the sensation that came over me when I was in it ; I had to retreat to the fresh air.

*By Commissioner :* My sensations were that I felt lazy and sick, and too lazy to be sick ; I seemed to lose the whole of my strength.

*By Mr. Curley :* I think No. 6 was better ventilated than No. 5 ; No. 1 was very heavy ; I mean by that that there was not sufficient ventilation to take away the heaviness, or not sufficient pressure to take it away ; there was not sufficient pressure to take the air-away from where the men were working to the return ; in No. 1 the ventilation has been bad for the whole of the five and a half years I have been there—more especially since they began to work the pillars ; I did shift-work in No. 1 ; I might be in Nos. 1, 5, and 6, during the day ; I went wherever I was sent ; I knew when the inspector was likely to make his visit to the colliery ; I knew that by being told in the morning to be prepared for it ; I was told that by the under-manager ; that extended over about three months, in 1895—till towards the end of September, 1895 ;

that is in July, August and September, 1895; it lasted till February last; the under-manager was Mr. H. Croft; I mean I was so informed of this from about the beginning of July, 1895, till February, 1898; Croft has told me of that when he has been in the position of under-manager, and Mr. Mouter when he held that position; there was never anybody else present when I was told anything like that; I have seen attempts made to divert the ventilation when the inspector has been in the colliery; I think I first noticed that in July, 1895; I made a note of it that night; I cannot tell what day of the month it was; I was sent into No. 1 return by Croft, the under-manager; Inspector Dixon, at the time, was going through Nos. 7, 9, and 6 districts, leading through and coming out by the No. 1 return way; I knew that, because it was his general course; I never knew him to alter his course through the mine; I noticed canvas in the return to block the main return airway; I went back from there; went into the main intake headings of No. 2, where I came across Newburn, the deputy, and Bailey, with a canvas across the main intake airway; each was holding the canvas at the side, thus preventing the current from going in its proper course; to the best of my opinion they were holding it; I went within 10 or 12 yards of them; they were on the other side of the canvas, and did not see me; I would rather say I went to within 20 yards of them; I did nothing in connection with that; I went back and went through to No. 1 return; in going back I passed under the canvas I had previously seen in the return. [*Witness marks with a broad arrow, in pencil, where he saw the canvas on the main intake, where Bailey and Newburn were, and also where he saw the canvas on No. 1 return.*] The effect of these canvases would be to prevent the air going into Nos. 1 and 2, and cause more to circulate through Nos. 6, 7, 5, and 9; I knew Bailey was on the other side of the canvas, because I heard him talking; I heard Newburn talking and laughing; they were both chatting and laughing; I could not hear what Newburn was saying; I have noticed a similar occurrence at another time; I made a note of it at the time; it was on the 15th February, 1898; the check inspectors were going round the mine; my duty was to supply the furnace with best coal; I was told to do so by Mr. Croft, the under-manager; Croft told me the check inspectors were coming; he said, "They are coming"; I knew whom he meant; I think he used the word "inspectors"; he instructed me to get ready the furnace with the best coal; that after a certain time of the day he would be in another part of the mine, and would place No. 5 overcast all right, and that I must see to the removal when they were coming out; he mentioned the names of the check inspectors when he told me they were coming; they were Hardy and George Clapton; I carried out his instructions about the overcast; when I got there I found the airway partly closed, and I cleared it; there was as much of it closed as could be closed nearly; I suppose the airway was about 4 feet by 4 feet; the overcast was that over the main haulage road. [*Witness marks position by broad arrow.*] The effect of closing this overcast would be to decrease the air in Nos. 5 and 6 and increase it in No. 2; the overcast was closed with canvas and timber; I saw the check inspectors coming out from No. 2 that day; I say definitely that it was on the 15th February, 1898; I think it was on the 15th February, 1898, I removed that canvas; the mine was working that day; I noticed nothing else that day beyond that before I removed it to show that I did not like the work, I met Mr. Croft and asked him where it was, although I knew where it was; he replied, "Good God! go ahead, and get it out of the road"; I noticed something else on the 25th February, 1898; I made a note of it on the same day; I made the other note about the stopping of the overcast on the 25th February, 1898, and not on the date of the occurrence; I made the two notes on the same day; on the 25th February, 1898, I blocked No. 5 return while the inspector was in No. 2; that was the Government inspector; I received instructions to do that from the under-manager, Mr. H. Croft; he said, "You'll go in front of us and wait until we go past Block No. 5 and take it away when we are coming out"; I told him I thought I could be employed at something better; the blocking that time would have the same effect as on the former occasion; I saw the inspector that day—Mr. Dixon; the mine was working that day; on several other occasions I have seen similar occurrences in the mine; I have only seen these things done during the period from July, 1895, to September, 1895, and from the beginning of the year till February, 1898; for that period of two years and nine months I was instructed to get the best coal ready for the furnace-man when the inspector was expected; the only occasion in 1895 when the canvas was put across the road—the ventilation diverted—was in July; that is the only one I have a date for; it has happened since that, but I have no dates for that; that was between July and September, 1895; the next occasion on which it happened was in February, 1898; there were two occasions in that month on which it happened; I did not see it on any other occasions; on the 28th February, 1898, I was put on the night-shift; No. 6 district was going in a south-west direction; I have a good knowledge of the positions of the different collieries adjoining the Newcastle Company's; No. 6 would be striking Burwood and New Lambton; I have never noticed any gases in No. 6, except the black-damp; I have seen black-damp in No. 6 pillars; I have noticed the air vitiated by it so that the lamp would not burn properly; the men suffered from the vitiated air; I heard Weir was burnt in No. 6; I heard it three or four days after it had happened; it was generally known throughout the mine; James Mouter was under-manager before Mr. H. Croft; I have heard Mouter say that there was a danger in approaching the fire-damp going through the faults in No. 6; he is not working in the colliery now; he is in England; there was a different under-manager between September, 1895 and February, 1898; Mouter was under-manager between those dates; H. Croft has been under-manager from February, 1898, to the present time; the notes of the occurrences spoken of were made in the book shown me on 19th July, 1895, and the 25th February, 1898; I left the Newcastle Company's employ at the end of 1898; I did not leave of my own accord; I was working on the night-shift, and seven or eight of us received notice at the same time to leave; the notice ran: "Mr. Dobb, your services will not be required after," then a date came, "at this colliery.—J. CROFT"; the manager gave me no reason why he dispensed with my services; he said he had too many; I did not ask for any reason myself; when I was put on the night-shift I asked for the reason why I was shifted from the day-shift; that was on the 25th February, 1898; when I received notice to leave I put a cavil in and it was accepted; I could have gone on the coal if I had desired to do so; I did not stop to work, however, but left; in that way I left the colliery of my own accord; I could have gone on the coal, but I did not see fit to do so; I thus left the colliery of my own accord.

*By Mr. Edmunds:* I reported in the book, when I was acting as deputy, every time I inspected; I never in any of those reports made a complaint about the ventilation, or reported the presence of any noxious gas; I was only employed as inspecting deputy for eleven or twelve days during the whole time.

*By Commissioner:* I did not see black-damp in any of those inspections I made as deputy; when the ordinary deputy was not there I was the competent person appointed to make the examination under the Act.

*By Mr. Edmunds:* If I acted as deputy during the eight or nine months I noticed the black-damp in No. 5, I did not notice the black-damp on any of my examinations; the boards in No. 1 that I spoke of as being bad were those going towards the fault, and beyond the point where the air turns back; I would have inspected No. 1 during the five and a half years I said it was bad; I worked with Turner only once; H. Croft was in charge of the works at that time; I did not inform him that I had found choke-damp there; I did not consider it my duty to inform him; there had been provision made for some air to scale over the door to that place in No. 6 way; the air came through through breaking open the stopping in that heading; I think Bailey was the examining deputy for that part; the board was up there to say it was safe; Turner and I were the only two persons working there at that time; I am speaking of the night when Taft was off; I only worked that one night with Turner; I do not know what the date was; I made no entry of it in my book; the entries in my book are, "July 17th, cutting canvas, pipe stolen, and chain thrown at me by J. Harrington"; "July 18th, in return No. 1 came across to force it in No. 6 cross No. 2"; "N. & B. x 2 road—In in 6"; "July 19th, remarked on it at pit bottom when sniped about *re* J. H."; the next entry, "H. rough on me for seeing his father" refers to the fact that when I was being put on the night-shift I went to see old Mr. Croft to know what was the reason in being disrated by being put on the night-shift; Mr. Croft said he was not the overman; I replied, "No, Mr. Croft, you're the manager, and I've come to you for redress"; he then said, "If you don't like it, you can leave it"; I told him it was not so; that I did not like it, but could not leave it, because perhaps I might not be able to better my position; the next morning the under-manager, H. Croft, got on to me about having gone to his father; I asked him what he would do if he were placed in the same position; he said I was a "bloody traitor" to go and see him; H. Croft used to tell me when the Government inspector was coming; Mouter used to tell me when he was there; I cannot give any of the dates of Mr. Dixon's visits; the deputies were informed of his visits also; I have taken word to them of it; I have told them that he had come, not that he was coming; I have been told before his visit that the inspector was likely to come; the furnace-man always knew when I was getting the best coal what was meant by it—that the inspector was to come; there was no blocking of the air-ways to my knowledge when Mouter was under-manager; Mouter was a gentleman of an upright honourable character as far as I know; the first thing I came across was the canvas I found in No. 1 return; I knew that would increase the air in Nos. 6, 7, and 9, and stop it in No. 1; I knew there were men working in No. 1—sixty, I suppose—but I did not think I was required to report it to the manager; I did not warn the men in No. 1 that they were getting no air; the men in No. 1 were friends of mine to a more or less extent; the blocking of the air from No. 1 meant death to them in course of time; I know that I should have informed someone of the stopping of the air; I told the under-manager of it afterwards, and he told me to keep my mouth shut; I did not warn the men in No. 1 because I ran the risk of losing my bread and butter.

*By Commissioner* : I did not know, when I first came across the canvas, that it had been placed there by the order of the under-manager ; for all I knew, it had been placed there against his direct orders.

*By Mr. Edmunds* : I did not consider it my duty to tear down the canvas when I saw Bailey and Newburn holding it up in the airway ; I did nothing to prevent the stoppage of the air ; Bailey and I were doing their best at the time of kill the men in No. 1 ; when I stopped up the overcast in No. 5 I would be doing my best to kill the men in No. 5, of whom there were forty at the time ; it was not entirely blocked up ; I blocked it with canvas and timber which had been lying there from the time H. Croft had blocked it ; I did not block it completely, because the canvas would blow back and let some air through ; I did not tell Mr. Dixon of this ; I was disrated almost the next day over it ; I was afraid of being further disrated if I had done that ; I do not know that the inspectors receive information from the workers without divulging the names of their informants ; I gave information in connection with this case ; that was about 20th April last ; that was the first time I had given information to the Government officials ; I had been dismissed since the beginning of the year ; I did not inform the Government of what I knew because I might not have got on so well as I have ; I did not risk my bread and butter by telling, as I had lost my position ; I do not think it would have done me any good to have told ; it would have done good for the men in the mine, I admit, but a man has sometimes to look out for himself ; if my story is true, Newburn, Croft, Bailey, and myself did this in order to trick the Government inspectors ; the inspector cannot provide against trickery of that sort ; it was a fraud to comply with the manager's request at the time ; it was a fraud on the men to give satisfaction to the persons employing me.

*By Mr. Bruce Smith* : I have said that I did not leave the colliery of my own freewill, and that I did leave of my own accord ; that means that I did not leave the work I was at of my own freewill, but that I left rather than go on the coal of my own accord ; I have given all my reasons why I was taken off the shift-work ; when I was taken off the shift-work the work had come to an end there ; it is not true that I told Mr. Atkinson I had left the shift-work because the work I was doing was finished, and the Company were reducing their hands ; probably that was the reason why we were dispensed with—owing to contract work coming on and there being too many shiftmen ; I knew that certain special work on which I was engaged had come to an end ; I did not believe that I was dispensed with in consequence of the work being finished ; I did not tell anybody that I left because that work was finished ; I might have said that I was dispensed with in consequence of the work upon which I was engaged coming to an end, and the Company reducing their hands ; I do not think that I stated to Mr. Atkinson that I was employed as a shiftman, and left in consequence of some work upon which I was engaged being finished, and they were reducing their hands ; I do not think I stated that to him ; it is four months since I communicated with Bailey about this matter ; I have seen Mr. Curley every day since he came into Court ; I have had no interviews with him outside about it ; I saw May first more than two months ago about it ; I saw him at his own house ; there was nobody with me ; Bailey was not with me ; I think Bailey asked me to go and see May ; I was asked to go there in connection with this investigation ; Bailey asked me to do that ; I knew that the investigation had not been granted at that time ; I was at May's house about an hour's time, which was devoted to the facts of this case ; May did not take notes, I think ; May knew that I was coming ; the next time I spoke to May about the case was after the inquiry had been granted ; I met him in the street, and spoke to him for about half an hour about the case ; I did not see him again till these proceedings started ; that was yesterday ; we spoke a little about this case yesterday ; I had not been in Court ; Bailey spoke to me about this matter shortly after he had been discharged ; before he was dismissed he spoke to me about the matter, and asked me what I would do in his place ; that was before he went up to Sydney, and before he was changed from night to day shift ; it was over three months ago that he spoke to me about it ; I saw him immediately after he was dismissed ; I met him, and he told me ; that was about the same day as he was dismissed ; he and I have been cheek-by-jowl over this matter, and have worked together over it ; when I saw Bailey and Newburn holding up the canvas Bailey did not see me ; it was after Bailey had seen the Minister that I told him I had seen him holding up the canvas ; I was not very thick with Bailey at the time I saw him holding up the canvas, although I am at present ; I scarcely knew him at that time ; I have never kept an exercise-book like that shown me before, with notes of that description in it ; I made a note about the chain being thrown at me at the time, because I meant to complain to Mr. Croft, the manager, about it ; I was using the book at the time ; that note was made on the day on which it happened ; I copied it into the other note-book so that I should have the dates if I were asked about them ; the note of the 18th July in the exercise-book I entered on that date ; the letters "N" and "B" were done at the same time, as far as I can recollect ; I have no recollection of inserting them after the rest of the entry ; to the best of my knowledge, the words in dark pencil were put in at the same time as the others ; I think I copied the notes into the note-book on the night of the 21st instant ; I did so because I could not get the exercise-book into my pocket ; that was my only reason ; I depended upon the notes for my recollection of the circumstances ; I put in the words "Was told to keep my mouth shut" in the note-book on the night of the 21st instant ; I was not in a comfortable billet in 1895 ; the first entry shows that—the chain being thrown at me ; I did not complain to Mr. Croft ; the words "Was told to keep my mouth shut" were not in the exercise-book in the original entry.

*By Commissioner* : I wish to qualify my evidence as to doing my best to kill the men by blocking the airway ; I knew we were doing wrong ; I knew it was to the injury of the men, and that if the airway had been completely blocked up it would have eventually killed them.

Taken and sworn at Court-house, Newcastle, this }  
30th day of June, 1899, before me,—

C. G. WADE, J.P.

BENJAMIN DOBB.

Inquiry adjourned till 10 a.m. on Tuesday, the 4th July next.  
Court-house, Newcastle, 30th June, 1899.

Inquiry resumed at 10 a.m. this 4th day of July, 1899, Court-house, Newcastle.

This Deponent, *Benjamin Dobb*, recalled on his former oath, states as follows (*to Mr. Bruce Smith*) : I began to make notes in the exercise-book as far back as 1895, because I thought I had been wrongly treated by the chain being thrown at me ; I thought I had been unjustly dealt with, and I thought the notes might come in useful afterwards ; I thought I could lay the matters before the manager afterwards ; the remark about the notes being useful afterwards applies to all those notes ; I thought the under-manager had not treated me properly when I complained to him about my treatment, and I accumulated these notes with a view to bringing them under the notice of the manager when I should go to him for redress ; I went to the manager on the 25th February, 1898, to complain to him about my treatment ; I waited till 1898 before I went to get redress—three years after I had cause for complaint ; it was after I had been put off my particular work by the under-manager that I went to see the manager about my treatment ; I was particular in recording the notes in the book ; there was no necessity to insert the words, "Was told to keep my mouth shut," in the original note ; the small note-book was produced by me in evidence before the exercise-book, and I stated then that the note-book contained the original notes, made at the time of the occurrences ; I have said that the notes in the note-book are a copy of those in the exercise-book ; I merely looked at the exercise-book, then copied the notes into the note-book from memory in copying the notes from the exercise-book to the note-book ; the notes in the note-book have not been copied directly from the exercise-book ; the ten or eleven days for which I acted as deputy were after 1895 ; I did not on any of those days detect any gas in the mine ; if the light were not put out, or the man carrying it put it out, I would not report the presence of black-damp ; I have never on any occasion as examining deputy reported the presence of any gas in the mine ; I have never on any of those occasions found any gas ; I cannot single out any occasion on which I was told that the examining inspector was coming ; I was told it on most occasions ; I was told it by Mr. H. Croft and Mr. Mouter ; they are the only two people who told me ; there was nobody present when I was told by either ; they would not want such a thing known ; I never took a note that I was told of this ; I thought it was a wrong thing at the time ; it was after 1895 ; I did not make any report of this matter because I was not looking for any redress in connection with it ; it was a regular thing for me to be told of the visits of the inspectors, so there was no necessity for me to make a note of it ; I have never made a note of being told of their visits ; I saw the plan produced [C] two or three days before the Court opened ; it was in Bailey's house ; Bailey explained it a little to me ; I pointed out the other day in my evidence what the arrows and different coloured lines meant ; that plan is drawn in the manner common to show the direction of the air-current ; I was able to give the dates of Mouter's under-managership because I remembered the date of his leaving for England, and the date, or about the date, he became under-manager ; I knew of the obstruction to the air-current when the check inspectors were in the mine ; I knew the inspectors were there on behalf of my fellow-workmen—that they were to check the air current on behalf of their fellow workmen ; I knowingly allowed them to be deceived ; I was acting in my own interests ; I have never from that day to this told them that I had connived at their deception ; I generally saw the reports of the check inspectors ; very likely I saw their report issued after this particular inspection ; I knew that that report was a false one, and likely to mislead my fellow workmen, but I did nothing to undeceive anybody ; the check inspectors

inspectors had the right to go into the mine without any notice ; I always knew when they were coming ; I knew from H. Croft ; I never told the check inspectors that I knew they were coming ; I took the obstruction to the air-current away because Mr. Dixon had to go to that part, and he would have seen it at once ; I knew it was an improper thing to put it up, and I knew it would have to be taken down before the inspector came there ; I deceived the check inspectors, and the Government inspector also ; the check inspectors and the Government inspector were not there at the same time ; the check inspectors were there on the 15th February, 1898, and the Government inspector on the 25th February, 1898 ; the obstruction was not up all that time ; the obstruction was regarded by Croft as a serious thing, both for the men and for him, if it had been found out ; I looked upon it as a serious thing for the men ; I did not go to find out if any of the men had been in any danger through the diverting of the current ; from my position at the time I could not go to see whether any of the men were in any risk ; I was from three-quarters of a mile to a mile from where the men were ; "best coal" is large coal ; it was not a usual thing to use large coal on the furnace ; we always used small, except when the furnace got dirty, and I used to ask for some good coal to brighten it up ; I went to the furnace, or near it, nearly every day when I was down the pit ; McGinness was the furnace-man on the night-shift ; a man named Frank "Asthma" was on the day-shift at one time, and more lately a man named Watson ; the best coal was got for the furnace before the inspectors came into the pit ; if it were not used up then it would be used in the furnace afterwards ; at the time I was put off the shift-work and left the mine I had not seen Bailey at all about these matters these subject of this inquiry ; I had my cavil in before I was put off the shift-work ; I had had notice from the management, and before the expiration of that notice I put my cavil in ; it depended on what place I got whether I took my place in the mine or not ; I did not intend to go to work in any part of the mine for the reason that I had had enough of the atmosphere in certain parts of the mine, and I would not have gone back to them ; I did not tell the manager of any single incident of those noted in the book of mine ; he did not give me a chance to do so ; I went to him to ask him why I was being put off the shift-work ; he told me he was not the under-manager ; I did not tell him anything to the effect that improper things were going on in the mine ; all I spoke to him about was my own position, and not about any irregularities in the mine ; I never wrote to him about any of these irregularities ; there was no use in doing so if I could get no redress ; the whole thing hinged on my getting redress ; I did not know in 1895 that I was going to be put off shift-work in 1898 ; there was no need for me to seek redress after Mr. Mouter came back, because I got redress from him ; there is a note in the exercise-book about a misunderstanding in January, 1896 ; I obtained redress from Mouter in 1895 ; the entries of 1898 were put there because I was not getting proper treatment, and I objected to do the dirty work that was going on.

*By Commissioner* Mouter was not there at that time.

*By Mr. Bruce Smith* : The furnace man never told me that he knew the inspector was coming ; he never knew till I commenced to put the best coal on.

*By Mr. Edmunds* I remember how Mr. Dixon did his inspection on the 25th February, 1898 ; he went to No. 2 first ; then the general practice was to take the in-take in No. 1 ; I knew he did so, because there was a mark there of the area of the air-current ; there were figures there which I understood to be the record of the air-current there ; after finishing No. 1 Mr. Dixon would come out of it ; I do not know when he would leave the mine ; I do not know when he went to No. 5 ; it was about 10 a. m. that I first saw Mr. Dixon on the 25th February, 1898 ; he was then going past No. 1 in the main heading towards No. 2 ; that would be about 600 or 700 yards from the pit bottom ; I do not know whether he came direct from the shaft to that point, or whether he had gone to some other part of the pit first ; I do not know how long he had been down at the time I saw him ; the news of the inspector's presence in the mine would soon spread all over the mine ; I cannot say that on every occasion of Mr. Dixon's visits it was known he was coming ; two or three times he came there without my knowledge beforehand, and I went and told the overman at once ; if I saw him at the pit bottom unawares beforehand to me, I would slip through another part of the mine and tell the overman ; I would have no idea of how long he had been engaged on top of the mine before he went down ; when I was working with Turner in No. 5 on the occasion of Taft's absence we were both using naked lights ; several times our lights went out ; Turner's light burnt a little better than mine because it was nearer the leakage of fresh air through the stopping ; my light was extinguished by the choke-damp ; I relit it each time without any difficulty ; there was not any time at which an ordinary light would not light ; we could always relight our lights ; we could always keep our light going ; Turner was better provided than I, as he had kerosene in his tallow.

*By Mr. Bruce Smith* : The pencil writing on the plan C is not mine ; that is the writing about B. Dobb seeing the canvas up ; there is none of my writing on the plan.

*By Mr. Curley* : On the 25th February, 1898, I both put up and removed an obstruction in No. 5 ; I did not regard myself as an official of the colliery at that time ; I was a shiftman, roadman, timbering—anything I was told to do ; I was not doing any mining for coal at that time ; on the 15th February, 1898, I removed an obstruction that had been put up ; I might have stopped at the mine if it had suited me, because my cavil was successful ; I did not stop there, because the part I cavilled had not good air ; that was No. 8 ; I knew it was not good, because I had worked there, and knew that the air was bad throughout that district ; when I say it was bad, I mean it was hot ; it was hot on the main heading, and very hot on the face ; I have read the thermometer records of the check inspectors there on several occasions, and it ranged from 78° to 84° or 85°.

*By Commissioner* : When the light is burning dimly the least movement of the head will put it out ; if the light is not attended to it will not burn properly ; I have never had an experience where my light has gone out and I have been unable to light it again ; that is as far as this mine is concerned ; black-damp is given off more or less in all mines ; with the ventilation in proper order it should be carried off ; I regarded it as unpleasant to work in, and dangerous to health if a man stayed in it for any length of time ; he might work in it for a lengthened period—four or five years—without experiencing any ill effects, and then it would "cook" him altogether ; when I spoke of the ventilation as being bad, I meant it was not sufficient to carry off the gases ; on the first occasion in July, 1895, when I saw the canvas in No. 1 return, I had been sent there by H. Croft to do some timbering ; that was the first knowledge I had of canvas being placed across the airways ; Mr. Dixon used to inspect the mine about every two months ; when I spoke of the course he took through the mine, I did not speak of what I saw myself, but of what was his usual course through the mine ; I have seen him take No. 9, and come back through Nos. 7 and 6 ; after going through 9, 7, and 6, he would come through No. 5 and out of No. 1 ; No. 2 would be inspected on another occasion ; the mine was too big to inspect all in one day ; in inspecting No. 2 he would generally just go into No. 1 and take the in-take ; that was his general custom ; I did not actually see him do that on the 25th February, 1898 ; I looked upon it as a disrating to be put on the night-shift ; the wages were the same, but it was more uncomfortable to work on the night-shift ; I could get my night's rest on the day-shift ; it was on odd dates between 1895 and 1898 that I acted as examining deputy ; I acted for one week at a time when a man named Jones was off ; when I found the air bad, I did not alter the canvas, because it was not my place ; it was the place of the deputy in that district ; I did not ask him to improve the ventilation ; if I had asked him to do so, and it had come to the under-manager's ears, he would have thought I was taking more upon myself than I should have.

*By Mr. Bruce Smith* : I understand the minimum required by the Act for each man, boy, and horse in the mine ; it is 100 cubic feet per minute ; I never troubled to find out the amount of air circulating in No. 8 ; I should think 130 cubic feet of air per minute sufficient to take off the bad air in No. 8 ; I refused my place in No. 8 ; I never made any test to see what amount of air was circulating in No. 8 ; 130 cubic feet per minute would be sufficient for each man, boy, and horse if taken to the places ; I refused my place in No. 8 about the end of last year ; 140 cubic feet of air per minute would be sufficient for each man, boy, and horse if taken to the places ; if not taken to the places, twice that quantity might not be sufficient ; the check inspectors do not measure in the bords ; it is not likely they would do so ; I have seen the check inspectors doing their work ; I would not like to say whether they did their work properly or not ; I have seen the check inspectors' reports ; I do not think their reports are a fair record of the air which the men are getting ; it was impossible for them to give a fair report when the obstructions were placed in the airways as I have described ; I refer to the obstruction I placed there myself ; if all the men in the mine are honest, the check inspectors' reports would be a fair record of the quantity of air the men were getting ; if ten times 140 cubic feet of air were passing, it would not be enough if the air were not pure ; if it were air of the proper sort, it would be sufficient ; I have heard that the holing in No. 8 was not very good ; it was what is called "ginger-bread" ; I do not like "ginger-bread" holing.

*By Mr. Curley* I have passed through the returns in the A pit—of the returns for 7 and 8 ; they had one return for those two districts and No. 9 ; that return was very good ; I also knew the return for No. 1 district ; that was not too good ; when I noticed it last it was closed up ; one could not travel it ; it was practically blocked through a fall of the roof ; that was about the 15th February, 1898 ; I have been through No. 2 return also ; you cannot travel it ; I have been through

through it only to see that the different stoppings were right ; it cannot be travelled owing to the falls and the presence of water in one portion of it ; I should call it a bad return ; I have not been through No. 10 return ; I have not been in it at all ; I have only travelled No. 2 once ; I have been to each end of No. 10 ; it was all right there ; the ends were a long way apart ; I have never been through No. 5 return ; No. 1 district was nearly always filled with men ; there would be from fifty to sixty men there ; that was three or four years ago ; there would be from forty to fifty men in No. 2 district when I noticed the return as I have described.

BENJAMIN DOBB.

## [Evidence in reply.]

This deponent, *Benjamin Dobb*, recalled, on his former oath, states :—I do not recollect having a conversation with Newburn at his garden ; I have had no conversation with him for the past year and nine months to my recollection ; I did not tell Newburn that I had got the run about the third pay in the quarter before the last ; I did not say to him, "Have you heard about Weir?" Newburn did not say, "No" ; I did not say, "I'll make it warm for young Croft yet" ; no such conversation took place between us ; I never at any time in 1898 called H. Croft a tyrant and a bully ; I have never spoken to him since the 26th February, 1898.

*By Mr. Bruce Smith* : I live at Merewether ; Newburn lives in Merewether, about three-quarters of a mile from my place ; I do not pass his house on my way to and from work ; I pass his house sometimes ; I do not know that I was on friendly terms with him ; I spoke to him ; I say that I have never once spoken to Newburn since he was deputy ; I have spoken to him over his garden fence more than once, perhaps ; I believe that young Croft was at the bottom of the chain-throwing ; he was there, and took as much delight in it as any of them ; I felt angry with him at the time ; I am not angry with him now ; I cannot say that I harbored that feeling of anger against him longer than the time the thing was actually happening ; I made up my mind to speak to his father about it when I got the chance ; I did not speak to his father until years after, and I had been disrated.

*By Commissioner* : I was not more than two or three minutes in No. 2 in-take when I heard Newburn and Bailey there on the occasion of the canvas being held up there ; it was down to the floor.

*By Mr. Edmunds* : The whole in-take was taken up.

BENJAMIN DOBB.

## EXHIBIT L.

THIS deponent, *James Bullerwell*, on his oath, states :—I am under-manager of the New Lambton mine ; I was at one time employed by the Newcastle Coal Company as a shiftman in the old pit ; I was working in the mine about seven months ; I found a small indication of black-damp once, but never reported it to anybody ; I never came across any inflammable gas, nor heard of it from anybody ; I never heard of any other case of black-damp ; I was subpoenaed last week to give evidence on behalf of Bailey ; I was not seen by anybody prior to being subpoenaed ; I was in attendance for two days, and was then told that I would not be required ; I left the mine of my own accord entirely, because I thought I was not being paid sufficiently for the work I was doing ; I asked Bailey why I was called as a witness, and he said something about No. 7 headings, but I could not catch distinctly what he said ; I cannot remember what he said.

*By Commissioner* : I left the mine on 22nd August, 1898 ; I was for three or four weeks acting as examining deputy, and it was during that time that I found the black-damp ; it was in No. 5 pillars that I found it ; it affected the light when I went to the face ; I found a bit of canvas had been knocked down by a bit of a fall ; I re-erected it, and the black-damp was taken away ; there was a good deal of fallen ground about there then ; it was during the latter part of my time that I was examining deputy ; I went down at 3.30 a.m. ; there were men working there then, but I cannot say who they were ; they were working the pillars.

*By Mr. Bruce Smith* : I remember Bailey asking me about five or six weeks ago whether I had found black-damp in the mine ; I refused to answer him ; I have no recollection of his telling or asking me anything about the furnace at the Court the other day.

*By Mr. Curley* : It was about 3 or 4 yards from the face of the pillars that I noticed the indications of the black-damp ; there were two pillars working there ; I noticed the indications in both pillars—about the same distance from the face in each case ; I have a little idea about the affairs of Turner and Weir ; I examined the pillars where they were working some time after they had worked there ; they had finished working there when I began to examine those pillars ; I did not report the black-damp because I found the canvas down and the air was not travelling in as it ought to have done ; when I replaced the canvas it cleared it all out ; I reported "all safe" when I found the black-damp was all out ; my report was made in the morning.

JAMES BULLERWELL.

## EXHIBIT M.

COURT of Investigation opened at 10 a.m. on Monday, the 26th June, 1899.

Mr. W. Edmunds, instructed by Crown Solicitor, for the Chief Inspector of Collieries.

Mr. Bruce Smith, instructed by Mr. H. J. Brown, for the Newcastle Company.

Mr. James Curley, on behalf of the Colliery Employees Federation.

This deponent, *John William Bailey*, on his oath, states (*in answer to Mr. Curley*) :—I am a coal-miner ; I have been what is termed fireman deputy in the Newcastle Company's A pit ; I hold a second-class certificate of competency ; I have not brought it with me, but can produce it if required ; it is an under-manager's certificate ; I was last employed as fireman at the Newcastle Company's pit on the 30th March last ; I had held that position for about nine months ; when I went down the mine as fireman I examined the working-places ; that was at 3.30 a.m. ; I made a report in the ordinary report-books ; on the 28th March last I saw gas in the mine ; I saw a little gas at a point about 3 inches from the roof ; I was examining with a safety-lamp ; I reported that in the book ; I reported that I had found the gas, and had put it out and left everything safe ; the document shown me is a correct copy of my report except that the word "front" is in instead of "back" dip heading ; the protest on it is the same as was placed on my report with the exception that the words "as it is not a correct report," instead of "it not being a correct report" [*document put in and marked A*] [*original report now produced and put in evidence as Exhibit B*] ; the report in that book is correct ; I have made a mistake respecting the wording of the report, and that in the protest ; I copied the report and protest from memory ; my evidence regarding the wording of each is incorrect ; this particular heading had a front and back, but sometimes I was mixed as to what was back and what was the front ; I examined both places ; I say now that I saw the gas in the first of the two headings ; the plan shown me is mine, and was drawn by me ; it is wholly mine with the exception of the pencil marks ; I decline to say who inserted the pencil writings [*plan put in evidence on the understanding that the pencil writings are not to be taken as evidence until the person who wrote them gives evidence, plan marked Exhibit C ; witness marks on the plan the spot where he saw the gas on the 28th March last—marked with a cross*] ; I drew that plan from memory ; I did not copy it from any colliery plan ; it is not drawn to scale, but approximately so ; I would term it a rough sketch plan of these particular districts ; the district where I found the gas I call No. 6 dip heading ; I had been fireman in the pillar district of No. 5, No. 6, and No. 1 ; I had been going round the district where I found the gas for six or seven months ; during that time I inspected those headings regularly every morning ; I had seen gas before the 28th March last ; I did not report it in the book ; I reported it verbally and by note to the under-manager—Mr. Croft ; those notes were destroyed by the under-manager in my presence, except the last one which I destroyed ; I cannot remember whether any remarks were made when I handed those notes to the under-manager ; the notes reported that I had found gas and had removed it ; I have seen other notes referring to gas ; I found them in the safety-lamp ; they were hanging between the pillar and the glass of the lamp ;

lamp; that was the lamp I used for inspection; I had those notes in my possession; they were in the writing of William Rendal; he is in the district at the present time; I sent those notes to the Minister for Mines at his request; nobody saw me post the letter forwarding those notes; I posted it at the Newcastle Post Office; nobody saw me drop it into the letter box to my knowledge; I did not enter my report as to the finding of the gas in the report-book, because I was instructed not to do so by the under-manager, H. Croft; it was said to me at the time I took over this gassy place; I said it would have to go into the report-book; he said it would not, that I would have to report it to him; that was about nine months before the date of my discharge; what Croft said to me about not reporting in the books was said on the morning before I took charge of the gassy part of the mine; that was the whole of the conversation as far as I can recollect; I cannot say with any certainty whether it was nine months before my discharge that this conversation took place; it was about eight or nine months; I had been told something by Rendal before I took over this gassy part of the mine; he was night overman; when I went down the mine that morning Rendal was waiting for me; I went with him to a certain part of the mine—down the back narrow bord down the dip to No. 6; I did not examine the place, but immediately started to put up some canvas [*witness marks about the spot on the plan marked with a circle*]; Rendal assisted me in putting up the canvas—about two lengths 12 feet long; the canvas was about 10 or 12 yards from the face when I went there; that would be to the carch; Rendal got that canvas from somewhere.

*By Commissioner:* As far as I could see the place was being worked.

*By Mr. Curley:* I do not know who worked in that particular place; I made this report in the book on this occasion because the under-manager had handed me back my last note, with the report on it, without reading it; after that I made verbal reports to him, and he did not seem very pleased when I did so; the under-manager was H. Croft; he seemed averse to receiving notes and to verbal reports; after I had made my report in the book nobody spoke to me about it until the under-manager came down; I spoke first and told him what I had done; that was on the same morning as I had made the report—28th March; I told him I had found gas in one of the dip headings and had reported it in the book; I forget what he replied; he seemed vexed; I told him to reach the report-book down and read it for himself, and he did so; he made a remark then to the deputies, who had arrived by that time; they were W. Ambrose, W. Yardley, W. Gall; Croft handed the report book to them, showed it to them, and said, "Look what he has done"; I cannot remember if he said anything more than that; nobody else spoke to me about it at that particular time; I then went on with my work; nobody spoke to me about that report on that day; when I went down next morning, about half-past 3, to make my usual examination, I found the under-manager in his cabin cleaning the lamp; he asked me to look at the report-book; I did so, and in it read his protest; I said, "That's it, is it?" and he replied, "Yes"; I then said, "Must I take my own lamp?" and he replied, "Yes"; I meant the lamp with which I made the inspection; that was a Marsaut lamp; I did not notice what description of lamp he had; it was not the lamp I used on my inspection; I asked should I go my own road and he replied, "Yes, call by the furnace"; I there saw Deputy Gall firing up with best coal; I started on my usual round and Gall and Croft followed me round; I went right round my usual rounds; it was about 3:30 a.m. or 3:40 a.m.; I noticed a slight movement of the flame of the lamp; I noticed nothing else.

*By Commissioner:* I noticed the movement in the flame of the lamp in two rise headings, shown in the plan [*witness marks points on the plan with a circle, with a line through it*].

*By Mr. Curley:* The brattice had been rearranged and tightened up in those places since I had been in there the previous morning.

*By Commissioner:* I had seen gas in those places on other occasions, but I cannot say whether I had seen it there the previous day.

*By Mr. Curley:* I made a report in the book on the morning of the 29th March last—the same book as contained my former report [*Exhibit B; report marked Exhibit D*]; when I took over the gassy part of the mine I used to examine every day, and make my reports in the book every day, in accordance with the Act; on the 29th March, Mr. Joseph Croft, the manager, spoke to me; I was sent for about 9:30 a.m. to where I was working to go to the deputies' cabin; I went there and saw Mr. Joseph Croft there as well as Gall, the deputy; H. Croft came up also; there was no one else there; Joseph Croft said to me, "As you're a little deaf, Bailey, we will go into a quiet place; I want to speak to you about your report"; we went up the No. 8 engine-room; about half way up we sat down and he said, "I want to speak to you about that report, as I consider it is not a correct one"; I said, "All right, Mr. Croft"; he had a copy of the Coal Mines Regulation Act and a copy of the Special Rules; I asked him what his objections were, and he said I had not mentioned roof or sides; I said, "I have no need to say anything about roof or sides, because I consider them sound"; Croft said, "Would you consider a small aperture in the roof as a defect?" I said, "No, I take that to mean a roof that is breaking away"; he then proceeded to read General Rule 4 in the Coal Mines Regulation Act, and another out of the Special Rules; I cannot say which of the Special Rules it was he read, whether it was No. 15 or No. 11 [*copy of the Special Rules put in and marked Exhibit E*]; after he had read them I said, "Would you allow me to read them, please?" I read them, sentence by sentence, and at the end of each sentence said to him, "Have I not done that?" I cannot remember his answer, but he finally said, "Well, Bailey, I wanted to keep that word 'car'—and then he hesitated, and his son said, "carburetted"; "I wanted that left out"; Joseph Croft seemed to be in a difficulty about pronouncing the word, and H. Croft told him "carburetted hydrogen"; Joseph Croft then repeated the words "carburetted hydrogen" and said he wanted those words left out of the report; I said, "What will be the consequences if I don't?" he replied, "Oh, nothing"; I then asked, "How must I report this gas?" he replied, "Say there's a little gas, not dangerous"; I then asked him how I should report the black-damp in No. 5 pillars; he replied, "Oh, put black-damp"; Gall interjected during the interview; he was present during the whole of this conversation; Gall said he could blow what gas there was there out; I said I did not want any bluff from him, but straight talk; that, practically, ended the interview, and I returned to my work; when I went down next day at 3:30 a.m. I found Gall firing up at the furnace; he accompanied me round the workings; I saw nothing exceptional that day; I did not see the manager; on the 31st March I received a letter from the under-manager removing me from my position as fireman [*letter produced and put in as Exhibit F*]; I did not go to work as requested in that letter; on Easter Monday I went to Lithgow to see the Minister for Mines; I saw the Minister and spoke to him; I then returned home and to my work; I cannot say when that was; I think I was off three shifts; the work I took up when I resumed was general shift-work at night; I worked at that for about a week; then one evening about 4 o'clock Rendal asked me to go over into the office, and I went with him; we saw Mr. Joseph Croft there; there was nobody else there; we spoke generally about the gas; I can remember saying to Mr. Croft, "Well, what about the man being burnt if there was no gas there?" I cannot remember what answer was made to that; Croft asked me where I had been; I said I had been to see the Minister for Mines and Mr. Atkinson, the Inspector of Collieries; he seemed annoyed, but I cannot remember any answers that were made to my questions in that interview; I left the office, and went to work with Rendal; the next day Rendal told me to go over to the office about 4 o'clock; I went there and saw Mr. Joseph Croft; there was nobody else there just then; he said the deputies would be in shortly; he got up and went outside for a minute; the deputies then came in—W. Newburn, W. Ambrose, W. Gall, and H. Croft; Rendal was not there; Joseph Croft came in about a minute before the deputies; they all sat down, and Joseph Croft said, "I want to speak about the gas and the canvassing business;" there was not much said about the gas; I cannot recollect what was said about the gas, but something was said about the canvas; Joseph Croft said to me, "Who did you see put the canvas up?" I replied, "W. Newburn"; Newburn denied it; I then said W. Ambrose had kept the door open on the No. 8 engine-road; that door is shown on the plan marked C [*witness marks spot on plan—a red line across the blue, close to the words "Wood-door."*]; Ambrose replied, "It's a lie"; they all wanted to speak at once; Newburn called me a traitor; Gall called me a b—— liar; and, finally, Croft, senior, who seemed excited, leaned over the table and shook his fist, and said I was a d—— liar; Joseph Croft said to me eventually, "Well, I'll not have you about the ground"; I asked him if I was to understand I was dismissed, and he said, "Yes"; as I was leaving the office some jeering remarks were made; I cannot exactly remember what they were, but there was one, "What were you dismissed from the Borehole for?" or to that effect; I then left the office, and I have not worked in the mine since; I saw the canvas being put up by Newburn, to which reference has been made by me; that was on the main in-take engine-road going to No. 2 [*spot marked with a red pencil-mark across the blue on the plan*]; that particular case of Newburn's happened about 1895; the effect of putting up the canvas there would be to increase the current of air in other districts of the mine—both in No. 6 and No. 1; I cannot fix the month in which that took place; it was about the middle of 1895; it was done during the daytime; the mine was working on that day when that was done; at that time there were between 300 and 400 men employed in that mine; I understood there were inspectors in the mine when this was done; I think Inspector Dixon was there at the time; I have known brattice to be put up in a similar way in the mine since then; that was about six or seven months ago; I have seen the canvas put up in this way on the only road connecting Nos. 7 and 8 districts; that was, approximately, about seven or eight months ago

[Indicated

[indicated on the plan by an arrow on the blue line ; also a red line across the blue line.] ; I put it up ; I was told to do it by W. Ambrose ; the putting up of the canvas there would practically cut off the air from No. 7 district, and send it down to No. 6 ; I was sent to put up that canvas, but was rather late in getting there ; W. Ambrose was already there, and I assisted him with it ; there was nobody else there ; that was done about 10 a.m. ; when I left the pit bottom at 6:40 a.m. that day the Government inspectors were expected ; I cannot fix the date of this ; I did not see the Government inspectors in the mine that day ; I heard in the office before leaving that the inspectors would be down that day ; I cannot remember whether anybody said anything about their coming that day ; I cannot say what was said to lead me to expect the inspectors would come that day ; someone in the office said they were coming ; the usual deputies were in the office at the time ; nobody took me out of the way on the occasion of which I am speaking ; I saw no brattice put up any other time to turn the air ; the door of which I have spoken as being kept open on one occasion was kept open by W. Ambrose ; that door led to No. 8 district ; that was about the 3rd or 10th March last ; there was a boy looking after that door ; he was with me when this door was kept open ; his name was Harry Jones ; I went up No. 7 headings with him ; I did so in order to be out of the way ; that was an instruction given to me by W. Ambrose ; he told me to take the boy out of the way for a bit ; I was away with the boy for forty-five minutes or an hour ; when I returned the door was open ; when I had left the door was shut, I believe ; I saw Ambrose when I left—at the box about 10 or 12 yards from this door ; the door was shut when I left with the boy to go up No. 7 ; when I came back the boy was with me ; the door was wide open when I came back ; I was told to go away again by W. Ambrose ; I took the boy with me ; I was away about the same length of time as on the first occasion ; when I returned that time the door was shut ; I cannot say who told me the inspectors were to be there that day, nor where I was told ; I was told in the mine.

*By Commissioner :* The visits of the inspectors were generally known to the men before they came ; I cannot say whether their intended visits were known to the management.

*By Mr. Curley :* On one occasion I myself knew of an intended visit by the inspectors ; I know that by being in the under-manager's position that day ; a deputy told me about 6:40 a.m. ; I do not know his name ; he told me that the inspectors were expected that day ; I do not know of any other occasions on which doors were kept open or canvas put up.

*By Commissioner :* Canvas was once put up by Newburn, once by Ambrose, and on one occasion the door was kept open by Ambrose ; those are all the occasions of which I knew.

*By Mr. Curley :* It was within nine months before my discharge that I was told the inspectors were coming ; I have come across black-damp in my inspections ; that was in No. 5 pillars ; the position of that place is indicated by the letters C. o. 2 with a black circle near them ; I know one man who was overcome by the black-damp in the mine ; his name was W. Taft ; I did not see him overcome myself ; I was told of it by the night-overman, W. Rendal ; Rendal said he had had a little trouble on ; he then told me that Taft had been carried out of the mine ; he did not state what was the cause of his being overcome ; he said he had been taken from No. 5 ; he was taken out at night ; that shift began at 4 p.m. ; Rendal said Taft had been carried out of No. 5 ; that was the gist of what he said to me ; Taft's shift would begin at 4 p.m. ; he was engaged in recovering pillars.

*By Commissioner :* That would mean that the headings had fallen in and he and the others were getting them up to lay the road and win the pillars.

*By Mr. Curley :* I cannot remember whether Rendal mentioned at what time Taft had been carried out ; I do not think there were any men working there in the daytime ; nobody inspected those parts of the mine between shifts ; if no men were working there in the daytime, there ought to be some inspection before the shift went in ; nobody did inspect those places ; the notes I posted to the Minister for Mines I found in my safety-lamp ; I have copies of those notes in my possession now ; I copied them myself ; what I produce now is a verbatim copy of what I found in the lamp ; I took particular pains to copy them correctly [paper put in and marked Exhibit G] ; I found those two notes on different occasions ; I put the date on the second note on the day I took it out of the lamp ; I got other notes, but destroyed them ; four or five members of my own family saw me enclose those notes to the Minister, as well as Mr. Dobb ; I have studied the question of gas in coal-mines to some extent ; I have seen references to it by writers ; I regard fire-damp as a very serious matter in a coal-mine ; I was examined with respect to gases when I obtained my certificate ; I have read Pameley on Coal-mining ; I have also read text-books on coal-mining ; I have read Peel on the subject ; I have not studied closely any mines reports ; I have read some of them with respect to this gas ; I read that regarding the explosion at the Dudley mine ; I consider General Rule 4 renders it imperative on my part as a deputy fireman to report the presence of any gas in the mine.

*By Mr. Edmunds :* It was one day during the last nine months of my employment at the mine that I acted as under-manager ; young Mr. Croft had met with an accident to his feet, and I took his place for that day ; I think I only acted for that day ; I was in the mine from 3:30 a.m. till 4 p.m. ; Mr. Dixon did not see me that day ; I have seen him in the course of his inspections ; his duties as inspector would bring him into relation with the under-manager ; if he had inspected during the day I acted as under-manager he would have seen me ; he did not make an inspection of the mine that day ; it was five or six months ago that Ambrose put up the brattice ; I cannot say how often Mr. Dixon inspected the mine ; I have only heard of Mr. Atkinson inspecting the mine once or twice besides Mr. Dixon ; I have seen Mr. Dixon carrying out his inspection of the mine ; I can only recall two occasions to my memory ; nothing was done to interfere with the ventilation on either of those occasions ; I never spoke to Mr. Dixon with reference to what I had seen regarding the door and brattice ; I used to meet Mr. Dixon pretty frequently about that time ; in private life he and I were not at all strangers to each other, and there was no unfriendly feeling between us ; I never mentioned the matter to him, either officially or privately, until I went to the Minister ; I was somewhat doubtful about Mr. Dixon as an inspector of late ; knowing the ventilation in the mine was bad, and that Mr. Dixon was the local inspector, I thought he should have known of the bad ventilation ; I should expect Mr. Dixon to be a man who would not tolerate any interference with his work as an inspector ; I did not report the matters I have spoken of to him because of my want of faith in him ; I have never measured the air-current with an anemometer ; I cannot say on how many occasions I have detected the presence of gas in the mine ; besides the 28th March last I detected gas in the mine on the 21st March last ; I always reported as instructed when I found gas ; I made no written report till the 28th March last ; the opening of the door would not shut off the air totally from another district, but would rob it of some ; that district was No. 6 ; there would be about thirty men there ; I do not consider there was sufficient air for that number of men when that door was opened ; I was absent that day for about an hour and a half or two hours ; the boy was with me all the time ; during that time there would not be sufficient air for the men in that part of No. 6 district ; I knew it was a wrong thing to do—to open that door on such an occasion ; I also considered it was wrong to deprive the men in No. 6 of that quantity of air ; the men in No. 8 district got an increased supply of air by the opening of the door ; this occurred between 9:30 a.m. and 11 a.m., perhaps later than 11 ; I did not see Mr. Dixon making an inspection that day ; I did not think it was my duty to remonstrate with Ambrose about what he had done, as he was a superior official to me ; I did not report the circumstance to anybody above him ; I first mentioned the matter to the Minister for Mines on Easter Monday ; I did not mention any of these circumstances to anyone in authority in the mine, nor to Mr. Dixon, nor to Mr. Atkinson ; it was generally known in the mine when the inspector was coming ; I knew it from general conversation among the deputies ; I may have seen Mr. Dixon there on more than two occasions inspecting, but it is too long ago for me to remember ; I cannot say now whether he did visit the mine to inspect it on the occasions I have mentioned when he was expected ; I have said that when I went inspecting with Mr. Croft and Gall I noticed the flame of the lamp affected ; I called Croft's attention to it ; I told him there was just enough to make the flame of the lamp pucker up ; it only happened the once ; the flame would consume what little gas there was there ; it was just a little flicker ; the puckering of the flame only lasted a moment ; I saw just the same thing in No. 6 rise headings ; I drew the attention of Croft and Gall to it ; each of them had a safety-lamp ; I believe Gall tried the air for gas ; I cannot say whether Croft did ; my lamp was not locked.

*By Commissioner :* I was making the inspection prescribed by the Act at the time ; my lamp was not locked, because the management provided no key with which to lock it ; it was never locked ; the lamps used by Croft and Gall were not locked, as far as I could tell.

*By Mr. Edmunds :* I knew it was my duty to examine with a locked lamp, and that I was committing a breach of the law in examining with an unlocked lamp ; I made no complaint about having no key for my lamp ; I did not ask for a key.

*By Mr. Bruce Smith :* I saw the Minister for Mines personally ; I did not know him personally ; I went all that distance to see him, because I felt the stigma to my name in being disrated ; I thought there were things which the Minister ought to know about the mine ; if I had not been disrated there would have been no need for me to have gone to him ; I went to complain to him about my disrating ; I thought it my duty to let him know all these breaches of the law of which I have spoken in my evidence ; I had some compassion for the workmen who were working in the badly-ventilated mine ; I made no complaint to the Department from 1895 to 1899, and then not until I was disrated ; during that period I knew something about the Act and the regulations under it ; I knew of General Rule 4, section 1 ; I also knew Special Rule 11 ; I was inspecting that part of the mine in which work was going on for six or seven months before the

28th March last; I only reported the presence of gas in the mine on the one occasion—28th March last—as prescribed by that rule; I had met with gas on at least half a dozen occasions before that date; I did not report those findings as prescribed by the rule; I did not report the finding of the gas on 21st March last, as required by the Act; I knew it was wrong on my part not to report the gas in the prescribed manner; I was not prepared to lose my situation; when I was disgraced I went to the Minister and reported the matter; I gave a verbal report of the gas because I was instructed to do so; I remember an interview that took place in the manager's office after the 28th March last, when Ambrose, Newburn, and Gall were present; I cannot remember Mr. Croft saying there was some underhand work going on; I did not tell Mr. Croft that some one had induced me to make that written report; I did not admit to them that somebody had instigated me to make that written report; I cannot tell whose handwriting is in pencil on top of the plan produced—[*Exhibit C*]; I decline to say whose writing it is; I refuse to say whether I know whose writing it is or not; I cannot say for certain whose it is, because I did not see it done; I have seen similar handwriting, but cannot say which of my friend's it is; I cannot say it is that of any certain person; I cannot recognise it as the writing of any particular person; I decline to say whose writing I believe it to be; the writing is familiar to me.

(Commissioner tells witness that he must answer the questions as to writing.)

*By Commissioner*: I have two friends who write like that.

*By Mr. Bruce Smith*: My reason for withholding the name of the writer is that I am not going to divulge my private business here; if I mentioned a name I might fix on an innocent person; I am not going to say who my two friends are who write like that.

(Commissioner instructs witness that he must answer the question put.)

*By Commissioner*: I consider it not right for me to divulge the names of my friends in this matter without their permission; that is where the private business comes in; it may be the writing of Mr. Dobb; I decline to say who the other friend is whose writing it is like; it may be the writing of Mr. May.

*By Mr. Bruce Smith*: Mr. May is an expert mining gentleman; he is a mining lecturer; I will not swear that I did not take the plan to Mr. May and show it to him before I brought it to Court; he saw it before it came to the Court.

Taken and sworn, at Newcastle, this 26th day }  
of June, 1899, before me,—

J. W. BAILEY.

C. G. WADE, J.P.

Court adjourned till 10 a.m. to-morrow.  
Newcastle, 26th June, 1899.

Court of Investigation resumed at 10 a.m. this 27th day of June, 1899, Court-house, Newcastle.

This deponent, *John William Bailey*, recalled, on his former oath, states (*in answer to Mr. Bruce Smith*):—I met Mr. May about 9:30 p.m. yesterday, and was with him for about half an hour; we were talking about things generally in connection with the case; I have known him about seven years as a student in his class; the plan produced [*Exhibit C*] has been prepared about a fortnight; it was copied from an original, which is worn out; I submitted the plan to Mr. May; the plan has been in the hands of both Mr. May and Mr. Dobb; Mr. Dobb's name is mentioned in the pencil-writing; I cannot say if the pencil-writing was on the plan when it was submitted to Mr. May; I asked Dobb this morning if he had put the pencil-writing on the plan, and he said he did not know; it may have been a fortnight, it may have been a month ago, that I submitted the plan to Mr. May; I cannot say exactly when that was done; I considered it a trivial affair, and nothing to remember; I believe I showed the original plan to May; I pointed out small details in the plan to May when I submitted it to him a month ago; I discussed my complaints with him when I submitted the plan; I know that certain correspondence is published in the local paper this morning regarding Mr. May's position in this matter; I have seen that correspondence; that correspondence may have been the subject of our conversation last night; I cannot remember if it was; I cannot remember whether it was; my mind was in such a state that my memory has become affected; I will swear that I cannot remember whether that correspondence formed part of our conversation last night; I will leave it to the Judge and solicitors to say whether I am in a fit state to give evidence this morning as to what took place a week or a month ago; I went over to May's last night as one friend would go to see another; perhaps Mr. May invited me to go; I believe he invited me to go to his house; I think I remember he asked me to go over yesterday morning; he did not ask me after the Court was over to go to his place last night; I did not see him between the time the Court rose and 9:30 p.m. yesterday; I cannot remember whether those letters were discussed between us last night; other details were in my mind, and I cannot remember trivialities like them; I cannot say whether I knew those letters were going to appear in the paper this morning; I was not surprised to see those letters in the paper this morning; I knew Mr. May had them; they might have appeared in to-morrow's paper; I cannot say whether I expected to find them in the paper this morning; I did not arrange with Mr. May last night that they should appear to-day; I have read the letters; I have not compared them with the originals, and cannot say whether they are correctly printed; I have May's letter in my pocket; I cannot say whether May has the original letter I wrote to him of the 19th June; he has not given it back to me; I find I have not May's letter on me; I must have pulled it out of my pocket with my handkerchief.

*By Commissioner*: I last saw it about 10:30 p.m. yesterday in my pocket; I was at home then.

*By Mr. Bruce Smith*: I had my letter to May last night; I had the two together then; it is a copy of my letter to him I am referring to; I have copied all my letters during the last eight weeks; I have not had the original letter from me to May since I sent it to him; I am certain there were original letters to these two letters; I can remember writing that letter; I cannot particularly remember receiving the letter from May; I cannot say whether the printed letters are substantially the same as the originals; I wrote to May: "The Minister for Mines has granted an inquiry into the subject of my dismissal and other matters connected with the Glebe mine"; I wrote those words to May; my dismissal was naturally the first subject I would speak or write of; I placed my dismissal first in order, because I thought it was the proper order in which to put them; I thought it was of first importance; I wrote to the Minister; the letter produced is mine (5th April, 1899); I had seen the Minister when I wrote it; the suggestion spoken of was mine; Messrs. Humble and Bates are Government inspectors; I have seen Mr. Bates once or twice, I believe; all the suggestions in the letter as to the method of carrying out the inspection are mine [*marked for identification—1*]; the writing on the margin of the letter is not mine; I wrote that letter as a full statement of the case to the Minister; I do not mention in it that I had been asked not to report the finding of gas in the mine; I cannot say why I omitted that from the letter; the letter produced (April 15th, 1899) is mine; after my letter of the 5th April the Minister did not ask me to write to him again; when I saw him at Lithgow he asked me to write to him, and I took that to mean I was to write more than one letter; I did not write the words "don't acknowledge" on the letter; I cannot say if in any of my letters to the Minister I spoke of being prohibited from reporting the gas in the books; I wrote five letters to the Minister altogether (5th April, 15th April, 19th April), enclosing the original notes, 10th May, 9th June; I also wrote a letter on the 27th April; I will not say I did not submit the last-mentioned letter to Mr. May before sending it; I cannot remember whether he assisted me in writing it; I was assisted in the writing of the letter, but I cannot say by whom; in that letter I suggested Mr. May as one of the persons to inquire into the matters I had brought under the notice of the Minister. [*Letters of 15th and 27th April marked 2 and 3 respectively for identification.*] When I wrote the letter of the 19th June, appearing in the newspaper, I had spoken to May frequently about my case; May would probably know from the papers that the Minister had granted an inquiry into my charges; I will not swear I had not told May that before; I spoke of my defective hearing in the letter to May of 19th June; I felt that my defective hearing placed me at a disadvantage in the conduct of this case; I expected that May would assist me in the matter before the Court of Investigation; I have not had half a dozen conferences with Mr. Curley over this matter; I cannot say how many I have had with him; I may have had half a dozen conferences with him over this; I cannot say how long these conferences lasted; they may have lasted an hour, or more, or less; I first saw him about the case about a month ago; I cannot say I knew a month ago that Mr. Curley was going to conduct the case on behalf of the miners; I knew it about a fortnight ago; I wanted May to conduct the case for me, because I had a high opinion of his abilities; I nominated May first as one of the tribunal to investigate this case; I did this although I had frequently consulted him about my case; I saw May very frequently; I wrote to him for the ordinary reason that I would have liked him to assist me; I wrote to him instead of asking him verbally, because it was the first thing came to my mind; I have not written to May in connection with this matter, except in that one instance; I cannot remember writing to the Department for permission for May to assist me in this matter; I did not do so, because I wrote to the Minister; I only remember writing to the Department of Mines; I cannot remember writing to the Department of Education for May's assistance in the matter; I cannot remember if I ever asked any Department to allow May to assist me in the conduct of my case; I cannot

cannot give any reason why I did not ask the permission of the Department for May to assist me in the conduct of the case; I first suggested that May should assist me, and first spoke of obtaining the permission of the Department for his assistance; my letter of the 19th June, in which I said, "If I obtain the permission of your Department," referred to the future, I expect; I did not apply to the Department because I was waiting for the answer from Mr. Cook; I expected a letter from the Department of Mines saying I could have May's assistance; the date of my last letter to the Department was 9th June; the letter shown me is that letter; I think the sentence in the letter, "I think you will give me fair play," refers to my request for May's assistance in the conduct of my case; I have no record of any later letter in my list; Mr. Curley was one of the deputation, and five Members of Parliament; I cannot name any other letter written by me in June; I believe the letters published in the newspaper this morning were written before yesterday; I will not swear they were; I cannot swear they were not written yesterday; I will swear I received a letter from May bearing date 20th June, 1899; I will not swear I received the letter published of that date; I will not swear I wrote the letter of 19th June, as published; I did not compare it with my letter; May and I spoke last night about the case—about what had transpired during the day in the Court; we spoke of the evidence that had been given; I cannot remember any details of our conversation last night; I cannot remember whether those published letters were discussed between us; I believe my memory is reliable enough to be taxed with questions as to occurrences of three months ago; I will not swear I did not write a letter in the words of the published letter, and dated 19th June; I cannot remember whether I did or not; I cannot swear whether May wrote a letter yesterday, dated 20th June.

*By Commissioner:* I believe I asked May last night if he had written on my plan; I cannot recollect any conversation between us as to the letters of the 19th and 20th June.

*By Mr. Bruce Smith:* I did not show the note on the plan to Mr. May yesterday; it was to ask him about that writing that I went to see him; I believe I asked him if he had written that note; I believe he said he had, but I cannot say definitely nor give the words he used; I understood him to say he had written the note; I cannot recognise any other writing of May's on the plan. [*Witness reads pencil note on the plan.*] I do not know how May knew that Dobb had seen the canvas stopping on the 18th July; I cannot say that I did not tell him of that; he may have seen Dobb; when the copy of the report-book was put in my hands yesterday, I said there were two words in it that were not correct; I wrote the letter dated 20th June [*marked 4 for identification*]; I cannot say whether I received a reply to that; I did receive such a reply [*marked 5 for identification*]; I look at the report in the book [*Exhibit B*]; it is correct that when I first wrote the report it concluded with the words "all safe" and that the writing which comes under the printed matter was not put in at that time; I afterwards took up the book and said, "I am not satisfied with that report, I am going to add something to it"; I then wrote in that portion referring to the finding of the gas; I prayed many a night for strength to put those words in, but had not the courage to do so until then; I found that courage because I asked God to help me to do my duty; I did not go through the formality of kneeling to pray, but I certainly asked God to assist me between the time of writing the first part of the report and the addition; I cannot say whether I have ever told anybody that I wrote that report at two different times; I felt I had been signing a lie; I did not make any additions to my former reports as to the finding of gas, because I could not; I had only one report for each day; I did not find sufficient gas to make it worth reporting after that date; there is enough gas to make it worth reporting when the light gives a blue cap; I cannot remember saying yesterday that I ever saw a blue cap to the flame; there was a blue cap on the 28th March last; I cannot remember whether I said anything about that in my evidence yesterday; I remember two occasions, which I mentioned yesterday, when the light was affected; there was no blue flame on either of those occasions; therefore, in my opinion, there was not sufficient gas to make it worth reporting; that is why I did not report it; I do not think I said yesterday in my evidence that I did not report them because I had been prohibited from doing so; I detected gas various times before the 28th March last, I cannot say how many; I saw the blue flame on three or four occasions; on those occasions I reported nothing in the book but all safe; I reported the gas verbally; I reported the finding of the gas on the 28th March last because the ventilation in the mine was getting worse and worse; I believe the ventilation of the mine was in its worst state in January, February, and March, this year, and perhaps two or three months prior to that; it was as bad in March as in January and February, speaking from memory; I did not test the air with a thermometer or anemometer during those months; my opinion of the state of the air is practically guesswork; the men in the mine have the privilege of checking the ventilation in the mine; I know that there should not be less than 100 cubic feet of air for each man in the mine; if 158 cubic feet of air for each man, boy, and horse in the mine were supplied it would be sufficient if it went to the faces of the working places; I consider No. 8 district was insufficiently ventilated; 188 feet per man, boy, and horse were sufficient if the men got it at the face; 180 feet would be sufficient under such circumstances; I had doubts about the ventilation in No. 8 district; when I was examined with regard to the report yesterday, I said the copy was all right except that the word "front" was used instead of "back"; I remember meeting Ambrose, Yardley, and Gall on the morning of the 28th March last; I do not remember telling Gall that I had got mixed about the back and front; I cannot say whether I told him that it was in the back I had found the gas, although I had said the front in the report; it was the front heading going in; there always used to be a misunderstanding between Rendal and myself as to the front and back headings in that district; I remember the two occasions after the 28th March on which I saw the flame move in the lamp; Gall was with me at the time; I told him the flame was moving the lamp; he said he could not see it; I then replied, "Oh, it's exhumed"; I cannot say those were the particular words I used; I think I said it was consumed; I meant that the light had burnt it and given off its product; I gave that as the reason for his not seeing it, there was such a slight quantity of gas present; I said yesterday that when I had the last interview with Mr. Croft, the others present jeered me, and asked me why I was dismissed from the Borehole?; that referred to a circumstance at the Borehole Pit in which I was concerned; I may have mentioned it to the men below; I spoke yesterday of cases in which the canvas had been tightened up; those places had had canvas there before; it is a common thing for the canvas to sag and become loose through the action of the atmosphere; I spoke yesterday of being sent away from the door with the boy Harry Jones; it is not a fact that I asked Gall to allow the boy to go with me to put up some canvas; I did go with the boy and put up a piece of canvas; we were told to go and put in our time somewhere out of the way; I said nothing yesterday about putting up canvas; I am certain I was sent away from the door twice; I cannot say that nobody took the boy's place while he was away; I found Ambrose there when I came back; when I went back the second time the door was shut; I only remember seeing Ambrose at the door when I went away with the boy; I will swear it was Ambrose and not Gall there when I went away; I obtained my information regarding Taft from Rendal and Taft himself; I only knew what happened to him from what he and Rendal told me; I missed Taft from his work the next day; I did not mention Taft yesterday as one of my sources of information with regard to his accident; I have said that I missed Taft from his shift; he was on the night-shift, which ended at 1 a.m.; I went on at 4 p.m., and knocked off at 1 a.m.; I cannot be sure whether I missed Taft myself, or whether I heard it from someone else; I remember the interview I had with Mr. Croft in the presence of Messrs. J. and H. Croft and Gall on the 29th March last; Ambrose was not there; I did not see him there; I did not hear Mr. Croft, senior, say, "There is something behind the scenes that caused you to make that report"; I did not reply, "Yes, there is"; I said, "Some time ago a man was burnt"; I cannot remember if Croft asked me who it was; I may have said it was Anthony Wear; I cannot remember if I said, "He and his friends have been talking over the matter, and say I ought to have reported finding the gas"; I do not remember Croft saying, "Whether you found it or not?" and I replied "Yes"; I did not hear Croft say, "I have lost confidence in you."

*By Mr. Curley:* I know Wear; I never saw him till the 20th May last; Mr. Inspector Dixon said something to me on one occasion at the Coal-mines Office; it was suggested that I should see Mr. Keightley; Mr. Dixon asked me would I see Mr. Keightley; Mr. Atkinson asked me would I see Mr. Keightley; I replied, "No, what would be the use, the man would not be put on oath"; Mr. Atkinson said I could have Wear, Abell, and one or two others to support me; that they would have the deputies there, and if I proved that they had done this thing they would be dismissed; Mr. Atkinson asked me at the "Great Northern Hotel" to write to him; he said, "Write me a reply"; I cannot remember whether Mr. Atkinson told me that he had informed Mr. Croft of my statements; I saw the Minister with reference to the notes which I say are missing; I saw him at the Mines Department; I said I had sent the notes on as he had requested; he said he had not received them; on one occasion Mr. Atkinson was present; I asked Mr. Atkinson if he had received them; he replied, "Why do you ask me, Bailey?"; that seemed to be his reply; as far as I recollect that was his answer; I have brought my certificate with me to-day [*letter forwarding certificate put in evidence as Exhibit H*]; I obtained that certificate by examination in Newcastle; I was examined by Messrs. Humble, McCabe, and Kater; I have been a practical coal-miner for twenty-four years; I have worked in mines in England, Australia, and New Zealand; I have worked in the North Staffordshire district in England in Earl Granville's mines; there was fire-damp in that colliery;

I worked there for two or three years; I also worked for the Chatterleigh Coal and Iron Company in England; there was fire-damp in that mine; I worked there about four years; I also worked in another pit of Earl Granville's in England; I have worked at the A. A. Co.'s mine, the Burwood, the Newcastle Coal Co.'s, and the Corrimal mine in this Colony; I worked at the A. A. Co.'s mine for two or three years and for about the same time in the Burwood; about three months at the Corrimal; I have worked at the Newcastle Co.'s mine about seven years; my experience in and about mines extends over a period of twenty-four years; I was three or four years outside mines; I believe gases were one of the subjects of my examination; I consider carburetted hydrogen is a dangerous element in mining, even in small quantities; I have read other works besides Peel's and Pameley's on mining.

*By Mr. Edmunds:* I am 36 years of age; I saw the Minister about the 3rd April last; I saw him again on the 18th April, I believe; that was at the Mines Department; he asked me to send him the notes Rendal had left; that was at the interview on the 18th April; Mr. Atkinson told me that Mr. Keightley was prepared to inquire into the matter, and if he found any of the employees of the mine to be in fault to dismiss them; he asked me if I had complained to Mr. Keightley about the injustice of my dismissal; he may have said that he thought it was the proper course for me to complain to Mr. Keightley and see what he would do; he seemed favourable to my complaining to Mr. Keightley in the first instance as a proper and reasonable course to take at first.

*By Mr. Bruce Smith:* The notes I have been refreshing my memory with are copied from a diary I kept; I have kept it since March last—since my dismissal; the notes are condensed from that diary; I never kept a diary before March last.

*By Commissioner:* I cannot say how many times I saw gas in the company's mine; it would be from six to ten times; that was when examining as a deputy; I think I saw the gas only when I was examining; I was never employed at cutting coal in the mine; when I saw the gas I usually tightened up the brattice, sometimes I extended it; I generally cautioned the deputies to carry the brattice well up to the face; they generally did so, but latterly, in my opinion, became negligent; I have seen a permanent blue flame on the lamp; that was on the 21st March last; I reported that verbally; I reported in the book "All safe"; I reported the finding of the gas verbally to the under-manager, H. Croft, about an hour or an hour and a half after finding it; there were men working where I found it; they were working there when Croft came down; I left a note for the manager that morning; I spoke to the deputies about it about an hour after I had reported it to Croft; I cannot recollect the names of the deputies; I considered there was fire-damp in that particular place; I know General Rule 13; I considered there was not enough gas for the men to see or be injured by after I had removed it; the gas lasted momentarily; it took the light away that time; I should say there was 7 or 8 per cent. of gas there; there may have been more or less; I had seen a permanent blue cap on previous inspections; that would be some time between last March and June, 1898; the effect of opening the door that I have spoken of would have the effect of decreasing the quantity of air in No. 6 district; that would have an ill-effect on the men in No. 6 district by robbing them of their proportion of air; I took no steps to see if they were suffering from any ill-effects; when the canvas was put up between Nos. 7 and 8 districts the air was cut off from No. 7 district; there were twenty or more men at work in that district at that time; there was a general feeling that there was not sufficient ventilation under ordinary circumstances; I took no steps to find out whether the men in No. 7 were put to any inconvenience by putting the canvas across on that occasion; I do not know who the check inspectors were; there have been check inspections between June, 1898, and March last; I made no complaint to them about the bad ventilation; I did not consider it my duty to do so; I thought I would eventually risk dismissal or disrating if I did so; I was on friendly terms with the check inspectors as far as I know; they are men chosen by the miners themselves for the purpose; I knew there was black-damp in the mine; I cannot say whether the falling of the roof would release black-damp; the ground where I saw the black-damp might be called rise and fall ground; I had been to the place where Taft was injured, but could not say how long before his accident; the conditions may have changed in that time, but from the nature of the work I should not think so; when I corrected the report of the 28th March it did not occur to me to alter the report of the 21st March; I would not alter a report that had gone by; I consider a report gone by when the under-manager comes down and takes charge; when I spoke to Mr. Croft on the 28th March and 29th March I told them of the gas I had found on the 21st March; I believe I mentioned it to Mr. Croft at the interview in the engine-room on the 29th March last; I would probably say I had seen a blue cap on that occasion; I believe a Marsaut lamp would show as low as 2 per cent. of the gas, or even less; I knew that the inspectors make a custom of examining the deputies' report-books when they inspected a mine.

*By Mr. Curley:* I knew that by seeing their signatures on the reports; I cannot say what dates I saw those.

*By Commissioner:* It was in one of the dip headings in No. 6 district that I saw the gas on the 21st March last, but cannot say which; I believe it was the first that one comes to on going in; it was about 5 or 6 feet from the face, and about 3 inches from the roof; I did not measure any of the distances; as soon as I saw it I commenced to remove it by means of the canvas; there was sufficient current of air to remove it after I had canvassed up.

*By Mr. Curley:* From my knowledge the ventilating furnace is damped down at the week end.

*By Mr. Smith:* I can swear to that.

*By Commissioner:* I am speaking of eleven months ago now; it has not happened to my knowledge since then.

*By Mr. Curley:* I did not go to see the furnace every morning when I was going on my inspections; I occasionally went there to do so; one of the three firemen deputies usually went in to see the furnace; the shift of the furnaceman would end about 1 a.m.; I do not think there was anyone then to attend to the furnace till the fireman deputy went down at 3:30 a.m.; I have fired up the furnace myself; there was nobody there then.

Taken and sworn at Newcastle, this 27th }  
day of June, 1899, before me.— }

J. W. BAILEY.

C. G. WADE, J.P.

This deponent, *John William Bailey*, recalled, on his former oath, states (*in answer to Mr. Bruce Smith*):—The original plan from which *Exhibit C* was made was destroyed by me; it was drawn on thin paper, and was of no use through rough handling; I tore it up; I prepared the original plan wholly; I would not swear to the pencil writing on the top of the plan, unless I saw the man writing it; I have said it was written by Dobb or May probably; I have heard Dobb say he did not write it; I think it is Mr. May's; I do not know when he wrote it; I cannot tell when he had the plan in his possession; it may have been a week, a fortnight, or a month ago; I took it to his house; I cannot say how many times I have had it in his house—not half a dozen, I think; I cannot say if I had it there three times; possibly I did; probably I left it at his house; to my knowledge he did not write that on the top of the plan while I was with him; I expect I gave him the information about Dobb to enable him to write it; when I went to the Minister at the "Great Northern," I did not know any of Dobb's dates; I gave him the dates of Dobb's incidents after the deputation had waited on the Minister at the "Great Northern"; the deputation was on the 30th May last; I do not know when I gave May Dobb's dates; I forget whether I gave him those dates in writing or verbally; I may have written down the evidence of one or two witnesses, and gave it to May; I think it was Alfred Johns' evidence that I gave to May; I took Dobb's evidence in writing, and then told May of it; I may have given May Johns' evidence in writing afterwards; I forget whether I took down Dobb's evidence in writing; as far as I can remember, I told May Dobb's evidence verbally; I gave May the evidence of no other witness to my knowledge; I cannot say for certain when I prepared the plan; I am not sure whether it was prepared on the date of the deputation; I have made three sketches with more details on than that produced. [*Exhibit C.*] It was the original of *Exhibit C* that I showed to May, and not the original of any other sketch; I cannot say when I first spoke to May about this inquiry; it was about a fortnight after I had received Croft's letter disrating me from the position of deputy fireman, that I gave May information about the black-damp and other matters in the mine; it was on the morning of Good Friday—31st March—that I got the letter from Croft; I cannot say how long after that I consulted May about the facts of this inquiry; it may have been a fortnight or more; it was soon after I had received the letter from Croft; I consulted him as a pupil would a teacher; I have taken no note of the number of times I have seen May between that time and the opening of this inquiry; perhaps I have seen him a dozen; I will not swear I have not seen him twenty times between those dates; everything on the plan produced [*Exhibit C*] was put on it by me, except the writing in pencil on the top; I will not swear I made that plan in May's house; I think I did; probably May was present when I made that plan; I cannot say whether I have any blue-ink in my house; I think I have red-ink in my house; probably I have used red and blue ink in May's house; the only use I would have for those would be to prepare a plan; I can mention no other plan that I made in May's house; I will not admit that that plan was made in May's house; I cannot remember talking the plan over with Mr. May in his house as I made it; I can remember going to Lithgow on the 3rd April last; some things are burnt in; I can remember meeting the Minister, and the room in which I saw him; I do not remember what

what papers I had with me ; I cannot swear positively whether I made that plan in May's house ; just now I cannot remember that ; perhaps, after other things have worked off my brain, I may remember that clearly ; May may have had red and blue inks in his house ; I believe I have seen my children using other inks than black ; I recollect distinctly writing the letter marked l for identification in my house ; if my memory serves me right, I wrote it in my own house ; I do not think I showed it to May ; I will not swear I did not ; I do not remember May suggesting the "surprise inspection" mentioned in it ; I will not say he did not ; I do not think that letter was shown to May before being sent to the Minister ; I will not swear it was not. [*Letter put in evidence, and marked Exhibit.*] I cannot say whether I showed the letter marked No. 2 to May before I sent it to the Minister ; I may have done so or not ; I cannot recollect whether I told May I was going to write to the Minister before I wrote to him ; I cannot swear whether May advised me to write to the Minister ; I had other people advising me to write to the Minister ; my whole family were doing so. [*Letter put in evidence, and marked Exhibit M.*] On the 27th April I wrote to the Minister suggesting a tribunal, representative of the Department, the owners, and the miners, and suggesting that May should be the representative of the Department ; I cannot recollect whether, at the time of writing that letter, I had consulted Mr. Parton about my case ; I will not say I had not ; the Robertson referred to in the letter was Dr. Robertson ; I cannot say how long I had been consulting May about my case when I wrote to the Department suggesting him as one of the tribunal to try the case ; I cannot say how many times I had seen May at that time ; I will not say I had not seen him a dozen times ; I cannot say I did not show May the letter in which I mentioned him as the Departmental representative ; I told May I had nominated him as one of the tribunal after I had written that letter ; I cannot say whether I told him of it before I wrote the letter ; I will not say that May did not ask me to nominate him ; I do not think I showed May that letter before I sent it. [*Letter put in evidence, and marked Exhibit N.*] I do not recollect writing any of the four letters shown me in May's house ; I will not say I did not or I did ; as far as my recollection goes I wrote them in my own home ; I cannot carry all things in my head ; I can carry in my head all the facts about the gas and other happenings in the mine ; that is because they have to do with this investigation ; those four letters are trivial things in my estimation ; it is a trivial thing in my estimation that May should have been consulted about my case, and then nominated by me as one of the persons to try the case ; I see nothing reprehensible in that. [*Letter put in evidence, and marked Exhibit O.*] [*Letter marked 5 for identification now put in evidence, and marked Exhibit P.*] I wrote to May on the 19th June last ; in the previous month I had had numerous verbal communications with him ; I cannot think of any other communication that I put into writing and sent to May ; I will not admit that I sent Dobb to May's house ; he may have met him in the street for all I know ; if Dobb says I sent him to May I will admit I did ; I had seen May several times about this case, and had sent the witness Dobb to see him ; I may have sent him to May in connection with some facts in the case ; I wrote to May to inform him what I was going to do in face of the fact that I was seeing him frequently about that time ; I do not think I had asked May to conduct my case before I wrote that letter published in the paper ; I cannot recollect whether I had or not ; I produce the letter sent to me by May, and a copy of my reply to it. [*Both letters put in evidence and marked Q.*] Before the 20th June last, May had assisted me along with others ; I remember a deputation waited on the Minister for Mines at Newcastle on the 30th May last ; May's letter to me (Q), bears a water-mark "New smooth ivory" ; I did not give May that paper ; my letter of 5th April is written on the same paper ; that of 15th April (M), is written on the same paper ; *Exhibit N* is also written on the same paper ; I wrote to the Minister on my own paper ; I have a book of that paper at home ; I always took it to be the same paper ; as far as I recollect I got my paper on which my letters to the Minister were written from my own book at home ; I believe I got May's letter to me (Q), through the post ; I will not swear so ; I cannot recollect whether he handed it to me ; the paper on which the letters are written is a popular one, and there is a good deal of it about ; I cannot say where I got my paper ; the Minister spoke in a low tone to the deputation, and I could not hear one-quarter of what he said ; I did not know the name of the boy who had opened the door at the time the deputation waited upon the Minister ; I believe the Minister said I had declined to give the name of the boy ; I had declined to give the name of the boy because I did not know it ; as far as I can recollect I said I had reasons for not divulging the name of the boy ; my reason was that I could not divulge it—I did not know it ; the report in the newspaper shown me is a correct report of the words I used ; I have said that Croft, junior, destroyed my notes regarding the finding of gas in the mine ; I cannot say how many notes there ; I can remember two ; I gave them to Croft, junior, immediately he came down ; I cannot be certain there was anyone else present at the time I gave them to him ; I think, S. Jones, one of the firemen, was present when he burnt one ; I destroyed one myself ; I believe young Croft was in his own cabin at the time I gave him the two notes, I can recollect ; he burnt them by his naked light in the cabin ; I believe S. Jones was present at the time he burnt one ; the two notes comprised in *Exhibit G*, were on separate pieces of paper ; they were put in the lamp on different occasions, some days apart ; the date 9/3/99, was put upon the back of the second note by myself ; I found the second one in the lamp ; I wish to qualify my evidence by saying that I do not remember giving May the note-paper on which is letter to me is written ; I may have been given the cartridge-paper on which the plan is drawn by May ; I will not swear I was not given it by him, or that it was.

Taken and sworn at Court-house, Newcastle, this }  
5th day of July, 1899, before me,— }  
C. G. WADE, J.P.

JOHN W. BAILEY.

Adjourned till 9-30 a.m. to-morrow. Court-house, Newcastle, 5th July, 1899.

This deponent, *John William Bailey*, recalled, on his former oath, states (to *Mr. Bruce Smith*) :—I have said that the under-manager seemed averse to receiving notes ; I have also said that he gave me instructions not to report in the book ; I do not think anyone heard him give me those instructions, unless the furnaceman heard him ; he told me that near the furnace ; he spoke in a tone loud enough for me to hear him ; I suggested there should be a written report ; I did not report in the book because I feared disrating ; I made the notes about the gas in order to have a record of it that I should not forget it ; when the under-manager came down at 6-30 a.m., I handed him those notes ; he took them from me, and destroyed the first in the lamp ; the second he handed back to me without looking at it, and I tore it up ; as far as I can recollect S. Jones would be present, but whether he saw or heard what went on I do not know ; he was an old man, and only half-awake on the occasions when the under-manager told me not to report in the book, destroyed the note, and handed back the note to me ; I cannot fix any time for these occurrences ; I always seemed to feel that S. Jones was present ; perhaps others were present ; those others would be the day deputies—Ambrose, Gall, and Yardley ; the note was handed back to me by the under-manager in the cabin ; the note was burnt in his cabin ; it seemed to me that he seemed averse to receiving the notes considering he handed them back to me ; that is my reason for using that phrase, "He seemed averse."

*By Commissioner* : It was about eight months prior to last April that the under-manager told me he did not want the reports put in the book ; it was in January or February last that he handed me back the note.

*By Mr. Bruce Smith* : I knew that it was my duty to report the finding of gas in the book ; I knew that I was breaking the Act in not doing so ; I did not take a note of this because I considered Special Rule 15 met the case ; I had reported the finding of the gas to the under-manager, and thought I was protecting myself in that way ; I was fairly safe under that rule.

*By Commissioner* : I know that General Rule 4 was the rule that ought to have been complied with in connection with the finding of the gas on inspection.

*By Mr. Bruce Smith* : I knew Special Rule 11, and knew that I was infringing that rule in not reporting the gas in the book ; I have said that on the 29th March, in going round, I saw the flame of my lamp move ; young Croft and Gall were with me, and very close to me ; it is a fact that after I had made that addition to my report I was followed round on my investigation for two days ; I did not report the flickering of the flame on that occasion because the quantity of gas was so small that it was not worth while reporting ; there was no blue cap to the flame ; I knew the general rules very well twelve months ago ; I could give the forty-eight of them off without any hesitation ; I knew them pretty well when I saw the flickering of the lamp ; I did not report the gas then because there was no blue flame ; I stayed away from the mine three days after the 29th March ; I did not ask for permission to do so, but sent a note to a shiftman, to be given to the night overman, to say that I would not be at the pit that night ; I cannot say which night of the three that was ; I do not know what date I sent the note ; that is the only communication I sent about abscenting myself from the mine for three days ; I have said in my evidence that they heard in the office that the inspectors were coming that day ; that was said in the overman's cabin ; all the deputies would be there—Ambrose, Yardley, and Gall ; I do not know which of them mentioned the coming of the inspectors ; if I have said that the visits of the inspectors were known to the men, I meant to the officials ; I consider the deputies necessary to the management ; by the "men" I mean the deputies ; I have said that within

within nine months of my discharge I was told of the inspectors' coming ; I cannot say which of the deputies told me that ; as far as I know the three deputies were present ; I am certain one of them was present because he was the source of my information ; I was under-manager on only two occasions, and this happened on the first of those occasions ; probably May gave me the cartridge-paper on which the plan is drawn ; I cannot say whether I carried that paper from May's house to mine before the plan was put on it ; probably I drew the plan on it at May's house from my original ; to the best of my belief I drew the plan at May's house.

*By Mr. Curley :* I have attended May's class as a student ; I have studied under May off and on since 1895 ; I have attended his classes at the Technical College ; in those classes I have had to draw plans ; I have always been intimate with May since attending his classes ; Dobb attended the same classes as I ; I have been intimate with May since before 1895 ; I believe I have been in May's house before this case came up ; I cannot say how often ; when I took charge of the gassy portions of No. 6 district I took particular care to examine for gas in making my examinations ; I cannot say when I first discovered the gas there ; I found it several times ; I did not report it in the book the first time I found it ; I believe it was before I found the gas there that I was told not to report it in the book if I found it ; the under-manager gave me those instructions ; when I went to May I went as a friend ; I believe I told Dobb about the instructions I had got not to report gas in the book ; Dobb lives about half a mile from me ; he was working in the mine when I was working there ; I occasionally met and conversed with him ; I always marked my letters which have been put in evidence "private" on the envelopes ; I cannot say definitely whether I saw Mr. Parton about this case or not before I asked for him to be one of the tribunal to try the case ; to the best of my belief I had not seen him at that time. [*Letter 22nd June put in, marked R.*]

*By Mr. Edmunds :* When I put the word "private" on the envelopes enclosing my letters I thought they would be regarded as confidential, and that they would not turn up in this inquiry, and that, although I was a witness in this inquiry, sworn to tell the truth and the whole truth.

*By Mr. Bruce Smith :* I did not know two months ago which Department May belonged to.

*By Commissioner :* I examined the place where I believed Weir was burnt a few hours after he was burnt ; I believe that I found a slight cap there, but would not swear so ; I was not inspecting-deputy of No. 5 when Taft was overcome ; I was not in that district when Taft was there ; I knew where Taft and Turner were working in No. 5 at night ; I have every reason to believe I inspected that place, but cannot be certain ; I have found black-damp there ; it varied in quantity ; I have found a large quantity there ; I did not report it in the book, but verbally to the under-manager and the deputy, Gall ; I was inspector in No. 1 pillars during the first quarter of this year, when Watts was working there ; I cannot say that the ventilation in No. 1 was good ; it was indifferent, and called for a remedy in my mind ; I did not remedy it ; I always told the under-manager or Gall when I had any reason for complaint.

Taken and sworn at Court-house, Newcastle, this }

6th day of July, 1899, before me,—

C. G. WADE, J.P.

J. W. BAILEY.

Dobb's exercise-book now put in evidence, and marked *Exhibit S*. Dobb's note-book now put in evidence, and marked *Exhibit T*.

Mr. Bailey's case is now closed, and evidence on behalf of the Department is now called.  
Court-house, Newcastle, 6th July, 1899.

This deponent, *John William Bailey*, recalled, on his former oath, states :—I recollect the meeting at the office on the 14th April ; to my knowledge I never used the words in the office to Newburn, "I can have you—can't I get a friend to come and swear that he passed under the canvas while we were holding it up" ; I did not use those words ; I did not say that I had my notice in my pocket ; I did not mention the name of either the Minister for Mines or the Chief Inspector with regard to my notice ; I did say that I had my notice written out ; Ambrose never charged me with being asleep while at my work ; on the second occasion I went away with the boy Jones ; Ambrose did not ask me if I had put up the canvas ; I did not reply no ; he did not say, "Go back and put it up" ; he did not ask me if I had canvassed the gannin bord ; he did not ask me the next morning why I had not canvassed the gannin bord, nor did I reply, "I was laying some rails."

*By Mr. Bruce Smith :* It was at the end of the interview, on the 14th April last, that I said I had my notice written out ; I am sure I did not say to Newburn, "I can have you, Newburn" ; my reason for saying I did not say it is that I do not recollect it ; if I had said it I would recollect it ; I had not my notice in my pocket at the time ; it was written out, but at home ; I had written it out because I was indignant at the treatment I had received ; I will swear I did not say, "I have my notice in my pocket" ; I said I had written it out ; I did not say that the Minister had told me not to hand it in ; possibly the Minister may have told me that ; I cannot remember whether he did or not ; he did not tell me in definite terms ; I may have told him that I was going to send in my notice, and he may have said, "I would not do that" ; I will swear Ambrose did not tell me of three bords when he sent me away with the boy on the 3rd March last ; he told me to go into the back heading of No. 7, and if it wanted a length of canvas to put it up ; I did it with the boy ; he did not ask me the next morning why I had not bratticed the gannin bord in No. 7 ; I can remember that distinctly ; I can remember that next morning he did not tell me that I ought to have bratticed it ; I am quite certain I was never told that ; Ambrose has never complained to me about canvas while I was under him in his district ; I can remember that he sent me away to put up some canvas in No. 7 ; that was why I went away from the door ; Mr. May has spoken to me about going into the witness-box ; he has not asked me to call him, nor have I asked him to go into the witness-box ; May showed me a note the other day which he said he had sent to Mr. Brown, asking to be put in the witness-box ; I do not know how many times I have spoken to May since I was examined as a witness ; I may have spoken to him twenty times since then.

*By Commissioner :* I did not inspect No. 5 at all at the time Taft was overcome ; I inspected that district afterwards ; I was in No. 2 in-take about half an hour holding up the canvas ; no train passed during that time ; some trains may be half an hour away, some less ; a train might be delayed ; there were no trains moving about when I was sent away with the boy Jones ; the train would not come through that door ; the wheeler would ; none came through while I was there ; I had a conversation with the manager and Rendal on the 13th April last ; I never mentioned Taft's case to the manager, nor black-damp.

*By Mr. Bruce Smith :* I have been to May's house three or four times since I gave evidence ; I stayed there from twenty to thirty minutes each time.

*By Mr. Curley :* I never saw the key produced (Marsaut) before yesterday ; I never saw that key in the cabin when I was using the safety-lamp ; I was never told that key was there ; I do not remember telling Inspector Atkinson definitely that Bullerwell had been dismissed for reporting black-damp ; I said it was my opinion that he had been dismissed for that reason.

*By Mr. Edmunds :* Mr. Atkinson took a note of what I said ; I saw him doing it ; he read it over to me afterwards ; and I said it was correct ; I think Mr. Atkinson gave me the book, and left it for me to read while he was out ; what is written in the book shown me is not what I read over then.

*By Commissioner :* I said it was my opinion that Bullerwell was dismissed for reporting black-damp.

*By Mr. Edmunds :* I remember starting to read that book at the page shown me, and I read on all that Mr. Atkinson had written ; the only fault I have to find with that report is that Mr. Atkinson did not put down that I gave it as my opinion why Bullerwell was dismissed.

Taken and sworn at Court-house, Newcastle, this }

14th day of July, 1899, before me,—

C. G. WADE, J.P.

J. W. BAILEY.

#### EXHIBIT F.

MEMORANDUM from Colliery Office, The Newcastle Coal-mining Company, Ltd., to Mr. J. Bailey, Merewether.

Dear Sir,

30 March, 1899.

I intended to see you personally this morning—but missed you coming out—to say that I have arranged with Mr. Jones, who is working with Mr. Rendal's gang, to take your place as deputy or examining deputy in Nos. 1 and 6 district, and you to take his place. There will be no alteration in your rate of wages. See Mr. Rendal about time he wants you to go down on Monday night.

Yours, &c.,

J. CROFT.

[Copy.]

[Copy.]

## ANNEX TO EXHIBIT M.

The Newcastle Coal-mining Company's Colliery—"A" Pit.

Deputy's Report.

28 March, 1899.

I HAVE this day examined, as required by General Rules, Coal-mines Regulation Act, 1896, all working places and roadways where workmen are to work or pass, in No. 1 and 6 District, and found all safe.

I found a small quantity of gas (carburetted hydrogen) in front dip heading, No. 6 District. Removed it, and left all safe.

(Signed) J. BAILEY.

I protest against this report; it not being a correct report.—J. CROFT.

## EXHIBIT N.

THIS deponent, *Arthur Johns*, on his oath, states:—I am a miner, a brother of Alfred Johns, the former witness; I am employed by the Newcastle Coal Company; I am working in the B pit now, but have worked in the A pit; that was in January last; I worked there from January to March last; I worked there till the beginning of March last; I was in No. 6 district; the place in which I worked was called the back dip heading; I have seen flashes there; I do not know whether I have seen fire-damp there; I have seen the flashes there with the lamp against the roof; that was at my own lamp; I first noticed that about the beginning of the quarter, January; the first flash I saw spread for about 2 feet or a yard; it was not far; Codwell was working with me at the time; it was about 9 or 10 a.m. that I saw this flash; I have seen such flashes twice in one shift; the second time I saw it it was similar to the first, it flashed at the roof; the flame spread about 2 or 3 feet on that occasion; during the quarter I saw those flashes several times; Gall was the deputy for that district at that time; Wilson's name was on the board as I went in in the morning; I have spoken of these flashes to Gall; I reported the first one to him as soon as he came in; I told him there had been a bit of a flash in there, and he said it was nothing; I never saw Wilson during the shift; I cannot say whether Wilson was the examining deputy at that time, but his name was on the board; I am sure it was his name on the board; I did not report any of the subsequent flashes to the deputy or any one else; I saw no variation in the flashes; they were all about the same; I have been in the employ of the Newcastle Company about six or seven years; I have worked in Nos. 1, 2, 7, and 8 districts in the A pit; the ventilation in No. 1 was right enough when I was there; it was right enough in Nos. 2 and 7, but in No. 8 it was bad; it was very close in No. 8; it is two years since I worked in No. 8; I complained to nobody about the air in No. 8; I did not go to the manager about the flashes I saw; I only spoke to Gall about them, and to no other official of the mine.

*By Mr. Edmunds*: I suppose I had fired a shot within an hour and a half of seeing the flashes I have spoken of; I could hear no hissing or other noise in the coal; only for the flash I would not have known there was any fire-damp there at all; Gall was in charge of the workings at the time; I did not know that Rule 73 required me to report every time I saw it; I have not read the Special Rules; I was mining in a bord when I noticed the air bad in No. 8; the air was carried into the bord by brattice, which was taken as near to the face as reasonable.

*By Mr. Bruce Smith*: I have not troubled to read the Rules, nor do I mind a bit of gas as long as it does not hurt me; I have seen the Rules posted up the mine; I believe there is a copy in my house; when I spoke to Gall about the first flash I just mentioned to him that there had been a bit of a flash; I did not say how much it was; he said it was nothing; I did not tell him it was 2 or 3 feet long; I cannot remember exactly what I did say to him; I did not mention the other cases to him, because I did not think it necessary; that was because no notice had been taken of the first one; no brattice had been put up in the bord as a consequence of my complaint; I had asked Gall several times to put the brattice further up; my mate was present when I asked him to do that; I was not nervous on account of the flash I had seen; I did not know that it was Wilson who had written his name on the board; his name was there, but somebody else may have put it there; I never took the trouble to complain to anybody else about the gas or the brattice; the brattice was within 2 or 3 yards of the face when I asked for it to be taken further up; I wanted it within 4 feet of the face; we had to "soldier" up the coal there; if it fell it fell out about a yard; the coal was about a yard above the holding; it was about a yard above the canch and about a foot below the canch; the coal does not fall more than 3 feet out when it falls; the seam is about 4 feet there; if the canvas were taken to within 4 feet of the face there it might not be injured when a shot was fired; I have asked Gall to take the canvas closer than 2 or 3 yards from the face; he said he would see to it; I never told him that I wanted it within 4 feet of the face; I have never spoken to Bailey about seeing this gas, nor to Mr. Curley; neither of them knew until to-day that I had met with this gas; I did not speak to Mr. May about it; I have spoken to several of my fellow-workmen about it; I had no fault with the ventilation anywhere I was, except in No. 8, where it was close; that was two years ago.

*By Mr. Curley*: I mean 4 feet was the full height of the coal seam where I was working, from floor to roof; the band is left up.

*By Commissioner*: The bord is high enough for me to work in without stooping.

*By Mr. Curley*: We have what are called "little tops" there; that is the first section from the floor; morgan follows; the little tops are a foot thick, and the morgan is 8 or 10 inches; then follows 4-inch coal, then 10-inch "first lift" they call it; then follows the big top, about 2 feet 6 inches thick; then comes the band, about 2 feet 4 inches or 2 feet 6 inches thick; the first portion of the band was worked, then it was altered to what is called "gingerbread"; we used timber there; the props were 6 feet 6 inches or 7 feet long; that was during the first part of the quarter, but it was altered after the first two months; when I asked Gall to put up more brattice he did not do it the same day; he did it afterwards; it was done the next morning; I did not see more than one deputy's board in No. 6; I saw nobody else's name there but Wilson's.

*By Commissioner*: The flashes occurred two or three times during the quarter—twice on one day, and once on another day a fortnight or three weeks after; I was standing on the canch at the time, and my light would be against the roof; I was pulling coal at the time; I did not see any flash any time after the brattice had been put up closer.

*By Mr. Curley*: My mate, Codwell, was present when these flashes took place.

Taken and sworn at Court-house, Newcastle, this }

C. G. WADE, J.P.

ARTHUR JOHNS.

## EXHIBIT O.

THIS deponent, *John Atkinson*, on his oath, states:—I am a miner at the Newcastle Company's mine; this quarter I am in No. 6 district, last quarter in the B pit, and the quarter before that in the No. 1 pillars; Price was our wheeler when in No. 1 pillars; I remember him making a statement when we were in No. 1 pillars; he had gone out for a train, and on returning, he said he had seen a canvas across No. 1 road, and a man with a prop on it to keep it down; that when he had got through the canvas, he said, "Hello, what game's this?" I suppose Dixon's in No. 2; the first time I see Dixon, I'll tell him about this, that the man had said, "For God's sake don't, or we'll be all gaoled"; the ventilation in No. 1 pillars was very hot; I was on the No. 1 pillar; I never measured the air; there was a current of air coming in, but it was very hot; it was vitiated air; I have found the air in other places in the A pit not so good as I would like to see it, but I have never made any complaints about it; a good few quarters ago in No. 1 district it was not good; the headings were very long, and there were a number of men in them; there must have been thirty or forty men working in them at that time; I am speaking of my own particular place, when I speak of the air as not being what I would like to see it; I cannot speak of any other place where the air was not good.

*By Commissioner*: I have never considered the air too bad to work in wherever I have been.

*By Mr. Edmunds*: I have always been able to keep my light burning; when I speak of vitiated air, I mean the life has gone out of it; I called it vitiated, because it was hot; Price told us it was Jarvis at the canvas; he did not say he was actually holding down the canvas, but that there was a prop on the foot of the canvas holding it down; the pillars we were taking out were only 14 yards long; the air must have circulated right up to where we were to a certain extent; there was no brattice there.

By

*By Commissioner* : I could not feel the air moving at the face, but when I went out to the end of the pillar, it moved the flame there, but would not at the face.

*By Mr. Bruce Smith* : I have been over twenty years in the Newcastle Company's mine ; I have had nothing to complain of in respect to the air during the whole of that time ; if I had, I certainly should have done so ; I have never known when a Government inspector was coming into the mine ; I have never known anyone else to know either ; I felt no difference in the air on the occasion of which Price told us when the canvas was put across the No. 1 road ; I did not see any canvas across the road, either going in or coming in ; Jarvis was a shiftman ; I never mentioned the matter to anybody.

*By Commissioner* : The pillars I was working were a long way off the fault.

*By Mr. Curley* : I was sitting at the end of the pillar when Price made this statement ; we were all having our tucker ; Johns was there at the time ; Watts was there also.

JOHN ATKINSON.

Adjourned till 9:30 a.m. to-morrow.  
Newcastle, 4th July, 1899.

#### EXHIBIT P.

THIS deponent, *George Watts*, on his oath, states :—I am a miner employed in the new pit of the Newcastle Coal Company ; that is the B pit ; I have worked in the A pit with Alfred Johns ; I worked with him the last three-quarters ; we worked in No. 6, then No. 1 pillars, then in the B pit ; Price was out-wheeler when we worked in the No. 1 pillars ; I recollect on one occasion when Price came into us, he asked us what we thought he had seen when he went out ; we said we did not know, and he said he had seen the brattice all across No. 1 ; that the shiftman was behind the brattice ; that he had asked the shiftman what it was for, and that the shiftman had replied, "There's too much air in No. 1" ; Price then said, "I know what it is for, the inspector is in No. 2" ; I left then, and heard no more ; the ventilation generally in the pillars was very bad ; I mean in No. 1 pillars ; I mentioned it once to the deputy, Gall ; he replied, "This place is grand ; there are worse places than this" ; I was working No. 2 pillar in No. 1 district at this time ; I worked the whole quarter there ; it was a little better at the commencement of the quarter than afterwards ; when we started the quarter, we could feel the air coming up to within 3 or 4 yards of where we started ; as we got further in the air got warmer ; as we finished the pillar, we felt the air getting warmer ; I could only put in about an hour and a half, when I would feel tired, and have to go back to where the air was better, leaving the skip half full ; on one occasion the two of us came back ; my mate said he was getting tired, and advising that we should go back and have a sit down ; all the way from the spot where we could feel the air coming to us, I found the air bad ; I could not say the air was good, even at the commencement, but we could feel a little of it ; there was an old cut-through just near that, and the air was drafting through the stone just there ; this bad air lasted for six or eight weeks ; I have worked in all the districts of the A pit ; about eight quarters ago in No. 8 the smoke was very slow going away ; I cannot say whether the ventilation was bad ; I was working with a man named John Roderick ; that lasted for a few weeks ; I worked in No. 6 the last quarter of last year ; I cannot say the air was bad there in the headings ; there was plenty of air there, but, in my opinion, a mistake was made when they cleared the gob to bring the road from the old bord ; the air was obstructed, and did not come up to us ; they heaped the dirt up the wrong way ; that lasted the whole quarter ; it was not like that when I commenced the quarter ; this defect lasted for eight or nine weeks of the quarter ; I can say nothing about any other district ; the bord in which I worked in No. 6 was No. 77 ; that was in the last quarter of last year ; Johns was working with me at this time.

*By Mr. Edmunds* : William Gall was the examining deputy for the No. 1 pillars ; I think Bailey was the officer to inspect the places before the men went to work ; I think Wilson was the officer to do that work in No. 8 when the smoke hung about in the manner spoken of ; in No. 6, the last quarter of 1898, Bailey was the officer to do that work ; I found no fault with the air in any of those places when I commenced work each day ; in No. 1 pillars we felt it very warm when we went into work in the morning, and very little air there ; the air was not brought up to our working place ; we were 3 or 4 yards from the air when we started, and about 20 yards when we finished ; there was no brattice put up there ; no provision was made to bring the air up to the working face where we worked, as far as I could see ; all the bords on the way in had fallen, and were closed through the falls ; I cannot say how many bords we were in ; I can say there was no air in there when we went in in the morning ; there was no way for the air to get out if it got in ; I complained to Gall about it, but only the one complaint ; I did not complain to anyone else ; I knew that the law required that my place should be properly examined, and steps taken to provide me with a proper amount of fresh air.

*By Commissioner* : There were no open bords on the road to where I worked in No. 1 ; they were all fallen bords on either hand of us as we went in ; I guessed there was a cut-through near where we worked, because I could feel the air drifting through the stone ; you could put your hand in the cracks in the stones ; that was near where we commenced work in that pillar.

*By Mr. Edmunds* : We worked right away from that cut-through as we went along ; in No. 8, where the smoke hung about eight quarters ago, the air was not good when we commenced our shift ; for about three weeks that lasted ; our lights were not affected, but we could hardly see each other in the bord on account of the smoke ; I heard that a hard heading was being worked at the time ; I did not complain about the air, but about the smoke not getting away ; I complained to the deputy about the smoke ; I have never complained to Bailey about the state of the ventilation in No. 6 ; I mentioned it to Gall ; the air was blocked from where we were working in No. 6 for eight or nine weeks ; we very seldom saw Bailey there ; he would examine before we went down to work, and Gall would be there while we were working ; I pointed out the heap of dirt that was obstructing the air to Gall ; he merely said, "Damn my rags," and there was no more about it ; I knew of the check-inspector's visits from time to time ; I never mentioned any of these defects to any of them ; I do not remember having seen the check-inspectors down while I was on No. 1 pillars ; I never complained to any of the check-inspectors about any of these defects, nor to any of the Government inspectors.

*By Commissioner* : I saw Mr. Dixon in the No. 6, while this gob was built up as I have described.

*By Mr. Edmunds* : I was working 15 yards from the current of air when Mr. Dixon was in there ; there was brattice there after we had driven our cut-through into the next bord ; it was there when Mr. Dixon was there—about 6 yards from the face ; he came right down to where the skip was ; the brattice was close on to the skip ; the smoke was slow in getting away at that time, and I guessed by that that the air was insufficient.

*By Commissioner* : The smoke hung about there, but not so badly as in No. 8.

*By Mr. Edmunds* : I did not see any ill-effect on the light, nor feel any ill-effect myself in that place, but judged the air was bad from the manner in which the smoke hung about.

*By Commissioner* : I remember Mr. Dixon was in No. 1, in the pillar, while I was working there, and the air was bad ; we were in about 10 or 15 yards at the time.

*By Mr. Edmunds* : We were 10 or 15 yards from the air then, and there was no brattice there ; Dixon came up close to the skip, and asked how we were getting on ; we replied, "Middling" ; I believe the under-ground manager was with him and the deputy, Gall ; I do not remember having seen a Government inspector in No. 8 while I was there.

*By Mr. Bruce Smith* : I think I have been in the Newcastle Company's mine for ten years ; the occasions I have spoken of are the only ones of which I have had to complain ; there was no smoke about No. 1 pillars, but the feeling of tiredness ; that did not happen every day, but occasionally ; I had never seen a brattice at the spot in No. 1 spoken of by Price ; I did not see it that day when we went out ; I never saw it at all ; I did not notice any difference in the air coming to me ; I would not have known the air had been interfered if Price had not told me of it ; I felt no ill effect from it ; I am not afraid to complain about anything I have cause to complain of, as a rule ; I was not afraid to tell Mr. Dixon of what I had seen when he came into our place ; he could see for himself what was there ; I never knew when any of the Government Inspectors were coming into the mine ; I never knew of anybody else knowing beforehand of their visits ; in No. 8, where the smoke hung about so much, there were men in the bord each side of us ; perhaps we would fire four shots a day, sometimes two, and sometimes one ; it was from the thickness of the smoke—the difficulty of seeing each other—that I judged the air to be bad there, not from any feeling I experienced ; I pay 1s. 6d. a fortnight towards the expenses of the check-inspectors ; they are supposed to see that the mine is supplied with the quantity of air prescribed by the law ;  
that

that would be in the interests of the men ; I have seen the reports of the check-inspectors, but do not think they are a fair report of the air supplied to the men as they took the air at the intake and not at the working faces ; I brought that up at a meeting one night, and the check-inspector said it was the custom to take the air at the intake and then divide it ; that was at the quarterly meeting before the last one, about three months ago ; I think Richardson was the check-inspector who said that ; it would be about fourteen weeks back ; I took particular notice of the report for No. 1, as I had been working there that quarter ; they gave it as over 500 cubic feet of air for each man, boy, and horse ; I knew that quantity of air was not coming to me at the pillars ; I do not know whether the thermometer reading was given on that occasion as 71° ; I know it was hot ; I have taken no steps to have the practice of making the check-inspection in this way altered. I proposed that an alteration in the method of inspection should be made, and it was discussed, but my proposal was not carried ; when working in the pillar I have noticed that the lamp would not burn so brightly in the face as further back, where we had the air ; my light has gone out, but I have lit it again.

*By Mr. Curley :* At one time the check-inspectors used to go round once a month, but lately have gone round once a quarter ; between the two pits it would take them three days to go round ; they are paid 9s. a shift, I believe ; including shiftmen, I should say there were 500 men in the mine ; when I spoke of the 1s. 6d. a fortnight I meant the total levy made for the lodge for everything, not for the check-inspectors alone ; when I challenged the check-inspector's report on the occasion referred to I said there were not 500 cubic feet of air for each man, boy, and horse, but that there was not enough air to bend the flame of the lamp.

Taken and sworn at Court-house, Newcastle, this }  
4th day of July, 1899, before me,—

GEORGE WATTS.

C. G. WADE, J.P.

### EXHIBIT Q.

THIS deponent, *Alfred Johns*, on his oath, states:—I am a miner employed by the Newcastle Coal Company ; at present I work in the B pit ; I have worked in A pit ; that was the quarter before last ; I was there the quarter before that also ; before that quarter again I was working shift work ; I have worked in the two pits for about seven years, but cannot say how long in either ; I have worked in all the districts in A pit getting coal ; I can hardly say who my wheelers were ; I have had different wheelers ; Price was my wheeler in No. 1 ; that was in the first quarter this year ; Price has made a statement to me [*this as an issue for the Commissioner*] ; Price went out one day, and when he came back I and two others were sitting down ; they were John Atkinson and George Watts ; we were waiting for skips ; he told us that he had been out to No. 1 turn ; that when he had got out there it was bratticed right across ; that he had got through the brattice and asked the shiftman who was putting it up what game did he call that ; that the shiftman replied, "There's too much air going into No. 1" ; that he (Price) replied, "I know what's the matter ; John Dixon's in-by ; I'll tell John Dixon the first time I see him" ; that the shiftman replied, "If you do you'll get us all into trouble, that's all" ; that Price replied, "What is it worth to say nothing about it?" and the shiftman replied, "You'll have to see Bert about that" ; Bert was the under-manager ; that was all that was said about the brattice ; I did not see Inspector Dixon in the colliery that day ; I saw Inspector Dixon in that district once during that quarter ; I worked on the night-shift ; I noticed the furnace once while on that shift ; I worked night-shift something under six months ; on one occasion I had occasion to pass the furnace, and saw that it was banked down.

*By Commissioner :* That would be during the third quarter of 1898.

*By Mr. Curley :* What I mean by the furnace being banked down is that too much coal had been put on at once, and it was not blazing brightly ; I cannot say what time I saw this ; sometimes there would be twenty-eight or twenty-nine men on shift work at that time, but sometimes three or four less ; on one occasion, about the second quarter in last year, I noticed the ventilation very bad where I was working at the coal ; that was in No. 7 district ; I was breaking away a bord, taking away the first facing on the main in-take ; the powder-smoke would hang about there all day.

*By Commissioner :* There were three bords breaking away, and there be two or three shots for each day ; they were not fired at the same time, but at different times during the day ; sometimes there would be more than two or three shots, sometimes less.

*By Mr. Curley :* I did not speak to the management about this bad ventilation ; I may have mentioned it to the deputy, but cannot be sure ; that was the worst case in regard to the ventilation that I know of.

*By Mr. Edmunds :* If the place Price referred to had been bratticed right across it would have interfered with the air coming to me at my place ; there were four pillars working in that part at that time ; that would be eight men and the wheelers ; when we were working the pillar the air was always hot ; I did not notice any change in the air about the time of Price's conversation ; if it was bratticed right across it would have stopped all the air coming to us ; that would have been noticeable to all the men in that district ; nobody went out to see what was the matter ; there was no commotion or disturbance about it among the men ; the eight men working there were the two Prouds, John Roderick and his mate, John Atkinson and his son, and my mate and myself ; in the latter part of the quarter Price did the wheeling for the lot of us ; I am not sure whether he did for the first part, because Atkinson came from another part ; he was wheeling for me all that quarter ; what I mean by the first quarter would be between the first cavil and the second ; the ventilation in No. 7 remained bad pretty well all the time I worked there ; I did not work all that quarter, as I was under medical treatment for pneumonia ; I worked there for several days, and it was bad all that time ; I cannot say how many days I worked there ; I have never heard of the intended visit of an inspector ; I never knew Mr. Dixon was coming till I saw him there ; when I went to work in No. 7, when the ventilation was bad, the air was not all right when I went back to work, but seemed misty ; I believe Wilson was the deputy for that district at that time.

*By Mr. Bruce Smith :* The shots in No. 7 were fired at different times during the shift ; the ventilation is much better there since ; it became better not long after the time I have spoken of it as being bad ; I may have complained about the bad ventilation, about the bad air, but not to the Manager ; I had no hesitation in complaining to the deputy ; it was remedied a good while after, but not at the time ; it was not in consequence of any complaint of mine that it was improved ; I forget the deputy's name ; he went as overman to Dudley ; it was my place to complain to the deputy ; I only noticed the furnace on the one occasion I have spoken of during the whole seven years I have been in the colliery ; there was too much coal on it ; it was neither at the beginning of the shift nor at the end of it that Price told us about the brattice being put up ; it was about the middle ; I did not notice it when I was going out if it had been there ; it was not there when we went in nor when we went out ; I noticed no difference in the air at the time Price spoke to us, nor at any time during that shift ; if it had been closely bratticed I would have observed a change in the air as well as the other men ; I do not think the brattice had been put up close ; I was first spoken to about giving evidence in this case about a couple of weeks ago ; Bailey spoke to me about it first ; he came over to me and spoke of it ; his brother was talking to me at the time ; I will not swear his brother did not speak to me about it before Bailey ; the instance of bad ventilation that I have given of the smoke hanging about was the worst case I knew during the whole seven years I have been there ; I do not remember any other occasion when I spoke to a deputy about the bad air ; I have never been afraid to speak to a deputy about the air ; notwithstanding that, I have only spoken to him once during the whole seven years of my employment.

*By Mr. Edmunds :* (Witness states the spot at which he understands Price to have said the canvas was hanging was on No. 1 in-take in by the turn) ; the heading would be about 12 feet wide, I think ; the whole bord was a narrow bord ; it was 6 feet high ; it was just timbered just near the turn and just past it.

*By Mr. Bruce Smith :* If the brattice were as I understood it to be it could have been seen from the main engine road.

*By Commissioner :* The effect of placing that brattice there would be to send the air straight down into No. 2 district.

*By Mr. Bruce Smith :* The last time I came out of there there was no brattice at the turn there ; there had been one there during the quarter ; it was just wide enough to let the skips pass.

*By Commissioner :* It was not brattice placed at the turn, but a wooden fixture ; it did not come right down to the floor ; there was room left for the skips to pass ; it was put up while we were working there.

*By Mr. Curley :* I was sitting just outside the pillar when Price spoke to us on the occasion referred to ; Price was away a bit longer than usual, because he had to go out to No. 1 turn to order his train.

*By Commissioner :* We had just begun a bord when I saw the smoky air of which I have spoken ; there was no cut-through while I was there ; we were only 3 or 4 yards in when I left off work there ; it was the third bord in the face of No. 7 front heading.

Air passing up furnace shaft, 101,440 cubic feet per minute.		

[Then follows *B Pit* takings]

We found the air ways and travelling roads in fair condition, and a good supply of timber on the various flats

J RICHARDSON,  
JOHN McNAMARA, } Check Inspectors

## EXHIBIT U.

THIS deponent, *Alfred Ashley Atkinson*, on his oath, states—*I am Chief Inspector of Collieries; I produce a plan showing the whole of the workings of the A pit of the Newcastle Coal Company; it is the record tracing which the Department keeps in accordance with the Act; as fresh surveys are made they are recorded on that plan; the plan shows the state of the mine up to a month ago; the mine is an extensive one, and presents various features with regard to the ventilation; it is being worked in two different directions; it is one of the oldest collieries in the Colony; it is one that presents varying difficulties in the matter of ventilation; the pillar districts would present the greatest difficulties in the matter of ventilation; that is common to all mines; the difficulty arises from the fact that it is more difficult to concentrate the air upon a given point in the pillar workings, because the strata have been disturbed in consequence of falls brought about by the removal of the pillars; the strata are always, more or less, in a state of disturbance when a pillar has been taken out, consequently it is more difficult to keep the stoppings tight; it is very common, also, to have more fire-damp in broken workings than in old workings, and it is much more common to have black damp in the broken workings than in the whole workings.*

*By Commissioner.* When I use the term "broken workings" I refer to the removal of the pillars

*By Mr. Edmunds.* The difficulty in concentrating the air in these broken workings is brought about by there not being any fast side in removing the pillar; in working a bord we would have the two fast sides, but in removing the pillar we would have two open sides and three times the area to concentrate the air upon; my first visit was made to the mine towards the end of 1897; it was more in the nature of an introductory visit, shortly after my arrival in the Colony, and for my information as new officer; we went down A pit, up the No 6 main engine road, through the pillar workings of No 6 and No 5, and the pillar workings of No 1, down No 1 main road, and out to the shaft again, on that occasion everything in the districts which I visited seemed to be satisfactory as regards the ventilation and working of the mine; my next visit was on the 28th February, 1899, with some Victorian friends; my first actual inspection of the mine was made on the 17th March last; there is generally some special cause for my inspections of the mines; on this occasion I was accompanied by Inspector Dixon; we went into No 9 district first and examined the whole of the working faces in that district; then we went up the return to the No 8 district, and visited the places in No 8, and came out by No 8 main heading; thence to the shaft; I directed particular attention to the condition of the ventilation on that visit; in the No 9 district the air was measured at a point marked A on the record plan; that point at that time was the face heading; the air there measured 2,640 cubic feet per minute; there were nine men, two boys, and two horses in that district, giving an average of 203 cubic feet for each; I also made inquiries of the miners whom I met as to the ventilation; they were satisfied with the ventilation in that district, and said they had been so for that quarter; that was the last week of the quarter, so that the men I saw had been there the whole quarter; from No. 9 we went to No 8; there were fifty four men, four boys, and four horses working in that district; we measured the air at a point marked B on the office plan; that would be at some distance after it had left the last man in No 8 district, there were 8,250 cubic feet per minute there, representing a supply of 133 cubic feet per minute for each man, boy, and horse; I examined all the working places in No 8, and, with one or two exceptions, the system of ventilation was satisfactory, in those cases the brattice was not near enough to the face; it was 8 yards from the faces; in such a mine I consider the brattice should be taken to within 5 or 6 yards of the face, two men also complained to me that they could not get brattice they had asked for; they said they had asked on three days before they could get any; I inquired into that complaint of the deputy who was responsible for the district—Ambrose; he denied the statement of the two men; the miners generally said that they got brattice whenever it was required; it was in reply to my inquiries that they told me this

*By Commissioner.* The effect of keeping the brattice too far from the face would be to cause smoke to hang about after a shot; I considered the ventilation was sufficient, but I found the air rather moist and hot in places where the brattice was short.

*By Mr. Edmunds.* Two of the miners said there was plenty ventilation, but that it was rather warm; I did not find the temperature anywhere unsafe for men to work in; I have seen the check-inspectors' reports, and have been through the mine myself, although I have not taken the temperature; I should say, however, it would vary between 75° and 80° in some places; I have never seen an instrument with which one could measure the air in the face unless there was a very strong current, or unless one took means to contract the current of air; there is not sufficient velocity in ordinary cases; an estimate can be made by the deflection of the flame of a lamp; continuous practice makes a man a very good judge of that, and he can go within a few feet of guessing exactly the amount of air passing; that amount can afterwards be checked by the anemometer by contracting the space in the face for the air to pass through

*By Commissioner.* The anemometer will not measure the air going into the bord just at the turn of the bord unless the area is very contracted.

*By Mr. Edmunds.* On the 17th March last I examined the workings of No. 8 and the No. 6 intake; on the 24th March last I again inspected the mine; prior to doing so I had received a certain communication and I went partly with a view to make a check on my former inspection; I visited the mine probably the day after receiving the communication; I would get to the mine about 9 20 a m; I visited the mine on that occasion entirely of my own motion, and unknown to any person up to the time I arrived in Newcastle; I went to the mine first thing in the morning; Mr. Dixon was with me; I wish to say that I may have been in Newcastle a day or two before I visited the mine on this second occasion; on the first occasion—the 17th March—I received a letter in Newcastle and immediately went to the mine on its receipt; on the 24th March we went down through the faces of Nos 6, 7, and 8, and down by No 8 return, and in the return to the upcast shaft; we measured the air in No 8 return at the point "B" and found 8,910 cubic feet per minute for the same number of men, boys, and horses as on the previous occasion; that visit was, as far as I know, entirely unknown to anybody but Mr. Dixon and myself up to the time we went there; that refers to the first visit also; I next visited the mine on the 16th June last; that was after Bailey's letters had been referred to me; I went down on that occasion more particularly to see whether I could find any inflammable gas; I took the Clowes hydrogen lamp with me; that will show  $\frac{1}{2}$  per cent of gas; I think 2 per cent is the lowest that can be seen on a safety lamp; Mr Dixon and I went up No 6, Mr. Croft, senior, Mr. Croft, junior, and some of the deputies were with us; we went into the face of the No 6 headings—both back and front headings; we also examined a place about 50 yards back from the face in the back dip heading; it was pointed out to me as being the place where Bailey had reported the finding of gas on the 28th March; about 10 inches of a bore hole had been left in the roof at this place; that corresponds with the point on the plan, Exhibit C, marked "gas referred to"; I tested for gas there with this Clowes lamp; I put the lamp right into the roof and arranged the ventilation of the lamp so as to draw the air from the roof; I could not detect any trace of gas there whatever; the roof was just a little broken there, but not to any great extent; by the experiment I made I got the air next to the roof; we then went into No 6 rise headings; they were only 25 yards in at the time; inasmuch as it was a new place and driven into the virgin coal, and to the rise, it was a place where it would be very likely to find any gas if there were any there; I made a thorough test of that place for gas but could not find any; we then went into No. 6 old rise headings, front and back; they are marked on Exhibit C—Ch4; I tested in both the headings there but could not detect any fire damp; we then went into the face of No 7 headings and tested in both the headings with the same result; that part is marked on Exhibit C; we then went to the face of No 8 headings and tested for gas there without finding any; we afterwards went along to the goaf edge, where the No 6 pillars had been worked, that is the part of the mine which has been completely worked out and the roof fallen; we had to creep over the fall to get to the edge; a goaf is the most likely part of the mine to find gas in; I tried three places in that part for gas, in one place I was 9 feet above the level of the seam; that place would be a natural reservoir for gas if there had been any there; I found no trace of gas there, nor in either of other two places which I tried, the pit was not at work that day, we measured the air at the furnace that day—close to the furnace in the return; measuring it all in one current we made 88,200 cubic feet per minute; measuring the two currents separately we got 61,250 feet and 32,760 cubic feet per minute, making a total of 94,010; the former was measured at a point about 8 yards from where the two returns join—further into the return; we took the separate measurements within a radius of 10 or 15 yards from where we took the combined current; the difference in the combined and separate measurements is not considered large, considering the circumstances under which the measurements are taken, I inspected the mine again on the 21st June last; we directed our attention more particularly that day to No 2 district; Mr Dixon was with me, Mr Croft, and, I think, Mr. Croft, junior; we saw Yardley in the course of our inspection; he went part of the way with us; as far as I know the mine people were totally unaware of my visit before I went there; I had not intimated my intention of visiting the mine to anybody; we tested all the most likely places in which to find gas, if there was any, we examined the faces of the No 2 special headings, and in several bords which are stopped at a fault, and in which there was no brattice, and in some of which there were falls off the face of the fault, there was no work going on in them; I could

could find no gas at all in any of those places; we then went round the working places on the left side of the main road—part of No. 2 district; we examined some of those places; we also went into the No. 10 return and examined the goaf-edge with the Clowes lamp; we could find no gas there; we then came out by the cross-cut and got into No. 2 return at the first air-crossing on the out-by side of the cross-cut; we travelled out to the furnace; there was water up to my knees in part of that return, and also falls over which we had to climb; the return was small, and required to be attended to in places on account of the falls; in testing for gas in this mine on these inspections I selected such places as I considered would be likely to have gas about them; I carried out what I considered a most complete examination for gas in every case with the best instruments, and found no trace of gas at all; Bailey's letters were referred to me; upon receiving them I endeavoured to investigate the whole of the circumstances; I saw certain persons and had conversations with them about the matter; I saw Bailey, Dobb, Wear, Fox, Abell, Bullerwell, and perhaps others whose names I have forgotten; I took statements from all of them; the matter was first mentioned to me, I think, in the second week of April last, and I then commenced to make investigations about the matter; I made my report to the Minister afterwards; I advised Bailey to see Mr. Keightley, and suggested that the whole matter might be inquired into by Mr. Keightley in the presence of Mr. Dixon, myself, and Bailey, and such others as were implicated in the matters; I told him I thought it was only fair to Mr. Keightley, as general manager, to investigate these matters, and that Mr. Keightley had promised to dismiss or disrate any official who he was satisfied had been to blame; I saw some notes in the possession of Bailey on the occasion of my first interview with him about this matter; that would be on the 12th April last; the first part of Exhibit G is a copy of the one note he showed me; I took a copy of that note; I saw a second one in his possession, but, as it had no reference to the administration of the Act as regards gas, I did not take a copy of it; I took it to mean an instruction to Bailey to take in some nails and brattice; as far as I can recollect, there was no reference to gas in that second note; if there had been any reference to gas in it I should certainly have taken a copy of it; there is something in that note which might refer to gas; I mean the words "a little there"; I do not remember those words in the note Bailey showed me; very considerable inquiry has been made by the Postal Department to discover those notes, but they have been unsuccessful.

*By Commissioner:* Bailey showed me only the two notes; I cannot remember whether they were in the same writing.

*By Mr. Edmunds:* With 1 per cent. of fire-damp Haldane says you get a blue cap on the flame of a safety-lamp; I do not think that less than 2 per cent. can be detected with an ordinary safety-lamp;  $5\frac{1}{2}$  per cent. will extinguish the lamp; with the one exception, I agree with the table given in Haldane now shown to me; Haldane also shows the effect of black-damp upon men and lights; I agree with those conclusions, except that he says a man working in  $16\frac{1}{2}$  per cent. of black-damp would feel no effect, but does not say as to whether he means that man works only a short time in the black-damp or a long time; I believe that a man working in such an atmosphere for a length of time would feel some ill-effects from it; generally speaking, the ventilation in shallow mines where it is kept up by means of a furnace is worse in the hot weather than in the cold.

(Mr. Edmunds puts in evidence the two tables from Haldane marked Exhibit U.)

*By Commissioner:* A well-constructed safety-lamp would show a blue cap with 2 per cent. of fire-damp in the air; a permanent blue cap means, in my opinion, that the gas was continuously found in a place.

*By Mr. Curley:* Before I inspected the Newcastle Colliery myself I relied upon Mr. Dixon's reports as to the state of the management there; having gone through the whole of the mine myself, I have no reason not to rely upon his reports up to the present time; I have relied upon his reports as to the efficiency of the management in that company's collieries; I do not know that I have discussed details as to the management of this particular colliery with him, but I have with regard to collieries in general; the question of ventilation has occupied my attention in respect to this colliery; I have discussed that with Mr. Dixon; I cannot say when that was; Inspector Dixon has not till the last week or two drawn my attention to any defect in the system of ventilation in this colliery with regard to the reports in the books; he said that he had found out that the Sunday-night examinations were not put into the report until some five or six months ago, and that he had had a discussion with the manager with reference to it, since which time those reports had been entered; I regard the inspection of mines by a competent person to be a matter of great importance.

*By Commissioner:* That is quite apart from the question of a mine giving off fire-damp; in that case it would be of still more importance.

*By Mr. Curley:* Generally speaking, I examine the report books when I go to the collieries; I first saw Bailey about this matter on the 12th April last; he made a statement to me, which I took down and read over to him; it was contained in my first report to the Minister [*Mr. Atkinson's two reports of the 14th and 24th April put in evidence, and marked Exhibit V*]; I would view the allegations contained in Bailey's statement seriously if they were proved to be true; I mean the finding of the gas and not reporting it, the obstructions to the ventilation by means of brattice, in fact any of them which involved a breach of the Act in any way; the non-reporting of the gas would tend to endanger the lives of the men in the colliery; I look upon it as a serious matter; if the ventilation has been obstructed with the brattice, as deposed to, I consider it as one of the most serious forms of deception that could be practised by the management; the opening of the door would have the same effect as far as the men are concerned, but in another way; I have seen the protest of the manager against one of the reports in the report book; the report was made by Bailey as to the finding of gas [*Witness looks at Exhibit B*]; that is the report I refer to; in my experience as an inspector I should say that was an uncommon thing for a manager to do; it would indicate to me that Mr. Croft did not believe in the correctness of the report; I have inquired into the matter of Weir's burning; knowing that Wear was burnt in that locality I would not consider it surprising to find gas there again shortly after; I did not take a copy of the second note shown to me by Bailey, because there was nothing in it which to my mind had anything to do with the administration of the Act; I remarked to Bailey that I would not take a copy of it, as there was nothing in it of importance; if Bailey told me that he had marked the date on one of the notes I have forgotten it; I read his statement over to him, and he said it was correct; when I suggested that Bailey should see Mr. Keightley I did not do so with the idea of stopping further inquiry into the matter; I was just as anxious as Bailey to get to the truth of the thing, and I still think it could have been done in that way; I was perfectly satisfied from Mr. Dixon's reports that there was no imminent danger to anyone in the mine; besides I did not know what course the matter might take, and I did not wish to do anything to prejudice anyone in the matter; those were my reasons for not going down the pit again; I was last in No. 6 district on the 16th June last; I saw Mr. Croft about half an hour after seeing Bailey; he did not practically have two months' notice of my coming; I did not go into No. 6 district till the 16th June last; I do not consider that that was practically giving the management two months' notice; I did not tell Croft that I was going there on the 16th June; I told Inspector Dixon of the allegations Bailey had made; I think that was on the 14th April last in Sydney; Mr. Dixon was with me when I saw Mr. Croft after seeing Bailey; Inspector Dixon had not made any special report to me about the No. 6 district up to the 14th April last; he had sent in his usual report; I asked Dixon if he had ever found any gas in this mine, and he said no; that was when this matter cropped up; I do not think I asked him if he had looked for any; when I suggested the interview with Mr. Keightley, I suppose I expressed my idea of what the inquiry into the matter should be; leaving Mr. Keightley out of the matter altogether, I looked upon it as a matter requiring a searching investigation; I received a communication regarding the A pit of this company; it had reference to the ventilation in that pit; when I went into No. 6, the mine was idle; in one respect I would not have the same opportunity of seeing whether fire-damp was being given off, inasmuch as the new faces were not being opened that day; that is if it were being given off intermittently; if it were being given off permanently I would have just as good a chance of seeing it while the pit was idle as when working; I did not notice particularly the spot where Weir was burnt; I travelled through that place; even if Weir had been burnt by gas there, it would have been difficult for me to have found gas there on the occasion of my visit; there was a full current of air passing through there when I was there; one of the deputies stepped the distance between the face and the point where Bailey says he discovered gas; it was 50 yards; I have not paid particular attention to the roof in the leading places in No. 6; not more so than in any other district; I noticed in one place there was a bore-hole in the roof itself; I examined with the safety-lamp right in the faces of the places, and did not observe anything unusual about them; I know that gas will sometimes burst the coal out in the face; it might affect a coal roof in the same way; I do not think I would have arrived at any different result if I had inspected it on a working day; I would have been able to question the men certainly; the inquiry had been decided upon when I made my inspection in June; my inspection was made for the purposes of this inquiry more or less; I did not make any request for Bailey to go with me; I think it would have been useless to have taken him; the advisability of taking Bailey with me never suggested itself to me.

*By Mr. Bruce Smith:* I never requested the manager or under-manager to go with me; Bailey informed me, as set out in my first report, that Bullerwell had been dismissed for having reported black-damp; I afterwards saw Bullerwell who

who told me that he had left the Newcastle Coal Company, because his wages had been reduced, and entirely of his own accord; he gave me no information in support of Bailey's story; I also reported having examined Dobb, of Merewether; Dobb told me that he had been employed as a shift-man, and had left as the work was finished, and the company was reducing its hands; before I made my examinations of the 16th and 21st June, I had seen all the men referred to by Bailey in his allegations, and had questioned them all; that enabled me to direct my attention particularly to those parts of the mine of which these men had spoken; the notes Bailey showed me were two distinct notes; even if the words "A little there," had been at the end of the second note they would only have referred to the preceding two lines; Bailey never offered me any information as to what any other notes contained; it would take a very great velocity of air, or something very unusual to have much effect on the flame of a safety-lamp; if kerosene were mixed with tallow it might cause the flame of a safety-lamp to elongate more than if ordinary Colza oil were used; if there were a large crack in the glass of the lamp, and a considerable current of air, the flame might flicker, but I hardly think so; gas might cause a flame in a safety-lamp to flicker if the flame were not drawn down while inspecting; it would elongate the flame, but not cause it to flicker in a lateral direction; the flame would be drawn up.

*By Mr. Curley:* I did not notice the return at No. 1 on my inspection; I did not go in there at all, because the district is not working at all; I went into just the in-end of No. 10 return, but did not travel it; that is on the left side of the mine; I cannot speak about the state of it; I did not try to travel it; I had no reason whatever for not going there; there was good ventilation round that district, and I take it that there must be a good return otherwise there would not be the quantity of air in the face that there is; I did not take particular notice of the floor where Bailey is reported to have found the gas; I did not inspect for gas on the floor there.

*By Commissioner:* There are several collieries in the Newcastle district which give off fire-damp; the system of ventilation in the Newcastle Company's mine was sufficient to carry off all gas given off if the bratticing is carried well up; it is also sufficient to carry off all black-damp given off if it is properly directed; a man would not feel the effect of black-damp until some time after his light has gone out; I have had experience of the effects of black-damp; it produced a headache sometimes, and in large quantities effects the breathing; if worked for a considerable time it produces a general inertness; a man would not become unconscious unless there was about 60 per cent. of black-damp in the air; I do not think that hot and cold sweatings are a symptom of the effect of black-damp; the ventilation in pillars can be carried out to some extent by means of bratticing, but it is a much more difficult matter than ventilating whole workings on account of the leakage through the stoppings, and the great lateral area to be ventilated; I was present when Rendal was giving his evidence; I think it would be necessary, as a matter of safety, where a man is put to bale water at the foot of the canch, which is 4 yards from the face, for that face to be examined; I remember inspecting bord 117 spoken of by the witness Williams, but have no particular recollection of the circumstance of seeing him; I know that a certain quantity of air was going round the face, through the cut-through marked B on exhibit J; I did not notice the cut-through marked A on that sketch; if it was going through that cut-through there was at all events sufficient left to go towards the face to supply the men there.

*By Mr. Curley:* No. 1 district was closed up when I was making my inspection; that might have the effect of sending more air into No. 6 district; it would not make a great difference; the amount that was taken off No. 1 would distribute itself over the various splits, not wholly into No. 6; the proportion in which it distributed itself would depend upon a variety of circumstances.

*By Mr. Bruce Smith:* I remember the door which was said to have been kept open while the boy Jones was taken away; the effect of leaving it open would be to send more air into No. 8 and take some from No. 6; the men in No. 6 might or might not feel the difference; the decrease in the air and those in No. 8 might or might not notice the increased air in their district; an inspector in either district might or might not notice the difference in the air; it would make some difference in an inspector's calculations in taking the air, but I cannot say to what extent.

*By Mr. Edmunds:* I did not know whether the mine would be working or not when I went there to make my inspection; on the second occasion when I inspected for gas it was working.

*By Mr. Curley:* If a man works continuously or for a long time in an atmosphere of black-damp he would feel the effect of it before his light went out.

Taken and sworn at Court-house, Newcastle, this }  
6th day of July, 1899, before me,— }  
C. G. WADE, J.P. } A. A. ATKINSON.

Adjourned till 9:30 a.m. to-morrow.  
Newcastle, 6th July, 1899.

This deponent, *Alfred Ashley Atkinson*, recalled on his former oath, states (to *Mr. Curley*):—Bailey did tell me that Bullerwell had been dismissed from the company's employment; I think every colliery manager in the Colony has been supplied with a copy of Mr. Commissioner Wade's report on the Dudley Colliery disaster; I cannot swear that Mr. Croft was supplied with a copy, but should think so; two or three of the collieries that are working with a permit have not been supplied with a copy; it is several months since they were sent out; I have also issued a circular letter with regard to coal-dust; that would be within the first month after the termination of the Dudley inquiry, as far as I can recollect. that letter was issued to all the colliery managers; copies of it can be procured from the Department; as far as I know, black-damp will not induce paralysis in a man; 28 per cent. of black-damp will induce heavier breathing in a short time. 50 per cent. produced severe panting in breathing; 66 per cent. will quickly endanger life; a man would first be affected in the head by black-damp; he would get a headache before his breathing was affected; after being in an atmosphere impregnated with black-damp a man would be overcome by a feeling of lassitude; it would vary according to the quantity of gas in the atmosphere; I do not know that the later text-books lay it down that less than 16 per cent. will extinguish a light; the older books used to lay it down that 10 per cent. would put out a light; that was when black-damp was understood to be CO<sub>2</sub> pure and simple; I should be surprised to hear that Fairley states that 2½ per cent. will extinguish a light; if he says so I say it is incorrect; Dr. Haldane says that a light will burn in 75 per cent. of CO<sub>2</sub> if there be 25 per cent. of oxygen in the atmosphere.

*By Commissioner:* I would not say that a human being would not feel the presence of the black-damp of 16½ per cent.; a man would feel some slight effect from such an atmosphere before the light was put out; in the composition of the atmosphere with black-damp in it there is a deficiency of oxygen rather than an excess of carbonic acid gas.

*By Mr. Edmunds:* Fairley when he speaks of the 2½ per cent. affecting the light speaks of it as being carbonic acid gas itself; it is generally recognised now that black-damp is not CO<sub>2</sub> simply but a mixture of CO<sub>2</sub> and nitrogen.

*By Mr. Bruce Smith:* The book of Fairley's shown me was published in 1888; at that time black-damp was supposed to consist of CO<sub>2</sub> only; then 2 per cent. was sufficient to put out the light and produce the effects spoken of in the book; I do not admit that under the old idea as to the gas 2½ per cent. was sufficient to put the light out.

*By Mr. Curley:* I have read the quotation in Fairley's book, now read to me, as to a light burning in 12 per cent. of the gas.

*By Mr. Bruce Smith:* Speaking of the lights going out and being relit without any trouble, it would depend a good deal upon the position of the light; if it were on the floor or near it it would be more difficult to relight it than if it were nearer the roof; some disturbance in the atmosphere might extinguish the light; I would think that it would not be possible to relight the lamp in the same atmosphere; I have never heard of paralysis of the legs with retention of consciousness as a result of breathing black-damp; the passage in Fairley read to me shows me that the author understood black-damp to be wholly CO<sub>2</sub>.

*By Mr. Curley:* The discovery of black-damp in a mine might indicate the presence of sulphuretted hydrogen if decomposition were going on; that would be brought about by a chemical action between iron pyrites in water in the old workings; I have come across a little sulphuretted hydrogen in connection with black-damp in my experience.

*By Commissioner:* That has been in old workings where the pyrites has come in contact with water and a chemical action been set up.

*By Mr. Curley:* Neither Wear's nor Taft's incident was reported to me.

Taken and sworn at Court-house, Newcastle, this }  
7th day of July, 1899, before me,— }  
C. G. WADE, J.P. } A. A. ATKINSON.

This deponent, *Alfred Ashley Atkinson*, recalled, on his former oath, states:—With an ordinary safety-lamp it is generally accepted that 2 per cent. of fire-damp can be detected; in order to see that it is necessary to reduce the flame of the lamp to reduce its luminosity; with the naked light, as its luminosity cannot be reduced, it is not possible to detect less than 3 per cent. of fire-damp; it could not be seen on account of the greater luminosity of the naked light, although the naked light might be affected by the fire-damp; a jet of fire-damp in the air will burn at a naked light in the same way as ordinary gas; it is then pure fire-damp; if fire-damp were issuing from the coal, and a lighted match were put to it it would light; I think the safety-lamp would show that gas; I do not think that fire-damp will show at a naked light if it will not on the safety-lamp.

*By Commissioner*: A safety-lamp will detect a lower percentage of fire-damp than the naked light when mixed with the ordinary current of air; there are cases in which the fire-damp will ignite at a naked light at the moment of issue; that gas will show on the safety-lamp if you could get the lamp to its point; there may be a case of a hole in the roof where the safety-lamp could not be put; it would be a breach of the rules to test for gas in such a place with the naked light.

*By Mr. Edmunds*: There are instances on record where gas has not been seen in a pit for several years, and has then been seen in some cases with explosions and loss of life.

*By Mr. Curley*: The pressure of the atmosphere has something to do with the likelihood of the appearance of gas in a mine; it is possible that it might be discovered in a locality at one time and not at another.

*By Commissioner*: The fact of a man feeling headaches and tiredness might be due to powder-smoke, or to the presence of black-damp, or to remaining in an unchanged atmosphere for some time; that is apart from the question of fire-damp; if the brattice were properly taken to the face any black-damp would be carried away; an ordinary still atmosphere would contain a certain amount of carbonic acid gas if a man were working in it for some time with a light, and the light would be affected to a certain extent; that should not happen when the man first goes into the place.

*By Mr. Curley*: The fault in No. 2 return will have very little effect on the ventilation; it is not an abrupt rise, but a slope.

Taken and sworn at Court-house, Newcastle, this }

C. G. WADE, J.P.

A. A. ATKINSON.

#### EXHIBIT V.

THIS deponent, *John Dixon*, on his oath, states to *Mr. Edmunds*:—I am an inspector of collieries, and have held that position for seventeen years; during that time I have made about 3,400 colliery inspections; I send reports of those inspections to the Department, keeping copies myself; I have in my office now copies of all the reports of my inspections of the Newcastle Company's A pit; up to 1887 I inspected that pit continuously; from that time Mr. Inspector Bates has made eleven inspections; I have also made inspections since 1887, but have not been the continuous inspector; Mr. Bates has made inspections when I have been unable to go there; with those exceptions I have continuously inspected the pit for seventeen years; so far as I know, nobody but myself knew when I was going to make my inspections; I told nobody of my intention to visit the mine; I never know what pit I am going to till about 8:20 a.m., when I get my mail; if the mail brings notice of an accident—especially to a miner—I make it my first care to go to that pit no matter where it is; under the present Act all working places have to be kept, if a man gets hurt, till the inspector sees them; I go principally to see the place as quickly as possible, so that the man's mate will not be kept idle longer than necessary; if the mail brings no such news, I may get instructions from Sydney which would take me off my track in the matter of inspections; it is only in the absence of this special work that I am unable to make my ordinary inspections; under the old Act inspections had to be made in not more than eight weeks between each other; I had to see every mine in my district at least once in two months; it took me all my time to do it; if I did not visit a mine for seven weeks, the mine people would naturally expect me during the eighth; under this present Act I am at liberty to go when I like; until recently I was not aware that any allegation had been made as to interference with the ventilation in the A pit during my inspections; I never heard of that till the 14th April last, when Mr. Atkinson brought it under my notice; I had no reason to believe such a thing had been done; Mr. Atkinson told me the information he had got from certain people and from certain letters; I have tabulated from my books all the reports I have made of my inspections of the mine since December, 1894; those are the only inspections made during that period, and they will show the dates on which inspections were made of this pit; I did make an inspection on the 18th July, 1895; I inspected only the A pit on that date; on the 25th February, 1898, I inspected the A pit; I was not in the pit at all on either the 3rd or 10th March last; I was at my wife's funeral on the 3rd March last; all the dates and the only dates I was in are contained in that tabulated statement I have made; I have set out in that the places inspected, the persons at work in those places, the total quantity of air passing each of those districts, and the average quantity for the people working there.

*By Commissioner*: The statement I have prepared shows the districts inspected by me, the quantity of air, the number of men, boys, and horses working there, and the average quantity of air for each man, boy, and horse working there. [*Mr. Edmunds puts in evidence a summary of witness's reports between 28th May, 1895, and 30th May and 1st June, 1899. Inspector Bates' reports are included in the document subject to their proof afterwards by Mr. Bates. Document marked Exhibit W.*]

*By Mr. Edmunds*: I look at the summary of my report of the inspection of the 17th and 18th July, 1895; the ventilation was good on that occasion; I visited all the working-places on that occasion; it is my custom to visit all the working-places in the pit on my inspections; I have been over every foot of all the returns in this pit; I have travelled every portion of the whole pit without exception; the inspection made by me of the 17th and 18th July, 1895, showed me that the ventilation in the pit was satisfactory, and in accordance with the Act; on the previous inspection—30th May, 1895—the ventilation was satisfactory, and also on the following inspection; at times I have noticed that the brattice in some places has not been close enough to the face in my opinion; I have seen it perhaps 10 yards back; that has been since 1896; I have required it to be close enough at once, and sometimes have waited till it was done; I have never found the quantity of air deficient; the most important place to take the air is where it is going on to the men who are working; not in the returns; the returns at the furnace would not only show the air that has been already read at various points, but also what air had leaked through various channels on the way to the returns; I look at my report of 25th February, 1898; there was a sufficient quantity of air going on that date for each man, boy, and horse in all the districts; there was an excess of the minimum quantity required by the Act; I first heard the allegation that there was inflammable gas in this mine on the 12th April last; I had at no time detected the presence of inflammable gas in the mine, nor been present when anyone else detected it; I have searched for it; I made search for gas in that mine years ago with Living's gas indicator, and never found any; when the indicator was sent up I searched all over the mine in every likely place for inflammable gas, but could find none at all; it would show  $\frac{1}{2}$  per cent. of gas; I had inspected portion of A pit on the 12th April last, and during the afternoon I saw Bailey's report in the colliery office; the next time I went into the pit—I think seven days after—I tested for gas with a safety-lamp; Mr. Croft was with me, the under-manager, and a boy; I tested with a Clanny lamp; I consider a man who can work his light properly can detect a little over 2 per cent. of fire-damp; I went down the main road of No. 6; I tested in the faces of both headings of No. 6 and in the last cut-through, which was partly driven through, and where the men were working; I also tested where the bore hole was in the roof, and back where Bailey said the gas had been found; I then went to the rise headings in No. 6 where Bailey reported he had found gas; I made the same examination there as in the main heading; there was no one working there then; I did not find a trace of gas anywhere in all those places; I did not examine any locality but No. 6 for gas on that occasion; when I was inspecting the mine on ordinary occasions I looked at the deputies' report-books; sometimes I read the check inspectors' reports; in all the deputies' reports I never saw the mention of fire-damp or choke-damp till I saw Bailey's report of the 12th April last; I was with Mr. Atkinson when he made his examination for gas; I know the place where Taft and Turner were said to have been working in No. 5; I never on any of my inspections heard that there were men at work in that part of the mine; I did not know they were working there at night; had I known they were working there I should have inspected that part of the mine; I find out where the men are working by going to them in the daytime; when they are working at night I can only find out by being told; I know No. 7 district, but know no place there where the smoke was heavy and hanging about all day; when I was in No. 7 the bords were all well bratticed, and I never saw any smoke hanging about; since the brattice has been kept up to the face in collieries I have never noticed any smoke hanging about the bords; it should not hang

hang about when the brattice is well up to the face; I remember being in the workings of No. 1 pillars in the first quarter of this year; pillar work in No. 1 was very warm in the face, but I do not know that there was any impurity in the air; I remember speaking to Atkinson in one of the No. 1 pillars; I asked how much longer they would continue working the pillars in No. 1, and was told they would not last more than a few days; the pillars were being worked from both ends; they are 35 yards long; the air came from No. 1 through some split pillars, and was forced up to where Atkinson was working; I considered the ventilation was satisfactory considering the way the ground was broken; it is a very difficult matter to ventilate pillars, especially when the ground is broken in that way; I never saw any dirt thrown from the goaf into an air passage in No. 6 blocking up the air passage; if I had noticed any blocking of an air passage I should have wanted to know all about it at once; I cannot understand Watts' evidence as to the blocking of the air passage; no complaint was ever made to me about the blocking of an air passage; if cut-through B on Williams' sketch [*Exhibit J*] were through the other cut-through A should have been blocked up, otherwise the air would have leaked through it; such a state of things as described by Williams did not exist when I was in that locality of the mine; I should have had a stopping put up if that had been the state of affairs there; during the whole of my inspections of this mine, I have always found it well conducted and properly equipped; during the whole of Mr. Croft's management I have never had cause to complain of anything in the mine; I have never served Mr. Croft with any notice of complaint; it is not a fact that I always travelled the same route in inspecting the mine; I did not keep to any fixed order of travelling at all; if a canvas was held by Bailey and Newburn in No. 2, as described by Bailey, it would spread the No. 2 air all over the mine; they would have to hold that canvas from four to five hours to affect the air as far as my inspection was concerned; it takes me from four and a half to five hours to go the round, and it is heavy travelling to do it in that time; a complaint came to me about the end of March last, in consequence of which I went to every place in the pit; I looked at the state of the air all through the pit; I examined every working place in the pit, particularly directing my attention to the state of the air; I found the pit all right; that would be the inspection of the 12th April last.

*By Mr. Curley*: I examined the deputies' report-books in connection with the mine; I inquire the number of men in the mine when I go to make an inspection; I have inquired the number of men working in the A pit during the day, but not during the night; I understand there are only a few shiftmen working at night; as an inspector I would have as much to do with the men working at night as those working in the day; I did not for a long time see a report-book for the night men; I presume that was because there was not a book for the night men; I have asked for such a book; that was about the latter end of last year or beginning of this; that was the only occasion on which I asked for one; it was in consequence of a conversation I had with Mr. Atkinson; up to that time I considered there was no necessity for the night overman to make any report seeing his shift was a continuous one; Mr. Atkinson said after the pit had been idle during the day the night overman should write a report; that was referring to the Sunday night work; it was never reported to me that a man had been burnt in the mine; Taft's incident was never reported to me; both these were matters that should have been reported to me; I believe I asked the manager why they had not been reported, and I think he replied that they had not been reported to him; he did not say whom he held responsible for not reporting them; I did not need to inquire who that was; I examined the report-book to see whether Wear's accident had been reported; there was no entry of it; I left the whole conduct of this matter with Mr. Atkinson, who had charge of it; I did not inquire of Mr. Croft why this matter had not been reported because Mr. Atkinson had charge of the whole matter.

*By Commissioner*: I did not inquire of Rendal about the burning of Wear; the person to report to me was the manager, and the person to report to the manager was either the person in charge or the man affected.

*By Mr. Curley*: I did not inspect No. 5 district when the men were working there at night; I cannot say whether I made an inspection of the mine while the men were working there; I do not know when they were there; I was round the face workings of No. 5 about June last year; that would be on the 28th June; that would be during the daytime; I found the ventilation there good; I have travelled every one of the returns in this colliery; I would not travel No. 1 return last year when they got back to the pillars; the roof fell about the pillars, but not to block up the return; where the roof had fallen I would call it a return through the goaf; the main roads in No. 6 are going towards Burwood colliery; I was surprised to hear about Wear being hurt; I did not hear it given in evidence that another man had seen gas there before Wear was hurt; if a man were burnt in No. 6 by fire-damp it would be a likely place to find gas again; I know of dykes in No. 6 district—intrusive dykes; they are running in all directions in No. 6; like all dykes, they twist about in every direction till you lose them.

*By Commissioner*: A proper fault runs in the one direction all through.

*By Mr. Curley*: The dykes are confined to No. 6 district; those are likely places to give off gas; I regard the inspection of places before the men go to work as a very important matter; I have seen the report-book in which Bailey made his report of the gas; I have seen Mr. Croft's protest in the same book; I have read all these report-books, and have written my name or initials on them on every inspection; I have read the examining deputies' reports since before March last; in no instance have I found a report of gas except that of Bailey; I never had the slightest suspicion that I was being tricked while making my inspections; I did not notice any great difference between the readings I made on my inspections; I have been through them since I made them, and can find no appreciable difference between them; I look upon the hanging of brattice and the opening of doors in the airways as a very serious matter; if they took air off the men it would be bound to affect the men in-by; it would depend upon how much was taken off as to whether the men were injured by it; if they took the air from the men in a split it would affect them for the time; I used to go in by the furnace when going in to make my inspections; the coal used in the furnace is mixed—large and small; I have taken the readings at the furnace from the various returns; they converge finally into the one return; I have taken the reading at that point; it has ranged between 94,000 and 100,000 cubic feet per minute; I got the former reading about a fortnight ago; my report of the 13th and 14th February last gives the whole of the ventilating districts in the A pit; No. 2 right gives 7,000 cubic feet; in No. 2 left there are 11,000 feet; all the ventilating districts are outlined in the record plan; in No. 6 there are 10,270 feet; in Nos. 7 and 8, 8,250 feet; in No. 9, 3,000 feet; the number of feet in No. 5 is not given, because No. 5 was not working; Nos. 5 and 6 are one ventilating district; I did not measure the air going into Nos. 5 and 6; the return air from No. 6 would be coming through No. 5; that would be 10,270 feet; I might get a different reading every time I went into the pit; the figures given make a total of 49,520 cubic feet per minute; the furnace return is over 90,000; the difference is simply accounted for by a leakage; it is a large leakage, I admit; for No. 2 right I took my reading just about the last bord [*marked with a C on the record plan*]; for No. 2 left I took my reading in the innermost heading next to a return—just about the last bord in the last pillar [*marked with a D on the record plan*]; for No. 6 I took my reading somewhere about the point marked E on the record plan; for Nos. 7 and 8 I took my reading at the point marked B on the record plan, and for No. 9 at the point marked A on that plan; I daresay I have talked to the manager about this large leakage; all of the bords in the districts are bratticed—that is, in the whole workings; there are no doors on the headings to turn the air into the bords; the brattice comes partly out of the bords into the headings to catch the wind; I have never seen any smoke hanging about any working-place; I would be annoyed to see any smoke hanging about any of the working-places now the present Act is in operation; I did not usually go the same round on my inspections; the fact that my reports of the 2nd June and February show the districts in the same order does not indicate that I always followed the same route in inspecting; I account for the order of the route in the reports for the reason that a large book is kept in the Department, in which the districts are put in the order in which I have placed them in my reports; to facilitate the entry of my reports I put them in as nearly the same order as they appear in that book; my reports are no index whatever of the route I travelled in my inspections; I did not usually finish up in No. 2 nor begin there; there would be perhaps fifty-four men, boys, and horses in Nos. 5 and 6 districts; I never found the air bad in Nos. 6 and 5; No. 6 was generally a very nice district; I consider that nothing can be called a return air that has not passed over seventy men with horses and boys; it would depend a great deal on what the air had to travel over; if I found air travelling over stagnant water I would very soon see to it; Taft and Turner got their air from No. 5, according to the evidence, before the stopping was broken; I say the same from my own knowledge of the mine; it came from No. 5, but not over any falls; the air did not come from the goaf, and that was the only place in No. 5 where there were falls; [*Witness Dobb is here put in the box to produce the plan showing where he and Turner were working; D is the place where the air scaled through after they had broken the stopping; and S is the stopping which they broke up. Plan put in and marked Exhibit X.*] I cannot fix the course of the ventilation to these men because I never saw them at work; when the four men were working in the pillars in No. 5—that is some time this year—there was a stopping in the return which turned the air up to the pillar the men were working; after going round the pillars it coursed back through the old workings to the return again; I cannot speak of the ventilation where Taft and Turner were working; I have referred to a certain communication received by me; it was a complaint of the general bad ventilation all through the A pit; it was an anonymous letter; I have never, to my recollection, sent any written communication to Mr. Croft about the

the ventilation in the mine ; in fact I am certain of it ; that is during the ten years he has been manager of the mine ; I have never found fire-damp on the northern boundary of the Burwood colliery ; that is opposite the narrow bords of No. 6 in the A pit ; it has never been found in the Burwood colliery near the boundary of this mine ; I have been two days in Burwood colliery this week ; I have not been on the northern boundary for some months ; I have been in the very bords on the northern boundary ; if I measure the air at the intake and then go to the last bord in that district and get it the same there I know it is going past the men ; I do not measure the air in the returns because such a measurement would be misleading ; I only look for the air to go to the men ; the return measurement might include a scaling from another source, which would show a larger quantity of air than was going into the men ; there is no one spot in the mine where I could measure the total quantity of air going into the pit.

*By Mr. Edmunds :* As long as there is enough air for the men in the pit any leakage in a district would only improve it ; it would keep the old workings sweet.

*By Mr. Curley :* I was commissioned to see Bailey and ask him to see Mr. Keightley ; I only saw him once about it ; I thought that if there had been an "office trial" before Mr. Keightley, the manager, the whole matter could have been cleared up and a lot of expense to the country obviated ; I wanted the thing seen to the bottom ; I wanted an investigation myself ; I think it was a matter requiring a searching investigation.

*By Mr. Bruce Smith :* I have said in my evidence that on several occasions I had to request that something should be done in the mine ; whenever I made such a request it was complied with ; none of my directions or requests were disregarded ; when I asked for a book to be kept to show the night examinations it was kept, and has been kept ever since ; as far as Mr. Keightley was concerned he was perfectly willing to hold the investigation that was proposed ; it was not proceeded with because Bailey refused to appear ; he had promised me in the first place to appear.

*By Commissioner :* About once a quarter I took the return near the furnace ; I knew the place so well that I knew what it was ; it was practicable to do so ; it was not practicable to take the intake at the furnace ; the only way to make any check as to the total intake and return is to take the air in the different splits and then in the main return, and put one against the other ; the tendency of the air is to leak ; leakage decreases the intake and increases the return ; the gross returns at the furnace show more than was in the different splits ; if any manipulation of the ventilation took place there would be more air in one district and less than another, but all the air would get back to the furnace ; if the air in the splits is counted twice over it would show more in the different splits than in the gross returns, therefore a measurement at the main return would be a check upon tampering with the air ; when I go to inspect a mine I sometimes take a cage and go down at once ; at other times I have a look round the surface, at the engines, &c. ; it takes me two days as a rule to do the whole of the pit ; I have measured the air in No. 2 intake at times ; I very seldom bothered with No. 1 intake on the main road ; between the time I examined the mine with Living's indicator and the inspection of April last with the safety-lamp I used a naked light on my inspections ; there was nothing to tell me that a safety-lamp was necessary between those dates ; in some cases the brattice can be brought up to the face in the pillars, but it is very awkward to do so ; I have seen one safety-lamp in the cabin I think ; it was always there for some months back now ; the dates of my inspections are not made public after the inspections ; the reports are not published ; it would be desirable for the inspector to know where the men have been working at night—such as in Taff's case ; I am not bound to look at the deputies' report-books for my own information.

*By Mr. Bruce Smith :* I have known men to complain of the brattice being too close to the face when it was within 6 feet of it ; if it were put within 4 feet of the face the firing of a shot would bring the face down on the brattice ; if the brattice is up to the catch it is close enough generally speaking.

*By Commissioner :* I keep no record of the returns at the furnace that I take about once a quarter ; when I spoke on page 176 that it took me four and a half to five hours I was referring to the whole of the pit, except No. 2.

*By Mr. Curley :* Bailey did not tell me that he would consider the matter of the investigation by Mr. Keightley ; I left him under the impression that he would appear before Mr. Keightley ; I afterwards received a written answer from him refusing to appear.

Taken and sworn at Court-house, Newcastle, this }  
7th day of July, 1899, before me,—

C. G. WADE, J.P.

JOHN DIXON.

EXHIBIT W.

[Mr. Dixon's Evidence.]

NEWCASTLE Coal Mining Co.'s A Pit.—Air currents, number of men in the several districts, and average quantity of air per minute for each man, boy, and horse, in cubic feet :—

[Mr. Dixon's Evidence.]

REPORT ON NEWCASTLE CO.'S A PIT COLLIERY.

Newcastle Co.'s A Pit Inspection.

Sir,

I have the honor to report inspection of this colliery on 17th and 18th instant.

No. 1.—In this district the current of air was about 8,000 cubic feet per minute for 64 men, &c., giving to each 125 cubic feet.

No. 2.—The current of air in this district was about 12,600 cubic feet per minute for 64 men, &c., giving to each 196 cubic feet.

Nos. 5 and 6.—In this district the current of air was about 13,500 cubic feet per minute for 62 men, &c., giving to each 217 cubic feet.

No. 7.

Merewether, 19 July, 1895.

No. 7.—In this district the current of air was about 5,400 cubic feet per minute for 44 men, &c., giving to each 122 cubic feet.

No. 9.—The current of air in this district was about 3,000 cubic feet per minute for 12 men, &c., giving to each 250 cubic feet.

No. 10.—The current of air in this district was about 6,000 cubic feet per minute for 16 men, &c., giving to each 375 cubic feet.

In this district there are six working pillar places, with two men in each. I visited each pillar, and found them all well timbered, and the roof quiet.

The working bords and wheeling headings throughout the whole of the workings were well timbered, and there was a plentiful supply of timber on the various flats, ready for use.

The engine planes and travelling roads were in good order.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields.

Seen.—J.M., 20/7/95. Records.

#### REPORT ON THE NEWCASTLE CO.'S A PIT COLLIERY.

Newcastle Co.'s A Pit Colliery.

Sir,

Merewether, 1 March, 1898.

I have the honor to report inspection of this colliery on 25th and 28th ultimo.

No. 1.—The current of air in this district was about 5,500 cubic feet per minute for 29 men, &c., giving an average of 187 cubic feet.

No. 2 Right.—In this district the current of air was about 6,000 cubic feet per minute for 48 men, &c., giving an average of 125 cubic feet.

No. 2 Left.—The current of air in this district was about 7,800 cubic feet per minute for 44 men, &c., giving an average of 177 cubic feet.

Nos. 5 and 6.—In this district the current of air was about 6,500 cubic feet per minute for 59 men, &c., giving an average of 110 cubic feet.

There were 8 men, 1 boy, and 1 horse in the No. 6 district in pillar work. They were supplied with a separate and distinct current of about 2,500 cubic feet of air per minute, giving an average of 250 cubic feet.

In the No. 5 district there were 8 men engaged in pillar extraction, but they are included in the 59 men as given above for Nos. 5 and 6 district.

Nos. 7 and 8.—The current of air in this district was about 6,000 cubic feet per minute for 46 men, &c., giving an average of 130 cubic feet.

No. 9.—In this district the current of air was about 2,000 cubic feet per minute for 8 men, &c., giving an average of 250 cubic feet.

An adequate quantity of air was reaching the working faces in each district.

The working places and wheeling roads were well timbered and in good order. There was also a plentiful supply of timber on hand, ready for use.

The whole of the main roads were also in good order and condition. The ventilating furnace was also in good working order.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines, Sydney.

Noted.—A.A.A., 4/3/98. Records. For the information of the Minister.—H.B.S. (for U.S.), 4/3/98. Seen.—S. SMITH.

#### REPORT ON THE NEWCASTLE CO.'S A PIT COLLIERY.

Newcastle Co.'s A Pit.

Sir,

Merewether, 9 March, 1899.

I have the honor to report inspection of this colliery on 13th and 14th ultimo.

No. 2 Right.—The current of air in this district was about 7,000 cubic feet per minute for 61 men, &c., giving an average of 114 cubic feet.

No. 2 Left.—In this district the current of air was about 11,000 cubic feet per minute for 57 men, &c., giving an average of 192 cubic feet.

Nos. 1 and 5.—In this district there were 10 men, &c., engaged in pillar coal extraction. The ventilation was good.

No. 6.—The current of air in this district was about 10,270 cubic feet per minute for 54 men, &c., giving an average of 190 cubic feet.

Nos. 7 and 8.—In this district the current of air was about 8,250 cubic feet per minute for 68 men, &c., giving an average of 121 cubic feet.

No. 9.—The current of air in this district was about 3,000 cubic feet per minute for 18 men, &c., giving an average of 166 cubic feet.

An adequate quantity of air was being forced to the face of each working place.

The working places and wheeling roads were well timbered and in good order. There was also a plentiful supply of timber on hand ready for use.

The main and travelling roads, return airways, and ventilating furnace were also in good order and condition.

In the matter of weighing all the coal, I may here state that no additional weighbridges have been erected. At the same time I have it on good authority that all the necessary weighing plant is on the way from England, and will be placed in position at both collieries owned by the Newcastle Company immediately on arrival.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines.

Noted.—A.A.A., 13/3/99. Under Secretary for Mines and Agriculture. For the information of the Minister.—H.B.S. (for U.S.), 13/3/99.

#### EXHIBIT W.

THIS deponent, *Thomas Lionel Bates*, on his oath, states:—I am a colliery inspector; I have on several occasions inspected the A pit of the Newcastle Coal Company's mine; I have gone through the figures of my reports, as shown in the summary produced by Mr. Dixon [*Exhibit W*]; there is only one correction to be made—the alteration of the 28th October, 1895, to the 29th and 30th October, 1895; on each of those occasions I made a careful inspection of the mine and found it in a satisfactory state.

By *Mr. Curley*: I have inspected the A pit eleven times since I have been an inspector; I have made four reports on the mine since July, 1895.

Taken and sworn at Court-house, Newcastle, this }  
7th day of July, 1899, before me,—

THOS. L. BATES.

C. G. WADE, J.P.

Adjourned till 9.30 a.m. on Monday next.  
Court-house, Newcastle, 7th July, 1899.

This deponent, *Thomas Lionel Bates*, re-called, on his former oath, states:—I produce my original reports of those referred to in the summary marked W. [*Put in and marked Y.*]

By *Mr. Curley*: I made eleven inspections of the colliery in twelve years; I look at my last four reports—the first 13th November, 1895; 21st November, 1896; 16th February, 1897; 3rd March, 1897; I measured the air in each district; I began somewhere near the first working places in each district; the measurements in the reports represent in-take readings

readings in each district ; I sometimes took a return reading, but cannot say whether I did so on any of those occasions ; if I had taken a return reading, I do not think I would have included it in my report ; I do not remember now whether I took a reading anywhere else than at the first working-places in each district ; I could tell the air was going to the men in the other parts, as I went round, by the flame of my lamp ; I took a reading at the furnace once, but cannot say when it was, or what the reading was ; I am not aware that I made inquiries as to the men on the night shift ; I have examined the report-books for the night-men since they have been used ; I can tell the velocity of the air as I travel along by the flame of the lamp ; I think night-men have as much right to be looked after as day-men ; I referred to the shortness of brattice in some of the places in my report of the 21st November, 1896 ; at that time I found the air pretty good in the mine as I went round ; I could not say that I went to every man in the pit at his place, but to most of them ; I have never met black-damp in this particular pit ; it will first put out a man's light, and if the man stays long enough in it, he will be affected ; I do not think he would feel it before the light was put out ; Pameley's work is one of the standard authorities on mining ; I cannot dispute what he says on the matter of the black-damp affecting a man before putting out his light ; I make myself familiar with the special rules of the collieries, which I visit myself ; I daresay if I inquired about the night-men, I would be supplied with particulars about them ; I regard the first inspection before the men go to work as a matter of great importance ; the hanging of canvas in the airways, while the inspection is being carried out, I regard as a very serious matter ; also the opening of doors in the airway ; the tampering with the return I also regard as a very serious matter ; such interferences with the ventilation of the pit would affect the health and lives of the men if carried far enough ; on 1st and 2nd March, 1897, I made a special inspection of the mine by direction of Mr. Dixon ; we meet sometimes in the office and chat about the mines and reports ; a special inspection would indicate something out of the ordinary in connection with the mine ; I cannot say why this special inspection was made ; I noticed nothing in that special inspection that called for notice in any way ; I carried out that inspection in the usual way ; I went into every working-place ; I discovered no cause for complaint in the mine. [Mr. Edmund's tenders reports of Mr. Dixon of 17th and 18th July, 1895, and 25th and 28th February, 1898. Put in and marked Exhibit Z ; also 13th and 14th February, 1899.]

Taken and sworn at Court-house, Newcastle, this }  
10th day of July, 1899, before me,—

THOS. L. BATES.

C. G. WADE, J.P.

### EXHIBIT Y.

[Mr. Bates' evidence.]

#### REPORT ON NEWCASTLE COMPANY'S A PIT.

Newcastle Company's A Pit Inspection, Merewether.

Sir,

Newcastle, 13 November, 1895.

I have the honor to report having inspected the above colliery on 29th and 30th October.

No. 1 Split.—There are 58 men, 5 boys, and 2 horses employed, total 68, and supplied with 9,000 cubic feet of air per minute, giving each an average of 132 cubic feet.

No. 2 Split (crosscut).—There are 50 men, 4 boys, and 4 horses employed, total 58, and supplied with 12,000 cubic feet of air per minute, giving each an average of 206 cubic feet.

No. 2 Split (right).—There are 30 men, 3 boys, and 3 horses employed, total 36, and supplied with 6,000 cubic feet of air per minute, giving each an average of 166 cubic feet.

Nos. 5 and 6 Splits.—There are 53 men, 5 boys, and 5 horses employed, total 63, and supplied with 13,500 cubic feet of air per minute, giving each an average of 214 cubic feet.

No. 7 Split.—There are 30 men, 3 boys, and 3 horses employed, total 36, and supplied with 4,320 cubic feet of air per minute, giving each an average of 120 cubic feet.

No. 9 Split.—There are 18 men, 2 boys, and 2 horses employed, total 22, and supplied with 7,140 cubic feet per minute, giving each an average of 324 cubic feet.

The wheeling and travelling roads were in good condition, and there was a plentiful supply of timber on the various flats.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

Seen.—J.D. The Examiner of Coal-fields, 16/11/95. Seen.—J.M., 16/11/95. Records.

#### REPORT ON NEWCASTLE COMPANY'S A PIT.

Newcastle Company's A Pit Inspection, Merewether.

Sir,

Newcastle, 21 November, 1896.

I have the honor to report having inspected the above colliery on November 16th, 17th, and 18th.

No. 1 District.—There are 52 men, 5 boys, and 5 horses employed, total 62, and supplied with 9,280 cubic feet of air per minute, giving each an average of 149 cubic feet.

No. 2 District, right-hand side.—There are 22 men, 3 boys, and 3 horses employed, total 28, and supplied with 3,360 cubic feet of air per minute, giving each an average of 120 cubic feet.

Left-hand side.—There are 60 men, 4 boys, and 4 horses employed, total 68, and supplied with 9,650 cubic feet of air per minute, giving each an average of 141 cubic feet.

Nos. 5 and 6 Districts.—There are 44 men, 4 boys, and 4 horses employed, total 52, and supplied with 7,900 cubic feet of air per minute, giving each an average of 151 cubic feet.

No. 7 District.—There are 36 men, 3 boys, and 3 horses employed, total 42, and supplied with 5,760 cubic feet of air per minute, giving each an average of 137 cubic feet.

The refuge places have been completed in Nos. 1 and 6 ; a few still require to be made in No. 2, but the work is being proceeded with in the night time, and will be finished in a week or ten days.

The air is carried to the face by means of brattice in almost the whole of the working-places ; a few places in No. 2 District require attention. The manager, Mr. Croft, informs me that all the available brattice cloth has been used up ; he has ordered a further supply which is daily expected.

A barometer and thermometer are placed in a conspicuous position on the pit top, and the necessary report-books are in use. The wheeling roads were in good condition and there was a good supply of timber on the various flats.

In my opinion the manager is progressing satisfactorily with the necessary alterations required by the Coal Mines Regulation Act, 1896.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

John Dixon, Esq., Inspector of Collieries, Newcastle.

From this report it appears that nearly all the necessary work has been done in order to bring this mine into compliance with the provisions of the new Coal Mines Regulation Act, 1896, and that the whole of the work will be completed in the course of a few days.—J. DIXON, 23/11/96. The Under Secretary for Mines and Agriculture.

Records, 24/11/96. For the information of the Minister.—H.B.S. for (U.S.), 25/11/96. Seen.—S. SMITH.

#### REPORT ON NEWCASTLE COMPANY'S A PIT.

Newcastle Company's A Pit Inspection, Merewether.

Sir,

Newcastle, 16 February, 1897.

I have the honor to report having inspected the above colliery on February 8th and 10th.

No. 1 District.—There are 42 men, 4 boys, and 4 horses employed, total 50, and supplied with 8,640 cubic feet of air per minute, giving each an average of 172 cubic feet.

No. 2 District, right-hand side.—There are 34 men, 4 boys, and 4 horses employed, total 42, and supplied with 5,280 cubic feet of air per minute, giving each an average of 125 cubic feet.

Left-hand side.—There are 48 men, 6 boys, and 6 horses employed, total 60, and supplied with 9,460 cubic feet of air per minute, giving each an average of 157 cubic feet.

Nos. 5 and 6 Districts.—There are 62 men, 6 boys, and 6 horses employed, total 74, and supplied with 9,700 cubic feet of air per minute, giving each an average of 131 cubic feet.

Nos.

Nos. 7 and 8 Districts.—There are 42 men, 4 boys, and 4 horses employed, total 50, and supplied with 7,200 cubic feet of air per minute, giving each an average of 144 cubic feet.

The working-places were well ventilated, the wheeling roads in good condition, and there was a plentiful supply of timber on the various flats.

John Dixon, Esq., Inspector of Collieries.

I have, &c.,

THOS. L. BATES,  
Inspector of Collieries.

Seen.—J. DIXON, 16/2/97. The Under Secretary for Mines and Agriculture. Records, 17/2/97. For the information of the Minister.—H. B. SULLIVAN (for U.S.), 17/2/97. Seen.—S. SMITH, 18/2/97. Mr. Dixon for special report as to whether the provisions of the Act are being complied with by this company, especially as regards the bratticing.—D. McL., 25/2/97. Mr. Inspector Bates for further report.—J. DIXON, 27/2/97. Further report herewith.—T. L. BATES, 3/3/97. Mr. Inspector Dixon.

#### SPECIAL REPORT ON NEWCASTLE COMPANY'S A PIT.

Special Report on Newcastle Co.'s A Pit, Merewether.

Sir,

Newcastle, 3 March, 1897.

In accordance with your minute I have made a further inspection of the above Colliery, on March 1 and 2, and have the honor to report as follows:—

No. 1 District.—There are 46 men, 4 boys, and 4 horses employed, total 54, and supplied with 5,760 cubic feet of air per minute, giving each an average of 106 cubic feet.

No. 2 District, right-hand side.—There are 34 men, 4 boys, and 4 horses employed, total 42, and supplied with 6,240 cubic feet of air per minute, giving each an average of 148 cubic feet.

Left-hand side.—There are 48 men, 6 boys, and 6 horses employed, total 60, and supplied with 6,545 cubic feet of air per minute, giving each an average of 109 cubic feet.

Nos. 5 and 6 Districts.—There are 62 men, 6 boys, and 6 horses employed, total 74, and supplied with 8,540 cubic feet of air per minute, giving each an average of 115 cubic feet.

Nos. 7 and 8 Districts.—There are 42 men, 4 boys, and 4 horses employed, total 50, and supplied with 6,300 cubic feet of air per minute, giving each an average of 126 cubic feet.

Since my last inspection, on February 8 and 10, two headings have been commenced between the faults in the No. 6 District; when these are connected the return airway will be considerably shortened and the ventilation improved. The places are being worked every day and will be completed in about a month.

I found all the working-places to be adequately ventilated. No complaints have been made by any of the men to the manager or under-manager with regard to ventilation, nor have I received any, although the men have had ample opportunity of doing so, either by letter or whilst I have been in the working-places, and I am of opinion there is no reasonable cause for any complaint to be made.

John Dixon, Esq., Inspector of Collieries, Newcastle.

I have, &c.,

THOS. L. BATES,  
Inspector of Collieries.

Seen.—J. DIXON, 3/3/97. The Under Secretary for Mines and Agriculture. Records, 5/3/97. For the information of the Minister.—H.B.S. (for U.S.), 5/3/97. Seen.—S. SMITH.

#### EXHIBIT X.

Coal Fields Office, Department of Mines, Newcastle, 20 May, 1899.

I, THE undersigned, Anthony Wear, coal-miner, of Broadmeadow, do hereby make the following statement, and I do hereby solemnly and sincerely declare that in or about the month of September last, I was engaged as a shiftman, working on the night shift in the Newcastle Company's A pit; on a Sunday night I and my mate, Thomas Abel, came to work at 10 o'clock, and were sent by the master shifter, William Rendal, to timber the two horse roads in No. 6 district; we took a trolley of timber into the front horse road; I went round to see what the back horse road required as regards slabs; when I went round the water haler, Joseph Fox, was in; I stepped up on to the bottom coal, my lamp being on my head alight; there was gas in the place; she lighted; I was burned about the shoulders down the right arm, the moustache burned, and eyebrows; Fox was in the place whilst this occurred; I came round, and went to my mate to warn him; he saw what had happened to me, and said he had heard the report of it; it dinned in his ears; Mr. Rendal came in shortly afterwards, and I reported it to him; he saw me, and said, "I see you are burned"; he went away, and came back again about half-past 3 a.m.; I went home, and got my wife to put some oil and whitening on the burned parts; I did not call in a doctor; I did not go to work on the Monday night, but resumed work on the Tuesday night, having lost one shift; Mr. Rendal admitted, in the presence of Mr. Abel and myself, that he was never further than the water, and was not at the face; and I make this solemn declaration as to the matter aforesaid, according to law in this behalf, made and subject to the punishments by law, provided for any willfully false statements in any such declaration.

Taken and declared at Newcastle, in the Colony of New South

Wales, on this 20th day of May, A.D. 1899, before me,—

ANTHONY WEAR.

W. J. ROBERTSON, J.P.

[Extract from *Newcastle Morning Herald and Miners' Advocate*, Wednesday, 9 August, 1899.]

#### THE BAILEY CASE.

Sir,

Merewether, 7 August, 1899.

The Court of Investigation having concluded, and the Commissioner given his decision, advances this protracted subject one step forward. When asking for the investigation, I was especially careful to respectfully request that the Court should be composed of men representative of the interests involved, and thoroughly competent by knowledge and experience to deal with and understand all the details of mining operations, and the duties, responsibilities, and practices of colliery officials and workmen. Appointing a lawyer to conduct the inquiry placed me at an enormous disadvantage, especially compared with those who could afford and those who had a barrister and solicitor provided for them. However, a lawyer was appointed, and has given his award. My charges were four, including my reporting fire-damp and being disrated, and eventually dismissed. 1st. The burning of a man with fire-damp. 2nd. Another being overcome with black-damp. 3rd. The opening of doors and other methods of turning air into districts when the Mines Inspector happened to be in. Commissioner Wade has found each of those four points proved.

While gratified that my charges were proved, it is certainly somewhat surprising that the Commissioner should question my credibility. Commissioner Wade's limited knowledge of mining practices is the only excuse for such remarks, as "He (Bailey) was practically an accomplice in committing breaches of the Coal Mines Regulation Act." There is a great difference between an accomplice and a paid servant, obeying orders under force majeure. Commissioner Wade cannot get past this, for he says, "I am fully of the opinion that in pursuance of the plan to suppress Weir's incident, the under-manager and manager instructed Bailey not to report the finding of fire-damp in the ordinary report-book." The Commissioner's finding is quite in keeping with the facts, but when having found about 16 cubic feet of gas, I, in the face of a certain contingency, complied with the Mines Act, enter it in my report-book, and within two days after find myself disrated, and eventually dismissed. The Commissioner has no word to say, except "That Bailey was dismissed because he made known the existence of fire-damp I am unable to say." Again, the Commissioner says, "There are things which he may feel are morally indefensible, but no man with a vestige of self-respect will lend himself under any condition to the perpetration of a fraud which may entail injury to his own friends and fellow-workmen." The Commissioner forgets that it was those very breaches of the Mines Act which Messrs. Atkinson and Dixon thought Mr. Keightley was the proper person to deal with, instead of a police court. Surely my refusal to become an accomplice in hushing up such gross breaches of the Mines Act deserved some slight recognition at the Commissioner's hands. Whatever

Whatever course the local members and the delegate board may take in the interests of the miners, I feel myself in duty bound to sue the company for damages for wrongful dismissal, to which end I am writing to the various lodges, and the local members individually, to assist me in engaging a lawyer of standing, such as Mr. Wise, if possible, who, in addition to my own legal claims, would be able to define a degree of responsibility incurred by a manager, under-manager, and fireman, when the latter commits a breach of the Mines Act, intimidated by the belief that if he refused he must tramp the roads for work, and his wife and children starve. One matter I wish in particular to draw your attention to. From April 3rd to June 26th—twelve weeks—I was doing my utmost to obtain the investigation. For this twelve weeks' delay no blame attaches to myself. I therefore consider it very hard that my wages for that period have been refused. Twelve weeks, at 46s. per week, although a large sum to me, is trivial to the Mines Department, especially in comparison to the amount paid to Messrs. Edmunds and the solicitor instructing him. Trusting I shall be assisted in this matter, and thanking Mr. Curley for his aid.

I am, &c.,

J. W. BAILEY.

## EXHIBIT 2.

THIS deponent, *William Gall*, on his oath, states:—I am a deputy at the Newcastle Company's mine; I have been employed for fifteen years, eleven of which I have acted as deputy; before that I was a miner; I first heard of gas in the mine on the 28th March last; in all my previous experience of the mine, I never came across gas in the mine nor black-damp; I never heard of either gas or black-damp in the mine prior to that date; I never heard anything of gas or anything else in the mine in connection with anybody; I never knew beforehand when an inspector was coming into the mine; I never knew or heard of a case where the ventilation was interfered with while an inspector was in the mine; the first I heard of the gas as reported by Bailey on the 28th March last, was when I went down the pit about 6.35 a. m. on that day with Mr. H. Croft and Yardley; that was at the cabin at the pit bottom, Deputy Jones, Bailey, Ambrose, Yardley, young Croft, and myself were present at the time; the under manager came into the cabin and said, "Good morning, are you all right?"; that is the usual thing to be said every morning; Jones replied, "Yes," but Bailey pointed to the book lying on the desk, and said nothing; Croft then looked at the book, and said, "Bailey has reported a little gas"; he then asked Bailey where he had got it, and he replied in the back headings—in the back dip heading; I looked at the book which stated it had been found in the front heading; Croft asked him how much was there, and he said he did not know; Croft asked, "Have you no idea?" and Bailey replied, "No"; Croft asked, "Where did you get it?" and Bailey replied, "I got it in a hole in the roof"; Croft said, "Did you get it in the lamp?" and Bailey replied, "Yes, it was there all right"; Croft then turned to me, and said, "Take your lamp and go and see what is wrong down there; I will follow you when I got the pit started"; I went straight in then to where Bailey had stated he had found the gas—in the back heading; I locked my lamp and went straight to the place; there was a man working there, and I took him out; I took my lamp and went in and searched for gas, but was unable to find any, I searched in every hole and corner of the heading where I thought gas was likely to be, I could not get the slightest trace of gas; I told the man to go to his work, then turned and went to the narrow bord where I met the under manager coming in; we went back and searched both headings—back and front—up and down, but could not detect the slightest trace of gas; that would be about 8 a. m.; I found a hole in the roof of the back dip heading; I tried there, but could get no gas; it would have been a likely place if there had been any gas there; the under manager used my lamp; the under-manager then went out to report the affair to the manager; Bailey had then gone to lay some rails in No. 7; there was no one working in the front heading that morning when I went in; Bailey was examining deputy until Ambrose and I came in; it was his business to have stopped the man from working in that heading when he found gas; between 2 and 3 p. m. same day the manager and the under manager met me at No. 6 station; in consequence of what the manager said I went with him to the dip headings, and made another examination of the front and back headings; we found nothing there; I was then instructed by the manager to accompany Bailey round the pit on his examinations in the morning; that would bring me into the pit at 3.30 a. m.; next morning I went down at 3.30 a. m. and got my lamp; there were three lamps altogether; they were a small Marsaut, a large Marsaut, and a small Clanny; I had key for the lamp; it was in the lamp box, and had been there since the lamp had been there; Bailey took the small Marsaut lamp; there was a key to it which was hanging alongside the lamp; Bailey did not lock his lamp nor take the key with him; I followed Bailey round; he went to No. 1, examined the places there, then No. 5 and then No. 6; when he got into No. 6 he took the bonnet of his lamp off and lit it; he did not light it till he got into the headings—the back rise heading of No. 6; he lit it by his naked light; I had lit my safety-lamp in the cabin at the pit bottom; Bailey put his naked light down on the out by side of the cut though then went to the face; he examined the back rise heading first; he came away and said as far as he could see it was all right; he then went to the front rise heading on to the canch; I went with him; he shoved his lamp right into the corner and said, "There, a small trace there"; he did it very quickly; I tried the spot, and could not detect the slightest trace of anything; I told him I could not get anything, and he said, "Oh! no, my light has exhumed it all; he went on to the other side of the heading, and shoved his arm up quickly there, and said, "There is a slight trace there"; I tried the place, but failed to find any gas; I saw nothing when he said he had got a trace; he had an extra large flare on his light at the time; he then went to the dip headings, and tried there getting nothing; he then went to the cabin and made his report; when he shot out his arm with the light in the way I have described he said his flame had puckered; I asked him what that meant, and he said it had moved; I told him he could not see a small quantity of gas in that way, and he said he could; I looked at his report after he had signed the book; he reported everything safe in the mine; I said nothing to him about it; about 9.30 a. m. the manager and under manager came in, and we all met at No. 6 station; there were Bailey, Ambrose, the manager, the under manager, and myself; we went up the No. 8 engine road, and the manager said, "I expect you have seen I protest against your report" Bailey replied, "Yes," and the manager said, "In my mind it's not a correct one"; Bailey made no reply; the manager then read the special rule bearing on Bailey's duties; he then asked Bailey where he had got the gas, and Bailey said, "In the back heading"; the manager asked how much, and he said he did not know; manager asked him where he had got it, and he said, "In a hole in the roof"; The manager said, "Did you get it in your lamp?" Bailey replied, "Yes"; the manager then asked if he had got a blue cap, and Bailey replied, "Yes"; the manager then said, "Does it not strike you, Bailey, that when you get a permanent blue flame on your lamp there is more than a little gas there?" Bailey made no reply to that; the manager then said, "Well, Bailey, I am of opinion that there is something behind the scenes that has caused you to make this report"; Bailey replied, "Yes, there is"; some time ago a man got a bit of a singe; the manager asked who, and Bailey replied, "Anthony Weir; him and his friends have been talking; they say that I should report a little gas"; the manager then said, "whether you get it or not"; and Bailey replied, "Yes, I have done so"; the manager said, "Well, Bailey, I am convinced there is collusion going on, and I have now lost confidence in you"; Bailey said nothing, but walked away to his work; he first asked the manager if he might go to his work, and the manager said, "Yes"; the next morning I followed Bailey round on his examination; he took his lamp, lighting it in the cabin; he did not take the key with him; I took a separate lamp; he went his usual round, through No. 1, then 5 and 6; nothing unusual took place there; there was no talk about gas, either back or front; I continued to follow Bailey round in that way till another man (Jones) was put on; that would be on the 4th April last; on the 14th April last, in the office, there were the manager, the under-manager, Ambrose, Newburn, Bailey, and myself; the manager questioned Bailey as to the charges he made against the deputies; the manager asked Bailey about some canvas, concerning which he had complained to the Minister for Mines; Bailey replied that he and Ambrose had done it; first of all, Bailey said he had been to Sydney; the manager asked him if he had made a statement to the Minister, and he said, "Yes"; the manager asked Bailey if he had told the Minister about some canvas being put across No. 2 in-take; Bailey replied, "Yes"; the manager asked, "Who did it?" and Bailey replied, "Me and Newburn did it"; the manager said, "Bailey, you never mentioned Newburn's name last night"; Bailey said nothing in reply to that; Newburn said, "Bailey, it's a lie", Bailey said, "Now, Newburn, I'll have you"; Newburn said, "How can you have me!" and Bailey said, "Can't I get a friend to swear he came on to the canvas while we held it up?" Newburn replied, "No, you can't get a friend, but you might get a lying scoundrel like yourself"; Bailey said nothing to that; Bailey accused me, in the office, that night of not having the canvas up in the heading; I said it was an untruth that the canvas had always been up; Bailey said "the canvas never was up, and that he had prayed to God for me to put it up"; I told him it was an untruth; the manager said to Bailey, "Well, Bailey, I consider you've gone to the Minister from nothing else but spite, to injure me and my officers"; Bailey replied, "I did not go with any antagonistic feelings towards you or your officers either";

either"; he then asked if he could go; the manager stopped Bailey and said to him, "Well, Bailey, I have made up my mind that you shall not go down that pit again under my management"; Bailey replied, "I have my notices wrote out in my pocket to give you, but the Minister for Mines and Chief Inspector Atkinson told me not to give it to him till he dismissed me"; Bailey then went away; Bailey never informed me that he had found black-damp in the place where Taft worked in No. 5 pillars; Taft's affair first came to my knowledge on the 14th April last, when it was mentioned by Bailey; I first heard of Weir's accident on the 29th March last, the day after Bailey reported gas; I heard it from Bailey; he told the manager; I never heard the under-manager instruct Bailey not to report in the book; I never saw Bailey hand the under-manager a note of any kind; I never saw the under-manager tear up a note in Bailey's presence, or out of it; I never saw the under-manager burn a note handed to him by Bailey; I never heard Bailey report to the under-manager the presence of gas or black-damp in the mine; I know the witness Arthur Johns; it is not true that he asked me several times to put up brattice beyond him, and that I refused him; I have found fault with Johns several times for pulling down the canvas after I had put it up; that was in the front dip heading of No. 6; the heading was worked in two sections, with about 2 feet 4 inches of bottoms; I used to put the brattice up on the canch, within about 6 feet of the face; he used to take the canvas down when he wanted his bottoms up, and throw it down any fashion, and cover it up with the muck; the face was then without canvas; I have gone there and found the canvas pulled down and lying under the dirt; I told him that if it occurred again he would have to go and see the manager; Johns never told me that he had found gas in the heading where he was working, nor did I tell him it was nothing; I never heard from him or anyone else that Johns had found gas in his heading; I know Williams and Taylor; I remember them sitting out on the heading for two days; that was at the commencement of the cavil; the men very seldom do much work for the first day of the cavil; I saw those two men sitting out on the heading, and asked them what they were doing there; they said they were not going to start, and I asked them what was wrong with it; they replied that they did not think they would work the cavil; I told them they could please themselves about it; I went and looked at the place where they had to work; it is not true that there was a scarcity of air where they were to work; there was any amount of air there for them; that particular bord was standing on a jump, which makes the work rather harder for the miner, but he is paid extra for the jump; Williams and Taylor asked me what was to be paid for it, and I said I had nothing to do with the pay; there was no accumulation of muck there to prevent them from working; I could walk up behind the canvas, which was up the first night; Taylor and Williams went in on the third day and worked on; Williams stopped work after a while, and was away for a fortnight; Taylor went to work with his younger brother; the younger brother had been working with another brother who had gone to Hillgrove; the Taylor who was Williams mate then went to work with the younger brother; when Williams came back he worked by himself for a while; I asked him what had been the matter with him, and he said, "The old complaint"; I asked, "What was that?" and he replied, "Asthma"; there was no alteration between the ventilation in that place when he came back and when he went away; there is an overcast there, but it has never been used to this day; it could not have altered the condition of things with regard to the ventilation of Williams' place; there was no door put up to alter the condition of the ventilation there; Williams was in bord No. 117; Selby and Tunncliffe were working in the back heading, and could not get their air from any other source than that which supplied Williams and his mate; I have never put coal on the furnace in the mine; it is not true that on one occasion, when the inspector was in the pit, I put large coal on the furnace in an unusual manner; we used what is called "shandygaff" for the furnace—mixed coal; I have never seen any unusual firing at the furnace when the inspector has been in the mine; I cannot remember any occasion when special coal was used; I have never spoken to Bailey about the anticipated visit of an inspector; I know the door in No. 8; the boy has been sent away from that door scores of times; I cannot remember any instance when the boy has been sent away without anyone left in his place; he would be sent away on various messages—getting harness, and hurrying up the drivers, &c; I can remember one morning sending him away with Bailey; Bailey told me that there were some bords wanted canvas in; I told him to go and put it up; he said time was getting on, and asked for the boy to go with him; I told him he might, but not to be too long; he was away with the boy about three-quarters of an hour, and I remained at the door and kept it closed all that time; I know Watts; it is not true that the gob was heaped up in No. 77 in No. 6 to such a height that the air was blocked; there was the ordinary gob from his own bord there—about 4 feet high and 8 feet wide; that remained there till the bord was finished; there was sufficient air going over the top of it to them; Watts once said that he wanted a little more air in; I told him I thought he had sufficient; I went to the face and tried it with my light, and showed him the deflection of my light, and asked him if there was not enough air there for him; he said "There's no bloody air"; he worked in No. 1 pillars during another quarter; that place did not require bratticing; we made a cut-through in pillar 13 to take the air through No. 1 pillars; Atkinson was working in the 14th pillar marked AA; Watts was working in 13th pillar marked W; the air was brought from the No. 1 in-take through the cut-through in pillar marked 13, brought up to the pillars where Watts and Atkinson were working; a cut-through was made in the pillar next to Atkinson, and the air there split, part going to Atkinson and part to Watts; I went in more than once and tried the air; in my judgment it was good air, and there was sufficient of it; I never saw the lamps burning badly in the pillars; I never had lights that were burning badly pointed out to me; at any of the interviews after Bailey's report of the gas, there was nothing said by the manager to the effect that he wanted something kept out of the reports; the manager never said put in "A little gas not dangerous"; Bailey never said to him, "What about the black-damp in No. 5 pillars?" nor did the manager reply, "Oh, in that case put in black-damp".

*By Mr. Edmunds:* I was deputy for No. 1 pillar workings; there were six men working there at first, but two were taken out; the work there ceased four months ago; the air was then cut off No. 1 by a check being put on at the in-take; there were no men at work in No. 1 after that; that check has been up for about eight months; it was not put right across till the work ceased; there was a space of about 18 inches or 2 feet left open to admit sufficient air for the men working there; there was too much air going in there before the check was put up; there were only four men working there; during the last twelve months never more than eight men at the most have worked in No. 1 pillars; before the check was put on there was enough air going into No. 1 for thirty men; the check was put up before the workings were stopped, because the number of men was reduced; there was a split in the front heading on the exhibit J at the cut-through marked A; the whole of the air supply did not go through cut-through A, because a big check was put on there—a canvas door; the cut-through at A was never left fully open.

*By Commissioner:* There were sixteen men on the faces off the back heading; on the out-by side of cut-through A at the back heading there was a stopping, and the air would come through cut-through A, and join the air that had gone to Selby at cut-through B, and would then go to the sixteen men at the face.

*By Mr. Edmunds:* I had some experience of gas in England; I have tested for gas in a mine there on several occasions; I have been taken in by a manager there to see gas and its effect upon the safety-lamp; for the last fifteen years I have not seen any gas at all.

*By Mr. Curley:* I am quite familiar with all the deputies in the A pit of this Colony; I first knew of an examining deputy using a lamp in the mine about twelve months ago; I heard the deputy say he was using the lamp; that was Bailey; it was in No. 6 district; that lamp was used for more abundant caution in approaching faults while inspecting; I did not hear of Weir's accident till the 29th March last; I had never heard the under-manager refer to it; I do not hold any certificate; I have never had anything to report in the mine on my examinations; I have examined the places off and on for the last eleven years; I have done the examining deputy's work when he has been off; that was all the examining I did before this; I have examined the pit when it has been idle; I know nothing about the night-overman going to No. 6 with a naked light while the examining deputy was using a safety-lamp; on two occasions before this I had to complain about Bailey; on those occasions he took the bonnet off his Marsaut lamp to look for gas; I told him he ought not to do it, and he said that was the way they did where he came from; and that he could find it better that way; I told him I thought so; on another occasion he had too big a flare on his lamp, and was poking about the corners when the large flare broke his lamp; that was on the Sunday night following the taking off the bonnet; this happened about eight months ago; the glass of that lamp was not injured before that; I had not been using it, but had been looking at it; I saw the book in which Bailey reported gas the morning he reported it; I was surprised to hear of any gas being in the mine, although I knew they had been using safety-lamps; the lamps were used as a matter of precaution in approaching the faults.

*By Commissioner:* The gas would more likely be given off in the daytime, when the faces are being worked; the lamps were not used in the daytime.

*By Mr. Curley:* If I had found gas in any of the places I should have blocked the place up, and prevented anyone going in, and also reported the gas; I would not try to remove the gas in any way; I did not see any gas on the 21st March; it was a check that was put up on No. 1 road; it was put up in different sizes; as the men were withdrawn from No. 1 it was put further across the road; when Atkinson and Johns and those other men were working there it would be within about 2 feet of the road; it would go partly over the roadway.

This

*By Commissioner* : The first portion was wooden, which was canvassed over afterwards.

*By Mr. Curley* : It was first of all constructed of canvas, but we found that would not do so we put up the boards ; the boards reached to within about a foot of the roadway ; when Bailey pointed to the book in the cabin the under-manager opened it and looked at it ; he did not then hold out the book and say to us "see what he has done?" he was standing at the time ; he sent me away to see if there was anything wrong after looking at the report ; he then went into the stables to turn the wheelers out to work ; he asked Bailey how much he had got ; Bailey could not tell him but said "it was there right enough ;" I call the in-by heading the front heading ; the back heading gets the air first ; that was not the first time I had had a lamp in my hand to look for gas in the colliery ; I had several times when examining the places used a lamp to look for gas ; I have used it for No. 6 ; I have used it in all places that were approaching a fault ; I examined No. 1 on September 24th, 1898, but not with a safety-lamp ; I examined No. 6 on several occasions with a safety-lamp when we were going towards any faults ; that was done as a precaution ; Arthur Johns never mentioned to me that he had seen a flash in his place nor did his mate Caldwell ; I cannot say how often I examined with a safety-lamp before that morning I went round after Bailey ; I only examined as examining deputy when the fireman deputy was off and some times when the pit was idle ; I saw Bailey at the furnace on the 29th March last ; I was waiting for him and had been there about half a minute when he came ; it was about 3.35 a.m. when I saw him there ; I went down about 3.30 a.m. that day, and Bailey came down in the cage following me ; there was a furnaceman there at the time—Redpath ; he had gone down at 3 a.m. ; the under-manager did not appear to be at all excited about this report ; Croft first spoke to me about following Bailey round about 3 p.m. on the 28th March last ; he told me to accompany Bailey till further orders ; he said then he had seen Bailey's report ; he did not appear to be the least excited about it ; before he told me to go round we had had an examination of the place ; we had a talk about it I suppose ; he has never ordered me to follow any other examining deputy round in the same way ; I was at the door about three times when the boy Jones was away with the deputy, but on many occasions I have sent him away myself on messages ; Ambrose and I used to take our meals near that door every day ; the boy has gone away twice with Ambrose when I have been at the door ; he was away half an hour or three quarters of an hour ; Williams never complained to me about bad air ; the air was good in No. 1 pillars ; Williams worked in No. 8, the air was good there ; the night overman was the man to see Taft and Turner were working at shift work ; Randle never complained to me about the ventilation in No. 5 ; the ventilation that got to Taft and Turner came from No. 6 ; it came in off the back narrow bord of No. 1 up the heading—the face of the heading ; then it turned round into the next heading below then out on to the back narrow bord again ; there was a sconce projecting about 7 feet into the back narrow bord of No. 1 ; that turned the air into the headings as far as where the men were working in the face ; then it went round the bord into the next heading below and then back into the narrow bord again ; the sconce did not go right across the back narrow bord ; it left an opening of only 2 feet for the air to go down ; what did not get past the sconce and escape would go up the heading to Taft and Turner ; Randle never told me that the air was very bad there nor that it was light ; I never heard of Taft having to be carried out of there till I heard it from Bailey recently ; Randle never told me of it ; before this affair with Bailey the deputies and officials of the mine worked together in a friendly manner ; I never heard the manager complain of Bailey before that time ; I never heard the under-manager complain about him ; I am certain Ambrose was present when Mr. Croft spoke to Bailey about the matter on the engine road ; I was there during the whole interview ; Bailey was the first man to leave of all ; I have never been instructed by either the manager or under-manager to put up canvas in the mine when the check inspectors have been down ; I would not have done it if I had ; I believe Bailey did act as under-manager one day ; I never knew when the check inspectors were in the mine, except when I saw them there.

*By Commissioner* : A road had not to be cleared to put up the brattice in bord 117, where Williams was working ; the road had been cleared and the brattice put up before he went there ; all these bords had been cleared and brattice put up in them when the men went to work there ; I do not know what happened to induce them to work on the third day after idling the first two days ; there was nothing unfavourable about those bords as compared with the others ; I would be in No. 1 pillars several times during a shift when they were being worked ; the air has been a bit warm there, but nothing to speak of—nothing more than could be expected in pillar-workings ; I was there when Atkinson was working there ; the air was a bit warm there, but not too hot ; in the bord between the cut-through where Atkinson was working and the pillar the roof had fallen, which would direct the air towards where he was working ; Watts did not point out any dirt to me in No. 1 which had been heaped up in the wrong place, nor did I use any such expression to him as "Damn my rags" ; I had no naked light when I went round with Bailey on the 29th March last ; Bailey carried a naked light as well as a safety-lamp ; I did not speak to him about it ; I thought his own sense should have taught him better ; if he had gone into the face with his naked light I should have checked him for it ; he was 15 yards from the face with the naked light ; I reported him to the manager for carrying the naked light on that occasion ; it was not my place to check Bailey for carrying the naked light on that examination ; I reckoned it was my place to speak to him on the other occasions when he went into the face with the safety-lamp, and did what he did there with his safety-lamp ; I knew he was going to look for gas when he took the naked light with his safety ; he did not look for gas in the place he said he had found it ; he went to the rise headings.

*By Mr. Curley* : Weir has asked me if his place had been examined ; I told him it had ; I said nothing else to him ; Abel was close by at the time.

*By Mr. Bruce Smith* : The lamp shown me is one used in the pit ; it is the small Marsaut, and the same one as Bailey used to examine the faces ; when the bonnet is off, a strong current of air might cause the flame to burn through the gauze ; I heard the lamp crack when Bailey had the large flare on it, and was holding it at an angle ; I spoke to him about it, and he replied, "That's nothing—I'll get another one."

*By Mr. Edmunds* : It is cracked now as it was then ; it has not been used since Bailey left.

Taken and sworn at Court-house, Newcastle, this }

C. G. WADE, J.P.

WILLIAM GALL.

This deponent, *William Gall*, recalled on his former oath, states as follows (*to Mr. Bruce Smith*) :—During the interview in the office, on the 14th April last, Bailey said nothing about considering Mr. Croft's poor wife and family ; nothing was said about Mr. Croft's wife and family.

*By Mr. Curley* : Nothing was said to Bailey asking him to consider the matter ; Newburn did not say to Bailey, "Think about poor Mr. Croft's wife and family" ; Bailey left the office first ; the rest of us left together ; I cannot say whether Newburn or I left the office first.

Taken and sworn at Court-house, Newcastle, this }  
11th day of July, 1899, before me,— }

C. G. WADE, J.P.

WILLIAM GALL.

### EXHIBIT 3.

THIS deponent, *William Ambrose*, on his oath, states :—I am a deputy at the Newcastle Coal Company's mine ; I have been in the employ of the company seven years, and as a deputy about two years ; before that I was a shiftman and a miner ; I was a shiftman for close on two years ; I have followed mining all my life ; I was mining at Waratah before coming to the Newcastle Company ; I have been employed in mines in different capacities for fifteen years altogether ; I have been in both the A and B pits of the Newcastle Mine ; until March last I never knew of the presence of gas in the mine, nor had I heard anyone else say he knew of it ; I never saw any black-damp ; I never heard of anyone being affected by it ; I never knew when the inspectors were coming into the mine ; on three different occasions Mr. Dixon has been round Nos. 7 and 8 before I knew he was in the mine ; I have never made any alteration in the ventilation when an inspector has been in the mine ; I have never known anybody to tamper with the ventilation in any manner when the inspector has been down ; I have never altered the ventilation when the check inspectors have been down, nor have I known of anybody else doing such a thing ; I go down the mine at 6.30 a.m., the same shift as Gall ; I have charge of Nos. 7 and 8 districts, and Gall of No. 6 ; Gall, being the senior deputy, sometimes goes round my district ; sometimes I go to his district to assist him ; I remember Bailey reporting the finding of gas in the mine ; I was down about 6.30 a.m. on the 28th March last, before the under-manager and Gall came down ; when the under-manager came down of a morning it was his custom to ask, "Is all right?" ; he did so on this occasion, and Jones, the examining deputy, replied, "Yes" ; Bailey

Bailey, Jones, Gall, Yardley, the under-manager, and myself were present; Bailey then pointed to the book on the desk closed; Bailey said nothing; the under-manager opened the book and said, "Bailey has reported finding gas"; the under-manager asked him where he had found it, and he said in the back heading; the under-manager asked him how much he had found; Bailey became confused and excited, and said he did not know; the under-manager then told Gall to go down to the place with the safety-lamp and examine it, telling him that he would be down as soon as he got the pit started; Bailey and I then went away together to work, starting the wheelers and looking after the roads; Bailey said nothing to me about the gas that day; the next day I received orders to meet the manager at No. 6 station about 9:30 a.m.; the manager, the under-manager, Gall, Bailey, and myself met together there; the manager said, "You being a little deaf, Bailey, and there being so much noise, we'll go to a quieter place"; we went up No. 8 heading; the manager said to Bailey: "Bailey, you've noticed that I've protested against your report; I do not think it is a correct report; it is strangely worded; where did you get the gas?" Bailey replied, "In a hole in the roof"; he asked him if he had got it in the lamp, and Bailey replied, "Yes"; the manager asked, "Did you get a permanent blue cap?" and Bailey replied, "Yes"; the manager said, "Did it not strike you when you got a permanent blue cap that there would be a large quantity of gas present?" Bailey replied, "I don't know"; the manager then said, "I think there is something behind the scenes to cause you to make this report"; Bailey replied, "Yes, there is"; he seemed to be in a state of confusion and excitement; he was sitting down at times and standing up at times; Bailey continued: "Some time ago there was a man got a bit of a singe"; the manager said, "Who was that?" and Bailey replied, "Anthony Wear; him and his friends have been talking about it, and say that I should report finding a little gas"; the manager said, "What, Bailey! whether you find it or not?" and Bailey replied, "Yes"; the manager then said, "Well, Bailey, I've lost confidence in you! I am satisfied there is collusion going on"; we then all separated and went on with our work as usual; on the 14th April last in the colliery office on the surface about 4:15 p.m. we all met again—the manager, the under-manager, Gall, Newburn, Bailey, and myself; Yardley was not there; we all sat round the table, and the manager said to Bailey, "Have you written to the Chief Inspector or Minister for Mines regarding some of my officers putting canvas across the air-courses, and regarding black-damp and gas?" Bailey had been off work about that time; when this question was put to Bailey, he replied, "I did not write"; the manager asked, "Did you see the Chief Inspector?" and Bailey replied, "I went further than that; I saw the Minister personally"; he said that he had told the Minister that brattice had been put across to turn the air, and about the black-damp and the gas; the manager asked who the men were that had put canvas across the air-courses, and Bailey replied, "Newburn put canvas across No. 2 in-take"; Newburn told Bailey he was telling an untruth; Bailey said, "Now Newburn, I'll have you; can't I get a friend to swear that he came on to the canvas while we were holding it up?" Newburn replied, "Yes; you may get a lying scoundrel like yourself, but not a man"; Bailey said nothing in reply to that, but seemed annoyed; the manager then asked Bailey, "Who else?" and Bailey replied, "Ambrose"; he put a canvas in No. 7 to deceive the Government inspectors; I told him he was telling a lie, and that I would not be connected with such dirty work; Bailey said nothing in reply to me; Gall then said that he doubted whether he—Bailey—had ever seen gas, and Bailey said to Gall, "Yes; you are the cause of all this trouble"; Gall said nothing in reply; Bailey did not say how Gall had been the cause of the trouble; the manager then said, "Bailey, you'll never go down this mine again while I am manager"; Bailey put his hand towards his trousers pocket, and said, "Oh, well, I have my notices written, but the Minister for Mines and the Chief Inspector told me not to hand them in, but to get the manager to dismiss him; they told me to write, and I'll do so—the world's wide and I'm done with you; the manager said to him, "Don't forget to tell the Minister and the Chief Inspector when you do write to them what you are discharged for—for incompetency and telling untruthful statements to the Minister and the Chief Inspector; I know Williams, the witness who has given evidence; I remember when he and Taylor got work in No. 8 during the first quarter; I remember them sitting down and doing no work for the first two days; they did very little at all for the first three days; I asked them what they were doing sitting about in that way, and they said they were taking a smoke; neither Williams nor Taylor made any complaint to me about the air there; there was nothing about the work in that bord which would make it compare unfavourably with the other bords; there was just a little jump in the floor; that would make their work a little harder; they would be paid something extra for the jump; I never told Williams that he had no business to replace a canvas that had been knocked down; I remember no canvas that had been knocked down in Williams' place; it is my place to put up any canvas that has been knocked down; there is no objection to a man putting up a sheet of canvas in his place if it has been knocked down; when those two men were sitting at the mouth of their bord there were two men—Selby and Tunnicliffe—further in than they were; Williams and his mate would get the air before Selby and Tunnicliffe; I have never heard the under-manager instruct Bailey not to report gas in the book; I have never heard him restrict Bailey in any way as to his reports; I have never seen Bailey hand the under-manager a note, nor the under-manager tear up or burn a note handed to him by Bailey; I have never heard Bailey tell the under-manager of the presence of black-damp or gas in the mine; I know the door the boy Jones had charge of; I have sent him away from that door dozens of times; when I have done so I have attended to the door myself; I can clearly remember sending him away three times with Bailey; that was on three different days; on the first occasion I sent them to No. 8 to bring down some rails and canvas; they would be away about half-an-hour; that would be between five and six months ago; on another occasion I sent the boy away with Bailey to canvas three bords in No. 7; Bailey had told me that there were some bords wanted canvassing; I was at the box by the door at the time; I sent the boy with him because Bailey's time was nearly out; I stayed at the door while they were away; it was closed all the time they were away; there was no inspector in the mine at the time; Bailey went away with the boy; he came back, and I asked him if he had canvassed all the bords; he said, "No"; I asked him if he had canvassed the gannin bord, and he said, "No"; I then sent him back to do it; he went away; the next morning on going round I found that he had not canvassed the gannin bord; I asked Bailey why he had not done it and he said he had been laying some roads instead.

*By Commissioner:* I saw Bailey come back the second time on that occasion, but did not speak to him; I was sitting on the box at the time.

*By Mr. Bruce Smith:* It is not true that I sent the boy away from the door that time in order that I might leave the door open and thus deceive the Government inspectors; on another occasion I had found Bailey lying asleep when I had sent him to do some work; I did not report him on that occasion; when he failed to put up the canvas, as I have described, I told him that if he failed in his duty again I would have to report him to the manager; sometimes when I have sworn in Bailey's presence he has thrown himself on his knees, shaken his head, and emitted groans; he has called that praying for me; I have never seen the lamps burning badly in No. 1 pillars; such a thing has never been brought under my notice; it is not true that Mr. Croft said in my presence, on the 29th March last, that he wanted to keep carburetted hydrogen out of the reports; that he stopped at the word "carburetted" and his son finished it for him; Mr. Croft never in my presence told Bailey, when he asked him how he should report black-damp, that he should just say black-damp; it is not true that he asked Mr. Croft how he should report—carburetted hydrogen gas or black-damp; I never heard of Weir's accident till I heard Bailey mention it, nor of the collapse of Taft; there is not a word of truth in the allegation that I ordered Bailey to put up special brattice when the inspectors were in the mine.

Taken and sworn at Court-house, Newcastle, this }  
10th day of July, 1899, before me,—

C. G. WADE, J.P.

W. AMBROSE.

Adjourned till 9:30 a.m. to-morrow.  
Court-house, Newcastle, 10th July, 1899.

This deponent, *William Ambrose*, recalled on his former oath, states:—I have known four lamps to be kept in the mine—Mueseler and Clanny—two of each; they were kept in the cupboard of the desk; there were keys to all of them; the keys were kept near the lamps; I never used any of the lamps until this inquiry began.

*By Mr. Edmunds:* There are faults in Nos. 7 and 8; I did not examine there with the safety-lamp before the 28th March last; I was the examining deputy for No. 6 about eighteen months ago; I have had no experience of gas in a mine.

*By Mr. Curley:* I look at the deputy's report for 24th September, 1898; it is signed by me; I made that report; I visited Nos. 6, 7, 8, and 9 when I made it; that was not eighteen months ago, but it may have been a Saturday; I did not examine with a safety-lamp on that occasion; I went round to all the working-places; the mine was idle; I never thought of looking for gas; we had never heard of gas in the mine; I never saw a safety-lamp used in the mine before the 28th March last; I had not paid much attention to safety-lamps before that; I had only read of them; Bailey had no conversation with me about keeping the canvas well up to the face in No. 6; he never told me to cut short props to put on the canch, so as to keep the brattice well up to the face; he never told me that unless I kept the brattice well up to the face

he

he would have to report gas ; he never mentioned gas to me in his life ; he and I went into No. 6 together nearly every day ; he was assisting me there ; I am positive that he never mentioned gas to me before the 28th March last ; as far as I know, safety-lamps were not used for the purpose of inspection till the 28th March last ; Bailey was inspecting-deputy on the 21st March last ; he would leave the cabin at the pit bottom about 6.30 a.m. that day with me ; he did not hand me a safety-lamp that morning at the pit bottom, nor did I see him give Gall one ; I never heard of Weir's accident till the 29th March last ; I heard of it from Bailey in No. 8 heading ; the manager, under-manager, Gall, Bailey, and myself were there together ; I am certain I was there ; as far as I know, no man was injured in my district without my knowledge ; a man may have been injured in another district without my knowledge ; I cannot explain how it was that I did not hear of Weir's accident or Taft's collapse ; it is very seldom that I go down No. 5 district ; Williams never complained to me about the ventilation in No. 8 ; it is not a usual thing to see men sitting about the bord ends smoking in working hours ; I know Williams was off work for some time ; he never complained to me of ventilation, but told me that he had had an attack of asthma ; I have always worked in fairly good air wherever I have worked ; I have never noticed bad air in a mine wherever I have been ; I dare say bad air would affect a man ; I hold no certificate, nor am I a mining student ; I am a practical miner ; the boy Jones was the keeper of the door, of which he had charge ; I did not go to assist Bailey instead of the boy, because it takes one deputy to keep the wheelers going on the flat ; the in-by points are about 15 yards in by the door ; to come to the one station there were two deputies on that flat, but Gall was away at the time the boy went away with Bailey ; he was down in No. 6 ; as a rule, there is one of us on the flat all the time to keep the wheelers moving and things in general right ; I could have kept the door open or shut during the time the boy was away ; when the boy came back with Bailey the first time, I saw him ; Bailey took a drink off the box 5 or 6 yards from the door, and the boy was standing behind him near the cut-through, about 3 or 4 yards behind Bailey ; Bailey stayed there while he got a drink—three or four minutes ; I did not tell Bailey to go back, and take the boy out of the road ; I asked him if he had bratticed the bords, and he said, " No ; " I then told him to go back and finish them ; if the boy is sent away from the door, the person left in charge of it could not do as he liked with the door, because the driver is going through every fifteen or twenty minutes ; the door could be kept open without his knowledge while he was away ; I did not get orders from anyone to send the boy away from the door on messages ; I had authority under Special Rule 30 to send him away as long as I stayed there myself ; it was an every-day occurrence for me to send him away to hurry up the drivers when the train was short ; I have never appointed anyone in his place while he was away ; I have always stayed at the door myself when I have sent him away ; I did not on any occasion order Bailey to go into No. 7 to put up canvas to divert the air ; it is not a fact that I was engaged in putting it up when Bailey came in and assisted me ; Bailey and I have always been very good friends, and, as far as I am personally concerned, are yet ; I had cause for complaint against Bailey only twice, and those I never reported ; once I sent him up No. 8 to do some work, and I afterwards found him lying asleep with his lamp out ; on the other occasion I sent him with the boy to put up canvas in the bords, and he neglected to do it in one of them ; I did not consider it serious enough to report ; if the officials of the mine were in the habit of falling asleep at their work, it would be a serious thing for the mine and men ; it would be a serious omission on the part of the deputy if he neglected to put up brattice where it was required, and where he had been told to put it up ; I do not think it was my duty to report Bailey for failing to put up brattice in the bord where he had been ordered to put it up ; I do not examine with the lamp now ; I am day deputy ; if I were acting as examining deputy to-morrow, and found gas, I would consider it my bounden duty to report it at once ; I have never been followed by anybody while making my examinations that I know of ; I know that the Government Inspector does not follow the same round every time, because he comes to my district first, sometimes to No. 6 ; he has been round part of the mine on three occasions before I knew he was in the mine ; I have never known when any inspector has been coming to the mine—never ; I have never known he was in the mine before he came into my district ; I believe once a complaint was made by a miner that I had refused to put up canvas in his bord ; I saw Mr. Atkinson, who told me that two miners had complained to him about not getting canvas ; I denied that I had ever done so, and I deny it now ; I cannot say whether one or both the men had complained to Mr. Atkinson ; there was nobody excited but Bailey at the interview in the manager's office, when Bailey spoke of having his notice written out ; the manager told me of these matters on the 12th April last, in the presence of Mr. Atkinson ; I exhibited no temper at the interview in the office.

*By Mr. Bruce Smith :* Bailey was under me in the mine.

*By Mr. Curley :* I put up the canvas in Williams' bord myself just after the cavil ; I put three sheets of 4 yards each up ; Bailey did not put up any canvas there at that time ; it was the day after the men had cavilled that I put up the canvas in Williams' place ; I put the three sheets up the day before they started work there, and a fourth sheet two days after they started work.

*By Commissioner :* There was not room for the fourth sheet when I put up the three ; the night shiftmen took down some splint before I put up the fourth sheet ; it was on the second day that I put up the fourth sheet ; if a bord is not to be worked for some time the brattice is taken out of it, and put up somewhere else.

*By Mr. Edmunds :* That bord had been standing before Williams and Taylor cavilled for it ; perhaps it was idle for a month before ; I think it had been worked during the previous quarter ; if I want brattice for a bord I would take it out of idle bord that was close by ; if I found no men working in a bord, and it had brattice in it, I might take the brattice down to be used in another bord that was working.

*By Mr. Bruce Smith :* If I knew that bord was to be worked a day or two I would not take the brattice out of it ; I would use my judgment in a matter of that sort.

*By Mr. Edmunds :* I know that bord is near the winning heading ; it was broken off the winning heading ; it would be a bord in which work would be likely to be carried out ; I have taken down brattice in bords in that way perhaps a month before the men went to work, perhaps more ; the brattice rots away if it is left standing in an idle bord.

*By Mr. Bruce Smith :* It takes from ten to fifteen minutes to put up the brattice in a bord ; I did not know that that particular bord was to be worked that quarter until the cavil had taken place ; I had the jump of 8 inches taken away before I put up the fourth sheet of canvas ; that had nothing to do with the face ; the jump was a kind of block ; whenever I sent the boy away from the door I stayed there myself ; I did not mean that if Gall sent him away I would be at the door ; when I was brought before Mr. Atkinson the men who complained were not there ; I made my explanation to Mr. Atkinson, and I heard nothing more about the matter.

*By Commissioner :* The fourth sheet of canvas brought it to within about 3 or 4 yards of the face ; the fourth sheet was necessary to comply with the general instructions to keep the canvas within 6 or 7 yards of the face ; I cannot give any reason why the fourth sheet was not put up before the men went to work ; the men there did not complain to me about the air in that bord ; they did not complain to me about the brattice ; to the best of my recollection that particular place had been stopped during the previous quarter ; I have never gone away from that door myself with the boy ; I am certain that I never took the boy away from the door ; I have no recollection of going away from the door with the boy, leaving Gall in charge of the door ; I do not remember ever taking Jones away from the door, but believe I have taken the other trapper away to help me put up canvas ; I am not sure whether it was Jones or Davis ; I took up No. 7 with me to assist in putting up canvas ; whichever it was, Gall was left in charge of the door while I was away ; the canvas will last in a bord about two months ; it then drops from the tacks to the floor.

Taken and sworn at Court-house, Newcastle, this }  
11th day of July, 1899, before me,— }  
C. G. WADE, J.P.

W. AMBROSE.

This deponent, *William Ambrose*, recalled, on his former oath, states (*to Mr. Bruce Smith*) :—I remember the interview in Mr. Croft's office when Newburn was present ; Newburn said nothing to Bailey to the effect that he should consider Mr. Croft's poor wife and family ; nothing of the kind was mentioned.

*By Mr. Curley :* No attempt was made to reason with Bailey about these matters ; Bailey did not say to Newburn, " Think about poor Mr. Croft's wife and family " ; nothing of the kind was mentioned ; Bailey left the office first, and the rest of us left together.

Taken and sworn at Court-house, Newcastle, this }  
11th day of July, 1899, before me,— }  
C. G. WADE, J.P.

W. AMBROSE.

EXHIBIT

## EXHIBIT No. 4.

THIS deponent, *Samuel Jones*, on his oath, states :—I am a deputy in the Newcastle Coal-mine, and have held that position over ten years ; I have been in the service of the company about twenty-one years ; I was a miner before I was a deputy ; I am on the morning shift, going in at 3-30 a.m. and coming out at noon ; I have never come across gas in the mine, or black-damp ; I never heard of gas or black-damp until I heard of Bailey's report ; I remember the occasion of Bailey's report ; I inspect Nos. 2 and 10 of the mine ; the first I heard of Bailey's report was when he came into the cabin ; he had signed his report before I went into the cabin ; when I went in he went out ; I signed my report ; he was away about a quarter of an hour, then returned ; he said, as he came in through the door, "I am not satisfied with my report" ; I said nothing in reply ; he went to the cupboard and got out the report-book, and wrote another report in it ; he added the words from his signature down in the report shown me—[*Exhibit B*] ; he said nothing when he put the book in the cupboard ; I went the next morning to see what he had added to his report ; the next morning the overman came down and asked was everything right ; that report was written about 6-20 a.m. ; I am not certain whether it was that morning or the next that the overman came down and asked was everything all right ; Ambrose, Gall, Yardley, Bailey, young Mr. Croft, and myself were present at the time in the cabin ; the overman said, "Good morning, is everything right?" Bailey showed the book to him ; he put his hand on the book and said, "Here, I found gas this morning" ; the under-manager asked him where, and he said, "In the back heading" ; Croft asked, "What quantity?" and Bailey said he could not tell ; Croft then told Gall to go into the place and examine it, and he would follow him as soon as he had started the pit ; I saw the book before the others came down that morning ; I did not know what he had added till I looked at the book ; the signature is always at the foot of the page, and not immediately under the words "all safe" ; I have never known when the inspector was coming into the mine ; I have never been informed beforehand when the inspector was coming ; I have never heard the under-manager instruct Bailey not to report gas in the book ; I have never heard him instruct Bailey as to any restrictions upon any report he might make about gas ; I have never seen the under-manager tear up a note in Bailey's presence ; I never told Bailey that I had seen black-damp or gas in the mine ; I heard that Wear was burnt a month or six weeks before the 28th March last, but understood it was by powder ; I heard nothing about gas ; the miners told me of it—I cannot remember which ; I did not report it to anybody ; I heard that Taft had a fit on the night when it happened ; I heard the miners talking of it ; I did nothing in consequence of that ; nothing was said at the time about black-damp ; I was told that he had had a fit and been taken out ; I do not go near the pillars when they are working. I never told Bailey that I dared not report gas nor anything like that ; I never at any time spoke to Bailey about gas.

*By Mr. Edmunds* : I am on good terms with Rendal ; I never had a chat with him about the Wear affair ; I very seldom see Rendal ; I see the under-manager as much as is necessary and no more ; I never had a talk with him about the Wear affair ; I may have spoken to my fellow-deputies about it when we heard Bailey's report ; we heard Wear had been burnt, and thought it was with powder ; I did not speak to anybody about it ; I spoke with the miners about it ; it was not Fox or Abell to whom I spoke ; I did not ask where it had happened ; I knew it was in No. 6, because I knew that Wear and Abell were working there ; I did not go and see Wear ; I do not know the man ; by "we" I mean the men I spoke to as I went round the bords ; they did not say they thought Wear had been burnt with powder, but I guessed that was what they thought ; I thought so ; the shiftmen use powder to cut the rock in driving through the faults ; I knew that Wear and Abell were driving the faults ; I was told that by different people ; I do not have a chat with the men in the mine on my rounds ; I have no time to chat ; I heard in the pit that Wear had been burnt ; I believe it was my own mate, Jones, that told me about Taft's affair ; I did not mention it to any of the other deputies nor to any one in the mine.

*By Mr. Curley* : I do not enter into any bond of secrecy as a deputy ; I am certain that I never saw Bailey give the under-manager a note of any description ; I have never told anybody outside the pit that I had seen Bailey hand the under-manager a note ; I know John Allison's place at the Glebe ; I might go in there once or twice a week ; I do not have a chat with Allison occasionally ; I never sat down in the house in my life ; I have spoken to Allison in his house ; I was there last night ; it is a hotel ; I did not tell John Allison that I had seen Bailey hand a note to the under-manager ; I did not tell him that two months ago, a month ago, or a week ago ; I have seen Bailey sometimes carrying a safety-lamp under his coat, and put it in the cupboard in the cabin and lock the cupboard ; I have seen Bailey write his report many times ; I have never seen him write notes after he had written his report ; I have never seen any but the one lamp in the cabin ; I have seen a book of rules in this cabin ; it was there this morning, and has been there a long time ; I cannot say whether I saw it in the cabin before Bailey made that report ; I have never seen a key for the lamp in the cabin ; I never saw a lamp-key in the cabin till the report came out ; I had nothing to do with Taft's affair ; it was not in my district ; I was examining Nos. 2 and 10 at that time ; I am not examining deputy for No. 6 now ; it was John Jones that took up Bailey's work as deputy ; I was not in No. 6 about that time ; I have been in No. 6 ; I have not been there for ten years, except when I have been fixing flats occasionally.

*By Mr. Bruce Smith* : There might be more lamps than the one in the box of which Bailey had the key ; I could not see into that box ; there were books and things belonging to the under-manager in that box ; it was a kind of case ; I have never looked into it.

*By Mr. Curley* : I might have got nails out of that box ; things might be in the back of the box without my seeing them ; it was about 4 or 5 feet long and about 2 feet wide and about 4 feet high ; the light we had to look into that box was the electric light in the cabin ; it is a good light ; I am sure it was not about the time Bailey began to use the lamp that I heard about Wear's affair ; Wear had gone home before I heard of it ; I did not as a deputy make any inquiry as to why the lamp was being used ; I never had any chat with Bailey concerning his reports of his district ; I met him in the cabin almost every morning.

*By Commissioner* : It was a month or two before he left the mine that I first saw Bailey using the safety-lamp ; I had never seen a safety-lamp used in the mine before that by any of the workmen or officers ; I was surprised to see it being used, but did not ask any questions about it ; I know the general rules under the Act, and that referring to examinations with a locked safety-lamp where inflammable gas has been found in a mine ; I cannot say now whether I heard of Wear's affair from more than one miner or not ; I knew what using a safety-lamp probably meant.

Adjourned till 9-30 a.m. to-morrow.  
Court-house, Newcastle, 12th July, 1899.

## EXHIBIT No. 5.

THIS deponent, *William Newburn*, on his oath, states :—I am assistant overman in the Newcastle Company's mine ; I have been in the employ of the company about twenty years ; I have had about thirty years' experience as a coal and iron-stone miner ; I have occupied my present position about nine years ; the first time I heard about gas in the mine was about the third pay-day in the quarter before the last ; we are paid fortnightly ; Dobb was the first to mention it to me ; I have never seen the slightest trace of gas in the mine during my twenty years' knowledge of it ; I have never found any black-damp in the mine ; I know the mine pretty well over ; I have worked principally in A pit ; it would be about the 14th April last that I heard that Bailey had reported finding gas in the mine ; I got a note from the manager to go to the office ; I went to the office, and there saw the manager, the under-manager, Ambrose, Gall, and Bailey ; the manager said to Bailey, "Who instructed you to place a canvas across the intake in No. 2?" Bailey replied, "Newburn assisted me" ; I said, "Bailey, you're a malicious liar ; how can you sit there and make such a statement?" he said, "Newburn, I can have you" ; I said, "How can you have me?" he said, "Can't I get a friend to say that he came on to the canvas while you and I were holding it up?" I replied, "You might get a lying scoundrel like yourself, but you cannot get a man" ; Bailey then said that Ambrose had held a door open in No. 6 while the inspectors were in No. 9 ; Ambrose said, "It is a lie ; I did nothing of the kind ; I would not do anything so mean" ; then Bailey said to Gall, "You're the cause of all this trouble" ; I could not make out the charges he made out against Gall, but he was so agitated and excited that I could not make out what they were ; the manager then said to Bailey, "You've told a parcel of lies to the Minister for Mines and Chief Inspector ; you've made a number of false charges against my officers, and I can't allow you to go down the mine any more while I am manager" ; Bailey then said, "I have my notice written out, but have been advised not to give it in by the Minister for Mines and the Chief Inspector till I was dismissed. I will do so now" ; I understood him to say that he expected dismissal ; he further said, "Now I will write to them," and then walked away ;

about the third pay in the quarter before last Dobb was passing my house and I asked him how he was getting on; he replied, "I've got the run; have you heard about Wear being burnt in the pit?" I replied, "No; Wear also has left"; he shook his head and said, "I'll make it warm for young Croft yet"; that was all the conversation; I first heard of gas being found in the mine from Dobb when he was telling me about Wear being burnt; he said he had been burnt with fire-damp; I never heard of Taft being overcome in the mine till I read it in the papers after this inquiry had started; I go into the mine between 6:30 a.m. and 6:45 a.m. each day; at present I am in the B pit; it is about eighteen months since I left the A pit; when I was there I had districts 2, 10, and 11 in my charge; I never knew when the inspectors were coming into the mine—decidedly not; I never knew of any alteration being made in the ventilation while any inspector was in the mine; I decidedly did not hear the under-manager instruct Bailey not to report gas in the book; I never saw Bailey hand him a note, nor the under-manager tear up or burn a note which Bailey had given him; I never heard Bailey tell him that he had found gas or black-damp; I know No. 2 return in A pit; I never told Dobb that it was so blocked up that I could not travel along it; I could have ridden a pony along it; it was never blocked up; I never helped Bailey to put up a canvas in the air-course to divert the air; on one occasion we restricted No. 10 intake with the object of sending over air into the new district that was opening out—No. 2; that reduced the air in No. 10 district; the men had been reduced from thirty-six or thirty-eight to fourteen in that district; it was putting the air into No. 2 district; the men in No. 2 were increased from twenty-seven to about forty-eight; as the change took place I made the alteration in the ventilation; Bailey was shifting dirt and making places ready; I ordered him to do the work of altering the ventilation and I assisted him; it took us from an hour to an hour and a half; Bailey did not ask me why I was doing it, nor did I explain to him why I was doing it; there was no inspector to my knowledge at that time in the mine; that canvas was never taken down, but remained there while the men were in No. 2; it stood for twelve or fifteen months; it was put up for no other object than to regulate the ventilation properly and give an increased supply of air to the increased number of men; I never had Bailey to assist me in putting up any other canvas; that happened about four years ago.

*By Commissioner:* It was done in the daytime.

*By Mr. Edmunds:* The men in No. 10 were gradually reduced from the fourteen till they were so few that it was not worth keeping a horse going there; they were not suddenly reduced from the thirty-six to fourteen, but gradually; they were never increased after being reduced to fourteen; we never had more than fourteen in No. 10 after being brought down to fourteen; I think forty-eight was the largest number we had in No. 2 at one time; I mean forty-eight miners; they would require eight horses and six or eight boys; I refer to No. 2 as a whole district; No. 11 was placed upon the same air as No. 2 right; there may have been as many as seventy-four men, boys, and horses in the whole air district in February, 1895; it is a fair estimate of the number of men, boys, and horses I have given; I cannot recollect the exact number of men, boys, and horses at work in the district at any given time; it is about eighteen months since I have worked in the A pit; it would be about the same time since I was in No. 2 return; I generally travelled the No. 2 return once a week, and the district return daily, when I was in charge of the district; No. 2 return is not the only return I have travelled in A pit; I have travelled No. 10 return; at the time I was asked to go to the manager's office I had nothing to do with A pit, but I suppose I was sent for in consequence of the charge made against me; if I had wished to deceive the Government inspector I could have gone into No. 2 return, where I had less area to block off; where Bailey said I put up the canvas there was an area of 48 or 49 feet, and the engine train was going by every quarter of an hour with forty-five skips; Dobb never told me that he had heard me behind the canvas; the first I knew of it was when I read it in the papers; I have worked in gassy mines in England—in the Felling pit, one of the most gassy in the county of Durham; I was working as a miner there.

*By Mr. Curley:* I hold the position of assistant under-manager; I hold a certificate for service, but none for examination; I obtained it just after the Act was passed; I applied for it to the proper authorities; I believe it was the Minister for Mines to whom I applied for it; there is a connection between the A and B pits; there is a narrow bord driven off No. 2 which connects the two pits; the engine road runs right through the two pits; I know of no connection between the two pits near No. 6 in A pit; if one goes out of No. 6 on to the engine plane, he can go straight along the engine road to B pit; there is no obstruction between the two pits there; there are about 220 miners engaged in the B pit; I do not recollect saying anything more than what I have stated in the interview in the office; I did not say, "Think about Mr. Croft's poor wife and family"; I left about 3 feet by 3 feet to ventilate No. 10 when we put up the brattice.

*By Commissioner:* The area may have been 12 feet by 6 feet before we put up the brattice.

*By Mr. Curley:* I never took any readings of the ventilation; I know No. 2 engine road in the A pit—between 1 and 10; I did not hang up a canvas where Bailey says I did; Bailey and I did not put it up between us; Bailey put it up in his imagination; I would scorn to do such a mean thing; I have never done anything of the sort; I cannot say whether Dobb would be familiar with my voice; I have conversed with him, but I cannot say how many times; he was working there when I was working there; when I have business with the manager I go to the colliery office; if he desires any of the officials to meet there we go there; we have not during the last eighteen months mingled more freely with the mine officials than during the previous months; we do not meet at stated times; when the deputies are sent for they go to the office; I have met the other officials of the mine at the colliery office during the last eighteen months; I did not hear of Wear being burnt by fire-damp there, nor about Taft; none of the officials told me of either of those occurrences; I have nothing to do with A pit now.

*By Commissioner:* I do not recollect whether anything was said about black-damp in the office on the 14th April last; the first I recollect of knowing or hearing of the black-damp was when I read the report of this inquiry in the papers; at a point about 100 yards in-by the spot where the No. 1 return joins the main return is another overcast, which takes the air into No. 10; we nailed the canvas on the joists of that last-mentioned overcast; we put canvas from the rib towards the centre, leaving an opening in the centre, and from the beams down to the floor; in the middle space there was a flap nailed on to the joist; there were not twenty men in No. 10 when that was done; to the best of my recollection, there were only seven places left, which would mean fourteen men, with the necessary boy and horse; any derangement or injury to that canvas would make a difference in amount of air; the canvas is often torn down by the skips; I cannot account for the increased average of air per man after that canvas put up; we did our best to reduce the air; I could tell by the office books how long the men worked in No. 10 after the alteration.

*By Mr. Curley:* The B pit is to the rise of the A pit in the colliery.

*By Commissioner:* I did not say I could ride a pony along No. 2 return; I said along a portion of it—most of it; I said the engine road ran from No. 6 to No. 2, and then along the narrow bord to the B pit; there is a door between the two pits, which is kept closed; when the canvas was put up in No. 10 the men in No. 2 were gradually increased, not suddenly.

Taken and sworn at Court-house, Newcastle, this }  
11th day of July, 1899, before me,—

C. G. WADE, J.P.

W. NEWBURN.

#### EXHIBIT No. 6.

THIS deponent, *Herbert Claude Croft*, on his oath, states:—I am under-manager of the Newcastle Coal Company's A pit; I have been in the employ of the company about nine years; I began as a trapper boy; I was from three to six months cutting coal; since then I have done general work in the mine till I reached my present position; I have worked partly in B pit; I have been exclusively occupied as under-manager of the A pit for about two years; I have never heard of gas in the mine till Bailey reported it; I had never come across black-damp, nor heard of it, till after Bailey had left the mine; I first heard of the Wear affair on the 29th March last, and of the Taft affair when it came out in the paper; I remember the 28th March last; when I went down the pit that morning, about 6:40 o'clock, I went to my cabin and bade the deputies and fireman good morning; Yardley and Gall went down with me and Jones; Ambrose and Bailey were in the cabin when I got there; it was usual for me to bid them good morning; I opened the report-book that was lying on the desk, and went through the reports; I found that Bailey had reported a little gas; when I addressed the men, I said, "What are you like?" and Jones replied, "All right"; Bailey pointed to the book on the desk; I then picked it up, and saw his report of the gas; I asked Bailey how much gas he had seen, and he did not answer; he was so agitated that I had to ask him a second time, "Bailey, I see you've reported a little gas"; he made no reply; he was confused and agitated; I said, "Did you get it in the lamp?" and he replied, "Yes"; I then turned round to the deputies, and Gall in particular; I said to Gall, "Bailey has reported a little gas in the front dip heading; take the lamp and go down, and examine

examine those headings ; I will be down as soon as I get the pit started ;" Gall went away ; it was before I questioned Bailey as to where he had got the gas that I told Gall Bailey had reported the gas ; I asked Bailey what quantity of gas he had got, and he could not say ; I did not ask him if he had got it on the flame ; Gall went away after Bailey ; I followed down as soon as I had done some work ; Gall had the safety-lamp ; there were two lamps in the pit at that time—a Marsaut and a Clanny ; when the bonnet is off the Marsaut lamp there is nothing on the top of the gauze to prevent the flame coming out when it is elongated ; I had a lamp of my own besides those two ; it was down the pit at different times, but not on that 28th March ; there were two keys for the lamps, and mine locked with a leaden plug ; those keys were kept in the cabin, and were accessible to the firemen ; Bailey used the small Marsaut ; the key of that was hanging alongside the lamp in my box ; neither of those two lamps was ever without a key ; when I went down to Gall that morning I asked him if he had found anything, and he said not the slightest trace ; he and I then made another examination of the back and front headings, but found no trace of gas ; Bailey had reported in the book that the gas was in the front dip heading ; he afterwards told us it was in the back dip heading that he had found it ; he told us also in the cabin that he had found it in the front dip heading ; Bailey went about his work when I went to meet Gall ; I had no further conversation with him that day ; next day I went down the pit about 3-30 a.m. ; the manager had ordered me to do that ; Bailey arrived about five minutes after I had gone down ; I asked him to look at the report-book, directing his attention to the protest of the manager ; Bailey turned to me and said, "I did not think that the company had lost faith in me ;" Bailey got his lamp, and we went together by the furnace ; he had the small Marsaut lamp ; he did not take the key with him, nor did he lock the lamp ; Bailey did not light at his lamp in the cabin, but afterwards ; I lit mine in the cabin, and locked it ; we went together as far as the furnace, where we met Gall ; I then told Bailey to go ahead, and Gall and I followed him at an interval of two or three paces ; we went by No. 1, and then to No. 5 ; Bailey had not lit his lamp, but was carrying a flame-lamp ; we went to No. 6 back heading, where Bailey lit his lamp and walked into the back heading ; he put his flare-lamp down by the stentin ; he lit his lamp by unscrewing it and lighting it at the flare-light ; he did not lock it ; we then went to the face of the back heading, Bailey leading ; he had about three-quarters of an inch flare on his lamp, and shoved it right up into the corners of the heading ; I asked him why he wanted to examine with a  $\frac{3}{4}$ -inch flare on his lamp, and he made no reply ; we then went through the stentin into the front rise heading ; Bailey went up into the face, where he poked his lamp up into the left-hand side, then turned and poked it up into the right-hand side ; he then said, "There's a small trace here ;" Gall said, "Where is it ? I could not get it ;" Gall had put his lamp up into the same place ; Bailey made no reply to this ; I asked him again to show us ; I said, "Show us it ; we can't get it with our lamp ; show us it ;" Bailey made no reply ; we then went round the works to the dip heading, Bailey testing as we went along ; we then went round to the shaft, where Bailey signed the book, "All safe ;" when we said to Bailey, "Show us it ; we can't get it," Bailey said, "Oh, my lamp has exhumed it all ;" the same day, from instructions, I told the deputies to meet the manager on No. 8 road, about 9-30 a.m. ; we met there—the manager, Ambrose, Gall, Bailey, and myself ; we went up No. 8 heading, where some of us sat down ; the manager said to Bailey, "You'll have noticed that I have protested against your report, it not being a correct report ;" Bailey said nothing ; the manager said, "The report is not in accordance with the Act, it being too vague for the first time of reporting the gas ; you have not said anything about the roof or sides, ventilation, brattice, &c. ;" Bailey made no reply to that ; the manager then read the special rules aloud to Bailey—those portions bearing on his examinations ; Bailey said nothing when that was finished ; the manager then asked him where he had found the gas, and he said, "In a hole in the roof ;" the manager asked him if he had got a permanent blue cap on the flame, and Bailey said, "Yes ;" the manager said, "You only found a small quantity," and Bailey replied, "Yes ;" then the manager said, "Did it not strike you, Bailey, that if you got a permanent blue cap on the flame there would be more than a small quantity given off ;" Bailey made no answer to that ; the manager then said, "Bailey, in my opinion there is something behind the scenes that has caused you to make this report ;" Bailey was very white and haggard, and his hands were trembling at this time ; Bailey replied, "Yes, there is ; some time ago there was some one got a bit of a singe, and he and his friends have been talking ;" the manager asked who it was, and Bailey replied, "Anthony Wear ; and they say I should report a little gas ;" the manager : "Whether you get it or no ?" and Bailey replied, "Yes ;" the manager then said, "Well, Bailey, I have lost confidence in you, and am now satisfied that there is collusion going on ;" Bailey then went to his work.

*By Commissioner :* The last words said were "Collusion going on."

*By Mr. Bruce Smith :* I stayed with the manager, and Bailey went to his work ; on the 14th April last I saw Bailey in the office at the colliery ; the manager told me to tell the officers to meet there after work ; we all met in the afternoon—the manager, Gall, Newburn, Ambrose, Bailey, and myself ; Bailey had been away from work at Easter-time, but had come back ; the manager said to us all, "Bailey has made charges to the Minister and the Chief Inspector, and I have brought you together to go through them and make an investigation ;" he then asked Ambrose if he had put up canvas in No. 8 to deceive the inspector ; Ambrose replied, "It's a lie," looking at Bailey ; Bailey said nothing in reply to that, but went on to say that he and Newburn and he had put canvas in the mine to deceive the inspector ; Newburn said it was a malicious lie ; Bailey turned to Newburn and said, "Could I not get a friend to come and swear that he passed under it as we were tacking it up ?" Newburn replied, "No, you could not get a man but a lying scoundrel like yourself to do so ;" Bailey then told Gall that he was the cause of all this trouble ; then the manager said to Bailey, "I have proved all your statements false, and I consider you went to the Minister and Chief Inspector out of pure spleen to injure me and my officers ; you will not go down this pit again while I have the management of it ;" Bailey put his hand to his pocket and said, "Oh, I have my notice written out to give to you, but the Minister and Chief Inspector told me not to do so, but wait till you discharged me, then write to them at once ; I have done with it now ; they told me to write, and I'll do so ;" the manager then said, "And don't forget to tell them why you are discharged—for incompetency and taking untruthful statements to the Minister and Chief Inspector ;" Bailey then left the office, and did not go back to work again ; I have never known of any brattice being put up or any obstruction to interfere with the ventilation of the mine while the inspector was in or shortly before he came ; I never knew when the Government inspector was coming into the mine ; on one occasion word was sent to me by the check inspectors, about half an hour before they came in, to meet them ; that was about two months ago—the last time the check inspectors were in the mine ; I went and met them ; no complaints have ever been made to me that the air was bad ; I know Williams and Johns, Watts, Taylor ; not one of those men ever complained to me about the want of brattice or insufficiency of air ; I never told Bailey not to report gas in the book ; I never told him how to report gas in the book ; I never had a conversation with him about gas in my life ; I never had a note of any description from Bailey in my life ; I never tore up or burnt a note he had given me ; he never reported to me verbally that he had found black-damp or gas in the mine ; I remember the deputy reporting to me at the beginning of the cavit before the last that Williams and Taylor were sitting about and not working ; that was the second working day ; I went down, but they had gone home ; it was in the afternoon ; I saw them the next day or the day after that at their work ; I did not say anything to them about not working ; they made no complaint about the brattice or air then, but about the jump ; Williams asked me did I think it was a fair place for a man to make a fair wage in ; I told them they would be paid for their jump ; that was all that took place ; they made no complaint about anything else.

*By Commissioner :* They were working at that time.

*By Mr. Bruce Smith :* I know where Selby and Tunncliffe were working at that time ; the air had to pass Williams and Taylor to Selby and Tunncliffe ; they had the one supply ; there is no confusion at all in my mind as to the back and front headings ; the furthest in heading I call the front heading ; the deputies I have under me are Gall, Ambrose, and Yardley, and deputy-firemen S. Jones, J. Jones, and Wilson ; one of the Joneses has taken Bailey's place since he left ; I never heard of any part of the mine being known as the gassy portion ; when Bailey put up his lamp, as I have described, I saw nothing whatever to indicate the slightest trace of gas ; I know No. 2 return ; it is not true that at any time one could not travel along that return ; it is not true that I ever promised Williams that I would get him something extra for working in the bad air ; I promised him something extra for working the jump, and he got that ; I never instructed Dobb to do anything to divert the ventilation while the inspector was in the mine ; I never did anything to divert the air while the inspector was in the mine ; I never heard of anything being done like that ; I never got on to Dobb for complaining to the manager ; I have had cause to speak to Dobb about the small amount of work he had done ; he called me a tyrant and a bully ; that was in the early part of the year 1898 ; we used mixed coal for the furnace ; I have never known any change to be made in the size or quality of coal for a special occasion ; best coal is always used in a certain proportion with the small ; I have never known any special firing-up to be done when the inspector was in the mine ; the fire is kept up during Sunday ; the water-baler looks after the fire on Sundays ; the ventilation is not slacked off at the end of the week ; I have never known anybody to be dismissed from the mine for complaining.

*By*

*By Mr. Edmunds* : I first saw Bailey's report of the 28th March on the 28th March ; I went down at 6:40 a.m. that day ; Bailey should have gone down at 3:30 a.m. ; when I went to the heading I went there to see if Bailey's report was correct ; if any quantity was giving off I should have found some there ; it was part of my duty to go and examine the place which had been reported as giving off gas ; I took particular notice of this report on account of Bailey's state of excitement and the peculiar wording of the report ; the words " All safe " are repeated ; the report is not according to the rule ; I inspected the place because it was my duty ; I reported it for the same reason ; I knew that Rendal never made a report till five months ago ; I did not know that he was doing wrong in neglecting to report ; it had never been done to my knowledge ; I knew that Taft and Turner were working clearing the road in No. 5 ; that place was inspected by the day deputy.

*By Commissioner* : I believe Rendal used to inspect that place within four hours of the men going to work there ; but he would not report it in the book until five months ago ; on other nights the day deputy would inspect that place going his rounds ; he was the only one that inspected that place ; the day deputy might have inspected that place within four hours of the night shiftmen going to work ; they went down at 4 p.m. ; I brought Bailey's report under the notice of the manager, and told him I doubted it ; that was on account of the way it was worded, and the agitated state of Bailey ; the repetition of the words " All safe " raised a doubt in my mind as to the correctness of the report ; the deputies have no restrictions placed upon them in making their reports.

*By Mr. Edmunds* : The manager suggested that Gall or myself should follow Bailey round the next morning ; I did not suggest that a protest should be written in the report-book ; I did not know that was to be done ; I know of no case where a protest has been made against a deputy's report in that way ; I was not present when that protest was written on the report ; I did not point out to the manager that it was not a right thing to do ; I believe I mentioned to the manager that the report said nothing about roof or sides, ventilation, &c. ; I consider it should have been a more detailed report ; there is no other report in the book with any more details, but this was the first time anything wrong had been reported in the mine ; it was because the gas mentioned that I found fault with the omission of the details as to the roof and sides ; I heard about Wear's affair on the 29th March last from Bailey ; I remember seeing Mr. Atkinson on the 12th April last ; I do not remember if he asked me if I was aware that a miner had been burnt with gas at any time ; he asked me if I knew of gas in the mine ; I said, " No " ; I had heard of Wear's affair at that time ; I have no recollection of Mr. Atkinson asking me if Wear had been burnt with gas, or if I knew of it ; I was present some of the time during the interview between Mr. Atkinson, Mr. Dixon, and my father in the office ; the manager told Mr. Atkinson that a deputy had reported finding gas ; I do not remember Mr. Atkinson asking me if gas had been reported to me some months ago when Wear was burnt ; I gave Mr. Atkinson no information about Wear's case ; the question Mr. Atkinson asked was had I seen any gas in the mine ; I told him no ; I told him nothing about what I had heard of the gas in Weir's case ; he never asked me about that ; it is more common for the in-take air to be brought in through the front heading and then through the back ; in the case of our mine it is the contrary in No. 6 ; I travelled through the No. 1 return about a week before the pillars stopped.

Taken and sworn at Court-house, Newcastle, this }  
11th day of July, 1899, before me,— }

H. C. CROFT.

Adjourned till 9:30 a.m. to-morrow.  
Court-house, Newcastle, 11th July, 1899.

This deponent, *Herbert Claude Croft*, recalled on his former oath, states (*to Mr. Edmunds*) :—Up to the time of writing that report there had been no cause of complaint against Bailey, nor had he made any against the mine ; the manager did not inform me of his intention to put Bailey on the night-shift before it was done ; I know there was a letter written to him about it, but I was not consulted about it ; the manager would know of Bailey from Rendal and myself ; I made no complaint about him ; I cannot give any reason for his removal to the night-shift.

*By Commissioner* : I wish to explain that I made a mistake yesterday when I said that Mr. Atkinson had not asked me if I knew that a man had been burnt in the mine ; he asked me if I knew that a man had been severely burnt ; I told him I did not.

*By Mr. Edmunds* : I made inquiries from Rendal about Wear's matter, and he told me that his moustache had been singed ; that was after the conversation of the 29th March last ; that was all the inquiry I made about the matter ; I did not ask who had seen it ; Rendal told me that Abell and Wear had been sent to the narrow bord ; he said nothing about Fox ; I made no inquiry of Abell ; Rendal told me that the matter had slipped his memory ; that he thought it was of such slight importance ; I told him that he should have reported it ; I know that any explosion of gas by which a man was personally injured should be reported to the inspector ; the question is : Was the man personally injured ? if such a case happened to-morrow I should report it to the inspector now ; if I had known of that matter of Wear's at the time I certainly should have reported it to the manager ; I did not censure Rendal for his neglect to report ; I simply told him he should have reported it ; I have had no experience of gassy mines at all ; I have a knowledge of the danger of gas explosions in a mine ; if a man inspected a place before the water-baler went in he should have inspected the face as well as where the baler was to work ; I have myself looked to the ventilation in No. 1 pillar workings ; they were ventilated up the front narrow bord, through the cut-through, up the gannin-bord, up again to a bearing-up stopping ; then we sided down ; about halfway down the pillar there was a cut-through put through, then the pillar went straight on ; the air was carried to the face in the pillars ; it was not bratticed ; there was no occasion for that ; I know the bord in which Williams was working ; he was working at the face on the third day of the caving ; I was in the bord on the second day ; there was some brattice in the bord then ; it was within 8 or 9 yards of the face ; I believe it was put up at the beginning of the quarter, after the fencing had been taken down ; a bord like that would be fenced off if work ceased in it for a few weeks ; I know the overcast in No. 1 return ; there was never anything put in it to my knowledge ; I know from the paper that Dobb swore I had ordered him to put a stopping in it and take it out again ; nothing like that happened with reference to the overcast to my knowledge ; there is no foundation, in fact, for such a statement as Dobb's ; I was the under-manager in the absence of Mr. Monter ; I was under-manager from July to September, 1895, and in February, 1898 ; I remember two check inspectors named Hardy and Clapton ; I did not tell Dobb that those two men were making a check inspection ; the check inspectors' book shows that those men made an inspection on the 14th, 15th, and 16th February, 1898 ; it appears from the book that that was the only inspection those men made ; some men prefer the night-shift, some the day-shift ; Dobb was put on the night-shift about that time because we had some work going on which we wished to push forward, and therefore wanted all the men we could get on the night-shift ; Dobb was never a deputy ; he was put off the shift-work because the work was finished, and we were reducing the shift-hands.

*By Commissioner* : We put extra men on the night-shift because the work could not very well be done in the daytime.

*By Mr. Edmunds* : I did not speak to Bailey about leaving the cabin with lamp unlocked because I did not deem it my duty to do so ; I thought he should know himself what he should do ; I knew he was breaking one of the rules by going out with his lamp unlocked ; I wished to take notice in what way he made his examination ; that is my reason for not speaking to him about his unlocked lamp ; when Bailey was put on the night-shift the manager told me that he wanted the places near the dyke inspected with a safety-lamp ; I never inquired whether Bailey was competent to make an inspection for gas with the safety-lamp ; when Bailey said he could get a man to say that he had seen Newburn and him holding up the canvas I never asked who the man was ; I made no inquiry into that allegation, because it was false ; I did not know of my own knowledge whether it was false ; I did not know of my own knowledge that the allegation about Ambrose taking away the boy from the door was false ; I knew the allegation with regard to Newburn was false, because he denied it in the office, and questioned Bailey about it ; the manager investigated that matter ; he made further investigation than that of the 14th April ; he made inquiries round the pit.

*By Commissioner* : That would be after the investigation in the office.

*By Mr. Edmunds* : The bords have a distinctive number only at the beginning of the quarter, and do not retain those numbers after that ; I remember a cut-through further in than where Williams was working ; I observed the current going to the men in No. 117 ; it was good ; it would not have been a better arrangement, in my opinion, to have closed the first cut-through, and brought the air round through the second and then on.

*By Mr. Bruce Smith* : I never heard of a chain being thrown at Dobb, and that he had lost his pipe ; he never complained to me of either of those matters ; I never at any time told Dobb that Mr. Dixon was coming into the mine ; I never knew when he was coming ; I never told Dobb to keep his mouth shut with regard to anything ; I have no recollection of any disturbance between Dobb and our men.

*By*

*By Mr. Edmunds:* I first heard of Taft's affair when I read it in the newspaper—when Bailey made charges against the management of the mine; I believe that was about the 23rd May last; I was in the office when the manager asked Rendal if a man had been overcome in the pit at all; Rendal said no; that a man had taken a shivering fit in the pit, and had told him that he had taken them on previous occasions in other places; that was shortly after Bailey's charges had appeared in the paper; Rendal said he had helped the man on to the heading; I believe the manager said to Rendal, "Why didn't you acquaint me with it?" he was told that anything like that that occurred again should be reported.

*By Commissioner:* I saw Taft in the office after that; I do not know when Wear left the mine.

*By Mr. Curley:* I have fifty-seven pairs of men in No. 2, eighteen pairs in No. 6—about 250 altogether, I should think; that is within the last three or four years; I consider that a middling-sized colliery; a safety-lamp was first introduced into No. 6 district about twelve months ago; I cannot tell the exact date; I made no note of it; the manager told me that the winnings approaching the dyke were to be examined with a safety-lamp; the safety-lamp was not introduced because a man was burnt in his place in No. 6 on the 25th September, 1898; Rendal did not tell me on the morning of the 26th September last that a man had been burnt in the mine; Bailey did not tell me that morning that something unusual had occurred in No. 6 district.

*By Commissioner:* I gave instructions for the use of the safety-lamp; I told Bailey to use one and also Rendal; that would be about the same date; Bailey used it from the time he examined No. 6, after being taken off the night-shift; the manager's instructions to me were that we were to use a safety-lamp in No. 6, not because there was gas there, but as a precaution against gas being found in the dyke; there were two lamps in the pit at the time—the small Marsaut and the Clanny; they had been there for some time before those instructions were given, but had not been used.

*By Mr. Curley:* I look at the report-book [*Exhibit I*]; by that book Bailey made his first report of No. 6 on the 26th September last; as under-manager, I about this time told Rendal to examine with a safety-lamp in the No. 6 district in the winnings approaching the faults; I do not think that Rendal put his reports in a book at that time; I do not think he reported in a book till about five months ago; till about five months ago we did not consider a report from Rendal necessary, as we considered it a continuous shift; he inspected on a Sunday night when there was not a continuous shift; I did not ask him for a report in the book then, because I considered a verbal one sufficient at that time—that was if he found no gas; had he found gas I would not have considered a verbal report sufficient; I did not tell him that if he found gas he had to report in the book; I regard fire-damp in a mine as a very serious danger; I have never read of an explosion in a colliery where, prior to that, no fire-damp had been seen; there is a connection between the A and B pits; between the two a large number of men are employed; it has occurred to me that the finding of fire-damp should be reported in a book; I did not know that Rendal had found gas; I did not know that he had put a note in the lamp about finding it as a friendly warning to Bailey; I would not say that Rendal had found it even after reading his note [*Exhibit G*]; I deny knowing anything about Wear's incident till I heard Bailey speak of it on the No. 8 heading; the only reason the manager gave me for the use of the safety-lamps in No. 6 was that we were approaching the dyke; although the manager had adopted the lamp because there was a likelihood of finding gas there, I doubted Bailey's report, because he made mistakes as to the heading, and was so confused and agitated in his manner about it; I never received a note from Bailey; he never handed me a note of any sort in his life; I never told him that it would be enough to report gas verbally; we did not anticipate gas in No. 6, although we used a safety-lamp; we used it as a precaution; I did not put myself in motion to discredit Bailey's report of finding the gas.

*By Commissioner:* I sent word to the manager the same day as Bailey reported the gas; I saw him a little after 2 p.m. that day about the gas.

*By Mr. Curley:* After he had read the report I told him that I doubted the correctness of it; he said nothing before I spoke after he had read it; I was the first to give rise to the doubt about the accuracy of the report; when I said I doubted it the manager asked me, "What causes you to doubt it?" I told him the excited state of Bailey and the way the report was worded; I had, prior to this, been down to the place where the gas was said to have been found; I had never doubted any of Bailey's reports prior to this; what made me doubt this one was the repetition of the words "All safe," and his excited manner; I doubted that he had found gas; I followed Bailey round with Gall because I was ordered to do so; it was not for the purpose of discrediting Bailey's report, but to find out whether there was any truth in it; on the morning I went in with Gall I went up to the back heading, cut through with my flare-light; Gall went to the same place; I believe ours were a little out-by side of Bailey's—possibly 6 feet; we all went up to the stentin with the flare-lights where the air was coming through; I saw nothing wrong in Bailey taking his flare-light to where he did; the point where the flare-lights were left was about 10 or 12 yards from the face; that was not near the place where Bailey had reported gas the previous day; it was in the rise headings that we left the flare-lights; the highest point in the pit is the rise heading where we left the flare-lights; I went in with Bailey and Gall, and noticed where he was testing; I did not "dog" Bailey at all; he was not molested in any way; it did not occur to me that it would be better for Bailey to make his examination by himself without any interference on our part; when Bailey said there was a small trace of gas in the right-hand side of the front rise heading I wanted him to show it to me; he said his light had exhumed it all; I expected, even if there was only a small trace, that we would get a movement of the flame; neither Gall nor I could get any movement of our flames; I did not expect him to show a blue flame on the lamp when we went there; I did not expect to see gas there at all; I inspected four places for gas that morning—the back and front rise headings and the back and front dip headings; I had never inspected for gas before that morning, nor had Gall to my knowledge; I had never, in my experience as colliery manager or official, in that pit or any other, inspected for gas before that morning; there was no charge made against me in the colliery office on the 14th April last; to the best of my recollection the manager did not ask Bailey to make a statement of his charges; I believe he took Ambrose's case first, and asked him if he had been a party at any time to deceive the inspector by putting up brattice in No. 8 return between 7 and 8 districts; Ambrose said, "It's a lie"; I do not remember the manager then asking Bailey to make a statement; I do not remember his asking Bailey to make a statement before he took up the second case; Newburn's case was taken next; Bailey introduced that; the manager said to Bailey, "You told me that you put up brattice in No. 2 intake"; Bailey turned to Newburn and said that he had done it, and asked him if he could not get a friend to come and swear that he had passed under it while they were holding it up; Newburn replied, "No, you could not get a man to do it but a lying scoundrel like yourself"; the manager then asked Bailey if he had told the Minister and Chief Inspector that someone had been burnt; Bailey said yes; the manager then said that he considered Bailey had only gone to the Minister and Chief Inspector out of pure spite towards him and his officers; that he would not allow Bailey to go down the pit again while he was manager; Bailey then said, "I had my notice written out and intended to give it to you, but the Minister and Chief Inspector told me not to do so, but wait till you discharged me, then write to them at once; I have done with it now; the world's wide; they told me to write, and I'll do so"; the manager then said, "Yes, but don't forget to tell the Minister and Chief Inspector why you are discharged—for incompetency and taking untruthful statements to the Minister"; I allowed Bailey to make inspections after the 28th March last; he inspected on the 29th and 30th March last; he made none later that I am aware of; the report-book shows that he made an inspection on the night of the 9th April last; that was a Sunday night; that inspection would be made for the shiftmen; the districts he examined were Nos. 1 and 2; Bailey made his last report of No. 6 district on the 30th March last; he did not report on that district after that, because there was another man inspecting that district; I had not removed Bailey from that district; the manager put the new man on in that district; the manager directs when a deputy is to inspect a certain district, and when to remove to another; I carry out the manager's instructions; the manager told me that Jones would be coming on in Bailey's place; I received that letter on the Thursday before last Good Friday; the letter was addressed to Bailey, and was given to me to deliver to him [*Exhibit F*]; nobody ever reminds me when the inspector is coming; I never fix any particular date in my own mind when he is likely to be there; I never told anybody in my life when the inspector was coming; I never knew; I did not on one occasion fix up No. 5 overcast; I would scorn such an action; I did not order Dobb to go and take that down afterwards; I did nothing of the kind when the check inspectors were in the colliery on the 15th February, 1898; I did nothing like that in 1895; I never in my life ordered Dobb or any one else to interfere with any air-course in the mine; when Taft and Turner were working in No. 5 I believe Bailey was the deputy; nobody ever reported anything about Taft and Turner to me; I was in that part of the mine when Taft and Turner were working there; that would be between 11 a.m. and 1 p.m.; I have not been there at night when those men were actually at work there; I have never been in to see how the night men are getting on unless I am down with the surveyor, when I have a peep at the men; I depend upon the night overman for reports about the night men; when the night overman was not making reports I did not inquire of him how things were going on at night, beyond remarking upon the quantity of work that had been done during the night; it was about 3:10 p.m. when I went into Williams's place on the second day of the quarter; the men had gone home then; I did not inquire

inquire why they had gone home ; I was with Inspector Atkinson some time ago, when he was going through the mine, and saw several men coming out of the mine ; one of the men complained to the inspector that he could not get brattice when he asked for it ; his name was Mitchell, and he worked in No. 8 district ; I did not inquire about Williams leaving the mine, because it was only the second day of the caving, and it is only about one man out of ten that goes to work for the first or second day ; they generally sit about and talk in their places ; it is not an exceptional thing for the men to go home ; I can tell the output for that particular day ; I think that will pretty well show what work was done ; neither Williams nor any one else in that district complained to me of the ventilation in that district ; I regarded it as good there ; it was good also where Taft and Turner were in No. 5 ; none of my deputies ever reported to me that the smoke hung about in No. 8 district ; I never saw it myself ; none of the men have ever complained to me during the whole time I have been manager ; I have never heard of them complaining to any of the deputies ; Gall never reported to me that a man in No. 6 had reported to him a flash of gas.

*By Mr. Bruce Smith :* The manager told me that Inspector Dixon had advised him to use the safety-lamps in approaching the faults ; the Sunday night inspections are reported now ; that began about five or six months ago ; the manager instructed that they should be reported ; he said that Mr. Dixon had requested that they should be reported ; in both these cases I was acquainted with the manager's reasons for making these changes ; I never knew of a case in which a report was filled in without an inspection ; at the meeting in the office on the 14th April last Bailey had an opportunity of explaining in every case which was brought under the notice of the manager ; it is not true that the word "traitor" was used at that meeting ; the manager did not say, "If I hear a man complain of bad air I promptly tell him to go where there is better air" ; he did not call Bailey a "damned liar" at that meeting nor at any time.

*By Mr. Curley :* It is not a fact that on idle days reports have been made of inspections which have never been made.

*By Commissioner :* There were two lamps in the cabin for some time before they were actually used ; it may have been a month or a couple of months ; the manager's reason for sending them there was that we were approaching the faults, and Inspector Dixon had asked him to use the safety-lamps when doing that ; we had never used them before when approaching faults ; it was at Mr. Dixon's instigation that we used them ; I do not know the reason why another man was put on in Bailey's place, and Bailey sent to the night-shift ; I know of no alteration in Gall's duties, or those of any deputy, to cause him to use a safety-lamp where he had not before ; since Fox gave his evidence the other day the manager has instructed every deputy to carry a locked safety-lamp on his examinations ; I do not know why the lamps were not used for the month after they had been sent down to the cabin ; I know there was a dyke near where Wear was working ; I know that a dyke is a likely spot in which to find gas ; I did not hear the question of black-damp mentioned at the meeting of the 14th April last ; to the best of my recollection I did not hear black-damp mentioned at that meeting ; in Williams's bord the canvas was 8 or 9 yards from the face ; the next day it was within 5 or 6 yards of the face ; there was plenty room for the air to go round between the end of the brattice and the face ; the brattice was close enough to the face when it was within 8 or 9 yards of it ; I suppose the deputy would put another length on when he was going his rounds ; a bit of splint had been removed on the second day I went there ; it was not in the way of the brattice on my first visit ; it was likely removed by the night-shift ; I think it was about the end of January or the beginning of February, 1898, that I had some words with Dobb ; it was shortly after that time that he was put on the night-shift ; no man took his place in the day-shift when he was put on night-shift ; I had words with him about ridding some stone that had fallen ; I did not consider he had done so much as he should have done ; he seemed to be very annoyed, and said I was a tyrant and a bully, and would not get the men to work for me ; I do not know who the shiftman was who worked in Williams's bord that night when the splint was removed ; I am in the habit of discussing with my father different things in the management of the mine ; he never told me of Taft's affair ; I first knew of it from the newspapers ; we may have discussed Bailey's charges before that, but I have no recollection of his telling me of Taft's affair.

*By Mr. Curley :* I cannot remember Bailey making a report to me when the pit was idle ; at the present time all the returns in the mine except No. 1 can be travelled ; No. 10 can be travelled ; it is in good condition ; No. 2 is also in good condition ; we stopped those places in No. 6 on account of our horses ; I refer to the dip headings ; there is another reason the dip heading will be up long before the narrow bords, and there will be no necessity to drive the headings ; those two headings have been standing since the beginning of the quarter.

*By Commissioner :* I did not know that Rendal was in the habit of inspecting with an unlocked safety-lamp after he was supposed to use a safety-lamp ; as long as Bailey did not inspect the face with his naked light there was no objection to his carrying it with the safety-lamp ; the station for No. 6 is just opposite No. 7 headings ; I knew they had passed through a dyke some few yards out by where Wear was supposed to have been burnt.

Taken and sworn at Court-house, Newcastle, this }  
12th day of July, 1899, before me,—

C. G. WADE, J.P.

H. C. CROFT.

#### EXHIBIT No. 7.

THIS deponent, *David Yardley*, on his oath, states:—I am a deputy in the A pit of the Newcastle Company ; I have occupied that position for about eighteen months ; before that I was a deputy in the B pit for about eighteen months ; prior to that I was employed on shift-work in B pit ; I have been employed by the Company between thirteen and fourteen years ; I began as a miner ; I never heard of any gas in the mine before Bailey's report ; I never came across it, nor heard about it from anyone else ; I never came across black-damp, nor did I ever hear of anyone else meeting it ; my hours in the A pit are from 7 a.m. to 4 p.m. ; I go down about 6.30 a.m. ; I met Bailey down the pit in the cabin ; I remember when Bailey reported having found gas ; the under-manager, Gall, and myself went down in the cage together ; we arrived at the cabin, and the under-manager said, "Good morning," as usual ; Bailey, Jones, and Ambrose were present besides us three ; the under-manager asked was all right ; Jones replied, "Yes" ; Bailey pointed to the report-book on the desk, and said, "Look at that" ; the under-manager opened the book, and said, "Bailey has reported a little gas" ; he asked Bailey how much gas there, and Bailey replied, "I could not say" ; the under-manager then asked him, "Did you get it in your lamp?" and Bailey replied, "Yes, it's there all right" ; that was all he said about it ; the under-manager then sent Gall away to the No. 6 dip headings, telling him that he would follow him as soon as he got the pit started ; I cannot say if Gall took anything away with him ; nothing more took place after that in my presence ; we all went to our respective duties ; I was never present at any other interview subsequently where Bailey was ; I never heard of the Wear incident till this investigation began ; I read it in the paper then ; I did not hear of the Taft affair till this investigation opened ; I have never known beforehand when the inspectors were coming into the mine ; I have never been instructed to alter the ventilation in the mine when the inspectors were there ; I have never done such a thing nor known anybody else to do it ; I have never known canvas to be put up while the inspector was in the mine, and taken down again after he had gone ; I never used a safety-lamp till after Bailey had reported the gas ; I have seen the safety-lamps in the Newcastle mine—close on a dozen I should say ; I have never heard the under-manager instruct Bailey not to report gas in the book ; I have never heard him instruct Bailey about limiting his report in any way in the book ; I never saw Bailey hand the under-manager a note ; I never saw the under-manager tear up or burn a note in Bailey's presence ; I have never heard Bailey inform the under-manager of the presence of gas or black-damp ; I never told Dobb that I could not travel in return No. 2 ; I have never known that return to be in such a condition that I could not travel along it.

*By Mr. Edmunds :* No. 10 was closed when I became deputy for No. 2 ; I cannot give the date when I became deputy for No. 2 ; No. 2 main engine-road is 8 feet high and 12 feet wide ; it is that nearly all the way of those dimensions.

*By Mr. Curley :* Sometimes the under-manager goes down before us, at other times with us ; I do not know how long before us he is when he goes down before us ; he might see Bailey when I was not there ; I have worked with Bailey on fairly friendly terms ; I never had any unpleasantness with him before this ; I see a report about gas in the report-book ; it is signed by Bailey, and says he found a small quantity of gas—carburetted hydrogen—in No. 6, and that he removed it and left all safe ; it bears a protest by the manager against the report as being incorrect ; I was an inspecting deputy at that date ; I never heard tell of gas in the Newcastle Colliery ; I never used a safety-lamp on my inspections ; I was never followed by anyone on my inspections ; I never had a protest made against my reports.

*By Mr. Bruce Smith :* I was not inspecting deputy for my district, but the deputy ; Samuel Jones was the inspecting deputy for the district ; he went down at 3.30 a.m. with Bailey.

*By Mr. Curley :* I never heard of Wear's or Taft's affair till this investigation started.

*By*

*By Mr. Edmunds*: I misunderstood Mr. Curley's question when I said I was the inspecting deputy; I only examined the pit when it was idle.

*By Commissioner*: I make an examination of the district once during my shift but I do not put any report in the book; there is nobody working in the mine between 1 a.m. and 4 a.m.

*By Mr. Curley*: I do not know that when men are coming in to work on the night-shift I should make a written report during my shift; if I were inspecting deputy now, and there were no men in the pit during the day, and men coming on in the night, I should make a written report of my inspection of the places.

*By Mr. Edmunds*: I have made written reports of the inspections of my districts; I reported as to the places in which men were not working when I inspected them, but men coming on to work in them afterwards [*witness produces report signed by him in Exhibit I*]; the pit was idle that day, but the water-balers were coming in that night, and I inspected their places for them.

*By Mr. Bruce Smith*: If from any cause the pit was idle during the day, and there were men coming on at night to work, I would inspect their places before they came in; the only cases in which the men have not been at work during the day, and there have been men coming on at night, were when the pit was idle.

*By Mr. Curley*: I made those inspections in the morning; I went down at 5.30 a.m., and soon after made my inspection; I would walk round my district once during my shift and make my report.

*By Commissioner*: If men are at work in the daytime in Nos. 2 and 6, but not in No. 5, which was also my district, and shiftmen were coming on in the night-shift to No. 5 to clear the headings, I would examine that part of No. 5, and make a report in the book.

DAVID YARDLEY.

Taken and sworn at Court-house, Newcastle, this }  
11th day of July, 1899, before me,—  
C. G. WADE, J.P.

#### EXHIBIT No. 8.

DEP. A, 1st April, 1899, to 2nd May, 1899.

#### EXHIBIT No. 9.

THIS deponent, *James Richardson*, on his oath, states:—I am a miner; I have acted as a check inspector; I last did in March last; I carried out the check inspections on two occasions—one on the 9th, 10th, and 13th March last, and the other 30th November and 1st and 2nd December, 1898; check inspectors generally hold their positions for six months; I know the witness Watts; I remember at a lodge meeting after the March report Watts stated that we had taken the in-take at the wrong place; that was not true; we took the in-take where it was always customary to take it; on each inspection we went round the same way; we gave nobody notice that we were going; as far as I know nobody would be aware that we were going round.

*By Mr. Edmunds*: We examined in all the working-places, and found the ventilation sufficient everywhere; we did our work together; we took a thermometer with us; I cannot say whether it had been tested; it was the one we always take; I cannot say how long it had been in use; the highest reading was 80° in 8 and 9 return, and in 74 pillar of No. 6; it was in the district return that we got that temperature, and in the pillar in No. 6; I carry the thermometer by a string; I do not put it in my pocket when I have taken a reading; in the November inspection we got 80° in a pillar in No. 6, and a pillar in No. 8; on that occasion we took the total return; we did so on each occasion; I am working in the B pit; I was working in the A pit for six months before the last cavil—a month ago; I worked in No. 10, No. 1, No. 8; I last worked in No. 10 about a month ago; I found the ventilation in No. 8 pretty good; in November there was an average current there of 140 cubic feet in that district; in March last we got an average of 180; it never struck me that there was any difference in the temperature of the mine when we were making our inspections and when I was working ordinarily in the mine; I never noticed any difference; I did not examine for inflammable gas; I did not inspect the faults; we went through no faults except in the return for 7 and 8; I have travelled the return for 7, 8, and 9, and the No. 2 right-hand return; there was no difficulty in getting through those returns; they were in pretty good condition, and there was a free passage for the air; we did not travel No. 1 return; there was no necessity to do that, and it would take up too much time to travel all the returns; the men are at liberty to complain to the check inspectors as they are going round; the manager goes round with us, but he does not go into all the working-faces with us; he stays on the heading when we get to some of the faces; no complaint of any sort was ever made to me as a check inspector; I know a good many of the miners; no complaint of any sort was ever made to us, either in or out of the mine, except that of Watts, at the lodge meeting.

*By Mr. Curley*: My reading for the furnace return in March last was 101.440 cubic feet; I took the thermometer readings on the headings and in the returns.

*By Commissioner*: It was in towards the face of the headings that the thermometer readings were taken; they were never taken on the flats.

*By Mr. Curley*: The reading for No. 2 main in-take was taken on the main engine-road; that was a half-mile from the nearest place we were going in that district; the reading for No. 7 pillar was taken at the pillar next to the working-face; the men were working a pillar from the same cut-through; the reading for No. 2 was taken about the same distance from the men at work there; the reading for No. 74 pillar in Nos. 6, 7, and 8 return was taken at the pillar next to where the men were working; the reading of 79° in pillar 134 was taken in the straight heading for No. 8, I think; some of the men were only a few yards from that, others might be 10 or 15 yards in; we go into every place in the mine—right to the face; nobody ever complained to me about ventilation; we inspected No. 1 pillars in March last; Watts was working there, and Proud; we took No. 1 in-take about two pillars along the main road in-by the return; that was not near where the men were working, but about half a mile on the out-by side towards the shaft; we took the return for No. 1; we went up No. 2 return over a fault, and took the return reading not very far from the No. 1 overcast; we took the in-take readings where it had been customary to take it.

*By Commissioner*: We divided our in-take reading by the number of men in the district, and thus got an average.

*By Mr. Curley*: We never took a reading at the bord ends where the men were working; Watts never suggested how we should take our in-take reading; I understood that he wanted the reading taken nearer the flat; it would be wider, if anything further in, than where we took our reading; Watts did not complain at the meeting that he did not get the air where he was working; all he complained of was that we took the reading too far out on the main road.

*By Commissioner*: He did not say that the reading should be taken near the working-place; I told him that it was the custom to take it where we did and divide it among the number of men in the district; we found an average of over 500 feet for No. 1; I would consider 80° at the working-faces a high temperature; as one goes into the headings the temperature gets higher; I consider when the temperature gets towards 80° it is warm; Watts did not propose at the meeting that the reading at the in-take should be taken in a different way; the question was not discussed and not carried; some of the air in No. 1 was turned towards where Watts was working, the rest went straight on; if it all went beyond the point where it was turned in towards Watts it might or might not get back to Watts.

*By Mr. Curley*: The manager was at the pit bottom when we went down to make our inspections.

Taken and sworn at Court-house, Newcastle, this }  
13th day of July, 1899, before me,—  
C. G. WADE, J.P.

JAMES RICHARDSON.

#### EXHIBIT No. 10.

THIS deponent, *Joseph Croft*, on his oath, states:—I am the manager of the Newcastle Coal Company; I have held that position about ten years; I have been with the Company about ten years; prior to that I was with a Mr. Bradley, and prior to that with Messrs. J. and A. Brown for twenty-four years; I have had thirty-three years' experience of coal-mining; I hold a manager's certificate; I first heard of gas in the mine on the 28th March last; I had never in all my experience of the mine found the slightest trace of gas in either pit; I had never had gas reported to me before that date; I first heard of

of black-damp in the mine on the 23rd May last, when I read of it in the local paper; I never saw fire-damp or black-damp in the mine; nothing of the kind was ever reported to me; on the 25th March last I received a message from the under-manager of the A pit, in consequence of which I at once visited the pit; I went to the cabin, where I met the under-manager alone; I read the report, and had some conversation with the under-manager; I then visited the place; I did not see Bailey before I went there; I went to the place where gas had been reported with the under-manager and Deputy Gall; I got a safety-lamp at the No. 6 station; I made an inspection of the dip headings, both back and front, which had been reported; I made a careful inspection, but could not get the slightest trace of gas in either; a hole in the roof was pointed out to me by the under-manager and Gall; there was a slight cavity in the roof there; I tried that for gas, but found not the slightest trace; I then arranged with the under-manager to send Gall round with Bailey on his morning inspections till further orders; I then told the under-manager to arrange for all the deputies to meet me the next morning at 9 o'clock; we all met that morning—Ambrose, Bailey, Gall, the under-manager, and myself; I asked Bailey to go to No. 8 engine-road with me, as it was quieter there; I said to Bailey, "Bailey, you will have noticed that I have protested against your report, because it is not a correct report"; he replied, "Yes"; I said, "It appears to me that on the first time of entering you find all safe; then under that you add finding gas"; I then read Rule 11—special—aloud to him, and continued, "I consider you should have said something more about the condition of the place where you said you found gas; did you get the gas in the safety-lamp?" he replied, "Yes"; I said, "Did you get a permanent blue cap on the flame?" and he replied, "Yes"; I then said, "And yet you only got a small quantity of gas?" and he replied, "Yes"; I then said, "Does it not strike you that if you got gas in your lamp and there was a permanent blue flame, that there was a large quantity of gas?" he replied, "I do not think so"; I then said, "Bailey, I am of the opinion that there is something behind the scenes that caused you to make that report"; he said, "Yes, there is; some time ago someone got a bit of a singe in the No. 6 heading, and he and his friends have been talking, and say that I should report having found a little gas"; I said, "Whether you found gas or not?" he replied, "Yes, and I've done so"; he seemed very agitated, and could hardly answer anything; he seemed anxious to get away from me; I said to him, "Well, I have lost confidence in you, and am convinced now that there is collusion going on"; I asked him who it was that was burnt, and he replied, "Anthony Wear"; nothing was said by Bailey at that interview about black-damp or Taft; I have given the whole of the conversation that took place between us on that date; on the 30th March last I sent the letter marked "F" to Bailey; I gave it to the under-manager about 4 p.m. on the 30th March last to send to Bailey; I next saw Bailey in connection with this matter on the 13th April last; Rendal, Bailey, and myself were only present; I sent for Bailey to come to the office, and arranged that Rendal should come with him and remain in the office till I had said all I wanted to say to him; I had spoken to Rendal and Mr. Atkinson before this meeting; I had seen Mr. Atkinson on the 12th April; I said to Bailey, "Bailey, how is it that you are neglecting your work?" (he should have started work on the 3rd April, and had not till the 6th April; he was off again on the 12th April; I had received no communication from him regarding his absence, nor had anyone else to my knowledge); he replied, "Chief Inspector Atkinson knows that I could not be at my work last night; I had an appointment with him"; I said, "After you made your report of finding gas in the report-book, and after I had protested against it, did you write or see anyone personally about the matter?" he said, "I did not write; I saw someone officially about it"; I said, "Whom did you see officially about it?" he replied, "The Minister for Mines and Chief Inspector Atkinson"; I said, "Did you go to Sydney to see them?" he said, "I went further than that; I went to Lithgow"; I asked, "When you were there did you tell the Minister for Mines that certain things were done to deceive the Government inspectors in taking their results of the districts?" he replied, "I did"; I asked him where it was done, and he replied, "In No. 2 in-take and No. 8 return"; I asked, "Who did it in No. 2?" and he replied, "I did it"; I asked, "How long ago is it since that happened?" he said, "Three or four years ago"; I said, "How often did it happen?" and he replied, "Once"; I asked, "How long is it since the No. 8 return?" and he replied, "Three or four months ago"; I asked him who did it, and he replied, "Ambrose and me"; I asked how often, and he replied, "Once"; I asked, "Did you also say that someone had been severely burnt in the mine?" he replied, "Yes"; I said, "How did you know that?" and he replied, "I was told so; he was off three or four days with the burns"; I said, "That's how you know he was burnt—because you were told so?" and he replied, "Yes"; I told him that I did not believe his statements, and that I intended to inquire into them at once; he then asked me might he go to his work, and I told him he could pending an inquiry; Wear's name was not mentioned in that interview; he did not at that interview mention Taft or black-damp; between the 29th March and the 13th April I had seen Mr. Atkinson at my office; that was on the 12th April; I next saw Bailey on the 14th April; I summoned the whole of the deputies to come to my office; there were present myself, my son, Gall, Newburn, Ambrose, and Bailey; that was about 4.15 p.m.; I said, "I have a statement to go through with you of charges that Bailey has been to the Minister about; he says that there was something put up in No. 2 in-take to throw more air into No. 1 district"; I had a few pencil notes in my hand; when I said that Bailey turned to Newburn, and said, "Newburn and I put it up"; he had not mentioned Newburn's name at the previous interview with me; Newburn then said, "It's a lie; I deny anything of the sort; how could it be possible for anybody to put up anything in No. 2 in-take, when trains are going in and out every quarter of an hour?" Bailey turned in his chair, pointed his finger in Newburn's face, and said, "Now, Newburn, I'll have you, I'll have you"; Newburn asked, "How can you have me?" Bailey replied, "Can't I find a friend to say that he went under the canvas when you and I were pulling it across the road?" Newburn replied, "You can get a lying scoundrel to say so, but you can't get a man"; Bailey said nothing in reply; I then said to Ambrose, "Bailey says that you assisted him to put up something in No. 8 return to deceive the inspectors"; Ambrose replied, "It's a lie"; Bailey said nothing in reply to that; I then turned to Bailey, and said, "Bailey, I have proved all your statements to be false; I consider you went to the Minister for nothing but spite, and to injure myself and my officers; I have made up my mind that you shall never go down that mine under my management"; he said, "I intended to leave, and I have my notice written out in my pocket to give you, but the Minister for Mines and the Chief Inspector, Mr. Atkinson, told me not to do so, but to get you to dismiss me and then to write to them at once; I've done with it now; the world's wide; they told me to write, and I'm going to do so"; I said, "Don't forget to tell the Minister and Chief Inspector what you are discharged for—incompetency, and for taking untruthful statements to them"; as he walked away he said, "I intend to do so"; nothing was said by Bailey at either of these interviews as to the authority he had for doing this work—the interferences with the ventilation; on the 23rd May last I saw some letters in the local newspaper about the "Bailey charges," in which the Taft incident was referred to; the letter shown me in the paper of the 23rd May last is what I refer to; at neither of my interviews with Bailey was anything said about the opening of doors [*newspaper of 23rd May last put in and marked Exhibit 1*]; I first knew of a man having been overcome with black-damp in the mine when I read that letter; I visit the A pit three times a week; I take readings of the ventilation and temperature once a month, in accordance with the Act; I have done that since the Act came into force; I keep records of those inspections, and they are entered in the book produced [*put in and marked Exhibit 2*]; I take the ventilation oftener than that, but record it once a month in accordance with the Act; I have taken the ventilation when the furnace has been out, in order to see what it was without the aid of the furnace; I took it on the bar of the furnace.

*By Commissioner*: The air goes through the same place when the furnace is burning as where I took it when it was out; the furnace had been out from 12 o'clock the previous night, and it was 8 a.m. when I took it.

*By Mr. Bruce Smith*: I found 20,000 cubic feet of air per minute passing over with the furnace out; I never knew beforehand when the inspectors were coming to the mine; I know of nobody that did know beforehand; I am familiar with all parts of this mine; it has been opened up during the last ten years; according to my judgment I developed Nos. 8, 7, 6, and 1, and No. 2 right and left since I have been manager—the whole of No. 2 from a point 20 chains from the boundary; I have often consulted Inspector Dixon in developing the mine—not as to the laying out of the mine, but matters in connection with faults and the reading of the Act; I have not consulted him as to which way I should take the air; safety-lamps were first brought into the mine about two years ago; I introduced one then—a Mueseler; I brought that in in consequence of a conversation with Mr. Dixon; we were coming to a fault, and Mr. Dixon said that as a matter of precaution we should use a safety-lamp; he referred to the adjoining colliery, and said that appearances of fire-damp had been seen there in the faults, and possibly we might come across it in our pit when we came to the fault, and passing through the fault; he said that my overman and I should use it now and then going round as a precaution; I got the lamp, and it was kept in the cabin at the bottom of the pit; there was a key to it; the cupboard in the cabin is about 5 feet long, about 4 feet high, and about 2 feet wide, and has a sloping top; it is used as a desk and cupboard in one; the whole of the front opens; the Marsaut lamp produced was brought from England by my late overman, Mr. Mouter; that was kept in the cabin in the cupboard; he said he had brought it out as the latest design in lamps; I next got the Clanny lamp; I got it because I liked it—preferred it to the heavy Marsaut; I have used a lamp in inspecting the fault since I spoke to Mr. Dixon; the third lamp was kept in the cabin also; it had a key to it; about a dozen more lamps have been purchased

purchased since this inquiry opened; that was in consequence of the evidence of Fox; there used to be an old Marsaut there twice the size of that produced; I think Mouter left that there; my first lamp I took home to my house; it was my own private property.

*By Commissioner:* The other two lamps produced are, I suppose, my private property also.

*By Mr. Bruce Smith:* The under-manager had key to the cupboard, and also the morning deputy; I know that Bailey had a key; I never restricted Bailey in any way with regard to his reporting in the book; I never offered any objection, or felt any, to the manner in which he reported in the book; the furnace-man starts in the morning at 3 o'clock, and is on till 7 a.m., according to my instructions; then there is a shift from 7 a.m. till 4 p.m., then from 4 p.m. till 6 p.m., then from 6 p.m. till 3 a.m.; from 3 a.m. to 7 a.m. Redpath attends to the furnace; his duties are to attend to the horses and look after the furnace; there is nothing in his duties respecting the horses to prevent him looking after the furnace; at 7 a.m. Watson comes on; his only duty is to attend to the furnace till 4 p.m.; he has nothing whatever to do with the pumps; from 4 p.m. till 6 p.m. Bennett is looking after the furnace and horses; he has nothing to do with the pumps, and his duties about the horses do not prevent him looking after the furnace; at 6 p.m. McGuinness comes on, and works till 3 a.m., looking after the furnace and pumps; there is nothing about the pumps, either as regards distance or anything else, to prevent him from looking after the furnace properly; I have never given instructions on any particular occasion that the furnace should be fired up with the best coal; I have never given instructions that different treatment should be adopted when the inspectors are in the mine; I have never applied the term "gassy" towards any part of the mine; I have never heard the term used in connection with the mine until Bailey's report; at the interview with Bailey and the deputies nobody called Bailey a traitor; I did not lean over the table, shake my fist at Bailey, and say he was a damned liar; it is not true that when he was leaving the office jeering remarks were made to him by the deputies; nobody in my hearing said to him, "What were you dismissed from the Borehole for?" I know the part of the mine where Dobb cavilled—No. 8 heading; I have been through there frequently; I found the ventilation there very good; I know the No. 2 return; I have never known it to be in such a condition that it could not be travelled over; as an air return it is the best return in the pit; I know that from having travelled over it; it is clear right through; there is a little water at the sump; it is pumped out from there every day; it might lie for a depth of a foot or 18 inches if anything went wrong with the pump; it is not difficult to get along that return; there is no heaped-up muck in it; it has never been in an unfit condition that I know of; there is no provision in No. 8 for cutting off the air.

*By Commissioner:* There were no falls in No. 2 which have to be climbed over; there is a fault there.

*By Mr. Bruce Smith:* There is a fault there; it is a rise from the floor; it is about 6 or 7 feet high, and a corresponding cavity has been made in the roof to give the space.

*By Commissioner:* I do not agree with Mr. Atkinson's evidence as to that return [page 155, beginning at the words, "We came out by the cross-cut," to the end of the paragraph].

*By Mr. Bruce Smith:* The sump is in the middle of the return, and is the width of the return; anybody walking along that return can get to the side of the sump, but if he walks along the middle of the return he will walk through the water; I can walk along the return without getting wet; the fault I have spoken of is not very rough; it is got over by walking; I have never in the slightest manner interfered with the deputies in their reports of what they found; I have never said that if any man complained of the air in that mine he could go where he would get better; it was on the 25th May last that Taft's name was first mentioned to me in connection with his accident; it was in consequence of the letter in the paper that I made inquiries in the pit about it, but could hear nothing about it; I heard of it by sending for Rendal; I told him what I had seen in the paper, and that I had been making inquiries through the pit, but could not hear of anybody who had been overcome with black-damp; I then asked him if anything of the kind had happened on his shift; he said that a man named Taft, working with Turner in the No. 5 pillars, was taken with the shivers one night when working in the No. 5 pillars; that he had assisted Turner to carry him from his place to the in-take air at the narrow bord; I asked, "In what way was he affected?" he shook his arms, and said, "He shook like that, and seemed to me to have the fever and ague; I asked him if he was affected like that before, and he said, 'Yes, but not in this mine';" I considered it was a matter that Rendal should have reported to me, and told him so; he said, "As the man was able to get up and walk out of the pit in a short time, I did not think it worth while reporting"; I asked him if he or Turner had been affected at all, and he said no; it was one or two days after the 28th March last that I heard from Rendal about Wear; I sent for Rendal, and asked him about the burning, and if he had heard that Wear had been burnt, or had a bit of a singe; Rendal replied, "I do not see any singe about the man—only a few hairs on the side of his moustache"; I asked him if he had seen any gas, and he said no; I asked him why he had not mentioned it to me before, and he replied, "It was so insignificant and small that I did not think it was necessary to report it"; I asked was he sure there were no burns on the man, and he replied, "Yes, I am sure there was no skin broken in any way whatever"; I told him he ought to have reported the matter to me; I did not on the 29th March, in the interview, speak the words, "Well, Bailey, I want you to keep that word carb—" and the stop, and my son finish the word "carburetted hydrogen"; the words "carburetted hydrogen" were never used at that meeting; Ambrose was present at the interview on the 28th March last; Bailey was appointed examining deputy in July, 1898; when I appointed him I did not know that he had any certificate.

*By Mr. Edmunds:* Rendal did not tell me that he had found gas on a previous occasion; there is no question that something happened to Wear, according to the evidence in this case; I do not remember Rendal say in evidence that he had found gas in the mine; I consider that if an overman sees gas in a mine he should report it; it would depend upon the quantity he got as to whether it was reprehensible on his part not to report it; I do not know that if an overman sees only a small quantity he should report it.

*By Commissioner:* I say that the only recognised test for gas is the safety-lamp, and if an overman does not discover it in the safety-lamp I do not think it should be reported.

*By Mr. Edmunds:* My desire in the management of the mine is to carry out the Act in its integrity; I consider that gas in any quantity whatever found in a mine should be reported, whether discovered with a safety-lamp or a naked light; I consider that what Rendal found should have been reported; I consider it was reprehensible on Rendal's part not to report the gas, both what he found himself and what he had heard of with regard to Wear; I consider it would be reprehensible on the part of the management not to report such an accident as Wear's to the Government inspector when known to the management; I do not think that Rendal's inspection of the place for water-baler was sufficient; I think he should have gone to the face, and that it was reprehensible for him not to have done so; I know Special Rule 73; I have heard the evidence of the men who say they saw black-damp; I think they should have reported it; I know that I am liable under the Act if I do not use all reasonable means for publishing the special rules and enforcing them; I consider the miners should report any choke-damp or fire-damp that they come across; I was first informed of Bailey's report of the 28th March by my son; he did not tell me that he had had any inspection made before he spoke to me; I understood he had had none made up till that time; I inspected myself, and did not see Bailey till next day; it was between 2 and 3 p.m. on the 28th March that I made my inspection, and Bailey's would be about 4:30 a.m.; I consider my inspection on that afternoon was a test as to whether Bailey had found gas there that morning; he said he had got a permanent blue cap on his flame, and that would indicate sufficient gas there to show me some trace of it in the afternoon. Bailey's report stated he had found a small quantity of gas and had removed it; I consider if he had found a blue cap on his flame it would be making all day, and that I should have found it in the afternoon; if the gas had been removed there would be no blue flame there, but the gas could be making all day; I consider that if there is sufficient gas found at 6 a.m. to show a permanent blue cap that I ought to find it there between 2 and 3 p.m., although the brattice had been put up to remove it; all I knew on that afternoon was what I had read in his report; I thought I might get the gas in the afternoon the same as he had in the morning; if he got it, I considered I would get it in the same spot; it would in all probability be exuding from the coal in the afternoon; I did not stop the work there; I saw no reason to stop it; I would have stopped it if I had seen any gas there; I did not consider it my duty to stop the work in that place after reading the report until I had made my inspection.

*By Commissioner:* If gas is found in a working-place in the morning by the deputy it would be unsafe to let men go to work there with a naked light that day.

*By Mr. Edmunds:* It would be hard to say how long one might expect to get gas after it had been found in a face by the deputy in small quantities; it would depend upon the quantity being emitted; the length of time of emission depends upon the quantity there; it might be coming off for a minute or a day, according to the quantity there; a small quantity might be emitted in a minute or two; the overman had told me that the place had been inspected before 7 a.m. that day by Gall, and afterwards by himself; if Bailey found gas there before 6 a.m. and removed it, it is possible that it could not be found there at 7 a.m.; it would depend upon the quantity of gas there. [Mr. Edmunds asks: "Can you give any reason for supposing that Gall's inspection at 7 would test the truth of Bailey's report on his inspection before 6?"

Witness answers: "They doubted the report. I cannot give any reason." It was upon the strength of my inspection that I wrote my protest—that and other things; I wrote it at 4 p. m. on the 28th March; the other things were the Chief Inspector and the District Inspector coming to those districts so often, and letters appearing in the paper about those districts made me suspicious; nothing appeared in the paper suggesting gas; there was nothing else prompted me in writing my protest; I considered it was not a correct report, because at first Bailey reported "All safe", then he comes back half an hour afterwards and adds to the report; that was enough to make me suspicious.

*By Commissioner* I did not know he had written the report at different times on the 28th when I wrote the protest.

*By Mr. Edmunds* The wording of the report made me suspicious; the overman also noticed the wording of it; when I said the report was not correct, I meant it was not made in a correct manner; I consider he should also have said something about the state of the ventilation in accordance with Rule 11, and the conditions of the place; I should have liked to know something about the brattice—whether it was up or down, I consider that should be stated when gas is found; I do not think that the fact that he reported that he had removed it was sufficient report as to the ventilation; that report means that the ventilation was satisfactory; I do not know that that means that the brattice was all right; I do not know that I knew the report was not correct when I wrote my protest, but I was suspicious about it in consequence of the wording; I thought I wrote my protest in the proper manner; I never wrote such a protest on report before that, I have never seen a deputy's report with such a protest on it; as far as I know this is the only protest of that kind that I have heard of; I do not think such a protest is likely to intimidate a deputy; I had my suspicion as to Bailey finding it; I suspected that he had reported gas when he had not seen it; I could not say whether the mistake was an honest one or a fraudulent one; I thought he had misrepresented intentionally; I do not know why I did not dismiss him on the spot; I sent him to take Jones' place afterwards, but did not reduce his wages; Jones was a leading man under Rendal; I ordered that Gall should accompany him on all inspections he made till further orders; I consider that was a proper step on my part; I did not tell Bailey Gall was to go with him; I told Gall to test with Bailey; I do not think that was intimidating a deputy; I think it left him free to state his honest opinions on his return to the cabin; I had Gall and Ambrose present at the interview of the 29th March, because I thought it was necessary for them to be there to hear what was said; the object of the interview with Bailey was to discuss his report; I did not specially ask Ambrose to be present, but sent a general message to all the deputies to be present; I am certain Bailey was not at his work on the night of the 12th April last; I am almost positive about it; I am speaking from what Bailey told me; I am sure he was absent from his work on the night of the 12th April; I know that from the pay-book; that shows the time of every man employed at the colliery; I heard from Mr. Atkinson of the charge of interference with the ventilation during inspection; the fact of a man being carried out from the mine was not mentioned at the interview between Bailey, Rendal, and myself in April last; in that respect Rendal's evidence is wrong; when I heard of Wear's matter I made inquiries of Rendal, that was the only inquiry I made; I asked Rendal if Fox had seen anything of it, and he said that Fox had told him that he had not seen anything of it; I did not know that Abell was Wear's mate at that time; I believe I asked Rendal who was his mate; I did not ask what his mate said about it; I depended upon Rendal for my information about it; I asked Rendal if he had inquired of Fox and Abell about it, and he told me that he had; I was satisfied with what Rendal told me; I knew that Rendal had not been a witness of the affair; I asked him who was in the place, and he said Fox; I asked him if he had questioned Fox, and he said "Yes," and that Fox had told him that he had seen nothing; Rendal said the thing was so insignificant that he did not think it worth reporting; Bailey had reported that a man had had a bit of a surge; I had been told that no skin was broken; I asked Rendal if it was not possible that it might have happened through the man's lamp being knocked off his head, and burning his moustache; Rendal said it was quite possible; I asked Rendal if he had questioned Fox about it, and he said "Yes," and that Fox had seen nothing of it; I then suggested that it might have happened through the lamp falling off his head; I do not consider that was what happened after hearing the evidence in this investigation; having heard the facts stated in evidence here, I consider the examination I made about the matter was sufficient, according to the way it was reported to me; I did not read Mr. Wade's report upon the Dudley Colliery explosion; I believe I received a copy of it from Sydney; on the 14th April I brought those men together for the purpose of honestly informing my own mind whether Bailey's charges against them were correct or not; when Bailey said to Newburn that he could find a friend to say that he went under the canvas, I took it that Bailey meant he would procure a false witness against Newburn; I do not know why I did not ask Bailey who the man was he could get; Bailey did not say he knew a friend who could say that; I did not know that Bailey had reported about Ambrose and the door being left open; I was satisfied with what Ambrose and Newburn said to the charges; I believed what they said, and not what Bailey said; I had proved all Bailey's charges to be untrue.

*By Commissioner* The black-damp was not referred to at that interview.

*By Mr. Edmunds* I considered the inquiry I then made was a sufficient one into such a charge as was then made—that the ventilation had been interfered with while the inspector was in the mine; Bailey was there to deny anything that was said, but did not do so; I consider I was justified in saying that Bailey had gone to the Minister only to injure me and my officers.

*By Mr. Curley* I first managed the Duckenfield Colliery in 1866, and continued there till 1887; I had experience of gas there; I do not recollect a number of men being burnt there when I was manager; I am not sure whether I was in charge of that mine in 1881; I was never absent as manager from the time I was appointed till I left there; I was not manager in 1866, but went to Minni in that year; I cannot remember whether it was in 1881 or not that I was appointed; I know of two men that were burnt in that colliery; when I went in on the 28th March I took my flare light to the box at No. 6 station; I examined by myself that day; there were others with me, but I made the examination; I knew that the under-manager was going round with Gall and Bailey when I instructed Gall to go round the following day; I did not instruct them that they were not to take their flare lights past the station; I did not know that they had gone past the station with their flare lights; I heard the under manager's statement yesterday as to where they took their flare lights; I do not consider that those three men committed a breach of the Act in taking their flare lights where they did on that occasion; the station was more than 12 yards from the face; it was 200 yards; it is a proper thing to take flare-lights within 12 yards of the face to examine for fire damp if they have not seen the fire damp; they went with Bailey to inspect the place where he had reported gas; I asked them if they had gone round with Bailey, and they said they had; I heard Gall state in evidence where Bailey had left his flare-light; I think it was in No. 6 rise headings; I did not on that occasion instruct them that they were not to take their flare lights past the station; I presumed they knew their duty, and what they were to do and not to do; I have not taken up the position that I will not accept my examining deputy's report unless I can corroborate it by my own examination; I have heard Bailey go back on the statement in his report; that happened in this inquiry; his report stated that he had found it in the front heading, and his evidence showed he had found it in the back heading; I do not remember my son stating in evidence that Bailey said verbally that he had found it in the front heading; these headings have been called back and front headings; the air does not go into the leading heading; the furthest-in heading is the front heading; that is not the heading that gets the air first, but the one this side of it—the in-by heading; the back heading gets the air first; if gas were being given off in equal quantities in both headings I cannot say in which heading gas would be more likely found.

*By Commissioner* The hole in the roof was in the back heading; I believe Bailey mentioned the hole in the roof when he spoke of the gas; that was the only hole there was.

*By Mr. Curley* I have never seen an examining deputy using a safety lamp in his inspections; the only instruction I gave was that a safety-lamp should be used as a precaution in approaching faults and going through them; I gave those instructions two years ago to the overman, Mouter.

*By Commissioner* The overman and deputy were to use them occasionally to test for gas in approaching and going through the faults, but no instructions were given that they were to use them on their morning inspections.

*By Mr. Curley* I gave Rendal general instructions about safety-lamps in approaching faults, but not with reference to any particular occasion; those instructions were given two years ago; I gave instructions that if they came across gas they were to report to me immediately; that included Rendal as well as the others; it was a general order; I cannot account for Rendal not reporting the finding of gas to me.

*By Commissioner* It was a breach of the Act, and of my order too.

*By Mr. Curley* I saw Bailey the morning after he had made his report of the gas; it was between 9 and 9 30 a. m.; I know the rule refers to noxious gases as well as inflammable gases; I cannot account for Rendal not reporting Taft's affair to me; I have paid some attention to the percentage of gas that will show on a safety lamp, it is from 2½ to 3 per cent, that will give a blue cap; I have heard the witnesses describe the manner in which Bailey tried for gas with his

his lamp by poking his lamp into one corner of the face and then into the other; I do not think that was a proper mode of examination; I would not examine for gas by putting the lamp into the roof of the working at first; I would lower the light to a pin's point, and start at the bottom and gradually raise it to the top; Bailey did not mention anything about a door being kept open in No. 8 engine-road in the interview in my office; the only excited man at that interview was Bailey; I saw nobody standing about the office outside when I went out; when a man sends a note as to his absence I am satisfied with it as long as it is a genuine one; any man who stays off for two days without any explanation is liable to be dismissed; I did not dismiss Bailey for being away without explanation; I got the key of the Marsaut lamp with the lamp; the Clanny lamp locks with a key also; the expression, "Think of poor Mr. Croft's wife and family," was never used at that interview in the office; I have at times had to speak to different deputies about some things that were not right in their districts; I never had occasion to find fault with Bailey; I have given Bailey a written testimonial; I wish to withdraw every word of it now; I did it as an act of kindness; I gave Dobb one also; I think Dobb was in my employ at that time; the clerks in my office are Mr. Clayton and Mr. Dixon; the latter is a son of Mr. John Dixon, the inspector; I say positively that I never had any intimation when Mr. Dixon was going to inspect the mine; I never heard of any interference with the ventilation of the mine till Bailey told me he had brought it under the notice of the Minister for Mines; I have never done anything myself while I have been manager to trick any of the inspectors; the difference between the furnace and district readings in my inspection of the 2nd March last is accounted for by the scalings through the old workings; that is done to keep them sweet; I take the readings in the in-take; I often take a reading in the district returns; I consider the manner in which our furnace is looked after is in compliance with the rules; my general order is that he shall keep a good brisk fire throughout his shift; he has to look after the pumps as well; I think he can attend to the pumps and still attend properly to the furnace.

*By Mr. Edmunds:* The whole of the A pit has been inspected since the evidence given in this inquiry about the gas being seen; it was not done prior to that; No. 2 return is not in the same state as when Mr. Atkinson last saw it; something has been done to it since; it is quite consistent that it was in the state as described by Mr. Atkinson when he visited it and in the state I have described it since; there was a good deal of stone lying about it when Mr. Atkinson examined it; the sump was high then, as the pump had been out of order for four days just prior to his inspection.

*By Commissioner:* I came to the conclusion in consequence of what Rendal told me that Wear had not been burnt with gas; he said Fox had told him he had seen nothing; I did not ask Rendal if Wear had been using powder at all; I did not tell Mr. Atkinson that I knew about Wear's case on the 12th April last; I had not heard of gas in the mine at that time; I was present with my son, and Gall, and Ambrose when Mr. Atkinson was questioning us; we were all asked whether we had seen any gas in A or B pit, and all answered, "No"; I do not remember Gall saying that he had come across a little of it about fourteen years ago; I brought Newburn down to the interview in the office because Bailey had been under him when the ventilation was interfered with in No. 2; I had asked Newburn whether he had been a party doing it; Newburn's name had not been mentioned to me by Bailey at that time; I was mistaken when I said that I had asked Newburn if he had been a party to it; I wanted Newburn at the interview to tell me how Bailey had been able to go away and do that without Newburn's knowledge; I remember Dobb being put on the night-shift; he came to my house about it; I told him to go and see the overman about it—that I left such matters to the overman; I allowed Bailey to go and inspect on the 29th March last, in order to see whether anything could be found; I wanted to see whether my suspicions were correct; I could not trust him to examine, so put him off the examination on the 30th of March last; I sent him to a different district—Nos. 1 and 2—on the 9th April last; he was not examining deputy for that district—S. Jones was; I suppose Rendal sent him to examine that night, which was a Sunday; it was contrary to my wishes; the bords should be ready for the men before they start the cavi; on 28th May, 1895, there were fourteen men working in No. 10 district with two horses and a man and a boy; it remained at fourteen men for about two months; it worked till 21st September, 1895; the inspector obtained his figures from the overman; the occasion of my giving Bailey the testimonial was when he was going up for his examination; that was about two years ago.

*By Mr. Curley:* I do not know that fire-damp is more likely to be given off in March than in any other month.

Taken and sworn at Court-house, Newcastle, this }  
13th day of July, 1899, before me, — }  
C. G. WADE, J.P.

J. CROFT.

This deponent, *Joseph Croft*, recalled, on his former oath, states:—I understood the Act to mean that gas should only be tried for with the safety-lamp, and if it could not be discovered in the safety-lamp it should not be reported; a very small quantity of gas would not show itself in the safety-lamp, and if it were so small as that I had doubt as to whether it should be reported; I had not considered Special Rule 73 in connection with the discovery of gas.

*By Commissioner:* The only recognised means for finding the gas is the safety-lamp; a naked light will light it; I have heard of a naked light lighting it where it could not be discovered with the safety-lamp; from what I have heard I should say that you will get the gas with a naked light where a safety-lamp will not show it; Bailey acted as under-manager on the 3rd March, 1899; on the 28th May, 1895, there were fourteen men on the pillars in No. 10, eight on ordinary bords; 29th June to 21st September, 1895, there were fourteen on pillars and ten in the bords; from 23rd September to December, 1895, the number of men was ten.

*By Mr. Curley:* I consider that any quantity of gas, however small, should be reported; the depth of our shaft is 300 feet; the length of the airway in No. 2 right district in-take and return is about 2 miles; in No. 2 left it is about the same; in No. 6 is 2½ miles; in No. 7 2½ or 3 miles; in No. 8 about 2 miles, and in No. 9 about half a mile; those are the districts I have mentioned for my report of 3rd July instant; there has been no material alteration in the length of those airways since March last; no portion of the fault in No. 2 return has been cleared away; it is the same now as it was ten years ago; it is not a hindrance to the coursing of the air.

*By Commissioner:* It is not correct, as Rendal stated, that he came to use the safety-lamp in consequence of Weir's accident, as I considered it would be better to do so in future to avoid such accidents.

Taken and sworn at Court-house, Newcastle, this }  
14th day of July, 1899, before me, — }

EXHIBIT No. 1.

[Extract from the *Newcastle Morning Herald and Miners' Advocate*, Tuesday, 23 May, 1899.]

THE MINES ACT.—IS IT BEING CARRIED OUT?

Sir,—Some four or five weeks ago, in compliance with the C.M.R. Act, I reported the existence of fire-damp in the Glebe A pit, No. 6 district. Two days after another man was put in my place, and eventually I was dismissed. I am approaching the Minister for a full inquiry, under section 23 of the C.M.R. Act, into this and three other circumstances:—

1st. The burning of a man with fire-damp.

2nd. Another man being overcome with black-damp (neither of which cases was reported to the inspector).

3rd. The opening of doors and other methods of turning air into districts when the Mines Inspector happened to be in.

A deputation of the members and the delegate board may possibly procure the investigation which, personally, I as yet have failed to obtain.

I am, &c.,

J. W. BAILEY.

Mitchell-street, Merewether, 22nd May, 1899.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## NEWCASTLE COLLIERY COMPANY'S "A" PIT.

(REPORT BY C. G. WADE ON INQUIRY INTO THE WORKING OF.)

*Printed under No. 1 Report from Printing Committee, 3 August, 1899.*

Sir,

21 July, 1899.

I have the honor to submit my report on the findings of the Court of Investigation appointed to be held under your hand on 16th June. In accordance with that appointment I proceeded to Newcastle, and on 26th June the investigation was commenced. I sat on fourteen different days, thirty-seven witnesses in all were examined, and at the conclusion of the evidence I heard the addresses of gentlemen appearing for the different interests upon the evidence.

The parties before the Court were represented as follows:—

Mr. W. Edmunds, instructed by the Crown Solicitor, appeared for the Chief Inspector of Collieries.

Mr. Bruce Smith, instructed by Mr. H. J. Brown, for the Newcastle Company.

Mr. James Curley, on behalf of the Newcastle Employees Federation.

The exact terms of my Commission were to inquire into the explosions and accidents that had recently occurred at the Newcastle "A" Pit, and the causes and circumstances of the same. At a very early stage, however, J. W. Bailey, who was really preferring the charges, offered evidence which was strictly quite outside the scope of the inquiry—certain matters, for instance, dealing with the obstruction of ventilation whilst the official inspections were going on in the pit. Mr. Bruce Smith, however, offered no objection to this line of evidence; and as he said that the Company courted, and were anxious for a full inquiry into all these matters mentioned by Bailey, I allowed the evidence to be given, and submit my findings on the whole of the evidence. This must not, so far as I am concerned, be taken as any precedent; because I am satisfied that my jurisdiction under section 23 of the Coal Mines Regulation Act is limited to those matters specifically mentioned in the section, or to circumstances directly bearing on those matters. This section is not a vehicle for investigating every kind of dispute between Colliery Manager and employees. Remedies are provided for breaches of discipline under various other sections of the Act itself.

Part of inquiry outside scope of Statute;

but not to be made a precedent.

I may, before coming to the main issues, refer to evidence given by the man named Price. He was called by Mr. Curley, and at once showed himself to be an adverse witness, and was questioned as to having made statements inconsistent with the evidence he was then giving. I allowed Mr. Curley to prove from the mouths of other witnesses that he had made inconsistent statements. Price was then recalled and admitted what he had previously denied, and proceeded to state facts in support of those admissions. However, in the face of his demeanour in the box, and his admissions, I decline to give any regard to his evidence, and consider the whole of his testimony wiped out. Under these circumstances, the evidence of Wells and Jarvis likewise becomes immaterial.

Evidence given by Price.

Bailey prefers  
the charges.

J. W. Bailey preferred his charges against the Company under the following circumstances:—It appears that he has been engaged in the A Pit as examining deputy since August, 1898. He is a man who professes to have some knowledge of the nature and danger of gases in connection with colliery management, and he also holds an under-manager's certificate of competency. He alleged on 28th March, and so reported in the Deputy's Report Book, that he had found gas in the mine. The Manager disputed the accuracy of that report. He was subsequently removed from that work, and at the end of a fortnight he was dismissed. On his dismissal he made a request to the Secretary for Mines to allow him an inquiry under section 23 of the Act; and he undertook, if this were granted, to produce evidence in support of a number of allegations he had recently made against the Company. Under these circumstances, I placed the responsibility upon Bailey of producing the evidence he wished before me.

Charges  
formulated.

The charges may be shortly stated as follow:—

- (1.) That Anthony Wear was burnt by an ignition of fire-damp.

This matter was elaborated by the production of evidence to prove:—

- (a) Efforts on the part of the Manager and Under-Manager to conceal the occurrence; and  
(b) That the dismissal of Bailey was in consequence of his making known the existence of fire-damp.

- (2.) That John W. Taft had been overcome by black-damp whilst working in the mine.

In dealing with this aspect of the case evidence was adduced as to —

- (a) The concealment of this occurrence by the Management.  
(b) The system of ventilation generally.

- (3.) That on various occasions the airways had been tampered with, so as to deceive the authorised officials when inspecting the pit.

In connection with this last charge there was an insinuation indirectly against the *bona fides* of Mr. John Dixon, one of the Government Inspectors, in the method of his inspections of this colliery.

- (4.) The manipulation of the furnace fire in anticipation of inspections.  
(5.) Discipline in the mine.

Bailey's  
credibility.

An accomplice.

The first and chief witness was Bailey himself. He was examined and cross-examined at very great length. His evidence altogether lasted more than two days, and on his credibility the case put forward by him must largely depend. There are, however, several blots on his credibility. He admits that in all these matters, in which he had a share and which he now charges against the Company, he was practically an accomplice in committing breaches of the Coal Mines Regulation Act; that he did these things, knowing that, at all events, the health of his fellow-workmen was endangered by his so doing; but he excuses himself by saying he preferred doing that to losing his situation by refusing. Moreover, one cannot overlook the fact that these accusations, serious as they are, are only made known outside the mine when he is in danger of losing his position. His manner and demeanour, moreover, on certain occasions during his cross-examination, were not such as to impress me with his reliability as a witness of truth. Consequently, inasmuch as his evidence and his own admissions prove him to be a man with a grievance, also to have played the part of an accomplice in what must be admitted was a most reprehensible fraud, I feel it would be absolutely unsafe to act on any material statement made by him unless it is corroborated in all substantial particulars.

Dismissed  
servant of the  
Company.

Demeanour  
on cross-  
examination.

His evidence  
must be  
corroborated.

#### FIRST CHARGE:—ANTHONY WEAR WAS BURNED BY THE IGNITION OF FIRE-DAMP.

Wear's case.

The evidence shows that Wear and Abel, both shift men, were working in the No. 6 headings on the night of Sunday, September, 25th, 1898. At first Abel and Wear were in the front narrow bord. A water-baler, named Fox, commenced to work at the edge of the canch, some 4 yards from the face of the back heading. The brattice was 12 yards away from the face, and subsequent events showed that the face had not been examined before these men went down to their work. Fox himself

himself did not go nearer the face than the edge of the canch. In a few minutes Wear came in. There is a dispute as to whether he had any right to be there; but the merits of that question are immaterial to this charge. Wear stepped on to the canch, went up to the working face, and his light then ignited some fire-damp. A slight explosion took place which resulted in his being burnt. That he was burnt by an ignition of fire-damp there can be no question. Wear burnt by fire-damp.

There is a controversy as to the extent of his injuries. Of those who saw him immediately after the occurrence, Abel seems to be the most reliable. He states that he heard the explosion some 40 yards away, and that shortly afterwards he saw Wear. He was not seriously injured, but suffering from shock. His hair was singed, the skin of his neck and arms was burnt a little; the skin on the neck rose. However, he remained at work for some hours. He then went home and was away during the next shift, apparently in consequence of the burning he had received. Fox says only the side of his moustache was singed. This witness was reticent. His attitude of mental reserve can be gathered from his evidence as to the occurrence. It was only a small flash, he says. When pressed for more detail he admits it was 6 feet in length. He also admits that Wear did complain of his neck being sore. Rendell, the night overman, arrived on the scene about 1 a.m., and Wear told him then that he had been burnt with the gas. Rendell belittles the whole thing in his evidence—describes it as a singeing of a few hairs of the moustache. However, Wear did complain of being in pain—so much so that Rendell allowed him to go home before his shift was finished. The important point at this stage to remember is that the Night Overman Rendell, the man who was in charge of the mine that night, was then informed definitely of the existence of inflammable gas. A circumstance of this character would be an epoch in the history of a colliery such as this, with a record, so far as I know, of freedom from gas, at all events, up to the beginning of 1898. The obvious and natural impulse of any man under these circumstances, with the interests of the mine and the workmen at heart, would be to acquaint the management. It was, moreover, a duty to do so, because the Act entails the following consequences on the discovery of inflammable gas:—

- (1.) To make a report in accordance with General Rule 7.
- (2.) To make a report of the accident to the Inspector according to section 29.
- (3.) The use of a safety lamp on inspections before work commences, under General Rule 4.

It was admitted subsequently that none of those abovementioned provisions had been complied with. The question who was responsible for those omissions brings us to the next matter. Provisions of Act not complied with.

(a) *Efforts on the part of the Manager and Under-Manager to conceal this occurrence.*

The evidence shows that Wear's occurrence was more or less generally known amongst the miners. Rendell, Wear, Abel, and Fox knew of it that same night. Dobb says he heard of it three or four days later. Wilson, an examining deputy at that time, swore that he heard Bailey telling Sam Jones, another examining deputy, of the occurrence a few days after at the overman's cabin. Fox, indeed, says that the matter was generally known amongst the shift men that night. H. Croft, the Under-Manager, was down below every day. Under ordinary circumstances, one would expect the news to quickly reach the ears of the management. On 24th September Ambrose was examining deputy in No. 6, using a naked light. On 26th September, under orders from the Under-Manager, Bailey undertook the duty of examining deputy in No. 6 district with a safety-lamp. Was this change made in consequence of Wear's accident? Bailey says distinctly that he acted under instructions from the Under-Manager. Is there any corroboration of that statement? Rendell states that he first used a safety-lamp on his inspections after Wear's occurrence after conversation with the Manager. This piece of evidence is most important as affecting Joseph Croft the manager; and Mr. Bruce Smith contended that Rendell's evidence will not bear that interpretation. But Rendell refers to the matter on several occasions. On page 47 he says: "I used the safety-lamp because Wear went to a place to which he had not been ordered to go, and he says that he saw a small flame of gas there; it was after I heard that that I took to using a safety-lamp." Page 105: "It was after Wear's accident that I began to use a . Wear's matter generally known.  
Safety lamps in No. 6 after 25th September.  
By order of Manager.

Explanation  
of Joseph  
Croft.

safety-lamp in that part of the mine—the No. 6 narrow-boards or dip headings.” Page 107: “I came to use the safety-lamp after Wear’s accident because the Manager and I thought it better to do so in order to make sure if ever such a thing occurred again.” This to my mind puts his meaning beyond doubt. Joseph Croft and Herbert Croft deny the truth of this statement of Rendell. Herbert Croft admits that he gave instructions to Bailey and Rendell to examine with a safety-lamp, and we may take it, as he himself implies, that he did so after consultation with the Manager. John Dixon, the Government Inspector, intimated to the Manager two years ago the desirability of obtaining safety-lamps with which to examine the country when approaching faults. The Manager says this was two years ago; the Under-Manager says twelve months. In any event I am willing to believe that they were in the pit in June or July, 1898. The Manager says the introduction of these lamps into the mine was owing to a general intimation from Dixon that the Manager or the overman might occasionally examine a locality for gas when nearing a fault; but no suggestion or instruction was given to the effect that deputies should use them whilst making their morning inspection of the pit. The Manager offers no explanation of the undoubted fact that the examining deputies, after 25th September, made it a practice to use the safety-lamp on their inspections in No. 6 district. The Under-Manager admits that he ordered Bailey and Rendell to use the safety-lamp, because, as he says, the Manager had told him that the winnings, when approaching faults, ought to be examined with a safety-lamp. Now it appears faults had been met with in No. 6 and other parts of the A Pit previously to 25th September, 1898. It also is established that a dyke had just been driven through some 4 yards before that spot was reached where Wear ignited the gas. If the Under-Manager’s version is true, no explanation is offered why that lamp was never used before by a Deputy in approaching faults or dykes and that the first occasion of its use is immediately subsequent to Wear’s occurrence.

Explanation  
of Herbert  
Croft.

Safeties used  
in conse-  
quence of  
Wear’s acci-  
dent.

Bearing in mind that Rendell, though called by Bailey, most strongly leaned towards the Company, I view any admission of his against the interest of the Manager or Under-Manager as probably true. Again, the use of safety lamps in this part of the mine immediately after the burning of Wear forcibly suggests that it was done as a consequence of what happened that night; and that probability is strengthened by the worthlessness of the explanation Joseph Croft and his son offer for the use of these safety lamps. The version offered by the Manager and his son is that they first heard of Wear’s accident on March 29th from the lips of Bailey. What is their procedure on hearing these facts? The Manager, whilst admitting that the omission to report a circumstance of this kind would be most reprehensible on the part of a deputy, asks Rendell for particulars. Rendell tells him that Fox and Able were both in the locality; he himself cannot throw any light on the matter; yet he, as Manager, takes no steps whatever to probe this matter deeper. On April 14th, when the Manager holds his Court of Inquiry into Bailey’s charges, a large array of deputies is present to deal with the ventilation matter; but neither Abel nor Fox nor Rendell is summoned to answer Bailey’s allegations in respect to the Wear occurrence. This apathy and neglect of the imperative duty imposed by the Act and the natural impulse of a man on hearing of fire-damp making an appearance for the first time in his colliery, is inconsistent with his discovery of these things on March 29th, but can be explained on the assumption that he was aware of the general features of the occurrence some time previously.

Manager knew  
of Wear’s  
injury,

I therefore come to the conclusion—

- (1.) That the Manager and Under-Manager both became aware about September, 1898, of the ignition of inflammable gas in No. 6 district;
- (2.) That they concealed this occurrence from the proper officials; and
- (3.) Protected themselves against a similar occurrence happening and perhaps being made public by examining that district with safety lamps.

and concealed  
it.

Bailey  
ordered not  
to report find-  
ing of gas in  
Report Book.

Bailey further alleges that when he was appointed to inspect No. 6, Herbert Croft told him, in case he found any gas, not to enter that fact in the Report Book, but to mention the matter to him. Now the Report Book is a record which is regularly examined by Government Inspectors on their periodical visits; and if the allegation of Bailey is true it is evident that such a course would be consistent with, and moreover necessary to, the plan of suppressing from the Government officials

officials anything that would suggest that Wear had been burnt, or even that gas had been found in the pit. It must be borne in mind that Bailey's new duty was to examine with a safety lamp in the locality where, I am satisfied, Herbert Croft then knew gas had been found, and where it might consequently be discovered again. Herbert Croft says that he told Bailey to report the finding of gas. The Manager states that he gave general instructions for the reporting of gas. Under these circumstances it is strange that Bailey should admit having openly violated his orders, and infringed the provisions of the Act, without any motive.

Inspectors  
examine  
Report Book.

I find, further, that Rendell not only did not report gas in Wear's case, but that he, on a subsequent occasion, on discovering fire-damp in the same district, again failed to report it. On the latter occasion, however, he thought the discovery of sufficient importance to justify him in leaving a note in Bailey's lamp as a warning to the latter. This action of Rendell, again, is contrary to what one would expect from him, an overman of seventeen years' experience, and it gives colour to what Bailey asserts.

Corroboration  
of Bailey.

Rendell's  
action.

Further corroboration may be gathered from the report of the Chief Inspector of Collieries (Mr. Atkinson) to the Secretary for Mines. (*Exhibit "V."*) There is a conflict as to this matter between Mr. Atkinson and the two Crofts. Where they are in conflict, I prefer to believe Mr. Atkinson's version. It appears from this report that on 12th April they had a conversation with Mr. Atkinson, and (although on their own admission they had heard from Bailey on 29th March all about Wear) when questioned by Mr. Atkinson they led him to believe that they are not aware of any person having been burnt with gas in the mine at any time.

Croft's inter-  
view with the  
Inspector.

I further am of opinion that, in pursuance of the plan to suppress Wear's incident, the Under-Manager and the Manager instructed Bailey not to report the finding of fire-damp in the ordinary Report Book. This brings me to the question—

(b) *Was the dismissal of Bailey in consequence of his making known the existence of gas?*

The facts leading up to the dismissal are shortly as follows:—On 28th March Bailey says he saw gas in No. 6 front dip heading. When he returned to the cabin he signed the Report Book as all safe in these words: "28th March, 1899.—I have this day examined, as required by General Rules, Coal Mines Regulation Act 1896, all working places and roadways where workmen are to work or pass in Nos. 1 and 6; found all safe." He left the cabin, returned some short time afterwards, and said to Jones, another examining deputy who was present, "I am not satisfied with that"; and then added the following words in the Report Book:—"I found a small quantity of gas (carburetted hydrogen) in front dip heading, No. 6 district; removed it, and left all safe."

Bailey's  
report of  
28th March.

An hour or so later the Under-Manager met the day and examining deputies at the cabin, and in reply to his query, "Is everything right?" Bailey referred him to his report. The Under-Manager asked him some questions about his discovery, and then sent Gall, a deputy, to examine the same spot.

Whether Bailey actually found gas or not is immaterial to this part of the inquiry. It is necessary for a moment to pause and see what facts must have been present at this time to the mind of the Under-Manager. Bailey up to that time had been trusted by him and his father. Inflammable gas had already been found in that neighbourhood. Safety lamps were being used in case it might be seen again. It is a matter of elementary knowledge that gas may be detected, be at once removed, and possibly never seen in the same place again; and Bailey's report states that he removed the gas and left all safe nearly two hours before this. The Under-Manager's account is as follows:—That the excited condition of Bailey when questioned, and the fact that the words "all safe" appeared twice in the report, caused him to doubt its genuineness. How those circumstances alone could produce that belief I fail to understand. He further adds that there should have been some reference to roof and sides. Such an addition no doubt might make the entry more complete, but could not be any guide as to the truth of the statements therein. However, he sends Gall at once to examine the spot with a safety-lamp, and follows himself shortly after, with the result that they find no trace of gas. Now an examination under these circumstances could only be negative. If gas was again found, it would confirm the previous report; but the failure to find it the second time, under the circumstances, could not possibly afford any guide as to the value of the report.

Under-  
Manager's  
conduct.

The

Manager's  
conduct.

The Manager is sent for by the son. On his arrival he is shown the book and informed of Gall's examination, and he, at that hour, 4 o'clock in the afternoon, proceeds to the spot with the expectation of finding gas. He is asked why he made the examination. His answer was, "If Bailey can find it at 6 a.m., I should find it at 4 p.m." He is reminded that Gall had failed to find any trace at 7 that morning. Another reason offered was that as Bailey found a permanent blue-cap in the morning, there must be a large quantity of gas, and there would probably be some there at 4 o'clock. But it appears he did not hear till the next day that the flame had a permanent blue-cap. Lastly, he says he was then suspicious, because the report was added to, a fact which first came to his knowledge the following morning. Yet he states that it was on the strength of his examination that he made his protest then and there, giving it as his opinion that Bailey's report was incorrect, and intentionally incorrect. However Bailey remains in the same work two days longer, Gall following him round on his inspections. On the following day, according to the defence, Bailey admitted that he had been put up to make this entry, because Wear's friends had said that gas should be reported. On the 30th March he is put on the night shift at the same wages. The Easter holidays ensued. On Easter Monday, Bailey interviews the Secretary for Mines, returns after some days' absence from the mine, and on one occasion after his return inspects, as deputy, Nos. 1 and 2 Districts. On 14th April, after an interview at which the Manager, Under-Manager, and deputies heard his charges, Bailey was dismissed.

Now, if the Manager honestly believed that the report of Bailey was untrue, and intentionally so, the fact of his allowing a man who had committed such a grave offence against discipline to remain in his service one hour, or of his permitting a person who had forfeited all claim to be trusted to ever examine again, is inexplicable. That a manager should take that view of colliery discipline is incredible. To my mind this course of conduct, so obviously opposed to what we should expect from a man of Mr. Joseph Croft's experience in coal-mining, can only be explained if there is some unusual motive prompting such action. That Bailey was dismissed because he made known the existence of gas I am unable to say. Denials by the deputies on 14th April of the other charges then made by him may have induced the Manager to believe Bailey was making false accusations, and so to dismiss him; but the failure to dismiss when he proved the first lie on 28th March is only consistent, considering all the surroundings and facts, with a desire to nullify the effect of Bailey's report, but still to keep him on in the service of the Company, whilst doing work where he could not find gas.

SECOND CHARGE:—THAT J. W. TAFT HAD BEEN OVERCOME BY BLACK-DAMP  
WHILST WORKING IN THE MINE.

Black-damp.

About twelve months ago Taft and Turner were at work on the night shift, clearing a heading in No. 5 District. Some miners were at work in that district in the daytime. These were the only two at work on the night-shift in that place, and were so engaged for a period of nearly three months. The lights used to burn dull, and Taft frequently suffered from headaches, when he would go out on to the flat till he felt better. On the night in question he had gone down to work at 4 p.m. His head began to ache some time before he actually was taken ill. At 7 he says his head was ready to burst. He lost the use of his legs, and his breathing became heavy. He called Turner to his assistance. Just then Rendell came on the scene, and he, with Turner, carried Taft on to the main intake airway. The air current, as he got into a cool atmosphere, caused him to shiver. His clothes were put on, and after a short rest he was able, with Turner's assistance, to travel home. Next day he had not recovered, and stayed away from his work.

Taft's illness.

Caused by  
black-damp.

The first question that arises is: Was this illness caused by black-damp? At no time did the atmosphere fail to support combustion. The lowest percentage of black-damp in the air which will extinguish a light is 16 per cent., according to Haldane's Tables (*See Exhibit "N."*) There must, consequently, have been a less amount than 16 per cent. of black-damp where Taft and Turner were working. Dr. Haldane further states that so long as combustion is supported, black-damp has no effect upon the individual. Mr. Atkinson thinks that proposition should be qualified to this extent: that although productive of no immediate effect, yet in a short time the head will begin to ache. On the other hand, the light may burn dull, and the head ache, owing to the presence of carbonic acid gas where men have been working  
in

in a still atmosphere for some time. Bullerwell, another witness, states that about that same period Taft speaks of he detected black-damp in these No. 5 pillars; and inasmuch as pillar workings are a likely place to find that gas, the probabilities seem to me to point to black-damp as being the cause of Taft's indisposition.

There can be no doubt that Rendell knew of Taft being taken home on that occasion. It is also admitted that neither the Manager nor the Under-Manager made any inquiry about this matter before the end of May, 1899. Was this because they were in ignorance of the occurrence? They say they never heard of the matter till 23rd May of this year, when they saw it mentioned in the Newcastle paper. S. Jones, the deputy, tells us that he heard of Taft being ill that same night, and he further says that he heard the miners talking about it subsequently. There is no evidence that it came to the knowledge of the Manager or of his son before 13th April; but on 13th April, says Rendell, he, Bailey, and Joseph Croft were all present at a conversation, in which Bailey referred to a man being carried out of the mine. On 14th April a conversation took place between the two Crofts, Gall, Ambrose, Newburn, and Bailey. Ambrose says that Joseph Croft asked Bailey if he had written to the Minister about black-damp, and that Bailey replied that he had told the Minister about black-damp. Gall, who was present, said, in answer to Mr. Bruce Smith, that he first heard of Taft's affair on 14th April, when it was mentioned by Bailey. Newburn has no recollection of this statement either way.

I find, then, that Taft's incident was known to both Crofts, father and son, on 14th April; yet for some inscrutable reason they made no effort to investigate this matter till just before the inquiry, when Taft is sent for and questioned.

(b) *The System of Ventilation generally.*

The evidence may be divided into—

- (1.) Ventilation of pillars; and
- (2.) Ventilation of workings other than pillars.

(1.) Taft states that he found the air bad in No. 1 pillars at the same time that he was working in No. 5, but his evidence is too vague to be of any assistance to me. John Atkinson and Watts, both men whose evidence I can rely upon, were working on pillars in No. 1 the first quarter of this year. Atkinson says the air was very hot and vitiated; that there was a current of air coming up to him, but it was very hot. According to Watts, who was in No. 2 pillar, near Atkinson, the air could be felt when he commenced the pillar, but as he advanced he left the air and the atmosphere became warmer. At the face there was not sufficient pressure to bend the flame of his lamp. There was no brattice in the pillar, and the state of the atmosphere quickly tired him. Mr. Dixon, the Government Inspector, examined Atkinson's place during that quarter, and found the air very hot; but the air was being forced into the pillar, and the ventilation was satisfactory considering the broken nature of the workings. With regard to Watts' pillar, I am satisfied that the air was not forced up to the working face in such a manner as to comply with General Rule 4 of the Coal Mines Regulation Act.

The ventilation of pillar workings is undoubtedly a difficult matter, because, unlike a bord, there is no fast wall along which the air current may be conducted. It thus becomes harder to concentrate the air, and, owing to the disturbance of the strata, the air has a tendency to leak. At the same time, it is practicable to conduct the air up to the face of the pillars; and, bearing in mind the imperative terms of General Rule 4 of the Act, it is clear that means must be devised to accomplish that object.

No. 5 Pillars.—The condition of the ventilation in this district has already been referred to in connection with Taft being carried out into the main intake. It appears that the air for this district was diverted from No. 5 return by a sconce which only partially projected across the return. As a result, some of the air escaped down the return. It is proved that these men complained to Rendell of the state of the ventilation, and that he took no steps to improve it. Yet the breaking down of the stopping by Dobb and Turner seems to have afforded relief.

As to (2)—Watts speaks of one instance in No. 6, at the end of last year, when the gob was heaped up in his bord and blocked the ventilation. However, Gall and Dixon deny that allegation, and I do not consider that charge to be substantiated.

Alfred

Alfred Johns deposes to smoke hanging about in the third bord in the face of No. 7 heading. This was in the middle of last year. This matter, again, is too vague to act upon.

No. 8 District.

No. 8 District seems to have given rise to some complaints on the part of the miners. Taft and Turner allege that the ventilation was defective about two years ago, when they were driving No. 8 back heading. Arthur Johns about the same date found the air defective in a bord in that district. Watts again says that about the same period he found that the smoke was very slow in getting away after firing a shot. This continued so for several weeks. These matters are all confined to the same period of time. The cause seems to have been of a temporary nature; but what it was I cannot say.

Williams was working last quarter in a bord off the front heading in No. 8. He complains that the air was deficient, and did not circulate up to the face of his bord, and that the air was hot like steam for the first fourteen days after he started to work. As against this, it appears that there were two men able to work on the same air after it had passed Williams, and Mr. Atkinson, the Chief Inspector, who was in the bord during that fortnight, is of opinion that there was sufficient air passing for Williams.

System of ventilation satisfactory.

This branch of the inquiry is one in respect of which it is not at all easy to arrive at a satisfactory conclusion; for complaint or approval is determined by the individual's temperament. What feels hot to one man is cool to another, and we have not the aid of the thermometer in case of doubt. A colliery cannot always be perfect, and temporary inconveniences must arise from time to time. The brattice occasionally may not be close enough to the face. But I do not consider there is any evidence to justify me in saying that the system of ventilation as a whole is deficient.

**THIRD CHARGE:—THAT ON VARIOUS OCCASION THE AIRWAYS HAD BEEN TAMPERED WITH SO AS TO DECEIVE THE AUTHORISED OFFICIALS WHEN INSPECTING THE PIT.**

Tampering with ventilation.

This is the most serious charge, and if established the most deserving of punishment. Nothing can exceed the baseness of men who, for the purpose of deceiving the Government officials, legally appointed to see that the Coal Mines Regulation Act is properly administered, employ means to hoodwink and mislead them, and the men who take part in such a conspiracy, even through fear of dismissal, can neither justify nor extenuate their conduct. There are things which a workman submits to for the sake of retaining his position which he may feel are morally indefensible; but no man with a vestige of self respect or honor will lend himself, under any compulsion, to the perpetration of a fraud which may entail injury to his own friends and fellow workmen. It is idle to urge "My poverty, not my will, consented." Bailey and Dobb, by their own admissions as to this aspect of the inquiry, lay themselves open to such criticism; and I decline to act upon any charge they may make unless they are supported by substantial evidence as to time and place.

Bailey speaks of certain occasions when he played his part during the last twelve months. Dobb deposes to two dates in February, 1898; and as to one incident in July, 1895, they both testify. To take Bailey first—

(1) Blocking airway in No. 7 District.

(1.) About seven or eight months ago, Ambrose, a deputy, instructed him to put up some canvas across the road connecting Nos. 7 and 8 Districts. This took place about 10 a.m., and when he left the pit bottom at 6.40 a.m. the Government Inspectors were expected. He was late in keeping his appointment, and when he reached the spot he found Ambrose already there, and he assisted Ambrose to put the canvas up. The effect of so doing would be to cut off the air from No. 7 District and send it down No. 6. Nobody else was present. The date of the incident he cannot fix, nor can it be proved that the Inspectors were in the pit that day.

To this Ambrose gives a denial. In the face of this contradiction, and in the absence of any evidence to corroborate Bailey, I hold that he has failed to prove this allegation.

(2) Forcing air into No. 8 District, March 10th, 1899.

(2.) The date of this occurrence he puts at about the 3rd or 10th of March, 1899. He had been told that the Inspectors were to be there that day. There is a door leading into No. 8 District which is always kept shut, except when wheelers pass

pass through it in the course of their work; and it was the duty of a boy named Harry Jones to attend to that door. The effect of keeping this door open would be to increase the volume of air in No. 8 District, and to correspondingly deplete the other districts. On this day Ambrose, he continues, told him to take the boy out of the way for a bit. He did so, and went up No. 7 heading for three-quarters of an hour. He left Ambrose near the door. While away they put up some canvas, and when they returned the door was open. Ambrose then told him to take the boy away again. He was then away about the same length of time, and on returning the second time the door was shut. Harry Jones was called, and he corroborated Bailey as to going away the first time. He heard Bailey and Ambrose talking before Bailey took him away, but could not hear the words. On returning he was some 12 yards behind Bailey. He heard him and Ambrose speak, but could not hear what was said. Bailey then said, "Come on back, Harry." They then went to the same locality, and Bailey picked up a small piece of quartz. On returning the second time Ambrose was at the door, and the door was shut.

Neither he nor Bailey saw any Inspector in the mine that day.

It appears that on March 3rd Bailey was Under-Manager; and as he was taking orders from Ambrose on the day he refers to, that day must be March 10th rather than the 3rd. On March 9th and 10th the check inspectors examined the A and B Pits.

Ambrose admits the two trips of Bailey with the boy, but explains them in this way: that Bailey had told him some bords wanted canvassing; that he then sent him to do the work, and as his shift was nearly over, Jones was sent to help him. When they returned he asked Bailey whether he had canvassed all the bords. Bailey said, "No, not the gannin bord." He, Ambrose, thereupon sent him back to do it.

Next morning, on going his rounds, he found that Bailey had not yet done the work in this bord, and when he questioned Bailey the latter stated he was laying roads instead. This in itself seems to my mind a reasonable explanation of Bailey's movements that day; and, inasmuch as the boy did not hear any conversation that passed between Ambrose and Bailey, and did not see the position of the door when he came back the first time, I am of opinion that there is not sufficient corroboration of Bailey to warrant me in holding that the charge has been proved.

As to Dobb,—That on February 15th, 1898, the Under-Manager, H. Croft, told him the check inspectors were coming round the mine. That he intended blocking No. 5 overcast, and Dobb must see to the removal when they came out. This overcast is at the spot where No. 5 return airway passes over the main haulage road. The effect would be to decrease the air in No. 5 and 6 Districts, and increase the air readings in No. 2. He states that he did as he had been instructed, and, further, that he saw the Inspectors coming out of No. 2 District on that day.

(3) Forcing air into No. 2 District, February 15th, 1898.

The check inspectors were in the Mine that day; but H. Croft denies the accusation so far as he is implicated, and I do not think it safe to act upon Dobb's story under the circumstances.

(4) On February 25th, 1898, a similar occurrence happened; but on this occasion Mr. Dixon was inspecting the mine. Mr. Dixon admits that he was so engaged. But Croft again denies the charge, and I decline to act upon Dobb's testimony.

(4) Similar to (3), February 25th, 1898.

We now come to the incident of which both Bailey and Dobb give evidence. Bailey's account is very short. In examination-in-chief, he states that he saw Newburn, a deputy, putting up canvas on No. 2 main intake on an occasion when he believed Mr. Dixon was inspecting. The effect of this proceeding would be to increase the volume of the air in the other portion of the pit, and to reduce it in No. 2 District very considerably.

(5) Blocking No. 2 District, July 18th, 1895.

Bailey's version.

The date was somewhere about the middle of July, 1895. In a conversation with Mr. Atkinson, on April 12th, he said that he assisted Newburn to put up this canvas.

Dobb states that he had been sent into No. 1 return airway to do some work when he saw canvas hung across the airway. He retraced his steps into No. 2 main intake, when he came across Bailey and Newburn holding up a canvas across that airway. He did not actually speak to the men or see them, but recognised their voices as they conversed together. He fixed the date specifically as being July 18th, 1895.

Dobb's version.

Bailey's story is attacked on specific grounds, apart from the question of general credibility.

Joseph Croft says the mention of Newburn's name is quite an afterthought ; that he had not said a word to him (Croft) about Newburn on April 13th, when they discussed these allegations of tampering with the ventilation. But I think Mr. Croft must be mistaken, for he had Newburn in attendance on April 14th, when these charges were to be discussed. Mr. Atkinson states in his report (*Exhibit "V"*) that Bailey mentioned Newburn's name to him on April 12th in connection with this matter. Bailey must have coupled Newburn's with the offence previously to April 14th. Dobb can be fairly charged with having a grievance against H. Croft. In his examination-in-chief, he stated that he had made notes at the time of this matter, and also of the occurrences of February, 1898. At Mr. B. Smith's request, he produced the original notes. It is suggested that these entries are of recent manufacture. Now, although they are open to fair comment in some of the details, I am satisfied on the whole that they are genuine. On the page where these notes appear other matters are intermingled, some referring to H. Croft, others personal to himself alone. The book itself contains entries dated 1894.

Corrobor-  
ation. Dixon  
did inspect  
that day.

Newburn's  
explanation  
of the charge.

Mr. Dixon admitted in his evidence that he did inspect the pit on July 18th, as alleged by Dobbs.

Newburn gave evidence as to the circumstances. He admits that Bailey did assist him to hang a canvas about four years ago, but says that the purpose was quite innocent.

At that time, he added, the number of men in No. 10 District had been gradually reduced until, on the occasion referred to, there were only fourteen men at work in that district, with a boy and a horse. At the same time the miners were being gradually increased in the No. 2 District. The opening leading into No. 10 was reduced from 12 feet x 6 feet to 3 feet x 3 feet. Under these circumstances, undoubtedly, the air volume should be increased in No. 2 and greatly reduced in No. 10.

Not supported  
by records.

On turning to Mr. Dixon's reports of inspections in the pits (*Exhibit "W"*), I find he gives the number of men, boys, and horses in No. 10, on July 18, 1895, as sixteen. This corresponds with the fourteen men, one boy, and one horse, of which Newburn speaks ; and this date is the only occasion when the number of men in No. 10 was as low as fourteen. It also appears from the same document that the number of men in No. 2 District, on July 18th, was fifty-four, and that the number had increased by September to 143.

These facts satisfy me that the occasion Newburn refers to must be in July, 1895. But when we come to examine the air readings for No. 10 Districts, we find that on May 28th the quantity of air was 4,000 cubic feet per minute for twenty-two men, &c. ; on July 18th it had increased to 6,000 cubic feet for sixteen men, &c. ; and on September 3rd was 5,000 cubic feet for twenty-four men, &c.

This charge  
proved against  
Newburn.

If, as I believe to be the case, Dobb made this entry referring to July 18th, 1895, at that time there must have been present, to his mind, something that had a sinister aspect rather than an innocent, and Newburn's explanation of what he asserts was a legitimate transaction is not borne out by the official records. This, then confirms my view that Dobb's entry refers to something dishonest. I therefore find that the charge as to July 18th, 1895, has been made out.

I should, however, add that there is not sufficient evidence before me to enable me to say that H. Croft was a party to the wrong-doing.

*Is there any ground for questioning Mr. Dixon's boná fides ?*

Mr. Dixon's  
boná fides not  
impeached.

Dobb and Bailey gave evidence to the effect that they knew from time to time when the Inspector intended to visit the pit. They say their information was derived from the deputies or Under-Manager. It was argued that if these inspections are, as Mr. Dixon asserts, on the surprise-system, then his arrival could not be anticipated without some reprehensible indiscretion on his part.

It may be argued now, if it is proved that the ventilation was obstructed for the purpose of giving false readings in the expectation of Mr. Dixon's inspection, that he must have made known his intention to the Colliery officials. Such a charge is very serious, considering that the whole value of an inspection depends upon whether warning has been given or not. The work of an Inspector who announces that he is coming is worthless, and he is not fit to occupy such a position of trust.

But

But I am glad to be able to say that I have no hesitation in absolving Mr. Dixon from the suggestion of warning the Company as to his visits.

I can well understand that his visit might very often be known through no fault of his.

It appears that another pit, B, is worked in conjunction with the A Pit, and the inspection, whether by the Government officer or by the check inspectors, for these two pits lasts sometimes as long as three days. Consequently any part not examined the first would certainly be dealt with on the following days. Further than that, the Inspector sometimes spends a little time at the pit mouth before descending, and word of his arrival may be thus passed along. And it is noteworthy that out of the four dates specifically mentioned by Dobb and Bailey, three of them are not the first day of an inspection.

That Mr. Dixon has been deceived is beyond doubt, but I cannot see how his integrity or *bona fides* has been in the least degree damaged by any evidence that has been given in this inquiry.

For the future, however, since fraud has been proved against some of the mine officials, some measures should be adopted to prevent such tricks being repeated. Precautions against fraud on Inspector.

No doubt if the Inspector descended the pit immediately on arrival, and measured the air in the intake and return at a point as near as possible to the pit bottom before inspection, and did so again on completion of the inspection, and compared these readings with the sum total taken of the readings in the various districts, it might be some indication whether the air has been doubled in any particular air split. The nature of these precautions, however, may well be left to the discretion of the Inspectors.

#### FOURTH CHARGE:—MANIPULATION OF THE FURNACE FIRE.

Some evidence was offered to prove that the furnace fire was allowed Furnace. improperly to get low, and that it was the custom to fire up with best coal so as to increase the draught of air when an Inspector was expected. I find that that charge is not sustained.

#### FIFTH CHARGE:—DISCIPLINE.

The following offences have been disclosed in the course of the evidence. In Discipline. In connection with Wear's accident Rendell is the chief offender:—

He has offended in—

- (1) Omitting to inspect the working face of the heading where Wear was burnt before Fox went in to bale water. (*See* Section 47, General Rule 4, and Special Rule 11.)
- (2) The brattice not being carried up so as to force the air as far as the face of the heading. (Section 47, General Rule 1.)
- (3) Omitting to make a report in the Report Book of inspections made on Sunday night before the shift men commenced work. (Section 47, General Rule 4.)

This rule seems plain enough, but it does not appear to have occurred to the Manager that it applied to Sunday night inspections, when the mine had been idle since Saturday.

For the last five months this has been done, on the representation of Mr. Dixon. He also at one time was under the impression that the report was not necessary.

- (4) Not complying with the provision of General Rule 7 after being informed of Wear's accident. He evidently considered the spot dangerous for he withdrew Fox and put up a danger mark.
- (5) Making inspections after September 23th, 1898, with an unlocked safety lamp. (Section 47, General Rule 4.)

He states that he never saw a key, but the Manager and his son say that a key was close by.

- (6) Omitting on a subsequent occasion when he ignited gas to make a report to the Under-Manager. (Special Rule 15.)

In connection with Taft's case—

- (7) Omitting to report the occurrence in accordance with Special Rule 16.

Joseph Croft's offences are—

- (1) Allowing any portion of the mine to be inspected with naked lights after discovering inflammable gas.
- (2.) Omitting to have a report in the book of the result of the examination of places where Taft and Turner were to work when they were on the night shift in No. 5 District. (Section 47, General Rule 4.)

Bullerwell was guilty of an offence under section 47 of General Rule 4 and Special Rule 15 in not reporting the presence of black-damp.

In addition to these there are the numerous breaches of the statute to which Bailey and Dobb have pleaded guilty.

Importance  
of enforcing  
Act.

There is no part of colliery management which is more important for the well-being of the miner than the enforcement of the Act and the Special Rules; and perhaps there is no task that is more thankless than endeavouring to instil into the minds of the workmen the necessity of reporting to the responsible officials the presence of gas, or defects in the condition of their places. The miners as a rule are content to let matters rest, so long as no harm ensues to them. The witness, Arthur Johns, did not hesitate to say that he did not mind a bit of gas so long as it did not hurt him. But these men forget that they owe a duty to their fellow workmen, and their own families; and they do not realise that by the timely reporting of what may seem to them an insignificant quantity of gas, they may avert a terrible catastrophe in the future. Of course a man may be too fond of picking holes in the management, and reckless fault-finding is to be deprecated on numerous grounds; but no reasonable person should complain because the existence of gas is made known to the proper authorities.

In the Newcastle Pit discipline is absolutely undermined. With regard to the matters that have come before me, the tendency has been to combine to evade those provisions which are meant to ensure the safe working of the mine. The evidence shows that Rendell, the night overman, has laid himself open to prosecution for seven distinct breaches of the Act and special rules. The Under-Manager sees Bailey start off to test for gas with an unlocked safety-lamp in one hand and a naked light in the other; and, although he knows that the latter is doing wrong, not a word of remonstrance escapes his lips.

The rules of discipline are the same for all mines, be they gassy or not. The law does not allow men to decide for themselves what is worth reporting and what may be passed over. To urge that fire-damp is not likely to appear again does not even mitigate (to my mind) the offence of concealing its existence when found. It may be that the presence of gas in a pit may lead to the necessity of working the mine with safety-lamps; although I do not at present see any necessity for such a course being adopted in the Newcastle Colliery. But if the existence of gas does make such a course expedient, the responsibility should not be shirked, however great the inconvenience that may be entailed thereby.

The Coal-mines Regulation Act of 1896 was framed for the protection of the miners, and the periodical visits of the various Inspectors are in the interests almost entirely of the workers underground. The men should comply with the Statute for their own well-being: there is a corresponding duty imposed upon the higher officials; but so long as those whose duty it is to do so refuse to co-operate to secure the safe working of collieries, so long will coal-mining remain a dangerous industry.

To summarise, I find that—

- (1) Anthony Wear was burnt by an ignition of fire-damp on September 25th, 1898.
- (2) The Manager (J. Croft) and the Under-Manager (H. Croft) became aware of that circumstance shortly after the event.
- (3) The Manager and Under-Manager concealed this circumstance from the proper authorities. (4.)

- (4) J. W. Taft was overcome by black-damp in the pit about June or July, 1898.
- (5) Taft's accident became known to the Manager and Under-Manager on or about April 14th, 1899.
- (6) Neither the Manager nor the Under-Manager took any steps to inquire into Taft's case until the end of May.
- (7) The general system of ventilation in the pit is satisfactory.
- (8) On July 18th, 1895, the air courses were obstructed for the purpose of deceiving the Government Inspector, Mr. John Dixon.
- (9) There is not sufficient evidence to connect the Manager or Under-Manager with this charge.
- (10) No charge can be made against the integrity of Mr. John Dixon.
- (11) The mine in places where the workings pass through dykes or faults is likely to give off fire-damp, but it cannot be called a "gassy" mine.
- (12) Black-damp exists in certain parts of the mine, but the system of ventilation, if properly applied, is sufficient to render it harmless.
- (13) The discipline is disgraceful.

I have the honor to be,

Sir,

Your obedient Servant,

C. G. WADE,

Commissioner.

The Honorable Joseph Cook,  
Secretary for Mines and Agriculture.

1899.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## EAST GRETA COLLIERY DISASTER.

(RETURN RESPECTING, NOVEMBER, 1898 )

*Printed under No. 6 Report from Printing Committee, 19 October, 1899.*

## SCHEDULE.

No		PAGE.
1.	Chief Inspector of Coal Mines, Newcastle (wire), to Under Secretary for Mines—Manager of East Greta Colliery reports three men buried by fall of roof in main incline drive 18 November, 1898	2
2.	Chief Inspector of Coal Mines, Newcastle (wire), to Under Secretary for Mines—Further particulars respecting accident at East Greta Colliery 18 November, 1898	2
3.	Chief Inspector of Coal Mines, Newcastle (wire), to Under Secretary for Mines—Reporting as to progress made in clearing away fall in order to reach entombed men 19 November, 1898	3
4.	Chief Inspector of Coal Mines, Newcastle (wire), to Hon Joseph Cook—Reporting as to progress made in clearing away fall in order to reach entombed men 19 November, 1898	3
5.	Hon J N Brunker, West Maitland (wire), to Hon Joseph Cook—Has visited East Greta Colliery—rescue of entombed miners considered hopeless 19 November, 1898	3

MANAGER of East Greta reports three men buried by fall of roof in main incline drive Am now going up to inspect, and therefore cannot return Sydney to-night Will wire further information early to-morrow  
A. A. ATKINSON

Particulars given to Minister Register —D McL, 18/11/98

Telegram from The Chief Inspector of Coal-mines to The Under Secretary for Mines and Agriculture

18 November, 1898

ACCIDENT (East Greta) has happened in main incline drive, dipping at an angle of 45 degrees, length of fall, approximately, 40 feet, and almost uniform height of 10 feet, top end of fall, 260 feet from face. Roof still uneasy, and consider inadvisable to allow any one to pass seat of fall until roof is secured, as little or no hope is entertained that any of the three men can be alive Going down now, and will report later if you will kindly wire West Maitland station your private address  
A. ATKINSON

## The Chief Inspector of Coal-mines to The Under Secretary for Mines and Agriculture.

Coal Fields Office, Department of Mines,

Newcastle, 19 November, 1898.

Sir,

In order that you may afford information to the Minister with reference to the accident at East Greta Colliery, I have the honor to give you the following brief particulars:—

The coal is won at this colliery by means of two main tunnels, and as the seam dips at an angle of 45 degrees, these tunnels approach more nearly to shafts than level drives. The rails are laid down about 4 ft. 8 in. apart, on which runs a trolley or cage on wheels, and which forms the receptacle to carry the tubs or skips in and out of the mine.

The coal-seam is about 10 feet thick, and overlaid near the surface by hard conglomerate rock, so hard, in fact, that it was unnecessary to timber a considerable length of the tunnel.

For some short time, however, the character of the roof appears to have been changing, and shale of a somewhat friable nature has come in immediately over the seam; and the conglomerate, at the point where the fall has taken place, appears to be about 10 feet above the top of the seam.

The fall took place, at a point about 670 feet from the mouth of the tunnel, or about 127 feet from the lowest pair of levels.

It is evidently about 40 feet long, 10 feet wide, and 8 feet thick, occupying a space of about 3,200 cubic feet, and the fallen material would weigh somewhat over 200 tons, probably. This material as soon as released would, in consequence of the heavy inclination, gradually run in to the face of the drive, which is about 90 yards further down to where the men were working, who would thus have little or no chance of escape.

There were three men in at the time of the fall, and it was just about the usual hour when they should have been relieved by another shift.

The timbering in this portion of the drift has been of a very substantial character, the roof, floor, and sides all being timbered.

I examined the seat of the accident yesterday evening, and considered, with the colliery managers who were present, that it would be highly dangerous to allow anyone to pass beyond the fall until the timber has been renewed and all made safe where the fall has occurred.

The rough sketch enclosed shows the method of timbering, and further particulars you will receive by wire as the work progresses.

After conferring with the Minister, if you think it desirable that the Crown should be legally represented at the inquest, which I do not think necessary, I hope you will be good enough to advise me as to what has been decided upon. So far as I am able to judge, it is a pure accident.

I will remain here until the bodies are recovered and the inquest has been held, unless I receive other instructions.

I have, &amp;c.,

A. A. ATKINSON,

Chief Inspector of Coal Mines.

For Minister's information,—Mr. Atkinson may be informed that it is not necessary to have the Crown represented at the inquest. An inspector should, however, watch the proceedings.—D.McL., 21/11/98. Read.—J.C. It was decided this morning with Mr. Atkinson that it would be better to be represented at the inquest if one is held.—D.McL., 22/11/98. Mr. Atkinson. Crown Solicitor (with papers), 28/12/98.

Main sets of timber are 5 feet apart

*Subject* :—East Greta Colliery Accident.

Sir,

Department of Mines and Agriculture, Sydney, 28 December, 1898.

For your information, I have the honor to send herewith all official papers bearing on the fatal accident which happened at the above colliery on 18th November causing the death of three miners, [see Appendix X]; also the Inspector's reports on the colliery since August, 1897.

The Chief Inspector of Coal-mines hopes to be able to call at your office on Friday or Saturday next to discuss the points which require to be brought out at the inquest.

I have, &c.,

D. C. McLACHLAN,  
Under Secretary.  
(Per H.B.S.)

## No. 16.

Extract from *Newcastle Herald* containing Reports of Inquest on body of Albert Moncrieff.

[*Newcastle Herald*, 26 December, 1888.]

THE EAST GRETA COLLIERY DISASTER.

THE INQUEST OPENED.—GRONOW'S BODY FOUND.

MR. MARTIN, of Newcastle, opened an inquiry at the colliery surgery, East Greta, on Saturday afternoon into the circumstances attending the death of the man whose remains were recovered from the tunnel at the colliery on the previous evening. A jury of twelve was empanelled and sworn in, and evidence of identification was given. Mr. T. L. Bates, colliery inspector, represented the Mines Department, and Mr. James Curley, Miners' General Secretary, was present in the interests of the relatives of the three victims of the disaster—Moncrieff, Gronow, and Barnes.

Arthur Morrison, a wheeler, engaged at East Greta, deposed that he recognised the knife produced as the property of his brother-in-law, Albert, or Bertie, Moncrieff. He could not identify the body as it was too much decomposed. Moncrieff was 25 years of age, was married to witness' sister, and had one child—a daughter. Moncrieff was born in Sydney, where his mother resided.

Constable W. T. Doran deposed that he received the clothes of the deceased, also the corpse, from Constable Townsend. On searching the trousers pocket he found a knife, which was identified in his presence by the previous witness, and also by William Tiedeman. He had shown the clothes to the relatives of Barnes and Gronow, and they declared that they did not belong to them.

At this stage the Coroner announced that sufficient evidence for identification purposes had been given, and he issued a certificate for the burial of Albert Moncrieff.

After consulting the jury and Messrs. Bates and Curley, Mr. Martin adjourned the inquest until Wednesday, the 5th January, at the West Maitland Court-house.

On Saturday most sensational rumours were circulated in town concerning the alleged finding of the bodies of the three victims of the disaster, and telegrams were sent to all the immediate relatives of the late Daniel Gronow, informing them that his body had been found. Needless to say, unnecessary grief and pain were given the bereaved relatives when it was discovered that only one body had been recovered.

The members of the four exploring parties, encouraged by the recovery of Moncrieff's remains, redoubled their previous efforts on Saturday, and at about 10:40 p.m. discovered a body on the floor of the tunnel between two sills. It appears that they had forged their way right over the body before they realised that it was beneath them. After about an hour's work they had the *debris* cleared, and the body prepared for removal to the surface. The body was lying between the middle of the road and the right side of the tunnel. It was on its left side, with one leg extended down the tunnel, and the other bent up towards the body, which was inclined towards the centre of the road under a steel rail. The body was facing down the tunnel, and the head was drooping towards the breast. The left arm was stretched down the tunnel, and the right rested on the body. The head was close to the upper sill. Just above the sill, at his feet, Gronow's clock, which was of the one-day Bee pattern, was found, uninjured. It had evidently continued going after the fall of conglomerate, which occurred

ALBERT MONCRIEFFE.

at 7:5 a.m., as the hands pointed to 1:20 p.m. when the clock was found. Gronow always kept his change clothing in a small bag, which he usually left above where he was working in the tunnel. This bag was found above the sill at the head of the body. The panel in which the remains were found is 20 feet from the bottom. A number of iron rails and some heavy timber extended from sill to sill over the body, but did not press on it.

The members of the shift who discovered and unearthed the body were George Price, Samuel Searston, John Tiedeman, Jack Jones, Phillip Degail, Herbert Davis. The men who completed the preparations and removal of the body to the surface were Dan Genge, Herbert Genge, Frank Genge, James

James Henny, John Lishman, J. Farnham. During the progress of this sad and necessary work Mr. R. St. V. Heyes, colliery engineer, Mr. Dave Lewis, deputy, and Constable Townsend were present in the tunnel. The body was not so much decomposed as that of Moncrieff, but the features were beyond recognition. Owing to the peculiar formation of the teeth in the upper jaw the relatives had no difficulty in identifying the body as that of Daniel Gronow, leader of the ill-fated shift.

Yesterday morning Dr. R. G. Alcorn, Government Medical Officer, examined the bodies at the colliery surgery, and failed to discover any fractured bones. He expressed the opinion that death probably resulted from shock to the system and suffocation. There could be no doubt, in view of the great mass of débris over them, that the men died almost instantaneously.

There was a sad scene at the surgery when Gronow's aged father and younger brother viewed the body for identification. The poor old man was warned by Constable Doran that the sight would be a terrible one, but he insisted upon being allowed to see the body. The constable permitted him to enter the room for a few moments only. He bore himself bravely while viewing his son's corpse, but completely broke down when he retired from the room.

The funeral of the late Bertie Moncrieff took place yesterday afternoon, moving from the colliery surgery at 1 o'clock for the Church of England cemetery at East Maitland. Although the funeral was held at a very inconvenient hour, it was well attended.

During the five weeks that have elapsed since the date of the disaster, the colliery officials, Messrs. A. Thomas (manager), R. St. V. Heyes (engineer), and H. Cartwright (under-manager), have been in close attendance supervising the work of exploration in the tunnel. Yeoman service has also been done by one of the deputies, Mr. Dave Lewis, who was always ready to lead the shifts where danger had to be faced. His many friends will regret to learn that the severe strain to which he had been subjecting himself had the effect of preventing him from taking his usual position at the tunnel.

West Maitland, Monday, 1.17 a.m.

The exploring party were engaged for several hours timbering below where Gronow's body was found, and it is expected that they will finish about 3 o'clock a.m. When this necessary work of precaution is completed, the party will resume the work of exploration.

[*Newcastle Herald*, 5 January, 1899.]

### EAST GRETA COLLIERY DISASTER.

#### OPENING OF THE INQUEST.

THE inquiry into the circumstances concerning the death of Albert Moncrieff, one of the victims of the East Greta disaster, on the 18th November, was resumed before Mr. Martin, Newcastle District Coroner, and a jury of twelve, at the West Maitland Police Court yesterday morning. Mr. J. V. Tillett represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Messrs. A. A. Atkinson (Chief Examiner of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

Robert George Alcorn, a duly qualified medical practitioner, residing at West Maitland, deposed that he examined the body of Albert Moncrieff. The body was in an advanced stage of decomposition. He came to the conclusion, from information received and from the examination made, that death was caused primarily from shock and suffocation. He was almost certain that death was instantaneous. There were no bones broken.

Ada Emily Moncrieff deposed that she was the widow of Albert Moncrieff, and identified the singlet and trousers produced as her husband's. She did not see the body of her husband after death. She had one child—a girl, Evelyn May—aged 7 months.

Azariah Thomas, manager of the East Greta Colliery, residing at Mount Dee, West Maitland, deposed that he instructed certain work to be done in a part of the pit. The work was let to David Lewis, Joseph Thompson, John Griffiths, and Daniel Gronow, on an understanding that they should make good wages at driving or sinking a tunnel, or what he would call extending No. 1 tunnel. He was to see that it was done to his satisfaction, and he was responsible for the work being done well. The work was done by continuous work of three eight-hours shifts, and the five extra men required were engaged by witness at the mine, and transferred to the tunnel as necessity occurred. He did not tell them what the strata was composed of, as he understood they knew themselves. He considered everything was perfectly safe there, and that the work of cutting through was safe for them. He did not go there every day, but when he did go he was satisfied with the work. He was deceived in the thickness of the conglomerate in that part where the accident occurred. He never found a thickness of conglomerate less than 50 to 60 feet at right angles. He considered that to be the average thickness where the men worked. The men never asked him about the safety of the tunnel.

To Mr. Tillett: The work was commenced from the lower level. They commenced to clear the old sump out on the 22nd June, 1897, preparatory to proceeding with the driving, and had got nearly to the end of the job when the accident occurred. The fall occurred 127 feet from the lower level, and 260 feet from the face. The tunnel had passed the place where the fall occurred some months previously. He went through the tunnel many times, and did not see any indications where the fall occurred. He did see indications in other parts of the tunnel, about 40 yards from the face. He noticed pressure on the timber there. The caps were bending, but that did not indicate to him a change in the roof. He did take precautions to examine the caps, but as they were not considered dangerous the timber was not strengthened. The same timbering was not maintained right through the tunnel, because they considered that the greater the depth the stronger the timbering should be. He was last in the tunnel on the Tuesday before the accident, which occurred on the Friday. That was one of the occasions on which he noticed the pressure on the roof. No complaints whatever concerning the roof had been made by anybody. He heard of none. The men were not to make, if they worked to his satisfaction, less than miners. They were paid at per yard, and extra for anything extra asked for. They had not to do the work in a certain time. No time was fixed. There were to be three in each shift. The four men were to have assistance if required, and the assistants were to be paid out of a lump sum. There was no written agreement. Under General Rule 4 of the Coal Mines Regulation Act, the four men—Lewis, Thompson, Griffiths, and Gronow

Gronow—were appointed as competent persons to make the inspections as required by the rule. Before they were paid the work was measured up, and they were supposed to settle with the others. He considered he was responsible for the wages of the other men. The model produced would show how the timbering was done in the tunnel. He also produced a tracing, showing the position and dimensions of the tunnel. The props and caps were from 8 to 10 inches in diameter, with a minimum of 8 inches. The sets were placed 5 feet centres apart, and were slabbed over the roof, by the sides, and under the sills. The slabs were 6 feet long,  $2\frac{1}{2}$  inches to 3 inches thick, and from 6 inches to 9 inches wide. The height of the tunnel from the top of sill to bottom of the cap was 10 ft. 6 in., and the mean width 12 ft. 6 in., or 12 feet at the cap and 13 feet at sill. The timber which fell had since been taken out, and some of the caps were found broken. He could not say whether those caps showed signs of having been bent before they were broken.

To Mr. Atkinson: The timber used was ironbark for sets and ordinary hardwood for slabs. The sills and caps were let into the sides. The caps were 15 feet long, and there was 15 inches outside of the prop on each side. They were let in from 8 to 10 inches. The sills were 16 feet long, and were let into the coal. They avoided the roof. The floor was moderately soft, and became softer from wet and exposure. The timber used was newly cut. It was not seasoned timber. The props were mortised into the sills and caps about 4 inches deep. The timber above the lower level was of the same dimensions, but the sets were farther apart, being 8 feet centres instead of 5 feet. He had occasion to renew some of the sets above the lower level some years ago, but not recently. The sills breaking rendered this renewal necessary. There was very seldom any fracture of caps or props. All pressure came from below. This pressure was probably due to the expansion of the floor by exposure to water and air. All timber for some time used was ironbark. He could not compare it with other timber, as he had used it almost exclusively. He had used, recently, as miners' props, ordinary hardwood. He had no fall previous to the late one in any part of the mine to indicate that the conglomerate had disappeared. The conglomerate at the lower levels was proved at 7 feet thickness at right angles. He did not know how much more it was proved. The station, under General Rule 4, was on the surface. The men commenced work on a Monday at 7 o'clock. David Lewis made the examination before they commenced work on Monday morning, and then took the night shift at 11 o'clock. He made a report every day in writing. None of the other men made a report. Reports on the condition of the tunnel were made every week by the engineer, under General Rule 5. The engineer's inspection had regard to the condition of the timber and other things. No defects had been reported by the engineer. There were refuge holes made in the tunnel at intervals of 20 yards. He did not know if any of the intervals exceeded 20 yards. The last refuge hole should have been made on the night of the disaster, within 10 feet of the face. It was generally instructed and understood that the refuge holes had to be cut at every 20 yards, and to be made immediately after securing the bottom corner of the intended manhole. None of the deceased were found in the refuge or manholes. They were found in the tunnel. All manholes found below the débris were completely blocked up. The tail end of the débris was 130 feet from the face of the tunnel. Under General Rule 39 the workmen did not make any inspection of the whole mine. He would estimate that caps he saw bent were bent from 2 to 3 inches. They did not require renewing, but would require strengthening ultimately. No strengthening was required below the lower level.

To Mr. Curley: He had a copy of the Special Rules of the colliery. Before the work was commenced he had an interview with the four men separately. He saw Lewis first, and told him he would like him and his party to take the work, as they had done a similar work so satisfactorily. They conversed about terms, and it was agreed that they should have a certain price, which he considered would be sufficient for them to make good wages, provided the ground proved the same as it did at the commencement; but should it alter and become worse he would give them more, and see that they would get wages equal to the miners. The price agreed upon was £3 19s. per yard. Nine men were engaged; three in each shift. He engaged all men at the colliery, and engaged all the nine men working in the tunnel. Before they began the work at the tunnel they were working at the East Greta Colliery in a general way. The assistants, that is those five men working, with the four who had the job, came to him and asked to be transferred from the mine to the tunnel, and he gave them permission. Moncrieff and Barnes were assistants. He considered both men sufficiently practical to work as assistants. He could not tell how long they had worked in the mine. Moncrieff was onsetting in the No. 2 tunnel when he asked to be allowed to work in No. 1. Barnes was last engaged in No. 2 in filling coal from a miner. He did not regard his arrangement with the men as a contract. He would not call it a daily wage pay, but an arrangement satisfactory to both parties. It was a verbal, not a written, arrangement. There was nothing binding in any way. The payment arranged was carried out, and was satisfactory. He last noticed the bent caps on the visit previous to the one on the Tuesday before the disaster. He made no note of the date. He could not tell whether he went into the tunnel once a week or once a month. The report books were kept at the colliery office, and were either examined by him or read to him. He saw nothing in the report books about the caps being bent. He did not consider it of sufficient importance to find the matter missing from the report-book. There were no extensive falls in the colliery prior to the disaster.

At this stage the inquiry was adjourned for an hour and a half.

On resuming, in reply to Mr. Curley, the witness, Mr. A. Thomas, deposed that he believed the tunnel was inspected by David Lewis on the night prior to the morning of the accident. That was previous to the deceased men entering the tunnel. He believed the three were working at the coal face that night, but one should have been making the manhole. Thompson and another man worked with Lewis on the shift timbering nearly all the time. Lewis and his men worked at the face when they were not timbering. Griffiths and Gronow, as well as Lewis, inspected the tunnel in the ordinary way. Griffiths and his men worked at the face. He considered it was complying with General Rule 4 for those men working at the face to be inspectors. He appointed them to inspect, but had no record of the appointment. He had some knowledge of the thickness of the strata overhead at the colliery. It could be seen on the surface. Some years ago he had a place driven from the lower to the upper seam off No. 1 level in the same tunnel, and that gave him an idea of the thickness, which was from 50 to 60 feet at 212 feet perpendicular from the surface. He had never seen it of a less thickness at the colliery. It was hard and strong. He had no knowledge of the stratification of the Maitland Colliery. They had no slow movements coming down and crushing pillars. He attributed cracks in the surface of the ground to subsidences after removal of pillars. The cracks occurred in old workings. From surface indications there was subsidence. He knew of no fall there. In No. 2 tunnel they

they had some floor upheavals. They had not done much extra work in the way of timbering since the disaster—not more than usual. He had the inspectors there. They drew his attention to the deeper workings and to the timbers and pillars. They advised him to use more timber in the mine, having regard to the altered state of the roof as revealed by the fall. They suggested that larger pillars should be left in the lower working. He had some communication in writing from the inspector, and was willing, with Mr. Atkinson's consent, to produce it. [*The letter was read, and, at Mr. Curley's request, was put in as evidence.*]

Mr. Bates was the inspector who usually inspected the colliery, but he never drew attention to anything of a very serious nature. He did make suggestions regarding the fencing of the machinery, and of the opening of the tunnel; also regarding ventilation, methods of signalling, security of roof in No. 2 tunnel on No. 1 level. He did not suggest that new timber should be put in. He drew attention to some timber broken by floor-pressure about two months ago. Attention was also directed to some timber in No. 2 level of No. 2 tunnel, showing evidence of pressure, two or three weeks ago. He did not suggest that more timber should be put in there. He sent no written communication about the matter, nor about any defect in the colliery. He had no objection to the men having two inspectors from their number, under Rule 39, as regards examination. He had never asked them to do it, nor to exercise the privilege. The face where the men were working at the time of the disaster was 387 feet away from any opening branching off the tunnel. A parallel drive was started, and was being worked by another gang of men at the time of the disaster. The depth the men were down gave him no anxiety as to their safety. The fact of the tunnel being near its present destination did not influence him in any way with regard to ordering additional timber to be put into the level. The fact of the inspector having drawn his attention to bent caps in other parts of the mine had no influence with him in attempting to get more timber into the tunnel before he considered it was required. He could not say how much coal, &c., came out in a shift, and the men placed no token on the tubs. No information was needed of that nature. The weighman could not tell. Gronow, Moncrieff, or Barnes never at any time complained of broken timber or of danger in the tunnel.

To Mr. Millard: He could have stopped the sinking of the drive at any time he wished. There was no agreement that they were to sink so many hundred feet in a certain time. The same four leaders had sunk the drive in No. 2 tunnel, and the pay was satisfactory to them, and the work to him. The rate of pay paid in No. 2 assisted in arriving at a right figure for No. 1. The leaders had good experience of the kind of work to be met with in the tunnel, and were well qualified for it. No ordinary miner, unless experienced, could do the work. He knew of no men anywhere better qualified to do the work than Lewis and his three mates. He could produce a general plan of the working of the colliery. [*The plan was produced.*] The seam at No. 1 tunnel was at an angle of from  $45\frac{1}{2}$  to  $47$  degrees. In No. 2 tunnel the length was 1,132 feet. Both seams crop out at the surface, and owing to the inclination the seams crop out close together. The stratum between the two seams is composed of conglomerate. As they drove No. 2 tunnel they found the same conglomerate roof, and had no indications prior to the fall of the conglomerate having thinned out. From indications in other places he found this conglomerate associated with the seam in the roof. When prospecting for the crop, the conglomerate was the indicator to where the seam lay for many miles from East Greta Colliery. It was a very hard conglomerate, and was very expensive to remove. It was an excellent roof for a coal-mine, having strength and cohesion. When working in No. 1 tunnel there was no indication of the conglomerate thinning out. At the seat of the big fall the top end of the conglomerate showed from 2 feet tapering to 2 inches and back to 2 feet at the bottom of the fall. Thirteen feet above the roof there was a band of conglomerate 2 feet thick, and a few days after the first fall this band also fell. Between this band and the band on the roof, and also above it, was mudstone, a soft weak substance. From what he had seen since the fall, he was of opinion that the mudstone and the very thin shell of conglomerate fell suddenly. From the top of the fall water is now coming. There was a subsequent fall on the 26th November, which proved 2 feet of conglomerate with mudstone above it. Very little of the roof lower down was broken. The place where he saw the caps bent was away from the fall, and they were still in the tunnel, only bent more. There was no timber bent at the seat of the fall. Pressure from below would bend the caps. The floor was a soft stuff, of the nature of fire-clay. The seam was about 10 ft. 6 in. thick in No. 1 tunnel. The tunnel was about 13 feet high when excavated. The fact of the timber being to a certain extent green was in its favour. He knew of no better timber that could be got than that which he used. It is recognised as being the best timber for strength and durability. The particular manner in which the tunnel was timbered has been recognised as the best. He went down the mine almost daily. He had been at No. 2 level several times a week, and from there the tunnel was straight, so that he had a good view to the face, and frequently held a conversation with the men below. In his opinion the cause of the accident was the change of roof, which was not apparent from the usual conglomerate to a soft mudstone, that being in a big pothole in a strong conglomerate roof, from which it shelled away.

At 4:30 p.m. the inquiry was adjourned until 10:30 this morning.

[*Newcastle Herald, 6 January, 1899.*]

#### EAST GRETA COLLIERY DISASTER.

THE inquiry was resumed at the Court-house, West Maitland, yesterday morning, before Mr. Martin, Newcastle District Coroner, and a jury of twelve. The following gentlemen were in attendance at the solicitors' table:—Messrs. J. V. Tillet, Millard, F. A. S. Bowden, Jas. Curley, A. A. Atkinson, and T. L. Bates.

The Coroner announced that he would not be able to sit this morning.

Continuing his evidence, which was interrupted by the adjournment on the previous evening, Mr. Thomas, manager of the East Greta Colliery, in reply to Mr. Millard, said he knew of no reasonable precaution not adopted by him that could have prevented the accident. The place where Mr. Bates drew attention to timbering was at the other side of No. 2 tunnel, and 28 chains from the seat of the fall. As No. 1 tunnel was cut no coal was worked on either side, so that extra strength was given to the roof. The pressure which caused the timber to bend in No. 2 could not possibly have caused the accident in No. 1 tunnel. The conglomerate has been standing between the surface and the top level without timbering for over seven years, and is still good and strong. There was no one in the colliery whose inspection

inspection of the tunnel would have been better than that made by Lewis, who worked for witness in the old country, and was skilled in that class of timber, and in timbering in mines with very bad roofs. That was in South Wales, in a mine 3,000 feet from the surface, and with the worst roof in the world. The caps and props were carried away by the fall, and only the sills remained. Probably 100 tons of stuff went down in the first fall, but it continued falling for days. After the fall the last set standing was made secure, and every effort was made, with safety of those working in rescue, to recover, if possible, those below before death. No expense was spared in the work of rescue. Four gangs of six hours' shifts each were engaged, and he was assisted by the advice of other colliery managers and Government inspectors. In the general working of the mine the amount of timber used was left to his discretion. He held Colonial certificates under the Act, and certificates of competency under the Imperial Act. He served his time as a mining engineer after receiving his certificate, and had experience in working coal at an angle in America and in England.

To Mr. Bowden: He had been over seven years with the company, who had never restricted his expenses at the mine. He selected the timber, which was dressed at the surface of the mine, and was seen by the Government inspectors, who, if not satisfied with, it would have condemned it immediately. The timber when put in was in the best condition. The timber removed after the accident was in a perfectly sound condition, and could be seen by the jury at any time. He believed the Government inspector went down the tunnel when it was in course of construction. The inspector did not find any fault with the timbering in the tunnel, or make any suggestions concerning the same. Where the inspector drew his attention to bent timber he had previously had the place strengthened. Whenever the inspectors did draw his attention to anything he did attend to it. The tunnel was intended as a permanent job, and any break in it would incur extra expense, so that he endeavoured to make it extra strong, as it was intended to be the main artery of that portion of the mine. It would have been a false move to have been economical with timber.

To Mr. Millard: When they continued down the extension in No. 2 tunnel they had a conglomerate roof right through.

To the Jury: The parallel drive would have been a safety to the men going in and out after its completion. The tunnel was thoroughly ventilated. When driving the tunnel under the seat of the fall no false sets had to be removed.

To the Coroner: No mention was made to the four men of the distance it was intended to drive the tunnel, as the distance would depend on the dip.

To Mr. Curley: Occasionally the top coal had been worked, and he had known bits of the roof to fall after the tops were removed. It fell after the timber was pulled out. He had known some to fall behind miners. It did not occur in more than one in ten of bords where they were working tops in. At present they had no tops to work, but would work them when it was safe to do so. It would be dangerous to work tops where there were bad roofs. They worked bords of 8 yards at the outside, and pillars from 5 to 11 feet. Mr. Heyes, colliery engineer, gave him intimation of the accident at about 7:30 on that morning.

John Jones, a wheeler, engaged at East Greta Colliery, and residing at East Greta, deposed: That he knew the three deceased men, and also that the inquiry was being held concerning the death of Albert Moncrieff. He was working in the jig just off No. 1 tunnel on No. 1 level on the morning of the disaster. Mr. Cantwell and his son Thomas were working with him. He saw the light in the tunnel at 6:35 a.m., where Moncrieff was working at the face. He called out to Moncrieff, who replied. He went down the jig to work, and between 5 and 10 minutes to 7 heard a noise like thunder. He went towards the tunnel, as he was startled, and heard the noise of falling stuff. He called out to those on top that the tunnel was falling in, and asked them to send the "alligator" down. He called the names "Moncrieff," "Gronow," "Barnes," and got no answer. The Cantwells clambered up the tunnel, and he remained at the level. He also helped in the search for the bodies, and found Gronow and Moncrieff. They found Moncrieff with his face to the slabs, and Gronow just below Moncrieff's, on his side. He was working at the colliery two years, but had never been below the level in No. 1 tunnel before the fall. Where he had worked the roof was composed of coal and conglomerate. He had only seen little indications of the roof working. He had noticed timber bent, but not broken. He thought it was a safe roof, or he would not have gone into the tunnel. He never heard any of the men complaining of the roof.

To Mr. Atkinson: He went to work at 11 o'clock on the Thursday night before the fall. He went down with Moncrieff to work, but had no conversation with him. In the bords in the steam jig of No. 2 tunnel he had seen a soft stone fall with the conglomerate. That was a long way from the fall. He remembered no falls nearer to the big fall. He never saw any falls of roof in the model jig when he worked there. The jig he was working in on the day of the disaster was 40 yards from No. 1 tunnel. He was working 30 yards from the level, and coal was left in the roof nearly the whole way. He thought the seam was 8 or 9 feet thick. He had a copy of the Special Rules.

To Mr. Curley: He never saw broken timber above or below the fall before the fall occurred. The caps he saw broken after the fall were broken in halves. He occasionally heard cracks and shakes in the levels and bords, but they never came to anything. That was at the other side of No. 2 tunnel. He could not say whether they were cracks from wood or coal. He noticed the coal a bit loose sometimes on the pillar sides about three months ago in No. 2 tunnel. He never noticed any timbers broken. In different parts of the pit he noticed caps bent. He never heard any of Griffiths' or Thompson's parties complaining of the roof.

At this stage the inquiry was adjourned for an hour and a half.

On resuming, at 2:30 p.m., John Jones, in reply to Mr. Millard, said he knew conglomerate when he saw it. With the conglomerate in the last fall there was some ironstone and some soft stuff. He saw the soft stuff in the mine before lying along the roads in the levels. It might have come from the roof. It was of a whitish colour. It was of a pebblish nature. He never noticed any of the soft stuff without the pebbles in the mine. He never saw any of this soft stuff in the roofs where the falls occurred after removal of props. The stuff there was a white stone. At 6:35 a.m. on the morning of the disaster, when he was at the level, and when he heard Moncrieff reply "Hulloa" to him, everything was all right. When he heard cracks and shakes in the mine he never reported to the manager or under-manager. The cracks he heard did not indicate danger. He had two years' experience in the mine, and other experiences at Home.

To

To the Jury: The white stuff he saw in the bords above where the conglomerate fell was sandstone. He never heard of Moncrieff saying anything to anyone about the roof. He could not say if Moncrieff and his mates would take the fall in the tunnel for the sound of coal falling into the alligator.

David Lewis, a miner, residing at East Greta, deposed that he was employed in the East Greta mine for about four years, and on the date of the accident was engaged sinking the No. 1 tunnel from the lower level. He was on the shift relieved by deceased. Thomson and Weller were with witness. The job of sinking the tunnel was between them. No distance was mentioned, as the manager could stop them at any time. They were to be paid by the yard, and were to be paid extra if there was extra trouble, so as to get fair wages. They had to do the timbering as well as driving. Nine of them were employed, three in each shift. Four of them took the job, and there were five assistants. The assistants were paid by the four, and were paid a daily wage. Those five were not included in the arrangement with Mr. Thomas of getting a daily wage. He was one of the deputies, and made his last inspections at 10:30 and after 11 p.m. on the Thursday night before the accident. He entered the report in the report-book at the office some time after 12 o'clock that night. The deceased men were then at work. The result of his inspection was that he believed all was safe. He inspected the roof right through the tunnel, and saw no indications of danger. A few sets were bent at the caps about 40 yards from the face. He did not consider these sets dangerous. He had seen those caps slightly bent on previous occasions. The sills might have risen and bent the caps. He never saw a move in the roof of No. 1 tunnel. He had seen no other falls or movement of roof in any other part of the mine.

To Mr. Atkinson: He was appointed a deputy about the end of June or the beginning of July, when the No. 1 tunnel was about to be extended below the lowest levels. He had a copy of Special Rules, and had read the "duties of deputies." He never had occasion to report any danger or defect. There was nothing dangerous to report. His inspection included No. 1 tunnel as far as the dam, but not the back place or the parallel jig. On the Monday before the accident, as on every Monday, he went to work at 4:30 a.m. and stopped until the men went to work. He examined No. 1 tunnel each Monday morning thoroughly, and made reports in the book at the office. No workman ever asked to be allowed to see the report-book. If they had done so he would have allowed them. Where the caps were bent the pressure in the floor would cause the caps to bend first, if the end of the caps were not tight. There was no space left between the slabs on the caps and the roof. He had no occasion to renew any of the sills in that or any other tunnel. The caps would be bent about 3 inches. Some sills were bent a little at the same place. Pressure from the floor and slight pressure from the sides would cause them to bend. He would not expect to get much side pressure in a single drive. He had seen no evidence of the coal being off the sides. In his capacity as deputy he did not think such bending of sufficient importance to discuss it with the manager. If he had seen similar bending in a sinking shaft he would consider it necessary to report it. In the No. 1 tunnel he did not deem it necessary, because he did not think there was the least danger of the timbers giving way. In consequence of illness after the second body was recovered he was prevented from knowing exactly where the body of Moncrieff was recovered. He never thought it necessary to ask for more timber or stronger timber to be put in. It required three men to fix a set. It would cause no inconvenience to fix in timber of a larger diameter. He was at the tunnel seven or eight minutes after the fall, and he went down with Messrs. Thomas, Hayes, and Cartwright to the edge of the fall. He shouted out to the three men below, but got no reply.

To Mr. Curley: When he made the reports on the Monday morning he returned the same night for another inspection. He commenced work at 11 p.m. on the Monday night, and worked eight hours. Some weeks he began work at 3 p.m., when another shift would come out. He inspected for the first shift at 4:30 a.m., and went home when the shift went to work at 7 a.m. He returned at 3 p.m. with his own shift, and made his next inspection before the 11 p.m. shift. He would make another inspection at 1 a.m. on the Tuesday morning, and that was sufficient on his part for the 7 a.m. shift. The other leaders had to inspect as well. He did not report in a book. When he started as deputy, Mr. Thomas told him to examine the tunnel and report every morning in the book at the office, and if he saw any sign of danger to withdraw the men and report at once. In the book produced, his first report appeared on 1st September. He made a mistake in saying it was in June or July. He worked at the coal face with one shift, but most of his time he was timbering. He very rarely got coal. He never noticed any breaks or falls in any other part of the mine. Gronow never spoke to him about the bent sets. He drew Thomson's and Weller's attention to the bent caps in a casual way. He did not remember the time. He never thought of placing other sets in where the caps were bent. When the work was commenced he was instructed to have sets 5 feet centres apart, and could have put others even less than 5 feet apart. It was left to him by the manager. If he saw there was the least danger in the bent caps he would have strengthened the caps. In the absence of the manager, he gave official orders to the other men in the tunnel. In a fortnight they took from 9 to 12 yards of stuff out of the drive. He did not consider it singular that he did not report the bent caps to the manager, as he did not believe there was any danger.

[*Newcastle Herald*, 11 January, 1899.]

#### THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieff, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning, at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillett represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, Manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Messrs. A. A. Atkinson (Chief Examiner of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

David Lewis, continuing his evidence, in reply to Mr. Millard, said that the roof generally in the mine was conglomerate. Before the accident he never saw any sign of that conglomerate running out or ceasing. The conglomerate continued all the way down No. 1 tunnel. The stuff that came through at the fall was a sort of a mudstone, a soft stuff. Before the fall he had never seen any sign of that soft stuff in the roof. There was no indication that would lead him to suspect the presence of mudstone there. Conglomerate made a good roof. It was a hard conglomerate. He got the extra depth by cutting out of the

the bottom, it being softer than the roof. In some places he cut into the roof, perhaps from 1 to 4 inches, and always found it very hard. He had some experience in cutting drives of that description, but not of exactly the same angle. He had experience over thirteen years in timbering. The system of driving and timbering in No. 1 tunnel was the best. He was stinted in no way for timber. The arrangements for wages worked satisfactorily. The place where he noticed caps bent was about 40 yards from the face, and not at or near the seat of the fall. So far as he could judge, the force which bent the caps was not the same as that which caused the fall. Had he strengthened the caps that were bent, it would not have prevented the fall. In his opinion, the bent caps gave no indication of what was the real danger. The caps under the fall must have been broken by the fall. He made an inspection from two to four times every twenty-four hours, but only one that he reported. He made one inspection at the end of his own shift. He never saw any sandstone in the roof of the seam. Since the fall he had been working in the tunnel very long hours. He worked without sleep until his health broke down, just before the last body was found. Since then he had been very ill.

To Mr. Bowden: He could not say when he first saw the bent caps. They were put in about two or three months before the accident. They drove from 9 to 12 yards a fortnight. Those were the only bent timbers.

To the Jury: According to regulations he was only required to make one inspection in twenty-four hours. He had no special reason to make more than one inspection other than that he always considered it his duty to keep a look-out. His first report and others which followed showed that all was safe. The cap-piece between the props was 12 feet long. With the cap sagging 2 or 3 inches the pressure would still be on the props. Four of the caps were bent together, but that was no indication of something being wrong in the roof. He saw the inspector at the top of the tunnel once. He could not say whether he was there oftener, because he (witness) mostly went down on the 11 p.m. shift. His mates never told him that the inspector was down the tunnel. His shift put timber in when sufficient coal was removed. When there was no room his shift would slab the bottom some sets back. When there was no timbering or slabbing to be done his shift worked at the coal.

To Mr. Bowden: It was his duty to maintain constant supervision over the tunnel. The timbers which he noticed bent were there still, but were broken since by the weight from the roof. That place was retimbered since.

To the Jury: When he inspected the caps before the accident they were bent, but after the accident they were broken. It took him about half an hour to inspect the tunnel.

To Mr. Curley: Thompson and Weller worked on his shift. The skip he went down in moved slowly. He never timed it.

To Mr. Millard: The bending of the caps was caused by the floor. He had experience of caps bent by the floor in other parts of the mine. There was a sort of swelling in the floor.

To Mr. Tillett: The caps were bent before the accident by the pressure from the floor, and were broken afterwards by the fall.

Thomas Cantwell, a wheeler, residing at East Greta, deposed that he knew Albert Moncrieff.

To Mr. Tillett: He was working in the lowest level in No. 1 tunnel with his father and Jones. He was working on the level. He went to work at 11 p.m. on the 17th November, and the three deceased went down with him. During the shift, at 6.30 a.m. on the 18th November, he called out to the men below for the "alligator," and they replied, "You can have it directly." After that he got the "alligator," filled it, and sent it on top. After that it went down to the deceased men, who filled it, and it had not reached the top when the fall commenced. He was about 5 yards from the tunnel in the level, and stepped back a few yards, because he thought the "alligator" had broken away. He then went in towards the jig, and met his father. His father, Jones, and he came out. Jones and his (witness') father shouted down to Moncrieff and Gronow. They then rapped for the "alligator." He also called on top for the "alligator," but it did not come down. He and his father then walked up the tunnel. He was working for five years in the mine. He had seen small falls in the mine in the old levels. He noticed movements in the roof of the steam jig bords, where the roof was of coal, but never reported it. He never heard of complaints of the dangerous nature of the roof from other miners.

To Mr. Atkinson: He worked in the back drive, or parallel jig, off the bottom level, before the accident. All the coal was not being worked. Some portion of the seam was left next the roof. He had no opportunity of seeing what the roof was there, except in one spot at the top of the jig, where it was pebbly conglomerate. The coal next the roof in the back drive stood well. Prior to the accident he had never been below the lower level in No. 1 tunnel.

To Mr. Curley: He noticed the roof down in the steam jig. It was a sort of white sandy stone, with little pebbles in it. It had fallen when he noticed it, and was mostly in fragments. The width of the level where he saw this was 9 or 10 feet. It had fallen out between the bars or cap-pieces. The bars there were 6 or 7 feet apart. It fell during daytime, on a shift in which he was working. About a couple of skips fell. Skips carried half a ton. He saw such falls on more than one occasion. They stopped work while it was cleared away. It would leave a space of a foot or 18 inches in the roof. He noticed no retimbering there. None of the deputies went in to see it. He did not know who the deputy was. It occurred two or three years ago. The deputies could see the stone on the side of the road. They used not to report such falls. Mr. Thomas was the manager of the colliery at that time. He noticed coal working about six or seven months ago in the steam jig in the bords. He saw some timber bent and broken. He saw much timber broken. The props were in some cases bent, and in others broken in three bords. The bords were about 9 yards in width. He did notice coal shelling off the pillar sides, sometimes five or six skips. He did not see top coal fall out. There is no board at the outside of the tunnel; no deputy's board. He had seen roof down in different places at different times in "slippery" level, and in the old bottom level. It fell between the timber in the "slippery" level, and in a similar manner in the old bottom level. The stone was damp in some places. It was not soft, but crumbled. He heard none of the deceased make any remark about the tunnel. He saw Gronow, Barnes, Moncrieff, and others at the mouth of the tunnel when they went to work. The last fall he saw occurred about two years ago. He had worked in No. 1 tunnel for three weeks before the accident. He never saw Lewis at the mouth of the tunnel at any time he went to work. He saw him of an afternoon coming up after they went down. During the three weeks he never saw Lewis standing at the mouth of the tunnel. They went down the tunnel on the "alligator" in about two minutes. For four years he had never walked in

or

or out of the tunnel. At the speed he went down in the "alligator" he could not have examined the tunnel very carefully. He would have time to see whether caps were bent, but he saw none. Where he saw the falls on the levels he also saw bent and broken caps.

At this stage the inquiry was adjourned for an hour and a half.

Cantwell resumed his evidence, in reply to Mr. Curley, at 2:40 p.m.: He had often conversed with the men down the tunnel, down which he had looked. He had seen bent caps 100 feet or more from the level. There appeared to be four or five. He noticed them a fortnight before the accident. They appeared about 9 inches below the others. He never heard the men talking about this matter.

To Mr. Millard: He never worked in any colliery other than East Greta. He was never lower down No. 1 tunnel than the level. At certain times, between a quarter and ten minutes to 3 in the afternoon, one could see down the tunnel nearly to the bottom. In the morning one could not see lower down than about 70 feet. He had worked four night shifts that week. He was 5 yards along the level from the tunnel when the accident took place. He heard no timbers straining before the fall, which took place quite suddenly.

To the Jury: He heard someone on the cricket-ground, two or three days before the accident, say they had heard some of the deceased complain of the state of the roof. He did not know who said it. The caps he saw bent were splintered on the under side. The noise made by the "alligator" might prevent him from hearing the cracking of the timber. He never saw any of the inspectors down the tunnel or in the new jig.

To Mr. Millard: If he saw anything dangerous where he was not working he would not report. He had never made any report. He had no idea a fall was going to take place.

To the Jury: He trusted to the deputy going round to see that all was safe. If the deputy said all was safe he would work then.

To Mr. Tillett: He read the Special Rules but he did not know Rule No. 70, which obliged anyone in the mine to report any insecurity in the roof, &c., to the person in charge.

To the Jury: He would trust to his father, who was working with him, to see that they did not stay in any danger.

Henry George Curtis, banksman, at East Greta Colliery, and residing at West Maitland, deposed that he went into work at 11 p.m., on the 17th November, with the three deceased men. He did not speak to any of the deceased after that, but got coal from them—several skips. He received the last skip at about ten minutes to 7 o'clock. He heard someone sing out, "The tunnel's falling in." He could not say at what hour. He ran and looked down the tunnel, and heard someone call out, "Send the alligator down, the tunnel's falling in." He sent the alligator down. He was four months at the colliery, and had never heard any complaints from the men about the roof.

To Mr. Atkinson: His duties were confined to the surface. He never at any time went down the tunnel. He could not say whether the signal for the pulling up of the last skip came from the level or from the face.

To Mr. Curley: The signal was in the engine-house. He could hear the signal at times. When the last coal was brought out he could not say what signal was given. He got to his post at the mouth of the tunnel at twenty minutes to 11 that night. He saw Moncrieff, Gronow, and Barnes go down the tunnel. The two Cantwells and John Jones went part of the way down. He saw no one else go in or come out that night. A board with signals on it was at the mouth. There was nothing else on that board but signals. When he got the report of what occurred in the tunnel, he sent the "alligator" down. John Jones was the first out of the tunnel, and he said the tunnel had fallen in. Witness sent some one to go and call Mr. Heyes, the engineer, who came to the tunnel about ten or fifteen minutes later. He (witness) had not been down the tunnel since the accident.

To the Jury: He had seen the inspector going down No. 1 tunnel, but how often he could not say.

John Downie, timberer, in East Greta Colliery, deposed that he was working in the jig alongside No. 1 tunnel at the time of the accident. He took part in the search for the bodies, and saw Barnes' body when it was found, lying on the left-hand side of the tunnel, standing or stooping on the last set of timber. The nearest manhole was twenty yards from him. They did not clear away the debris to the face. He was working in the colliery between three and four years. He was never down No. 1 tunnel before the accident lower than the bottom level. He never looked down the tunnel. He had known slight falls to take place in the roof along the levels. Conglomerate fell from the roof. It was not the same as the stuff which went down in the big fall. Conglomerate, ironstone, and mudstone were in the big fall. The falls in the levels occurred a good while ago, in the slippery jig. He noticed caps bent in the tunnel. They bent from the weight of the floor, but in some cases from the roof. When they bent from the floor the sills bent up also. The sets below the fall were broken in No. 1 tunnel from roof pressure. Before the fall he never heard anyone complain of the state of the roof, or timbering in the tunnel.

To Mr. Atkinson: The jig he worked in was parallel to No. 1 tunnel. He put the timber in there. The timber was under the coal. He had no opportunity of seeing the roof above the coal. Michael Byrnes worked with him on the shift. In the back drive the sets were put 6 feet apart. The timbers were 6 inches in diameter. The timbers seemed to stand in the back drive, and did not bend. Cantwell made no remark concerning bent caps in No. 1 tunnel. No one else did. When he recovered Barnes' body he could see the coal face. The body was about 6 feet from the face. From the position of the body it appeared Barnes got there for refuge. He did not see Moncrieff or Gronow recovered.

To Mr. Curley: The deputy or the underground manager always gave him his instructions to timber. Hoskings and Higgison were the deputies, and Cartwright was the underground manager. He was never told to do any special timbering in No. 1 tunnel. He was instructed to go to No. 4 bord, in Armstrong's jig, on the day of the disaster, to timber. The jig was in No. 2 tunnel. He had to timber the top rib, which was all broken away. That timber was set under the coal roof. A good amount of props had been broken there lately. They were broken from floor pressure, and in some cases from the roof. He had done a good deal of timbering in No. 1 tunnel from the fall to the face. Some caps below the fall were broken. Pretty well all caps from the fall to the face were broken. The timber was iron-bark. He never measured the distance the sets were apart. He had since put new sets in, and they were about 15 inches from the broken sets. Two sets were put between each pair of broken sets. He never knew of any extensive fall in the colliery. He did know of rails being bent by floor pressure. He had been sent to do some timbering in broken places—slight falls—along the level. The falls extended from

from 1 foot to 3 feet into the roof. The stuff that fell in those places was conglomerate. Slight falls had occurred on the bottom level on the Scotch heading side. He had done no timbering in the bords, and had seen no falls when they were taking the top out. Scotch heading was on the right-hand side of No. 1 tunnel. He knew of other deputies, Mr. Jowitt and Mr. Higgison. He knew of no others.

To Mr. Millard: He had worked in no other colliery. None of the falls were very near to No. 1 tunnel. Armstrong's jig was near No. 2 tunnel. He had nothing to do with the timbering of No. 2 tunnel.

To the Jury: The tunnel was slabbed all round. He never looked down the tunnel when passing into the level. He timbered all through the jig with the other shifts.

[*Newcastle Herald*, 11 January, 1899.]

#### THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieffe, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillett represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Messrs. A. A. Atkinson (Chief Examiner of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

Edward Weller deposed that he worked at East Greta Colliery. He knew the deceased, Albert Moncrieffe, and was working in No. 1 tunnel on the 18th November in Lewis' shift. He left the tunnel at 11 p.m. on the night of the 17th November. He was timbering in the tunnel, fixing a set 5 feet from the face. He worked in the tunnel between four and five months. There was no fall of roof while he was working there. While timbering he had a good opportunity of noticing the roof, and had neither seen nor heard the roof working that night. He did hear the roof working at other times, but did not report it, as he did not believe it to be dangerous. He noticed caps bent about 100 feet from the face. There were cracks in them. He took no notice of it. Either the roof or the floor could have caused it. The roof was of conglomerate mixed with slaty stuff. The slaty stuff was soft to work. Sets were kept 5 feet apart right through, whether under conglomerate or under the slate. He had been in the tunnel since the fall, and the stuff that came out was a mixture of conglomerate and slaty stuff.

To Mr. Atkinson: He had no conversation with his mates about the bent caps. He did not remember mentioning it to any one. Some of the caps were cracked—split. They presented broken splinters on the bottom side of the caps. He had no idea of how much the caps were splintered through. The big fall took place where the caps were bent. He could not say how far the big fall was from the face. He had taken no means to find out whether the place where the timbers were bent coincided with the site of the fall. There were three or four bent caps. They were bent about 3 inches. The broken splinters were not of any great length. He noticed slaty stuff in the tunnel previous to the fall. There were spots or patches of it all the way down the tunnel. He could not say how much of the tunnel was made while he was there. He worked from the bottom of the sump. He had no conversation with his mates relative to the change of roof. He saw no danger in the bent caps. He remembered instructions being given for a manhole to be made. Gronow, Barnes, and Moncrieffe were given those instructions. His shift started the manhole. He knew it was his duty to report any defect in the roof or any danger of any kind.

To Mr. Curley: (*Witness showed by bending a pen handle how the caps were broken.*) He saw the caps bent six weeks before the accident. Lewis worked on his shift. He never saw a board placed at the tunnel mouth for notices, and never saw that any report was made on a board concerning those bent caps. He did not know how he located the bent caps with the seat of the fall. There were no distinctive marks to help him. David Lewis told him they were 100 feet from the face last Thursday. They were speaking about the case outside the court, and he asked Lewis what distance the bent caps were from the face. He noticed no other bent caps in the tunnel. Thompson also worked in his shift. Thompson did not mention the bent caps. He never saw Mr. Thomas down the tunnel. He did not see Mr. Cartwright there. Lewis went down with him to the face to work, and stayed the whole of the shift. They worked on the coal. Lewis never warned him to go out on account of danger. Neither Thomas, Cartwright, nor Lewis ever warned him. Lewis paid him his wages, 6s. 6d. per day. He worked in the mine just the time the tunnel was being driven, but worked on top before.

To Mr. Millard: The bent caps were above the water cask, but could be seen from it. David Lewis told him the big fall was 100 feet from the face; also that the bent caps were 100 feet from the face. That was how he knew the fall was at the place where the bent caps were. If the fall was 200 feet from the face the bent caps could not have been at the fall or in the position he said they were. He could see that the bent caps were 20 or 30 feet above the cask. He saw the soft stuff all the time they were driving the tunnel. The first 10 feet from the sump he thought was conglomerate. He could not say whether there was anything else but conglomerate in the first 50 or 100 feet. He only knew there were patches of the blue-stone right through the tunnel, but could not say where it began. He had to go up and down the tunnel very often to get timber. Lewis went with him for the big stuff.

To the Jury: He had experience in mining. He never noticed any danger in the roof. He worked in the Co-operative mine for three years previous to going to East Greta. Lewis never said anything to him about change or danger in the roof. He knew Lewis was appointed deputy to look after the tunnel, and depended upon him, if there was any danger, to withdraw witness from the tunnel. He never saw or heard of the inspector being down the tunnel. He was on the night-shift for a month before the accident. He would know the inspector if he saw him. He never saw a false set put in the tunnel. He did not know what a false set was. He never saw a set put in and removed. He did not consider himself a practical miner. The caps and posts were mortised and tenoned together.

To Mr. Millard: He would not have gone into the tunnel if he thought there was danger, even if Lewis said otherwise. The roof of the Co-operative Mine was of conglomerate and blue-stone.

To Mr. Curley: The water-cask was there to catch water coming down, and prevent it from going to the face. He used to go to the cask to empty it. He could not say how far the cask was from the face. It was down from the bent caps. The cask was, perhaps, about 80 feet from the face.

Josiah

Josiah Thompson, a miner, residing at East Greta, knew the deceased, Albert Moncrieff. He worked in No. 1 tunnel with Lewis and Weller, and went in to work from 3 p.m. to 11 p.m. on the 17th November, and was not timbering. They worked on the face that night. He was one of the four who took the job, and he was appointed a deputy for the shift by Mr. Thomas. As deputy, it was part of his duty to inspect the roof of the tunnel. The roof, so far as he knew, there was conglomerate all the way down. They found muck under the conglomerate. The muck was from an inch to 4 inches thick when it came down. They never took any stuff down that would stop up. He worked in the tunnel from the commencement to the time the fall occurred. He noticed three or four bent caps. They were not splintered. The bending was caused by side and bottom pressure. There was a spring in the sill, but not what one would notice, travelling up and down. He would expect to find side pressure in such a drive. The bent caps were about from 70 to 75 yards from the top level. He had been in the tunnel since the fall; but the fall occurred above where the caps were bent. He did not regard the bent caps as indicating any danger. He made no report after inspection of the tunnel.

To the Coroner: When the muck came away he considered they had a thickness of 60 feet of conglomerate.

To Mr. Atkinson: He understood when he commenced work in the tunnel that he was held responsible for the shift. He commenced from the bottom of the sump. He read the special rules several times. He also read General Rule 4 of the Mines Act. He made his inspections every time he went up and down the tunnel. He would go up and down three or four times in nearly every shift, and in each he made a careful inspection. The inspection was made from the alligator, or tub, they went up and down in. The alligator never went up and down slowly, but not particularly slow. Taking heavy timber down they went very slow. He never saw a drop of water in the roof. The props were set with the lay of the seam, at right angles with the dip of the seam. They had a square, a straight-edge, and a spirit level, and used them on every third or fourth set. Lewis never mentioned the bent caps in a special manner, but did in a casual manner. They expressed surprise at the new timber bending so soon, and he expressed the opinion that side pressure assisted a little by bottom pressure had bent the timber. There was no talk about strengthening the bent timber so far as he was aware. As deputy he did not consider it of sufficient importance to report to the manager. If he thought there was danger he would have reported through Lewis to the manager. The bent caps and the appearance of muck did not lead him to believe there was a change of roof. The slabs set behind the props were wedged tightly between the props and the coal. If there was side pressure the slabs need not necessarily bend the props. He never thought of side pressure bending the props. The caps were wedged end-tight with hardwood, and the props with ti-tree, which would bend.

To Mr. Curley: The ti-tree was put in with the bark on. The ti-tree was put between the slabs and the sides, roof, and bottom. The ti-tree was not dressed. It was used to pack the space between slabs and the sides. The ground was a bit live. There was no great weight on the coal. He had seen chips of coal burst off the side as they drove. If the pressure had been severe enough to break the caps the posts would have been affected. The roof was hard. The caps were bent in the centre from side pressure, and in his opinion there was no pressure on the roof, notwithstanding that the fall had taken place. He had been working two and a half years at the colliery. He worked in the sinking of No. 2 tunnel, in slippery jig, bottom jig, and in a bord in Armstrong's jig, and never saw a case of roof pressure. He never saw falls of stone, and heard of none. He heard of no men being hurt in the mine from fall of roof. In No. 2 tunnel the sets were put in 5-foot centres. In that case they were paid by the yard as in No. 1 tunnel. There were four in that party, Lewis, Griffiths, Gronow, and himself. He saw no caps bent there. They took up the bottom there, and did the packing in the same, just the same as in No. 1 tunnel.

At this stage there was an adjournment until 2:30 p.m.

On resuming, the witness, in reply to Mr. Curley, said tenders were called for the work to be carried on. A notice was posted at the office. He and his party tendered for the work. The price they tendered at was not accepted. Their tender was £4 7s. 6d. per yard. They later on had a consultation with the manager about it. He objected to the price they put in, and asked them if they would do it for a certain price, at which he thought they could make wages. They came to an understanding with him to work for £3 19s. per yard, and they were to get more if they did not make good wages. The conditions were that they were to drive a tunnel similar to No. 2. They were to take out coal, put timber in after lifting the floor. It was explained to them that sills had to be 16 feet long, caps 15 feet over all, props 10 feet 6 inches. Timber had to be ironbark sills, caps, and props, and common hardwood slabs, the same as in No. 2 tunnel. The sills were about 9 or 10 inches, and some were 15 inches in diameter. The caps were about the same as the sills, say, 9 inches through in diameter. Sills and caps were in round timber. The props were also about 9 inches in diameter. He never saw any defective timber sent down; in fact, they always took it down themselves. Sometimes the timber would be a fortnight lying on top before being used. When he saw the caps bent the idea never occurred to him that the roof was weighty. He never thought of putting in a set between the bent caps. The tunnel had about 45 feet, or nine sets, further to go. Mr. Heyes and Mr. Thomas were down the tunnel measuring to see how much further the tunnel had to go. That was two or three days before the accident. He had no conversation with the manager about pushing on to complete the work. They got as much out as they could every day. He never said to the manager, under-manager, or to Lewis that it was necessary to put in fresh timber where the caps were bent. He did recognise himself as a deputy to make a report. There was an understanding with Mr. Thomas that he (witness) was to see that all was safe on his shift. Mr. Thomas did not say he was not to report. He did not consider he was bound under General Rule 4 to report. Lewis made reports. They started to drive the tunnel some time in June. He (witness) kept the record of the number of yards driven per fortnight. He knew Weller, who had every opportunity of seeing the cap-pieces as he went up and down. They used the ordinary pit lamp for a light. As a rule they all went down the tunnel in the alligator together, Weller, Lewis, and himself. He never saw any other caps bent but those he had mentioned. There were two casks on the road-side in the tunnel. The water ran down out of the levels, bleeding out of the coal. He never saw any come from the roof. One cask was between the third and fourth manhole from the level, and the other was lower down, perhaps 30 yards. The manholes were 20 yards apart.

To Mr. Millard: The muck under the conglomerate was a band. There was sometimes bands in seam, not always the same. The presence of that band in no way would affect the safety of the roof. The soft stuff never appeared above the conglomerate, or mixed with it; only below it. He noticed the roof very carefully as he went down, and had there been any soft stuff there he would have noticed it. The timber supplied was good. He never saw better, and knew of no better than ironbark for that kind of work. He had experience of timbering. He knew the tunnel was intended to be a permanent work. The bent caps he saw were further down towards the face than the big fall. The big fall extended about 60 feet in length. The lower end of the fall would be 15 or 20 yards from the bent caps. If fresh timbers had been put in under where the caps were bent the accident would not have been prevented. So far as he could judge, the bent caps had nothing to do with the cause of the accident. He had experience in other collieries. The East Greta roof, a conglomerate roof, was a good one. It was not an uncommon thing to find a mine where there was no small fall to be found. It was a very common occurrence to find enough fall to fill a skip or a skip and a half in any colliery. That would not indicate any special danger. In abandoned workings it would not be unusual for the roof to come down.

To the Jury: He carefully inspected the tunnel when he went up and down. He said before that there were three or four caps bent. The slabs averaged 3 inches thick. The slabs were not bent. He considered the roof a good solid one, and that the pressure did not come from it. He never saw anything wrong with the timber where the fall took place. The caps were wedged at each end. The slabs were wedged against the roof by ti-tree. The pressure mostly came from the sides, and the posts were not bent. Fresh cut timber would be equally as good as timber three months old. All that he knew about the thickness of conglomerate was from information received.

To Mr. Millard: Had there been pressure from the roof he would have expected to have seen the slabs bent. The overcast showed a thickness of conglomerate showing 7 feet.

To the Jury: He had seen unbroken cap-pieces taken out after the fall. He heard that the inspector was down the tunnel three weeks before the accident. Gronow told him.

To Mr. Curley: The slabs were from 7 to 10 inches in width. He heard Mr. Thomas and Mr. Heyes say that the conglomerate was 50 or 60 feet thick. The overcast was cut right through conglomerate. The piece of conglomerate produced was from the overcast. The stuff that came down from the fall was a kind of muck. Ironstone came from the top end of the fall. The rock he saw on the table he termed a soft conglomerate; the blue or slaty stone he called muck; and the whiter stone he called a fine conglomerate. The blue or slaty stone examined by the jury was somewhat like what they had taken up in the floor of the tunnel—sometimes softer than the specimen on the table, and sometimes harder.

John Downie, recalled, said, in reply to Mr. Tillet, that the stone produced, three pieces, had been brought from East Greta Colliery. One piece came from the big fall, and was marked Exhibit C. The other two pieces came from a skipful of muck from the colliery, and were marked D. The skip of muck had not been exposed to the weather.

To Mr. Curley: He made the selection of the stones for no particular purpose. He got them that morning, at the request of Senior-constable Brown, at the colliery. He considered the stone produced a fair sample of the stuff that fell. He could not tell from what part of the fall it came.

At this stage the inquiry was adjourned until 10:30 a.m. to-day.

In reply to Sub-inspector Fowler, the Coroner said that the jurymen could please themselves about going out to see the mine. If they wished they could do so.

#### THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieff, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillet represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Mr. A. A. Atkinson (Chief Examiner of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

James Cantwell, a miner residing at East Greta Colliery, deposed, to Mr. Tillet, that he was in the colliery at the time of the accident, and went into the tunnel on the night before at 11 o'clock with the deceased. He was working in the new jig running parallel to the tunnel, and his son and John Jones were with him. He neither saw nor had communication with the deceased during the shift after going down. The accident occurred at 6:55 on the 18th November. The first intimation they had of an accident was a rumbling noise like thunder. He listened for a while, and then ran over to the tunnel. He thought it was old workings falling on the opposite side. He looked up the tunnel first and could see nothing; then he walked round the shoot into the middle of the tunnel, and looked down the tunnel and saw the fall. He and Jones called out to the deceased men below, but got no reply. He then went up the tunnel. He had worked for seven years in the colliery, but had never been down the new tunnel. He never noticed any defects in the new tunnel. On a clear day he could see a good distance down. He never took any particular notice. He never heard a complaint about the roof. He had a conversation two nights before the accident with Moncrieff about the tunnel. He was alone with Moncrieff, who said some of the bars were bent and broken about 100 feet from the level down towards the face, and spoke of them as dangerous, expressing a wish that he was out of the place, as he was frightened. He did not speak of that conversation or report it to anyone. Moncrieff said nothing else about it to him.

To Mr. Atkinson: He knew the roof of the East Greta mine. Parts of it were conglomerate, and parts soft stone. The stones produced resembled the soft stuff in the roof, but he saw softer patches. There was no conglomerate at all where he saw the soft stone. That was along the middle level, then called the bottom level. It commenced 40 yards from No. 1 tunnel, and extended in patches along the level for 500 yards. The soft stone was not on the tunnel side of where the dam was fixed. He first observed the soft stone fair over the dam while the level was coming in and out. The patches were about 3 feet up, where it used to drop out between the sets. He was working with a deputy, Higginson, who used

used to repair each fall that would come. The sets were about 5 feet apart. The weight of the pillar broke a good many sets there. The pressure came from the coal pillars. The coal fell off the pillar sides occasionally, about a skip or a couple of skips at a time. The cap-piece or bar of the set got broken. The bars were 9 feet long and 9 to 10 to 12 inches in diameter, and were ironbark. The sets were slabbed only in places where they thought the roof bad. The slabs did not often break. They sometimes put packing between the props and the rib side. The packing was of ti-tree or short slabs, or anything they could get. He saw soft stone in other parts of the mine, in bord No. 2 above the present level, when taking down top coal. That would be about 500 yards from No. 1 tunnel. He never saw it nearer No. 1 tunnel. Top coal was taken down to within 5 or 6 inches of the roof along the level, and falls sometimes displaced that coal. He considered the roof more dangerous where the soft stone was. He reported the change only to the deputy, but to no one else, because there was a deputy with him. Had he considered those places dangerous he would have no need to report, because he presumed the deputy would report.

To Mr. Curley: It was three years ago since he did that timbering. He saw the manager (Mr. Thomas) down the mine, and he would certainly have a knowledge of the change of roof also. No 1 tunnel was an extension of the East Greta workings, that have been working for years. He knew the back drive or jig that was 30 yards from No. 1 tunnel. It was going at the same dip as the No. 1 tunnel. No place had been driven between the tunnel and the jig. The jig was down 130 feet, and was at work at the time of the fall. He had done timbering in the Scotch heading, which was to the right 200 yards from No. 1 tunnel, travelling south. He was working in a level and in bords. He never saw any conglomerate fall in that level. He did see top coal fall, but not stone. Pressure from the old workings above caused the top coal to fall. After the coal was taken out a creep would take place, and then there would be a fall of roof. There was one very large fall in No. 3 bord of Scotch heading over three years ago. He visited the bord with the deputy, and tried to secure it by extra timbering. He saw some of the roof that came down, and it was soft stone. He had done timbering on the left side of No. 1 tunnel in the north district in the left-hand bottom level. He saw no stone fall in that level. He was timbering there to keep the roof up and secure it. There was timber there before, and it was 5 feet apart. He had occasionally to put more timber in between those sets. There were 5 or 6 inches of coal left in the roof there. There were caps bent and broken. They were broken here and there, and new ones were put in. In the level where he worked prior to the accident he saw the manager three times in one week. The under-manager he saw twice in one week. He (witness) was there on day-shift once in the three weeks he was working there. He was two weeks on the night-shift there. He heard Deputy Jowitt there one night. Jowitt called down to him. Jowitt may have been there before, but he never saw him. Had they gone down the jig he (witness) would have seen them. He was sure that he only saw Jowitt once on that night-shift, and he did not go into where witness was working.

To Mr. Millard: The conversation with Moncrieff took place as he and witness were going from the cricket-ground to the pick-shop. It was at 6 o'clock in the evening. No one else was there. As a practical miner, he would not go to work in a place he believed to be dangerous. In the level when he was putting in new timbering and packing where the falls occurred, he considered he was in danger. He made a remark to the deputy about it being dangerous. The deputy said they should be careful, and not go underneath it till it was fixed. He could not say how many patches of stone he saw in the 500 yards. In some places there would be patches in every second set, and then there might be none for five or six sets. He believed there would be 100 patches in the 500 yards. The roof came away in small parts. Where the conglomerate came away there was conglomerate left. The flakes of conglomerate that came away were about 9 inches thick. Where soft stuff came away soft stuff was left, but how much he could not say, nor whether there was conglomerate above it again. It was very soft. He could not account for the soft stuff not continuing to fall once it began. It came away like potholes in the level, 3 feet high, higher in the middle. It was retimbered and packed in overhead. He saw at a distance the stuff falling from the big fall, and continuing to fall, but in the places he was speaking of the stuff did not continue to fall. Where the caps were bent and broken in the level the pressure came from the rib. He saw one big fall in the Scotch heading, which was being worked at the time. The pillars had not been taken out to his knowledge, and had not been worked since. If the pillars are out they must have been taken out before the fall. He was positive the pillars were not taken out before the fall. In the East Greta it was not usual to take pillars out. The roof generally in East Greta was patched. He believed there was more conglomerate than soft stone. Where he had been in the colliery, except on the left-hand side for 500 yards, he had always seen patches of soft stuff. There was no soft stuff in the overcast. The overcast was at the level, 30 or 40 feet above where the extension started, and showed the roof to be hard conglomerate.

To Mr. Bowden: He had worked in no other colliery. He was never stinted for timber or any stuff for packing by the company. The falls he referred to occurred three years ago.

To the Jury: Parts of the roof of the mine were safe. Where there was soft stuff he believed the roof was dangerous. He believed that the manager and all officials had done their best to safeguard the lives of the men in the mine. He never heard anything from anyone except Moncrieff about the roof of No. 1 tunnel being dangerous. He never heard of anyone being discharged for saying that the mine was unsafe. If Mr. Thomas said the pillars in Scotch heading were removed he would not be speaking the truth. The pillars could not be removed without his knowledge. The broken caps were not in the tunnel. In the level where the caps broke the slabs came down, but there did not appear to be any roof pressure on them. He saw Government inspectors down the mine. He was working contract in the jig with Jones, Morrison, Downey, and Byrne. He knew of caps being bent, broken, and replaced in the old No. 1 tunnel. Moncrieff slept in on the night of the conversation, but was at work next night. On the left-hand level, 400 or 500 yards from No. 1 tunnel, there was a fall. Shuffler worked there. Witness saw what fell. At least 80 tons fell. They did not continue to take out pillars after the fall. When he went to the Scotch heading with the deputy, to see if they could do anything to repair the fall and prevent further falls, they found they could do nothing with it, because it was too high. The men were called out on account of the fall. That was near the surface. He could not say whether the men there lost their tools or cans. He would not call those falls extensive. As an experienced miner, he would not take bent caps always as an indication of roof pressure. Caps did not always break from roof pressure. If the props and the sills were intact, and the caps only bent, then that would indicate roof pressure. If the props were

were wedged tight, the sills intact, and caps bent, it would not, in his opinion, be indication of side pressure. If there was side pressure enough to bend the cap, then it should also show in the prop. With bottom and side pressure the centre of the sill would go first, then the sides. The fact of the packing being between the slabs and the side would keep the side pressure off for a time.

To Mr. Tillett: He would expect side pressure in No. 1 tunnel.

To Mr. Millard: The legs were mortised into the caps and the caps were wedged into coal. If the caps were so wedged tightly and the props only packed, the pressure would come on the leg. When ti-tree packing is put in with the bark on it would give very little. The ti-tree would give sooner than the hardwood wedge at the end of the caps. The ti-tree giving would ease the pressure on the props. If there was roof pressure he would expect to see an effect on the slabs, which would bend or give a little. The slabs were not so strong as the caps.

At this stage there was an adjournment until 2:30 p.m.

At 2:30 p.m. the inquiry was resumed, and James Cantwell was re-called.

To Mr. Curley: He repaired the timber in No. 1 tunnel midway between top level and the middle level. The caps were broke there. There were half a dozen removed by him. He passed in and out of the tunnel before he was sent to repair them, and could see they were broken. He noticed them like that for not more than a week. He did not notice the nature of the roof there, as the slabs were overhead. The cap-pieces were broken, and were from 9 to 10 inches in diameter. That was a little over three years ago.

To Mr. Millard: He had noticed sills bent up, but not broken right through in that tunnel.

To Mr. Bowden: When repairing timber he was under Deputy Higgison. None of the slabs above the broken caps were either bent or broken. He saw bent and broken slabs in a bord. Before he went to the colliery he was a fencer. He was employed on the surface for some little time before he went below—about six months, as near as he could think. He had of late had charge of a shift strengthening timber in No. 2 tunnel.

To the Jury: He and Mr. Thomas were on friendly terms. The bent caps he saw in the tunnel were not at the seat of the fall. He could not swear that there were bent caps under the fall before the accident. He had a contract to drive the jig. Roster was his partner. Tenders were called for the work; no distance was mentioned. Downey was one of his men, and was paid by him. When the fall took place he rang for the "alligator," but it was not sent down. When he rang for it, it should have been sent down. Jones rang for it after him. He knew a shift was coming down, and he ran up the tunnel calling out to them not to come down, as the tunnel was falling in. He never noticed any bent caps in the extension, but never looked at a time when he could see down well. At about 3 p.m. was the best time to see well down the tunnel. He never took the trouble to look down at that time.

To the Jury: He never saw falls from the sides. Falls took place where timbers had been strained, but not always. As a practical man, from seeing strained timbers, he would conclude a fall would take place.

To Mr. Millard: He put in whole sets in No. 2 tunnel, when sills were broken. He did that for 300 feet in No. 2 tunnel.

Henry Cartwright, under-manager at East Greta Colliery, deposed, to Mr. Tillett, that he knew the deceased, Albert Moncrieff. He was manager and under-manager since the inception of the colliery. He was manager before Mr. Thomas came, and under-manager since. He knew the extension of No. 1 tunnel. He was one of the first to enter the tunnel after the fall. Lewis and Heyes, the engineer, went down with him. That was at 7:10 a.m. on the 18th November. A fall had taken place, and they went right to the edge of the fall. He shouted out, and also knocked the rails, but got no reply. He could not say exactly when he was in the tunnel before the fall. As near as he could remember, it was a fortnight. He examined the roof all the way down then, and saw no indication of danger in the roof. He saw a couple of caps bent, but not broken. The bend was only just discernible, and was no indication of danger. Before the big fall took place he had not seen stone of the description of the exhibit in the colliery. The colliery roof was nothing but conglomerate for a good way. He had seen slight falls of roof in the colliery before the big fall after pillars were taken out. He had seen slight falls in the levels of half a yard thickness. The stuff that fell was a conglomerate. He went down to the bottom level every day since the level was driven, and did not remember having seen stone like the exhibit there.

To Mr. Atkinson: When he was called at the time of the accident he was at the top of No. 2 tunnel. He had not been down the mine that morning. The pit started to draw coal at 7 a.m. The usual time for him to go down was 8 to 8:30 a.m. He was not near the top of No. 1 tunnel that morning. He was under-manager for the whole mine. It would take him one day to examine in every working place in the mine. He read the rules concerning the under-manager's duties. [*The witness here read No. 3 of Special Rules.*] No. 1 tunnel was looked after by Mr. Thomas and Mr. Heyes (engineer) while it was being sunk. Mr. Thomas told him Lewis was put in charge as deputy, and Mr. Thomas was always there, and looked after No. 1 tunnel. He saw Mr. Thomas there. He did not look upon the extension of No. 1 tunnel as a particularly important place. He could not say when Lewis was given charge of the extension. Lewis was put in charge when they started to drive from the bottom of the sump. That was about July last. Jowitt, the night deputy, made the report at that time, for how long he could not say. It was until Lewis began to report—about a couple of months after they started. He did not think Jowitt continued to visit No. 1 tunnel after Lewis took charge. Pillars were taken out in the colliery; some of them on the north and south sides of No. 1, between the top level and the middle level. When those pillars were taken out there were falls of conglomerate, but he noticed no other stone. The fall would be up about 5 or 6 yards, and all the stone was conglomerate. He could not say how far No. 1 tunnel was to go. He knew a level was coming over from No. 2 tunnel to meet No. 1 when it got down to a certain point. He examined the roof in that level, and it was conglomerate. He remembered a drive being put from the bottom seam to the top seam. He could not say how far apart the seams were. The drive went through conglomerate and another stone. The latter was met just before they got to the top seam. There were distinct facings in the coal at East Greta. The facings ran east and west. He would expect coal to come off the side of a jig easier than in a level. There was not much evidence of side pressure at East Greta. They generally set timber in jigs. They always set timber in jigs. They generally wedged the cap-ends tight. In a mine subject to side pressure he would not consider it a good practice altogether to wedge the ends of the caps tight between the caps and the coal. He saw the big coal. He believed the cause of the fall was a leakage of water making its way into the mudstone, which swelled and broke

broke the cap-pieces. That was pressure from the roof. Side pressure had something to do with the fall. The sides of the coal were in good condition, and did not indicate much side pressure. The fall was influenced by floor pressure. They were troubled a lot with the floor, which was so soft. The bottom heaved up, forced the sill and the props up, and lifted the ends of the cap-pieces. The middle of the cap-pieces being wedged tight was some help towards breaking the caps. Generally the slabs were wedged tight right across. With pressure from the bottom he would certainly expect the sill to break first. Where he saw bent sills he noticed no props bent. He noticed no water dripping from the roof prior to the fall. During the work of exploration he noticed that a considerable number of caps were broken. He saw no broken slabs. That was a matter of surprise to him. He saw Moncrieff and Barnes recovered. Moncrieff's body was found about 20 or 25 feet from the face, and Barnes' between 5 and 10 feet from the face.

[*Newcastle Herald*, 18 January, 1899.]

#### THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieff, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillett represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Mr. A. A. Atkinson (Chief Examiner of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

Henry Cartwright, under-manager of East Greta Colliery, was recalled.

To the Jury: They never put jigs the same distance apart. They considered the thickness of the pillar between the No. 1 tunnel and the jig, but he did not remember the thickness. He considered it his duty to know the thickness of the pillar for the safety of the men on account of No. 1 being the main tunnel of the mine. They did not work tops and pillars from the first jig. He could not remember the distance they worked the pillars from the first jig. It was seven years ago. They drove a jig further in than that one. It was between the first and second jig that they took the tops and pillars out. They did not continue to work the tops and pillars further in the workings. They worked them on the south side—the opposite side—in a similar manner to those on the north side. They did not continue to work the tops and pillars further south. They worked all the pillars they could out in Scotch heading, except No 1 on each side. He knew some of the men who worked the pillars there. John Hallan, John, David, and William Adder were some of them. None of them were now at the mine. He knew of a place being driven at right angles between the two seams on the Scotch heading side. Something occurred to induce them to make that drive. It was a fall. He could not remember the distance, although he himself measured it. A Mr. Hughes, who worked in it, would be able to give more particulars than witness. The work changed hands two or three times if he remembered rightly, and he could not say how long Mr. Hughes worked there. He could not say who worked there when the drive was finished, but he thought it was Jim Allen. The sides in No. 1 tunnel looked the same as when they were driven through, but they sounded a little different. A skip or two in one or two places fell. If the side pressure was sufficient to break a 6 or 8 inches bar he did not think it was necessary that the sides should fall there. Where that side pressure was it was not necessary that the coal should show broken on the sides. At the seat of the fall he did not remember having seen any splintered caps. It was about four years since the tops and pillars were removed in the Scotch heading.

To Mr. Millard: When the floor raised by swelling in No. 1 tunnel they tried to get the additional height by cutting the roof, but did not succeed, because it was so hard that blasting would be necessary, and Mr. Thomas would not allow that. The roof was too hard for ordinary working. No pillars were taken out to the north of the extension of No. 1 tunnel. It was all virgin coal from No. 1 tunnel north to the workings of No. 2. The only work done south of the extension of No. 1 tunnel was the beginning of Cantwell's jig. On each side of the extension of No. 1 tunnel they had the unworked virgin coal.

To the Coroner: When they were timbering No. 2 tunnel the floor kept good and kept good till they had finished. The sets there were put in 5 feet apart all the way. From the very start in No. 1 tunnel the floor was found to be very troublesome and soft. In the extension of No. 1 tunnel the sets were 5 feet centres apart. They considered No. 1 to be as good as No. 2 tunnel. When they were driving No. 1 extension they had no more trouble than in No. 2. They did not consider the floor of No. 1 any worse than that of No. 2, and considered sets, 5 feet centres apart, sufficient to well support the roof.

To Mr. Millard: At the present time they were replacing timber in No. 2. The floor of No. 2 was good, also No. 1. Both were kept good by timbering. Age and time have the effect of lifting the floor. In about ten years or so the floor ought to settle. In a couple of years it would begin to settle. The old part of No. 1 tunnel has been driven fully seven years, and No. 2 tunnel about two years.

To Mr. Curley: The stone produced was hard conglomerate, but it was not so hard as Exhibit B. It was not the same class of stone as the fine conglomerate produced, but it was as hard. One was as hard as the other. Exhibit D was the same as the first stone, and was as hard as it, and also as hard as the fine conglomerate. He would not be surprised to know the first stone came out of No. 1 tunnel. The overcast was in the level. He knew a door not far away from the tunnel on the north side, and examined the roof there. It was a conglomerate roof. It was soft, but if a foot was taken off, what was left would be hard. The piece of stuff produced was a very fine conglomerate, and was soft. It was soft from exposure. He would not be surprised to know that it came from near the doorway. It might have come from within 3 feet of the hard stone. The stone in his hand was a fine blue conglomerate, and could possibly have come from East Greta mine. It could be seen very often intermixed with conglomerate. It could have come from the mine, and from the floor of No. 1, but he could not say. He knew the position of the dam in the level. It was about 40 yards on the south side of No. 1 tunnel. His attention was never drawn by Lewis or anyone else to soft stone in the tunnel. When he went into the tunnel on the morning of the fall the stone that had fallen had mostly gone down the tunnel. There might have been a shovelful or two left in between the sills. He noticed about six or seven sets of timber knocked out. He saw a good part of the timber after it was recovered from the bottom of the tunnel, and noticed broken cap-pieces. He noticed props broken—some splintered, others broken in two. The road was relaid from where

where the fall occurred. The rails were broken away by the fall, and partly went down the tunnel. Every pair of rails was put down fresh. Some of the sills went with the rails. The rails were laid on the sills, and were fastened with fishplates and bolts and dogs. He could not say how many sills went down. He saw some of the stuff brought out of the tunnel. It was pretty lumpy. It had to be broken up before it could be put into the skips. The largest piece was about 4 by 6 by 2 feet, looking down the tunnel. There were one or two others below that one, but he could not give dimensions. He could not say how much fine stuff there was in the fall. He thought there were many tons of it. The mudstone which had been referred to during the inquiry he would call soft blue shale. The stuff that was carried away in the fall was soft blue shale. He could not say what kind of stone the big one was. They had to break some of it to get deceased Barnes out. He considered that the stuff which fell in the big fall was conglomerate, like Exhibit D, but a little browner, soft blue shale, greyish shale, and ironstone.

To Mr. Millard: The action of water on the conglomerate would make it fret and crumble. The action of air would have the same effect.

To the Jury: If the hardstone produced were soaked in water for five years he believed it would soften. The fine conglomerate would go sooner.

To Mr. Curley: He could not say when the overcast was driven. It was driven since the extension had been commenced. It was driven more than a month before the fall. He had a record of it in the books, and could give the date. In driving the overcast the men had to blast all the way. The position of the drill-holes could still be seen. There had been no fretting there.

To the Jury: The No. 2 level, between No. 1 and 2 tunnel, was not in good repair. If anything happened there the men could get out on the Scotch heading side, or through the level.

At this stage the inquiry was adjourned until 2:30 p.m.

On resuming at 2:30 p.m.,—

Ernest Marsh, a hay-presser, residing at West Maitland, deposed, in reply to Mr. Tillett, that he was working in East Greta Colliery at the time of the accident. He had worked for about two years on the surface, and had been underground about ten weeks when the accident occurred. His shift left the tunnel at 3 p.m. on the day before the accident. Jack Griffiths and Ted Parsons were on his shift. They were getting coal in the extension of No. 1 tunnel. He noticed the roof, and saw some of the caps bent and cracked. He only saw the roof working in one place, about quarter-way down the extension. The bent and cracked caps were there when the roof was working. He spoke to Jack Griffiths, and asked him if it was not dangerous, and he said he did not think it was. Moncrieff said that if something was not done to the cracked timber they would not see him there much longer. That was said a few shifts before the tunnel fell in. Dick Barnes and Gronow, the two deceased, Ted Parsons, and Jack Griffiths were present when Moncrieff made that statement, at the bottom of the tunnel. None of the others present said anything. The roof was composed of conglomerate and slaty rock. The conglomerate was the same as the Exhibit F, and the fine piece of conglomerate. The slaty rock was the same as the bluish stone marked C. He saw a little rock come down in the tunnel at times. Both conglomerate and slaty stone came down. He knew where the fall took place. He believed it was about the place where he saw the bent timbers.

To Mr. Atkinson: The stone found usually over the top of the coal was conglomerate and slaty stone mixed. He could not measure the thickness of conglomerate. He could not say how much broke away above the coal. The conglomerate was about 18 inches thick. About 150 feet of the tunnel was driven while he was working there. He could not say whether the bent caps were at the top, middle, or bottom of the fall. Griffiths was chargeman of the shift, and used to inspect the roof from the commencement of the tunnel to the face. Griffiths did that both going down and coming up. Witness worked with Lewis and Thompson also. He never saw water dripping from the roof where he saw bent caps.

To Mr. Curley: The bent caps were quarter-way down from the beginning of the extension, and 100 feet from the bottom level. He noticed some bent and some cracked, and could see them quite plain and distinct. He never counted them, but believed there were about four or five. He saw Mr. Thomas once in the tunnel, on the Tuesday morning before the accident. He only spoke once to Lewis about the bent caps and the roof. He was working down at the face when he heard the roof working. He could hear the timber crack occasionally, and it was then that he drew Griffiths' attention to the matter. He never saw anyone at the top of the tunnel when he was going to work to tell him everything was right. When he saw conglomerate 18 inches thick he also saw the blue stone. They had sometimes to chip the roof to get the roof fixed, and that was how he came to see the blue stone. He went into work on the Saturday after the fall and saw where the fall had taken place. The rails on the left-hand side were bent out, but he did not see them disconnected. He did not see that some of the rails went down the tunnel. He never saw the under-manager down the tunnel before the fall. When he worked with Lewis and Thompson they all went down together. He did not know if Lewis went down the tunnel before they went in. When Lewis went down with them he appeared to be making an inspection of the tunnel. When Lewis was below he sometimes worked at the face getting coal and sometimes timbered. Where the fall had taken place the sills appeared to be in the same position as they were before the fall.

To Mr. Millard: He saw the bent caps when he was coming up the tunnel in the skip five or six weeks before the fall. He told Griffiths five or six weeks later. The caps were bent about a foot. When he first noticed them they were bent a few inches, and it took them 5 or 6 inches to show a foot. He noticed that they did progress daily. Still he never spoke about it until a few shifts before the fall. He used to bale the cask out into the "alligator." One could see the bent caps from the cask. They were about 140 or 150 feet from the cask up the tunnel. The cask was about 120 feet from the face. He did not count the sets from where the caps were bent, and had no means of fixing the distance, but his impression was that the distances he had given were correct. He had seen three or four bent caps further down the tunnel, half-way between the first lot of bent caps and the face. They were bent 3 or 4 inches. He spoke to no one about them. He noticed them about two or three weeks before the accident. They were bending slowly. They were a bit above the cask, and could be seen from the cask. When he said he heard the roof working he meant nothing more than the timber cracking. It was loud at times, and could be heard at times when they were working. He believed it was the roof, not the sides, that was working. That was his idea. He did not know that pressure from the sides could cause the top timber to bend, nor that pressure from the floor would have the same effect. When he was at the face he was  
from

from 250 to 300 feet from where the fall took place. The cracking might have come from other places than the seat of the fall. He saw the caps bent a foot under the fall, and the slabs were sinking down with the caps. He did not notice if the slabs had sagged down in the middle between the caps. There were distinct cracks in the bent caps. He asked Griffiths if there was any danger of the timber coming in. He thought himself that it was dangerous. He referred to the bent and cracked timber when he spoke to Griffiths, who said he did not think it was dangerous. It was on another occasion that Moncrieff spoke, and Moncrieff began the conversation. He knew the band on top of the coal. It was a black stuff, like the patch on Exhibit C, and was 2 or 3 inches thick, and as black as coal, but harder. The conglomerate was next to the hard black stuff. There was no band of grey stuff between the black stuff and the conglomerate. When he went down the tunnel ten weeks before the accident he had never been underground to work before. He only had ten weeks' experience in the mine.

To Mr. Bowden: He saw the timbers bent in two places, and believed other men saw them too. They never spoke about the two places to him. When he went to work with Lewis the latter met him at the tunnel mouth. Sometimes Lewis was there first, and sometimes he was before Lewis. When they were getting coal they sometimes sent up some of the floor. Two feet were taken out in his shift. He had discussed the case outside the Court; but had not said anything about the timber. He had spoken to different people—to men who had been working in the tunnel. There were men in the Court with whom he had been conversing—Jack Griffiths, Alick Cameron, and W. Kerr. He could not say that Moncrieff was anxious not to miss the shift after his conversation.

To the Jury: He had never spoken to any of the jury about the case. The slabs were sagged down on the bent caps when he drew Griffiths' attention to them. They were down at the face at the time. He was sure Griffiths understood what he meant at the time. During the five weeks he noticed the caps bending he thought they were dangerous; but he trusted in those who had more experience. He would not mind going back to work in the mine again. He never saw the Government inspector down the tunnel. He mentioned the bent timbers to the deputy, Lewis, who said he did not think it dangerous. He was not on bad terms with Mr. Thomas.

To the Coroner: Had he not been earning money he would not have remained when he heard the timber cracking.

To the Jury: He did not see any bent sills in the tunnel. He did not take notice of the legs or props, and could not say whether they were bent or not. He thought they were not.

To Mr. Millard: He mentioned to Lewis about bent and cracked caps at different times while they were on shift together. He mentioned it first a week or two after he saw the bent caps, while they were going up and down the tunnel, and also while they were at work at the face.

[*Newcastle Herald*, 19 January, 1899.]

#### THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieff, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning, at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillett represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Mr. A. A. Atkinson (Chief Examiner of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

Edward March was recalled.

To Mr. Millard: He mentioned the bent caps two or three times to Lewis. Thompson and Weller were on the shift, and went down on the alligator with him, and would hear him mention about the bent caps to Lewis as they went up and down the tunnel. At that time the caps were bent and cracked, and the others could have seen them as well as he. They spoke of the bent caps also, at times, when in the alligator. He heard the other men speak about them first, about a week or two after he saw them bent, but he did not hear them say they were dangerous. Lewis spoke about them, but he did not remember what he said. There was a good deal of talk about those caps—the upper lot.

To the Jury: He heard Mr. Thomas tell Griffiths that he was speaking to Lewis about renewing the timber at the end of the week. That was on the Tuesday morning before the fall. Mr. Thomas viewed the bent timber on the Tuesday.

To Mr. Curley: Moncrieff said the bent timbers were dangerous. From what Moncrieff said, if something was not done he would not stay in the mine. He believed Mr. Thomas inspected the bent timbers, because he saw him stop there some time on the Tuesday. Witness was at the face, and saw Mr. Thomas's light. He was about 250 feet from the face. Mr. Thomas's words to Griffiths were: "I was speaking to Lewis about the cracked timber, and we agreed to attend to them at the end of the week." Griffiths made some remark. Mr. Heyes, Ted Howard, Ted Parsons, Griffiths, and witness were present at the time. That was said down at the face. He believed Mr. Thomas was measuring and examining the tunnel. He could not say whether or not Mr. Thomas had an instrument. He did not remember asking Lewis the distance from the fall to the face.

To Mr. Tillett: The conversations in the alligator were about the mine, and were casual ones.

To Mr. Millard: Nobody seemed to attach much importance to the timber except Moncrieff.

To Mr. Curley: He believed they all thought the timber should have been repaired.

To the Jury: Ted Parsons and Ted Weller said they thought the bent timber was dangerous.

To Mr. Curley: He never saw a false set or a slab and a prop put in after the tunnel was finished. A slab and a prop were used at the face in places where the roof seemed bad. The slabs were let in the face to hold the roof up until the permanent set was put in, and then they were taken out. Lewis did that.

Edward Parsons, a labourer, residing at Morpeth, deposed, in reply to Mr. Tillett, that he knew deceased Moncrieff. He worked in East Greta Colliery, and was in the shift that came out of the tunnel on the day before the accident at 3 p.m. He was working in the mine from February. He had been down mines before with timber, but had no experience in mining. He was four months at work in the extension of the No. 1 tunnel. He noticed broken caps. They were about 100 feet or more from the lower level. He first noticed one six weeks before the fall. He was sitting down with Pike and Griffiths having tucker, when

when he heard something, which he took to be a cap-piece, crack. He asked Griffiths what it was, and they conversed about it. Griffiths said it could not be a sill, because when those sills went there would be something wrong. After that the caps went on working and breaking. He noticed them most while he was on the 11 p.m. shifts. There was a different kind of air, the damp air after midnight, which might have caused it. He heard Gronow and Moncrieff say that the roof was working. When one of them would notice a bad piece of roof he would tell the others of it. That would refer to the face all the way through. One morning they went down Gronow told them that they had spent the biggest part of the shift in the manhole, and were driven there by the timber above them working. He heard Moncrieff say that if something was not done to the timber he would not go into work any more. Witness often talked to Griffiths about the timber. March was with them sometimes, and sometimes Lewis, when a set of timber had to go in. The greater part of the roof was composed of soapstone and a conglomerate. The soapstone was like the bluish slaty stone on the table. The conglomerate there resembled the stones produced and marked D and E. Before a set was put in slabs were put from the last cap into a hole in the face, to prevent bits of roof coming down. When the set was put in those slabs were sometimes lowered down to the caps, and sometimes left up.

To Mr. Atkinson: He noticed five or six broken caps down a foot below their proper level. The slabs lowered with them, but were not broken. The sills were not bent or broken. He did not think the props were broken. He had been down the tunnel since the fall, working seven or eight shifts. The fall occurred where the caps were broken. Half an hour after the fall he could see that the broken caps were gone. He did not mention it to anyone, as the most of the time he was alone on the level at the rapper-wire. He came out at 6:30 p.m. that day. He did not remember mentioning it to anyone on the road home. He heard a conversation about renewing the bent caps on the Tuesday before the fall at the face where they were at work. March, Griffiths, Mr. Thomas, and a labourer, whose name he did not know, were present with witness. Mr. Thomas said to Griffiths that he was going to leave that timber up there [*pointing to the bent caps*] till the week end, so as it would not interfere with the contractors' work much. No more was said. His shift had never to retire to a manhole on account of timber cracking. They changed shifts about 20 feet from the face. The three, Griffiths, March, and witness, generally went down together. Griffiths was supposed to be charge-man of the shift. He made inspections of the tunnel going down mostly. Blasting was done in getting coal, powder being used. The shots never disturbed the roof to his knowledge, unless it was a shot in the top coal, when a bit of roof would come with the coal. Sometimes soft stone and sometimes a patch of conglomerate would fall away. The greatest distance he had seen into the roof before the fall was 6 inches.

To Mr. Curley: They did not fire many shots in working the coal. Sometimes in working the bottom coal no shot would be fired. They might fire two shots per shift. They all bored the holes for the shots. In the top coal the holes would not be a foot off the roof. He never saw any exceptionally soft roof there. The roof was fairly regular so far as he saw it. Whether shots were fired or not bits of the roof used to fall. He saw bent caps in the tunnel besides those that were broken. There were more than one. They were below the broken caps towards the face. On the Tuesday before the fall, when Mr. Thomas was speaking about the bent timber, he said he hoped that by the next time he was down the tunnel the cage would be run. Griffiths said he wished the tunnel was done then. Sometimes he heard cracks in the tunnel once or twice in the shift, and sometimes a dozen times. Griffiths would also be present each time. Lewis was on witness' shift occasionally when they had timber to put in. He would not swear Lewis was there when witness heard the timber crack, but he believed he was there. Half an hour after the fall he was down the tunnel as far as the last leg left standing. The rails were bent in all shapes. The first length of rails was not disconnected. The sills were the same as before the fall pretty well all through the tunnel as far as he went. Since the fall he had been right underneath the fall, no farther. He did not know what the sills and rails were like below the fall. He knew the band between the coal and the roof. It was sometimes a sort of a black stone, a dull black, not shining like coal. There was at times a very small grey band between the coal and the roof, sometimes like Exhibit H produced, and also like the piece of fine conglomerate. It would be up to an inch and a half thick, and sometimes would be in the coal. They called it out at the mine a fine conglomerate. It was not a very soft nor a hard roof, but a patchy roof. The bottom was mixed, too. They took a couple of feet out of the bottom to get the timber in. They had to dynamite the bottom sometimes to get it out.

To Mr. Bowden: The bent timbers were lower than the broken timbers. Three sound caps were between the bent and broken timbers. He saw several bent caps there—about four. They stood up after the big fall. When he went down after the big fall he thought there were about seven sets gone. The bent timbers below the broken ones were bent about 2 or 3 inches. Before the big fall he saw no bent timbers below the bent timbers already alluded to. A man had to look closely for bent caps.

At this stage the inquiry was adjourned for an hour and a half.

The inquiry was resumed at 2:30 p.m., and Edward Parsons was recalled.

To Mr. Bowden: When he heard the caps cracking he was at the face. He could not say the broken caps were cracking. It might have been other timber. He could have a good idea of where the cracking came from. His idea was that it came from the broken or from the bent timber. The cracking came from above the cask. The first crack he heard in the tunnel seemed about 20 feet above him in the tunnel. He reported that cracking to Mr. Griffiths. When he was at the face and heard cracking he could form a good idea of the place where it came from. He knew it came from a place up above him, but not near him, but how far up he could not say. He believed it came from the broken timber or from the bent timber.

To the Jury: He mentioned the first cap he heard go off to Griffiths, who said it was nonsense. Witness thought it was a sill. He was certain that Griffiths saw the slabs belled down on the bent caps. On the Thursday morning before the fall witness said they were looking bad. He said that on several mornings. In the big fall the legs and caps went down together. Some of the chocks used to wedge the caps were left in the ribs which stood. He was not down the tunnel since the bodies had been recovered, nor would he ever go down again. The reason he left the pit was because he was going to get better wages. He would work in any part of the mine except the tunnel. The air in the pit was good, and there was nothing to complain of about it. He noticed the sills in the extension before the fall, but never saw any bent. Had there been any bent the alligator could not have gone up and down.

Rudolph St. Vincent Heyes, engineer, residing at South Maitland, deposed that he knew deceased, Albert Moncrieff.

To

To Mr. Tillett: He was engineer at East Greta Colliery, and remembered the fall in No. 1 tunnel. He was in the tunnel 10 to 15 minutes after the fall, and went down to the edge of the fall. He was last in the tunnel on the Tuesday before the fall, measuring the distance from the second level down to the face. Mr. Thomas and Edward Howarth were with him. Griffiths, Parsons, and March were at the face at the time. He saw the timber as he was going down, and it was all sound. There were one or two bent caps about 130 feet from the face. He heard no conversation between Mr. Thomas and Griffiths about the timber. Mr. Atkinson, Chief Inspector, gave no directions since the fall about how the timbering had to be done nor about bigger timber, but he asked witness if he put any defective timber in, and he answered "No." He had not written to witness on the subject. The stone produced, called mud-stone, and marked J, came down in the big fall, and was given by witness to Senior-constable Brown. He gave him another piece, which he believed came out of the big fall.

At this stage Senior-constable Brown was called, and deposed that he received from Mr. Heyes the stones marked J and K, and he picked up two other pieces, now marked L, which Mr. Heyes said had been exposed to the weather.

Rudolph St. Vincent Heyes was recalled.

To Mr. Atkinson: They measured the tunnel, 565 links from the second level down to the last sill. That would be about 370 feet. His duties took him down the tunnel once a week to report on the general state of the tunnel. That included the condition of the timber and the timbering. The timber below the level was sound, except for the caps he had already mentioned and a few sills slightly bent. The sills were about 120 feet from the face, and the bent caps were a few feet off. He had been down the tunnel frequently since the fall, and had kept an account of the progress of the work as shown on the plan. He saw the timber which had been brought out since the fall. Two or three sills were knocked out by the fall. They were out of position altogether. The rails went down as well. The fall from the roof and the cap pieces coming away carried the sills and rails with it. He recognised the distance the bent caps were from the face by the position of the dam and the water-casks. He had not counted the number of broken caps that had come out of the tunnel. As an engineer, and from his knowledge of ironbark timber, he considered it a good timber for the purpose for which it was used. He made no experiment to see how much a bar would bend. They had electric signal bells in connection with their signal system. The signals were carried to within three or four sets of the face. When the accident happened the engineman was at his place. There were 4 ft. 6 in. from the back end of the cage to the under side of the caps. There was a clearance of 18 inches on each side.

To Mr. Curley: He examined the machinery, ropes, and everything in connection with the working of the tunnel and boilers. He made that examination once a day. They had safety valves on the boilers, also steam gauge. His examination of the tunnel included timber, and he made his examination once a week. He made no report about bent caps. The date of his last report prior to the fall was the 17th November, and that was the daily report. The report books were kept in the outer, or open office. He considered it his duty to report, and show any defects he saw in the timber. He made those examinations at all times during the day. The last one was made on the morning before the accident. The examination took two or three hours. He was quite sure he saw only two bent caps. They were bent about 3 inches. He saw no broken or splintered caps. He had examined the timber after the fall while rescue work was going on. He was down every day. A lot of the timbers were carried away. Of those left some were bent, and some were broken. He never counted them, nor did he regard it as part of his duty to do so. He kept a progress plan, but no report of the broken or bent caps. After the big fall they could get 127 feet down to the top end of the big fall, but there were no broken or bent caps in that 127 feet. They were all sound caps there. That was from the level to the top end of the fall. He went all the way inspecting the tunnel until the bodies were recovered. He did notice broken and bent caps below the fall during the work of retimbering. There were a number. It was no wonder to find a number of broken caps after the fall, because of the big fall hitting them and knocking them out of position. Some of the legs were also knocked out of position. He put nothing of that in his reports. The timber was mostly fresh from the bush. He had a fair knowledge of timber. He noticed sap circling the timber, and never saw green timber without sap. He had no idea of the thickness of the sap. He had examined it. He never suggested that stronger timber should be used for the tunnel. The Tuesday he was down the tunnel he was at the face the whole of the time the manager was there, and he never heard any conversation about timbering the tunnel at the weak end. Such a conversation might not have been carried on without his hearing it. Lewis never mentioned about any bent caps in the tunnel to him. None of the men did, nor the manager. If some of the men swore they saw four bent caps that would not make him see more than he did. It was possible that other men might see more than he would. Mr. Thomas gave the order for the supply of timber to the bushman. Witness looked upon it as his duty to see that the supply of timber was not defective. He had challenged and discarded timber, but only for being too small. There were no defects. They were props. The dimensions of the timber were given to him by Mr. Thomas. The tunnel timber was to be 8 inches in diameter at the small end. That was for legs, caps, and sills. He found one or two less than that, and rejected them.

To Mr. Millard: On the Tuesday before the fall he walked up and down the tunnel, and waited for the men some time. The spot where he waited was 132 feet from the tunnel. It was at the 2-chain mark, under the place where the big fall occurred. There were no broken caps over him. If there had been five or six broken caps sagging down a foot with the slabs down on them he would have seen them; and would not have stayed there. Had there been any broken caps further down the tunnel he would have seen them as he was inspecting the tunnel.

The inquiry was then adjourned until 10:30 a.m. on Monday.

The East Greta Colliery inquiry was adjourned from yesterday afternoon until Monday morning, at 10:30, at the request of Mr. Curley, whose duties as Miners' General Secretary will detain him in Newcastle to-day and on Friday. The jury, by a majority, consented to the adjournment.

[*Newcastle Herald*, 24 January, 1899.]

## THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieff, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillett represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Mr. A. A. Atkinson (Chief Examiner of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

Rudolph St. Vincent Heyes, engineer at East Greta Colliery, was recalled.

To Mr. Millard: He saw one or two sills bent in the tunnel, not to any great extent. That bending would not prevent the cage from running. After the fall the road was disconnected, fourteen or fifteen pairs of rails being knocked down the tunnel from the top edge of the fall. A person at the top end could see that the rails were gone. Those rails were bent and twisted in all shapes, and some of them were still at the pit mouth. On the Tuesday before the fall the manager made a stay at the second level when he went down first. They both stayed there, and the manager fixed his instrument, and took the angle, after which witness went down to measure to the bottom, and then walked back to 2 chains from the manager, right under the site of the big fall. The manager did not leave the level while witness was measuring down the tunnel. The manager on his way up did not stop under the fall. Witness was with him all the time. It is not true that the manager stopped under the site of the fall to examine the timber. The men at the face stopped working from the time the manager got to the level. Griffiths held the light for the manager. The bent caps he saw before the accident did not indicate any danger. It is not an unusual thing to see timber bent like those he saw. He would attribute the bending to bottom and end pressure. He had seen caps bent from side pressure, but not in that mine. He saw them in old Greta Mine, and they remained bent for years, and were taken out eventually, but the roof did not come down. The sides also stood there. He had a general knowledge of the roof of East Greta Mine, and of tunnels in particular. The roof was conglomerate, and proved a good one to a great extent. The timber and the method of timbering, in his opinion, could not be better. No precaution that he could think of could have been taken that was not taken to prevent the accident. The bent caps he saw were 130 feet from the face and 70 feet below the lower edge of the big fall. There were several slight changes in the grade of the tunnel. There was a change at 130 feet from the face. Anyone not understanding it would think they all had come down owing to the change of grade.

To the Jury: To affect the cage running the sills would have to be bent up 8 or 10 inches. He attributed the accident to the action of the water on the soft mudstone above the roof, which proved to be not so good as they at first believed. The bent sills had nothing to do with the bent caps. He replaced the legs that had been knocked out. [*Witness here showed where legs and caps had been replaced after the fall.*] Sixty pieces went down in the fall. After the fall he saw a bent cap 120 feet below the fall. If fresh timbers had not been put in where bent timbers were found there would eventually have been another fall. He revised report books, but never saw that any shift had spent the greater part of the shift in the manhole through the dangerous state of the tunnel. Gronow had worked two years in the colliery, and had experience in other mines.

To Mr. Curley: Before the fall he had not suggested the strengthening of the sets. With skips on the cage there would be 8 inches clear between them and the lower end of the caps. The sides of the skips ran 18 inches from the sides of the legs. There would be no space to put supports from legs to caps in that 18 inches. He received orders from the manager, who never suggested at any time the bricking of any part of the tunnel. Witness had not suggested that bricking to the manager, not even where the fall took place. The rails were 5 yards long. Fifteen new ones were put in after the fall. The sixty pieces that went down the mine did not include slabs. There were about 1,000 slabs. There were four sills.

To the Jury: The cage was not running in the tunnel.

To Mr. Millard: If the caps were bent down 12 inches the tunnel would not have been of any use for the purposes for which it was intended.

John Griffiths, a miner at East Greta Colliery, deposed that he knew deceased Albert Moncrieff.

To Mr. Tillett: He was on the shift that came out of the tunnel at 3 p.m. on 17th November. March and Parsons were with him, and he had charge of the shift. He had been working in the tunnel since the end of June or the beginning of July. He knew where the big fall took place. He saw no bent caps where the fall took place. He saw some about 150 yards from the face. There were three or four. He heard timber cracking in the tunnel. It was a usual thing when new timber was put in to hear it cracking. He believed someone spoke to him about the cracking. The roof of the tunnel was conglomerate and a little band, running from 2 to 6 inches thick, of soft bluestone, sometimes, but not always, across the face. Exhibit C was what he called soft bluestone. He saw Mr. Thomas in the tunnel on the Tuesday before the accident, and they were speaking about the grade of the tunnel, but not about the timber, to his knowledge.

To Mr. Atkinson: He worked at East Greta a little over five years as a miner. He had not got coal from the bottom level of No. 1. He had not worked along the level at any time. He had seen no falls where he had been working. While working in No. 1 extension he had seen stone fall 6 or 8 inches above the coal occasionally. That was bluestone. The cracking he heard came from six or seven sets back from the face. He never heard cracking away from the face. He attributed the cracking to the timber setting in the joints. The timber was always set right into the joints before the sets were left. There would always be a little grinding in the joints from bottom and side pressure. He could not form any idea of the cause of the accident. He had charge of the shift, to see everything was right, by inspecting the tunnel every day. His attention was never drawn to dangerous timber in the tunnel.

To the Coroner: It never struck him that there was danger in the tunnel.

To Mr. Curley: He had nearly thirty years' experience as a miner. He had not seen very many falls in mines. Where a fall takes place where there was timber used it is the sign of a bad roof. Bent timbers were not always the sign of a bad roof. Sometimes they were, and sometimes they were an indication of side pressure. With side pressure in the tunnel he would expect to see its effect on the timber. He would not expect to see the props bent, unless the pressure was extraordinary. With bottom pressure

pressure he would not always expect to see it in the sills. Where the caps were bent he saw no signs of bottom or of side pressure, any more than that the caps were bending. He could not say when he noticed the first cap bending. Hearing the cracks did not lead him to make an examination. The men did not speak to him about the bent caps. He made careful inspections going up and down. After he first saw the bent caps he always saw them. He could not say how far they were bent. They were not splintered; not cracked. Nothing drew his attention to the bent caps, only that he was looking about him. He had no conversation with Lewis about them. About a fortnight or so before the accident he was off work, and Thompson was in his place. His mates were with Thompson. No man, so far as he knew, was put into the tunnel to take his place. They had a spare man, Ernest March, there at the time. They could not have been more bent timbers in the tunnel without his seeing them. He saw the bent timbers before Mr. Heyes was in the tunnel. If there were other bent timbers they must have been bent very lightly. He did not know that any timber had been replaced in the tunnel before the fall. When the manager was in the tunnel on the Tuesday witness asked him how far they had to go, and the manager said he could not tell him until he went to the office. He said he believed they would be finished by Christmas. Witness replied that he wished it was finished then. Mr. Thomas said, "Why, Griffiths?" and witness replied because the water did not agree with him. Mr. Thomas did not say anything about having spoken to Lewis about the timbering, or about going to do timbering at the week end. Witness had no talk with any one about the timbering. He was acquainted with the deputies of the colliery. He never spoke to Lewis about the timbering at any time, nor to Mr. Thomas, nor to Mr. Heyes, nor to the under-manager, nor to any of the deputies, all the time he was at the colliery. He was down the tunnel the day the fall took place, and went right down to where the fall took place. He might have stayed five or ten minutes at the time. Lewis, Thompson, and Mr. Thomas were with him. He noticed nine or ten sets of timber gone. He noticed the roof down, nothing else. He noticed the road and the sills. The road was bent in all shapes. Two or three sills were knocked out. The rails had become disconnected. How much he could not say, as he could see very little. He had fairly good sight. He could not say how far the rails had separated. He had sometimes to put a slab up in the face before he got his set up. That was done to keep the stone up. They had to do that pretty often. He had never to chip the conglomerate to get sets in, but the timber men, Lewis and Thompson, had to do so. He saw the stuff that came down when they did chip. It was very hard to get down sometimes. He did not see particularly soft patches of conglomerate, but had seen some a little softer than others. He would not say from that that the conglomerate varied in places. The bottom, as a rule, was soft. They had occasionally to put a shot into it when they met a hard patch. He did not work after the fall clearing the stuff out. Some of the men spoke to him about the timbers cracking, and asked him if there was any danger, and he said no, it was always the same where new timber was put in. He often heard those cracks. The men did not speak to him often about the cracks. It might have been twice. He never heard the men speak to one another about the bent caps. When he was going up and down with them they never at any time drew his attention to bent caps. Gronow never spoke to him about them. He never heard the men speak about a statement made by Moncrieff about the bent caps. He spoke to no one about the bent caps.

To Mr. Millard: He knew the colliery pretty well all over, and his experience of the roof was that it was a good one. No. 2 he saw from top to bottom, because he drove the tunnel, and the roof was a very good one, but the floor was soft. The extension of No. 1 appeared very much the same as far as they could see. There was nothing where the fall took place to indicate that it was a weak spot. The roof there appeared to be conglomerate, and appeared the same all the way down. Wherever the roof was cut into it always appeared to be conglomerate. The potholes he saw were small, and showed no break in the conglomerate which appeared above them. The potholes were something similar to the bands. There was nearly always a band between the coal and the conglomerate. Sometimes it went out just like a wedge. Where the fall took place there were no bent caps. If there had been bent caps down 12 inches with the slabs down on them he would have seen them. Nothing was ever said in the cage by the men about the caps being bent there. March never spoke to him about bent or broken timbers. Parsons did not. On the Tuesday before the accident when the manager was down the tunnel he went straight down from the bottom level. He did not notice him stop going up. He did not see him stop under where the fall afterwards took place to examine the timber. He had not much experience in timbering. The other men did the timbering. There was nothing in the tunnel before the accident to indicate to him any danger, or he would not have gone down. It was not unusual to see caps bent as he saw them. They were bent nothing out of the way. He saw timbers bent at old Greta Colliery. He saw caps there bent by side pressure. Those caps stood, and some of them were standing to-day, though the roof had come down and left them there. New timber cracked. It cracked all the way in No. 2. The fact that it was green timber would not make it crack more or less.

To Mr. Bowden: The sills were not put on the ground. A block of wood was put under each end, and from one leg to the other it was hollow under the sill. They used to put four or five sets in before they slabbed the bottom. Very often there would be 6 inches between the sill and the bottom when they left it. The bottom very often swelled up to the sills, and it was often necessary to use a pick or a drill to make the hole under the sills again. When the stuff had been removed from under the sill he had seen the sill spring back an inch. The slabs used at the face were only used to keep the loose stuff from falling. The loose stuff sometimes would be soft bluestone, and sometimes coal.

To the Jury: His mates were Edward Parsons and Ernest March. Nine men were working on the extension. A man named Pike worked on the extension. Pike was not working at the colliery at present. He left through sickness. The potholes of soft bluestone were not to him indications of danger. He would not call the roof of the tunnel a patchy one. It was regular. A live mine was one in which there was a good deal of cracking in the coal. That did not indicate danger. It was just what they liked to see. Mr. Thomas did not mention Lewis' name to witness on the Tuesday before the accident. He was present in Court when March and Parsons made statements about Mr. Thomas, saying that Mr. Thomas told him Lewis would repair the timber at the end of the week. Mr. Thomas did not tell him that. Mr. Thomas did not say the bent timbers were to be renewed at the end of the week. He was positive of that. One of those men did not call his attention to the caps being bent with the slabs sagging down on them. Before the fall they considered the timber strong enough to hold the roof. He saw the Government inspector down the mine. He saw him more than once.

The inquiry was at this stage adjourned until 2:30 p.m.

On

On resuming, John Griffiths was recalled.

To Mr. Curley: Some men besides those mentioned worked in the tunnel at odd times. He thought Gronow was away from work some time before the accident. Kelly took Gronow's place, so far as he knew. He did not know if Kelly was working at the colliery still. Witness was working five years at the colliery, and had no fall to speak of. He saw some little bits in the road on the level. They were generally coal. How much he could not say. He was never in places where they took tops out. He never had to go where falls had taken place to do any work. He never had to clear out of the mine in consequence of falls.

To the Jury: He was not a contractor. He was paid so much per yard, and did not consider that contract work. It was just an understanding between Mr. Thomas and them. He was not appointed a deputy, but was appointed by Mr. Thomas to take charge of the shift. He never heard Mr. Thomas make mention on the Tuesday about repairing timber. It could not have been said without his hearing it. Mr. Thomas might have stopped under the site of the fall without witness noticing him. When Mr. Thomas left the face they did not go on working. He saw Mr. Thomas going up the tunnel. They used a couple of shots of dynamite getting up the bottom. He had not been talking to anyone about the accident any more than mostly everybody else would be talking about it. Besides Kelly, March, and the nine men previously mentioned, other men worked odd times in the tunnel. He did not remember who they were. As boss of his shift, he had the power to withdraw his men if danger was reported to him, so as to remedy the danger. The late Daniel Gronow had the same power.

To Mr. Bowden: He had worked in other mines, and had heard cracking in them similar to that which he heard in the tunnel. That cracking did not indicate danger of a fall. He could not locate the timbers from whence the cracking proceeded. If Mr. Thomas stopped going up the tunnel he could not tell where he did stop. He could see his light; the reflection of his light, but not the light itself, unless it was held up a good bit, owing to the grade of the tunnel. When Mr. Thomas was taking the grade of the tunnel he held the light up on a stick, so as Mr. Thomas could see it.

To the Coroner: There was danger sometimes when timber cracked.

To the Jury: The tunnel was steeper in some places than in others. Grades were not shown in the plan.

To Mr. Bowden: The cracking of the timber would not make anything like the same noise as one of the 9-inch caps. The noise of breaking timber was much stronger than that caused by cracking. He never heard a 9-inch bar break.

To Mr. Curley: Timber was put in a mine to prevent it from breaking in.

David Lewis was recalled.

To Mr. Millard: He knew the seat of the fall. There were no bent caps there before the fall. It was not true that at that spot there were caps bent 12 inches, with the slabs sagging down on them. That was not the case in any part of the tunnel. Neither Parsons nor March drew his attention to broken or bent timbers. He heard none of the men speak of timber being bent or broken where the fall occurred. March asked him at the pit top how far it was from the level down to the fall, and he replied that he did not know exactly. Witness asked why he wanted to know, and March replied, "I should like to know, as there will likely be an inquiry after this." March said he did not know, and witness told him he ought to tell them he did not know. Witness also told him he did not know. March had been down the tunnel between the time the accident occurred and the time of the conversation. March was not down the tunnel after the conversation.

To Mr. Bowden: He heard Cantwell swear that Moncrieff slept in one night. Moncrieff slept at home on the Wednesday night. On the Tuesday night Gronow said he was a man short, and on top witness asked Morrison if he would call Moncrieff. Morrison said, "All right." Moncrieff called at witness' place as he was going to work. On Wednesday night he did not turn up, and witness spoke to Thompson, who said, "You had better leave him sleep to-night, and it will be a lesson for him." On Thursday night he did turn up, and witness said to him, "Hulloa, did you find yourself?" and Moncrieff said, "I made sure of it to-night. I came to the pit top at 7 o'clock, and had a sleep in the little skip on top." The skip was still at the tunnel mouth. Moncrieff slept there from 7 p.m. until 11 p.m., so as not to miss the shift.

To Mr. Tillett: He used to talk to the men about the mine going down in the cage. He did not pay particular attention to what was said at any time.

To Mr. Millard: Had anyone said that the timbers were dangerous or the caps were bent, he would remember that.

To Mr. Curley: If anyone said to him, "That timber has been cracking down there to-night," he would ask in a minute, "Where?" It would depend on the answer whether he put it in the report-book or not. He heard the timbers creaking, not cracking. He remembered being in the tunnel with the jury and being asked to get a sample of stone from the roof. The Exhibit F he got down below the fall. How far below the fall he could not say. The water had been over it. He did not know how far up the tunnel the water was. The Exhibit H was similar to that near the door in the level near the overcast. He did not hear Mr. Thomas say there was a soft patch there. The stone was a sort of a conglomerate. He had to fire three or four shots in the bottom. He never tested the roof by putting a hole up in it. He and Thompson set all the timber in the tunnel. If there was any defect in connection with the setting of the timber he would regard himself and Thompson responsible for it. The timbering was inspected by Mr. Heyes and Mr. Thomas. They sometimes found fault with some of the sets. Mr. Heyes would point out where a mistake had been made, and they would have to rectify it. Mr. Thomas on one occasion said some set was not at right angles to the seam. He said it was out, and witness said it was not out. Mr. Thomas said it was out a couple of inches. They got the square to see who was right, and neither was right. It was an inch out, and it was put right. He could not say the thickness of the cap on the timber. It was not possible for bent caps to be in that tunnel without his seeing them. When the jury were down the tunnel he saw bent and broken caps below the fall. He worked clearing out the fall from the time of the fall onward to the recovery of the bodies. The jury could not get to the face on account of water. There were 60 or 80 feet of water. He had been down below that when the water was not there. There were some bent and broken caps below the water. He noticed the bent and broken caps as soon as they took the dirt out as they went along. Before the fall he only saw four bent caps. He could not account for the bent and broken caps after the fall. The roof broke some of them. The  
roof

roof and the sides probably broke them. He did not know the names of all the men who took the stuff out with him. There were Dan, Frank, and Jack Genge, Jack Downie, Jim Hennie, Jack Leishman, Fred Cook, Ernest Nixon, and Gilson. He was there soon after the fall. The rails under the fall were gone, and could not be seen. The rails were hanging on to the top end of the fall. The dogs were sprung out. One of the sills was gone at the seat of the fall. Four sills went altogether. The first missing sill went from near the bottom end of the fall. All the rails from the fall to the face were gone. They were swept down the tunnel.

To Mr. Millard: The rails were found along the tunnel, some against the roof. They were not all in a heap.

Azariah Thomas, manager of East Greta Colliery, was recalled.

To Mr. Millard: He remembered being down the tunnel on the Tuesday before the accident surveying. He had a conversation with Lewis, but did not say a word about re-timbering or repairing. No reference was made to timber being broken or bent. He did not stop going down or coming up to look at bent timber. Timber could not be bent and broken as described by Parsons and March without his knowledge. He saw no timber bent except that already mentioned by him, near the cask.

To Mr. Bowden: He had heard timber crack in a mine. He heard it near him. The noise of timber setting could not be mistaken for the noise of cracking. The noise made by breaking caps 9 inches thick would be a very loud one.

The inquiry was adjourned until 10:30 a.m. to-day.

[*Newcastle Herald*, 25 January, 1899.]

#### THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieff, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillett represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Mr. A. A. Atkinson (Chief Inspector of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

Hugh Humphreys, manager of Dudley Colliery was recalled.

To Mr. Curley: The cause of the fall was the mudstone taking the place of the conglomerate. Under the fall the conglomerate showed a shell from 18 inches to 2 feet thick on one side to 5 inches thick on the other. Lower down the conditions were reversed. It was 4 or 5 inches on the right side for about 30 feet, when it began to thicken. On the left side it began to thin out down to 15 or 20 feet from the bottom of the fall. In the strata of mines there were vertical and horizontal layers, and the facings often ran upwards. If there was water trickling through the strata at the fall he did not think it would come through the conglomerate, though it would affect it. It would certainly have affected it if the caps were broken, the slabs lying on the caps and the roof lying on the slabs. In a case of that kind he would, under such conditions, have expected to see water coming through. If the water did not come through he would not expect water above, but that did not show there was no water above. He would call Exhibit J a soft shale-stone; Exhibit K a fine conglomerate; Exhibit F a conglomerate. If he saw timbers bending below 500 feet down the tunnel he would put the sets closer together, as was apparently done in this case.

To the Jury: Leaving aside the fall, he considered the roof of the tunnel an exceptionally good one. He had seen the conglomerate above the top slabs on the ribs down below the fall. There may or may not have been patches of mudstone above the slabs.

To Mr. Millard: He noticed no band between the coal and conglomerate. Such a band would not be a source of danger.

To Mr. Bowden: While travelling up and down in the alligator he could not detect mudstone between the slabs. He could if the alligator went slow or stopped. It would be too high to examine off the floor. A proper inspection of the timber could be made from the alligator. From what he saw of Lewis he considered him in every way a competent, skilled practical man.

Duncan McGeachie, manager, Waratah Colliery, was called.

To Mr. Millard: He had twenty-seven years' experience in coal-mining in all its branches in Scotland and New South Wales. He was also an engineer and surveyor. He had a fair knowledge of all the Greta Measures. The roof over the East Greta seam was a hard conglomerate up to a depth of 40 feet. After the accident he noticed the method of driving and timbering in No. 1 tunnel, and in his opinion it was on most approved principles. The work was good. The timber was all good ironbark. He knew the conditions that existed before the accident, and considered the place well timbered. He made an examination, not a minute one, of the cavity of the fall. He found a thin casing or shell of conglomerate from 18 inches on one side to a few inches on the other. Immediately above the shell was mudstone, and above the mudstone was sandstone. That was not a usual thing to find in conglomerate. As a geologist he would never have expected to have found it there. He was not below the fall. He observed David Lewis work. Lewis was a thorough practical man, and one who deserved great credit for the work he had done. He believed the cause of the accident was the mudstone in the roof, assisted by water or something else. He thought the fall gave very little if any warning. If the timbers once began to go, they would not last five minutes with the weight that came away.

To the Coroner: He was very much surprised when he saw the mudstone there. It was a thing he had never seen before.

To Mr. Tillett: It was the first mudstone he had seen in that roof. If he did see any there before it would indicate to him a change in roof. If the mudstone appeared in potholes he would not expect a change of roof. A patch right across the face would indicate a change of roof, and he would make provision. He did not think the fall would gradually settle on the timbers, because the hard conglomerate would not yield, but would crack like glass, and the stuff above would break through.

To Mr. Atkinson: He had experience in steep measures in Scotland. The dip was 43 to 47 degrees. They were worked by shafts. The roof was rather bad. They drove down a certain distance and worked up the rise, the same as at East Greta. He was nearly two years under-manager at Greta Colliery. He remembered

remembered the depth of conglomerate at about 40 feet. It was bare, not bricked. He did not think side or bottom pressure had anything to do with the fall at East Greta. It was roof pressure. He examined the roof along the lower level, and it appeared to be a very sound conglomerate. That was in the overcast. He had been in no other part of the mine. He had experience of iron-bark caps. If he saw five or six of them bent in a tunnel he would think there was something wrong, and would look for the cause. If he found it was due to pressure from the roof, he would replace them. He would not take much notice of one or two bent caps. In that tunnel, if a cap were bent 6 or 8 inches, it would be perfectly useless. With side pressure he would expect to see the effect first in the props.

To the Coroner: The floor above the seat of the fall was soft and yielding, and the sills there were well put in.

To Mr. Curley: He would take no notice of one or two caps bent in that tunnel. If a cap was bent 6 inches it would be past the point where it would have any resistance. He would take notice of four bent caps, and if the pressure was from the roof he would be guided by circumstances. If the timber was too light he would put it closer together, or put in stronger timber.

To Mr. Bowden: There was no appearance of water when he examined the fall. It was a surprise to him to see the conglomerate narrow out to 6 or 8 inches. The timber was good; could not have been better for the purpose. If the caps had been bent 12 inches they would not bear their own weight. He had seen timber bent by side pressure. It would not have alarmed him to have seen three or four sets bent from side pressure. He would expect to see side pressure at all times show itself first on the props. It would have been impossible to have seen patches of mudstone at the fall.

To Mr. Tillett: He would not say no patches had been seen. He could only speak of what he had seen.

To the Coroner: He was at the fall on the Monday, Wednesday, and Friday after the fall.

To the Jury: He was asked by Mr. Thomas to go to the tunnel and to inspect the fall, with a view of getting over the difficulty. He saw no change of roof in the overcast. It was good conglomerate. He never saw changes in that roof before the fall. He had seen faults coming in the coal, and they were of common occurrence. He had a fair knowledge of the Greta Measures. What he knew of the East Greta roof he had seen since the accident. He would prefer seasoned to unseasoned timber, but the timber put in the tunnel was good, whether seasoned or unseasoned. The fact of the caps being bent below the fall was proof that they were not strong enough to stand the pressure after the fall.

To Mr. Millard: If he saw bent timbers he would be guided by past experience. If he had previously found the roof intact further up the tunnel after the removal of bent timbers he would conclude that side pressure had existed. He was requested by Mr. Thomas to go to the mine to assist by advice in recovering the bodies of the dead men.

To Mr. Curley: If caps were bent or broken and the roof remained intact, the pressure would be from some place other than the roof.

To Mr. Millard: There was no great danger in the bord and pillar system.

To Mr. Bowden: Patches of mudstone underlying the conglomerate would not indicate a certain change. All roofs were to a certain extent patchy. The patches were not thick.

At this stage the inquiry was adjourned for luncheon.

The inquiry was resumed at 2:30 p.m.

Richard Thomas, manager of the Duckenfield Colliery, deposed:—

To Mr. Millard: He had twenty-eight years' experience in mining, fifteen at Home and thirteen in the Colony. He knew East Greta seam, and had experience of it. He studied geology. He went over the whole field with Professor David. The roof was a hard calcareous conglomerate, and was generally found over the Greta seam. He had traced it from South Greta Colliery to 5 miles south of Richmond Vale, a distance of about 16 miles. That conglomerate roof was the best for coal-mining purposes. It was proved from 50 to 80 feet thick. He visited East Greta Colliery when it was being opened up, and on the day of the disaster. He had been there several times since the disaster. He noticed that the timbering was well adapted to resist pressure from roof, floor, or sides. It was a modification of the Welsh system. The tunnel was driven on scientific principles. The class of timber was good. Under conditions existing before the accident the timber was all that could be desired. He visited the scene of the fall, and noticed the strata disclosed by the fall. He noticed overlying the slabs a thin layer of conglomerate 18 inches thick on the left-hand side, and a foot thick on the right. Above that he saw 5 feet of mudstone, then a grey pebbly sandstone, 10 inches or a foot thick; above that, 4 feet of mudstone, and above the latter, dark brown sandstone. He went to the lower end of the fall in another visit. The conglomerate on the left-hand side prevailed right through, and on the right-hand side thinned out to almost nothing. He had no particular knowledge of the roof other than what he saw in the fall. He saw the overcast driven right through the solid conglomerate. He did not go into the level. The erosion of mudstone into that conglomerate was a freak of nature. Conglomerate was formed by a swift current, and mudstone was carried by a slow current. It was the silt deposited by the slow current. [*The witness here drew a sketch showing how mudstone was deposited in the conglomerate.*] In his opinion, the accident was caused by the erosion of mudstone in the conglomerate. It could not be guarded against because it was quite unexpected. To find timbers bending to any small extent in mines was a usual thing. If he saw in a tunnel like No. 1 timber slightly bent, that would not indicate any danger. A bend of 2 or 3 inches would be a slight bend. If he noticed the caps bent in that way, and the slabs did not follow the caps, there would be no roof pressure. With regard to what he would do with bent caps, he would be guided by his past experience in the same mine. If the roof higher up the tunnel stood intact after the removal of bent caps, he would assume that the bending had been caused by side and floor pressure. He believed the conglomerate shell under the fall burst away suddenly. He thought the fall would be almost instantaneous after the breaking of the conglomerate. Mudstone would be a dead-weight on the timber once the conglomerate had broken. It would not be possible for the caps under the fall to be broken, to have the slabs down on the broken caps, and the mudstone visible through the slabs. Caps 5 feet centres apart would each stand 20 tons. After a cap had been cracked and broken through, it would not support itself. Once a cap began to crack it would weaken. A cap bent 8 inches and cracked would not support 20 tons.

To Mr. Tillett: Mudstone had no cohesion. Had the tunnel not been timbered, the thin band of conglomerate would have been broken by the weight of the mudstone above. The fall did not take place earlier because the timber was there to support it. Had they known there was dead-weight of mudstone there

there they would have strengthened the timber. Any movement in the conglomerate would have shown in the caps. He saw no evidence of water there, either in the mudstone or conglomerate. The timber was sufficient for the conditions apparent before the fall. The mudstone showing above the coal would indicate no danger.

To Mr. Atkinson: He would not expect much side pressure in that tunnel. Side or bottom pressure had not much to do with the fall. Conglomerate geologically was a rock that varied little in its character. In making calculations of the strength of a cap piece he assumed that the weight was distributed equally over the cap. If four or five caps together were bent 5 or 6 inches he would be guided by his previous experience in the mine. He would see if the roof was intact. If pressure came from the sides he would expect to see them fall when the roof was taken away. The sides of the fall were to all appearances what they were when driven.

To Mr. Curley: He was in the mine in its early stages, ten years or more ago. He was in No. 1 tunnel then. He saw a hard patch of conglomerate there where there was no timber. It was 75 or 80 feet long. He saw timber after that, and patches without timber. Below that he saw timber continuous after that. He attributed the continuous timbering to the increased depth. Prudence and precaution were observed there against possible accident by roof or sides. Danger would increase as they went down. When he was there ten years ago the tunnel was down 100 or 150 feet, and some bords were going at the time. He had not been in the colliery from that time to the accident. He would not consider any serious falls with the roof they had there. If there had been certain falls in the colliery he would want to know the conditions of the falls. He would not put his limited experience of that mine against the manager's experience. It would be unreasonable. He would not say his experience was a closed book. It was a fairly open one. If he had conglomerate breaking, and mudstone showing above, he would conclude a change of roof indicated. If the mudstone appeared above a broken crust of conglomerate it would show a want of uniformity. There was practically no cohesion about mudstone. Exhibit J was mudstone, and it had practically no cohesion. It would want close timbering; and knowing the conditions of the fall as he knew them after the fall he would have the timbers not less than 3 feet apart. If he knew the mudstone to be of unknown quantity he would treat it all as mudstone. He made the first measurement on the first or second day of the fall, and he made the other when he was there last. They were not made by rule, but by observation. At the top end of the fall the nearest cap to the edge was good, and the second one was bent 4 inches. There was no break in the roof at the side. He was not in the colliery generally. He went there to help the rescue parties. Inspectors Dixon and Bates, Mr. Ross, Mr. Thomas, and Deputy Lewis were with him when he made his first measurement. On the second occasion Chief-Inspector Atkinson, Inspector Bates, Mr. Jonathon Dixon, and Mr. Thomas were with him. East Greta Colliery required more attention than one running on an even grade.

To Mr. Tillet: The roof was a coarse conglomerate. He knew "Geikie's Geology," and looked upon it as a standard work. He could not agree with Geikie's theory about conglomerate. Geikie could not have had a knowledge of our marine beds when he wrote it.

To the Jury: The second fall ran into the sides 3 feet. He visited the tunnel in the first instance to see if they could get the men out alive. When that was hopeless he went to assist in getting the bodies out. He was quite satisfied with what he saw in the tunnel to judge as to the cause of the fall. He already knew the nature of the roof. If there was a soft patch in the level near the overcast that would be no indication of danger lower down the tunnel. Calcareous conglomerate would be affected by exposure to water and air.

To Mr. Bowden: He had seen caps bent by floor pressure at Home, but not at Newcastle. It would bring the sides away. A body of stone with little cohesion could not hang for a time if it was depending on itself. A roof with little cohesion would stand until the limit of resistance was reached. If he saw a patch of shale in the roof he would not come to the conclusion that it was all through the roof. The presence of such patches was not an indication of change of roof.

The inquiry was then adjourned until Friday, at 10:30 a.m.

[*Newcastle Herald*, 28 January, 1899.]

#### THE EAST GRETA DISASTER INQUIRY.

THE inquiry into the circumstances connected with the death of Albert Moncrieff, on the 18th November, 1898, in East Greta Colliery, was resumed yesterday morning at the West Maitland Court-house, before Mr. Martin. Mr. J. V. Tillet represented the Crown Law Department. Mr. Millard appeared for Mr. Thomas, manager of East Greta Colliery; Mr. F. A. S. Bowden for the East Greta Coal Company; Mr. James Curley for the relatives of the victims of the disaster; and Sub-inspector Fowler for the police. Mr. A. A. Atkinson (Chief Inspector of Coal-fields) and T. L. Bates (Colliery Inspector) represented the Mines Department.

Azariah Thomas, manager of East Greta Colliery, was recalled.

To Mr. Curley: The dip of No. 1 tunnel from the bottom level to the face was 47 degrees. He instructed the timber setters to set the timber at right angles to the pitch or the dip of the tunnel. He did not know the term "underset." He was in the tunnel on the Tuesday before the fall, but not afterwards before the fall. The caps now bent and broken in the tunnel below the fall were broken after the débris from the fall had run down, and after the water had affected the calcareous conglomerate roof. It was evident they were broken after the fall, because they rested on the débris. The water had not affected all the broken caps. The water and débris filled up the tunnel to 130 feet from the face. They saw the timber between the débris and the big fall bending and breaking while they were down. They heard them cracking while they were putting timber in where the big fall took place. The timber by the side of the fall was in good condition. The first set near the fall was good. The second was good.

To the Coroner: Water was running from the lower end of the fall. No water was seen at the top end of the fall. The mudstone from the top end of the fall was dry. The mudstone that came down the tunnel was like Exhibit J.

To the Jury: It would be impossible to get timber from the bush without sap. The small ends of the caps had to be 8 inches in diameter. He knew ironbark with sap to last seven and a half years, and be then in good condition. They used it on account of its durability. Directly or indirectly, it had never been hinted, suggested, or reported to him that there was a dangerous roof approaching.

To

To Mr. Curley: The tunnel was commenced some little time over seven years. There was another tunnel near it down as far as the top level. The tunnels were 135 yards apart on the surface. The little tunnel was 120 yards down by horizontal measure. Two places were opened out of the bottom of it when he took charge. It was very little timbered—just a stick in here and there. It did not occur to him to do anything in No. 1 tunnel that he had not done. There was no restriction on him whatever.

William Kerr, engine-driver at East Greta Colliery, was called.

To Mr. Curley: He was working the 3 p.m. shift at the tunnel. He was at the colliery a year and nine months. He had shift about. He went on at 11 p.m., or at 7 a.m. at other times. The 3 p.m. shift finished at 11 p.m. Sometimes he sent the shift down, and sometimes the other engine-drivers did so. He was on the 3 p.m. shift at the time of the disaster. Lewis went down that week at 3 p.m. When the men went down they did not at all times go straight down to the face. Sometimes they did, and sometimes they stopped at the level. They went all together. He could not see the men at all from his handles. The alligator went down with the men. He knew by the signals men were going down. The tunnel men went down in one batch. When the jig was started, sometimes the jig and tunnel men would go together, and sometimes in two lots. The alligator went at a fair speed for men. The men on the previous shift came up after the others had gone down. The cage used to take five minutes coming direct from the face to the top. He was never told by Lewis to go slowly, as he was going to make a thorough examination of the tunnel. Timber took a minute and a half or two minutes longer to send down. The men went down with the timber, which was placed in the alligator. Sometimes he went to work with the men working in the tunnel. He heard Dan Gronow remark about bent timbers down the street one Saturday, five or seven weeks before the accident. Gronow said there were two or three caps that were bending and splintering. He said no more than that. None of the other men said anything to him about it.

To Mr. Tillett: The conversation took place at the post-office. Gronow said there would be some timber to replace when the tunnel was finished, as two or three caps were bending and splintering. He did not speak of them as indicating danger.

To the Coroner: He never saw Lewis going down, but knew he must be there.

Thomas Lionel Bates, Inspector of Collieries, was called.

To Mr. Tillett: He inspected East Greta Colliery at various times, and made his last inspection on the 5th September before the accident. He was in the tunnel then, and went to the face. It was below where the first fall occurred. He inspected the timbering, which did not show the slightest indication of undue pressure. He had previous experience of the colliery, and was quite satisfied with what he saw of the timbering.

To the Coroner: He walked down the tunnel, and from where he stood examined the roof 50 or 60 yards below the level. He could see between the slabs, and as far as he could see it was conglomerate. Conglomerate was the predominating feature of the seam.

To Mr. Atkinson: He had been inspecting the colliery for nine years. He was at the colliery three times between the 5th September and the date of the disaster investigating accidents. During his inspections he had seen slight falls in various parts of the mine. What came down was an argillaceous or clay shale, and the conglomerate was above. It was 5 or 6 or 8 inches thick. He invariably saw the conglomerate above the shale. He had one complaint, an anonymous one, in the early part of 1897. It was from a wheeler, complaining that a bord he was working in was dangerous on account of the roof. He investigated it without delay—made an investigation. He found the floor swelling and troublesome to wheel along, but the roof was safe. It was on the left-hand side of the lower level of No. 1. That was between No. 1 and No. 2 tunnels on the lower level. The roof was coal. The bord was in 50 or 60 yards. There was no fall from where the bord was turned away to the face. He had been down the tunnel since the accident. He had no two opinions about the accident. It was caused through the conglomerate thinning out. As it could not expand above on account of the conglomerate it would burst away at the point of least resistance, which would be at the cavity caused by the excavation of the tunnel. Side or bottom pressure had little to do with the fall.

To the Coroner: Where the falls occurred he invariably found the conglomerate overhead and nothing else. The stuff that fell was 6 or 8 inches thick above the coal. He saw two kinds of conglomerate, the silicious conglomerate and the calcareous. The silicious was undoubtedly the harder of the two. The roof of the tunnel was composed of both. The silicious was at the overcast. The calcareous was below the big fall. There might have been some in the fall. He saw the roof between the slabs, and knew it to be conglomerate. He noticed no shale of any description. He examined the timber, and so long as it was sound and safe the men were safe. It was not an uncommon thing to see a fall in a mine. He had seen hundreds. When pillars were out he could quite understand the roof would come down. He heard that large falls had taken place where pillars had been taken out, not otherwise. He had not inspected the action of the falls on the sides. He had seen nothing of any importance showing weight on the timbers—nothing he deemed worth calling attention to. He saw several places on the levels where there had been small falls. That was not extraordinary. There was no element of danger in it. About 6 or 8 inches might have come down. He would pay attention to cavities caused by falls between the timbers on the levels. If other persons had seen falls up to 2 or 3 feet he had no recollection of them. He had been in the lower level and saw the roof there. There was a kind of mudstone above the coal similar to Exhibit J. The roof was not broken to a dangerous or alarming extent. He saw it when he was down with the jury. The conglomerate was above the mudstone; but he did not see any between the latter and the coal. He saw conglomerate there. He was in the overcast, and saw silicious conglomerate there, but nothing else.

To the Coroner: He saw no falls there more than in an ordinary mine. The timber was sufficient for the roof.

To Mr. Curley: He examined the report books at the colliery when he made his inspection, and at the time they were to his satisfaction. From the evidence he heard he was not satisfied. He was not satisfied with the person who made the inspections. The manager or the under-manager should have been down the tunnel oftener. If the under-manager was not down the tunnel for a fortnight, he did not comply with Special Rule 7. A mine of such a character as East Greta should be under strict supervision.

To

To Mr. Millard: He knew David Lewis since the disaster. He believed him to be a most competent man from what he had seen of him. He was a thoroughly practical man. He looked upon Lewis in the light of a contractor, who was therefore ineligible to make an inspection. He was quite satisfied Lewis was competent to make the inspection.

To Mr. Bowden: On the whole the colliery was a carefully and skilled managed one.

To the Jury: If there was conglomerate between the tunnel and the mudstone, at the seat of the fall, it was beyond human conception to have expected so large an amount of the mudstone there. It would be possible, but not expedient, to work the tunnel with double skips and props down the centre. He did not like the props in the middle of the tunnel. Almost invariably he visited every working place in the mine when he inspected it. It was not carelessness on the part of the men who timbered the tunnel that caused the accident.

To Mr. Curley: The last time he was in the tunnel he was not at the face. He was only once in the extension, and went close enough to see all he wanted to see.

To Mr. Millard: It would be reasonably practicable to put bores into the roof to test it. Something of the kind was done at Stockton to prove the roof. It was a question of expense. After what has occurred, he would like to see it done. If he thought it desirable he could have had it done.

To the Jury: When he visited the tunnel the face was below the big fall.

To Mr. Curley: He saw the fall on the day of the accident. Two of the caps at the edge of the fall showed signs of bending, and they were strengthened. He had a look at the strata. It was conglomerate, shale, and sandstone. The conglomerate was calcareous, and was thickest on the left-hand side at the top of the fall. The timber below the fall was more or less broken. At the bottom end of the fall two or three caps were standing. Below them was another fall. He took no record of the bent or broken caps.

To Mr. Millard: He saw water coming from the roof on the Monday, but not on the day of the accident. It came from the top. He saw it after the second fall in the big fall.

Edward Davis, colliery carpenter, was called.

To Mr. Millard: He had often been down the extension of No. 1 tunnel. Sometimes he was down once, and sometimes twice a day. For two or three days he might not be in it. The last time he was below the bottom level was a week ago. The timber was in a good state. He noticed none of the cap pieces bent. He knew about where the fall took place. If any timbers were bent they were bent very slightly. There were no broken ones. Had there been any bent or broken down a foot he would have seen them. He was fixing up the road and looking after the signals. He fixed a roller 60 or 70 feet from the bottom, and was there an hour or an hour and a half. He occasionally walked down.

To Mr. Tillet: His work was on the floor and sides.

To Mr. Curley: When he was fixing the roller 50 or 60 feet from the face he saw no five or six broken caps there. He saw none bent. He could see some little distance down the tunnel. He did not see four bent caps there. He had nothing to do with looking after the road.

Edward Howarth, labourer, at East Greta Colliery, was called.

To Mr. Millard: He knew the extension of No. 1 tunnel. He was down with Mr. Thomas and Mr. Heyes on the Tuesday or Wednesday before the accident. They got off at the level, and Mr. Thomas took the grade of the floor. Mr. Thomas called out to Griffiths at the face to give him a sight. He took the level. Witness described how he assisted Mr. Thomas. He saw two bent caps nine or ten sets above the face. He saw no others. He saw every set as he went down. Mr. Thomas was at the bottom level. Mr. Heyes went back up the tunnel, and he and Mr. Thomas went down to the face in the alligator. Griffiths, Parsons, and March were there also. Mr. Thomas asked how they were getting on, and Griffiths asked Mr. Thomas how much further they had to go. Mr. Thomas replied that he would let him know as near as he could. He said it was about 45 feet, and that would mean about nine more sets of timber. Griffiths said he wished it was his last shift, as he was sick of the water, which was not agreeing with him. Griffiths also said that it would be finished by the New Year. They (Mr. Thomas, Mr. Heyes, and witness) went up in the alligator to the level. Mr. Thomas did not stop going down in the alligator.

To Mr. Tillet: He was watching Mr. Thomas coming down in the alligator. His work was all along the floor. He could just notice the two bent caps he saw.

To Mr. Curley: He was told what he was going to do before he went down the tunnel. Mr. Heyes told him he was to go down and draw the chain. That was his only trip down to the face. He had often been down to the bottom level. He went one day nine or ten sets below the bottom level. He had been 100 yards along bottom level towards No. 2 tunnel. He saw no breaks in the roof there. He saw no bent timbers there.

Alfred A. Atkinson, Chief Inspector of Mines, was called.

To Mr. Curley: He had about twenty-four years' experience in coal mines, and during that time had to deal with various roofs in collieries. Conglomerate was a very unusual thing in coal-mines in the Old Country. He had given attention to the study of geology. Knowing that Geikie was a great geologist, he would take it that he would not be likely to write anything that was not correct. From his knowledge of managers he believed they tried to get a knowledge of the strata overlying the roof. They would go to some considerable trouble to get acquainted with the roof. The manager ought to have a fair knowledge of the roof after the falls described by Cartwright. If caps or other timbers were bent or broken that should make a manager look for the cause. He was in the colliery in October, 1897. The extension was not then commenced. The mine was idle. He went down No. 1 tunnel as far as the level and along the level to the face on the south side. He was down the tunnel since the fall twelve or fifteen times. He had gone through mostly all the principal working places. He saw the character of the roof at the big fall in No. 1 tunnel. He noticed the roof over the dam. Above the conglomerate was some shale. There were 2 feet of conglomerate. The shale was there. The hole was half the width of the tunnel, and the shale showed in the hole. Seeing that shale there he would think it possible for it to be found in other parts of the mine. In the overcast he saw one place on the left-hand side which showed a softer stone than the conglomerate. It was mudstone, mixed with sandstone. It was a small patch in the conglomerate itself. The conglomerate over the dam was a mixed one, silicious and calcareous. He saw the fall on the day of the fall. The conglomerate there was mostly calcareous, and was about 18 inches thick on the left-hand side, tapering down to 4 or 5 inches on the right-hand side. Shale or mudstone was above the conglomerate, and was several feet thick, and above that was hard

sandstone. The silicious was the stronger conglomerate, and would not suffer so much as the calcareous. It would carry more weight than calcareous. If Mr. Thomas visited the tunnel often he would know the nature of the two conglomerates. He noticed no water on the day of the accident, but he saw some dripping out of the top of the fall on the Monday afterwards. It was dripping. The sides appeared good, except where the caps had torn a little of the coal away at the top. He noticed no bending in the sills. The caps near the fall appeared right but it was decided to strengthen them in view of possible danger. He could not say the men would have a knowledge of the mudstone over the conglomerate. The timber setters would have a knowledge of it if the conglomerate had run out and mudstone had taken its place. If the conglomerate did run out Mr. Thomas should have known it. If conglomerate run out and mudstone took its place he considered the timbering should have been strengthened. The timber, as mining timber, was very good. He had seen larger timber put in mines. He had seen sets put closer. He had seen tunnels bricked. In his opinion Lewis was not eligible under General Rule 4 to make the inspection. The Special Rules were considered to be of equal force with the Act itself. Cartwright did not comply with Special Rule 3 when he remained away from the tunnel for a fortnight.

Mr. Millard and Mr. Bowden objected to Mr. Curley's questions about the rules, and asked for notes to be made of the objections.

Continuing his evidence, in reply to Mr. Curley, the witness said some of the roads wanted more timber on the bottom level of No. 2 tunnel. Conglomerate roofs did not run so regularly as the ordinary sandstone or shale roofs.

To the Jury: One could not say how far the mudstone would spread itself out.

Oliver Kay Young, auctioneer, was called.

To the Jury: The witness, Parsons, spoke about the accident to him in his office some few days after the accident, and asked if he wanted any men. Parsons said he was in the rescue work at No. 1 tunnel, and he was not going to work there any more, as Cartwright, the under-manager, had said he could not work at the mine unless it was in No. 1 tunnel. Parsons said no one forced him to go into No. 1 tunnel. Parsons said, "I've got the company under my foot, and I'm going to squeeze them."

To Mr. Curley: He was a director of East Greta Colliery Company. He did not know Parsons by name when the conversation took place. He had an animus against Parsons because he believed Parsons told untruths in the witness-box.

The Coroner declined Mr. Curley's request to be allowed to address the jury, as the other gentlemen present did not wish to do so.

The Coroner complimented Sub-Inspector Fowler upon the able manner in which he had collected the evidence and enabled the inquiry to run so smoothly. The thanks of the jury and the Coroner were due to the Sub-Inspector and to Senior-Constable Brown, also to Mr. Roberts, who had taken the evidence and saved the Coroner so much trouble.

The Coroner then reviewed the evidence in a brief address, and left the matter in the hands of the jury.

[*Newcastle Herald*, 30 January, 1899.]

#### THE EAST GRETA DISASTER.

THE conclusion of the Coroner's inquest into the circumstances of the death of Albert Moncrieff, one of the victims of the disaster at East Greta, is a lame and impotent one. Ample evidence was adduced in the case, and every care was taken by cross-examination and otherwise to throw light on the causes and circumstances of the deplorable fatality. The majority of people who had read the evidence had probably arrived at the conclusion that the deaths were accidentally caused, but that the catastrophe emphasised the necessity for taking the most stringent precautions in underground workings where the nature of the strata placed unusual strain on the timbering. It is understood that ten of the jury were desirous of bringing in an unconditional verdict of accidental death, but that two jurymen were determined on bringing in a stronger verdict. As matters stand, no verdict has been obtained. Nevertheless, it would be unjust to declare that the holding of the inquest has been absolutely resultless. One thing it emphasises, and that is the necessity for multiplying precautions in order to secure the lives of underground workers. What further is to be done in the matter remains to be seen. It is probable that the possibility of a Departmental inquiry being held may have contributed in some degree to the failure of the Coroner's jury to arrive at a verdict.

#### THE EAST GRETA DISASTER INQUIRY.

##### THE JURY DISAGREE.

THE jury, which had been in retirement for fifteen hours, returned into Court on Saturday morning at about 8 o'clock. The Foreman, Mr. F. W. Thursby, then announced to the Coroner, Mr. Martin, that the jury had disagreed, and that there was not the slightest hope of a verdict being returned.

The Coroner expressed his regret at the statement made by the Foreman, because it appeared as though there were something lacking. The evidence had been voluminous, and Sub-Inspector Fowler had done exceptionally well in bringing such an amount of evidence bearing on the case before them. All that was possible was done by the police to assist them in arriving at a verdict. Their confinement during the night was unavoidable under the circumstances, and he hoped they would not think he had acted harshly in the matter, as it was his duty, if possible, to obtain a verdict. He again expressed his regret that no decision was arrived at.

The Foreman said that on behalf of the jury, he desired to thank the police for the way in which the evidence had been collected, and for the way in which it had been put to the jury. It was also the desire of his colleagues that he should thank the Coroner for his kindness and courtesy to the jury, and to compliment him upon the conspicuous ability displayed by him throughout the inquiry.

The Coroner thanked the jury, and said it was a pleasure to a man to know that his efforts to do his duty were appreciated.

Sub-Inspector Fowler, on behalf of the police, thanked the jury for the references made to the work done by him and his officers.

The

The jury was placed in charge of Senior-constable Brown during Friday night, and that officer was assisted by Constable Kent. The evidence was freely discussed, and at times during the night it was evident that very heated arguments were in progress. The matter was viewed in every possible light, and ten jurors decided in favour of an unconditional verdict of accidental death, while the other two considered that some attention should be paid to what they considered as a non-compliance with the Special Rules of the colliery by some of the officials. It was this point which proved to be the stumbling block to a verdict being returned. The contradictory evidence concerning the existence or non-existence of broken cap-pieces under the seat of the fall had much to do with placing the jury on the horns of a dilemma. We have been informed by several of the jurymen that although the discussion throughout was of a very heated nature there was no display of ill-feeling. The evidence will now be forwarded to headquarters in Sydney, and it will rest with the Department to decide what action shall be taken in the matter.

Telegram from Mr. Sub-Inspector Fowler to The Chief Inspector of Coal-mines.  
*Re Greta Colliery accident. Jury discharged—did not agree.* 28 January, 1899.  
 F. FOWLER.

Noted.—A.A.A., 28/1/99. Seen.—D. McL., 28/1/99. The Hon. Joseph Cook, Minister for Mines, Lithgow,—Greta Colliery accident. Jury discharged. They did not agree. Wire so to the Honorable Joseph Cook, M.P., 28/1/99.

---

No. 18.

The Chief Inspector of Coal-mines to The Under Secretary for Mines and Agriculture.

*Subject :—East Greta Inquest.*

Coal-fields Office, Department of Mines and Agriculture,

Sir,

Sydney, 28 January, 1899.

I have the honor to inform you that the jury in the above inquest after having been locked up since 5 p.m. yesterday were discharged this morning without any verdict being recorded. The inquest occupied a period of thirteen days, during which a large number of witnesses were examined, and it is probable that but for the constitution of the jury a satisfactory verdict would have been given.

I venture to think, for the reasons set out hereunder, that it is not expedient that an inquiry should be held under section 23.

1. Every latitude was allowed in the calling of witnesses, and their cross-examination. The Crown as well as all other parties interested were represented, though they were not allowed to address the Court.

The course adopted by the Coroner in this case, though not acceptable to the miners' representative, is the one usually followed at such proceedings in England, and appears to me to be much preferable to allowing a number (some four or five) of long addresses, which very often only serve to confuse the minds of the jurymen.

2. So far as I am aware, all witnesses of any value who were procurable gave evidence, and it is not likely that any further light will be thrown upon the "causes and circumstances" of the accident by any further inquiry.

3. The expense of the inquest to the Government has been great, and that of an investigation under section 23 would be greater still.

4. In my opinion the best course to adopt at the present stage, having regard to the proper administration of the Act, is to prosecute the manager and under-manager—the manager for a breach of General Rule 4, for employing contractors in making the inspections, &c., under that rule; and the under-manager for breaches of Special Rules Nos. 3 and 7. [copy of rules herewith—*Appendix 1.*]

In this connection I would invite your attention to the opinion expressed by Mr. Wade at page 12 of his report on the Dudley Colliery explosion in the paragraph regarding "Prosecution." [*Appendix 2.*]

As the offences were committed in the month of November last, and the time (three months) allowed for commencing proceedings will shortly expire, no time should be lost if it is intended to proceed under the Act against the manager and under-manager.

I have, &c.,

A. A. ATKINSON,

Chief Inspector of Coal-mines.

Approved. To proceed against manager and under-manager as suggested.—J.C., 28. Minister might see Mr. Atkinson on Tuesday morning.—D.C. McL., 28/1/99. Mr. Atkinson to note and return.—D. McL., 30/1/99. Will the Crown Solicitor kindly arrange for the necessary steps to be taken in this matter?—D. C. McLACHLAN, B.C., 31/1/99.

---

APPENDIX No. 1.

[To Report by Chief Inspector of Collieries, dated 28th January, 1899.]

SPECIAL RULES for the conduct and guidance of the persons acting in the management of the East Greta Colliery, in the district of Maitland, and all persons employed in or about the said colliery, framed in conformity with the provisions of the Coal-mines Regulation Act, 1896, 60 Victoria No. 12.

*Manager.*

1. The manager (or the under-manager when acting for him) shall have the daily supervision of the above colliery, and shall have full command over all other officers and workmen employed in or about the colliery, who are to receive their orders from him, and shall apply to him for instructions as often as may be necessary.

2. He shall comply with the requirements of the Coal-mines Regulation Act, 1896, and shall, to the best of his power, enforce the observation of the said Act, and enforce observation of the General and Special Rules.

*Under*

*Under-manager.*

3. The under-manager shall have the daily supervision and responsible charge of the mine under the direction of the manager, and shall give all necessary instructions to the men and boys in the mine respecting their work, and shall, to the best of his power, see that they comply with the rules and regulations of the colliery, as well as the orders of the manager, and shall visit every working-place in the mine daily, or as often as may be practicable, and see that the air courses and stoppings are kept in a good state of repair, and that an adequate quantity of fresh air is constantly supplied to the men.

4. He shall give immediate attention to any complaints, and shall inspect personally such portions of the mine as are reported to be unsafe or in any way to need his attention.

5. He shall see that a sufficient supply of timber is sent down the mine and into the different districts.

6. He shall see that each miner keeps his working-place sufficiently timbered, and shall suspend at once any miner refusing or neglecting to do so.

7. He shall examine every day the different main and district air currents, and shall see that the furnaces are kept in good repair and carefully attended to.

8. He shall, under the direction of the manager, cause safety-lamps to be used, and naked lights to be excluded where required by the Act.

9. He shall see that the deputies, miners, shifters, and all others under his charge in the mine, strictly and rigidly observe the rules applicable to them, and shall suspend immediately anyone infringing, or attempting to infringe, any rule, order him out of the mine, and report the same to the manager.

*Deputy.*

10. Each deputy shall be informed by the manager or under-manager as to what portion of the workings is to be under his charge; and all persons working in that portion of the mine will be under his direction, and he shall, in the absence of the manager or under-manager, direct the workmen how and where they shall work, and shall see that the rules applicable to them, as well as the orders of the manager or under-manager, are strictly attended to.

11. The deputy or other competent person appointed for that purpose shall be in the mine within four hours before the workmen commence, to enable him to examine the working-places, &c., carefully, and shall ascertain the condition thereof so far as the presence of gas, ventilation, roof and sides, and general safety are concerned, and shall record the result of such examination without delay in a book to be kept at the mine for the purpose.

12. He shall place cross timbers or rails thus, X, or a signal-board, as a signal of danger, at the entrance of every working-place which he may find unsafe, and on his return to the station shall state on his board all places so found unsafe.

13. In any place where there is a dangerous appearance of fire-damp, locked safety-lamps shall be used, and no workman shall be permitted to remain where fire-damp has accumulated in such a quantity as to show a permanent blue cap over the flame.

14. Before safety-lamps are taken into the workings the deputy, or some other competent person duly appointed for the purpose, shall examine the entire lamp, and if all is right, shall lock it for the miner.

15. Should there be any discharge of gas, or any condition of roof from which the deputy apprehends any danger, he shall instantly report the circumstances to the under-manager.

16. He shall report as soon as possible to the manager or under-manager all accidents, dangers, or defects which may occur in his district of the mine, and he shall also so report any accident, danger, or defect to or in any machinery or structure in the mine which may come to his knowledge.

*Wheelers.*

17. The wheelers shall report to the under-manager or deputies if any part of the road or roof has been deranged or is insecure or dangerous.

18. Any wheeler injuring a door or brattice-cloth door, and not immediately reporting the fact, shall be suspended. He shall also report to the under-manager or deputy every morning the quantity and different lengths of timber required for his miners.

19. He shall take in without delay any timber the miners may require, and shall at all times carry out the orders of the manager, under-manager, or deputy, in order to facilitate and promote the work of the mine.

20. Any person neglecting these rules will be liable to instant dismissal or prosecution according to law.

*Onsetter.*

21. The onsetter shall, subject to the directions of the manager or under-manager, have the sole control of the pit bottom and the command of the signal up the pit, and on no account shall he allow any person to interfere with the signals. He shall at all times, when sending up skips of coal, see that none of the coal projects beyond the side of the skip, and shall pay the greatest attention to the signals when men are going to ride, in order that accidents may be avoided. The signals shall be as given in Rule 87.

22. No timber, materials, stones, coal, or other things shall, under any circumstances, be lowered or lifted in a pit while men are being lowered or lifted in it, except such as may be necessary in repairing a pit while the repairs are going on.

23. The onsetter shall not, on any account, allow more than six persons in a single cage, or ten in a double cage at the same time.

24. Any person refusing to leave the cage when ordered to do so shall be immediately suspended.

*Miners.*

25. Any miner, after passing through a door, must instantly close it, and shall not injure a door or leave it open, break down a stopping or brattice, interfere with or obstruct or damage an air-crossing, or an air-pipe, or remove or go beyond a mark or "danger-signal," without orders from the manager, under-manager, or deputy.

26. Every miner shall securely sprag or uphold the coal whilst holing, and shall securely prop up the roof of his working-place so that accidents may be avoided; and should he not be provided with a sufficient quantity of timber he shall cease working and report the same to the manager, under-manager, or deputy.

27. The seam of coal must be wrought strictly in accordance with the orders of the manager or under-manager.

28. Every miner shall in all matters relating to the working of the mine or the safety of the men, obey strictly the orders of the manager, under-manager, or deputy; and no person shall go into any part of the mine other than where he is employed, except by the order of the manager, under-manager, or deputy.

*Door-keepers.*

29. A door-keeper must only open a door for the passage of persons, skips, or animals, and must instantly close the same when they have passed through. He must never allow a door to remain open, or to be propped or fastened back, unless authorised to do so by the manager, under-manager, or deputy.

30. A door-keeper must not leave any door or doors under his charge until the work of his shift is finished, or until another person appointed by the manager, under-manager, or deputy takes his place.

31. Any door-keeper becoming aware of any defect in, or damage to, any door, shall report the same as soon as practicable to the manager, under-manager, or deputy.

*Persons in charge of Ventilating Appliances.*

32. The persons in charge of any ventilating furnace or other ventilating appliance shall not leave the same without the permission of the manager, under-manager, or engine-wright.

33. Furnace-men must pay careful attention to the furnace under their charge; and shall maintain the fire in such a state as constantly to ensure efficient ventilation.

34. The fan and fan-engine shall be carefully attended to by the person or persons in charge thereof, who shall keep the same running at the speed ordered by the manager, so that effect may be given to the provisions of the Act as to ventilation.

35. All persons in charge of ventilating furnaces, fans, fan-engines, or other ventilating appliance, shall immediately report any damage, defect, or derangement therein to the manager, under-manager, or engine-wright.

*Lamp-keepers.*

*Lamp-keepers.*

36. No person, except a person authorised by the manager or under-manager, shall either take himself or give out for use in any mine any safety-lamp.

37. Lamp-keepers must see that every safety-lamp is thoroughly cleaned, properly put together, in safe working order, and securely locked when given out for use in the mine. If any lamp be not returned at the proper time they shall at once report the fact to the manager or under-manager.

38. All persons entrusted with the duty of cleaning any gauze, or other part of any safety-lamp, or with the duty of putting any safety-lamp or parts thereof together, shall at once report any defect therein to the lamp-keeper, or if there is more than one lamp-keeper, then to the head lamp-keeper.

39. Whenever any defective or damaged lamp is received from any person by any lamp-keeper he shall report the fact to the manager or under-manager, and shall cause such lamp to be kept in the state in which he received it until seen by one of them.

40. Every lamp-keeper shall see that all oil, spirit, and other inflammable articles under his charge are carefully and properly stored and used, and that no greasy waste or other refuse is allowed to accumulate in or near the lamp cabin.

*Engine-wright.*

41. The engine-wright, or other competent person appointed for the purpose, shall cause the ventilating fan or other mechanical ventilating apparatus, together with the engines, machinery, and boilers for driving the same, to be properly attended to.

42. The engine-wright, or other competent person or persons appointed for the purpose, shall have charge of all engines, machinery, and boilers used for raising or lowering persons or minerals, or for pumping water, and of all ropes, chains, appliances, or apparatus connected therewith; and of all guides, ropes, chains, conductors, or other appliances in the shafts, and of all other engines, machinery, and boilers in or about the mine. In case he shall discover any weakness, defect, or want of repair therein, he shall, as soon as practicable, cause the same to be repaired and made good, and shall at once report to the manager the fact of such defect, weakness, or want of repair, and also the steps taken to remedy the same.

43. The engine-wright, or other competent person or persons appointed for the purpose, shall make the examinations and report required by General Rule 5.

44. The engine-wright, or other competent person appointed for the purpose, shall cause every rope used for raising or lowering persons or minerals to be securely attached to the drum, so that when either cage is at the pit bottom, there shall be not less than two rounds of rope upon the drum.

45. The engine-wright, or other competent person, whenever a winding rope requires capping, coupling, or splicing, shall superintend the same, and shall see that no spliced rope is used for raising or lowering persons in a shaft.

46. The engine-wright, or other competent person or persons appointed for the purpose, shall see that the fences are fixed and maintained at the top of every shaft, and that the guides, signals, covers, flanges, or horns, appliances, brakes, indicators, fences, valves, gauges, and things required by General Rules 18, 20, 26, 27, 28, 29, 30, 31, 32, and 33, or any of them, are fixed and maintained as therein required; and that the provisions of General Rule 25 are carried out above ground.

47. The engine-wright shall cause bells or other signals to be fixed in every drawing engine-house, connected with the drawing pit bottom, and with every entrance for the time being in work between the surface and bottom of the shaft; and shall cause the board required by Special Rules 23 and 64 stating the number of persons authorised to descend or ascend the shaft at one time, to be fixed and maintained on the pit bank.

48. The engine-wright shall cause each working boiler to be cleaned and examined as often as the manager shall so order.

49. The engine-wright shall cause the code of shaft signals used in moving the cages to be fixed and maintained at the top and bottom of each winding shaft, and at every shaft to which the provisions of Special Rule 57 apply, he shall see that the point named in that rule is distinctly marked on the indicator.

*Engine-drivers.*

50. Every engineman shall attend at such time as the manager may appoint, and as required by General Rule 25.

51. An engineman shall not allow any person to interfere with the engine or machinery under his charge, or to remain in the engine-house unless authorised by those in authority above him. A winding engineman while winding must remain at the handle and must pay particular attention to the indicator and signals, and if he perceives anything wrong must instantly stop his engine and not start it again until the defect is put right or until he receives an order to go on.

52. Every winding engineman before commencing work in his shift, and before any person descends the shaft, shall carefully examine the engine, machinery, drums, ropes, brakes, indicators, and signal apparatus in the engine-house or under his charge, in order to ascertain whether they are safe and in good working order, and shall run the cages at least once up and down the shaft. Where shifts are worked continuously, it shall be sufficient if this rule is carried out at the commencement of the morning shift.

53. Every engineman, unless some other competent person is specially appointed for the purpose, shall keep the engines, machinery, and things connected therewith under his charge, properly cleaned and oiled, and shall see that they are in good and safe working condition. He shall see that the provisions of General Rules 27, 30, 31, and 32 are carried out and observed during his working shift, so far as they relate to engines or machinery under his charge.

54. Every engineman must diligently and carefully attend to the working of the engine and machinery under his charge. He must examine such engine and machinery before commencing work, and if he becomes aware of any weakness or defect, or apprehends any danger, he must, as soon as practicable, inform the manager, under-manager, deputy, or engine-wright. He shall not alter a safety-valve without leave from the manager, under-manager, or engine-wright.

55. Every engineman, in addition to the duty in this respect imposed on the engine-wright, shall see that any ropes attached to the drum of the engine under his charge are securely attached, and so that when either cage is at the bottom of the pit there shall not be less than two rounds of rope upon the drum.

56. Every winding engineman, whenever the engine under his charge ceases working, shall see that the cages are left so as not to impede the ventilation.

57. When men are being raised in shafts where the winding apparatus is not provided with some automatic contrivance to prevent overwinding, the cage shall not be wound up at a speed exceeding 3 miles an hour when and after it has reached a point 10 feet from the top of the shaft, as required by General Rule 27, and such point shall be marked on the indicator.

58. The signals given in Rule 87 shall be carefully observed by the engine-man.

*Banksman and Assistants.*

59. That the banksman shall, subject to the directions of the manager, under-manager, and engine-wright, have the control of the pit top, and the command of the signals down the pit and to the engineman.

60. That the banksman shall be responsible for the state of the pit top, and shall see that the frames and the surface near the pit mouth are kept free from coals, stones, or dirt.

61. That at least one banksman and one onsetter, or other person appointed by the manager, under-manager, or deputy for that purpose, shall be at their respective posts at the proper time every morning, to give the proper signals, and to see the men and boys carefully into and out of the cages at the top and bottom of the shaft.

62. The banksman must be at the drawing shaft at such times as the manager or under-manager may appoint. He shall not allow a person to descend or ascend until the cages have been once run up and down the shaft, but where continuous shifts are worked it shall be sufficient if this is done at the commencement of the morning shift.

63. That the banksman shall not permit strangers or persons not employed in the mine to descend the pit or remain upon the bank, unless authorised by the manager; and shall caution strangers descending to keep carefully within the cage until they are fairly landed. He shall not allow an intoxicated person to descend the pit.

64. That the banksman or onsetter shall not allow more than six persons in a single cage, or ten persons in a double cage; nor shall any person be allowed to ride with or against coals, slack, dirt, &c. Neither shall any person, unless specially

specially allowed by the manager, under-manager, or deputy, be permitted to carry any tools, implements, props, rails, or such like in his hands whilst so riding; but the same shall be securely placed in the cage, skip, or basket, so that no danger may exist of their falling out during their ascent or descent, or of their coming in contact with anything in the pit; and no person shall be allowed to get upon or off the cage at the pit top unless it be standing upon the catches or keeps, or at a mouthing, without the signal first being given and responded to.

65. The banksman must frequently observe the pit top pulleys, ropes, chains, cages, and landing apparatus during working hours, and whenever he becomes aware of any weakness or defect therein, or in anything belonging to the shaft, or any engine, machinery, or winding tackle, he must immediately inform the engineman, and the manager, under-manager, or engine-wright, so that it may be repaired.

66. The banksman must report to the manager or under-manager any disobedience on the part of the miners or others.

67. The signals given in Rule 87 shall be carefully observed by the banksman.

*Miners and all other persons employed.*

68. No person acting in a place of trust shall depute anyone to do his work without the sanction of the manager.

69. No swearing or fighting is allowed in or about the mine, and no intoxicating liquors shall be permitted in the mine without the consent of the manager.

70. Any person employed in the mine shall inform the person in charge of the workings of the existence of any choke or fire-damp, of any insecurity of the roof, shaft, or any other part of the workings, or of any air-door being damaged or left open, immediately on its being observed by him.

71. No person shall be permitted to carry a naked light attached to the cap or hat on his head whilst handling explosives, or in charging holes for blasting.

72. A safety-lamp must be frequently examined, and if a lamp shows a blue cap, the person using it must carefully draw down the wick with the pricker, cease working, leave the place, and report the same to the manager, under-manager, or deputy.

73. No person shall place a safety-lamp on its bottom unless it is necessary to do so for the safe performance of any particular work, or unless authorised by the manager, and in all cases the lamp shall be hung or placed at least 2 feet from the swing of the pick, hammer, or other tool.

74. No person shall leave a lighted candle or other light in any part of the mine when leaving his work.

75. No person shall try the wastes or workings for fire-damp with a naked light, and no person shall smoke or take a naked light, tobacco, pipe, cigar, cigarette, lucifer matches, or candle, where safety-lamps are ordered to be used.

76. No naked lights shall be allowed or taken beyond any danger signal where gas exists.

77. No person shall wilfully kindle a feeder of gas, or negligently have the gauze of his safety-lamp full of fire, or unlock the lamp, or unscrew the gauze, or blow out the flame, or light tobacco or other substance at the gauze, or damage or improperly use the lamp, or leave it in the works, when he has ceased using it.

78. Any person discovering any stoppage or derangement to ventilation, injury to an air-crossing, door, regulator, sheet stopping, brattice, or air-pipe, or observing any injury to or obstruction of an air-course, shall immediately give notice to the manager, under-manager, or deputy, and to any person or persons whose safety may be endangered thereby.

79. Any person passing through a door or sheet must instantly close the same, unless it is a door or sheet ordered to be kept open. No person shall, without authority, remove any caution board, notice, or danger signal, or pass any danger signal, caution board or fence.

80. In case of a shot missing fire the workman shall place a danger signal at the entrance to his working-place, and shall immediately report the same to the manager, under-manager, or deputy.

81. Every miner or other workman in charge of any working-place, before commencing work, and at intervals during his shift, shall examine his working-place, and in case any danger is observed shall at once report to the manager, under-manager, or deputy.

82. No person shall leave coal, slack, or other material so as to impede the ventilation; nor leave a skip or other obstruction in the air-current.

83. Every horsekeeper shall see that no animal under his care is allowed to go to work while in an unfit state, and shall report to the manager, under-manager, or deputy, any injury received by any animal.

84. No person shall wilfully injure any animal whilst in his charge, or permit it to receive injuries by his wilful act or negligence, and shall report immediately to the horsekeeper or a deputy any injury received by such animal while in his charge.

85. No person shall take a horse on to or travel along any incline or plane, either in the mine or on the surface, which is self-acting or worked by machinery, while it is in motion, without special instructions from an officer of the mine.

86. Every person in charge of any animal shall immediately report to the manager, under-manager, or deputy, in case he finds such animal cannot pass along any road without rubbing against the roof or timbering; and no person shall, unless otherwise authorised, give his horse into the charge of any other person than the horsekeeper at the stables.

*Shaft Signals.*

87. The following signals (with such additions as under special circumstances may be ordered by the manager) shall be carefully observed by the engineman, banksman, onsetter, and other persons employed at this Colliery:—

One knock—to go on.

One knock—to stop when the engine is in motion.

Two knocks—lower down.

Three knocks—When any person is going to ascend or descend.

One knock—in reply before any person is allowed to get into the cage.

Four knocks—to lower slowly.

Five knocks—to ascend slowly.

88. Every person, when on the pit bank, or while about to descend the shaft, shall obey the orders and directions of the banksman; and every person, while in or about the pit, or while about to ascend the shaft, shall obey the orders and directions of the onsetter.

89. No person shall improperly use any signal, signal wire, or signal apparatus.

90. No person shall get into the cage after the authorised number is in, or if forbidden to do so by the banksman or onsetter.

91. Every person who shall couple or fasten any skip to any other skip, or to any rope or chain shall see that such coupling or fastening is made secure.

92. Before any person moves a skip in a bord he must see that a safety-block is at or near the entrance of the bord, and in good order and set across the rail.

93. All persons employed in the mine shall be under the control of the manager, under-manager, and deputies, and shall at all times obey their lawful commands.

94. Any person committing a breach of any of the foregoing Special Rules is liable to be instantly dismissed.

END.

Name of the Mine—East Greta Colliery. Where situated—Near West Maitland. Name of the Owner—East Greta Coal Mining Company, Ltd. Name of the Manager—Azariah Thomas. Name of the Under-Manager—Henry Cartwright. Name and address of the Inspector of Mines of the District—J. Dixon, Newcastle.

CERTIFICATE OF SPECIAL RULES, EAST GRETA COLLIERY.

AZARIAH THOMAS, Manager.

I HEREBY certify that the above copy of Special Rules has been shown to my satisfaction to be a true copy of the Special Rules which at this date are established under the Coal Mines Regulation Act, 1896, for the above-named mine.

30th day of April, 1897.

(Signed) JOHN DIXON, Inspector of Collieries.

## DUDLEY COLLIERY EXPLOSION (REPORT OF THE COURT OF INVESTIGATION ON).

Printed under No. 4 Report from Printing Committee, 29 September, 1898.

## REPORT OF THE COURT OF INVESTIGATION.

Sir,

On the morning of the 21st March, at 9 a.m., an explosion took place at Dudley Colliery, in consequence of which fifteen men lost their lives. A Coroner's inquest was held subsequently on two of the bodies which had then been recovered. The taking of evidence extended over fourteen days, and fifty-one witnesses were examined. The verdict of the jury was to the effect that the two men, Thomas Dorrity and John Benson, met their death in the Dudley Colliery on the 21st March, 1898, from carbon mon-oxide poisoning, and that there was not sufficient evidence before them to determine the cause of the explosion. They added :—

“ We consider the natural ventilation insufficient and unreliable, and that the artificial ventilation of the Dudley Mine is quite sufficient to ventilate the said mine, providing air-courses are in thorough order and bratticing is carried up to each working face.

“ We consider that sufficient examination was exercised for the safety of the workmen, according to Rule 4 of Part 2 of the Coal Mines Regulation Bill (referring to the deputy's inspections); but we consider a greater margin should be allowed for a more thorough inspection of the whole mine at all times, and with station farther back from the working faces.

“ We consider the question as regards naked lights a matter between management and inspection.

“ We are of opinion, according to evidence, that all precautions necessary for the safety and comfort of the workmen were attended to by the Management, with the exception of Rule 1 of Clause 47, Part 2, of the Coal Mines Regulation Bill, referring to ventilation being constantly produced, of which we consider ourselves unable to interpret.

“ We consider that the Dudley disaster was quite unexpected, as not sufficient reports of danger were made to the Management prior to the explosion.”

Owing to a fire that manifested itself during the search for dead bodies, it was deemed necessary by those who undertook the management of exploring operations after the explosion to temporarily seal the pit down. This was done on 24th March, and it was unsealed on 17th June.

I received an appointment in June, under the hand of the late Secretary for Mines, Mr. Sydney Smith, to hold an investigation into the causes of the explosion, under the provisions of Section 23 of the Coal Mines Regulation Act of 1896. As the indications seen immediately after the unsealing of the pit pointed to a great confusion underground, and five bodies were not yet recovered, it was decided to postpone the opening of the inquiry until the hitherto unexplored districts had been opened up.

In the meantime, after the last body had been recovered, I spent the greater part of one day in the pit in company with Mr. Atkinson, Chief Inspector of Coal-mines; Mr. John Dixon, an Inspector of Collieries; Mr. Humphreys, Manager of the Dudley Colliery; and Mr. Turnbull, Manager of the A. A. Company's Colliery, who was then superintending the opening up of the mine; and I visited the chief points of interest in connection with the explosion.

The Court of Investigation was opened on Monday, 15th August; and sittings for the taking of evidence were held on thirteen days, when forty-five witnesses were examined orally. I used as exhibits the depositions of various persons who had been called at the Coroner's Inquiry, but whose evidence was not of sufficient importance to warrant the expense of bringing them to the Court by summons. [Appendix C.]

The following persons appeared before me representing various interests :—

Mr. W. H. Baker, Solicitor, appearing in the interests of Mr. Hugh Humphreys.

The Hon. Alexander Brown, M.L.C., appearing for the proprietors of the Dudley Colliery.

Mr. James Curley, Secretary of the Colliery Employees' Federation, appearing on behalf of that Federation, and also for some of the relatives of the deceased.

Mr. A. A. Atkinson, Chief Inspector of Coal-mines, appearing to watch proceedings in the interests of the Mines Department.

They were afforded the opportunity of cross-examining witnesses, and, at the conclusion of the evidence, of addressing me on any matter they might think pertinent to the inquiry.

No evidence was obtainable as to the circumstances leading up to the explosion, inasmuch as no person survived who was in the mine at the time of the disaster; but a number of witnesses gave evidence as to the general condition and management of the colliery; of its examination (immediately after the explosion, and also after the unsealing in June) as to the presence of fire-damp; the finding of the bodies of the men who were killed; and there is no reason to suppose that any evidence which is material to the inquiry has been withheld.

Upon the facts so disclosed, I have the honor to submit my Report, under the following heads :—

- (1.) Description of the Mine.
- (2.) The Management and Working of the Mine.
- (3.) The State of the Mine just before the Explosion.
- (4.) The Explosion and its Results.
- (5.) Cause of the Explosion.
- (6.) Conclusion.

## (1.) Description of the Mine.

The Dudley pit is situated some few miles south of Newcastle, in the locality known as Redhead. Sinking operations commenced somewhat more than nine years ago. There are now two shafts—the down-cast, 624 feet below the surface, and the up-cast or fan shaft, 553 feet deep. The coal is bituminous in character, and, as is general in the Newcastle district, it is the Borehole seam that is being worked. The height of the seam is 6 feet 3 inches, and it is worked to an extent of 5 feet 9 inches, 6 inches being left in the roof. Above the coal is a band, 2 feet 6 inches in thickness, consisting of rotten shale and ironstone. In places where the shale has not fallen the roof is supported by props; but falls have occurred from time to time in spite of these precautions. The mine as a whole is dry and dusty, more particularly so in Nigger's heading and the headings to the right of the second right main headings. The district to the left of the last-mentioned headings is wet. The main roads are watered, but it was admitted to be done more for the sake of convenience in travelling, and it is obvious that to water the roadway and to omit the sides where the fine dust collects, would be useless as a check upon the spread of an explosion. There is a rise, generally speaking, in the pit from the down-cast towards the up-cast shaft. The area that has been worked up to the present is acres. The plan appended hereto, and marked “A,” will show the main features of the mine; the crosses with figures denoting the places where the dead bodies were found; the pencil arrows showing the directions of force or flame as deposed to by different witnesses; the small ink arrows giving the direction of the air-current. The lines coloured blue are the intake airways, those in red the return.

## (2.) The Management and Working of the Mine.

The system of working is what is known as the “pillar and bord”; the wider oblong spaces on the plan indicate the pillars, and the narrow the bords. The mine, when working, has always given off fire-damp, more or less, especially in the winning places; and when the connection was being made between the two shafts, it was found advisable by the Management to introduce safety-lamps for that particular work. In recent years, however, naked lights have been used throughout the mine, except during the deputy's inspections, when safety-lamps are used. The working places have always been bratticed up to the face, even prior to the existing Coal Mines Regulations Act, and when it was not compulsory; but,

but, nevertheless, numerous instances were recorded by witnesses of the presence of fire-damp in an inflammable state manifesting itself by igniting at the naked lights of the men. The pit is ventilated by a fan situated at the mouth of the up-cast shaft, which usually runs when the mine is at work, at a speed of from forty to forty-five revolutions to the minute. There are five distinct ventilating districts, and the main intake current is distributed throughout the workings by means of splits. It has been the custom, when there were no men in the pit at the week end, to stop the fan on Saturday and Sunday, and, should all the men be going to work on Monday morning, to start it again on Sunday night. After the men had come out of the pit at 4 p.m., the fan would be idle daily until 9 p.m., when it would again be started—some hour and a half before the shiftmen went down.

**Ventilation.**

**Stoppage of fan**

**Inspection.** The method of inspection under Rule 4 was as follows:—

**Stations.** It appears that since 1896, in addition to the miners who were working on contract, shiftmen were employed on day-wages in getting coal at night-time. Rule 4 provides, for the purpose of inspection, that a station or stations shall be appointed at the entrance to the mine, or to different parts of the mine, and no workman shall pass beyond any such station until the part of the mine beyond that station has been examined in the prescribed manner.

Section 46 of the Coal Mines Regulation Act provides for the division of a mine into parts, but there is no evidence that the Dudley pit has been divided in accordance with that section. As a matter of fact, at Dudley a station has been established at the bottom of the down-cast shaft, and beyond this point the miners on contract may not pass in the daytime till they receive the deputy's permission. The shiftmen and water-bailers, on the other hand, were in the habit of passing this station before any inspection of the mine had been made, and travelling with an intake current of air would wait at a flat or station in their respective districts for the deputy's report. At night the deputy would go down the pit half an hour before the men, and examine the working places in each district where the men were to work, travelling with the air-current. If he found gas, his duty was to remove it before the men went in to that working-place; if all was safe, the practice was to mark the date in each bord or working-place. After this inspection he would meet his men at the station for that particular district, make a verbal report to them as to the condition of the district, and set them to work, and subsequently make the prescribed entry in the deputy's book. Thus the men would very often be at work at their places before the deputy had made his report in his book in accordance with the Act. Later on, in the early hours of the morning, he would make a second inspection, as provided for in Rule 4, and would meet the miners going down at 7.30 a.m. at the station near the bottom of the down-cast shaft. The old workings were not examined unless the ventilation going through them subsequently passed through a district where men were at work. The deputy's duty was further to replace immediately all brattice that was disarranged, and convey to the manager all information which he had with regard to the presence of gas and other sources of danger. There was a corresponding obligation imposed on all persons employed in the mine by the Special Rules of the colliery to report to the person in charge of the works the existence of fire-damp. In practice, it would appear from the evidence that the deputies recorded in their book the place and circumstances of their finding gas in the course of their inspections, but the books do not show any entry of an ignition of gas having taken place during the ordinary working hours. Many of the miners admitted that they made no report of the presence of gas which they experienced from time to time; some, indeed, stated that they did report such ignitions to the deputies, but the latter when so informed seem to have neglected to make these matters known to the manager. I shall have occasion to refer to these matters in detail later on.

**Reporting presence of gas**

### (3.) *State of the Mine just before the Explosion.*

The places had been balloted for by the miners on 17th March, and Monday, 21st, was to be the first day of working under the new arrangement. Operations had been suspended in Nigger's heading since the previous October. On the 18th March some men had been at work laying rails in that part, in pursuance of the intention to resume work there immediately. In the second left district, Bob's heading had recently been worked by night, and Star's heading by day. Work had also been carried on in the second right district. On various occasions since the beginning of the year fire-damp in a more or less inflammable state was proved to have been given off both in the face of the second right main headings and in the bords contiguous thereto; but in the previous ten days it had been detected in Bob's heading, in a bord opposite to the spot where the body of Hindmarch was subsequently found, and also in the last unholed bord, marked "AO" on the plan.

**19th March.** The men came out of the pit on Saturday morning, the 19th. Up to that hour nothing unusual was noticed, nor was there any indication of the subsequent explosion. The fan, according to the usual practice, remained idle from then until Monday morning; it was to start at 6 a.m. that day. There was, however, some uncertainty as to what hour it did commence to work, and I have come to the conclusion that the time was undoubtedly later than usual. However, by 6.30 its speed was somewhere about 42 revolutions to the minute, thereby providing for a current of air to the extent of 100,000 cubic feet entering the mine every minute. And it was stated by several witnesses that this volume of air was sufficient to dilute and render harmless all noxious gases with which it came directly in contact; that although there might possibly be some accumulation of gas that morning in consequence of the fan having been idle for forty-seven hours previously, yet that current of air was ample, assuming that the brattice and ventilating apparatus generally were in proper order, to clear the mine of all noxious gases in less than one hour.

**21st March.**

**Duties of workmen.** Young was the examining deputy for the day. His work would take him down the pit about 7 o'clock. Towards 7.30 the other men descended. Amongst them were Hetherington, the deputy, and Hindmarch, the underground manager. The two deputies carried safety-lamps when last seen at the pit-mouth that morning; the other men, including Hindmarch, had naked lights. Benson, the pumpman, had been engaged at the pump. Hetherington had charge of a gang of men in Nigger's heading. Young would be in charge of the three water-bailers, Rudge, Jones, and Cook, whose work was in the left of the second right-hand headings. In the second right return airway there was a fall of roof some four stentons in by of the up-cast shaft. Haddon and Mowbray would be employed there filling skips, which McDougal wheeled round to Price and Dunn, who, in their turn, disposed of the contents in the stow-bord behind the up-cast shaft. Hetherington would probably examine the district called Nigger's heading for his men. Young would first examine the district where the water-bailers were about to work, and according to practice place the date, in chalk, upon the working-faces. Having disposed of them he would probably proceed with the examination for the other men. After completing this preliminary inspection, Young had some work to do near where his body was ultimately found. There would be then, some hours later, a second inspection provided for by the Act. Hindmarch's duties took him nowhere in particular on that morning. In all fifteen men were in the pit at 9 o'clock, and as far as is known there was to be no shot fired that day, nor has any evidence been obtained since to suggest that a shot was fired before the explosion took place. Two youths, Croker and Parsons, were down below for a short time that day, returning to the surface just before 9 o'clock. About 8.45 Green was seen by Croker at the cross-cut end, and Dorrity in charge of a horse at the pit-bottom. None of these fifteen men were seen alive again.

### (4.) *The Explosion and its Results.*

**Effect of explosion.** At ten minutes past 9 there was a loud report, and quantities of dust and dirt were forced up both of the shafts. These indications were noticed to proceed from the up-cast shaft some few seconds earlier than from the down-cast. At the up-cast the result was that the covering of the shaft was blown away and a door of the fan chamber was broken, and the timber baulks, on which rest the pulley legs, were plastered with mud on the underside. At the down-cast the cage, weighing 22 cwt., which was at the pit-mouth at the time, was thrown upwards some 23 feet, the chain of the cage was broken, some sheets of iron were blown off the roof, and dust and small coal were emitted in large quantities. The cage at the shaft-bottom was wrecked, and the guide-ropes were broken. The exploring parties descended the pit in the course of that same day. At the shaft-bottom there was evidence of very great force travelling outby; the ventilation was everywhere disarranged. Up to the 24th ten dead bodies had been recovered, but owing to the presence of what was deemed to be a fire it was decided to seal the pit down.

**Up-cast shaft.**

**Down-cast shaft.**

Up to that point the evidence indicated that the force had proceeded chiefly from the left-hand side of the mine, and it was thought by some that Nigger's heading was the initial point of the explosion. Since the unsealing of the pit in June, most parts of the colliery have been carefully and minutely explored, and further investigation has led the majority of the witnesses who offered an opinion on the matter to locate the starting-point somewhere on the right-hand side of the mine. Indeed, not only is there a difference of opinion as to the inference to be drawn from the facts disclosed, but in more than one instance there is a conflict as to the evidences of force. Moreover, thousands of tons of fallen roof were found after the pit had been reopened, and it was proved that many of these falls had taken place after the shafts were unsealed. The displacement of air so occasioned would have the same effect upon stoppings as the explosion itself. Care is therefore required in endeavouring to trace the course of the explosion to avoid attributing to the original force damage which has been caused subsequently.

After

After due consideration, the following are the conclusions I have arrived at as to the indications of force :—

Proceeding first along the main narrow bords intake airway from the down-cast shaft, we find a set of full skips near the overman's cabin, which had evidently been blown along the road some distance by a force travelling outover. At the first over-cast the wall on the left-hand side was standing, that on the right bore evidence of having been acted upon by two forces, one travelling outby, the other proceeding from the back heading of the first right-hand heading. Of the stentons between the first over-cast and the cross-cut, three were standing, the stopping of the second going inby being blown into the return, that is from right to left. Opposite that stenton a set of loaded skips were standing; some of these had been blown against the right rib, indicating a force from left to right. Opposite the third stenton, which was standing, was another set of skips. Some of the skips in the middle of this train were forced against the right rib. Three skips at the rear, that is on the inby side and just opposite to the first cut-through, were spread out and partly turned round in the direction of the down-cast shaft. At the cross-cut the door marked "D" on the plan had been blown inover. Here again was a set of skips standing; those actually opposite to the cross-cut opening being moved against the right rib as if a force had come outby from the cross-cut. The first skip of this set was tipped on end and blown outby. Either the sixth or seventh stenton was standing, but with that exception all stoppings between the narrow bords from the cross-cut, and as far as the faces of the main narrow bords, were blown into the return. Standing opposite to the second cut-through was another set of skips, the rear skips being turned round from right to left, in a similar manner to those at the first cut-through. The second over-cast shows a force from left to right, the bricks being blown outby, and the timber from left to right. At the entrance to the second left headings there is a drift of dust driven from the heading into the main narrow bord. Yet again, Mr. Humphreys says that some of the timber has not yet been recovered, and the only part hitherto unexplored where it can possibly be found is the return airway of the second left-hand heading. The door of the first stenton inby of the second over-cast was blown towards the left, and its remains were found in the return of the second left-hand headings. The third over-cast affords no clear evidence. We find the bricks are blown into the return towards the left, and some of the timber was found in the intake of the second right-hand headings to the right. Still travelling inby of the third over-cast, the stoppings to the right of the narrow bords are blown to the right; the first stopping has been blown to the right with some force, inasmuch as some bricks were found 44 yards away in that direction. The stentons further inby are fallen, but as no part of the stoppings has been found in the intake it is fair to assume that the force which must have displaced them was from left to right. Travelling along the main narrow bords return inby from second over-cast, the first two stoppings on the left are blown from right to left; the third was fallen.

There are indications of flame in the stentons, both inby and outby of Star's heading.

Going along Star's heading there is a general indication of force and flame in the bords on either side of the heading, having travelled from the main narrow bords. In some bords the brattice has been blown up against the left rib, and has been subjected to great heat. The flame has travelled down the bords on the left towards the second left-hand headings. From the end of Star's heading to where Hindmarch's body was unearthed there is no evidence of flame, as the roof has fallen. In the bord to the right of Hindmarch the brattice-cloth is torn. Some props in the bord to the left show signs of flame having travelled towards the second left headings. From this point, generally speaking, there is evidence of flame, as seen by scorched props and coke-dust travelling towards the second left. In the going bord at the fourth pillar, down from Star's heading, a full skip has been driven some distance off the flat in the same direction. In the second left-hand return, the first stopping inby was standing, the second has fallen, and the third was blown into the intake.

In a bord directly opposite to the third stenton, and contiguous to the intake, some bricks were found which had been blown 20 yards from that stenton. Between the second and first left headings, coke-dust and other signs of flame are to be met with. The stoppings between the first left-hand headings have been blown from right to left with great force, the bricks of the first, second, and third being embedded to a depth of 3 or 4 inches in the opposite pillar.

Returning again to the junction of the second left headings with the main narrow bords, travelling outby, in each of the three cut-throughs there is evidence of flame, and in the first cut-through inby of the first over-cast the tram of a skip was found close to the main narrow bords, some 20 yards inby the skip itself was found. There are indications that it had been loaded, and coal was lying about in the vicinity. Just inside this heading were also found the bottom of some empty casks, the other portions lying on the inby side of this skip.

Taking the second right main headings, going inby, the stoppings between the two headings are all blown from right to left, with four exceptions—that is, the third, fourth, seventh, and ninth, which are standing. The fourteenth stenton shows very strong force from right to left, the bricks of the stopping being embedded in the opposite pillar. The stoppings on the left-hand side of the intake do not present a uniform appearance. As far inby as the fan-shaft they are blown from left to right, inby of the fan-shaft many are standing; those which have been displaced are blown from right to left. On the flat at the first going bord on the left side of these headings a skip has been blown inover. Of the stoppings in the first going bord to the left, the first on the left is standing, that on the right is blown to the right. The stoppings on either side of the next two headings are blown right and left respectively. Further on inby of the second going bord a skip has been blown out-over. In the going bord the stoppings of the first and second headings have all been blown to the left. In the third heading the left stopping is blown left, and the canvas stopping on the right is standing. From the main narrow bords the force has been towards the first going bord, and from the face of the second right headings the force is also towards that bord. In the whole of this district there is no evidence of flame, and the force is only slight.

Returning to the third over-cast, and traversing the second right-hand return, the first, second, and fourth stoppings on the right inby are blown into the return, and a door on the second pillar behind the up-cast shaft has been blown towards the return. The first stopping on the right inby of the up-cast and such others as can be traced have been blown into the return.

Taking next the bords off the second right-hand return, at the inner bord inby where Young's body was found, a skip has been forced inover. From this spot to the face of the heading there is no sign of force or flame, and there have been no falls. Travelling along the face, there are no indications between where Young's body was found and bord 21, as the roof has fallen. In the neighbourhood of the latter bord a skip has been tipped in the direction of the main narrow bords, and props in that vicinity indicate that flame has travelled outby. Between this point and the stow-bord the directions of force and flame are very conflicting—sometimes inby, at other times outby, and occasionally travelling opposite directions in two parallel bords. Going from the stow-bord towards the main narrow bords, the same conflicting evidences of flame are encountered.

The body of Cooke when discovered was lying a pillar's distance from his water-tub. Haddon, Rudge, and Jones were found nearly 70 yards away from their respective working-places, and Mowbray some 35 yards. The rest all died close to their work. The immediate cause of death of every man whose body was examined *post-mortem* was attributed to carbon mon-oxide. In some instances the bodies were burnt or injured by falls of roof, which injuries might in themselves have brought about the death of the individual in the course of a few days had not the effects of after-damp immediately supervened. A detailed account of the circumstances surrounding the death of each man will be found in Appendix "D."

#### (5.) Cause of the Explosion.

All the witnesses were in substantial agreement that the explosion has been caused by the ignition of fire-damp at a naked light; that the quantity of gas was probably not large; but that the explosion has been intensified and extended by the action of coal-dust. The initial explosion must have stirred up some fine dust, which in its turn has been inflamed and exploded, thus leading to a series of almost simultaneous explosions. As to the seat of the explosion, there is much difference of opinion. Messrs. Atkinson and Humble make Hindmarch's light the starting-point; Mr. Croudace agrees with them—that the mine fired on the left-hand side, but does not actually say where. The Brothers Dixon, and Messrs. Humphreys, Henwood, Ross, Brown, and Mason say it originated on the right-hand side, the witnesses varying in making Young or Haddon or Price the initial point of the disaster, or leaving the matter entirely at large. Messrs. Turnbull and Thomas declined to commit themselves to either side. So long as it is established that this was a fire-damp explosion, the fixing of the exact point of ignition becomes a matter of secondary importance; and although there are difficulties in the way of adopting either theory, the balance of probability to my mind is in favour of the explosion originating at Hindmarch's light. From Hindmarch the general direction of the explosion was across the second and first left-hand headings, through the pump-drift, and up the down-cast shaft. Portion of this force was diverted when meeting the second left headings, and after driving the stenton stoppings into the intake, it has travelled along the intake and blown the second over-cast into the main narrow bords. Here the force has again subdivided after striking against the fast wall of the main narrow bords, part of it travelling inby has blown the door in the first stenton into the return, as described, thus allowing a

portion of the explosion to travel along the return. As the force travelled along the main intake, it found a partial escape into the third cut-through. Continuing in by, it has distributed itself left and right through the stoppings on either side, thus reaching respectively Star's heading and the headings to the right of the main narrow bords. As it approached the face the force was gradually dying out, and in its last effort travelled against the air from the face of the main narrow bords to where the two air-currents met in that bord (No. 54). Returning now to the main narrow bords at the second over-cast. At this point the remainder of the force of the explosion took a direction out by, finding a partial escape at the second and first cut-throughs. In these headings to the right of the main narrow bords, the explosion has travelled in different directions, finding an outlet partly at the first right headings, partly at the up-cast shaft, and also through the stoppings off the return of the second right-hand headings, eventually crossing these last-mentioned headings somewhere near the spot where Rudge and Jones were found; then travelling with slight force against the air and along the working-faces as far as bord 54, and out by as far as the second going bord.

The fact of dust issuing from the up-cast shaft earlier than from the down-cast does not assist us, for that is equally consistent with either theory. Again, the evidences of force and flame in the second right district are so contradictory as to afford little help in themselves.

Right-hand  
side theory.  
Difficulties.

- The following seem to me strong objections to accepting the view that the mine fired on the right-hand side:—
- (i) The evidence of force having moved the second over-cast from left to right, and having carried a skip and casks along the first cut-through, is inconsistent with the idea that the explosion entered the main narrow bords from the right-hand side, and no explanation that has been offered has removed that difficulty from my mind.
  - (ii) If the explosion had originated on the right, one would expect a greater exhibition of force than the evidence affords, in the stoppings between the second right main headings; and some evidence of flame or force at the faces of the same headings.
  - (iii) The fact that all the men on the left-hand side were found close to their work, whilst on the right-hand at least five had travelled some distance from their places before they succumbed, suggest that those in the right heard the sound of the explosion, and, being alarmed, had dropped their lamps, and had had sufficient time to travel in three instances as much as 70 yards before they were overcome. Such an occurrence would not be probable if the explosion originated some 200 yards away, when the sound and force would reach them almost simultaneously.

On the other hand, the left-side theory presents a difficulty. If Hindmarch's light initiated the explosion, one would expect the flame to branch out in all directions when first seeking an outlet. It may be that Hindmarch, before being overcome by after-damp, travelled some short distance towards the second left headings, and that the explosion, after splitting at the second overcast, has returned almost to the starting-point. It was suggested that, although Hindmarch entered to the pit with a naked light, he would be carrying a safety-lamp at the time of his death. To settle this question, I adjourned the Court for a week to give the management an opportunity to make full search in the vicinity of his body and Young's, but up to the last day the Court sat no trace of any lamp or light in either spot had been found.

Cause of gas  
accumulating.

There was, undoubtedly, some accumulation of gas upon which the ventilating current was unable to properly act on that morning. This may have been brought about by a fall of the roof liberating a quantity of gas, or the fall may have disarranged the brattice, and thus caused an accumulation of gas shortly before the explosion, or the brattice may have been disarranged on the previous Saturday in some bord where gas was exuding, and the accumulation of those forty-seven hours may have been uninfluenced by the air-current on Monday morning up to the moment that the naked light came into contact with it. There is no evidence upon the matter, and I can only say, judging from the history of the mine, that the last alternative seems the most probable.

#### Conclusions.

I find that—

- (i) The explosion was caused by the ignition of fire-damp at a naked light.
- (ii) The explosion was intensified by the agency of coal-dust.
- (iii) Evidence did not show what was the approximate quantity of fire-damp, or what the circumstances were under which it assumed an explosive character.
- (iv) Ventilation was not "constantly" produced in accordance with the terms section 47, Rule I, of the Act.
- (v) Inspections were not conducted in accordance with General Rule 4.
- (vi) There was in the mine a quantity of fire-damp, which rendered the use of naked lights dangerous.
- (vii) Locked safety-lamps should have been used at the time of the explosion.

Ventilation

It is manifest, according to the decision of the English Courts in the case of Knowles v. Dickinson (2 E. and E., 705), that it is the duty of the management to keep the fan constantly at work each day in the week, and whether the men are actually in the mine or not, so long as it is being worked as a going concern. The circumstances of that case are very similar to the present one, and the decision seems to me to be directly in point. A prosecution for a breach of the Act in this respect is at the present date barred by statute. However, the following remarks are noteworthy in this connection:—

- (i) The evidence proved that the stoppage of the fan from Saturday till Monday was not the cause of the gas being in explosive state; on the contrary, that the volume of air was sufficient to dilute all noxious gases (assuming the brattice was in proper order so as to enable the current to reach all places where gas did exist).
- (ii) The practice of stopping the fan at the week-end has been common for years to Dudley and other pits without any protest on the part of the colliery inspectors; in fact, the wording of the report of Mr. Inspector Humble, of 31st October, 1896 [Appendix E], reads as if he was then under the impression that the fan need not be worked unless men were actually in the mine.
- (iii) A notice has been issued by the Chief Inspector of Coal-mines since the conclusion of the Coroner's inquest to Mr. Humphreys, drawing his attention to the duty of keeping the fan at work during any temporary suspension of work; and the manager, since that notification, has complied strictly with the terms of Rule I.

Inspection.

As to the method of inspection (Division V, page 24): A station with a deputy bord in accordance with Rule 4 and Special Rule 11, has been established at the bottom of the down-cast shaft. Beyond that no person may pass until the part of the mine beyond that station has been stated by the deputy to be safe (see Rule 4).

The practice with regard to inspection before the miners enter in the morning as above mentioned (see page 3), is strictly in accordance with the rule; but the system in connection with the night-shift is undoubtedly not only irregular, but a breach of the rules. The deputy precedes the night-shift men down the pit by some half-hour; they in their turn pass the station at the entrance to the mine and wait at different places or stations as they have been termed, till they see the deputy. My view of the provision as to stations is as follows:—

Station at  
entrance to the  
mine, or to  
different part  
of the mine.

Where a mine is worked as a whole with one system of ventilation, then one station only is allowable—that is, at the entrance to the mine. If, however, a mine is divided into parts, under the provisions of section 46 of the Coal Mines Regulation Act, so as to make each part a separate mine within the meaning of the Act, then a station may be established at the entrance to each different part. I find confirmation of this view in a passage of the judgment of Mr. Justice A. L. Smith, in *Wales v. Thomas* (16 Q.B.D. 340, page 348).

Therefore, to appoint stations in the various districts of Dudley, as deposed to in evidence, is a violation of the Act in two respects, for—

- (1) Only one station is permissible as the colliery is at present worked.
- (2) That station must be at the entrance to the mine.

With the removal of these various so-called stations from the various flats, the examining deputy will then make a complete inspection of the working-places, &c., and will meet the shiftmen at the entrance to the mine, and sign his report in the same manner as he now does when the miners on contract go to work.

Safety-lamps.

As to Division VII (page 9)—the use of safety-lamps: The evidence shows that from its earliest history the mine has always been giving off fire-damp, and to deal with it effectually it has been necessary to brattice the working-places. The history of the mine during the eleven months prior to the explosion shows that gas had been reported by deputies on sixteen different occasions in various parts of the mine. Miners had experienced ignitions of gas in the faces of the second right headings generally, in the first left, and, during the week previous to the explosion, in Bob's heading and in the bord next to where Hindmarch's body was found. After the explosion a quantity of fire-damp was discovered in the faces of the second right main heading. This might be due to the circumstances attending the explosion, yet since 21st March, we find that, though the faces of the coal have been undisturbed, gas was being still exuded as late as 20th August from the faces of the second right-hand main headings, and up to the end of the same month in the bords abovementioned in Bob's heading.

The

The deputies' books some years back, and after the fan was introduced, show that in different parts of the mine gas was found daily for periods extending over a fortnight [Appendix F]. From the evidence it is clear that it was necessary to have both the fan at work and the brattice erected in order to prevent accumulations of gas. On different occasions when the fan has been working and the brattice disarranged gas has been discovered, and *vice versa*. Some twenty witnesses gave evidence of ignitions of fire-damp which they had experienced. These ignitions may be divided into the following classes:—

- (1.) Those caused by the bratticing being damaged, or not being sufficiently close to the face.
- (2.) Those caused by the firing of a shot.
- (3.) Those caused by workmen going to the face with a naked light too soon after firing a shot.
- (4.) Those caused by a workman's light when drilling a hole.
- (5.) Cases of which no explanation is forthcoming.

Causes of gas lighting up.

Referring to these individually, the first may be dealt with by properly enforcing the provisions of Rule 1 as to ventilation. The means for detecting the presence of fire-damp require the constant attention of those in authority. In many instances the insufficiency of the brattice to carry off the gas should have been found out by the deputies, or, if discovered, should have been remedied. The necessity of strict attention to this part of their duty should be impressed upon the officials.

As to (2): Possibilities of that kind may be avoided by strictly adhering to the conditions of General Rule 12.

(3): May be obviated by more care on the part of the workmen, who, in more than one instance, admitted that they knew they were taking a risk in returning to the face with a naked light before the smoke had cleared away.

There remain, however, a number of instances where an ignition of gas has taken place which could not be accounted for by any temporary defect in an otherwise perfect system of bratticing. These ignitions occurred sometimes in the early morning when the miner first entered his working-place; on other occasions after a temporary absence during the shift. In these cases there was no shot-firing, and the brattice was well up to the face. In most cases the flame was of small extent, with the exception perhaps of Harrison's, the flame in his bord ran back along the broken roof a distance of 12 yards. Nobody hitherto had actually been burnt. Several witnesses treated these flares-up, as they were styled, with great contempt (the manager saying that 99 cases out of 100 there was no necessity to make a special report as the quantity was infinitesimal). The underground manager did not consider a flame 4 or 5 yards long dangerous to workmen. As illustrating the danger attending the lighting of a small quantity of fire-damp, I will refer to the report for 1892 of Mr. Stokes, one of Her Majesty's Inspectors of Mines for the Midland Counties. Referring to fire-damp, he says: "With regard to what quantity might be considered dangerous, a clear proof of what might be the result of igniting a very small quantity of gas is given in the lists of non-fatal explosions, in which is recorded the ignition of a very small quantity of fire-damp at a gate-end lip by a naked light held by a workman. The quantity was so small that the man who ignited the gas was in no way injured, but the flame from the ignited gas passed along a break in the roof and exploded other gas in the goaf and burnt two men working 56 feet away from the point of first ignition. This accident clearly shows that a quantity of gas so small in itself as when ignited not to injure the person igniting it, is yet sufficient to prove dangerous to the mine and persons working some distance from it, due to its flame being extended by gas lying unknown in breaks in the roof."

A number of cases unexplained.

Danger of fire-damp.

The above extract shows that a small quantity of inflammable gas may be a danger to workmen if there are surrounding circumstances of an aggravating nature.

Another element to be considered is the question of coal-dust. The manager says that the whole of the left side of the second right is damp, also Bob's heading and the lower portions of the second left and first left; but the remainder of the mine is both dry and dusty.

Coal-dust.

The Royal Commission on Explosions from Coal-dust in Mines, in their Report published in 1894, are of opinion that the danger of explosions in a mine in which gas exists, even in very small quantities, is greatly increased by the presence of coal-dust; that air and dust with a very small quantity of fire-damp, such as practical people perhaps could not find with the ordinary safety-lamp, would cause violent explosions. Thus what might be a local explosion of a simple character is transformed through the medium of coal-dust into a widespread disaster.

Increased danger from fire-damp.

Moreover, it appears that, from time to time, falls of roof may take place in the Dudley pit, which may either liberate some fire-damp or derange the brattice and cut off from the influence of the ventilating current those parts of the pit contiguous to the damaged brattice. The falls have not hitherto been frequent, yet, as Mr. Humphreys says in his evidence, "the falling of the roof on the brattice is a possibility that has to be reckoned with in the mine. The roof, as it is generally in the mine, is liable to fall at any time, in spite of precautions."

Falls of roof.

Up to the time of the explosion no measures had been taken by dumping the coal-dust to check the spread of a possible explosion.

The existence of these three sets of circumstances, namely,—

- (1.) The ignitions of gas in spite of proper and perfect ventilation;
- (2.) The liability of the roof to fall and derange the ventilation;
- (3.) The presence of coal-dust ready to transmit and intensify a fire-damp explosion,

suggests the question: Was the use of naked lights likely to be dangerous to workmen in the mine about the time of the explosion, and should safety-lamps have been used? My answer is, undoubtedly yes.

The Honorable A. Brown, on the question of safety-lamps, referred me to the Report of the Royal Commission on Accidents in Mines of 1886, where it appears, on page 117, they refrained from prohibiting the use of naked lights in mines giving off fire-damp. But it will be noticed that whilst the Commission do not advise safety-lamps merely because a mine gives off fire-damp, they assume that their adoption is essential when fire-damp is associated with coal-dust; and certainly the trend of expert opinion and legislation during the last ten years in England is to enforce the use of safety-lamps in every mine where fire-damp is found.

Royal Commission, 1886: opinion as to safety-lamps.

Mr. H. D. Greene, Q.C., in his Report in 1890 on the Llanerch Colliery Explosion, advocates legislative prohibition against allowing or using naked lights in a mine, where inflammable gas has been reported within a period of twelve months.

Opinion of Mr. H. D. Greene, Q.C. Mr. Robson.

Mr. Robson, Her Majesty's Inspector of Mines for the South Wales District, in his Annual Report of 1890, states that in his opinion all mines known to produce fire-damp should be worked with safety-lamps of the best description, and all other lights excluded.

Mr. Martin, another Imperial Inspector, holds equally strong views.

Our own local Act, The Coal Mines Regulation Act, 1896, makes it compulsory under Rule 4 to conduct all inspections of the working-places with a locked safety-lamp unless the mine has been absolutely free from inflammable gas for a period of twelve months.

Mr. Martin. Coal Mines Regulation Act, 1896.

The explosives in Coal Mines Order, 1898, supersedes the rule in England which corresponds to Rule 12 of the Coal Mines Regulation Act of this Colony, and indicates that in any mine in which inflammable gas has been found within three months in such a quantity as to be indicative of danger, or which is not naturally wet throughout, no explosive, other than those specially authorised by that order, shall be used. Statistics further show that whereas in Great Britain 1,561 persons lost their lives through explosions caused by a naked light between 1873 and 1893, during 1897 there were only fifteen deaths from the same cause, when 720,000 were engaged and the output of coal was 200,000,000 tons.

Explosives in Coal Mine. Order, 1898.

The Inspectors of Coal-mines, who up to the time of the explosion had not heard of these ignitions of gas detailed in evidence before me, stated that those facts demanded the use of safety-lamps throughout the Dudley Colliery. Mr. Turnbull says: "If you find gas and it lights up you ought to have safety-lamps." Mr. Croudace says: "If gas has given off and the ventilation working and the brattice well up, one should increase the ventilation or use safety-lamps." Mr. Henwood says: "If Harrison's evidence is true, the gas is a danger to workmen."

Opinions of witnesses called.

Mr. Humphreys swore that, with the exception of Harrison's experience, he had no knowledge of gas igniting at naked lamps when the ventilating appliances were in proper order. And in justice to himself, it should be mentioned that many of the men who gave evidence of these flares-up admitted that they failed to report them to the proper authority, and, further, when the matters were reported to a deputy, they were not recorded in any way. Thus the probabilities confirm the manager's testimony. However, I think that the incident Harrison spoke of, and the other circumstance peculiar to this colliery, should have put him upon inquiry and prompted him to use safety-lamps in compliance with Rule 8. Such a matter as a prosecution for breach of this rule is now out of the question, as it is Statute-barred after three months (*see* section 62).

Manager ignorant of the ignitions of gas.

Nor do I think I am justified in making any recommendation as to a prosecution for manslaughter, for the jury at the Coroner's Inquest had before them all the facts of the case, and decided that no responsibility was to be attached to the manager

Prosecution.

manager for the consequences of the disaster. In the first place I cannot say that such a finding was unreasonable, and secondly, I do not think it lies within the scope of this inquiry to suggest criminal proceedings for any offence other than what may be dealt with under the Coal Mines Regulation Act itself.

Future working  
of the mine.

For the future, the use of safety-lamps is entirely a matter for the discretion of the management; responsibility in this respect is removed by section 20 from the shoulders of the inspectors and transferred to the mine officials. And I have no doubt that they will show the same regard for the interests of all associated with the mine as has been exhibited in the past.

Coal-dust.

Side by side with the precautions taken to prevent the ignition of inflammable gas, strict measures should be adopted to prevent the possibility of a small local explosive becoming extensive through the agency of coal-dust, and some method either of removing the dust or of damping it, or both, is essential where the dust exists in any quantity.

Importance of  
reporting  
presence of fire  
damp.

However, the true interests of the mine cannot be effectually safe-guarded unless all concerned strictly comply with the requirements of the Act and the Special Rules. Special Rules 15 and 71 impose upon the deputy and the miners respectively, the duty of informing those in charge of the existence of fire-damp whenever found. The tendency seems to have been for the individual to constitute himself the judge of what should be reported and what not. Mr. Humphreys said that in 99 cases out of 100 there was no occasion to make a special report as the quantity of gas was insignificant. A manager should clearly understand and likewise impress upon those under his control, that every discovery of gas of any quantity must be reported in compliance with the Special Rules under pain of instant dismissal. Had this course been universally adopted throughout the mine, it is possible that we should never have heard of the Dudley explosion.

I have, &c.,

G. C. WADE,  
Sole Commissioner,  
19th September, 1898.

The Honorable Joseph Cook,  
Secretary for Mines and Agriculture.

#### No. 19.

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

Sir, Crown Solicitor's Office, Sydney, 30 January, 1899.

I have the honor to return herewith the papers, numbered as in the margin (98/2,208), forwarded with your letter of the 28th ultimo requesting that one of my officers should represent your Department at the inquest upon the bodies of the men who were killed in the recent accident at East Greta Colliery.

One of my officers attended at West Maitland as requested, when, after a protracted hearing, the jury were unable to agree upon a verdict, and were discharged by the Coroner on the 28th instant.

I have, &c.,

GEO. COLQUHOUN,  
Crown Solicitor.

#### No. 20.

Mr. Inspector Bates to The Chief Inspector of Coal-mines.

Coal-fields Office, Department of Mines, Newcastle,  
31 January, 1899.

Sir,

I herewith enclose, for your information, the official notice of the fatal accident at East Greta Colliery on 18th November last.

I am preparing my annual report, and hope to post it to you to-morrow.

I have, &c.,

THOS. L. BATES,  
Inspector of Collieries.

Noted.—A.A.A., 1/2/99. Records.

Telegram from Mr. A. Thomas to Mr. Inspector Bates.

18 November, 1898.

THREE men entombed in No. 1 tunnel through a fall.

A. THOMAS.

Noted.—T.L.B., 18/11/98. The Chief Inspector of Coal-mines.

Telegram from Mr. A. Thomas to Mr. Inspector Bates.

24 December, 1898.

ONE body found last night. Inquest likely this afternoon.

A. THOMAS.

Noted.—T.L.B., 24/12/98. The Chief Inspector of Coal-mines.

Dear Sir,

East Greta Colliery, near West Maitland, 18 November, 1898.

A serious accident occurred at No. 1 tunnel of this mine this morning, at about 7 a.m. A fall of roof took place in the main tunnel, about 127 feet below the second or bottom level. The timber and rubbish from roof after falling ran down towards face of tunnel and entombed three men, names David Gronow, Bertie Moncrieff, and Stephen Hy. Barnes.

Yours, &c.,

T. L. Bates, Esq., Inspector of Collieries, Hamilton.

A. THOMAS.

Seen.—T. L. BATES, 18/11/98. The Chief Inspector of Coal-mines.

Dear

Dear Sir, East Greta Colliery, near West Maitland, Christmas, 1898.

Another body was found last night at 10.40 p.m., that of Gronow. It was on the right-hand side, about 3 feet from the side, between the sills, with his head inclined a little towards the middle of the tunnel.

The police doctor examined the two bodies this morning and found that no bones were broken in either.

It is thought that we are approaching another body.

T. L. Bates, Esq., Hamilton.

Yours, &c.,  
A. THOMAS.

No. 21.

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

*Re* Bates *v.* Thomas.

Sir, Crown Solicitor's Office, Sydney, 4 February, 1899.

I have the honor to forward herewith an information to be laid by Inspector Bates in the above matter, and to request that you will inform me of the return day of the summons, when the prosecuting officer will attend to conduct the prosecution. The witnesses required are Thomas L. Bates, David Lewis, Joseph Thompson, Edward Weller. The Under Secretary for Justice to produce depositions taken at inquest, and Sub-Inspector Fowler.

I have, &c.,  
GEO. COLQUHOUN,  
Crown Solicitor.

The information may perhaps be forwarded to Mr. Inspector Bates with instructions to lay the same, notifying me of the day of return of the summons, and summon the witnesses named herein.—A. A. ATKINSON, Chief Inspector of Coal-mines, 6/2/99. The Under Secretary.

Approved.—D.C.McL., 6/2/99. Mr. Inspector Bates.—A.A.A., B.C., 6/2/99. Report herewith.—T. L. BATES, 17/2/99. The Chief Inspector of Coal-mines.

---

No. 22.

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

*Re* Bates *v.* Cartwright.

Sir, Crown Solicitor's Office, Sydney, 4 February, 1899.

I have the honor to forward an information herein to be laid by Inspector Bates, and to request that you will inform me of the return day of the summons. The witnesses required are Thomas L. Bates, Azariah Thomas, to produce Special Rules signed by the Inspector of the District, and appointment of Cartwright as under-manager. The constable, to whom Cartwright made a statement of the evidence he could give at the inquest, to produce the statement. The Under Secretary for Justice to produce depositions taken at inquest, and Sub-Inspector Fowler.

I have, &c.,  
GEO. COLQUHOUN,  
Crown Solicitor.

Mr. Inspector Bates may be instructed to lay the two informations herein, notifying me of the return day of the summons; and summon the necessary witnesses indicated by the Crown Solicitor.—A. A. ATKINSON, Chief Inspector of Coal-mines, 6/2/99. The Under Secretary.

Approved.—D.C.McL., 6/2/99. Mr. Inspector Bates.—A.A.A., B.C. 6/2/99.

NOTE.—There are two informations to be laid against Mr. Cartwright, one in regard to Special Rule 3, and the other in regard to Special Rule 7.

Report herewith.—T. L. BATES, 17/2/99. The Chief Inspector of Coal-mines.

---

No. 23.

Mr. Inspector Bates to Mr. H. D. Wood, Mines Department.

Sir, Coal-fields Office, Newcastle, 7 February, 1899.

I have been to West Maitland this morning laying information against Mr. A. Thomas and H. Cartwright, of East Greta Colliery, for breaches of the Coal Mines Regulation Act, 1896, and Colliery Special Rules.

The case is set down for hearing on Thursday, 16th February.

I enclose herewith two summonses, requiring the Under Secretary for Justice to produce the depositions taken at inquest held at West Maitland, before Mr. Coroner Martin, on 24th December, 1898, on the body of Albert Moncrieff.

Will you kindly take such steps as will ensure the documents reaching the proper quarter.

I have informed Mr. Atkinson when the case will be heard.

I have, &c.,  
THOS. L. BATES,  
Inspector of Collieries.

Inform Crown Solicitor that the cases are set down for hearing on the 16th instant.—H.B.S., for U.S., 8/2/99. Crown Solicitor informed, 9/2/99. Return the attached notice of service of summons to Mr. Inspector Bates.—Chief Inspector of Coal-mines, 11/2/99.

## No. 24.

## Mr. Inspector Bates to The Chief Inspector of Coal-mines.

East Greta Colliery Prosecutions.

Sir,

Coal-fields Office, Newcastle, 9 February, 1899.

Would it not be desirable for the Department to produce the letter from Mr. A. Thomas, dated 1st October, 1896, nominating himself as manager, and Henry Cartwright as under-manager of East Greta Colliery.

I have a copy of the Special Rules signed by Mr. Inspector Dixon, which can be produced as evidence.

I have, &amp;c.,

THOS. L. BATES,

Inspector of Collieries.

## No. 25.

## Mr. A. Thomas to Mr. Inspector Bates.

Dear Sir,

East Greta Colliery, near West Maitland, 1 October, 1896.

I herewith appoint myself as manager of the East Greta Colliery, and Mr. Henry Cartwright, as under-manager of the same colliery. We also (both) have made applications for certificates to the Minister of Mines, as we are entitled to, under the 1896 Act.

I remain, &amp;c.,

A. THOMAS,

Agent.

Will Mr. Winchester please note this letter in a book, and then forward this document to the Under Secretary, Department of Mines and Agriculture.—J. DIXON, 5/10/96. Noted.—H.W., 5/10/96. Records, 6/10/96.

I presume that Mr. Thomas means this to be the nomination of Mr. Cartwright. It may be pointed out to him that a person is required by section 3 (II) to be the holder of a certificate of competency or service before he can be nominated as an under-manager, qualified to exercise the supervision of the mine. If Mr. Thomas has appointed himself under clause *b* of subsection III, section 2, he should send notice to the Inspector of the district of the reason for the appointment. The issue of certificates of service to those entitled to them will be expedited. Mr. A. Thomas may, perhaps, be so informed.—H.R., 7/10/96. Under Secretary. Submitted.—H.B.S., 7/10/96.

## No. 26.

## Chief Inspector of Coal-mines to The Under Secretary for Mines and Agriculture.

[Very Urgent.]

Coal-field's Office, Department of Mines,

Sir,

Newcastle, 14 February, 1899.

I understand from Mr. Inspector Bates that in the prosecution case against Mr. Thomas, manager of East Greta Colliery, that the defendant has secured the services of Mr. Edmunds, barrister, of Sydney. Under these circumstances, I think it would be desirable for the Department to be similarly fortified, and shall be glad if you will take the necessary steps to that effect.

Mr. Tillet, of the Crown Solicitor's Office, has the case in hand, and purposes coming up to Newcastle to-morrow night. If I might be permitted to suggest, Mr. George Wallace, barrister, who conducted the case against Mount Kembla Colliery, on the weighing question, would be a good man, as he has had experience in mining matters.

I have, &amp;c.,

A. A. ATKINSON,

Chief Inspector of Coal-mines.

For approval, to ask the Crown Solicitor to see that the Crown is represented by counsel.—H.B.S., 15/2/99. Approved.—J.C., 15.

The Crown Solicitor has arranged with counsel to leave for Maitland to-night with Mr. Tillet. A letter should now be written to the Crown Solicitor asking him to do what he verbally promised me to do this morning.—R. M. GIBSON, 15/2/99.

Yes. Write to the Crown Solicitor.—H.B.S., for U.S., 15/2/99. Mr. Atkinson informed by wire.—R.M.G., 15/2. The Crown Solicitor asked, 16/2/99.

## No. 27.

## Telegram from The Chief Inspector of Coal-mines to The Under Secretary for Mines and Agriculture.

15 February, 1899.

POSTED important letter to you last night *re* East Greta prosecution. Please ask Mr. Wood to ascertain from Justice Department if depositions taken at inquest have been forwarded, as they are required to-morrow.

A. A. ATKINSON.

Mr. Gibson. Ask Mr. Wood, by telephone, if depositions have been forwarded.—H.B.S., 15/2/99. The Chief Clerk, Justice Department, informed me by telephone this morning that the depositions had been forwarded some days ago to the C.P.S., Maitland, for production to-morrow.—R. M. GIBSON, 15/2/99. Inform Mr. Atkinson by wire.—H.B.S., 15/2/99. Chief Inspector Coal-mines informed by wire, 15/2/99. Noted.—A.A.A., 17/2/99.

No. 29.

Mr. Inspector Bates to The Chief Inspector of Coal-mines.

Bates v. Cartwright.

Sir,

Newcastle, 17 February, 1899.

I have the honor to report that the above case was heard at the West Maitland Police Court yesterday, 16th inst., before G. F. Scott, Esq., P.M., and H. Crothers, Esq., J.P.

The Department was represented by Mr. J. C. Gannon, barrister, Mr. J. V. Tillett, of the Crown Solicitor's Office, the Chief Inspector of Coal-mines, and myself.

Mr. Cartwright, under-manager of East Greta Colliery, was charged with a breach of Special Rule 3 and Special Rule 7 of East Greta Colliery. The two cases were tried together. He was defended by Mr. W. Edmunds, barrister, of Sydney, and Mr. G. W. Millard, solicitor, of Newcastle.

He at first pleaded "Not guilty" to both charges, and the cases were proceeded with, subsequently he pleaded "Guilty" to Rule 3, and the other charge against Rule 7 was withdrawn. The Bench imposed a fine of 10s. and 6s. 8d. costs.

I have, &amp;c.,

THOS. L. BATES,

Inspector of Collieries.

Mr. Inspector Bates to The Chief Inspector of Coal-mines.

Bates v. Thomas.

Sir,

Newcastle, 17 February, 1899.

I have the honor to report that the above case was heard at the West Maitland Police Court yesterday, 16th inst., before G. F. Scott, Esq., P.M., and H. Crothers, Esq., J.P.

The Department was represented by Mr. J. C. Gannon, barrister, Mr. J. V. Tillett, of the Crown Solicitor's Office, the Chief Inspector of Coal-mines, and myself.

Mr. Thomas was charged with a breach of section 47, General Rule 4 (1), of the Coal Mines Regulation Act, 1896. He was defended by Mr. W. Edmunds, barrister, of Sydney, and Mr. G. W. Millard, solicitor, of Newcastle.

He pleaded "Not guilty," and after evidence had been taken, the Bench dismissed the case on the ground that Lewis and the others were not contractors for getting coal.

I have, &amp;c.,

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

Re Prosecution of the Manager and Under-manager of East Greta Colliery.

Sir,

Crown Solicitor's Office, Sydney, 17 February, 1899.

I have the honor to acknowledge the receipt of your letter of the 16th inst., this morning, asking me to arrange that your Department be represented by counsel in the above cases, and to inform that these cases were heard yesterday at West Maitland, when the under-manager was fined 10s. and 6s. 8d. costs for breach of Rule 3. The information for breach of Rule 7 was withdrawn. The case against the manager was dismissed. I am of opinion that the magistrate was right, and that no good would be done by appealing. Papers returned herewith.

I have, &amp;c.,

GEO. COLQUHOUN,

Crown Solicitor.

No. 32.

Extract from the *Newcastle Herald*, 17 February, 1899.

IMPORTANT COAL-MINING CASES.

EAST GRETA COLLIERY.

MR. G. F. SCOTT, P.M., and Mr. H. Crothers, J.P., occupied the Bench at the West Maitland Police Court yesterday, when three cases of unusual interest to the mining community were dealt with, the complainant in each being Mr. T. L. Bates, Government Inspector of Collieries.

Azariah Thomas was charged that on the 17th November, 1898, he, as the manager of a certain mine to which the Coal Mines Regulation Act of 1896 applies, called the East Greta Colliery, did contravene and fail to comply with General Rule 4, section 47, of the Act, in that in the course of the shift working from 3 p.m. to 11 p.m. on the 17th November, 1898, an inspection of all parts of the said mine in which workmen were to work or pass during that shift was not made by a competent person or competent persons

persons appointed by the owner, agent, or manager of the said mine, who was not a contractor or contractors for getting minerals in the said mine. Mr. J. C. Gannon, instructed by Mr. J. V. Tillett, of the Crown Solicitor's Office, appeared for the prosecution, and Mr. Walter Edmunds, instructed by Mr. Millard, for the defence. Mr. A. A. Atkinson was also present.

Thomas Lionel Bates, Inspector of Collieries, deposed that he had occupied the position of Inspector for twelve years. He believed the information to be true.

To Mr. Edmunds: Defendant held an Imperial as well as a colonial certificate. He knew David Lewis slightly, and from what he saw of him he considered him to be a competent miner, and one well qualified to make inspections under General Rule 4.

Frederick Fowler, Police Sub-inspector, identified the signature of Azariah Thomas to the depositions given by him as manager of East Greta Colliery at the East Greta Disaster Coronial Inquiry.

Mr. Dawson then tendered the depositions, and certain parts of Mr. Thomas' depositions were read by Mr. Black, C.P.S.

David Lewis deposed that he was a miner and knew East Greta Colliery, where he was working in charge of men. He was sinking a tunnel, and was engaged by Mr. Thomas, who arranged with Thomas, Griffiths, Gronow, and himself to sink a tunnel at £3 19s. per yard. If there was any trouble their wages would be made up. He had control of the men. He and his three mates received the wages and paid their assistants. In the course of their sinking they worked coal or anything else they met with. They were paid £3 19s. per yard no matter whether it was coal or dirt they met with and took out. He inspected the tunnel where they were working. Thompson also inspected it on the 17th November. Gronow and Griffiths also made inspections of the tunnel. Messrs. Thomas, Heyes, and Cartwright also inspected. Between 3 p.m. and 11 p.m. on the 17th November he made the inspection of the tunnel.

To Mr. Edmunds: His inspection covered the whole of the tunnel, which was intended as a main artery for the mine. They were paid for the amount of place opened up, but not for the amount of stuff received on top. They were all engaged as miners by Mr. Thomas. It was immaterial to them what the nature of the stuff they met with was. He had seventeen years' experience in coal-mining—ten in Wales and seven in the Colony. It was particularly his duty to attend to and do all the timbering.

This was the case for the prosecution.

Mr. Edmunds held that no case had been made out. The whole gist of the charge was that the person appointed to make the inspections was not eligible under the section. It was admitted by the prosecution that he was competent and that he had made inspections. They had failed to prove he was a contractor for getting minerals. The men were not contractors, but miners, and could have been taken away from the work at any time.

The P.M.: They were decidedly not contractors for getting coal.

Mr. Edmunds: Then that settles the case at once.

Mr. Gannon said the men were contractors, to do certain excavations, and incidentally to get coal or any material met with. Coal had been taken out, and consequently they were contractors for getting out coal. The Act aimed at protecting the men. He held the information was good, and that Lewis was ineligible.

The Bench expressed a desire to hear Mr. Thomas.

Azariah Thomas, manager, East Greta Colliery, deposed that Lewis, Griffiths, Thompson, and Gronow had to drive the tunnel. Whether they met with coal or dirt they were to be paid by the lineal yard. They were to receive a certain wage, not less, no matter what they took out. They had no interest in what came out, but would still be paid even if not an ounce of coal was recovered. It was in his power to stop the work, and take any one or all of the men out of the tunnel and put them in other parts of the mine.

To Mr. Gannon: He could have taken Lewis out of the tunnel and put him somewhere else in the mine. They started on coal, and followed the seam as near as possible. The grade was changed in order to land on the right spot. They worked on a varying seam of coal. The four men were appointed as inspectors. They were competent men.

To Mr. Edmunds: Their object was to make the best passage for the working of the mine. The men had no interest whatever in what was recovered.

To the Bench: The coal was not weighed when it was taken out, but an endeavour was made to make some of it marketable. If the stuff taken out was valueless, the men would have been paid all the same.

At 12 o'clock the magistrates retired to consider the case.

On returning, a few minutes later, the P.M. said: "We dismiss the case, as we do not consider Lewis and the others were contractors for getting coal."

Henry Cartwright was charged that he did unlawfully, in East Greta Colliery, contravene and fail to comply with Rule 17 of the Special Rules, in that he did not examine the air current of No. 1 tunnel, he being a person bound as under-manager to observe the Special Rules established for a mine called the East Greta Colliery, in pursuance of the Coal Mines Regulation Act of 1896.

The same defendant was also charged that he did unlawfully, in East Greta Colliery, contravene and fail to comply with Rule 3 of the Special Rules or the colliery, in that he did not visit every working-place in the mine. Defendant pleaded not guilty to each charge.

Mr. Edmunds suggested that the two cases should be tried together. Mr. Gannon consented, and the Bench agreed.

Thomas Lionel Bates, Inspector of Collieries, produced the Special Rules of East Greta Colliery, which were tendered in evidence. He knew the mine from the time it started. He would call the air current in the tunnel a district air current.

To Mr. Edmunds: Witness explained, by the aid of a rough plan produced, the system of ventilation in the colliery.

To Mr. Gannon: To inspect the air current a man would have to go down the whole tunnel.

To Mr. Edmunds: A man standing at the level could tell the quantity of air going down and coming up the tunnel.

At this stage Mr. Gannon tendered the depositions of defendant at the East Greta Disaster Inquiry. The depositions were read by Mr. Norman Black, C.P.S.

Mr. Gannon said he had other evidence to call, but in face of the sworn depositions of defendant he would not do so, and closed his case.

Henry Cartwright, under-manager of East Greta Colliery, deposed that he was at the level every day. On the 17th November he was down in the mouth of the tunnel, and was called down by Griffiths, who was complaining of some men letting the water down on them. He was down 20 or 30 feet. He did

did inspect the air current. When he said, in the depositions, that he had not been to the tunnel, he meant he had not been to the face of the tunnel. He did not go to the face daily, because Mr. Thomas and Mr. Heyes were inspecting there. On the 17th he could not go there, owing to a mishap in another part of the mine.

At this stage the Court was adjourned until 2.15 p.m.

On resuming at 2.15 p.m., Mr. Edmunds consulted with defendant, and subsequently announced that Cartwright wished to withdraw his plea of not guilty to the charge of neglecting to comply with Special Rule 3, if the other charge was withdrawn.

Mr. Gannon agreed to the suggestion.

Mr. Edmunds asked for a lenient fine, as the breach of the Act was a technical one, and no harm had been done. Besides, the men working there were quite as competent to inspect as defendant was.

The Bench imposed a fine of 10s., with 6s. 8d. costs.

Put with Mr. Atkinson's report on these cases.—D.C.McL., 20/2/99.

### No. 33.

#### The Chief Inspector of Coal-mines to The Under Secretary for Mines and Agriculture.

Sir,

Department of Mines and Agriculture, Sydney, 17 February, 1899.

I have the honor to state that, together with Mr. Gannon, barrister-at-law, Mr. J. V. Tillett, of the Crown Solicitor's Office, and Mr. Bates, Inspector of Collieries, I attended the West Maitland Court yesterday, with reference to the prosecution of the manager and under-manager of East Greta Colliery. The latter were represented by Mr. W. Edmunds, barrister-at-law, instructed by Mr. G. W. Millard, solicitor, of Newcastle. The magistrates present were Mr. G. F. Scott, Police Magistrate, and Mr. Crothers, J.P. The case against the manager, under General Rule 4, for employing, as the "competent persons" under that rule, men who were driving the tunnel at so much per yard (and deemed by the Crown Solicitor to be "contractors for getting minerals") was dismissed, for the following reasons:—

1st. The men doing this work were not, in any way, paid for the quantity of coal they got.

2nd. Although the tunnel was driven mostly in coal, it was partly stone, as some of the bottom was removed in order to get the required size.

The magistrates soon came to this conclusion, and expressed the opinion that the men were not "contractors for getting minerals" in an early stage of the case.

In view of their opinion being in opposition to that given by the Crown Solicitor, and the important principle which is involved, I beg to suggest that the Crown Solicitor may be asked to move the magistrates to state a case for the Supreme Court.

The under-manager was summoned for breaches of Special Rules 3 (not visiting No. 1 tunnel daily, or as often as practicable) and 7 (not examining the air currents of No. 1 tunnel daily), and for the former was fined 10s. and 6s. 8d. costs. It was thought by the counsel for the Crown that the case under Special Rule 7 (which was heard first) was likely to be lost, and the charge was therefore withdrawn.

I may state for the information of the Minister, that in June, 1898, the manager of South Greta Colliery was prosecuted for breaches of General Rules 1, 4, 5, and 32, the magistrate on that occasion being Mr. G. F. Scott, when the manager was fined 1s. and 4s. 10d. costs for each offence. This fine was, in my opinion, altogether inadequate for the offence committed; and it is, therefore, satisfactory to note that the fine in the present instance was made more severe. I understand that Mr. Scott has frequently fined workmen 1s. for offences under the Coal Mines Act.

Though the proceedings of yesterday may not be considered altogether satisfactory, I am still of opinion, and for the reasons stated in my letter of the 28th ult., that it is unnecessary to hold a formal investigation of the accident under section 23 of the Coal Mines Regulation Act.

I have, &c.,

A. A. ATKINSON,

Chief Inspector of Coal-mines.

Submitted. The causes and circumstances surrounding this accident have been fully ascertained by the prolonged inquiry which has already been held, and I do not see that anything further can be elicited by another inquiry.—D. C. McLACHLAN, 17/2/99. The suggestion that the Crown Solicitor should move the magistrates to state a case for the Supreme Court should, I think, be acted upon.—D.C.McL., 17/2/99.

Approved. To get the case to the Supreme Court, if possible.—J.C., 18/2/99. 99/3,051 M. The Crown Solicitor, who will perhaps be so good as to cause the necessary steps to be taken to give effect to the Minister's wish herein.—H. B. SULLIVAN (for U.S.), B.C., 20/2/99.

### No. 34.

#### The Chief Inspector of Coal-mines to The Minister for Mines and Agriculture.

REPORT to The Honorable Joseph Cook, Secretary for Mines, on the causes and circumstances of the Accident which occurred at the East Greta Colliery, on 18th November, 1898.

Sir,

Coal-fields Office, Department of Mines and Agriculture, Sydney, 17 February, 1899.

In pursuance of section 22 of the Coal Mines Regulation Act of 1896, I have the honor to make the following Special Report with respect to the accident, by fall of roof, which took place at the East Greta Colliery on 18th November, 1898:—

The following Appendices are attached to this Report:—

Appendix I.—Evidence of Witnesses.

„ II.—Special Rules of the Colliery.

„ III.—Plan showing the workings of the Colliery.

„ IV.—Section of No. 1 tunnel, showing position of fall, progress of rescue work, and method of timbering.

*Position of Colliery.*—East Greta Colliery is situated about 3 miles from West Maitland, and works two seams of coal in the Greta or Lower Coal Measures. The strata is lying at an angle of from 45 degrees to 47½ degrees, and dips towards the east. This is due to an upheaval between Maitland and Greta, the top of the anticline being found about Lochinvar, and the East Greta workings are lying on the eastern slope of this anticline.

*Winning and Working of the Coal.*—The top seam of coal is only worked to a small extent by means of two tunnels driven from the surface. The lower seam, which is about 11 feet thick, has been worked for about ten years, and the coal is won by means of two main tunnels (Nos. 1 and 2), which commence at the outcrop of the seam at the surface, and follow the full dip of the Measures. These tunnels are used for the haulage of the coal from the levels to the surface and the descent and ascent of workmen, and as intakes for air. At certain intervals, levels are driven at right angles to the main tunnels, and from these the coal is worked to the rise, on the bord and pillar system. The pillars have been made from 5 to 7 yards in thickness, and the bords usually 8 yards wide, but turned away narrow, are driven on the strike of the seam. When the bords are first driven, it is usual to leave between 3 and 4 feet of the seam next to the roof, which in many cases is afterwards taken down. The extraction of coal in the broken or pillar working has only been carried on to a limited extent, as indicated by hatching across the pillars on the plan.

*Haulage.*—The haulage of the coal from the bords to the levels is effected by means of self-acting "jigs," and on the levels by ponies to the tunnel, where the tubs are put on to the cage, which runs on rails 4 ft. 8½ in. apart, and thence hauled to the surface by means of a steam engine placed there.

*Roof of Seam.*—The roof of the seam in which the accident occurred is usually a hard conglomerate, sometimes calcareous and sometimes siliceous in its nature. This roof forms a sort of landmark or beacon by which the seam in many places has been found along the outcrop, and by which means it has been traced for a distance of 16 or 17 miles.

*Management, &c.*—The manager of the mine is Mr. A. Thomas, who holds an Imperial certificate, and gained his mining training in South Wales. He has also had experience of working steep measures in the United States of America. The under-manager is Mr. Henry Cartwright, who holds an under-manager's certificate. He has been at the mine since it was opened, at first as manager, until succeeded by Mr. Thomas about seven years ago, since which time he has acted as under-manager.

*Inspections under General Rules 4 and 5.*—No. 1 tunnel, in which the accident occurred, was inspected by the following four men, viz., David Lewis, Joseph Thompson, John Griffiths, and Daniel Gronow (killed by fall), in terms of General Rule 4. David Lewis made the daily report in writing. The engineer, Mr. R. St. Vincent Heyes, also made a weekly examination and report of the tunnel, in terms of General Rule 5.

*Work in No. 1 tunnel.*—At the time of the accident, No. 1 tunnel was being extended further into the dip, in order to win out more coal, and all other operations were temporarily suspended in this part of the colliery. The distance from the surface to the lowest levels is 546 feet, and when the accident happened the main tunnel had been driven to a point 387 feet below this, or 933 feet from the surface. From the lowest levels a place parallel to the main tunnel had also been driven 129 feet, but no communication between these places had been made. The work in connection with driving and timbering the main tunnel was carried out by nine men, including the four men who made the inspections, working in three continuous shifts of three men each, and the parallel or back place was driven by six men in three shifts of two each.

*Accident.*—The fall occurred about 7 a.m., on November 18th, and resulted in the death of the following three men, who were engaged at the time in extending No. 1 tunnel below the lowest levels:—

Daniel Gronow, aged 29, married, leaving a widow and four children.

Albert Moncrieffe, aged 25, married, leaving a widow and one child.

Stephen Richard Barnes, aged 23, unmarried.

The out end of the fall which occurred was 127 feet from the lowest levels, and extended for a distance of 60 feet. The top of the fall was about 15 feet above the top of the coal and probably about 300 tons of stone fell, which, in consequence of the high inclination of the seam, rolled down into the face, doubtless causing the almost instantaneous death of the three men, all of whom were afterwards found within 30 feet of the face. In consequence of the dangerous and difficult character of the work to be done in recovering the bodies of the deceased men, and the large quantity of timber which it was necessary to put in to secure the fall and strengthen the other timbers, in order to ensure safety to the rescue parties, it was not until December 23rd, or five weeks after the fall occurred, that the first body was recovered. The second was recovered on the 24th December, and the third on December 26th. Having regard to the uneasy state of the roof after the first fall, and further falls which subsequently occurred, I think that every reasonable endeavour was made to recover the bodies of the three men with as little delay as possible.

*Signals.*—When the extension of the tunnel was proceeding, electric signals were kept within a few yards of the face.

*Manholes or Places of Refuge.*—Manholes or places of refuge were made at intervals of 20 yards, in accordance with General Rule 14, and it was stated in evidence at the inquest that one was to be prepared close to the face during the night before the accident.

*Inspections.*—I reached the colliery about 4 p.m. on the day of the accident, and made an inspection of the seat of the fall. Subsequently I made several inspections as the work progressed at the fall, besides examining the workings of No. 2 tunnel, and some of the old workings of No. 1 tunnel.

As the result of these inspections, I deemed it advisable to address a letter to Mr. Thomas, the manager, of which the following is a copy:—

Sir,

With reference to recent underground inspections of the East Greta Colliery, and conversations with you on several matters in connection therewith, I respectfully desire to call your serious attention to the following points:—

1st. Having regard to the altered character of the roof of the seam proved by the fall of the 18th ultimo in No. 1 tunnel, and by a fall in the lowest north level of No. 2 tunnel, it is desirable to increase considerably the quantity of timber on all these lower levels to keep them secure.

2nd. It is desirable to prove the thickness of the conglomerate above the seam in the lowest level of No. 2 tunnel going towards No. 1 tunnel.

3rd. It is not advisable, having regard to altered nature of the roof, to allow the levels when going with the top coal left on to remain without being timbered near the face.

4th.

10 December, 1898.

4th. Under the conditions of increased depth and altered roof it is desirable to increase the size of the pillars considerably.

5th. The diameter of the props used by the miners in the bords would afford more security if increased in size, and this is necessary, having regard to the extra depth at which the workings are carried on, and also the altered character of the roof.

Trusting these matters will receive your serious consideration, and I shall be glad at any time to further discuss them with you.

I have, &c.,

A. A. ATKINSON,

Chief Inspector of Coal-mines.

A. Thomas, Esq., East Greta Colliery.

*Roof in No. 1 tunnel.*—As stated before, the seam of coal is about 11 feet thick, and usually overlaid by a hard conglomerate. From the lowest levels towards the face of the tunnel, a band of shale, a few inches in thickness, had made its appearance between the top of the coal and the conglomerate. Where the fall occurred the conglomerate had thinned down in places to 4 or 5 inches in thickness, and was very variable in thickness, although it did not altogether run out.

Above the conglomerate at the fall was a considerable thickness (5 or 6 feet at least) of rotten argillaceous shale or mudstone. This stone was not laminated, and presented many slippery facings and joints, as revealed in the fall. When immersed in water, it decrepitates very rapidly.

Between the surface and the lowest levels, there is about 180 feet of tunnel, driven about seven years ago, which is not timbered at all, the conglomerate being hard at that point.

From the lowest levels to the face the sets of timber were put in 5 feet apart from centre to centre.

These consisted of—

- A—One sill or floor piece of ironbark, 16 feet long, 8 inches diameter at the small end, let into each side.
- B—One cap piece of ironbark next to the roof, 15 feet long, 8 inches diameter at small end, let into each side 8 or 10 inches.
- C—Two legs or props of ironbark, 10½ feet long, 8 inches diameter at the small end. These were mortised into sill and cup about 4 inches deep.
- D—Slabs of hardwood 6 feet long, 6 to 8 inches wide, and 2 to 3 inches thick.
- E—Pieces of tea-tree for packing behind the slabs, in order to make all secure.
- F—Sole pieces of ironbark between the sills, near to the sides, and parallel with the tunnel.

The props were 12 feet apart at the top, and 13 feet at the bottom, measured between inside and inside. They were fixed at right angles to the dip of the strata, which is the correct method to resist the greatest pressure.

The ironbark timber was cut fresh before being used, and, when examined after the fall, by sawing it in two appeared to be quite sound, though containing a good deal of sap.

In his book of "Notes on the Commercial Timbers of New South Wales," Mr. J. H. Maiden, F.L.S., states, with reference to ironbark, "Ironbark is the king of New South Wales hardwoods; in fact, it is not excelled in any part of the continent for combined strength and durability."

Assuming that the pressure on the sets of timber in the tunnel at East Greta was equally distributed, the pressure which each set would bear before breaking works out to figures varying between 16·76 and 23 tons according to different authorities.

If the character of the roof in the extension of No. 1 tunnel had been the same as that exposed at the "overcast," or where the lowest levels are driven from the tunnel, I think that the sets of timbers would have been ample, and the fall would not have occurred.

In order to get sufficient height for sets of timbers some of the stone below the seam was removed. Occasionally, also, a little cutting had to be done in the stone above the coal, although much the greater portion was taken out of the floor, as it was much softer than the roof stone.

*Inquest.*—The inquest, at which a large number of witnesses were examined, was opened by Mr. G. C. Martin, Coroner for the Newcastle district, on December 24th, and resumed on January 4th, occupying altogether thirteen days, on one of which the jury made an underground examination of the tunnel.

The Crown was represented by Mr. J. V. Tillet, of the Crown Solicitor's Office; the owners, by Mr. F. S. Bowden, solicitor, Maitland; the manager, by Mr. G. W. Millard, solicitor, Newcastle; the miners and the relatives of the deceased, by Mr. James Curley, General Secretary to the Colliery Employees Federation; and Mr. T. L. Bates, Inspector, and myself watched the proceedings on behalf of the Department.

The jury retired to consider their verdict at 5 p.m. on January 27th, and, as they failed to agree, were discharged at 8 a.m. on January 28th.

The following were the most important points disclosed at the inquest:—

1. The four men, Davis Lewis, Joseph Thompson, John Griffiths, and Daniel Gronow, undertook to drive the tunnel for £3 19s. per yard, and, in my opinion, were therefore ineligible to be employed to make inspections under General Rule 4.
2. The under-manager, Henry Cartwright, admitted that he had not examined No. 1 tunnel for a fortnight before the accident, which was a breach of Special Rule 3.
3. He also admitted having committed a breach of Special Rule 7.
4. The evidence of several witnesses was to the effect that the roof above the coal, as disclosed by falls in different parts of the mine, was not invariably composed of conglomerate far above the coal.
5. The consensus of opinion was that the fall was caused by roof pressure, due to the thinning out of the conglomerate, the place of which was taken by mudstone; this being acted on by water in the roof, which was not seen until after the fall. Some of the witnesses, however, were of the opinion that the fall was due principally to bottom and side pressure.
6. Some of the witnesses considered that the fall had taken place suddenly, and without warning, by bending the caps, while others thought that the pressure had gradually bent the caps before the fall occurred.
7. It was stated by the witnesses Parsons and March, that a conversation had taken place between Mr. Thomas, manager, and John Griffiths, in the face of No. 1 tunnel, on Tuesday, 15th November, about replacing some bent caps during the next week end, and that these caps were situated where the fall afterwards took place. This was denied *in toto* by Messrs. Thomas, Griffiths, Heyes and Howarth.

8. On the morning of the accident Thomas Cantwell spoke to some of the deceased from the lower level about 6.30 a.m. (half an hour before the fall took place) at which time the deceased evidently did not think there was cause for alarm.

- 1, 2 and 3. With reference to the first three points, it has been decided to prosecute the manager and under-manager.
4. As to the fourth, I am of opinion that, having regard to the somewhat altered character of the roof in different parts of the mine, the manager would have exercised wise judgment if he had examined the roof in the extension of No. 1 tunnel by putting borcholes at intervals up through the conglomerate. The result would probably have been to induce him to put the timber sets closer together; but the omission to bore these holes, however, does not, in my opinion, amount to culpable negligence.
5. The cause of the accident, in my opinion, was due to roof pressure, consequent upon the conglomerate having been replaced by mudstone, which, by virtue of its jointy nature, and the presence of water, rested on the timbers, and caused the caps to break.
6. Although the fall might have occurred without much warning of timber breaking at the last, I am of opinion, some days before it actually took place, evidence of pressure would have been afforded by the bending of the caps.
7. I am unable to say, from the evidence, whether the conversation referred to took place.
8. This does not require any comment.

A good deal was said in evidence at the inquest about the unchangeable character of the conglomerates in the Greta Measures; in fact, one witness said that the intrusion of the mudstone might be considered as a "freak of nature." On this point I give a quotation from Professor Archibald Geikie, an acknowledged authority on geology, with reference to conglomerates: "Coarse conglomerates which represent ancient shingles and gravels, thicken and thin out rapidly, and do not usually cover a large area; they pass laterally and vertically into grits and sandstones which have a much wider distribution and these again shade off into clays and shales that range also over large areas."

This opinion, coming from such an authority, should have the effect of causing the managers, who have conglomerate roofs, for the future to place less reliance on their consistent character.

I have, &c.,

A. A. ATKINSON,

Chief Inspector of Coal-mines.

The Hon. Joseph Cook, M.P.,  
Secretary for Mines and Agriculture.

Submitted for Minister's information.—D.C. McL., 17/2/99.

Seen.—J.C., 22/2/99.

#### APPENDIX II.

SPECIAL RULES for the conduct and guidance of the persons acting in the management of the East Greta Colliery, in the district of Maitland, and all persons employed in or about the said colliery, framed in conformity with the provisions of the Coal Mines Regulation Act, 1896, 60 Victoria, No. 12.

##### *Manager.*

1. The manager (or the under-manager when acting for him) shall have the daily supervision of the above colliery, and shall have full command over all other officers and workmen employed in or about the colliery, who are to receive their orders from him, and shall apply to him for instructions as often as may be necessary.

2. He shall comply with the requirements of the Coal Mines Regulation Act, 1896, and shall, to the best of his power, enforce the observation of the said Act, and enforce observation of the General and Special Rules.

##### *Under-manager.*

3. The under-manager shall have the daily supervision and responsible charge of the mine under the direction of the manager, and shall give all necessary instructions to the men and boys in the mine respecting their work; and shall, to the best of his power, see that they comply with the rules and regulations of the colliery, as well as the orders of the manager, and shall visit every working-place in the mine daily, or as often as may be practicable, and see that the air courses and stoppings are kept in a good state of repair, and that an adequate quantity of fresh air is constantly supplied to the men.

4. He shall give immediate attention to any complaints, and shall inspect, personally, such portions of the mine as are reported to be unsafe or in any way to need his attention.

5. He shall see that a sufficient supply of timber is sent down the mine and into the different districts.

6. He shall see that each miner keeps his working place sufficiently timbered, and shall suspend at once any miner refusing or neglecting to do so.

7. He shall examine every day the different main and district air currents, and shall see that the furnaces are kept in good repair and carefully attended to.

8. He shall, under the direction of the manager, cause safety-lamps to be used, and naked lights to be excluded where required by the Act.

9. He shall see that the deputies, miners, shifters, and all others under his charge in the mine, strictly and rigidly observe the rules applicable to them, and shall suspend immediately anyone infringing or attempting to infringe any rule, order him out of the mine, and report the same to the manager.

##### *Deputy.*

10. Each deputy shall be informed by the manager or under-manager as to what portion of the workings is to be under his charge, and all persons working in that portion of the mine will be under his direction, and he shall, in the absence of the manager or under-manager, direct the workmen how and where they shall work, and shall see that the rules applicable to them, as well as the orders of the manager or under-manager, are strictly attended to.

11. The deputy or other competent person appointed for that purpose shall be in the mine within four hours before the workmen commence, to enable him to examine the working-places, &c., carefully, and shall ascertain the condition thereof so far as the presence of gas, ventilation, roof and sides, and general safety are concerned, and shall record the result of such examination without delay in a book to be kept at the mine for the purpose.

12. He shall place cross timbers, or rails, thus X, or a signal board, as a signal of danger at the entrance of every working-place which he may find unsafe, and on his return to the station shall state on his board all places so found unsafe.

13. In any place where there is a dangerous appearance of fire-damp, locked safety-lamps shall be used; and no workman shall be permitted to remain where fire-damp has accumulated in such a quantity as to show a permanent blue cap over the flame.

14. Before safety-lamps are taken into the workings the deputy, or some other competent persons duly appointed for the purpose, shall examine the entire lamp, and if all is right, shall lock it for the miner.

15. Should there be any discharge of gas, or any condition of roof from which the deputy apprehends any danger, he shall instantly report the circumstances to the under-manager.

16. He shall report as soon as possible to the manager or under-manager all accidents, dangers, or defects which may occur in his district of the mine, and he shall also so report any accident, danger, or defect to, or in any machinery or structure in, the mine which may come to his knowledge.

17.

*Wheelers.*

17. The wheelers shall report to the under-manager or deputies if any part of the road or roof has been deranged or is insecure or dangerous.

18. Any wheeler injuring a door or brattice-cloth door, and not immediately reporting the fact, shall be suspended. He shall also report to the under-manager or deputy every morning the quantity and different lengths of timber required for his miners.

19. He shall take in without delay any timber the miners may require, and shall at all times carry out the orders of the manager, under-manager, or deputy, in order to facilitate and promote the work of the mine.

20. Any person neglecting these rules will be liable to instant dismissal or prosecution according to law.

*Onsetter.*

21. The onsetter shall, subject to the directions of the manager or under-manager, have the sole control of the pit bottom, and the command of the signal up the pit, and on no account shall he allow any person to interfere with the signals. He shall at all times when sending up skips of coal see that none of the coal projects beyond the side of the skip, and shall pay the greatest attention to the signals when men are going to ride, in order that accidents may be avoided. The signals shall be as given in Rule 87.

22. No timber, materials, stones, coal, or other things shall, under any circumstances, be lowered or lifted in a pit while men are being lowered or lifted in it, except such as may be necessary in repairing a pit while the repairs are going on.

23. The onsetter shall not, on any account, allow more than six persons in a single cage, or ten in a double cage at the same time.

24. Any person refusing to leave the cage when ordered to do so shall be immediately suspended.

*Miners.*

25. Any miner after passing through a door must instantly close it; and shall not injure a door or leave it open, break down a stopping or brattice, interfere with or obstruct or damage an air-crossing, or an air-pipe, or remove or go beyond a mark or "danger-signal," without orders from the manager, under-manager, or deputy.

26. Every miner shall securely sprag or uphold the coal whilst holing, and shall securely prop up the roof of his working-place so that accidents may be avoided; and should he not be provided with a sufficient quantity of timber he shall cease working and report the same to the manager, under-manager, or deputy.

27. The seam of coal must be wrought strictly in accordance with the orders of the manager or under-manager.

28. Every miner shall, in all matters relating to the working of the mine or the safety of the men, obey strictly the orders of the manager, under-manager, or deputy; and no person shall go into any part of the mine other than where he is employed, except by the order of the manager, under-manager, or deputy.

*Door-keepers.*

29. A door-keeper must only open a door for the passage of persons, skips, or animals, and must instantly close the same when they have passed through. He must never allow a door to remain open, or to be propped or fastened back, unless authorised to do so by the manager, under-manager, or deputy.

30. A doorkeeper must not leave any door or doors under his charge until the work of his shift is finished, or until another person appointed by the manager, under-manager, or deputy takes his place.

31. Any doorkeeper becoming aware of any defect in, or damage to, any door, shall report the same as soon as practicable to the manager, under-manager, or deputy.

*Persons in charge of Ventilating Appliances.*

32. The persons in charge of any ventilating furnace, or other ventilating appliance, shall not leave the same without the permission of the manager, under-manager, or engine-wright.

33. Furnacemen must pay careful attention to the furnace under their charge; and shall maintain the fire in such a state as constantly to ensure efficient ventilation.

34. The fan and fan-engine shall be carefully attended to by the person or persons in charge thereof, who shall keep the same running at the speed ordered by the manager, so that effect may be given to the provisions of the Act as to ventilation.

35. All persons in charge of ventilating furnaces, fans, fan-engines, or other ventilating appliance, shall immediately report any damage, defect, or derangement therein to the manager, under-manager, or engine-wright.

*Lamp-keepers.*

36. No person except a person authorised by the manager or under-manager shall either take himself or give out for use in the mine any safety-lamp.

37. Lamp-keepers must see that every safety-lamp is thoroughly cleaned, properly put together, in safe working order, and securely locked when given out for use in the mine. If any lamp be not returned at the proper time they shall at once report the fact to the manager or under-manager.

38. All persons entrusted with the duty of cleaning any gauze, or other part of any safety-lamp, or with the duty of putting any safety-lamp or parts thereof together, shall at once report any defect therein to the lamp-keeper, or if there is more than one lamp-keeper, then to the head lamp-keeper.

39. Whenever any defective or damaged lamp is received from any person by any lamp-keeper he shall report the fact to the manager or under-manager, and shall cause such lamp to be kept in the state in which he received it until seen by one of them.

40. Every lamp-keeper shall see that all oil, spirits, and other inflammable articles under his charge are carefully and properly stored and used, and that no greasy waste or other refuse is allowed to accumulate in or near the lamp cabin.

*Engine-wright.*

41. The engine-wright, or other competent person appointed for the purpose, shall cause the ventilating fan or other mechanical ventilating apparatus, together with the engines, machinery, and boilers for driving the same, to be properly attended to.

42. The engine-wright, or other competent person or persons appointed for the purpose, shall have charge of all engines, machinery, and boilers used for raising or lowering persons or minerals, or for pumping water, and of all ropes, chains, appliances, or apparatus connected therewith; and of all guides, ropes, chains, conductors, or other appliances in the shafts, and of all other engines, machinery and boilers in or about the mine. In case he shall discover any weakness, defect, or want of repair therein, he shall, as soon as practicable, cause the same to be repaired and made good, and shall at once report to the manager the fact of such defect, weakness, or want of repair, and also the steps taken to remedy the same.

43. The engine-wright, or other competent person or persons appointed for the purpose, shall make the examinations and report required by General Rule 5.

44. The engine-wright, or other competent person appointed for the purpose, shall cause every rope used for raising or lowering persons or minerals to be securely attached to the drum, so that when either cage is at the pit bottom, there shall be not less than two rounds of rope upon the drum.

45. The engine-wright, or other competent person, whenever a winding rope requires capping, coupling, or splicing, shall superintend the same, and shall see that no spliced rope is used for raising or lowering persons in a shaft.

46. The engine-wright, or other competent person or persons appointed for the purpose, shall see that the fences are fixed and maintained at the top of every shaft, and that the guides, signals, covers, flanges, or horns, appliances, brakes, indicators, fences, valves, gauges, and things required by General Rules 18, 20, 26, 27, 28, 29, 30, 31, 32, and 33, or any of them, are fixed and maintained as therein required; and that the provisions of General Rule 25 are carried out above ground.

47. The engine-wright shall cause bells or other signals to be fixed in every drawing engine-house connected with the drawing pit bottom, and with every entrance for the time being in work between the surface and bottom of the shaft; and shall cause the board required by Special Rules 23 and 64, stating the number of persons authorised to descend or ascend the shaft at one time to be fixed and maintained on the pit bank.

48. The engine-wright shall cause each working boiler to be cleaned and examined as often as the manager shall so order.
49. The engine-wright shall cause the code of shaft signals used in moving the cages to be fixed and maintained at the top and bottom of each winding shaft, and at every shaft to which the provisions of Special Rule 57 apply, he shall see that the point named in that rule is distinctly marked on the indicator.

*Engine-drivers.*

50. Every engineman shall attend at such time as the manager may appoint, and as required by General Rule 25.
51. An engine-man shall not allow any person to interfere with the engine or machinery under his charge, or to remain in the engine-house unless authorised by those in authority above him. A winding engineman while winding must remain at the handle and must pay particular attention to the indicator and signals, and if he perceives anything wrong must instantly stop his engine and not start it again until the defect is put right or until he receives an order to go on.
52. Every winding engineman before commencing work in his shift, and before any person descends the shaft, shall carefully examine the engine, machinery, drums, ropes, brakes, indicators, and signal apparatus in the engine-house or under his charge, in order to ascertain whether they are safe and in good working order, and shall run the cages at least once up and down the shaft. Where shifts are worked continuously, it shall be sufficient if this rule is carried out at the commencement of the morning shift.
53. Every engineman, unless some other competent person is specially appointed for the purpose, shall keep the engines, machinery, and things connected therewith under his charge, properly cleaned and oiled, and shall see that they are in good and safe working condition. He shall see that the provisions of General Rules 27, 30, 31 and 32 are carried out and observed during his working shift, so far as they relate to engines or machinery under his charge.
54. Every engineman must diligently and carefully attend to the working of the engine and machinery under his charge. He must examine such engine and machinery before commencing work, and if he becomes aware of any weakness or defect, or apprehends any danger, he must, as soon as practicable, inform the manager, under-manager, deputy, or engine-wright. He shall not alter a safety-valve without leave from the manager, under-manager, or engine-wright.
55. Every engineman, in addition to the duty in this respect imposed on the engine-wright, shall see that any ropes attached to the drum of the engine under his charge are securely attached, and so that when either cage is at the bottom of the pit there shall not be less than two rounds of rope upon the drum.
56. Every winding engineman, whenever the engine under his charge ceases working, shall see that the cages are left so as not to impede the ventilation.
57. When men are being raised in shafts where the winding apparatus is not provided with some automatic contrivance to prevent overwinding, the cage shall not be wound up at a speed exceeding 3 miles an hour when and after it has reached a point 10 feet from the top of the shaft, as required by General Rule 27, and such point shall be marked on the indicator.
58. The signals given in Rule 87 shall be carefully observed by the engineman.

*Banksman and assistants.*

59. That the banksman shall, subject to the directions of the manager, under-manager, and engine-wright, have the control of the pit top, and the command of the signals down the pit and to the engineman.
60. That the banksman shall be responsible for the state of the pit top, and shall see that the frames and the surface near the pit mouth are kept free from coals, stones, or dirt.
61. That at least one banksman and one onsetter, or other person appointed by the manager, under-manager, or deputy for that purpose, shall be at their respective posts at the proper time every morning, to give the proper signals, and to see the men and boys carefully into and out of the cages at the top and bottom of the shaft.
62. The banksman must be at the drawing shaft at such times as the manager or under-manager may appoint. He shall not allow a person to descend or ascend until the cages have been once run up and down the shaft, but where continuous shifts are worked it shall be sufficient if this is done at the commencement of the morning shift.
63. That the banksman shall not permit strangers or persons not employed in the mine to descend the pit or remain upon the bank, unless authorised by the manager; and shall caution strangers descending to keep carefully within the cage until they are fairly landed. He shall not allow an intoxicated person to descend the pit.
64. That the banksman or onsetter shall not allow more than six persons in a single cage, or ten persons in a double cage; nor shall any person be allowed to ride with or against coals, slack, dirt, &c. Neither shall any person, unless specially allowed by the manager, under-manager, or deputy, be permitted to carry any tools, implements, props, rails, or such like in his hands whilst so riding; but the same shall be securely placed in the cage, skip, or basket, so that no danger may exist of their falling out during their ascent or descent, or of their coming in contact with anything in the pit; and no person shall be allowed to get upon or off the cage at the pit top unless it be standing upon the catches or keeps, or at a mouthing, without the signal first being given and responded to.
65. The banksman must frequently observe the pit top pulleys, ropes, chains, cages, and landing apparatus during working hours, and whenever he becomes aware of any weakness or defect therein, or in anything belonging to the shaft, or any engine, machinery, or winding tackle, he must immediately inform the engineman, and the manager, under-manager, or engine-wright, so that it may be repaired.
66. The banksman must report to the manager or under-manager any disobedience on the part of the miners or others.
67. The signals given in Rule 87 shall be carefully observed by the banksman.

*Miners and all other persons employed.*

68. No person acting in a place of trust shall depute anyone to do his work without the sanction of the manager.
69. No swearing or fighting is allowed in or about the mine, and no intoxicating liquors shall be permitted in the mine without the consent of the manager.
70. Any person employed in the mine shall inform the person in charge of the workings of the existence of any choke or fire-damp, of any insecurity of the roof, shaft, or any other part of the workings, or of any air-door being damaged or left open, immediately on its being observed by him,
71. No person shall be permitted to carry a naked light attached to the cap or hat on his head whilst handling explosives, or in charging holes for blasting.
72. A safety-lamp must be frequently examined, and if a lamp shows a blue cap, the person using it must carefully draw down the wick with the pricker, cease working, leave the place, and report the same to the manager, under-manager, or deputy.
73. No person shall place a safety-lamp on its bottom unless it is necessary to do so for the safe performance of any particular work, or unless authorised by the manager, and in all cases the lamp shall be hung or placed at least 2 feet from the swing of the pick, hammer, or other tool.
74. No person shall leave a lighted candle or other light in any part of the mine when leaving his work.
75. No person shall try the wastes or workings for fire-damp with a naked light, and no person shall smoke or take a naked light, tobacco pipe, cigar, cigarette, lucifer matches, or candle, where safety-lamps are ordered to be used.
76. No naked lights shall be allowed or taken beyond any danger signal where gas exists.
77. No person shall wilfully kindle a feeder of gas, or negligently have the gauze of his safety-lamp full of fire, or unlock the lamp, or unscrew the gauze, or blow out the flame, or light tobacco or other substance at the gauze, or damage or improperly use the lamp, or leave it in the works, when he has ceased using it.
78. Any person discovering any stoppage or derangement to ventilation, injury to an air-crossing, door, regulator, sheet stopping, brattice, or air-pipe, or observing any injury to or obstruction of an air-course, shall immediately give notice to the manager, under-manager, or deputy, and to any person or persons whose safety may be endangered thereby.
79. Any person passing through a door or sheet must instantly close the same, unless it is a door or sheet ordered to be kept open. No person shall, without authority, remove any caution-board, notice, or danger signal, or pass any danger signal, caution-board, or fence.
80. In case of a shot missing fire the workman shall place a danger signal at the entrance to his working-place, and shall immediately report the same to the manager, under-manager, or deputy.
81. Every miner or other workman in charge of any working-place, before commencing work, and at intervals during his shift, shall examine his working-place, and in case any danger is observed shall at once report to the manager, under-manager, or deputy.

82. No person shall leave coal, slack, or other material so as to impede the ventilation; nor leave a skip or other obstruction in the air-current.

83. Every horsekeeper shall see that no animal under his care is allowed to go to work while in an unfit state, and shall report to the manager, under-manager, or deputy, any injury received by any animal.

84. No person shall wilfully injure any animal whilst in his charge, or permit it to receive injuries by his wilful act or negligence, and shall report immediately to the horsekeeper or a deputy any injury received by such animal while in his charge.

85. No person shall take a horse on to or travel along any incline or plane, either in the mine or on the surface, which is self-acting or worked by machinery, while it is in motion, without special instructions from an officer of the mine.

86. Every person in charge of any animal shall immediately report to the manager, under-manager, or deputy, in case he finds such animal cannot pass along any road without rubbing against the roof or timbering; and no person shall, unless otherwise authorised, give his horse into the charge of any other person than the horsekeeper at the stables.

*Shaft Signals.*

87. The following signals (with such additions as under special circumstances may be ordered by the manager) shall be carefully observed by the engineman, banksman, onsetter, and other persons employed at this colliery:—

One knock—To go on.

One knock—To stop when the engine is in motion.

Two knocks—Lower down.

Three knocks—When any person is going to ascend or descend.

One knock—In reply before any person is allowed to get into the cage.

Four knocks—To lower slowly.

Five knocks—To ascend slowly.

88. Every person when on the pit bank, or while about to descend the shaft, shall obey the orders and directions of the banksman; and every person, while in or about the pit, or while about to ascend the shaft, shall obey the orders and directions of the onsetter.

89. No person shall improperly use any signal, signal wire, or signal apparatus.

90. No person shall get into the cage after the authorised number is in, or if forbidden to do so by the banksman or onsetter.

91. Every person who shall couple or fasten any skip to any other skip, or to any rope or chain, shall see that such coupling or fastening is made secure.

92. Before any person moves a skip in a bord he must see that a safety-block is at or near the entrance of the bord, and in good order and set across the rail.

93. All persons employed in the mine shall be under the control of the manager, under-manager, and deputies, and shall at all times obey their lawful commands.

94. Any person committing a breach of any of the foregoing Special Rules is liable to be instantly dismissed.

*End.*

Name of the Mine—East Greta Colliery. Where situated—Near West Maifland. Name of the Owner—East Greta Coal-mining Company (Limited). Name of the manager—Azariah Thomas. Name of the under-manager—Henry Cartwright. Name and address of the Inspector of Mines of the District—J. Dixon, Newcastle.

CERTIFICATE OF SPECIAL RULES, EAST GRETA COLLIERY.

AZARIAH THOMAS, Manager.

I HEREBY certify that the above copy of Special Rules has been shown to my satisfaction to be a true copy of the Special Rules which, at this date, are established under the Coal Mines Regulation Act, 1896, for the above-named mine.

(Signed) JOHN DIXON,

30th day of April, 1897.

Inspector of Collieries.

No. 35.

Extract from letter by Mr. W. N. Atkinson.

EXTRACT from a letter from Mr. W. N. Atkinson, Inspector of Mines in North Staffordshire, *re* interpretation of certain words in General Rule 4 of Coal Mines Act of 1896.

Barlaston, Stoke-on-Trent, 14 January, 1899.

"As to whether a person contracting to drive by the yard is a 'contractor for getting mineral,' opinions would probably differ, but I am inclined to think that the legal decision would be that he is not.

"The English Inspectors have proposed that when the Coal Mines Regulation Act is amended, General Rule 4 shall be altered in that respect, as follows:—

"Gen. Rule 4 (1). After the word 'contractors,' in line 2, delete the words 'for getting minerals' and substitute 'for any work in the mine, or in the employ of any such contractor.'"

For the information of the Minister.—A.A.A., 2/3/99. Under Secretary for Mines and Agriculture. Submitted.—H.B.S. (for U.S.), 3/3/99. Seen.—J.C., 3/3/99.

No. 36.

Extract.

Legislative Assembly, 22 February, 1899.

"THE Minister for Mines, in answer to Mr. Edden, said it was too late now to take any further legal action in regard to the Greta disaster inquiry."

No. 38.

Copy of Case stated by Magistrate.

[Copy.]

In the Supreme Court of New South Wales.

In the matter of an appeal from the determination of the undersigned, two of Her Majesty's Justices of the Peace in and for the Colony of New South Wales, in a proceeding before us at West Maitland, in the said Colony, between *Thomas Lionel Bates*, complainant, and *Azariah Thomas*, defendant.

The information alleged that on the 17th day of November, 1898, Azariah Thomas, of East Greta, was the manager of a certain mine to which the Coal Mines Regulation Act of 1896 applies, called the East Greta Colliery, and the said Azariah Thomas, unlawfully in the said mine, did contravene and fail to comply with General Rule No. 4, in section 47 of the said Act, in that in the course of the shift working from 3 o'clock to 11 o'clock in the afternoon of the said 17th day of November, 1898, an inspection of all parts of the said mine in which workmen were to work or pass during that shift, was not made by a competent person, or competent persons appointed by the owner, agent, or manager of the said mine, who was not a contractor or contractors for getting minerals in the said mine.

The defendant pleaded not guilty, and after hearing the parties and the evidence adduced by them, we did on the 16th day of February, 1899, dismiss the said information.

The complainant, alleging that he was aggrieved by the said determination as being erroneous in point of law, did within eight days thereafter apply in writing to us to state and sign a case setting forth the facts and the grounds of such determination for the opinion thereon of this honorable Court, and did, at the time of making such application, and before the stating of this case before a Justice of the Peace, enter into recognizance to Her Majesty in the sum of £20, with a condition to prosecute this appeal with effect and without delay, and to submit to the judgment of this honorable Court, and pay such costs as may be awarded by the same, and; thereupon, in pursuance of the Act in such case made and provided, we state and sign the following case:—

This deponent, *Thomas Lionel Bates*, on his oath, saith as follows:—I am an Inspector of Collieries, and reside at Hamilton; I have acted so for twelve years; my information as read is true.

*To Mr. Edmonds*: I have no personal knowledge of the causes of complaint on the 17th November, 1898; I know defendant, whom I believe to be a thoroughly competent colliery manager; I know David Lewis slightly; I had him under observation during the rescue work at the mine, and from what I saw believe him to be competent as to mining and timbering and the work generally going on, also a competent miner, and competent to make inspections under General Rule 4; it is admitted that defendant was the manager of the East Greta Colliery on the 17th November, 1898.

THOS. L. BATES.

Taken and sworn at West Maitland, the 16th }  
day of February, 1899, before us,—

GEO. F. SCOTT, P.M.  
HY. CROTHERS, J.P.

This deponent, *Frederick Fowler*, on his oath, saith as follows:—I am a Sub-inspector of Police, and reside at West Maitland; I was present at the inquest held on the body of Alfred Moncrieffe; I recollect the oath being administered to Mr. Thomas, the depositions being read over to Mr. Thomas, and his signing same; the signature attached to the depositions shown me is defendant's.

No questions.

F. FOWLER.

Taken and sworn at West Maitland, the 16th }  
day of February, 1899, before us,—

GEO. F. SCOTT, P.M.  
HY. CROTHERS, J.P.

This deponent, *David Lewis*, on his oath, saith as follows:—I am a miner, and reside at East Greta; I know the East Greta Colliery, and I know defendant; I was working at the colliery when the accident took place; I was engaged by defendant; the arrangement between us was that Thompson, Griffiths, Gronow, and I were to get £3 19s. per yard; we never looked upon it as a contract; payment was made to me, and the others with me, at £3 19s. per yard if the ground proved right; if we met anything unforeseen we were to get extra; I had control of the men working with me on behalf of defendant; I paid the assistants, but I received the money and shared with my partners; on the 17th November I was working down at the bottom; I had been on this work three or four months; during the course of this time we generally followed the seam; we worked coal and anything else that came in our way; we got a good deal of coal and other stuff; the coal we got was sent up on top; I do not know what became of this coal; we were paid £3 19s. per yard, irrespective of whether we got coal or anything else; I am an experienced miner; I cannot say how much coal I took out, but what I took out I was paid so much per yard for the length I drove the tunnel; on the 17th November, 1898, I inspected the parts of the mine where we were working; Thompson, who is one of my partners, also made an inspection; Gronow, who was in charge of the shift, inspected the working place as well; there were other workmen working in the same vicinity of where I was working on that day; Thompson, Griffiths, Gronow, and I were appointed by the manager to make inspections; I do not know whether anyone else made an inspection on the 17th November; I have a clear recollection of making an inspection for the shift working from 3 to 11; I only inspected the tunnel, which I did completely; I made the inspection for that shift. (Admitted, there is no part of the mine in question except the tunnel.)

To

*To Mr. Edmunds* : I made a careful inspection of all parts where the workmen were to work or pass in that shift; the tunnel was to be 10 feet 6 inches on the clear; this tunnel was to be the main artery for the further development of the mine; the work of the mine had been carried on through the upper part of the tunnel prior to my sinking the tunnel; I had to inspect the tunnel from top to bottom; my work was to open up this main passage, and I was paid for the exact amount of space opened up during the course of the work; I and the three others had all been miners in the colliery; all the men carrying on the work were engaged by defendant as miners in the colliery; in carrying on the work it was perfectly immaterial to us what stuff was got out, the softer the better for us; I have had seventeen years' experience as a coal-miner—seven years in this country and ten years in Wales, and my experience has been particularly directed to timbering all sorts of places; it was a particular part of my duty to look after the timber; my shift did all the timbering, and this occupied nearly the whole time of my shift; after the others had driven I would come along and do the timbering; defendant required me to look after the timbering; this was part of the understanding before we started.

*To Mr. Gannon* : The men with me worked at the coal face; I might have worked at the face a couple of times; the face we worked on was partly coal and partly country; Thompson, Griffiths, Gronow, and I were partners, and were appointed by the manager to make inspections.

*To Mr. Edmunds* : I would call them mates, and would also call the assistants mates.

Taken and sworn, at West Maitland, the 16th }  
day of February, 1899, before us,— }

DAVID LEWIS.

GEO. F. SCOTT, P.M.  
H. CROTHERS, J.P.

This deponent, *Azariah Thomas*, on his oath, saith as follows:—I am the manager of the East Greta Colliery, and reside at Mount Dee; I have a certificate under the Imperial Act and also under the Colonial Act, and I have had a large experience; it became necessary to drive the tunnel further into the field of coal at as uniform a grade as possible; I arranged for the driving of the tunnel at so much per lineal yard completed; it was possible that the seam would leave the tunnel and the stuff obtained be valueless, then the men were to be paid just the same; they were to be paid not less than usual wages, and more if the ground proved hard; the men had no interest in what they took out of the tunnel; they were paid so much per yard completed, and not for any coal obtained; I have heard portions of my depositions, taken before the Coroner's Court, read; they are correct; I thought I was responsible for the wages of the other men; I examined the work as it went on, and it was within my power to stop the work at any time, take the men away, and put them on to other work, or take any one man away and put him in any other part of the mine.

*To Mr. Gannon* : I could stop Lewis working in the tunnel and put him to any other work I liked; Lewis is a deputy and a colliery employee in the mine, though he was working under an arrangement—a contract, Mr. Gannon calls it; I laid out the work; the men did not altogether follow the seam; I slightly altered the course of the tunnel to follow the coal; in getting this coal out I was opening the mine up; the change in the course of the tunnel was to reach a certain point, and to have an even grade; the men were working on an uneven seam of coal; sometimes they left some coal on top; the men drove 355 feet, at £3 19s. per yard, and I paid about £460 for the work; Lewis got the money; Lewis and the others were appointed by me as competent persons to make inspections; the efficiency of the tunnel was to be a good passage for the development of the mine, not to get all the coal I could; I insisted on Lewis doing the timbering, on account of his qualifications.

*To the Bench* : The men were not paid anything at all for the coal got; the mine got the benefit of it all.

AZARIAH THOMAS.

Taken and sworn, at West Maitland, this 16th }  
day of February, 1899, before us,— }

GEO. F. SCOTT, P.M.  
H. CROTHERS, J.P.

It was not proved, upon the hearing, that the competent person or competent persons to make inspections, as required by the Coal-mines Regulation Act, was or were a contractor or contractors for getting minerals in the said mine.

We determine that the matter hereinbefore stated did not support the said information.

The question for the opinion of the said Court is whether our said determination was erroneous in point of law.

Dated at West Maitland, this 23rd day of March, A.D. 1899.

G. F. SCOTT, P.M.  
H. CROTHERS, J.P.

### No. 39.

The Crown Solicitor to The Under Secretary for Mines and Agriculture.

*Re Bates v. Thomas*.—Special case.

Sir,

Crown Solicitor's Office, Sydney, 7 June, 1899.

I have the honor to return herewith the papers sent me herein, and to state that the matter was decided by the Full Court on the 1st instant, when the appeal was dismissed with costs, the Court holding that the magistrates were right in determining that the Act does not apply to persons contracting to make a tunnel, though they may remove coal in so doing.

I have, &c.,  
GEO. COLQUHOUN,  
Crown Solicitor.

## No. 40.

## The Secretary to The Attorney-General to The Under Secretary for Mines and Agriculture.

Bates v. Thomas.

Sir,

Attorney-General's Department, Sydney, 15 July, 1899.

I have the honor to request that you will be good enough to cause the sum of £47 0s. 8d., amount of defendant's taxed costs herein, to be placed to the credit of my public account to enable me to pay same.

I have, &amp;c.,

HUGH POLLOCK,

Secretary.

For approval.—D.McL., 20/7/99. Approved.—J.C., 20. Accountant. Voucher herewith.—E.C.P., 21/7/99. The Examiner. Vou. 99/1900-1156. Secretary, Attorney-General. £47 0s. 8d., passed, 21/7/99.—G.P.L., Examiner, Department of Mines and Agriculture.

## APPENDIX X.

## REPORTS BY MR. INSPECTOR BATES ON EAST GRETA COLLIERY FROM OCTOBER, 1897, TO NOVEMBER, 1898.

Accident at East Greta Colliery.

Sir,

Newcastle, 25 November, 1898.

I beg to report an accident by a fall of coal, which occurred to two miners named William Henderson and George Rowley, at East Greta Colliery, on 7th November.

I visited the colliery on 8th November, and ascertained the following particulars:—

The accident occurred in the second jig on the second north level, in No. 2 tunnel. This jig had been driven 4 feet wide and 4 feet high in the coal, upwards from the second level to the first north level. It was then necessary to increase the size to allow the cage to be run in it, the finished size to be 8 feet wide and 7 ft. 6 in. high inside timbers. The angle of dip is 40 degrees.

The men commenced work at the top (No. 1 level), and the coal taken down was sent through the original opening into skips on the No. 2 level.

About 14 yards of the work had been completed, timber set every 5 to 6 feet, sill, side props, and caps with slabs at the sides.

Two sets of timber had been put in on the day of the accident, the last set being close to the face.

About 3:30 p.m. on the 7th instant, whilst the men standing at the mouth of the opening were engaged in shovelling coal down, some coal fell away at a slip at the sides and roof on to the men, who could not get away quick enough owing to the steepness of the measures. Henderson had two ribs fractured and Rowley a fractured thigh and serious internal injuries, which it is doubtful whether he will survive. Both men were experienced miners, and in my opinion this is a pure accident, and no blame attributable to anyone.

I have, &amp;c.,

THOS. L. BATES,

Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines.

Noted. Will Mr. Bates please say if injuries to either of these men was caused by falling on a pick, as I have heard.—A.A.A., 26/11/98.

I inquired at the Maitland Hospital yesterday, and was informed that the injuries to Rowley, in addition to a fractured thigh, are two wounds in the back caused by some sharp instrument, probably a pick; but neither Rowley nor Henderson can give me any information on the matter.—T.L.B., 2/12/98. The Chief Inspector of Coal-mines.

Noted.—A.A.A., 3/12/98. Under Secretary, Mines and Agriculture. For the information of the Minister.—H.B.S. (for U.S.), 6/12/98. Approved.—J.C., 6/12/98.

Dear Sir,

East Greta Colliery, near West Maitland, 7 November, 1898.

Two miners—William Henderson and George Rowley—were injured by a fall of coal this afternoon.

Yours, &amp;c.,

A. THOMAS.

T. L. Bates, Esq., Inspector of Collieries, Hamilton.

Report herewith.—T.L.B., 25/11/98. The Chief Inspector of Coal-mines. Noted.—A.A.A., 26/11/98.

Dear Mr. Winchester,

Hamilton, 7 November, 1898.

I have just received a wire of an accident to two men at East Greta Colliery by fall of coal, and that the place is waiting inspection, so must go there in the morning. Will endeavour to be at office on Thursday.

Yours, &amp;c.,

THOS. L. BATES,

Inspector of Collieries.

Mr. Atkinson.—H.W., 8/11/98. Noted.—A.A.A., 14/11/98. Records. Please furnish a copy of the report made on this accident. Urgent.—D.McL., 23/11/98. Inspector's report not yet received at Records.

## REPORT on accident to A. Whiteley at East Greta Colliery.

Accident at East Greta Colliery, West Maitland.

Sir,

Newcastle, 12 October, 1898.

I beg to report an accident by the slipping of a rope on the surface, which occurred to an assistant banksman named Albert Whiteley at East Greta Colliery on 27th September.

I visited the colliery on 3rd October, and ascertained the following particulars:—

Albert Whiteley and his brother Sydney are banksmen at the mouth of the No. 2 tunnel. Near the tunnel is a small coal-hopper, and a skip carries the small coal from underneath the screen up a slanting tramway into this hopper. The rope from the skip passes through a snatch block on the hopper, and passes over the pit-bank to a small engine worked by a boy named Martin Jensen, 17 years of age.

The distance the skip travels is 25 feet, and there is a mark on the rope to denote where to stop.

Between 8 and 9 o'clock in the evening of 27th September, the boy Jensen, by mistake, pulled the skip up too far, and the connecting chain got fast in the snatch-block. This was liberated by the two Whiteleys and another man, but, probably owing to the darkness, neither Albert Whiteley or any of the other men noticed that the side-iron of the snatch-block was slightly bent. They resumed work, and after the skip had been pulled up four or five times, the rope came out of the block, and becoming taut, broke some side-rails and struck Albert Whiteley (who was passing underneath on his way to get some skips to put on the cage) on the back, knocking him down on the rails. His right leg was fractured below the knee. He was removed to Maitland Hospital, where it was necessary to amputate the injured limb.

I have, &amp;c.,

THOS. L. BATES,

Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines, Sydney.

Noted. Will Mr. Bates kindly say if any one is to blame, or if he can suggest any means of preventing a recurrence of this.—A.A.A., 13/10/98.

I do not see my way to blame any one person for this accident. The accident is due primarily to the boy Jensen, who, by mistake, pulled the skip up too high and jammed the coupling of the rope in the snatch-block. This was liberated by several men, amongst whom was the injured man Albert Whitely, and no one appears to have noticed any injury to the block. Since the accident a more substantial mark has been made on the rope, and a similar accident should, therefore, be avoided.—T. L. B., 15/10/98. The Chief Inspector of Coal-mines.

Noted.—A. A. A., 20/10/98. Records. For the information of the Minister.—H. B. S. (for U. S.), 21/10/98.

Dear Sir,

East Greta Colliery, near West Maitland, 28 September, 1898.

A young man named Albert Whitely had his leg broken last night on the surface at the above colliery; he was assistant banksman.

Yours, &c.,

A. THOMAS.

Mr. Jno. Dixon, Senior Inspector of Collieries, Merewether, near Newcastle.

Report herewith.—T. L. BATES, 12/10/98. The Chief Inspector of Coal-mines.

REPORT ON EAST GRETA COLLIERY.  
East Greta Colliery Inspection, West Maitland.

Sir,

Newcastle, 20 September, 1898.

I have the honor to report having inspected the above colliery on 5th and 16th September.

All the workings, bords, of No. 1 tunnel are at present idle until the tunnel has been driven a further distance to the dip.

No. 2 Tunnel, Lower Seam, South Side.—There are 22 men and 2 boys employed underground in each shift, and supplied with 7,500 cubic feet of air per minute, giving each an average of 312 cubic feet. This is by natural ventilation. The air current descends the No. 2 tunnel, and returns up what is known as the steam jig.

North Side.—There are 25 men and 2 boys employed underground; total, 27 in each shift, and supplied with 15,000 cubic feet of air per minute, giving each an average of 555 cubic feet. The air-current descends the No. 2 tunnel, and returns to a furnace at the extreme north of the workings.

There are three shifts worked at this mine, each having the number of men and boys as stated above.

The wheeling and travelling roads were in good condition, and there was a plentiful supply of timber on hand.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines, Sydney.

Noted.—A. A. A., 24/9/98. Records. For the information of the Minister.—H. B. S. (for U. S.), 26/9/98. J. C., 27.

REPORT ON EAST GRETA COLLIERY.  
East Greta Colliery Inspection, West Maitland.

Sir,

Newcastle, 11 June, 1898.

I have the honor to report having inspected the above colliery on 17th May and 10th June.

No. 1 Tunnel, Lower Seam, South Side.—I inspected this portion of the mine on 17th May, and found 14 men, 4 boys, and 1 horse employed; total, 19,—and supplied with 10,070 cubic feet of air per minute, giving each an average of 530 cubic feet.

These workings are at present suspended until the main tunnel has been driven a further distance to the dip, when operations will be resumed.

North Side Workings.—The coal from the north side workings is drawn out of two tunnels. The No. 2 tunnel is filled up with cages, in which the men, &c., ride; the other tunnel, known as the steam jig, is used for hauling coal only. The mine is ventilated by means of a furnace on the surface, and a brick chimney connected with an opening to the surface north of the steam jig.

The current of air in circulation was 17,390 cubic feet per minute. The mine works three shifts, and in each of the shifts there are 57 men, 7 boys, and 1 horse; total, 65, which will give each an average of 267 cubic feet.

The wheeling and travelling roads were in good condition, and a plentiful supply of timber on hand.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines, Sydney.

Noted.—A. A. A., 13/6/98. Records. For the information of the Minister.—H. B. S. (for U. S.), 14/6/98. Seen.—S. SMITH.

REPORT ON EAST GRETA COLLIERY.  
East Greta Colliery Inspection, West Maitland.

Sir,

Newcastle, 11 February, 1898.

I have the honor to report having inspected the above colliery on 31st January and 8th February.

No. 1 Tunnel, Lower Seam.—Only the coal from the south workings of the mine is drawn up this tunnel. There are in this portion of the mine 24 men, 4 boys, and 1 horse employed; total, 29,—and supplied with 9,900 cubic feet of air per minute, giving each an average of 341 cubic feet.

No. 2 Tunnel, Lower Seam.—All the coal to the north of the No. 1 tunnel is drawn up this one. There are usually 41 men and 2 boys employed, but on the day of my inspection no miners were at work, and no coal being drawn. Four men working in one of the jigs fixing up a drum for the purpose of lowering the full skips of coal from the bords down to the main level, from which they are drawn in the cage to the surface.

The ventilation in this portion of the mine was satisfactory.

Two shifts are worked with the above number of men, &c., in each shift.

The wheeling and travelling roads were in good condition, and there was a plentiful supply of timber on hand.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines, Sydney.

Noted.—A. A. A., 14/2/98. Records. For the information of the Minister.—H. B. S. (for U. S.), 14/2/98. Seen.—S. SMITH.

REPORT ON EAST GRETA COLLIERY.  
East Greta Colliery Inspection, West Maitland.

Sir,

Newcastle, 18 October, 1897.

I have the honor to report having inspected the above colliery on 7th and 15th October.

No. 1 Tunnel, Lower Seam.—The only coal drawn up this tunnel is from the south side workings, where 23 men, 4 boys, and 1 horse are employed; total, 28,—and supplied with 9,800 cubic feet of air per minute, giving each an average of 350 cubic feet.

No. 2 Tunnel, Lower Seam.—All the coal from the north side workings is now hauled up this tunnel. There were only 4 men and 2 boys employed at the time of my inspection, no coal being drawn, but usually there are 31 men and 1 driver employed. There was a satisfactory amount of air circulating through the working-places.

Two shifts are worked, with the above number of men, &c., in each shift.

The wheeling and travelling roads were in good condition, and there was a plentiful supply of timber on the flats.

I have, &c.,

THOS. L. BATES,

Inspector of Collieries.

A. A. Atkinson, Esq., Chief Inspector of Coal-mines, Sydney.

Seen.—A. A. A., 27/10/97. Under Secretary, Mines and Agriculture. For the information of the Minister.—H. B. S. (for U. S.), 1/11/97. Seen.—S. SMITH.

## APPENDIX Y.

## ORIGINAL DEPOSITIONS TAKEN AT INQUEST ON BODY OF A. MONCRIEFFE.

## MINUTE.

*Subject* :—Inquest at East Greta and Court-house, West Maitland, upon the body of Albert Moncrieffe (letter from Coroner, Newcastle, 1/2/99).

SUBMITTED for the Minister's information.

Department of Justice, Sydney, 9 February, 1899.

A subpoena has been received for the production of these depositions at the hearing of a case, *Bates v. Thomas*, at the Court of Petty Sessions, West Maitland, on the 16th instant.

They might be forwarded to the Clerk of Petty Sessions, West Maitland, for production to the Court.

G.M.

Approved.—C.A.L., 10/2/99. Depositions and subpoena to C.P.S., West Maitland, 11/2/99. Forwarded to the Under Secretary for Mines and Agriculture, in accordance with request specially made to-day—G.W. (for U.S.), B.C., 17/10/99.

Sir,

Newcastle, 1 February, 1899.

I have the honor to inform you that I forwarded yesterday by post (registered) two packets of depositions of witnesses, taken during the inquest held before me touching the death of *Albert Moncrieffe*, in the East Greta Colliery.

The inquest was opened at East Greta on the 24th of December, 1898, and was continued for twelve days at the Court-house in West Maitland, and concluded on the 27th of January, 1899. I much regret that though the evidence covered every subject in connection with the disaster itself, and the state of the colliery, and that the context was nearly the same throughout, yet the jurors, after over fourteen hours continuous debate, could not agree upon a verdict, and without the least likelihood of doing so, as the foreman said, if they were locked up for a month. I therefore then discharged the jury.

I enclose application for an advance, and obligation receipt for the sum of £69, to pay the jurors' allowances.

The Exhibits and other papers connected with the inquest will be forwarded as soon as I receive part of them from West Maitland. There is a model of the tunnel, showing manner of timbering; it is very bulky, and would, perhaps, be better left at Court-house, in West Maitland, with the different samples of stone from the colliery.\* Kindly advise me respecting these.

Can I do anything more in the case, as the result was so bald?

I have, &c.,

GEO. C. MARTIN,

Coroner, District of Newcastle.

The Under Secretary, Department of Justice.

\*Submitted for approval of this suggestion—G.M., 9/2/99.

Sir,

Court-house, West Maitland, 18 February, 1899.

I have forwarded, under separate cover (registered), the depositions taken at the inquest held on the body of one Albert Moncrieffe, which were duly produced at this Court of Petty Sessions, in accordance with your instructions.

I have, &c.,

NORMAN BLACK,

Clerk of Petty Sessions.

The Under Secretary of Justice, Sydney.

Depositions to Under Secretary for Mines, 6/3/99.

[Coroner, Newcastle.]

Telegram from Geo. C. Martin, Coroner, Newcastle, to The Under Secretary for Justice, Sydney.

Newcastle, 3 January, 1899.

MR. ATKINSON, Chief Inspector of Collieries, was asking if a type-writing deposition clerk would attend at West Maitland on Wednesday next to take evidence. Kindly inform me early.

GEO. C. MARTIN,

Coroner.

Inform not intended send clerk, unless it appears that otherwise the proceedings will be lengthy. As to this Mr. Martin might report to-morrow.—G.M., 3/1/99. Wire sent, 3/1/99. File with inquest proceedings when received.—G.W., 10/1/99. Remind Mr. Martin that he has not furnished the report asked for in my telegram of 3rd instant, and ask how much longer he thinks the inquest will last.—16/1/99. Wire. Wired Coroner, Newcastle, 16/1/99.

[Coroner, Newcastle, that he has adjourned inquest on Albert Moncrieffe till 4th prox.]

Newcastle, 27 December, 1898.

Sir, I have the honor to acknowledge the receipt of your wire, and to inform you that I opened the inquest touching the death of Albert Moncrieffe last Saturday afternoon at East Greta; and, after taking evidence for identification, adjourned till Wednesday, the 4th of January, 1899. I considered the holidays would be over then, and also that it would give time for the mine to be opened and cleared up to where the fall commenced. About 25 feet of building up and supporting must be done to get there; 5 feet is done, as I have heard, each day.

The adjournment will be at the Court-house at West Maitland, to commence at 10-30 a.m. I expect the inquest will last some days.

I have, &c.,

GEO. C. MARTIN,

Coroner, District of Newcastle.

The Under Secretary, Department of Justice.

Seen.—J.L.W. (for U.S.), 29/12/98.

[Coroner, Newcastle.]

Telegram from Geo. C. Martin, Coroner, Newcastle, to The Under Secretary of Justice, Sydney.

Newcastle, 28 December, 1898.

AM leaving this afternoon for East Greta, to open inquest; wish your wire had reached me earlier.

GEO. C. MARTIN,

Coroner.

## MINUTE.

*Subject* :—Inquest at East Greta and Court-house, West Maitland, upon the body of Albert Moncrieffe,

Department of Justice, Sydney, 3 March, 1899.

THE proceedings in this case are forwarded for the information of the Department of Mines.

G.M.

Submitted for the information of the Minister.—A.A.A., B.C., 13/3/99. H.B.S. (for U.S.), 14/3/99. J.C., 15. The papers are now returned. The Under Secretary of Justice.—H. B. SULLIVAN (for U.S.), B.C., 16/3/99.

Sir,

Newcastle, 4 February, 1899.

I have the honor to forward herewith by post (registered) papers in connection with the East Greta Inquest,

viz. :—

Exhibit marked "A."

Do Tracing of Tunnel.

Do Special Rules of Colliery.

Affidavit of Jurors.

Death information, "Albert Moncrieffe."

Index to witnesses in Depositions.

Voucher in duplicate for the conveyance of jurors twice.

Voucher in duplicate for tea-meal for jurors on the evening of the 27th.

I have, &c.,

GEO. C. MARTIN,

Coroner, District of Newcastle.

The Under Secretary, Department of Justice.

[Exhibit

[*Exhibit at Inquest by Mr. Thomas. Geo. C. Martin, Coroner, 4th January, 1899.*]

SPECIAL RULES.—For the conduct and guidance of the persons acting in the management of the East Greta Colliery, in the district of Maitland, and all persons employed in or about the said colliery, framed in conformity with the provisions of the Coal-mines Regulation Act, 1896, 60 Victoria No. 12.

*Manager.*

1. The manager (or the under-manager when acting for him) shall have the daily supervision of the above colliery, and shall have full command over all other officers and workmen employed in or about the colliery, who are to receive their orders from him, and shall apply to him for instructions as often as may be necessary.

2. He shall comply with the requirements of the Coal-mines Regulation Act, 1896, and shall, to the best of his power, enforce the observation of the said Act, and enforce observation of the General and Special Rules.

*Under-manager.*

3. The under-manager shall have the daily supervision and responsible charge of the mine under the direction of the manager, and shall give all necessary instructions to the men and boys in the mine respecting their work; and shall, to the best of his power, see that they comply with the rules and regulations of the colliery, as well as the orders of the manager, and shall visit every working-place in the mine daily, or as often as may be practicable, and see that the air-courses and stoppings are kept in a good state of repair, and that an adequate quantity of fresh air is constantly supplied to the men.

4. He shall give immediate attention to any complaints, and shall inspect personally such portions of the mine as are reported to be unsafe or in any way to need his attention.

5. He shall see that a sufficient supply of timber is sent down the mine and into the different districts.

6. He shall see that each miner keeps his working-place sufficiently timbered, and shall suspend at once any miner refusing or neglecting to do so.

7. He shall examine every day the different main and district air-currents, and shall see that the furnaces are kept in good repair and carefully attended to.

8. He shall, under the direction of the manager, cause safety-lamps to be used, and naked lights to be excluded where required by the Act.

9. He shall see that the deputies, miners, shifters, and all others under his charge in the mine, strictly and rigidly observe the rules applicable to them, and shall suspend immediately anyone infringing or attempting to infringe any rule, order him out of the mine, and report the same to the manager.

*Deputy.*

10. Each deputy shall be informed by the manager or under-manager as to what portion of the workings is to be under his charge, and all persons working in that portion of the mine will be under his direction, and he shall, in the absence of the manager or under-manager, direct the workmen how and where they shall work, and shall see that the rules applicable to them, as well as the orders of the manager or under-manager, are strictly attended to.

11. The deputy or other competent person appointed for that purpose shall be in the mine within four hours before the workmen commence, to enable him to examine the working-places, &c., carefully, and shall ascertain the condition thereof so far as the presence of gas, ventilation, roof and sides, and general safety are concerned, and shall record the result of such examination without delay in a book to be kept at the mine for the purpose.

12. He shall place cross timbers, or rails, thus X, or a signal-board, as a signal of danger at the entrance of every working-place which he may find unsafe, and on his return to the station shall state on his board all places so found unsafe.

13. In any place where there is a dangerous appearance of fire-damp locked safety-lamps shall be used; and no workman shall be permitted to remain where fire-damp has accumulated in such a quantity as to show a permanent blue cap over the flame.

14. Before safety-lamps are taken into the workings, the deputy, or some other competent person duly appointed for the purpose, shall examine the entire lamp, and, if all is right, shall lock it for the miner.

15. Should there be any discharge of gas, or any condition of roof from which the deputy apprehends any danger, he shall instantly report the circumstances to the under-manager.

16. He shall report as soon as possible to the manager or under-manager all accidents, dangers, or defects which may occur in his district of the mine, and he shall also so report any accident, danger, or defect to or in any machinery or structure in the mine which may come to his knowledge.

*Wheelers.*

17. The wheelers shall report to the under-manager or deputies if any part of the road or roof has been deranged, or is insecure or dangerous.

18. Any wheeler injuring a door or brattice cloth door, and not immediately reporting the fact, shall be suspended. He shall also report to the under-manager or deputy every morning the quantity and different lengths of timber required for his miners.

19. He shall take in without delay any timber the miners may require, and shall at all times carry out the orders of the manager, under-manager, or deputy, in order to facilitate and promote the work of the mine.

20. Any person neglecting these rules will be liable to instant dismissal or prosecution according to law.

*On-setter.*

21. The on-setter shall, subject to the directions of the manager or under-manager, have the sole control of the pit bottom, and the command of the signal up the pit, and on no account shall he allow any person to interfere with the signals. He shall at all times when sending up skips of coal see that none of the coal projects beyond the side of the skip, and shall pay the greatest attention to the signals when men are going to ride, in order that accidents may be avoided. The signals shall be as given in rule 87.

22. No timber, materials, stones, coal, or other things shall, under any circumstances, be lowered or lifted in a pit while men are being lowered or lifted in it, except such as may be necessary in repairing a pit while the repairs are going on.

23. The on-setter shall not, on any account, allow more than six persons in a single cage, or ten in a double cage at the same time.

24. Any person refusing to leave the cage when ordered to do so shall be immediately suspended.

*Miners.*

25. Any miner after passing through a door must instantly close it; and shall not injure a door or leave it open, break down a stopping or brattice, interfere with or obstruct or damage an air-crossing, or an air-pipe, or remove or go beyond a mark or "danger-signal," without orders from the manager, under-manager, or deputy.

26. Every miner shall securely sprag or uphold the coal whilst holding, and shall securely prop up the roof of his working-place, so that accidents may be avoided; and should he not be provided with a sufficient quantity of timber he shall cease working and report the same to the manager, under-manager, or deputy.

27. The seam of coal must be wrought strictly in accordance with the orders of the manager or under-manager.

28. Every miner shall, in all matters relating to the working of the mine or the safety of the men, obey strictly the orders of the manager, under-manager, or deputy; and no person shall go into any part of the mine other than where he is employed, except by the order of the manager, under-manager, or deputy.

*Door-keepers.*

29. A door-keeper must only open a door for the passage of persons, skips, or animals, and must instantly close the same when they have passed through. He must never allow a door to remain open, or to be propped or fastened back, unless authorised to do so by the manager, under-manager, or deputy.

30. A door-keeper must not leave any door or doors under his charge until the work of his shift is finished, or until another person appointed by the manager, under-manager, or deputy takes his place.

31. Any door-keeper becoming aware of any defect in, or damage to, any door, shall report the same as soon as practicable to the manager, under-manager, or deputy.

*Persons*

*Persons in charge of Ventilating Appliances.*

32. The persons in charge of any ventilating furnace or other ventilating appliance shall not leave the same without the permission of the manager, under-manager, or engine-wright.

33. Furnace-men must pay careful attention to the furnace under their charge; and shall maintain the fire in such a state as constantly to ensure efficient ventilation.

34. The fan and fan-engine shall be carefully attended to by the person or persons in charge thereof, who shall keep the same running at the speed ordered by the manager, so that effect may be given to the provisions of the Act as to ventilation.

35. All persons in charge of ventilating furnaces, fans, fan-engines, or other ventilating appliance, shall immediately report any damage, defect, or derangement therein to the manager, under-manager, or engine-wright.

*Lamp-keepers.*

36. No person, except a person authorised by the manager or under-manager, shall either take himself or give out for use in the mine any safety-lamp.

37. Lamp-keepers must see that every safety-lamp is thoroughly cleaned, properly put together, in safe working order, and securely locked when given out for use in the mine. If any lamp be not returned at the proper time they shall at once report the fact to the manager or under-manager.

38. All persons entrusted with the duty of cleaning any gauze, or other part of any safety-lamp, or with the duty of putting any safety-lamp or parts thereof together, shall at once report any defect therein to the lamp-keeper, or if there is more than one lamp-keeper, then to the head lamp-keeper.

39. Whenever any defective or damaged lamp is received from any person by any lamp-keeper he shall report the fact to the manager or under-manager, and shall cause such lamp to be kept in the state in which he received it until seen by one of them.

40. Every lamp-keeper shall see that all oil, spirit, and other inflammable articles under his charge are carefully and properly stored and used, and that no greasy waste or other refuse is allowed to accumulate in or near the lamp cabin.

*Engine-wright.*

41. The engine-wright, or other competent person appointed for the purpose, shall cause the ventilating-fan or other mechanical ventilating apparatus, together with the engines, machinery, and boilers for driving the same, to be properly attended to.

42. The engine-wright, or other competent person or persons appointed for the purpose, shall have charge of all engines, machinery, and boilers used for raising or lowering persons or minerals, or for pumping water, and of all ropes, chains, appliances, or apparatus connected therewith; and of all guides, ropes, chains, conductors, or other appliances in the shafts, and of all other engines, machinery, and boilers in or about the mine. In case he shall discover any weakness, defect, or want of repair therein, he shall, as soon as practicable, cause the same to be repaired and made good, and shall at once report to the manager the fact of such defect, weakness, or want of repair, and also the steps taken to remedy the same.

43. The engine-wright, or other competent person or persons appointed for the purpose, shall make the examinations and report required by General Rule 5.

44. The engine-wright, or other competent person appointed for the purpose, shall cause every rope used for raising or lowering persons or minerals to be securely attached to the drum, so that when either cage is at the pit bottom there shall be not less than two rounds of rope upon the drum.

45. The engine-wright, or other competent person, whenever a winding rope requires capping, coupling, or splicing, shall superintend the same, and shall see that no spliced rope is used for raising or lowering persons in a shaft.

46. The engine-wright, or other competent person or persons appointed for the purpose, shall see that the fences are fixed and maintained at the top of every shaft, and that the guides, signals, covers, flanges, or horns, appliances, brakes, indicators, fences, valves, gauges, and things required by General Rules 18, 20, 26, 27, 28, 29, 30, 31, 32, and 33, or any of them, are fixed and maintained as therein required; and that the provisions of General Rule 25 are carried out above ground.

47. The engine-wright shall cause bells or other signals to be fixed in every drawing engine-house connected with the drawing pit bottom, and with every entrance for the time being in work between the surface and bottom of the shaft; and shall cause the board required by Special Rules 23 and 64, stating the number of persons authorised to descend or ascend the shaft at one time, to be fixed and maintained on the pit bank.

48. The engine-wright shall cause each working boiler to be cleaned and examined as often as the manager shall so order.

49. The engine-wright shall cause the code of shaft signals used in moving the cages to be fixed and maintained at the top and bottom of each winding shaft, and at every shaft to which the provisions of Special Rule 57 apply; he shall see that the point named in that rule is distinctly marked on the indicator.

*Engine-drivers.*

50. Every engine-man shall attend at such time as the manager may appoint, and as required by General Rule 25.

51. An engine-man shall not allow any person to interfere with the engine or machinery under his charge, or to remain in the engine-house unless authorised by those in authority above him. A winding engine-man while winding must remain at the handle and must pay particular attention to the indicator and signals, and if he perceives anything wrong must instantly stop his engine and not start it again until the defect is put right or until he receives an order to go on.

52. Every winding engine-man, before commencing work in his shift, and before any person descends the shaft, shall carefully examine the engine, machinery, drums, ropes, brakes, indicators, and signal apparatus in the engine-house or under his charge, in order to ascertain whether they are safe and in good working order, and shall run the cages at least once up and down the shaft. Where shifts are worked continuously, it shall be sufficient if this rule is carried out at the commencement of the morning shift.

53. Every engine-man, unless some other competent person is specially appointed for the purpose, shall keep the engines, machinery, and things connected therewith under his charge, properly cleaned and oiled, and shall see that they are in good and safe working condition. He shall see that the provisions of General Rules 27, 30, 31, and 32 are carried out and observed during his working shift, so far as they relate to engines or machinery under his charge.

54. Every engine-man must diligently and carefully attend to the working of the engine and machinery under his charge. He must examine such engine and machinery before commencing work, and if he becomes aware of any weakness or defect, or apprehends any danger, he must, as soon as practicable, inform the manager, under-manager, deputy, or engine-wright. He shall not alter a safety-valve without leave from the manager, under-manager, or engine-wright.

55. Every engine-man, in addition to the duty in this respect imposed on the engine-wright, shall see that any ropes attached to the drum of the engine under his charge are securely attached, and so that when either cage is at the bottom of the pit there shall not be less than two rounds of rope upon the drum.

56. Every winding engine-man, whenever the engine under his charge ceases working, shall see that the cages are left so as not to impede the ventilation.

57. When men are being raised in shafts where the winding apparatus is not provided with some automatic contrivance to prevent overwinding, the cage shall not be wound up at a speed exceeding 3 miles an hour when and after it has reached a point 10 feet from the top of the shaft, as required by General Rule 27, and such point shall be marked on the indicator.

58. The signals given in Rule 87 shall be carefully observed by the engine-man.

*Banksman and Assistants.*

59. That the banksman shall, subject to the directions of the manager, under-manager, and engine-wright, have the control of the pit top, and the command of the signals down the pit and to the engine-man.

60. That the banksman shall be responsible for the state of the pit top, and shall see that the frames and the surface near the pit mouth are kept free from coals, stones, or dirt.

61. That at least one banksman and one on-setter, or other person appointed by the manager, under-manager, or deputy for that purpose, shall be at their respective posts at the proper time every morning, to give the proper signals, and to see the men and boys carefully into and out of the cages at the top and bottom of the shaft.

62. The banksman must be at the drawing shaft at such times as the manager or under-manager may appoint. He shall not allow a person to descend or ascend until the cages have been once run up and down the shaft, but where continuous shifts are worked it shall be sufficient if this is done at the commencement of the morning shift.

63. That the banksman shall not permit strangers or persons not employed in the mine to descend the pit or remain upon the bank, unless authorised by the manager; and shall caution strangers descending to keep carefully within the cage until they are fairly landed. He shall not allow an intoxicated person to descend the pit.

64. That the banksman or on-setter shall not allow more than six persons in a single cage, or ten persons in a double cage; nor shall any person be allowed to ride with or against coals, slack, dirt, &c. Neither shall any person, unless specially allowed by the manager, under-manager, or deputy, be permitted to carry any tools, implements, props, rails, or such like in his hands whilst so riding; but the same shall be securely placed in the cage, skip, or basket, so that no danger may exist of their falling out during their ascent or descent, or of their coming in contact with anything in the pit; and no person shall be allowed to get upon or off the cage at the pit top unless it be standing upon the catches or keeps, or at a mouthing, without the signal first being given and responded to.

65. The banksman must frequently observe the pit top pulleys, ropes, chains, cages, and landing apparatus during working hours, and whenever he becomes aware of any weakness or defect therein, or in anything belonging to the shaft, or any engine, machinery, or winding tackle, he must immediately inform the engine-man, and the manager, under-manager, or engine-wright, so that it may be repaired.

66. The banksman must report to the manager or under-manager any disobedience on the part of the miners or others.

67. The signals given in Rule 87 shall be carefully observed by the banksman.

*Miners and all other Persons Employed.*

68. No person acting in a place of trust shall depute anyone to do his work without the sanction of the manager.

69. No swearing or fighting is allowed in or about the mine, and no intoxicating liquors shall be permitted in the mine without the consent of the manager.

70. Any person employed in the mine shall inform the person in charge of the workings of the existence of any choke or fire-damp, of any insecurity of the roof, shaft, or any other part of the workings, or of any air-door being damaged or left open, immediately on its being observed by him.

71. No person shall be permitted to carry a naked light attached to the cap or hat on his head whilst handling explosives, or in charging holes for blasting.

72. A safety-lamp must be frequently examined, and if a lamp shows a blue cap, the person using it must carefully draw down the wick with the pricker, cease working, leave the place, and report the same to the manager, under-manager, or deputy.

73. No person shall place a safety-lamp on its bottom unless it is necessary to do so for the safe performance of any particular work, or unless authorised by the manager, and in all cases the lamp shall be hung or placed at least 2 feet from the swing of the pick, hammer, or other tool.

74. No person shall leave a lighted candle or other light in any part of the mine when leaving his work.

75. No person shall try the wastes or workings for fire-damp with a naked light, and no person shall smoke or take a naked light, tobacco, pipe, cigar, cigarette, lucifer matches, or candle, where safety-lamps are ordered to be used.

76. No naked lights shall be allowed or taken beyond any danger signal where gas exists.

77. No person shall wilfully kindle a feeder of gas, or negligently have the gauze of his safety-lamp full of fire, or unlock the lamp, or unscrew the gauze, or blow out the flame, or light tobacco or other substance at the gauze, or damage or improperly use the lamp, or leave it in the works, when he has ceased using it.

78. Any person discovering any stoppage or derangement to ventilation, injury to an air-crossing, door, regulator, sheet stopping, brattice, or air-pipe, or observing any injury to or obstruction of an air-course, shall immediately give notice to the manager, under-manager, or deputy, and to any person or persons whose safety may be endangered thereby.

79. Any person passing through a door or sheet must instantly close the same, unless it is a door or sheet ordered to be kept open. No person shall, without authority, remove any caution-board, notice, or danger signal, or pass any danger signal, caution board, or fence.

80. In case of a shot missing fire the workman shall place a danger signal at the entrance to his working-place, and shall immediately report the same to the manager, under-manager, or deputy.

81. Every miner or other workman in charge of any working-place, before commencing work, and at intervals during his shift, shall examine his working-place, and in case any danger is observed shall at once report to the manager, under-manager, or deputy.

82. No person shall leave coal, slack, or other material so as to impede the ventilation; nor leave a skip or other obstruction in the air-current.

83. Every horse-keeper shall see that no animal under his care is allowed to go to work while in an unfit state, and shall report to the manager, under-manager, or deputy any injury received by any animal.

84. No person shall wilfully injure any animal whilst in his charge, or permit it to receive injuries by his wilful act or negligence, and shall report immediately to the horse-keeper or a deputy any injury received by such animal while in his charge.

85. No person shall take a horse on to or travel along any incline or plane, either in the mine or on the surface, which is self-acting or worked by machinery, while it is in motion, without special instructions from an officer of the mine.

86. Every person in charge of any animal shall immediately report to the manager, under-manager, or deputy in case he finds such animal cannot pass along any road without rubbing against the roof or timbering; and no person shall, unless otherwise authorised, give his horse into the charge of any other person than the horse-keeper at the stables.

*Shaft Signals.*

87. The following signals (with such additions as under special circumstances may be ordered by the manager) shall be carefully observed by the engineman, banksman, on-setter, and other persons employed at this colliery:—

One knock—to go on.

One knock—to stop when the engine is in motion.

Two knocks—lower down.

Three knocks—when any person is going to ascend or descend.

One knock—in reply before any person is allowed to get into the cage.

Four knocks—to lower slowly.

Five knocks—to ascend slowly.

88. Every person, when on the pit bank, or while about to descend the shaft, shall obey the orders and directions of the banksman; and every person, while in or about the pit, or while about to ascend the shaft, shall obey the orders and directions of the on-setter.

89. No person shall improperly use any signal, signal-wire, or signal apparatus.

90. No person shall get into the cage after the authorised number is in, or if forbidden to do so by the banksman or on-setter.

91. Every person who shall couple or fasten any skip to any other skip, or to any rope or chain shall see that such coupling or fastening is made secure.

92. Before any person moves a skip in a bord he must see that a safety-block is at or near the entrance of the bord, and in good order and set across the rail.

93. All persons employed in the mine shall be under the control of the manager, under-manager, and deputies, and shall at all times obey their lawful commands.

94. Any person committing a breach of any of the foregoing Special Rules is liable to be instantly dismissed.

END.

Name of the mine—East Greta Colliery. Where situated—Near West Maitland. Name of the owner—East Greta Coal-mining Company, Ltd. Name of the manager—Azariah Thomas. Name of the under-manager—Henry Cartwright. Name and address of the Inspector of Mines of the district—J. Dixon, Newcastle.

CERTIFICATE

## CERTIFICATE OF SPECIAL RULES.—EAST GRETA COLLIERY.

I HEREBY certify that the above copy of Special Rules has been shown to my satisfaction to be a true copy of the Special Rules which at this date are established under the Coal-mines Regulation Act, 1896, for the above-named mine.  
 Thirtieth day of April, 1897.

AZARIAH THOMAS, Manager.

JOHN DIXON, Inspector of Collieries.

*Exhibit A.—Put in by Mr. Thomas.*

NEW SOUTH WALES.

Sir, Coal-fields Office, Department of Mines and Agriculture, Sydney, 10 December, 1898.

With reference to recent underground inspections of the East Greta Colliery, and conversations with you on several matters in connection therewith, I respectfully desire to call your serious attention to the following points:—

1st. Having regard to the altered character to the roof of the seam, as proved by the fall of the 18th ultimo, in No. 1 tunnel, and by a fall in the lowest north level of No. 2 tunnel, it is desirable to increase considerably the quantity of timber on all lower levels to keep them secure.

2nd. It is desirable to prove the thickness of the conglomerate above the seam in the lowest level of No. 2 tunnel going towards No. 1 tunnel.

3rd. It is not advisable, having regard to altered nature of the roof, to allow the levels, when going with the top coal, left on to remain without being timbered near the face.

4th. Under the conditions of increased depth and altered roof it is desirable to increase the sizes of the pillars considerably.

5th. The diameter of the props used by the miners in the bords would afford more security if increased in size; and this is necessary having regard to the extra depth at which the workings are carried on, and also to the altered character of the roof.

Trusting these matters will receive your serious consideration, and I shall be glad at any time to further discuss them with you.

A. Thomas, Esq., East Greta Colliery, West Maitland.

I have, &amp;c.,

A. A. ATKINSON,

Chief Inspector of Coal-mines.

Copy of original.—3-1-99.—GEO. C. MARTIN, Coroner.

New South Wales, } County of Northumberland.  
to wit.

INFORMATION and depositions of witnesses, taken on oath, before me, George Cannon Martin, one of the coroners of our Sovereign Lady the Queen, for the Colony of New South Wales, this twenty-fourth day of December, one thousand eight hundred and ninety-eight, at the surgery, at East Greta, district of Maitland, in the said Colony, on view of the body of Albert Moncrieffe, then and there lying dead.

*Arthur Morrison*, having been sworn, states:—I am a wheeler, and am employed at East Greta Colliery, and I live in West Maitland; I have seen a body this day in the surgery at East Greta, in the presence of the coroner and jury; I cannot recognise the body from its appearance on account of the body being too decomposed; but I see a clasp knife now produced, and I know that it belonged to Albert Moncrieffe; I am sure that the knife was his; the point of it was blunted through he and others opening tins with it; I was told that this knife was found on the body we have now viewed; I am the brother-in-law of Albert Moncrieffe; I am almost sure that Moncrieffe was in the East Greta pit at the time of the late disaster; he was 25 years of age, and was born in Sydney, and he was married; his wife is alive; she lives in West Maitland; he leaves one child—a girl; he does not leave any property or invested money.

*By Jury*:—I was personally acquainted with the three men who were entombed in the pit. Dick Barnes was, I believe, the tallest of the three men, and Moncrieffe was, I think, the short one of the three.

Sworn and made at East Greta this 24th day }  
of December, 1898, before me—

ARTHUR MORRISON.

GEO. C. MARTIN, Coroner.

This Deponent, *William Thomas Doran*, on his oath saith as follows:—I am a constable in the Police Force, and reside at and am stationed at West Maitland; at 6:30 a.m. this day I received the body just now viewed by the jury, and also a tin, containing clothing, from Constable Townsend, at this surgery; shortly afterwards, I took the clothes out of the tin to wash them, and I then found in the trousers pocket the knife that is produced; this knife was identified in my presence by the last witness, Morrison, as the knife of Moncrieffe, and also by William Tiedeman as the property of Moncrieffe; the clothes were not identified; the body that I received was too decomposed to be recognised by the features; I have shown the clothes taken off the deceased to the relatives of the other two men entombed, and they positively say that they were not worn by either Gronow or Barnes.

*By Jury*:—The tin of clothes handed to me was said to have been removed from the body I received at the same time.

Sworn and made at East Greta this 24th day }  
of December, 1898, before me—

W. T. DORAN.

GEO. C. MARTIN, Coroner.

Inquest adjourned for the purpose of obtaining further evidence until 10:30 a.m. on Wednesday, the 4th day of January, 1899, at the Court-house at West Maitland, the jury being bound over and warned of time and place.

Dated at East Greta, this 24th December, 1898.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at half-past 10 o'clock on the 4th of January, 1899, at the Court-house at West Maitland, in the District of Maitland and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe; the jurors having answered to their recognizance the examination of witnesses was proceeded with.

Dated at West Maitland, this 4th January, 1899.

GEO. C. MARTIN, Coroner.

This Deponent, *Ada Emily Moncrieffe*, on her oath saith as follows:—I am the widow of Albert Moncrieffe, and reside at West Maitland; I was shown a singlet and a pair of trousers, those now produced, and I identify them as belonging to my late husband, Albert Moncrieffe; he leaves one girl, named Evelyn May, aged 7 months; the singlet and trousers were shown to me by Sub-inspector Fowler.

Sworn and made at West Maitland this 4th day }  
of January, 1899, before me—

ADA EMILY MONCRIEFFE.

GEO. C. MARTIN, Coroner.

This Deponent, *Azariah Thomas*, on his oath saith as follows:—I am the manager of the East Greta Mine, and reside at Mount Dee; I instructed certain work to be done in a part of the East Greta pit; it was let to David Lewis, Joseph Thompson, John Griffiths, and Daniel Gronow, on an understanding that they should make good wages at driving or sinking a tunnel—what we term extending No. 1 tunnel; I had to have it done to my satisfaction, and anything wrong that I objected to would have to be made good by those working; there were three shifts, of eight hours each, continuous working; and the five extra men were engaged by me for the mine and transferred to the work of the No. 1 tunnel as necessity occurred; I did not tell the men of what the strata was composed; I imagined that the men working knew of what it was composed; I always considered everything there was perfectly safe, and that all their work would be done in perfect safety; I did not go to see the tunnel every day; I cannot say how often, but I was satisfied with the work when I did go; I was deceived in the thickness of the conglomerate where the men had to tunnel; we had never found that the conglomerate was less than 50 to 60 feet, and I considered that 50 or 60 feet would be the average thickness of the conglomerate where the men had to go through in the tunnel; the men employed never referred to the place as being unsafe.

By

*By Mr. Tillett:* The driving of the tunnel was commenced—that is, the men commenced to clear the old sump out on the 22nd of June, last year; the men had nearly got as far as we intended to go at present, when the fall took place; the fall occurred 127 feet from the lower level, and about 260 feet from the face; the tunnel had been driven some distance beyond where the fall occurred; I was through the tunnel many times; I had not noticed any pressure on the timbers where the fall occurred; but I had noticed pressure in other parts of the tunnel; I noticed pressure on the timber about 40 yards from the face; the caps were bending; that did not indicate to me a change in the roof; the caps were not considered dangerous, so precaution was taken, but the timber was not strengthened; the same timbering has not been carried out from the surface to the face in the No. 1 tunnel, because we considered that stronger timbering should be put the greater depth we got; I was in the tunnel last on the Tuesday, the 15th of November, before the accident occurred on the 18th; this was one of the occasions on which I noticed pressure; no complaints had been made as to the roof by anybody, nor did I hear of any complaints; the men were not to earn less than miners, but if the work was to my satisfaction, they would be paid more; the men were to be paid by the yard; and also for anything extra that they did; there was no time fixed for the work; the men were to have assistance if required to be paid for out of the lump sum; I did not name the men who were to assist them; I had no written agreement whatever; In the Coal Mines Regulation Act, I know Rule 4; the four men, David Lewis, Thompson, Griffiths, and Gronow, were appointed as competent persons to inspect the work, or make the inspections in compliance with Rule 4; the work was measured up before these men were paid, and they were paid according to the measurement, and they were supposed to settle with the others, though I considered I was responsible to the men, these four men employed.

*By Mr. Tillett:* The model produced shows how the timbering was done in the tunnel, and I also produce a tracing of that portion of the No. 1 tunnel where the fall occurred; the props, sills, and caps were from 8 to 10 inches diameter, and with an 8-inch minimum; the sets were placed 5 feet centres apart, and slabbed over, and by the sides and underneath the sills, same as the model; the slabs were 6 feet long, and 2½ to 3 inches thick, and from 6 to 9 inches wide; the height of the tunnel from the top of the sill to the bottom of the cap was 10 ft. 6 in.; the mean width of the tunnel was 12 ft. 6 in., 12 feet to the cap, and 13 feet to the sill; we have taken out some of the timber that fell, and some of the caps are broken in pieces; I cannot say if they were bent before getting broken.

*By Mr. Atkinson:* The timber used for the sets was of ironbark—that is, the sills, cap-pieces, and props, and the slabs were of ordinary hardwood; the sills and caps were let into the side; the sills and caps were let in from 8 to 10 inches; the sills were 16 feet, and the caps 15 feet over all, that is their total length; they were set into the coal, and we avoided the roof; the sills were let into the bottom of the floor of the seam; the floor was moderately soft, and becoming softer as it got exposed.

*By Coroner:* The timber was new timber; the first lot of timber used was cut in June; the timber was not seasoned; the prop was mortised into both cap and sill about 4 inches deep; the timber from the lower level upward was much the same as that I have described, only it was set farther apart; I have had occasion to renew timber here, some years ago, but not recently; they were renewed on account of the sills breaking; the props seldom fractured, all pressure came from below; we supposed it was the floor expanding or swelling by the water and air that caused the sills to break; we have entirely used ironbark for all purposes until some little time ago; I cannot compare it with other timber on account of only using it; I have used ordinary hardwood for props in the bords recently; I had not had any fall previous to this one in the mine to indicate that the conglomerate had disappeared; the conglomerate has been proved at least at 7 feet at the lower levels, but how much more it may have been we could not tell; the station was on the surface under General Rule 4; the men commenced work on a Monday at 7 o'clock; David Lewis examined before the men went to work; Lewis came on the Monday morning to examine, and took the night shift; the night-shift went in at 11 o'clock, and Lewis stayed all that shift; I cannot say where he would meet the shift coming in; Lewis made a report in writing every day; none of the other four men made any report; the engineer made a report of the tunnel every week, under General Rule 5 of the Coal Mines Regulation Act; this inspection was made as to the condition of the timber and other things; no defects were mentioned in any of the reports; there are refuge holes in the No. 1 tunnel; I do not know how many there are, but I think that the plan shows six about 20 yards apart; we suppose that a refuge hole was made the night of the disaster within 10 feet of the face; general instructions were given to make these holes to be put in every 20 yards, and to be made immediately after securing the bottom corner of the intended man-hole; none of the deceased were found near man-holes; they were picked up in the tunnel; some of the fallen stuff had blocked up completely all the man-holes below the point we found the debris had filled the tunnel; the tail end of the debris was 130 feet from the completed face of the tunnel; the workmen did not make any inspection of the whole mine under General Rule 39; I cannot say how much the caps were bent, but I should say the worst may have been bent from 2 to 3 inches; I considered that they would require strengthening with others ultimately; I did not strengthen any at the lower levels, as they did not require it.

*By Mr. Curley:* I have a copy of the Special Rules of the East Greta Mine; before work took place in the tunnel I had an interview with David Lewis, and told him that I would like he and his party to take the work, as they had completed similar work satisfactorily; we conversed about terms; it was agreed that they should have a certain price, which I considered would be sufficient for them to make good wages, provided the ground proved the same as it did at the commencement; but should it alter and become worse, I should give them more, and to see that they would get as much wages as the miners; the price agreed upon was £3 19s. a yard, and nine men were to be employed, three in each shift; I engage all workmen at the colliery; I engaged all the nine men, but before going at the tunnel they were working in the East Greta Colliery; Moncrieffe and Barnes were two of the five assistants; these men asked me to transfer them to the work in the tunnel, and I did so; I considered them sufficiently practical men as assistants; they had worked in the colliery for some time; Moncrieffe was on-setter in No. 2 tunnel when he asked me; Barnes was engaged at, I think, filling coal for a miner before he went to the tunnel; I did not regard my arrangement as a contract; I would not call it a daily-wage payment; I call it an arrangement satisfactory to both parties; there was nothing in writing; the payment was made as arranged, and was satisfactory; I found the caps bent on a prior visit to that of the 15th of November, but I cannot say when; I did not make any note of the date of the caps being broken; I cannot say if I went into the tunnel once a week or once a month; the report books are kept at the colliery office; I either examine the report books daily or have the reports read to me; there was no mention of the caps being bent in the report book; I did not consider it of sufficient importance when I found that it was missing from the report book; there have been no extensive falls in the East Greta Pit until the present one, in no part of the colliery.

Sworn and made at West Maitland, this 4th day  
of January, 1899, before me,—

A. THOMAS.

GEO. C. MARTIN, Coroner.

Inquest adjourned, for the purpose of obtaining lunch, until 2:30 p.m. on Wednesday, the 4th day of January, 1899, at the Courthouse, West Maitland, the jurors having been bound over, and warned of time and place of adjournment.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 2:30 p.m. on the 4th of January, 1899, at the Courthouse, at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

GEO. C. MARTIN, Coroner.

This deponent, *Azariah Thomas*, recalled on his former oath, saith as follows (*By Mr. Curley*):—I believe David Lewis inspected the tunnel prior to these men going in to work—that is to say, the three men, Gronow, Moncrieffe, and Barnes; all these men worked at the coal that night except one that should be working at a manhole; even that would be working in the coal; Thompson and one of the assistants generally worked with Lewis on his shift; in the ordinary mode of working, when Lewis and his mates were not timbering, they would be at work at the coal-face; Lewis was not the only man in the ordinary way who inspected the tunnel; Griffiths and Gronow inspected it; Griffiths would be working in the face at coal or at anything else required; I consider that all this was in compliance with Rule 4 in the sense that is meant; I appointed them to inspect in the way I have mentioned; I have no record of the appointment; I had some knowledge of the stratification overhead at the East Greta Colliery; it can be seen on the surface, and some years ago we had a place driven from the lower to the upper seam off No. 1 level in this same tunnel; this gave me an idea of the thickness of the conglomerate; it was from 50 to 60 feet thick; this was 212 feet below the surface; I have never seen the conglomerate of less thickness than 50 to 60 feet anywhere; it was hard and strong; I have no knowledge of the Maitland Colliery or its strata; we have never had any slow or quick movements in the roof at the East Greta Colliery; we have had an upheaval of the floor; we have had some floor-upheaval in the No. 2 tunnel; we have not done much timbering in this

tunnel since the fall ; no extra work than usual ; the inspectors have been at the colliery, and have drawn my attention to timber and pillars in the deeper workings since the fall, and have advised the use of more timber, having regard to the altered state of the roof, as revealed by this fall ; it has been remarked that I should have larger pillars in the lower section ; I have had communication from the Inspector in respect to the workings ; I now produce the letter from the Chief Inspector of the 10th of December, 1898 ; this letter is made an Exhibit " A."

Sworn and made at West Maitland, this 4th day }  
of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

A. THOMAS.

This deponent, *Robert George Alcorn*, on his oath, saith as follows :—I am a legally qualified medical practitioner, and reside at West Maitland ; I examined the body of Albert Moncrieffe on the 25th December last year ; I found no bones broken ; the body was in an advanced state of decomposition ; I came to the conclusion from examination and the information that I received, that death was caused primarily from shock and suffocation ; I am almost certain that death was almost instantaneous.

Sworn and made at West Maitland, this 4th day }  
of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

ROBERT GEO. ALCORN, L.R.C.S.I.

This deponent, *Azariah Thomas*, recalled on his former oath, saith as follows (*by Mr. Curley*) :—The Government Inspector who usually inspects my colliery at East Greta is Mr. Bates ; Mr. Bates during his inspections has drawn my attention to fencing the machinery according to the Act, and fencing openings to the tunnel, to the ventilation in different parts, and methods of signalling, and to the security of roofs in different parts of mine ; this was some time ago ; this was on No. 1 level ; Mr. Bates did not suggest that more timber should be put in, and he pointed out some timber that was broken from the pressure from the floor ; this was, I think, about two months back or more ; I think that it was on the second level of No. 2 tunnel that Mr. Bates pointed out some timber showing evidence of some pressure ; this would be, I should say, some two or three months ago ; I cannot recollect any other place ; he did not suggest that more timber should be put in to strengthen these localities ; he did not forward me any written communication about the matter ; I have never had any written communication from Mr. Bates as regards any defects in the condition of the colliery ; I have had no objection to the workmen using the function mentioned in Rule 39 as regards examination, but I have not asked them to do it ; the face in this No. 1 tunnel would be 387 feet from any opening ; branching off this tunnel a parallel drive had been started recently, and was being worked at the time of the disaster by another gang of men ; I had no anxiety as to the safety of the men, though I knew they were so far away from any opening ; the fact of the tunnel being near its present destination did not in any way influence me in ordering additional timber being put into the level ; the fact of Mr. Bates pointing out to me the broken timber in other parts, did not influence me in attempting to get more timber into that tunnel, not before we considered it was required ; I cannot say how much coal came out of that tunnel.

*By Mr. Millard* : I could at any time I wished stop the sinking of the drive, showing that there was no agreement ; these same men—that is, the four men—had sunk No. 2 tunnel ; the men were satisfied with their payment for that work, and I was satisfied with their work, as I have previously said, and the payment I made for No. 2 assisted both sides in arriving at the right figure for No. 1 tunnel ; the four men were experienced, and particularly qualified for the work ; no regular miner, unless experienced in it, could be trusted to do the work in No. 1 tunnel ; I do not know of any other men anywhere better or as well qualified to do this class of work as Lewis and his three mates ; I produce a general plan of the workings of the East Greta Colliery, and point out the particular part of the seam referred to in evidence ; the seam at East Greta Colliery is inclined at an angle of 45 to 47 degrees at No. 1 tunnel ; No. 2 tunnel is driven a length of 1,132 feet, and coal has been worked on both sides of No. 2 tunnel ; both seams crop out at the surface, and, owing to the inclination of the seams, crop out close together, and the whole of the strata between the two seams is composed of conglomerate ; we found the conglomerate all the way of the 1,132 feet that we drove the No. 2 tunnel ; we never had any indications prior to the fall that this conglomerate had at all thinned out ; from indications in other places we have always associated this conglomerate as a roof for the seams ; in prospecting for the crop of the seam this conglomerate is the indicator as to where the seam lies, and it extends many miles from the East Greta Colliery, and it is a very hard conglomerate, and very expensive to remove by blasting ; it is an excellent roof for a coal-mine ; it has cohesion and strength on account of its being so thick ; we did not find any thinning out of the conglomerate roof in the No. 2 tunnel, but we saw the conglomerate in the roof all the way we went ; at the seat of the big fall the top end of the conglomerate showed only a few feet to paring down a few inches ; I may say to a mere shell, and above the conglomerate was a thickness of shale or mudstone ; the nature of mudstone is a soft, weak substance ; I believe, from what I have seen since the fall, that the roof came away suddenly, it being only mudstone with a thin shale of conglomerate next to the timber ; this is my firm opinion ; the caps that were bent that I spoke of are in the tunnel, and in position still, only more bent, and not very near the seat of the fall ; there was no timber bent near where the seat of the fall was ; the width of the seam was 10 feet 9 inches in the last place ; I measured it in No. 1 tunnel, and the height of the tunnel from roof to floor would be about or over 13 feet ; the bottom was taken out on account of the known hardness of the roof ; the timber being what I would call green, was in its favour ; I do not know of any better timber than I used that could be got for that purpose ; it is recognised as being the best timber for the purpose for durability and strength, and I know that the way that the tunnel was being timbered it was done in the best way that it could be done ; I go down the mine almost daily, and have been at the beginning at the extension of No. 1 several times in the week, and the tunnel is straight, and one could hold a conversation from one end of the tunnel to the other ; in my opinion the cause of the disaster was from the change in the roof not being apparent, and yet it had changed, from a thick conglomerate into the soft mudstone.

Sworn and made at West Maitland, this 4th day }  
of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

A. THOMAS.

Inquest adjourned, for the purpose of obtaining further evidence, until 10:30 o'clock, on Thursday, the 5th day of January, 1899, at the Court-house, West Maitland, the jurors being bound over and warned of time and place of adjournment.

Dated at West Maitland, this 4th of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 10:30 o'clock, on the 5th day of January, 1899, at the Court-house at West Maitland, in the District of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 5th day of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *Azariah Thomas*, recalled on his former oath, saith as follows (*By Mr. Millard*) :—I do not know of any reasonable precaution that I could have taken, to prevent this accident, that was not taken ; the timber that Mr. Bates called my attention to as being bent, was on the other side of the tunnel, and over 28 chains from where the fall occurred ; I now point this part out to the Jury, as it is shown on the plan now in Court ; virgin coal being in No. 1 tunnel at the sides, and not being worked, and not having been worked, proved of great strength to the sinking ; it is impossible that the pressure, as noticed by Mr. Bates, had anything to do with the fall ; there is a part of No. 1 tunnel where the roof was without timbering for over seven years ; it is between the surface and the top level of No. 1 tunnel, and it is now good and strong ; I had no one in the colliery who could have made a better inspector than Lewis ; Lewis is skilled in that class of timber, and in the timbering ; I know this, as he worked for me in the Old Country in a mine, with about the worst roof of anyone I know, and with very deep workings ; I found on examining, after the fall, that the caps and props had all fallen ; the sills only remained ; I should say that probably 100 tons of rock and mudstone came away altogether I made every exertion to get to where the men had been at work, using all precautions in the way of securing and

and timbering to keep those attempting the rescue from being injured, and no expense was spared in connection with this work; the work was continuous for the twenty-four hours, and advice and assistance were tendered by managers of other collieries; the amount of timber to be put in is at my discretion; I hold a manager's certificate under the present Colonial Act, and also one under the Imperial Act; I also served my time as a mining engineer, and have had experience in working coal at an angle.

*By Mr. Bowden:* I have been with this company over seven years, and know all matters connected with the colliery. The Government Inspectors could see the timber that was put in, and, had they not been satisfied with it, would have mentioned it to me; the timber was in the best condition for its purpose; the timber taken out after the fall, except being broken, is in as good condition as being sound as when put in; I believe that the Government Inspector was down the tunnel while it was being constructed; whenever the Government Inspector pointed out anything to me I was careful to attend to what he would draw my attention to; when the tunnel was being sunk I had it heavily timbered, so as to make it as strong as possible, as this tunnel was intended as the main artery of the mine.

*By Mr. Thursby, Foreman of Jury:* After the tunnel, that I mentioned as being on a parallel, had got finished, it would be of great advantage to the men in going in and out, and also to their safety; the place was well ventilated; the Coal Mines Act does not compel me to have a parallel tunnel cut; the parallel tunnel is down about 40 yards; this tunnel is not as large as the main tunnel.

*By Mr. Curley:* I have seen, when top coal was worked, that the top coal came down with the conglomerate, sometimes 1 foot, 18 inches, and perhaps 2 feet, but I never saw any mudstone come down with the top coal, but this was of seldom occurrence.

*By Mr. Millard:* When top coal was taken down, the props were first removed; this was only done when abandoning a certain portion.

Sworn and made in West Maitland, this 5th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

A. THOMAS.

This deponent, *John Jones*, on his oath, saith as follows:—I am a wheeler at the East Greta Colliery, and reside at East Greta; I knew all the three deceased; and I know that this inquest is being held on the body of "Albert Moncrieffe."

*By Mr. Tillet:* I was in the mine working at the time of the disaster in the jig just off No. 1 tunnel, on the lower level; Mr. Cantwell and his son Thomas were at work with me; I saw the light of "Albert Moncrieffe" in the distance in the bottom of No. 1 tunnel, at about 25 minutes to 7 a.m.; I sung out to Moncrieffe, and he replied "Hullo"; I went down the jig where I was working, and filled a skip of coal, and I heard something that sounded like rolls of thunder; I ran towards the tunnel, as it frightened me a little; I heard the fall when I got to the end of the level; I sung out to the man at the top that the tunnel had fallen in, and to sent the alligator down; I called out "Moncrieffe" first, and then "Gronow," and then "Barnes"; I called out loud, and got no answer; I stopped at the end of the level, and the Cantwells went up the tunnel; I engaged in the search party, and found "Moncrieffe," and Gronow; I found Moncrieffe's body lying face towards the slabs at the side of the tunnel, and Gronow's body was on its side; I have been at work at East Greta Colliery for about two years; I have not been further down the No. 1 tunnel before the fall than I was at the time I called to the men; I know that the roof where I have worked is composed of coal and conglomerate; I have seen the roof work just a little in places; I have seen timber bent where I have worked; I should say that the roof was a safe one, otherwise I should not have worked there; I have never heard any of the men at work say that the roof was unsafe; but I have heard the roof creep occasionally, now and again.

*By Mr. Atkinson:* I commenced my work on the occasion of the fall at 11 p.m. on the Thursday night, the deceased went down at the same time as I did; I did not have any conversation about his work; I have seen where the tops have been taken down, that the conglomerate came through, and also brought some other soft stone that was behind the conglomerate with it; this occurred in the seam jig in one of the bords off No. 2 tunnel; this would be a long way from where the present fall occurred; I do not remember any similar falls to this last large one; I worked in the model jig, just off No. 1 tunnel; it was only at bottom coal I worked there; I did not see any falls of roof there; the place I was at work in on the day of the fall was about 40 yards from the No. 1 tunnel; I did not examine the roof thoroughly where I was at work; it seemed a hard roof of coal; I was at work down about 30 yards from the level; I cannot say how much coal was left next the roof in this part; I do not know how thick the seam is, but I should say about 8 or 9 feet; I was driving this jig parallel to No. 1 tunnel about 6 feet; the props were about 6 feet long; I never heard any of the deceased express themselves as being unsafe where they worked; I have got a copy of the Special Rules of the East Greta Colliery, but as I cannot read I have not read them.

*By Mr. Curley:* The timber I saw broken was a cap-piece; it was broken from the centre; I saw several caps broken; I do not know how many; I was working nearly the whole time with those who were at work after the fall in No. 1 tunnel; I did not see Barnes's body recovered; I cannot say how far the other bodies were recovered from the mouth of the tunnel; I have heard the cracks or shakes in the levels and bords in No. 2 tunnel; I cannot say it was the timber that cracked, or what, or it might have come from the coal; I mean by shakes, a shaking noise; I did not expect that the mine was likely to tumble in; I have noticed the coal on the pillar sides a bit loose in some places; this was in the bords; this would be about three months ago; I never took notice if the timbers were broken; I have noticed caps bent but not broken in tunnels and bords, and in different parts of the mine; I believe I have been with the other men when they went into work; I cannot remember that they made any remarks about the work or the timber in the tunnel.

Sworn and made at West Maitland, this 5th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

Witness to mark,—

F. FOWLER, S.-Insp.

Inquest adjourned, for the purpose of obtaining lunch, until 2:30 o'clock on Thursday, the 5th day of January, 1899, at the Court-house, West Maitland, the jurors being bound over, and warned of time and place of adjournment.

Dated at West Maitland, this 5th day of January, 1898,—

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 2:30 o'clock p.m., on the 5th January, 1899, at the Court-house, at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 5th day of January, 1899,—

GEO. C. MARTIN, Coroner.

This deponent, *John Jones*, recalled on his former oath, saith as follows (*by Mr. Millard*):—I know conglomerate when I see it; I know that in the last fall there was some stuff that was not conglomerate, it was ironstone, as well as soft stuff; I call the soft stuff conglomerate; I have seen this stuff that I call soft in other parts of the mine; I have seen it lying along the roads and the levels on the side; it might have come from the roof; it was the same as the most of the roof above the coal, it was of a whitish colour; I know the difference between conglomerate and clay; I have never noticed the soft stuff that I saw there in other parts of the mine; I do not know what it is called; I never saw this same stuff come away from the roof where I have seen roof come away with top coal; everything seemed all right, when I heard Moncrieffe say, "Hullo"; I never made any report to anyone about the cracks and shakes that I heard; I have about two years' experience in the East Greta Mine; I did not think that these cracks or shakes indicated any danger; they might have been caused by weight coming on the timber.

Sworn and made at West Maitland, this 5th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

Witness to mark,—

F. FOWLER, S.-Insp.

his  
JOHN x JONES.  
mark,

This

This deponent, *David Lewis*, on his oath, saith as follows:—I am a miner, and reside at East Greta; I know that this inquest is being held on the body of Albert Moncrieffe.

*By Mr. Tillet*: I have been working in the East Greta Mine about four years, and at the date of the accident I was engaged sinking No. 1 tunnel from the lower level; I was on the previous shift to the deceased men; I had with me Thompson and Weller; it was understood between us and the manager that we were to sink this tunnel; no distance was mentioned; the manager could at any time stop us; we were paid by the yard, and if we could not make fair wages we were to be compensated, or if the manager wanted us to do anything else, we were to do it; we had to do the timbering as well as the driving; Mr. Thomas employed nine of us—three on each shift; four of us took the job, and the other five assisted; the party of four paid the daily wage; I was appointed a deputy by Mr. Thomas; I made my last inspection at 10:30, and after 11 p.m. on the Thursday night I made a report of that inspection, and entered it in the report-book at the office at after 12 o'clock that night; the three deceased men were then at work; the result of my inspection was that I considered it was all safe; I inspected the roof right through the tunnel, and saw no indications of danger except a few sets bent in the caps, about 40 or 42 yards from the face, but these did not make me think there was danger; I had seen these caps slightly bent on previous inspections; I did not think it anything unusual to see these caps bent; the sills might have rose a little and caused the caps to bend; I did not report that the caps were bent; none of the other men drew my attention to these bent caps; I never saw a movement in the roof of that tunnel; I have not seen any falls in any other part of the mine or any movement of the roof in any part of the mine.

*By Mr. Atkinson*: I was appointed a deputy about the latter end of June or the beginning of July, at about the time the continuation of No. 1 tunnel was commenced; I had a copy of the Special Rules, and have read that part referring to the deputy's duties; I have had no occasion since acting as deputy to report any danger or defect; there was nothing that I saw of a dangerous nature; my district was No. 1 tunnel, as far as the dam; it did not include the back place or the parallel jig; I went to work on the Monday previous to the accident, at 4:30 a.m.; I stopped until the men came in, and remained with them, and before they came in I thoroughly examined the No. 1 tunnel; I made a report in the book at the office; none of the men working ever asked to be allowed to see the report-book, had they done so I would have allowed them; there is no space left between the slabs and the roof; I have not had occasion to renew any of the sills either in this tunnel or anywhere else, the caps were bent back about 3 inches; I never noticed much, but the sills were bent a little at the same part where the caps were bent; the pressure that bent the caps and sills came from the floor, perhaps a little from the sides; I would not expect to get much side pressure in a single drive; I have not seen any evidence of coal peeling off the side of this tunnel; I had no conversation with the manager about these bent caps and sills; I did not consider the matter of sufficient importance; I looked upon this tunnel more in the light of a sinking shaft than a level drive; if I had seen similar bendings in a shaft I should have thought it of sufficient importance to report to the manager, but not in this case; the reason was that I did not think there was the least danger or that the timbers would give way; I cannot tell the distance the body of Moncrieffe was found from the face; I was prevented by illness from knowing this; I cannot say if the other men can tell this; I have never had occasion to ask to have stronger or more timber put in; it requires about three men to fix one of the sets; it would not be inconvenient to put in stronger timber; I was at the tunnel about seven, eight, or ten minutes after the fall; I went down the tunnel and got down to the beginning of the fall; I called out the names of the three men, but got no reply.

*By Mr. Curley*: I returned to make another inspection on the same Monday night; I went in at 11 p.m. and I remained for eight hours; I made the inspection before the working-men went in; sometimes I went in at 3 p.m. to start work some weeks; another shift had been in before I started at 3 o'clock; I inspected for this shift in the morning at 4:30; the men went in with me at 3 p.m. to go to their work; my next inspection would be before the 11 p.m. shift; I would be along with the men for one or two hours afterwards, so that I would be there until 1 or 2 a.m. on the Tuesday; this inspection would be sufficient on my part for the working shift coming in at 7 a.m., the leader of the incoming shift would also inspect for his shift; these men did not report that I know of; the first entry I made in the report-books was at the latter end of June or the beginning of July; Mr. Thomas appointed me to be deputy in the tunnel, and report in the book, and if I saw anything wrong after carefully examining the places, to withdraw the men, and report to him to that effect; Mr. Thomas meant that I was to make my reports in the book at the office of the colliery; I cannot see the report I mention in the report-book; my first report there is on the 1st of September last year; the shift that I went down with, and worked a shift continuously; I worked at the coal face occasionally when there was nothing else for us to do; we were generally engaged timbering; I have never noticed falls in any other part of the mine; Gronow never spoke to me of the sets that were bent; I never draw the attention of the men particularly to the bent caps, but in passing I have just mentioned them to Thompson and Weller; I cannot say if this would be a week or a month before the accident; I never thought of placing other sets between those where the caps were bent; I understood that there were to be 5 feet centres; that was my instructions from Mr. Thomas, the manager; I could have put in other sets even less than 5 feet apart, without consulting the manager; he gave me instructions to put up what I thought was required; had I thought there was the least danger I would have attended to it at once; I do not consider it singular on seeing the caps bent that I did not exercise the extra power that Mr. Thomas had given me; as deputy I gave official orders to the other men during the absence of the manager; we have taken out from 9 up to 12 yards during the fortnight.

DAVID LEWIS.

Sworn and made at West Maitland, this 5th day }  
of January, 1899, before me,— }

GEO. C. MARTIN, Coroner.

Inquest adjourned, for the purpose of obtaining further evidence, until 10:30 o'clock a.m., on the 10th day of January, 1899, at the Court-house at West Maitland, the jurors being bound over, and warned of time and place of adjournment.

Dated at West Maitland, this 5th day of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 10:30 o'clock a.m. on Tuesday, the 10th day of January, 1899, at the Court-house, at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizances the examination of witnesses was proceeded with.

Dated at West Maitland, this 10th day of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *David Lewis*, recalled on his former oath, saith as follows (*by Mr. Millard*):—The roof of the East Greta Mine was of conglomerate; I never before this fall saw any sign of that conglomerate running out, and it continued all the way down the No. 1 tunnel; I know the stuff that came through was a sort of mudstone—soft stuff; before that fall I had never seen any of this description of stuff in the roof, and I saw no indication to lead us to expect that any mudstone was there; conglomerate is a good roof; it was a hard conglomerate; we got the extra depth that we wanted by cutting out the bottom, as it was softer than the roof; we cut into the roof in some places from 1 to 4 inches; we found the roof very hard; I have had some experience in making drives of this description, and thirteen years' experience in timbering; in my opinion the system we carried out in the No. 1 tunnel was the best; we were not stinted in the timber in any way; the wages that we received were also satisfactory; the caps that were bent were about 40 yards from the face; it was not near the seat of the fall; the force that bent the caps was not the same force that caused the fall, as far as I can think; the fall could not have been prevented by replacing the bent caps with good ones; the bent caps gave no indication of the real danger or what was the real danger; the caps under the fall must have been broken by the fall; I made an inspection every twenty-four hours that I reported; but I made two to four inspections during a twenty-four hours; I made that inspection towards the end of my own shift; I never saw any sandstone in the roof of the seam; I have worked since the fall in No. 1 tunnel; I have worked long hours, but how many I cannot say; sometimes I went without sleep to attend there; finally my health gave way just before we found Barnes' body, and since then I have been very ill.

*By Mr. Bowden*: I cannot say the first time I saw the bent caps that were 40 yards from the face; I put the timbers in that were subsequently found bent two or three months back, before the accident; we would drive from 9 to 12 yards in a fortnight; those timbers were the only bent ones.

*By*

*By Foreman of Jury* : As far as I am aware of, I am only required to make one inspection in the twenty-four hours ; I had no particular reason for making extra inspections ; the first report that I made in September last would be to the effect that I found everything safe ; the whole of the No. 1 tunnel was under my inspection and charge ; the floor at the East Greta Colliery has always been a trouble ; I do not know if the Government Inspector was down ; I am sure I saw him once at the top of the tunnel ; the most of my time I was down on the 11 p.m. shift, I was doing timbering.

*By Mr. Bowden* : It was my duty to keep a constant supervision over the work ; the bent timbers are there still, but the bent parts are now broken ; these were broken by the weight of roof, as far as I know ; no other timbers have replaced these.

*By the Jury* : It would take me half an hour or three-quarters of an hour to inspect the tunnel.

*By Mr. Curley* : Thompson and Weller worked with me on my shift ; the skip took me down to the level, it went slow ; I never timed it from starting to stopping.

*By Mr. Millard* : I am still of the opinion that the bending of the caps before the fall was due to the floor ; I have had other experience of caps being bent by the floor on account of its being soft and swelling.

*By Mr. Tillett* : I consider that the caps got bent by the floor, but I consider that their breaking came from the weight of the roof afterwards.

Sworn and made at West Maitland, this 10th day }  
of January, 1899, before me,—

DAVID LEWIS.

GEO. C. MARTIN, Coroner.

This deponent, *Thomas Cantwell*, on his oath, saith as follows :—I am a wheeler, and reside at East Greta ; I knew Albert Moncrieffe, and that this inquest in sitting on his body.

*By Mr. Tillett* : On the morning of the 18th of November I was working on the level, and my father and Jones were at work in the jig ; we went to work at 11 p.m. on the 17th November ; we and the three deceased all went down together ; I saw down the tunnel where the deceased were at work ; I called down for the alligator and got a reply that I was to have it directly, this was at 6.30 a.m. ; I got the alligator and filled it and sent it on top, then it came back to the deceased, and they filled it ; it had not reached the top when I heard the fall ; I stepped back a few yards as I thought that the alligator may have broken away ; then I went into the level and met my father ; the three of us, my father, Jones, and I came out, and Jones and my father shouted down to the men under the fall ; afterwards we rapped for the alligator, then I called on top for the alligator ; my father and I then started down the tunnel, and Jones went to report ; I have worked in East Greta Colliery five years altogether ; I have known slight falls of roof in the colliery in the old levels ; I noticed the stuff that fell ; we call it conglomerate ; I have not been down the tunnel since the accident ; I don't know what stuff fell from the roof at the fall ; I have seen the roof work in the steam-jig bords, that is the coal roof ; I never reported these roofs working ; I never heard any complaints from the miners of the roofs working or of the timbers.

*By Mr. Atkinson* : I worked in the back or parallel jig before the accident ; all the coal was not being worked ; some portion of the scam was left next the roof to my knowledge ; I had no opportunity of seeing what the roof was, except in one spot at the top of the jig, it was a pebbly conglomerate there ; the coal in the back drive stood well next the roof ; prior to the accident I had never been in the No. 1 tunnel below the levels.

*By Mr. Curley* : The roof was down ; what I called the pebbly conglomerate was in a level ; it looked like a sort of white sandy stone with little pebbles in it ; it had fallen when I noticed it ; it was mostly broken up ; the width of the level where I saw it would be about 9 or 10 feet. It had fallen out between the bars, between the cap pieces, I should have said ; I should say that the bars there would be 6 or 7 feet apart ; the fall came down during the daytime, during the time I was on my shift ; the most I have seen fall would be about a couple of skipsful ; a skip would carry about half a ton ; I have seen this on more than one occasion ; it did not stop work only while it was being cleared away ; it would leave a space of a foot or 18 inches in the roof ; I did not notice any re-timbering after the stuff was cleared away ; no one came in to see about it ; I cannot say who the deputy was for that part ; it was two or three years ago ; anyone coming along could see the stuff until it was cleared away. We used not to go and inform when any falls like these took place ; Mr. Thomas was the manager at that time ; when I saw the coal roof work it was six or seven months back in the bords in the steam-jig ; I have seen much timber broken ; the props were some bent and some broken in the bords ; it was in more than one of the bords ; it was in three of the bords ; the width of the bords was about 8 or 9 yards ; I have seen coal shell off the rib side, sometimes five or six skips would shell off ; I have not seen any top coal fall between the props in the bords ; I did not see any board hanging outside of the tunnel, no deputy's board ; I have seen roof down in different places in the slippery level, and the old bottom level, it fell in the slippery level from between the timbers, and also in the old bottom level ; I handled some of this stone, it was damp in some places ; I did not see any real soft, it was friable or crumbly ; I cannot say if any one of these falls was larger than the other ; the last one I noticed was about two years ago ; I never heard any of the three deceased make any remark about the tunnel ; I saw Gronow, Barnes, and others at the mouth of the tunnel when we went to work ; I worked in the No. 1 tunnel for about three weeks before the accident ; I have not seen Lewis in the morning at the entrance to the tunnel when I went to work ; I have seen Lewis at the entrance to the tunnel of an afternoon ; when we were coming down Lewis was about going up ; I do not remember seeing Lewis at the entrance to the tunnel at any time during the three weeks that I worked in the tunnel ; I went down the tunnel on the alligator ; it would take us a minute or two ; the distance would be about 600 feet, I think ; I have not walked in or out for this past four years ; one could not examine the tunnel very carefully at the speed that the alligator travelled ; I think at the rate the alligator went one would have time to notice if the caps were bent ; I have noticed that the caps were bent where I have seen the falls of roof on the levels.

Sworn and made at West Maitland, this 10th day }  
of January, 1899, before me,—

T. CANTWELL.

GEO. C. MARTIN, Coroner.

Inquest adjourned for the purpose of obtaining lunch, until 2.30 o'clock on Tuesday, the 10th day of January, 1899, at the Court-house, West Maitland, the jurors being bound over and warned of time and place of adjournment.

Dted at West Maitland, this 10th of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 2.30 o'clock in the afternoon of the 10th day of January, 1899, at the Court-house in West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 10th of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *Thomas Cantwell*, recalled, on his former oath, saith as follows :—I have looked down the tunnel, and have conversed with the man down the tunnel ; I have seen cap pieces bent down the tunnel, at about 100 feet from the level ; I have seen four or five cap pieces bent ; I noticed them about a fortnight before the accident ; they were about 9 inches lower than the other sets, it appeared to me ; I never heard the men talk about this.

*By Mr. Millard* : I have never worked in any colliery but East Greta ; I could see at a certain time of the day very nearly to the bottom of the tunnel—say, at a quarter to 3 p.m. ; in the morning one could not see down above 50 to 70 feet ; I had been on the night shift for three shifts ; it was at my fourth shift when the accident happened ; I was about 5 yards away when the fall came away.

*By the Jury* : The caps that I saw bent, on looking down the tunnel, were also splintered ; I think the alligator might make sufficient noise to prevent me hearing any timber cracking ; I have never seen any inspectors down in the new jig, nor have I seen the inspector go down to No. 1 tunnel.

*By Mr. Millard* : I had no idea that a fall was going to take place ; I know that if I saw anything dangerous in my workings I would report it ; I do not remember ever making any report.

*By the Jury* : If the deputy said the working place I was in was safe, I would work in it without examination myself ; I have had a copy of the special rules, but I do not know Rule 70 ; I hear it says that all miners and those employed should report to the person in charge any insecurity in the roof, &c.

Sworn and made at West Maitland, this 10th day }  
of January, 1899, before me,—

T. CANTWELL.

GEO. C. MARTIN, Coroner.

This

This deponent, *Edward George Curtis*, on his oath, saith as follows:—I am a banksman at East Greta Colliery, and reside at West Maitland; I know that this inquest is being held on the body of Albert Moncrieffe.

*By Mr. Tillet*: I was at work at East Greta mine at the time of the accident; I was in the shift that went in to work at the tunnel at 11 p.m. on the night of the 17th; I saw the deceased at 11 p.m. on the 17th, when I let them down; I had not spoken to them or communicated to them after that time; I had not received signals direct from them, but had got several skips of coal from them; I think I received the last skip at 10 minutes to 7; I heard somebody sing out the tunnel had fallen in; I can't say the time; I had no time with me; I ran to the mouth of the tunnel and looked down, and I heard someone sing out, "Send the alligator down, the tunnel has fallen in"; I sent the alligator down; I had been employed at East Greta Colliery about four months; I have never been underground; I have never heard any complaints or any remarks about the roof of the colliery; I took no part below in the search for the bodies.

*By Mr. Atkinson*: The engine-driver gets the signal to pull up the alligator.

*By Mr. Curley*: The signal was in the engine-house; I could hear the signals given at times; I cannot say what signal was given before the last skip of coal was taken up; I was at my post at about 20 minutes to 11 p.m.; I saw Bert Moncrieffe, Dan Gronow, and Richard Barnes go down the tunnel that night; three others, named two Cantwells and John Jones, went part of the way; I did not see anyone else that night either go in or out; I don't remember seeing anyone else that I knew there that night; there is a board just inside the door with signals on it; that is, simply signals for working the tunnel; I have frequently seen this board, but have not seen any other notice on it except signals; as soon as I heard of the fall I sent the alligator down at once; John Jones came out first, and said the tunnel had fallen in; I told somebody to go and call Mr. Heyes, the engineer; Mr. Heyes came after about 10 or 15 minutes; I have not been down the tunnel at all, either before or since the accident.

*By Jury*: I have seen the Inspector go down; I cannot say how often.

Sworn and made at West Maitland, this 10th day  
of January, 1899, before me,—

E. G. CURTIS.

GEO. C. MARTIN, Coroner.

This deponent, *John Downie*, on his oath, saith as follows:—I am a timberer in the East Greta Colliery, and reside at East Greta; I knew the deceased man, Albert Moncrieffe.

*By Mr. Tillet*: I was working in the mine at the time of the accident; I was working in a jig alongside of the tunnel; I took part in the search for the bodies; I came across Barnes's body; it was lying on the left-hand side of the tunnel, standing, or rather in a stooping position, on the last set of timber; there was no man-hole nearer than 20 yards; we did not clear the debris right up to the face; we got the body and then left off; I have been at work at East Greta between three and four years; I have never been past what was originally called the bottom level; I never noticed the state of the roof; I never had time to look down the tunnel; I have known of slight falls along the levels; these were falls of roof; the stuff consisted of conglomerate that fell; it was not the same stuff as fell at the big fall; there was a sort of mixture of stuff at the big fall; there was in that some conglomerate, ironstone, and mudstone; the falls at the levels at the one known as the "slippery jig" level; I cannot say when it occurred; I have noticed caps bent in the mine; the weight causes them to bend; sometimes the floor causes them to bend, and sometimes the roof causes them to bend; when they bend from the floor, the sill springs up too; the caps in No. 1 tunnel are broken below the fall from the pressure of roof; I had not heard from any of the men the state of the roof in the tunnel.

*By Mr. Atkinson*: My jig was going in the same direction as the No. 1 tunnel; I put the timber in the jig; the timber was put under coal; I never saw the roof above the coal; Michael Burns worked in my shift, the two of us alone; the sets were apart 6 feet; the size of the timber was 6 inches diameter; the timber had a cap-piece; the timbers did not bend while I was in it; neither Cantwell or anyone made any remark about bent timber in the No. 1 tunnel that I heard; when Barnes's body was recovered I could see the coal face; the face was about 6 feet from his body, I should think; it appeared to me as if Barnes must have gone where he was found for refuge; I did not see either of the other bodies found.

*By Mr. Curley*: I was instructed to timber by one of the deputies, Mr. Hosking, or by the underground manager, Mr. Cartwright; I was never instructed to do any special timbering in No. 1 tunnel; I had instructions on my last shift to go to No. 4 bord, in what is known as Armstrong's jig, to timber, this is No. 2 tunnel; I had to timber the top rib, because it had all broken away; this timber was set under the coal roof; a good amount of timber has been broken there lately, props mostly, this was due to pressure, mostly from the floor and in some places from the roof; I have done a good bit of timbering in No. 1 tunnel since the accident; pretty well most of the caps from the fall to the face were broken in No. 1 tunnel; this timber was ironbark; I am sure I did not measure the distance that the sets were apart; the first set we put up would almost touch the broken set on both sides, and the next set would be between the new set and the old one; I have never known of any extensive fall in the East Greta Colliery; I have known rails bent from pressure from the floor; I have done some timbering in slight falls on the level, the fall would be up in the roof, sometimes 18 inches and sometimes 3 feet; I would call what fell from the roof conglomerate; I have timbered in other levels for slight falls; I have timbered in the bottom levels in the Scotch heading side; on no other levels or other places for falls from the roof; I have never seen any falls in the bords when tops were being taken down; the Scotch heading is on the right-hand side of No. 1 tunnel, and the top level is on the left side of No. 1 tunnel; I know other deputies—one Mr. Jowett and the other Mr. Eggleston; I do not know of any other deputies in that colliery.

*By Mr. Millard*: I have never worked in any colliery but East Greta; none of the falls I have mentioned were any way close in the lode by fall; I had nothing to do with the continuation of No. 1 tunnel, and have never been past the bottom level.

Sworn and made at West Maitland, this 10th day  
of January, 1899, before me,—

JOHN DOWNIE.

GEO. C. MARTIN, Coroner.

Inquest adjourned, for the purpose of obtaining further evidence, until 10:30 a.m., on Wednesday, the 11th of January, 1899, at the Court-house, in West Maitland, the jurors being bound over and warned of time and place of adjournment.

Dated at West Maitland, this 10th day of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, until 10:30 o'clock a.m., on the 11th of January, 1899, at the Court-house in West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 11th of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *Edward Weller*, on his oath, saith as follows:—I am a miner, and reside at East Maitland; I knew the deceased man, Albert Moncrieffe.

*By Mr. Tillet*: I was working in No. 1 tunnel on the day of the accident; I was in Lewis' shift; I went in at 3 p.m. on the 17th November, and came out at 11 p.m.; I was there timbering in No. 1 tunnel; I was fixing the set; this set was 5 feet from the face; I had been at work in No. 1 tunnel between four and five months; no falls took place while I was at work there; I had a good opportunity of noticing; I never saw the roof work; I never heard any movement in the roof, but I heard the roof working at various times when we were quiet, taking lunch; I never took any notice of it; I did not consider it dangerous; I have seen caps bent about 100 feet from the face; they had cracked a little; I did not take notice of it; I cannot say if it was from the roof or the floor; the roof was of conglomerate mixed with slaty stuff, the heavy stone is conglomerate, and the other the slaty stuff; the slaty stuff is soft to work; there was no difference in the timbering; they were put the same distance apart for both sorts of stuff; I have been in the tunnel since the fall; the fall consisted of the two descriptions of stone now before me.

*By Mr. Atkinson*: I did not have any conversation with my mates about the bent caps; I do not remember mentioning it to my mates; I mean that the caps were split; there were splinters on the bottom side of the caps; I saw it only in the bottom side; I cannot say how much of the cap was splintered through; the fall took place where the caps

were

were bent ; I cannot say how far the big fall was from the face ; the caps were bent 100 feet from the face ; I did not take notice after I went down after the fall to see if the bent caps that I had previously noticed had been where the fall afterwards occurred ; I saw three or four bent caps ; I cannot say how much the caps were bent, but I should say about 3 inches ; the splinters were not of any great length ; I have seen this slaty stone in the mine previously ; there are parts of this slaty stone all the way down ; I cannot say how far or what distance the tunnel was worked ; I worked from the bottom of the sump ; I never heard my mates make any remarks about the change in the roof ; the bending of the bars did not strike me as dangerous ; I heard instructions given by Mr. Lewis to make a manhole ; they were given to Daniel Gronow, Barnes, and Moncrieffe ; these instructions were given before they went to work on their last shift ; we had started the manhole in our shift ; I have had a copy of the special rules ; I know that it is a part of my duty to report a defect in the roof or any special danger that I may see.

*By Mr. Curley :* I now show on a penholder how the timbers were cracked ; I noticed these caps six or seven weeks before the accident ; Lewis worked on the same shift as I did ; I have never seen a board with any reports on it at the tunnel mouth ; I never saw reported on any board that the caps had been bent as I have described ; I cannot say how I came to notice that the fall had occurred where I had seen the caps bent ; Lewis told me on last Thursday that the fall was 100 feet from the face ; Lewis said that the bent caps were 100 feet from the face ; this conversation occurred outside this Court ; I asked Lewis what distance the bent caps were from the face ; I did not notice any other bent caps ; Lewis did not mention it in the mine at any time ; Mr. Thompson was working with us ; he did not mention it ; I was on the night-shift, and never saw the manager (Mr. Thomas) down ; I did not see the under-manager down either ; Lewis went down with us when we went to work, and he stayed the whole of our shift ; Lewis worked with us on the coal ; Lewis never warned us at any time to go out ; he never said the place was unsafe ; Thompson never did so, nor did either Cartwright or Mr. Thomas, the manager ; Mr. Lewis paid me my wages ; he paid me 6s. 6d. ; I have worked in East Greta Colliery just the time the No. 1 tunnel was being driven.

*By Mr. Millard :* I remember a water-cask in the tunnel ; the bent caps were above that ; you could see them from the cask ; I have been to the cask, and could always see the bent timber from it ; I know from what Lewis told me that the fall was 100 feet from the face ; and he also said that the bent caps were 100 feet from the face, and that is how I know where the bent caps were ; if the fall was over 200 feet from the face the bent caps could not be in the position that I said they were ; I should say that the bent caps were about 20 or 30 feet above the cask ; I have seen the soft stuff all the time we were driving the tunnel ; I cannot say where I first saw it ; I think that in the first 10 feet of the tunnel the roof was of conglomerate ; I always went by myself up the tunnel to get any small timber, but for any heavy timber Lewis would come with me.

*By Foreman of Jury :* I have had experience as a miner ; I did not look for any danger, though the stuff did change ; I worked at the Co-operative Colliery for three years as a wheeler ; Lewis never said anything to me about the roof or about any danger ; I knew Lewis was appointed a deputy to look after the tunnel ; I depended on Lewis to withdraw me if there was any danger ; I never saw the Inspector down the tunnel, but I was on the night shift for a month before the fall ; I had previously worked on a day shift ; I knew the Inspector ; I never saw a false set of timber put in ; I never saw a set put in and then removed ; I do not consider myself a practical miner ; I knew that the props and caps were morticed right through.

*By Mr. Millard :* The roof in the Co-operative mine is of bluestone and conglomerate ; falls there are pretty frequent ; I would not have gone in if I had thought that there was danger.

*By Mr. Curley :* The water-cask was there to catch water coming down the tunnel ; I had to go to this cask to empty it ; I cannot say its distance from the face ; I think that the cask was about 80 feet from the face.

EDWARD WELLER.

Sworn and made at West Maitland, this 11th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This deponent, *Joseph Thompson*, on his oath, saith as follows :—I am a miner, and reside at East Greta ; I knew the deceased, *Albert Moncrieffe*.

*By Mr. Tillet :* I was working in No. 1 tunnel, and was in the same shift as Lewis and Weller, and went in to work on our last shift on Wednesday afternoon, from 3 p.m. until 11 p.m. ; we were working on the face that night ; I was one of the four that took the job of sinking, and was appointed deputy for the shift I was on ; as deputy, it was a part of my duty to inspect the roof ; the roof was of conglomerate, as far as I knew, all the way down ; the stuff I now hold is not conglomerate ; I call it muck ; it was under the conglomerate, and where I have seen it come down it would be from 1 inch to 4 inches ; we never took anything down that would stop up ; I worked in the tunnel from the commencement ; I saw three or four bent caps in the tunnel ; they were not splintered ; my opinion was that the bending was caused from side and bottom pressure ; we knew that the bottom was always springing ; I would likely find side pressure in a single drive ; the bent caps were from 70 to 75 yards from the top level ; I have been in the tunnel since the fall ; the fall occurred above where the bent caps were ; I did not regard these bent as showing any danger ; I do not make any report of my inspection, either written or otherwise ; we were considered to have 60 feet of conglomerate, and I consider that we had that thickness of conglomerate, where the stuff I call muck came from ; I saw Gronow's body in the surgery, and I identified it.

*By Mr. Atkinson :* I have been appointed deputy since the work commenced ; I understood from Mr. Thomas, the manager, that I was to look after things in my shift ; I commenced from the bottom sump ; I have read the special rules of the colliery ; I believe I have read general rule No. 4 of the Mines Act ; my inspection was made every time I went up and down the tunnel ; that would be very likely three or four times some shifts, if extra timber was required to be brought in ; the inspection was made from the alligator going up and down ; the alligator would not go quick, slow enough to have time for inspection ; it did not go particularly slow, but in taking heavy timber in, the alligator would go very slow ; I never saw a drop of water in the roof ; the timbers were set with the lay of the seam ; the timbers were set at right angles to the dip of the seam ; I had a square, a straight-edge, and a spirit-level ; we would use the square at about every fourth set ; Lewis and the others have talked about bent caps in the tunnel ; we were surprised at the new timber bending so quick, and consequently we expressed our opinions about it ; my opinion was that the caps were bent from side pressure ; there was no talk about strengthening or of renewing bent timbers ; as deputy I did not think that it was of importance to mention it to the manager, as I did not consider there was danger ; had I thought so I would have reported to Lewis, and through him to the manager ; I did not think that, seeing the soft stuff called muck, that it denoted a change in the roof ; there was no space left between the props and the coal ; there were no props bent that I saw ; I should not have expected to see the props moved by the side pressure ; the reason that I give for the caps being bent was that the caps were wedged tightly from the rib on each side, both ends being wedged tight ; the ti-tree might give behind the props.

*By Mr. Curley :* The ti-tree was put there with the bark on it ; the ti-tree was not dressed, it was in its natural state of round timber ; the ti-tree was used for packing ; sometimes it would not be required behind the timber ; the ground was what I would call live ground ; there was no great weight on the coal ; I would see the coal burst out occasionally ; I do not think there was sufficient side pressure to interfere with the side timber ; I do not believe that there was any pressure from the roof, notwithstanding the fall ; I have worked at East Greta Colliery about, I think, two and a half years ; I worked in No. 2 tunnel, sinking ; I also worked in the slippery-jig, in the bottom jig, and various parts of the mine ; I have never seen any part of the roof giving, nor have I seen any falls from the roof, nor have I heard of any falls, or of anyone being hurt by any falls ; the sets in No. 2 tunnel were put in 5 feet centres ; that tunnel was driven exactly the same as the No. 1 ; we were paid by the yard in No. 2 tunnel, the same as in No. 1 ; the party consisted of Lewis, Griffiths, Gronow, and myself ; I never saw any caps bent in that tunnel ; we took up the bottom the same as in No. 1, and did the packing the same way.

Sworn and made at West Maitland, this 11th day of }  
January, 1899, before me,—

JOS. THOMPSON.

GEO. C. MARTIN, Coroner.

Inquest adjourned for the purpose of obtaining lunch, until 2:30 o'clock on Wednesday, the 11th day of January, 1899, at the Court-house in West Maitland, the jurors being bound over, and warned of time and place of adjournment.  
Dated at West Maitland, this 11th day of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest

Inquest resumed, in pursuance of adjournment, at 2:30 o'clock on the 11th day of January, 1899, at the Court-house in West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 11th day }  
of January, 1899,—

GEO. C. MARTIN, Coroner.

This deponent, *Joseph Thompson*, recalled, on his former oath, saith as follows (*By Mr. Curley*): Tenders were called for work in No. 1 tunnel, I believe; I think that a notice was posted up in the office; we tendered for the work; the price that we tendered was not accepted; we tendered, as far as I can remember, at £4 7s. 6d. per yard; after we had a conversation with the manager, Griffiths and I together had a conversation with the manager, and he objected to our price; the manager asked us if we would do it at a certain price, and we came to an understanding, and if we could not make wages at it he said he would see that we made wages; we agreed afterwards for £3 19s. a yard; for that we had to drive the tunnel, as far as I can remember, the same as in No. 2; we had to take the coal out and put the timber in, after lifting the floor; it was explained how we were to put the timber in, the sills were to be 16 feet over all, the caps 15 feet, and the props 10 feet 6 inches, and the class of timber to be of ironbark, same as No. 2, and ordinary hardwood for the slabs; the sills were to be varied from 9 to 10 inches, and of round timber cut off the bush; the cap pieces were to be about the same as the sills, about 9 inches through, put in as they come from the bush, except for fitting in; the props would be of the same thickness, about; I never saw any timber that was defective; sometimes a good bit of the timber would remain on the surface; when I saw the caps the idea never came to me that the roof was weighty; I never thought about putting in a set between the bent caps; as far as I understand the tunnel would have to go about another nine sets, about 45 feet; I cannot say who told me, but I think it must have been Griffiths; this was about two or three days before the accident; we had no conversations about pushing on the work to get it completed; we pushed on every day as much as we could; I never said to the under-manager, the manager, and Lewis, that it was necessary to put in fresh timber where the caps were bent; I considered myself a deputy to make inspections, but not to make a report; the understanding was with Mr. Thomas, and that was, that he would look to me as responsible for anything that occurred on my shift; but Mr. Thomas did not say that I had to report; I did not consider, under general rule 4, that I should report; I believe that my mate, Lewis, who worked with me, made reports; we started at the tunnel four or five months back; I think it was in June last; I generally kept the record of the distance we had driven; I can produce the book I entered that in; I know Edward Weller; he worked along with us; he had, I should think, every opportunity of seeing those cap-pieces; we used the ordinary miner's light; as a rule, we all went down together, Lewis, Weller, and myself; I have never seen any other cap-pieces bent besides those in No. 1 tunnel; there were two casks on the roadside; the water came down the tunnel; it did not come out of the roof; I think that it came out of the coal; there was one cask between the third and fourth man-hole from the level going down the tunnel, and the other cask was further down; I cannot say how much further, but the casks would be about 20 or 30 yards apart; the man-holes were 20 yards apart; the first one was 20 yards from the level.

*By Mr. Millard*: The stuff I called muck would be between the coal and the conglomerate; there are bands in the seam sometimes; it is not always the same; I do not think that this band would affect in any way the roof; I never saw any of the muck mixed with the conglomerate, or above it; I noticed the roof carefully as I went down; had there been this muck in the conglomerate I must have noticed it; all the timber supplied was good; I never saw better; I do not know of any better class of timber for this work; it is recognised as the best; I knew that this tunnel was meant to be a permanent work; the bent caps that I saw were nearer the face than the fall; I do not know the distance of the big fall from the face; the fall extended 55 or 60 feet; I should think that the bent caps would be about 15 or 20 yards from the lower end of the big fall; had fresh timber been put in where the bent caps were, it would not have prevented the accident; the bent caps had nothing to do with the accident, I think; I have had experience of other collieries; the East Greta roof being conglomerate, I should consider it a good roof; it is not an uncommon thing to see falls from the roof in other collieries; I should say that a skip and a half or two skips coming down would be a common thing; I don't think that this would indicate any special danger; in abandoned workings it would not be at all strange for the roof to come down, it would be unusual if the roof stayed there, under those circumstances.

*By the Jury*: The bent caps are still there as far as I know; they were there when I was there last; all that I know of the thickness of the conglomerate is from what I have been told; the slabs were not bent.

*By Mr. Millard*: Had there been pressure from the roof I should have expected to see the slabs bent; I have seen conglomerate in the overcast; this conglomerate shows about 7 or 8 feet thick.

*By Jury*: I have seen since the fall a cap piece taken out that was not broken; I heard that the Inspector was down the mine; this was said to me by Gronow about three or four weeks before the accident; I did not see the Government Inspector myself.

*By Mr. Curley*: The slate above may have been of an average of 8 inches; I have heard the manager and the engineer, and others say that the conglomerate was of the thickness that I have mentioned.

*By Mr. Tillett*: The piece of conglomerate produced is from the overcast, and is marked as an exhibit B, in blue.

*By Mr. Curley*: Where the fall took place I call it soft conglomerate and muck; the rock that I see on the table I term a soft conglomerate, the blue or slatish stone I call muck, and the whiter stone I call a fine conglomerate; the blue or slatish stone examined by the jury is somewhat like what we have been taking up in the floor of the tunnel, sometimes softer than this stone, and sometimes harder.

JOS. THOMPSON.

Sworn and made at West Maitland, this 11th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This deponent, *John Downie*, recalled, on his former oath, saith as follows:—I see the stone on the table; I brought it from the East Greta Colliery; I cannot say where one piece came from in the colliery, but the other piece came from the big fall in the colliery; this piece is marked as an Exhibit "C"; I got this stone, marked "D," out of a skip of muck; this muck had not been exposed to the weather, and the Exhibit "C" I got out of a heap of stone that came out from the big fall.

*By Mr. Curley*: I think that the stone I produce is a fair sample of the stuff; I cannot tell what part of the fall it came from.

Sworn and made at West Maitland, this 11th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

JOHN DOWNIE.

Inquest adjourned, for the purpose of obtaining further evidence, until 10:30 o'clock on Thursday, the 12th day of January, 1899, at the Court-house at West Maitland, the jurors being bound over and warned of time and place of adjournment.

Dated at West Maitland, this 11th }  
of January, 1899,—

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 10:30 o'clock on the 12th day of January, 1899, at the Court-house at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 12th }  
of January, 1899,—

GEO. C. MARTIN, Coroner.

This deponent, *James Cantwell*, on his oath, saith as follows:—I am a miner, and reside at East Greta; I knew the deceased man, Albert Moncrieffe.

By

*By Mr. Tillet :* I was working at East Greta Colliery at the time of the accident ; I went in at 11 p.m. on the 17th November ; the three deceased men went in with me ; I was working in the new jig, running parallel to the new tunnel ; my son Thomas and John Jones were there with me ; I did not see any of the deceased, or have any communication with them after going down ; I remember the time of the fall, at 5 minutes to 7 on Friday morning ; we heard a noise as a rumbling like thunder ; I stood and listened for four or five minutes ; then I ran over to the No. 1 tunnel ; I thought the old workings on the opposite side had fallen in ; I looked up the tunnel and could see nothing ; then I walked round and looked down the tunnel and saw the fall ; I and Jones called out to the deceased men and got no reply ; we then went up the tunnel ; I have been at work at East Greta Colliery for seven years ; I have never been down the new tunnel ; I have not seen any defects in the tunnel, as I have not been down ; you could see a good distance down on a clear day ; I never heard any complaint of the tunnel ; I had a conversation with Moncrieffe (2) two nights previous to the accident ; I was alone with Moncrieffe ; he said that some of the bars were bent and broken ; he did not say any more ; he said that they were 100 feet from the level down towards the face ; Moncrieffe said that he wished he was out of the place, as he was frightened ; I did not mention this conversation to any one that I am aware of ; Moncrieffe did not say anything else about it.

*By Mr. Atkinson :* I know the roof of the East Greta Mine ; it was composed, parts of it of conglomerate and parts of soft stone ; these stones represent the roof ; we had softer stone in the colliery than any of that stone in the roof represented here on the table ; I saw patches of it ; there was no conglomerate at all where I saw the soft stone I have mentioned ; the place where I saw it was on the bottom level—now called the middle level—about from the tunnel 40 yards, and 500 yards further in ; it was only in patches during this distance ; I know where the dam is fixed on that level ; I did not notice the soft stone on the tunnel side of where this dam is fixed ; I saw the soft stone just fair over the dam ; I saw this while the coal was coming in and out ; the thickness of the patches of soft stone would be of about 3 feet up between the timbers ; I was working with a deputy named Higginson ; we had no conversation about it ; he would repair any little fall that would come ; the sets were about 5 feet apart ; the weight of the pillar broke a good many of the sets ; I think the pressure came from the coal pillars ; the coal occasionally fell off the pillar sides, in about the quantity of a skip or a couple of skips at a time ; the bar or cap pieces got broken ; I know that the bar was 9 feet long and 9 and 10 inches in diameter ; it was of ironbark ; the sets were only slabbbed in bad places ; the slabs did not often break ; I put packing sometimes between the prop and the rib side ; this timber was generally of ti-tree or short slabs—anything we could get ; I have seen this soft stone in other parts of the mine ; I have seen it in No. 2 bord, above the present level in taking down top coal ; it would be about 500 yards from No. 1 tunnel, travelling south ; I have not seen this soft stone in any other place except that level, not nearer the tunnel ; the top coal was taken down to within 5 or 6 inches of the roof ; falls sometimes would displace this coal ; it used to drop off ; I considered the roof more dangerous where the soft stone is ; I did not report the change, because a deputy was with me ; I presumed that the deputy would report if anything was dangerous.

*By Mr. Curley :* It was three years ago since I was doing the timbering ; I have seen the manager where I was working ; I mean Mr. Thomas ; Mr. Thomas would have a knowledge of the change of roof same as I would ; the No. 1 tunnel is an extension of the workings of the No. 1 tunnel, that have been working for years ; I know of a parallel tunnel that is being made about 30 yards from the No. 1 tunnel ; it goes at the same dip as the tunnel ; no places have been driven between these two tunnels ; the jig is down about 130 feet ; it has not been worked since the fall, but was at work at that time ; I did timbering in the Scotch heading ; this was at the right of the tunnel, about 200 yards from it ; I was working in a level and bords ; I never saw any conglomerate fall there, but I have seen coal fall there only ; I presume that pressure from the old workings caused the coal to fall ; after the coal is taken out a little creep takes place, and then there is a fall of roof ; there was a very big fall of roof in No. 3 bord over three years ago ; I visited this bord with a deputy, and tried to secure it by extra timbering ; I saw what came from the roof ; it was soft stone ; I have done timbering on the left-hand side of the tunnel ; I call that the north district ; I did not see any stone fall on that level ; the timber I put in was to secure the roof ; there was timber in previously ; this timber was about 5 feet apart ; I had occasionally to put extra timber in between the sets ; there was about 5 or 6 inches of coal left in the roof there ; some of the caps were bent and some broken ; they were broken here and there in patches, and new ones were put in ; I cannot say how often I have seen the manager in where I was working before the accident ; I have seen him in three times one week ; I know the under-manager ; I have seen him come in twice when I was on the day-shift ; I was on the night-shift there for a fortnight ; I heard Jowett's voice one night he called out down to me ; Jowett was the only official I heard there during the fortnight ; I was at that time driving the jig ; had they come down the jig I must have seen them ; I am quite sure that Jowett was the only official about there during that fortnight.

*By Mr. Millard :* I was going to the pick-shop from the Cricket Ground when Moncrieffe and I conversed about the tunnel ; it was at about 6 o'clock in the evening ; I would not go into a place I knew to be dangerous ; I worked at it to put it in a safe state ; it was dangerous while we were working at repairing it ; afterwards I remarked to Higginson that it was dangerous ; Higginson said that we need be careful of it and not go underneath it ; the patches of soft stone, I cannot say how many I saw during the 500 yards, as far as I could judge ; in some places the patches occurred in every second set, and then you might go for five or six sets and not see any more ; I believe that there would be 100 patches in the 500 yards ; there was only conglomerate in patches also in that level, small parts, that is flakes, came away ; it still seemed, when this came away, that there was conglomerate above it ; I cannot say how much soft stuff there was above the other that came away ; I cannot say if there was conglomerate above the soft stuff on the level ; the stuff was very soft ; I cannot account for its not keeping on falling except that in places the timber may have kept it up ; it came away about 3 feet in the level, higher in the middle ; after it fell timber was put up against the roof ; the pillars had not been taken out in the Scotch heading to my knowledge ; if they are out now they must have been taken out before the fall ; I am positive the pillars had not been taken out in the Scotch heading at the time of the fall ; it is not usual to take pillars out in the East Greta Colliery ; the roof of the East Greta Colliery was patchy ; I believe that there was more conglomerate in it than soft stone ; I know the overcast in the bottom level, there is no soft stuff in that, it is composed of hard conglomerate ; the extension starts 30 or 40 feet below the level of the overcast.

*By Mr. Bowden :* I have never worked in other collieries ; we could always get all timber that we ever required.

*By the Foreman of the Jury :* I consider that the parts of the East Greta Colliery that are not safe is that where is a soft roof ; I consider that the manager and those in charge have always done their best to safeguard the men at work in the mine ; I never heard from anyone but Moncrieffe anything that would reflect on the safety of the No. 1 tunnel ; I cannot remember anyone being discharged for saying that the mine was unsafe.

*By the Jury :* I still work at the East Greta Colliery ; if Mr. Thomas, the manager, says that the pillars have been removed in the Scotch heading it is an untruth ; it is not possible that the manager could take anyone down to take out these pillars without my knowledge ; I have seen a Government inspector in the colliery ; when I looked up the tunnel I did not think that the fall was where it had occurred ; I thought it was a fall in the old workings ; I knew that caps were broken in the old No. 1 tunnel, and were replaced with new ones ; the fall where Shuffler was at work at the pillars came from the roof ; it would be away about 400 yards, to the best of my belief, from the No. 1 tunnel, where the last fall occurred ; I cannot say how long he was taking them out, or if he still continued to take them after the fall ; I saw this fall afterwards ; I should think about 80 tons may have fallen of roof ; the pillars were not continued taken out there after the fall ; top coal was taken out the same side as the fall, but farther on ; Higginson and I went to the Scotch heading to see if we could do anything to repair or prevent further fall, and we found that it was so high we could not do anything with it ; the front shift had come out, and there was no one at work there when Higginson and I went in ; I did not call these extensive falls ; caps do not always break from roof pressure ; it may be from other causes ; if the props were intact, the sills were intact, and the caps only bent, this would indicate roof pressure ; I am experienced in timbering, and if I saw the props were tightly wedged, and the sills had not moved, and yet the caps were bent, I should say there would not be side pressure ; if there was sufficient side pressure to bend the caps, it should also show in the props ; with bottom and side pressure I should say that the sills would bend or break in the middle, and then I should say that the sides would go next ; the packing of ti-tree would for a time keep back the side pressure.

*By Mr. Tillet :* I would expect to get side pressure in a tunnel of that description.

*By Mr. Millard :* The caps, I know, were wedged into the side tight, and if the side was packed the pressure would come on the legs ; the ti-tree packing, if put in with the bark on, could give a little ; ti-tree put in with spongy bark on it would give sooner than the wedges ; the ti-tree giving would ease the pressure on the props ; I should expect in roof pressure to see it affect the slabs ; they would give or bend a bit ; the slabs are not as strong as the caps.

Sworn and made at West Maitland, this 12th day  
of January, 1899, before me,—

JAMES CANTWELL.

GEO. C. MARTIN, Coroner.

Inquest

Inquest adjourned, for the purpose of obtaining lunch, until 2·30 o'clock p.m., on Thursday, the 12th day of January, 1899, at the Court-house in West Maitland, the jurors being bound over, and warned of time and place of adjournment.

Dated at West Maitland, this 12th of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 2·30 o'clock p.m. on Thursday, the 12th day of January, 1899, at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 12th of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *James Cantwell*, recalled, on his former oath, saith as follows (*by Mr. Curley*):—I had repaired timber in No. 1 tunnel; this would be midway between the top level and the middle level; the caps were broken that I replaced; I saw about half a dozen caps that I helped to remove; I had to pass in and out of the tunnel before I went to repair them; I could see that they were broken before I went to repair them; they could not have been broken more than a week before I went to repair them; I did not notice the roof, as I could not see it for the slabs overhead; it was the cap-pieces that were broken; they were from 9 to 10 inches; this was a little over three years ago.

*By Mr. Millard*: I have noticed sills bent up in that tunnel.

*By Mr. Bowden*: I was with Deputy Higginson when I went to repair the timber; where I noticed the caps bent or broken the slabs were not bent or broken; in bords I have seen slabs broken; I was a fencer, or at any kind of bush-work, before I went to the East Greta Colliery; I was employed on the surface at East Greta Colliery before I went below, for about six months, as near as I can think; I have of late had charge of a shift down below; my duties were then to replace timber in No. 2 tunnel, or to put timber in to strengthen it.

*By Jury*: Mr. Thomas and I are friendly; we have never had any quarrel; the caps that Mr. Higginson and I saw were above the No. 1 tunnel; I had a contract for driving the jig, running parallel with No. 1 tunnel; I had one partner in that contract, Aquila Roster; tenders were called for it; there were no specifications; no distance, only an ordinary jig; I had men working for me; Downie was one of my men; I paid him his wages; after the fall took place, I rang for the alligator; it was not sent down; it is the rule for it to be sent down if rung for; but I did not ring for it on any previous occasion; Jones rang for it after I had done so; I knew a shift was coming down, so I sung out for them not to come down; I have looked down where the continuation of No. 1 was going on; I never noticed any bent caps, as I was never there at a time you could see far down; at about 3 p.m. you can see well down the tunnel; I never happened to look down the tunnel at that time, though I have been there in going about my work; I could have seen had I looked at that time.

*By Foreman of Jury*: I have never seen a fall from the side; the falls generally took place where the timber had not been strained; if I heard a fall at some distance in a mine where there were strained timbers, I should infer that it occurred where the strained timbers were.

*By Mr. Millard*: I put full sets in where the sills were broken.

*By Mr. Curley*: I did this work for about 300 feet in No. 2 tunnel.

Sworn and made at West Maitland, this 12th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

JAMES CANTWELL.

This deponent, *Henry Cartwright*, on his oath, saith as follows:—I am under-manager at East Greta Colliery, and reside at East Greta; I knew the deceased man.

*By Mr. Tillett*: I have been under-manager and manager since the inception of the colliery—first as manager, and then, after Mr. Thomas came, under-manager; I know the extension of the new No. 1 tunnel; I was one of the first to enter the tunnel after the fall; there were three of us together, Heges, the engineer, David Lewis, and myself; the time was, I think, at ten minutes past 7; we found the tunnel had fallen in; we went right to the edge of the fall and called to the deceased; I shouted out loud and knocked on the rails, but got no reply; I was in the tunnel before the fall, but I cannot say exactly when or if I had been in during the week the fall took place in; I think I was in the tunnel for the last time about a fortnight before the fall took place; I examined the roof all the way down then; I did not see any indications of danger in the roof; I saw a couple of caps bent, not broken; they were so bent that one could only just discern it; I did not regard this as an indication of danger; I do not remember seeing stone of the sort now before me at the East Greta Colliery; the roof of the mine was of conglomerate; I have seen slight fall of roof before this fall, after the pillars have been taken out; I have seen slight falls in the levels, but of no thickness; the stuff that came down was sometimes coal and sometimes roof, nothing like this stuff; I went down in the bottom level every day; this has been my practice every day, but I cannot remember seeing this description of stone.

*By Mr. Atkinson*: I was at the top of No. 2 tunnel when I was called at the time of the fall; I had not been down the mine that morning; the pit starts to get coal as soon as the men are down at 7 a.m.; my usual time for going down is 8 to 8·30 a.m.; I had not been near the top of No. 1 tunnel on that morning; I am under-manager for the whole of the mine; it would take me one day to examine the whole of the East Greta mine; I refer to examining No. 1 as well as No. 2; I have read the rules as to the duties of the under-manager; I now read No. 3 rule of the special rules; I can only explain not complying with the Rule 3 that Mr. Thomas and Mr. Heges looked after No. 1 tunnel whilst sinking; Mr. Thomas told me that he had put David Lewis in charge as deputy of No. 1 tunnel; I saw Mr. Thomas about No. 1 tunnel; I did not look upon the extension of No. 1 tunnel as a particularly important place; I cannot say when Lewis was given in charge as deputy of No. 1 tunnel; I do not keep any record; Lewis was put in charge as deputy at No. 1 tunnel when it was started from the bottom of the sump; this would be, if I think rightly, about last July; Jowett, the night-deputy, made the report at the time the tunnel started, and I believe that he reported about it until Lewis took charge as deputy, about a couple of months from the start; I do not know why Lewis came to take charge as deputy; I do not think that Jowett looked after the tunnel after Lewis took charge as deputy.

*By Mr. Atkinson*: Pillars were taken out in the East Greta pit; some of them on the north and some on the south side of No. 1, between the top level and what is now known as the middle level; there were falls of conglomerate when these pillars were taken out; I do not remember seeing any other stone than conglomerate; the fall would be up about 5 or 6 yards; it consisted all of conglomerate; I do not know how far the No. 1 tunnel was to go; I knew that the level was coming from No. 2 tunnel to meet the No. 1 tunnel when it reached a certain point; I have examined the roof in the level; it is of conglomerate; I remember a drive being made from the bottom seam to the top seam; I cannot say the distance; I have been in the place while driving it; conglomerate went through it; it was all conglomerate, if I remember rightly; on second thoughts, I think there was some other stone just before we got to the top seam, but I cannot remember what it was; there are distinct facings in the coal at East Greta; the facings run east and west; I would expect coal to come off the side of the jig easier than a level; there has not been much evidence of a side pressure in East Greta; we generally set timber in the jigs; we always do; we generally wedge the cap-ends tight; I have a good deal of experience in timbering; in a mine with a side pressure I would not think it good practice to wedge the ends of the caps tight; I have seen the big fall in No. 1 tunnel; I think, in my opinion, that a leakage of water made its way to that blue mudstone, and made it swell, and broke the cap-pieces; this was pressure from the roof; I think that side pressure had some influence on the fall; I have noticed the sides of the coal; they are in good condition; I should not take this as a sign of much side pressure; I think the fall was influenced by pressure from the floor; we are troubled a lot with the floor, it is so soft; the bottom heaves up and forces the sill up and then the props, and lifts the ends of the cap-pieces with the middle, being wedged tight, and this is some help towards breaking the cap-pieces; as a general thing the slabs on top are tighter than the sides; by pressure from the floor I should expect the sill to break first; I did not notice the sills bent where I saw the caps bent; I did not notice any water dripping from the roof prior to the fall; since exploration I have noticed a considerable number of caps broken; I never saw any slabs broken; it is a surprise to me to see the caps broken and no slabs broken;

broken; I saw Moncrieffe and Barnes recovered; I cannot say how far from the face they were, but I think that both were about 20 or 25 feet from the face; I should say that Moncrieffe was about 20 feet from the face, and Barnes about from 5 to 10 feet from the face.

HENRY CARTWRIGHT.

Sworn and made at West Maitland, this 12th day }  
of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

Inquest adjourned for the purpose of obtaining further evidence, until 10:30 o'clock on the 13th day of January, 1899, at the Court-house, in West Maitland, the jurors being bound over and warned of time and place of adjournment.  
Dated at West Maitland, this 12th day of January, 1899. GEO. C. MARTIN, Coroner.

Inquest resumed in pursuance of adjournment at 10:30 o'clock on Friday, the 13th day of January, 1899, at the Court-house, in West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.  
Dated at West Maitland, this 13th day of January, 1899. GEO. C. MARTIN, Coroner.

This deponent, *Henry Cartwright*, recalled on his former oath, saith as follows (*by Mr. Curley*):—I have a good knowledge of the East Greta Colliery; I think I have; I have noticed falls in the colliery at different times; I have seen them both north and south, that is prior to the fall in this No. 1 tunnel; I have not seen any large falls only where pillars and tops were being taken out; the falls were large then; I do not remember anyone being shut in by a fall; I have known of smaller falls in the colliery mostly in the levels, both north and south of this No. 1 tunnel; these falls took place where timber was in; the falls came between the timbers; from seeing these falls I have a fairly good knowledge of the roof; I do not remember any of this blue shale coming down; I have seen stone like the piece marked C come down; it came down about 6 inches below the top of the coal, and sometimes next the roof; I call this stone conglomerate that I now hold; I have seen stone like this fine conglomerate come down from falls; the stone marked B is what the roof is composed of; the width of the levels where I saw the falls between the timbers would be 9 feet; I call the conglomerate stone marked B very hard stone; the piece marked C I call a soft shale intermixed with a grain of conglomerate, or rather streaked with conglomerate; I do not remember seeing any of this stone in the falls between the timbers, but I have seen both the hard and fine conglomerate; I have seen both these conglomerates at the same fall between the timbers; I should call the fine conglomerate a strong one; I should say that a little damp, water, and the air caused it to come down; I have seen cap-pieces broken where these falls were; I should say it was due to the bottom; we have not had sills in these levels; I have seen props broken—that is, split up; when I have seen the falls between the timbers, I should say there was no weight on the roof; I call the conglomerate I have referred to very heavy stuff; the weight would lay heavy on the caps from the damp, the water, and the air; the falls were of 6 or 7 inches; I would call it more from fretting; I have seen it larger—from 18 inches to 2 feet; I do not remember seeing anything beyond 2 feet; my instructions on seeing the cap-pieces broken were to put fresh ones alongside, and take the others out; I saw in the No. 1 tunnel two cap-pieces bent; these were 5 feet apart, one next the other; I did not give any instructions about them; the roof where the larger falls were was of conglomerate, similar to that on the table I have referred to; I never saw any other stone that I can remember but conglomerate; I saw the face of the fall all the way; I climbed up; the thickness was 5 or 6 yards at right angles to the seam; this was on the north side of No. 1 tunnel; this would be on the left-hand side going down; I cannot say what the locality was, but it was betwixt the No. 1 level and what we called the middle level; I know of a fall on the same side, betwixt the surface and No. 1 level; I forget the number of the jig; the roof there I saw was a few yards in thickness, and it was a conglomerate, but I think a little browner and rougher than the stone I now see, something similar to the stone marked D on the table; the piece marked D is a rougher conglomerate than the other, and of a softer nature; the piece marked D is more friable than the other two pieces; it would fret more; I did not see any other stone at that fall than I have spoken of; I do not remember any other falls that I have examined; I have known of falls in what we call the Scotch heading, and in No. 2 level; in the Scotch heading the fall was a large one; I saw it; I could see up; I think my light would only show me up as far as 4 or 5 yards, but what I did see, if I remember right, was conglomerate; the stone mostly resembled that stone marked D inside the paper on the table; in the fall I saw between the No. 1 and No. 2 level, on the south side of the tunnel, if I remember rightly, the stone that came away was conglomerate, but I will not say positively that it was conglomerate; this occurred about three or four years ago, I think; I cannot speak positively, as it is so long since it occurred; I do not remember seeing anything but conglomerate fall; after it has fallen I have not seen any other stone but conglomerate; the main intake for air for No. 1 tunnel is the No. 1 tunnel; we had no difficulty in getting the air to the men there; it was got there from No. 2 level by natural ventilation; the distance from No. 2 level to the face of the tunnel I cannot tell you; I know No. 7 of the special rules; I did not comply with that rule; I examined the report-books at the colliery office every morning; knowing that the cap-pieces were bent, and not seeing any report of it in the report-book, I was no ways alarmed, and did not think of doing anything towards putting the cap-pieces right; I do not think that I took too much for granted in this matter; as I did not go to the tunnel, if there were defects, I could not possibly see them; I have read Special Rule 3 very carefully, but it did not make me anxious to be in that tunnel oftener than I have been; I cannot say when my previous visit to the tunnel was before the fortnight I have mentioned; I regarded the roof of the East Greta Colliery as an exceptional roof; I have had experience in other collieries as overman and under-manager; notwithstanding that the roof was exceptionally good, the tunnel was boxed with timber in a similar way to the model before the Court; but this has not been sufficient to cope with the roof in the No. 1 tunnel.

*By Mr. Millard*: We have had caps broken above the extension in No. 1 tunnel, and other caps have been bent; these bent and broken caps have been taken down, and when these caps were taken down, the roof stood; the slabs were not bent or broken where the caps were bent and broken; I have seen sills bent and broken there likewise; I have seen many of these broken; we have had trouble with the bottom in No. 1 tunnel; the bottom heaved up; the road was lifted; the height of the tunnel was reduced by the bottom lifting; I should not say that the bent and broken caps that I removed were put in that way by the roof; it was done by the floor and sides; the swelling of the floor was the same all the way up the No. 1 tunnel; I replaced all the sills in the No. 1 tunnel; I did not replace all the caps; I had to replace sills in No. 2 tunnel for about 100 feet; I remember a cage breaking away in No. 1 tunnel before the extension was commenced; it carried away several sets; I should think about seven or eight sets it carried away; the roof did not come down when the sets were carried away; the sides and floor moved where the sets were carried away; this would be evidence that the timber held the sides and floor in position, not the roof; the sets are 8 feet apart where this took place, so that about 50 feet of sets were carried away; we boxed up the No. 1 tunnel with timber, as shown in the model, to hold the roof, sides, and floor; had the sides and floor been as good as the roof it would not have been necessary to timber; there is a part of the No. 1 tunnel without timber; this part is between the surface and No. 1 level; where the fall I spoke of in the Scotch heading was the pillars had been all taken out, except the two bottom bords in the Scotch heading, jig, that is in No. 1 bord on each side of the jig; the falls took place after drawing the pillars and tops.

*By Mr. Bowden*: There was an ample supply of timber always kept in the mine; we always got what was necessary; the timber was considered to be good; the work ordered by the company was required to be done safely; expense was not studied to the detriment of safety; I did everything that was necessary to the safety of the men and the mine.

*By Foreman of Jury*: When I went down the tunnel after the accident I found the sides still standing; I believe that there was some side pressure, but that did not make it certain that the sides would come in; I think that the slabs being under the sills, the pressure from the floor was greater; I did not think the slabs under the sills would be a benefit some time ago, and, from the experience of it, I do not think so now; I think that had additional timber been put into the No. 1 tunnel it might have prevented the fall.

*By Mr. Millard*: The bottom of the old No. 1 tunnel was not slabbed.

*By Jury*: In this particular place, on account of the troublesome floor, the slabs were put in at the bottom; this model is a correct specimen of the No. 1 tunnel as regards the timbering, with the exception that in the model there is a string piece on the end of the caps; I have seen a Government inspector in this tunnel; Mr. Thomas and Mr. Heyes measured the work in the extension of the No. 1 tunnel; I do not know how often it was measured; when working-places have been examined by the deputy I have not seen the name and date put in the bord or face; I do not remember acquainting

acquainting Mr. Thomas of falls having taken place in the mine ; I do not consider it is my duty to acquaint the manager with any falls that I have seen ; I was getting pillars out when the falls took place in the northern side of the No. 1 tunnel ; we had the jig drove from the top level to the lower level.

HENRY CARTWRIGHT.

Sworn and made at West Maitland, this 13th day }  
of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

Inquest adjourned, for the purpose of obtaining further evidence, until 10:30 o'clock a.m. on Tuesday, the 17th day of January, 1899, at the Court-house, in West Maitland, the jurors being bound over and warned of time and place of adjournment.

GEO. C. MARTIN, Coroner.

Dated at West Maitland, this 13th of January, 1899.

Inquest resumed, in pursuance of adjournment, at 10:30 o'clock on the 17th day of January, 1899, at the Court-house in West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

GEO. C. MARTIN, Coroner.

Dated at West Maitland, this 17th of January, 1899.

This deponent, *Henry Cartwright*, recalled, on his former oath, saith as follows :—We never put a jig the same distance apart from another jig ; we considered the distance between the jig we started and the No. 1 tunnel ; we consider the thickness between the No. 1 tunnel and the jig, but I do not remember the thickness of the pillar ; I consider it my duty to know the thickness of the pillar, on account of it being the main tunnel of the mine ; we did not work the tops and pillars from the first jig ; I cannot remember the distance we worked the pillars from that jig ; the time was six or seven years back ; we drove another jig further in than this jig, and it was between these jigs that we took the tops and pillars out ; we did not continue to work the tops and pillars further in the workings ; we worked them on the opposite side, also in a similar manner to those worked on the north side ; we did not continue to work them further south ; we worked all the pillars out in the Scotch heading, except those I have previously mentioned ; I know some of the men who worked those pillars ; they were named Joe Hallam, John, and David, and William Haddow ; neither of these men are working in the colliery now ; I know of a place being driven at right angles between the two seams ; it was in the Scotch heading, the south side of No. 1 tunnel ; a fault occurred that made us put in this drive, and the distance driven I cannot remember ; I know it was measured ; I did it myself ; a Mr. Hughes, I think, can give you particulars of the distance ; I cannot say how long this Mr. Hughes was working at it, for, if I remember rightly, it changed hands ; Mr. Hughes was in that drive at the time it was being driven ; if I remember rightly, it was Jim Allen who finished the drive ; I cannot remember who started, or who finished it ; by sounding them the sides seem different to what they did when driven through ; they, however, look the same ; if the side pressure was so great as to break a 6-inch bar, it does not necessarily say that it would bring about a fall from the side ; that pressure would not necessarily show the coal on the side to be broken.

*By the Foreman of Jury* : There are no splintered caps where the fall occurred, as far as I remember ; the clearing of the pillars in the Scotch heading took place about four years ago, I think.

*By Mr. Millard* : We tried to cut the roof in the old No. 1 tunnel to get the additional height, but did not succeed in getting the height, because to do so we must have commenced to blast, and Mr. Thomas would not allow this ; the roof being hard conglomerate would have required blasting ; no pillars were taken out to the north of the extension of the No. 1 tunnel ; it was all virgin coal from the No. 1 tunnel north to the workings of the No. 2 tunnel ; there were no pillars taken out south of the extension of No. 1, and no jigs, and no workings, except the starting of Cantwell's jig.

*By the Coroner* : The floor of the No. 2 tunnel kept good all the time we were sinking and timbering, and the sets were put in 5 feet apart all the way ; in the extension of No. 1 tunnel, from the start the floor was found to be soft and troublesome, but we did not consider it worse than in the No. 2 tunnel, and thought 5-foot centres were sufficiently close to well support the roof.

*By Mr. Millard* : The floor of the No. 2 tunnel is good now, and the floor of No. 1 is good now, and they have been kept good by timbering ; age and time affect the floor ; they make it lift, but in about ten years or so the floor would have settled ; I should say that in a couple of years the floor would begin to settle ; the old No. 1 tunnel was finished to the No. 2 level about seven years ago, and the No. 2 tunnel has been finished about two years, if I remember rightly.

*By Mr. Curley* : This stone I call conglomerate that I have now in my hand ; but this I now hold, marked B, is harder ; and this stone I now hold I call fine conglomerate, and is as hard as this that I looked at first ; one is, in my opinion, as hard as the other ; the piece of stone I see marked D is also a conglomerate, and is as good stone as the others, the fine and hard conglomerate ; I would not be surprised to know that the first piece of stone you put in my hand came out of the No. 1 tunnel ; I know the overcast ; it is on No. 2 level ; I know a door there, not far away ; I have examined the roof there ; this door is about 30 yards from No. 1 tunnel, on the north side ; I have noticed the roof close to this door ; it is composed of conglomerate ; the first foot might be soft from fretting, but at the back of that it would be hard conglomerate ; I call this stone I now hold a very fine conglomerate ; it is soft now, from exposure ; I would not swear that it came out of the East Greta mine ; I would not be at all surprised to hear that this stone came from near the door mentioned ; this other stone is a fine blue conglomerate ; possibly it came from the East Greta mine ; you can see some of this stone mixed in the conglomerate ; this stone may have come from the floor ; I cannot say ; I know the position of the dam, it is about 40 yards from the south side of No. 1 tunnel ; my attention was never called to any soft stone in the tunnel by anyone ; when I went into the tunnel after the fall the stone that had fallen had mostly gone down the tunnel ; there might have been a shovelful of dirt between the sills where the fall occurred, but no stone ; we reckoned there were about six or seven sets knocked out ; I saw a good part of the timber that was recovered from the tunnel ; I noticed cap-pieces broken ; I cannot say how many ; I also noticed props broken ; they were both broken and splintered ; we have relaid the rail-line from where the fall occurred ; the rails were broke away ; they had separated, and partly gone down the tunnel ; to make the connection complete we had to put every pair of rails down afresh ; some of the sills went down with the rails, as the rails are laid on the sills ; we fasten them together with fishplates, bolts, and dogs ; I cannot say how many sills went down ; I saw some of the material that was filled out of the tunnel ; it was pretty lumpy ; it had to be broke up to lift it into the alligator ; the largest piece would be about 4 feet one way, 6 feet one way, and 2 feet one way ; looking down the tunnel this piece would be (say) 2 feet thick ; there was not much fine stone, it was filled away ; I think that there were many tons of small dirt ; the stone said to be mudstone I should call a soft blue shale ; the stuff carried down the tunnel, I should call this soft blue shale ; I cannot say what was the composition of the large stone I mentioned ; we had to break some of it to get Barnes's body out ; I should say that the stone that composed the fall generally was this conglomerate (marked D), only browner, a soft blue shale, and some other sort of grey shale, and some ironstone.

*By Mr. Millard* : The action of water on the conglomerate makes it fret and crumble, and air has something of the same effect.

*By Foreman of Jury* : I cannot say if soaking this conglomerate in water for twelve months would make it soft, but I should say that in five years' soaking it would go soft ; the fine conglomerate would go soft first.

*By Mr. Curley* : The overcast was built since the extension was started ; I cannot say when ; I should say that it was a month at least before the fall ; in driving the overcast the men had to blast the whole way ; I think that some of the drill-holes can still be seen ; I do not think that it has fretted much.

*By Mr. Markham, Jurymen* : The No. 2 level is not in good repair between the No. 1 and No. 2 tunnels ; there are ways of getting out of the tunnel if the mouth was blocked.

HENRY CARTWRIGHT.

Sworn and made at West Maitland, this 17th day }  
of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

Inquest

Inquest adjourned, for the purpose of obtaining lunch, until 2:30 o'clock p.m. on Tuesday, the 17th day of January 1899, at the Court-house, at West Maitland, the Jurors being bound over to appear at that time and place of adjournment. Dated at West Maitland, this 17th of January, 1899. GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 2:30 o'clock on the 17th of January, 1899, at the Court-house at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The Jurors having answered to their recognizances, the examination of witnesses was proceeded with. Dated at West Maitland, this 17th of January, 1899. GEO. C. MARTIN, Coroner.

This deponent, *Ernest March*, on his oath, saith as follows:—I am a hay-presser at present, and reside at West Maitland; I knew the deceased man, Alfred Moncrieffe.

*By Mr. Tillet*: I was at work in the East Greta Colliery; I had been at work there for about ten weeks at the time of the accident; I had been working at East Greta, on the surface, for about two years previously; I had been away, and came back and worked for ten weeks; I was working in the shift that came out at 3 p.m. on the 17th of November; I was working with Jack Griffiths and Ed. Parsons; I was working in the extension of the No. 1 tunnel getting coal; I noticed the roof; I noticed some of the caps bent and cracked; I saw the roof work in one place; this was at about a quarter of the way down from where the tunnel was commenced; the caps I saw were also about a quarter of the way down; I spoke to Griffiths; I asked him if it was not dangerous; he said he did not think it was; I did not speak to anyone else; I spoke to Moncrieffe, and Moncrieffe said that if something was not done to it they would not see him there much longer; he said this a few shifts before the tunnel fell in; Dick Barnes and Gronow were both present, and Ted Parsons and Jack Griffiths also; it was said at the bottom of the tunnel at the face; no one present said anything more about it; the roof was composed of conglomerate and slaty rock; the conglomerate was the same as the sample marked "F" and a piece spoken of by witnesses as fine conglomerate, and also something like the bluish stone marked "C"; I call this the slaty rock; a little rock came down in the tunnel at a time; both conglomerate and slate came down; I worked three shifts in the tunnel since the fall; I know where the fall took place; I believe the fall came away at about the part where I saw the bent timbers.

*By Mr. Atkinson*: I know the stone just over the coal; the stone was mixed; it was conglomerate, and dark slatish stone; I could not measure the thickness of the conglomerate; I cannot say how much of the stone was broken on top of the coal, but there was about 18 inches of conglomerate; about 150 feet of the tunnel was driven while I was working there; Jack Griffiths was the chageman in our shift; he used to notice the roof, but he made no remarks about it; it was from the top of the tunnel to the face that he noticed; Griffiths examined going down and coming up; I worked also with Dave Lewis and Joe Thompson; I never saw water dripping from the roof where I saw the bent caps.

*By Mr. Curley*: The bent caps I saw were down from where the tunnel was commenced—the new part; it was 100 feet from the bottom level where I saw the caps bent and cracked; I saw them plainly and distinctly; I never counted them, but I believe there was four or five; I saw Mr. Thomas, the manager, there once on the Tuesday morning before the accident; he was at the face at the bottom; I only spoke once to Griffiths about the broken caps and the roof; I was at the face at the time working when I heard the roof work; I could hear the timber crack occasionally, and it was at that time I drew Griffiths' attention to it; I cannot say if anyone examined the tunnel before we went to work; I never saw anyone at the top of the tunnel who told us that everything was right; I saw slaty stone with the conglomerate; one time the slaty stone would be first; at another the conglomerate would be first; we had sometimes to chip the roof to get the sets fixed; that was how I came to see the stone; I went into the fall on the Saturday morning after the fall to work; I saw where the fall had taken place; I saw the rails on the left-hand side were bent out; I did not see them disconnected; they had not separated; I did not see that any part of them had gone down the tunnel; I never saw the under-manager down there while I was at work before the fall; we all went down the mine together when I worked with Lewis; I do not know if Lewis went down the tunnel to inspect before I went in to work; when Lewis went down with us he appeared to be making an inspection of the tunnel; I cannot say if Lewis made any other inspection during the shift; at times Lewis was working in the face, and at times he was timbering; when I say Lewis was working at the face he was getting coal with a pick; the sills appeared to be in the same position where the fall had occurred as they were before the fall.

*By Mr. Millard*: I noticed the bent caps going down and coming up; I was sitting in the skips; it was about five or six weeks before the fall that I noticed them; I spoke to Griffiths about it a few shifts before the fall took place; that would be about five or six weeks after I had noticed them; the caps were bent about a foot; when I first noticed them they were only bent a few inches; it took five or six weeks to make them show a foot; one could hardly see how they progressed, but they did; I had to go up and empty the cask by baling out into the alligator; you could see the bent caps from the cask in the daytime; they were about, I think, 140 or 150 feet from the cask—up from the cask; the casks would be about 120 feet from the face, I think; I cannot fix the distance by anything, but I believe I am about right in my impression; I saw some caps bent lower down; I could not say how many, but perhaps about three or four; these caps were about halfway between the first lot of bent caps and the face; this second lot were bent 3 or 4 inches; I did not speak to anyone about them; I noticed these caps about two or three weeks before the accident; they seemed to get bent more slowly than the first ones; these caps were a bit above the cask; you could see them from the cask; when I say I heard the roof move I mean I heard the timber cracking; it was loud at times; you could hear it at times above the noise of those working; what I heard was, I believe, the top, not the sides; my reason was the weight coming on the timber, but I did not see the weight come on the timber; I do not know that the sides pressing in could cause the top timber to bend; I do not know that the bottom timber pressing up could affect the top timber; when I was at the face I was about 250 feet to 300 feet from where the fall was, so that I cannot say but what I heard of timber cracking may have come from other places; I did not notice any shifting in the slabs, but they were sinking down with the caps; on each of the bent caps the slabs had sunk down with the caps; I did not notice if the slabs had sagged down between the caps; there was a distinct crack in the caps; in speaking with Griffiths, Moncrieffe being present, I spoke first; I asked Griffiths if he thought that there was any danger of the timber coming in; I thought myself that it was dangerous; I said to Griffiths the bent and cracked timber was dangerous; Griffiths said he did not think it was dangerous; it was on another occasion that Moncrieffe spoke; it was after that other; it was Moncrieffe who began the conversation; I know the band on top of the coal; it is composed of conglomerate; I do not see any stone here like the stone I have seen in the band except the piece marked "C"; there is a patch on it like the band I mention; the band would be only 2 or 3 inches thick; the band was as black as the coal; I could tell it from coal, because it was harder; there was nothing between these two; I would not be surprised to hear that there is a grey band between the coal and the conglomerate showing there now; it was the first time I had been down below that ten weeks I worked.

*By Mr. Bowden*: I believe other men saw both the lots of bent cap-pieces; they did not speak to me about the two places that I remember; when I went down Lewis met me at the mouth of the tunnel; at times he met me there, and at times I was there first; at times we got out some of the floor with the coal; I believe that 2 feet of the floor had to be taken out, and we took out this 2 feet in our shift; I have discussed this case outside, but I know I have not said anything about the timber; I have spoken to those men who worked in the tunnel with me.

*By the Foreman of the Jury*: I have never spoken to any of the jurymen; when I spoke to Griffiths, and called his attention to the caps being bent, the slabs were sagged down on the caps; at the same time we were down at the face, and I am sure that Griffiths knew what I meant as regards these being dangerous; during the whole five weeks I felt that there was danger, but I trusted in those whom I thought had better knowledge; I am not now working at East Greta Pit; I would not mind going back to work at East Greta; I was only on the day shift about a week and a half; I did not see the Government Inspector down the mine; I never mentioned the cracking to Mr. Thomas, the manager, but I mentioned it to Mr. Lewis, and he said he did not think the timber was dangerous.

*By Mr. Markham, Jurymen*: I noticed the sills all down the tunnel, but I did not see any bent; I did not take particular notice of the props or logs; I cannot say if they were bent; I do not think they were.

Sworn and made at West Maitland, this 17th }  
day of January, 1899, before me,— }

GEO. C. MARTIN, Coroner.

ERNEST MARCH.

This

This deponent, *Ernest March*, recalled, on his former oath, saith as follows:—*By Mr. Millard*: I mentioned about the bent caps to Lewis at different times; it was while we were on the shift together; I did not mention it as soon as I saw it bend; it was a week or two after I saw it; I mentioned it while we were going up and down the tunnel, and also while we were at work at the face.

ERNEST MARCH.

Sworn and made at West Maitland, this 17th }  
day of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner,

Inquest adjourned, for the purpose of obtaining further evidence, until 10-30 o'clock, on Wednesday, the 18th day of January, 1899, at the Court-house, at West Maitland, the jurors being bound over and warned of time and place of adjournment.

Dated at West Maitland, this 17th January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 10-30 o'clock, on the 18th day of January, 1899, at the Court-house at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizances, the examination of witnesses was proceeded with.

Dated at West Maitland, this 18th of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *Ernest March*, recalled, on his former oath, saith as follows:—I mentioned it to Lewis two or three times; Joe Thompson and Weller were on the shift with me; they went down in the alligator with me, and they would hear me then mention it to Lewis; I could not say where or what part of the journey it was when I mentioned it, but I mentioned it when the caps were in sight; the caps were plainly bent and cracked; those with me could see these caps as well as I could; these men spoke of the caps at times when on the alligator going up and down; I heard the others speak of them first; I cannot say who spoke first; they spoke about them a week or two after I saw them bent; I did not hear them say they were dangerous; Lewis spoke about them several times before I did; I did not hear Lewis speak of the lower lot of bent caps.

*By one of the Jury*: I heard Mr. Thomas tell Mr. Griffiths that he had been speaking to Lewis about doing something to the timbers; this was on the Tuesday morning before the fall; Mr. Thomas viewed the bent timber on the Tuesday morning when he was down.

*By Mr. Curley*: Moncrieffe said he thought it was dangerous, and if something was not done to it he would not stay; I understood this from what he said; I believe that Mr. Thomas went down to inspect these timbers; I saw him stop there some time, and that led me to think he was inspecting the timbers; I did not go up the tunnel to see him, but I saw his light; I think at that time he would be about 250 feet from the face; Mr. Thomas said to Griffiths, I was speaking to Lewis about the cracked timbers, and Griffiths made some remark, but I cannot say what.

*By Mr. Millard*: Mr. Hayes, Ted Howard, Ted Parsons, and Griffiths were all together at the face when this was said; I believe at that time Mr. Thomas was measuring and examining the tunnel; Griffiths was holding the light.

*By Mr. Tillett*: We used to converse of matters when in the alligator; those were casual conversations about certain matters in the mine; no one seemed to attach much importance to the timber except Moncrieffe; the men seemed indifferent to it.

*By Mr. Curley*: It appeared to me that the men in the tunnel considered that the timber should be looked to.

*By the Foreman of Jury*: Of the men there, Ted Parsons and Ted Weller were two of them who said that they thought those bent timbers were dangerous; I never saw a false set used in that tunnel; I saw slabs put in the roof to hold it up before the permanent timber was put in; these timbers were used in the present face at the bottom where we were working; as far as I know those were only used in places where the roof was bad; the slabs were let into the face to hold up the roof, and the sets were put in underneath them if there was room; if not the slabs were taken out.

ERNEST MARCH.

Sworn and made at West Maitland, this 18th }  
day of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

This deponent, *Edward Parsons*, on his oath, saith as follows:—I am a labourer, and reside at Morpeth; I knew Albert Moncrieffe.

*By Mr. Tillett*: I was in the shift with Griffiths and March the day before the fall; I left the bottom about 3 p.m.; I have worked at the East Greta Colliery since last February, all underground; I had been down mines, but had not had any experience in mining; I think I was at work in the extension of the No. 1 tunnel for about four months; I noticed in that tunnel broken timber; they were cap-pieces; they were about 100 feet down from the lower level; I first noticed one of these broken cap-pieces about six weeks before the big fall; my two mates were with me sitting at tucker, when I heard something crack, which I took to be a cap-piece; those two mates were Pike and Griffiths; we conversed about it; I asked Griffiths what it was; I said I thought it was a sill, and Griffiths said it could not be, as when those sills go there will be something wrong; the caps went on working and breaking; it was about on the 11 o'clock shift that I noticed the caps going more than at other times; I could not say the reason for noticing it so particularly at these times, but it may have been the dampness of the air in the early morning; I have heard Dan Gronow and Albert Moncrieffe speak of the roof as working; when we would get to the face, if there was any bad roof it would be noticed, and one would say, "Look out for the bit of roof," mentioning a certain part wherever there might be a piece likely to drop out; I refer to the face all the way through; one morning when we were down at the bottom, Dan Gronow said that the biggest part of their shift then had been in the man-holes on account of the timber above them working; I heard Moncrieffe speak about it; he said that unless something was done to the timber, that he would not come in to work any more; I have often talked to Griffiths about the timbers; March was with us sometimes, and sometimes Lewis; when a set of timbers wanted to go in, he would be with us also; the roof was composed of a very soft soapstone and some conglomerate, and the stone; the large piece called the bluey-slatish stone is most like what I call the soapstone; the conglomerate that was there resembled the stones marked "D" and "F"; before a set was put in, slabs were put sometimes from the last cap to the coal in the face to prevent bits of roof from coming down; when the sets were put in, these slabs were sometimes lowered down to the caps, and at other times they were left up.

*By Mr. Atkinson*: I noticed five or six broken caps on the last shift that I worked before the accident; I suppose these caps were down a foot from their proper level; as a cap lowered down, the slab lowered with it; the slabs were not broken, nor were the sills bent or broken; I do not think that the props were broken; I have been down the tunnel since the fall frequently; I worked in seven or eight shifts after the fall; the fall occurred where these caps were broken; I know, because when I went down half an hour after the fall, I saw that the broken caps that I had formerly noticed had been carried away; I do not recollect mentioning this to anyone, as the most of the time I was down that time I was alone; I was working on the level at the rapper wire; I came out at 6-30 in the afternoon; I cannot remember mentioning it that night; I remember a conversation about renewing the bent caps; I heard it on the Tuesday before the fall; it was at the face where we were at work; Ernest March, Jack Griffiths, Mr. Thomas, the manager, and a labourer whose name I do not know, were present with me there at this conversation; I do not remember who commenced the conversation, but Mr. Thomas said to Griffiths that he was going to leave that timber up there, signifying the bent caps, till the week end, so that it would not interfere with the contractors' work much; I never had to retire to a manhole when I was at work; we changed shifts at 20 feet from the face; we, that is Griffiths, March, and I, came down together generally; the charge man in our shift was supposed to be Griffiths; he made an inspection of the tunnel mostly as he was going down, by standing up on the alligator; powder was used in getting coal; the shots never disturbed the roof, to my knowledge, unless it was a shot in the top coal, and sometimes it would shake the roof and a bit of the roof would come away with the coal; the bit of roof that came away would be sometimes conglomerate and sometimes that soft stone I have spoken of; I have seen into the roof 6 inches above the coal.

*By*

*By Mr. Curley:* I have not fired many shots in working at that coal; Griffiths used to do that part of it; he might fire two shots in a shift; I bored some of the holes for the shots, and March bored some, and Griffiths bored some; these holes would be a foot off the roof; I never saw any exceptionally soft roof that I can say; the roof was fairly regular as far as I saw; with shots or without shots some part of the roof would fall; I have seen bent caps besides those I saw broken; there was more than one bent or cracked in the tunnel; these were below the broken caps, towards the face; on the Tuesday before the fall, at the time Mr. Thomas was speaking about the broken timbers, he said he hoped, by the next time he came down, the cage would be running; Griffiths replied to the statement made by Mr. Thomas, and said he hoped so too, and wished the tunnel was done then; sometimes I have heard the caps crack once or twice, and sometimes a dozen times; Griffiths would be present at these times; Lewis was with us on shifts occasionally, when we had timber to put in; I cannot swear if Lewis was present when the cracks were heard, but I expect he was there; after the fall I was down the tunnel as far as the last leg left standing; I noticed the rails; they were bent in all shapes; the first length was not disconnected; I noticed the sills; they were the same as they were before the fall pretty well all through the tunnel as far as I went.

*By Mr. Millard:* Since the fall I have been right underneath where the fall was; I know the band that runs between the coal and the roof; it is sometimes a black stone, or a sort of a black stone—a sort of dull black, not shiny like the coal; there was, at times, a small piece of grey band between the coal and the roof; it was something like the piece of stone here marked "H," and also like the piece of stone called "fine conglomerate"; the grey band would hardly be seen sometimes, at others it would go to an inch and a half, and sometimes it was in the coal; I have been told that stone like that was called "a fine conglomerate"; the roof was not hard nor soft—it was a patchy roof; the bottom was mixed too; the bottom had sometimes to be dynamited to remove it.

*By Mr. Bowden:* The bent timbers were lower down than the broken ones; there was more than one bent timber; the bent timbers were three sets below the broken ones; there were about four sets of bent timbers; these were standing after the big fall; I estimated that five or six or seven broken timbers were carried away by the big fall; the timbers that were bent were so for about 2 or 3 inches; I have never noticed any bent timbers below the other bent timbers that I have mentioned; a man must look carefully to notice timber that was only bent.

EDWARD PARSONS.

Sworn and made at West Maitland this 18th }  
day of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

Inquest adjourned for the purpose of obtaining lunch until 2:30 o'clock on Wednesday, the 18th day of January, 1899, at the Court-house at West Maitland, the jurors being bound over, and warned of time and place of adjournment.

Dated at West Maitland, this 18th of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed in pursuance of adjournment at 2:30 o'clock on the 18th of January, 1899, at the Court-house at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizances, the examination of witnesses was proceeded with.

Dated at West Maitland, this 18th of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *Edward Parsons*, recalled on his former oath, saith as follows:—(*By Mr. Bowden*): I was generally at the face when I heard the caps cracking; I cannot swear that it was the broken caps that were working—it might have been other timber; I could form a good idea from where the cracking came by the noise it made; I was sometimes away about 120 feet from the cracking noise; this would mean that I was about by the cask at the time the timber was cracking above the cask; you could tell whether it was above you or to the right or the left of you; there are no other workings down there; the width of the tunnel, as I understand, was 14 feet, so that the crackings either right or left must have been within a very few feet of me; the first crack seemed about 20 feet from where I was sitting; I was on a sill; I reported the cracking to Mr. Griffiths; I could form a pretty good idea of where the cracking I heard at the face came from by where the sound came from; I could not tell how far it came down the tunnel; I said it was the caps, because that timber was the only timber that did work.

*By Foreman of Jury:* I only mentioned the cracking of the first caps to Griffiths; I did not go and examine, because Griffiths said it was nonsense; I thought it was a sill; I am sure that Griffiths saw the broken caps, and also the slate bearing and following the caps down, and I said several mornings to Griffiths that they were looking bad; the legs of the sets had come away with the cap pieces, but the side coal or the ribs stood.

*By the Jury:* I noticed the sills in the extension of No. 1 tunnel; I never noticed any bent; had there been we could not have travelled in the alligator, I think.

EDWARD PARSONS.

Sworn and made at West Maitland, this 18th day }  
of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

This deponent, *Rudolph St. Vincent Heyes*, on his oath, saith as follows:—I am an engineer, and reside at South Maitland; I knew the deceased, Albert Moncrieffe.

*By Mr. Tillet:* I am the engineer at East Greta Colliery, and I remember the fall that took place there on the 18th of November, last year; I was in No. 1 tunnel about ten minutes after the fall; I went down to the edge of the fall; I was in that tunnel on the Tuesday previous to the fall; I was on that day measuring the distance from the second level down to the face; Mr. Thomas was with me, and also Edward Howarth; I saw John Griffiths, Ernest March, and Edward Parsons there; I saw the timber as I was going down on the Tuesday; the timber was all sound; there was one or two bent caps at about 130 feet from the face; I saw no other bent timber but these caps; I did not hear any conversation between Mr. Thomas, the manager, and Griffiths about the timber; Mr. Atkinson has not since the fall said anything to me about how the timbering should be done, but he has asked me if we have put any defective timber in; I answered, "No"; Mr. Atkinson has not written to me on the subject; I believe the stone on the table, called by me mudstone, came out of the roof of the No. 1 tunnel—it is now marked "J"—of the East Greta Colliery, at the time of the big fall; I gave this stone to Senior-constable Brown; I gave him also another piece of stone; it came out from the fall.

R. ST. V. HEYES.

Sworn and made at West Maitland, this 18th }  
day of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

This deponent, *Robert Brown*, on his oath, saith as follows:—I am a senior-constable in the Police Force, and reside at and am stationed at West Maitland; I received some stone from Mr. Heyes; I got the piece of stone marked "J," and also this piece marked "K," and I picked up at the mouth of the tunnel two other pieces of stone marked "I," which Mr. Heyes said had been exposed to the weather; I found it outside, lying at the mouth of the tunnel.

R. BROWN.

Sworn and made at West Maitland, this 18th }  
day of January, 1899, before me,— }  
GEO. C. MARTIN, Coroner.

This deponent, *Rudolph St. Vincent Heyes*, recalled on his former oath, saith as follows:—(*By Mr. Atkinson*):—The distance that the tunnel measured was 565 links from the second level down to the last sill, making it, in fact, 370 feet; my duties took me down the tunnel once a week; my duties were to report on the general state of the tunnel, including the condition of the timber and the timbering; a few sills were slightly bent besides the one or two caps I have mentioned; these sills were 120 feet from the face; the sills were bent within a few feet of where the caps were bent; I have been down the tunnel frequently since the fall; I kept an account of the progress of the work, as shown on the plan; I have seen the timber brought out since the fall; two or three sills were knocked out, I presume, by the fall; I mean that they were knocked out of their position altogether; all the rails had gone down; the roof, including the caps, coming away,

carried

carried the sills and rails with them ; I located the bent caps from the dam being there and the water-casks also being there ; I did not count how many broken caps came out among the timber ; I consider ironbark a good timber for the purpose that we used it ; I have never tested the breaking qualities of a bar of ironbark ; our method of signalling in the tunnel is by electricity ; the signals are carried to within three or four sets of the face ; the engineman was in attendance at the handles when the accident happened ; there is about 4 ft. 6 in. between the back end of the cage, its highest point, to the under side of the caps, and at the sides 18 inches at each side.

*By Mr. Curley :* I examined the machinery and the ropes in connection with the working of the tunnel ; I examined the boilers also ; I made the examination once every day ; the boilers have safety-valves and steam-gauges ; I made my report once a week ; I never said anything in my report about bent caps ; the date of my last report was on the Wednesday, the 17th of November last year ; this was the daily report ; the report books were kept in the outer office ; I considered it was my duty to report any defective timbers and show the defects in the report ; I made my examination during the day ; I made my last examination before the accident on the morning before the accident ; I am quite sure that I only saw two bent caps ; they were bent about 3 inches ; I did not see any broken caps ; I did not see any splintered caps ; I have not made any examinations in the No. 1 tunnel the same as before the accident, but I made examinations during the work of finding the bodies ; I did not consider it part of my duty to count the bent or broken caps after the fall, but I saw a good few after the fall ; I did not make any report of those I found ; we could only get 127 feet down from the level ; I did not see any bent or broken caps in this 127 feet ; I am certain of this ; for this 127 feet down the timber is all sound ; the top end of the fall was 127 feet from the level ; during the progress of retimbering the tunnel I saw a number of broken and bent caps ; I account for this quantity by the fall hitting them and knocking them out of position ; some of the legs are knocked out of position and yet the caps are up ; I did not make any report of this in the report book ; all of the timber was fresh from the bush ; I have a fair knowledge of timber ; I noticed sap in the timber ; I never saw round timber without sap—that is, green timber ; I cannot say how much sap there is circling in that timber ; I have examined it ; I never suggested that stronger timber should be used for this tunnel ; I was at the face on the Tuesday that the manager was there, but I did not hear any conversation about timbering the tunnel at the week end ; no conversation could have been carried on without my hearing it ; Lewis never mentioned to me at any time about any bent caps in the tunnel, neither did the manager or Griffiths mention anything of it ; it is possible that other men might see more than I would ; Mr. Thomas gave the order for the timber to the bushmen ; I looked on it as part of my duty to see whether the timber supplied was defective or otherwise ; I have discarded timber, but not for any defects, but only for being too small—the standard size ; I believe it was for props ; I had the dimensions from Mr. Thomas—8 inches diameter at the small end for the legs, caps, and sills.

*By Mr. Millard :* I was at the face on the Tuesday, walking up and down the tunnel ; I waited there some time at 132 feet from the level I was measuring at the time ; there were no broken caps near me while I was sitting that day ; had five or six caps been broken and slabs sagging down on them, I would not have sat there ; I would have seen any bent or broken caps, because I kept a good eye on the state of the tunnel.

R. Sr. VINCENT HAYES.

Sworn and made at West Maitland, this 18th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

Inquest adjourned for the purpose of obtaining further evidence until 10:30 o'clock on Monday, the 23rd day of January, 1899, at the Court-house, West Maitland, the jurors being bound over and warned of time and place of adjournment.

Dated at West Maitland, this 18th day of January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed, in pursuance of adjournment, at 10:30 o'clock a.m. on the 23rd day of January, 1899, at the Court-house, at West Maitland, in the district of Maitland, and in the Colony of New South Wales, to further inquire touching the death of Albert Moncrieffe. The jurors having answered to their recognizance, the examination of witnesses was proceeded with.

Dated at West Maitland, this 23rd day of January, 1899.

GEO. C. MARTIN, Coroner.

This deponent, *Rudolph St. Vincent Heyes*, recalled on his former oath, states (*in answer to Mr. Millard*): I saw one or two sills bent in the tunnel ; they were not bent to any great extent, but slightly ; the bending of the sills in that way would not prevent the skips from running ; after the fall the road was disconnected from the tunnel ; fourteen or fifteen pairs of rails were knocked down the tunnel ; that would be from the top end of the fall ; a person from the top end of the fall could see that these rails were gone ; the rails were bent and twisted in all shapes ; some of them are at the pit mouth now ; on the Tuesday before the fall the manager made a stay at the second level ; we stayed there for some considerable time before we went down ; he fixed his instruments there ; after he had taken the angle I went down to measure it, and he stayed at the level—the bottom level ; I walked down to the bottom, then back to within 2 chains of where the manager was staying ; the manager did not leave the bottom level while I was measuring down the tunnel ; I waited at the 132 feet point ; the manager did not stop at that point either on his way up or down ; I was with him the whole time ; he did not stop under where the big fall took place to examine the timber ; he did not stop at all ; the men were stopped working from the time we got down to the level ; Griffiths was holding a light for the manager ; the bent caps I saw before the accident did not indicate any danger ; it is not an unusual thing to see timber bent to the extent that I saw those bent ; I attribute the bending of this timber to the bottom pressure and the end pressure—the pressure on the end of the caps ; I have seen caps bent in a similar way from side pressure, but not in this mine ; it was in the old Greta mine ; they were bent in that way for years ; I know that one was taken out eventually ; the roof did not come down on that being done ; one could not notice that the sides had come in ; there was no fall from the sides ; I have a general knowledge of the roof in the East Greta mine, and of the tunnels in particular ; the roof is conglomerate ; it is a good roof, and had always proved itself so ; the method of timbering and timber employed, in my opinion, could not be bettered ; I cannot think of any precaution that could have been taken to prevent the accident ; the bent caps I saw were 70 feet from the lower edge of the big fall ; there were several slight changes in the grade of the tunnel there ; there was a change in the grade about 130 feet from the face ; that would give the timber the appearance of coming down more so than where the grade was different ; the tunnel begins to dip more at that point.

*By Jury :* The sills would have to be bent to the extent of 8 or 10 inches to affect the running of the cage ; I attribute the accident to the soft mudstone giving way through the action of the water ; that has proved the roof to have been not solid—not so good as I expected to find it ; the sills that were bent were 120 feet from the face ; the caps were bent at about 130 feet from the face ; the bent sills had nothing to do with the bent caps ; there were not four or five caps bent where I saw the two ; it would have been impossible for four or five to have been bent without my seeing them ; I replaced the legs that were knocked out. (*Witness marks on plan where the legs were knocked out.*) I could see a cap bent 120 feet below the fall after the fall had taken place ; if fresh timber had not been put in where the caps were bent another fall might eventually have taken place ; I used to revise the report book every night ; I never saw it reported that the shift on one night had passed most of their time in the manhole through the dangerous condition of the tunnel ; the man in charge of the shift would be neglecting his duty if he did not report such a circumstance.

*By Coroner :* Daniel Grono had been working in the colliery for two years and more as a miner ; he had charge of the shift in which Barnes and Moncrieffe worked.

*By Mr. Curley :* I never suggested the strengthening of timber by placing cross-pieces from the sides to the caps ; the skips would not have got through if that had been carried out ; the skips do not go into the cage ; they go on top of the cage ; there would be a space of about 8 inches between the skips and the bottom end of the caps when the cage was thus loaded ; the sides of the cage run within 18 inches of the props ; the skips run the full length of the cage ; there would be no space to put supports from the legs to the caps under those circumstances ; I receive my instructions as to the working of the mine from the manager ; the manager has never suggested to me the bricking of the tunnel at any part of it ; I have never suggested such a thing to him, not even where this fall took place ; the rails are 5 yards long ; fifteen new ones were put in ; the pieces of timber I have spoken of as going down the mine did not include the slabs ; they would have to be added to those ; there were about 1,000 slabs and four sills.

By

*By Juryman:* There would be about 8 inches between the skip and the caps when the caps were plumb; the cage could not work with the cap bent 12 inches; the cage Mr. Curley referred to was not working at the time we repaired the tunnel.

*By Mr. Curley:* A sinking skip was working when the repairs were being effected before the fall.

*By Mr. Millard:* If the caps had been bent down 12 inches the tunnel would not have been of any use for the purpose for which it was intended.

*By Juryman:* When the hood was on the cage there would be about 18 inches space between the top of it and the cap; the hood does not go over the last skip.

R. ST. VINCENT HEYES.

Taken and sworn at West Maitland, this 23rd day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This deponent, *John Griffiths*, on his oath, states:—I am a miner, and have been employed in the East Greta Colliery; I knew the deceased, *Moncrieffe*; I was in charge of the shift that came out at 3 p.m. on the 17th November last; I had with me *Ernest March* and *Edward Parsons*; I was one of the party sinking the tunnel; I commenced about the end of June or beginning of July last; I know where the big fall has taken place in the tunnel; I did not see any bent caps where the fall took place; I saw some about 40 or 50 yards from the face; I cannot say to what extent they were bent; there were three or four of them; I have heard timber cracking in the tunnel many times; it is a usual thing when new timber is put in to hear it cracking; I believe some persons have spoken to me about the timber cracking; there were one or two of the men working with me who did so; the roof was composed of conglomerate; there was a band of soft blue-stone, running from 2 or 3 inches to about 6 inches; it sometimes extended right across the face; the piece of stone produced, marked "C," is what I call soft blue-stone; I saw *Mr. Thomas* in the tunnel on the Tuesday before the accident; he spoke to me; he did not speak to me about the timber; he spoke to me about the grade of the tunnel; I am positive he said nothing to me about the timber, to my recollection.

*By Mr. Atkinson:* I have worked in East Greta a little over five years altogether; I have worked as a miner during that time; I have not got coal off the bottom levels in No. 1 tunnel; I have not worked along the bottom level at any time; I have seen no falls in the mine where I have been working; while I worked in No. 1 tunnel, during the extension, I have seen the stone fall above the coal about 6 or 8 inches occasionally; that was the soft blue-stone I have referred to; the timber I have referred to as cracking was the timber last put in; it might be six or seven sets back; I have never heard cracking except in the timber near the face—never away from the face further than six or seven sets; I attributed that cracking to the timber setting into the joints; the timber is put right into the joints before the set is left; there would be some settling after that had been done, in my opinion; the pressure would cause that settling or grinding; that pressure would come entirely from the bottom and sides, in my opinion; I cannot give any opinion as to the cause of the accident; I cannot form any idea as to the cause of it; I had charge of the shift; my duties were to see that everything was right—to inspect the tunnel going down; I used to inspect it every day, both going down and coming out; none of the workmen ever expressed any danger to me owing to the timbering in the tunnel.

*By the Coroner:* It never struck me, while at work, that there was a weak place in the tunnel.

*By Mr. Curley:* I have had nearly thirty years' experience as a miner; I have not seen many falls in mines; when a roof is timbered and a fall takes place I suppose it is a sign of a bad roof; the bending of the timbers at the roof is not always a sign of a bad roof; it is sometimes; at other times it is an indication of side pressure; if there was side pressure in the tunnel I would expect to see the effect of it upon the timber; I would not expect to see the props bent; if there was extraordinary pressure I would expect to see the props bent; if there were bottom pressure, I would not expect to see the effect of it on the sills always—unless there was extraordinary pressure; where the caps were bent I did not notice any signs of bottom pressure; I saw no signs of side pressure; I could see no more indication of it than that the caps were bending; I cannot say when I first noticed a cap bending in the tunnel; hearing the cracking of the timber did not induce me to make an examination; I have not said that the men were speaking to me about these bent caps; I cannot say when I noticed any of the bent caps; I cannot say even approximately; it was over a week before the accident; I cannot say how far they were bent; they were not splintered or cracked; nothing in particular drew my attention to these bent caps; I just noticed them in the course of my ordinary examination of the tunnel; I had no conversation with *Lewis* about them at any time; I was off work about a fortnight or so before the accident; *Thompson* was working in my place; my two mates worked with him; no other man was put into the tunnel to fill my position; we had a spare man there at the time—*Ernest March*; I do not think it possible for there to have been other bent timbers in the mine without my seeing them than those I have spoken of; I saw those bent timbers before *Heyes* was in the tunnel; if I could not see any timbers bent that were bent they must have been bent to a very slight extent; I do not know whether any timber was replaced in the tunnel before the accident; on the Tuesday before the accident I asked the manager how much further the tunnel was to go, and he said he could not tell me until he had gone to the office; he said, "I believe you'll be finished by Christmas"; I replied, "I wish it was finished now, *Mr. Thomas*"; *Mr. Heyes* said, "Why, *Griffiths*?" I replied, "Because the water does not agree with me"; that was about all the conversation that took place; I do not recollect *Mr. Thomas* saying that he had been speaking to *Lewis* about the timber, and that they were going to do it at the week end; I heard him say nothing like that; I had no talk with anybody about the timbering; I am acquainted with all the deputies of the colliery; I never at any time to my recollection spoke to *Lewis* about the timbering; I never spoke to *Mr. Thomas*, the manager, about it, nor to *Mr. Heyes*, nor to the under-manager, nor any of the deputies; I was down the tunnel on the same day as the fall took place, not since; I went right down to where the fall had taken place; I stayed there about five or ten minutes at a time; *Lewis Thompson* and, I believe, *Mr. Thomas* were with me at the time; I noticed that nine or ten sets of timber had gone, and that the roof had fallen; I noticed nothing else; I noticed the road and the sills where the fall had taken place; the road was bent into all shapes, and two or three sills had been knocked out; the rails had become disconnected; I cannot say for what length; I could see very little; I have fair sight; I cannot say how far those rails had separated; I had sometimes to put up a slab in the face before I got my sets up; that was because sometimes there were 6 inches of coal there, and if we had good height we used to keep that up; if we were short of height we used to take the coal down and try to keep the soft stone up with slabs; we had to do that pretty often; I never had to chip any of the conglomerate to get my sets in, but the timber men did; they were *Lewis* and *Thompson*; I saw the stuff that came down when they did chip; there was sometimes difficulty in getting it down; it was always hard when the conglomerate had to be chipped down; I never saw any particularly soft patches of conglomerate; I have seen some softer than others; I would not say from that that the conglomerate varied in certain places; the bottom was, as a rule, soft; we have put a shot into it occasionally when we struck a hard patch; it was not soft where we had to do that; it was soft on the top sometimes, with hard layers underneath; I did not assist to clear any of this stuff out after the fall; some of the men spoke to me about the timbers cracking; they would listen, and ask me what was that, and if there was any danger in it; I always told them no, that it was always the same when new timber was put in; I often heard this cracking of the timber; the men did not often speak to me about it—no more than once or twice; I do not remember ever having heard the men speak about these bent caps; they never, as we went up and down, drew my attention to them, and said, "There's a bent cap there"; at no time did they do so; *Gronow* never spoke to me about them; I never heard the men mention a statement that had been made by *Moncrieffe* about these caps; I have never spoken to anybody about these bent caps.

*By Mr. Millard:* I know the East Greta Colliery generally; I have seen the roof in No. 2 from top to bottom, and considered it a good roof; the roof generally I considered a good roof; I drove the tunnel in No. 2; it was a very good roof there; the floor was not equally good; it was a soft floor; the roof in No. 1 appeared very much the same as No. 2; I worked all the way down carrying out the extension, and there was nothing about the spot where the fall afterwards took place to indicate in the slightest degree that it was a weak spot; the roof there appeared to be conglomerate, and the same all the way down, as far as I could see; wherever the roof was cut into it appeared to be conglomerate; the "pot-holes" referred to were small, and showed no break in the conglomerate, which appeared to be above them; the pot-holes were the same stuff as the bands, or something similar to them; the band was pretty nearly always between the coal and the conglomerate; sometimes it went out like a wedge; there were no caps bent where the fall took place; if there had been caps there bent down 12 inches, and the slabs sagging out with them, I must have noticed them; nothing was ever said by any of the men going up and down in the skips with me about the caps being bent there; *March* never spoke to me about broken timbers or bent timbers; *Parsons* never did; I remember the Tuesday before the accident, when the

manager came down; he came straight down from the bottom level; I cannot remember whether he stopped going up; I did not notice him do so; I cannot say whether he stopped underneath where the fall afterwards took place, and examined the timber; I did not see him do so; I have not had much experience of timbering; the other men did the timbering; before the accident there was nothing in the tunnel to indicate to me any danger; had there been I should not have gone down; it is not an unusual thing to see caps bent in the way I saw them; they were not bent to any out-of-the-way degree; I know the Greta Colliery, and have seen timbers bent there, and caps bent by side pressure; those caps have stood for a length of time, and some of them are standing there yet; I have often heard timber crack, and have attached no importance to it; I do not think the timber being green would make it crack more than seasoned timber.

*By Mr. Bowden:* The sills were not put on the ground, but a piece of wood was put under each end, from one leg to the other; it was hollow underneath, the bottom being cut from underneath it; we used to put in four or five sets of timber before we slabbbed the bottom; very often there would be 6 inches between the sill and the bottom; the soil was very often scooped out under the sill to allow for the bottom pressure; it used to swell up to the sills, and we would have to take a pick or a drill to break a hole under the sills again; that was on account of the swelling that took place after the sill had been put in; I have seen the sill sometimes spring back about an inch after we had taken the stuff out to put in the slabs; the slabs put in from the end timber to the face were only put in to keep the loose stuff from falling; that loose stuff would sometimes be the soft blue-stone and sometimes coal.

*By Jury:* Edward Parsons and Ernest March were my mates; there were nine men working on that extension altogether; since the tunnel was begun there have at times been ten men working there; Pike was the tenth man working there; I do not know how long it is since he left; he may have worked there for two or three weeks; I do not think Pike is still at the colliery; I do not know where he is; he left through sickness; the soft blue-stone and the pot-holes indicated no danger to me; I would not call the roof of the tunnel a patchy one; it was pretty regular; I know the meaning of the term "a live mine" as described by one witness; it means that there is a good deal of life in the coal—that it is cracking while being worked; that does not indicate danger, but is just what we like to see; Mr. Thomas did not mention Lewis' name to me on the Tuesday before the fall when he came down the tunnel; I heard March and Parsons give their evidence the other day, and heard them say that Mr. Thomas said he would see Griffiths and speak to Lewis about the bent timbers; Mr. Thomas did not say that; I am quite positive about that; he never mentioned such a thing; Mr. Thomas did not speak to me about the bent timbers and say he would have something done to them at the end of the week; March did not draw my attention to a bent cap with the slab sagging down upon it; the cause of the fall was something unseen; when we put the timber in we considered it quite strong enough to support the roof; I cannot say how far the fall went down the tunnel; I could not tell how far the rails had gone; I have seen the Government Inspector down the mine; I cannot say how often; I saw him more than once between June last and the time of fall.

Taken and sworn at West Maitland, the 23rd }  
day of January, 1889, before me,—

JOHN GRIFFITHS.

GEO. C. MARTIN, Coroner.

Inquest adjourned at 1 p.m. till 2:30 p.m. this day for lunch.  
Court-house, West Maitland, }  
23rd January, 1899,—

GEO. C. MARTIN, Coroner.

Inquest resumed at 2:30 p.m. this day.  
Court-house, West Maitland, }  
23rd January, 1899,—

GEO. C. MARTIN, Coroner.

This deponent, *John Griffiths*, recalled on his former oath, states (*in answer to Mr. Curley*):—I think Grono was off work for a day or two before the accident; that was while I was at home; I cannot say how long ago that was; I believe a man named Kelly worked for him during that time; I do not know whether Kelly is working at the colliery now; I have never seen any fall to speak of in the colliery while I have been there; I have seen little bits of falls; they were along the level; that was not roof, but coal, as a rule; there might have been a little bit of roof occasionally, but nothing to speak of; it did not extend far into the roof; I have never been in a bord where they have taken the tops out; I have never had to go to a place where a fall has taken place; I have never had to clear out of the mine in consequence of falls.

*By Jury:* I was not a contractor in the No. 1 tunnel; I was paid so much per yard; I did not consider that contract work; I consider it was not contract work, because we took it to sink by the yard; there was no contract about it at all; it was an understanding between Mr. Thomas and ourselves; I was not appointed a deputy; I was appointed to take charge of the shift; I was appointed by Mr. Thomas; I do not think Mr. Thomas could have spoken about repairing the timber on that Tuesday without my hearing it; Lewis never spoke to me about that timber; Mr. Thomas could have stopped at the scene of the fall without my seeing him on his way up; I did not start to work at the face after he had left us; we could not do so till we got the skip; I watched him going up the tunnel; if he had stopped at the locality of the fall I might not have seen him; we used a couple of dynamite shots in getting up the bottom; I have not been speaking particularly to anyone about the accident since it happened; I have only spoken of it in a general way to those who have mentioned it to me; I cannot mention some of those to whom I have spoken about it; we only had nine men working in the mine except for a little while, when Ernest March worked as a spare man; he worked in the tunnel; Kelly worked in the tunnel; others besides those men mentioned have worked in the tunnel, but I cannot say who they were; I considered myself responsible to the men for wages; that would not be the means of my knowing who they were; if my mates had reported the tunnel as dangerous I had the power to withdraw them from the face to remedy that danger; Grono had the same power in that respect.

*By Mr. Bowden:* I have worked in other mines—all sorts of mines; I have heard cracking in them similar to that I heard in East Greta; any mine that has sets of timber will crack in that way; that cracking does not indicate to me that there is any danger or likelihood of a fall; one cannot locate the timbers from which this cracking emanates; I could not see Mr. Thomas when he was going up the tunnel; I could see his light, but not the part of the tunnel in which he was; that was because the grade of the tunnel altered to a very great extent; my mates at the bottom of the tunnel could not have seen him either; we could see the reflection of his light, but not the light itself, unless he held it up a good bit; when we were at the face I held the light for him; I held it in my hand, but I had a 5-foot stick on the sill with the light on top of it; I lifted the light as he required it to be done; I had to hold the light up on the stick before he could see.

*By Coroner:* It was the ordinary cracking of the timber that I took no notice of; anything out of the way I would inspect and look for the cause of.

*By Jury:* The tunnel was steeper in some parts than in others; the tunnel had not the same grade all through, as shown in the plan produced.

*By Mr. Bowden:* The cracking noise coming from the timber is not the same noise as that produced by the breaking of a 9-inch bar; it is nothing like it; the noise of the timber breaking is much louder than that of the timber cracking; I heard only the one noise—the cracking of the timber; I have never heard a 9-inch bar break in a mine; I have never heard any timber break.

*By Mr. Curley:* Timber is put up in a mine to prevent it from coming in.

Taken and sworn at West Maitland, the 23rd }  
day of January, 1899, before me,—

JOHN GRIFFITHS.

GEO. C. MARTIN, Coroner.

This deponent, *David Lewis*, recalled on his former oath, states, in answer to Mr. Millard:—Where the fall took place there were no bent caps before the fall; it is not true that at that point there were caps bent down 12 inches, with the slabs sagging down on them; that was not the case in any part of the tunnel; March never spoke to me about bent timber when we were going up or down in the skip, nor did Parsons; I never heard any of the men in the skip say that the timber was bent or broken at the point where the fall took place; March spoke to me after the fall as to the position of the fall; he asked me at the pit top how far it was from the level down to the fall; I said, "I cannot tell you exactly; what do you want to know for"; he replied, "I should like to know, because very likely there will be an inquiry after this"; I asked, "Do you not know?"; and he replied, "No"; I said, "Well, if you do not know you can tell them that you do not know"; he said, "I should like to know," and I answered, "Well, I cannot tell you"; March had been down between the time of the accident and this conversation; he was not down after that.

*By*

*By Mr. Bowden* : I have never heard timbers breaking in a mine ; I was in Court when the witness Cantwell told the jury that Moncrieffe had slept in one night ; I know that Moncrieffe did sleep at home one night ; that was on the Wednesday night ; on the Tuesday night, when I came up on top, Moncrieffe's brother-in-law was on top, and I asked him to call Moncrieffe ; Gronow had told me that he was a man short ; he said, "All right" to me ; Moncrieffe went to work, calling at my house on his way ; on Wednesday night he never turned up at all, and I spoke to the men about it ; Thompson said, "You had better leave him sleep to night, it will be a lesson for him" ; on Thursday night he turned up, and I said to him, "Hello, did you find yourself" ? he replied, "Yes, I made sure of it to-night" ; I said, "What did you do ?" he replied, "I came to the pit top at 7 o'clock, and had a sleep in the little skip on top" ; that is the skip that is now at the tunnel ; he had slept there from 7 till a quarter to 11, so as not to miss the shift.

*By Mr. Tillett* : I used to talk to the men going down in the skip ; sometimes we spoke about the mine ; I did not pay particular attention to those conversations, and they would soon pass out of my memory.

*By Mr. Millard* : If anybody had said that the timbers were bent so as to be dangerous, I would not forget that.

*By Mr. Curley* : If anyone had said to me, "That timber has been cracking down there to-night," I would ask in a minute, "Where ?" ; whether I put it in my report book would depend upon the sort of answer I would get ; I have never heard the timbers "cracking" down there ; but I have heard them "creaking" ; to illustrate my idea of the difference between the two terms—if you sit on an old chair it will "creak," but if the leg breaks it will "crack" ; I recollect being in the tunnel with the jury on the 13th instant, and being asked to get a sample of the stone from the roof ; the exhibit marked "F" is what I got ; I procured it from the roof of the tunnel down below the fall ; it was a good bit below the fall ; the stone had been in the water, but was not when I got it ; I do not know how far the water came up in the tunnel after the fall ; I look at the piece of stone marked "H" ; I recollect being through the drift in the overcast near the door ; I got a piece of stone there very much like that produced ; if that piece came in the parcel that I sent to the Court that would be the piece of stone ; Mr. Thomas was there ; I did not hear him say there was a soft patch there ; I call that stone a sort of conglomerate ; the piece of stone now shown me came from the floor [marked "M"] ; I had sometimes to shoot the bottom ; I had to fire three or four shots ; I have never tested the roof by putting a hole up into it nor in any other manner ; Thompson and I set all the timber that was put up in the tunnel ; any defect in it I would hold myself and Thompson responsible for ; Mr. Heyes and Mr. Thomas, the manager, inspected the timber besides Thompson and myself ; sometimes they found fault with the manner in which the timber was set ; Heyes used sometimes say they were not in line and point out how they ought to be ; we had to rectify that ; that was all Mr. Heyes drew attention to ; Mr. Thomas once complained to me that the timber was not set at right angles to the seam ; he said it was out, and I said it was not ; he maintained it was ; I asked him how much, and he said a couple of inches ; eventually we had to get the square head to prove who was right ; neither of us was right ; it was an inch out ; the timber had to be put right ; at no other time was any complaint made to me by Mr. Thomas about the timbering ; the under-manager did not trouble us very much there ; I never measured the thickness of the sap in the timber ; I do not think it possible for bent caps to have been in that tunnel without my seeing them ; on the 13th instant, when down with the jury, I saw a number of bent and broken caps below the fall ; I was working on the clearing out of the fall from shortly after it took place till the recovery of the bodies ; on the 13th instant the jury could not get to the face for water ; they were 60 or 80 feet from the face ; I have been below that point myself since then, and have seen broken and bent caps along there ; I noticed them after the fall as soon as we got the dirt clear from them, as we worked our way along ; before the fall I only saw four bent caps ; after the fall I have seen any number of broken caps ; I cannot account for that alteration in the timber ; I should say the roof had broken those caps, or some of them ; the others may have been broken by the sides ; I do not know the names of the men who were working with me in clearing the tunnel after the fall ; there were three of the Genges, Jack Downey, Jimmy Hinney, Jack Lisman, Fred Cook, Ernest Nickson, a man named Jilson, and others whose names I cannot remember ; I was on the scene soon after the fall ; the rails were all right down to the fall ; down about two-thirds of the fall I could not see any road ; the rails had gone ; in the other part of the fall the rails were hanging on to the top end of the fall ; the dogs had sprung out ; there was one of the sills gone near the seat of the fall ; that was the only one there, but we found others gone as we went down ; I think we found four altogether gone ; the first one was about two-thirds down on the fall ; the others were lower down as we went down ; all the rails had gone from the fall to the face ; they were all swept from their places to the face.

*By Mr. Millard* : The rails had not all gone in a heap to the very bottom ; some of them were thrown up against the roof and fastened there. DAVID LEWIS.

Taken and sworn at West Maitland, the 23rd day }  
of January, 1899, before me, — }  
GEO. C. MARTIN, Coroner.

This deponent, *Azariah Thomas*, on his oath states (*in answer to Mr. Millard*) :—On the Tuesday before the accident I was down the tunnel surveying ; I had a conversation with Griffiths ; I did not mention to him to speak to Lewis to have the timber repaired at the end of the week ; I did not say a word about that ; not one word was said about the necessity of timber being repaired ; not one word was said about timber being broken or bent ; I did not stop either on the way up or on the way down to look at any broken or bent timber ; there could not have been timber bent and broken as described by March and Parsons without my seeing it ; I saw no timber bent, except that near the water-cask.

*By Mr. Bowden* : I have never heard any creaking of the timber in the tunnel ; I have heard timbers crack in a mine and have stood by them ; I know the noise produced by the settlement of timber ; that noise could not be mistaken for the breaking of timber ; if the timber is large it would make a noise like the report of a cannon on breaking ; the timber in East Greta mine was what I would call large timber ; if the timber had been broken in the manner suggested by previous witnesses, the noise produced would have been a very loud one. A. THOMAS.

Taken and sworn at West Maitland, the 23rd day }  
of January, 1899, before me, — }  
GEO. C. MARTIN, Coroner.

Inquest adjourned till 10:30 a.m. to-morrow, the 24th of January, 1899, the jurors being bound over.  
Court-house, West Maitland, }  
23rd January, 1899, — }  
GEO. C. MARTIN, Coroner.

Inquest resumed at 10:30 a.m. this day, at the Court-house, West Maitland, on the 24th January, 1899, the jurors answering to their recognizance.  
GEO. C. MARTIN, Coroner.

This deponent, *Edward Parsons*, recalled on his former oath, states (*in answer to Jury*) :—Since the accident I have had a conversation with some one about the bent caps in the extension ; I have conversed with Mr. O. K. Young ; he has not offered me a cheque for £20 to keep my tongue silent about the bent caps ; I have never said that he did so ; when I left the mine on the Thursday the props were not bent and the caps were not broken at the shoulders ; it was possible for the caps to have been bent 12 inches without being broken at the shoulders ; I think it possible for them to have bent 2 feet without being broken at the shoulders ; I think I said Griffiths and I were in the "alligator" together when I called his attention to the caps and the slabs sagging down on them ; that was on the day before the fall, between 6:30 and 7 a.m. ; one would naturally think that the roof would fall in as soon as the slabs sagged down in the manner I have described ; I called his attention to five or six caps that were broken as we passed down ; I am quite positive that those caps and slabs were at the place where the fall occurred.

*By Coroner* : They were right under where the fall took place ; I could not see the roof there ; I could see between the timbers ; you could put your hand up between the timber on each side of the tunnel ; the roof looked like a sort of composition ; it looked more like the mixed stone than the conglomerate.

*By Jury* : There were spaces between the slabs through which you could see ; whenever I got close to the cap-pieces I used to examine them at the corners close to the props ; I will not swear they were broken, or that they were sound close to the props ; the slabs could sag a foot without the caps being broken.

*By Mr. Millard* : I first noticed I could see the roof between the slabs when they first began to drop ; that was about three weeks before the fall ; the stone I could see through the roof was like that marked "J" ; I made no remark to anybody about the stone showing through there ; I heard nobody else make such a remark ; the stone I could see in the roof

roof through the slabs was broken up; it was pressing right on to the slabs; the spaces between the slabs were about 1 inch wide; pieces of this stone used to drop through and come down the tunnel; I could not say whether it dropped through the slabs or from the rib; the rib was of coal; at the corner of the caps there might be coal or the stone; I never saw any stuff falling from the roof as I went past in the alligator; the stuff could not roll down the tunnel; it would fall down the tunnel; sometimes it would hit the sills and go jumping down the tunnel; there used to be pieces coming down the tunnel like that all the time I was working in the colliery; one night a piece fell from about 50 feet from the surface, and the engineer had to stop the engine; we saw the patch where it dropped out, and saw where it fell on the bottom; the other men working there could see this stuff dropping out as I could; the slabs were not sprung in any way, but bent down.

*By Jury* The other men would not speak about the stuff falling, because they were frightened of losing their job.

*By Mr. Millard* I considered it dangerous when a large piece of this stuff came tumbling down.

*By Mr. Bowden* None of the men told me that they were frightened of losing their jobs.

*By Jury* Five or six of the caps in succession were bent down—about 30 feet altogether; the slabs were split slabs; they averaged 3 inches in thickness; some were about 1½ inch thick; the larger slabs never slipped over the smaller ones when the caps bent; the slabs have a lap of pretty well a foot over the edge of the caps; the larger slabs might slip over the smaller ones, but the weight on top would tend to prevent them doing so; it might be possible for them to have slipped over in that way.

*By Foreman* I say that I did call Griffiths' attention to the broken and bent caps.

*By Mr. Curley* There are no broken or bent caps in the model of the tunnel produced; that is not a correct representation of the tunnel as it was before the fall; if I saw bent and broken caps in the tunnel before the fall, the fact that I saw bent and broken caps there after the fall might or might not confirm the statement I have made that there were bent and broken caps in the tunnel before the fall; I cannot properly understand that question; Griffiths can hear pretty well; he knows well when a workman is not using his pick; Griffiths was not more than 12 feet away from me on the day I heard the conversation between them; Mr. Thomas was about 5 feet away from Griffiths; Thomas said to Griffiths, "Well, Griffiths, we are going to let that timber there," pointing up the tunnel, "go till the week end, so as not to interfere with the working of the tunnel"; I am still positive he said that to Griffiths; I took particular notice of it; I do not know what made me do so, but I did; notwithstanding the fact that both Thomas and Griffiths have denied that anything of the sort was said between them, I still say it was.

*By Foreman* I went down the tunnel after the accident; the broken caps were not there then, but the bent ones were.

*By Mr. Millard* The same bent caps were there after the fall as I had seen before the fall; they would be about the third or fourth set below the fall; I am certain those were the caps I had seen bent before the fall; before the fall the bent caps were two or three sets below the broken ones; the broken caps were 100 feet at least below the bottom level; I cannot say they were not 150 feet below it; they may have been; I think they were about 130 feet below the bottom level; I cannot say the first of the broken caps was 130 feet from the bottom level; I cannot say within 30 feet where the first broken cap was; the first broken cap was within 100 feet of the bottom level, it may have been a little more, it was not less; I cannot say where the first broken cap was within 30 feet; I still say those broken caps were under the big fall.

*By Jury* I thought there was a bit of danger in working down the pit; whenever I heard the timber work I thought of the danger; I did not think the mine was so dangerous as it was; I trusted the men above; I asked them about it, and they said it was all right; I told them the timbering was looking bad, and that something ought to be done to them; I did not think they would come down as quickly as they did; if I had thought so I would not have stayed there; I was not afraid of losing my billet, because I had made my living before I went to East Greta, and could do so after leaving; from what I saw before the fall I located the broken caps after the fall; there were either five or six sets of timber that I saw bent down in the manner I have described; I think seven sets were carried away by the fall; there may have been more.

*By Coroner* I never spoke to Mr. O. K. Young about the accident at all that I know of.

*By Mr. Bowden* I went to see Mr. Young about a job; he did not give me a job.

*By Mr. Curley* Nothing at all took place between Mr. Young and myself; I simply asked him for a billet on hearing that he wanted a couple of men.

EDWARD PARSONS.

Taken and sworn at West Maitland, the 24th day }  
of January, 1899, before me, —

GEO. C. MARTIN, Coroner.

This deponent, *Jonathan Dixon*, on his oath, states (to *Mr. Millard*):—I am the manager of the Greta Colliery, and reside at Greta; I know the East Greta Colliery; I have had about twenty-nine years' experience of coal-mining in all its branches; I have had experience in the A. A. Co.'s mine, the Stockton Colliery, the Wickham and Bullock Island Colliery, the Newcastle Colliery, and at Austimmer on the southern coast, the Maitland Colliery; I have, in addition, visited several other collieries; I was not in the East Greta Colliery prior to the date of the accident; I know the seam there, and have had practical knowledge of it at the South Greta Colliery and at the Maitland Colliery; the roof overlying the seam is conglomerate; the hardness of the conglomerate is characteristic of that seam; at Captain Russell's old mine, at the junction of the Wollombi and Great Northern roads, it has a thickness of 39 feet; according to Professor David's geological report of 1888, it has a thickness of 49 feet at the Homeville Colliery; I have proved the conglomerate myself at the Maitland Colliery; I proved it there to a thickness of 52 feet; that is about 2 miles from East Greta Colliery, in a direct line; that conglomerate is an exceptionally hard roof; it is, consequently, a reliable roof; I have also proved it at the South Greta Colliery and in the Old Greta Colliery; at the Greta Colliery there is a thickness of 25 feet immediately overlying the top seam; that thickness has been obtained in the sinking of the shaft at Greta; the exhibit marked "F" is a sample of that conglomerate; Exhibit "B" is also a sample, and particularly resembles the conglomerate in the Maitland Colliery; Exhibit "K" is also an extremely fine sample of the conglomerate; Exhibit "H" is a sample of sandstone; Exhibit "F" has been subjected to the action of water and the atmosphere.

*By Coroner* Exhibit "J" is a sample of mudstone; I have seen stone similar to that in my visits to East Greta since the fall.

*By Mr. Millard*: That stone is not characteristic of the seam; I have been into the tunnel at East Greta since the accident; I took particular notice of the timbering; I have not been to the face; I consider the method of timbering in the colliery good; it is scientific timbering; the timber used—ironbark—is considered one of our best timbers; spotted gum is considered more resilient than ironbark, but I doubt its greater strength; I was at the scene of the fall about 2 p.m. on the day of the accident, and saw the cavity; as well as I could with safety I took notice of the strata of the cavity; afterwards I had a better opportunity of doing so; on the left-hand rib—speaking of the cavity—there were from 18 inches to 2 feet of the conglomerate on the head of the coal; that seemed to thin out to 4 or 5 inches on the opposite side; the conditions were reversed when we got down to where the bridge had been left; above the conglomerate there was the mudstone, and above that again a stone somewhat similar to the sandstone produced; the mudstone went to a height of 8 or 10 feet; I have been into the overcast two or three times; from what I saw there, and what I have seen of the cavity, I would not have expected to have found such a thickness of the mudstone; from my knowledge of the seam and its strata I could not have imagined such a thickness of mudstone on the hard conglomerate; the timber in the tunnel was sufficiently strong to have met all requirements that might reasonably have been expected; from what I saw there, and my knowledge of the seam, I would not have anticipated such an accident.

*By Coroner* In the light of this accident I think an intrusion of this mudstone upon the conglomerate may be expected anywhere in connection with this seam.

*By Mr. Millard* It is not an unusual thing to find timbers bending in a mine; there is not a mine in the world using timber where bent timber will not be found; the deflection of a cap or several caps is not a positive indication of danger; the movement of the strata will bring that about until the strata have settled down; if the caps were bent and the slabs not pulled down with them, I would say the pressure was a lateral one.

*By Coroner* Seasoned timber has the greater power of resistance, and is better for all mining purposes than new timber.

*By Mr. Millard* The fact of the timber being new would not weaken the tunnel, because timber of a greater strength than is required is generally put in; under the conditions I have named, and allowing for the fact that the timber in East Greta was new timber, I consider it was sufficient for all purposes of the colliery; notwithstanding the fall, I still adhere to my opinion that the system of timbering carried out there was the best under the conditions existing; approximately

approximately I should say that from 250 to 300 tons of stuff came away in that fall—that is, including the slabs and legs, &c. ; I scarcely think that caps bent down a foot and the slabs sagging down on them would have supported such a weight for six weeks ; a broken cap will support a certain amount of weight ; if a cap is broken right through, the leverage gained from the joint will support a certain weight ; if five or six caps were broken like that they would not support such a weight as I have mentioned.

*By Mr. Tillet :* I cannot accept the statement that the caps were deflected 12 inches the day before the fall ; I daresay an ironbark cap with a length of 12 feet would deflect 8 or 10 inches before it broke where the pressure was on the centre of it ; the ends of it would still have some strength ; I saw the broken caps at the pit mouth ; I should imagine they had been broken from the under side ; I have not met the mudstone in the other collieries in the conglomerate as it has been found in East Greta ; if I had known of the falls of mudstone in the tunnel I would have to find out first whether the fall was a merely local one or a general one in the tunnel before I would strengthen the timbering ; if I had found the mudstone right across the face in sinking and at other places finding the conglomerate, I would think a change was showing itself and take precautions to deal with it ; sometimes you get three or four bent caps running sometimes at intervals ; the fact of these caps being bent in that way would not indicate too much pressure on the roof ; in a drive like that at East Greta, with the coal on each side, I would expect a lateral pressure ; the fact of it having a soft bottom would tend to make part of the coal slide, and thus exert a lateral pressure ; after the fall I thought the pillars were standing very nicely ; it was quite possible for there to have been a lateral pressure there ; I have formed an opinion as to the cause of the accident ; the mudstone, which is an indurated clay, has become infiltrated with water, and has thus lost its adhesive properties and thrown all its weight on the caps, which have suddenly gone—that is, one or two of the bent caps have gone and thrown the others out ; a small piece of the Exhibit "J" placed in water and left for a few minutes would have to be picked out in small pieces, thus showing the action of the water on the stone ; the weight of the mudstone would come suddenly on the caps at the last moment after complete impregnation ; the bent caps would be an indication of the pressure of the stone on them if you knew the mudstone was there ; the fact of the clearing being made between the caps and the roof would allow the mudstone, after full impregnation, to come down suddenly on the caps and snap them off ; if ti-trees were placed on top of the slabs and the mudstone were sliding a deflection of the caps would be brought about before the actual fall.

*By Mr. Millard :* The layer of conglomerate between the slabs and the mudstone would not hold any weight if it was thin ; had the thickness been right across about 18 inches it would have held up a good weight, but my examination showed it to be thinning between the two sides of the tunnel ; if none of the caps were bent before the fall it does not alter my opinion as to the cause of the accident ; there must have been a space between the timbering and the roof.

Taken and sworn at West Maitland, the 24th }  
day of January, 1899, before me,—

JONATHAN DIXON.

GEO. C. MARTIN, Coroner.

Inquest adjourned till 2:30 p.m. this day for lunch.

Court-house, West Maitland, }  
24th January, 1899,—

GEO. C. MARTIN, Coroner.

Inquest resumed at 2:30 p.m. this day.

Court-house, West Maitland, }  
24th January, 1899,—

GEO. C. MARTIN, Coroner.

This deponent, *Jonathan Dixon*, recalled, states (*in answer to Mr. Atkinson*) :—Water would disintegrate the mudstone very rapidly ; water finding its way to the mudstone would commence to disintegrate it at once, and the water would percolate through the interstices it made in the stone ; if I noticed changes of a marked character in a roof I was dealing with I would increase the quantity of timber, not alter the method of timbering ; from what I have seen of the roof since the fall, I do not consider the manager would see sufficient to warn him of the change in the roof, and the impending danger resulting therefrom ; the conglomerate would hide from him any deficiency in the roof above it ; to my mind the mudstone would not be visible till after the fall had taken place ; on looking through the breaks in the slabs on the day Moncrieffe's body was found, I could see the conglomerate in its usual position above the coal ; if I had known the mudstone was immediately over the coal I would have considered it necessary to put in additional timber ; the fall was influenced to a very slight extent by side or bottom pressure, in my opinion ; if the caps were not put tightly in a very slight side movement would cause a bending of the caps ; knowing there was a side movement, I would not recommend that the caps be tightly wedged at the ends ; had there been much side pressure I should expect to see it first shown on the legs ; I was not at the Maitland Colliery when the sinking was being done ; that shaft is bricked, but not through the conglomerate ; I have never noticed any patches of mudstone in the conglomerate.

*By Coroner :* I took particular care to examine the tunnel since the fall ; I saw nothing but the conglomerate, thick or thin, except where the fall had taken place, and there there were traces of the presence of the conglomerate ; the conglomerate overlaid the coal everywhere.

*By Mr. Curley :* The water would eventually work through the mudstone and trickle down ; probably the piece of stone produced marked "J" has not been subjected to the action of water ; it does not follow that all the mudstone was wet, but sufficient had been acted upon by the water to bring down the whole body ; on the Monday after the second fall, I saw the water running and dripping down from the roof ; the action of the water will affect some kinds of conglomerate ; it will affect calcareous conglomerate, but not the hard siliceous conglomerate ; the conglomerate marked "D" is not of the same class as that marked "B" ; the latter is the harder, and water will not affect it, while it will the former ; if the water trickled through the roof, it would be noticeable by the manager ; I was manager of the Maitland Colliery for about four years, actively and inactively ; it worked continuously during that time, except for one short break ; the workings extended about 300 yards to the south, and about 150 yards to the north as well as to the west ; we worked the bord and pillar system with 8 yards bords ; we used a fair amount of timber ; we had a soft floor, but not so soft as I have seen in the tunnel of the East Greta ; we took the bottom up when we drove the stone drift ; we only took up a few inches of the bottom ; that would be portion of the roof of the lower seam ; I have seen a roof in a mine vary in different parts of the roof ; that is not a common occurrence in a marked degree ; you generally get a characteristic roof over the whole of your seam ; I have spoken of the timbering in the Stockton Colliery being bent and broken in many places ; I know that a fall took place there many years ago ; that was the cause of the timber being put in ; there was a good roof at Stockton, but I decline to say what was the cause of that fall, as that matter has been investigated by a Commission ; the probabilities with regard to such a tunnel as East Greta are that the timber put in would be too strong for the requirements ; the timber put in at 500 feet depth would be far in excess of the requirements, so that at 1,000 feet I would not increase the size of the timber ; there was nothing to my knowledge before the fall to show or indicate that the timber was not strong enough to bear the roof at any depth ; I have examined the tunnel carefully since the fall, and found the conglomerate overlying the seam everywhere ; I am satisfied now that there is not uniformity in the roof of the East Greta Colliery ; if the cap were broken in the middle, and the end fastened into the coal at the side, the end would support a certain amount of weight by reason of the leverage gained from the leg ; if I had seen four bent caps in succession in the tunnel, I would certainly have looked for the fifth ; I would have found out whether the wedging at the side caused the bending, or the side pressure or the top weight ; I would have looked for the cause of the bending or breaking ; I would find out the cause first before putting in extra timber ; I would be guided by the conditions of the case as to whether I put in extra timber ; broken caps will sometimes support a heavy weight upon it.

*By Mr. Bowden :* If mudstone were saturated with water, there might not be sufficient water to trickle through the stone and into the tunnel ; the moment a heavy weight fell upon a thin band of conglomerate it would snap at once, and not bend ; I would not expect to find the conglomerate in the tunnel bending down to a depth of 8 or 9 inches before breaking ; if the mudstone were immediately in contact with the conglomerate the conglomerate would break away first in the case of such a fall ; when the conglomerate broke in that way the other strata would be all ready to come away ; if the caps had cracked they would be weaker than before ; the pressure upon them should increase as they bent more and more ; if the water had not gone into the mudstone, I do not think we should have heard of the fall in East Greta ; if the water were performing its action unseen it is possible that it might be disintegrating the material on the top, and bending the caps.

*By Foreman :* I have proved 52 feet of hard conglomerate over the second seam of the Maitland Colliery ; that was 512 feet below the surface ; that is the corresponding seam to the seam at East Greta at No. 1, which comes out to the surface ;

surface; the conglomerate near the surface would be subjected to the action of weather, and be softer than conglomerate lower down, but it would be affected for a depth of a few feet only from the surface; after that it is all the same all the way down, as long as it is the same kind of conglomerate; it is just as likely to be as hard at East Greta as at the Maitland Colliery; the piece of stone produced marked "K" is on the line of demarcation between conglomerate and poststone; I do not think that water trickling over it would disintegrate it; water falling from some height would disintegrate it; the stone marked "D" would disintegrate before that marked "K" if placed in water; the fact that the tunnel extension was being carried on for five months, and the fall happening suddenly, may be accounted for by the fact that the water was silently doing its work, and without being visible; the fact that the bodies were found where they were is an indication to me that the fall must have taken place suddenly; otherwise, if the cracking of the timbers had been going on for some time, the men would have had time to have reached the level.

*By Jury*: I cannot say whether the water had come through the seam after the fall had taken place or not; I think it had been there for some time affecting the mudstone; there would not, in my opinion, be a cavity in between the two seams that held that water; I think the water was held in the strata; in all probability I would have a look at any bent timber in the tunnel as soon as I knew of it, and try and find out the cause of it bending; if it were due to roof pressure, I would not necessarily strengthen it; it would all depend upon the circumstances; after first putting in timber the movement of the strata might bend the timber and then settle down, and no more bending be visible; the bending or breaking of timber is not necessarily a cause for repair; I would be entirely guided by conditions; I have seen timber break with only 2 or 3 feet of stuff on top of it, and then, after the removal of that stuff, a thoroughly safe roof found where it was not formerly known to exist; a large body of running water acting upon the mudstone would bring the mudstone down through the slabs, but where there is only a small body of water acting on the stone, it would take a very long time to do its work and percolate through the stone; I saw a length of roof in the tunnel with the roof untimbered; if all the roof had been like that it would not have required timbering.

*By Mr. Millard*: If I saw a band of dark shale above the coal, and between it and the conglomerate, I would not look upon that as a change in the roof; even although this dark shale ran into the roof in small potholes I would not deem that a change as long as the conglomerate lay above it.

JONATHAN DIXON.

Taken and sworn at West Maitland, the 24th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This deponent, *Hugh Humphreys*, on his oath states (*in answer to Mr. Millard*):—I am the manager of the Dudley Colliery, and reside at Dudley; I have had twenty-three years' experience of coal-mining in the Wallsend and Dudley Collieries; I have visited East Greta Colliery several times since the accident; I have made observations as I have gone down the tunnel as to the manner in which the tunnel has been driven, and the method of timbering adopted there; the methods of driving and timbering I consider good; I have had no experience of the East Greta seam; from what I have seen of the roof since the accident I consider the timbering in the tunnel was sufficient for its purpose—that is, taking into consideration the conglomerate roof I have seen there since; a slight bending of the caps does not always indicate danger; it is quite a usual thing in mines to find timber bending; it is quite possible for side pressure to bend timber; if I saw caps bending, but the slabs not being affected in any degree, I would attribute it to side or bottom pressure; I have been down the tunnel six or seven times since the accident; I took notice of the strata where the fall had taken place; I saw a layer of conglomerate about 18 inches thick on top of the coal with the soft mudstone immediately above the conglomerate; I noticed conglomerate on the sides of the tunnel, just on top of the coal, in other parts of the tunnel; I have made no inspection through the slabs of the roof; I attribute the accident to the faulty ground—the mudstone—which has been acted upon by water, breaking some of the timber, and carrying away the rest of it; if there was no indication, such as the creaking of the timber a quarter of an hour before the fall, I would call that a sudden fall; we estimated that from 250 to 300 tons of stuff came away in the fall—that is, including the stuff that came away in the second fall; if that weight had been pressing on the roof for some time, it would give some indication of that pressure; if it came away suddenly, there would be no such indications.

*By Mr. Tillet*: I should expect a fall of that sort to give some indication of its coming; it is not impossible that it came away without any warning; that warning might be the bending of caps, or a crushing and creaking of the timber; I do not think that could have been going on for three weeks before the fall; if I saw extensive patches of the mudstone in the conglomerate roof, I would take extra precautions in my timbering; if I saw any great extent of it, I would deal with it, instead of the conglomerate; I would not put in stronger timber, but put it closer together; with such a roof as they have had to deal with at East Greta, I consider the timbering there sufficient.

*By Coroner*: I have had no experience with conglomerate roofs; I do not know that mudstone comes into conglomerate in extensive patches; the cause of the East Greta accident was the conglomerate thinning out, and the mudstone taking its place.

*By Mr. Atkinson*: I consider side or bottom pressure had very little to do with this fall: I have seen the sides of the tunnel where the fall took place; the sides there were in good condition; if there had been much side pressure, and the slabs had been well wedged in, I should expect to see it on the legs first; I have not had an opportunity of examining the roof on the lower level; the roof where I have examined, it was very hard conglomerate; I did not see the roof in the neighbourhood of the dam; if in a tunnel like No. 1 I saw four or five consecutive caps bent to the extent of 6 inches, I would ascertain the cause before dealing with them; if the roof were lying down on the caps, I would consider it roof pressure, and that they required renewing; timber in a tunnel, at an angle of 45 degrees, would require more attention than timber on a level drive; timber in a tunnel of this sort would require more attention than timber on a level drive.

Taken and sworn at West Maitland, the 24th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

H. HUMPHREYS.

This deponent, *Jonathan Dixon*, recalled on his former oath, states:—I wish to say that every credit is due to the workmen employed in restoring the tunnel for the manner in which they carried out their work; I wish to make special mention of Deputy David Lewis for his intrepidity, calmness, and sound judgment in supervising the work.

Taken and sworn at West Maitland, the 24th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

JONATHAN DIXON.

Inquest adjourned till 10-30 a.m. to-morrow, the 25th of January, 1899, the jurors being bound over.  
Court-house, West Maitland, 24th }  
January, 1899,—

GEO. C. MARTIN, Coroner.

Inquest resumed at 10-30 a.m. this day, the jurors answering to their recognizances.  
Court-house, East Maitland, }  
25th January, 1899,—

GEO. C. MARTIN, Coroner.

This deponent, *Hugh Humphreys*, recalled on his former oath, states (*in answer to Mr. Curley*):—On the left-hand rib the conglomerate showed from 18 inches to 2 feet at the seat of the fall; on the right-hand rib it only showed 4 or 5 inches; lower down the conditions were reversed; the thin layer seemed to run for about 30 feet down the fall; after that it began to thicken on the right-hand side, and thin out on the other side; on the left-hand side of the bottom of the fall the thickness of the conglomerate was 4 or 5 inches; the thin layer on the left-hand side extended about 15 to 20 feet from the bottom end of the fall; I am satisfied that the stone put into the glass yesterday by Sub-inspector Fowler has been affected by the action of the water; I have noticed veins lying vertically and horizontally in the strata of mines; they lie in layers; there are sometimes natural facings in the strata; if water had been trickling through at East Greta, and came through the slabs, it must have been seen; it must have affected the conglomerate, or the fall would not have taken place; if the caps were broken, and the slabs lying on them, and the roof lying on those slabs; I should say the water had affected the roof; otherwise the roof would have remained, and the slabs would have come away by themselves; under those conditions I should have expected to have seen some indication of the water; if no water was coming through under the

the conditions of roof described, I could not say that water was there; I called the stone marked "J" soft shalstone; that marked "K" is hard poststone; that marked "F" I would call conglomerate; if I had to use timber at 500 feet in that tunnel, and timber at 200 feet lower down, and I saw the timber in the lower level bending, I would set it closer together, as has been done in this case.

*By Foreman:* I have got out at the No. 2 level on the right-hand side; I have been through the overcast several times; I did not notice a soft spot over the overcast; I examined the nature of the roof of the overcast; all I saw there was extremely hard; if there is any soft material there I did not see it; leaving out of consideration the part where the fall took place, I consider the roof of the tunnel a very good one; had the conglomerate, as it appears at the overcast, continued right through the tunnel, there would have been no fall; I saw nothing like the stone marked "H" in the overcast; that is a sandstone; it may be portion of the conglomerate; probably above that the roof would be hard again; there would not be much of that stone in the roof; down the tunnel, below the fall, the roof I saw through the top slab was conglomerate.

*By Jurymen:* I have had no experience of the East Greta roof, but I know what a conglomerate roof is; I saw the roof near the surface at the overcast, and where I saw it above the slabs on the side; practically the only places where I could examine it properly were above the tunnel, and at the overcast; there may have been soft patches that I could not see at all; my opinion of the roof is formed from what I saw of it at the place where it is not timbered and at the overcast; if the roof was as solid as it is at the overcast and out by the level, I do not consider it would have required timbering all the way down; if that sort of roof continued it would not require timbering at all, leaving out the soft bottom.

*By Mr. Millard:* I did not see a band between the coal and conglomerate; if there is one it would not be a source of danger.

*By Mr. Bowden:* A person travelling up and down in the alligator could not see the nature of the roof while he was doing so; he would have to stop and examine it.

*By Mr. Tillet:* Anyone that stopped under the timber and made an examination through the timber he could see the nature of it.

*By Coroner:* A deputy or man in charge travelling in the alligator could not see the nature of the roof unless he went very slowly.

*By Mr. Bowden:* A person in the alligator could make a proper inspection of the timber from it if travelling slowly.

*By Jurymen:* There must be some portion of the roof exposed at the face before they can get it in.

*By Mr. Bowden:* From what I saw of Lewis I consider him a thoroughly practical man; I had every opportunity of watching him while I have been at the mine.

H. HUMPHREYS.

Taken and sworn at West Maitland, the 25th }  
day of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This deponent, *Duncan McGeachie*, on his oath, states (*in answer to Mr. Millard*):—I am manager of the Waratah Colliery; I have had about twenty-seven years' experience of coal-mining in all its branches, both in Scotland and in this Colony; I am also an engineer and surveyor; I had not visited the East Greta before the accident; I have a fair knowledge of the whole of the Greta Measures; the roof found over the East Greta seam is a hard conglomerate roof; that is known as the general roof of the seam; that conglomerate extends to a depth of 40 feet; when I visited the tunnel after the fall I took notice of the method of driving and timbering; I consider the timbering had been done on the most approved method for a tunnel of that description; the manner of carrying out the work appeared to be good; the timber employed was all good that I saw; I have heard the conditions existing with regard to the roof before the accident, and consider the roof was well timbered; I took notice of the strata at the seat of the fall; I found that the conglomerate there had run out to almost a thin casing or shell—from about 18 inches to a few inches on the other side; above that there was a soft mudstone, and above that a hard sandstone; that is not a usual thing to find in a conglomerate roof; from my knowledge of geology and the strata of this district I would never have expected to find such conditions; I was not down the tunnel lower than the fall; I had an opportunity of observing David Lewis at work; I consider he was a competent person to superintend such work; I consider him a very competent man, and a man deserving great credit for the work he has done there; from what I have seen the accident has been caused by this mudstone coming into the roof; it may have been assisted by water; I think the fall took place quite suddenly, with very little warning, if any; I do not think the timbers at the fall would last five minutes if the weight had come on them; they would not last five weeks with the weight of the roof on them in that way.

*By Coroner:* I was very much surprised when I saw the cause of the accident; it upset all my preconceived ideas of the strata of the seam; I had never seen such a thing before in that stratum.

*By Mr. Tillet:* It is most unusual to find this mudstone in such a roof; I had never seen it before; if I had seen it it would indicate to me a change in the nature of the roof; sometimes stuff of that sort would fall through a little hole and would not mean any change in the roof; I would not be surprised to find small potholes of it in the conglomerate; if I found a patch of it extending right across the face it would indicate to me a change in the roof; under such circumstances I would consider a change in the timbering necessary to strengthen it; I do not think it possible that this roof gradually settled on the timbers; the conglomerate underneath is so hard that it would not yield; it would break suddenly when the weight came on it; the weight might have been on the conglomerate without being seen, but the moment the weight became too much for the conglomerate to bear, it would snap away suddenly.

*By Coroner:* If I saw the change in the roof spoken of I would either put in heavier timber or put the same timber closer; it would depend upon the circumstances of the particular case.

*By Mr. Atkinson:* I have had experience in steep measures in Scotland; the dip was from 43 to 47 degrees; those mines were worked by shafts; the roof was what was called a treacherous one; the main working places went to the rise, and the main leading places to the dip; the main leading places required timbering; they were from 10 to 12 feet wide; the main dips were not driven on pillars as at East Greta; they were worked on the long-wall system; my experience of the Greta seam consists of two years under-management of the Greta Colliery; we worked the conglomerate in the shaft there; the shaft was not bricked where the conglomerate was; I think roof pressure had all to do with this fall; I saw no water dripping from the roof on any of my visits; I had an opportunity of examining the roof in the lower level at East Greta; it seemed to be a very sound conglomerate there; I saw no indication of any other stone there, at the overcast; I was in no other part of the mine to examine the roof; I have had experience of ironbark caps in other collieries with which I have been connected; if I saw four or five of those caps together, bent to the extent of 5 or 6 inches, I would think there was something wrong; I would try to find out what was the matter; if I satisfied myself that it was due to pressure from the roof I would consider those caps required renewing or strengthening; I do not think that the bending of a cap for 3 or 4 inches would be anything out of the way; when it comes to be bent 6 or 8 inches it is practically useless; if there were side pressure I would expect it to show first on the props.

*By Coroner:* I noticed the floor just above the fall; it seemed to be of a nature that would be easily affected by water; taking that into consideration, I consider the timbering there was good; the sills were good and well put in.

*By Mr. Curley:* If a cap were bent 3 or 4 inches I would not consider worth while putting in another; if bent 6 or 8 inches it would be past the point of resistance; if I noticed four sets in a line bent 3 or 4 inches I would take notice of it; I would try and ascertain the cause of the bending; if it were roof-pressure I would provide against it; according to the circumstances of the case, I would either put in heavier timber or put the same timber closer; I did not make a minute examination of the conglomerate at the fall; on the right-hand side it thins out to 5 or 6 inches; I cannot say how far that thinning out extended; it extended for several yards; I examined the left-hand side of the fall also; the conglomerate was thicker on that side; I was never out of the main tunnel except into the overcast.

*By Mr. Bowden:* I saw no water or appearance of water at the fall when I examined it; from my knowledge of the seam, I would not expect the layer of conglomerate to thin out to 6 to 8 inches as in this case; I think the timber used was good timber—could not have been better timber for the purpose for which it was used; if the caps had been bent to the extent of 12 inches they could not have stood up for any length of time; they would not have stood their own weight; I have seen timber bent by side pressure; if I had had any trouble with side pressure in one part of the tunnel, the bending of three or four sets of timber in another part would not have alarmed me; in the case of pressure from the roof, I would have expected to have seen the slabs bulge down between the caps; if they were not bulged down, and I had had side pressure previously, I might take it that the side pressure was affecting the caps; if the slabs were not tight down on the caps

caps at the ends I would not consider it was roof pressure, I would expect to see side pressure exerted on the props, even with packing of ti-tree; caps wedged hard in would be affected by side pressure before the legs; where the fall occurred it was impossible to see that such a change in the roof had taken place; I saw patches of the soft stone at the sides of the tunnel, but that was no guarantee that it extended right across the tunnel; it was impossible to see such patches extending across the tunnel where the fall took place; they could not be seen for the conglomerate.

*By Mr. Tillet:* I do not say that such patches did not exist, and had been seen; what I say is, that it was impossible for them to have been seen at the seat of the fall.

*By Coroner:* I was at the mine on the Monday, Wednesday, and Friday following the fall, and saw no water on any of those days.

*By Foreman:* I first visited the mine on the Monday after the accident; I went there to consult with Mr. Thomas; I was asked to go there; I was asked to inspect the seat of the fall in order to give my ideas as to the best way of getting over the difficulty and getting the place retimbered; I could see for myself what was the cause of the fall—a change in the roof; I could see that in the fall; I saw no change whatever in the roof at the overcast; I went no further than the overcast; I tried to ascertain the nature of the roof; I looked at the roof in the overcast at the edge of the tunnel; I did not go there to find out what was the nature of the roof; I knew the nature of the roof pretty well before I went there; I examined the roof over the overcast and saw it was good conglomerate; I was not on the dam side of the tunnel; if I had thought such questions were to be put to me I would have made a closer examination of the roof; I only went there for the purpose of advising as to the best way of repairing the fall.

*By Juryman:* I never saw a change in the Greta seam like that before; I have known faults to come in the coal in that seam; that has not surprised me; I consider that I have a fair knowledge of the Greta measures right through; I never saw the East Greta mine before the Monday after the fall; I consider I have a practical knowledge of the East Greta roof in consequence of my general knowledge of the nature of the Greta measures; I have never seen such changes in the measures as revealed by this accident; I did not go round the overcast; I only went to the one side of it; I saw the roof at the beginning of No. 1 tunnel; some of the roof there had no timbering; from what I could see of the whole of the roof from the outside it did not appear to require timbering anywhere; I prefer seasoned timbering; the timber that has been put in the East Greta tunnel is good enough for anything—either seasoned or unseasoned; I think I saw one or two sets of timber below the fall broken; that fact was proof that the timber was not strong enough to withstand the pressure that came on it after the fall; the fall would certainly influence the bending of the caps immediately below the fall; simply because of the greater weight thrown on them by the fall; I do not think the fall would affect the caps 200 feet below the fall.

*By Mr. Millard:* As to replacing bent timber I would be guided by my past experience as the manager of the mine; if I had previously found timbers bent higher up the tunnel, and on examination, taking them down and the roof were found intact, I would incline to the belief that the cause was not roof pressure; if I had had trouble with the bottom I would incline to the same belief; I went to the colliery because I was asked to do so by the manager, to assist with my advice in carrying out the operations for finding the bodies, and repairing the tunnel.

*By Mr. Curley:* One could tell whether the pressure came from the roof or the side or bottom when the bent cap was taken away; I have seen broken or bent caps in a mine that showed pressure from the roof, and not from the sides.

*By Coroner:* I was asked to visit the Dudley and Stockton mines after the disasters there, but did not give evidence afterwards.

*By Mr. Millard:* There is no greater danger in the bord and pillar system than in the long-wall system; the long-wall system would not have prevented this accident.

*By Mr. Bowden:* Patches of this mudstone underlying the conglomerate would not indicate a general change in the roof; all roofs are patchy to a more or less extent; these patches are not usually thick, but what are termed pot-holes.

*By Juryman:* I would describe the stones produced as exhibits by the same terms as the other witnesses.

D. McGEACHIE.

Taken and sworn at West Maitland, the 25th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

Inquest adjourned till 2.30 p.m. this day for lunch.

Court-house, West Maitland, }  
25th January, 1899. }

GEO. C. MARTIN, Coroner.

Inquest resumed at 2.30 p.m. this day.

Court-house, West Maitland, }  
25th January, 1899. }

GEO. C. MARTIN, Coroner.

This deponent, *Richard Thomas*, on his oath, states (in answer to *Mr. Millard*):—I am manager of Messrs. Brown's collieries; I have had about twenty-eight years' experience of mine managing; I have a general knowledge of the strata of the coal seams throughout the Maitland and Greta district; I know the East Greta seam, and have had experience of it; I have made a study of geology; I went over the whole of the Greta field with Professor David; the roof in the East Greta seam is hard conglomerate—calcareous; that is generally found over the Greta seam; I have traced it for about 16 miles from the Homeville mine; that is the best roof for coal mining purposes; it has been proved from 50 to 80 feet thick throughout that distance; I have visited the East Greta colliery, both before the accident and after; I visited it when it was opened up, and was there on the day of the disaster, and on several occasions since; I took particular notice of the methods of driving and tunnelling; the timbering was squarley framed, very strongly put together, and well adapted to resist pressure from roof, floor, or sides; it is a modification of the Welsh style of timbering, specially adapted to resist floor pressure; the tunnel has been driven and timbered on thoroughly scientific principles; the class of timber employed is the best that can be used for that purpose; under the conditions obtaining before the accident, I consider the timbering was all that could be desired for the purpose for which it was intended; I visited the scene of the fall and took notes of the strata disclosed by the fall; immediately over the slabs was a thin layer of conglomerate, 18 inches thick on the left-hand side, and a foot thick on the right-hand side; above that about 5 feet of mudstone; then a pebbly sandstone from 10 to 12 inches thick; above that about 4 feet of mudstone, and above that a dark-brownish sandstone; on a subsequent visit I went to the lower end of the fall, and the conglomerate on the left-hand side prevailed right through, and on the right-hand side thinned out to almost nothing; I went no further than that; I have had no particular experience of the roof in the tunnel beyond that; I saw the overcast in the second level driven right through the solid conglomerate; that showed no sign of giving out; I did not go into the level at all; from my knowledge of geology, and of this seam in particular, this erosion of the mudstone is not what I would expect; it is what I would call a freak of nature; conglomerate is always carried along by a swift strong current, while mudstone is carried along by a slow stream or current; it is not unusual for the conglomerate to carry away the mudstone, but it is very unusual for the mudstone to carry away the hard conglomerate; the conglomerate would be in the first instance laid down horizontally; a band of shale between the coal and conglomerate would not affect the roof unless it formed the roof; as long as the main roof of conglomerate was overhead its stability would not be affected; a stream of water has first run over the coal depositing silt, then another current has brought down the conglomerate and carrying away the silt, leaving patches of it; we never expect the soft silt to carry away the hard conglomerate; originally the stream of water would leave the conglomerate of a uniform thickness, especially when it is found persistent over such a large area as in this instance; the accident has been caused, in my opinion, by the erosion of the mudstone into the conglomerate; such a thing would be quite unexpected, and a danger that could not reasonably be provided against; it is not an unusual thing to find timbers bending to a small degree in mines; it is a usual thing to find them so, for the reason that they are not put in tightly in the first instance, and do not get their full proportion of the weight; a cap slightly bent is quite as good as new; a bending of 2 or 3 inches is only a slight bending; if the caps were only slightly bent and the slabs had not come down with them, I would not expect the cause of the bending in the caps to be roof pressure; in dealing with these bent caps I would be guided by my general experience in the mine; if I had found at one point in the tunnel that the caps were bent, and, on examination, found that the roof was intact, a bending of the caps lower down would lead me to believe that it was not caused by any defect in the roof, but due to the same cause as the bending in the caps higher up; I think, in regard to the fall, that the conglomerate would probably break away suddenly

suddenly ; it is a roof that will not bend ; when once the conglomerate had broken away the timber would not stand the strain long ; there would be double the weight thrown on the set next to the first that carried away, and treble the weight on the next ; I think the breaking of the conglomerate and the actual fall would be almost instantaneous ; if the caps were broken and the conglomerate broken through, the timber would not support the weight of the roof for any length of time ; there would be so much extra weight thrown on each set of the timber as soon as the conglomerate had given away ; I do not think it possible for the caps to be bent or broken and the slabs sagging down on them with the mudstone visible through them for some weeks before the fall ; I consider the caps in the tunnel would support a weight of 20 tons each ; after the cap had been cracked and broken through it would hardly support itself ; if the cap were bent down to an extent of 8 inches, and were cracked, it would have reached the limit of its strength ; it would not then support 20 tons ; any amount of cracking would reduce its strength ; I cannot give any estimate of the strength of the slabs used in the tunnel ; in mining, the strength of the slabs is not taken into consideration ; the cap is supposed to bear the whole weight.

*By Mr. Tillet :* This mudstone has practically no cohesion ; if the tunnel had not been timbered, the thin layer of conglomerate would not have supported the mudstone for any time ; the face had been driven some distance past the fall ; it had been driven for about three months ; the fall did not take place sooner because the timber was there to support the conglomerate ; it was not necessary for the conglomerate to break before the weight came on the set of timber ; the timber was carried right into the conglomerate ; if the mudstone had to depend upon itself it would have come away ; if the caps were tight under the conglomerate, any movement of the conglomerate would come right on to the caps at once ; I could not see any evidence of the assertion that water played a part in this fall ; there was no evidence of the action of water either upon the conglomerate or the mudstone ; the timbering was sufficient for the conditions existing as far as could be seen before the fall ; the existence of the mudstone upon the coal meant nothing ; small furrows of the mudstone may not have been scoured away by the conglomerate, but there was not sufficient of it to affect the stability of the roof ; my opinion of the formation of the roof is that there was this dark band on the coal, then irregular patches of mudstone, which were subsequently partially scoured away by the conglomerate in its deposition ; only practice would tell me whether these patches of mudstone are extensive or not.

*By Mr. Atkinson :* I would not expect much side pressure in a tunnel of this kind ; I do not think that side or bottom pressure had much to do with the fall ; I consider that conglomerate is a rock which geologically varies very little in its character, especially such a consistent conglomerate as this is ; in calculating the strength of the cap-piece I assumed that the weight was equally distributed throughout the length of the cap-piece ; if four or five caps together were bent to the extent of about 6 inches, I would be guided by my previous experience of the tunnel in dealing with them ; I would first make my examination to see whether the roof was intact ; if it was intact I would not consider the pressure came from the roof ; if the pressure came from the sides I would expect to see the sides fall ; the sides under this fall were to all appearances just as they were driven.

*By Mr. Curley :* I was in the East Greta in its earlier stages ; that would be ten years ago or more ; I was in the No. 1 tunnel at that time ; I saw a hard patch of conglomerate there, entering that tunnel, which is not timbered ; there are about 75 or 80 feet of that untimbered roof ; I saw timber following on that, and also patches without timber, then timber continuously ; I should say that the continuous timber would be put in owing to the greater depth, and it is a precaution that a prudent and cautious manager should take against accidents in connection with the roof or sides ; the continuous timbering at the greater depth would be necessary because the cover was so much greater ; where there was no timbering there was not the same thickness of cover ; the tunnel was down about 100 or 150 feet when I was there about ten years ago ; some bords were going at that time ; I have not been in the colliery since up to the time of the accident ; during that interval I would not think there had been any serious falls of the roof with such a roof as they had ; if there had been falls of the roof in that time I would want to know the conditions of them before I would class my knowledge of the mine with that of the manager ; I would not compare my limited knowledge of the mine with that of the manager ; I would not say that to a great extent my experience of the mine is a closed book ; my scientific knowledge enables me to form an opinion as to the tunnel, and the characteristics of the formation of it ; in making my geological examination of the district I took my points at Homeville Maitland Colliery, East Greta, Heddon Greta, Sandford Greta, Silkstone, Richmond Vale, and Scholey's bore ; that would be about 16 miles long, and about 4 miles wide ; if I had had the conglomerate breaking, and the mudstone showing above it, I would say that the conglomerate did not prevail throughout the roof, but a patch of mudstone under the conglomerate would not affect the roof at all ; if the mudstone were above the conglomerate I would say there was a want of uniformity in the roof ; the exhibit marked "J" is mudstone, and practically has no cohesion ; a roof composed of that would require close timbering ; if I knew the conditions prevailing at the fall before the fall I should put the timber not more than 3 feet apart ; if I knew of the presence of mudstone in unknown quantities with the thin conglomerate I would treat it as mudstone, and timber accordingly ; I made my first measurements on the first or second day of the fall, and the others on the last visit ; I made them at the first set of timber that was standing, and close to it ; I measured from observation, and not with any instrument ; other measurements were made at the bottom end of the fall ; at the bottom of the fall there were three caps good and the fourth broken ; this side of the fall, the nearest to the edge of the fall, was good, and the second one bent about 4 inches ; at the side there I could see no sign of weight upon the timber at all ; I noticed no break of the roof there ; I did not get beyond the overcast ; I went there to look after the rescue of the men, and effect it, if possible, and to attend to the safety of the explorers ; Inspectors Dixon and Bates were with me when I made the measurements, and Mr. Thomas, the manager, Mr. Ross, and Lewis, the deputy ; I think a colliery worked with such a deep incline requires more care and attention than one working on the even grade.

*By Mr. Tillet :* I would call the conglomerate in this roof a coarse conglomerate ; I know "Geikie's Geology" ; it is a standard work ; I do not agree with the description quoted by you to me as to the nature of our conglomerates in the Greta district ; Geikie could not have had experience of our marine beds when he wrote that ; the quotation applies to our Newcastle freshwater beds.

*By Mr. Millard :* My examination of the field contradicts that quotation from Geikie.

*By Foreman :* The first fall did not extend beyond the rib, but the second fall ran over the rib about 3 feet ; the second fall happened at the same point as the first ; the extension of the fall over the rib only applied to the left-hand side ; my first object in going to the fall was to try and rescue the men ; when that was found impracticable, I devoted my energies to getting their bodies out, and looking after the safety of the explorers ; those were the main objects of my visit ; of course, I took a scientific interest in trying to ascertain the cause of the fall ; it was not necessary for me to go all over the mine to find that out ; it would no doubt have been interesting for me to have examined the roof over the No. 2 level, but I had no time to go all over the mine ; my visits could only be made when I could spare the time from my own mine ; I would not, from the fact of the presence of a soft patch in the roof near the overcast, expect to find the soft roof the same all through.

*By Jurymen :* The coal was deposited there by a slow current, carrying driftwood, which, on becoming consolidated, became coal ; that would likely be covered with the silt or mudstone, which would afterwards be carried away in furrows by the conglomerate ; if the coal had not been solid, the conglomerate would have scoured it away ; calcareous conglomerate will soften if exposed to the atmosphere or the action of water ; after the fall, the edge of the conglomerate there would be exposed to the air, and might soften rapidly ; I believe the tunnel in which the fall took place was the same as I went down ten years ago.

*By Mr. Bowden :* I have seen caps bent by pressure from the floor in the Old Country, but not in the Newcastle district ; if the timber were bent from the floor, the sides would be affected ; it is not possible for a body of stone with little cohesion in the roof to hang for any time if it depends upon its own support ; a roof with little cohesion could stand there till its limit was reached, and then it would come away ; there is a certain breaking point which, on being reached, brings the stuff away ; if I saw a patch of that shale-stone in the roof, I would not from that expect to find a large quantity of it there ; the presence of those patches is no indication of a change in the main roof.

Taken and sworn at West Maitland, the 25th day }  
of January, 1899, before me,—

RICHARD THOMAS.

GEO. C. MARTIN, Coroner.

Inquest adjourned till 10:30 a.m. on Friday next, the 27th instant, the jurors being bound over.

Court-house, West Maitland, 25th January, 1899.

GEO. C. MARTIN, Coroner.

Inquest resumed at 10:30 a.m. this day, the 27th of January, 1899, the jurors answering to their recognizance.  
 Court-house, West Maitland, }  
 27th January, 1899,— }  
 GEO. C. MARTIN, Coroner.

This deponent, *Azariah Thomas*, recalled on his former oath, states (*in answer to Mr. Curley*):—The dip of the No. 1 tunnel was 47 degrees from the bottom level to the face; my instructions to the timber-setters were to set the timber at right angles to the pitch; the set of the timber was at right angles to the angle of the tunnel; I did not tell the setters to set the timber at so many degrees, but at right angles to the dip of the tunnel; I have formed an opinion as to the cause of the caps in the tunnel being bent and broken after the fall; the lower sets of timber were broken by the water soaking into the roof after the fall; the water affected the conglomerate; it is quite evident that the breaking of those caps happened after the fall, because those caps are resting on the stuff that came down in the fall; I would not say that the water had been over all the broken caps; the water and *debris* filled up the tunnel for about 130 feet from the face; the timber immediately below the fall we saw breaking during the time we were repairing the tunnel where the big fall had taken place; we both heard and saw that; I heard the timber cracking while we were putting in timber where the fall had taken place; I noticed the timbers on the out-by side of the fall towards the level; they were in very good condition; the sets next the edge of the fall were in good condition; they were not bent, as far as I could see.

*By Coroner*: The mudstone that came from the fall was in much the same state as the Exhibit "J"; the bottom end of the fall had mudstone in it which contained water; the mudstone that had not been immediately in contact with water was in a solid state; as we worked down the tunnel we could see the water working its way down to the face under the timber.

*By Jurymen*: It was impossible for me to have got timber out of the bush without sap in it; the 8 inches required in the timber included sap and all; the smaller end was to be that size; the other end would be larger; I have known ironbark to be in a mine for seven years and a half, and it is there still; the sap of ironbark is considered much better than that in other timbers; that is one reason why it is chosen for permanent work; it is possible to get square timber without sap—that is, if the timber is large enough to allow of the sap being cut out; growing timber cannot be got without sap; I have never had it reported to me, directly or indirectly, that the roof or any part of it was dangerous and a demand made for extra timber.

*By Mr. Curley*: That particular tunnel was commenced a little over seven years ago; there was another tunnel near it down as far as the top level; I do not know how far away from this tunnel that was; there was a distance of 135 yards between the two mouths on the surface; the other tunnel was down 120 yards horizontally when I took charge; there were two places opened out on it, if I remember rightly; it was very little timbered—only a stick in here and there; it never occurred to me to do anything in the No. 1 tunnel that I have not done; there was no restriction at all on me.

Taken and sworn at West Maitland, the 27th day }  
 of January, 1899, before me,— }

A. THOMAS.

GEO. C. MARTIN, Coroner.

This deponent, *William Kerr*, on his oath, states:—I am an engine-driver employed at the East Greta Colliery, and residing in West Maitland.

*To Mr. Curley*: I was on the 3 o'clock shift at the tunnel at the time of the accident; I worked a year and nine months at the colliery; I was not on that shift all that time; the other shifts I went on at 11 p.m. and 7 a.m.; the 3 o'clock shift terminated at 11 p.m.; sometimes I would send the men down on the 3 o'clock shift, sometimes the other man; Lewis went down the tunnel at 3 o'clock during the week in which the accident occurred; I sent Lewis down and the men on that shift; the men did not always go right from the surface to the face; sometimes they went right to the face; sometimes I stopped them at the level; Lewis and the men usually went down together; I could not see them at all from the handles; it was the alligator that went down with the men; I knew by the signals that men were going down; we had a signal for men going down, and another for men coming out; the tunnel men used to go down in one lot sometimes, and sometimes they and the jig men would all go together; I cannot remember whether during the week before the accident I sent them down in one lot or two lots; the alligator went down at a fair speed with the first lot of men; it would go with the same speed with the second lot; the men on the previous shift came up after the other shift went down; it generally took five minutes to bring up the men from the bottom direct to the top—I mean from the present face of the tunnel; I was never told by Lewis or anybody else to go down slowly as he was going to make a careful examination of the tunnel; the method I have described of lowering and bringing out the men has been the practice since I have been at the mine; the timber took a minute and a half or two minutes longer; the men had to come up for the timber; they went down with the timber which was placed in the alligator; I sometimes went to work with the men working in the tunnel; I have heard some one remark about broken or bent timber in the tunnel; that was Dan Grono; it was during a conversation I had with him in the street here one Saturday afternoon, between five and seven weeks before the accident; he said there were two or three caps that were bending with a splinter in them; he said nothing more than that; none of the other men working in the tunnel ever said anything to me about broken or bent caps.

*By Mr. Tillet*: The subject was brought up by the tunnel being mentioned between us, and one asking the other how it was going on; he said there would be some timber replaced when the tunnel was finished, and then went on to mention about the caps being bent with the splinter; he did not speak of them as indicating danger at all.

*By Coroner*: I could tell that Lewis went down with the other men, because I only sent the alligator down once, although I could not see who were in the alligator.

WILLIAM KERR.

Taken and sworn at West Maitland, the 27th day }  
 of January, 1899, before me,— }

GEO. C. MARTIN, Coroner.

This deponent, *Thomas Lionel Bates*, on his oath states (*in answer to Mr. Tillet*):—I am an inspector of collieries, residing at Hamilton; I have inspected the East Greta Colliery several times; I last inspected it before the accident, on the 5th September last; I was in the extension of No. 1 tunnel on that occasion, and down to the face; it was then driven about 50 or 60 yards; that was below where the first fall occurred; I inspected the timbering; it did not show the slightest indication of undue pressure; I had had prior experience of the tunnel, and from what I saw of the timbering on the 5th September last was quite satisfied with it.

*By Coroner*: I walked down the tunnel; I could not see much of the roof because it was slabbed over; I could see the timber as I went down; I examined the timbering in the extension carefully; I could see the roof just through the slabs, and, as far as I could see, it was the usual conglomerate; the predominating feature of that seam is that conglomerate.

*By Mr. Atkinson*: I have inspected that colliery ever since it commenced—about nine years ago; I was at the colliery three times between the 5th September and the day of the accident investigating accidents; I have seen light falls in the mine during my inspections; what came down was what I would call an argillaceous shale or clay shale; I only saw it from 5 to 8 inches thick; I invariably saw the conglomerate above that shale; in the early part of 1897 I had an anonymous complaint about the mine; it came from a wheeler, and set out that the place in which he was working was dangerous on account of the roof; I investigated the matter at once, and all I could find was that the floor was lifting and making the road dirty and difficult to wheel upon; the roof was perfectly good; that was on the left-hand side of the lower level of No. 1; the roof was of coal; the bord was in some little distance—some 50 or 60 yards or thereabouts; there was no fall of roof from where the bord was turned away to the face; I have been down the tunnel since the fall; I am satisfied that the accident was brought about by the conglomerate thinning out, and this mudstone creeping in large bodies; that has become saturated with water and brought about the fall; the saturation with water would cause the mudstone to expand; it could not expand upwards on account of the conglomerate above it, so it would break away where the least resistance was offered, which would be at the point where the fall took place; the side or bottom pressure had very little to do with the fall.

*By Coroner*: I cannot account for the water getting into the mudstone; it might have been brought about by the excavation of the tunnel, which would allow the mudstone to expand.

*By Mr. Curley*: I never saw anything but conglomerate in the slight falls that I have spoken of; I have seen two kinds of conglomerate in the colliery—the silicious and the calcareous; the silicious is the harder of the two; the roof of this tunnel is composed of both kinds—the silicious at the overcast; I cannot tell how far that goes down the tunnel; the calcareous

calcareous comes in below the fall ; there might be some of it in the big fall ; I could only see between the slabs to examine the roof, and wherever I looked I found the conglomerate ; I did not notice any shale ; I looked to see that the timbering was sound and safe ; as long as that was so the men were safe ; I have not investigated any falls in the mine ; I have just seen where some slight falls have taken place ; it is not an uncommon thing to see a fall in the mine ; I can quite believe that there have been big falls where the pillars have been taken out ; I have heard of such falls under those circumstances ; I have not noticed the action of these falls upon the pillars ; I have seen nothing in connection with these falls to indicate any action of the roof upon the timber before the falls ; I have seen several places where there have been slight falls on the levels ; there was nothing important about them, nothing to indicate any danger ; about 6 or 8 inches have come down ; if I, as an inspector of the East Greta Colliery, knew that the levels were timbered in a certain way, and falls had taken place between the timbers, I would take notice of such falls ; I have not, to my recollection, seen falls on the level extending for 2 or 3 feet in thickness ; I have been in the level where the dam is ; I have seen the roof there ; there is a kind of mudstone above the coal there ; it is something like the exhibit marked J ; the roof is not broken to a dangerous extent there ; it is broken where the mudstone has come away, but not to an alarming extent ; I cannot say to what extent it is broken ; I saw it when I was down with the jury ; I cannot say whether it was broken for inches or feet ; the conglomerate was above it ; I saw none between it and the coal ; I think the conglomerate there was calcareous ; I have been in the overcast ; I saw silicious conglomerate there ; I did not go up as far as the door when the jury were down ; I saw nothing but conglomerate in the overcast.

*By Coroner :* Even if the whole of the roof were calcareous conglomerate I consider the timbering was sufficient for the purpose.

*By Mr. Curley :* I have examined the report-books of the colliery when making my inspection ; they were to my satisfaction at the time—that is, prior to the accident ; from what I have heard in this inquest about the report-books, I am not satisfied ; I am dissatisfied with the person who made the inspections, and recorded by Lewis ; I consider that Cartwright or the manager should have been down the mine during the fortnight ; I have read Special Rule 7 of the East Greta rules ; I do not think that the under-manager complied with that rule when he was not down the tunnel for a fortnight ; I should say that a mine of the character of East Greta should be under very strict supervision.

*By Mr. Millard :* I had no knowledge of Lewis before the fall ; I have nothing to say against his competency as a practical miner ; I believe him to be a most competent man from what I have seen of him since the accident ; he appears to be a thoroughly practical man ; I look upon him in the light of a contractor, and say that he is ineligible to make the reports in the books ; I do not say he is incompetent ; that is a question of law, and I only offer my opinion as a layman ; I cannot mention anybody in the mine more qualified to make the inspections than Lewis.

*By Mr. Bowden :* On the whole, the colliery is a carefully and skilfully managed one ; I should call the current of air in the extension a district current.

*By Foreman :* The opening of the top seam some years ago would not affect this tunnel with regard to water.

*By Juryman :* It was beyond human conception to expect the mudstone in such large quantities in that roof before the fall ; if the tunnel had been worked with a straight ventre and double skips, with a line of props down the middle, it would have been doubly strengthened ; that was not practicable though ; it would have increased the safety of the mine if the roof had been bored periodically ; it would be possible to work the tunnel with the props down the centre, but it would not be expedient ; if the skip got off the line at all it would bring down the props ; I visit pretty well every working-place in the mine on my inspections ; I know No. 1 in the No. 2 jig on the north side of the No. 1 ; I believe it was a bord going north that I had the complaint about ; I have seen the tops and pillars between the No. 1 and No. 2 jigs ; I have seen where falls have taken place there ; I have never see any falls take place in the places while the men have been working ; I considered those falls extensive ones ; I saw no reason to stop the men working ; there was no danger ; I know that they stopped taking out pillars ; I know the roof in other mines in this district ; I have never seen the mudstone in the roof to any appreciable extent, but only in small patches ; I would attach importance to it if I saw it for 2 or 3 feet with the sandstone above it.

*By Foreman :* The manager did not evade any provision of the mining laws by not running the jig down in front of the tunnel.

*By Juryman :* I never knew from whom the complaint came about the roof in the mine ; it was quite possible for the men to be working in that tunnel without knowing of the presence of the mudstone ; only the conglomerate was exposed to their view, and they could not tell the thickness of it.

*By Mr. Curley :* I did not go to the face the last time I was down ; the tunnel was timbered close to the face, so I could not have seen the roof by going down to the face ; I went close enough to see all that I wanted ; I went close enough to see the face.

THOS. L. BATES.

Taken and sworn at West Maitland, the 27th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

Inquest adjourned till 2:30 p.m. this day for lunch.

Court-house, West Maitland, }  
27th January, 1899,—

GEO. C. MARTIN, Coroner.

Inquest resumed at 2:30 p.m. this day.

Court-house, West Maitland, }  
27th January, 1899,—

GEO. C. MARTIN, Coroner.

This deponent, *Thomas Lionel Bates*, recalled, states (*in answer to Mr. Millard*) :—The periodic boring of the roof would have been a reasonable safeguard against such an accident as this fall ; it would not be practicable to put those bores in every 2 feet ; I would advise another bore at 50 feet from the overcast, if one were put in at that point ; I believe bores are put in the roof at Stockton to see what is in the roof ; if bores were put in about every 50 feet it would show that precautions had been taken to find out the nature of the roof ; the presence of the mudstone in bords would not have the same effect if it fell as in the main tunnel ; the putting in of the bores would be an additional precaution ; I would never have asked for these bores to have been put in before the accident ; I should advise such a thing now, after hearing the evidence in this case.

*By Juryman :* I have never visited the tunnel since the 5th September last up to the time of the accident.

*By Mr. Curley :* I first saw the fall on the day of the accident ; two of the caps, I think, showed signs of bending on the out-by edge of the fall ; I just noticed the strata of the fall, but did not take any measurements of it ; there was a little bit of conglomerate—from a few inches to 18 inches—then the argillaceous shalestone, then the sandstone ; I think the conglomerate must have been the calcareous ; I did not take particular notice of it ; going down the tunnel the conglomerate was thicker on the out-by edge of the fall, on the left-hand side ; there was very little of it on the other side ; that thin shell ran for about 15 feet, I think ; I was desirous of pushing on the work of rescue and did not want to do anything to hinder it ; below the fall the timber was more or less broken ; below the fall there were two or three sets that were not broken ; then there was another fall below them ; I saw some water dripping from the roof at the fall ; that was on the Monday after the fall ; I saw no water on the day of the accident.

*By Mr. Millard :* I do not think there was any water there at all on the day of the accident ; it was after the second fall had taken place that I noticed it.

*By Juryman :* One could make a certain examination of the roof while going up or down in the cage at the ordinary pace ; to make a proper examination it would be necessary to go more slowly ; I saw Lewis's signature to the reports in the report-books as having inspected the mine ; I did not object to his signing the books when I saw his name there.

*By Mr. Tillett :* I did not object to it because I did not know he was a contractor at the time.

*By Juryman :* There must have been 13 feet between the top of the fall and upper seam.

THOS. L. BATES.

Taken and sworn at West Maitland, the 27th day }  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This

This deponent, *Edward Davis*, on his oath, states (in answer to *Mr. Millard*) :—I am a colliery carpenter, and reside at East Greta ; I have been often down the extension of No. 1 tunnel ; I have sometimes gone down once a day, sometimes two or three times a day, and sometimes not down at all for three or four days at a time ; I was down there about a week before the accident ; that was the last time I was right down to the place ; I noticed the timber in going up and down ; it was in a very good state, I consider ; I did not notice any of the cap-pieces bent or broken ; I know about where the fall took place ; there were no broken timbers there, and if any had been bent it must have been very slightly, or I would have noticed them ; if there had been five or six caps bent or broken, and sagging down a foot, I would have seen them ; there were none in that state ; my work was fixing up the rollers and oiling them, and looking after the signals ; I fixed a roller about 60 or 70 feet from the bottom, just before the accident ; I was there for at least an hour and a half.

*By Mr. Tillett* : I was not concerned much in the roof, my work being on the floor and sides.

*By Mr. Curley* : I did not see five or six caps broken where I fixed the roller 60 or 70 feet from the face ; I did not see one bent ; I just casually looked at the roof as I went by ; I could see some little distance down and up the tunnel ; I did not see four bent caps there ; I had nothing to do with looking after the road in the tunnel.

EDWARD DAVIS.

*By Mr. Bowden* : The rollers were fixed to the sills

Taken and sworn at West Maitland, the 27th day  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This deponent, *Edward Howarth*, on his oath, states (in answer to *Mr. Millard*) :—I am a labourer at the East Greta Colliery, and know the extension of No. 1 tunnel ; I was down there either on the Tuesday or Wednesday before the accident ; I went down with the manager and Mr. Heyes ; we went as far as the bottom level, where we got off ; Mr. Thomas took the grade of the floor ; the three of us stayed there ; Mr. Thomas sang out to Griffiths to give him a sight ; Griffiths did so ; he was down at the face ; Mr. Thomas said, "Is that right?" after taking the level, and Griffiths answered, "Yes" ; Heyes threw the chain down the tunnel, and told me to take it down and mark every chain ; I did so ; I walked across the tunnel three times, then drew the chain down to the bottom ; I took notice of the timber as I went down ; I saw two bent caps ; they were about nine or ten sets before you come to the face ; I noticed no others bent ; there were none bent at 2 chains from the bottom level ; I saw every set as I went down ; I did not chain up the tunnel ; Mr. Thomas was at the bottom level all this time ; Mr. Heyes asked me how many, and I told him I did not know, as I had not been told to count them ; he said, "I'll have to climb back again now, as you did not count them" ; he then went back up the tunnel ; I do not think he went quite to the level ; Mr. Thomas and Mr. Heyes came right down the face afterwards on the alligator ; Griffiths, Parsons, and March were at the face ; Mr. Thomas did not get off the alligator ; Thomas asked the men how they were getting on ; there was nothing said about the timber, only Griffiths asked Thomas how far they were to go ; Thomas told Griffiths that he would let him know as near as he could ; he told Griffiths he had about 45 feet to drive in, and that would mean about nine more sets of timber ; Griffiths said he wished it was his last shift, as he was sick of the water which did not agree with him ; he said, "Well if that is all we have got to go we will have her done about the new year" ; Heyes told me to roll up the chain and get on the alligator ; I rolled up the chain and got on the alligator ; Messrs. Thomas and Heyes got on with me ; we did not stop between the face and the bottom level ; we stopped at the bottom level to get the instruments ; Mr. Thomas did not stop between the bottom level and the face coming down in the alligator.

*By Mr. Tillett* : I was watching him come down in the alligator ; I could see him quite plainly from the face ; I cannot say whether the chain was one or two chains long ; we chained along the rail ; Mr. Heyes was at the top end of the chain ; my work was all along the floor ; you could just notice these two caps bent, and that was all ; I could not go down very quickly with the chain as it used to get caught.

*By Mr. Curley* : I was told what I was going to do before I went down that tunnel on that occasion ; Mr. Heyes told me to go down and draw the chain while they measured it ; that was the first time I had ever done that work from the bottom level to the face ; that was my only trip as far as the face ; I had been down to the bottom level often ; one day I went down about nine or ten sets below the bottom level ; I dropped a pair of tongs from the bottom level, and went after them ; I do not go often into the mine ; I have been about 100 yards along the bottom level ; I have seen timber set there ; I saw no breaks in the roof there ; I cannot say how close the timber was set there ; I saw no bent timbers there.

E. HOWARTH.

Taken and sworn, at West Maitland, the 27th day  
of January, 1899, before me,—

GEO. C. MARTIN, Coroner.

This deponent, *Alfred Ashley Atkinson*, on his oath, states (in answer to *Mr. Curley*) : I am the Chief Colliery Inspector ; I have had about twenty-four years' experience of colliery workings ; during that time I have had to deal with various kinds of roofs in collieries ; I have not had to deal with conglomerate roofs ; that is a very unusual roof in the coal mines in the old country ; I have given some attention to the study of geology ; I heard the quotation from Professor Geikie the other day ; knowing him as a recognised geologist, I take it that he would not write anything that was incorrect ; my experience of mining managers teaches me that they usually endeavour to ascertain the nature of the strata overlying their coal seams ; I should think they would take considerable trouble to become acquainted with the roof of their various collieries ; I have heard reference made in this inquiry to falls in the East Greta mine such as that referred to by Cartwright ; from that I should say the manager should have a good knowledge of the roof of the mine ; if caps were broken or bent, or other timbers broken, I should say the manager should look for the cause ; I was once on the East Greta colliery in October, 1897 ; the extension of the tunnel had not been commenced then ; the mine was idle on that day, but I went down No. 1 tunnel as far as the lower level, and along the level to the face on the south side ; I was not making a general inspection of the working places ; it was my first visit to the colliery, and I did not think it necessary to go any further, as the mine was not at work ; I have been down the mine since the fall twelve or fifteen times ; I have gone through most of the working places, and part of the old places ; I have tried to ascertain the general character of the roof ; I have seen the character of the roof at the big fall in No. 1 tunnel ; I could not get along further to the south than the dam ; I noticed the character of the roof over the dam ; above the conglomerate there is some of that soft mudstone ; there were about 2 feet of conglomerate there in thickness ; I examined the mudstone above the conglomerate, and am satisfied it was there ; I could not say that it would run into No. 1 tunnel ; the whole was half the width of the level ; the mudstone ran the whole of that distance, as far as I recollect ; from finding it there I would think it possible to find it in other parts of the mine as well ; I did not get beyond the dam ; I went through on the other side in connection with the overcast ; I saw one place on the left-hand side which showed a little softer stone through the conglomerate ; that stone, I think, was mudstone, with sandstone mixed ; that was just on the left-hand side ; I should say that was just a small patch in the conglomerate itself ; I think the conglomerate over the dam was silicious mostly, although there appeared to be traces of the calcareous conglomerate as well ; since the fall I have made what observation of it I could without going up into the fall ; I went there first on the day of the fall ; the conglomerate there was mostly the calcareous ; on the left-hand side on the top of the fall it appeared to be about 18 inches thick, and tapered down to a few inches on the right side—4 or 5 inches ; I cannot say with any accuracy how far that thin layer extended ; above the conglomerate was the mudstone ; that was several feet thick ; when I first saw the hole there seemed to be the hard sandstone or fine conglomerate ; the silicious conglomerate is the stronger, and would not suffer so much from the weather or influence of water ; I should say the silicious conglomerate would support a bigger weight than the calcareous ; a colliery manager would have that knowledge if he had opportunities of seeing the action of the weather and water upon the two ; I would naturally expect Mr. Thomas to know the nature of the roof in No. 1 tunnel ; I did not notice any water on my first visit to the mine after the accident, but saw some later, I think, on the Monday following the accident ; it was dripping from the roof right out of the top of the fall ; there was not much water ; it was not running, but dropping fast ; the sides appeared good, except where the caps had gone, and torn a little of the coal away at the top ; I did not take particular notice of the floor on my first visits, but afterwards looked at them ; I noticed no bending in the sills above the fall ; I noticed the cap pieces on the out-by side of the fall ; they appeared to be all right, but it was decided to strengthen them in view of possible dangers ; no doubt the men chipping the roof would have a knowledge of the mudstone which was lying immediately above the coal, but I could not say that they would know of the mudstone lying over the conglomerate ; if the conglomerate ran out, and the mudstone came in, the timber-setters would have a knowledge of it ; if the conglomerate had run out, and the mudstone come in, and the timber-setters known of that, I think it probable that some of them might have mentioned it to Mr. Thomas ; if the officials knew that the conglomerate had run out, and been replaced by mudstone, I should say it was a matter requiring their attention, and they should have

have put in stronger timbers and closer together; timber may be strengthened by adding sets of the same size or putting in stronger sets at the same distance; I have noticed the timber particularly that was put in; it was very good timber; I know that a lot of it came green from the bush, and was put in with the sap in it; I have seen larger timber than that put in mines; I have seen it put closer; I have seen tunnels bricked; that was where a tunnel was being driven from the surface, and ground was soft and treacherous; on the other side of the fall there were two or three sets standing good then—one set badly bent; as the work progressed several of the sets below were seen to bend a good deal more. [*Objected to by Mr. Millard and Mr. Bowden*: I do not consider that Lewis was eligible under General Rule 4 to make the inspections of the mine; I know the Special Rules of the colliery; the Special Rules of a colliery are according to the Act to be considered of equal force as the Act itself; I heard Cartwright's evidence as to his not being in the tunnel for a fortnight; I do not think he complied with Special Rule 3, or Special Rule 7.] I have been in the colliery since the accident several times; I found the pillars in good condition; I did not see much crushing of pillars; some of the roads I thought required more timber; I cannot tell whether it has been put there; those roads were on the bottom levels in No. 2 tunnel; it is general admitted that conglomerate roofs do not run with such uniformity as deposited to by several witnesses in this inquiry; my opinion is that they do not; I do not think they run so regularly as the ordinary shale or sandstone roof.

*By Foreman*: I could not say that the mudstone visible in the fall extended beyond the limits of the fall; it was probable that it spread itself out beyond the fall in a lateral direction; the water running down the tunnel, I expect, came from the dam; I should think that it was extremely unlikely that water from the dam percolated through the roof to the fall.

*By Jurymen*: If the conglomerate at Greta is good, that at East Greta would also probably be good if it were of the same composition; I was through some of the workings in No. 2 tunnel; I found some of the mudstone in one of the levels where there was a fall.

A. A. ATKINSON.

Taken and sworn at West Maitland, the 27th day }  
of January, 1899, before me,— }

GEO. C. MARTIN, Coroner.

This deponent, *Oliver Kay Young*, on his oath states (*in answer to Foreman*):—I am an auctioneer, residing in West Maitland; the witness Parsons had a conversation with me about a job; he spoke to me about the accident; he came to my office in High-street a few days after the accident, and asked me if I wanted any men; I told him no, and asked him where he was working; he said at East Greta, in the rescue work at No. 1 tunnel, but was not going to work there any more; that Cartwright, the under-manager, had said to him that if he did not work at No. 1 tunnel he could not go to work at the mine; he said, "I don't intend to work there"; I asked him if anybody had forced him to work there, or if he had gone of his own freewill; he said nobody had forced him to go there; I then asked him what right he had to come to me to dictate where he would work, and where he would not; he replied, "I've got the company under my foot, and I'm going to squeeze them"; he said nothing about my having made him any offer; nothing was said about any offer of money to him.

*By Mr. Tillet*: I have mentioned this conversation to others.

*By Mr. Bowden*: There were two people within hearing of this conversation.

*By Mr. Curley*: I am one of the directors of the East Greta Mine; Mr. W. J. Gilham, of Newcastle, is chairman of the company; I have an interest in the mine; Parsons and I have never had any quarrel; I did not know who he was when he came to see me; I recognised him by the lump on his neck; I have a feeling against him, because he told an untruth in his evidence.

O. K. YOUNG.

Taken and sworn at West Maitland, the 27th day }  
of January, 1899, before me,— }

GEO. C. MARTIN, Coroner.

[Court-house, West Maitland, 8:30 o'clock a.m., 28th of January, 1899.]

WE, the undersigned jurors, impanelled and sworn on an inquest opened at the Surgery, at East Greta, on the 24th day of December, 1898, and continued at the Court-house, at West Maitland, on the 4th, 5th, 10th, 11th, 12th, 13th, 17th, 18th, 23rd, 24th, 25th days of January, 1899, and concluded on the 27th day of January, 1899, touching the death of Albert Moncrieffe, do hereby solemnly and sincerely declare that, after (14) fourteen hours' continuous debate, we cannot agree together on a verdict; and we, the said jurors, do hereby affirm that it is not possible that we could come to any agreement however long we might be locked up to further consider the verdict:—

Frederick William Thursby, Foreman.  
Henry Atkinson.  
Daniel Joseph Ryan.  
James Joseph Maher.  
William Henry Oxley.  
John Markham.

Stephen Prendergast.

24 October, 1899.]

**SCHEDULE OF PAPERS.**

No.	PAGE.
1. C. J. Muston to the Under Secretary for Mines—Reporting that the labour conditions are not being complied with on mineral lease 8,531; with minutes. 21st November, 1898.....	1
2. G. N. Marks to the same—Showing cause why lease should not be cancelled; with minutes. 8th December, 1898	2
3. Report by Warden Evans—That work has been resumed; with minutes disallowing complaint. 24th February, 1899	2
4. C. J. Muston to the Under Secretary for Mines—Notifying change of address. 22nd February, 1899 .....	2
5. E. S. Marks to the same—Applying for permission to surrender mineral lease 8,531, as he has made application to Lands Department for a special lease of same area. 10th April, 1899 .....	3
6. W. C. Muston to the same—Reporting that the labour conditions are not being complied with on mineral lease 8,531. 13th July, 1899 .....	3
7. R. A. Price, M.P., to the Secretary for Mines—Supporting W. C. Muston's complaint; with minutes. 29th July, 1899 .....	3
8. E. S. Marks to the Under Secretary for Mines—Asking that complaint against mineral lease 8,531 be not proceeded with, pending decision on special lease application; with enclosure and minutes. 21st August, 1899.....	3
9. W. C. Muston to the same—Protesting against E. S. Marks being allowed to apply for a special lease whilst a complaint against the mineral lease is pending. 22nd September, 1899.....	4
10. Minute by Registrar, with report by Professor David and the Government Geologist as to the nature of the deposit on mineral lease 8,531. 26th September, 1899.....	4
11. Decision to allow special lease application to proceed. Note of interview by Mr. Muston, and subsequent request to Lands Department to stay action on the special lease application. 3rd October, 1899 .....	5
12. W. C. Muston to the Under Secretary for Mines—Offering to find bonds to the extent of £200, that he is prepared to carry out the labour conditions imposed under mineral lease 8,531. 11th October, 1899 .....	5
13. Minute directing that lessee be informed that unless labour conditions are fully complied with within fourteen days the lease will be cancelled. 13th October, 1899.....	5
14. E. S. Marks to the Secretary for Mines—Urging that he be allowed to secure area now held under mineral lease 8,531 as a special lease under the Lands Act. 20th October, 1899.....	5
15. <i>Resumé</i> of case .....	6

**No. 1.**

Mr. C. J. Muston to The Under Secretary for Mines and Agriculture.

Sir,

25, Victoria Arcade, Sydney, 21 November, 1898.

I have the honor to report that the labour and other conditions under which Mr. E. S. Marks holds a mineral lease, M.L. 8,531, pns. 110 and 111, parish of Wingen, county of Brisbane, 40 acres, have not been complied with, and request that the said lease may be declared forfeited.

I have, &amp;c.,

C. J. MUSTON.

Acknowledged.

Acknowledged. Particulars of lease.—M.L. 8,531, E. S. Marks, of Bligh-street, Sydney, portions 110 & 111, parish Wingen, 40 acres; delivered 21/7/98; work to commence, 21/7/98; two men to be employed first three years, and four remainder.—F. H. C. BROWNLOW, Senior Clerk, Registrar's Branch, 24/11/98.

Call upon the lessee to show cause, and inform Mr. Muston.—E. H. RAY, Registrar, 26/11/98. Lessee called upon by registered letter. C. J. Muston and Warden at Scone informed, 28/11/98. Noted.

---

No. 2.

Mr. G. N. Marks to The Under Secretary for Mines and Agriculture.

Sir, 35A, Bligh-street, Sydney, 6 December, 1898.

In answer to your letter (98-22,127 M.), I have the honor to inform you that on the same date as your notice I received enclosed receipt for £5 6s. in payment for work done on mineral lease No. 8,531. I beg also to state that five (5) tons of mineral products from the lease, to be tested as a soil fertiliser in England, have already been sent away; also that many large sample packages have been distributed amongst nurseries of New South Wales.

You will observe that I am doing all that I can to further the interests of this province in regard to agriculture by my before-mentioned actions. I wish to mention that so much of the condensed vaporous deposit can be obtained in a short space of time, and so peculiar to the nature of it, that the lease is not possible to be worked in the usual way now common to other mineral leases. Should the experiments turn out successfully, I can assure you that more than the ordinary labour conditions will be immediately fulfilled.

As this is perfectly *bonâ fide* business undertaking on my part, I trust you see your way to suspend, temporarily, any adverse action of the Department.

I have, &c.,  
GERALD N. MARKS.

---

The Warden, Scone, for report.—E. H. RAY (for U.S.), B.C., 13/12/98.

Memo.—The Warden has had inquiry made, and has the honor to report that at present nothing further has been done to comply with the labour conditions on mineral lease 98-1, parish of Wingen, and that there is nothing on the land to indicate what work has been done. No doubt, as stated by Mr. Marks, stuff has been taken from the land from time to time, it is presumed from the surface, for the purpose of being tested. Perhaps, as the lessee has expended some money for survey, &c., the Minister may see his way to grant some time longer to allow for the minerals being tested as to its value.—GEO. R. EVANS, P.M., Warden, Scone, 19/12/98. The Secretary for Mines, &c., Sydney. Records, 22 Dec., '98.

M.L. 8,531.—Under the circumstances, and in view of the fact that the lease was only delivered in July last, the lessee might be allowed one month to put on full labour; failing this, the land should be cancelled.—EDGAR H. RAY, 29/12/98.

For approval.—D. C. McLACHLAN, Under Secretary, 29/12/98. Approved.—J. COOK, Minister for Mines, 29/12/98. E. S. Marks, c/o G. N. Marks, informed. C. J. Muston and Warden informed, 30/12/98.

---

[Enclosure.]

Dear Sir,

I beg to acknowledge cheque for £5 6s. in payment of four cases ore sent from Mount Wingen by me. Excuse delay, as illness prevented me from writing sooner.

The Range, Wingen, 28/11/98.

I remain, &c.,  
TOM S. WALSH.

Mr. E. S. Marks.

---

No. 3.

Mr. Warden Evans to The Under Secretary for Mines and Agriculture.

Mineral Lease 8,531.

SEE papers herewith.—Mr. Warden Evans, for report as to whether full labour is now employed.—W. H. TUNKS (for Under Secretary), B.C., 30/1/99.

Scone, 24 February, 1899.

MEMO.—The Warden has the honor to report that the full complement of men, viz., two, were put on to work on mineral lease No. 8,531, parish Wingen, on the 30th of last month, and are still working there.

GEO. R. EVANS, P.M.,

The Under Secretary for Mines and Agriculture, Sydney.

Warden.

M.L. 8,531.—Under the circumstances, the complaint may be disallowed. As a matter of fact, this is hardly land that should be held as a minning lease, the product is being tested as a soil fertiliser, and, I understand, for some medicinal purposes. Any other person taking up the land for mining purposes would experience the same difficulty in continually employing full labour.—EDGAR H. RAY, 25/2/99.

For approval.—D. C. McLACHLAN, Under Secretary, 25/2/99. Approved.—J. COOK, Minister for Mines, 27/2/99. E. S. Marks, C. J. Muston, and Warden informed, 28/2/99. Noted.

---

## No. 5.

Mr. E. S. Marks to The Under Secretary for Mines and Agriculture.

Dear Sir, 8 and 9, Post-office Chambers, Pitt-street, Sydney, 10 April, 1899.

Referring to the interviews Mr. B. F. Marks had with your Department, respecting mineral lease No. 8,531, of 40 acres, situated in the parish of Wingen, county of Brisbane, and Mining District of Peel and Uralla, I desire to state that this area was leased for the purpose of investigating the medical properties of the loam, said to be effective for destroying insect-life, and also a remedy for diseases in plants, vegetables, &c.

For this purpose the quantity of loam required is nominal, and one or two men can produce sufficient in a few days to meet the demand for six or twelve months, consequently I find it impossible to fulfil the labour conditions imposed on the said lease, and I therefore desire to surrender this lease, No. 8,531, and have this day written to the Under Secretary, Department of Lands, to grant me a special lease in place of same.

Trusting you will give this matter your prompt attention.

I have, &c.,  
E. SEABORN MARKS.

## No. 6.

Mr. W. C. Muston to The Under Secretary for Mines and Agriculture.

Dear Sir, 5 and 6, Victoria Arcade, First floor, Elizabeth-street entrance, Sydney, 12 July, 1899.

I respectfully beg to again report the holder of mineral lease No. 8,531, portions 110 and 111, parish of Wingen, county of Brisbane, for non-fulfilment of the labour conditions.

Yours, &c.,  
W. C. MUSTON.

Particulars of lease:—M.L. 8,531; E. S. Marks, of Bligh-street, Sydney, for portions 110 and 111, parish Wingen; area, 40 acres; delivered 31/8/98; work to commence, 21/7/98; two men to be employed for first three years, and four remainder.—F. H. C. BROWNLOW, Senior Clerk, Registrar's Branch, 14/7/99.

## No. 7.

R. A. Price, Esq., M.P., to The Secretary for Mines and Agriculture.

Dear Sir, 29 July, 1899.

Re Mr. Muston's complaint that the labour conditions had not been performed in connection with the property taken up by Marks and party near Scone, I shall be pleased if Muston's case is considered by you specially.

Yours, &c.,  
R. A. PRICE.

U.S. for report.—J. Cook, Secretary for Mines, 29/8/99. I understand that Mr. Marks has made an application to the Lands Department for a special lease of this ground. Please ascertain what is being done by that Department?—E. H. RAY, 7/8/99.

Mr. Marks, the lessee, applied for permission to surrender this lease in April last, and at the same time I understand he applied to the Lands Department for a special lease of the ground; the minerals to be mined for are sulphur, alum, and iron, on the Burning Mountain, Wingen, and are used for medicinal purposes. Mr. Marks informed me that he could get out enough in two weeks to last him for twelve months. Under the circumstances I hardly think it worth while calling upon the lessee to show cause, but recommend that the papers be referred to the Lands Department, with a view to ascertaining what action is being taken on the application for special lease. If approved, Mr. Price, M.P., and Muston may be informed.—E. H. RAY, 15/8/99.

Better in the first place to call upon lessee to show cause.—D. C. McLACHLAN, Under Secretary, 15/8/99. E. S. Marks called upon by regd. letter; Warden at Scone informed; R. A. Price, M.P., informed; and W. C. Muston informed, 17/8/99. Noted. Is it intended to inform Mr. Price and Mr. Muston that lessee has been called upon to show cause? Mr. Ray.—A. FRY, Correspondence Clerk. Yes, please.—E. H. RAY. R. A. Price, M.P., and W. C. Muston informed, 17/8/99.

## No. 8.

Mr. E. S. Marks to The Under Secretary for Mines and Agriculture.

Dear Sir, 8 and 9, Post-office Chambers, Pitt-street, Sydney, 21 August, 1899.

I beg to acknowledge receipt of notice from your Department dated 17th August, calling upon me to show cause within thirty days why mineral lease No. 8,531, portions 110 and 111, parish of Wingen, should not be cancelled, for non-fulfilment of labour conditions.

In reply, I respectfully desire to call your attention to my letter of 10th April last, duplicate of which I enclose, and as this communication was written at the request of your Department, and understanding at the time when I had lodged my application for a special lease that there was no need for fulfilment of labour conditions, and having made application to the Lands Department for a special lease in place of mineral lease referred to, and as I am now in possession of a notice to appear before the Local Land Board at Scone, on the 29th instant, with respect to my application, I therefore trust you will see your way clear not to proceed any further in the matter.

I have, &c.,  
E. SEABORN MARKS  
(per B.F.M.).

Submitted

Submitted that this matter be allowed to stand over until action by the Land Board on the application for special lease is complete ; if the lease were cancelled, Mr. Muston, the complainant, would be in the same position as the present holders.—E. H. RAY, 28/8/99.

For approval.—D. C. McLACHLAN, Under Secretary, 28/8/99. Approved.—J. COOK, Minister for Mines, 29/8/99.

[Enclosure.]

Dear Sir,

8 and 9, Post-office Chambers, Pitt-street, Sydney, 10 April, 1899.

Referring to the interviews Mr. B. F. Marks had with your Department, respecting mineral lease No. 8,531, of 40 acres, situated in the parish of Wingen, county of Brisbane, and Mining District of Peel and Uralla, I desire to state that this area was leased for the purpose of investigating the medical properties of the loam, said to be effective for destroying insect-life, and also a remedy for diseases in plants, vegetables, &c.

For this purpose the quantity of loam required is nominal, and one or two men can produce sufficient in a few days to meet the demand for six or twelve months ; consequently, I find it impossible to fulfil the labour conditions imposed on the said lease ; and I therefore desire to surrender this lease, No. 8,531, and have this day written to the Under Secretary, Department of Lands, to grant me a special lease in place of same.

Trusting you will give this matter your prompt attention.  
D. C. McLachlan, Esq., Under Secretary, Department of Mines.

I have, &c.,  
E. SEABORN MARKS.

#### No. 9.

Mr. W. C. Muston to The Under Secretary for Mines and Agriculture.

5 and 6, Victoria Arcade (1st floor), Elizabeth-street,  
Sydney, 22 September, 1899.

Sir,

*Re* "my complaint for non-fulfilment of labour conditions on lease No. 8,531, portions 110, 111, parish of Wingen, county of Brisbane," it has accidentally come under my notice that the holder of the said lease has applied to the Lands Department for a lease, under the Lands Act, of 100 acres, including the same ; and I would respectfully bring under your notice that this has been done to evade the conditions under which he holds the lease under your Department, and on account of my complaint that he was not fulfilling same, and, if granted, would lock up valuable mineral property.

I therefore trust that when the matter comes under the consideration of your Department you will bear this fact in mind, and give my position due consideration.

I have on two occasions lodged complaints for the non-fulfilment of labour conditions, and am prepared to take up the said lease and carry out the labour and other conditions.

It appears to me very unfair that the lessee should be allowed to apply for a special lease under the Lands Act while holding a mineral lease under your Department, especially in the face of a complaint lodged for the non-fulfilment of the conditions of same.

I may add that I have lodged an objection with the Lands Department to his obtaining a lease under their Act.

Under any condition I should be glad to know whether a special lease in the Lands Department would take priority over an application for a lease under the 23th section of the Mining Act.

I have, &c.,  
W. C. MUSTON.

#### No. 10.

Minute for The Secretary for Mines and Agriculture.

*Subject* :—Mineral Lease 8,531.—E. S. Marks.

Registrar—Department of Mines.

THIS lease was reported for non-observance of the labour conditions by W. C. Muston in November last year. After the usual inquiry, the complaint was disallowed in February, the Warden having reported that the necessary labour was employed.

In April last Mr. Marks applied for permission to surrender the lease on the grounds that it was impossible to profitably employ the necessary labour all the year round. The minerals to be mined for are sulphur, alum, and iron, and are, I understand, used for medicinal purposes. Mr. Marks has applied to the Lands Department for a special lease, including the land now held by him under mineral lease.

In his letter herewith, dated 22nd September, Mr. Muston states that he is prepared to hold the land as a mineral lease, and carry out the labour conditions. He has also notified the Lands Department that he objects to the land being granted as a special lease. Mr. Muston explained to me, at a personal interview, that he had the means of utilising the minerals from the Burning Mountain unknown to any other person in the Colony.

As there are points about this case which render it somewhat difficult to deal with, I would recommend that the papers be referred to the Government Geologist, with a view of ascertaining whether the minerals in question are such as can be mined for under our Act, and whether Mr. Marks should be allowed to secure this land under special lease from the Lands Department. In the meantime the Department of Lands should be asked to stay action on Mr. Marks' application for a special lease.

EDGAR H. RAY, Registrar,  
25/9/99.

For approval.—D. C. McLACHLAN, Under Secretary, 25/9/99. Approved.—J. L. FEGAN, Minister for Mines, 26/9/99. Lands Department asked to stay action on Mr. Marks' application for a special lease, 27/9/99. As Professor David has examined the Burning Mountain at Wingen rather recently, I shall be obliged if he will give the Department the benefit of his opinion on the question at issue.—E. F. PITTMAN, Government Geologist, 30/9/99.

Having geologically examined this ground near Wingen, I can state that the occurrence of the mineral material in it (sulphur, sulphate of iron, &c.) is extremely limited, being confined to very narrow cracks in the sandstone formation overlying the burning Greta coal seam below. As the coal burns away the sandstone roof subsides and cracks, and the sulphur, &c., is deposited in these cracks. The market, too, for this material must be extremely limited. I am of opinion that it would not pay anyone to hold the ground

ground as a mineral lease, and consider that under the circumstances a special lease under the Land Act would be the fairer form of tenure.—T. W. E. DAVID, Professor of Geology, Sydney University, 30/9/99. The Government Geologist, 30/9/99.

I concur in Professor David's opinion. The substance which is being collected is really a sublimation from the burning coal, and it accumulates in small quantity in the cracks or joints of the rocks. I believe it is locally termed "Wingen," and is manufactured into an ointment which is used for healing purposes. It is not likely, therefore, that there could be a very large output for it, and the enforcement of the labour conditions attached to an ordinary mineral lease would appear to be inequitable in such a case; therefore such a tenure appears to be unsuitable.—E. F. PITTMAN, Government Geologist, 30/9/99. The Under Secretary.

---

### No. 11.

#### Decision to allow Special Lease Application.

UNDER these reports I think the special lease under the Land Act should be allowed to go on.

D.C. McL., Under Secretary,  
3/10/99.

Approved.—J. L. FEGAN, Secretary for Mines, 3/10/99. See Lands Department and ask them to hold the special lease application for a day or two.—E. H. RAY, 5/10/99. Urgent. Mr. Muston called and asserted that he was in a position to put on the labour and keep it employed continuously.—E. H. RAY, 10/10/99. Ask the Lands Department to stay further action in the special lease application until a decision has been arrived at in connection with the mineral lease.—E. H. RAY, 11/10/99. Lands asked to stay further action, 12/10/99.

---

### No. 12.

#### Mr. W. C. Muston to The Under Secretary for Mines and Agriculture.

Re "Mineral Lease No. 8,531," portions 110, 111, parish of Wingen, county of Brisbane, comprising 40 acres.

5 and 6, Victoria Arcade (1st floor), Elizabeth-street,

Sir,

Sydney, 11 October, 1899.

With regard to my conversation with you and your officers in the above matter, I beg to state that I am prepared to find bonds to the extent of £200, for two years, that in the event of my obtaining a mineral lease of the above property I will carry out the labour conditions attached to same.

I am agreeable that the present lessee receive fourteen days' notice to put on labour and carry out the labour conditions of the said lease, on condition that should he fail to do so at any time the said lease will be transferred to me.

I have, &c.,

W. C. MUSTON.

Register and send to me, please.—E. H. RAY, 12/10/99. Acknowledged.

---

### No. 13.

#### Minute.

THE present lessee may be informed that it has been represented that the labour conditions prescribed under the mineral lease regulations can be continuously and profitably carried out on this land, and that consequently this Department must object to any other tenure over it than that of a mineral lease, and that unless the labour conditions are fully complied with within fourteen days the lease will be cancelled.

D. C. McLACHLAN,

Under Secretary,

13/10/99.

Approved.—J. L. FEGAN, Secretary for Mines, 13/10/99. E. S. Marks informed as directed above, 14/10/99. Records. End of fourteen days. Noted.

---

### No. 14.

#### Mr. E. S. Marks to The Secretary for Mines and Agriculture.

Sir,

8 and 9, Post-office Chambers, Pitt-street, Sydney, 20 October, 1899.

I have the honor to bring under your notice particulars with respect to the mineral lease No. 8,531, of 40 acres, situated at Mount Wingen, near Scone, for which I have received notice of intended cancellation for non-fulfilment of labour conditions.

A notification was given by me in writing to the Mines Department on 10th April last to cancel this lease, as I intended applying for a special lease under the Lands Act (which application has been granted), and I respectfully request that the Mines Department should be instructed to take no other action in the matter than was requested by me in my letter of 10th April last.

I desire to state Mr. John Bennett purchased the right to this lease from the original lessee, Mrs. Bailey, about four years ago, for the sum of £300, and, desiring co-operation, he arranged with me last year to apply for a lease, as the property was originally held under a mineral license.

This lease was granted, and the labour conditions duly complied with. The chemical deposit on this lease was hitherto used for medicinal purposes, and one man could procure sufficient of the material in one day for one year's requirements.

I recently discovered that the material contained chemical properties that would destroy insect-life in plants and trees without injury to the latter, and I have gone to considerable expense in introducing the material to the notice of agriculturists, and have forwarded bulk samples to the Agricultural College at Richmond, Carpenterian Reformatory, Atkin's Nursery, Mr. H. W. Potts, the Victorian Government Agricultural

Agricultural Expert, and many others, and have forwarded bulk samples to England and America for exhaustive tests, for the purpose of proving the best form for preparing the material for every-day use, and as soon as the point is satisfactorily settled, it was intended to erect a large plant and to employ the necessary scientific and other labour for working the deposit.

As it appeared that the working of the deposit must be erratic for the present, it was recommended that the mineral lease should be cancelled, and a special lease applied for under the Lands Act, and the application for this lease was granted by the Local Land Board of Scone on 29th August last, after an exhaustive inquiry. Some parties have taken, without permission or payment, quantities of the material for making medicinal preparations, and claim that they are the discoverers of its chemical value, whereas medicinal preparations have been made by Mr. A. J. Watt and others for many years past, under arrangement with Mr. John Bennett and the previous owners.

The property was lying idle for some years until I applied for a lease, during which time the material was being removed by other parties without license or payment to the Government. Since the issue of this lease attempts have been made to get it cancelled even while the lessee was fulfilling the labour conditions. In the month of August notice was received from the Mines Department that an objection had been lodged in consequence of the non-fulfilment of labour conditions, when the following extract of a letter dated 21st August was forwarded by me to the Under Secretary for Mines:—"I respectfully desire to call your attention to my letter of 10th April last, duplicate of which I enclose, and as this communication was written at the request of your Department, and understanding at the time when I had lodged my application for a special lease that there was no need for fulfilment of labour conditions, and having made application to the Lands Department for a special lease in place of the mineral lease referred to, and as I am now in possession of a notice to appear before the Local Board at Scone on 29th instant with respect to my application, I therefore trust you will see your way clear not to proceed any further in the matter."

After a lapse of nearly two months, the Mines Department notified that unless the labour conditions are fully complied with within fourteen days the lease will be cancelled, which notification is most extraordinary, as the position is in no way altered, and the Department were fully aware by my letter of 21st August that I was incurring considerable expense attending the Land Court at Scone.

With respect to obtaining a special lease, of which they were duly advised by letter from me on 10th April instant, in this letter I advised my desire and intention to cancel the mineral lease, and the receipt of which letter was duly acknowledged. I understood from the Mines Department that on application for the special lease from the Lands Department there was no further need to comply with any labour conditions, and then only was labour suspended for the time being, and now that a special lease has been granted by the Local Land Board with the knowledge and without objection of the Mines Department, I trust that you will consent to the cancellation of the mineral lease so that I may obtain the special lease on the area, which I understood would be permitted if the Land Board granted my application for a special lease.

I would mention that the object of transferring the lease from the Mines to the Lands Department is to obtain a title to the lease and prevent being continually harassed in our operations and endeavours to bring the business in hand to a successful issue, and it is important to note that we have asked for no concession from the Government, and we have agreed to pay the same rental to the Lands Department as we have paid to the Mines Department.

I have incurred considerable expense not only in payment of rental to the Government and for labour employed, but also in bringing the material under the notice of agriculturists and in making tests as to its value for destroying insect-life with prospects of success, in which case it should prove a boon not only to this Colony, but to agriculturists in all parts of the world. It is now sought to interfere with my rights and the conduct of the important business I have in hand, which would be a great injustice if permitted, as my efforts and intentions are strictly *bonâ-fide*, and my enterprise in the matter will, I trust, be found to merit your favourable consideration.

I have, &c.,

E. SEABORN MARKS  
(per D.M.).

## No. 15.

### *Resumé* of Case.

Mineral Lease No. 8,531.—E. S. Marks.

MR. E. S. MARKS is the lessee of mineral lease 8,531, for portions 110 and 111, parish of Wingen (the Burning Mountain), to mine for sulphur, alum, and iron, and the labour conditions require two men to be employed.

In November, 1898, C. J. Muston reported this lease for non-compliance with the labour conditions. After due inquiry, the complaint was disallowed, the Warden having reported that the necessary labour was employed.

In April, 1899, Mr. E. S. Marks asked to be allowed to surrender his mineral lease, and stated that he had applied to the Lands Department for a special lease including the same area. The reasons given for this action were, that the mineral lease was held for the purpose of investigating the medical properties of the loam, and its effects in destroying insect pests on plants, &c., and that one or two men could produce a sufficient quantity of the material in a few days to satisfy the demand for six or twelve months, and consequently he found it impossible to fulfil the conditions of the mineral lease.

In July, 1899, this lease was reported by Mr. W. C. Muston, supported by Mr. R. A. Price, M.P., and the lessee was called upon, on 17th August, 1899, to show cause why the lease should not be cancelled for non-compliance with the labour conditions.

On 21st August the lessee replied that as he had lodged an application for a special lease under the Lands Act, and notified this Department of his action, he understood that there was no necessity to comply with the labour conditions of the mineral lease, and asked that the matter be not further proceeded with pending decision of Local Land Board on his special lease application. The Minister approved, on 29th August, 1899, of the complaint standing over until action on the application for special lease was complete.

In September, 1899, Mr. Muston wrote, protesting against the granting of the special lease application, on the ground that valuable mineral land would be locked up, and urging that his complaint should be entertained and the mineral lease cancelled.

The Minister approved of the Government Geologist being asked to state whether the minerals contained in the area in question are such as can be mined for under the Mining Acts, and whether Mr. Marks should be allowed to secure the land under special lease from the Lands Department.

The Government Geologist asked Professor David, who had recently examined the Burning Mountain, Wingen, for an expression of opinion.

Professor David stated that the occurrence of the mineral material (sulphur, sulphate of iron, &c.) is extremely limited, being confined to very narrow cracks in the sandstone formations overlying the burning Greta coal seam below. In his opinion the market for this material must be very limited, and it would not pay anyone to hold the ground as a mineral lease, and that a special lease under the Lands Act would be the fairer form of tenure.

The Government Geologist concurred in the opinion expressed by Professor David. Mr. Pittman states that the substance which is being collected is locally called "Wingen," and is manufactured into an ointment which is used for healing purposes, and it is not likely, therefore, that there could be a very large output for it, and the enforcement of the labour conditions attached to an ordinary mineral lease would appear to be inequitable and the tenure unsuitable.

In view of these reports, the Minister decided (3rd October, 1899) to allow the special lease under the Lands Act to go on.

Mr. Muston subsequently called at the Department and asserted that he was in a position to put the labour on and work the mineral lease profitably and continuously, if he could secure possession. The Lands Department was accordingly asked to stay action on the special lease.

Mr. Muston, under letter dated 17th October, 1899, stated that he is prepared to find bonds to the extent of £200, for two years, that he would carry out the labour conditions imposed under the mineral lease. He further expressed his willingness to the lessee being given fourteen days' notice to put full labour on, provided the lease was cancelled if work was not resumed within that time.

In view of the representations made by Mr. Muston the lessee was informed (14th October, 1899) that this Department objects to the area in question being held under any tenure other than a mineral lease, and that if the labour conditions were not fully complied with within fourteen days the lease would be cancelled.

The lessee, in reply, strongly urges that he be allowed to surrender his mineral lease and secure the area under special lease from the Lands Department. He points out that the application for the special lease was made with the knowledge, and without objection, by the Department. He further states that the property was lying idle for some years, until he applied for a lease, during which time the material was being removed by other parties without license or payment. It is alleged that every effort is being made to prove the best form for preparing the material for every-day use, when it is intended to erect a large plant and employ the necessary scientific and other labour for working the deposit, and until this point is settled work on the lease must be erratic.

On inquiry at the Lands Department it has been ascertained that, subject to the determination of the mineral lease, the Local Land Board has recommended that an area of 66 acres be granted as a special lease to E. S. Marks for the purpose of "removing loam" at a rent of 4s. per acre per annum (£13 4s.). It will be noticed that this is an area of 26 acres in excess of that held as a mineral lease, and that the rent to the Crown represents an additional sum of £5 4s. per annum.

## MINE AT BRINDABELLA, OWNED BY THE BANK OF NORTH QUEENSLAND.

(PETITION FROM WILLIAM REID, OF BRINDABELLA, PRAYING THAT HE MAY BE REPRESENTED BY COUNSEL OR ATTORNEY, OR IN PERSON, BEFORE THE SAID COMMITTEE, WITH THE RIGHT TO CALL WITNESSES, AND EXAMINE AND CROSS-EXAMINE ALL WITNESSES THAT MAY GIVE EVIDENCE BEFORE SUCH COMMITTEE.)

---

*Received by the Legislative Assembly, 30 November, 1899.*

---

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in  
Parliament assembled.

The Petition of William Reid, of Brindabella, in the Colony of New South Wales,—

HUMBLY SHOWETH :—

1. That on the twenty-first day of November, in the year of our Lord one thousand eight hundred and ninety-nine, your Honorable House appointed a Select Committee to inquire into and report upon the alleged mal-administration of Warden Maitland.

2. That your Petitioner humbly prays that he may be represented by counsel or attorney, or in person, before the Select Committee appointed to inquire into and report upon the said matter, with the right to call witnesses and adduce evidence, and to examine and cross-examine such witnesses as may give evidence before the Select Committee.

And your Petitioner, as in duty bound, will ever pray.

WILLIAM REID.

“A Report made by the Board, appointed by the late Government, with  
“respect to the Government Metallurgical Works, Clyde.”

*(Mr. Nobbs.)*

## SCHEDULE.

NO.		PAGE.
1.	Minute approving of appointment of Messrs. Power and Charleston as a Board to inquire into the working of the Government Metallurgical Works. 10th May, 1899.....	1
2.	Copy of instructions issued to Messrs. Power and Charleston as to scope of inquiry, &c. 16th May, 1899.....	2
3.	Report of Messrs. Power and Charleston. 16th June, 1899.....	2
4.	Under Secretary for Mines to Secretary for Mines, submitting report of Messrs. Power and Charleston. 21st June, 1899 .....	10

## No. 1.

Minute approving of appointment of Messrs. Power and Charleston as a Board to inquire into the working of the Government Metallurgical Works.

Department of Mines and Agriculture, Sydney, 10 May, 1899.

So much comment has been made from time to time as to the effectiveness of these works that it is desirable an independent report on the whole subject should be obtained. The object of the establishment and the scope of these works have, I believe, been misunderstood, and it is desirable, therefore, that a comprehensive report on the whole matter should be laid before the public. Until this is done the misunderstanding will go on, and the complaints will continue as in the past. I have given much consideration to the matter, and think that, to secure a thoroughly satisfactory report, it is desirable two gentlemen should be appointed, one to deal with the metallurgical and scientific aspect of the question, and the other the practical.

I have endeavoured to submit the names of competent gentlemen, unconnected with similar private works, to make a report of the kind indicated. After considering a number of names, I have arrived at the conclusion that Mr. Frederick Danvers Power would satisfactorily carry out the professional or scientific side of the question, and Mr. J. K. Charleston, of Sunny Corner, the working or practical part. Both are gentlemen of recognised ability in their special lines. The former is a mining engineer, metallurgist, and surveyor, late President of the Institute of Australian Mining Engineers, member of the American Institute of Mining Engineers; Life Fellow of the Royal Geographical Society; Member of the Amalgamated Mining Engineers' Association of Australasia (Ballarat Branch); late Examiner in Mining at the University of Melbourne; and besides is the author of a work on Mining and Metallurgy. He is also a Life Member of the Institute of Mining and Metallurgy of London.

380—

[580 copies—Approximate Cost of Printing (labour and material), £10 0s. 0d.]

Mr.

Mr. Charleston has been long connected with the practical part of mining, and would make an excellent associate with Mr. Danvers Power in thoroughly inquiring into the question.

I have consulted Mr. Power and Mr. Charleston, and they are willing to undertake the work on the payment of a fee of twenty-five guineas each. This I consider reasonable.

If the Minister see fit to have the works reported upon in the way proposed, these gentlemen will be instructed to thoroughly inquire into all the operations of the works since they started, and deal with the objections that have been raised by Members of Parliament and others. They will be given a free hand in every way; all documents will be placed at their disposal, and they will be at liberty to obtain information or evidence from any source they choose. In addition to reporting upon the works as they stand, they should be asked to say whether they are in any way defective, and whether they can suggest any direction in which they may be made more effective and useful to the mining community.

D. C. McLACHLAN,

Under Secretary.

Approved: Ask them to get to work at once.—J. Cook, Secretary for Mines, 11/5/99.

## No. 2.

### Copy of Instructions issued to Messrs. Power and Charleston as to scope of Inquiry, &c.

New South Wales, Department of Mines and Agriculture,

Sir,

Sydney, 16 May, 1899.

I am directed by the Secretary for Mines and Agriculture to inform you that it has been decided to obtain a joint report as to the nature of the appliances in use at the Government Metallurgical Works at Clyde, and particularly as to their efficiency in saving the precious and other metals contained in the ores sent there for treatment, and that Mr. Secretary Cook has selected your name, with that of Mr. F. Danvers Power, to make the report.

With that object in view, he desires that you will report as to the scope of the works, and as to whether they satisfactorily accomplish the objects for which they were established.

At different times they have been subjected to considerable criticism, and it is his wish that you should look into the defects which it is alleged exist, and report whether in your opinion there are any just grounds for the complaints of inefficiency and delays in treatment that have been made. To enable you to do this all papers in the possession of this Department will be placed at your disposal, and it is Mr. Cook's wish that you shall have the fullest liberty in making the inquiry and arriving at your conclusions.

In addition to reporting upon the works as they stand, he desires that you will point out any way in which they are defective or wanting in sufficient appliances, and also say whether there is any direction in which you consider the works can be made more effective or useful to the mining community.

I may point out that the works are not designed to treat ores in what may be termed a commercial way, but were established for experimental work in the concentration of ore and its treatment by the various methods which exist other than that of smelting. The primary objects of the establishment of the works were,—

- (1st.) To prove the economic value of ores.
- (2nd.) To ascertain the best methods of extracting the metal from the ore, or of reducing the ore to a marketable commodity.
- (3rd.) To demonstrate the methods by which the by-products can be profitably saved; and,
- (4th.) To impart the fullest information to mine-owners and others in the several methods of treating the various kinds of ore, so that—
  - (a) Owners of mines might be saved wasteful expenditure of capital in the construction of unsuitable works or the purchase of inefficient appliances.
  - (b) That valuable mines might not be abandoned as worthless through lack of the knowledge of the methods requisite to develop and extract their wealth.
  - (c) To afford working miners the fullest information, at reasonable cost, of the composition of their ores, and the best and readiest means of treating them; and,
  - (d) To give inventors of new methods and appliances which might be deemed worthy of trial an impartial test of the value of their inventions.

The Minister further desires that you shall specially look into and report upon the several comments made by Mr. Hurley and other Members of Parliament, and state whether you consider there is any reasonable justification for the comments made. A full report of the Parliamentary proceedings will be duly placed before you.

Mr. Cook has decided that you shall be allowed a fee of twenty-five (25) guineas for this report, and should you require to visit any portion of the Colony during the course of the inquiry, the Department will furnish you with a free pass over the railways and defray any attendant expenses.

I am to add that a similar letter has been addressed to Mr. F. Danvers Powers, who is associated with you in making this report.

I have, &c.,

D. C. McLACHLAN,

Under Secretary.

J. K. Charleston, Esq., Sunny Corner.

(Duplicate of above letter sent to Mr. F. Danvers Power.)

## No. 3.

### Report of Messrs. Power and Charleston.

Sir,

68½, Pitt-street, Sydney, 16 June, 1899.

In accordance with your instructions, communicated to us by letter, dated the 16th May of this year, we have made an exhaustive inspection of the Government Metallurgical Works, at Clyde, and have also examined the papers in connection with them. We now beg to hand in the following report:—

On

*History.*

On the 2nd July, 1886, a deputation waited on the Hon. Jas. Fletcher, the then Minister for Mines, and proposed that the Government should erect smelting, roasting, and refining furnaces near Sydney for the purposes of treating about 100 tons of argentiferous lead and copper ores per diem, the plant to be eventually extended so as to embrace the treatment of antimonial, stanniferous, and other ores. It was stated that such works, run as a national institution, could be made self-supporting by saving home expenses; besides this, it would be a suitable place where students could learn practical metallurgy, and that the works would be availed of by small mine-owners who could not afford to put up works of their own. The deputation further remarked that "if test works only were erected they could not be made self-supporting, nor yet give material impetus to metalliferous mining."

The original idea and scope of the works, as outlined above, was not adopted, but on 11th May, 1888, while the Hon. F. Abigail was Minister for Mines, the Cabinet approved of the following objects:—

1. To prove the economic value of the ores.
2. To ascertain the best methods of extracting the metal from the ores, or of reducing the ore to a marketable commodity.
3. To demonstrate the methods by which the by-products can be profitably saved.
4. To impart the fullest information and practical instruction in the several methods of treating various kinds of ores.

So that—

1. Owners of mines may be saved from the wasteful expenditure of capital on the construction of unsuitable works, or the purchase of inefficient appliances.
2. That, so far as preventable, capital may not be invested in worthless mines.
3. That valuable mines may not be abandoned as worthless through lack of skill requisite to develop and extract their hidden wealth and
4. To afford inventors of new methods or appliances, which may be deemed worthy of trial, an impartial test of the value of their inventions.

Before starting the works, a Board, consisting of Messrs. J. Cosmo Newbery, T. W. Edgeworth David, A. Liversidge, A. Leibius, and Edward F. Pittman, was asked to advise on the matter. They submitted their report on the 27th August, 1892, to the Hon. T. M. Slattery, the Minister for Mines at that time, recommending that smelting works be not established, as—

1. The cost of treating each parcel separately would be too great.
2. The result would be of little economic value, as the necessary fluxes might not be in the neighbourhood of the mine.
3. The small experimental furnaces in use at certain Schools of Mines are purely for class instruction, and are unsuited for bulk samples.

There had been much wild talk about erecting works for the treatment of all kinds of ores, as at Swansea and Frieberg, by some who had never seen those places, or troubled to investigate the matter. The neighbourhood of Swansea has been selected by several companies and private individuals as suitable for metallurgical works, on account of being a convenient harbour and near a coal-field. At Frieberg and Clausthal the German Government own mines, and have erected works to treat their ores. The idea was not to usurp the business of private individuals, but to find employment for able-bodied men; for being surrounded by possible enemies, the Government desires to retain in the country as many of her trained soldiers as possible.

Both Welsh and German works purchase ores to blend together for economic purposes; these are purchased on assay, and those who sell are not informed of the treatment employed. In fact it would be little use if they were, as local circumstances at the mines are not likely to be similar to those at the works. In quoting Welsh and German works as models it must be noted that there is no one works in those countries where all kinds of ores are treated.

The avowed objects of the Government Works at Clyde was not to treat ore on a commercial scale, or to interfere with private enterprise; but to treat experimentally small parcels of ore in order to determine the best method of extracting their valuable contents, with a view to advising miners as to the best and most suitable plant to erect in connection with their mines.

From this it will be seen that it was not expected the works should pay their way directly; but that the benefit to the Colony for the outlay would be in the working of the mines that would otherwise be closed down, together with the stimulus to other industries more or less dependent on mining.

After due inquiry into the qualifications of several candidates, Mr. Jas. Taylor was recommended to the position of Government Metallurgist, and was engaged for a period of five years, dating from 11th February, 1893, on which day he arrived in Sydney. This time has since elapsed; but the services of Mr. Taylor have been retained.

According to the agreement made between the Agent-General, representing the Government of New South Wales, and Mr. Jas. Taylor, in connection with the latter's appointment as Government Metallurgist, the following were mentioned as included in his duties:—

1. The superintendence of the erection of the Metallurgical Works, and the direction and control of such works when erected.
2. The introduction, testing, and development of processes and methods for the treatment of metallic ores (especially auriferous and argentiferous), with a view to the economic recovery therefrom of metal and other substances possessing a commercial value.
3. The instruction of smelters, miners, and others in the various methods and processes of treatment. The precise nature and extent of the said duties shall be left for fuller definition to the Honorable the Minister for Mines, and if the Government of the said Colony should require it, the said James Taylor shall enter into a further agreement in which such duties shall be fully set forth.

A considerable delay in erecting the works was experienced from the commencement—changes in the Government, straitness of the finances, and the proposal to restrict the limits of noxious trades to some unknown distance from the metropolis were the chief factors. In the meanwhile Mr. Taylor visited several of the mining-fields of New South Wales, so as to make himself acquainted with the requirements of the mines.

After inspecting several possible sites, and nothing coming of the proposed noxious-trade limit, the present position at Clyde was selected. This comprises an area of 4 acres 3 roods 20 perches, situated on the Duck River, a small tidal stream flowing into the Parramatta River, up which barges drawing 5 to 6 feet can come at high tides. There is no wharf or landing-place on the property in connection with this stream, but up to the present there has not been any occasion to use this channel for navigation purposes, the works being connected with the main western line by a siding. The land, where not bounded by water, is fenced in by a galvanised-iron fence.

That portion of the works for dealing with gold was first erected, and in October, 1896, the works, though far from complete, started operations.

#### *The Plant.*

The following apparatus are comprised in the existing plant:—

- A Pooley's platform scales capable of weighing up to 1 ton.
- A No. 1 Gates' crusher set to crush ore to  $\frac{3}{4}$ -inch cube.
- One bucket elevator to raised crushed ore to the ore-bins overhead.
- One platform hoist for bags of ore, &c.
- Two ore-bins with a capacity of 10 to 12 tons each.
- Two Clarkson's rapid samplers Nos. 1 and 5 for fine and coarse sampling. These mechanical samplers do away with any personal error in hand sampling, and can be regulated so as to take varying proportions of the parcel.
- A Fraser's and Chalmer's sample-grinder for dealing with small parcels.
- A John's No. 2 disintegrator, used for reducing the coarse sample taken after passing through the Gates' crusher before it is put through the small sampler.
- A large-size Tustin mill with a nominal capacity of 16 tons per twenty-four hours' continuous work, but it is only worked at the rate of 2 to 3 tons per eight hours, and so far has been found equal to all demands made on it. The reason this class of mill was bought instead of the ubiquitous stamper mill was because it was more suited for application to either wet or dry parcels, besides which ore from small parcels can be more readily cleaned up than in a battery, and this is a very important point. Ore in this mill is generally crushed to pass through a 30-mesh woven wire with holes 0.026 inch across.
- A copper plate table with the usual quicksilver ripples and well.
- Two Frue vanners—one smooth belt, the other with a felted belt. The former collects No. 1 concentrates, which are less in bulk but richer in contents as a rule than the latter, which collects No. 2 concentrates.
- One tailings-pit 8 feet square and 2 feet deep.
- Four triangular slime pits made by dividing two wood-lined pits of the same dimensions as the tailings-pit diagonally. The tailings-pit catches the sand, and the pulp passes over into the first slime-pit at one angle, and as it spreads out the current is diminished and the slimes have an opportunity of settling; this, when repeated in the other pits, leaves so little in the water that although it is discoloured only a thin skin of slimes has precipitated outside the pits from the beginning, so small in fact that there has never been any occasion to clean it away, and grass can be seen growing through it. These pits are cleaned out by hand and the solid material placed on one side.
- One 4-foot Berdan pan used for amalgamating.
- Wash-up troughs, dishes, quicksilver buckets, retorts, &c.
- A Roberts' alluvial washer.
- Small vertical steam-engine for driving Frue vanners.
- A high-pressure compound Tangye engine, with 9-inch and 14 $\frac{1}{2}$ -in. cylinders and 20-inch stroke, using 120lb. pressure of steam. This is the main driving-engine.
- A Babcock and Wilcox water tubular high-pressure boiler of 46 nominal horse-power.
- A Worthington feed-pump.
- A reverberatory calcining furnace, consisting of three steps, hearths each 10 feet square. The flue from this furnace, as also that of the boiler, is so arranged that the heat from them can be utilised to dry wet ores.
- Four chlorination vats, 7 feet in diameter and 3 $\frac{1}{2}$  feet in depth. Of these, two are used for leaching and two for precipitation.
- A chlorine generator.
- A small trial chlorination plant capable of treating about a hundredweight of ore.
- A tub for holding scrap iron in which ferrous sulphate is prepared.
- Two vats for scrap iron in which copper in the solutions is precipitated.
- A vessel for containing sawdust or charcoal through which the spent chlorine solutions are allowed to flow before going to waste.
- A 400-gallon iron tank in which cyanide solutions are made.
- Four cyanide vats, two of which are for leaching the ore—one for the strong solution, and one for the alkaline wash. They are all 7 feet in diameter and 3 feet 6 inches deep, with the exception of one leaching-vat, which is 8 feet 6 inches in diameter and 2 feet 9 inches deep above the filter bottom.
- Two rectangular cement sumps underground.
- A Worthington pump for circulating solutions.
- Two zinc boxes.
- A wind furnace for smelting gold. This smelting of gold is done in the shed instead of in the assay office, so as not to run any chance of contaminating the assays.
- A muffle furnace.
- A pulsometer for elevating tailings, &c.
- A forge, anvil, and tools.

The processes capable of being used by this plant are shown in the accompanying tree.

Up

Up to the 30th April, 1899, the following parcels have been treated at the Government works by the different processes :—

Amalgamation, 434·35 tons.  
Chlorination, 70·88 tons.  
Cyaniding, 91·54 tons.

Total of all sorts, not counting those simply crushed and sampled, or portions that were also treated by chlorination or cyaniding, 572·27 tons.

The value of the gold extracted was £3,114 3s.

Fees received, including what the Prospecting Board paid on behalf of impecunious senders of ore, £672 16s.

#### *New Machines and Models.*

The owners of new machines who desire to have their inventions tested are permitted to erect them at these works at their own expense. Besides finding the space, the works supplies the motive power, and gives any assistance which will not interfere with the proper working of the ordinary processes.

The following is a list of the machines thus tested :—

Garland and Murray's centrifugal amalgamator.  
A three-head rapid stamper battery.  
Wynne and Tregartha's plates.  
Hill and Bryden's gold saver.

Besides these there is a working model of Clarkson and Stanfield's dry concentrator, on loan to the works.

#### *Staff.*

Besides the Government Metallurgist, the men actually employed at the Metallurgical Works consist of :—

One working foreman.  
One furnace-man.  
One chlorinator.  
One labourer.

These are, of course, variously employed, according to necessity. There is always some work going on at the works, so there has not been any occasion to knock off any of the hands for the past twelve months.

Mr. Taylor is to be seen at the works every morning, and again in the evening, on his way home, if he has been obliged to go to Sydney in connection with his other duties.

In the assay office there are six analysts and assayers and three labourers.

#### *Parcels of Ore.*

The following parcels of ore have been sent to the Metallurgical Works for treatment, from the commencement up to the 30th April, 1899 :—

In 1896	...	...	...	...	22 parcels.
In 1897	...	...	...	...	63 "
In 1898	...	...	...	...	72 "
In 1899	...	...	...	...	15 "
Total ... ..					172 "

This shows a gradual annual increase.

Most of these parcels were under 5 tons. Of the above number, forty-four were between 5 and 10 tons, and only nine were of 10 tons or over. Parcels under 1 ton are only crushed, sampled, and assayed, as they are too small to treat in the plant.

Thirty-three of the 172 parcels, or over 19 per cent. were paid for by the Prospecting Board.

The majority of the parcels were sent in to be treated for gold; but there were a few for antimony, copper, lead, tin, and wolfram. As there were no means for extracting these metals, the parcels were crushed, sampled, and, in some cases, concentrated, and the value determined, and the ore reported upon, together with advice given as to the best way to dispose of it.

Each parcel sent in is taken in turn, no matter whether it is paid for by the owner or the Prospecting Board.

Where any possible error may have existed on the part of the Department, the authorities have always shown their desire to relieve the miners as far as possible by refunding fees, testing parcels free of cost, &c. In the case of W. Quinn and party, a letter addressed to W. P. Crick, Esq., M.L.A., dated the 28th March, 1898, states that "the Department is prepared to treat 6 tons" (being the amount originally sent), "belonging to them (Quinn and party) free of cost for treatment, and also to bear the cost of carriage from the mine to the works." Which it did. Again, in the case of Messrs. Howard and Clark, of Slippery Creek, it was agreed on the 31st December, 1896, to pay them cash for the assay value of the ore sent, as its treatment was not satisfactory, owing to the ore being unsuitable for the plant available. This was one of the first parcels received, and it came to hand before the works were as well equipped as at present.

It is usual for the public to have inflated ideas of the value of their ores; therefore assayers and the owners of custom works seldom get credit for returning full value of the parcels of ore. The same opinion appears to hold good with regard to the Government works, though some of the complaints are frivolous, *e.g.*, when Quinn and party wanted 9 dwt. 7·1,712 grains of silver handed over, being the total amount of about 6 tons of ore, which only assayed 1 dwt. 12 grains per ton, having a total value of about 1s.

The Department does not desire to compete with customs works, and therefore will only accept up to 12 tons (or two truck-loads) from the same source, except in cases of doubt or special difficulty. Nevertheless, it is to be feared that many parcels are forwarded, not because the owners desire to know how to treat them, but because they want the gold extracted, and a Government certificate to show possible purchasers.

A report giving an account of the treatment and assays of the various products is written out and sent to the owner of each parcel, and, if desired, interim reports are forwarded from stage to stage.

Up to 30th April, 1899, parcels have been received from over a hundred different localities of New South Wales, the positions of which are shown on the accompanying map.

#### *Delays.*

There are many causes that have militated against quick returns from the parcels of ores sent to the works, and as the sender of the ore dates his expectations from the day he despatches the parcel, the time seems longer to him till he receives the official results than that which was actually required to deal with the ore; and when he unreasonably compares the time taken in experimentally treating the ore with that required by custom works to sample and assay a parcel of ore they buy right out, the delay seems still worse.

1. At first there was a delay, as is usual in all new works, on account of various necessary adjustments. Even now certain machinery would have to be shifted in order to treat ore in some particular way, and that all means time.
2. Occasionally a parcel of ore will be delivered elsewhere, as in the case of J. L. Campbell from Goulburn, when it was wrongly addressed, and no advice of its despatch sent to the Government Metallurgist.
3. Sometimes, as in the case of W. E. Myring, the ore was not treated immediately on receipt, as the necessary fee was not forwarded. Since complaints have been brought forward by Members of Parliament, parcels have not been held over on this account, and as a consequence what was feared has happened, viz., some parties have refused to pay their dues when the value of the gold won did not cover it, *e.g.*, W. H. Carroll's ore from the Manning River, which was received on 22nd September, 1897, and reported on 30th September, 1897.
4. When several parcels arrive about the same time they have to take their turn.
5. The Government Metallurgist had other work to attend to, and had not time to write out the reports, even when the treatment was completed. Among other duties that took up the Metallurgist's time may be mentioned:—
  - (a) He had to lecture on metallurgy at the University for a year. This is now dispensed with.
  - (b) Several weeks were spent in dealing with the cyanide question.
  - (c) He has to look into new patents dealing with metallurgical subjects, and so far has investigated over 136.
  - (d) He has to visit and report on metallurgical processes elsewhere.
  - (e) He has had to inspect machinery at different places.
  - (f) He has had to examine candidates for the position of Assistant Demonstrator in Metallurgy for the Technological College, and also for the Assistant Analyst and Assayer at the works.
  - (g) He has occasionally visited mining-fields since the works have been started, *e.g.*, Broken Hill and Parkes; but during his absence Mr. Mingaye, the Analyst and Assayer to the Mines Department, looks after the works; but the reports are not written until the Government Metallurgist returns.
  - (h) Much time has been taken up in replying to Parliamentary questions.
6. When there is a rush of work in the Assay Office, and the works' samples have to take their turn or are difficult to treat, parcels of ore may be delayed pending the results.

Three weeks may be taken as the usual time required to treat a parcel of ore; but this naturally varies with the nature of the ore. The treatment proceeds eight hours a day. The engine-driver comes a little earlier than the others in the morning to get up steam, and while this is being done the first quarter of an hour is occupied in dressing the plates, oiling bearings, &c. The treatment of a parcel of ore is arrested in its various stages while assays are being made.

The following will give an idea of the length of time necessary to deal with a 6-ton parcel of ore by the different processes, if not subject to any delays:—

#### *(a) Free Milling.*

	Days.	Hours.
Coarse crushing and sampling . . . . .	1	...
Assaying the sample . . . . .	1 to 3	...
Reducing in the Tustin mill, and passing over plates and vanners, say 2 tons a day . . . . .	3	...
Cleaning-up . . . . .	...	2
Overhaul . . . . .	...	1
Drying concentrates . . . . .	1 to 2	...
Sampling, bagging, weighing, and assaying two lots of concentrates . . . . .	1 to 3	...
Syphoning off water from tailings and slime-pits, emptying pits, and wheeling tailings and slimes away . . . . .	...	3 to 4
Assaying tailings and two kinds of slimes . . . . .	1 to 3	...
Treating the gold saved on the Wynne and Tregartha plates in the Berdan pan for six hours, panning-off, and retorting the whole of the quicksilver . . . . .	1½	...
What flows off from the Berdan pan constitutes No. 3 concentrates; it is sampled, dried, bagged, weighed, and assayed . . . . .	1 to 3	...
Calculations and report . . . . .	1	...
Total . . . . .	11½—20 plus 6—7	All

All assays are made in triplicate, and are repeated until they agree. If the assay is only 2 dwt. or under, it is not considered worth proceeding with, and the owners are communicated with. If the complete treatment is not carried out, half the fee is returned. Should the assay indicate that the parcel is worth treating, the work is proceeded with without waiting for the assays to agree, samples being panned-off to determine the nature of the stone, and the size-screen to be used. Certain work may be going on in the plant while assays are being made in the laboratory; but in cases where the manipulation of a parcel must await the result of assays, or where the men and machinery are available, other parcels are taken in hand.

## (b) Chlorination.

	Days.	Hours.
Drying the ore ... ..	1	...
Coarse crushing and sampling ... ..	1	...
Assaying ... ..	1 to 3	...
Dry crushing, 2 tons daily... ..	3	...
Conveying to furnace and calcining, $\frac{3}{4}$ tons per day ... ..	8	...
Cooling ore and filling two 3-ton vats ... ..	...	6
Gassing ... ..	1 to 3	...
Leaching and washing ... ..	1	...
Precipitating ... ..	1	...
Collecting slimes, drying, and smelting ... ..	2	...
Sampling and assaying residues ... ..	1 to 3	...
Report and calculations ... ..	1	...
Total ... ..	21 to 27	plus 6

A grab sample is taken after passing all the ore through the Tustin mill, and is assayed as a check on the previous proportional sampling.

The calcination of the ore is slow, as the fire is banked up every night, the ore only being stirred seven hours out of the twenty-four, so this irregular work cannot be as satisfactory as if continuous;\* also a little time is lost in the morning by getting up the ore to the necessary temperature. To put on extra hands in such cases is unadvisable, and to break up the present staff into three shifts would retard other work, though it has been done on occasion when desired to push on with chlorination.

If the owner is not present to take possession of his bullion, it is sent to the Bank or Mint to be assayed and sold. This may take any time from three to fourteen days, thus causing a further delay before the miner gets his returns.

## (c) Cyaniding.

	Days.	Hours.
Drying the ore ... ..	1	...
Coarse crushing and sampling ... ..	1	...
Assaying ... ..	1 to 3	...
Dry crushing, 2 tons daily ... ..	3	...
Conveying to furnace and heating ... ..	0 to 2	...
Cooling and filling two vats ... ..	...	6
Treatment in vats and precipitation on zinc ... ..	4 to 14	...
Emptying vats ... ..	...	4
Assaying tailings... ..	1 to 3	...
Calculations and report ... ..	1	...
Total ... ..	13 to 29	plus 2

As it would be too costly in such small parcels to dissolve up all the zinc so as to obtain the gold, and since all the gold could not be obtained by rubbing, as is practised on mine plants, the Department has decided to pay for gold in the ore according to the difference between the assay of the ore before and after treatment. The ore is sometimes heated before cyaniding in order to aid in the percolation of clayed ore, but this is not usually the case. The rate of percolation varies very much with different parcels of ore, and this again makes the length of time taken in treating a parcel a varying quantity.

When the ore to be treated is the concentrates or tailings of parcels that have already been amalgamated on the premises, the preliminary operations above mentioned are, of course, unnecessary, as having already been done.

It must be borne in mind that experimental work cannot be carried out as quickly as that of an ore that is known, for, besides various mishaps, all machinery is liable to, *e.g.*, burst screens, one has to discover the best adjustment of the machinery to any particular class of ore, and, in many cases, the parcel is so small that it is through before the best results can be obtained, and when once through it cannot be treated again with satisfaction. Again, in test work, processes often have to be tried that would not be used on mines on account of the time they take preventing economic results, *e.g.*, ores difficult to leach, but which can only be determined for certain by experiment.

## Cost.

The expenses of the Metallurgical Works proper, and those of the Assay Office, are so intimately connected that they are difficult to separate, more especially since they have some items in common; but the following figures will give a fair idea of the position of affairs.

The Assay Branch was in existence years before the works were started, and has been gradually growing. Not only is the chemical work of the Geological Survey carried out in this laboratory, but an enormous number of free assays are made for the public from all parts of the Colony. Now, as this establishment is not supposed to bring in any pecuniary return, it is only fair that its expenses should be deducted from the general expenses of the Metallurgical Works, which is debited with it.

Lists

\* It would not pay to be continuous like on a mine. We would have to triplicate our staff.—Note by U.S.

Lists of the assays and analyses made for the Geological Survey and for the Metallurgical Works are given below.

Metal determined.	12th Oct. to 31st Dec., 1896.	1st Jan. to 31st Dec., 1897.	1st Jan. to 31st Dec., 1898.	1st Jan. to 30th April, 1899
Gold and silver ... ..	1,424	5,243	4,394	1,255
Antimony ... ..	11	23	16	5

Alumina ... ..	.....	.....	.....	7
Bismuth ... ..	2	23	11	1
Copper ... ..	86	530	466	199
Chrome ... ..	2	18	13	4
Cobalt ... ..	7	25	13	.....
Iron ... ..	6	45	87	37
Lead ... ..	21	74	55	24
Lime ... ..	.....	.....	.....	2
Miscellaneous ... ..	3	16	154	17
Manganese ... ..	4	26	33	12
Nickel ... ..	1	8	6	2
Phosphoric acid ... ..	3	.....	.....	20
Tellurium ... ..	.....	12	11	1
Titanium ... ..	1	.....	39	1
Tin ... ..	19	57	25	17
Silica ... ..	3	.....	.....	33
Wolfram ... ..	.....	4	6	9
Zinc ... ..	2	10	12	14
<b>Total number of samples ... ..</b>	<b>1,466</b>	<b>5,131</b>	<b>4,428</b>	<b>1,364</b>
<b>Total number of assays and analyses ... ..</b>	<b>1,645</b>	<b>6,240</b>	<b>5,455</b>	<b>1,720</b>

These determinations were made for the Geological Survey. Those for the Metallurgical Works during the same period, *i.e.*, since they commenced, are:—

Gold and silver ... ..	38	379	558	108
Acidity — extraction and consumption ... ..	.....	5	.....	4
Amalgam, &c. ... ..	9	59	.....	33
Antimony ... ..	1	2	.....	1
Bismuth ... ..	.....	2	.....	.....
Copper ... ..	3	12	3	1
Cyanide ... ..	.....	.....	132	62
Lead ... ..	3	6	2	.....
Moisture ... ..	5	12	5	.....
Miscellaneous ... ..	2	72	12	.....
Manganese ... ..	.....	.....	3	.....
Platinum ... ..	.....	18	6	.....
Tin ... ..	.....	27	5	.....
Wolfram ... ..	.....	6	.....	.....
Zinc ... ..	3	4	.....	.....
<b>Total number of samples ... ..</b>	<b>.....</b>	<b>518</b>	<b>720</b>	<b>209</b>
<b>Total number of determinations ... ..</b>	<b>64</b>	<b>604</b>	<b>726</b>	<b>209</b>

It will be seen that it is impossible to get at the exact cost of each determination, but it is safe to say that the majority of those carried out for the Metallurgical Works cost considerably less than those for the Geological Survey—for instance, the determination of the strength of cyanide solutions; still the only way open is to average the lot.

Those items which may be considered as common to the Assay office and works are:—

	£	s.	d.	£	s.	d.
Cost of land ... ..	587	17	9			
Cost of fencing ... ..	147	6	3			
Buildings ... ..	3,567	17	0			
				4,303	0	0
Those belonging to the Assay office:—						
Salaries of Assay staff ... ..	£3,182	0	0			
Wages of men employed in the Assay office ... ..	296	14	0			
	£3,478	14	0			
Less proportional cost for works assays ... ..	347	15	7			
				3,130	18	5

These

These figures do not include the cost of chemicals and apparatus, much of which was on hand when the Assay office removed to Clyde:—

	£	s.	d.	£	s.	d.
Salary of the Metallurgist. Though nominally head of the Assay office also; still, as he confines his attention to the works, this branch is debited with the whole of his salary ... ..	5,675	0	0			
Wages of the men ... ..	2,103	4	6			
Machinery ... ..	2,461	6	7			
Proportional cost of assays ... ..	347	15	7			
Cost of siding ... ..	216	16	6			
						10,804 3 2

*Conclusion.*

We find that Mr. Taylor, the Government Metallurgist, has carried out all the duties enumerated in his agreement with the Agent-General, in addition to others imposed on him since his arrival in the Colony.

The plant erected is suitable for testing small parcels by amalgamation, chlorination, and cyanide processes, and the machinery is kept in good working order. Here the public has an opportunity of having refractory ores experimented with by a trained metallurgist.

In test works the machinery adopted should be that which can be best adapted to the varying conditions under which it will be employed, and it is not laid out like that on mines, which is intended to treat but one class of material on a commercial scale. It is impossible without much expense to arrange a test plant in such a manner as to have everything convenient for all varieties of combinations to which it is capable of being applied\*.

To have works in which all kinds of ores can be treated would be a most costly and unwarrantable affair, as much of the plant would only be used once in a way. An instance in point is the Robert's alluvial washer, which was purchased to deal with a parcel of wash, but has never been used since. The subject of smelters has already been dealt with by the Board appointed to advise on the matter, which we endorse. It is not always advisable to erect machinery for the treatment of ore when only a limited number of parcels of that class is expected; still it is probable that were it known the appliances were available ore would be sent that is now withheld. By adding a set of rolls, coarse and fine jigs, hydraulic classifier and slime concentrator to the Gates' crusher, Tustin mill, and Frue vanners, one would have an ore-dressing plant capable of dealing with lead, copper, wolfram, chrome, tin, and other ores that require mechanical treatment. The Government Metallurgist speaks of adding a circulating apparatus to the cyanide plant, as also a filter-press to assist in the leaching of slimes. Two more vats that can be applied to other leaching processes are also advisable.

In works of this sort very little can be done in the way of saving by-products. Cupriferos solutions are passed over scrap iron, and spent auriferous liquors flow through charcoal or sawdust before being allowed to escape. The products go to the State, as it is out of the question to portion the minute quantities among the various small parcels treated.

Inventors have availed themselves of the works in order to test their machines, but students do not go there for practical instruction, as was anticipated, for during the term they are fully occupied with other studies.

These works are not supposed to be self-supporting; they never have been, and never will be. Most of the complaints about the plant are baseless, and were made after a hasty inspection of the works, which was visited with the evident intention of finding faults. Remarks from those who are biassed from the outset, and do not make a careful investigation, or will not take the trouble to ask for explanations of things they do not understand from the responsible head, cannot carry much weight.

Reasons have been given in this report why certain delays have taken place. Some of these have already been remedied, and as the work in hand is up to date others are not likely to occur again, unless a rush of work comes in. There are two points, however, that we think might be improved upon, considering that most parties sending ore pay for its treatment.

1st. That the first duty of the Government Metallurgist should be to attend to the treatment of ores at the works, and that his report be sent in within twenty-four hours of his possessing the necessary data.

2nd. That the works' assays be given precedence over the free assays, and not taken in rotation, so that the treatment of the ore can be proceeded with as quickly as possible.

We have, &c.,

J. KEMP CHARLESTON.  
FRED. DANVERS POWER.

To the Under Secretary for Agriculture,  
Mines Department, Sydney.

Places from which parcels of ore have been sent to the Government works:—

Albury.

## No. 4.

## The Under Secretary for Mines to The Secretary for Mines.

21 June, 1899.

I SUBMIT herein the report made by Messrs. Charleston and Danvers Power, who were appointed to inquire into the Government Metallurgical Works at Clyde. The report must, on the whole, be accepted as satisfactory to the Department, although I fear that in this establishment we have taken up a class of work which will leave the Department open to complaints from persons who are disappointed with the returns they get from their stone. It is not, I believe, within the power of any man, or any works of this kind, to give universal satisfaction, because it is not possible in every case to make a bulk treatment of stone give the same result as a small assay sample of some few ounces in weight. Senders of ore to the works usually get the assay returns first, and because the bulk test, when the material is sent to the Metallurgical Works, does not give the same returns as the original assay they are dissatisfied, and blame the efficiency of the works or the management. It is not, however, the fault of the works, or, in my opinion, the management; but it is because the gold or silver, as the case may be, is not in the bulk parcel of stone as shown by the assay, and while we continue such an establishment I see no help for it but to look for these complaints.

The additional appliances mentioned by Messrs. Charleston and Power should be put into the works without delay, and I suggest that Mr. Taylor be instructed accordingly. He should also be directed to see that assays of material which has been paid for are to take precedence over the free assays, as suggested in the report.

D. C. McLACHLAN,

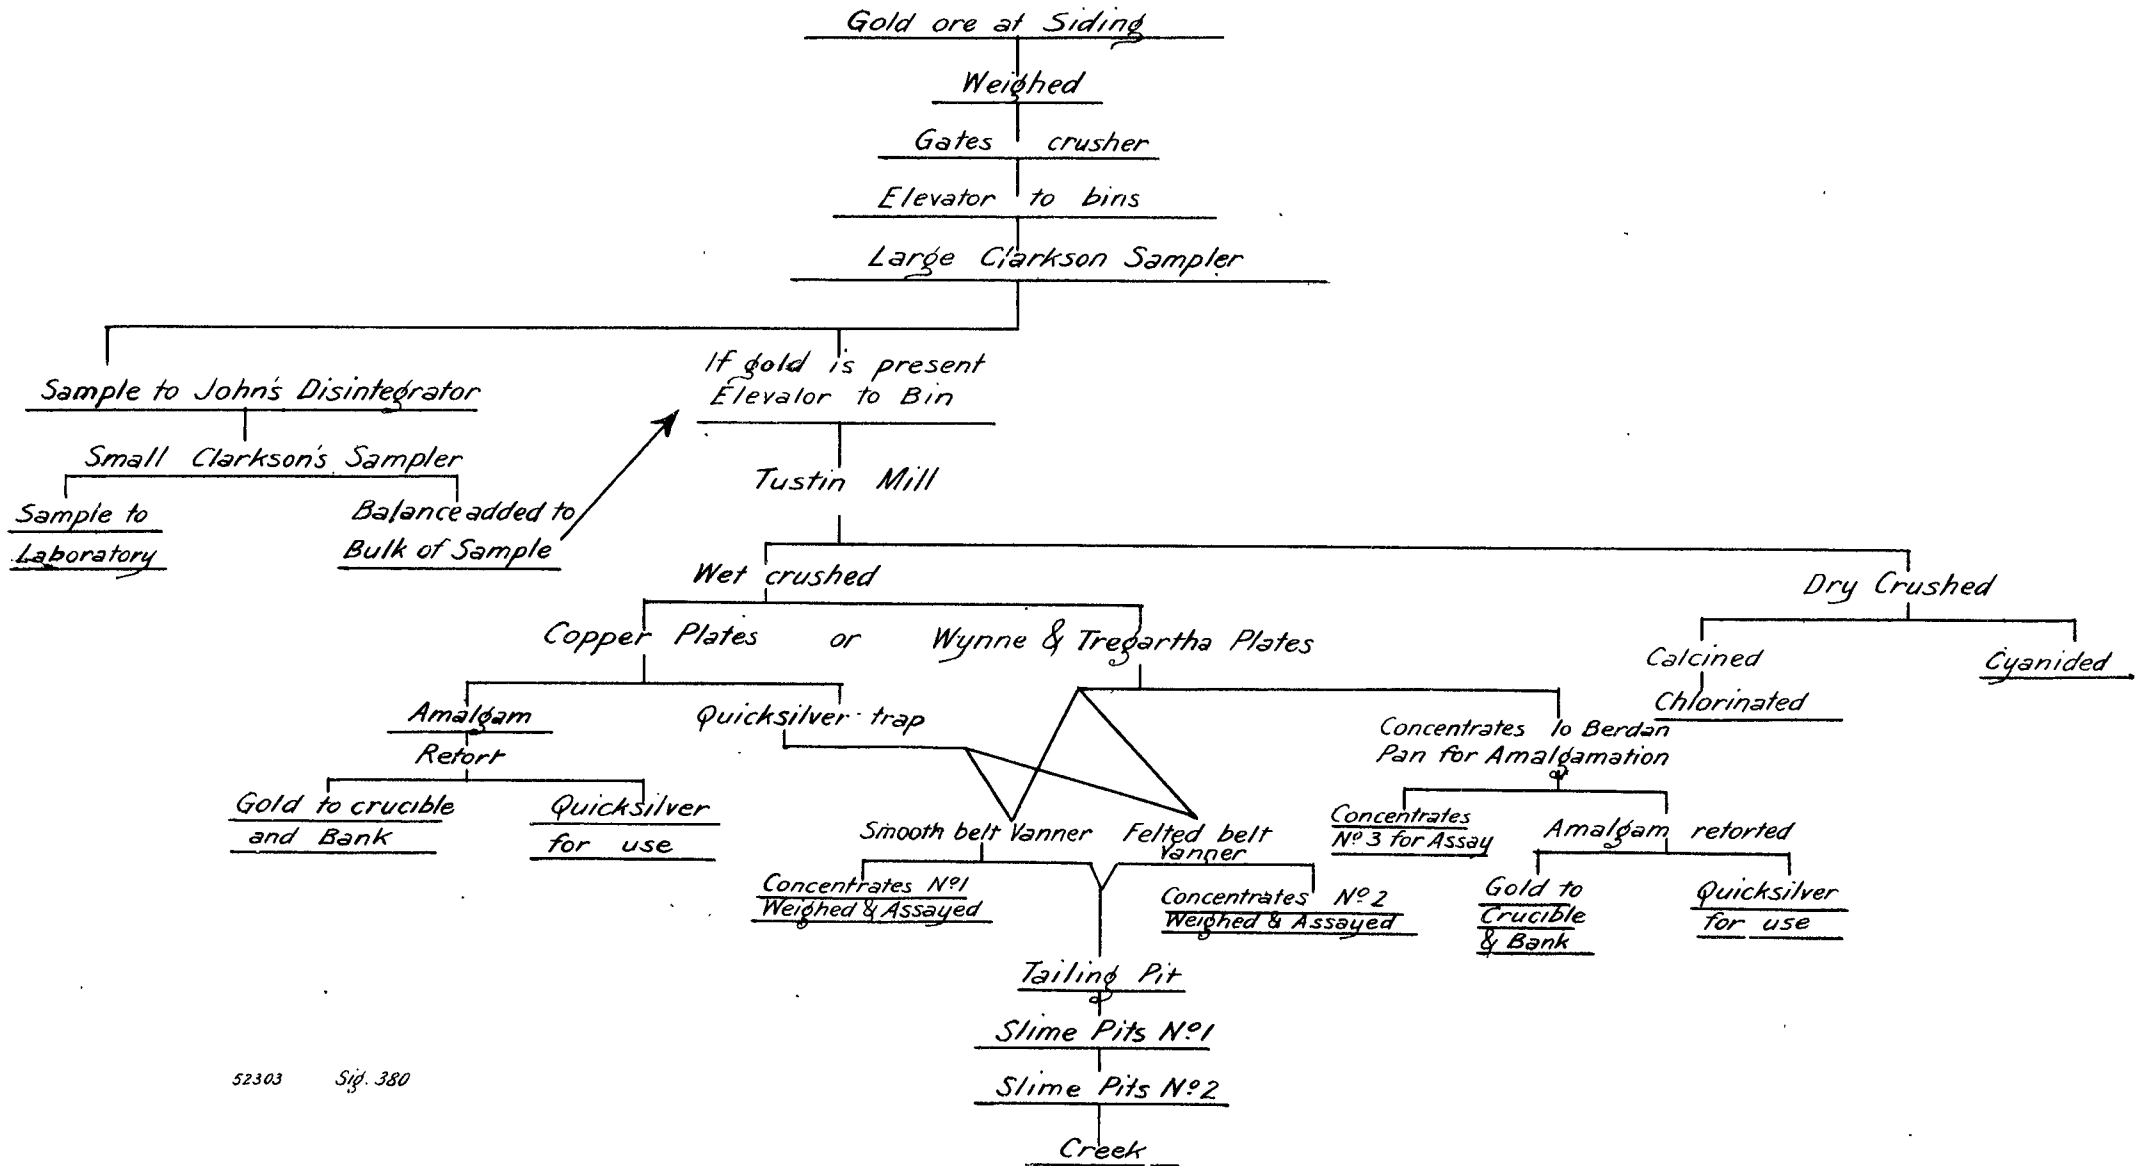

Under Secretary.

Approved.—J. COOK, Secretary for Mines, 22/6/99. Forward to Mr. Taylor to note and return at once; he should lose no time in arranging for the additional appliances.—D. C. McLACHLAN, Under Secretary, 23/6/99. Urgent.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## DEPARTMENT OF MINES AND AGRICULTURE.

(REPORT OF THE STOCK AND BRANDS BRANCH FOR THE YEAR 1898.)

*Printed under No. 6 Report from Printing Committee, 19 October, 1899.*

The Under Secretary for Mines and Agriculture to The Secretary for Mines and Agriculture.

Sir,

I have the honor to submit the report of the Chief Inspector of Stock for the year 1898, which shows a decrease in horses, cattle, and sheep, owing to the severe drought.

## Veterinary Surgeon.

During the year Mr. J. D. Stewart, M.R.C.V.S., was appointed Veterinary Surgeon to the Stock Branch.

## Inspectors' Work.

The inspections made by the staff number 52,278, exclusive of the inspections of Queensland cattle on the Border—rather more than usual—which include horses, cattle, sheep, dogs, pigs, and inspections of pounds, commons, &c., and in this work Inspectors travelled an average of 4,329 miles each. 306 prosecutions took place under the different Acts, and 291 convictions were obtained.

## Horses.

The number of horses in the Colony at 31st December last was 449,989 being a decrease of 16,824 on the previous year.

No serious outbreaks of disease in horses have taken place. Parasitic blindness was reported from five districts.

## Cattle.

The cattle decreased through the drought to the extent of 60,339, and now stand at 1,886,390.

Several districts report pleuro-pneumonia. Cases of tuberculosis have been met with in most of the districts, and the cattle were destroyed.

## Tick Plague.

Unfortunately ticks are making progress towards our Border, but the advance, through the exertions of Queensland, assisted by Victoria and this Colony, has not been very great, only to a short distance south of Ipswich and Brisbane. Every effort is being made to prevent their entering this Colony from any other quarter. The Border is fenced and patrolled from Stanthorpe to Tweed Heads, the portion of the Border which it is considered necessary to close to sheep, cattle, and loose horses; and lest the ticks should cross the Border, preparations have been made for inoculating, and a commencement will be made as soon as the season will admit and there is green grass for the cattle while they are under the influence of the inoculation. Where cattle, sheep, or loose horses are admitted, they have to be accompanied by a declaration and certificate that they are clean and come from clean country, and are closely examined one by one at the Border before crossing.

\*207—A

Sheep.

[2,685 copies—Approximate Cost of Printing (labour and material), £55 6s. 2d.]

### Sheep.

The returns show a decrease of 2,711,893 on the previous year.

The large decrease is, of course, due to the drought.

A careful classification made of the different breeds shows the total number of merinos to be 37,725,965, comprising 27,691,723 combing, and 10,034,242 clothing; long-woolled sheep number 1,095,060, and cross-breds 2,419,979, making, together, 3,515,039.

Of all descriptions, the grand total at 31st December last, was 41,241,004.

During the year 247 stud rams and ewes were imported from London, America, and Germany, and passed the prescribed quarantine.

It will be seen that nearly the whole of the sheep are now paddocked, and that their quality is reported as improving in those portions of the Colony where the effect of the drought has not been so severely felt.

### The Lambing.

The actual lambing for the whole Colony was estimated at  $52\frac{1}{4}$  per-cent. The spring lambing gave  $65\frac{1}{4}$  per cent., and the autumn and winter lambing  $42\frac{1}{4}$  and  $44\frac{1}{2}$  respectively.

### The Clip.

3,643,450 lambs were shorn in the grease, and 139,000 washed; while 34,931,165 sheep were shorn in the grease, and the wool of 2,506,825 was scoured.

The average weights of the clip are estimated as follows:—

						Lambs.	Sheep.
						lb. oz.	lb. oz.
Grease	...	...	...	...	...	1 14 $\frac{1}{8}$	6 0
Scoured	...	...	...	...	...	1 2 $\frac{1}{2}$	2 15

The total clip for the Colony is estimated at 223,968,833 lb., being a decrease of 312,813 lb. on the year 1897.

Of the total mentioned, 183,822,643 lb. are estimated to have been sent to Sydney, 32,856,323 lb. to Melbourne, and 7,289,862 lb. to Adelaide.

The sheep were comparatively free from disease during the year. Outbreaks of anthrax still occur in several districts, but owners are vaccinating with decided success, and the deaths from this deadly disease are decreasing.

It is very satisfactory to report that the sheep in the whole of the Colonies, including Tasmania and New Zealand, are now free from scab; Western Australia, being the last to be free from that pest, was officially declared so in October last.

### Pigs.

The number of pigs in the Colony is 247,061, a number very far short of what there ought to be.

### Dogs.

Fifty-four dogs were quarantined during the year, but of these twenty-two were "ships' dogs," and only remained in quarantine until the vessels to which they belonged left the port.

### Travelling Stock Reserves.

Owing to the drought many of these reserves were quite bare of grass, and as it assumed serious proportions, travelling in many cases became impossible, and the sheep perished on their runs.

The advisability of withdrawing the principal travelling stock reserves from lease, and proper provision made for their protection, is every day more apparent, and is a subject demanding early and serious consideration.

### Registration of Horse, Cattle, and Sheep Brands and Marks.

About the average number of brands were registered during the year, and the total number of Horse and Cattle Brands registered since the Act came into force in 1866 up to 31st December last, was 79,790, and the number of sheep brands were as follows:—Fire-brands, 5,721; tar-brands, 22,118; and ear-marks, 13,423.

### Public Pounds.

There are 326 pounds open. They are periodically inspected, with the result that there are now very much fewer complaints in regard to the conduct of pounds than formerly.

### Noxious Animals.

The receipts under the Pastures and Stock Protection Acts during 1898 reached £32,720 17s. 4d., while the amounts expended by the different Boards in the Colony for scalps of animals destroyed, and other expenses, amounted to £28,910 13s. 10d.

In only three districts were the full rates of assessment levied.

The number of the different animals destroyed, and paid for, is shown in Appendix M to this Report.

The Boards are still urging amendments in the Pastures and Stock Protection and other Acts.

Among the Appendices, some interesting information is given by the Chief Inspector with regard to the Export Trade in Australian Mutton, Experiments in Cross-breeding, and other subjects of interest to pastoralists.

A large, elegant handwritten signature in black ink, reading "W. C. Lachlan". The signature is written in a cursive style with a long, sweeping underline that extends to the left and then curves back under the main text.

Under Secretary, Department of Mines and Agriculture.

### The Chief Inspector of Stock to The Under Secretary for Mines and Agriculture.

Sir, Department of Mines and Agriculture, Stock and Brands, Sydney, 1st September, 1899.

On the 1st February last I submitted a Progress Report for the year ending 31st December, 1898, giving the approximate number of the horses, cattle, and sheep then in the Colony; and I have now the honor to submit for your consideration my complete Report for that year on the working of this Branch, which is, as usual, based very much upon Inspectors' estimates, owners still showing very little inclination to furnish data. It will be seen that there is a very large decrease in the number of all descriptions of stock. This, of course, is attributable to the excessively severe drought from which almost every portion of the Colony suffered. There has been no such general protracted drought for more than fifty years. With the exception of a comparatively small part of the north-eastern and extreme north-western portions of the Colony, and some portions of Monaro and of the Upper Billabong, no part of the Colony escaped. In the Eastern Land Division of the Colony the losses were greatest in the middle portion. In the Central Division, the losses were very heavy, and they were greatest in the northern portion. In the Western Division, the losses were very light in the northern portion, very heavy in the middle, but not so heavy in the southern.

As the issue of my report has, through press of work and shortness of staff, been delayed, I have included information of a later date than that in the body of the report in regard to the tick pest and other subjects which are of interest to stock-owners, in the Appendices.

I have, &c.,

ALEX. BRUCE,

Chief Inspector of Stock.

### APPOINTMENT OF VETERINARY SURGEON.

Owing to Mr. Chief Veterinary Inspector Stanley's time being fully taken up with the work connected with the Health Department, it became necessary to appoint a Veterinary Surgeon in connection with the Stock Branch. For this position, Mr. James Douglas Stewart, M.R.C.V.S., was selected, and since his appointment he has, as will be seen from his reports, besides carrying out his other duties, been devoting a large portion of his time to the initiation of inoculation for tick-fever.

### INSPECTORS' WORK.

The Colony is now divided into sixty-five Sheep Districts, and there are fifty-two Staff Inspectors employed, who have made the following inspections during the year 1898:—

Stock, including horses, cattle, and sheep	...	...	...	28,905	inspections.
Reserves	...	...	...	5,618	„
Public Pounds	...	...	...	647	„
Commons	...	...	...	827	„
Dogs	...	...	...	1,731	„
Pigs	...	...	...	2,281	„
Under Pastures and Stock Protection Act	...	...	...	9,197	„
Under Public Watering-places Act	...	...	...	1,489	„
Under Diseased Animals and Meat Act	...	...	...	1,583	„
Total	...	...	...	52,278	„

being an average of 1,005 inspections by each Inspector.

The total number of stock inspected was,—118,022 horses, 942,402 cattle, and 21,363,541 sheep. This shows an increase of 6,284 horses and 89,681 cattle, and a decrease of 2,513,690 sheep inspected during 1898, as compared with the previous year. This is exclusive of the inspections made by the Inspectors stationed along the Queensland Border.

#### *Flemington Sale-yards.*

As usual, the whole of the stock arriving at these yards were carefully inspected on each sale-day by an Officer of the Board of Health and an Inspector of Stock, and a considerable number were condemned as unfit for human consumption. The numbers of stock submitted to auction were as follows:—

Cattle, 113,508 head.

Sheep, 2,692,250 head,—

a weekly average of 2,182 cattle and 51,774 sheep. Compared with 1897, this is an increase of 22 cattle and 2,260 sheep per week. These inspections occasionally lead to the detection of stolen stock, as the Inspector's duty requires him to compare the brands and marks on the stock with those in the permits and travelling-statements accompanying them, which are filed in this office for reference by persons inquiring about stock supposed to have been stolen, and the identification of the owners of animals condemned at the abattoirs. Some of the permits and travelling statements collected by the Inspector at Flemington are still imperfect, especially as regards the brands and marks, and are useless in tracing stock or for production in a court of law. Should this continue the Inspector will be compelled to prosecute for non-compliance with the Act and Regulations.

#### *Inspectors' Mileage.*

During the past year the staff travelled over a distance of 225,142 miles while on duty, an average of 4,329 each per annum, or an increase of 171 miles.

#### *Prosecutions*

*Prosecutions and Convictions obtained.*

Under what Act.	No. of Prosecutions.	No. of Convictions.
Diseases in Sheep Acts ... ..	58	49
Imported Stock Acts... ..	10	10
Registration of Brands Acts ... ..	2	2
Pastures and Stock Protection Acts ... ..	189	185
Public Watering-places Act... ..	22	22
Impounding Acts ... ..	5	3
Diseased Animals and Meat Act ... ..	20	20
Total ... ..	306	291

Attention is again called to the neglect on the part of the Pastures Boards to compel defaulting owners to destroy the noxious animals on their holdings. If compulsion after caution was brought to bear on defaulters to a moderate extent by the Boards—and moderate compulsion can hurt no one seriously—simultaneous action would be brought about, and something like value for the money now expended would then be obtained, while the pest would, year by year, be reduced.

**HORSES.**

The number of horses in the Colony during the thirty-eight years previous to and including 1898 was as follows:—

Year.	No.	Year.	No.	Year.	No.
1861 ... ..	251,497	1874 ... ..	334,462	1887 ... ..	390,609
1862 ... ..	233,220	1875 ... ..	357,697	1888 ... ..	411,363
1863 ... ..	273,389	1876 ... ..	366,703	1889 ... ..	430,777
1864 ... ..	262,554	1877 ... ..	328,150	1890 ... ..	444,163
1865 ... ..	284,567	1878 ... ..	336,468	1891 ... ..	459,755
1866 ... ..	282,587	1879 ... ..	360,038	1892 ... ..	481,416
1867 ... ..	278,437	1880 ... ..	395,984	1893 ... ..	481,399
1868 ... ..	280,201	1881 ... ..	398,577	1894 ... ..	500,068
1869 ... ..	280,818	1882 ... ..	323,026	1895 ... ..	482,459
1870 ... ..	280,304	1883 ... ..	326,964	1896 ... ..	484,028
1871 ... ..	337,597	1884 ... ..	337,172	1897 ... ..	466,813
1872 ... ..	304,100	1885 ... ..	344,697	1898 ... ..	449,989
1873 ... ..	323,408	1886 ... ..	361,663		

being a decrease of 16,824 horses on the number returned for the previous year, which is accounted for by the severe drought which prevailed nearly over the whole Colony, less breeding, consequent on low prices and use of bicycles.

The number of horses as returned in each Sheep District of the Colony will be found in Appendix A, as also the number of cattle, sheep, and pigs.

*Breed of Horses.*

Under this head the Inspectors' returns give the different breeds of horses as follows:—

	Ordinary.	Thoroughbred.	Total.
Draught ... ..	122,769	18,018	140,787
Light harness ... ..	102,616	12,606	115,222
Saddle ... ..	167,218	26,762	193,980
Grand Total ... ..			449,989

*Australian and Foreign Horses Introduced and Imported.*

*Australian Horses*—From other Australian Colonies.—By sea: 29 stud horses. Overland: 23 stud horses, 61 stud mares, and 2,260 ordinary horses; total, 2,373.

*Foreign Horses*.—During the year 13 horses were imported from Great Britain and Ireland and other countries, and were subjected to the prescribed quarantine of fourteen days in Sydney (except in the case of two lots which arrived without complete certificates, when an additional term of fourteen days

days was imposed, in accordance with Sub-Clause 3 of Regulation No. 33 under Imported Stock Acts) before being allowed to go inland. Particulars as to number and breed of these horses are as follows:—

Name of Importer.	Address.	Where from.	Breed.

*Horses fit for Sale, number Exported, Improvement, &c.*

In the several districts of the Colony, Inspectors' reports show that there are 17,391 draught, 18,485 light harness, and 21,186 saddle horses fit for market, while of this number 15,281 are considered suitable for requirements of India and China.

During the year 7,880 horses were exported, principally to India, Victoria, Queensland, New Zealand, Western Australia, Fiji, Java, and the Straits Settlements.

Reports from thirty-seven districts say that the horses are improving, owing to introduction of improved sires.

In nineteen districts there is no improvement, while in nine districts they are reported as deteriorating.

*Tax on Stallions.*

A tax on stallions is still asked for by owners, and, in the interest of horse-breeding generally, is I think highly desirable. Stallions should be registered and certified by a Veterinary Surgeon as sound.

**DISEASES AND AILMENTS OF HORSES.**

*Blindness in Horses.*

From five districts, principally on the Darling, horses to the number of 442 are reported as having been affected with parasitic blindness; but the ailment has yielded to the treatment prescribed by the Department, which is as follows:—

*Vermifuge.*

Arsenic—5 grains, carefully mixed in (say) 3 lb. bran, and give three doses to each horse at intervals of one week between each dose—each horse to receive 5 grains in each dose; or

Turps and Linseed Oil { 3 draughts for each horse at intervals of one week between } 1 pint linseed oil.  
 Linseed Oil { each draught. } 2 oz. turps.

*Tonic.*

To follow the vermifuge if the disease has been allowed to make considerable progress:—

Black antimony	...	...	...	2 drams	} 1 dose.
Tartar emetic	...	...	...	1 dram	
Sulphate of iron	...	...	...	3 drams	
Common salt	...	...	...	$\frac{1}{2}$ oz.	
Powdered sulphur	...	...	...	$\frac{1}{4}$ "	

Dose to each horse at intervals of three days for three weeks, to be given in chaff or bran damped.

In the localities in which the horses are attacked, licks of salt and sulphur should be provided for them in troughs in the paddocks, and the horses could be enticed to the licks by a little bran and chaff.

*Australian String-halt in Horses.*

The horses in five districts are reported as having been affected with this ailment during the year.

The majority of the horses, however, recovered when the spring set in.

Mr. Chief Veterinary-Inspector Stanley and Mr. Veterinary-Surgeon Robinson consider this a parasitical disease, and are of opinion that the curative treatment is to expel the parasites by the administration of anthelmintics, and dose after dose may be required for this purpose. It is necessary to remember that brood after brood have to be poisoned; and that when they are ensconced in a living being, whose tissues are also liable to suffer from the introduction of drastic drugs, it is impossible to effect our object without perseverance; and to prevent reinfection it is advisable to move the patients to a sound paddock or, better still, into a yard or stable, to feed liberally, and also constantly supply salt with their food.

Preventive measures are very important. With this object, avoid putting an affected animal into a paddock at all favourable for the development of worms. Infected paddocks should not be used by horses, even temporarily; half an hour's grazing may affect them, especially during the spring and autumn. The first grass after summer will scour animals, and has been known to cure them, because at that season the parasites are prepared for exit. Microscopical examination shows one affected animal introduced, though he may be eventually cured, means later on (all circumstances being favourable) a hot-bed of infection for future tenants of the paddock. The

The following prescription is recommended as an anthelmintic and tonic, viz. :—

Common salt	...	...	...	...	...	...	...	2 lb.
Powdered sulphur	...	...	...	...	...	...	...	2 "
Black antimony	...	...	...	...	...	...	...	1 "
Tartar emetic	...	...	...	...	...	...	...	$\frac{1}{2}$ "
Sulphate of iron	...	...	...	...	...	...	...	1 "

Doses, divided into ounce-doses and given in the feed, which may be varied by the administration of a draught every alternate day, composed of linseed oil (raw) 1 pint and spirits of turpentine 2 oz.

#### *Influenza.*

This disease is reported to have affected the horses in one district. For its character, symptoms, and treatment, see Appendix B.

#### *Ophthalmia.*

This disease has not been reported as affecting the horses during the year. Its nature, and treatment recommended by Mr. Chief Veterinary-Inspector Stanley, is described in Appendix C, and is applicable to all stock.

The skin disease (*prurigo*) is reported from one district; and anthrax (supposed to be) from three districts.

With the exception of the above ailments the horses throughout the Colony have been exceptionally free from disease during the year.

Owners are cautioned, where their stock are not removed from the paddocks where poisoned pollard is laid for rabbits, that they should see that the pollard pellets are small, as both horses and sheep are liable to pick them up when laid large or in lumps.

The estimated losses in horses during the year from various causes, principally through drought, amount to 20,060.

### CATTLE.

The returns of cattle in the Colony during the thirty-eight years ending 31st December, 1898, stand as follows :—

Year.	No.	Year.	No.	Year.	No.
1861	2,271,923	1874	2,856,699	1887	1,575,487
1862	2,620,383	1875	3,134,086	1888	1,622,907
1863	2,032,522	1876	3,131,013	1889	1,741,592
1864	1,924,119	1877	2,746,385	1890	1,909,009
1865	1,961,905	1878	2,771,583	1891	2,046,347
1866	1,771,809	1879	2,914,210	1892	2,147,074
1867	1,728,427	1880	2,580,040	1893	2,155,500
1868	1,761,411	1881	2,597,348	1894	2,290,112
1869	1,795,904	1882	1,859,935	1895	2,023,768
1870	2,195,096	1883	1,640,753	1896	2,043,707
1871	2,014,888	1884	1,425,130	1897	1,966,729
1872	2,237,660	1885	1,317,315	1898	1,886,390
1873	3,794,327	1886	1,367,844		

From the above it will be seen there was a decrease caused by the great drought of 80,339 cattle during the year 1898, and an increase of 263,483, as against the decennial year 1888.

The number of cattle in each of the Sheep Districts of the Colony will be found in Appendix A.

196,031 cattle were introduced from other Colonies during the year, and 54,619 exported, being an increase in the number introduced over the number exported of 141,412; of the number introduced 188,383 came from Queensland.

#### *Breeds of Cattle.*

	Pure and Stud.	Ordinary.	Total.
Shorthorns	48,785	611,186	659,971

*Increase and Decrease of Cattle in the several Districts.*

On reference to the number of cattle returned for each district as given in Appendix A, it will be seen that there is an increase in twenty-six districts, which is attributed to the extension of the dairying industry, additional settlement, increased breeding, large numbers introduced from Queensland, and more complete returns.

In the remaining thirty-nine districts they have decreased, in some to a very slight extent and others very considerably, through losses by drought and less breeding.

*The "Cast" of Fat and Store Cattle.*

It is estimated that the "cast" of fat cattle for market during the coming year will be 236,620, and store cattle, 204,320. From seventeen districts the fat cattle are principally sent to Victoria; from three districts they are principally sent to South Australia and Tasmania; and the remaining districts supply the markets of Sydney, Maitland, Mudgee, Bathurst, Orange, Goulburn, Tamworth, Albury, Western Australia, and New Caledonia. The principal markets for store cattle are Muswellbrook, Maitland, Goulburn, and Wagga Wagga.

*How kept.*

The number of cattle kept wholly in paddocks is returned as 1,533,596; on open runs, 240,506; and the balance, 112,288, are depastured both ways.

*Improvement and Deterioration.*

In thirty-nine districts the cattle are said to be improving; in twenty districts they are stationary; and in six districts deteriorating. The principal reasons given for the improvement are—introduction of good stud stock; more attention and care in selection and breeding of stock, more particularly those for dairying purposes; also closer culling and keeping in paddocks. The reason given for deterioration is inattention to breeding, some owners breeding from all sorts without respect to breed or quality, and using the same blood for years.

*Their Diseases and Ailments.*

*Pleuro-pneumonia*—Inspectors' reports show that this disease existed in thirty districts and that the cattle on ninety-five runs were affected; while the other districts are reported to be free from the disease. Inoculation was practised on 117 holdings as a preventive with good results.

*Cumberland Disease*.—From five districts the number of cattle reported to have died from this form of anthrax is 175.

*Symptomatic Anthrax or Blackleg* is reported to have carried off 1,428 head in six districts.

*Cancer and Actinomycesis*.—1,531 cattle are reported to have died in thirty-eight districts from these diseases.

*Tuberculosis*.—Cattle to the number of 4,587, suffering from this disease, are reported from forty districts as having died or were killed and boiled down.

*Ophthalmia* occasionally assumes an epidemic form, and the number of cattle attacked is in some cases considerable, causing much temporary inconvenience to stock from blindness. Outbreaks have been reported from eight districts, and the deaths numbered 479. For treatment, see Appendix C.

*Poisonous Plants*.—From seven districts deaths to the number of 1,181 are reported through eating supposed poisonous plants, but they were, it is believed, due in most cases to hoven, arising from starving cattle gorging themselves with succulent vegetation.

*Tick-fever*.—Statement with reference to the steps taken in this Colony to prevent the introduction of Ticks, and the progress and treatment of the disease in Queensland, as well as the initiation of inoculation against tick-fever, will be found in Appendix D.

*Diseased Animals and Meat Act.*

The number of cattle condemned under this Act is given in Appendix E, kindly furnished by the Board of Health. SHEEP.

## SHEEP.

The number of sheep in the Colony during the thirty-eight years ending 31st December, 1898, stands as follows:—

Year.	No.	Year.	No.	Year.	No.
1861 ... ..	6,119,169	1874 ... ..	22,797,416	1887 ... ..	46,965,152

1871 ... ..	16,766,012	1884 ... ..	31,660,321	1897 ... ..	43,952,897
1872 ... ..	17,873,696	1885 ... ..	37,820,906	1898 ... ..	41,241,004
1873 ... ..	18,990,595	1886 ... ..	39,169,304		

For number of sheep in the several Sheep Districts, *see* Appendix A.

*Increase and Decrease.*

This shows a decrease for the whole Colony of 2,711,893, occasioned by the prolonged drought.

The number of sheep imported during the year was 700,718, and the number exported 1,311,880, an increase in the exports over the imports of 611,162 sheep.

In Appendix F there is a statement kindly furnished by the Government Statistician, which accounts for this decrease.

For losses from causes other than by drought, *see* Appendix G.

*The different Breeds.**Merino.*

The annual "cast" of fat sheep for the ensuing season is estimated at 4,389,130, and store sheep, 3,731,170.

*How Sheep are kept.*

Paddocked ...	...	...	...	...	...	...	...	40,296,357
Shepherded ...	...	...	...	...	...	...	...	381,354
Both ways ...	...	...	...	...	...	...	...	563,293
								41,241,004

*Quality of the Flocks.*

In forty-three districts an improvement in the sheep is reported, the principal reasons given being more attention to breeding, paddocking, introduction of high-class rams and ewes, and more careful classing and culling.

In eleven districts the sheep are said to be stationary, and in eleven districts they are deteriorating.

*Lambing.*

From a return of the autumn, winter, and spring lambings obtained from the Inspector for each Sheep District, the average percentage of lambing for the whole Colony is estimated at 52½ per cent., *i.e.*, calculating the number of lambs marked on the number of ewes put to the rams. The spring lambing was the highest, averaging 65½ per cent., while the autumn and winter lambings averaged 52½ and 44½ per cent. respectively. The estimated number of ewes put to the ram during the year was 14,489,816, and the number of lambs returned as marked during the autumn, winter, and spring lambings was 7,566,868.

*The Clip.**Average per Sheep.*

*Lambs.*—The number of lambs shorn in the grease was 3,643,450; the number washed, 139,000; total lambs shorn, 3,782,450.

*Sheep.*—The number of sheep shorn in the grease was 34,931,165; and scoured, 2,506,825; total sheep shorn, 37,437,990.

The average weights of the clip are estimated as follows:—

							<i>Lambs.</i>	<i>Sheep.</i>
							lb. oz.	lb. oz.
Grease ...	...	...	...	...	...	...	1 14½	6 0
Scoured ...	...	...	...	...	...	...	1 2½	2 15

*Total Clip.*

Total clip in the Colony for the year 1898, according to the number of sheep, would be:—

34,931,165 sheep shorn in the grease; average clip, 6 lb. 0 oz. per sheep	=	209,586,990 lb.
2,506,825 " scoured	"	2 " 15 " " = 7,363,798 "
3,643,450 lambs shorn in the grease	"	1 " 14½ " per lamb = 6,859,933 "
139,000 " scoured	"	1 " 2½ " " = 158,112 "

223,968,833 lb.

The estimated total weight of the clip as shown above is below that of the previous year by 312,813 lb., owing principally to the large decrease in the number of sheep and lambs shorn. This, again, was occasioned by the exceedingly severe drought which affected the greater portion of the Colony.

Condition

## Condition of Clip.

In a few of the districts, including the Upper Billabong, Mudgee, Liverpool Plains, and New England the clip was sound and in good condition. In a great many of the others which suffered from drought the wool was unsound and dust-stained. This was especially the case in regard to clips in the greater part of the south-western portion of the Colony.

## Exportation of Clip.

The clip grown in the Colony of New South Wales is shipped principally to England, America, France, Germany, and Japan, and considerable portions of it is so from the ports of the three neighbouring Colonies, as well as from Sydney and Newcastle. The portions of our clip thus shipped from the other Colonies is often mistaken as the produce of those Colonies, more particularly for that of Victoria and South Australia.

The following is an estimate of the clip sent to Sydney, and also the proportion sent across the Border to Melbourne, Adelaide, and Brisbane for the years 1897 and 1898 :—

Port of Shipment.	1897.			1898.		
	Greasy.	Washed.	Total.	Greasy.	Washed.	Total.
	lb.	lb.	lb.	lb.	lb.	lb.
Sydney .....	180,329,890	6,077,859	186,407,749	177,846,389	5,976,259	183,822,648
Melbourne .....	28,841,536	919,320	29,760,856	32,038,440	817,883	32,856,323
Adelaide .....	7,207,152	749,930	7,957,082	6,562,094	727,768	7,289,862
Brisbane .....	155,959	.....	155,959	.....	.....	.....
	216,534,537	7,747,109	224,281,646	216,446,923	7,521,910	223,968,833

This shows a decrease in the quantity of wool shipped during the year from the ports of Sydney and Newcastle of 2,585,101 lb., as compared with that shipped in 1897.

This decrease is no doubt attributable to the very large increase in the quantity of New South Wales wool shipped from Melbourne during the year. It will also be noted that none of the clip was sent to Brisbane.

## Classing of Clip.

In forty-one districts the clip is reported as having been fairly to well classed. In the other districts it is not considered to have been so, and the reasons given were—that owners consider it does not pay, that prices obtained are no better, want of convenience, clips not large enough to warrant expense, and the difficulty of obtaining competent wool-classers.

## Wool-presses.

A great number of different kinds of presses are used; those most in favour are Ferrier's Patent, Langley's, Lough Bros., Ritchie's, Wilding's, and Williams and Robinson's; rack screw and pinion presses are used. There is still room for improvement in the mode of pressing, especially by the owners of small clips.

## Woolpacks.

The woolpacks used are mostly Calcutta and Dundee, of various sizes, from 4 ft. 6 in. x 2 ft. 2 in. to 5 ft. 3 in., and the weight from 10 to 12 lb.

On forty-six holdings the wool is dumped before leaving.

## Sheep-brands and Marks.

During the year 1898 the number of Sheep Brands and Ear-marks recorded, transferred, and cancelled were as follows :—

Recorded.		Transferred.		Cancelled.		Total Registered.
Fire Brands ...	182	Fire Brands ...	57	Fire Brands ...	59	5,721
Tar do ...	1,019	Tar do ...	150	Tar do ...	176	22,118
Ear-marks ...	840	Ear-marks ...	134	Ear-marks ...	133	13,423
Total ...	2,041	Total ...	341	Total ...	368	41,262

## Ear-marking and Tattoo Branding.

In all districts the system of ear-marking sheep is now generally carried out. Tattoo-branding is mostly used by owners of stud-sheep, not as yet to any great extent in the case of ordinary flock sheep, but where tried it has been found to be a good preventive of sheep-stealing.

## Destruction of Wool by Tar and Paint Brands.

During the year a trial was made by two of the District Inspectors with some English marking ink supplied by Messrs. John Bridge & Co., Sydney, for the purpose of testing its qualities as a branding material, and was favourably reported both as regards permanency and slight damage to the wool.

## DISEASES IN SHEEP.

*Scab.*—The flocks in this Colony and in the Colonies of Queensland, Victoria, South Australia, New Zealand, and Tasmania, and Western Australia are now free from scab. No case of scab has been met with in the latter Colony since May, 1895, and it was officially declared to be clean in October last.

*Anthrax.*—This disease appears to be spreading, and owners are now availing themselves of the facilities offered for vaccinating their sheep, which has been the means of lessening the mortality. A statement (Appendix I) is attached showing the vaccinations made during the year.

With respect to the appointment of a bacteriologist the matter is still in abeyance, as through the kindness of the President of the Board of Health the services and advice of Dr. F. Tidswell, M.B., Ch.M., D.P.H., principal assistant medical officer, has been obtained by the Department with respect to tick-fever and other infectious and contagious diseases.

*Foot-rot.*—Six districts report foot-rot among the sheep, but only to a slight extent, the past season not being favourable to its spread. Remedies for foot-rot will be found as Appendix J.

*Fluke.*—Owing to the dry season this disease also has been less prevalent than in previous years. The losses from fluke reported from twelve districts amount to 27,353. To prevent its spread, owners are urged to free their land from surface water by running plough furrows where practicable and helping them with the spade. The preventives used by owners were salt, tar, and turps, sulphate of iron and Liverpool salt, and salt and sulphur.

*Parasitic Worms.*—Eleven districts report the sheep as having been infested with worms to the extent of about  $4\frac{2}{3}$  per cent.; in five districts the sheep were infested with stomach, lung, and tape worms; two districts with stomach and tape worms; and in four districts with stomach-worms only.

The following results have been gathered regarding the efficacy of the various drenches and licks used for sheep for worms:—

*Drenches.*

*Arsenic.*—For the stomach and tape worms the arsenic and soda drench is still reported as the most effective, and has been by far the most generally used. It has, however, been recommended that potash, as being less severe on the lining of the stomach, should be substituted for soda in its preparation. The arsenic and soda drench is reported by several of the Inspectors as having been also efficacious for lung-worms. No authenticated information has been received of this drench affecting the health of the sheep or injuring the wool.

*Turpentine.*—Turpentine, with various mediums, has been very generally given for stomach, tape, and lung worms, with good results, when repeated.

*Hayward's Specific* is reported as having given satisfactory results where used.

*Weaver's Drench* is reported to have been used in a few districts with fairly satisfactory results.

While it can be said that a decided improvement follows the administration of most of the drenches generally used, it is a fact that even in the case of the most effective the *post-mortem* examinations disclose that generally where the sheep are at all badly infested some worms are still alive; and this again, it is believed, arises from the owners delaying too long in drenching, and allowing the worms to have too great a hold on the sheep before they are drenched. The consequence is that some worms are left, which keep the sheep from thriving, and, with the introduction of fresh eggs from the water and pasture—if the weather is at all favourable for the development of the worms—in the course of a few months the sheep are as bad as they were before they were drenched. To make the cure effective, therefore, sheep which have been badly infested should, on receiving one drench, be kept as near the drenching yards as possible, and receive a second drench in the course of twelve or fourteen days after the first.

But, while licks and drenches should be provided and given at as early a date and as often as required, owners should give their earnest attention to the removal of what may be termed the contributing causes of the pest by avoiding overstocking, attending to the proper nourishment of the lambs and weaners, burning off old pasture, and getting rid by draining off surface and stagnant water, as suggested in Vol. II, part 2, of the *Agricultural Gazette*.

*Licks.*

It is reported that the following licks have been used with good results:—

Salt and sulphur.	Salt, sulphate of iron, and Hayward's Specific.
Salt and sulphate of iron.	Salt, tar, and turpentine.
Salt and turpentine.	Pottie's Preventive Lick.
Salt, sulphate of iron, and turpentine.	Salt and lime.
Salt, sulphur, and sulphate of iron.	Salt, sulphur, and lime.

It is scarcely necessary to point out that a lick, if it is efficacious in warding off an attack of worms, is far preferable to a drench; and as owners in all but the true saltbush country are now aware that it pays them well to give their sheep a liberal supply of salt, it would add very little to the trouble or expense to give once a month with the salt some of the other ingredients here mentioned which they found from experience was to any extent effective in protecting their sheep from the worm-pest.

*Sheath Disease in Wethers.*

A considerable number of fresh outbreaks of this disease have been reported during the year.

Full particulars as to the nature of the disease, its treatment, and prevention, as furnished by Mr. Veterinary-Surgeon W. Scott, will be found in my Annual Report for 1895, as Appendix H.

## PIGS.

On 31st December, 1898, the number of pigs in the Colony stood at 247,061, being an increase of 39,323 on the returns for the previous year.

Three thousand five hundred and ninety-eight pigs were introduced by sea and land from the other Australian Colonies and England.

Eleven thousand four hundred and ninety-six pigs were exported during the year.

Forty-two pigs were killed on board, as the owners would not quarantine them.

There was a decrease in the number of outbreaks of swine fever in Great Britain and Ireland during the year 1898 as compared with previous years. *See Appendix Q.*

I regret to have to report that an outbreak of this disease has occurred in New Zealand. The introduction of pigs from that colony has been prohibited.

## DOGS.

Thirty-two dogs which arrived from England and other places outside the Australian Colonies passed through quarantine during the year.

Twenty-two "ships' dogs" were quarantined during the stay of vessels in port, and seven "ships' dogs" were destroyed.

All "ships' dogs" and other stock on board foreign vessels for the use of the passengers and crew are now quarantined during the stay of the vessel to which they belong in port, whether in Sydney or at Newcastle.

One hundred and seventeen Colonial dogs were introduced at the Port of Sydney from the other Colonies, and 429 dogs were inspected prior to exportation.

*Diseases in Dogs.*

Rabies is reported as having decreased in the United Kingdom during the past year. *See Appendix Q.*

For report on Regulations *re* introduction of Foreign Dogs, *see Appendix R.*

TRAVELLING STOCK (*Reserves, Roads, Tanks, Wells, &c.*).*Trespass on Reserves.*

In thirty districts the travelling stock and camping reserves are reported as having been trespassed upon, generally only to a slight extent, and in thirty-five districts they are reported as being free from trespass.

From forty-seven districts it is reported that 7,577,230 sheep have travelled through during the year in search of grass and water. From nine districts the number of loafing sheep is given at 166,000.

Owing to the continued drought the number of sheep on the road were more than treble that during the previous year, and the reserves, especially where leased, were found quite inadequate for this extra traffic.

The Stock Boards Council of Advice have taken up this matter with a view to the reserves and the stock traffic being placed on a more satisfactory footing, and have, at the request of the Minister, submitted for his consideration the principles on which they consider a measure for dealing with travelling stock reserves and travelling stock should be framed. *See also Appendix S* on this subject.

*Marking of Travelling Stock and Camping Reserves.*

Fair progress has been made with regard to the marking of travelling-stock and camping reserves, there being at present about 1,430 miles surveyed and about 50 miles in course of survey. The routes marked are:—

1. From Boggabilla, *via* Yetman, Warialda, and Cobbadah, to Breeza.
2. From Moree, *via* Millie, Narrabri, Boggabri, Breeza, and the Liverpool Range, to the Bulga Mountains.
3. From Walgett, *via* Coonamble and Mendooran, to Uarbry.
4. From Coolah, *via* Uarbry, to Rylstone.
5. That portion passing through Terry-hie-hie Holding.
6. From Boggabri, *via* Turrabeile or Cox's Creek, to Coolah.
7. Mungundi to Moree.
8. Along the Mara Creek from the Barwon River upwards.
9. Along the Bogan to travelling stock reserve on the Murda Creek.
10. From Breelong to Dubbo.

In course of marking:—

That from Jennings to Tamworth.

With a view of making these surveys of practical benefit to drovers, stock-owners, and others, lithographs are being prepared showing sections of the roads in lengths of between 20 and 30 miles.

Lithographs of the roads, Boggabilla to Cobbadah, in six (6) sections; Moree to Cobbadah, *via* Gurley Holding, in one (1) section; Walgett to Uarbry, in five (5) sections; and Liverpool Range to Putty, in five (5) sections, are now on sale at the Head Office, and also at the local Stock Offices, at 1s. per section.

*New Stock Roads required.*

In twelve districts new roads are required for travelling stock, and to obtain these action has been already taken in ten districts.

*New Stock Reserves required.*

In twenty districts new reserves and alterations of existing ones for travelling stock are required. In forty-five districts there are sufficient reserves ; but in a great many cases the reserves are under annual lease, and are kept very bare of feed.

*New Wells, Tanks, or Dams.*

In twenty-five districts the inspectors report that new wells, tanks, or dams should be constructed by the Government at places which they indicate.

## REGISTRATION OF HORSE AND CATTLE BRANDS.

*Brands registered.*

The number of horse and cattle brands registered up to 31st December, 1898, was 79,790. The number of brands registered during the year 1898 was—Horse brands (alone), 134; cattle brands (alone), 395; and horse and cattle brands, 1,058; making a total of 1,587.

This shows an increase of 68 in the total number of brands registered during the year as compared with 1897. There is also an increase in the number of brands transferred and cancelled.

*Brands transferred.*

The brands registered during the year 1898 as transferred were—Horse brands, 13; cattle brands, 21; horse and cattle brands, 113; total, 147—being an increase of 12 on previous year.

*Brands cancelled.*

The brands cancelled (horse and cattle) in 1898 were 198.

*Addresses changed.*

The number of addresses of owners changed in 1898 was 65.

*Compliance with the Act.*

In all the districts the provisions relating to registration and the other requirements of the Act are reported as being fairly carried out.

*Benefits of the Act.*

The inspectors, in alluding to the benefits of the Act, report that it prevents duffing, stock-stealing, facilitates identification, assists in recovering lost stock, and otherwise is a great convenience and protection to stock-owners.

Two new systems of branding have been brought under notice, and are reported on in Appendix K.

## POUNDS.

*Number and Inspection.*

At the end of the year there were 326 pounds in operation in the Colony. The whole of the pounds are inspected periodically by the Stock Inspectors.

*State of Yards.*

Forty-seven of the pound-yards are reported to be old; some require renewing, being unfit for the safe custody of stock; while others need repairs. The remainder are said to be in a fair and good condition.

*Keeping and Depasturing Pound Stock.*

The provision for the proper sustenance of impounded stock, which has to be made by the Pound-keeper at his own expense, according to the reports received, is satisfactory. As a rule, poundkeepers in the country districts have now paddocks for the stock.

*Management of Pounds.*

The poundkeepers are reported to be performing their duties, upon the whole, in a satisfactory manner, and the appointment of inspectors of stock as inspectors of pounds has had a very beneficial effect.

## NOXIOUS ANIMALS.

*The Districts in which the Pastures and Stock Protection Act is in force.*

The Act has been brought into operation in all the districts, and during the year work has been done to the extent shown in Appendices L and M.

*Receipts and Expenditure under the Act.*

The amount of assessment paid by stock-owners in 1898 was £32,720 17s. 4d.; and the amount expended £28,910 13s. 10d. Two districts are reported to be in debt to the amount of £109 4s. 1d.

In three districts full rates were levied, in fifty-eight districts less than full rates, while in four districts no rates whatever were levied.

During

During the year the bonuses paid by the Boards for scalps ranged as follows:—For kangaroos, from 2d.; kangaroo rats,  $\frac{1}{2}$ d. to 3d.; wombats, 6d. and 2s. 6d.; wallaby, from 1d. to 4d.; wallaroo, from 1d. to 2d.; paddymelon, from  $\frac{1}{2}$ d. to 3d.; bandicoot, 1d. to 2d.; hares, from 1d. to 6d.; native dogs, from 5s. to 30s.; pups, 2s. 6d. to 10s.; wild pigs, 3d. to 6d.; eagle-hawks, 6d. to 2s. 6d.; crows, 1d. to 6d.; and foxes, 2s. 6d. and 20s.

*Increase and Decrease.*

Kangaroos are reported to be increasing in seven districts, wallabies in twelve districts, native dogs in ten districts, hares in eleven districts, and wild pigs in five districts. In twenty-five districts kangaroos are reported to be decreasing, wallabies in fifteen districts, native dogs in fifteen districts, hares in thirteen districts, and wild pigs in six districts.

*Number destroyed.*

The number of kangaroos destroyed during the past year was 13,827; of kangaroo rats, 86,758; of wallabies, 570,165; of wombats, 170; of bandicoots, 366; of paddymelons, 37,797; of wild pigs, 15,439; of hares, 442,319; of foxes, 358; of native dogs, 12,000; of opossums, 75,230; of eagle-hawks, 4,688; of crows, 66,335; of emus, 288.

*Steps taken for their destruction.*

In the majority of the districts, hunting with dogs, drives, shooting, trapping, and poison have been adopted with satisfactory results. In forty districts poison has been used, mostly for dogs, with fair to best results, and from ten districts it is reported that the results have not been satisfactory, the dogs being too cunning to take baits.

LOSSES FROM NATIVE AND TAME DOGS.

The losses through native dogs for the year are estimated at 185,635 sheep, valued at £42,446; and from tame dogs 74,344 sheep, valued at £19,238; making a total loss of £61,684. A stricter enforcement of the law with respect to stray dogs, and the registration of dogs, is urgently required.

COMMONS.

There are now 351 Commons in the Colony, the average acreage of which is about 4,000 each.

*Number of Commoners, Stock, &c.*

The average number of Commoners to each Common is estimated at seventy-six, and the average number of stock kept on each Common at 100.

Many of the Commons are unfenced, consequently are trespassed upon by travelling and other stock.

FRESH LEGISLATION.

*Amendments suggested by the Boards.*

The agitation for the passing of the Consolidated Stock and Pastures Bill still continues, and among other amendments in the law asked for it is suggested that bonus be paid for rabbit scalps; that the Government should contribute a higher rate of subsidy to the funds of the Boards; that rabbits be declared noxious animals; that the Boards should have the administration of the Rabbit Act; and that a measure should be passed dealing with noxious weeds and plants. Owners should be compelled to lay poison for noxious animals; triennial elections of directors; compulsory bonus for all noxious animals.

*Consolidated Diseases in Stock Bill.*

This measure has also been framed, and would have been in readiness for introduction when Parliament met; but now that a Royal Commission has been appointed to inquire into the diseases affecting stock and the legislation for dealing with them, it will have to be deferred until the Commission has concluded its labours.

Among other things, the Bill as framed provides for the establishment of a Central Board or Council of Advice, and a contribution from the owners of large stock towards the expense of the Stock Branch.

*The Registration of Brands Bill.*

Copies of the draft of this Bill, which was prepared in accordance with the resolution of the Intercolonial Stock Conference held in Melbourne in 1898, has been forwarded to the other Colonies for their consideration and report. The draft has also been submitted to the Stock Boards and Council of Advice for any suggestions they had to make. These have been received, and, so far as deemed advisable, have been incorporated in the Bill, together with additional provisions dealing with mustering, stock stealing prevention, and the regulating of travelling stock which were revised by the Council of Advice; and the Bill will be ready for introduction when the opportunity occurs of submitting it to Parliament.

MISCELLANEOUS.

*Cultivated Grasses.*

In thirty-one districts cultivated grasses have been sown for pasture during the year, the most successful being lucerne, prairie, rye grass, and clover.

*Number and Division of Runs.*

The number of open or unenclosed runs in the Colony is 6,188; the number enclosed is 39,871; the number partially subdivided is 14,785; and the number properly subdivided is 22,697.

*Improvements,*

*Improvements, Fencing, Dams, Tanks, and Wells.*

The number of miles of fencing throughout the Colony is estimated as follows:—736,178 miles without wire netting, at an average cost of (say) £34 6s. 6d. per mile, amounting to £25,265,230, and 48,765 miles with wire netting, average cost at (say) £67 2s. 6d. per mile, amounting to (say) £3,273,708.

The number of dams used for stock purposes is estimated at 50,913, at an average cost of (say) £41 4s. 9d.; number of tanks, 56,342, at an average cost of £139 17s. 3d. each; and the number of wells used is estimated at 9,141, at an average cost of £125 14s. each.

Cost of fencing, £30,727,920; cost of dams, £2,099,717; cost of tanks, £7,885,870; cost of wells, £1,149,219; making a total of £41,862,726, as representing the amount expended by way of improvements, &c.

*Plants and Weeds.*

## Prevalence.

In fourteen districts *trefoil burr* grows to a very large extent; in eleven districts, to a considerable extent; in sixteen districts, to a slight extent; and in twenty-one districts there is none reported.

In twenty-six districts *variegated thistle* is reported to a slight extent; in twelve, to a considerable extent; in five, to a very large extent; and eighteen districts are reported as free from it.

In twenty-two districts *black thistle* is reported to a slight extent; in sixteen, to a considerable extent; in six districts, to a very large extent; and eighteen districts are reported to be free from it.

In eight districts the land is reported as being infested to a very large extent with *Bathurst burr*; in thirteen districts, to a considerable extent; in twenty-nine districts, to a slight extent; and in fourteen districts the land is not infested.

In nineteen districts other noxious weeds grow to a slight extent; in fourteen districts, to a considerable extent; in sixteen districts, to a very large extent; and in ten districts there is none reported.

## Legislation for Noxious Weeds.

Legislation is urgently required for dealing with noxious weeds and plants, more especially the Bathurst burr, the prevalence of which is inflicting very serious loss on travelling stock. A Bill has been prepared by the Minister for Lands to deal with the matter.

## Cost of clearing Commons, Reserves, &amp;c., of Weeds.

The cost of clearing the Commons of noxious weeds throughout the Colony is estimated by inspectors at £24,193; the police paddocks, £1,081; the travelling stock reserves and droving roads at £183,778; amounting in all to (say) £209,052.

## PREVENTION OF SCAB IN SHEEP ACCOUNT.

A detailed statement of receipts and expenditure by the Department in connection with the above Fund for year 1898 will be found in Appendix N hereto, and will be published annually in the same form.

For statement of the salaries paid to the different inspectors from the above account, see Appendix O. See also Appendix P, which gives salaries of secretaries under Pastures Boards.

## DISEASES IN STOCK IN THE UNITED KINGDOM.

It will be seen by tabulated statement under Appendix Q that there was a very considerable decrease during the year in infectious and contagious diseases in Great Britain and Ireland.

## FROZEN MEAT TRADE.

Messrs. W. Wedell & Co., in their report for 1898 (from which the figures I have here collected are taken), state it was anticipated that, with the settlement of the labour troubles and the general improvement in trade in the United Kingdom, better prices would be obtained for frozen mutton in 1898 than in 1897.

This actually took place, although the importations exceeded those of 1897 by 189,000 carcasses.

The total importations aggregated 6,422,153, being an increase for the year of 189,000, and representing a daily consumption of some 18,000 carcasses. Of this 1,263,422 (being a decrease of 144,000) came from Australia, 2,818,289 (being an increase of 115,000) from New Zealand, and 2,340,442 (being an increase of 245,000) from River Plate.

Of the Australian mutton, 1,253,422 carcasses were landed in London and only 10,000 at Manchester. The whole 2,818,289 from New Zealand were landed in London, while of the River Plate only 275,152 carcasses were sent to London, 1,842,465 went to Liverpool, and the balance, 222,825, were sent to Cardiff and other ports.

*Australian Mutton.*

The decrease in the Australian shipments is accounted for by the continuous general drought with which the colonies have for nearly four years been afflicted.

This has not only reduced the output of Australian mutton, but it has also affected the quality, and, combined with the Argentine competition and the want of co-operation among our shippers, has led to Australian mutton realising prices which, although a shade higher, on the whole, than 1897, have, after paying expenses, left comparatively little to the producer.

For a good many years our mutton realised decidedly higher prices than the River Plate. Gradually the price of that mutton improved, and for some time the prices of Australian and Plate mutton were about the same. Now, however, the prices River Plate mutton brings are generally higher than Australian, and this has occurred through the extensive introduction of English sheep, principally Lincoln, into the Argentine.

With more favourable seasons, greater attention to breeding and fattening, shipping only prime sheep, and more co-operation among our exporters in the transit and sale of our mutton in London, there is no reason why we should not regain the position we previously held as regards our great competitors in the Argentine, or at least come again on equal terms with that country on the London market.

#### BREEDING OF CROSS-BREDS.

It is said that, owing to the rise in the price of merino wool, it is the intention of a good many sheep-breeders, who were thinking of trying cross-breeding, to give up the idea, and that even some of those who had commenced using the English rams were about to revert entirely to the merino.

Before they finally decide which course they will adopt, it is suggested that the owners whose holdings are well adapted for cross-breeding, and especially those who have gone into wheat-growing, should give such opinions as the following due consideration:—

1. That it was mainly the superabundance of merino wool, combined, to some extent, with the fashions, that brought the price of that description of wool so low from 1892-3 to 1896-7; and that, if a general rush were made for growing merino wool in the Argentine as well as in Australia, lower prices would be likely to follow.
2. That there is already a movement, though, perhaps, not a very general one, in the Argentine to revert to the merino, and, with the large number of sheep in that country, it would not take long before the effect is felt in the London market if the change were to become general, as it is likely it would if the rise in the price of merino wool is maintained.
3. That, with proper management on those properties where wheat-growing is extensively carried on, and where sheep must be kept to maintain the fertility of the soil, the owner will obtain a better return from cross-breds than merino, especially if care is taken to put merino ewes with a good quality of wool to the English rams—even if merino wool should continue to bring the excellent price it now does—seeing that the cross-bred mutton brings a higher price than merino, and the cross-bred wether is ready for market a year earlier than the merino.

As connected with this subject, I here give the result of Mr. W. E. Abbott's valuable experience in the breeding and fattening of cross-bred sheep, as he has undoubtedly removed what has hitherto proved a great stumbling-block to many of our sheep-owners and farmers in taking to cross-breeding. I allude to the difficulty of finding substitutes for the turnips, rye-grass, and clover which have done so much for the New Zealand farmer, but which can only be grown in a comparatively few portions of this Colony with success. In place of these, he has been feeding and fattening with pumpkins, prairie grass, lucerne, and rape, which can, to a fairly successful extent, be grown in all parts of the Colony, except where the New Zealand crops can be so. No better crop than lucerne can be grown, and extensive areas are now being laid down in Riverina and other parts of the Colony after two or three crops of wheat, before the soil is at all exhausted. There is no doubt a good deal of land in the Colony where the subsoil is unfavourable for lucerne; but there the other green crops grown by Mr. Abbott, and a good many others which have not as yet been tried, would, according to the climate and soil, give fair to good returns, and put the owners of land in a position to turn off prime fat sheep and lambs which would manure the land and maintain its fertility. Such a system would enable owners to produce really fine milk lambs at 5 or 6 months fit for export—a trade which pays well, and is most unlikely to be ever overdone.

Besides this, Mr. Abbott, although he makes no claim for doing so, has solved a still more important matter—that is, the question of a profitable rotation on fair to middling good land, which, if adopted, would put a stop to the ruinous practice, which may be said to have hitherto prevailed, of growing wheat year after year on the same land without manure till it is run out and ruined. By growing such crops in rotation as Mr. Abbott mentions, and feeding them off with sheep, which do very much more than pay their way, the heart and fertility are not only preserved in the soil, but, with the occasional application of a little artificial manure of the right description, which more than repays the cost in additional yield, are actually increased.

The following is an extract from the statement made by Mr. Abbott on this subject, as it appeared in the public Press to which the foregoing remarks apply:—

#### *“Fattening Sheep for Freezing.”*

“After four years of experimenting at Wingen, he found the raising of green crops to feed sheep was the most profitable form of farming. These included pumpkins, prairie grass, lucerne, and rape. The great advantage was that one man and his dog could harvest 10,000 acres, and there was no heavy cost of carriage to pay, as the sheep carried themselves to the nearest railway station, or to the freezing works at Aberdeen. The result of the system in New Zealand was that practically all the fat sheep raised were produced by the farmers. In a small place in the Canterbury District, he one day saw 16,000 store sheep sold in lots of 500 to the small farmers. The result of this important method of farming in New Zealand was that, although the whole colony only carried 18,000,000 sheep, she exported three times as much frozen mutton as New South Wales with 40,000,000. That was the whole secret of New Zealand being at present more prosperous than any of the other Australian colonies, for the man who exported was not the only person who profited by the undertaking, as the value of the exports came back in either money or goods, and all members of the commercial community benefited. Mr. Abbott's best record so far is eighteen sheep to the acre of rape, and these were sold as freezers at Aberdeen.”

The following is a Statement of the Boiling-down, Chilling, Freezing, and Preserving Works in the Colony and of their Capacity, and the Work done during 1898.

## THE STOCK BOARDS COUNCIL OF ADVICE.

During the present year the Council has been placed on a more permanent footing by the formation of "The Stock Boards Convention of New South Wales," having for its objects, general and united action on the part of the Pastures and Stock Protection Boards to assist the Minister in dealing with diseases in stock, and in the administration of the laws relating to the pastures and stock of the Colony, and to promote, in every legitimate way, the live-stock industry.

The Council had during the year under consideration many very important matters, and, although not much progress has been made in obtaining the amendment of the Acts which they have been urging on the Government, the opinions of the Boards on these questions have been ascertained and a great deal of valuable materials have been collected which will be turned to account in preparing the measures which are being framed to carry out these amendments, and will be ready to be submitted to Parliament when the opportunity occurs. There is no doubt that the experience and advice of its members will be of great assistance to the Department and the Minister.

*Subjects dealt with by the Council.*

The Condemned Stock Fund.

Appointment of a Royal Commission on the Diseased Meat Question.

Anthrax.

Starving stock rates.

Strict enforcement of the Dog Act.

Removal of emus from list of protected birds.

Increased subsidy for destruction of noxious animals.

Travelling stock routes.

Assessment on large stock.

Pastures Boards' correspondence free.

Rabbits be declared noxious animals under the Pastures and Stock Act.

Amended regulations under the Pastures and Stock Protection Act.

Additions to the Brands Bill.

APPENDIX A.  
RETURN of Stock in the several Sheep Districts.

## APPENDIX B.

## INFLUENZA IN HORSES.

(By E. Stanley, F.R.C.V.S., Chief Veterinary Inspector.)

## Character.

It is a contagious equine fever, due to germinal matter invading the system, producing disastrous changes in the blood, which interfere with nutrition, excite congestion, and occasionally inflammation of important organs or tissues.

The germs of this disease are always lurking about, and epidemics are due to exceptional climatic changes that have a lowering effect on the health of horses, and at the same time favour the vitality of the disease germs.

The worst cases are amongst hard-working horses in overcrowded sheds, with bad sanitary surroundings; next come fat horses; and the least susceptible are horses that are in good working condition, cleanly kept, and well cared for. If such have the disease at all, it is in a mild form, and they speedily recover.

Symptoms.

*Symptoms.*

In the onset, loss of appetite, drowsy headache, pain in the limbs, general weakness; in many cases the eyelids are swollen, tears trickle down the face; there may be discharge from the nostrils, and occasionally coughing; the eye will be found scarlet and orange colour, the tongue furred, breath offensive, the heart beats feebly but quick, the pulse is small and weak, the dung is soft, and the urine high-coloured; there is a general rise of the bodily temperature.

As the disease progresses the symptoms will depend on its course, which is very variable, as the numerous names given to the disease indicate. The vital forces in many cases overcome the toxic effects and excrete the poison from the system. It is to assist this process that we have recourse to treatment.

*The Treatment.*

This should consist of rest, pure air, shelter from sun, rain, or wind, bran mashes, and cut green food with drachm doses of chlorate of potash, carbonate of ammonia, or nitrate of potash given in the drinking water. If the case has been taken early enough, and the surroundings are good, the fever will abate, and recovery be complete in a very few days.

Unfortunately many horses are worked at the commencement of the illness; then they are completely knocked up, and they present a variety of bad symptoms, owing to the mischief being located in individual organs, such as those of respiration, or the bowels, liver, spleen, lymphatic glands, or cerebro-spinal system. The location can only be diagnosed by the educated veterinarian, and every case should be treated to suit the nature and stage of the illness. Dropsical swellings are a favourable indication, but time and patience must be allowed for recovery. No case is cured until the horse is playful at exercise.

## APPENDIX C.

## EPIZOOTIC OPHTHALMIA.

*Nature and Treatment.*

This affection is usually seen in several cattle or sheep about the same time in various paddocks in the same district. However, as the majority recover, little notice is taken of the disease in the early stages; but that is just the time when proper treatment (if it were possible to apply it) would be of the greatest benefit.

It is in the acute stage, when the inflammation is severe, the animal being almost blind, that treatment is attempted. Now, at this particular stage, much harm is done by injudicious treatment. Even yarding animals, unless done very carefully, will do more harm than good.

The eye is a very delicate, sensitive organ to deal with; therefore, Nature is frequently the best restorer. She can be assisted by attending the animals' comfort, having food and water accessible to the nearly blind animals, keeping them perfectly undisturbed and in shady places.

It may happen that the animal becomes nearly blind in one eye, the other recovering. In such cases the disease becomes chronic, the cornea covering the eye remains a milky-white colour. Proper treatment in this form is sometimes beneficial in clearing the eye.

For animals that can be handled, the following applications are recommended for the eyes:—

For the first stage of the disease, 1 oz. of tincture of opium, 1 pint of water; or 1 oz. of liquor plumbi subacetate, 1 oz. tincture of opium, 2 pints of water. These may be applied two or three times daily.

For the second stage after the acute inflammation has subsided, 1 part of boracic acid, 60 parts of water; or 40 grains of nitrate of silver, 1 pint of water. These may be applied two or three times a week.

In the chronic stages, finely powdered burnt alum may be blown on the eye once a week.

## APPENDIX D.

## THE PREVALENCE OF TICKS IN QUEENSLAND, AND THE PROCLAMATIONS ISSUED AND MEASURES TAKEN BY NEW SOUTH WALES TO PREVENT THE INTRODUCTION OF TICKS OR TICK-FEVER.

*The extent of the Prevalence of Ticks in Queensland.*

SPEAKING in a wide and only approximately correct way, the following may be described as the infected, suspected, and doubtful portion of Queensland:—

All that country in Queensland bounded on the south by the Colony boundary from Tweed Heads to Maryland; thence to the rabbit fence near Dalveen; thence by that rabbit fence north-westerly to Chinchilla; and thence northerly to the north-east corner of Walloon Run, may be considered infected, suspected, or doubtful, as also all that part of Queensland lying north-east and north of a line starting from the last mentioned point, and running north-westerly to Emerald, on the Central Railway line; thence by that line to Longreach, and thence by a line north-westerly to the South Australian border at the north-west corner of Herbertvale Holding.

The nearest point to this Colony where ticks are known to exist is to the south of Ipswich, about 50 miles from the Border. Ticks have also obtained a footing in the neighbourhood of Brisbane, and they have so likewise at many points on the coast country between Brisbane and Rockhampton.

*Proclamations and Regulations issued prohibiting and regulating the Introduction of Stock from Queensland.*

The Colony of Queensland is, under our proclamations for preventing the introduction of ticks or tick-fever, divided into three portions (*see* map herewith standing as Appendix T), with the third portion subdivided again into three portions, named respectively:—The country in Schedule A; the country in Schedule A 1; the country in Schedule A 2; the country in Schedule A 3, and the country in Schedule A 4.

*Regulations re Stock in Country in Schedule A by Land.—Stock prohibited.*

Loose horses and camels, broken or unbroken; and all cattle, pigs, sheep, and goats.

*Stock*

*Stock Admitted, and Conditions.*

*Horses* in actual work, on production at our Border of declaration and certificate by inspector for district from which they come, and after inspection and smearing or dipping.

*Camels* in work on same terms.

*Stock in Country described in Schedule A 1 by Land.—Stock prohibited.*

Loose horses, and all cattle, sheep, pigs, and goats.

*Stock Admitted, and Conditions.*

Only *horses* in actual work are admitted, and they must be accompanied by a declaration by their owner and a certificate from the Inspector for the district from which they start that they are free from disease, and before crossing they must be inspected by an Inspector for this Colony, and dipped or smeared to his satisfaction with an approved disinfectant.

*Stock in the portion of Queensland described in Schedule A 2 by land.—Stock prohibited.*

Cattle, pigs, horses, and camels (except horses and camels in actual work) which have not been in the portion of Queensland described in Schedule A 2 for more than three months.

*Stock Admitted, and Conditions.*

Cattle, horses, camels, sheep, pigs, and goats are admitted if they have been three months in Area A 2, and if they are accompanied by a declaration by the owner and a certificate by the Inspector for the district from which they came that they are free from infection, after they have been inspected at our Border one by one on both sides in a crush and found free from infection, and if they come from the north-eastern and north-western half of this Area A 3 and A 4, they must have been subjected to another crush inspection before travelling into the southern half.

*Regulations re Stock from Queensland by Sea from country described in Schedule A and A 2.—Stock prohibited.*

All horses (except horses in actual work), and all cattle, camels, sheep, pigs, and goats.

*Stock Admissible by Sea.*

Horses in actual work under the following conditions:—

- (1.) That they are landed at Sydney.
- (2.) That the owner gives the Inspector notice of their arrival.
- (3.) That a declaration by the owner and a certificate from the Inspector for the district from which the horses come that they are free from infection, and have been dipped or smeared, is produced to the Inspector.
- (4.) That they are, on inspection, found free from disease, and smeared to the satisfaction of the Inspector.

*The Staff engaged in carrying out these Regulations.*

There are Acting Inspectors stationed at the following crossing-places, with Assistants:—

- 1 Tullabudgera (Tweed Heads), with three Assistants.
- 1 Grady's Creek and Mount Lindsay, with four Assistants.
- 1 Killarney, with seven Assistants.
- 1 Wallangarra, with two Assistants.
- 1 Boggabilla and Texas, with two Assistants.
- 1 Mungindi, with two Assistants.
- 1 Brenda.
- 1 Barringun.
- 1 Hungerford and Parragundy, with one Assistant.
- 1 Wompah; and
- 2 Inspectors on Buffer Line, South of Brisbane; that is to say, twelve Inspectors and twenty-one Assistants.

*The Assistants' time is principally occupied in patrolling the Border.*

To carry out these Regulations, and prevent the introduction of infected or suspected stock, about 120 miles of the most dangerous portion of the Border, including as it does the coast country from near Wallangarra to the Pacific Ocean at Tweed Heads, wherever it is not naturally impassable for stock, has been fenced with a five (5) barb-wire fence; and it will be seen, on reference to the Regulations applicable to the country included in Schedule A 1, that no stock of any description, except horses in actual work, are admitted from that portion of Queensland, and those only after inspection and smearing. The gates at which horses are admitted are kept locked, and only opened when horses which have been inspected and smeared in accordance with the Regulations are crossed. The gatekeepers reside at the gates in cottages built by the Department.

On this portion of the border there are four (4) Acting Inspectors, who have under them fourteen Assistant Inspectors and Gatekeepers, who patrol short portions of the Border, and two Travelling Inspectors, who examine the stock at some distance from the Border.

*Buffer Area.*

To the north of this portion of the Border, for a distance of about 40 miles in Queensland, is a buffer area, into which no cattle or loose horses are allowed to enter from the infectious or suspected portion of that Colony. To assist in maintaining the northern boundary of this buffer area, Victoria and this Colony each maintain two Inspectors, to whom portions of this line have been allotted.

*Outlay*
