1351. But if you select land within a mile of a railway, do you not get it at the upset price? Yes; the railway debt is increasing, and it would be very hard for any one to indicate where a line which would pay from the beginning could be constructed anywhere in New South Wales. I must confess I do not know of one.
1352. *Chairman.*] Do you say that you think it is not fair to charge the users of a paying line with the losses of a non-paying line? No. I say that whether the railways are paying or non-paying, those who use them have to pay such freights and fares as will enable the Commissioners to meet the interest on the capital cost, as well as the working expenses—that is to say, they have to carry the whole burden of the lines, whether they pay or not, and whether they have been built for the development of the country or not.
1353. Do you think that part of the cost should be borne by the general taxpayer? Yes; I think that should have been done long ago, and it would not have been felt.
1354. Is it your opinion that the general taxpayer, or the people residing in the large cities, could not reside there unless other people went on the land? I would not like to indicate what the incidence should be; but I certainly think that asking the users of the railways to meet the very large amount of interest which has to be paid annually, in addition to paying for the actual working expenses, is imposing upon them a very heavy burden. It must inevitably cripple the development of the interior, so long as those freights and fares have to be maintained.

1355. *Dr. Garran.*] The estimated loss on this line is £3,249;—do you think that is a fairly reasonable loss to face? I think so. Under the circumstances it is not unreasonable, because, as I have already indicated, the estimate is not so liberal. Very little allowance has been made for agricultural development; and, as a matter of fact, the figures are based upon the actual business of to-day. J. Harper.  
Aug., 1899.
1356. Is that loss of £3,249 exclusive of the £3,000 loss which you anticipate on the Temora line? Yes; the estimated revenue is net.
1357. Then the total loss would be £6,240? Yes.
1358. The loss of that £3,000 is somewhat disguised by not being mentioned in the same connection? I do not think it is intentional.
1359. I do not say that it is intentional? There is no railway constructed which will not more or less affect some other railway.
1360. You have spoken of an almost certain extension of this line to Hillston;—as an expert, do you think it would be wise to go in for that extension straight away? I should not think so at present.
1361. Would you be content to go to Wyalong? Yes; at Wyalong there exists to-day a large and apparently settled population and industry. From whatever point the line is constructed, I think that Wyalong is entitled to consideration.
1362. If we stop at Wyalong, there will be settlement for 10 or 15 miles west of Wyalong; and afterwards, if we want to make an extension, we will have to buy the land back from these people? The Committee could attach such conditions to any such extension as might appear to them to be reasonable.
1363. After a survey has been made, would it not be possible to reserve the land in that direction so as to prevent private ownership? Yes; for many years a number of surveyed trunk lines had a mile or half a mile reserved on either side; but before the lines were built I think a great deal of that land was alienated.
1364. Were there not great complaints that those reserves checked free selection? Yes.
1365. Did it not often happen that people looking forward to a probable extension of a railway line selected land along the route? I have heard of it; but I cannot say anything about it of my own knowledge.
1366. In that case would they not get the increment of value? Yes.
1367. Do you think that the railway revenue should get the benefit of that? I am not going to say that. I think, as units, they should contribute towards it.
1368. Do you think the Treasury should obtain the benefit of the increment of value given by railway extension? That is not only my own view, but I think the Commissioners have, on numerous occasions, emphasised that opinion.
1369. Personally, you coincide with them? Yes.
1370. The question is how that could be brought about? Yes; I speak feelingly, because I have watched the growth of our capital debt, on which interest has to be paid year by year. I know we are adding each day to the non-paying lines, and I know that for the development of the country it is absolutely essential that those lines should be constructed.
1371. So far as our present experience has gone, in making extensions into the less settled districts, have you any encouraging illustrations to give us of lines which have become paying lines? Yes; there is the Moree line, which paid within less than three years of its construction. The Cobar line is just about paying now.
1372. In the case of the Cobar line, was that mainly due to mineral development? Yes. The Parkes-Forbes line is getting on pretty well now; it is getting very close to the paying point.
1373. What about the railway in the Richmond River district? I am pleased to say that is improving.
1374. Is the Temora line improving, or is it stationary? Last year it was better than the year before. The loss in 1897 was £3,519; in 1898 it was £2,866.
1375. Is there any one of these lines absolutely stationary? Yes, unfortunately. We cannot get the main Northern line between Tamworth and the Queensland border to move up.
1376. Are the other sections paying? Yes.
1377. *Mr. Watson.*] Does the section between Sydney and Newcastle pay? That is not taken out separately. From Tamworth to Armidale the loss is £28,433; from Armidale to Jennings the loss is £56,366. These are the losses we do not like to face. The unfortunate part of the business is that they are so expensive to work. Then from Wallerawang to Mudgee the loss is £26,000. These are all annual losses.
1378. What about the line from Kiama to Shoalhaven? The Sydney to Kiama line is improving; but there is very great room for improvement—the loss is £37,000. The loss from Kiama to Nowra is £12,000.
1379. *Mr. Watson.*] What is the loss on the line Murwillumbah to Lismore? £23,398.
1380. *Dr. Garran.*] Looking at the prospects of this Grenfell to Wyalong line, do you think that a loss of between £3,000 and £4,000 is not an unreasonable one to face? Yes.
1381. May we hope that within five years it will make good that loss? Yes; I should expect it to do so.
1382. Looking at the additional settlement which we may expect when the leases fall in, is it reasonable to suppose that there will be a large increase in agriculture and production? Yes.
1383. Even if it would not pay a purely railway company, might it pay a railway company which was also the great landowner in the district? Yes.
1384. *Mr. Shepherd.*] Is the land for 30 to 35 miles on the Grenfell line towards Wyalong good agricultural land? Yes.
1385. Does it improve again near Wyalong? No; we then strike pastoral black-soil country. After passing through over 20 miles of that country, you again strike red-soil country in the neighbourhood of Wyalong. It is not as good in quality, nor is the rainfall as good as in the neighbourhood of Grenfell.
1386. What is the nature of the cultivation there? Wheat almost exclusively.
1387. We have it in evidence that there was a certain quantity of stone taken from Temora to Wyalong? Yes; I have included that in the estimate.
1388. Is that traffic on the increase? I have not got comparative figures, but it has only recently started, and it may be said to be on the increase each year.
1389. Would the construction of a railway give an impetus to that traffic? Yes, decidedly. They pay more for cartage from Wyalong to Temora by about 2s. or 3s. a ton than it would cost them to send it from Wyalong to Dapto.

- J. Harper. 1390. I suppose the only advantage in sending the traffic from Wyalong to Temora is that it is so much shorter? Yes.
- 9 Aug., 1899. 1391. In the event of the line being made from Grenfell to Wyalong, would it absorb the whole of the traffic? Yes.
1392. In giving evidence as far back as 1894, I see that you said there were about 40,000 bags of wheat produced at Temora? Yes.
1393. Would that be in all directions around Temora? Yes.
1394. Has that increased much in five years? Not materially. We have had a succession of bad seasons since then.
1395. Have you any return showing the amount of wheat produced at Grenfell? I think that would be found in the evidence given on the line from Koorawatha to Grenfell.
1396. Is Grenfell too far from the railway at present to be able to produce very much, and if a railway were constructed would it give an enormous impetus to production? Yes. The rainfall there is good; there is an average of about 28 inches.
1397. What is the character of the black-soil country there? It is magnificent fattening country, and would give us a considerable volume of traffic in live stock and wool.
1398. What is the nature of the timber there? There is no useful timber for railway purposes.
1399. Do you favour the line from Grenfell to Wyalong in preference to a line from Temora to Wyalong for all purposes? Yes.

THURSDAY, 10 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

George Charles Yeo, draftsman, Stock Branch, Department of Mines, sworn, and examined:—

- G. C. Yeo. 1400. *Chairman.*] Do you produce a map of the Grenfell-Wyalong district? Yes. The red portion is the area that will be included in the proposed line, Grenfell to Wyalong. There is also a blue edging showing the alternative proposal, Temora to Wyalong. The following are returns connected with the proposed railway, Grenfell to Wyalong:—
- 10 Aug., 1899.

Stock Returns in area tinted pink on map "A." Area, about 4,800 square miles.

Year.	Horses.	Cattle.	Sheep.
1896.....	1,435	4,376	616,087
1897.....	1,224	3,762	499,034
1898.....	1,140	2,216	373,777

Clip for 1896, 1,200 tons; 1897, 860 tons; 1898, 650 tons.

1401. Do these refer to sheep running in the district which would be served by the proposed railway? Yes. I have also the following returns concerning the proposed railway, Temora to Wyalong:—

Stock Returns in the area edged blue on map "A." Area, about 3,000 square miles.

Year.	Horses.	Cattle.	Sheep.
1896.....	1,027	3,389	472,259
1897.....	831	2,948	368,192
1898.....	779	1,493	272,775

Clip for 1896, 820 tons; 1897, 640 tons; 1898, 610 tons.

1402. *Dr. Garran.*] Your figures show a steady decrease in pastoral production during the last three years? Yes.
1403. I believe we may attribute that to the drought? Yes.
1404. Is it attributable to any other cause? Not that I am aware of.
1405. If the seasons had been good, would you have expected an increase? Yes.
1406. Has this district felt the pinch of the dry weather? Yes.
1407. Have you any figures as to the increase of agriculture, either in the Grenfell or Temora district? No, we do not deal with that in our Department; that is done in the Agriculture Department.
1408. If the drought has been felt at Wyalong, has it been felt west of Wyalong, towards Hillston? Yes.
1409. Do the returns which you have furnished deal with the country west of Wyalong? No.
1410. Do you simply give what was raised in the district? Yes.
1411. I presume that the stock and wool which would come to Wyalong from the west, to be taken by the railway, would also show a decline? I should say so; but as I have not taken out those figures, I cannot speak definitely.
1412. In watching your statistics from year to year, have you noticed that where there is a moderate taking up of pastoral land by small settlers—but only a moderate taking up—there is no great decrease in the quantity of wool produced in that district? No.

1413.

1413. Does the quantity seem to keep up, although a certain portion of land has been withdrawn from the squatters? I have never gone into that question. G. C. Yeo.
1414. Do many of these settlers also take to growing wool? Yes. 10 Aug., 1899.
1415. So that the number of sheep depastured in the district will not actually diminish? No; our general returns show that there is a slight increase all over the Colony in favourable seasons.
1416. If land is taken for agriculture that is taken from pasturage, would that quantity appreciably diminish the quantity of wool grown? Yes; I should think so.
1417. Have you noticed whether the pastoral leaseholders, when they are confined to a smaller area, have a larger proportionate product of wool, or do they produce the same quantity per acre? I have never observed that; but I should not think that they would have a larger production. They are already in many cases overstocked.
1418. Do you notice the difference in your statistics as between old and new settlers? No; we confine ourselves to the quantity of produce.
1419. *Mr. Shepherd.*] Has there been a gradual increase in production for many years until the bad seasons came on? Yes; but there has been a falling off for the last seven years.
1420. Have you noticed whether, in this district, the falling off in sheep and cattle has been regular, or has one class of stock suffered more than the other? From what we know, the sheep have suffered most, because this is mostly sheep country. There are very few cattle there, and most of our returns refer to dairy cattle, which are hand-fed.
1421. *Mr. Dick.*] Do your stock records go very far back? Yes; for a great number of years.
1422. Do you know whether, many years ago, a large number of cattle were depastured on the Bland country, between Grenfell and Wyalong? I cannot say, except by looking up records and returns.
1423. Previous to the period of prolonged drought which we have just experienced, has there been an increase in the amount of stock carried along the proposed line? I cannot say with regard to that particular district; but there was an increase in the number of stock in the Colony, taken as a whole.
1424. *Mr. Watson.*] Can you say where the Bland stock goes to now? There is a big drift of stock going up the Bland River, and making towards Wagga Wagga, and those places.
1425. Would that strike the railway at Stockinbingal, Yeo Yeo, and Cootamundra? Yes; a good many go in that direction.
1426. Does any of it make over towards Grenfell? Yes; there is a fair drift making down from Forbes to Grenfell. That would not affect the railway; they could be trucked at Forbes as well as at Grenfell. The same thing would apply to the traffic which comes from Condobolin, and north of that, because there is another railway there.
1427. Have you any knowledge as to what quantity of fat stock is taken off the Bland country? No; but I could give you that, because we get a return every year showing the cast of fats.
1428. Is there anything in that return to indicate their destination? No; simply the number prepared to go to different markets. I will send in that return. [*Vide Appendix.*]

William Henry Hall, Sub-editor of Statistical Year Books, Government Statistician's Office, sworn, and examined:—

1429. *Mr. Trickett.*] Have you any statistics for the Committee with regard to agriculture and other matters connected with the district proposed to be served by this railway? I have several returns prepared—one is in connection with the population that would be affected. In this estimate is included a suggested extension as far as Hillston. The following is the first return:— W. H. Hall.  
10 Aug., 1899.

PROPOSED RAILWAY, GRENFELL TO WYALONG, AND THENCE TO HILLSTON.  
ESTIMATED Population that will be served by the construction of such a line.

Locality.	Estimated Population.	Locality.	Estimated Population.
Bimbi .....	380	Marsden .....	920
Morangarell.....	600	Ungarie .....	380
Reefton.....	380	Yalgogrin .....	280
Barmedman.....	700	Hillston .....	1,360
Wyalong .....	4,300		
		Total.....	9,300

1430. Does that give the population of the district starting from Grenfell? Yes, but exclusive of Grenfell.
1431. What is the population from Grenfell to Wyalong? 7,280. That includes Wyalong, but excludes Grenfell.
1432. Have you similar information with regard to the country which will be traversed by a railway from Temora to Wyalong? Yes; but of course in a great many cases the same localities would be served by either railway. The following is the return:—

PROPOSED RAILWAY, TEMORA TO WYALONG, AND THENCE TO HILLSTON.  
ESTIMATED Population that will be served by the construction of such a line.

Locality.	Estimated Population.	Locality.	Estimated Population.
Morangarell.....	600	Ungarie .....	380
Reefton.....	380	Yalgogrin .....	280
Barmedman.....	700	Hillston .....	1,360
Wyalong .....	4,300		
		Total .....	8,000

1433. What would be the population served between Temora and Wyalong? 5,980.

W. H. Hall. 1434. In giving information with regard to these railways, to what distance do you go on either side of the proposed line? Twenty miles I hand in the following returns.—  
10 Aug, 1899.

PROPOSED RAILWAY, GRENFELL TO WYALONG, AND THENCE TO HILLSTON  
STATEMENT showing the Area under Cultivation and Yield therefrom, for the years 1895 to 1898

Yalgogrn	1898	132	14	120			4			114	44					
	1895	6,700	4,236	32,932			11			2,403						
	1896	8,013	5,064	33,749			80			2,850				5	1	13
lston	1897	9,494	6,055	49,948						3,413	2,267					26
	1898	14,256	8,669	9,370						5,561	571					26

1435. Do these figures indicate that in all the districts which you have enumerated agriculture is practicable? Yes; they indicate that each year there is an increasing area under cultivation, but with a smaller result. The drought has so affected returns that they have shrunk considerably. Take the case of Bimbi. For the period included in this return the area under cultivation has been doubled, while the yield is only half what it was at the beginning of that period.

1436. Is that accounted for by the almost unprecedented drought? Yes.

1437.

1437. Do any of the figures which you have quoted tend to show the comparative productiveness of the land between Temora and Wyalong, and between Grenfell and Wyalong? An opinion on that subject can be derived in this way: Following out a suggestion made by Mr. Shepherd when I was here last, I have tried to get the wheat averages for a period of years. In most cases I have got those returns for four years, and in some cases for three years. The returns show practically the productiveness of each district, because the conditions are somewhat similar, so far as the drought is concerned. A comparison of those figures will afford a comparison as to the productiveness of the districts. I have summarised them as follows:—

W. H. Hall.  
10 Aug., 1899.

PROPOSED RAILWAY FROM GRENFELL TO WYALONG, AND THENCE TO HILLSTON.

Wheat Averages.

Locality.	Period of Years.	Total Area under Cultivation.	Total Yield therefrom.	Bushels per Acre.
		acres.	bushels.	
Bimbi.....	3	6,400	40,824	6.38
Morangarell.....	4	10,157	48,436	4.77

1438. Does the information which you have given clearly show that wheat can be grown at Wyalong? Yes.

1439. That being so, there is very little doubt that between the two places, Grenfell and Wyalong, and between Temora and Wyalong—being more to the east, and possibly having a better rainfall, they could grow wheat all along the proposed lines? I know nothing about the country, except what I have heard.

- W. H. Hall. There is a good deal of black soil all through there, and in that country they could not grow wheat,—that is on the Grenfell-Wyalong line.
- 10 Aug., 1899. 1440. Is it a wheat-growing district between Temora and Wyalong? I passed through there seven years ago, and it struck me after leaving Barmedman that a portion of the country there is black soil, and not suitable for wheat,—that is coming from Barmedman towards Temora.
1441. Are not the averages which you have quoted rather low? Yes; they comprise the last four years, which were years of drought.
1442. Have you any statistics to show the average yield in fair seasons? No. The particulars have been taken for several years; but certain results were not taken out, and as a consequence they are of no value.
1443. Which of the two routes proposed would serve the larger number of producers? I cannot say, as we have no information in the office about that.
1444. Is wheat-growing in those districts a recent development? Yes.
1445. Has not the growth of wheat immediately around Wyalong increased very much during the last few years? Yes; it started with 129 acres, in 1895, and it has increased to 1,870 acres, in 1898.
1446. *Mr. Watson.*] In the return as to the population on the two routes, and dealing with the population between Grenfell and Wyalong, have you taken in Bimbi? Yes.
1447. That is within the 20-mile limit; but do you know whether it is likely that the Bimbi people would use the railway, if made between Grenfell and Wyalong? I do not.
1448. Can you offer any opinion on the same subject with regard to Morangarell? No.
1449. Would not Morangarell be within 20 miles of the line Temora to Wyalong? Yes.
1450. So that if the population there is counted, should it not be counted in connection with both lines? Yes; Morangarell, Reefton, Barmedman, and Wyalong. Bimbi is really the only place not included in both lines, and also Marsden.
1451. Have you included Barmedman and Reefton in your returns with regard to the Grenfell-Wyalong proposal? Yes.
1452. But Reefton is not within the 20-mile limit? On the map which I have I laid down the 20-mile limit very carefully, and Reefton does come within it.
1453. By the road it is about 24 or 25 miles;—do you include both Reefton and Barmedman in your returns with regard to the projected Grenfell-Wyalong line? Yes.
1454. Would it not appear, from the return as to the wheat production, that Reefton has given the best return for the last four years? Yes; the best average.
1455. And Bimbi next? Yes.
1456. Did you say that when you were going between Barmedman and Temora, some years ago, you saw some black soil? Yes.
1457. When you said black soil, were you thinking of what is generally known as black-soil country, that is, the country subject to inundation? Yes.
1458. Must you not have been a considerable distance off the road? Yes; it was impossible to traverse the road; it was in the flood of 1892, when the whole country was flooded.
1459. Is it not generally supposed that there is no black soil on the road? We had to keep away to the right of the road.
1460. Then you must have got on to a portion of the Bland country which is composed of black soil? Yes; we had to get into the paddocks.
1461. Are you not confusing some of the gilgai country with it? No.
1462. *Dr. Garran.*] Your figures seem to show that in spite of the bad seasons the area under cultivation has steadily increased? Yes.
1463. Does not that seem to imply that the farmers are determined to go on in the hope of getting good seasons? Yes.
1464. Therefore, the first good season we get, we may expect a very large increase of produce in this district? Yes.
1465. Is it a district which is tending towards agricultural development as hard as it can go, although the people there have not yet realised their expectations? Yes.
1466. So that the prospect of a railway will give additional encouragement to these people? I should think so.
1467. So that there will be no speculation as to the prospect of an increased production? No.
1468. *Mr. Dick.*] On which of the two routes has the persistent increase in the area under cultivation been more marked—on the Temora to Wyalong or the Grenfell to Wyalong, leaving out Grenfell as a centre? The influence of the two lines will be practically over the same area, with the exception of two localities—Bimbi and Marsden. Those are the only two localities unaffected by the Temora to Wyalong line, so that practically the increase is the same.
1469. Can you give the proportionate increase around Bimbi and around Reefton? The proportionate increase for a period of five years, as far as Bimbi is concerned, is 72 per cent., as against 156 per cent. in the case of Reefton.
1470. Do your agricultural returns show that between Grenfell and Wyalong there is a considerable area of black-soil country unfit for cultivation? No.
1471. Do you know the Bland country between those points? I travelled over a portion of it, but I did not pay much attention to it, and I would not attempt to give any opinion.
1472. *Mr. Shepherd.*] Has the country which we are now considering suffered about equally with other parts of the country during the drought of the last four years? I should think so, judging from the returns.
1473. Has Wyalong particularly been a sufferer from the drought? Yes.
1474. Then the statistics which you have given can hardly be said to indicate the productiveness of the country? Only to the extent that they cover a period of four years.
1475. But have not the last four years been exceedingly dry? Yes.
1476. So that these figures would not indicate the character of the country at all? It would not be a fair estimate by any means.
1477. Still, the fact that the area under cultivation has increased shows clearly that the farmers there have confidence in the country? Yes.

1478. With the return of good seasons, would the production be largely increased? Yes. In addition to the returns which I have already handed in, I furnish the following:—

W. H. Hall.  
10 Aug., 1899.

PROPOSED RAILWAY FROM GRENFELL TO WYALONG AND THENCE TO HILLSTON.

MINERAL production for 1898.

Locality.	Gold.	
	Quantity.	Value.
Barmedman .....	oz. 2,950	£ 8,456
Reefton .....	300	1,186
Wyalong and Wyalong West .....	34,582	138,328
Yalgogrin .....	1,180	4,130

PROPOSED RAILWAY FROM TEMORA TO WYALONG AND THENCE TO HILLSTON.

MINERAL production for 1898.

Locality.	Gold.	
	Quantity.	Value.
Barmedman .....	oz. 2,950	£ 8,456
Reefton .....	300	1,186
Wyalong and Wyalong West .....	34,582	138,328
Yalgogrin .....	1,180	4,130

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and further examined:—

1479. *Dr. Garran.*] You gave us some information before with regard to the tenure of the land on the Grenfell-Wyalong line, and you were good enough to say you would get corresponding figures with regard to the proposed line from Temora to Wyalong? Yes, I have those figures with me now; they are as follows:—

C. E. Rennie.  
10 Aug., 1899.

\* TENURE of land within 20 miles on each side of railway trial lines.

Line.	Alienated land.	Leases other than pastoral.		Reserves.	Crown land.
	acres.	acres.		acres.	acres.
Temora to Wyalong .....	675,000	120,300	{ 67,300 acres scrub leases ..... 53,000 settlement leases ..... 92,300 homestead leases ... 281,400 improvement leases... 52,500 scrub leases ..... 39,300 inferior leases ..... 11,300 settlement leases ..... 126,200 homestead leases .. 66,700 settlement .. 211,740 improvement leases.. 60,500 scrub leases .....	251,600	291,800
Wyalong to Hillston (direct) .....	670,300	476,800		429,000	1,482,300
Wyalong to Hillston, <i>vid</i> Cargellico..	818,800	465,140		476,000	1,495,860

TENURE of Crown Land.

Line.	Leasehold area.	Expiration of lease.	Held under Occupation License.	Untenanted.
	acres.		acres.	acres.
Temora to Wyalong .....	156,300	1899 to 1904 .....	63,500	72,000
Wyalong to Hillston (direct) .....	619,400	1899 to 1903 .....	278,630	473,670
	110,600	1918, Western Division		
Wyalong to Hillston, <i>vid</i> Cargellico .....	447,200	1899 to 1903 .....		
	289,000	1918, Western Division	373,360	386,300

Areas quoted as under lease and occupation license do not include reserves within the holdings.

1480. Under each one of these headings are the figures with regard to Temora to Wyalong smaller than the figures with regard to Grenfell to Wyalong? Yes.

1481. Is the area really smaller on the Temora to Wyalong railway route? Yes.

1482. *Mr. Watson.*] The distance between the two points is 17 miles less on the Temora to Wyalong line as compared with the Grenfell-Wyalong line? Yes; and consequently the area must be less.

1483. *Dr. Garran.*] Between Grenfell and Wyalong the reserves are 346,000 acres, and the Crown lands 358,000 acres; how much of that would be available for settlement within a reasonable term of years;—if that is good land will not the whole of it become settled within four or five years? Yes; the presumption is that the area held under occupation license is open, but has not yet been taken up. The other area under leasehold may all become available within a few years.

1484. Is the land held in reserves good land? Yes; but it is impossible to say what will be done with it. It may be necessary to retain them as reserves; but it is more likely that the area will be reduced.

1485. As the pastoral leaseholders die out, those reserves will not be so much required, and they will be available for settlement? Yes, a portion of them at any rate.

1486. Would it be excessive to estimate that 500,000 acres will be available for settlement within five years on the Grenfell to Wyalong line? No. Of course, although there is all that land now available, or it may become available, yet the question is how much would be suitable for closer settlement. The presumption is that the larger portion of it will be.

1487.

\* NOTE (on revision):—Since giving these figures before the Committee, information came to hand of the sale of approximately 200,000 acres of improvement leases near Hillston, and within the 20-mile limit. The figures were, accordingly, altered to correspond.

- C E. Rennie. 1487. When you get the best land all taken up, do you find that the poorer land remains permanently unoccupied, or do the settlers nibble at it gradually? Small settlers gradually take it up, and the inferior parts are disposed of under different tenures—annual leases, improvement leases, and scrub leases.  
10 Aug., 1899.
1488. Do the people in the neighbourhood take it up? Yes; those tenures do not require additional settlement, but there is additional use of the land.
1489. Is there any possibility of making an estimate of the quantity of land on the Temora to Wyalong line, which will probably be taken up during the next five years? It is very hard to say. Perhaps there might be about 300,000 acres, but that is only a guess.
1490. *Mr. Watson.*] The map which you produce, showing the manner in which the land is held between Grenfell and Wyalong, shows private land for the greater portion of the way which the line goes? Yes, pretty well the whole of it.
1491. Between Temora and Wyalong does the map show that there is a railway reserve for the greater part of the way? Yes; there are reserves the greater part of the way. The trial line is only roughly sketched, and, as the reserve is not a wide one, the permanent line might not pass through the reserve the whole of the way; it is probably a travelling stock reserve.
1492. Do you notice that reserve shown on the map a little to the south-west of Grenfell,—what class of reserve is that? It is a forest reserve, called the Weddin forest reserve.
1493. Although that is included in the return, is it likely that that would be fit for settlement? I do not know the character of the country, but, being a forest reserve, it is probable that it would be retained. There are 35,500 acres in that reserve.
1894. Is it usual in your Department to indicate all the ranges on the map? There is no rule observed, but the principal ranges are shown on the maps.
1495. Are the portions shown on the map with hatchings in blue, settlement leases? They are scrub and settlement leases.
1496. Are the lands in settlement leases necessarily poor country? No.
1497. As I understand it, it is a form of tenure designed to be applied to land when, although it is perhaps good enough for agriculture, it is too far away from a railway to be availed of for that purpose? There are settlement leases for agriculture up to 1,280 acres. Over that area they are for grazing purposes.
1498. Then some of the land in scrub leases, if it were near a railway and cleared of the scrub, might be fit for agriculture? Yes; it does so happen sometimes that if the land is clear and near a railway it is under occupation for agriculture.
1499. Some people have an impression that because a piece of land is thrown open as scrub-land it is necessarily poor? That is not so. It does not necessarily follow that it is inferior land for agricultural purposes.
1500. When you get west of Wyalong I notice that on the map you show a considerable area of country either untenanted or under occupation license at a very low rental? Yes.
1501. What would the presumption be with respect to that land? Probably it is largely scrub land, but I cannot speak with confidence as to the character of the country. I know there is a considerable area of scrub-land there.
1502. If scrub were the only drawback to that land, would not the Minister be able to dispose of it under scrub or improvement leases? Yes; perhaps that is so.
1503. From the fact that there is a considerable area out in that direction untenanted, may we not presume that it is not extra good? There might be many reasons for its not being taken up. It might be the want of a water supply or distance from market. That would not apply in the case of pastoral occupation.
1504. But it is not occupied even for pastoral purposes? In that case it is probably too scrubby. The term of the pastoral leases is limited. Improvement leases are for twenty-eight years, and the maximum area is 20,480 acres.
1505. Then that area is not sufficient to induce people to take up land in the district towards Hillston? Some of the land there is under improvement lease. Between Wyalong and Hillston there are 92,300 acres under homestead lease; 281,400 acres under improvement lease; 52,500 acres under scrub lease; 39,300 acres under inferior lands lease; 11,300 acres under settlement lease. Then on the proposed line between Wyalong and Hillston, *via* Cargellico, there are 126,200 acres under homestead lease; 66,700 acres under settlement lease; 211,740 acres under improvement lease; and 60,500 acres under scrub lease.
1506. But I notice that on your map, close to the improvement lease areas, there is a large amount of land under no occupation? Yes, that is the case.
1507. Is it possible that that portion, marked "untenanted," is under annual lease? It is not at all likely. We do not keep a record in our office of the annual leases; the tenure is so constantly changing that we do not trouble to show it; but I am pretty safe in saying that there are no annual leases there.
1508. Is it to be assumed that the general conditions as to climate and other characteristics would be the same throughout that district; we notice improvement leases with large areas of unoccupied Crown lands around them;—is it not probable that all that land is of the same character? I suppose the lands are the same; but possibly the unoccupied land adjoining the leases may consist of dense mallee scrub, which, I believe, is practically hopeless. With some kinds of mallee the soil is thoroughly bad, whereas in other cases it grows on good soil.
1509. Is it possible that some of the people who have these homestead or settlement leases are anxious to have the surrounding land unoccupied, so as to have the run of it? It may be so; but it is hardly likely. All their time would be taken up in carrying out the improvement conditions of their leases. They hold very large areas.
1510. Then we must fall back on the assumption that there are not sufficient inducements to people to take up that land? Yes.
1511. *Mr. Shepherd.*] Have there been many forfeitures during the last few years of land taken up on leases or free selections? If you limited the question to a certain area, I could find out. There are always a certain number of forfeitures all over the country; but I cannot give an idea as to how many there are in any precise locality without looking up the records.
1512. Do you not think it likely that if railway facilities were given, a great deal of the land now idle would be taken up? Yes; it is likely that some of the better country out west would be taken up if a railway were made.
1513. Are you aware of the character of the scrub country? I do not know the country. That information would have to be obtained from the local officers. We can get information here and there from the surveyors' reports, but it would take some time to work it out.
- 1514.

1514. *Mr. Dick.*] Can you give us a general idea of the size and character of the holdings between Grenfell and Wyalong—as to whether they are chiefly pastoral or agricultural, and what is their average size? No; I have not got the number of holdings, and it is almost impracticable to obtain them. A great many of the holdings are mortgaged, and they stand in the names of the mortgagees. There are a lot of questionable tenures. I could not give you a reliable return from my own knowledge.

C. E. Rennie.  
10 Aug., 1899.

1515. *Mr. Trickett.*] Following up Mr. Shepherd's question with regard to abandoned holdings,—when you were examined in connection with the Condobolin-Euabalong line, you gave evidence then that there was a large tract of country abandoned between Wyalong and Hillston;—do you know whether that abandonment has extended to the eastward of Wyalong? No; it is not likely, because there it is pretty well all alienated. That evidence applied to pastoral holdings. There is one unoccupied area east of Wyalong, and it is likely that that is held under annual lease.

1516. So that there is every prospect of the land between Grenfell and Wyalong being retained for permanent settlement? Yes; it has practically gone out of the hands of the Crown.

1517. When you referred to the large number of abandoned holdings to the west of Wyalong, towards Hillston and Euabalong, did you refer to the leasehold lands which were devastated by rabbits, and to the scrub land? Yes.

1518. *Mr. Dick.*] Is it a fact that many of these so-called untenanted areas have been left in that condition, as far as leasing is concerned, for a long time, and have then been taken up under annual occupation licenses, because the assessment of the value is considered by the holders to be too high;—do they prefer to take them up under occupation licenses rather than lease them on the new assessment fixed by the Government? I cannot tell you what was the object of the people who gave them up; but I think you will find that that is not the case in this district. I do not think any of the occupation licenses there are abandoned pastoral holdings. Speaking off-hand, I do not think they are.

1519. Since 1884, is it not the case that in many parts of the Colony the resumed areas have not been taken up, but have been held under occupation licenses? The resumed areas are held under occupation licenses, and the land is open for selection from Thursday to Thursday.

1520. Is not the rent for an occupation license much less than for an ordinary lease? Yes; on account of the insecurity of tenure.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined:—

1521. *Mr. Dick.*] It is proposed to construct a line from Grenfell to Wyalong; at present the area which that line will serve is served with respect to its postal requirements by your Department;—will you give the details of the contracts which exist now in that area? I have prepared all the information required in the following shape:—

J. Clarke.  
10 Aug., 1899.

PARTICULARS OF MAIL CONTRACTS BETWEEN GRENFELL AND WYALONG.

Contractors' Names.		Addresses.	Postal Lines.	Distance in Miles.	Frequency of Communication.	Mode of Conveyance.	Annual Amount payable to Contractors.	Date of Termination of Contracts.

1522. *Mr. Trickett.*] Can you give us any information as to what charges the Railway authorities will make for conveying the mails which you have just described? The Railway Commissioners charge us at a minimum rate to start with of £12 per mile per annum.

1523. Do they convey all mail matter at that minimum charge? Yes.

1524. Can you offer any opinion, founded on your statistics, as to which district—the Temora-Wyalong or the Grenfell-Wyalong—has progressed the more rapidly during the last ten years? No; I have only two years' returns. Of course, Wyalong has only come into existence during the last three years.

1525. What would be the total charge made by the Railway Department for conveying the mails on the two proposed routes? The charge on the Grenfell to Wyalong line will be £720 per annum; on the Temora-Wyalong line, it will be £504 per annum.

THURSDAY, 17 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to  
Wyalong.

William Henry John Slee, Chief Inspector of Mines, Department of Mines, sworn, and examined:—

1526. *Chairman.*] Are you acquainted with the country between Grenfell and Wyalong, from a mineral standpoint? I have been between Grenfell and Wyalong on several occasions, *via* Marsden, but I have not been to Wyalong itself for the last two years.

1527. I believe that at one time it was thought that the Wyalong reefs would not go down to any great depth? My report in 1894 states distinctly that I thought the reefs to be permanent, but that the population, which was at that time about 8,000, would go down. I have never said at any time that the reefs would not go down.

1528. If the impression has got abroad that your Department is of opinion that the reefs are not permanent, it is incorrect? I gave evidence before the Committee in April, 1894, and twice since that date, to the effect that I thought the reefs would be of a permanent nature, but that the population would go down. The population at the time referred to was estimated to be 8,000 or 10,000.

1529. As a matter of fact, the reefs have been proved to a considerable depth? I have not been to Wyalong for the last two years, but I know they have worked down to about 300 feet, and the quartz is as rich as any that was ever found on the surface.

1530.

W. H. J.  
Slee.

17 Aug., 1899.

- W. H. J. Slee.  
17 Aug., 1899.
1530. Does the information possessed by your Department go to show that there is every possibility of the reefs carrying gold further down? Yes.
1531. *Mr. Trickett.*] Will you give us your views of Grenfell and surrounding districts as a mining centre? I may state that I am one of the old pioneers of Grenfell. I had a crushing-machine there in the early days, and I resided there for some years. I do not expect any extensive mineral discoveries between Grenfell and Wyalong, *via* Marsden.
1532. What do you think of Grenfell itself as a mining district? Grenfell at one time employed thirteen crushing-machines. When the field was first started it yielded as much as 8,000 oz. per week, and the reefs were very large. The alluvial, of course, gradually worked out, and the reefs were not developed as they ought to have been. They were in the hands of individual miners. The deepest of them was 720 feet, and it has not been touched for twenty-two years. There are two other shafts which are about 450 feet deep. I believe that Grenfell will in time to come again take its place as one of the best of our mining-fields.
1533. Do you think the field has been thoroughly tested? The Grenfell field has, to some extent, been neglected.
1534. Have they gone in for deep mining there? No; only one mine went down to 720 feet.
1535. Why did it cease working? The mine was very carelessly worked. I paid a visit of inspection to it, and condemned it. The result was that the management were required to spend £800 for repairs, and this they would not do. A few weeks afterwards the mine fell in, and it is there now. That is known as the Consols mine. Then there is the Homeward Bound mine, which is now crushing payable stone at a depth of 450 feet. There is also the Lucknow mine, 450 feet deep. We have had at Grenfell reefs standing clear above the surface and yielding 3 and 4 oz. to the ton. One reef was, in one part, 15 feet in width, yielded 1½ oz. to the ton. The Lucknow mine yielded 7 oz. to the ton. As you went down, as is generally the case, the yield diminished. The first shareholders either sold out or spent their money, and there the reef remained. I have no doubt that, sooner or later, Grenfell will, as a mining-field, come into the first rank.
1536. Do you consider that if the reefs were worked at a greater depth they would pay? Yes; if they were worked on a different principle. They are now worked in a primitive style—in the same way as they were worked thirty years ago.
1537. How far to the west of Grenfell does the auriferous country extend? Twelve miles to the west of Grenfell we have the Weddin Mountain. I do not think there are any minerals about the Weddin Mountain.
1538. Is there only a little patch of auriferous country at Grenfell, or is the auriferous district a large one? The Grenfell mining field is a large one, but, instead of extending towards the Weddin Mountain, extends towards Young—towards Tyagong and other places.
1539. Do you look for any gold development to the north of the Weddin Mountain? No. Small deposits may be found; but I do not look for any extensive deposits between Grenfell and the Weddin Mountain.
1540. You have stated that the gold-bearing country has a tendency to follow the direction of Young? Yes.
1541. I take it that whether a line goes from Grenfell to Wyalong, along the route proposed, or by way of Bimbi, it will not make much difference, so far as minerals are concerned? No, it will not.
1542. How many people are engaged in mining at Grenfell at present? About 150 are engaged absolutely in mining.
1543. Has the field fallen off very much? Not during the last two or three years. Formerly there used to be a very large population there. At one time there were 15,000 people there. That was when there was a mining boom, and when large alluvial deposits were to be found.
1544. The diminution of population applies, I believe, to Wyalong as well as to Grenfell? Yes; the population of Wyalong has reached a level at which we may expect it to remain for some years. It might, of course, rise slightly. When I had charge, as warden, of the Wyalong gold-field it was estimated that there were 8,000 or 10,000 people there. I stated at the time that it would dwindle down considerably. Wyalong, however, will support from 2,000 to 3,000 people for many years to come. In the meantime the farming interest will gradually make its way.
1545. Do you think that the Wyalong population is likely to increase? Yes; I think that at present it is as low as it is likely to be.
1546. Do you regard the Wyalong field as one for individual miners or for companies? It is not an individual miner's field now, although it was at one time, when there was nothing but pick-and-shovel work. Now that a great deal of the cream of the field has been taken away, capital has to be employed, and the work has to be carried on under quite a different system. The country is hard, and the ore is refractory. I believe, however, that in three or four instances the yield of gold has been higher in the refractory ores than it has been in the oxidised ores.
1547. I suppose it is simply a question of scientific mining and treatment? Yes.
1548. Do you know what is the average return of the field now? No; as I have stated, I have not been there for the last two years, and I would not state what it is from hearsay.
1549. What is the character of the country between Wyalong and Barmedman? Leaving Barmedman *via* Wyalong you come to Yalgogrin, which was opened prior to the discovery of Wyalong. Yalgogrin is in a north-westerly direction from Wyalong, and is about 25 miles from it. From Yalgogrin the large extent of country towards Hillston will, no doubt, sooner or later, be worked as mineral country, although it has not developed as fast as it ought to have done.
1550. Is it alluvial or reef country? Reef country. There has been no payable alluvial at Wyalong so far.
1551. Does that class of country start directly you leave Wyalong? There are reefs here and there between Wyalong and Yalgogrin. The principal part is about 25 miles from Wyalong.
1552. What population is there at Yalgogrin? About 250 at present. The farming interests will bring the population up very quickly. A good deal of land has been taken up about there.
1553. Is the population of 250 a mining population? Yes.
1554. Are there any batteries there? Yes; there are two. They have prospected for alluvial there, but without success up to the present.
1555. Do they treat the ore locally? Yes; they have a cyanide plant there.
1556. Does it belong to a company? To a syndicate.

1557. Going to the west, from Wyalong towards Hillston, what sort of country is to be met with? It is the same class of country right to Hillston. In my opinion, nothing very extensive in the way of gold-bearing country will be found. I have been to Hillston, but I did not go from Wyalong. W. H. J. Slee.  
17 Aug., 1899.
1558. Has that country been thoroughly prospected? No. The whole of that back country has had very little prospecting, owing to the severe droughts and scarcity of water. It is only a certain class of men who are accustomed to the back blocks who will go there.
1559. What is the state of the Wyalong supply of water at present? They have several large tanks there. Of course there is no such thing as a running creek or stream there, and the well-water is not very fit for human consumption.
1560. A water supply has, I believe, always been looked upon as a necessity for the advancement of the town? Yes.
1561. Has not a satisfactory scheme been initiated by the Government? The Government have put down several large tanks, and they have resumed several large tanks from Mr. Ricketson. As far as tanks are concerned, the Government have done as much for Wyalong as they have done for any other gold-field in a given time.
1562. Have they tried boring? Boring would be of no good; it would only give us the same water as that which we get in the mines; it is only fit for stock purposes. It is granite country, and you can get no artesian water.
1563. Would it not do for mining purposes? Yes; but even then it would have to be lifted up. The average depth is 200 feet from the surface, and it would have to be lifted that height.
1564. Is there likely to be any large mineral development between Wyalong and Barmedman? Yes. I believe that between Wyalong and Barmedman there is likely to be discovered an area of country which is auriferous—in fact, I have often told the manager of a station, when I have been at Wyalong, that I was quite certain that sooner or later we shall get what would be called in these days “a rush” between Wyalong and Barmedman, on his very station.
1565. Is the character of the country about there the same as it is about Wyalong? No. At Wyalong we have granite country; at Barmedman we have porphyry; and at Reefton we have slate country. The whole of the geological formation there tends to the belief that auriferous deposits may be obtained at any time.
1566. I believe that the slate deposits at Reefton are difficult to work? Not so difficult as the Wyalong reefs. At Reefton they have gone down to a depth of 300 feet with very little blasting.
1567. Is Reefton looked upon as an established gold-field? There is a little town there, formed since Wyalong was opened.
1568. What are the mineral prospects between Reefton and Temora? Between those places there is one continuous line of auriferous country. A report was handed in to you by myself a few years ago showing that sooner or later gold would be obtained along the whole line from Woodtown to Barmedman. It is gradually developing.
1569. As you near Temora, does the process of obtaining the gold become easier? No; some of the country about Temora is very hard. Some of it is diorite country, some of which is very hard.
1570. Which part of the country do you look upon as being the most easy to work? The country about Reefton is as easy as any.
1571. From the point of view of mineral development, which line would you favour as a means of railway communication to Wyalong—one from Grenfell or one from Temora? I would favour a line from Temora, although my personal interests would be in a line from Grenfell. Officially, however, I would favour a line from Temora to Wyalong.
1572. For what reason? I believe it would tap more mineral country. Another reason is that during seasons of drought the people from Hillston and other parts would bring their stock to the Cootamundra line and have it conveyed to the mountains.
1573. Have you regarded the question from an agricultural point of view? No. From an agricultural point of view the Grenfell to Wyalong route is superior to the other. There is really rich agricultural land there.
1574. *Dr. Garran.*] Is the Young gold-field a granite gold-field? Yes.
1575. Is the Temora gold-field a granite gold-field? No. Most of Temora is slate and diorite country.
1576. Like Reefton? Yes.
1577. Is the Grenfell field a granite field? No; it is porphyry, where the best quartz reef occurs. There is, however, a large area of slate country. So far, however, the reefs in the slate formation have never turned out well at Grenfell.
1578. What sort of field is the Forbes field? As a rule we have the porphyry formation at Forbes.
1579. What about Parkes? At Parkes there is almost every geological formation you can mention, and Parkes is one of the best gold-fields we have.
1580. The Wyalong field is of granite formation? Yes. At Barmedman they have diorite and porphyry formation.
1581. So far as you know, there is no probability of mineral development between Grenfell and Wyalong? I will not say there is no probability of it, but as far as I know there will be no extensive mining operations carried on between Grenfell and Wyalong.
1582. There are no surface indications of it? The indications are not good enough.
1583. Neither by the Bimbi nor the Marsden route? No.
1584. Are there any mineral indications west of Wyalong? West of Wyalong you come to Yalgogrin, and go on towards Hillston. That country has not been developed, but it has the appearance of being auriferous.
1585. Have you been along the Willandra Billabong towards the Darling? For some distance. Of course I have only been where mining is carried on.
1586. Have you been out prospecting yourself? No. I may say that all our gold-fields have an up and down tendency. The late Mr. Wilkinson and myself reported in favour of Cobar, although it was considered to be of no good at all. Although a mining-field may be down to-day, the least accidental discovery might bring it up to the first rank.
1587. I gather from your answers to Mr. Trickett that, so far as mineral development is concerned, you prefer the railway from Temora to Wyalong? Yes.

- W. H. J. Slec. 1588. So far as agricultural settlement is concerned you prefer the railway from Grenfell to Wyalong?  
Yes.
- 17 Aug., 1899. 1589. With a good road between Temora and Wyalong, would Reefton and Barmedman be fairly served by railway stations at Temora and Wyalong? I think so. Reefton is only half a mile from a main road. Barmedman, of course, is a proper township.
1590. If the road is good, there would be no hindrance to mineral development along it on account of the difficulty of carrying stores? I do not think there would. At the same time, if machinery and stores cannot be got at a cheaper rate than they can be got by railway, a line must help the development of mining.
1591. Nevertheless, mines are developed far away from roads and railways? Yes; if they are good enough they get developed anywhere.
1592. There is nothing at present to hinder any development between Temora and Wyalong? No; in fact I honestly believe that we may see developments between Temora and Wyalong at any time.
1593. If the gold-fields along the route are so different in character, it is evident that the country is not, by any means, uniform? Yes; but the more disturbance we have of that kind, the more likely are we to get different kinds of minerals.
1594. How far around Wyalong might we reasonably look for mineral deposits? To the east you can go to Temora, and to the north to Lake Cowal and Billy's Lookout. There are some alluvial diggings there. It is in that direction that we expect alluvial gold to be found, if there is any at all. To the south the country has not been very much prospected.
1595. Do you think that there is a likelihood not only of Wyalong being a permanent field, but of a considerable district around Wyalong being discovered to be auriferous? Yes. I believe that not only will Wyalong be a permanent gold-field, but that there will be a settled farming population around it.
1596. Apart from farming, do you think it likely that there will be mineral discoveries within a radius of 10 miles around Wyalong? Yes.
1597. Then we do not yet know the full limit of that gold-field? No.
1598. What is the furthest distance of any mine from the Wyalong township? Yalgogrin is 25 miles away; but there are reefs in between.
1599. Has the intervening country along that 25 miles been moderately prospected? Not so well as one would wish, owing to the lack of water.
1600. You think that at any time good mining country may be discovered between Wyalong and Yalgogrin? Yes, and west of that.
1601. *Mr. Dick.*] You say you think the Grenfell to Wyalong line would offer greater facilities for agricultural development than a line from Temora to Wyalong? Yes; it will tap more of the agricultural country.
1602. Is it not a fact that the greater portion of the good agricultural land along the proposed line is within easy distance of Grenfell? Yes.
1603. Would not that land be served by the extension from Grenfell? I could not say that. My opinion is that you will get good agricultural land all the way from Grenfell to Morangarell, and on towards Barmedman.
1604. Do you know the Bland country between Grenfell and Wyalong? Yes.
1605. Is it good agricultural land? Yes, excepting around Sandy Creek.
1606. Have there been any mineral developments round Marsden? No.
1607. Or around Bimbi? No. I may state that alluvial prospecting, assisted by the Government, has been carried on between Marsden and Grenfell, but so far it has been unsuccessful.
1608. You do not think much of the area between Grenfell and Wyalong as a field for mineral development? No.
1609. *Mr. Shepherd.*] You stated, in 1894, that you had no doubt whatever about the Wyalong field being permanent;—have you had any reason to alter your opinion since? No.
1610. Is the machinery now on the ground at Wyalong capable of treating all the stone raised? I think so. Of course they have greatly-improved machinery. They have not only cyanide, but chlorination works.
1611. I noticed that it was stated some time ago that 130 tons of stuff from Wyalong were being crushed at Wollongong;—do you know the reason of that? Because some people think that a local battery can never be of any good. The further some people send their stuff away the better they think its treatment will be. I know of an instance which occurred in 1896, when a party sent material to be crushed in Victoria, and retained some to be crushed at Wyalong. The return from the material crushed at Wyalong was double the return from that crushed in Victoria.
1612. Your opinion is that the machinery at Wyalong is capable of treating everything that is raised? Yes.
1613. And that there is really no occasion to send material away? In my opinion there is not.
1614. Then, in the event of a railway being constructed to Wyalong, it is not likely that it will obtain much traffic in stone from Wyalong? No. I think that if any large companies are formed they will treat their own stuff with their own machinery.
1615. Are the reefs at Wyalong wide? Some of them are of a good width. Some of them narrow in, as they do in granite country, and bulge out again.
1616. Do they go down without varying much? Yes.
1617. Have any minerals, apart from gold, been discovered at Wyalong? No; nothing which can be worked separately; no regular copper-lode has been discovered.
1618. Are you of opinion that copper-lodes are likely to be found there? I do not think so. The nature of the country does not favour them.
1619. Do you think the agricultural country between Grenfell and Wyalong is superior to that between Temora and Wyalong? I think it is somewhat similar country. After you leave the Tyagong the country is very much similar.
1620. Has there been any extension of the Wyalong field of late years? No; the extension has only been towards Yalgogrin.
1621. I notice from your evidence in 1894 that you stated that the country would be found auriferous for over 50,000 acres;—are you still of that opinion? Yes.
1622. And yet there has been no great extension? No. There is a good reason for that. As I stated before, there is no water there.
- 1623.

1623. I notice that in Western Australia, where the water is scarce, dry-blowing is resorted to;—has that been practised at Wyalong? No; but when I was at Mount Browne, in 1881, there was nothing else there but dry-blowing. W. H. J. Slee.  
17 Aug., 1899.
1624. Is any particular locality more suitable for dry-blowing than another? It requires sandy, dry soil. Wyalong would not be suitable for dry-blowing.
1625. *Chairman.*] We have it in evidence that most of the Wyalong gold finds its way to Melbourne;—can you explain the reason of that? I do not know anything of a definite character about that. I may mention, however, that Mr. Neeld and others, who were first on the field, were farmers from Victoria. Their sympathies are with Victoria—their relatives are there,—and the consequence is they go to the market to which they have been accustomed. Probably they obtain little concessions from the Mint, but I cannot say.
1626. Your opinion is that old associations may have something to do with it, and that certain concessions may be allowed? Yes. At one time the yields from Cobar and Wilcannia went towards Melbourne; but since others have mixed with the people there they are gradually coming to Sydney and to other parts of the Colony.
1627. Has it ever come to your knowledge that the Wyalong people are more liberally treated at the Melbourne Mint than at the Sydney Mint? I do not like to say that they have been. Another thing, I do not believe it.
1628. Even though you heard it, you would not believe it? No.
1629. In answer to a question in the Assembly the other night, the Minister stated that better terms were given by the Melbourne than by the Sydney Mint? It is possible that the Wyalong people might tell the Melbourne authorities that they were coming from New South Wales with a parcel of gold, and the Melbourne Mint authorities, wishing to retain their custom, might order their clerks or officers to receive it at whatever time it arrived.
1630. You have stated that from a mining standpoint you prefer a line from Temora to Wyalong? Yes.
1631. And that from an agricultural standpoint you prefer a line from Grenfell to Wyalong? Yes.
1632. Could you say whether railway traffic from an agricultural country would be more profitable than it would be from a mineral country? No. I believe traffic from a mineral country is far superior and greater than that from an agricultural country. As a rule, a mining population, if it has money at all, spends it. The farmers, as a rule, have enough to do to keep what they earn for a rainy day.
1633. Is there any mineral country to the north of Wyalong, towards Condobolin? There certainly are indications of minerals about Lake Cowal. For instance, several reefs have been worked at Billy's Lookout, only a few miles from Lake Cowal.
1634. Are there any workings there now? Yes; men are working there now, and are making a living.
1635. On which side of Lake Cowal? On the Wyalong side.
1636. The traffic from there would find its way towards Wyalong? Yes.
1637. *Dr. Garran.*] In view of an extension beyond Wyalong, which would be the better direction for minerals, towards Cudgellico or towards Hillston? Towards Hillston. I have been to Lake Cudgellico and to Euabalong from Condobolin, and there is really very little to be said about minerals, only in isolated places.
1638. Do you think it is possible that some day there may be a continuous line of minerals discovered between Wyalong and Hillston? I will not say a continuous line, but I believe that there will be discoveries here and there.
1639. And the line as far as Hillston will tend to develop that country? Yes.
1640. There is no certainty about it? No.
1641. But there are positive indications on that route? The indications are not very grand. There is no certainty about it; still there are indications that mineral deposits may be discovered.
1642. Do the old rocks crop up anywhere between Wyalong and Hillston? Yes, in a few directions.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

1643. *Chairman.*] Can you give the Committee any information as to the average rainfall over the country which will be served by the proposed line? The average rainfall at Grenfell is 27·23 inches, extending over a period of thirteen years. The rainfall at Brundah, a little north of Grenfell, is 24·65 inches, extending over fourteen years; the rainfall at Oma is 22·01 inches for eleven years; the Marsden record is 19·79 inches for seven years; at Barmedman the rainfall is 19·85 inches for twelve years; at Mandamah, a little south of Barmedman, it is 19·76 inches for thirteen years; at Yalgogrin, to the west of Mandamah, it is 19·42 inches for fourteen years. There is another station, known as Yalgogrin North, where the rainfall is 21·02 inches for eleven years. At Nariah the rainfall is 19·71 inches for fourteen years; at Youngara it is 17·82 inches for nineteen years; at Ungarie it is 18·22 inches for eight years; at Lake Cowal it is 19·72 inches for twelve years; at Condobolin it is 19·78 inches for seventeen years; at Brotherony, a little north-west of Condobolin, it is 18·56 inches for fourteen years; at Booberoi, a little west of Brotherony, it is 17·75 inches for fourteen years; at Euabalong, on the river, it is 18·25 inches for fourteen years; at Lake Cudgellico, close to Euabalong, it is 17·55 inches for fifteen years; at Rankin's Springs, a few miles south-west from Lake Cudgellico, it is 17·64 inches for eleven years; at Conapaira, a little further south, it is 19·73 inches for seventeen years. Hillston reports 16·11 inches, extending over twelve years; and Roto, on the Lachlan, a little east of Hillston, 15·34 inches for twenty-one years. Wangaroo, north-west of Hillston, reports 14·74 inches for twelve years. Merrowie North has 16·55 inches for seventeen years; Yathong, a little west of that, 15·51 inches for ten years; Cowl Cowl, 15·28 inches for twenty-five years; and Marungle, which is not far from Booligal, 14·65 inches for twenty-two years. H. C. Russell,  
C.M.G.  
17 Aug., 1899.
1644. What is the rainfall at Wyalong? There are three Wyalongs, really. There are the station and the two towns. Upper Wyalong (No. 2) has a fall of 20·81 for twelve years, and Upper Wyalong (No. 3) 19·49 inches for fifteen years. Wyalong town has only a two years' record. Temora has an average of 21·00 inches for eighteen years. The averages at Reefton and Bimbi have not been reported.
1645. Is the average over that area sufficient for successful wheat-growing? Generally speaking, the rainfall of this area, with the exception of the extreme western part of it, is in excess of what is supposed to be sufficient for wheat-growing. 1646.

- H. C. Russell, 1646. Is the rainfall distributed in such a way as to beneficially affect the crops, or does it fall at times when it is of little use? It is fairly evenly distributed. If anything, there is a preponderance in the latter half of the year. In the winter, particularly, a good deal of rain falls over this area. There is not much difference between the first and last months of the year.
- C.M.G.  
17 Aug., 1899.
1647. *Mr. Shepherd.*] I suppose the drier portions of the year are the hottest months of summer? Yes, generally. The bulk of the rain coming along Riverina comes during the winter.
1648. Do the rains commence as early as April? Not generally.
1649. That is rather late for putting in crops? The ground does not seem to be hard enough to prevent them, in ordinary seasons, from turning it up and getting it ready.
1650. I notice from your returns that there is a gradual decrease in the fall as you go west from Grenfell? Yes.
1651. Does it still further decrease as you go further west? Yes. When you get to the Darling country it comes down to 10 and 14 inches. Menindie is about the driest place. I published that fact about a year ago, and a gentleman residing on the border, about 100 miles south of Broken Hill, said he had a drier place on his station; but I never could get anyone to record between the Lower Darling and the boundary until quite recently. Therefore I do not know much about it, excepting that it is a dry area.
1652. I suppose, however, that your averages take in the worst as well as the best seasons? Yes. When you get a twenty years' record you may take it that is a fair average of good and bad seasons.
1653. *Dr. Garran.*] What is the Mossgiel return? 12·42 inches for four years.
1654. That is midway between the Lachlan and the Darling? Yes. There is a station with a long record, no great distance from there, called Kilfera. That has a record of 12·31 inches for twenty-six years.
1655. Is the record for Condobolin pretty much the same as that for Wyalong? Condobolin has a record of 19·28 inches, and Wyalong has a record of 19·49 inches.
1656. Has the Wyalong district been much dried up by reason of the last drought? People have complained a good deal about it. I know some people, with whom I am intimate, who were paying very heavily for hay.
1657. Do the monsoonal rains come as far east as Wyalong? They seldom come as far south. Three times out of four the monsoonal rains are not heavy below Cobar.
1658. Does Wyalong get most of its rain from the south? Yes; the south-westerly winds bring it there. It is a sort of branch with the Victorian rainfall. Of course they get northerly rain at times.
1659. I suppose that south of Cobar the warm monsoonal rains do not come? No.
1660. Are they dependent on the southerly rains between Wyalong and Condobolin? Yes.
1661. Does the easterly rain get as far west as Forbes? Very seldom. The only way the easterly rains get inland is all over the low mountains at the head of the Hunter. Above Cassilis the mountains are lower than in the main range.
1662. Does much rain get up that way, and to Gulgong? Yes, sometimes.
1663. The country to which reference has been made cannot trust much to the easterly rains? No.
1664. Has the time of the year at which the rain falls in this part of the country anything to do with the rain coming in from the north or the south? Yes; there is very seldom any monsoonal rain in the winter months.
1665. If they do not get the autumn rains from the monsoons they have to wait until the spring? Yes. Their best months are the last six months of the year.
1666. The Darling country has to wait for the spring monsoons? Yes. If they do not get rain in January, February, or March, they give up hope of getting it, as a rule.
1667. Does it matter much to the farmer whether the rain is a cold or a warm one? Not in the early stages of wheat-growing; but in the latter stages a cold rain rather hinders the growth.
1668. I suppose that for grass-growing a warm rain is the best? Yes.
1669. Does Dubbo get the benefit of the monsoons? Yes. The further north you go the more abundant they are.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane.  
17 Aug., 1899.
1670. *Chairman.*] Would a line from Grenfell to Wyalong, *via* Bimbi, pass through more agricultural country than would the proposed line? I take it that there would be less agricultural country on the Bimbi route, because you arrive upon the plain country earlier. The advantages of the direct route are a slightly shorter length, and that it apparently cuts the country up better, and serves Marsden and the country to the north better. It also avoids back shunting at Grenfell station. Otherwise, as I have already pointed out, the line is estimated to cost about £700 less. With regard to the continuation of the Koorawatha to Grenfell line, it will be remembered that the terminus at Grenfell points nearly due north. To get to Wyalong by way of Bimbi, back shunting would have to be adopted, and there are serious traffic objections to that. The traffic over this class of line consists chiefly of mixed trains. The middle part of the train consists of the goods trucks, and the passenger carriages are placed at the rear. If you run into a station engine first and carriages at the end, when you want to go out in the same direction you have to reverse everything. That means shunting, which would be avoided if there were a straight run through. Thinking it would be of use to the Committee, I had the measurements made of the Crown land and alienated land traversed by the Bimbi deviation. The Crown land traverses in length 45 miles 74 chains, and the alienated land 16 miles 22 chains, making a total of 62 miles 16 chains, which is the length of the line. That shows, of course—for the greater part of the route the line traverses Crown land—travelling stock and other reserves.
1671. As a matter of fact, the country about Bimbi is within reasonable distance of Grenfell? Yes, and of Young.
1672. *Dr. Garran.*] Going north from Grenfell you have to cross a low range;—does that offer any serious engineering trouble? No; there is rather a large cutting at the top of it, but I can get a grade of 1 in 100.
1673. Without much of a detour? The detour is not much at the first range, but when you come to the Weddin Mountains there is considerable curvature.
1674. You would have no such difficulty on a line *via* Bimbi? No; that has a good fall all the way down.
1675. From a constructional point of view, the Bimbi route is the best; but you do not regard the difficulty to which you refer as a serious one? No, because we can get a grade of 1 in 100.

1676. The detour will not very much increase the cost of the line? No; I have already given the comparative estimates. H. Deane.  
 1677. *Mr. Trickett.*] If the Bimbi route were followed, could you avoid the back shunting by keeping a little to the south of the town of Grenfell, and altering the station site? I do not think so, because the approaches into Grenfell are upon very high ground all round the town, excepting in the valley of the Yeo Yeo Creek. To approach from Koorawatha, and to make a short cut round, so as to get a curve to the Bimbi deviation without entering the town, would necessitate a very steep grade. 17 Aug., 1899.

SATURDAY, 19 AUGUST, 1899.

[The Committee met at the "Empire Hotel," Grenfell, at 7.30 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

John Sharpe McIntosh, farmer and grazier, sworn, and examined:—

1678. *Chairman.*] Where is your holding? Twenty-nine miles from Grenfell, and 4 miles from Caragabal station, north of the proposed line. J. S. McIntosh.

1679. How many acres do you hold? 2,339 of which 125 are under cultivation. When I first came to The Carse there were only 10 acres under cultivation. Last year I put in 90 acres, and this year 125 acres. 19 Aug., 1899.

1680. Are you satisfied with the prospects of farming? Yes; so much so that I have 500 acres cleared and ready for the plough.

1681. Are you prepared to put more land under cultivation if you have better means of getting the produce to market? We are prepared to let the balance, which we do not require, on lease.

1682. How long have you been in the district? Five years.

1683. Since the construction of a railway from Koorawatha to Grenfell has been sanctioned, have the promises of agriculturists in the district, to the effect that they would clear large tracts of country, been carried out? Yes; the people are at present clearing land under difficulties, on account of bad seasons.

1684. Are they quite satisfied with the prospects of wheat-growing? Yes; if they can get within 10 miles of a railway.

1685. Are the climatic conditions favourable to the growth of wheat? We have had five very trying seasons, and we have had three good crops out of five.

1686. What is the character of the country for stock? It is the most fattening country you could possibly get.

1687. So that mixed farming can be profitably carried on? Yes. With the two combined there is a great future for the district.

1688. Is the land held in large areas? In the district in which I live the Government is throwing open thirty-six selections, averaging from 1,400 to 2,500 acres. They will be thrown open next year.

1689. Do you think 1,400 acres is sufficient for a man to make a living for himself and family upon? No; the smaller areas are not sufficient. It requires 2,500 acres, at least, to enable a man to carry on.

1690. Have you any statement to make to the Committee which would be of service to them in connection with the present inquiry? I have a thorough knowledge of the country between Grenfell and Wyalong, having managed Back Creek station for two years. I have also travelled from Temora to Wyalong. Between Grenfell and Wyalong there is not an inch of country which cannot be made available for pastoral and agricultural pursuits. Between Wyalong and Temora there is some very good land all the way; but I think there will be a greater difficulty in constructing a line over that portion of the country than over this.

1691. How does the land between Grenfell and Wyalong compare with the land between Wyalong and Temora? The better route, taking the whole of the land right through, is from Grenfell. We have a better class of country for agriculture and pasture combined. You can scarcely get an acre of waste land between Grenfell and Wyalong.

1692. Do you know the Bland country? Yes.

1693. Could any of it be cultivated? Some of the Myall Plains are very good. There are two gentlemen at present living on Back Creek who have been following agricultural pursuits on a small scale for the last ten or twelve years, and they have grown extraordinarily large crops.

1694. *Mr. Watson.*] You have stated that the Government is going to throw open holdings of about 1,400 acres each? Yes.

1695. Do you know what capital value has been placed upon them? No; they have not been thrown open yet.

1696. Do you know the carrying capacity of the country between Grenfell and Wyalong? About three sheep to 4 acres.

1697. Do you think the returns from the Stock Department would be any guide as to the quantity of sheep carried? Yes, in fair seasons.

1698. Do you consider that the returns which are sent in are fairly reliable? Yes.

1699. Do you think that the year 1896 can be taken as a fair average season for sheep? Decidedly not; no season since 1894.

1700. Do you think the return for 1894 would be a fair average return? Yes; so far as good, improved land is concerned.

1701. According to the returns of the Stock Department for the year 1896, the land carried one sheep to 5 acres in the district to which we have referred? I will admit that, and I will give an explanation.

1702.

J. S.  
McIntosh.  
19 Aug., 1899.

1702. Of course, in 1898, it has come down to about one sheep to ten acres? Yes. There is a lot of waste land, which has never had an axe put to it, being held by the lessees. They have allowed it to get into a worse condition than it was originally. The country which at one time would carry a sheep to 3 acres would not now carry a sheep to 10 acres, because of neglect. I can prove that by the property adjoining my own, and by several other properties in the district.
1703. Then the return to which I have referred is not to be taken as a criterion? No. When the ground is thrown open every inch of it will carry one sheep to 2 acres.
1704. At present it is not carrying one sheep to 10 acres? It is not carrying one sheep to 15 acres.
1705. Have you suffered from the drought? Yes. I lost 1,800 sheep last year. I may mention that my experience of Back Creek is that it has carried, on portions of the country, eight sheep to the acre for four months.
1706. You have stated that a man, in order to maintain himself and family, should have at least 2,000 acres of land? Yes. I consider that anywhere between Grenfell and Wyalong a man would require at least that amount.
1707. Do you regard the land between those two points as good land? As good as any you can find.
1708. Do you know that, not far from Grenfell, a number of men are making a living on 640 acres of land? It must be only a short distance from Grenfell, and there must be a good rainfall.
1709. It is not more than 30 miles from Grenfell? Then the land was improved for them before they obtained it.
1710. It was rung? Yes. I was, a short time ago, referring to land which was thrown open at Wheogo in its natural state. It has been ringbarked, but it is worse than ever now. Where there was one tree formerly there are ten now.
1711. Still, if that land were improved, it would, after a time, be as good as the land which has been improved for a considerable period? Every bit of it; but it would require such a lot of money to improve it that a small farmer going upon 640 acres could not afford to do it.
1712. You do not think 1,400 acres would be sufficient to maintain a man and his family? No; unless the blocks are picked and ready for the plough. Nothing less than 2,500 acres of the heavier land, where the scrub and undergrowth exist, would be sufficient.
1713. Do you think that some of the black-soil country is fit for agriculture? Yes; some of the myall ground.
1714. Is there any large proportion of that between Grenfell and Wyalong? Yes.
1715. Is there any of it between Bimbi and Williams' Crossing? Yes; a portion of it.
1716. Which of the two routes towards Wyalong do you favour—that to the north, *via* Piney Range, or that to the south, *via* Bimbi? That to the north. There will be more available land for agricultural and pastoral pursuits on that route. The land on the Bimbi route is at present held in larger holdings. It is in the hands of the banks, and it cannot be cut up. It also runs right under the base of the Weddin Mountains.
1717. Then on one side of the Bimbi route there is the Weddin Mountain, and on the other side large properties already alienated? Yes.
1718. Therefore you favour the route *via* Piney Range? Decidedly.
1719. *Chairman.*] Have you had any experience of the country in other parts of New South Wales? Yes.
1720. How would the country between Grenfell and Wyalong compare with that in other parts? I used to think that the Bokara was the best fattening property I was ever on; but I now think that in the winter there is nothing to beat the country between Grenfell and Wyalong. In 1897 we had a good fall of rain, and the way in which the sheep put on the fat was astonishing. I was able to get ready for the market sheep which were dying in June.
1721. You think, then, that the land to which you have been referring is equal to any in New South Wales? It is equal to any over which I have travelled; it is as good as any of the Liverpool Plains land—of course, I mean where it is ringbarked and made available for the plough. I bought my present property after two years' experience in the district.

Joseph Hancock, farmer and grazier, Barbingal, sworn, and examined:—

J. Hancock.  
19 Aug., 1899.

1722. *Mr. Trickett.*] Where is your holding? Twenty-two miles to the west of Grenfell. I have held 2,560 acres since 1885.
1723. Do you carry on mixed farming? Yes; agriculture and sheep grazing. I have 300 acres under cultivation.
1724. Have you extended your farming operations since you have been at Barbingal, on account of the suitability of the land? Yes; especially during the last year or two, with the expectation of a railway coming to the district.
1725. Is the whole of your holding suitable for farming? No.
1726. Will you describe the character of the holding? There are some yarran country, some gilgais, and pine ridges.
1727. Is there much red soil about the holding? It is mostly red soil; some of it is rather white as well.
1728. How does it compare with the soil between Grenfell and Iandra? Very favourably; most of it is similar soil. Of course the gilgai country would not be suitable for cultivation.
1729. How far is Barbingal from Caragabal? About 12 miles to the east.
1730. Will you describe the character of the country between Grenfell and Caragabal? From Grenfell to my place, which is 22 miles distant, the land is nearly all fit for growing feed, except on very few portions where you meet with the gilgais. It is a little hilly at the Grenfell end, but it is not mountainous.
1731. What number of sheep have you? I have lost a large number by reason of the drought, and I have not many left. I have had as many as 3,000 upon my 2,560 acres. That was during a wet season.
1732. Was it an exceptionally good season? We had three or four good seasons, and we could not put enough stock on the land to keep the grass down.
1733. What is the carrying capacity of your land during an average season? About a sheep to the acre—perhaps not so much.
1734. Would it be three sheep to 4 acres? Yes.
1735. Is that the fair average carrying capacity of the country? Yes; in good seasons, if the country is improved.

J. Hancock.  
19 Aug., 1899.

1736. Improved to what extent? By being rung, and a lot of the timber land picked up.
1737. Is that very expensive work? It is very troublesome.
1738. What does it cost per acre to ring? The ringing does not cost much. The difficulty is in keeping the suckers down. It would cost about 4s. to 5s. per acre.
1739. Do you mean that it would cost that to kill the suckers every year? It would not cost that every year.
1740. What is the smallest quantity of land that a man requires, in order that he may make a fair living upon it? If a man goes upon land alone, 1,200 acres will be sufficient. If he has a family, he will require more.
1741. Which do you think pays you better, situated, as you are, some distance from a railway—agriculture or sheep-growing? Sheep-growing.
1742. Which would pay you better if you were within 15 or 20 miles from a railway? If we could make anything out of wheat-growing, we should go in for it largely.
1743. What do you consider the lowest price of wheat per bushel which would justify you in growing it? We could make a living out of it at 2s. a bushel.
1744. If you get 2s. a bushel for your wheat ready bagged on the ground, would it pay you? Yes; but I do not think we should make much out of it.
1745. Would that be the minimum price? Yes.
1746. Do you not think that you could generally get that price? We have done so up till now.
1747. Are the prospects of remunerative wheat-growing, provided you have reasonable carriage, good? I think they are fairly good.
1748. What has been your experience in regard to the increase of agriculture in the district since you have resided here? It seems to be increasing a little every year. Since the railway has been mooted a number of people have extended their agricultural areas. I have 70 acres more land ready for cultivation this year than I had last year, and I am still clearing.
1749. Is the character of the soil such that it will last for any length of time for wheat-growing? I have been cultivating my land for seven or eight years, and it still grows good crops.
1750. Have you not rested it? No; but I intend to rest it this year.
1751. What is the average yield in fair seasons? During one year I had 28 or 29 bushels to the acre; but I think the average in a fair season will be from 16 to 17 bushels per acre.
1752. How close do you require to be to a railway to encourage a larger cultivation of wheat? I could afford to carry wheat 10 or 12 miles, or further, for 2s. per bushel. This year I have carried it 50 miles for 2s. 3d. per bushel.
1753. Supposing there were no good agricultural land suitable for wheat-growing at a less distance than 20 miles from a railway, would it suit you to take it up? Yes.
1754. Then you look upon 20 miles as the limit of the distance which you should be from a railway station to enable you to grow wheat satisfactorily? It depends on the price of the wheat. If I could get a high price I could carry it further than 20 miles. If the railway is constructed from Koorawatha to Grenfell I shall only have to carry my wheat a distance of 20 miles, and I shall be satisfied.
1755. How far will you be from the projected line? If the line follows the northern route it will just touch my land.
1756. Where should you look to for your chief market? I think there would be a good market Hillston way, especially in dry seasons.
1757. Do you think railway communication to your holding would benefit you so far as stock are concerned? Yes; if there had been a railway near my holding I should not have lost as many stock as I have done. If the railway comes near to myself and others we shall have an opportunity of sending small lots of stock away by rail.
1758. Is this a good fattening country in good seasons? Very good; the Bland is as good a fattening country as any in the Colony. The red soil is the best for agriculture, and the black soil is the best for pasturage.
1759. Have you cultivated any of the black soil? No; there is none on my holding, unless it is amongst the gilgais.
1760. Does the red soil predominate between Grenfell and your holding? Yes. Thence towards Marsden the black soil predominates.
1761. Have you seen any of the black soil cultivated? No.
1762. Could you give us any idea of the extent of land on the cultivation between Grenfell and your holding? I could only tell you the quantity near my holding. Mr. Casey must have 400 acres; Mr. Maddam must have 300 to 400 acres; one of the Cleary's has 200 acres, and the other about 300 acres; I have 300 acres. Then there are Mr. Birge and Beazley Brothers, who have only gone in for cultivation during the last year or two.
1763. Do you think that the land between Grenfell and your holding is capable of such extensive agricultural development as is the land from Iandra to Grenfell? I do not think it is. At the same time I do not know what is to prevent anyone from growing wheat all the way along the proposed line to my holding. There are only one or two little hills—perhaps 20 to 30 acres—which would not be suitable for cultivation.
1764. I suppose that land is chiefly alienated? Yes, near the proposed railway line; but there is some unalienated land within a few miles of the proposed line, which is to be thrown open next month.
1765. Do you think that what is known as the "halves" system is likely to largely increase the agricultural development of the district? I think it is; but there is not much in it for the farmer. The land-owners should give the farmers better terms.
1766. With reasonable terms is not the "halves" system a good way of giving a man a start in a district like this? Yes.
1767. How far is it from Marsden to your holding? Twenty miles.
1768. What is the character of the country from your holding towards Marsden? It is mostly plains of black soil. I do not think it would be of much good for cultivation. Still, I have heard that farmers have grown wheat Bundaburra way. From what I have heard, they seem to prefer the black-soil country to the forest land; but I have no actual knowledge of that.
1769. Have you formed any opinion as to whether the route of the proposed railway or the Bimbi route

is

- J. Hancock. is the better? I prefer the northern route, because there are more small holders on it than there are on the southern route, and there is also more land fit for cultivation.
- 19 Aug., 1899. 1770. Do you know the country along the Bimbi route? Yes; I have been over it as far as Bimbi. Along the road the soil is good for agricultural purposes—as good as it is on the northern route.
1771. Is the country you know of suitable for other crops than cereals? Yes.
1772. Will it grow fruit? I think it is rather too dry for that. It would grow grapes if the white ants did not destroy them, as they do to a large extent in that district.
1773. Have you any experience of the dairying industry? At one time I had a number of cows, and they seemed to do well; but I found that sheep paid better, so I got rid of them.
1774. I suppose sheep paid better because they were easier to look after? Yes; and there was no market for butter except in Grenfell, and, of course, we could not get it up like the factory butter.
1775. Is the black-soil country good for feeding cattle? Yes; it is good fattening country. It is famed for being fattening country.
1776. Do you think, if there were a system of treating the milk locally, that dairying could be carried on upon it to a considerable extent? I think the country would be very good for dairying, but it is also in every way suitable for sheep and agriculture.
1777. Do you think the settlement of the district is likely to increase to such an extent that the estimated loss on the proposed line would be speedily reduced? No doubt if the land is thrown open it will be taken up; but I do not know whether it will be settled to such an extent as to speedily reduce the loss on the line.
1778. Is there much land which can be thrown open? Yes, about Wheego.
1779. Where is that? Between Grenfell and Caragabal.
1780. Do you know what extent of country will be available? I am not sure, but possibly 20,000 acres.
1781. I presume that the development of the district must be looked for chiefly in connection with the holders of land increasing their operations in agriculture? Yes.
1782. Do you think that is likely to take place to a large extent? It will take place; I do not know whether it will take place to a large extent. I feel satisfied, no matter what quantity of land is available, that it will all be taken up.
1783. *Mr. Watson.*] How far is Bimbi from Grenfell? Twenty-two miles.
1784. Do you think if the proposed line be constructed *via* Piney Range, the traffic from Bimbi will tap it somewhere about Piney Range or Barbingal, or will it go towards Grenfell? From Bimbi it would, I think, go to Grenfell.
1785. In that case the people of Bimbi would have to travel 22 miles with their produce? Yes.
1786. The distance from Bimbi to the surveyed route of railway is between 11 and 12 miles? Under those circumstances I think many would go direct to the line.
1787. Of course, you understand that if they did they would have more railway carriage to pay for the carriage of their produce than they would have if they came to Grenfell? Yes.
1788. Would you feel inclined to invest any capital in dairying, if you had an area of black soil? I have not had much experience of cattle. I know that the land is very suitable for fattening, and if it will fatten cattle, it will produce milk.
1789. I presume you would not keep your cattle on such land all the year round? I do not think you would be able to depend on the grass altogether. You would have to go in for ensilage, as they do in other parts.
1790. Do you think you could get produce from the black soil with which to make ensilage, unless there is some red soil mixed with it? I think so.
1791. *Mr. Trickett.*] Supposing you had railway communication close at hand, and were encouraged to grow wheat in consequence, how many hands do you think you would employ in putting 1,000 acres under crop? At times I should have to employ twelve or fifteen hands.
1792. Then the development of wheat-growing would mean the larger use of labour on your estate? Yes.
1793. Does agriculture employ more labour than sheep-breeding? A great deal more.

William Walter Bell, farmer and grazier, Grenfell, sworn, and examined:—

- W. W. Bell. 1794. *Mr. Dick.*] How long have you resided in this district? Twenty-six years.
- 19 Aug., 1899. 1795. How would you describe the land for 20 miles on each side of the proposed line? I think the land for 20 miles on each side of the proposed line is second to none. It is, I believe, good for anything. I have not had any experience of the plains, but all the rest is good for anything you like to grow upon it in a decent season.
1796. Your opinion is that, practically, the whole of it, with fair seasons, is good agricultural land? Yes.
1797. What distance along the proposed route is taken up by the Bland plain country? Twenty miles.
1798. Have you supplied the Wyalong market with your produce? Yes.
1799. Do you think that with the construction of the proposed line that market will be even a larger one than it has been in the past? There would be a good outlet for forage at Wyalong in a bad season.
1800. Do you send any wheat to Wyalong? No; only chaff and other produce.
1801. What has been the effect of the sanctioning of the Koorawatha-Grenfell line, so far as the placing of land under agriculture is concerned? It has had the effect of causing two-thirds more land to be got ready for the plough.
1802. Do you think that if the proposed line is constructed to Wyalong the same results will be experienced elsewhere? Yes.
1803. Do you think the proposed line would pay? Yes, after a time. I think the estimate of loss would be reduced after a year or two.
1804. Do you think there is a sufficiently large area of good wheat country between Grenfell and Wyalong, almost equal in quality to that between Koorawatha and Grenfell, to justify the construction of the proposed railway? Yes.
1805. Do you think the people at Bimbi would carry their produce to the nearest station on the line or to Grenfell? I think they would go to the nearest station.
1806. In spite of the fact that they would have heavy traction on bad roads, and a longer railway journey to get their produce to market? The railway journey is not to be compared with the road journey.

1807. What is your opinion as to the maximum distance a man should be from a railway in order that he may grow wheat successfully? It depends on the price of the wheat. A man should clear 2s. a bushel to make wheat-growing pay. If he has to draw his wheat 20 miles he cannot do it under 3d. a bushel. If he has to draw wheat that distance he should be able to sell at 2s. 3d. a bushel. W. W. Bell.  
19 Aug., 1899.
1808. Do you consider that any distance over 20 miles from a railway is a serious handicap to an agriculturist? Anything over 20 miles is a very serious handicap.
1809. What is your opinion as to the relative merits of the northern route and the Bimbi route? The northern route would be the best, and would open up more country. The Bimbi route is along the mountain, and the holdings there are larger than on the northern route.
1810. Do you agree with the evidence which has been given to the effect that a man, in order to make a fair living between Grenfell and Wyalong, requires 2,500 acres of land? Hardly. A man could make a living out of much less than that. If the land is good he could make a living, by farming, off 640 acres. Many men have to make a living off less. If 640 acres will not keep a man and his family the land must be very poor.
1811. Do you think that the land between Grenfell and Wyalong is of such a character that a man could make a decent living off 640 acres? Yes.
1812. Do you attach any conditions to that statement? No; but, of course, a man could not keep sheep upon it, although he might keep a cow or two upon it; and, of course, he would have to be able to get his grain away.
1813. Is it the general experience that, whenever there is a bad season about Hillston and Wyalong, there is a fairly good season in the Grenfell district? Sometimes that occurs.
1814. How many times do you think it has occurred during the last twenty-five years? A good many; I could not say how many.

Jacob John Cundy, produce dealer, Grenfell, sworn, and examined:—

1815. *Mr. Shepherd.*] How long have you been a resident of Grenfell? Over thirty years. J. J. Cundy.
1816. What business have you been engaged in? Buying produce, such as hides, tallow, sheepskins, bones, and so on. 19 Aug., 1899.
1817. Do you generally send your goods to Sydney? Since 1st January I have forwarded about 300 tons of goods to Cowra.
1818. How long have you been engaged in your present business? Over two years.
1819. Have you found that there has been a large increase in your business since you have been engaged in it? Yes; I get more produce of all sorts.
1820. Do you expect a still further extension of business? Judging from present appearances it will extend.
1821. Do you think the Grenfell district is a favourite one for the production of fruit? Grapes and cherries grow well.
1822. What effect do you think the construction of a line from Grenfell to Wyalong will have upon your business? It will increase it considerably. The great drawback at present is the high carriage to market.
1823. What distance from Grenfell does your business extend? I get produce 40 miles from Grenfell.
1824. Has the increase in wool production been very marked during the last two years? I received more wool last year than I did when I first started business.
1825. *Mr. Watson.*] In what branches has your business increased during the last year? Sheepskins, hides, wool, bones, and opossum skins.
1826. Has the increase in sheepskins been general throughout this portion of the Colony on account of the drought? Yes; but if we had a good season we should have an increase in tallow.
1827. Where is the general drift of sheep from the Bland country? They generally make to Cowra.
1828. Have you seen any considerable quantity of sheep going that way? Yes.
1829. Have you been out of the town much? Yes; several days a week I go out from 15 to 20 miles.
1830. Then you do not go upon the Bland? No.
1831. Have you any knowledge of the Bland country? No.

James Beazley, farmer and grazier, sworn, and examined:—

1832. *Mr. Watson.*] Where is your holding? Twenty-six miles west from Grenfell. J. Beazley.
1833. What is its area? 8,228 acres, of which 450 acres are cultivated. 19 Aug., 1899.
1834. Have you increased your cultivated land? Yes; a few years ago I only had 100 acres of it.
1835. Has the prospect of the railway coming from Koorawatha to Grenfell had anything to do with your increasing your area under crop? Yes. We had to go in for mixed farming before that.
1836. Was there not sufficient prospect for making money out of sheep alone? No.
1837. Is your holding near Barbingal? Yes, close to it, on the Caragabal Road. The surveyed route runs through it.
1838. How long have you been in the district? Fourteen years.
1839. Do you know the country beyond your holding, towards Wyalong? I have been to Wyalong. I worked there for eight or nine months.
1840. How would you describe the country between Grenfell and Barbingal? It is good country for wheat growing, to where I live, for 10 miles beyond.
1841. Is there any considerable area of broken ground between Grenfell and your holding? No.
1842. Do the Weddin Mountains make a break in the land fit for agriculture? Yes; but it is good up to the foot of the mountain.
1843. What is the character of the country 35 miles from Grenfell? You get upon the plains there, and they continue about 10 miles further on to the Bland. The route followed by the proposed railway is better for agricultural purposes than is the land lower down; it is not so wet.
1844. How would you describe the land on the other side of the creek, towards Wyalong? There is very good country on the other side of the creek, but the land about Wyalong is rather poor.
1845. Do you regard the plain country as fit for agriculture? Parts of it.

- J. Peasley.  
19 Aug., 1899.
1846. What parts? The red plains. I do not think much of the black parts. The red plains are flat and low, and there is no puffy ground; the puffy ground is where the black soil is, and it is too wet. It is very good pastoral country.
1847. Then you think the greater portion of the route to Wyalong is over good country? Yes, very good country.
1848. Do you know the route of the surveyed line, *via* Bimbi? Yes.
1849. Which of the two routes is, in your opinion, more likely to benefit the country generally? I prefer the northern route.
1850. Does that go nearer to your holding than does the Bimbi route? Yes; but apart from that I think it is the best.
1851. For what reason? It runs through better land. There is more Crown land on the northern than on the Bimbi route. I think it is likely that 35,000 acres will be thrown open on Wheogo and Bogolong.
1852. What sized blocks will be necessary in order that a man may have a chance of making a living? 1,280 acres, combining agriculture with sheep-farming.
1853. Would the railway be of any service to you if it were taken *via* Bimbi? Certainly.
1854. Where would you take your produce if the line *via* Bimbi were constructed? To Bimbi, a distance of about 16 miles.
1855. How far are you from Grenfell? Twenty-six miles. Going to Bimbi would result in a saving of 10 miles of carriage.
1856. Do you think that under those circumstances you would be sufficiently close to a railway to enable you to grow wheat at a profit? I would be in a better position than I am at present.
1857. Do you think that at a distance of 16 miles from the railway you would be sufficiently close to make wheat-growing profitable in an average season at an average price? I think so.
1858. Whilst preferring the northern route, do you consider that the construction of the railway *via* the Bimbi route would be justifiable? Yes.
1859. What do you regard as a fair limit for cartage for a wheat-growing farmer? From 20 to 25 miles.
1860. Is there a good road between your holding and Grenfell? Fairly good. Of course in wet seasons I could not carry produce to Bimbi, and would have to go to Grenfell.
1861. With a decent road, 25 miles would not be outside the influence of a railway for wheat-growing? No.
1862. Supposing the line comes from Koorawatha to Grenfell, and stops there, will you give up growing wheat? No.
1863. Assuming that the present price of wheat is maintained, and you have ordinary seasons, you think it would pay you to grow wheat? Yes.
1864. Has any Crown land been thrown open about the district in which you reside? Yes; during the last two years. It was thrown open as homestead selections at £1 an acre.
1865. Was that timbered country? Yes.
1866. Is it likely to be fit for agriculture if improved? Yes.
1867. Would you care to give as much for the plain country as for the timbered land? I would rather have the timbered land.
1868. Does it not cost more to put it into working order? Yes; but it is the better land when improved.
1869. How many failures are you likely to have out of ten seasons? We have had three failures in thirteen or fourteen years.
1870. What was the average yield of wheat per acre during the good years? Sixteen to eighteen bushels to the acre. We have had as high as 30 bushels to the acre.
1871. Over what area of land? Sixty to seventy acres. Last year was the worst year we have had. Of course, the crop was a failure altogether.
1872. Leaving that year out of account, what was the lowest return? Ten to twelve bushels per acre—the average, however, is as I have stated—16 to 18 bushels per acre.
1873. *Mr. Trickett.*] Do you agree with other witnesses, that the land will carry about three sheep to 4 acres? In fair seasons it will carry about one sheep to the acre.
1874. Do you know what is the profit per acre out of raising sheep? I think that if a man makes 4s. an acre out of sheep-raising it is a reasonable amount.
1875. Do you agree that in order to obtain a profit out of wheat its minimum price should be 2s. per bushel? Yes.
1876. Then, if your average yield is 16 bushels to the acre, you will get a gross return from wheat of 32s. per acre, as against 4s. per acre for sheep-raising? Yes.
1877. Under those circumstances wheat-growing is the more profitable? Yes.

James Casey, farmer and grazier, sworn, and examined:—

- J. Casey.  
19 Aug., 1899.
1878. *Mr. Trickett.*] Where is your holding? Fourteen miles west of Grenfell. I have 7,000 acres of freehold and 3,000 acres of leasehold.
1879. Do you agree with the other witnesses as to the capabilities of the country for wheat-growing? Yes. I have 400 acres under wheat this year, as well as a lot of land already cleared.
1880. Do you contemplate increasing your crop? I have been increasing it during the last few years in the hope of the railway coming from Koorawatha to Grenfell.
1881. In the hope, I presume, of making more out of the land per acre than you can out of raising sheep upon it? Yes. Of course, sheep will pay in one sense, but agriculture will pay better. I may mention that in 1897 I sold at Forbes £360 worth of wheat off 100 acres. I got eighty bags of seed out of it. That was a year of high prices. Of course, I had to pay carriage out of that sum.
1882. Will the proposed railway pass through your property? Yes; it will cut it in two for a distance of  $4\frac{1}{2}$  miles.
1883. Have you any objection to that? No; I think that what is taken away from me will benefit the country.
1884. And yourself as well? Yes.
1885. Are you willing to give to the Government the land they require? Yes.
1886. How long have you been engaged in sheep-farming? Fourteen years.

1887. Do you look upon quick and convenient transit by railway as a necessity for a farmer in this district? Without that he might as well not start farming at all.
1888. Do you know of any instance in which the farmers have not been able to get their crops to market? Yes. I know of small farmers who came here with the intention of cultivating, and who had to sell out on account of there being no market. Practical farmers from Victoria were at that time buying flour in Grenfell for their own use, because it was cheaper to buy it than to cultivate it.
1889. Do you agree that 20 miles is as far as a farmer can profitably cart produce to market? Yes.
1890. Is the climate of the district sufficiently favourable to secure an average of crops which will pay the farmer, even without railway communication? I consider the climate in the Grenfell district is as good as any in New South Wales. The average rainfall is 23 inches per annum. The land is as good for wheat-growing as any in the Colony.
1891. Are the holdings about Grenfell very large? There are a number with 2,560 acres; others with 640 acres and 1,280 acres.
1892. Are there many large holders like yourself, Mr. Wood, and Mr. Greene? Bogolong and Caragabal are large holdings.
1893. Do you think these large holdings would be used more extensively if there were railway communication? Many men, when they see their neighbours cultivating, begin to put their own land to use. If the stock of big holders is of value, they must grow produce for them, and feed them in the winter time.
1894. Do you do that? Yes; I grow a good deal of hay for myself, but I sell a lot as well.
1895. Is this a good fattening country in ordinary seasons? Yes; it is a country which will carry a lot of stock.
1896. What do you think the land is capable of carrying? In good seasons I have had 10,800 sheep on about 8,000 acres.
1897. Would the land carry, on an average, a sheep to the acre? Yes, if it is improved.
1898. Do you grow any corn? Yes; it is a profitable crop in a good season. I have sold some at Wyalong at 2s. a bushel on the ground.
1899. Do you know the Albury district? Yes.
1900. How does the Grenfell district compare with it for vine-growing? The land is better here than it is there for vine-growing. We have chocolate-red soil and little slopes. Only small patches of the Albury district are adapted for grape-growing, but here you can find thousands of acres which are adapted for it.
1901. Which industry is the best as a means of employing labour and increasing settlement? Agriculture will employ more hands by five to one.
1902. Do you think the construction of the proposed line will tend to increase the population of the district? Yes. I think that any vacant Crown lands will be readily taken up.
1903. How far does the agricultural tract of country extend westward from Grenfell? You can get red soil for 32 miles out. After that you cross some plains of black soil.
1904. Do you think that is good for growing crops? Yes; it will grow heavy crops in good seasons, but it is more expensive to work.
1905. Have you any pests in this part of the country which affect the crops? It is sound country; there is very little rust in it.
1906. Does it produce good, marketable, sound wheat? Yes; it produces the best wheat in the Colony.
1907. Are there any pests of any kind in the district? Only the droughts.
1908. *Chairman.*] Have you ever seen the black-soil country cultivated? I think there is very little of it cultivated in this part of the Colony.
1909. Would a man be justified in trying to grow wheat upon it? Certainly.
1910. Would there be any possibility of draining the black-soil country? Certainly; but they will not go to the expense of doing it.
1911. Supposing a railway were constructed through that country, would men owning it be induced to cultivate it and to take all the risks? I daresay the small holders would chance it, but the big holders would refrain from cultivating it as long as possible.
1912. One witness has stated that it pays better to go in for agriculture than for sheep-raising;—is not a man with a lot of land just as eager to make money as is a man with a little land? Some of them are; others will do nothing but run sheep upon their land.
1913. How long will the land about Grenfell stand cropping without a spell? Some of my land has been cropped for thirteen years without a spell. The year before last, which was not a very good season, I got a ton of hay to the acre off it.
1914. *Mr. Watson.*] Was not the year before last a very fair season for hay? Yes, in some parts.
1915. *Chairman.*] Do you get 24 inches of rain at seasonable times, or at such times that will not improve your crop? We get it at seasonable and unseasonable times. Our last twelve months' rainfall was 17 inches. That is sufficient if we can get it when it is wanted. Last September and October we had no rain here.
1916. Generally speaking, does it come when it is beneficial to the crops? Yes; last year, however, it came out of season.
1917. Given a cheap means of getting produce to market, would the owners of land in this district put their land under cultivation? Yes.
1918. Where is your market for fat stock? Sydney. We truck at Cowra, which is 34 miles from Grenfell and 14 miles more from my holding.
1919. What is the cost of carrying a truck from Cowra to Sydney? About £5 3s.
1920. Supposing the proposed line is constructed, and you have good seasons and plenty of grass on the stock routes, will owners of sheep travel their stock by road to Cowra, or will they use the line? If you travel stock from Grenfell to Cowra by road they lose weight all the time, and they are knocked out when they get to Sydney. The result is that there is a loss of about 1s. 6d. per head.
1921. The saving by travelling them would be more than the loss by the falling-off in condition? Yes; the wages of the drovers alone would pay for a portion of the carriage. You would have to keep two or three men on the road for eight or nine days.
1922. Then stockowners would truck their stock at the nearest point for the simple reason that it would pay them? Certainly.

J. Casey.  
19 Aug., 1899.

- J. Casey.  
19 Aug., 1899.
1923. *Mr. Watson.*] You say that you have not seen any of the black soil cultivated? Not on the Bland; but I have seen it cultivated at Forbes.
1924. Do you think that the black soil at Forbes is similar to that of the Bland? Yes.
1925. When did you see the black soil cultivated at Forbes? I saw it last year. It looked right enough when I saw it; but I do not think the crops came to anything.
1926. I presume a crop would burn off quickly on that country? Yes.
1927. Which do you think would stand the drought the better, with a crop in it—the Bland black soil or the red soil? The timbered country would stand it better than would the plain country. If you are growing for ensilage, you can grow more on 1 acre of black soil than on the other soil.
1928. If you could get water for the purposes of irrigation, the black soil would be worth a good deal? Yes.
1929. If a railway is constructed from Koorawatha to Grenfell, you will be within 14 miles of it, and will consequently be fairly well served? I shall be 8 miles off it.
1930. The Railway Commissioners anticipate that the proposed line from Grenfell to Wyalong will show a deficiency of £3,000 per annum;—do you think the increase in production, consequent on the construction of the line, would be sufficient to make up that loss within a reasonable period? Yes. I may mention in regard to dairying that we can make in this part of the country as good butter as is made anywhere; but we have no place to which to send it. It is deplorable to see Sydney butter coming to this part of the country to be sold.
1931. Do you consider that the Young district is as good a district as Grenfell? Yes; from Young to Grenfell is as good a district as any in New South Wales.
1932. Are you aware that for some years past the butter factories in Young have been doing practically nothing on account of the bad season? Yes; I myself started cheese-making on a small scale, but I had to discontinue it.
1933. In view of the experience of Young, and the fact that its rainfall is about the same as that of Grenfell, do you think that dairying here is likely to be successful? It depends on the people who support it.

MONDAY, 21 AUGUST, 1899.

[The Committee met at the Municipal Council Chambers, Grenfell, at 10 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

William Richardson, farmer and grazier, sworn, and examined:—

- W. Richardson.  
21 Aug., 1899.
1934. *Chairman.*] What is the extent of your holding? I have 13,500 acres of secured land, and 10,000 acres of Crown land.
1935. Do you know the character of the country through which it is proposed to take a line from Grenfell to Wyalong? Yes. It is all good agricultural country to the edge of the Bland Plain—that is, for 30 miles out, and for 20 miles on each side of the proposed line. The whole of it is good agricultural land, excepting the tops of the hills, which are stony.
1936. What experience have you had of agriculture? I have grown wheat and corn, and all kinds of produce.
1937. Does your knowledge of the country enable you to say that the land for 30 miles out is suitable for agriculture? Yes; and also for 20 miles to the north and south of the proposed line.
1938. That means an extent of country 30 miles long and 40 miles broad? Yes. It is as I have described, with the exception of the Weddin Mountain, and the tops of the hills, which are stony. The land which is not suitable for cultivation will be, in extent, about 80,000 acres.
1939. Have you any tenants? I have farmers on the “halves” system; they have 600 acres of cropping this year.
1940. Are they satisfied with the results? Yes.
1941. Does your experience lead you to the belief that in a district like this the land will bear continuous cultivation? I think it will do so with safety for five or six years. Then it should be spelled for a couple of years, or there should be a rotation of crops.
1942. As a labour-giving occupation, is agriculture preferable to pastoral pursuits? It is far ahead of depasturing stock—so much so that I only keep three men all the year round looking after the sheep, whereas I have had upwards of twenty men on 600 acres of crop.
1943. To how many men do you estimate employment could be given if the agricultural land which you hold were put under cultivation? About 300.
1944. Are you situated within a reasonable distance of Grenfell? About 5 miles away.
1945. So that whether the proposed line is or is not constructed it would make very little difference to you? Very little difference. In the interests, however, of the people further west, it would be a good thing to construct the line.
1946. From what distance does it pay to carry wheat to a railway station? From anywhere within a distance of 20 miles.
1947. Have you proved the capabilities of the country in any other direction? I have grown all kinds of vegetables and fruit remarkably well.
1948. If the proposed line is constructed, are you prepared to increase the area you have under cultivation? That is my intention. I have already 1,000 acres ready for the plough, and I am preparing more.
1949. Do you think the promises which have been made that increased areas of land will be put under cultivation if the Koorawatha to Grenfell line is constructed are likely to be carried out? Yes. When the line is constructed people will find that they will make more money by growing cereals than by raising sheep.
- 1950.

1950. Is there not a reluctance on the part of pastoralists to become agriculturists? No doubt there has been; but as the population increases they must turn to cultivation. They will turn to what pays them best. What they want, however, is a line in order to convey their produce to market.

W.  
Richardson.  
21 Aug., 1899.

1951. Is it the want of cheap carriage to market that has prevented people from putting their land under cultivation hitherto? Yes. Opportunities would be given by commercial companies to enable men to clear more land if the line were constructed.

1952. Are the holdings in the district large, or is the land fairly cut up? It is very fairly cut up; but they are quite sufficient for a man to make a living off.

1953. Have you any knowledge of the country which the Bimbi deviation would serve? I know it fairly well; it is very good country. A few miles from Grenfell the land is very good; but it is not so good further on.

1954. Have you any knowledge of the black-soil country being cultivated? Only to a slight extent; but in years to come means will, I think, be found for dealing with that land satisfactorily, so as to enable it to grow cereals. I think it will be necessary to add light manure, so as to make the soil more friable. It will require draining as well. It is very rich pastoral country. All the land on the banks of the creeks is fit for growing crops, and so are the sand ridges. That land is dry and easy to work; the other land becomes saturated in wet weather, owing to the want of drainage.

1955. Is there any fall in the land there? A very slight fall. It would be necessary to run the water-course into the creek. I may mention that I have taken notice of the surveyed route of the line from Grenfell to Wyalong, and I would suggest that a cutting should be made in the gap one mile from Grenfell, so as to shorten the construction by a mile or a mile and a half. Instead of the line going exactly on the route proposed, I would deviate it a little further north, and go through the gap and along the northern side of portion 151. By doing that a large curve would be avoided. If at some future time it were found necessary to connect with Forbes, the Forbes survey could be continued to meet the 315-mile point.

1956. What amount of construction would that save? About  $1\frac{1}{2}$  mile.

1957. Would it not necessitate a heavy cutting? It might necessitate a tunnel 30 chains in length.

1958. Then you think it would be advisable to pierce the range by means of a tunnel 30 chains in length in order to avoid  $1\frac{1}{2}$  mile of construction and maintenance for all time? Yes. I may mention that in the cutting there is a fine head of ballast, which would probably last for all rail and road purposes for 100 years.

1959. *Mr. Shepherd.*] What crops would you grow in rotation in addition to wheat? Oats, barley, peas, and perhaps beetroot.

1960. Would it pay you to grow a large quantity of peas? I think so. Some of the crops might be ploughed down for manure.

1961. There is no doubt that growing green manure thoroughly resuscitates the land? Yes; as population increases people will be compelled to do something of that kind.

1962. What area of land do you think is sufficient to support a family in this district? In order that a man may support a family and live at all well, he would require 2,000 acres, so that he can run sheep upon it. If we had the railway, so that the land could be put to its fullest use, I should think a man could make a comfortable living out of 200 or 300 acres.

1963. Has an attempt been made to grow fodder—sweeds for instance, for cattle? No; we only grow corn, barley, and rye, and have cut it green.

1964. Have you endeavoured to grow pumpkins? Yes; they do well.

1965. *Mr. Trickett.*] Can you say what extent of land over an area of 20 miles on either side of the proposed railway is suitable for agriculture? Taking a radius of 20 miles on either side of the proposed line, and for a distance of 30 miles from Grenfell, there are, so I estimate, 300,000 acres of wheat-land; that area would reach as far as Caragabal one way, half way to Forbes the other way, and to Bimbi on the south. All the land around Bimbi is suitable for cultivation.

1966. Would the northern route accommodate the Bimbi people? The southern route will accommodate them better.

1967. How far would the Bimbi people have to carry their produce if the proposed line were constructed? Twelve miles. If the railway went to Bimbi it would be going towards Young.

1968. If the line is constructed *via* the northern route, will not the Bimbi people bring their wheat to Grenfell instead of striking it at right angles? I think so, because they have a road to Grenfell.

1969. Are the 300,000 acres of land to which you have referred red-soil? Yes.

1970. Is it alienated land? No. I think there must be 70,000 acres of Crown land which will shortly be thrown open.

1971. In one block? No, in various blocks. There are 8,000 acres on Bogolong, and there will be more on the runs further west.

1972. Is the Crown land good land? Yes; it will grow anything when it is cleared.

1973. What kind of country is there beyond Caragabal? Beyond Caragabal you get into the boree and plain country; it is all black soil.

1974. Is it suitable for growing crops? If it were treated with some light litter, such as straw, and were drained, there is no doubt it could be cultivated to advantage. As the population increases in years to come some method will no doubt be found of dealing successfully with it.

1975. But naturally the red soil, which is more easily cultivated, would be taken up first? Yes, certainly.

1976. Does the black soil extend all the way from Caragabal to Wyalong? No. From Caragabal to 20 miles beyond would be the extent of the boree country. That would take you 50 miles from Grenfell. Then there are 10 miles to Wyalong, and a good deal of that country is covered with mallee. If the mallee were destroyed it would be thoroughly good agricultural land. It is a red, loamy soil.

1977. Is it not rather difficult to clear? The people of New South Wales think so, but the Victorians think little of clearing mallee. They burn the bushes, draw the rollers over it, knock up the stumps, and then plough it with heavy ploughs. The stumps are then gathered up and burnt. We have had so much land about here to deal with that we have not been compelled to clear the worst.

1978. Which of the three soils is the best suited for agriculture—the red, the black, or the mallee? Most decidedly the red soil.

1979. In the ordinary course of events, wheat-growing is not likely to extend in that direction until all the good land is used up? I would not say that. If the proposed line is constructed to Wyalong the mallee country will be put under cultivation immediately.

1980.

- W. Richardson. 1980. If that is so, you will be deprived of that portion of the country as an outlet for your produce? Yes.
- 21 Aug., 1899. 1981. In that event your market will, to a large extent, be Sydney? And England, I suppose. We shall have to ship wheat in the same way as we have to ship wool.
1982. I understand that one of the mills in Grenfell has been destroyed, and that the other has been closed? Yes. A movement was started some time ago to establish a mill, but the difficulty was that those who took part in it was not quite satisfied as to where the line was going to be. I understand that, as soon as the position of the line was definitely known, steps would be taken to erect a mill at Grenfell.
1983. Do you think milling will be gone in for locally to a large extent? Yes; fully for the requirements of the district.
1984. Can you give us any information as to the comparative cost of treating land for pastoral purposes and for agriculture, and also as to the actual results? It seems clear to me that, when you take into consideration the making of tanks, the construction of fences, and ringbarking the land, it will cost almost as much money to prepare land for sheep as it will to prepare it for wheat. I estimate that it would cost 10s. more per acre to prepare land for wheat than it would to prepare land for sheep. I think, however, from what I have seen, that the return from wheat is greater than the return from sheep.
1985. We have been told that an average price of 2s. per bushel of wheat on the ground will give a fair profit? I am satisfied that if we had a railway here that would pay. If there were 10 or 20 bushels to the acre the profit, of course, would vary. If we have an average of 16 bushels to the acre, that means, of course, 32s. an acre. Inasmuch as a crop can be put in and taken out for £1 an acre, the result under those circumstances would be a profit of 10s. an acre.
1986. How would that compare with the profits per acre from sheep? If the land is well improved, sheep should give a return of 5s. an acre in this district. When the land is thoroughly improved it will maintain a sheep to the acre.
1987. You estimate, then, that the return from wheat-growing is double that from sheep-grazing? Yes.
1988. What is your opinion of the northern route as compared with the Bimbi route? I think the northern route would be the better, because it is shorter. It would be a quicker way of getting coal to the Wyalong mines, and of sending produce to the west. A good deal of traffic which is not at present thought of would be opened up. I also advocate the northern route with the view at some future day of connecting with Forbes. The adoption of the northern route would avoid the necessity of back-shunting at Grenfell.
1989. What is your opinion of the character of the land on the two routes? I think the land around Bimbi is, on the whole, equal to that I have already described.
1990. You have stated that 70,000 acres out of 300,000 acres are to be thrown open this year;—is the balance held by large holders? No; the largest holdings are from 2,000 acres to 3,000 acres.
1991. Are there no large holdings? Not until you come to Caragabal.
1992. Is the country capable of supporting a population of small holdings? Yes, I know of one person on 160 acres of land. He cultivates it thoroughly, and I know of no farmer who is more comfortable than he.
1993. Then there is every prospect, with a speedy despatch of produce to market, of the population largely increasing? It must do so.
1994. Mr. Donkin, when in Sydney, stated that the country about Lake Cowal and to the south would, he thought, be largely used for dairying? I think so too in good seasons. It is a wonderfully rich grazing country.
1995. Is it not subject to drought? Every district has been subject to drought during the last four years.
1996. He also stated that as the result of many years' experience he found it necessary that a man keeping stock should hold double the land necessary to carry them, in order that he might be able to spell his paddocks? Yes, in droughty seasons; but not in good seasons. I consider that 2,000 acres is sufficient to enable a man to maintain a family.
1997. Does that remark apply to the country in the Lake Cowal district as well? Yes.
1998. Even if a quarter of the land had to be rested? It oftens happens that owing to the want of a railway our stock, when fattened, have to be kept at home. If they are driven a great distance they become poor. If we had railway communication they could be trucked away at once, and we could then spell our land.
1999. Do you know the cost of clearing mallee country? I should think 10s. to 12s. an acre would cover it. For that sum you could cut the mallee down, roll it, burn it, and afterwards plough it.
2000. *Mr. Shepherd.*] The mallee country to which I have been accustomed could not be cleared for anything like that sum, because of the large size of the roots? The mallee about here is very small. It is what is known as scrub mallee. With a strong plough it can be taken up after being rolled.
2001. *Mr. Watson.*] The price you have mentioned would be quite as low as that which is paid for getting dry timber taken off box country? Yes; but in that case we have to dig round the trees and chop out the roots.
2002. I believe the reason the mallee country has not been taken up is because it is more expensive to clear? No; I believe the reason is because it is too far from a market. I feel sure that when we have a railway the mallee country will be dealt with.
2003. You have stated that with drainage the black soil could probably be used for agriculture;—will you tell me to where it would be possible to drain in that flat country? The Bland Creek.
2004. Do you think it would be worth while going to the expense of draining when there is so little fall, in order to get the black soil into cultivation? Yes; when the population increases, say, fifteen or twenty years hence.
2005. How much would it cost per acre to drain any considerable area of that country? I could not give an estimate.
2006. Would it not cost a large amount of money? No. If I were to drain it, I should get a strong team of bullocks, and a huge plough, and would plough a few furrows, and throw the soil out by means of scoops.
2007. But even then it would cost a good deal of money to make drainage effective when there is so slight a fall in the ground? I would point out that the main creek runs through the Bland country, and every mile or half a mile there are little natural waterways running into it. The country could be easily drained into

into these waterways. I do not think draining would be of service without the application of some light manure to open the soil. If you apply straw to clayey ground, it becomes so light that you can draw your foot through it after a period of about five years.

2008. Is it not a fact that a drought affects the black-soil country more quickly than it does the red-soil country? Yes.

2009. Is the rainfall out towards the Bland less than it is around Grenfell? Yes.

2010. You have stated that an outlet for coal might be found in Wyalong? Yes.

2011. Mr. Pittman, the Government Geologist, has expressed the opinion that the ores there will not require smelting? I could not speak on that subject, of course.

2012. I believe that at one time the people on the Bland ran cattle solely? Yes.

2013. They gave up cattle, because they found that sheep would pay better? The reason they gave up cattle was because of the 1877 drought.

2014. If a man goes in for dairying, must he not have a reasonable prospect of obtaining feed all the year round? Yes; dairying cannot be profitably carried on, unless you grow sufficient green fodder to provide for the winter, and even for the summer as well.

2015. Should you care to embark in dairying on the Bland country? No; I could not say that I should. I may state that the proposed line will go through 7 or 8 miles of my land, and I should be willing to give what is required to the Crown.

W.  
Richardson.  
21 Aug., 1899.

Patrick Alfred Madden, farmer and grazier, near Piney Range, sworn, and examined:—

2016. *Mr. Dick.*] Where is Piney Range? Nearly 20 miles from Grenfell.

2017. How many acres of land do you hold? 2,500.

2018. Have you gone in much for wheat cultivation? Yes; for nearly 300 acres.

2019. How long will land in this district stand cropping? I took up land in 1885, and cultivated it, and it has had a spell of two years. It is being cropped at present, and there is a prospect of it giving 2 tons of hay to the acre, or 20 bushels of wheat.

2020. In other words, you have cropped it for twelve out of fourteen years? Yes.

2021. What is the carrying capacity of the holding which you devote to sheep-raising? I have shorn 4,600 sheep there, and sold them all as fats.

2022. That means about two sheep to the acre? Yes.

2023. Is there much land between Grenfell and Wyalong of a similar character to yours? Yes; for 35 miles from Grenfell.

2024. Have you had experience in agricultural and pastoral pursuits in any other part of the country? Yes; at Albury and in Victoria.

2025. Given railway communication to Wyalong, how would you compare the prospects of this district with those of the Albury district? A man can do better here; we have just as good land for cultivation, and it is a great deal better for fattening stock. For the last six years I have sent over 1,200 fat sheep to Sydney, yearly.

2026. Has the prospect of the construction of the Koorawatha to Grenfell railway induced you to put a large area of land under cultivation? Yes.

2027. Would the construction of a line from Grenfell to Wyalong lead you to still further increase your cultivated area? Yes; I intend to continue until I get 1,000 acres ready.

2028. In spite of the fact that you have sold 1,200 fat sheep yearly? Yes.

2029. Are we to conclude from what you say, that, given railway communication, the profits from wheat-farming are greater than those from sheep-grazing? Yes; I do not think that I get an average of more than 4s. 6d. for my sheep, although I have to go to the expense of driving them from here to Cowra or Young.

2030. Do you agree with Mr. Richardson as to the profits from sheep-farming and wheat-raising, namely, 10s. an acre from wheat, and 5s. an acre from sheep? I think I should have estimated 6s. or 7s. an acre from sheep. Still a man cultivating wheat would have the advantage.

2031. Do you think the district between Wyalong and Hillston would be a market for the Grenfell producers? In a dry season it would be a good market for this district.

P. A.  
Madden.  
21 Aug., 1899.

John Cleary, farmer and grazier, Piney Range, sworn, and examined:—

2032. *Mr. Shepherd.*] What is the extent of your holding? 2,560 acres.

2033. How much land have you under cultivation? 170 acres.

2034. Is the whole of your holding ringbarked and scrubbed? Yes.

2035. How many sheep have you? 1,200.

2036. Do you consider your holding fully stocked? No.

2037. In the event of a railway from Grenfell to Wyalong being constructed, would you be likely to increase your holding under agriculture? Yes; up to 1,000 acres.

2038. What does it cost you to prepare land for agriculture? Fourteen shillings to 15s. per acre. The highest we have paid has been 16s. Of course I am not referring to country in its natural condition; it has to be ringbarked and scrubbed for eight or ten years.

2039. What distance do you consider it would pay a man to carry wheat to a railway station? With the present prices ruling for wheat, I consider a man should be within 15 miles of a railway to enable him to make wheat-farming pay. He should be so situated that he would be able to get to and from the railway station in a day.

2040. What is your average yield per acre in an ordinary season? About 16 bushels.

2041. What do you consider is the cost per acre of ploughing, sowing, and harvesting your land? About 15s.

2042. So that if you have 16 bushels to the acre you would make a clear profit of 17s. or 18s. per acre? Yes.

2043. You can do nothing like that in sheep-farming? No.

2044. Do you keep any fat cattle? Not many.

J. Cleary.  
21 Aug., 1899.

- J. Cleary. 2045. Have you fairly good pasture all the year round? Yes; in an ordinary year we should have fairly good pasture all the year round. The pasture is of a very fattening nature in the spring of the year.  
 21 Aug., 1899. 2046. What sort of grass have you? The natural grass—that is the Bland grass—will grow if the country gets a spell, and it will eventually take the place of all other grasses. It grows 6 or 7 feet high, and is the natural grass of that part of the country.  
 2047. Are you well acquainted with the route of the proposed railway? I know 30 miles of it.  
 2048. Which route do you think would be the better for the public, irrespective of individual interest? The northern route; it would benefit more people. If the population is not there at present, it will come there; but I think that even at the present time it will benefit more people than will the Bimbi route. It would give a great impetus to agriculture.  
 2049. How long will the land stand cropping without manuring or resting? At least ten years.  
 2050. Does it become completely worn out in that time? No. I may mention that the same class of country exists for a distance of 30 miles.  
 2051. Do you think that at the end of ten years the land will cease to pay for growing crop? Without manure.  
 2052. Do you think it is wise to cultivate the land to the last point? No; I think it is wise to spell it, or to rotate the crops. For instance, it might grow oats and barley.  
 2053. Have you had any experience of manuring with green manure? Yes.  
 2054. How have you found it answer? More satisfactory than any other manure we have applied. Field peas have suited the purposes of manuring, and have given a good return as well. On worn out land at Albury I have sown peas, and then wheat, and I had as good a crop of wheat as any I ever produced.  
 2055. Did you find the field peas to answer well? Yes, it cleans the land and makes it suitable for growing any crop.  
 2056. *Chairman.*] It has been stated that a return of 2s. 9d. per bushel for wheat-growing would make that industry pay? I think that, with facilities for getting to market, wheat at 2s. 9d. per bushel will pay better than sheep-farming.

Steele Caldwell, farmer and grazier, sworn, and examined:—

- S. Caldwell. 2057. *Mr. Trickett.*] Where is your holding? Thirty miles to the south-west of Grenfell.  
 21 Aug., 1899. 2058. What holding have you? 20,000 acres, including 11,000 acres of freehold. I have 5,200 sheep, sixty cattle, and twenty horses. The area under crop is 220 acres, and I intend to increase it yearly.  
 2059. Have you any statement to make? Yes. I wish to state that I advocate the construction of a line of railway from Grenfell to Wyalong across the Bland country. The prosperity of the whole of the Bland district has been diminishing yearly for a considerable time. The disadvantage of its being out of touch with a railway during periods of drought has caused untold loss. I contend that the construction of a line of railway would be the means of assisting this district to regain its normal condition. As far as my experience goes, grazing alone does not pay. I have had the advantage of being within the district during some of the best of seasons, and my position to-day is very little better than it was twenty years since, or at the time I came into possession of the property I now hold. I take it that necessity will compel landholders within the Bland and Wyalong districts to cultivate their holdings, or part thereof, to combine grazing with farming, as the only possible means of making the land pay. The two industries worked together assist each other. South and south-west of the Weddin many are farming on a fairly large scale, but the area intended to be cropped has been greatly restricted this last two or three years by drought. I understand they are all increasing the area of cultivation, and intend continuing to do so, in the event of a line of railway being constructed within a suitable distance. I consider, with suitable roads, farmers are fairly well served if within 16 miles of a railway. Many contend that beyond that distance farming does not pay. I am in favour of the line south of the Weddin. It is more central and will serve a much larger population. It passes through the village of Bimbi, which has a population of 150, and a school roll of fifty-four children. There is a great demand west of this district for produce. This line would enable this district to get a market there. This line would bring into touch some of the finest farming land in the Colony; embracing the lands that once comprised the pastoral holdings of Kikiama, Upper Balabla, and the southern part of Bribaree Creek. The country that once comprised these holdings now embraces numerous farms. A siding at Bimbi and one near Arramagong would bring all this land within 16 miles of a railway, and the roads leading thereto would descend, which would be an advantage in the hauling of produce to the line. Further along this line, for a distance of 25 miles, there would be a plentiful supply of water, which, I understand, is not so easily obtainable along the northern line.  
 2060. When you get past the 25 miles to which you have referred, the water supply on either route will be the same? Yes.  
 2061. What is that water supply to which you have referred? It is underground water, within 20 feet of the surface, along the banks of the Burrangong Creek.  
 2062. You seem to have a small number of sheep on your holding? It is small, but it is about the average carried during the last two or three years. I do not think any of the land in the Bland district has carried more than one sheep to 3 or 4 acres during the last two years. Before that, on improved lands, we generally carried one sheep to the acre.  
 2063. Is there any special reason why you have not got on too well in the district? It is on account of losses caused by the recent drought.  
 2064. Would better means of railway communication improve the present state of things? Yes; it would enable graziers in droughty seasons to cultivate portions of their holdings.  
 2065. Is the country in the locality in which you live suitable for cultivation? Portions of it are. The red soil is especially good.  
 2066. Has it been a success where you have gone in for it? Yes.  
 2067. What is a fair average yield to the acre? About 12 bushels.  
 2068. Do you think 16 bushels per acre would be an excessive return? It might not be nearer to Grenfell.  
 2069. As you go more to the west, the rainfall diminishes? Yes.  
 2070. Would 12 bushels of wheat to the acre be a payable crop? I think so. Of course, the use of modern machinery means less expense in cultivation.  
 2071.

2071. Mr. Richardson has told us that he thinks the mallee land about Wyalong could be put to some use;—do you agree with that statement? Yes. West and south of Wyalong it is splendid land. It has a light rainfall; but it is quick-growing soil. S: Caldwell.  
21 Aug., 1899.
2072. Then Wyalong would not be a market for Grenfell if that land were cultivated? Perhaps not.
2073. Under those circumstances you would have to export your produce? Yes.
2074. What is your opinion of the character of the country on the northern route as compared with the Bimbi route? I think the balance of the productive country would be on the southern route.
2075. Do you base that statement upon the fact of the mountain taking up a lot of land not suitable for agriculture? I do.
2076. What is your nearest distance to a railway station? Young is the nearest point of access at present, and that is 37 miles away.
2077. Is the road a bad one? It is an indifferent road. Only a portion of it has been attended to. Some of it has not even been cleared.
2078. Is that one of the disadvantages, to which you refer in your statement, in keeping the country back? Yes.
2079. Have you lost much stock during the last few droughty years? Yes. I have had to sacrifice large quantities of stock at a low price.
2080. Would you have been able to get some of them away to market with a railway? Yes.
2081. Would you, as a large holder, go in for agriculture to any extent if you were within 16 miles of a railway? Yes; it is my intention to do so, even at my present distance from Grenfell—30 miles.
2082. Do you consider that the estimated loss on the proposed line would soon diminish? I think the population would increase rapidly. There are about 74,000 acres of Crown lands west of Bimbi, which will be thrown open during the next twelve months. I refer to the Euroka holding, Wentworth Gully holding, West Bland, and Worangora.
2083. Is the bulk of that land suitable for agriculture? It is suitable for mixed settlement. There is a good deal of red soil in it, and it is the best of grazing country in moderate seasons.
2084. Do you go as far as some of the witnesses by saying that every acre of it is good? I do not.
2085. Do you think a man could live on 200 acres of land? I know of one who lives on that amount.
2086. What does he do? He farms wholly and solely, and shears during the off seasons. He does very well. He has had two or three failures lately on account of the droughty seasons.
2087. Is the 74,000 acres to which you have referred slightly improved? It is ringbarked.
2088. After it has been ringbarked a year or two is it easily cleared? Yes.
2089. Do you think the value of the Crown lands would be largely increased with railway communication? I do.
2090. Could you say to what extent? To a quarter, or nearly double the present rental.
2091. Other witnesses have stated that the northern route has advantages over the southern route, from a natural point of view? I think the southern route would serve the larger population. It would be a less difficult line to construct, from an engineering point of view, although it would be longer.
2092. Are either of the routes on what you would call flooded country? No. The country is low, crossing the Bland Creek, but I do not think there would be any engineering difficulties.
2093. Could you say that one would be more likely to be damaged by heavy rainfalls than the other? The further up the creek you go the less liability is there to flood. If there is any difference at all, I should say the southern route has the advantage. The banks are higher there, and the country less liable to floods.
2094. *Mr. Watson.*] How many miles is Bimbi from Grenfell by road? Twenty-one and a half.
2095. Supposing the line is constructed by the northern route, would the Bimbi people make towards the railway at Bolingerai? I believe so.
2096. Do you think the Bimbi people would make towards the Wyalong extension with their trade, or go towards Grenfell by the existing road? I believe the traffic would divide itself. Some would prefer the road, and others the line.
2097. Would the northern route be of any advantage to the people of Bimbi? Very little. Most of them would prefer to go towards Grenfell by the existing road.
2098. Generally speaking, you prefer to go with your produce to a centre? Of course, a good deal would depend on the conditions under which the produce would have to be conveyed.
2099. Do you think the people of Bimbi are so far from the proposed line that they will be materially handicapped in their cultivation? Yes; the people at Bimbi and east of Bimbi.
2100. If the proposed line were taken near Bimbi, would the Piney Range people be handicapped? They would have a railway station at Grenfell.
2101. Do you think that is sufficient to reasonably serve them? Yes; it is only 15 or 16 miles away.
2102. You consider, then, that the people at Bimbi would be inconvenienced to a greater extent by the line not being taken in their direction than would the people of Piney Range? Considerably more so.

James Simpson, farmer and grazier, Emu Creek, sworn, and examined:—

2103. *Mr. Watson.*] Where is Emu Creek? Eight miles from Grenfell, on the Bimbi road. J. Simpson.  
21 Aug., 1899.
2104. What is the extent of your holding? 1,200 acres. 642 acres are under crop.
2105. What has been your experience with regard to production? It has varied according to the seasons. I have had from 24 bushels down to 5 or 6 bushels of wheat per acre. The average for a number of years has been about 12 bushels.
2106. Do you favour the construction of a railway from Grenfell to Wyalong *via* Bimbi? I do.
2107. For what reason? There is more agricultural land on that route, and it will be more suitable for a larger population. On the northern route the land is not suitable for cultivation. It is hilly country. Between Mr. Richardson's station and Emu Creek the land is suitable for cultivation, but when you go to the right it is hilly country. As you advance towards Piney Range there is a lot of country between the Marsden and the Forbes roads, which, in my opinion, is not very suitable for cultivation. It is not what I call first-class agricultural land. It is not to be compared with the land on the southern route.
2108. Have you been far out from Grenfell, on the Marsden road? Yes, about 18 miles.
2109. Do you consider there is less land for cultivation on that route than there is on the southern route? When you get out about 8 or 10 miles the land improves; but for the first few miles from Grenfell,

- J. Simpson. Grenfell, except on the left hand side of the road, it is of an inferior quality. I travelled over that land before I settled down.
- 21 Aug., 1899. 2110. And eventually you settled down at Overdale in preference to land to the north? Yes.
2111. Had you an opportunity of obtaining land to the north? Yes; when I came here all the land was open.
2112. You could have taken land on the north or south, as you wished? Yes.
2113. And you preferred, on account of your knowledge of the country, to go where you now are? Yes.
2114. Was there any other reason which influenced you in making your choice? No. I may mention that at that time there was no railway nearer than Goulburn. I took up the land, because it was good, and better-watered country, and there were better means of conserving water. I wanted to get as close to Grenfell as I could, as I thought I could do something in the way of dairying.
2115. Would you not have been as close to Grenfell on the northern route? I could not get as good land on that route.
2116. But you could easily have conserved water? But the land is not so good.
2117. You say you know the land for 18 miles round? Yes; for the first 10 miles it is not so good as the land on the Bimbi route.
2118. What about the next 8 miles? It is fairly good; but I consider there is too much sand in it. I do not think it will stand cultivation in dry seasons as well as land with more body in it.
2119. You say that the land for the next 8 miles is more sandy than is the land around Bimbi? It is sandy; but it approaches to the land about Bimbi very much. I think, however, a greater extent of country would be served by the line going by way of Bimbi. Going out towards Forbes you get into black-soil country, which I do not consider suitable for cultivation.
2120. Have you been on the Bland country? Yes.
2121. What is your opinion of it? I do not think it is suitable for cultivation except in regard to portions of it.
2122. Do you think it could be drained at a moderate cost? No; most of the Bland country is small-gilgai country, and the water lies in it. You would require underground draining to bring it into a condition for cultivation.
2123. And that would cost more than wheat-land would be worth? Yes.
2124. Do you think a line constructed in a northerly direction would help the Bimbi people? I do not think it would suit them at all.
2125. Would they take advantage of it? I do not think so, unless they were sending their produce west. I may say that I would rather draw my produce 20 miles if I were going towards a market, than I would draw it 10 miles to a railway station, taking me away from my market, which going to Bimbi would entail.
2126. Do you consider that it is only in occasional dry seasons that you would find a market to the west? For a few years to come. I believe we should have a market to the west until such time as the land about Wyalong were brought under cultivation.
2127. Do you look for any permanent market to the west? We might have one for ten or twelve years, but we should have to depend on exporting.
2128. I do not suppose you consider yourself interested, to any extent, in the proposed railway, seeing that you are situated only 8 miles from Grenfell? The proposed line passes through my property, and I take it that if the Bimbi route is followed, there will be a siding to which I shall have the opportunity of conveying my produce.
2129. But you are not so far from the proposed line that its non-extension in your direction will do you any material injury? That is so. I only wish to see the line constructed, so that it will benefit the greatest number. There is a lot of land in the neighbourhood of the Bimbi route which will be thrown open in a year or so, and a large population will settle upon it. There are 2,000 acres of Crown lands on the Arramagong East holding, which I hope to see thrown open on the expiration of the lease.
2130. Has there been any increase in cultivation in the district in which you reside, on account of the proposed construction of the line from Koorawatha to Grenfell? Every one round about has increased his area of late years, and I attribute that partly to the prospect of getting the line to Grenfell.
2131. Then it is reasonable to suppose that, with the construction of a line from Grenfell to Wyalong, there would be a further material increase in cultivation? Yes.
2132. How far on the Bimbi route does the land fit for agriculture extend before you reach the black soil? There is land fit for cultivation 30 miles out, although not continuously. It extends past Euroka.
2133. That is a similar distance to that which, we are informed, is available on the northern route? You might extend it to more than 30 miles, because it will go within 4 miles of Williams' Crossing, and still find good land.
2134. Do you say that you could cultivate to within 4 miles of Williams' Crossing? Yes.
2135. How far is that from Grenfell? About 37 miles.
2136. Have you been to Wyalong? Yes.
2137. What do you think of the land towards Wyalong? There is some good land for farming purposes in the neighbourhood of Wyalong. If I were now looking for a home I would be inclined to take up land near Wyalong.
2138. Is it possible to do anything with the gilgai country near Wyalong? Only for grazing. The mallee would be good farming land, but it would be expensive to bring it under crop.
2139. On the whole you think that the construction of a line from Grenfell to Wyalong is justifiable, and that it should go by way of Bimbi, in order to serve the largest population? Yes. There is water at convenient distances on the route. It follows the bank of the Emu Creek for 10 miles. Water can also be got at Sandy Creek, within 8 or 10 feet of the surface.
2140. Have you any further information to supply to the Committee? I may say that in the immediate neighbourhood of my holding there are on the Arramagong estate twelve selectors who would be served by a railway *via* Bimbi. The northern route would not serve them at all, and they would have to rely on getting to Grenfell.
2141. Have you had any experience of working the black soil country? No; but from what I have seen of it I would not take it up for farming purposes.
2142. *Mr. Trickett.*] What length of line would there be through your property? About half a mile.
2143. Should you be willing to give your land, if required, for railway purposes. Yes. I think others are willing to do the same. Some are also willing to exchange for land adjoining.

Hugh Gault, farmer, grazier, and sawmill proprietor, Bimbi, sworn, and examined :—

2144. *Mr. Dick.*] Have you heard the evidence of the previous witnesses with regard to the Bimbi route? Yes. I am in favour of that route, because I think it will be advantageous to the largest number of people and it would lead to a greater increase of closer settlement than would the construction of the line *via* the northern route. H. Gault.  
21 Aug., 1899.
2145. Do you know the Bland country? Yes.
2146. One of the witnesses in Sydney has told us that the flooded area along the Bimbi route is wider than it is along the northern route? I differ from that opinion altogether.
2147. Does the flooded area widen as the Bland Creek goes north? Yes.
2148. What is the area of your holding? About 5,000 acres of selections and leasehold area. I have about 150 acres of it under crop.
2149. Did the prospect of railway extension from Koorawatha to Grenfell lead to an increase in cultivation in your district? Yes; but not with me personally, because the seasons have been too dry for ploughing.
2150. If the line were constructed along the northern route, whence would the people of the district take their produce? Personally, I would go to Young with some of it, in preference to going to Grenfell. In wet weather it is almost impossible to get out to Caragabal.
2151. Then, if the line were constructed on the northern route, the people of the Bimbi district would continue to haul their produce to Grenfell or Young? Yes.
2152. Is Bimbi a progressive district? Yes; it was only formed a few years ago. A village was surveyed there, and a number of suburban blocks of from 4 to 6 acres were put up for auction. Two years ago none of them were available. The township blocks are nearly all occupied. There is not much more room for settlement in the village. There is a permanent population there.
2153. Do you think the Bimbi route affords superior facilities for the trucking of stock? At the village of Bimbi there are five travelling stock routes intersecting each other. There is one through Caragabal, Williams' Crossing, Old Balabla, Young, and Grenfell.
2154. Are they used much? Yes.
2155. Would the construction of the southern route offer any advantages in regard to the supply of timber for the line? Yes; there is a good deal of ironbark close to the line. The Weddin Forest reserve is getting cleared now. Sixty men have been sent from Sydney to clear and thin it out. There is a fine lot of ironbark there.
2156. Is it the real ironbark, or mugga? It is not the really good ironbark; but there are some large trees there.
2157. The Weddin Forest would be available for either route? Yes.
2158. Would you have any new markets by the construction of the line *via* Bimbi? Yes. Young consumes the principal portion of our timber. Harden also takes some of it.
2159. Would the construction of the railway affect those markets? It would give us cheaper carriage. There are 32 miles of very bad carriage. It is almost impossible to travel in wet seasons on the black country, for the first 14 miles from Bimbi. My opinion is, that whenever a line is constructed there should be an adequate water supply for the use of the engine. I have been working an engine for the last twenty years, and the water, for which I have had to sink 90 feet, is corrosive. The water in the surface drift at Bimbi is as good as any to be found, and there seems to be a never-ending supply. During the last three or four years the stock of the district have had to be conveyed to it to get water.

Thomas Goonan, farmer and grazier, near Bimbi, sworn, and examined :—

2160. *Chairman.*] Where is your holding? Six or 7 miles south-west of Bimbi, and about 27 miles from Grenfell. T. Goonan.  
21 Aug., 1899.
2161. How many acres have you? I have 1,800 acres.
2162. Have you any reasonable prospect of making more than a living off your ground without a railway? Without a railway it is a very hard job. With a railway I hope to make a comfortable living off it.
2163. What proportion of your holding is fit for agriculture? About one-half.
2164. Is the quality of the soil on your holding similar to that on other holdings in the locality? I think so.
2165. What percentage of the land in the district is fit for cultivation? About 50 per cent.
2166. Would it be cultivated if railway communication were given? Yes.
2167. Have you grown wheat? Yes; for ten years. With the exception of the last two years, I have had fair crops.
2168. What do you consider to be a fair average crop? Twelve to 13 bushels to the acre, although for six or seven years I have got more than that. For six or seven years I have had as much as 20 bushels.
2169. Has wheat-growing in this district proved remunerative in average years? Yes.
2170. Where do you carry your produce to? Young.
2171. When the Koorawatha-Grenfell railway is constructed, where will you take it to? Most likely to Grenfell. It all depends on the price a man can get or the market he can find.
2172. Supposing there were not a fair price for it, what would you do with it? I would send it to the best market, where I could get the most for it.
2173. We are approaching the time when the surplus wheat of New South Wales will have to find a market outside the Colony;—when that time arrives, do you think you can successfully grow wheat for shipment to other countries? I think so.
2174. Have you carefully watched the prices for wheat outside New South Wales? Yes.
2175. Do you think that if the average price is maintained, you can successfully compete? Yes.
2176. What is a fair average price for wheat at the barn? 2s. 6d. a bushel.
2177. Would 2s. per bushel pay you? No doubt it would; but it is rather a low price.
2178. Supposing 2s. per bushel becomes the rule, and not the exception, what then? I think a man would have to grow it all the same.
2179. Do you think improved methods of cultivation would enable you to produce more cheaply? Yes. Improved machinery makes the land more easy to cultivate, and enables us to get a return from a lower price.
2180. Do you think that, as the price comes down improved machinery will be employed? No doubt.
2181. Have you any further statement to make? The Piney Ridge people object to the southern route, but I myself prefer it.
2182. Supposing you were a resident of Piney Ridge, what would you do? The people on the Bimbi side

- T. Goonan. side have to go in a westerly direction to get to Piney Ridge. If they want to get anything from Sydney they have to go there; whereas people on the Piney Ridge side are within a fair distance of Grenfell, and if they want to send produce to the Western district, they would have a station on the route. They can make for a market either way.
- 21 Aug., 1899.
2183. If you were living on the Piney Ridge side, would not your evidence on that point be somewhat modified? No doubt it might.
2184. *Mr. Shepherd.*] Is all the land you have fit for cultivation of black-red soil? No; I have some black soil.
2185. Do you find that there are two kinds of black soil, some of a clay, and some of a granular character? Yes; I am cultivating the clayey soil.
2186. Do you think it would be much improved by drainage? No doubt it would. I have no artificial drainage on my land.
2187. Land is sometimes so situated as to be naturally drained? Yes; there is a gradual fall on my land.
2188. Do you get as good a crop from the black soil as from the red soil? I have got better.
2189. How long have you been cultivating it? For ten years, and it was cultivated before I went there.
2190. Do you think it is likely to last longer than the red soil? I think it is. I do not think the red soil will stand so well as will the black soil.
2191. *Mr. Watson.*] Is the black soil which you have been cultivating similar to that which is on the Bland plains, or is it similar to that which you sometimes get on the banks of creeks? It is a mixture.
2192. Is it as bad as the black soil on the Bland? I do not think it is.
2193. Is it liable to floods? When the creek becomes flooded, the water runs over it.
2194. Does it run off? Yes.
2195. Then it is not the same class of soil as that on the Bland plains? No.\*

John Quayle Wood, farmer and grazier, Brundah, sworn, and examined:—

- J. Q. Wood. 2196. *Chairman.*] Where is Brundah? Between Grenfell and Koorawatha.
- 21 Aug., 1899. 2197. Did you give evidence on the proposal to construct a railway line between Grenfell and Koorawatha? Yes.
2198. When that proposal was being considered, it was stated that if the line were constructed, a large quantity of land would be put under cultivation;—can you tell us whether that has been done? It has. The returns show that in 1897 the area under cultivation was 43,069 acres. Twelve months afterwards—in 1898—that return was increased by 21,601 acres, the total area under cultivation in that year being 64,670 acres.
2199. I think you stated on a former occasion that the landowners were prepared to clear a further 70,000 acres? Yes, and that 21,601 acres is an instalment of it. I estimate that for the present year—1899—the area under cultivation will be not less than 80,000 acres, in spite of the excessively bad seasons.
2200. Do you know the country towards Wyalong? Yes.
2201. Speaking generally, what proportion of country west of Grenfell is equal in character to that east of Grenfell? I should hardly like to commit myself to a statement as to the proportion.
2202. How far is Grenfell from Koorawatha? Thirty miles. For 30 miles west from Grenfell, towards Wyalong, the country is almost similar in character to that between Koorawatha and Grenfell.
2203. So that if the land in the vicinity of the line from Koorawatha to Grenfell is being got ready for cultivation, there will be a similar result in connection with a line from Grenfell to Wyalong? I think so.
2204. Are you the President of the Railway League at Grenfell? Yes.
2205. Have you prepared any statement with reference to the progress of the district? Nothing beyond what appears in the evidence I gave on the proposed railway from Koorawatha to Grenfell.
2206. I understand that you hold 16,000 acres? Yes.
2207. How much is cultivated? 10,000 acres are under actual crop. I am cultivating entirely on the "halves" system.
2208. Are both parties to the agreement reasonably satisfied? Yes, beyond expectations.
2209. Do you think the working of the land in that way will be permanent? Yes, I am sure of it. I look upon it as being past the experimental stage. The system is now extending to small selectors. The smaller men themselves are subletting. The system is carried out on the principle of a division of risks, and a division of profit; and each side can, under those conditions, carry on much longer than they otherwise could do.
2210. Do you think the system will extend? It will extend indefinitely.
2211. I suppose the land is not likely to go back into grass? No; the profits from working the land for agriculture are so much greater than working it for pasture.
2212. Have you any doubt as to whether the system will extend wherever the line goes westerly? I have no doubt of it.
2213. Then, if a line between Koorawatha and Grenfell is justifiable, its extension from Grenfell would in your opinion, be equally justifiable? Yes.
2214. It has been stated that the land, by being put under wheat, would maintain a larger population than it will by being put under grass? Considerably.
2215. What is the proportion? I will give you some particulars. Under pastoral occupation on our own property we incurred expenses, other than purely domestic expenses, of about £150 per year, plus about £400 shearing expenses in connection with 20,000 sheep. That represents an aggregate of about £550 per year. During the four years we have been engaged in cultivation our books show an expenditure of £1,500 a year in improvements alone—that is, in clearing and other improvements necessary in connection with farming. Those expenses, however, are not of a permanent character, because the time will come when the clearing expenses will be ended. At present we have twenty-four share-farmers on our property, and they employ, besides themselves, fifty-one hands in putting in the crop, and 156 hands in harvesting.
2216. How many acres have they? 10,000.
2217. What are the relative profits from agriculture and grazing? I may say that I have allowed very liberally for pastoral occupation. I put that down at 4s. an acre net. The estimate of the Land Boards,
- in

\* NOTE (on revision):—I should like to add that if you take 12 miles south of the Bimbi route, and the same distance on the northern side of the Piney Range route, I think you will see that we have a much larger population to serve than the Piney Range people. The Bimbi people are much further away from a railway than those at Piney Range. The former will have to make Young their railway station if the Piney Range route is adopted, and some of those people are between 30 and 40 miles from Young. I myself cannot reach Young under 38 miles.

in assessing the carrying capacity of the land, is about 3s. an acre. The returns in regard to wheat for a 12-bushel crop show, with wheat at 2s. per bushel, 24s. an acre; the cost of bags is 1s. 3d.; cost of ploughing, 6s. an acre; harvesting, 6s. an acre; seed, 1s.; and interest at 6 per cent. on 10s. an acre for clearing, or an aggregate of 14s. 11d., which, deducted from the 24s., leaves 9s. 1d., or more than double the profit on what could be obtained from purely pastoral occupation. J. Q. Wood.  
21 Aug., 1899.

2218. So that the owner gets twice as much net profit per acre, and in addition to that he is enabled to find employment for more people? Yes. I should like to state, in view of some evidence given on Saturday night by a witness who spoke more from a theoretical point of view than from actual experience as to the position of share-farmers, that during the season 1897-8, to quite a large number of my farmers I paid over £2 an acre for their crop.

2219. You informed a previous Committee that you have seen good crops growing on the black soil of the Bland country? Yes.

2220. Can you give us an account of what you saw at that time, and of the character of the season? I mentioned that, at the time, I took very little interest in agriculture—in fact I looked upon the agriculturist as my natural enemy. I saw cultivation however being carried on in black soil at Oakhurst, and I thought the owner—Mr. French—was wasting his time by putting in his seed. I saw the crop at harvest-time, and I was astounded at its character. I asked Mr. French to keep an account, when he cut it into chaff, of the yield, and I ascertained that it gave a trifle over 4 tons to the acre. I am quite satisfied from what I saw of the crop, that the return was correct. The soil was a stiff, black clay, but I have no recollection of the season. I am inclined to think it must have been a good season. It was sometime back in the eighties, but I forget the exact year. I was astounded to see such a result from ground which I thought was literally incapable of being put to agricultural use.

2221. Have you any land on the route of the proposed line? No. My interests will be entirely served by a railway from Koorawatha to Grenfell.

2222. Do you care to give an opinion as to which of the routes would be the better one to construct—*via* Piney Range or *via* Bimbi? I could not give any opinion, because there is a good deal to be said in favour of each route. Personally, I look upon the routes as being about equal.

2223. What could be said in favour of one could be said in favour of the other? Yes.

2224. Have you any further information to supply? I should like to qualify what I said a moment ago, to the effect that I was perfectly served by the proposed line from Koorawatha to Grenfell. I think that the obtaining of access to the western market will be a great advantage, not only to myself, but to every producer in the district. We have had applications for produce, from the neighbourhood of Wyalong, for horsefeed, during the last three years, which we could not entertain; but if there had been railway communication the market would have been available to us.

2225. One witness has stated that wheat at 2s. a bushel would be a payable crop;—when you were examined by a previous Committee you were asked a question as to the price at which you could afford to sell wheat profitably, and your answer was, “1s. 6d., with a railway close at hand”;—what do you mean by the remark “close at hand”? I meant a siding close to the paddock, so that no expense in hauling would be incurred. I reckon that 2s. a bushel would be a fair paying price under ordinary circumstances. When I gave the estimate of 1s. 6d. per bushel, I did not mean that it was to be looked upon as a remunerative return, but that agriculture would still continue if that price ruled, if the crops were adjacent to the line.

2226. Would 1s. 6d. per bushel be a minimum price? Yes.

2227. *Mr. Shepherd.*] Could a man live with wheat at that price? Yes, with good management, including the use of the six-furrow ploughs.

2228. *Chairman.*] If wheat comes down to 1s. 6d. a bushel, will there not have to be a remarkably heavy crop in the Colony? Yes; and with a big crop at that price, you would, perhaps, be better off than you would with a medium crop, and the price of 2s. per bushel. With regard to the possibilities of the returns in a good season, I may mention that we have taken off as many as 42 bushels to the acre.

2229. What was your return during your worst year? The worst year during which we got any returns at all gave us 8 bushels to the acre.

2230. *Mr. Trickett.*] I understand that you have 10,000 acres under cultivation? Yes.

2231. What did you pay in freight last year? Last year the crops were a total failure. The year before that, with 6,500 acres under cultivation, we had to pay about £800 for carriage to Koorawatha. I could not tell you the railway freight, because we sold delivered on the trucks at Koorawatha.

2232. You stated on a former occasion that the returns which you gave in connection with the proposed Koorawatha to Grenfell railway included the district 15 miles to the west of Grenfell? Yes; the object was to show the area under agriculture and the freight statistics.

2233. So that, in considering the proposed railway from Grenfell to Wyalong, we must start 15 miles west of Grenfell? Yes, so far as those statistics are concerned.

2234. And so far as the revenue to the proposed railway is concerned? Yes.

2235. Do you think people 15 miles to the north and south-west of Grenfell would bring their produce straight to Grenfell instead of taking it on to the Grenfell-Wyalong line? I do not think so, because if there were trucking stations 15 miles west of Grenfell the people would truck at them instead of bringing their produce to Grenfell. Mr. Richardson is the only one who would use the train inside a distance of 7 miles. I think you would have to exempt about 10 miles. There would still be a large amount trucked at a distance of 15 miles from Grenfell.

2236. Would nothing between Grenfell, and 10 miles to the west, be carried to Grenfell? I would not say that. If there were a station, say, at Bogolong, the people would be close upon it.

2237. You think they would go to the nearest trucking place? Yes.

2238. The extra freight for railway carriage would not be so high as the road carriage? No. I think, that with the extension of agriculture, the team haulage will become greater, because there are more applicants for teams than there are teams available. Whenever that state of things occurs the teamsters can dictate their own terms.

2239. On a former occasion, you stated that out of your 16,000 acres of land you intended to put 14,000 acres under crop;—have you gone on extending since then? Yes; we hope to get 14,000 acres under crop within two years from now.

2240. Only retaining sufficient unplanted land for the purposes of your horses? Yes. We expect to have recourse to manures. We do not think the ground in its present state will grow crops for an indefinite period without manure. A more scientific cultivation will pay better.

- J. Q. Wood. 2241. Has the development of your wheat-bearing ground been largely to your advantage? I would not say that, because we have had to contend with some of the worst of which we have had experience, but compared with pastoral pursuits it has paid better.
- 21 Aug., 1899. 2242. And if you had had a succession of reasonable years instead of drought it would have paid you better still? Yes; everybody would have been practically independent. The best proof of that is the fact that we are still going on clearing.
2243. *Chairman.*] It has been estimated that the loss upon the Koorawatha-Grenfell line will be about £2,000 per annum;—do you think, in view of the fact that people have gone in so largely for cultivation, that loss will be reduced? I am sure of it. When an officer of the Railway Department came to Grenfell to select statistics he struck out nearly one-third of our returns. He thought they were exaggerated. He did not examine the individual returns. He examined the total, and struck out about one-third. That, of course, accounts for a big difference in regard to the amount of loss. The railway league is quite clear that, with the increased development of agriculture, the estimated loss will be made up. We are looking forward confidently to the result of the first twelve months' running. If the line does not pay it will be so near to it that there will be no room for concern on the part of the Railway Commissioners.
2244. *Mr. Watson.*] You do not anticipate being called upon to make up the deficiency? No; we do not think that is within the limit of probability.
2245. Do you think the estimated loss of £3,249 per annum on the proposed railway from Grenfell to Wyalong might be reduced? I think so. I may mention that I had ample opportunity of talking to Mr. Usher, of the Railway Department, about the matter of statistics. He stated that his instructions were to keep on the safe side, and, of course, no one can find fault with him. Of course, the Railway Commissioners are in a responsible position, and it is better to err on the safe side than on the other.
2246. Are you of opinion that, not only will the line pay in the near future, but that it will add to the earning powers of lines already constructed? That is my opinion.
2247. *Mr. Trickett.*] Your holding is to the east of Grenfell;—you have no personal interest in the extension from Grenfell to Wyalong? Only this, that as a producer I realise the advantage of having access to the western market. In the ordinary course of things the western districts will have more bad seasons than will this district, and their necessity will be our opportunity.
2248. *Mr. Dick.*] You stated that the "halves" system involves a division of profits and a division of risks? Yes.
2249. Will you show in what way the division of risks is likely to operate? The system helps both parties; but I think, it helps the farmer to a larger extent than it helps the landowner—that is, where they are working under agreements similar to those in vogue at Iandra and Brundah. In order to encourage high-class farming we recognise the expediency of giving to the successful farmers what is practically a bonus. We have, therefore, made this arrangement: that whatever they produce over 18 bushels to the acre is to be awarded to them as a bonus. Until that arrangement was made I never got any 26-bushel crops. Those who produced the 26-bushel crops got over two-thirds, and the landowner had rather less than one-third. Still it paid better than halving with a man who only raised a 12-bushel crop.
2250. How does the tenant-farmer suffer in the case of a loss? In the case of a loss the tenant loses his labour and his horse feed. If it had not been for the share system almost all the farmers who were working for us would have been entirely ruined during the recent bad seasons. What they made on the share system enabled them to keep their homes going on their own land.
2251. You know that there is a general desire in favour of closer settlement;—could you fairly describe the half system as a modified form of closer settlement, involving certain advantages in the case of loss to the tenant-farmers? I think the arrangement is the best for the tenant-farmer. Under closer settlement he would have to bear all the risk. The cost of seed, the floating capital necessary for preparing the land for cultivation, amounts to more than double the cost of the plant for working the ground.
2252. If the "halves" system were likely to prove permanent all the best effects of closer settlement would be gained? Yes.
2253. Which industry would involve the greater disaster to the producer, say during a drought like that of last year—sheep farming or agriculture? Agriculture. Of course, it would only be right to take that into consideration.
2254. Taking all things into consideration, do you think it would be fair to say that agriculture is quite as profitable as sheep raising? Yes; more than twice as profitable.
2255. Which will provide the larger revenue for a railway—sheep farming or agriculture? Agriculture will provide immensely more revenue than sheep farming.
2256. *Mr. Watson.*] Admitting that the share system is an improvement on the older style of keeping large properties confined to pastoral pursuits, would you say that it is better than having men settled on their own land in smaller areas? Not if you could give an assurance that you would keep them there. Nearly all my farmers are men who were settled on the land, and they went "bung" upon it.
2257. Do not many men get rid of their small blocks, not because they cannot make a profit out of them, but because they are tempted by a cash sale? No. I know of an instance in which one man was simply driven off his land on account of the exorbitant rate of interest he was charged. That instance is typical of a large number. As a matter of fact, I know that a good many of my own tenant-farmers are now practically clear of the banks—an experience to which they were strangers before they started share-farming.
2258. Have not those men farms of their own some distance away which they work when not engaged on your estate? They work both together.
2259. What do the majority of them do after the crop is in, and after they have left your estate? Some go in for carrying, and others for contract work.
2260. Then they do not rely wholly on what they get out of the land under the halves system? Not up to a certain stage. The matter is one which requires explanation. One of my farmers, who is working up to 1,500 acres, has employment in fallowing ground, which occupies him the greater portion of the year. His efforts are not confined to the ground which is producing during a particular year. We look upon that as a step in the right direction, and are giving it encouragement. He finds work for three or four months in dealing with ground for the following year's crop.

John Flynn, farmer, Piney Range, sworn, and examined:—

2261. *Mr. Watson.*] How far is your holding from Grenfell? Twenty to 21 miles.
2262. What is the size of your holding? 3,710 acres.
2263. Is any of it under wheat? About 200 acres on the share system.
2264. Have you more land cleared with a view to putting it under cultivation? Yes.
2265. Are you offering to farm that on the share system? Yes.
2266. Do you think the construction of a railway from Grenfell to Wyalong is justifiable? Yes.
2267. Which of the routes do you prefer? I can scarcely say; I cannot say which route has the more suitable land.
2268. Would the Piney Range route suit you best? Yes.
2269. But you cannot say which would be the better in the interests of the country? No.
2270. Have you had any experience of the southern route *via* Bimbi? Yes; I have been out that way.
2271. What is your opinion of the land between Grenfell and Piney Range? It is good when you get a few miles out of town, and thence to the Piney Range you cannot beat it. I do not know much about the land beyond Piney Range.
2272. Irrespective of the benefit which will accrue to you through getting your wheat to Sydney by means of a railway, what other advantages will there be by carrying a railway line to Wyalong;—will it help you by giving you further markets westerly? Yes; I often think that the western markets will, in bad seasons, be better than the Sydney markets.
2273. If it is a fact that towards Wyalong there is a fair area of agricultural land which would be opened up by railway communication, is it not possible that they may supply themselves? Yes.
2274. In the event of there being a shortage there, however, it would be an advantage to the people of this district to supply it? Yes.
2275. Have you any other information with which to supply the Committee? There are fat stock in the district which we cannot get to a railway, on account of the want of water and feed.
2276. Were you a delegate to the farmers' conference at Orange? Yes.
2277. Was any motion relating to railway extension adopted? Yes; as applying to the central and western parts of the Colony, asking that railways should be undertaken.
2278. With a view to opening up Crown lands and helping settlement? Yes.
2279. I suppose the members of the conference were practical farmers, many of whom came from the Western and Central Divisions? That is so.
2280. *Chairman.*] I believe your holding is on the northern survey? Yes.
2281. We have it in evidence that if the line were constructed along that route, the Bimbi people would not be likely to take their produce to it, but would come to Grenfell. Supposing the Bimbi route were agreed to, would you be likely to carry your produce to it? I should have to bring it to Grenfell.
2282. Then if it would not pay them to go on the northern route it would not pay you to go on the southern route? No.
2283. *Mr. Trickett.*] What are the advantages of the "halves" system? It is only in its infancy at present.
2284. Do you look upon the "halves" system as a fair deal between the owner and tenant? Yes.
2285. Have those who have worked under that arrangement been satisfied? Yes. I have letters from old share-men who worked with me asking me as to the conditions of share-farming in this district.
2286. What do you think ought to be the nearest distance of a farmer to a railway? They do not like to travel more than from 10 to 12 miles unless you can give them great concessions.

J. Flynn.  
21 Aug., 1899.

John Michael Nowlan, farmer and grazier, Bimbi, sworn, and examined:—

2287. *Chairman.*] What is the extent of your holding? 1,800 acres. I have 30 acres under cultivation. J. M. Nowlan.
2288. How far are you from Grenfell? About 21 miles.
2289. What has led you to undertake the cultivation of your land? The prospect of the construction of a railway. Previously I did not give the matter a thought. 21 Aug., 1899.
2290. You have seen the experiment tried by others? Yes.
2291. And, seeing what other people have done, you have been led into cultivation? Yes.
2292. Do you corroborate the evidence which has been given by other witnesses? Yes.
2293. Do you corroborate that portion of the evidence to the effect that if the proposed line must not go by way of Bimbi, you cannot profitably go in for cultivation? If the line comes *via* Bimbi, it will be more profitable to it.
2294. If it does not go by way of Bimbi, will you still go on cultivating land? Yes; we should continue if possible.
2295. Where would you carry your produce to under those circumstances? To Grenfell.

John Francis Clode, station manager, sworn, and examined:—

2296. *Chairman.*] What is the extent of your holding? 12,500 acres of secured land and conditional lease. In addition to that, the Belabla and Bribaree estates are under my management, and consist of 10,000 acres. J. F. Clode.  
21 Aug., 1899.
2297. Do you manage for the Bank of New South Wales? Yes.
2298. How many acres are fit for cultivation? 12,000, or more than 50 per cent.
2299. What is the distance of the estates from Grenfell? The distance varies from 14 to 26 miles.
2300. How far are you from Young? Twenty-three miles; Belabla is 26 miles from Young.
2301. Which is the best road? To Young.
2302. From what portion of your estate is the produce taken to Young? From Kikiama and from the other estate as well. It has always gone through Young, and will do so unless there is a railway here.
2303. How many acres have you under cultivation on the estates? 800 acres under wheat now; there is other cleared land which we have not put in.
2304. Given greater railway facilities, would those 800 acres be increased to any great extent? Yes; probably to 8,000 acres in a short time. I may mention that at present we have to pay 1s. per bag for the carriage of wheat from Kikiama to Young—a distance of 23 miles. The carriage is so high that with wheat at a low price the production does not pay.

2305.

- J. F. Clode. 2305. How long have you been harvesting wheat and sending it away? Only for two seasons. The last season was altogether a failure. The first season, which was not a good one, we got 11 bushels to the acre.
- 21 Aug., 1899. 2306. How did the 11 bushels per acre pay in comparison with sheep-raising? The net profit is greater than it was from sheep.
2307. Do you think you would have the same results, if there were a good season, from sheep? Yes; in a reasonable season the profit is greater from the agricultural land.
2308. What is your experience in regard to fat sheep;—would they be driven any distance, or would they be trucked at the nearest point to the railway? I should truck at the nearest point. It does not pay to travel sheep when they are fat.
2309. Supposing the proposed line is constructed, will more sheep pass through the owner's hands than would pass through them if it is not constructed? I think so. There will be greater facilities for buying and selling. You could send a few fat sheep away at any time if a railway were available, whereas if you were 20 or 30 miles away from it, you could not do it as profitably.
2310. You would have to wait until you got enough together to pay for travelling them? Yes.
2311. Do you think you would use the proposed line if it were constructed along the northern route? No.
2312. You would prefer to come to Grenfell, or to Young? Yes; the northern line would be of no use to me. The line south of the Weddin Mountain would be the line to suit these properties.
2313. Do you think it would be of any value to the people of Bimbi? I could not give an opinion.
2314. What price did you get for the eleven bushels per acre of wheat which you say paid you better than the fattening of sheep? 2s. 3d. a bushel.
2315. Can you generally reckon on getting 2s. or 2s. 6d. a bushel? Yes.
2316. Was that at the railway station? At Young I have to pay 3d. a bushel for carriage, so that I only got 2s. per bushel net.
2317. *Mr. Shepherd.*] Are you cultivating anything besides wheat? I recently put in 80 acres of lucerne.
2318. Have you any stock in addition to sheep? Only two or three milch cows.
2319. Do they do pretty well? Yes.
2320. What is the nature of the pasture you have on your holding? Barley grass, crow's foot, and a little Mitchell grass.
2321. Have you no salt-bush? No.
2322. You say that one-half the holding is fit for agriculture? More than one-half.
2323. What is the character of the remainder? On the Kikiama holding there are about 8,000 acres fit for cultivation, and on Belabla about 4,000 acres.
2324. What is the character of the soil? It is deep red soil.
2325. What is the character of the country which is fit for grazing? It is mixed country; there are some gilgais about it. It is somewhat like the Bland country.
2326. It seems to be generally understood that the black soil is fit for grazing, whilst the red soil is fit for agriculture? I think that has to be proved. The black soil has not been tested. A lot of land not yet tried will be found equally as good as that already cultivated.
2327. You have not cultivated any black soil yet? No; but within the last two years I have seen a paddock situated to the south-west of the southern route cultivated by Mr. Leahayne. That land is of the same nature as the land of which we are speaking. The crop was as good as, if not better than, some of the crops on the high ground about Grenfell.
2328. *Mr. Watson.*] Is not Mr. Leahayne's holding timbered country? It is.
2329. It is not what you have described as plain, black-soil country? No, but the land itself is identical with a good deal of the Bland country.
2330. Is there not a great distinction between the plain and the timbered country? Yes; we have none of the plain country.\*

Jacob Hoad, farmer and grazier, near Grenfell, sworn, and examined:—

- J. Hoad. 2331. *Mr. Shepherd.*] How far is your holding from Grenfell? About 28 miles.
- 21 Aug., 1899. 2332. In which direction? South-west—on Belabla.
2333. I believe you were appointed by your neighbours to give evidence on their behalf? Yes.
2334. Will you state your views on the proposed railway? We have come to the conclusion that, as we are too far away from Young, and the roads are very hilly, it would suit us much better if the line went by way of Bimbi.
2335. You favour the Bimbi route? Yes.
2336. Why do you favour that route in preference to the northern route? The northern route would be of no service to us; it is too far away.
2337. What sort of country have you on your holding? All sorts; I have sandy country, black or pug soil, gilgais, and hills.
2338. How much land have you under cultivation? 150 acres.
2339. What kind of soil are you cultivating? Principally the black pug, except in one paddock, and that is sandy.
2340. There seems to be some confusion in regard to the black and red soils, will you explain the difference? The red soil has not so much slush in it. It is of a more sandy nature than the black soil.
2341. Do you find the black soil equally as good as the red soil? Yes; and in dry seasons it is better.
2342. Have you cultivated it for any length of time? Yes; for the last thirteen years.
2343. Does it still produce good crops? Yes; I have had as much as eight bags, or 32 bushels, to the acre from it.
2344. Have you much stock on your holdings? I generally run about 2,500 sheep.
2345. What do you get from your sheep on an average? It depends greatly on the price of wool. As a rule, I average between the wool and the fats about 4s. each.
2346. What number of acres do you require for a sheep? About a sheep to an acre in a fair season.
2347. What is your average yield per acre? About 12 to 13 bushels.
2348. What does it cost you to send it to the railway station? About 4½d. per bushel.
2349. What do you get for it per bushel? It varies; the year before last I got 4s. per bushel.
2350. Do you think the construction of the proposed railway would induce you to cultivate more land? Yes.
- 2351.

\* NOTE (on revision):—Cartage on wheat: Belabla to Young, 1s. 3d.; Belabla to Bimbi could be done for 6d., and from Kikiama, 8d.

2351. Is that the general feeling of those whom you represent? Yes; personally, I should put another 200 acres under crop, and my neighbours will put more under crop. J. Hoad.  
 2352. Are you satisfied with the result of your farming? Yes; I have done very well, and so have some of my men. 21 Aug., 1899.
2353. According to your statement, the construction of the railway will reduce your sheep areas, and increase your agricultural areas? It will not reduce the number of sheep to any extent, because the stubble is good feed for them.
2354. Have you a fairly regular rainfall? Yes.
2355. At what part of the year do you generally get the rain? October and June. The last year or two, however, have been exceptional.
2356. Is not the gap between June and October a large one? Yes; but the sun is not very hot, and we could do with less rain if we only got some about October. We get occasional showers.
2357. How are you off for water? We get a supply from the tanks.
2358. *Mr. Watson.*] Is the black soil which you have cultivated similar to the Bland plains black soil? It is pretty much the same.
2359. Is it what is known as pug soil? Yes.
2360. Has it been growing timber? Yes.
2361. Then it is different from the Bland country? It is; but I think it is the same sort of soil, excepting that one has the timber and the other has not.
2362. Perhaps that makes a great difference? It has not been tried.
2363. *Chairman.*] Is the subsoil the same? Yes.
2364. *Mr. Watson.*] Have you ever tried to cultivate any of the black plain country? No; but in my opinion the soil is similar.

William Bristowe, farmer and grazier, Piney Range, sworn, and examined:—

2365. *Chairman.*] How far is your holding from Grenfell? Fifteen miles. W. Bristowe.  
 2366. What is the extent of it? 433 acres. 21 Aug., 1899.
2367. Are you engaged in any other occupation than that of farming? I keep an hotel as well.
2368. How much land have you cultivated? Seventy acres.
2369. Is the whole of your lands fit for cultivation? Yes.
2370. Have you had considerable experience in farming? I have done a little farming.
2371. Do you think you would be able to make a living from farming alone off 433 acres? I dare say I could.
2372. Would it be a hard pinch? It would depend on the access to market and the character of the seasons.
2373. What distance do you require to be from a railway in order to make a small holding like yours pay? Not more than 15 to 20 miles.
2374. May we take it that if a man is able to take his produce to a railway station and return in one day he will be able to cultivate wheat profitably? I think so.
2375. How far are you from the Bimbi route? Eighteen miles in a direct line.
2376. If a line were constructed *via* Bimbi, to which point would you convey your produce? Grenfell.
2377. How long have you had possession of your holding? Eight years.
2378. Was it cultivated before you got it? A portion of it—30 acres.
2379. How long has the land been under cultivation? About fifteen years.
2380. When was your last decent season? It is four years since we have had anything like a decent season.
2381. Did the land four years ago show signs of exhaustion? No.
2382. Will the land stand continuous cropping for several years? Yes.
2383. For how many? I cannot specify any time.
2384. Has anybody been cropping continuously for sixteen years? Yes.
2385. Does the land which they are cropping show signs of exhaustion? No.
2386. Has it been manured? No. The sheep have camped upon it now and again.
2387. Have you a general knowledge of the country along both routes? I have a fair knowledge of it.
2388. What, in your opinion, would be the best route to follow? The northern route; it would equally divide the country between Forbes and Young. I think there are more farmers on both sides of the northern route than there are on the southern.
2389. What sort of country is there for 20 miles north on the northern route? It is all good agricultural country. Many of the farmers there are now taking their produce to Forbes.
2390. Is it better country than that on the Bimbi route? I think the country is about equal in quality on both routes.
2391. Have you ever seen any of the plains on the Bland country cultivated? Yes, at times.
2392. What was the result? Some people seem to think that the plains produce better wheat crops than the other country—that is if there is anything like a decent season.
2393. How many decent seasons out of ten can you reasonably expect in connection with the black soil country? We ought to get eight out of ten.
2394. Do you think it likely, if a line were constructed through the Bland country, that the farmers would experiment with the black soil? I think they would. They have done so already.
2395. Do you think the experiments which have been made justify the planting of wheat in that country? I think so.
2396. Therefore the Committee would not be justified in altogether discarding the black soil country from their calculation as to what would be a fair agricultural area to be served by the proposed line? I do not think they would.
2397. Is it quite possible that the black soil will grow as heavy crops as the red soil? I think it will grow better crops, and will last longer.
2398. Does it not scald badly? Some parts of it, where the water lies, do, but the fact of it being open plains causes the soil to dry up quickly.
2399. What is the name of the farmer who has been trying to cultivate it? Mr. Hutchinson, on the Caragabal boundary.

- W. Bristowe. 2400. Is it not very good fattening country? Yes. I think that after it has been cropped it is better country for grazing.
- 21 Aug., 1899. 2401. Then the Railway Commissioners may anticipate carrying a good many stock in that part of the country? I think so.
2402. I suppose that even on the red-soil country the farmers hold a few sheep in order to spell their land? Yes.
2403. Do you think farming has come to stay in this district? Yes; the population is increasing, and the greater the population the greater the demand for farming produce. A lot of country in the district to which I have been referring will be opened up for selection, and I think it will all be taken up.
2404. What is the extent of the Crown lands out there? About 70,000 acres.
2405. What is the character of it? It is all fairly good agricultural land.
2406. Would there be any difficulty in the Crown getting rid of it? No. I know of lots of people who are waiting for it now.
2407. Do you know of any other holdings in that direction where cultivation has been indulged in for a number of years? A good many farms out there have been cultivated during the last ten years.
2408. Have the people expressed any opinion as to their success? Yes; they are all satisfied with the results. My neighbour has 700 acres, and he is going to put the whole under crop. He makes twice the profit out of agriculture that he makes out of sheep.
2409. Then the cultivation of wheat has gone considerably beyond the experimental stage, and will be a permanent industry, and will find work for a line, if one is constructed, for years to come? I think so. I do not see anything to stop it; it is the anticipation of everyone out there. There are many farmers within 7 or 8 miles of the northern route who intend to do it.
2410. *Mr. Shepherd.*] Has rust made its appearance in the district? No.
2411. Have you had any smut? Sometimes; but I think it could be remedied.
2412. What is the average extent of the holdings? Between 2,000 acres and 4,000 acres.
2413. What do you consider is a fair-sized holding for a family to live upon? It depends on the distance from the market. I think 1,280 acres out there is sufficient.
2414. Do the farmers as a rule start with much capital? I think they generally begin with pretty small amounts.
2415. Are they in the habit of accepting contracts for fencing and clearing? Not where I am living.
2416. Do they all appear to be fairly satisfied? Yes.
2417. *Mr. Watson.*] Have you yourself ever had any experience of the plains black soil? No.
2418. Would you like to say that the black soil would stand growth like the red soil? I would not like to say it would; it may not. But I do not think the red soil will stand it very much better.

Peter Cram, farmer and grazier, near Bimbi, sworn, and examined:—

- P. Cram. 2419. *Chairman.*] Where is your holding? Eight miles from Grenfell, on the Bimbi road.
- 21 Aug., 1899. 2420. Have you resided long in the district? For twenty-three years.
2421. How much land do you cultivate? Two hundred acres out of 1,450 acres.
2422. Are you preparing any fresh land? Yes, I have over 800 acres cleared.
2423. I suppose you will increase your cultivation area, whether the line follows the Bimbi or the northern route? Yes. If the Bimbi route were followed I think there would be a platform 2 miles from where I am situated.
2424. Do you corroborate the evidence that has been given by previous witnesses? Yes; I think their evidence on the whole is very fair.
2425. Have you anything to add to it? The opening of a market at Wyalong would help us a great deal. It would be a good opening for produce.

John Quayle Wood, farmer and grazier, sworn, and further examined:—

- J. Q. Wood. 2426. *Chairman.*] I understand that you have some further information to supply to the Committee? Yes. I wish to point out that, so far as the land on either route up to the Bland Creek is concerned, the people owning the land would be prepared to surrender to the Government what might be required for railway purposes in exchange for such fair equivalent in land or money as may be decided by the Secretary for Public Works. The people to whom I refer are: Thomas Casey, Piney Range; E. H. Lloyd, Piney Range; Thomas Armstrong, Allandale; A. McAllum, Ravensleigh; Patrick John Cleary, Piney Range; W. Richardson, Bogolong; John Leonard, Piney Range; D. C. Burge, Little Caragabal; Joseph Handcock, Barbingal; and James Casey, Weddin View, Piney Range. These people have signed an agreement which will allow the question of taking the land required for railway purposes to be settled by the Minister on the terms I have mentioned.

John Quigley, vigneron and farmer, Grenfell, sworn, and examined:—

- J. Quigley. 2427. *Mr. Shepherd.*] What is the extent of your holding? Nearly 200 acres of leasehold, freehold, and selection.
- 21 Aug., 1899. 2428. How far are you from Grenfell? Two miles.
2429. What is the extent of vineyard? Twenty-five acres.
2430. Have you been cultivating it long? For nearly seventeen years.
2431. What kind of grapes do you find do best? The kinds I have are the Hermitage and Muscatelle, both of which seem to do well. The Black Prince grapes also do very well.
2432. In making wine, do you press the different classes of grapes together? No; separately.
2433. Is the quality of your wine pretty good? It is considered to be pretty good. I have taken the first prize for it fourteen times at Grenfell.
2434. At what age do you dispose of it? Two to five years.
2435. What is the character of the country upon which your vineyard is situated? It has a beautiful aspect to the east. The soil is red, and the subsoil is slate and clay.
2436. Have you averaged the yield of wine per acre? I have kept no returns; but I reckon that I obtained 3,000 gallons, or ninety-seven casks in one year. It was a good year; dry seasons are not half so good.
2437. Have you a ready sale for the wine? Yes. 2438.

2438. What market have you for your table grapes? Grenfell, Wyalong, and Forbes.
2439. What other kinds of fruit do you grow? I have 4 acres of mixed fruit, including cherries, apples, pears, plums, and quinces. J. Quigley.  
21 Aug., 1899.
2440. Do they all give you a satisfactory return? Yes; I have fair average crops. The cherries and apricots are very plentiful.
2441. Do you think that the construction of a railway from Grenfell to Wyalong would give a great impetus to grape-growing? I think it would.
2442. Do apples grow well in the district? Yes; some of them are very choice. Pears also seem to do nicely.
2443. What agricultural produce do you grow? I have 40 acres under wheaten hay.
2444. What is your return in ordinary seasons? About a ton to the acre.
2445. Do you intend to largely increase your area of vines? Yes, if the proposed railway is constructed. I should plant an extra block of from 14 to 15 acres.
2446. *Chairman.*] Do you, as a rule, obtain your fruit in good marketable condition? Yes. We are at times subject to some of the pests, but the fruit seems to ripen well enough.
2447. When the railway is constructed from Grenfell to Koorawatha are you likely to use it for the purpose of conveying your fruit to Sydney? I should prefer to send it to Wyalong and out to the west.
2448. Do you think you would help to find some work for the proposed railway? Yes.

William Roberts, sergeant of police, Grenfell, sworn, and examined:—

2449. *Mr. Watson.*] Do you collect the statistics relating to the crop yields in this district? Not for the whole district. W. Roberts.  
21 Aug., 1899.
2450. What portion of the district comes under your notice? The Grenfell Police District has three police stations in it, and each station collects a portion of the statistics.
2451. What are the boundaries of the portion of the district which comes under your notice? It goes west about 15 miles, 16 miles south, 20 miles east, and 10 miles north.
2452. Have you any figures bearing on the area and yield of that district? Yes. The area under cultivation in the district for the year 1895 was 21,597 acres, of which 16,932 acres were under wheat, and yielded 216,001 bushels. For the year 1898 the area under cultivation was 54,849 acres, of which 46,310 acres were under wheat, and yielded 287,298 bushels.
2453. *Chairman.*] Has there been much activity in farming operations about Grenfell since it has been decided to construct a line from Koorawatha? I think so. When I came here in 1896 there were between 30,000 and 40,000 acres under cultivation, and now I should say there are between 50,000 and 60,000 acres under cultivation.

WEDNESDAY, 23 AUGUST, 1899.

[The Committee met at the Court-house, Wyalong, at 2 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Frederick Neeld, mine-owner, Wyalong, sworn, and examined:—

2454. *Chairman.*] How long have you been in this district? Since 2nd August, 1893. F. Neeld.  
23 Aug., 1899.
2455. Have you had every opportunity of knowing what is going on in connection with the field? Yes.
2456. Do you think it is a permanent field? It depends upon what you mean by the term permanent.
2457. Is the field likely to peter out in a year or two? Not for a good many years.
2458. Can you give the Committee any idea as to the progress of the district? It is more permanent now than ever it was. It has proved its permanency. At one time many experts said the field would not be permanent; but I think they are now fairly satisfied that it is permanent.
2459. It has been stated that the field would not be a permanent one, and that the leads would not go down? No; it was stated that they would cut out when we got to the hard granite.
2460. Have they been showing any signs of cutting out? No; they are strengthening as we go down.
2461. What is the nature of the ore when you get down to any depth? Sulphide.
2462. How do you expect to treat the ore when the oxidized material has given out? By smelting.
2463. Have you thought over the question whether you would erect smelters here, or send the ore away? The general tendency is, I think, to take the ore to the fuel and fluxes.
2464. Have you any idea as to the quantity of fuel and flux which would be required to treat the ore at Wyalong? No.
2465. If a railway were constructed, which route would suit the field the better—from Grenfell to Wyalong, or from Temora to Wyalong? As far as the mines are concerned, I should say that the Grenfell route would be the best, so that we might get to Lithgow.
2466. Can you give an idea as to the amount of ore which would be sent away? Our claim would send away at least 100 tons of ore a week. Last year we produced one-seventh of the ore on the field. The total production was 700 tons a week. I think, however, there ought to be more than that, and that the total production will now be about 1,000 tons a week.

2467.

as you went down to a greater depth;—has that opinion been realised? As far as we have gone, Father Curran is wrong. We only know that there is a strong reef underfoot carrying gold; but how far it is going to carry the gold we cannot tell. F. Neeld.  
23 Aug., 1899.

2491. Father Curran was asked:—

Do you find the reefs growing in richness as you get to greater depths? On the contrary, quite the other way. In addition to what we might conclude from examining the rocks, we know for a fact that the gold is not getting richer. More than that, in eighteen months' time very different methods will have to be resorted to to get the gold, provided work goes on continuously.

To extract the gold? Yes.

What is the general character of the quartz reef? Up to a depth of 150 to 190 feet the gold occurs as what we call free gold mixed with sulphides. Below that depth there is very little free gold, as far as our knowledge up to date goes; but there is gold combined with pyrites, both iron and arsenical.

Take the greatest depth of claim at Wyalong;—what would be the width of the reef, and what would it be likely to yield per ton? I do not think I could answer both sides of the question with one reply. So far, the stone crushed has to my own knowledge yielded on an average 2 oz. to the ton.

That is taking the whole field? Yes; that is naturally the richer ore. In a certain sense there is what we might call surface concentration there. Some thousands of feet of country have been removed, and as the country has been removed a good deal of the gold has dropped back into the reefs, because wherever water will go gold will go.

As the claims follow the reef down, they become troubled with water? It is a fortunate trouble. They have struck water on every deep shaft on the field, which I consider a fortunate thing.

And they will not be able to work the claims without some appliances for pumping? Certainly not. That is one of the reasons why I have said I do not consider it a poor man's field. Below 200 feet it will require capital to develop it. Certainly there was never a field so easily worked up to the present time, and, I may add, so badly worked. They have taken out the reef simply with a pick and shovel. The surrounding rock is so decomposed that it can be dug out.

Has it been your experience that up to a certain depth the field has only been scratched over, and that when you get down you obtain stuff more difficult to treat? Yes; and more difficult to work. Instead of the pick you have to use the hammer and drill.

2492. Notwithstanding the increasing depth, do you find the venture a paying one? Yes.

2493. What depth are you down to now? 300 feet.

2494. Have you lots of gold-bearing stone in view for a number of years? If we only employed the regulation labour (sixteen men) it would last very many years. What we have in sight would, I think, last for another twenty years.

2495. That is pretty good? We are satisfied.

2496. When you gave evidence on a previous occasion you stated that the largest plant in any of the colonies was going to be erected by a person named Climo? That was in 1895. Climo's works were erected, but they now belong to a man named Sully.

2497. Are they extensive, and are they paying? Yes. From £22,000 to £25,000 was laid out on them.

2498. Is the want of water a great drawback to the advancement of the district? Yes. We were idle for two months for want of water. Whilst the drought prevailed we took advantage of it and increased the size of our tanks.

2499. Do you think that the want of a proper water supply is likely to keep the field back? Yes.

2500. How do you think the difficulty should be met? I think we should have a large reservoir made to the west of West Wyalong. We should certainly want a very wet winter to fill it, but once it was filled water could be brought down by means of pipes. It would be necessary for a surveyor to go over the ground to take the levels. I may state that about 8 miles west of Wyalong you come to the "divide," and, of course, it would be no use the reservoir being constructed beyond that point. It would have to be constructed on the Wyalong side, and have a good catchment.

2501. Do you think water could be conserved to a greater extent? Yes; that is the opinion I expressed four years ago, and it is the only means of getting water. The idea of getting water from the Murrumbidgee is all moonshine; it would cost too much money.

2502. Is the ground good water-holding ground? It could not be better.

2503. Why is no effort made by the townspeople to get such a scheme as that to which you have referred carried out? The battery-owners do make provision for water. We would make our tanks larger, but we have not the room. Of course, we cannot go upon another man's ground.

2504. That seems to show the necessity for combined effort? You cannot get a number of people to join together.

2505. In looking at a report of a former Committee on a proposed railway from Temora to Wyalong, I notice that one of the strong grounds against that project was that you would never get a big population here until you obtained a permanent water supply? I have seen Bendigo, Maryborough, and other places without water, but they are not without water now. Bendigo is supplied from Malmesbury, a distance of 50 miles.

2506. Would you expect to get a larger population with a better supply of water? I think so; but there will always be a large population here. I think it will increase.

2507. What fuel do you use for the mines? Firewood.

2508. Is it getting dearer? Yes, by reason of having to go further away for it.

2509. Do you see a prospect of that becoming a difficulty, so far as smelting is concerned? I do. We are paying 1s. 6d. to 2s. a cord more for it than we did two years ago.

2510. If a railway were constructed, I suppose you would be inclined to get fuel from the Western mines? Yes, from the nearest and cheapest place.

2511. Do you know anything, apart from the mining industry, which should induce the Government to build a railway to Wyalong? I think there will be more settlers here.

2512. For what purpose? For agriculture. We have had very bad seasons during the last four years; but they are not going to continue. The average rainfall is quite equal to that of the Goulburn Valley, and that is a large agricultural country.

2513. I believe the soil here is good for wheat-growing? I had not been here more than a month when one of my former neighbours from the Goulburn Valley came over, and we showed him round. He said, "Yalcha, a parish in the Goulburn Valley, is considered to be the cream of the Goulburn Valley; and there is not a selection in Yalcha equal to your selection here at Wyalong." Of course, he was referring to the character of the soil. He was an old farmer, and knew what he was talking about.

2514. What do you think is the greater incentive towards the construction of the railway—a large agricultural population or a mining population? I think there would be both here. I think this place is teeming with minerals.

2515.

- F. Neeld.  
23 Aug., 1899.
2515. Which would you sooner have—a first-class water supply or a railway? We want both.
2516. Which do you think is the first necessity? I think water is our first necessity.
2517. You are not very strong on the question of railway construction yourself? I know it would be a great saving to us if we had one.
2518. Have you any strong opinion as to the route the railway should take? No; although speaking as a miner, I should like to get to Lithgow. I am satisfied that we shall have to send ore away, and we do not want to have to send it double the distance necessary.
2519. Then, if a railway were constructed, your ore would go to the fuel? I think so. If it were only a matter of a few shillings a ton difference we would sooner have the smelter here; but if it is a matter of doubling the cost we would sooner send it away.
2520. Is there a large area within 15 miles of Wyalong suitable for agriculture? I think so.
2521. *Mr. Watson.*] Do you know whether there is any flux to be obtained about Lithgow? I do not know, but I believe they are smelting material from Cobar.
2522. Are you aware that all the material now sent from Cobar to Lithgow is matte, which is only to be refined? I do not.
2523. Have you ever heard that they have to bring flux from the Southern line to Lithgow? It is very possible. I was talking with an expert on one occasion, and he told me that he was positive that if we could send our ore to Lithgow they would give us the full gold contents of it, and charge us nothing for it.
2524. So as to get the by-products? Yes; and it is the very material they want for fluxing.
2525. What was that gentleman an expert in? It was Mr. Roberts, the mining editor of the *Daily Telegraph*; and I take him to be an authority.
2526. Supposing you wished to go to Lithgow, what extra distance would you have to travel if, instead of constructing a line from Wyalong to Grenfell, one were constructed from Wyalong to Temora? I believe it makes a difference of 60 miles.
2527. Are you aware that at Mittagong they have both coal and flux suitable for fluxing? No.
2528. Is not Mittagong almost as near to Wyalong, *via* Temora, as is Lithgow *via* Grenfell? I do not know.
2529. Do you obtain all your machinery from Melbourne? Yes.
2530. Are you likely to continue to do that for some time? I think that when Federation is fully established we shall get most of the Melbourne manufacturers to come to New South Wales, and the machinery will be made in this Colony.
2531. Will it be worth their while, seeing that they will have the free run of the colonies, to set up two establishments? I think it would pay them to come to the coal.
2532. Is it not almost as cheap to take coal from Newcastle to Melbourne, as it is to take it from Newcastle to Sydney? I should not think so; it is a much further distance.
2533. But a few hundred miles of water carriage does not make much difference? I should think it would.
2534. In any case, you have been getting your machinery from Melbourne, because it suited you better to do so? Yes; we can get exactly what we want in Melbourne, and in case of breakages we have only to send word and obtain what we require in about a week. If we buy in Sydney we get European or American machinery, and if we have a breakdown we have to wait for months before we can get it repaired. I know of an instance in which a delay of five or six months occurred in waiting for duplicate parts.
2535. Do you bring your machinery from Melbourne, *via* Temora? Yes.
2536. If it is conveyed from Melbourne by way of Grenfell, will it not mean an extra 83 miles carriage? It means, of course, extra carriage.
2537. Might it not prove cheaper to smelt near the flux, if you also have coal, than it would to take the flux and the ore to the coal? I cannot give any opinion about smelting, because I have never had any experience.
2538. If it is a fact that at Lithgow there is coal but no flux, and that, as a consequence, you would have to carry both ore and flux to that place in order to engage in smelting operations, is it not probable that it would be cheaper to take the ore to where the coal and flux exist, even though you had to carry it a little extra distance? I think so. We may have flux near to us for anything I know to the contrary.
2539. Have you seen any limestone about the place? No.
2540. I suppose you know that so soon as a line begins to pay, local rates, which are always imposed in connection with branch lines, are done away with in favor of through rates. As a line from Grenfell to Wyalong will involve a capital expenditure of between £40,000 and £50,000 more than a line from Temora to Wyalong, do you think it is as likely to be beneficial to the country? I do not know. That is really a matter for the railway engineers.
2541. Do you think the advantages of the Grenfell route are so much greater than those of the Temora route as to make up the difference in the annual interest on an extra £50,000? I could not express an opinion on that point.
2542. If you found the carriage of flux was an important matter, would you be prepared to modify your opinion in regard to the proposed railway? It is a matter of £ s. d. I only hope we shall be able to treat the ore locally.
2543. I suppose that when the field was first rushed a large number of claims which have since proved duffers were opened up? Yes; I may state that I was in Sydney over three years ago, and had a conversation with Mr. Sydney Smith, the then Secretary for Mines. I complained about the leases not being granted, and he said, "You must allow that owing to the leases not being granted the place has been better prospected." I replied, "I will not allow that. I will allow that there have been more holes sunk; but whom have they been sunk by? By persons who, if they went through a reef formation which was not quartz, would not know that they were in one."
2544. Is it not the experience on every new field that a great number of claims are opened up which afterwards proved valueless? Yes.
2545. Consequently, any falling-off in population is not to be taken as indicating anything wrong in connection with the field? The large population to which I have referred did not remain here for more than five months. When they found that they could not pick up nuggets of gold in the street they came to the conclusion that the place was not what they thought it was.
2546. Has there been any falling off in population since the field got upon its feet, so to speak? No; and there is certainly a better class of buildings going up.

2547. I believe you have backed up your opinion of the field by the erection of a large amount of machinery and plant? Yes; about £9,000 worth. F. Neeld.
2548. Do you think there is any probability of the present population of Wyalong diminishing? No; I feel sure that it will increase. 23 Aug., 1899.
2549. Can you say how the men are employed in and about the mines at Wyalong? No; I believe, however, that 300 miners are connected with the Miners' Association. The whole of the miners on the field are not connected with the Association.
2550. Are the whole of the 300 underground men? No; the number includes top men.
2551. I suppose the 300 would not be the whole of the men employed in mining? No; we ourselves will be able to employ one-third of that number within a few months, and, perhaps, double within another twelve months.
2552. Do you not think that there would be a greater probability of Wyalong obtaining assistance from the Government in the matter of water supply if it were formed into a municipality? But we cannot get Wyalong formed into a municipality. We have tried to do so for the last four years.
2553. What is the difficulty? Opposition.
2554. Why is the opposition shown? Some parties are not satisfied.
2555. Do they give any reason why the town should not be formed into a municipality? They say the town is not forward enough. Again, we wanted the west township to join with the township proper, but they were not satisfied to do so. They wanted a show of their own.
2556. Is not water a great necessity, so far as the field is concerned? I think water is our first necessity.
2557. I have read that a movement is on foot to test the country for artesian water? I have always been opposed to it, and the Government Geologist says it is an impossibility. The movement in that direction has dropped.
2558. *Chairman.*] Do you think the field would be better prospected if men with capital could get to it more easily? Yes.
2559. Do you think there would be a better chance of the field being tested if a railway were constructed to it? Yes. The journey from Temora to Wyalong, a distance of 40 miles, frightens a lot of people.
2560. Then you are convinced that further prospecting would reveal the existence of more minerals, and, therefore, give the railway a chance of paying in the near future? I am.
2561. We are told that you and others send your gold to Melbourne in preference to the Sydney Mint? That is so.
2562. What are your reasons for doing that? In the first place, the Sydney Mint charges are considerably higher than those of the Melbourne Mint. For 500 oz. of gold the Melbourne Mint only charges 2d. an oz., whilst the Sydney Mint charges 6d. an oz. We find also that it is better to take the gold to the Mint ourselves, as by so doing we save escort fees of 4d. an oz. On those two items alone we save 8d. an oz.
2563. I believe there are other advantages in connection with the Melbourne Mint? Yes; there is this advantage: When you arrive in Melbourne, no matter on what day or at what time, you can go straight to the Mint, and the gold will be taken charge of. They accept all responsibility from the moment it is taken there.
2564. What is the course followed at the Sydney Mint? The train gets to Sydney at 6 o'clock in the morning. We go to the Mint, say at 7 o'clock, and the sergeant of police who is on duty there will take the gold; but he will tell you that he is not responsible for its safe custody. I have corresponded with the authorities in Sydney on the matter. We have tried to treat with them; but we have been unable to get any satisfaction. On one occasion I suggested that some arrangement should be made for receiving gold after and before the ordinary office hours, and I received this reply:—

Gentlemen,

Chief Secretary's Office, Sydney, 29 June, 1898.

In reply to your letter of 18th instant in continuation of previous correspondence, with respect to your request that increased facilities be afforded persons who may wish to deposit gold at the Sydney Mint after the ordinary office hours, I am directed by the Chief Secretary to append for your perusal copy of a further minute addressed to this Department by the Deputy-Master on the subject.

I have, &c.,

CRITCHETT WALKER,  
Principal Under Secretary.

The minute referred to is as follows:—

THE Mint Regulations provide only for the receipt of gold between the hours of 11 a.m. and 3 p.m. daily, except on Saturdays and holidays. The safe in the guard-room was intended for the custody of gold arriving at the Mint by Government escort in sealed boxes out of office hours. To meet the convenience of our customers and the general public, the practice has grown for the sergeant of police to receive gold for safe keeping at all hours; but it cannot be expected that he should be authorised to give formal receipts for the amount and value of the gold he has received, and he simply gives a memo. of the number of packages. In addition to our own customers, there are several shipping companies who store bullion here in large quantities to await the sailing of their vessels. They pay nothing for this service, and I presume that the strong-room of the Safe Deposit Company is at the disposal of those who may have valuables on their hands.

The police safe here is hardly large enough. They have only one constable on duty at a time, and he has to patrol the whole enclosure at intervals of half an hour all night.

It is impossible to report further on this individual case, as your correspondent has furnished no date. The senior-sergeant of police reports that he knows nothing of this matter.

E. H. VON ARNHEIM,  
Deputy Master, Royal Mint, Sydney.

Principal Under Secretary.

2565. In consequence of that I suppose you send the whole of your gold to Melbourne? Yes.
2566. What do the other mine-owners do? At least 10,000 oz. of Wyalong gold go to Melbourne every year. I saw in a newspaper, at the commencement of the year, that about 15,000 oz. of gold were received at the Melbourne Mint during the previous twelve months which had not been reported as crossing the border. That gold came from New South Wales. If you start from here with 500 to 600 oz. of gold, and get to Sydney with it early in the morning, you do not feel inclined to carry it about the streets with you for four hours.
2567. If the Sydney Mint had followed the same course as the Melbourne Mint, would you take your gold to Sydney? More than likely. I may state that two of my sons go down with the gold and they are allowed £10 each for expenses. We find that that pays us better than sending it by escort.
2568. Do you suggest that, in order to attract the New South Wales gold to the Sydney Mint, the authorities should adopt the same methods as those which are adopted at the Melbourne Mint? Yes, and the same charges.

2569.

- F. Neeld. 2569. Do you know anything about the question of titles to the land in West Wyalong? No; but I have always been opposed to West Wyalong altogether, because I consider the township is right on the top of the gold. From the very first I objected to that portion, from the corner of Mallee-street to the White Tank, being occupied, except for mining. I argue that if it had not been for the gold there would have been no storekeepers here. Therefore, the storekeepers have no right to interfere with the mining. The main road, for a distance of half a mile, is right on the top of mines. If what has occurred at West Wyalong occurred on our ground it would have ruined the mine, and we could not have put up machinery.
2570. Does the ore pay better from the deeper than from the top levels? Yes, it does; although it is harder to work. There is a better yield, and the reefs are wider. In addition to that, it takes 15 to 16 cubic feet of oxidised ore to make a ton, whereas of the sulphide ore it only takes 10 to 11 cubic feet. That ton will produce more than the ton above.
2571. Your experience shows you that the deeper you have gone the better the mine has paid? Yes.

Edward Ernest Tyler, mine-owner, Wyalong, sworn, and examined:—

- E. E. Tyler. 2572. *Mr. Trickett.*] How long have you been in Wyalong? Since the field opened.
2573. I believe you own the largest mine in Wyalong? I have collectively the largest interests in Wyalong.
2574. Do you agree with the evidence of Mr. Neeld as to the prospects of the field? Yes. I would, however, be inclined to emphasise more strongly what he has said about the permanence of the field. The deeper you go the channels get larger, and the ore gets richer. There is an instance of that on Boultee's mine. It barely paid until they got down 150 feet, and since then it has produced 20 to 30 oz. to the ton. At present we have developed to 500 feet, and a little deeper, and there is every evidence of the channels widening, and showing great permanence. I am interested in five different mines, and they are all at work.
2575. Have you a large sulphide plant? I have no plant at all. We go to Custom's works to get the ore treated, or else we send to Dapto.
2576. Do you contemplate erecting works of your own? It depends on the development of the mine. I think it is more important to develop them first, and then to put up what works the development justifies. The treatment is very cheap so far, and it pays us better to accept what treatment we can get.
2577. Do you find it expensive to send the ore to Dapto to be treated? The main part of the expense is the carriage by road to Temora. That costs £2 per ton. From Temora to Dapto the charge is only 14s. per ton.
2578. Is £2 the ordinary road freight? It goes as back loading, which is £1 a ton. Of course in wet weather the charge would be higher.
2579. As you do not treat your own material you are not inconvenienced by the want of water? Not at present. We have been inconvenienced on account of the batteries stopping. We have had to suspend the raising of stone on account of not being able to treat it.
2580. Has that been a frequent occurrence? No.
2581. Do you agree with Mr. Neeld, that a water supply is an absolute necessity in order to enable the place to become a large mining centre? There is no doubt that the demand for water will be greater than it is at present, but I have no doubt that tanks will be put down as the requirements grow.
2582. Has the health of the town suffered from want of proper water? There has been a good deal of typhoid, which, I suppose, is partly due to that.
2583. At what depth are you working? 500 feet.
2584. With what result? We are prospecting at that depth in two mines.
2585. Then you have not come across rich stuff at that depth? We have come across permanent-looking channels, and we are developing them.
2586. Which do you consider is the better route for a railway to Wyalong—from Grenfell or from Temora? I think there is better agricultural country on the Grenfell route than there is on the Temora route; at the same time there is good country between Temora and Wyalong. We want a railway, and the question as to which way it comes is not of great importance, so far as the field is concerned. As Mr. Neeld has remarked, I think the construction of a railway would lead to the introduction of capital. There has been absolutely no capital put into the field. It has had to develop itself. The field has been labouring under every disadvantage.
2587. Do you think surface developments are likely to occur as time goes on, or has the surface been thoroughly prospected? I think there is room for further prospecting, although most of the developments will be from working at greater depth.
2588. Do you think that with the construction of a railway, extensive plants would be erected here? I feel certain of it. It would give a great impetus to the field. If the field had been in Victoria, we should have had a railway long ago, and a lot of other assistance from the Government.
2589. Is the tendency now-a-days in the direction of treating the ores locally, rather than sending them away, if there is no difference in the outlay? I think that the mine-owners will be glad to see the stuff stop on the field. Of course, however, it is hard to say what refractory ores we may get hold of which will require to be sent away for smelting. Otherwise we should be inclined to patronise local treatment.
2590. Is the ore you found so far capable of local treatment? Some of it was considered refractory. Local men are now getting over the difficulty of treating it, and are ready to take it on the terms upon which it can be treated elsewhere.
2591. *Mr. Shepherd.*] What quantity of stone have you sent from Wyalong to Dapto? We have sent some hundreds of tons. We used to send the stone to Victoria before the Dapto works started.
2592. Do you send the stone to Dapto because you cannot get it treated satisfactorily on the spot? Yes.
2593. Is the machinery at Wyalong incapable of dealing with all the ore raised? I think certain gentlemen on the field are prepared to treat any ores you like to offer them unless there is a lot of copper, and that would probably necessitate smelting.
2594. Then the sending of stone to Dapto or elsewhere is likely before long to be discontinued? It is all a matter of terms. If they find they can treat it satisfactorily, and offer fair terms, the necessity of sending it away will be obviated. Again, if Dapto reduced its tariff it might pay us better to continue to send the ore there. As I have stated, it is purely a matter of £ s. d. If the railway were constructed,
- the

- the cost of sending away the material would be reduced, and the local men would consequently have to treat it at a cheaper rate in order to keep it on the field. E. E. Tyler.
2595. Did the carriage of £2 a ton pay the whole of the expenses to Dapto? I might explain that it cost us £1 a ton by road to Temora, and 14s. a ton by rail to Dapto. Then, of course, there are the charges for treatment. 23 Aug., 1899.
2596. In the event of a railway coming to Wyalong, would you expect the carriage to be much reduced? Yes.
2597. I believe your mine, which is 500 feet deep, is the deepest on the field? No; the Bantam is deeper—namely, 600 feet.
2598. Have either of you struck the reef at that depth? Yes; but we have not got upon payable gold. In our case, however, we have had the misfortune for the time being to lose the channel. We are doing what might be called prospecting work. In the case of the Bantam, they went down in the channel. As far as indications go, the channels improve with depth.
2599. Have you sunk a vertical shaft, or are you following the underlay? In the case of the Lighthouse we are sinking a vertical shaft.
2600. You are not at present in a position to say whether the reef is as likely to be as rich at or below the depth to which the Bantam and the Lighthouse claims are sunk, as they are at a shallower depth? We can only judge by the appearance of the channel, which I consider is everything.
2601. You have not yet had a crushing at 500 or 600 feet? No, because we have not had the stuff to crush. There are shoots and blanks in every mine, and as long as you are in a blank you cannot get stone. When you are in a channel you know what you are likely to get when you reach stone.
2602. Can you speak positively of the value of the reef at the depth to which you have sunk, namely, 500 and 600 feet? I cannot speak from results at present.
2603. Therefore, everything is supposition so far? I do not consider it supposition.
2604. Do you consider it a certainty? I do. I consider it a certainty that the reef is as good there as it is above, and that it is likely to be better.
2605. What is the greatest depth from which you have had a crushing? About 360 feet in the True Blue and the Shamrock.
2606. Have you stoped out a considerable quantity at that depth? Yes.
2607. What return did you get from that depth? Various returns—from rich mineral to low-grade stuff, which ran 10 dwt. to the ton.
2608. Then, in your opinion, the material 500 and 600 feet deep is quite equal to that at 350 feet deep? Yes.
2609. *Mr. Trickett.*] Is there a large quantity of ore at grass awaiting treatment? Mr. Neeld alone has some thousands of tons; other mines have hundreds of tons in different places.
2610. Why is it not more vigorously treated? The batteries have been hung up for want of water.
2611. That brings us back to the question whether a water supply is not the first necessity here? I do not know. I think the question of the water supply will gradually work its own way.
2612. Do you know what quantity of stuff is at grass on the whole of the field? I should say about 10,000 tons.
2613. Is it usual to keep such a lot of stuff as that at grass? No.
2614. Then there must be some reason for it? Since the batteries have re-started it is gaining on the heaps. Mr. Neeld is keeping his big heaps back for his own battery which he is erecting.
2615. *Mr. Watson.*] You have stated that you pay £1 per ton for your ore as back loading from Temora? Yes.
2616. Do you know whether the freight has ever been less than that? Not to my knowledge. Of course, in wet weather it goes up to £2 per ton.
2617. It has been stated that in 1895 carriage could be obtained from Wyalong to Temora for 15s. a ton? It is possible, but men would not have a chance to make a living at it.
2618. Dapto, according to the railway time-table, is distant from Temora, *via* Sydney, 347 miles; Lithgow, from Temora, is distant 252 miles—a difference in favour of Lithgow of 95 miles; it does not appear that you send your ore to Lithgow, notwithstanding the difference of 95 miles in railway carriage;—I suppose that is because the Dapto people offer the better method of treatment? Yes; and the cheaper method.
2619. It does not seem, then, that distance is the only consideration in the question of treating ores? No. Dapto has made concessions for the sake of getting Wyalong ore.
2620. *Chairman.*] If ores were treated at Lithgow for the same charges, would you not prefer to carry the stuff the shorter distance? No doubt, other things being equal.
2621. Have you had any communication with the Lithgow people as to whether they would treat the ores? No; I do not think any stuff has gone there.
2622. *Mr. Watson.*] Have you heard that at Lithgow they have lately been turning their attention to treating ores? No; I am not aware that they are turning their attention to the matter.
2623. Do you think smelters are likely to be established at Lithgow for the sake of the trade they would get from Wyalong alone? No.
2624. There would not be sufficient trade from Wyalong to justify the establishment of works similar to those at Newcastle and Dapto? Certainly not.
2625. Then it would seem probable that a connection with Lithgow is not of such importance to Wyalong as is the easiest possible way of getting to a place like Dapto? No.
2626. The greater the variety of ores they smelt from different parts the cheaper they can do the work? No doubt.
2627. A work, such as that at Dapto would, I should imagine, be more effective for the treatment of Wyalong ore than smelting works which might be put up at any other place? Yes.

George Smith Duncan, proprietor of cyanide works, Wyalong, sworn, and examined:—

2628. *Chairman.*] Have you any statement to make to the Committee? Only that we are treating the G. S. Duncan ores raised in the Wyalong mines.
2629. Are you engaged in mining? I have an interest in two or three mines. 23 Aug., 1899.

- G. S. Duncan. 2630. Are you in a position to corroborate the evidence which has been given by previous witnesses? Yes, generally speaking. I may mention that I am not a local resident, and I am only in Wyalong occasionally. I am a resident of Victoria, and do not possess a full knowledge of the field so far as the mines are concerned.
- 23 Aug., 1899. 2631. Have you had experience in Victorian mining? Yes.
2632. Does that experience enable you to say whether the Wyalong mines are likely to prove permanent? There is every indication of permanency, on account of the nature of the minerals. The channels are well defined.
2633. And when you strike a shoot, is it pretty rich? Yes.
2634. What processes are you using at present? The cyanide process. We treat all the various classes of ores on the field.
2635. Do you reduce the ores to tailings first? Yes.
2636. Do you get the free gold out before you put the ore through the cyanide process? No; we treat it *in globo*.
2637. Is the impression that some people possess, that cyanide will not treat rich ore, correct? It depends on the class of ore you are treating. Wyalong ores are especially adapted to cyanide treatment. The richness of the ores does not affect their treatment.
2638. Do you think the sulphide ore will be possible of treatment by cyanide? We are at present treating it successfully.
2639. Do you anticipate, from what you know of the class of ore from the deeper levels, that there will be any necessity to resort to smelting? That is the question. If there is anything deleterious to cyanide treatment we should have to resort to smelting.
2640. But you had no indications of ore which would require smelting? There is only one mine, belonging to Mr. Tyler, in which there is copper about.
2641. At what depth was that obtained? 200 feet, I think.
2642. Is it possible that any development of copper in that mine might be only incidental, and not of a general character? I should think it was incidental, because the other mines, although much deeper, have shown no trace of it.
2643. Is that the only indication you have had of a class of ore which might require treatment different from the cyanide treatment? That is all.
2644. If the ore continues to be obtained in its present character it can be treated by cyanide? Yes; it carries up to 40 per cent. of sulphur.
2645. Supposing you had ore carrying 40 per cent. of sulphur and no other ore to mix with it, could you treat it? Yes.
2646. I suppose local treatment is better for the general business of the field? Yes; and the rates paid on the field are more favourable when the cost of carriage is taken into consideration.
2647. Do you think you would be able to compete with the Dapto works if there were through-carriage from Wyalong? I could not say at present.
2648. Do you know of anything to make you doubtful whether you can deal with any ore on the field? No; we have thoroughly tested the whole of the ores.
2649. How do you purchase the ores? We pay a certain percentage on the assay value—up to 95 per cent.—and we charge so much per ton for treatment.
2650. What is your charge? It ranges from £3 downwards, according to the value of the ore.
2651. Do you charge more for the treatment of valuable ores? The more valuable the ore the higher the price of treatment.
2652. Do you know what the Dapto people charge? Their charges are on a sliding scale, according to the value of the stuff treated. I do not know what the scale is.
2653. Is it not possible that they may be in a better position to compete for ore, owing to the fact that they put through a greater variety and a greater quantity than can be put through by the local works? Yes; they get ore from all parts.
2654. Then they will always be a strong competitor with any local cyanide works? Yes. We are not afraid of competition to such an extent as would lead us to say that we do not want a railway constructed.
2655. Have you any doubt as to the prospects of the field? No; we have a very extensive plant, and are adding to it.

---

Edward Janitzky, manager, Sully's Chlorination and Cyanide Works, Wyalong, sworn, and examined:—

- E. Janitzky. 2656. *Chairman.*] Have you heard the evidence of previous witnesses? I have heard the evidence of Mr. Duncan and Mr. Tyler.
- 23 Aug., 1899. 2657. One of the witnesses has stated that when the oxidised ores give out you will require to smelt the ores here, and other witnesses say that, so far, they have been able to treat any of the ores which have been raised;—will you give us your opinion on the matter? Unless things change considerably everything can be treated locally.
2658. Then, so far as the ores are concerned, there is not likely to be much traffic in them on a railway? No. I do not think there is any necessity for a railway, so far as the carriage of minerals is concerned. But there is a necessity for it so far as agriculture is concerned.
2659. Which of the two routes do you think would be the more likely to give some return to the State? The more populated route.
2660. Which is the more populated route? I could not tell you.
2661. *Mr. Shepherd.*] In carrying out your work, would not coal suit you better than wood? Yes; but it could not be obtained cheaper than wood. There is any amount of wood for years to come.
2662. Do you think you would be induced to bring coal to Wyalong for the purpose of carrying on your work if it could be got here at a cheap rate? If the timber can compete with the coal, I do not think there will be any necessity for using coal. We should use whatever is the cheaper.
2663. *Mr. Trickett.*] What is the character of the water supply at Wyalong? The want of water impedes mining.
2664. Is a water supply required more than a railway? I think it is a most important matter to get a water supply.

---

Herbert

Herbert Bertram Christie, stock and station agent, Wyalong, sworn, and examined:—

2665. *Mr. Dick.*] Have you a fair knowledge of the country between Grenfell and Wyalong, and between Wyalong and Temora? Yes. H. B. Christie,  
23 Aug., 1899.

2666. Have you any statement to make? Yes. I have been in the district during the last eight years, and managed Wyalong No. 2 station for six years, from 1891. Since I have come to the district the number of stock has fallen off fully three-fourths. That is due to the growth of scrub, and to the advent of the rabbit. The district is now being wire-netted, and scrubbing is universal, consequent upon the issue of scrub and improvement leases. I consider that, in four years' time, the country will carry the same number of sheep that it carried in 1891. Moreover, the country is yearly being better watered and subdivided. In 1891, fat stock were very plentiful, and they will again become plentiful. I estimate the annual output of sheep at about 25,000—that is, for the district north, west, and south of Wyalong—or 200 trucks, which, at £6 10s. a truck, would give £1,300 worth of freight to the proposed railway. During the past year it has been impossible to send fat stock from this district owing to the distance from a railway. With regard to wheat, I may mention that I have roughly totalled the areas under crop lying to the north and south, within a radius of 25 miles. I have excluded east of Wyalong. I find that the area under crop in that extent of country amounts to over 7,000 acres. This area has been trebled during the last three years, in spite of the severe drought, and I think that, within the next three years, it will have increased to 20,000 acres or 30,000 acres. The district has proved its extraordinary suitability for wheat-growing. I estimate the average crop at 11 bushels to the acre, taking all seasons, or an output in three years time of from 200,000 to 300,000 bushels. That would give freight equal to 5,000 or 7,500 tons. I am excluding what will be used for chaff. That should amount to about 3,000 tons. If we had had a railway during the recent bad seasons we should possibly have been able to get stock away to where there was good grass. Owing to the want of a railway thousands of stock have been lost in the district within a radius of 35 miles. If we had a railway to Grenfell we should be able to send our starving stock to the Cowra district. That would be the most suitable place to which to send them, because the whole of the Upper Murrumbidgee country is snapped up by the Riverina squatters. They are able to give better terms than are the people about here.

2667. You state that in four years' time the number of sheep in the district you have mentioned will, in your opinion, be as large as it was in 1891? Yes.

2668. What was the carrying capacity per acre in 1891? I could not tell you; but I have made inquiries, and I find that at ten stations within a radius of 25 miles they were carrying 215,000 sheep.

2669. Have you any idea of the area of those stations? No.

2670. Do you think they would carry a sheep to 2 acres? I should think they would carry one sheep to 3 acres. This country, if fairly improved, will carry a sheep to 3 acres, and in many parts it will carry a sheep to 2 acres.

2671. You referred just now to a return of £1,300 per annum for freight;—what was that for? For the carriage of fat stock from this area. Prior to this no stock has gone from here. It is too far to a railway at present, and the water on the road is bad.

2672. Do you anticipate that there will be a large increase in the area under wheat? I estimate that there are at present 7,000 acres under wheat, owned as follows:—Mrs. Smith, 150 acres; W. Smith, 150 acres; P. Neilsen, 350 acres; A. Clark, 300 acres; P. Clarke, 250 acres; W. Bottrell Bros., 350 acres; J. Haub, 200 acres; C. Haub, 200 acres; Rootes (2), 300 acres; Cattle Bros., 400 acres; Lang, 250 acres; Gagie, 200 acres; Wells, 100 acres; A. Blyter, 200 acres; Maddison, 700 acres; J. Bolte, 100 acres; P. Bolte, 200 acres; Rankin, 400 acres; J. C. Moore, 300 acres; Lewington, 200 acres; Phelan, 500 acres; Thompson, 200 acres; James Jamieson, 300 acres; John Jamieson, 200 acres; Hawkins, 150 acres; Giles, 100 acres; J. Jones, 400 acres; Hildebrandt, 150 acres; Elliott, 200 acres; Goodwin, 300 acres.

2673. Have you authority from those people to put their names down for the amount stated? No; but I believe those to be the areas they have under cultivation. I know a good number of them, and I have asked them.

2674. And there may be more whose names you have not put down? Yes.

2675. Do you anticipate an almost immediate increase in the area under wheat around Wyalong? Most certainly, if we have a railway.

2676. Is that a condition of the increase? I think so.

2677. If a railway is constructed, do you think the agriculturists around Wyalong would be able to supply the Wyalong market and the district to the west? Undoubtedly.

2678. Can you give us any information as to the average number of times the following state of things occurred in ten years: That in the Western district—about Hillston and further west—there is a drought, whereas between Wyalong and Grenfell, there is a fair or tolerable season;—does it not happen that if there is a drought at Hillston, there is also one between Wyalong and Grenfell? I think we are all pretty well in the same zone. For the last two or three years, there has been a drought all over the place.

2679. Do you look upon the western market around Hillston as being of any importance to the agriculturists around Wyalong in times of drought? Not so far. We have had to get stuff to supply our own wants, without sending any away.

2680. Do you think the rainfall around this district is sufficient, year in and year out, to encourage people to go in for an increase in agriculture? I think so. They have actually been increasing during the last year, and no year could have been worse.

2681. What market do they anticipate they will supply? They will send wheat to the Sydney market. The whole of the 7,000 acres has been cultivated practically since the discovery of the Wyalong field. I do not think the land would have been put under cultivation if Wyalong had not been discovered. With regard to wool, I should have stated that with this district running 250,000 sheep, there should be a tonnage for the railway, at the lowest, of about 530 tons of wool.

2682. Where does that wool drift to now? Mostly to Temora.

2683. In the event of a line being constructed from Grenfell to Wyalong, do you think the wool would be trucked at Wyalong? Yes.

2684. Do you know enough of the two rival routes to be able to express an opinion as to their relative merits? I know the route to Grenfell.

2685. Which do you think would open up the larger area of good agricultural land? I know that the land

- H. B. Christie. land between Wyalong and Grenfell is the best; it would be more easily put under cultivation. It is not so heavily timbered. There is a lot of plain country about it. I am also given to understand that more Crown lands are available along that route.
- 23 Aug., 1899. 2686. You have mentioned the item of the carriage of starving stock? Yes; it would be better suited to this district if we had a railway to Grenfell, because of the ease with which the Cowra district could be reached. We should send our sheep to the Upper Lachlan rather than to the Murrumbidgee.
2687. Have you had any experience in the transit of starving stock? No.
2688. Do you think that in times of drought there is a sufficient area of available land in this Colony to which to send any considerable number of starving stock? Yes. The droughts are not always in the same part. Last year was an exceptional year; I do not think there was sufficient room for them.
2689. What would have happened in regard to starving stock if a railway had been built to Wyalong two years ago? I think it would have saved several thousands of sheep.
2690. *Mr. Watson.*] Do you think you would have a better chance of getting grass for starving stock at Cowra than on the Murrumbidgee? Yes.
2691. Do you know that last year there was as great a rush there as anywhere? Yes; I think the whole of the colony was rushed for grass because the drought was universal. I may state that personally I am not favouring any particular route. We want a railway whichever way you like to send it.
2692. You have stated that the country between Wyalong and Grenfell could be more easily put under cultivation owing to the fact that it is not so heavily timbered? Yes.
2693. Do you know of any instance in which successful cultivation has been tried on the plain country? Yes; at Forbes.
2694. Is that the same as the Bland country? I refer to the red portions of the country.
2695. That is more like the Myall Plains? It is not so stiff as that.
2696. Is there much plain country between Wyalong and Grenfell similar to the Forbes Plain? Not a great deal. In my opinion a great deal of these plains will be under cultivation.
2697. What makes you think that? Because it is splendid land.
2698. Do you think the rainfall is sufficiently regular to give that kind of country a fair chance of cultivation? Yes. Clayey country retains the moisture far better than does sandy loam. It is, therefore, better in times of drought than loam. The best returns I have seen from wheat are from clayey country. Of course, there are three sorts of clayey country on the plains. There is stiff black clay called gilgai country. In a wet season that would be flooded, and the water would lodge on the surface, and kill the wheat. With regard to the red clay and the lighter coloured clay the water would get through.
2699. In what direction do the farmers, to whom you have referred, live from Wyalong? Nearly the whole are to the north, west, and south.
2700. How far west do the farms extend? About 25 miles. Most of the farmers whose estimates I have given are to the north of Wyalong.
2701. Are those farmers as far from a railway as are the farmers on the Bland country? They are about the same distance.
2702. It seems then that successful cultivation is going on north of Wyalong, at a similar distance from railway communication as the land at present uncultivated on the Bland;—may we not infer from that that the land on the Bland is not so suitable for cultivation, as that which you say is under cultivation to the north of Wyalong? I do not think so, because we have a market here for our stuff.
2703. Would not the Bland people have the same chance of a market here for their stuff? No; they may both be 50 miles from a railway, but it does not follow that they are both handy to Wyalong.
2704. How far is the one who is furthest away from Wyalong? Twenty-five miles; but the majority of them are within 12 miles.
2705. How far is Back Creek station from Wyalong? The homestead is 14 miles away. The areas to which I have referred would never have been under cultivation if Wyalong had not been discovered.
2706. Have you taken any interest in mining matters? Yes.
2707. Is it likely that ores will be treated locally? I could not say. Up to the present we have treated stuff at Dapto simply because it has paid us better. If we had the same treatment here and the same terms we should give the preference to Wyalong.
2708. Do you think you are likely to get that treatment at Wyalong? Yes; we are getting it now. I am interested largely in the True Blue mine, and all our stuff is being treated locally.
2709. Do you think it will be necessary to change the present method of treatment? Not in our mine.
2710. *Mr. Trickett.*] In view of the possibility of a railway line going to the west in the direction of Hillston, which do you think would be the better line to construct—one from Temora to Wyalong, or one from Grenfell to Wyalong? I should say one from Grenfell to Wyalong. The Ariah district has splendid land, and it would be well served from Temora, and that would be a parallel line to the Hillston line. If we had a railway from Grenfell to Wyalong a good deal of the machinery which is now coming from Melbourne would, I think, be purchased in Sydney. So far, with the exception of two plants, the whole of the machinery on the field has been purchased in Melbourne.
2711. Do you know the country west of Wyalong? Yes, up to 7 miles on the other side of Yalgogrin.
2712. What is the character of the country there? There is any amount of splendid wheat land.
2713. Do you know the country 20 to 30 miles north of Wyalong? Yes.
2714. What is it like? It is tip-top agricultural land, especially on the Wyalong side of Back Creek.
2715. *Mr. Watson.*] You have stated that if a railway were constructed from Grenfell to Wyalong the machinery for the field would be brought from Sydney instead of from Melbourne? Yes.
2716. Do you think, then, that the question of saving a few miles of carriage would influence purchases of plant for mining? I understand that the difference in the carriage would be 64 miles, instead of 7 miles.
2717. Is it not a fact that people go to Melbourne for their machinery because the Victorian people having a greater interest in the field have laid themselves out to cater for the supply of machinery? Of course, they are very much ahead of New South Wales.
2718. They make more effort to meet the demands of mining investors than do the Sydney people? Yes.

Digby Noy Johns, pastoralist and farmer, Ungarie, sworn, and examined :—

2719. *Mr. Shepherd.*] How far is your holding from Wyalong? Between 30 and 40 miles north-west.  
 2720. Have you any statement to make to the Committee? Yes. I have been examining the estimate of prospective returns which have been supplied to the Committee from the Traffic Department, and I have come to the conclusion that they are based on incomplete data. Since 1890 the number of sheep in the district lying west and north-west from Wyalong has been reduced by 78 per cent. This is due partly to the rabbits, partly to the drought, but I think chiefly to the growth of scrub. I will give you the returns of sheep from eight runs, lying close to the west of Wyalong, all of which would send their wool to Wyalong if a railway were constructed to it. The figures are as follows :—

D. N. Johns.  
 23 Aug., 1899.

	Number of Sheep.				Number of Sheep.		
	1890.	1899.	Distance from Wyalong.		1890.	1899.	Distance from Wyalong.
Wyalong No. 1.....	25,000	2,000	14 miles.	Yalgogrin .....	20,000	7,000	20 miles.
Buddigower .....	50,000	4,000	20 „	Youngara .....	20,000	3,500	35 „
Wollongough .....	25,000	11,000	30 „	Ungarie .....	20,000	7,000	25 „
Bolygamy .....	15,000	6,000	20 „	Youngee Plains.....	15,000	.....	18 „
Merringreen .....	25,000	3,500	30 „	Total .....	215,000	44,000	

NOTE :—These figures do not include the selectors' flocks on those holdings.

These reductions are due to the scrub—at any rate that is the principal cause. We have dealt with the rabbits now, and nearly all the runs are netted, some of them, like our own, into sections. There is also also very much better water conservation than there was in 1890, but the scrub is the great difficulty.

2721. *Mr. Watson.*] Is it a worse difficulty than the drought? Yes.

2722. *Mr. Shepherd.*] What kind of scrub is it which is so disastrous? Box seedlings are the worst. Then there is the pine. The country west from Wyalong is almost all pastoral leasehold. It was all ringbarked when the leases were granted for ten years in 1884. When four or five years had passed away, and the time had come to go over the country and sucker it, the leases were half expired. Accordingly the lessees said they had better wait to see what would happen, because they thought that they might lose the country after they had improved it. The Government then passed the 1889 Act, which gave them power to grant a further extension not exceeding five years. In 1895 the leases were thus again running out, and the same condition of things existed. The scrub there is now fifteen years old. The Government will not give tenant right even now. If they did, the land would be ready for selection in a few years.\*

2723. Then the chief losses have been occasioned through the want of tenant right? Yes; at no time did a lessee have tenant right under a pastoral lease. The Chief Justice has laid down the common law now, not only with regard to the resumptions under the 1895 Act, but also under the 1884 Act, that there was no tenant right whatever. That is why the lessees, when they ringbarked the first time, did not go on operating later on. They discovered that they had no tenant right, and at the end of the five years to come, all that they had spent might be lost.

2724. Can you state at what period the greatest losses occurred;—was the decrease gradual, or did it occur at any particular period? The 220,000 sheep to which I have referred as having been on the runs in 1890, would have been exceeded in 1895 or 1896. There was a considerable loss in 1888, when there was a bad drought. We only had 9 inches of rain. In 1889 we had a splendid season, and the number increased again in that year and in 1890. In 1891–2–3, the numbers would have been as high as those I have quoted, or higher. For instance, Wollongough carried more sheep in 1893, the number shorn being 27,000, but in 1890 the numbers were as I have stated. In 1895 the rabbits came. Since then the country has never had a chance of recovering, for this present drought followed the rabbit invasion.

2725. Then the greatest decrease has occurred since the drought set in four and half years ago? Yes. Up to 1894 the country was carrying, not what it had been carrying when the improvements were new in 1885 and 1886, but still it was carrying an immense quantity of sheep. The Buddigower station shored 75,000 sheep as against 50,000. Wollongough in 1885 shored 46,600 sheep, and in 1890 the number was down to 25,000. Merringreen in 1885 shored 48,000 sheep; in 1890 the number was 25,000. The country was beginning to go back. The ringbarking was followed by grass, and then the work being neglected the scrub began to grow and the capacity for carrying sheep gradually decreased.

2726. The neglect has been occasioned almost entirely on account of the lessees not being certain that they would be able to secure the renewal of their leases? The country was neglected because the lessees knew they had no tenant right, and that all the money they spent would be lost to them. Of course, the expense of improving a run, per acre, is ten times more than the rent. You might not think a rent of one penny an acre dear, but to ringbark might cost you 2s. an acre, and that is twenty-four years' rent.

2727. If the work had been done at the first the cost would have been trifling? I was speaking of the first cost. The first cost of ringbarking that virgin country in those days was 2s. 6d. an acre. The runs to which I have referred will send their clips to Wyalong. Their distance from Wyalong varies from 14 to 35 miles. They lie to the west and north-west. The list I have given does not, of course, include any of the selectors' flocks. If you add them to the list we should have estimated 250,000 sheep ten years ago. The scrub leases are now being taken up in rather a half-hearted way, because there is no tenant-right for them either. Ten years is allowed for one half, and twenty years for the other half. They contain often a railway resumption clause. I know of a scrub lease for ten years which was offered the other day. It was admitted that it would cost 5s. 6d. an acre to scrub and re-scrub it fully. The Board fixed the rent of it at about two-thirds of a penny per acre per annum; in other words, the rent for ten years would amount to 7d. per acre. The improvement of scrubbing alone would cost 5s. 6d. to 5s. 9d. per acre. You will see how ridiculous it is that, if a thing is only worth 7d. for ten years, and 5s. 6d. is spent on scrubbing it, you should be expected to agree to lose this expenditure. If a railway  
 came

\* NOTE (on revision) :—No change in the present law is required to vest the tenant right, in scrubbing, in a lessee; this rests with the Minister. In the case of improvement leases the tenant right in the scrubbing is also within the discretion of the Minister to grant to the lessee; and this he nearly always does. My contention is that the Minister should not discriminate between two classes of leases which are virtually identical in their object and conditions. In both, the tenant right in water and fencing improvements vests in the lessee, but the performance of the conditions in respect to these two improvements does not cost more than a sum equivalent to about one shilling over the area of land leased.

- D. N. Johns. came along you would lose all your money. The land and the improvements would be gone, because you had not got tenant-right, and the railway clause absolutely determines the lease, without tenant-right expressly.
- 23 Aug., 1899. 2728. Then the condition of things now will greatly prejudice the taking up of the country? Yes; west of Wyalong.
2729. Do you think the old lessees would take up land again after it became re-available for selection? No one will take up scrub lands unless they get a twenty years' lease, unless tenant right is given in the scrubbing.
2730. Then the land to a certain extent has been rendered useless through neglect? Yes. Of course there are areas of land in which this has not occurred. There are considerable areas which are clear and available for selection, being country of a more open character.
2731. Is a considerable portion of it fit for agriculture? I think all the country from here westward is suitable for agriculture, when the timber and scrub are sufficiently dead and decayed to burn readily.
2732. For how far westward? All the way from Wyalong to Hillston.
2733. Do you think it is likely that it will be taken up for agricultural purposes? Yes; if a railway is built, it will be taken up. If it is not built there is not the faintest prospect of it. It would be absolute ruin for anyone to go in for it. The wool output from 250,000 sheep, at 6 lb. per head, comes to about 800 tons of wool. That is on the 1890 basis. Of course, if Parliament builds a line to Wyalong, this country will be taken up in small areas by settlers. If they know a railway is coming they will settle. In my opinion, if a railway comes here, you would in five years' time have the country in a state of improvement similar to that which existed ten years ago.
2734. The leaseholders, yourself and others, would disappear? Yes; a great many would. I do not think we should regret disappearing. We are very sorry we ever appeared.
2735. *Chairman.*] Where is the wool trucked now? Generally at Temora. You would also have a considerable amount of fat stock to carry. On an average, about 10 per cent. of a man's sheep are fattened, and that would give you out of 250,000 sheep about 20,000 fats a year, or 200 trucks. In addition to that there would be about 150 to 200 tons of salt brought out from Sydney as back traffic. You would also have between 20 and 30 tons of woolpacks as back loading. With regard to wheat, I gave evidence when a former Committee was at Wollongough, and I compared the rainfall of this district with that of Urana, not far from Berrigan, on the border of Brookong station. Taking the months of August, September, and October for the last nine years—from 1890 to 1898—I find that out of twenty-seven spring months we have had nineteen wetter months than they, and they have had eight wetter months than we. I think that for grass it has a better climate than this, but for wheat-growing this climate is equally as good as that. It is not easy to compare the two, because that country was improved in the sixties. With regard to the quality of the soil, Mr. Hassall went over the land out north-west of Wyalong, and reported that it would bear favourable comparison with some of the most productive in Riverina. Mr. Slee also gave evidence on the country between here and Lake Cudgellico, and said it was "a perfect Garden of Eden." I produced a letter from the manager of Brookong station before the former Committee, referring to the land of this district. He said he thought it was quite as good for wheat-growing, but not so good for grass as Brookong. We have grown wheat constantly, also oats, barley, potatoes, corn, fruit, and vines experimentally. With regard to the routes, I may state that I have been around the district, and the whole of the pastoralists but one prefer the Grenfell route. The reason of that is this: We believe there will be an enormous area under wheat out here; and if the line is constructed from Temora, inasmuch as our harvest comes in at the same time as the Riverina harvest, there will be a perpetual block at Cootamundra. We consider that the wheat-growing future of this district is underestimated. We have watched the extraordinary way in which the growth of wheat has increased. During bad years we do fairly well out here. The average for the Wollongough district last year was  $8\frac{1}{2}$  bushels per acre, and that compares very favourably with almost any other district in New South Wales in a bad season. Another reason is that, owing to the constant block of wheat traffic at Cootamundra, it would be almost impossible to truck fat stock in summer-time. The Lake Cudgellico secretary wired me yesterday, asking me to notify you that they were unanimously in favour of the Grenfell route. The Grenfell route is for us the cheapest route to Sydney. We used to send our wool to Melbourne, *via* Temora, and Sydney, and round by sea.
2736. *Mr. Watson.*] Why did you send it to Melbourne? In those days we got a better price in Melbourne for that particular class of wool. We do not send it round to Melbourne now, but sell it in Sydney. The main reason we are in favour of the Grenfell route is that we consider there will be a huge area under wheat between Wyalong and Hillston when the line is continued, and that there will be a lot of traffic at Cootamundra, because the southern Riverina traffic comes in at the same time as the traffic from here. With regard to starving stock, of course, it would not pay to make lines for them. I heard what Mr. Christie said about the Upper Murrumbidgee being completely overrun last year by sheep from Riverina. That is perfectly true. At Orange the other day I met Mr. Brett, the Stock Inspector, from Urana, and he told me that not only was the Upper Murrumbidgee so overrun that sheep from about Urana had actually paid 1s. a head more than their value for grass, but that they had come back "rotten as pears," suffering from fluke and ringworm. The Upper Lachlan country is the country to which Hillston sends its sheep, and it is a better place to which to truck them. The Inspector of Stock at Hillston told me that during the first six weeks of this year 160,000 sheep, most of which came up the river, had left the Hillston district. The Upper Lachlan is best reached *via* Koorawatha junction.
2737. Do you think they would be diverted to the proposed railway if it is constructed? Not unless it goes on to Hillston. I may state that if we could not get country for starving stock on the Upper Lachlan it would cost us one halfpenny per head extra at starving stock rates to send them the 60 miles between Koorawatha and Cootamundra and then on to Gundagai. They would be only two hours more in the trucks, and if the sheep are fit to climb those hills they are fit to stop two hours more in the trucks.
2738. *Chairman.*] Do you know whether this state of things has happened in New South Wales: that a railway going into a pastoral country has had the effect of increasing the carrying capacity of the runs;—would you send the stock away for fattening in small quantities? If you bring the line to Wyalong the country 30 to 40 miles west will be taken up. The result will be that the carrying capacity will be as great or greater than it was ten years ago. I consider that of the 250,000 sheep then there, at least one-tenth will be fattened annually. The principal months during which they will be fattened will be September, October, November, and December.
2739. That means that at present you send no fat stock away at all? No; no fat stock are now sent.
2740. As you sent them away would you replace them? We should be breeding. This is essentially a breeding

breeding country. It is not fattening country like the Bland, where they buy for the purpose of fattening. That is the best fattening country in New South Wales.

2741. *Mr. Trickett.*] You base your possible wool traffic on certain figures on the one hand, and on the other hand you state that the country year by year is becoming of less value by reason of the growth of scrub; if that is going on, the carrying capacity will diminish? That country is going back at present; but if you bring a railway to Wyalong the country for 40 miles out will be taken up by small holders; they will not go out into that wilderness unless it is close to a railway; any man above 30 miles from Wyalong is cooked.

2741½. Do you think that under present circumstances, with regard to the leasehold areas occupied by you and the adjacent holders whom you have named, you and most holders, unless the law is altered so as to give you a different tenure and tenant-right, will not keep on at the end of the term? We should not attempt to improve. We are all letting the land go back; that process would continue.

2742. And letting it go back, necessarily means that the carrying capacity is getting less every year? Yes.

2743. Then a railway would be of no benefit to you individually, unless there were a corresponding alteration in the land laws, excepting that you would possibly become a small holder instead of a large one? The railway would benefit us in this way: that at present we are a prey to the vermin breeding on large areas of abandoned country further westward which is going back, and that land might be selected and improved.

2744. Your estimate of the possible supply of wool to the railway is based upon the railway being extended to Wyalong, and the probability of a number of small holders taking up the scrub land and improving it? That is one basis. The other basis is to give all leases with tenant right.

2745. *Mr. Watson.*] You state that the lessees, after the 1884 Act was passed, ringbarked the country, and so on;—about five years afterwards that country was suckering and becoming scrubby? Yes; they found they had no tenant right.

2746. The Act of 1889 was passed, and that gave them a possible extension of another five years? What the Act meant was very obscure; besides one would not know till the case should be heard in 1894.

2747. They were under the impression, at any rate, that they were to have an extension by virtue of improvements? Not exceeding five years, and it might be only one, and too dear to accept, therefore.

2748. According to the extent of the improvements they made, the greater extension they would get? Yes, provided the Board thought the land would not be required for settlement.

2749. Will you explain why, when the 1889 Act was passed, they did not go on suckering, which at that time could have been done cheaper than it could have been done subsequently? I believe there were ninety-seven holdings in my district which applied, under the 1889 Act, for an extension by virtue of improvements. The applications had to be lodged in 1890, and they came before the Condobolin Board in 1894. Some of them showed improvements of about 1s. and 1s. 6d. per acre, and some showed improvements up to 4s. and 5s. per acre. The Board gave one decision in regard to the whole of the applications. The whole of the applicants except one, who withdrew, went to appeal, and the Condobolin Board gained the record for the whole of the world in having every one of their decisions upset.

2750. Do I understand you to say that it would cost 5s. 6d. an acre to scrub the country to which you have been referring? That is a cheap estimate.

2751. Do you think the land is worse than the pine scrub on the Bogan? No; the District Surveyor swore that the scrub there was about the same as on the Bogan. I do not know, myself.

2752. The average cost of scrubbing the Bogan was under 3s. an acre? Yes, for the first treatment; but there is a second treatment necessary here at the end of two or three years, and from time to time afterwards during ten to fifteen years.

2753. Then a lease for ten years would be too short? Not if you give tenant right. If a man had tenant right he would get his principal back. He can then accept a lease containing a resumption clause, without danger of losing more than interest.

THURSDAY, 24 AUGUST, 1899.

[The Committee met at the Court-house, Wyalong, at 10 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

George Stevenson, Police Magistrate and Mining Warden, Wyalong, sworn, and examined:—

2754. *Chairman.*] How long have you been in Wyalong? Since the middle of January last.

2755. Have you been long enough here to make yourself acquainted with the whole of the district to be served by the proposed railway? I am very well acquainted with the whole of the district.

2756. Have you prepared any statistics for the Committee? Yes. I have prepared a comparative statement of the yield of gold. In 1896 the production of the field was 31,211 oz., of the value of £124,844. In 1897 the production was 32,571 oz., of the value of £130,284. In 1898 the production was 36,839 oz., of the value of £147,356. This year I estimate that the output will be at least 40,000 oz., of the value of £160,000.

2757. The returns show a steady increase since 1896? Yes.

2758. In your opinion, is there every probability of it continuing? I think so.

2759. Then the permanency of the field seems to be assured? It seems to me to be the most paying gold-field we have in the Colony. I have seen quite a number of gold-fields in the Colony, and the reefs here are larger and more permanent. They are not lost, but can be traced from start to finish, and there is plenty of stone to work.

2760. In the immediate vicinity of Wyalong? Yes.

2761. What mining is there outside of Wyalong? There is Yalgogrin, with a population of about 300 engaged in mining.

2762. Is that being fairly well developed? It is very much at a standstill at present on account of most

G.  
Stevenson.  
24 Aug., 1899.

G.  
Stevenson.  
24 Aug., 1899.

of the auriferous land being held by conditional purchasers and conditional lessees. Some of it is being worked under the Mining on Private Lands Act. The Department of Mines, on my recommendation, are about to resume 2,560 acres. It is nearly all auriferous.

2763. What is the general opinion of that field? Very favourable. It has paid all those who have worked there up to the present time; but there have not been facilities enough to induce a large population to remain there. They were short of water last summer—in fact, it ran out. The population dwindled away. It is increasing since the rain came, and they have more tanks down now. They secured more water during the last rainfall than they have ever had before.

2764. Are there any fields north of Wyalong? Hiawatha is a place where a large rush occurred some time before I came here. That is 11 miles to the north. There is not a very large population there now. They knocked off work in consequence of the drought. They could not get enough water for domestic purposes.

2765. Then we may reasonably suppose that the field for some distance around Wyalong will maintain a permanent population engaged in the mining industry? I think it will.

2766. Have you any further information with which to supply us? There are eighty-seven gold leases in operation at Wyalong, containing 373 acres, and twenty-five claims occupying 100 acres. The miners' rights issued at Wyalong during the past twelve months numbered 1,189, and the business licenses numbered 633. Those figures show an increase on previous years, but the increase is not very rapid. The value of the machinery employed in the abstraction of gold is now £110,000. In 1897, the value was £75,000. It is likely to increase still further, as we have not enough machinery here. The paddocks are full of stone, and we cannot get it treated, although the machinery is going full time.

2767. Are the appliances for the abstraction of gold considered to be up to date, or have you heard any complaints of the treatment of the ore? The public seem to be well satisfied with the public batteries, and with the cyanide and chlorination works. The private enterprise upon the field has given it a permanence, of which we are now reaping the benefit. I feel certain that it was the determined stand taken by the Needs in the first instance, and the energy they put forward to obtain the latest appliances in chlorination and other works for the purpose of extracting the gold from the refractory stone, which has shown the way to the others upon the field, and we are now reaping the benefit of it.

2768. Have you any idea as to whether smelting will have to be resorted to? I think it will, because some of the ore is getting very refractory. We shall have to bring coal here or take the ore to the coal.

2769. Is that the opinion of those who are engaged in the industry? Yes; they have expressed that opinion, and I feel certain such will be the case. We have not yet got beyond cyanide and chlorination.

2770. There is no necessity yet? The necessity is quickly arising in consequence of the depth which has been attained on the reefs. As a greater depth is obtained, the ores, in my opinion, will get a little more refractory. Such being the case, we shall require better appliances.

2771. Is the reserve of oxidised ore getting worked out? Yes. We get into the sulphide after 200 feet. I can give you the returns for the years 1894 and 1895. In 1894 the yield was 9,449 oz., of the value of £35,946. In 1895 the yield was 24,497 oz., of the value of £91,863.

2772. Have you any information to supply with regard to the population? I estimate the population to be at least 4,000 souls, and it is increasing.

2773. *Mr. Trickett.*] I believe that in 1895 the population was stated to be 4,500? Yes, I believe so.

2774. The evidence then given was that a little before that it was 6,500;—does that show the advancement of the district or otherwise? I can explain that to you. There was a great rush here when gold was first discovered, and in connection with the rush a large number of people went out looking for alluvial gold. They did not find it. A large number of people also came here who did not understand anything at all about quartz mining. The consequence was that they had to go away. A large number of people who know nothing whatever about mining go to every rush. We have passed that stage now, and are on the upward grade in regard to population.

2775. Do you think much stone will go away to be treated, or will it be treated locally? I think it will be treated locally.

2776. When they take the gold away it will not give very much traffic to a railway, especially if it is taken away in the shape of gold? The coal coming here should give a good deal of traffic. We must either bring the coal here or take the ore to the coal.

2777. Do you look upon the mineral prospects of Wyalong as the only inducement for the construction of a railway in this direction? That is the only thing in which I am interested.

2778. Is not a large quantity of gold taken away from here privately? I could not say a large quantity. The yield I should say would be 10 per cent. more than the authorities have discovered. There are some people who take away the gold, and there always will be, and we cannot trace it.

2779. We have always been told that the great drawback to this district is primarily the want of a better water supply? That is true.

2780. Do you look upon that as the first necessity? It would be the grandest thing which could happen to Wyalong.

2781. Is it not a fact that during dry seasons the plants cannot be worked? That is so.

2782. Has not the field often suffered materially, owing to the plants lying idle? They were idle last summer for two months; but I am happy to say they are now in full work, because we have had rain. The owners of the tanks took the opportunity of increasing their capacity when they were dry, and they are now full.

2783. How many plants are there on the ground capable of treating the ore which is obtained from the mine? There are different kinds of plants; we have batteries, cyanide works, and chlorination works.

2784. How many of each? I could not tell you for the moment.

2785. Do you look upon the erection of plants for dealing with the gold in this district as having been speedy or slow? I think it has been speedy.

2786. *Chairman.*] Do they meet the requirements of the field? Hardly. There are many thousands of tons at grass which cannot be treated for want of plants. We want larger plants, and more of them.

2787. Does that state of things show that this is a live district? Certainly. I would point out that this field has been developed without the aid of capital outside. The miners came here, took up their claims, and worked them themselves. I do not know of more than two companies on the field, and they are very small local companies. They have developed the ground from the proceeds of their labour, and they have also put up their plants from the proceeds of their labour. They have taken the gold out of the ground before they have expended it.

2788. Generally speaking, if a gold-field is a prosperous one, capital comes into it very rapidly? I should like to explain that matter. When this field was opened, the Government absolutely refused to grant leases, and no person would pay capital into a claim, because the holding of it was very precarious. The title is no good. The claim might be deserted any time by the parties working it, and if it is deserted it is liable to be reported and forfeited, but a lease can be held and is good security. I think I am right in saying it is only about two and a half years ago that the Government would grant a lease in Wyalong at all. That retarded the working of the field with capital which would have developed it more speedily than has been the case. That development, however, is now in rapid progress.

G.  
Stevenson.  
24 Aug., 1899.

2789. Plants are being erected and improved? Yes; on every hand, and they are all paying.

2790. Then you think the field is on the way to material advancement? I certainly do. The Secretary for Mines has sent the Government Geologist here to see where he thought the alluvial belonging to the field could be found. He is also going to expend a few thousand pounds in experimenting with hand-drills, and if the alluvial is found close to the town, as is expected, we shall have an enormous population here in a very short time.\*

Russell Alfred Collie, cordial manufacturer, West Wyalong, sworn, and examined:—

2791. *Mr. Watson.*] How long have you been residing in the district? Since 3rd May, 1894.

2792. Have you occupied a representative position in West Wyalong? I have taken a great deal of interest in public matters, and I am chairman of the progress committee.

R. A. Collie.  
24 Aug., 1899.

2793. Have you any information of a general character as to the necessity for railway communication? I have statistics of the tonnage of goods which have come from Temora to the principal storekeepers of West Wyalong, from June, 1898, to June, 1899. They are as follows:—Sharman Bros., 300 tons; Meagher & Co., 700 tons; Basha, 99 tons; Burnstein, 100 tons; Thom, 470 tons; Man, Sing & Co., 270 tons; Gelling, 400 tons; Souden, 98 tons. This tonnage does not include the supplies to fruit-shops, hotels, and other businesses. The hotel business is very extensive.

2794. I suppose that a number of the hotels get goods direct from Sydney? Yes. The consumption of beer alone on the field is very great. The climate is so warm that I have no doubt it is necessary to a great extent. It has been suggested by some of the witnesses that the line should be constructed by way of Grenfell. I have had a good deal of experience in stock, wool, and land, and I would like to point out that the rate of wool-carriage from Temora to Sydney, and from Koorawatha to Sydney is, strange to say, exactly the same—£3 16s. 9d. per ton. The distance from Sydney to Temora is 291 miles, and the distance from Koorawatha to Sydney is 236 miles.

2795. I suppose your contention is that it would be cheaper to send wool *via* Temora than *via* Koorawatha, because the intervening distance between the two stations mentioned is shorter *via* Temora? Yes, very much shorter. We are 38½ miles from Temora, whereas we are 59 miles from Grenfell, and another 30 miles from Koorawatha—in all 89 miles. I find from the rate-book that the charge per ton for wheat from Wyalong to Sydney would be, for 326 miles, 12s. 10d. per ton, or at the rate of 4d. per bushel. Between 326 miles and 351 miles there would be no difference in the rate.

2796. That would mean that there would really be no difference in the rate of carriage for wheat to Sydney, whichever way it went; the freights for wheat are worked on a zone system? Yes; that is rather a disadvantage, in one sense, to the Temora route; but it is only fair that it should be referred to.

2797. The people of Wyalong who wanted to send wheat away, would pay the same rate, no matter which route they took? Exactly. If the Grenfell route is adopted, there will be enormous wear and tear on the rolling-stock on the Western line. There is no doubt that the haulage is very much heavier over the mountains, and it must be enormous in comparison with the Southern line, where the haulage is very slight. With respect to passenger traffic, I would point out that from Cootamundra to Sydney, the train runs through in ten hours, the distance being 253 miles. On the Western line, from Sydney to Blayney—172 miles—the mail train time is eight hours. There is a difference only of two hours between Cootamundra to Sydney, and Blayney to Sydney, whereas Cootamundra is 253 miles from Sydney, and Blayney, on the Western line, is 172 miles from Sydney.

2798. *Chairman.*] I suppose that will be equalised in time? I should not think it possible, considering the heavy grades over the mountains.

2799. *Mr. Watson.*] As far as passenger traffic is concerned, there would be a saving in time by reaching the mail train earlier by going to Temora? Yes.

2800. You would have 80 miles travelling on a branch line, whereas on the Grenfell route you would travel 89 miles and 60 miles—in all 149 miles? About 149 miles.

2801. The branch-line trains travel much slower than the main-line trains? Considerably. When the line was constructed from Cootamundra to Temora it did not pay, and the trains only ran three times a week. Shortly after Wyalong was opened, the trains ran daily. The distance from Cootamundra to Temora is 38 miles. One staff of men is employed on the line. The run is, as nearly as possible, about two hours. The train arrives at Temora at 9:30 a.m., and it remains there until 5 p.m. The men connected with the train are idle during that time.

2802. What do you wish to draw from that? I wish to point this out: That we being 38½ miles from Temora, these men could run on to Wyalong. The train could arrive at Wyalong about 11:30 or 11:45. They could remain here for two hours, and then they could pick up the same time at Temora to catch the Southern train. The same staff of men, and the same rolling-stock, should be able to work a line from Wyalong to Cootamundra. It would only take eight or nine hours to complete the journey there and back.

2803. Would not that probably occur if a line were constructed *via* Grenfell? Probably, but the distance is very much greater. Grenfell is 59 miles from Wyalong, and if the line goes *via* Grenfell, it must necessarily follow that the Temora to Cootamundra line will drop back to what it was formerly—perhaps a train twice a week, or less. In fact I think it would almost hang that line up.

2804. You think the subtraction of the Wyalong traffic from what is at present carried on the Temora line, would make a difference in its earning power? Considerably.

2805. And that would make it a still worse-paying line than it is at present? That is so. At present, I believe, it does not quite pay. There is no doubt that one train service a week would do for Temora, if the Wyalong traffic were taken off it.

2806.

\* NOTE (*on revision*):—Since the inquiry, rich gold has been struck in the Bantam, which adjoins Neeld's in the north, at a depth of 637 feet. This is the deepest shaft on the field and its discovery has fully doubled the value of existing claims and leases, and absolutely proves the permanence and richness of the field.

- R. A. Collie. 2806. You prefer a connection with Temora? Undoubtedly.
- 24 Aug., 1899. 2807. Is that based on any personal advantage which would accrue to yourself? Unfortunately not. It would be entirely against my interests, for this reason: The business I am carrying on now would fetch another market so much nearer to me.
2808. You mean that Temora would be likely to compete with you? Undoubtedly; they have better water than we have here, consequently they could make better cordials. I am speaking entirely in the interests of the farmers. I know what land is; I have been round this part of the country, and I believe it will be equal to any wheat-growing district in the Colony. I have been in the Blayney district for twenty-five years. I was astonished when I went out towards Bena and Yalgogrin, at the nature of the soil.
2809. Do you think there will be a large agricultural population if Wyalong gets railway communication? I do.
2810. I understand you to say that it is in view of the extension of agriculture that you would sooner see a connection with Temora? Yes.
2811. Why is that? Between Wyalong and Temora you would find some of the finest land you ever saw. That land is between Wyalong and the Half-way House. I cannot say much about the other side. The land I have seen is along the road, and on Wyalong No. 2 station.
2812. You think then that the land between Wyalong and Temora is suitable for agricultural settlement generally? Some of it. I must say that I have seen poor land between Wyalong and Temora; but there is also really good land within a very short distance of Wyalong. There is a 13,000-acre scrub lease adjoining Wyalong.
2813. Which is the poor country between Wyalong and Temora? It is a bit of mallee country.
2814. Mallee is not altogether hopeless country, is it? No; there is good subsoil in it.
2815. Would you regard the gilgai country as good for agriculture? No. It is good grazing country; but there is very little of it. Then there are the sand-hills, which are considered to be the poorest land here. At the Land Board meeting at Barmedman some time ago, I took some witnesses to object to the granting of a scrub lease. One of those witnesses swore that he was prepared to pay 30s. an acre for 1,280 acres of land between Wyalong and Roberts'—towards Barmedman—and he was prepared to take the sand-hills. The man knew what he was talking about, because he was thoroughly experienced in farming.
2816. Why would the Temora connection serve the farming community of Wyalong and district better than a connection *via* Grenfell? Because it would give them an equal market in each direction. It would put them on the centre of the line between Sydney and Melbourne.
2817. It would cost them no greater amount to get to Sydney, and they would have a better chance of getting to Melbourne? Exactly.
2818. They would have the choice of markets? Yes, and they would get to Sydney very much quicker.
2819. Of course, the farmers are not so much interested in getting to Sydney as in getting a market for their produce? That is so.
2820. We were referring a moment or two ago to the question as to which line was the more desirable, from an agricultural standpoint, and your contention is that the larger choice of markets is of importance to the agriculturist? Decidedly, when our seasons are so uncertain. I think it would be of advantage, instead of sending the traffic by way of Koorawatha, to tap the main trunk line at Cootamundra.
2821. Then, you are emphatically of opinion that the Temora line is the better line with which to connect? I think so, from all standpoints. In the first place it will cost about £45,000 less than will the Grenfell route. There can be no two opinions about the fact that the engineering difficulties on the Temora route are nothing. We have the necessary belts of timber along the road for sleepers.
2822. You think that the question of saving between £40,000 and £50,000 in construction is worthy of consideration? Decidedly. It has been stated that there are 70,000 acres of land available on the Grenfell route; but it has never been stated, up to the present, what portion of that would be served by a line along the Temora route. I am given to understand that there is a great deal of land on the south-western side of the Temora road, which is included in that estimate of 70,000 acres.
2823. Whose estimate are you referring to? To Mr. C. E. Rennie's. I may point out that some evidence was given in 1894, in respect of timber at Cudgellico. It has been stated that there is a splendid lot of pine there, fit for market. There is no doubt that that is an industry which should be opened up, and I think it could not strike a better part of the main line than what I would call the central point, that is Cootamundra.
2824. Do you know anything of the general feeling of the district as to which route is preferable? I know that a large number of farmers are members of our league. We have them from Bena, Yalgogrin, and Lake Cowal. Mr. Stewart, of Lake Cowal, thinks that the line should, in the interests of the country, go *via* Temora, and he would be quite willing to send his produce to the Temora line.
2825. Has your league decided that they are in favour of the Temora connection? Yes. A meeting was called for last Monday. There was a representative attendance of farmers and business men of West Wyalong and some from Wyalong. It was unanimously agreed that we should support the Temora route.
2826. Do you think that in taking up that attitude you represent any considerable portion of the people settled around the field? Decidedly.
2827. What is the feeling in regard to the question in the district? About August last year the progress committee thought it advisable to call a meeting on the railway question, and it was decided to form a league. We had farmers present from all parts of the country. Some came from Barmedman and Temora, and one representative came from Cootamundra. It was unanimously decided at that meeting, which included miners as well, that we should support the Temora route.
2828. Was that a large meeting? Yes. It was a fairly large meeting—what you would call an ordinary public meeting. It was also fairly representative. I believe that an amendment was moved that the question of the route be left open, but there was only a proposer and a seconder, and they were eventually quite agreeable to fall in with the views of the meeting.
2829. Do you know whether any public meeting has been held with a view to supporting the Grenfell route? Not that I am aware of.
2830. Then in your opinion the majority of the people seem to be in favour of a connection with Temora? Certainly.
- 2831.

2831. As a reason why the Grenfell connection should be made, it has been stated that it would bring this district into closer touch with Lithgow;—do you think that is a consideration which should weigh with us as against other considerations? I do not think so. I may state that from Blayney to Eskbank, the charge on coal is 5s. a ton. I was interested in the Annandale copper-mine at Blayney, and we used to get the coal from Eskbank, and run it into a siding on the mine. It cost us 5s. a ton for carriage from Eskbank to the siding. If it cost us 5s. a ton for that distance, I should think the cost of carriage to Wyalong would be three times as great. I do not think it could be landed at less than 12s. 6d. a ton. For a distance of 76 miles the cost is 5s. per ton, and Wyalong is 229 miles away from Lithgow. With regard to fuel I would point out that this field has been open for five years, and at first there was a population of 10,000 people. We have been using the wood from the district ever since. Of course, an enormous quantity has been used; still I think that within a radius of 7 or 8 miles we ought to have wood sufficient to last us for the next eight or ten years. There is not the slightest doubt that a good deal of wood would be sent in by rail from either route, and I think the line would derive a good revenue from its carriage.
2832. Whatever route is adopted it is not likely that any great amount of coal will be carried? I do not think so. They appear to be treating the ore with wood now and that treatment, so I understand, is efficient. Wood here is cheap.
2833. Do you know of any smelting works dealing with general classes of ore at Lithgow? I believe they treat matte at Lithgow.
2834. Matte requires refining only? That is so.
2835. If you desire to take ore to Lithgow or to bring coal from Lithgow to Wyalong, you would require flux to work the smelters? Decidedly.
2836. Do you know if that is obtainable about Wyalong? Not that I am aware of.
2837. In any case, you think there is little likelihood of any extensive importations of coal into the district whichever line is constructed? Not for some years.
2838. *Chairman.*] You have stated that you think you would obtain an advantage by having two markets, if a line were constructed to Temora;—have you ever known crops to fail in Victoria, and to be grown here? I cannot say that I have. Still, in view of the uncertain seasons that we have, such a thing might occur.
2839. Do you know whether the seasons on the Victorian side are as uncertain as they are here? I could not say.
2840. Have you considered the question of the break of railway-gauge in getting to the Victorian market? No.
2841. *Mr. Trickett.*] With whom do the people of Wyalong deal at present? With Sydney and Victoria. The bulk of the trade is done at Sydney.
2842. The total haulage from Wyalong to Sydney *via* Temora would be 6 miles longer than by way of Grenfell? That is so.
2843. Do you not think that if a line were constructed from Grenfell the people of Wyalong would not have much to complain of in having to travel the shorter distance? So far as the passenger traffic is concerned I should say that the Southern line would be preferable on account of the time saved in travelling.
2844. But at present the Railway Commissioners are improving grades everywhere they possibly can, and it is in contemplation to alter the route of the Zigzag? I know it is in contemplation.
2845. If the Zigzag were cut out, and you could go to Sydney as quickly or more quickly than by the other route, would not a line from Wyalong to Grenfell suit you? Possibly it might, if we could go quicker than by the other route. Even if we could go as quickly, it might help us as far as passenger traffic is concerned.
2846. Supposing that the journey occupied even ten hours longer for ordinary goods, would that be a great disadvantage to you? As I have pointed out, the cost of the carriage of wheat on both routes would be equal. On the other hand, there would be a considerable advantage in regard to the carriage of wool. Judging from the evidence given yesterday, it seems likely that we shall have a large settlement of small holders in this district, and that a lot of stock will be fattened. It necessarily follows that we shall have a good deal of wool to send away. Wool is an important item, and if a person can save only a little per bale it is a great advantage. It is a matter of considerable importance if we can send the wool cheaper by the Southern line than we can by the Western line.
2847. I understand that you are looking at the question of the construction of the proposed railway from a Wyalong point of view? It is purely in the interests of the farmers that I have taken an interest in the matter at all.
2848. You are not considering the question from the point of view of the further extension of the line westward? Decidedly I am. I believe it will open up a splendid country to the west.
2849. If it were proposed to construct the line at once towards Hillston, would you still advocate the Temora route in order to get to that place? I do not see why I should not; the line might follow good country, and when we consider that there is only a difference of about 6 miles, it should not be very much out of the direct course after all. I cannot see very much difference myself.
2850. Which do you think the best agricultural country—that between Temora and Wyalong, or that between Wyalong and Grenfell? I could not say, as I have not been over the country.
2851. Where is the greater population? I should think between Wyalong and Temora.
2852. You have referred to West Wyalong;—do I understand that that is a different place altogether from Wyalong proper? No; we are all on the gold-fields.
2853. But you do not seem to be exactly in touch with each other? We shall get settled down by-and-by when we obtain our titles.
2854. Have you any idea as to what would be the total tonnage between Wyalong and Temora? The estimate I have given shows that there would be 2,437 tons of general merchandise inwards.
2855. That would come to about £1,200 in carriage? Yes.
2856. Do you think the outward tonnage would be as much as that? I could not say, but I should like to point out that all the fruiterers, small storekeepers and publicans' carriage is not included in my estimate. Neither is all the heavy machinery we have got in. We have had an enormous amount of machinery brought here. During the last twelve months Mr. Neeld has had about 50 tons of machinery. Then there are the owners of the Prince of Wales mine, the White Reef mine and several others who are bringing machinery down.

R. A. Collie.  
24 Aug., 1899.

- R. A. Collie. 2857. Has agriculture advanced very extensively between Temora and Wyalong since the line from Cootamundra to Temora has been constructed? I cannot say that it has to my knowledge.
- 24 Aug., 1899. 2858. Have not the results been rather disappointing? I could not say.
2859. Mr. Harper, of the Railway Department, in giving evidence in Sydney on the 9th August last, was asked:

Do you still think that the answer given by you in 1895 on that subject will hold good. The following is an extract from the evidence on that occasion:

"Can you tell the Committee the character of the settlement between Temora and Wyalong? There is absolutely none, except mining. There are about half a dozen selectors on the road."

What have you to say with regard to that? Yes; it is practically the same now. I fully expected that the mining development at Wyalong would have led to more farming development in that part of the country.

Seeing that from 1895 to 1899 there has been so little progress, although the line from Cootamundra to Temora has been built, it does not speak very promisingly for the extension of agriculture? I think you will agree with me that, as a rule, a mining community are the pioneers of the back country, and that the country round a mining field is generally taken up and settled upon. For instance, we have Young, Forbes, Parkes, and Temora, in this quarter of the Colony. There is every prospect of mining development between Wyalong and Temora. It is the opinion of those who ought to understand mining matters, and who have reported favourably on the appearance and nature of the country, that gold will be discovered between Wyalong and Temora.

2860. Supposing the powers that be were to decide that a railway should be constructed by way of Grenfell, would the people of Wyalong sooner do without it? I do not, for one moment, say that they would. We would sooner have a railway, but we think that in the interests of the country, and of the surrounding districts, it would be better if it were to go by way of Temora. I have overlooked one matter in respect of machinery coming from Victoria. I should like to point out that it would suit us very much better to get our machinery by way of Cootamundra, instead of having to haul it by way of Koorawatha and Grenfell. Most of our machinery has come from Victoria.

John Smethurst, architect, Wyalong, sworn, and examined:—

- J. Smethurst. 2861. *Mr. Dick.*] Have you any statement to make to the Committee? I have been going into the matter of the probable traffic of a line from Grenfell to Wyalong. I estimate that the passenger traffic in and out of Wyalong during the year is equal to 1,500 persons each way. I have made that estimate from the number of those who come and go by the coach daily during normal times, and from the additional number who go backwards and forwards during holiday seasons, when there is a tremendous traffic.
- 24 Aug., 1899. The revenue derived from them, at the rate of 7s. 6d. each—which I think would be about an average fare—would be £562 10s. I estimate, from my experience of other towns which have been connected with a railway, that the passenger traffic to Wyalong will be doubled if we have a railway. If it were doubled, that would mean 1,500 fresh through passengers to Sydney—£3 15s. return—both ways, which would mean a revenue of £5,625 for new passenger traffic, which would be induced by the facilities for coming to the place, which at present do not exist. Personally, I have not been to Sydney for the last two years, on account of the journey by coach; but I would have gone half a dozen times at least if there had been a railway. One reason which would tend to an increase in traffic would be the saving of time on the journey, which would make people less disinclined to undertake it. There would be an absence of discomfort, and that would induce them to travel more freely. What is more, a gold-field town is a sort of show place, and when it can be easily and comfortably reached by rail, it induces an enormous amount of traffic from people who take every opportunity of seeing what a mining field is like. It also brings the place more easily into communication with those who may feel disposed to invest in mining interests, and who would assist in the development of the place. I was a resident of Broken Hill for a long time, and after the railway was opened there the number of people who came simply to see the place was enormous. As an architect, my business has brought me closely into connection with everything connected with the building trade, and one of the difficulties under which we labour in Wyalong in erecting buildings is the absence of suitable timber. The pine which grows within a reasonable distance of Wyalong, although very fair as a makeshift for temporary and inferior buildings, is very unsuitable for buildings of a substantial character, which are intended to be permanent. It is also unsuitable for many portions of any ordinary building, so that if there were a railway, and it were possible to get the timber through rapidly, I believe fully 300 tons of it would be brought from Sydney to Wyalong, per annum. I estimate that the railway, if constructed, will carry not less than 2,000 tons of mining timber per annum. A great deal of the timber at present used is carried 12 and 15 miles by team. No doubt the mills would shift their plants to the most convenient spots near the line where the timber grows. It would be cut there and brought in by the railway to the mines. I estimate that there would be 2,000 tons of timber per annum brought in for use in the mine. That, of course, would be local traffic—not new traffic extending to Sydney. It is only a question of a very short time when the firewood will be brought in by rail. I consider that there are a thousand points of consumption of firewood in Wyalong, which would average at least 10 tons per annum. Ten thousand tons of firewood per annum would be carried to supply the batteries, chlorination works, general treatment works, and the household requirements of the town.

2862. What do you think could be earned by the proposed railway? I think that passenger traffic would return £6,187 10s. per annum; ordinary timber would return £1,000, and mining timber, £200; firewood, £1,000. That gives a total of £8,387 10s. Along with other goods the total would be £8,387 10s. As the annual expenses are estimated to be £9,112, that would give a minimum railway profit of £2,094.

2863. Do you not think that your estimate in regard to passengers is a sanguine one? It means that a very large number of people who do not come from or go to Sydney would come and go, perhaps two or three times a year. Those who came on business would most certainly come three or four times as often as they do now. Those who come and go for pleasure would do so more frequently. My estimate represents four passengers to-day, exclusive of holiday traffic.

2864. Then you think the coach journey from Wyalong to Temora practically reduces the possible passenger traffic by 50 per cent.? I feel certain that it does. Both myself and many others do everything possible to avoid going away on account of the horrible discomfort of the journey and the loss of two days in travelling by coach.

2865. Do you think the construction of a line from Grenfell to Wyalong would encourage the visit of mining speculators? I do.

2866. Is it not a fact that men who put their money into mining speculations generally employ an expert? *J. Smethurst.* That is true, but many of them like to visit the fields themselves as well. Nearly every man who has had anything to do with mining thinks he is an expert, and he likes to have the corroboration of his own eyesight. 24 Aug., 1899.

2867. Then you think that, as a general rule, a man who puts money into a field like Wyalong makes a personal visit to it? I think a great number of people who cannot afford to employ mining experts would make a visit to the field for the purpose of seeing it, and by seeing it they would be induced to assist in its development.

2868. Do you think men who cannot pay a mining expert have sufficient capital to devote to the development of a field like Wyalong? I think that a man who has £500 to invest cannot afford to pay £10 or £20 in sending an expert on a mere speculative visit.

2869. You hope, then, that a multitude of men interested in mining in a small way will use the line? Yes. If you were to attempt at present to float a Wyalong mine on the Sydney Stock Exchange, you would have no chance of doing it, because the ordinary public buyer does not know enough about the place, and the people who have large capital are inundated with offers of all kinds from everywhere.

2870. With respect to your estimate of the timber to be conveyed to Wyalong, is it not a fact that lately there has been a great increase in brick rather than wooden buildings? Yes. That is the very thing which tends to the importation of hardwood and softwood timber. The timber around Wyalong is not suitable for building purposes. It is unsuitable. It is the worst timber of which I have ever had any experience.

2871. Is it not the best timber in the Colony for resisting the attacks of white ants? That saves it from utter condemnation. That is its one good point. It would be quite impossible to use it where it would be exposed to any strain, and where its breakage would be likely to injure anyone.

2872. Do you know that at Young, which is a somewhat similarly situated place to Wyalong, they export timber rather than import it? They may export it for the purpose for which it is useful. It is possible to make flooring boards out of it if you cut it carefully, but I am informed that timber of similar character to ours which grows in other districts is much superior in quality. I am informed by those who have had experience in other parts of New South Wales that timber of superior quality is obtainable elsewhere.

2873. The natural drift of trade at present is between Wyalong and Temora? Yes.

2874. Can you say why the people of this district do not treat with Grenfell? There is no possible means of communication with it. To get to Grenfell you could go occasionally by coach to Marsden and thence to Grenfell.

2875. Do you think the construction of a line from Koorawatha to Grenfell would make any difference in the trade from Wyalong? No. The avenue of trade would not be altered in the slightest degree by the construction of that line.

2876. Do you know what led to the alteration of the service on the Temora-Cootamundra line from a tri-weekly to a daily service? I believe it was owing to the increased trade brought about by the development of Wyalong.

2877. And that, of course, helped to make that line somewhat nearer to a paying line? Yes.

2878. If a line is built from Grenfell to Wyalong the Temora to Cootamundra line will lose the whole of that trade? I presume so.

2879. And it will go back to its old position of a very unprofitable line? That is really a matter for a financial man to consider.

2880. Presuming that the construction of a line from Grenfell to Wyalong resulted in a great loss to the trade on the Temora to Cootamundra line;—do you think the total result to the country from the construction of that line would be a satisfactory one? In the absence of knowledge as to what incidental good to the country would be done in addition to the direct good which was done to Wyalong by the connection with Koorawatha it is impossible for me to answer.

2881. *Mr. Shepherd.*] In estimating the increase in passenger traffic, you referred to Broken Hill;—are you aware that there are hundreds and thousands of shareholders interested in the Broken Hill mines, and that it is very likely that a very large number of visitors to that place are those shareholders? But they did not go there before the railway was built; that is the point which I wish to emphasise.

2882. They may have been induced to go there because they were shareholders; but I understand that there are no companies at Wyalong at all? The fact of there being shareholders existed before as well as after the line was constructed. The inducement to visit the place was not sufficient until the facilities for visiting it were increased.

2883. Is it a fact that there is really not one large public company in Wyalong? Yes. Consequently, if the mines are developed by the formation of companies, and a large army of shareholders is created, the result will be a very great increase in passenger traffic.

2884. Do you think the opening of a railway to Wyalong would really induce people to take more interest in the mining development of the place than is taken now? Yes; I believe it would induce a large number of people to come and see the place, and, of course, many of them would assist in its development.

2885. On the whole, do you think the construction of one line would be more favourable than the construction of another to induce passengers to come to the field? I do not think it would.

Lawrence Daniel Mullain, auctioneer, West Wyalong, sworn, and examined:—

2886. *Chairman.*] Have you any statement to make to the Committee? Yes. I have made a comparison as to which of the two routes—Temora to Wyalong, or Grenfell to Wyalong—would be the more profitable and beneficial to the district generally. The machinery coming to this field comes principally from Victoria. I may mention that I am interested in a number of the mines, and am employed by Messrs. Duncan, Lloyd & Co., in purchasing ores, &c. This is not a fat-stock producing district, and, excepting in a good season, I have had occasion to go to other districts to obtain stock. Gundagai is one of the principal markets to which we have to go from here to obtain fat stock for the purpose of supplying the wants of the place. The consumption here is very great, and the price of meat is, I believe, the highest in any of the colonies. It is, I believe, up to 6d. per lb. at the present moment. If the stock had to come by way of Grenfell it would make the price very much higher than it is now. L. D. Mullain.  
24 Aug., 1899.

2887.

- E. D. Mullain. 2887. If you could get fat stock between Wyalong and Grenfell would you not do so? Yes, but to my knowledge there has never been a beast which has come from the direction of Grenfell, and I have been in the commission agency business since 1894.
- 24 Aug., 1899. 2888. Do you not know that they have had fat stock in London which have come from that direction? I do not think so, within the last four or five years. With regard to the removal of stock from this part of the country to the Tumut mountains in summer time, I may mention that last Christmas I took a trip to Yarrangobilly Caves, and I was given to understand whilst at Tumut that there were 2,500,000 sheep on the mountains which had come from outside districts—principally Riverina. My idea is that a line from Grenfell to Wyalong, and on to Hillston, would be of no service for the removal of stock. Some stock came from out back to this district last summer. They were able to go no further, and they remained here for a few months. If there had been railway communication in the direction of the Tumut mountains, they would have gone straight on. Six or seven lots of stock settled in the district, not on account of the good pasturage we had, but because there was no herbage in the country, and they could not travel further. With regard to settlement I am of opinion, from my knowledge of the soil of the district for agricultural purposes and also for grazing purposes, that if the land were improved and a railway constructed, industry would be very much increased. The soil from Wyalong to Yalgogrin is equal to that of most of the Riverina district. The last witness has stated something about the haulage of timber for mining requirements. I am of opinion that his estimate is lower than what our actual requirements will be. The amount of timber required under ground for the safe working of the mines is very great, and in the course of a very short time—in fact, at present—all the good available timber for propping purposes within a radius of 15 miles of Wyalong will be used up. I am of opinion that in two years' time we shall have to travel a distance of 25 miles for it.
2889. *Mr. Watson.*] What class of timber is required for that work? It requires hardwood, with a straight grain. The timber required for the working of the mines underground will have to come from a distance, and if it has to come 25 miles to 30 miles by team the progress of the mines will be very much retarded. Another class of timber required is firewood. The cyanide works, with which I am connected, use a very large quantity of firewood. They catch their gold on charcoal and it is reduced to bullion in the furnaces. There are eight fires at Duncan Lloyd & Co.'s works, and they are kept going all day. The class of wood within a reasonable radius of the field will become very scarce in a short time. It will eventually have to come by rail. If it has to be carried any distance by team it will put a strain on the mines and on those who are running works for the treatment of ore.
2890. Where is the best place from which to get the timber? West, towards Yalgogrin.
2891. *Mr. Dick.*] If a line were only constructed to Wyalong none of that country would be connected with it? No; not until the line was extended. Of course there are good belts of timber between Wyalong and the Bland and between Wyalong and Barmedman.
2892. If a line is constructed from Grenfell to Wyalong the good timber between Wyalong and Barmedman will still be hauled by team? Yes.
2893. *Mr. Watson.*] Is there any hardwood between Wyalong and the Bland? When I refer to hardwood I refer to wood other than pine, such as box and ironbark. At present ironbark sleepers are being sent from the west of Wyalong to Temora.
2894. *Chairman.*] Then whichever way the line is extended the traffic will be common to it? Yes. I may state that I am of opinion that Mr. Collie's estimate in regard to the carriage of traffic is very much below the mark.
2895. *Mr. Watson.*] I gather from your evidence that you favour a connection with Temora? Yes.
2896. Do you know the country on both routes? Yes.
2897. How do you think they compare from the standpoint of producing revenue for a railway? I do not think there is any comparison. I think the country between Wyalong and Temora is better than that between Wyalong and Grenfell.
2898. Have you had opportunities of talking with the farmers who have settled around Wyalong? Yes.
2899. Have they expressed any opinion on the subject of railway connection? Yes; they all prefer the Temora route.
2900. Is it because it will give them a greater choice of markets than will the other route? Yes.
2901. With regard to the better methods of reaching market, and the cost of conveying produce by the different routes, do you think that with £50,000 less capital expenditure there would be a greater probability of a railway paying by way of Temora than by way of the more costly route—Grenfell? I do.
2902. The sooner a line pays, the quicker the probability of getting local rates reduced to through rates? Yes.
2903. *Mr. Trickett.*] Do you know the Bland country? Yes.
2904. Supposing a line were constructed from Temora to Wyalong, and thence to Sydney, do you think the wool and the other produce from the Bland country would be attracted to the Temora line, or would it be sent to Young and Grenfell? That would depend on the portion of the Bland to which you refer. One portion of it is in close proximity to Barmedman, and the produce from it would be sent by way of Temora.
2905. Are the Tumut mountains capable of carrying a great deal of stock? Yes.
2906. Are you aware that during the late protracted drought the proportion of stock required to be deported exceeded by millions the number which that country was able to accommodate? I am not aware of it.
2907. Of course you know that there is not country always available to which to send stock? I may mention that in former years I was in charge of stock on the mountains referred to. I have been informed that last Christmas there were 2,500,000 sheep on the mountains.
2908. Are they likely to be sent again; I ask you this question because we have been informed that they came back suffering from fluke, worms, and foot-rot? I could not uphold that statement; it depends on the country upon which they are depastured. Of course wet country is flukey and is liable to cause foot-rot; but if sheep are supplied with salt and dissolved iron, they should not be subject to fluke. Of course foot-rot is a matter of attention so far as its cure is concerned.
2909. *Mr. Watson.*] Have not stock been sent to the Tumut Mountains for years past? Yes.
2910. If it was such a bad country for stock I suppose farmers would not have continued to send them there? No.

John Boyd Donkin, civil engineer and grazier, sworn, and further examined:—

2911. *Chairman.*] Have you any information to supply to the Committee? I merely wish to hand in a statement showing the probable annual traffic on the proposed line, from Bland stations. It is as follows:—

J. B. Donkin.  
24 Aug., 1899.

Station.	Fat sheep.	Bales.
Caragabal...	10,000	800
Tregalana...	4,000	300
Lake Cowal (Donkin)	10,000	500
Hammond's selection.	1,000	100
Cowal North	1,000	200
Lake Cowal	4,000	800
Allen's selection	1,000	100
Billabong...	4,000	400
Oakhurst...	4,000	500
Back Creek	2,000	300
Bland	5,000	600
Various selectors...	4,000	400
	50,000	5,000

2912. How long is it since you had fat sheep at Lake Cowal? In October and November of last year I sent away 8,000.

2913. Have you had any this year? This year I have sent away two small lots, numbering about 1,000.

2914. You have heard the statement of the last witness, to the effect that there are no fat stock between Wyalong and Grenfell;—the witness seemed to be somewhat sceptical as to fat stock being sent to the London market from that district? Five thousand of my lambs went to London last year.

2915. Then, as a matter of fact, stock have gone from this district north of the proposed line to the London market? Yes.

2916. *Mr. Shepherd.*] Have you made any estimate as to what the freight on the sheep and wool to which you referred would be? No; but I know it costs 1s. 6d. per head for the sheep; and the cost of the trucks is £6 15s.

2917. *Mr. Watson.*] I understand that there have been no fat cattle on the Bland for some time? No, except for station use.

2918. Then the cattle for the supply of this district would probably come from the mountain country? I do not think so, because all the Bland is a cattle walk. When I first came, there was nothing but cattle, and during the last few years there have been nothing but sheep.

2919. On what is your statement respecting the probable trucking of stock based;—is it based on your present condition or upon what may be described as a fair season? Upon a fair season. In my own case, for instance, I have had 10,000 fat sheep and 500 bales of wool. Last year I had 8,000 fat sheep and 305 bales of wool. That was the worst year we have ever had.

2920. Where are the stock trucked now? Forbes or Young.

2921. Would that remark apply to most of the other stations? Most of the other stations send their produce towards Young. It is 85 miles to Young, and in the summer-time, 85 miles, without grass, and often without water, is a long drive. The result is that people have not gone in for trucking as they will do when they get a railway alongside of them. In addition, it takes a week or ten days before you can make arrangements to get sheep to Sydney, and by that time the market has gone to pot. If we could sell them more quickly it would be better for us.

2922. Supposing a branch line were constructed from the Southern line to Wyalong, how far would the majority of the sheep be from Wyalong? Thirty to 40 miles. Some of them would be closer. For instance, my own sheep would be 25 miles away, and the Back Creek sheep would be 13 miles away.

2923. Would the Caragabal station send sheep to Grenfell if there were a terminus there? Yes.

2924. Do you think a 25 to 30 miles drive would have any effect in blocking the trucking of fat sheep? It would in driving them to Wyalong, because the country through which they would have to travel is scrubby.

2925. I should imagine that if there were a railway terminus at Wyalong the roads would become more open? No doubt.

2926. Have you a cleared road to Marsden? Portion of it is cleared.

2927. Then the greater portion of the fat stock would, with railway termini at Grenfell and Wyalong, still find its way to the railway system? Yes.

2928. Although not so conveniently, if the line came right across the Bland? That is so. With regard to my former evidence, I wish to refer to the question of the railway crossing the Bland. Statements have been made respecting the flooded state of that portion of the country; but from my experience I am able to state that in 1872 that part of the Bland was not flooded to any extent. It may possibly be that the railway line will follow a dry bank. It may be flooded to the extent of a few inches, but that will go off in a day or two. I think the Engineer-in-Chief stated that a bank 3 feet high would make the line completely dry, and that I quite believe. It is the lower part of the Bland, towards Lake Cowal, a distance of 20 miles, which is low country. The surveyed line goes through dry country all the way.

Samuel Wilson, junr., station manager, Lake Cowal, sworn, and examined:—

2929. *Chairman.*] Have you heard the evidence which has been given by former witnesses? I have heard the last three witnesses.

S. Wilson,  
junr.

2930. Can you corroborate what they have stated? I can corroborate what Mr. Donkin said about the floods on the Bland. I have come over that country during one of the highest floods, and I have never seen it a foot high along the route of the proposed railway.

24 Aug., 1899.

2931. Have you any information with which to supply the Committee? Personally, the Grenfell route would suit me better; but I am in favour of the Temora route, from a national point of view. I heard Mr. Donkin's statement as to the number of bales of wool and fat stock which would probably come from the Bland country, and I think it is well within the mark.

- S. Wilson,  
junr.  
24 Aug., 1899.
2932. Why do you favour the Temora route? Because the country between Wyalong and Temora consists mostly of Crown lands, which could be thrown open for settlement in small blocks of 640 acres. Judging from an experience extending over fourteen years, I think that what has injured most selectors has been over-selecting. If they had had less country they would have been better off. I am a Victorian, and I think it is a mistake to take a full block, because, as a rule, the greater portion of it remains idle. I feel certain that a man could make a living upon 640 acres within 10 miles of a railway station much better than he could upon 2,560 acres without railway communication. I understand that the country between Wyalong and Grenfell is nearly all selected. I think the railway should be run through Crown lands. The country between Wyalong and Temora is better than it looks. In this district, the country which looks best is not really the best. When I first came here I considered a rich, chocolate soil was the best. I took some years to get that idea out of my head; but I have come to the conclusion that it is not the best. The grey soil is better for agriculture and grazing. I could give several instances to prove what I say.
2933. Which route do you say has the more Crown lands upon it? Judging from the map, there is not much to choose between them.
2934. *Mr. Watson.*] You know the land between Temora and Wyalong? Yes.
2935. Do you know the land between Grenfell and Wyalong? I know the land between Grenfell and the Bland, and for a few miles between Wyalong and the Bland. I also know the land from Back Creek to Grenfell.
2936. That is a distance of 40 miles;—how does that country compare with a similar distance of 40 miles between Wyalong and Temora—I mean from a railway-producing aspect? The average soil on the Temora route should be better, because there is some very rough country 10 miles on the other side of Grenfell. From a wool-producing point of view, the Bland country is a long way ahead of the other.
2937. Then you think the country from Temora to Wyalong consists of better agricultural land and is better able to carry close settlement? I do.

John Peterswald, sergeant of police, Wyalong, sworn, and examined:—

- J.  
Peterswald.  
24 Aug., 1899.
2938. *Chairman.*] Do you produce a statement showing the agricultural and other returns for the district? I have the records from 1896 to the end of 1898. In 1896 the total of alienated land was 29,140 acres, freehold; 1,560 acres, rented; 123,469 acres of Crown lands; and of that, 971 acres are cultivated, 86 acres are under wheat for grain, and the total yield of wheat is 508 bushels. Those figures apply to a radius of 12 miles around Wyalong. Portions of Yalgogrin, Barmedman, and Marsden districts come within the 12 miles radius. In 1897 not so much acreage is shown. I can only account for that by the fact that the Yalgogrin and Barmedman police have collected some of the returns. The total area under cultivation was 1,326 acres. Of that, 136 acres were under wheat, and the yield was 847 bushels. In 1898 there were 13,350 acres of freehold, and 640 acres of rented land. Of Crown lands, there were 106,549 acres, of which 3,620 acres were under cultivation. 1,870 acres of this amount were under cultivation for wheat for grain, and the yield was 5,849 bushels. I do not know what the other cultivation consists of, but the principal portion of it would be for hay. In January of this year the population within the 12 miles radius was 3,627. I have a return showing the actual gold sent from Wyalong by escort. From October, 1896, to the end of that year, the amount was 4,073 oz. 16 dwt. 6 grs. In 1897 the amount was 19,644 oz.; in 1898, 18,406 oz. During the first half of 1899 the amount was 9,881 oz.
2939. Then, roughly speaking, one-half of the gold raised here leaves by escort, and the remainder goes through private channels? Yes.
2940. Have you any idea how much is carried away by private means? No.
2941. Do you think that 3,627 is the present population of the district? It may have slightly increased during the last six months, but not to any great extent.
2942. *Mr. Watson.*] The Police Magistrate has told us that 1,199 miners' rights were issued last year;—would they all be for Wyalong itself, or would some of them be for miners working at Yalgogrin? No; miners' rights were issued also at Yalgogrin. The 1,199 would be for Wyalong itself.
2943. Might they be taken to represent miners, or would some of them be for tenement purposes? Some would be for tenement purposes.

Edward Barnes, senior-constable, Marsden, sworn, and examined:—

- E. Barnes.  
24 Aug., 1899.
2944. *Chairman.*] Will you describe the boundaries of the district under your charge? The district is about 35 miles by 35 miles. It extends northerly to within 18 miles of Forbes. There are about 138,000 acres of alienated land in that district, and 273,000 acres of Crown lands, comprising leasehold lands, and all lands held under various leases from the Crown.
2945. How much of that land is within the influence of the Forbes railway? The 122,000 acres of alienated land and 233,000 acres of Crown lands would be within the influence of a line from Grenfell to Wyalong. There are about 900 acres under crop for wheat in the portion to which I have referred. Last year and the previous year the crop was a complete failure.
2946. Does any of the produce from the 900 acres to which you have referred find its way to a railway? I think some of it would come to Wyalong. Most of it would be cut for wheat. Within a few miles of Marsden there is not a great deal cultivated, except for station purposes.
2947. Have you seen any of the Bland plain country cultivated? I do not know of any cultivated land on the Bland. There is a paddock or two at Oakhurst, on the Bland, and also at Lake Cowal, and Mr. Donkin cultivates a little.
2948. *Mr. Watson.*] What sort of a township is Marsden? There were two hotels there; but one has been burnt down lately. There are also two stores and twenty-three or twenty-four houses.
2949. *Mr. Trickett.*] Are the 233,000 acres of Crown land within the influence of the proposed railway agricultural or pastoral land? Chiefly pastoral. A great deal of it would be suitable for agriculture; but I think the larger portion is pastoral country.

2950. Do you think that tract of country is likely to be largely availed of for agricultural purposes? Several areas which have been thrown open of late have been quickly taken up by men who say they are going to cultivate. There is a lot of land to the west of Marsden which really looks very suitable for cultivation; and of late land has been taken up with that view. The selectors seem to be anxious that there should be a railway; but the people of the township itself are quite indifferent about it. E. Barnes.  
24 Aug., 1899.
2951. *Mr. Watson.*] How far is the land suitable for agriculture west of Marsden, from Wyalong? About 22 miles. The land which has been thrown open on Lake Cowal would be the same distance from Wyalong. Then, north-west from Marsden, there is a lot of land which will be about 25 miles from Wyalong—that is towards Bena way—which is suitable for cultivation.
2952. *Chairman.*] That would be nearer to Wyalong than to the railway crossing the Bland? Yes. A lot of land has been thrown open on Sandy Creek, which has been taken up and put under cultivation.
2953. Where is the best land suitable for agriculture near Marsden? There is a lot of good land towards Billy's Look-out and Sandy Creek.
2954. Where would the people of that district convey their produce? To Grenfell, I think; it would be too far to go to Forbes or Condobolin.
2955. Where would be a suitable station on the Grenfell line for them to send it to? A lot of produce would be sent in about the Bland—about 6 or 8 miles from the Bland crossing.
2956. In what direction would they take their surplus produce? There are a lot of farmers around Sandy Creek—towards Grenfell and the Marsden road—and they would be at least 35 miles from the Forbes railway. If there were a station anywhere on the Bland, that would be the nearest point to which they would convey their produce.
2957. Supposing a line were constructed from Grenfell to Wyalong, would they come to Wyalong to put their stuff on board the train? No.
2958. If, on the other hand, a line were constructed from Wyalong to Temora, would they come to Wyalong? I think not. The men about Sandy Creek would go to Grenfell. A lot of land has been thrown open about Sandy Creek. Selections have been taken up to within 20 miles of Forbes.
2959. Where is the largest quantity of land suitable for agriculture—west or east of Marsden? There is a lot of suitable agricultural land west of Marsden. Around Billy's Look-out there are a great number of settlers.
2960. Would their produce be brought to Wyalong? Yes, I think so.
2961. Do you know the country towards Forbes? Yes.
2962. Have you seen the land which has been put under cultivation about there? Yes.
2963. Do you know whether they have been successfully cultivating in the Forbes district? Those who have been farming in my district are increasing the area of land upon which they are going to cultivate.
2964. Then, judging from what you have seen, you are able to state that the farmers in that direction would go in for agriculture if they had the means of getting their produce away? Yes.

John Williams, settlement lessee, near Wyalong, sworn, and examined:—

2965. *Chairman.*] What is the size of your holding? 2,748 acres.
2966. Where is it situated? Within 8 miles of Wyalong, in an easterly direction.
2967. *Mr. Trickett.*] How long have you been there? Nearly three years.
2968. Are you engaged in grazing? Yes.
2969. What is the character of the country for grazing? Very good when we get a rainfall.
2970. Have you improved your holding? Yes.
2971. To what extent? I have ringbarked, scrubbed, fenced, and watered it.
2972. How do you find it for carrying sheep? I have had bad luck; but under favourable circumstances it ought to carry a sheep to the acre.
2973. What are your opinions of the agricultural prospects of the district? There are patches upon which you could raise sufficient feed to carry you over times of drought.
2974. Do you intend to go in for agriculture? Yes; on a small scale for my own purposes, and I intend to sell the surplus.
2975. How do you view the district so far as the exportation of wheat is concerned? It would be very uncertain, owing to the dry seasons.
2976. Has agriculture about Wyalong been followed to any great extent? No.
2977. When we were in Grenfell, one of the strong reasons urged for the construction of a railway to Wyalong was that it was thought that Wyalong would be a good outlet for the produce of the Grenfell district? I dare say it would in times of drought. It could also go further on towards Hillston.
2978. Do you think that there is a better rainfall around Grenfell than there is around Wyalong? Yes. As you go west the rainfall decreases, and the uncertainty of the crops increases.
2979. How long have you been in the district? Twenty-nine years. Before I got my present holding I was on the Bland as a selector.
2980. Why did you leave it? I took up my present holding as an additional one. Only 12 miles divide the two places.
2981. Do you use your place on the Bland for grazing? During the last three years it has carried no stock whatever.
2982. Is that cleared country? Yes; principally plain, black, clayey country.
2983. Then it has given right out in the dry seasons? Yes. The grass came there for two months in the spring, and after Christmas it gradually disappeared.
2984. Are you on any part of the Bland liable to flood? No. During the last five years there have been no floods of any consequence there. We have all suffered from want of water.
2985. If a railway were run across the Bland, would it be likely to be damaged by the overflow of water? I think that if a railway went through Caragabal holding, it might be slightly injured by water. After it crossed the Bland, on the Wyalong side, it would be quite safe.
2986. The proposal is to construct what is called a surface railway;—do you think that country would be suitable for it? The speed at which the trains would travel would have to be very slow in wet seasons. I presume there would be no ballast on the line, excepting in bad places.
2987. Do you think the Bland plain country is likely to develop into an agricultural area? No; there is no possible chance. It is purely grazing land, and it is unsuited for agriculture.

J. Williams.  
24 Aug., 1899.

- J. Williams. 2988. Has agriculture been tried? Yes; by several settlers; and it has always resulted in failure.  
 24 Aug., 1899. 2989. Then, on those plains, we are not likely to develop any close settlement? No; I think the plains are principally freehold. The land has passed away from the Crown.  
 2990. Is there any suitable area of land about there, which is not on the plain proper, and which is suitable for agriculture? Yes; from Caragabal to Grenfell a great amount of land is fit for agriculture.  
 2991. Coming further on towards Wyalong, is much agriculture likely to be developed? From Back Creek station to Wyalong we have good land. A great amount of it is suitable for agriculture.  
 2992. Do you know enough of the country along the two routes—Grenfell to Wyalong, and Temora to Wyalong—to enable you to say which would be likely to develop the more agriculture? The distance is very much greater between Wyalong and Grenfell, than it is between Wyalong and Temora. There is a great amount of good land on the Temora line—thick timbered country.  
 2993. Do you think the water supply for the purposes of a railway between Grenfell and Wyalong would be a difficult question? Plenty of water could be conserved in the Bland Creek by constructing overshoot dams. I believe there are watercourses from the Bland Creek towards Caragabal holding.  
 2994. I believe that on the route, *via* Bimbi, there is plenty of land where water is easily obtained by sinking? Yes.  
 2995. *Mr. Shepherd.*] What is the extent of your holding on the Bland? 2,200 acres.  
 2996. How long have you resided there? Since 1879.  
 2997. When you say there has not been a bit of feed there for three years, do you include the whole of the Bland country? There is feed there in the spring of the year, but after Christmas it has, during the last three years, practically disappeared, and the sheep have had to be scrub-fed.  
 2998. Is the country subject to floods? It is, in good years.  
 2999. Does the water remain on the surface? Not very long. It has very good drainage from Lake Cowal and the Bland Creek. After the rain ceases, the water goes down in a few hours.  
 3000. Does not the soil on the Bland plains vary a good deal? Not that I know of.  
 3001. Is it all of the same character? Very nearly. Caragabal, East Bland, and Oakhurst are alike.  
 3002. What is the nature of the soil there? It is purely a clayey country, I think.  
 3003. Have you ever gone down to any depth? I have seen tanks excavated for 13 or 14 feet, and it is all the same.  
 3004. Is it a bluish-black clay? It is more a greyish clay, with black soil.  
 3005. Is it not generally termed black soil? I believe it is.  
 3006. Have you attempted to cultivate any of your holding on the Bland? Yes.  
 3007. What has been the result? A failure. In good years you would get a fair crop off it, but in times of drought you would get no crop at all.  
 3008. What have you grown? Wheat only.  
 3009. Have you heard of anyone attempting to grow any of the millets? No. Lucerne has been tried in small patches, but the land is too dry for it.  
 3010. What depth have you to go for water? On the west side of the Bland Creek several shafts have been put down, and the water, when discovered, has proved of no value for stock. It is very brackish. The water was obtained at a depth of 45 feet and 50 feet, and less.  
 3011. Has the Bland Creek generally got water in it? During the last drought the waterholes were 10 and 12 miles apart. As a grazing country, with good seasons, it carries a great amount of stock.  
 3012. Are you aware that a good deal of stock was sent off it even last year? No; I do not think such a great amount was sent away last year. At Morangarell station, where they used to carry 30,000 sheep, there are none now. Chisholm, Brothers, used to shear 70,000, and they have only 9,000 or 10,000 at present. All this has occurred during the last four or five years.  
 3013. I believe that prior to that you were pretty successful with sheep? Yes, fairly successful.  
 3014. *Mr. Watson.*] Can you express any opinion as to which would be the more desirable route from Grenfell to Wyalong,—north of the Weddin, by way of Piney Range, or south, by way of Bimbi? I do not think there is a great deal of difference. I suppose there are a great number of settlers towards Forbes, on the holding known as Sandy Creek, and I have no doubt they would benefit more by the construction of a line by way of Piney Range.  
 3015. You have stated that there is some bad country between Wyalong and Temora;—which portion were you referring to? I was referring to country between Wyalong and Barmedman, on the southern side. It is mallee country. The other country is good for agriculture. I am told that the mallee country also is good country for agriculture, but the expense of clearing it, and getting it into order, is too great.  
 3016. Is the mallee country very extensive? No; it is very patchy.  
 3017. Apart from the mallee country, what is your opinion of the character of the land between Wyalong and Temora? It is more adapted for agriculture than is the land from Wyalong to Caragabal.

John Charles Holmes, farmer and grazier, Wyalong, sworn, and examined:—

- J. C. Holmes. 3018. *Mr. Shepherd.*] Where is your holding? Eight miles east of Wyalong.  
 24 Aug., 1899. 3019. What is its extent? 2,582 acres. This year I am cultivating 50 acres.  
 3020. Is that the most you have had under cultivation? Yes; but I am clearing 220 acres for next season. I have only put land under cultivation this year. I had 1 acre last year, and, although we had a drought, it grew about 15 cwt. of hay.  
 3021. How many sheep have you? 350.  
 3022. Are the trees ringbarked? Yes. I have had up to 2,000 sheep upon the holding.  
 3023. Are you quite satisfied with your prospects? Yes; provided we get a railway to send away the surplus produce.  
 3024. Irrespective of your own interests, which do you think would be the better line to construct? A line from Grenfell to Wyalong would be more suitable for me, because it would be nearer to my holding; but in the interests of the country, I think that the Temora line would be the best. That line would give us two markets. It would be cheaper to construct, and there would be less land to resume.  
 3025. Have you any further statement to make? No; excepting that the want of a railway is keeping back agriculture.

3026. Are you thoroughly acquainted with the country between Wyalong and Grenfell, and between Wyalong and Temora? I am not acquainted with the whole of the country between Wyalong and Grenfell, but I know it for a distance of 15 miles. I know the country between Wyalong and Temora thoroughly. The 15 miles of country between Wyalong and Grenfell is very good agricultural land as far as the timber extends. J. C. Holmes.  
24 Aug., 1899.
3027. You think it is equal to the same distance of country between Wyalong and Temora? Yes.
3028. What is the character of the country the whole distance between Wyalong and Temora? With the exception of a few belts of mallee, it is all suitable for agriculture.
3029. We have been told that the best country is the first half of the distance from Wyalong? I do not think that is so. I have seen good crops between Barmedman and Temora, and I have seen vines growing near Temora.
3030. Is there much cultivation between Wyalong and Temora? There is a fair amount.
3031. Are there any extensive vineyards on the route? No; but I have seen a selector growing grapes for his own use.
3032. Do they seem to do well? Yes.

Thomas Joseph Foley, farmer and grazier, Buddigower, sworn, and examined:—

3033. *Chairman.*] Where is Buddigower? Eleven miles west of Wyalong, on the Willandry Road. T. J. Foley.  
24 Aug., 1899.
3034. *Mr. Watson.*] What is the nature of your holding? It is a conditional purchase and conditional lease.
3035. What are you engaged in? Pastoral pursuits and agriculture. I have 14 acres under cultivation, and nearly 100 acres cleared.
3036. Have you seen much of the country about Buddigower? Yes; all the country from there to Temora.
3037. How would you describe the country immediately west of Wyalong? It is suitable for both agriculture and pasturage. Of course, there may be places which are not very good, but taking the country as a whole it is splendid.
3038. With railway communication, would a fair amount of country be opened up for agriculture? Yes; there is a good deal opened up at present. At the back there are a lot of selectors. On Mandamah, Buddigower and Kildary, there will be more land for selection when the leases run out.
3039. I believe there is a lot of scrub there? That is due to neglect.
3040. Do you anticipate finding a market in Wyalong if a railway is constructed? Yes, for chaff. If we had a railway I should put a great deal more land under cultivation, because there is less expense in producing wheat than hay.
3041. Do you know the country between Temora and Wyalong? Yes.
3042. Do you care to express an opinion as to its suitability for production? Yes; taken as a whole, it is good country.
3043. Is it as good as that upon which you are living? Some of it is better. I am speaking of a radius of 25 miles from the Temora road. South of the present coach road there is as good land as any in New South Wales, for agriculture or pasturage. There are some strips of mallee along the road; but if you go further in you find beautiful pine country.
3044. I believe you were station-master at Temora? Only for twelve months.
3045. Have you a fair idea of the proportion of traffic along the Cootamundra to Temora line, due to Wyalong? Certainly 50 per cent. of the merchandise, if not more. Then there was the mineral traffic going back, before the large works were established at Wyalong. That gave a great impetus to the traffic. On one occasion we had a special train of minerals, which were going to Ballarat or Footscray. Since then Wyalong has become self-supporting, and it is about the best developed mining centre in New South Wales, so far as mining and the expenditure of money are concerned.
3046. Leaving out of account the ore which was sent through Temora during the time you were station-master, would the Wyalong traffic be equal to 50 per cent. of what was received altogether at Temora? It would be more. Mr. Meagher, a great consignee of goods, received in Temora goods for both places. Consequently, of what might nominally be received for Temora, two-thirds might belong to Wyalong.
3047. Of course that traffic would have to be subtracted from the Cootamundra-Temora Railway returns if a line were constructed from Grenfell to Wyalong? Yes.
3048. Would the Cootamundra to Temora line pay so well if the Wyalong traffic were taken from it? No.
3049. How would you prefer the railway to Wyalong to run? Speaking as a railway man and as a farmer, I think it is ridiculous to talk about a railway from Grenfell to Wyalong.
3050. Then you prefer a line from Temora to Wyalong? It is not a matter of preference with me. I speak for the greatest number.
3051. A railway from Grenfell would serve you equally as well as one from Temora? It would.
3052. Still, you think the line should run from Temora? Yes. No one who has any real knowledge of the matter would advocate any other route. The greatest population to be served would be on the Temora route. Then, again, there is better country beyond. A line from Temora to Wyalong will also be cheaper to construct. I do not suppose that on the Bland country there is much ballast, but there is ballast as well as ironbark on almost every part of the road between Wyalong and Temora. At present, ironbark sleepers are being taken to Temora to be despatched to other parts of the country.
3053. We are informed that a line from Temora to Wyalong will cost £45,000 less than a line from Grenfell to Wyalong? That is so. Then there is the reduced cost of maintenance as well. If the railway passes over the Bland on an 18-inch embankment one good storm will destroy it. If you want to build a line for the convenience of the public at large, and also for the public good, you should take the most direct route from the main trunk line. Again, if we have Federation, why should not people be able to travel to Melbourne as well as to Sydney? If we have to travel by way of Grenfell and Koorawatha there will be a number of changes. We shall have to change at Koorawatha, Harden, and Albury. That means three changes in a very short distance. With regard to the congestion of traffic at Harden or Cootamundra, I would point out that it would be easy to duplicate the line from Cootamundra to Young. This duplication must be carried out in time.

- T. J. Foley.  
24 Aug., 1899.
3054. You contend that a line from Temora is more likely to pay, and that it will give the farmers a better choice of market? Yes. It will also be cheaper to maintain, and will confer the greatest benefit on the greatest number.
3055. *Chairman.*] Have you been over the country between Wyalong and Grenfell and Koorawatha? I have been by train to Koorawatha, but not over the intervening country.
3056. You have stated that one of the reasons in favour of the extension from Temora to Wyalong is that it would be bad policy to leave the railway where it is? Yes.
3057. A line from Koorawatha to Grenfell has been sanctioned, and that will be in exactly the same position if it is left at Grenfell? It will; but there is no reason why it should be brought across an expensive part of country, and a country without population.
3058. You say you do not know what the country between Koorawatha and Grenfell, and thence to Wyalong, is like? The country from Grenfell to Koorawatha is good, but the Bland country is all pastoral.
3059. How much of the country between Grenfell and Wyalong is what is known as Bland country? I could not tell you.
3060. Do you think, if you had some land in that direction, your views would be altered a little? Personal interests might make anyone alter their views, but I do not see why the country should be ruled by private influence or for personal interest.
3061. If we were to discount the opinions of the people in the Grenfell district, because of their personal motives, you would not be offended if we discounted yours for the same reason? Certainly not.
3062. Do you think if a railway were constructed to Wyalong the people of the district would go in for agriculture? Yes; to a great extent.
3063. If no railway is constructed to Wyalong it means, I suppose, that the land would be devoted to sheep? It will go back to the Banks.
3064. Will not the Banks make some use of it? Yes; but when they put out a selector, another will hardly go to them.
3065. If there is no railway, or cheap means of conveying agricultural produce, will not the land go back to pasture? Yes; into something which is not agriculture.
3066. *Mr. Trickett.*] Do you know that the line from Cootamundra to Temora is running at a loss? I do not know what you call a loss. The Commissioners might say it was running at a loss compared with the previous year.
3067. I suppose that all the produce from Wyalong is taken by way of Temora? Yes.
3068. If the Railway Commissioners have sworn that the Temora to Cootamundra line is running at a loss, do you not think that they have good reasons for doing so? I should like to know what they mean by a loss. When I was station-master at Temora there was a good revenue, and if the revenue is now lower than it was then, they regard it as a loss. That is one way of computing losses.
3069. What is going to provide the great traffic from Wyalong to Temora? The Wyalong gold-field, and the population surrounding it.
3070. We have evidence that year by year the population of the district is decreasing; it is now down to 3,600, whereas a year or two ago it was nearly 5,000? That may be on account of the want of a railway; there will be a larger population when there is a railway.
3071. What will the population do? Cultivate the land.
3072. We have evidence to the effect that the mines are frequently stuck up for want of water;—do you wish us to understand that in view of that fact people will come here to settle on the land? Yes; the cause of the want of water is the absence of water conservation. Twelve months ago there was not a tank here capable of holding a year's supply.
3073. But you do not conserve water to grow wheat? You must conserve water to enable people to cultivate—to keep the horses going, and so on. Any farmer who has not enough mutton with which to feed himself and his men is not worthy of the name of a farmer. He should at least keep enough water for the purposes of his stock. The land upon which I was living was selected in 1888, and there has never been a dearth of water there. During the five or seven years in which it was in my hands my neighbours were supplied with water from it.
3074. Was not the railway from Cootamundra to Temora intended to tap an agricultural district? Yes.
3075. Has it done so? Yes; it has exceeded the most sanguine expectations.
3076. If the Railway Commissioners say that the Temora line does not pay, are you prepared to deny it? Whilst I was station-master at Temora it paid.
3077. *Mr. Watson.*] You have stated that although you advocate the construction of a line from Wyalong to Temora, it does not matter to you from which direction the line goes; you will be within 11 miles of it, whichever way it goes? Yes; but still it would matter a great deal.
3078. Personally, one route would not benefit you more than the other? Certainly not, if I could get my goods to market at the same rate.
3079. If a line went from Temora it would be no nearer to your property than one from Grenfell? No. At the same time, if I wanted to go to Sydney I should be sorry to be taken by way of Koorawatha, and the mountains, whilst I could go to Sydney or Melbourne by way of Temora.
3080. *Chairman.*] You have stated that you thought the people would do very much better if they conserved the water? Yes.
3081. You meant that remark to apply to pastoral and not to agricultural pursuits? Yes. A man with 2,560 acres of land might be able to run 1,000 or 500 sheep and cultivate 1,000 acres of his land, if he had a good water supply. I look upon any farm which has not a good water supply as a failure. No matter what you do in this or other parts of the country, you want a good water supply.
3082. If we have seasons such as we have had during the last few years, you could not grow wheat very well? I think you could grow a fair crop of wheat if you fallowed your land at this time of year, or at any time when there is a chance of a shower of rain, which will make it fit to plough. You could then put in your crop at any time, whether you got rain or not.

James Joseph McDonnell, mine-owner, Wyalong, sworn, and examined:—

3083. *Chairman.*] Do you think the mining prospects of Wyalong are better than they were during the early days? I think there is every possibility of the field being permanent.

3084. Have you any information to supply to the Committee? Since 1870 I have been all over this country, including the Bland. Knowing the character of the country between Wyalong and Grenfell, and between Wyalong and Temora, I think it would be beneficial if a line were constructed from Temora. There is pretty good land on both routes. If I want to go to Albury, I do not care to be dictated to, and told that I must go by way of Koorawatha. The residents, and not the Railway Commissioners, are the individuals who are to be considered as to whether the line should or should not go to Temora. It has been stated in Sydney that on the Grenfell route there is a population of 7,000. I do not think that is correct. I was a resident of Barmedman prior to the Wyalong field being opened. I came to Barmedman before the Cootamundra to Temora line was opened. A line was measured to Hillston, and owing to that I came to Barmedman and bought into an hotel, in the hope of the line coming on. I am one of those who settled on the Temora route on account of the pledge of the Department that the line would come through. I do not think anyone on the Grenfell route ever expected that a line would come along that route to Wyalong. Mr. Meagher has told me that on one occasion he grew 42 bushels of wheat to the acre at Kangaroo Hill, 2 miles on the Wyalong side of Barmedman.

3085. *Mr. Shepherd.*] I believe you have shafts here at a depth of 500 and 600 feet? Yes.

3086. Have you been down any of them recently? I have been down the 300-foot shafts only—the Kurragong, Golden Fleece, and White Reef.

3087. Do the reefs appear to be thoroughly satisfactory at that depth? If you go far enough you get into a blank occasionally. Take the case of the Golden Fleece—fifteen or eighteen months ago we were down to 320 feet, and knocked off because there seemed to be nothing there. Later on they only went a few feet lower at the Tributors', and obtained splendid stuff, which went 18 oz. 15 dwt. to the ton, by assay.

3088. How long is it since you reached a depth of 320 feet? Fifteen months. We got into a bit of a blank, but if you go far enough you are bound to meet the reef again.

3089. Some reefs will continue, almost within an inch, the same width for hundreds of feet? They make larger in shoots.

3090. It seems strange that if you have been to that depth for fifteen months you have not attempted to prospect lower down? It is a matter of opinion. I might be in favour of it, and other directors might not be in favour of it.

3091. The usual thing is to test your mine to a considerable depth? Yes; but where there are ten to twenty men you have to do as the majority wills. It means calls, and so on.

3092. What is your opinion of the prospects of the mine at a greater depth? Very good.

3093. Are they equal at the 320-foot level to what they are at the 200-foot level? Better.

3094. They have kept on improving all the way down? The deeper you get—the more of the grey ore you get—it becomes richer. The same ore at 300 feet will assay half as much again as it will at 200 feet.

3095. That being so it is a wonder you have not gone deeper? We are quite satisfied. We are only 5 years old at present.

3096. *Mr. Watson.*] You have referred to the evidence you have seen published in the newspapers relative to the population on the respective route. In the evidence estimating the population between Grenfell and Wyalong, within the influence of a line from Grenfell to Wyalong, there were included the populations of Barmedman and Reefton;—do you think it would be right to assume that if a line were constructed from Grenfell to Wyalong the people from Barmedman and Reefton would come to Wyalong with their traffic? No; they would go to Temora.

3097. Being as near to Temora they would go to that place, as it is closer to Sydney? I should think so.

Robert Gagie, farmer and grazier, near Wyalong, sworn, and examined:—

3098. *Mr. Trickett.*] How long have you been in the district? About seventeen years.

3099. West of Wyalong I believe the country has gone back of late years? Yes; on account of the scrub.

3100. Have the flocks been reduced very much? Yes; on account of the runs not being improved by reason of the uncertainty of tenure, and the want of tenant right. On Buddigower in 1890 there were 50,000 to 60,000 sheep. They sent away 775 bales of wool that year, and now I do not think they could send away 20 bales.

3101. What prospect is there of things improving in that direction? Unless they get a further lease of their runs in order to improve them, they will be just the same as ever.

3102. Do you mean that, unless there is an alteration of the land law, there will be no produce to be carried to a railway from that direction? That is so. The land has been allowed to go wild, and the dry weather has reduced everything. Of course, the land is there, and it only wants throwing open for settlement, with secure tenure, to make it carry what it did in 1890.

3103. Do you think it is a class of country upon which a man with a small holding could do well? Yes.

3104. How much of the land would a man require to live upon? 2,560 acres.

3105. If the land were available, would it be largely taken up? I think so. I have grown wheat on my holding for a number of years, and I have as good crops as I had in the Southern district. I have had up to 24 bushels an acre. The last few years have been bad, but in fair seasons we get good crops.

3106. What would you call a fair average? About 16 bushels.

3107. Do you think you would get as much as that here? Yes.

3108. Do you think, in the absence of better railway communication, there is any prospect of people going in for wheat-growing to any extent? The distance to market is too great. With a railway they would have no inducement to go in for cropping. I am 42 miles from Temora, which is too far, as the road carriage is very heavy.

3109. How far west of Wyalong could wheat-growing be carried on? To Lake Cudgellico or Hillston. It is all good wheat-growing land. The soil is red loam—a mixture of pine, box, and different scrubs. It is more fit for agriculture than for grazing.

3110. What do you regard as the best class of soil for growing wheat? Red loam.

3111. One witness has told us that the grey soil is better than the red soil? But we cannot get it. In parts of Victoria the grey soil is better than the red soil; but here we have mostly red soil. 3112.

J. J.  
McDonnell.  
24 Aug., 1899.

R. Gagie.  
24 Aug., 1899.

- R. Gagie.  
24 Aug., 1899.
3112. Have you formed any opinion as to which would be the better route for a railway? No; our trouble is only to get it here.
3113. You do not care which way it comes? No; but of the two routes I prefer that by way of Temora, on account of getting stuff here from Gundagai. It would save me 80 miles of road carriage.
3114. What do you think of the Bland plain country as fattening country? In good seasons it is as good as any in New South Wales.
3115. I suppose the droughts are only temporary? They occur in places. I have seen the same at Albury.
3116. One of the great inducements put forward for building railways for this class of country is the probability of a large agricultural development;—do you think that is likely to occur here? I think so. If we had communication to Wyalong, and thence to Hillston, there would be a great number of selectors along the line. There are 150 miles of country between Wyalong and Hillston with no one upon it. You could ride all day and not see any one. If we had a railway through it, the whole of the country would be inhabited.
3117. Have you been to Grenfell lately? Yes.
3118. Have you been beyond Grenfell? Not on the Young side; but I have been on the Cowra side. From Grenfell to the edge of the Weddin Mountain there is a lot of agricultural country; but from the Weddin Mountain to within a few miles of Wyalong it is all pastoral country.
3119. What about the country between Wyalong and Temora? It is mostly agricultural land all the way.
3120. Is there much evidence of that on the road? Not between Wyalong and Barmedman.
3121. How is that? I do not think it has been open for selection long. There is a travelling stock route between Wyalong and Barmedman, and you cannot see anything from it.
3122. Are the people going in for agriculture wide of the travelling stock route? I could not say.
3123. What kind of agricultural development is there from Barmedman to Temora? Nearly all wheat-growing farms.
3124. Are there any very large tracts under wheat? The largest one is that of Mr. de Little, Temora station, and that of Mr. O'Keefe.
3125. What extent of wheat have they? About 3,000 acres.
3126. You do not see anything like 10,000 or 20,000 acres in one block, or in adjoining blocks, under wheat? No.
3127. Is the country patchy for wheat-growing? There are occasional patches. Off the road for 10 miles on each side between Barmedman and Temora there are farms growing wheat.
3128. *Mr. Shepherd.*] What do you reckon is the cost of ploughing, sowing, and harvesting your crop? Ten shillings an acre; I have known times when it has cost £1 an acre.
3129. Where do you take your wheat? To Temora; the cost of carriage is 7d. per bushel.
3130. What average price do you get for it? About 3s.
3131. Are you satisfied with that price? We have to be.
3132. Have you grown anything but wheat? Yes; wheaten hay, since Wyalong opened.
3133. Do you think the Temora route is the best in the interests of the country generally? Yes; it would not cost so much for construction. The guards on the Cootamundra to Temora line have stated that they would just as soon run out to Wyalong as be detained at Temora.
3134. *Mr. Watson.*] Have you been through Trungley? Yes; three years ago.
3135. Was cultivation going on at that time? A little.
3136. *Chairman.*] Can you say what quantity of land is under wheat within 20 miles of Temora? I could not.
3137. Do you think there are 30,000 acres under wheat? I think there are more.

Frederick Dempster, secretary, Wyalong Railway League, sworn, and examined:—

- F. Dempster.  
24 Aug., 1899.
3138. *Chairman.*] Have you anything to do with mining interests at Wyalong? Only as secretary to several companies.
3139. The Committee would like some information as to the depths of the levels? Between 400 and 500 feet is the deepest level I know of from which sulphides are coming. Eleven-ounce ore is coming from that depth—not in barrow-loads, but in large parcels. We send 50 tons away at a time to Dapto.
3140. What is the width of the reef? It varies. It pinches and bulges. It would be difficult to strike an average. Sometimes it might be 2 or 3 inches, and at other times nearly a foot.
3141. *Mr. Shepherd.*] Do you find the stone becoming more refractory as you go down? No; it can all be treated here. One of the characteristics of the reefs on this field is that they pinch down to a thread. Sometimes they absolutely cut out, and come in again.
3142. Has the reef of which you are speaking increased in richness as you have gone down? It has always averaged about 11.oz. for 300 to 400 tons.
3143. At what depth did you first commence stoping? There are four or five different levels in the mine, and I think three of them are working now. There is stone in the other levels, but it will be left until it is wanted, because it is of a poorer quality. That is nearer the surface—about 100 feet deep.
3144. I believe that one of the features of the mines here is that stone is not found very near the surface? Some very good stone has been found at different times a few feet down.
3145. There are no reefs showing on the actual surface? No.
3146. We have been told that the deeper the shafts go, the more refractory the ore becomes, and the more difficult it is to treat? There has never been any difficulty in treating the ore from the mine of which I am speaking.
3147. Are there appliances and machinery here sufficient to treat the whole of the ore raised? Yes; it is only a matter of tariff.
3148. Is ore still being sent away to be treated? It is in some instances. Of course, the rates are coming down now, and they are almost on a par with the Dapto charges.
3149. Do you think the appliances on the ground are capable of treating the ore as efficiently as the Dapto appliances? Yes.
3150. When they come down in charges the carriage of stone from here will cease? That is so.
3151. I suppose that competition will bring down the prices? It is bringing them down now.

3152. Have you heard of any more plants to be erected here for treating the stone? No; but Messrs. F. Dempster, Duncan, Noyes, & Co., are adding to their plant.
3153. If a railway is constructed is it likely that any quantity of stone will be treated elsewhere? As a matter of fact, there are not sufficient battery appliances now to treat the stone at grass. Lots of people are waiting. The claim of which I am speaking has command of twenty head of stampers at one battery, and they are likely to keep them going for eight months, and that shuts other people out. Messrs. Nicolas and Reymond have added fifteen head of stampers to their battery, and will get through a lot more stone than they did formerly; but it will take them a long time to catch up.
3154. Could you give an estimate of the quantity of stone at grass? No; but it is considerable.
3155. Do you think the opening of a railway would give much impetus to mining? Yes.
3156. Do you think it would be likely to cause more miners to be put on, and work to be carried on more energetically? Yes; I believe it would cause an influx of capital.
3157. Have you studied the question of the two routes? No. I am secretary to the railway league, and, of course, I am only voicing the opinion of the league. If I were not in favour of the Temora route I would not have kept the records of a body who are.
3158. What are your reasons for favouring that line? Because it is more central, and by connecting with Cootamundra you have a choice of three or four different services. You can go whichever way you like—north, south-east, or west—and you can go more quickly. I think, also, that that line would pay better.
3159. Do you think the Victorian element has something to do with favouring the Temora route? I suppose it has; at the same time there is a lot of machinery on the field which is American.
3160. *Mr. Trickett.*] Why is it cheaper to send stuff to Dapto to be treated? On account of the rates charged by the cyanide works.
3161. Then it is a kind of monopoly here? It was until Dapto started. You can send to Dapto, and pay freights and everything else, and then get a better cash return.
3162. The charges at Wyalong must be very high to compensate for sending ore by team to Temora and thence to Dapto? Yes; you can get it sent for £1 a ton return loading. The carriage to Dapto is 14s. That makes 34s. Ore up to a certain standard can be crushed for 32s. a ton, and you get the whole of the gold. Here you have to pay £3 15s. a ton, and you only get 90 per cent. of the gold.
3163. Could you give us any guide as to whether the stone is likely, ultimately, to be sent away or kept at Wyalong? I do not think that much ore would leave the field ultimately by train.

Digby Noy Johns, pastoralist and farmer, Ungarie, sworn, and further examined:—

3164. *Chairman.*] I believe you have some further information to supply the Committee? Yes. With regard to what I said about starving stock, I wish to point out that there is very little in sending away starving stock. At Wollongough this year we had some rough grass feed, but our sheep were beginning to die in two paddocks. We therefore fed them on wheat in addition. We gave one bag of wheat per day to 1,000 sheep. That kept them alive. They were deserting their lambs as quickly as they were born, before we started feeding them. After we started feeding them, those that had deserted their lambs commenced to sing out for them. Nearly all the lambs we marked were born subsequent to feeding. It cost 1s. per 100 sheep per day.
3165. *Mr. Watson.*] What did the wheat cost you on the station? This particular wheat cost us about 3s. a bushel on the average. We gave one-eighth part of a pennyworth a day to every sheep. If any of them died we got the skins. We had the advantage of there being no disease brought on to the run. With regard to what I stated in reference to the Murrumbidgee mountains, I may mention that I spoke on the authority of Mr. Brett, the Stock Inspector at Urana, and Mr. Culley. They told me that the sheep came back as rotten as pears, suffering from fluke and lung-worm. Of course, that may die out if they have a dry season or two, but it will not die out if the seasons are wet. I represent the Farmers' and Settlers' Association at Ungarie. We are giving our evidence exclusively in our own interests. We do not pretend to give it in the interests of the country at large, but we leave the Committee to decide between the two routes. We consider there is going to be an enormous area under grain in this district, and, that being so, the importance of a junction with the main railway system at Koorawatha cannot be over-estimated. As it is not likely that a line will be commenced to Hillston within five or six years, I think it the duty of Parliament to take steps to pave the way for its then settlement, so that the line may pay from the jump. It will take some years for the settlers to get the land into such order as to make the line pay. An enormous quantity of produce would be sent from Hillston itself. I may mention that the President of the Bena Farmers' Association and of the Lake Cudgellico Farmers' and Settlers' Association gave me to understand that they would be here to support the Grenfell route.
3166. Did you hear Mr. Collie give evidence to the effect that a large public meeting had decided in favour of the Temora route? Yes; my own brother was at the meeting, and I may mention that, on account of the way in which the business was conducted, he, too, was "bulldozed" or yarded, as it were, into supporting the Temora route.

FRIDAY, 25 AUGUST, 1899.

[The Committee met at the "Barmedman Hotel," Barmedman, at 12 noon.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

WILLIAM THOMAS DICK, Esq.

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Edward Butler, mining engineer, Barmedman, sworn, and examined:—

3167. *Chairman.*] How long have you been at Barmedman? About three and a half years.
3168. Have you been engaged in mining all the time? Yes.
3169. What are your views of the Barmedman gold-field? I think the permanency of the field is undoubted. The difficulty we have to contend with is that it is not a find adapted for miners, in the ordinary

E. Butler.  
25 Aug., 1899.

3184. Have you had any long drives? The reef has been driven on and worked at intervals for over 700 yards.
3185. With good results the whole way? With very satisfactory results the whole way.
3186. Is that at the one level? Yes; the 120-foot level—40 feet to 50 feet below the water level.
3187. What kind of holdings have you here in connection with the auriferous country? Chiefly leasehold. There are some, but not many, quartz claims.
3188. Have the leases been often suspended? Yes; for the purpose of obtaining machinery.
3189. How far are you from Temora? Twenty-two miles.
3190. Is it a very bad road? It is becoming a moderately fair road, but when I first came here it was simply villainous.
3191. Would you contend that it would be desirable to construct a line to Barmedman? No.
3192. As far as Barmedman is concerned, machinery and other stuff could be dragged along the 22 miles of road from Temora without any great disadvantage? Yes. Of course, one always prefers, in dealing with machinery, to prevent two or three handlings.
3193. Do you think that, if the mines at Barmedman increased in number, local treatment would be resorted to? I should imagine so. Of course, it would not pay here to put up chlorination or large reduction works on a big scale.
3194. Why? Because the ore is so admirably handled at Dapto and Cockle Creek that it is better to pay the freight. If you can get any reasonable reduction of freight on the railway it is almost cheaper than sending to Wyalong.
3195. Have you visited the Wyalong mines? Yes.
3196. Do you know Mr. Neeld's mine? Yes.
3197. Have you anything at Barmedman which would compare with it? This mine is on a different class of stone entirely. If you compared the area you would find that our reef is very much larger, but, of course, it is not as good in quality.
3198. What is the character of the stone here? It is soft and friable—almost a decomposed quartz. It is gradually increasing in hardness with depth. It carries gold, of a coarse, rugged nature. It is fairly free from minerals. There is no doubt, however, that the minerals are coming in with depth.
3199. Are the lodes surrounded by granite formation? No; by a soft decomposed diorite. The mother country is slate.
3200. Is it distinct from the stuff from which you get the gold? Yes.
3201. Then there is a distinct lode with the auriferous ground? Yes. At Wyalong the reefs are east and west, and, of course, it is a different country altogether to this. We have nothing in the shape of very hard country.
3202. This would really be easier country to work? Yes, if one had not to contend with the water.
3203. Are there any mines here whose progress has been sufficiently long and prosperous to indicate that they are likely to be continuous? I think you might say that all of them have had a long and prosperous career, but you have to take into consideration the fact that the water level, being at 70 feet, it is not a field upon which poor men can work. Unless there is a large capital behind the mines they cannot be worked satisfactorily or profitably.
3204. It means heavy expense for timbering, pumping, and draining? Yes.
3205. Taking all those things into consideration, you still think the mines will be payable? Yes.
3206. Has all the stuff obtained here been treated elsewhere? Some of it was treated at Grenfell in the earlier days of the field, but then they would only look at the very choice stone.
3207. What treatment does the stone from here go through? Battery and cyanide treatment.
3208. How many companies are working here? Three.
3209. Are they all live concerns? I think so.
3210. In 1897, when evidence was given here before a former Committee, it was stated as the greatest drawback to the place that the ground from which gold could be best obtained had for the past ten years been under constant suspension;—is that ground going to be kept in that state? I do not know of any ground here under suspension, except one special gold lease, and that is simply due to the repairing of certain boilers.
3211. Has the state of things to which I have referred ceased to exist? Yes.
3212. Do you think that with a railway here there would be much need for fuel to be brought here, or is there sufficient local fuel to last for many years? I should say there is an almost unlimited quantity of firewood here.
3213. Then we need not look for much revenue from the carriage of coal? Of course, if reduction works are started, and coal can be bought cheaply it will be used in preference to wood-fuel. If we could get coal here at 25s. a ton it would be better than using wood for the furnaces. There is a considerable quantity of mining going on independently of the companies.
3214. With the mines in full swing, how many people would be employed on each? There is room for sixty or seventy in each—that is by working them only on a very moderate scale.
3215. Have you been here sufficiently long to say whether you think these enterprises would increase in number? I think so. What has crushed the place is the want of capital, and the fact of ground which could not be worked otherwise than with capital being held under suspension.
3216. According to your statement, the reefs are far-reaching; therefore, I apprehend that each holding will have to be a pretty large one? The holdings, undoubtedly, require to be fairly large.
3217. What is the size of yours? Ten acres.
3218. Do you think there is scope for a number of big enterprises? I think so; the place has only been scratched so far as mining is concerned. The water has stopped us for the present. Personally, I am putting in a 12-inch pump to cope with it.
3219. Does the water come in everywhere, or only in certain streams? It comes in everywhere. For instance, I drained a shaft 800 yards away from me, on the north-east side, and I also drained shafts 400 to 500 yards away from me on the south side.
3220. Is the water mineralised, or can it be used? It cannot be used; it is heavily charged with sulphuric acid. It is absolutely useless, except for battery tables.
3221. How do you get on for water for working your machinery? It is caught in tanks.
3222. With proper tanks and good drains to them, could a sufficient supply be obtained to keep things going? Undoubtedly; there is a very fair catchment here.

- E. Butler. 3223. You state that what is keeping back the place is want of capital? Undoubtedly. If Barmedman had been anywhere else but in New South Wales, capital would have been here years ago. The water difficulty is nothing.
- 25 Aug., 1899. 3224. *Chairman.*] Is it difficult to get capital on a small area like this? Yes.
3225. Is it not because the leases are small that there is difficulty in getting capital? The reason is that the field was held in small holdings, and there were so many interested in them. One party may agree to take a certain price, and then one individual would stand out for more than his share.
3226. If larger leases had been granted in the first instance, would the field have been further ahead? I would not say that, because there would still have been so many interested. If one man had been in a position to deal with the leases ten or eleven years ago, they could have been floated many times over. One or two have stood out for more than the others were getting, and thus, to use a mining expression, they "crabbed" the sale.
3227. *Mr. Trickett.*] You have stated that you think a line could be constructed along the Temora route for £1,300 a mile; the lowest estimate of the Engineer is £2,300 a mile? I do not see why, if a line is constructed on the same system as that in vogue in the United States, it should cost more than I have stated.
3228. *Mr. Watson.*] Are the indications of gold-bearing stone and gold-bearing country around the district extensive, or are they confined to the immediate neighbourhood of Barmedman? You can follow the line from Temora to Reefton right through the Phoenix and Hard-to-find reefs. Between Barmedman and Wyalong there is a fault, but you get on auriferous country again, and that continues the whole way up to Wyalong.
3229. Then, in your opinion, there is a connected line of mineral country right from Temora to Wyalong? Right from Gundagai to Wyalong, and further.
3230. There are evidences of valuable mineral deposits between Temora and Barmedman? Undoubtedly.
3231. With a slight fault between Barmedman and Wyalong? A slight fault of about 2 miles; otherwise it is practically continuous.
3232. It does not follow, of course, that you will get good payable gold all along? No; but the whole of that ground is worth prospecting.
3233. And occasionally you might get reefs carrying gold? Undoubtedly. They are getting into an entirely new class of stone at Reefton, which, under certain treatment, will give remarkably good returns; but that would not pay for treatment at the battery. At Reefton they are getting a peculiarly mineralised stone at 300 feet.
3234. How far are the Phoenix and Hard-to-find reefs from Barmedman township? One and  $1\frac{1}{4}$  of a mile.
3235. What class of stone are they on? At the Hard-to-find they are on mineralised stone at 150 feet, and at the Phoenix, at 140 feet.
3236. Are they experiencing any difficulty with water there? Not so much as we are; but there is quite sufficient water to contend with.
3237. Is the formation at the Hard-to-find and Phoenix similar to that here? No; it is a brown slate there, and might go down thousands of feet.
3238. Is that an indication of permanence? Personally I prefer to see it.
3239. *Mr. Shepherd.*] Do you find the water increase very much as you go down? Not very much. What I have had to deal with has been the fact that there has been large accumulations of water in the old workings.
3240. Do you find the reef of such a nature that the water finds its way along it? Yes; the reef is acting as a drain for the whole of this country. The stone is exceedingly soft and porous.
3241. Did you commence stoping at the 130-foot level? No; it was done before I came here.
3242. What is the lowest depth at which any stone has been stoped from the mine? From 130 feet right up to the surface. Some of the best gold was taken from the surface. The Fiery Cross reef was within 2 feet of the surface.
3243. Has the reef increased in richness as you have gone down? Yes; the distribution of gold in the stone has become more regular, and the actual tonnage has become richer.
3244. Have you tried a greater depth than 130 feet? Yes; we have sunk to 200 feet, where the stone has shown good gold.
3245. Is that the deepest shaft which has been sunk on the field? The shaft on the battery hill is at the same depth. They were on a reef, but they had the same financial misfortunes to contend with as I had, and unfortunately the thing went no further.
3246. How many distinct reefs have been discovered on the field? Two or three. There is one distinct line of reef on the Fiery Cross which has been bored into by side-boned or herring-boned reefs which are numberless. All those side-bone or herring-bone reefs have gone 2 and 3 oz. to the ton.
3247. Are they small leaders? They vary from 3 or 4 inches to 2 and 3 feet.
3248. Do they make in towards the main reef? They are east and west on the surface, and they gradually turn to north and south as they go down and join the main reef.
3249. Have they been traced any great distance from the main reef? No.
3250. Then, generally speaking, they come within the limits of the claims which are taken up? Unfortunately they do, if they do not spread over a distance of between 800 and 900 feet. In fact the side-bone reefs have not been found at any great distance from the main reef.
3251. Are the three companies to which you have referred satisfied with the results of their workings? I can only speak for my own company, and I think they are satisfied. I believe Messrs. Conway & Co. are perfectly satisfied. They have come back here after an absence of thirteen years, and they have put their own money into the field. They left here thirteen years ago, made money at Wyalong, and have returned to resume operations; they have gone to the expense of putting down machinery and plant.
3252. Are there sufficient batteries on the field to deal with all the stone which is required? I should say so. The plant is old, but there are twenty-five head here. Of course, it would pay a claim like the Phoenix to put its own battery down. I may mention that a public battery has been erected for many years.
3253. Is it able to deal with all the stone raised? Yes, in all, it has put through something like 45,000 tons of stone.

James Alexander Walker, managing director, cyanide works, Barmedman, sworn, and examined:—

3254. *Mr. Watson.*] Have you been long on the field? Nearly three years. I have been engaged on the cyanide works, and also in crushing a little stone. J. A. Walker.  
25 Aug., 1899.
3255. Can you give the Committee any information as to the prospects of mining here? As far as I can see the prospects are very good. There has not been much done. One hundred feet is the limit of development. The water difficulty has not been faced, and the consequence is that the field has hung fire.
3256. Do you think the prospects are encouraging? Yes, for capitalists; but not for working men. It is of no use coming here with a windlass and pick and shovel only. Capital is required. I will not say a large amount; but people cannot start with nothing.
3257. I understand that arrangements have lately been made in some instances to start work in opening up? Yes. The prospects at present are very encouraging. Conway's have struck gold; and the Fiery Cross people are getting ready to face the water difficulties. We are also thinking of having a cut in if we can get the money for our section.
3258. Where is your section? We join the Fiery Cross. The reef is north and south of them; and we are on the northern end.
3259. Do you think you would be able to get that work going as well? I think so. Of course, you cannot form companies at once to tackle these things. To put up the gear we have down there will cost about £5,000.
3260. Will the pumping which has been started at the Fiery Cross have the effect of draining your area? Yes. The water drains from the whole of the field into the Fiery Cross down to 130 feet, where there is a dyke which is supposed to intercept it.
3261. I believe you operate with cyanide upon the tailings? Yes; and the first of the Wyalong stone was crushed there.
3262. Had the tailings any mineral in them? There was a variety. The heap we crushed came from a radius of 2 miles round.
3263. Have you seen any of the mineralised stone which has come from the bottom of the existing workings? I have not seen any stone from the deep level. Anything we have crushed has been little shoots which have been accidentally discovered by three or four working men.
3264. What did the battery leave in the tailings? I am not authorised to give the information; except that it paid us very well.
3265. Do you know anything of the character of the stone at the Phoenix? I rather like it.
3266. Is it mineralised? Yes.
3267. Would you be able to treat it here with a battery and the cyanide process? Yes. It is not sufficiently mineralised to be sent away. When stone gets above a certain value of course it is best to send it away.
3268. Do you think it would be better for the people here, supposing they require to have stone smelted, to bring coal and flux to the field, or to send the stone to Dapto? It would be better to send the stone to Dapto.
3269. Why? I do not think the production of mineralised stone here would be sufficient to warrant the erection of smelters, and the ratio of ore in smelting is generally small compared with the fluxes. I do not think they would cart flux here, in the way of coke and limestone.
3270. Then you think that there is no doubt that any valuable, mineralised stone should go to Dapto or some other place? Yes; to central works where they make a speciality of the business.
3271. Do you think that remark would apply to Wyalong? Yes.

William Conway, miner, Barmedman, sworn, and examined:—

3272. *Mr. Dick.*] What is the name of the mine with which you are connected? The Phoenix, 2 miles and 60 chains from Barmedman. W. Conway.  
25 Aug., 1899.
3273. What is your opinion as to the prospects of Barmedman as a gold-mining field? I have been here for about fifteen years, and I worked at the Phoenix fifteen years ago. I abandoned it on account of the water difficulty. I returned to it after I got sufficient capital to enable me to cope with the water.
3274. Do you think the water difficulty has hindered the development of this field? It has. All that is required to make it progressive and prosperous is sufficient capital to enable the claim-holders to cope with the water.
3275. Do you think this is a field which poor men could work? No.
3276. Is there any other reason besides the water difficulty, which, in your opinion, has proved an obstacle to the development of the field? No.
3277. What is your experience as to the character of the ore as you go deeper;—have you found that it carries more or less gold as you go deeper? My experience is that the ore has turned out better as you go deeper.
3278. How many years practical experience have you had as a miner? Over twenty.
3279. Have you seen other fields besides Barmedman? Yes.
3280. How would this district, with the introduction of capital, compare with the Wyalong gold-field as a means of employing labour and producing revenue for a railway? The Forest King was the first claim, half-way between Barmedman and Temora, into which I put my money in this district. I spent £1,800 there. That is a gold-producing tenement, and it is gold-producing all the way from Temora to Wyalong. Afterwards I went into the Phoenix, and I have come back again. I went to Wyalong in the meantime. I might say that I opened Wyalong. I was the first man to report payable gold there, and I have come back to the Phoenix again.
3281. You evidently think that this district is a better one for the investment of capital than is Wyalong? I would not have left Wyalong if I had not thought so.
3282. What effect would the construction of a railway from Temora to Wyalong have on this district? It would open up the country a good deal from a mineral point of view.
3283. What are your reasons for that opinion? In the first place, there are thousands of tons of stone going away daily from Wyalong to Sydney, *via* Temora.
3284. You think that the gold-bearing district extends from Temora to Wyalong? Certainly.

- W. Conway. 3285. Do you think the ores are of such a character as to require furnace treatment? All the ores are, in this district.
- 25 Aug., 1899. 3286. Do you think the traffic in coal to this district is likely to be large, or will the ore require to be sent to the coal? It will be necessary to send the ore to the coal and flux.
3287. Are the claims about Barmedman sufficiently large to warrant the expenditure of capital to deal with the water difficulty? They are.

Thomas Love, stationer, and formerly Mining Registrar, Barmedman, sworn, and examined:—

- T. Love. 3288. *Mr. Trickett.*] How long have you been in the district? Fifteen or sixteen years.
- 25 Aug., 1899. 3289. Has the district advanced or gone back during that time? There is more settlement; but mining matters here been very quiet since Wyalong has gone ahead. Barmedman itself has gone back because of the water difficulty. Miners have been unable to work for want of machinery and capital to develop the mines.
3290. What do you think is wanted to advance the district? Railway extension. It would assist the farmers to make a living on the ground they occupy. I was a farmer for fifteen years in Victoria, and I know a good bit about land.
3291. What is the character of the soil in the district? I think it is as good as many parts of Victoria. During the last few years, however, the crops have been very bad, owing to the dry weather.
3292. Has agriculture increased about Barmedman during your residence here? Yes; they are putting more under crop every year.
3293. Do you call that a good tract of agricultural country between Wyalong and Barmedman? It is fairly good in places away from the road.
3294. Are there not some mallee and country difficult to work about there? Yes; the mallee country is hardly suitable for agriculture.
3295. Then people are not likely to touch it until they have dealt with the good stuff? I think not.
3296. Is there much red-soil country? Not a great deal.
3297. Do you regard red soil as the best for agriculture? The light loamy soil is the best in this district.
3298. What is the largest tract under wheat between Barmedman and Wyalong? Between 200 acres and 300 acres in one paddock is the largest I know of. Of course, people would go in more extensively for wheat-growing if they had access to market. The cartage to Temora is the great difficulty. A great deal of time is wasted in cartage, which should be devoted to preparing the land.
3299. How far should a man carry his produce to make agriculture pay? If he could get to a railway and back in one day he would be fairly well situated.
3300. What distance would he have to be from a railway station to do that? Twelve to 15 miles at the farthest—10 miles is a fair day's work.
3301. Do you remember Temora, and the district 15 miles towards Barmedman, before the Cootamundra to Temora Railway was constructed? Yes.
3302. Were there many farms about there then? It was dense scrub.—in fact, I do not think there was any settlement at all between Barmedman and Temora at that time. Nearly all the land is taken up. There is a considerable amount of farming being carried on 15 miles on the Barmedman side of Temora.
3303. What extent of agricultural country is there between Temora and 15 miles on the Barmedman side? I could hardly say that, but all the land is taken up. I have a return of the gold produced in Barmedman since 1883, with the exception of three years which are lumped together. It is as follows:—

*Barmedman Gold Returns.*

Including years 1883 to 1885—various reefs ... ..	6,335 ounces.
Steffani's Never Sweat reef, only—year 1886 ... ..	1,078 „
Various reefs—	
„ 1887 ... ..	1,542 „
„ 1888 ... ..	987 „
„ 1889 ... ..	450 „
„ 1890 ... ..	327 „
„ 1891 ... ..	54 „
„ 1892 ... ..	79 „
„ 1893 ... ..	412 „
Including crushings—Wyalong	
„ 1894 ... ..	4,176 „
„ 1895 ... ..	117 „
	15,559
Value per oz., £3 17s. 6d. to £3 18s. ... ..	4
	£62,236

With regard to the return for 1894, I may mention that it includes a lot of Wyalong stone which was brought here and was crushed. During the last two years there have been no crushings, with the exception of a few tons.

3304. That does not look very promising? No; but they have been unable to work since 1887.
3305. Then for twelve years the district has stagnated because of the water difficulty? Yes.
3306. Is it not rather a significant fact that if the field is a good one no one has attempted to develop it for twelve years because of the water difficulty? They are developing it now, and I think they are likely to go ahead with it.
3307. What would be the average yield per ton? From 15 to 20 dwt.
3308. Do you look upon that as a payable quantity? Yes; but, of course, in mining a great number of claims do not pay. The main reefs have paid.
3309. What do you look upon as the chief thing to develop the district and bring a large population? I think we could reasonably look for a development of both mining and agriculture along a line of railway. I have a report from Mr. Wilkinson showing that he examined the country right through to Temora. It is all mineral country, and a good deal of it is agricultural country. From Temora to Yalgogrin there are hills which are all mineralised.

3310. As far as one can observe, this does not seem to be a country which would induce a miner to operate upon it;—you appear to be troubled above ground by continuous droughts, and below ground by continuous water;—do you think it will always require combined effort to develop the mines here? I think it will be necessary for companies to deal with the water difficulty. T. Love.  
25 Aug., 1899.

3311. Are there many Victorian farmers in the district? There are a good many on the other side of Wyalong.

3312. *Mr. Watson.*] Do you know the country between Barmedman and Wyalong? Yes.

3313. Do you think the stock route fairly representative of the rest of the country on the other side? I know the country well, but I do not know which is the stock route.

3314. How far on each side of the road have you been? Seven or 8 miles.

3315. Is the stock route to be taken as representative of the land on either side of it? No; there is far better land on either side of it.

3316. Take a belt of land, between Barmedman and Wyalong, 10 miles wide, what proportion of it would be fit for agriculture? I should think about two-thirds. That is only a guess. I have not gone over it with the intention of ascertaining. I have gone over it to look for gold more than for anything else.

3317. What proportion of the country over which you went would have mallee upon it? The only mallee I know of is on the left-hand side from Wyalong. That extends to the Wyalong No. 3 station, and is about 5 or 6 miles wide. I do not know what the length of it is.

3318. Is it heavy or light mallee? It is heavy.

3319. When you were alluding to loamy soil, had you red soil in your mind? Yes. It is poor country where the mallee is. The loamy soil is of a reddish tint; but it is not what the Victorians would call the red loam.

3320. Do you consider it good soil? Yes.

3321. Would you describe it as gray or chocolate loam? It is something between gray and red. It is good land, and I have seen crops growing upon it in different places.

3322. Is not the box country in this part of the Colony supposed to be pretty fair land? Mixed box and pine is considered to be the best.

Edwin Davis Donkin, grazier, Mandamah, near Barmedman, sworn, and examined:—

3323. *Chairman.*] How long have you resided at Mandamah? Twenty years.

3324. Have you been engaged in grazing and farming all the time? In grazing, and only recently in farming. E. D.  
Donkin.  
25 Aug., 1899.

3325. Do you know the country through which the proposed line from Wyalong to Grenfell will pass? Yes, very well.

3326. Starting from Grenfell, how would you describe it? For the first 20 miles there is the ordinary bush land—pine and box country—the ordinary fair farming land. After that there is the stiff black and chocolate soil. That extends to the Bland Creek and across the Bland Creek, varying on the west side from 5 to 7 or 8 miles.

3327. Is any of that country suitable for agricultural pursuits? Not fronting the Bland Creek.

3328. I mean from where you leave the first 20 miles to the Bland Creek? That is not agricultural land, as at present worked. It is first-class pastoral land.

3329. What is its carrying capacity in ordinary seasons? About 1 to 2½ acres to the sheep, taking it right through. Lately it has carried one sheep to 4 acres. Of course, in a really good season you can put a sheep to the acre; but it is not wise or safe to do it.

3330. What is the character of the country from the Bland Creek going towards Wyalong? For the first 5 or 6 miles it is similar country—hard, level plains, of both red and black soil to Back Creek. From there to Wyalong it is the ordinary bush land—box, oak, and pine. I think there is one little stony ridge through it; but it does not extend very far.

3331. Do you know where the line is surveyed? Yes.

3332. How would you describe the country for the first 20 miles out of Grenfell, going north and south;—is it much the same in character for any distance north or south? Provided the line passes north of the Weddin Mountain it is similar country. Of course, the south is jammed by the mountain.

3333. How far north does that good land extend towards Forbes? I think the whole way, more or less.

3334. How far west of the surveyed line to Forbes would the good land extend? So far as I know it extends so far as you like to go, with very little variation. Of course, when you get near the Lachlan you get into black soil; but it is very rich land. There is rich black soil or red soil the whole way from Grenfell to Forbes.

3335. How far does it extend to Lake Cowal? All the way. It is similar country all through. It is all good country. For the whole of the distance to Lake Cowal, with the Lachlan on the north, it is good country.

3336. What is the character of the country east or west of Lake Cowal, and coming down to the proposed line south? Directly you cross the lake to the west you get into very inferior pastoral country.

3337. Do you know the country south of the line? The frontage to the Bland, pretty well all the way south, on both sides, is not agricultural land.

3338. What distance on each side of the banks of the Bland is not agricultural land? From about 5 miles on the western side.

3339. And what width on the eastern side? It varies; but as a rule on the eastern side it goes back 10 to 15 miles or more. It is not agricultural country; but it is first-class pastoral country. I dare say it could be cultivated; but it would not pay on account of the difficulty of working it.

3340. People are not likely to cultivate that land whilst there is other land more easily cultivated? No. It is, however, first-class pastoral land.

3341. From the 5 miles west of the Bland, and west of that again, how far does that country extend? The first-class pastoral land really goes from the Bland to Back Creek. After that the character of the land changes. It goes into a scrub land—box, oak, pine, wattle, and rubbish; but if it were not for the clearing—of course, the clearing is a great drawback—it is good agricultural land. A range comes down west of Back Creek; but it is not more than a mile or so in length.

3342. What is the character of the country from Wyalong to Temora going through Barmedman? The whole of the country from Wyalong to Barmedman and thence to Temora is of a somewhat similar character.

- E. D. Donkin. 3343. What is the character of the country from Wyalong to Barmedman? It is all of the same character. It is all scrubby land. It is not good pastoral land unless a lot of money is laid out upon it; but when it is cleared it is all good agricultural land—not first-class agricultural land; but good sound agricultural land, with the exception, of course, of the mallee. It is said that that can be cleared and cultivated; but it would be a big expense, and would not be utilised until all the rest had been absorbed.
- 25 Aug., 1899. 3344. Is there much of that mallee country? Nothing worth mentioning. It is a few miles long and a few miles broad.
3345. What percentage of mallee would there be? Coming to Barmedman from Wyalong it stretches to a distance of from 10 to 12 miles on the road.
3346. What is the breadth of it? It varies from 2 to 3 or 4 miles. It is merely a belt of country. I know that country, as I had the management of Wyalong station, which runs into the township, for two or three years.
3347. What is the character of the country from Barmedman to Temora? It is all one character—a sound, box country—the whole way. It is scrubby, with a great deal of undergrowth; but it is slowly coming into cultivation the whole way. It is good agricultural land. A good deal of it has been coming into cultivation during the last two or three years. The farmers are perfectly satisfied, and clearing is going on in all directions.
3348. For how many years out of the twenty years during which you have been in the district would you consider wheat-growing a failure? About one year out of ten. Last year was undoubtedly the driest year which we have had, and the crops were almost an entire failure. That was the worst year we have had during the last ten years. The worst year before that was exactly ten years before it—in 1888.
3349. Then, according to your experience, we may expect nine years out of ten to produce a paying crop of wheat? I think so.
3350. How far out from Temora are they growing wheat for market? All the way to Barmedman. They carry the produce 20 miles.
3351. Is that the outside distance it would pay to carry in fair seasons? It is a big handicap.
3352. The Committee have accepted 20 miles as an outside distance? The Committee are perfectly correct in doing so.
3353. How many bushels to the acre does that country yield? They have grown up to 30 bushels in the immediate vicinity of Barmedman. I should say that a good average would be about 12 to 15 bushels. It is only during the last four or five years that agriculture has been gone into extensively—that is, since the railway came to Temora.
3354. Going west from Wyalong, towards Yalgogrin and Rankin's Springs; is there similar country? Yes; all the way down to Hillston, with occasional patches of ridges. I have not been to Hillston; but I have been close to Euabalong.
3355. Do you think that with railway conveniences most of that country would be cultivated for wheat? I do; I feel sure of it.
3356. What percentage of good wheat country is there between Barmedman and Euabalong? At least two-thirds of the land. There is very little variation in it.
3357. Do those who have taken to farming appear to be satisfied;—are they increasing their areas? Yes; they are all increasing their areas, and certainly under great disadvantages in regard to cheap carriage.
3358. Had they better and cheaper means of carriage, no doubt they would have cultivated more than they have done? This district is only in its infancy in agriculture.
3359. You think, then, that if a railway were constructed, there being so much good agricultural land, a sufficient quantity of it would be put under cultivation to pay for it in time? I think so, to a large extent. I hold that a railway should precede agriculture. It is hard to force agriculture ahead of a railway.
3360. People are not likely to plant crops in an out-of-the-way place in the hope of a railway coming; therefore, you think a railway should precede agriculture? It is the only way to open up the country.
3361. Do you think that the farmers with a railway could compete with the markets of the world? Yes; it is their only salvation.
3362. Have you given sufficient study to the question to be able to say whether the people, with railway convenience, would be able to compete in the world's markets with their wheat? I think so. It would depend on railway carriage. A very little land carriage would equal a great deal of railway carriage.
3363. Have you any further statement to make? I have some statistics as to the traffic through Barmedman. It is tabulated, and was taken by a maintenance man by order of his superior officers. It was taken from the early months of 1896 to the end of 1897. It was taken during the summer months from 6 a.m. to 7 p.m. A great deal of traffic goes along the road on moonlight nights, especially in the summer time, so that the statement is really an under-estimate. It averaged a total in twelve months of 6,000 tons of carriage.
3364. That was when the population of Wyalong was much greater than it is now? I think it was a little. There were also nearly 9,000 passengers. There were 820 horsemen and 400 pedestrians. The rate of tonnage varied from 30s. to £2 10s.—that is, from Temora to Wyalong.
3365. What is it now? About £2 or £2 10s. It has gone up a little lately on account of the increased price of forage.
3366. We have been told that with back loading £2 a ton is the rate of carriage from Temora to Wyalong and back;—do you think that is a fair price? It is a starvation rate to haul goods 40 miles and back on a bad road.
3367. Mr. McLachlan, Secretary for Railways, was examined in July last and stated: "With regard to the road carriage I may say that an officer who was in the district in December, 1898, says, 'the lowest rate of team carriage between Wyalong and Temora is 15s. a ton, but the average rate when the roads are good is quoted at £1 2s. 6d.'";—can you explain that? I can explain it so far, that I always pay £1 a ton from Temora to my place, which is 20 miles. I know that the standing rate with my carrier to Barmedman has been £1 a ton for years past. A short time ago—perhaps at the time Mr. McLachlan gave that evidence—there were really cut-throat rates, but now there is union, and I think I am safe in saying that there is no carriage now, and there has not been for a long time, under £2 a ton outwards. Of course, inward carriage is, as a rule, back loading. The carriage of ore back again may have been 15s. a ton. I have paid 15s. a ton for wool.
3368. ,

3368. *Mr. Watson.*] I believe the worst part of the road is between Barmedman and Wyalong; there it is likely that the rate will be higher in proportion? Yes. E. D. Donkin.  
25 Aug., 1893.

3369. What is the usual passenger-fare from Temora to Wyalong? Ten shillings. It has varied. Occasionally it has been lower and occasionally higher. Ten shillings is the fixed rate, but I do not think the coach-proprietors are making much out of it.

3370. Have you any other information to supply to the Committee? We think a line to Temora from Wyalong would have greater advantages than one from Wyalong to Grenfell. We are at present living, and have been for some months during the drought, entirely on Victorian produce. That is one reason why we think the Temora line would have great advantage. It would save an unnecessary haulage of 100 miles to Wyalong. If a line were extended from Grenfell to Wyalong it would make a difference of 100 miles of unnecessary haulage.

3371. That is for people between Cootamundra and Wyalong? Yes.

3372. But there would be only one year out of ten in which that would occur? What has happened before may possibly happen again. Of course, if agriculture succeeds it would not be necessary. Agriculture has, practically, only been started here during the last three years.

3373. For getting your produce away from the district and for serving the district generally you think a line from Temora to Wyalong would serve you best? I do not think there is a shadow of a doubt about it.

3374. I suppose that will be the opinion of everybody along the Temora route? Undoubtedly; we have always been led to believe that the railway would come by way of Barmedman. I, and others, have gone to great expense in agriculture on the strength of the belief that the line would come.

3375. If a line is constructed from Grenfell to Wyalong, and not from Temora to Wyalong, what will be the result? Barmedman on either side would be 20 miles distant from the railway; but I have no doubt that even under those circumstances there would be a certain amount of agriculture. Nearly 100,000 acres not far from Barmedman are to be thrown open early next month.

3376. I gather from your statement that a line from Temora to Wyalong would have a much greater proportion of land which could be cultivated along it than would a line from Grenfell to Wyalong? Yes.

3377. On account of there being a wide stretch of country, which is purely pastoral, and which you call the Bland country? Yes; Mr. French, in the middle of the Bland, tried year after year to cultivate it. He changed his paddocks, and went to great expense, when it was a hard matter to get anything to grow. The ground was too stiff.

3378. *Mr. Trickett.*] What has been the effect, from an agricultural standpoint, of the extension of the railway from Cootamundra to Temora? Agriculture has very largely increased. Without exception, every selector is cultivating more or less, many of them large areas from 200 to 500 acres. It is the only use to which they can put their land.

3379. Are those places visible along the main road? To a great extent they are not.

3380. Mr. Harper, of the Railway Traffic Department, was asked the following questions on the 9th instant:—

Do you still think that the answer given by you in 1895 on that subject will hold good. The following is an extract from the evidence on that occasion:

"Can you tell the Committee the character of the settlement between Temora and Wyalong? There is absolutely none, except mining. There are about half a dozen selectors on the road."

What have you to say with regard to that? Yes; it is, practically the same now. I fully expected that the mining development at Wyalong would have led to more farming development in that part of the country."

Do you still say there are only half a dozen selectors on the road? I do not say that; there might be twice as many, but I expected there would be a great many more by this time.

I want to know whether in the last visit you noticed any alteration since that statement was made, four years ago? It is almost imperceptible.

? He is perfectly correct. To explain that, I may say that a great deal of the road—in fact, all the Government land from Temora to Barmedman—was placed under railway reserve in anticipation of the railway coming here. Those reserves are gradually being cancelled. It is proposed, in driving you back to Temora, to make a little deviation to take you by way of Duck Creek, where there is a little German colony. As it happens, along the road between Barmedman and Temora, there are only three or four areas under cultivation, but on either side—especially on the east side—every farmer has a certain amount of cultivation, from 200 to 500 acres; and when you get within 5 miles of Temora they run into 2,000 acres. Mr. Harper is perfectly correct in saying that very little cultivation is to be seen from the road.

3381. What do you think is the average return of wheat in this district? Fifteen bushels. The highest return in this district has been 30 bushels, and the lowest nil.

3382. Mr. Hall, from the Statistician's Office, presented a return on the tenth of this month for four years, showing an average of 3.37 bushels to the acre? I would not be surprised at that, because we have had four bad years.

3383. You have stated that a lot of hay comes from Victoria and goes to Wyalong? Yes; it is entirely from Albury.

3384. Is the explanation the same: that they have been unable to grow crops at Wyalong during the last few years? The area there was exceedingly small, and last year the supply was very soon exhausted. In fact, the supply of New South Wales was exhausted. There is no chaff in New South Wales now.

3385. Is that owing to the drought? Yes.

3386. When you were examined previously, I think you had 100 acres under crop;—have you increased that? Yes; I had 200 acres last year, and have 300 acres this year, or a little more.

3387. Do you look upon it as a more remunerative method of using the land than grazing? Certainly.

3388. Have you thought out the question as to where the produce of the country is to go? We have not overtaken our own demand yet. Whenever there is a good season in one country, there is a bad one in another. The price of wheat is so low that it is absolutely necessary to work in the most economical way to make it pay. I believe it costs 2s. a bushel to grow wheat.

3389. Which do you say is the better land—that between Grenfell and the Bland country, or that between Temora and Wyalong? I do not think there is a particle of difference—that is, of course, striking out the Bland frontage.

3390. Mr. Harper, the Railway Traffic Manager, was asked that question, and he said, "I do not think the country between here and Temora is nearly as good as the country between Grenfell and the Bland country";—you do not agree with that? I do not; one is as good as the other. There may be a little better rainfall about Grenfell, but the land is no better on the Wyalong side of Grenfell. 3391.

- E. D. Donkin. 3391. Have you considered the question as to which would be the better route, having in view an extension to Hillston? I think it would be madness to take the line the other way.
- 25 Aug., 1899. 3392. For what reason? Because of the saving of stock.
3393. Where would you bring them to by way of Barmedman? If they are trucked from Hillston to Wyalong they will go, without shunting, straight to the hills—to Tumut.
3394. We have heard a certain amount of evidence to the effect that the shifting of stock to the Tumut mountains was attended with danger, inasmuch as they came back suffering from foot-rot, fluke, and so on? I have sent stock to the mountains myself, but still it is the lesser of the two evils.
3395. Mr. Harper gave evidence to the effect that 15,000,000 sheep were lost owing to the drought during the recent bad seasons, and that the country available for these starving stock was not capable of carrying more than 1,000,000;—if that is the case, all the argument in favour of light lines for the removal of starving stock falls to the ground? To a certain extent, Mr. Harper is quite right as regards this year. The Riverina has been starved out, and it alone would absorb all the hills; but it is the first time Riverina has ever had such a starving out. It comes to this—you may have 20,000 sheep on your ground, and you may see that the water will only last them a month. You must at all events make an effort to save your best stock.
3396. I suppose you look upon the last two or three years as exceptional, and that you cannot argue from such a period? I would not like to say that. It is a dry country. I had just as great losses in the eighties, but I have had no losses during the last two or three years. I have learnt by bitter experience that you must not overstock. That is the solution of the difficulty to a great extent.
3397. I suppose also that with railway accommodation you could bring food to your starving flock to a great extent? There is nothing like a railway. It is the most civilising thing we can possibly have. We feel safe if we have a railway.
3398. Supposing you were living somewhere in the neighbourhood of the Grenfell to Wyalong route, would you give it as your unbiassed opinion that the Temora route was still the best to follow? There is not the shadow of a doubt about it in my mind. It would be sheer madness to spend £50,000 more over a line which could not possibly serve the people so well as a line from Wyalong to Temora. The connection with the Southern line seems to me to have enormous advantages. There is also the question of the shorter distance of construction and the cheapness of the line to consider. When a former Committee were here, I suggested that if the line were constructed by way of Temora, the road should be resumed, as it will be no earthly use. The Government have spent nearly £20,000 upon the road, and we are not a whit the better for it. It is a 3-chain road, and the moment the line is built, there will not be a dray along it once a week. We have the sleepers close at hand and ballast all the way.
3399. The experiences of the Cootamundra to Temora extension so far have not been very satisfactory? No; I was surprised when Mr. Young was here to hear him make the same remark. Of course no short line of railway can possibly pay.
3400. Do you think the extension of the Cootamundra to Temora line is the only way of making it pay, and that it will not be the means of increasing the loss upon it? I do not think it would increase the loss upon it? Of course it would pay indirectly in many ways. If it increases the prosperity of the people, it pays to a certain extent. It is better than building a road. I maintain that a railway road is cheaper than an ordinary road. There is also this difference: a railway is an asset, and an ordinary road is a liability for all time.
3401. Do you look upon the extension to Wyalong as a railway which would stop there, or should it go further west? It should go further west to Hillston. It appears to me madness to encourage people to go on the land and not give them railway communication. It is a hopeless struggle without it.
3402. What place do you aim at on the seaboard from this part of the country? Sydney.
3403. Is there likely to be a better market for agricultural produce in Sydney than in Melbourne? Nothing will be sent to Melbourne for sale, except wool.
3404. *Mr. Watson.*] Would it not be an advantage to you here, and also to those further out, to have the opportunity of reaching a second market? Undoubtedly it would be an advantage to have an alternative market.
3405. Do you think it would be an advantage to those who would settle on the land west of Wyalong to be able to reach, at a minimum of expense, Sydney or Melbourne alternately? I think so. I think the Government is bound to give them the choice of the two.
3406. Although you anticipate that Sydney will be the main market, you still think an additional market is a factor which ought to be considered? Yes, especially in view of Federation.
3407. If you yourself were going to connect Wyalong with the railway system, would you think it was a wise thing to spend £50,000 additional in taking a line across the Bland to reach the same objective point, which you could reach at a less cost? It would be a most unbusiness like proceeding.
3408. A certain amount of traffic which now comes *via* Temora, and helps to make up the deficiency on the Temora line would be subtracted if a line were constructed from Wyalong to Grenfell? No doubt a certain proportion of it would go through here under any circumstances.
3409. The estimated cost of construction of the Wyalong to Grenfell line is £2,411 per mile. The estimated cost of constructing a line from Wyalong to Temora is £2,300 per mile;—do you think it would be possible to reduce that estimate? I cannot see how that amount would be spent on the Temora line. It seems to me to be an outrageous estimate. I know that when the contractor finished the line from Cootamundra to Temora he offered to extend it to Wyalong for £500 a mile. That was some years ago.
3410. That would have been essentially a lighter line than what is ordinarily constructed? It would have been a counterpart of the line from Cootamundra to Temora. I do not, of course, include the sleepers and the ballast—only the formation. I believe it could be done for very much less now.
3411. I believe that between Wyalong and Barmedman there is not much cultivation? No. There is a little for about 3 miles out; but that land is not open. It is still under lease.
3412. Do you think a man would be attracted towards that land with a railway terminus at Temora? No; except in regard to the local demand at Wyalong.
3413. Mr. Harper stated in his evidence that he did not think there was room for more than 1,000,000 extra sheep in the summer time on the mountains, because of the fact that, so far as he knew, the people of Riverina had only sent that number;—assuming that he refers to the number that went by rail, do you think it probable that they sent any by road? Yes; I understand that the bulk of the sheep went by road.

3414. Then the number that went by road would not be any guide as to the capacity of the mountains to feed starving stock or stock which wanted summer grass? I do not think so. I understand that large quantities went in different ways to the mountains from all directions. E. D. Donkin.  
25 Aug., 1899.

3415. Then if we were to test the capacity of the mountains by the number of sheep that is carried by rail we should under-estimate? I think so.

3416. Did you know the Temora country for some time before the line from Cootamundra was constructed? Yes.

3417. Do you think it looked any better before the line was constructed than does the country between Temora and Wyalong? No; except when you get close to Cootamundra. It is undulating there; but the ordinary country is precisely the same. There is country within a few miles of Temora exactly the same as that from Barmedman to Wyalong.

3418. We may assume, perhaps, that as that railway has led to the development of extensive wheat-growing about Temora, similar developments will occur between Temora and Wyalong if a line is constructed? Yes; all the settlement leases which have been taken up about here during the last two or three years are cultivating, although in many instances roughly.

3419. Knowing the whole of the country from Cootamundra to Wyalong, you say that the land between Temora and Wyalong is as good as the land about Temora whilst it was in its virgin state? I think it is precisely similar.

3420. *Chairman.*] Would you advocate running a main trunk line out west, and then constructing branch lines north and south from it, or would you prefer to run lines parallel to each other at an average distance apart—say sufficiently close together to catch the produce of all the agricultural land which could be served? I should be inclined to run cross lines as feeders; but you cannot in this country make a hard-and-fast rule.

3421. *Mr. Trickett.*] You have stated that the contractor for the Cootamundra to Temora line offered to extend the line to Wyalong for £500 a mile? Yes.

3422. Are you aware whether that estimate included carthworks, timber bridges, plate-laying, sleepers, station buildings, and so on? No; it was merely for forming the line.

Denis Byrne, farmer and grazier, and Member of the Land Board, Barmedman, sworn, and examined:—

3423. *Mr. Shepherd.*] How long have you resided in the district? Eight years.

3424. Are you thoroughly acquainted with the country between Temora and Wyalong? Yes. I have had good opportunities of seeing the whole of the district, on account of being an assessor under the Land Tax Act. D. Byrne.  
25 Aug., 1899.

3425. Have you prepared any information for the Committee? Yes; I have a statement showing the agricultural development of this part of the country. It is as follows:—

STATEMENT showing holdings and areas under cultivation around Barmedman, and their distance from that town (extending only 5 miles in a southerly direction).

Name of Landholder.	Area under cultivation or cleared ready for same.	Area of holding.	Distance from Temora.	Distance from Barmedman.	Name of Landholder.	Area under cultivation or cleared ready for same.	Area of holding.	Distance from Temora.	Distance from Barmedman.

36. Kildary station....	300	.....	.....	.....	Total.....	9,717			

A great many of these people are recent arrivals, and they have taken up settlement leases during the last two or three years.

- D. Byrne. 3426. Have the whole of these people a portion of land under cultivation or in preparation? Yes. On the Kildary holding preparations are being made to put 500 or 600 acres under crop next year.
- 25 Aug., 1899. 3427. How far is the furthest of the properties to which you have referred from Temora? Forty-five miles.
3428. And Temora is the nearest railway station? Yes. Of course, it would not be if the line were extended to Wyalong. The longest distance which would have to be travelled then would be 25 or 27 miles.
3429. Will you describe the character of the country between Temora and Wyalong? I regard it as a very good agricultural and grazing country. Of course, there are small broken ridges which intercept the good country here and there; but on the whole it is a very good class of country for agriculture or grazing.
3430. Is that country included within 20 miles on either side of the surveyed route from Temora to Wyalong? No, not on the eastern side.
3431. Do you know the country between Grenfell and Wyalong? Not the whole of it. I know the land on the west of the Back Creek, and also on the east of the creek to Marsden; but I do not personally know the character of the country from the Bland Creek to Grenfell.
3432. What is the character of the country as far as you know it? It is entirely grazing country. There may be a small plot of agricultural country here and there, but it is purely a pastoral district. About 8 miles on the eastern side of Wyalong is agricultural country, but beyond the Back Creek and across the Bland, the country is, for some distance, purely pastoral.
3433. Are you acquainted with the Bland country? Yes.
3434. Do you consider it unfit for agriculture? Decidedly.
3435. Have you had any experience of country similar to that? No; but on the border I have had small patches of similar country to deal with; but no extent of it.
3436. Did you ever try draining that sort of country? No; of course, in that country there is the natural drainage of gilgais, which does not seem to make much difference.
3437. What effects will the opening of a railway from Temora to Wyalong have on the holdings which you have described? I think it would considerably more than double the area of cultivation within the next three years. Myself and neighbours cleared land in anticipation of a railway coming here. Some of those who had only 100 acres cleared when I first came have now 600 acres cleared.
3438. Do you think it is chiefly in anticipation of a line being opened that so many have gone in for agricultural areas? Yes; I know that, before there were any prospects of getting a line here, there was no cultivation. Before the line was constructed to Temora there was not a 20-acre paddock in the district.
3439. What do you consider a fair paying distance from a railway station for the cultivation of land? Twelve to 15 miles is a reasonable distance, although I expect agriculture could be carried on at a greater distance away. Of course, it would depend to some extent on the nature of the road.
3440. Have you any further information to offer? In my opinion the greater amount of settlement will be promoted by bringing the line from Temora. Most of the land on the Bland has been bought up as freehold years ago, and it consists of large grazing properties.
3441. Has most of the land taken up for agricultural purposes been ringbarked? A great proportion of it has.
3442. Are the holdings you have named in the return you have put in mostly to the west or east of Barmedman? Mostly to the west.
3443. Would any of them come within the influence of a line from Grenfell to Wyalong? No.
3444. *Mr. Watson.*] I believe that a great number of those whose names are included in the return are 40 to 50 miles from Temora? Yes.
3445. If a line were constructed through Barmedman, would they be within a fairly reasonable distance of it? Yes.
3446. If a line were constructed from Grenfell to Wyalong, would they find it possible to reach it at Wyalong any easier than they reached the line at Temora? No; I do not think that six out of the total number would be materially benefited. I have only submitted the names of those who would be benefited by a line from Barmedman to Wyalong.
3447. *Chairman.*] Are those people between Barmedman and Temora? I have only taken them 5 miles from Temora, and then out to the west. There is only one holding in the list which is 9 miles to the east of us. Most of the others which are easterly are 5 miles to the east of us.
3448. How far is Barmedman from Wyalong? About 20 miles.
3449. Do you not think that if a line were constructed from Grenfell to Wyalong, and further out, in a westerly direction afterwards, they would go to it? They would be compelled to go to the nearest railway station, whether it suited them or not.
3450. A line to Temora would suit them better? It would.
3451. You have included in the return places 50 miles from Temora? Yes; they would send to Wyalong, of course.
3452. Are most of the holdings to which you have referred nearer to Temora than to Wyalong? No; most of them are practically half way.
3453. *Mr. Watson.*] Do I understand you to say that the bulk of the people whose names are included in the list are half way from Temora to Wyalong? The bulk of them are.
3454. If a line were constructed from Grenfell to Wyalong, and the present terminus remained at Temora, they would be an equal distance from Temora and Wyalong? They would be in the same position as they are to-day.
3455. How far would the bulk of them have to travel to get to Temora or Wyalong if both points remained as the termini of a railway;—would they be within trafficable distance? The bulk of them would not be within a reasonable distance for wheat growing.
3456. What do you call a reasonable distance? From 12 to 15 miles.
3457. Would the bulk of them be within 20 miles of Wyalong? No; the average distance would be nearer 25 miles.
3458. If a line were extended from Temora to Arianah some would be within 10 to 25 miles? Yes.
3459. *Chairman.*] If a line were constructed from Temora to Gunbar, would not a number of these people take their stuff to it? Yes.

Arthur Herriott, grazier, and Member of the Land Board, Barmedman, sworn, and examined:—

3460. *Mr. Dick.*] Where is your holding? Four and a half miles from Barmedman, in a north-westerly direction.
3461. How far is your holding from Temora? Twenty-six or 27 miles.
3462. Have you cultivated any of it? No; but I intend to do so.
3463. Is the handicap of 26 miles from a railway too great to enable you to cultivate successfully? Yes. I would not think of cultivating unless I was pretty certain of the line coming near me.
3464. Would the construction of the Grenfell to Wyalong railway bring you within a fair distance of railway communication? Yes, within 8 miles. We could take what produce we had to Wyalong. The northern boundary of my holding is 8 miles from Wyalong, and the southern boundary is 10 miles from it.
3465. Can you give any general idea as to the possibilities of agriculture on the route from Temora to Wyalong? I have no doubt that if a line were constructed from Temora to Wyalong, thousands of acres within 10 miles of each side of it would be taken up for agricultural purposes alone.
3466. Do you know the route from Grenfell to Wyalong? No, not very well.
3467. Do you know it as far as the eastern edge of the Bland country? Fairly well.
3468. Which of the two routes has included within its trafficable area the larger amount of plain country? The route from Grenfell to Wyalong.
3469. Has there been a general increase in cultivation between Temora and Barmedman during the last five years? Yes; it is increasing every year, although slowly. It would increase more rapidly if there were a prospect of a railway.
3470. Do you think that the fact of the Temora to Wyalong route having been inquired into has led to an increase in cultivation? Yes. I am at present clearing 300 acres along the road. If I were certain that the line would not come this way I should not continue the work now being done.
3471. How many years' experience have you had in the district? About six years, during which the seasons have been very bad.
3472. What is your average yield of wheat? Twelve to 14 bushels to the acre.
3473. How much land 20 miles west and east of the Temora to Wyalong route would be fit for agriculture? The whole of the land west of the route is fit for agriculture. On the eastern side it is only fit for grazing.
3474. Which route offers you the more advantages? The route from Temora to Wyalong. I think the Government would get a bigger revenue from a Temora to Wyalong line than from a Grenfell to Wyalong line.
3475. Which of the two lines would offer you, as a producer, the greater advantages? A line from Temora to Wyalong.
3476. Upon what facts do you base that statement? It would give me more than two markets. I should have several markets to which I could send my wheat. If a line were constructed from Temora to Wyalong there would be a good market for firewood. There are thousands of acres of dry boree and yarran, which is the best firewood that can be got, and it would pay in times of drought to send this wood to places like Cootamundra, Murrumburrah, Goulburn, and Junee. There is another advantage from a pastoral point of view, and that is that stock could be sent to Kiandra by way of Temora. We should have to pay more to send them by way of Grenfell, and the stock would be too long in the truck.
3477. Presuming that the Government are desirous of encouraging closer settlement on the Temora route, what area would be sufficient to enable a man and his family to make a fair living if the Temora-Wyalong line were constructed? I think the betterment system should be adopted, and that the areas should start at 640 acres and increase according to the distance from the railway. The nearer you are to the railway the smaller should be your area.
3478. Then you think 640 acres close to a line is sufficient for the maintenance of a man and his family? Yes; year in and year out. It is only fair that the Crown should get a capital value of £2 for land close to the line and of £1, say, 10 miles out.
3479. Have you any further information to supply to the Committee? No. I am confident that if a line is constructed from Temora to Wyalong there will be a much larger population within 10 miles of it than there will be along a line from Grenfell to Wyalong, and the revenue will be larger. My experience tells me that an agricultural line pays better than a pastoral line.

A. Herriott,  
25 Aug., 1899.

Arthur Quinn, farmer; Barmedman, sworn, and examined:—

3480. *Chairman.*] What is the extent of your holding? 2,560 acres, 12 miles west of Barmedman.
3481. How far are you from Temora? Twenty to 30 miles.
3482. Have you any information to furnish to the Committee? I would cultivate four times as much as I am cultivating now if a line from Temora were constructed. I have 200 acres under crop and 400 acres cleared. I have last year's wheat waiting, but it costs too much at existing prices to carry it by road.
3483. I believe you came from the Corowa district? Yes.
3484. Have they gone in for wheat-growing in that district? Yes.
3485. How does this district compare with that as a wheat-growing country? During the last two years the crops were poor, but this year my son's crop is quite as good as any I have ever seen at Corowa.
3486. Is the rainfall of that district better than the rainfall of this district? It has been lately. I think there will be three times the cultivation carried on here if a railway is constructed.

A. Quinn,  
25 Aug., 1899.

Alfred Doyle, farmer, near Barmedman, sworn, and examined:—

3487. *Mr. Trickett.*] How many acres have you under cultivation? 400 acres, 300 of which are under crop.
3488. What is your experience of this district? I have only been here for two years from Hillston, but I think it is a splendid wheat-growing country.
3489. How does this country compare with Hillston? The Hillston country is equally as good as this. Most of the farmers of that district have to carry their produce a distance of 80 miles.
3490. If your holding is 8 miles south of Barmedman, you are within 14 miles of Temora? I am 20 miles from there. I am not on the direct route.

A. Doyle,  
25 Aug., 1899.

- A. Doyle. 3491. Do you think that is too far to convey your produce? Yes, to make wheat-growing pay we should not have to carry more than 15 miles.
- 25 Aug., 1899. 3492. Did you take up your land as virgin country? Yes, I have had to clear it.
3493. What does it cost per acre to clear it? It depends on how you clear it. I have yankee grubbed it, and have cut down 60 acres for about 7s. an acre. It had been rung when I went there; but had grown up again.
3494. What depth would you plough that land? An average of 4 inches.
3495. Do you think that the country from Wyalong towards Hillston is fit for agriculture? The country all the way from Wyalong to Hillston on the western side of the surveyed route, and on the south-east side, is more fit for wheat-growing than for grazing. It is splendid soil—as good as any you could wish to see. It is, however, given up to the wild dogs and rabbits, owing to the unsettled nature of the tenure.
3496. In advocating the construction of a railway to Wyalong, do you think that it should go beyond that point? Yes; it should go as far as Hillston.

---

George John Howard, farmer, Barmedman, sworn, and examined:—

- G. J. Howard. 3497. *Chairman.*] Where is your holding? Eight or 10 miles south-west from Barmedman.
- 25 Aug., 1899. 3498. *Mr. Watson.*] How far are you from the Temora railway? About 20 miles.
3499. What is the extent of your holding? 11,000 acres. I have 700 acres under crop.
3500. What distance do you think you should be from a railway in order to make farming pay? About 10 miles.
3501. Do you know the country across the Bland? No; only from Temora to Grenfell, through Morangarell.
3502. Have you any information to supply in addition to what has already been given? No. I am in favour of the Temora to Wyalong route. I endorse the evidence of the other witnesses in regard to that route. I think it would be a distinct advantage for us to have the choice of two markets.

---

Phillip Harry Thomas, farmer, Barmedman, sworn, and examined:—

- P. H. Thomas. 3503. *Chairman.*] What is the extent of your holding? 2,560 acres, 13 miles west from Barmedman.
- 25 Aug., 1899. 3504. Do you corroborate the evidence which has been already given? Yes.
3505. Have you anything to add to what has been stated? Only that I have to pay 1s. 5d. to 1s. 6d. a bag to draw the wheat from my place to Temora.
3506. How much does that leave you? About 2s. per bushel.
3507. *Mr. Watson.*] How far would you be from Wyalong if a line were constructed from Grenfell to that place? Twenty-five miles. It would ease me a little, but still it is a terrible draw for wheat.
3508. Whether a line is constructed from Grenfell to Wyalong, or from Temora to Wyalong, you will still be a fair distance away? Not from Barmedman—I should only be 13 miles from Barmedman. When the leases on Kildary and Mandamah are thrown open there will be larger settlement.
3509. *Mr. Dick.*] How much of your holding do you cultivate? 220 acres. If a railway were constructed from Temora I should considerably increase that area.

---

Jesse Boxall, farmer, Barmedman, sworn, and examined:—

- J. Boxall. 3510. *Mr. Shepherd.*] How far are you residing from Barmedman? Three miles.
- 25 Aug., 1899. 3511. Are you acquainted with the Bland country? Yes.
3512. Have you ever attempted to cultivate it? Yes, with very poor results; it is strictly a pastoral country. I was cultivating it for about fourteen years.
3513. Did it take you fourteen years to find out that it would not pay? I did not grow wheat upon it, only hay for home consumption.
3514. Did you ever try to drain it? No; there was natural drainage where I had my cultivation paddock.
3515. Did you try any other crops but hay? Only the garden crops.
3516. Did you persevere for fourteen years? Yes, off and on. The market was too far away to cultivate to pay. Of course I depended on the grass and the boree country for stock.
3517. Have you any further information? I know the Bland country where the proposed railway would cross it.
3518. Which of the two routes under consideration do you prefer? The Temora to Wyalong route. It is a better agricultural route. I have seen the Bland one sheet of water from creek to creek. There are 12 miles of water there in flood-time.
3519. How long does the water remain there? About a week after the rain ceases.
3520. *Chairman.*] With what results did you cultivate hay? At times I got fair crops—about 8 cwt. or 10 cwt. to the acre. Being 50 miles from the market, I never attempted to grow wheat.
3521. *Mr. Trickett.*] Is your objection to the Bland country on account of its distance from a market? No; I do not think it is suitable for agriculture.
3522. Does it not produce good crops? Medium crops, at times, but at other times the hot winds sweep them off.
3523. Would not the hot winds affect other country in the same way? They do, close to the edge of the plains.
3524. But not the sheltered land? No.
3525. Is the Bland country to be compared with the loamy soil which we see on the rising ground? No, it is not.
3526. Had you good hay crops in fair seasons? They were poor crops.
3527. Given fair seasons and red soil, would you have got better results? Yes.
3528. *Chairman.*] Have you ever grown hay where you are now? No. I have only been there for two years.
3529. What tonnage has been obtained here per acre? I have seen 1 and 2 tons of hay to the acre.
3530. What was the most you got on the Bland? Never more than 12 cwt. That was my best crop.

3531. Do you consider that a good proof that the Bland country is not suitable for agriculture? It is not suitable for it. J. Boxall.
3532. *Mr. Watson.*] I suppose you only picked out a small area on the Bland, and grew hay upon it for home consumption? Yes; I picked out the 15 acres of the rising ground. 25 Aug., 1899.
3533. Was that the pick of what you could get? Yes.

Thomas William Tucker, butcher, Barmedman, sworn, and examined :—

3534. *Chairman.*] Have you any evidence to furnish with regard to stock matters? For the last four years we have had to bring stock from Tumut and Gundagai. It was railed to Temora. T. W. Tucker.
3535. How is it that you prefer to go to those places? You cannot get what you require elsewhere on account of the drought. 25 Aug., 1899.
3536. What you have stated is evidence of the fact that there is better country to draw your fat stock from about Gundagai than there is west or north? Yes; in times of drought. We are running three shops, and it takes something to keep them going. We have one each in Temora, Barmedman, and Wyalong.
3537. If a railway is constructed from Temora, how will it help you? We truck from Gundagai to Temora, and if a line is constructed from Temora to Wyalong the stock will be dropped at our door.
3538. What amount of cattle do you require for the three shops? Not less than eighty a month, and about 400 sheep a month.
3539. *Mr. Shepherd.*] Have you to bring sheep as well as large stock a great distance? Yes.
3540. That does not say much for the district? We have some of the best fattening country about here, but the continuous drought has necessitated us going away for sheep and cattle.
3541. *Mr. Watson.*] Mr. Donkin, of Lake Cowal, has stated that he could take a contract to supply Wyalong with all the beef it requires? I think he was overstating. Last spring, and the spring before, I bought all Mr. Donkin's fat cattle. When he gets over the spring he has nothing for the butcher in the way of cattle.
3542. It is only during the best spring months that he would have fat cattle? That is all. Whilst there is stock on the Bland I can get it from there; but after the spring I have to go elsewhere.
3543. *Mr. Trickett.*] We have been told that one of the great reasons in favour of the construction of a railway in this district is to enable the surplus stock to be taken away? No doubt in times of drought people want to get starving stock away.
3544. Under those circumstances it would be only occasionally that you would require the railway to bring fat stock to Barmedman? It is coming every week to supply Barmedman and Wyalong.
3545. Is this a fattening district? It is in the spring.
3546. Prior to the last four years, had you sufficient stock here to supply the district? Yes; when Wyalong was first discovered stock was obtained from the Bland. Now we have to go to Gundagai for it.

Harry Morphy, station manager, Young Land District, sworn, and examined :—

3547. *Chairman.*] Are you a landholder? No; I manage the East Bland station.
3548. Are you able to give the Committee some idea of the number of stock in the district? Yes. H. Morphy.
3549. Where is the East Bland station? Twelve miles north of Morangarell and 18 miles south of Marsden. The Bimbi route is within 3 miles of the homestead. 25 Aug., 1899.
3550. In what direction does East Bland lie from Caragabal? A little south of west.
3551. Then you are in what is called the Bland country? Yes.
3552. If a railway were constructed would it be used for the conveyance of stock? Yes. From the Bland station, in an average season, we send between 14,000 and 16,000 stock away. I have also sent away between 600 and 800 bales of wool.
3553. Is the Bland first-class fattening country? Yes.
3554. Is it good for agriculture? Portions of it are.
3555. About what proportion? On the Bland run nearly two-thirds—that is, if it is improved.
3556. *Mr. Shepherd.*] Is that the plain country? No; I should not consider all the big plain itself good for agriculture.
3557. *Chairman.*] There is a belt of country known as the Bland plain country,—where does it commence? About 10 miles on the Bland side of Bimbi. It comes east of Barmedman from the creek about 9 or 10 miles.
3558. Does it go any further south of Barmedman? No.
3559. What is the width of it, going east from that point? About 8 or 9 miles or more; it is broken.
3560. Is it 20 miles across? I should say so, and it goes right beyond Marsden.
3561. What is the length of that? About 30 miles. There is some good country here and there.
3562. Can you give us some information with regard to the floods on the Bland? The creek overflows its banks. I have seen the Bland and Back Creeks about 7 miles wide, at a depth of 6 inches. The house on Bland station is on the bank of the creek, and it is raised 18 inches on piles. The water has never got into the house or near it.
3563. Is there much washaway after a flood,—is there much current? No; it is pretty level country, and there is no great rush of water.
3564. Supposing there were an embankment with sufficient openings, would there be any danger of it washing away? I should not think so.
3565. When you make dams in that part of the country, I believe you throw up the soil and form embankments? Yes.
3566. Has any of that washed away during floods? No.
3567. Then, if an embankment of that character would hold, I suppose a railway embankment would hold? I should think so.
3568. If a railway had been constructed, would you have been able to save any stock? Yes; we could have got fodder for them. With the heavy droughts we have been experiencing it has been almost impossible to get teams to bring fodder from the nearest railway station.
3569. Would you have availed yourself of a railway for the removal of starving stock to other districts? Yes. As it was, I could never get my sheep away, because there was no water on the roads.

- H. Morphy. 3570. Then, although the Bland country is not so suitable for agriculture, it would still contribute towards the revenue of a railway in bad seasons by stock being removed, or feed being brought to them, and in good seasons by fat stock being sent away? Yes.
- 25 Aug., 1899. 3571. Do you know the whole of the country from Grenfell to Wyalong? I do, *via* Bimbi. I have never been round the northern end of the Weddin, but I have an idea what the country is like.
3572. With the exception of the Bland country, how would you describe it? I should think it is nearly all good agricultural land.
3573. Is it similar to the country between Temora and Wyalong? I should think it is better. I cannot say, however, that I have seen much of the Wyalong to Temora country. I do not think it would cost as much to clear it.
3574. Do you mean it would cost more to clear the Temora to Wyalong country? Yes.
3575. Have you any further information to offer? I have seen very good crops growing in the Bland district. I have obtained as much as 2 tons of wheaten hay per acre off a small lot.
3576. Was it off the black soil? No; off what we call the banks or rising ground. All the rising ground is very good indeed for wheat.
3577. Where does the rising ground occur? In patches and strips throughout the country. All the box forest is adapted to the growing of wheat or oats.
3578. What percentage of rising ground would there be along that belt of country, where the black soil commences and ends, near Barmedman? About one-third. A selector out there once told me that he thought the black ground would be the best in a dry season, as it holds the moisture longer.
3579. *Mr. Watson.*] What distance is your homestead from Barmedman? About 17 miles.
3580. What distance is it from the Bimbi survey? About 3 miles.
3581. How far are you from Cameron's Crossing? About 7 miles.
3582. If a line were constructed from Grenfell to Wyalong *via* the northern route, you would be 7 or 8 miles from it? Yes.
3583. And if the line were brought from Temora to Wyalong, *via* Barmedman, you would be within 17 miles of it? Yes, in a direct line; but if I were to travel stock to Barmedman, I should have to cover 20 miles.
3584. You would not consider yourself as being outside the influence of a railway for pastoral purposes at a distance of 20 miles? No; of courses there is the Bland Creek to cross.
3585. But the creek is not regularly in flood? No.
3586. How long is it since there was a flood there? We have had no heavy flood there since 1894.
3587. How long have you been there? Six and a half years.
3588. When was it that you obtained two tons of hay to the acre? In 1893.
3589. Was that a good season? Yes. It was only off a small lot for homestead use. In a good season you could, if the land were attended to, always get that return. I have been told that there has been an infinitely better crop there.
3590. You have stated that a selector told you on one occasion that the black soil was the best? Yes, during a drought. There was a little patch on my cultivation paddock which just dips into the black country, a chain long by half a chain wide. The year before last wheat was growing on that, when on other places it had dried up. I mentioned this to the selector referred to, and he said he had known it to occur before.
3591. If a railway came within 20 miles of your homestead, would it not reasonably serve your requirements? A great deal would depend on the teams. During a bad drought the teams are not to be found in this district at all. During the last two or three years I could just as easily obtain my supplies from Temora as from Barmedman.
3592. How far are you from Temora? Forty miles.
3593. I suppose that on account of the drought there was a great demand for teams? There were none in the district. They could not travel unless they were fed.
3594. You, as a pastoralist, would not be as badly off as an agriculturist 20 miles from a railway? No.
3595. Do you know that the freight for wool on the railway is the same from Koorawatha to Sydney as it is from Temora to Sydney? I was not aware of it.
3596. Where have you generally sent your wool? To Young.
3597. *Mr. Trickett.*] Do you think there would be any probability of Messrs. Chisholm going in for agriculture on the Bland holding if they had better means of communication? One member of the firm has spoken to me about putting in lucerne to a large extent, and he asked me if I could plough a lot of ground for that purpose.
3598. What about wheat crops? I should put in wheat if I had the means of getting it away.
3599. On the route from Grenfell to Wyalong, you pass through a block in the Bland country;—do you know what is the length of it? I should think there are 16 or 17 miles of it.
3600. You mean by that that there is a continuous stretch of 16 or 17 miles of the Bland country along the route of the proposed railway from Grenfell to Wyalong, two-thirds of which are entirely unfit for agriculture? Hardly. I thought you were talking about the whole of the absolutely plain country.
3601. What is the length of the plain country along the route of the proposed railway? About 12 miles.
3602. And out of that 12 miles of country, about one-half is unfit for agriculture? Yes.
3603. That leaves 5 miles of plain country which differs from the rest? Yes; that country is higher than the other country, and is fit for agriculture.
3604. *Mr. Watson.*] You have stated that the Bimbi route comes through 12 miles of absolutely plain country? Yes.
3605. How far is it from the point at which you get upon the plain country to Williams' Crossing? About 5 miles, or a little more.
3606. *Mr. Shepherd.*] Does the Bland Creek overflow its banks sufficiently to kill the trefoil? No.
3607. I suppose the floods really do good? Yes; they leave a deposit.

SATURDAY, 26 AUGUST, 1899.

[The Committee met at the "Reefton Hotel," Reefton, at 11 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

George Williams, farmer, Duck Creek, near Reefton, sworn, and examined:—

3608. *Chairman.*] What is the size of your holding? 1,130 acres.

3609. How long have you been in the district? Eight years.

3610. Have you prepared any statistics for the Committee? Yes, as follows:—

G. Williams.

26 Aug., 1899.

Selector's Name.	Holding.	Under Crop, 1898.	Under Crop, 1899.	Number of Sheep.	Cattle.	Horses.	Distance from Reefton.

\* Vegetable and fruit garden.

3611. Can you describe the boundaries of the holdings which you have read? They vary in distance from 1 mile to 9 miles from the "Reefton Hotel" as a centre.

3612. I believe that during the last two years the crops have been a partial failure, owing to the drought? Yes; last year in particular. The previous years could not be called a total failure, although the yield was below the average.

3613. What was the average yield to the district the year before last? About 10 bushels of wheat to the acre.

3614. What is the average in a good season? In the area I have indicated it is from 18 to 20 bushels.

3615. What did you do with your wheat? It is chiefly sold to agents in Temora for Sydney and other markets.

3616. How far is Reefton from Temora? The holdings I have enumerated are from 12 to 18 and 20 miles from Temora.

3617.

- G. Williams. 3617. Is that the maximum distance it would pay a farmer to carry wheat? Eighteen miles is a fair distance. Anything over that is too far.
- 26 Aug., 1899. 3618. Then the construction of a line from Grenfell to Wyalong would not be of any use to you? As a matter of fact it would have a very bad effect on the farming industry between Reefton and Wyalong, and in the immediate neighbourhood of Reefton.
3619. Why? On account of the distance it would permanently place producers here from a railway station. As closer settlement increases, the people who live 18 to 20 miles from a railway station are compelled to grow their produce and sell it in the same market as those who have the advantage of being within easy distance of railway communication. With the large increase in agriculture which is going on, wheat, as well as anything else, will necessarily fall to a low price, which will actually shut those people out from competition with those who have the advantage of being close to a railway. Nearly the whole of the land between Temora and Wyalong, if there were railway communication, would be opened up as farms; it is now lying waste. If it is debarred from railway communication, the people cannot possibly start farming operations. I notice that Mr. Donkin, of Lake Cowal, stated that the country about Lake Cowal, in ordinary seasons, and under ordinary circumstances, was equal to any country in Riverina. He also stated that if he had handy railway communication, he would in a short time have 1,000 cows milking for the purpose of dairying. I would like to impress upon the Committee the idea that this statement is very erroneous. Any person with a knowledge of that part of the country must know very well that it would be a mad thing for a man to go in for that number of cows to start a large dairying industry. There are times of the year when the land is very prolific, and when it will fatten stock, but they are only for a limited period. Again, in order that a man might milk 1,000 cows, it would be necessary for him to have at least 3,000 cows on his holding. I have it on good authority that in order to feed one cow in this country you require, under ordinary circumstances, 10 acres of land. If Mr. Donkin is going to feed 3,000 cows in order to milk 1,000, how, if he cannot make a living with grazing sheep, is he to make a living by grazing that number of cows. I do not think he has an area sufficiently large to graze that number of cows. It would be only during certain times of the year that they would be able to feed themselves at all, and they would have to be fed artificially. A deputation, representative of the landholders and the pastoral lessees of the Lake Cowal district, waited on the Secretary for Lands a few months ago asking for a further extension of the pastoral leases. Those people had had an extension for five years, and as it had practically expired they asked for a further extension. It was pointed out that under ordinary circumstances it would take the graziers fifteen years to recoup what they had lost during the last five years. It was pointed out that under really good circumstances it took that country all its time to pay the lessees at all. They stated that they had no encouragement to go in for improvements; in fact, the tale they told was something deplorable.
3620. You do not consider that the country to which you have been referring is suitable for dairying? I would not like to try it myself. With reference to the carriage of products on the connection of the existing Temora line with Tumut and Gundagai, I would point out that during the last few years a very large amount of the meat which is being consumed in this district has been brought from those places. Again, we do not grow corn in this district. Nearly the whole of it comes from Tumut and Gundagai. An extension of the line from Temora to Wyalong would necessarily increase the amount of stuff which would be carried on branch lines from Gundagai and Tumut.
3621. What is the average rainfall of the district? About 15.53 inches for the last four years, which have been very dry.
3622. What was the average rainfall during 1897? 18.02 inches.
3623. Is that sufficient for wheat if it falls at the right time? Yes. All the rain we can get at this particular time of the year would not be of much benefit if we had a drought during September and October.

Charles Aubrey Naylor, farmer, Gidginbung, sworn, and examined:—

- C. A. Naylor. 3624. *Chairman.*] Where is Gidginbung? Six miles south from Reefton, towards Temora.
- 26 Aug., 1899. 3625. How near are you to Temora? Ten miles, by road.
3626. Have you been cultivating? Yes; I have 500 acres under cultivation this year.
3627. Are you satisfied with your prospects? Yes.
3628. Do you think wheat-growing will be a paying industry in this district? Yes.
3629. How long have you been cultivating? About thirteen years in this district.
3630. Have you been cropping the same land year after year? Yes.
3631. Has it shown any signs of giving out? No; one paddock of 150 acres has been growing wheat for twelve seasons, and there is a crop in now, and it is looking well.
3632. Then you have no fear as to the prospects of the farming industry in this district? None whatever.
3633. What is the lowest price at which you think wheat can be grown and sold at a railway station 10 miles distant? It depends on the seasons. With average seasons it could be grown for 2s. a bushel. Of course, it could not have been grown at that price during the last two seasons.
3634. Have you heard the evidence of the last witness? Yes; I can corroborate all he has said.
3635. *Mr. Watson.*] Do you know the lands towards Wyalong? Yes.
3636. Is it agricultural land? Yes; pretty well all the way.
3637. If a railway went through that country, what area would a man require in order to make a reasonable living? 500 to 600 acres would support a family well.
3638. Have you been across the Bland country towards Grenfell? Yes.
3639. How does the land from Reefton to Wyalong compare with the land from Grenfell to Wyalong, for wheat-growing? I think this is far superior land to that on the Grenfell route.
3640. *Mr. Trickett.*] Does that remark apply to the whole of the land from Grenfell to Wyalong? No. I except 15 miles near Grenfell. That may be fair wheat-growing land; but after passing that none of it is fit for wheat-growing until you get within a few miles of Wyalong.
3641. Then the country about Bimbi is not good for wheat-growing? No.
3642. Have you been there lately? It is four years since I was there.
3643. Then, you will be surprised to hear that there are some thousands of acres there producing wheat crops at present? Yes.

3644. *Mr. Watson.*] Do you refer to the country between Bimbi and the Bland? I would not be surprised to hear that there is wheat land from Bimbi this way; but I would be surprised to hear of it being north.
3645. Do you think their rainfall in 1897 would be similar to yours? I should think it would.
3646. Therefore, if the statistics show that their return during that year was a little over 3 bushels of wheat to the acre, and that your return was a little over 9 bushels, you think that yours is the better plan? Certainly.
3647. Do you know the country north of the Weddin? Yes; it is very good land.
3648. Would you regard that as the edge of the good land towards the Bland, from Grenfell, coming north of the Weddin? Yes.
3649. *Chairman.*] Is the rain in the district local or general when it falls? It is pretty general.
3650. Do you sometimes get a good rainfall at Reefton when there is none 10 miles away? Excepting when there are thunderstorms in the summer, it is pretty general.
3651. *Mr. Shepherd.*] What does it cost you to grow your crops from the time of ploughing to harvesting? About 16s. an acre.

C. A. Naylor.  
26 Aug., 1899.

Paul Schubert, farmer, Duck Creek, sworn, and examined:—

3652. *Chairman.*] In what direction do you reside? Six miles south-east from Reefton.
3653. What is the extent of your holding? 640 acres. I have about 100 acres under crop. The whole of the land, with the exception of 40 acres, is good for agriculture.
3654. Have you heard the evidence given by former witnesses? Yes. I can corroborate every word of it.
3655. Do you think there can be no going back for agriculture in the district? I do not think there can.
3656. How long have you been in the district? Eight years—sufficiently long to know it.

P. Schubert.  
26 Aug., 1899.

David Nixon, farmer and grazier, Reefton, sworn, and examined:—

3657. *Chairman.*] What is the extent of your holding? 4,315 acres.
3658. How far are you from Temora? Between 16 and 17 miles.
3659. Would it pay you to grow wheat and cart it that distance? Yes; but you would have to put in a large area. I have 240 acres under crop this year. Last year there was an increase in this district of land for agriculture of between 4,000 and 5,000 acres, and it will be greater next year. The timber is getting dry, and the land can be cleared at less cost.
3660. I believe there is a great amount of land towards the north-east which would be taken up if a railway were constructed from Temora to Wyalong? Yes.
3661. How far does that land extend? About 15 miles. It would be taken up and planted with grain if a line from Temora were constructed. If, however, a line is constructed from Grenfell to Wyalong, it will not help that land in the least. It is outside the distance within which it would pay a man to carry to a railway station. Mr. Naylor has referred to stock coming from Tumut. I may mention that I have been doing a little butchering during the last two or three years, and I am able to state that most of the fat stock has been trucked from Tumut and Gundagai. Wyalong is supplied with fat stock from Gundagai. I do not know very much about the Grenfell to Wyalong district, but I have had experience of country similar to the Bland country. It is similar to the country about 25 miles from Deniliquin. I put in a crop there for five years running and only got seed off it. It is good land if you can get the rainfall at the right time.
3662. How many failures in wheat-growing could a farmer stand in five years? I think that if he got a failure one year he would want a good season the next year.
3663. Do you think that the failures on that class of country would be so many that it would not pay to cultivate? Certainly.

D. Nixon.  
26 Aug., 1899.

William Joseph Hanson, farmer, Reefton, sworn, and examined:—

3664. *Chairman.*] Where do you reside? Six miles south-west from Reefton.
3665. What is the extent of your holding? 1,000 acres, of which I cultivate 450 acres.
3666. Are you still getting land ready for cultivation? Yes.
3667. Then you have no fear about the agricultural industry? No; I have increased my cultivated land 200 per cent. every year during the last few years.
3668. Do you corroborate the evidence which has been given to-day? Yes; in the main it is correct, especially with reference to the quality of the land for wheat. I have had experience in South Australia in regard to wheat-growing.
3669. What was the average wheat production there for that part of the country from which you came? From 8 to 12 bushels per acre.
3670. And what has it been here? I have only had two crops here, and they have been next door to failures on account of the seasons. Last year we only had 3 bushels to the acre.
3671. What are the seasons like in South Australia? Where I came from they were more regular than they are here? I came from the south-east country.
3672. How would the prospects in this part of the country compare with the prospects of the district in which you resided in South Australia? I think they are better here. I have great faith in the land, and I think that, with a fair rainfall, we shall have excellent crops. The land is evidently good from a farmer's point of view, and a railway would be a great boon to them.

W. J. Hanson.  
26 Aug., 1899.

James Stewart, farmer and grazier, Reefton, sworn, and examined:—

3673. *Chairman.*] Where is your holding? About 2 miles west from Reefton.
3674. What area is it? 4,560 acres of my own. I and my sons have over 9,000 acres.
3675. Are you cultivating any of it? 300 acres this season.
3676. Have you any intention of getting any more ready for cultivation? I have only been cultivating this last year or two; and if the railway is constructed I intend to continue it.
3677. If the railway were constructed, would you get more out of wheat growing than sheep? Yes.

J. Stewart.  
26 Aug., 1899.

- J. Stewart. 3678. Have you ever estimated the difference in profit between wheat and sheep? Not minutely; but it pays to work the two together.  
 26 Aug., 1899. 3679. Have you heard the evidence which has been given to-day? Yes; I can corroborate it. If a railway passes through Reefton it will be a great boon to it, inasmuch as Wyalong, as well as Sydney, would be a market for it. I have been over a good deal of the Bland country, and I think this district is far superior to it from an agricultural point of view. At certain times of the year the Bland country is a better grazing country than this.

Samuel Lauder, miner, Reefton, sworn, and examined:—

- S. Lauder. 3680. *Mr. Watson.*] Have you resided long at Reefton? Since the opening of the field, five years ago.  
 26 Aug., 1899. 3681. What are the prospects of the field? I think it has very good prospects ahead of it. 12,000 tons of stone have been raised since the field was opened, worth £35,000. The reef has been proved payable to a depth of 350 feet. I am quite satisfied that it will be a permanent field, and that it will carry a large mining population.  
 3682. What class of stone are you getting at the lower levels? It has altered as we have gone down and has become more mineralised.  
 3683. Is that an indication of permanency? Yes.  
 3684. Is there any difference in the contents of the stone when it is found to contain minerals? I do not think so. The battery treatment will not get as much gold out of the lower levels as out of the top levels; but the assays from the lower levels are as good as those from the top. In order to get the gold we should have to send the concentrates away.  
 3685. Where would you send them? To Dapto.  
 3686. Is the net result as good from the stone at the lower levels as it is from the stone at the higher levels, of course allowing for extra cost of treatment? Not at present, because the expense is greater. We have a lot of water with which to contend at the lower levels, and we have not the proper appliances for dealing with it.  
 3687. What have you to pay for sending stuff to Dapto? It costs us 16s. or 17s. a ton from Temora. It costs us 10s. a ton to cart it to Temora.  
 3688. How much per ton would you save if the material were trucked at Reefton? Six shillings or 7s. That would be an important item.  
 3689. In connection with a reef which does not yield a very large return, it might mean the difference between paying and not paying? It might.  
 3690. From a mining point of view, you think a railway would be of benefit to you? Yes.  
 3691. Do you think the amount of ore of a mineralised character is likely to be expansive? I believe it is. There are not many claims down to a great depth yet; but so far as the claim with which I am connected is concerned, the deeper we go the more mineral is shown in the stone. The size of our formation is 4 feet, and the assays run from 1½ oz. to 3 oz. The reef is about 18 inches wide.  
 3692. Will an 18-inch reef of good stone pay? Yes.  
 3693. Is there more than one show in the way of reefs? There are two or three different lines which are carrying gold, and which are being worked. The only thing the field wants is capital.  
 3694. Have you any doubt about capital coming to the field? No. I am sure we shall get it later on. What has kept the place back is the fact that speculators have not called to look at it, owing to Wyalong being a greater attraction. Not £1 of foreign money has come to the place.

[The Committee met at the "Empire Hotel," Temora, at 4 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

William Miller, stock and station agent, Cootamundra, sworn, and examined:—

- W. Miller. 3695. *Chairman.*] Do you know anything of the country to be served by the proposed line of railway? I know all the country between Grenfell and Wyalong, and between Temora and Wyalong. With regard to the route between Grenfell and Wyalong, I think all practical men who have had experience in agriculture, grazing, dairying, and land matters, are of opinion that it would be a huge blunder to construct a line along it, for the following reasons:—Practically the pick of the country is all secured in comparatively large estates for grazing purposes, and very few people would be served. Any land settlement which would take place between those two points in the future would be subject to the caprice of the present landholders. Practically the Crown would derive very little advantage from the intersecting of that particular stretch of country by a railway. The land is also, practically speaking, unsuitable for agriculture. It has never been sought after. During my twenty-five years' experience in these districts it has never been the ambition of any man requiring land for a home to go into that particular part. It is good grazing land—splendid fattening country—but the soil is of a blue-clayey nature. It is very heavy in wet seasons, and it is very severe when the opposite extreme occurs.  
 26 Aug., 1899. 3696. Are you speaking of the whole of the land between Grenfell and Wyalong? Yes; I am speaking of it generally from Grenfell to Wyalong. East Bland, West Bland, Caragabal, Trigalong, Wheogo, Sandy Creek, and stations contiguous to the proposed railway are of blue-clay plains, and unsuitable for agriculture. It is practically grazing land. It is held for the main part in large estates, and as far as that particular section is concerned it does not warrant the cost of a railway. It has been contended by the advocates of that route that it intersects that piece of country between the South-west line and the Western line more equitably. That looks very well on paper. On the other hand, the country between Temora and Wyalong is practically settled. All the valuable Crown lands have been taken up by selectors.

selectors. About Barmedman, especially, there is a large population of struggling selectors, who are opening up the country and improving it. There are no large landed estates. A lot of Crown lands will be opened for settlement shortly. That route is not harassed in any way by monopolies of land in large estates. There is a large settlement there which will reap the advantage of a railway. A railway will encourage them to improve the land and go in for larger production. To support my statement, I may mention that the Lands Department made the headquarters of one of their districts right in the centre of it—Barmedman—which is sufficient to show that what I am stating is of moment. The establishment of the headquarters of the Land District in this particular part of the country goes to show that the Lands Department, at least, thought there were a great many people to be served. Speaking from twenty-five years' experience, I am able to state that the Bland watershed is subjected in some seasons to severe floods, which would necessitate lengthy viaducts—3 and 4 miles—to carry off the surplus water. If they are not constructed the result will be that large portions of the line will be washed away. Of course, floods are of rare occurrence; but they must at the same time be provided for. That is an item which does not come into the construction of a line between Temora and Wyalong, where the engineering difficulties are of greater moment. Apart from clearing the timber the line could almost be laid down without any forming whatever. I notice that one witness stated that if a line were constructed from Grenfell to Wyalong he would be prepared to start dairying with 1,000 cows. Any person of long residence in the district must know that it is absolutely absurd to think of carrying on the dairying industry in the Bland district. You might do it for two months in the year, with good seasons.

W. Miller.  
26 Aug., 1899.

3697. Do you know how long he has been there? I dare say he has been there as long as I have been in this district. It is a statement which I challenge.

3698. Would your business pursuits enable you to contradict his experience? Most decidedly. The Lake Cowal district and the Bland district are absolutely unsuited for dairying or agriculture. Every practical man in the southern districts will bear me out.

3699. What is your reason for thinking that those districts are not suitable for dairying? The grasses are of a light nature. The only way to keep a herd of cattle would be by intense cultivation and irrigation. The country is not naturally suitable for supporting dairy cattle. In good seasons it is good fattening country; but as the grass is very tender, it is very sensitive to the summer heat.

3700. Are the grasses milk-producing? They are; but the risk attached to the establishment of the dairying industry in the Bland district is so great that nine out of ten men would not think of incurring it. The climate, soil, and grasses are not suitable.

3701. Years back no one would have thought the Temora district would have been fit for agriculture;—what amount of agriculture was there in the Temora district twenty-five years ago? Any man would know that it would grow wheat if he tried it.

3702. How was it that at that time wheat-growing was not tried? There was no population to open up the country; the gold-fields opened up the country. People followed the gold, and came here and settled on the land as the gold began to give out.

3703. What is your opinion of the Bland district as a sheep-breeding or fattening country? Nothing could be better.

3704. Then, if Mr. Donkin goes in for dairying, you think he will come to grief? In my opinion, that is an absolute certainty. The only justification I can see for the construction of a line from Grenfell to Wyalong is the unimportant one of a more equitable bisecting of the country on paper. It looks well on paper; but every practical man would agree that it would be a great national blunder.

3705. Do you know the country from Koorawatha to Grenfell? I know the country fairly well; I have been to Iandra, but not to the junction with the main line.

3706. Do you think the construction of that line is justified? In giving evidence before a Sectional Committee on a former occasion, I said that I thought Grenfell was entitled to a line. It is a pioneer district. There is a large agricultural settlement about there, and the line is not a long one; but I think that the construction of a line from there westward would be condemned by every man of experience in these districts.

3707. On account of the Bland country? Yes, on account of the unsuitable nature of the Bland country—40 to 50 miles of it—which is held for grazing, and would serve few people.

3708. Do you mean 40 to 50 miles along the route which the railway would follow? I should say about 40 miles; including the broken range country, which is, of course, of no use for settlement.

3709. I think you will find that that statement is rather over-estimated? It may be over-estimated—it may be only 30 miles, but still, that is a big stretch of country.

3710. How long is it since the country between Temora and Wyalong has been sought after for agricultural purposes? There has been a constant stream of people coming here ever since the diggings broke out.

3711. Have they been taking up land for agriculture? There has been a constant stream of people to Barmedman, Wyalong, and Humbug Creek since 1884.

3712. If the people from Koorawatha, out west, had had railway communication to Grenfell, or further on, do you not think that they would have sought after the land for agricultural purposes? Railway communication generally follows land settlement.

3713. You have stated that people have taken up land about Barmedman in small areas for wheat-growing, and that they have not done so between Grenfell and Wyalong;—is not that due to the fact that in this district the people have railway communication within a reasonable distance, whereas in the Grenfell to Wyalong district they have not? I do not think that is the reason. Many of the people at Barmedman and on the Humbug Creek were there even before the Cootamundra to Temora line was built.

3714. Did they grow wheat then? No, except for their own use.

3715. Do you not think that if people had good wheat lands in other parts of the Colony they would grow wheat if they had a railway within a reasonable distance? Decidedly. It is the want of railways which kills all the wheat-growing industry.

3716. The reason you advocate the construction of the Temora line is the fact that people are already settled between Temora and Wyalong? That is one reason.

3717. The land between Temora and Wyalong is much the same as that between Grenfell and Wyalong, apart from the Bland? I should say the wheat land between Temora and Wyalong preponderates. The blue-clay country predominates on the Grenfell to Wyalong route. It is land with subsoil. I should like

W. Miller.  
26 Aug., 1899.

like to draw attention to the design of the railway system. The Federal spirit must be considered. Instead of concentrating the whole of the railways towards Sydney we should aim at obtaining a more perfect system. By making the Temora to Cootamundra line the connecting link of the system which is going to tap this large area of country to the west, we shall equalise more the traffic between Sydney and Melbourne, and give the people connection with both these large cities. It would be equally convenient to the people on the Western and South-western lines. When Federation is accomplished, and the people desire, as they assuredly will, to carry their produce to the markets of Sydney and Melbourne, a connection with the junction at Cootamundra will be far more desirable than a connection with an out-of-the-way place like Koorawatha.

3718. Do you know that there is a loss of £3,000 per annum on the Cootamundra to Temora line? I know that there was a loss.

3719. There is also an estimated loss on a line from Temora to Wyalong of £5,000 per annum, which the people of New South Wales will have to bear;—under those circumstances do you consider we shall display a federal spirit in feeding the lines of Victoria with the traffic to which you have referred, and not those lines which have to be maintained by the people of New South Wales. I certainly think that if Federation means anything, it means that the people of New South Wales should have the privilege of reaching the Melbourne market as well as that of Sydney. With regard to the loss which would be entailed by the construction of a line from Temora to Wyalong, I pointed out on a previous occasion that the carrying of a line through the Humbug Creek valley, right out to the Lachlan, would be virtually through Crown lands. I estimated that there were 20,000,000 acres of arable land locked up in pastoral leases under the Act of 1884, which, when thrown open, would be increased in value 10s. an acre, at least, by the running of a railway through it. If the construction of a railway would increase the value of 20,000,000 acres of land by 2s. 6d. an acre, and the railway only costs £500,000, you could surely afford to build it. The construction of a railway will make this land at least 2s. 6d., and in many instances 10s. an acre more valuable.

3720. Do you think it is fair to those who have pioneered, or gone into the country, to neglect them in order to run a line through Crown lands which nobody has bought;—do you not think that the men who have settled on land ought to have a railway run for their convenience? You cannot deal with everyone in that way. You must study the greatest number.

3721. The greatest number would be where people have purchased? Not necessarily. If one man held all Riverina, he would not be entitled to a railway.

3722. But one man does not hold all Riverina? About ten of them hold the bulk of it.

3723. In constructing a line from Temora to Wyalong, would it not be fairer to construct it, so that it may be convenient to those who have settled upon the land, rather than to construct it where there is Crown lands? Certainly; they are entitled to the first consideration; but those people are desirous of getting upon the land, and it is no good to them without a railway.

3724. How is the land held on the northern side of the line from Cootamundra to Temora? With the exception of one large estate, it is all held in selector's holdings. There is one estate of 64,000 acres immediately you come out of Cootamundra.

3725. Have you anything to say with regard to the removal of fat stock? The Cootamundra to Temora line has been largely availed of for the conveyance of starving stock. If the line had been extended to 40 miles, thousands of sheep would have been saved; thousands died on the way to catch the train at Temora.

3726. *Mr. Trickett.*] Have you been to Grenfell lately? Not for three or four years.

3727. Have you been between Grenfell and Bimbi? Not during the last year or two.

3728. Are you aware that there has been a considerable amount of wheat-growing going on in that direction? Yes.

3729. Supposing it were proposed to construct two lines—one from Grenfell to Wyalong and one from Temora to Wyalong—would you then have opposed the Grenfell line? That is what I am doing now.

3730. Are you opposing it in the interests of Cootamundra and Temora or on national grounds? On national grounds. I have no interests to serve. I am actuated by motives of State economy and proper practice.

3731. The line from Cootamundra to Temora was built for the purpose of opening up a large agricultural centre? Its practical object was to serve as a stepping-stone to a great trunk system extending out to Wilcannia. At the same time there were other considerations. The local considerations were that it should serve the Temora farmers.

3732. Do you think it has been a success in that direction, seeing that it has been run at a loss? It has certainly stimulated the production of wheat and production generally.

3733. If a line is constructed from Temora to Wyalong, is there any solid reason for thinking that it is likely to pay for some years to come? I do not think it would pay. I look at it from a broader standpoint. It is the stepping-stone for the opening up of a large tract of country which must be served by a railway ultimately. I mean a large tract of country between the South-western and the Western systems, extending from Cootamundra towards Wilcannia.

3734. At what points are most of the farmers of whom you speak situated, between Temora and Wyalong? There are farmers all the way from Temora to Barmedman, and there is a large nest of them.

3735. Are they not pretty well served by the present line to Temora? Barmedman is 22 miles from Temora, and the people there are fairly well served.

3736. Do the people of Temora and Cootamundra deal chiefly with Sydney at present? Yes.

3737. Do you think it is likely that wheat will be sent from this district to Victoria within a reasonable time? In a few years time, when wheat becomes an exportable commodity, it may suit a lot of people in this district to ship their wheat at Melbourne instead of at Sydney.

3738. How far is Melbourne from Cootamundra? 270 miles; Sydney is 254 miles away.

3739. Did you give evidence in favour of the Cootamundra to Temora railway? Yes.

3740. Have your expectations of it been realised? They have been fully borne out.

3741. *Mr. Watson.*] Do you know the country between Grenfell and Wyalong? Yes.

3742. You have stated that the people on the Temora side of Barmedman were fairly well served by the Temora terminus;—do you think that people 20 miles out of Grenfell, towards Wyalong, would be fairly well served by a terminus at Grenfell? Yes.

3743.

3743. Do you think that 20 miles would exhaust the good land on the west of Grenfell? The country west of Grenfell, on the northern route, is very broken, with ironbark ridges and spurs from the Weddin Mountain. It is not a tract of good agricultural country. W. Miller.  
26 Aug., 1899.
3744. Do you think the country within the 20 miles radius of Grenfell would reach the edge of good agricultural land? Yes.
3745. Do you think it would be good policy to take a line to the edge of the agricultural country? If a stretch of country is fairly well served by a railway there is no necessity to go to the expense of constructing one to it.
3746. You have stated that you do not expect a line from Temora to Wyalong to pay immediately it is constructed? No.
3747. The first thing to rely upon would be the direct trade of Wyalong itself? Yes. Already the country is largely settled, and there is a good deal of wheat-growing going on. A lot of wool is also produced.
3748. Assuming that the trade of Wyalong is worth a certain amount per annum, is it likely to pay the interest on a smaller or a larger capital which may be expended? The larger the expenditure the less likelihood of the railway paying.
3749. Consequently, if a line from Grenfell to Wyalong costs nearly £50,000 more than one from Temora to Wyalong, it is to be assumed that a line from Temora to Wyalong will have the better chance of paying? Certainly.
3750. How long has the line from Cootamundra to Temora been constructed? Five years.
3751. Do you think that is a sufficiently long time to allow a fair agricultural development in a country of this character? Development can go on for the next twenty years. The agricultural land has not been exhausted by any means.
3752. If a man has only a small capital, it takes him some time to get his holding up to its maximum bearing capacity? Yes.
3753. Therefore, it is probable that the land about here, if the timber is green, will not be got into bearing order for some years? That is so.
3754. So that the comparative non-success of the existing Temora line is hardly an indication that it is going to be a failure? I do not admit the non-success of the Temora line. I maintain that the indirect benefit to the State has been a big set-off.
3755. It is estimated that the Railway Commissioners are at present losing about £3,000 on the Temora line—that is, inclusive of the Wyalong traffic? Yes. I think the first year's loss on the Temora line was only £900. The losses during the last year or two have been due to failures in the crop. Last year only 10,000 bags of wheat were carried, whereas in the previous year the number was 70,000 bags.
3756. We will assume that there is a loss of £3,000 per annum on the line; it is also estimated that there will be a loss on the proposed line from Grenfell to Wyalong of a similar amount;—under those circumstances, is it a good thing to subtract all the Wyalong traffic from the line from Cootamundra to Temora, a line which is not paying? If the line to Grenfell is constructed, it will mean an additional loss on the Cootamundra to Temora line.
3757. *Mr. Shepherd.*] In speaking of the Bland country, do you refer to the plain country only, or to the country which is timbered as well? I refer to all the level country where there is no red soil.
3758. Including the timbered country as well? Yes.
3759. If anyone told you that he had obtained better results from some of the timbered country than from the red-clay country, would you believe him? It would only occur about one year in ten. In a good season the blue-clay country will grow anything, but in nine cases out of ten it will not.
3760. Does that remark apply to the timbered country? It applies to all the blue-clay country—to all country without a subsoil.
3761. Do you consider the floods any detriment to the land? They would be for agriculture.
3762. Is it not a fact that the floods enrich the land? For pasture. That clayey country has been formed by floods.
3763. Do not the floods leave a deposit which enriches the land? Floods generally do.

William Hall Matthews, storekeeper, Cootamundra, sworn, and examined:—

3764. *Chairman.*] Have you heard the evidence of the last witness? Yes.
3765. Can you corroborate it? In every particular. With regard to the flooded country, I may add that a deposit is not left there similar to that which is left on the rich alluvial flats of the coast. You might have a flood over this country without any deposit whatever. It has not the same effect here as it has on the Hunter River, where there is a large wash carried down from the mountains. The effect of the water lying on the plains is prejudicial. W. H. Matthews.  
26 Aug., 1899.
3766. *Mr. Watson.*] It is a damming back of water rather than a rushing of flood waters? It is. With regard to the carriage of starving stock, I might mention an instance in which 800 bullocks were started from the back of the Lachlan to be driven across to the Tumut, for grass. Only seventy of them got to Tumut; the rest died on the road. If there had been a railway line they could have been carried there straight away.

Denis O'Keefe, farmer, West Temora, sworn, and examined:—

3767. *Chairman.*] How far is West Temora from the Temora railway station? About 10 miles.
3768. What is the size of your holding? 7,000 or 8,000 acres.
3769. How much have you under cultivation? 2,000 acres.
3770. Is the balance fit for cultivation? A good portion of it is.
3771. What percentage of the holding is fit for wheat growing? About 50 per cent.
3772. Is that a fair average for this district, or is your holding better or worse than others? A good deal of mine is rather worse than others.
3773. Then your proportion of good agricultural land is rather under the average than above it? I think so.
3774. Are you satisfied with the results of wheat-growing? Yes.
3775. Are there any signs of the land giving out? No. I have been a resident about here for thirty-one years.
3776. Where is your market? Sydney chiefly. D. O'Keefe.  
26 Aug., 1899.
- 3777.

- D. O'Keefe. 3777. Do you think that the old idea that New South Wales is not a wheat-producing country has been exploded? I never held that idea. All that those who are outside the influence of a railway require is cheap railway communication, and a fair rainfall. The land is good enough if we only have a railway. I have some land to the east of Barmedman. I sold some of it twelve months ago; it consisted of dense scrub. It is under crop to-day, and it is looking splendid.
- 26 Aug., 1899. 3778. What is a reasonable distance to carry wheat to a railway station? Twelve to 15 miles; anything over that is rather a handicap.
3779. *Mr. Dick.*] Have you a good knowledge of the country from Temora to Wyalong? Yes.
3780. What would be a fair-sized holding to enable a man to make a decent living for his family? 1,280 acres.
3781. Would that be for mixed farming? Yes.
3782. Do you think 640 acres would be sufficient? I think it is rather small.
3783. Have you cropped any land continuously for a number of years? No; but I am well acquainted with land which has been cropped, on and off, for the last thirty years.
3784. Do you think that land is of such a character that it will stand continuous cropping? I think it will stand cropping a long time.
3785. Do you agree that the Bland country is not fit for agriculture? It is not. In order to bear out my statement, I may mention that 2,200 acres of it has been offered for sale to-day. The sale was fairly well advertised. The land was the pick of the land for grazing, and it is within a short distance of the proposed line. Nevertheless, there was not a single bid for it. If the same land had been offered for sale, publicly or privately, along the Temora route, there would have been no difficulty in selling. In fact, conditional purchase and conditional lease land was sold here a fortnight ago for £2 2s. an acre.
3786. Was the land on the Bland to which you refer private or Crown land? It is conditional purchase land. It was advertised at 6s. 6d. and 6s. 4d. per acre, to make it freehold.
3787. *Chairman.*] Where was it? On the boundary of Curraburrama, West Bland, and Barmedman—a short distance from the proposed line from Grenfell to Wyalong.
3788. *Mr. Dick.*] Would it be a fair conclusion to draw that that land was not enough for any single man to take up to make a living upon it? He could not make a living upon it. You cannot live in that country without cultivation.
3789. Do you think the development of wheat-culture in this district, since the Cootamundra to Temora line has been constructed, has been fairly large? Yes.
3790. Do you agree that it takes time to prepare green-timbered land for agriculture? Yes.
3791. Do you anticipate that in years to come an increasing revenue will be derived from the Cootamundra to Temora line, by the placing of the present timbered land under wheat-cultivation? Yes; during the last twelve months it has very much increased.
3792. Is the land between Cootamundra and Temora scrubby? No; only a small portion of the ironbark country is scrubby. I think that one of the greatest arguments in favour of a line from Cootamundra to Wyalong is the fact that it will carry starving stock from the dry country. There is no doubt that at some future time a line must be constructed to Tumut. During the present year thousands of sheep would have been saved if there had been a line to the back country. I saw that country thirty-five years ago, when it was first taken up. It got into such a state that if we boiled the billy in the open air the sheep would actually knock it over in order to get at the boiling water. There is, however, water there now. If there had been a line to the mountains, about 75 per cent. of the sheep would have been saved last year.
3793. Do you think that the Temora route offers you the choice of the Sydney or Melbourne market, with a consideration in favour of that route? I do not think it would be of much advantage to us at present, on account of the border duties.
3794. Would it be an advantage under Federation? It might be some slight advantage. I would not place much stress upon that.
3795. *Mr. Watson.*] Do you consider that the fact that the land has scrub upon it renders it unfit for agriculture? No.
3796. Have you seen scrub land made fit for agriculture? Yes; I saw land twelve months ago with the scrub upon it. It was knocked down at 2s. an acre, and it was cleared ready for the plough at 6s. an acre.
3797. Then it is quite possible to make scrub land good agricultural land, that is if the soil is good, with little expense? Yes. Most of the scrub lands about here are good agricultural land.
3798. *Mr. Shepherd.*] Does not trefoil grow chiefly upon that land? Yes.
3799. Is it not a fact that it seeds very heavily, and that the stock feed upon the seed for a great part of the year? Yes.
3800. How long do you suppose the seed would sustain stock during the year? It depends on the season and the spring. During a year like last year it would not last the stock long.
3801. I suppose that last year you had no feed anywhere? We had some in different parts of the country. It was not bad about here.
3802. Are you fairly well served by the present railway arrangements? Yes.
3803. *Mr. Watson.*] Have you had any experience in cattle? Yes, a little.
3804. Would you start dairying on the Bland if you were there in an ordinary season? If I did, I think I should incur a great loss. It was carried on some years ago for two or three months in the spring without success. It was done more to quieten the cattle than with a view of making money, and practically it was a failure. You require plenty of water and green feed for dairying. None of that country is adapted to dairying.
3805. Have they tried it at Young without success? Yes; and the rainfall is better there than it is here.
3806. Do you think that at Young, with its better rainfall and good land, the people should be as likely as the Bland people to make a success of dairying? The Young country is superior to any of the Bland country for dairying, and frequently at Young they have not made dairying successful. There has been no dairying on the Bland for the last twenty-five or thirty years.
3807. Was there not a local population thirty years ago, at Lambing Flat and Forbes, which they were able to supply with meat and cheese? Yes.
3808. They would have a monopoly of the market? Yes. They also had a market at Young and Forbes; but even then they could not get high enough prices to induce them to go on.

## MINUTES OF EVIDENCE—RAILWAY FROM GRENFELL TO WYALONG.

John Brett, farmer and grazier, Molonga, sworn, and examined:—

3809. *Chairman.*] Where is Molonga? Between 80 and 90 miles from Temora, on the road to Hillston.
3810. Have you any statement to make? Yes. In that part of the country we are greatly handicapped. I heard a lot of evidence given with regard to settlement. We are as nearly settled out there as are people here, and we have the Humbug Creek, Bygalorie, and Lake Cudgellico. One acre of that country is worth two of the country about Temora for grazing or agriculture. I have never seen better country than that between Wyalong and Hillston. There are belts of mallee, but whenever it occurs there is also splendid agricultural land. Wyalong is the poorest mallee country I have seen anywhere; but you have only to go 5 miles west and you come upon good mallee—open flats intersected with mallee ridges which run to Hillston. No man has any idea of the splendid country between Wyalong and Hillston. The great drawback is that, owing to the amount of limestone in the country, the grass, in hot weather, dries up. There is, however, no better fattening country than that about Lake Cudgellico and the valleys of the Lachlan. If I had not rented a piece of country in the neighbourhood of the Lake this year, I should have lost 4000 sheep. All that the country wants is a railway. It is surprising that the Government have left such a vast tract of Crown lands about that district without a railway. I do not think there are 300 acres of secured country upon Molonga. Not long ago 16,000 fats were sold from there to a Melbourne dealer for 13s. a head.
3811. Do you know the country on the route from Grenfell to Wyalong? I have been on a portion of the Bland country. It is alum country, and wherever that is in the soil you cannot grow wheat.
3812. Have you any further information to offer? I should like to see a line constructed from Temora to Wyalong. It does not matter whether the fat sheep go to Sydney or Melbourne, because the market will be regulated from lower Riverina, and we shall have a better market in Sydney than in Melbourne. It would, however, be an advantage to get them to the mountains.
3813. Your great want is a railway, and you are not particular where it goes to or from? As far as the fat stock is concerned, it will not make any difference.
3814. *Mr. Watson.*] Why do you prefer a railway from Temora to Wyalong? Because it will give us a chance of getting to the summer grass on the mountains, and it will be an outlet for store stock to Melbourne after the border duties are removed. The fats would mostly go towards Sydney. There is a man living alongside me on whose land I have seen as good a wheat crop as anywhere in the country. It is grown on yarran country, and you cannot beat it.
3815. In order that fat stock can go to Sydney and store stock to the mountains or to Melbourne, you desire a connection between Temora and Wyalong? Yes. If the proposed line is built I do not think it will pay the cost of axle grease, because you cannot divert our traffic from Cootamundra. The people of Wyalong are more in touch with the people of Cootamundra, Junee, and Wagga than with the people of any other part of the country. You cannot divert the traffic to Grenfell.

J. Brett.  
26 Aug., 1899.

William McClintock, pastoralist, The Bland, sworn, and examined:—

3816. *Chairman.*] Have you any statement to make? I may mention that I shall not be affected by a line from Grenfell to Wyalong. In view of the character of the country, I think a line should be constructed from Temora to Wyalong, upon which route there is better agricultural land. Fifteen miles west of Grenfell you get into poor country for cultivation, although it is good stock country.
3817. What is the character of the country from Back Creek to Wyalong? Fair agricultural country.
3818. Is the land from Temora to Wyalong similar to that about Wyalong? Yes; it is much better than it is west of Grenfell. I have been on the Bland for nine years, and have only had one successful crop. Dairying on the Bland is a failure. I was brought up to dairying on the South Coast. They are using condensed milk on the Bland at the present time.
3819. How long were you in the South Coast district? I was born there, and remained there for twenty years.
3820. If you had to milk fifty head of cattle how many head would you have to keep altogether? About eighty.
3821. Would you want 3,000 cattle, if you had to milk 1,000? No; that would not pay.
3822. What is the width of the Bland country along the route of the proposed railway? Fifteen miles of plain country, and then there is some timbered country.
3823. Is it intersected by belts of land which are worth anything? No.
3824. What is the extent of the plain and timbered country on the Bland? It is about 20 miles wide.
3825. Where does it commence on the southern side of the proposed line? About 30 miles.
3826. Where does it extend north of the proposed route to Lake Cowal? It extends right out to Lake Cowal along towards the Lachlan.
3827. There appears to be a belt of inferior agricultural country between two belts of good country? Yes; it is a valley. I believe it has been a lake which has gradually silted up. The land on the Barmedman side is superior to that on the Grenfell side. It is a sort of granite country west of Grenfell, and will not stand cropping. It will give a crop for a year or two and then fail.
3828. How far west of Grenfell is that class of soil to be found? Nine miles west.
3829. *Mr. Watson.*] North or south of the Weddin? Both.
3830. *Mr. Shepherd.*] What kind of stock do you raise? Sheep.
3831. How many sheep have you? We have very few now, but in a fair season, when we are stocked, we have about 10,000.
3832. Is there sufficient feed all the year round for them? There is in an ordinary season, but during the last three years we have had to send them away. In a good season the land will carry a sheep to the acre.
3833. Are you satisfied to remain there? Yes.
3834. Do you consider the Bland suitable for large cattle? No; not for quantity. Only for one's own use.
3835. Is the country upon which you are situated timbered? There is some timber and some plain country.
3836. What difference do you find between the two? There is not much difference. It is all a clayey country.
3837. What crops have you tried to grow there? Oats, wheat, and barley.
3838. Which succeeds the best? The best crop we had was one of oats.
3839. Had you any wheat in during the same year? Yes.

W.  
McClintock.  
26 Aug., 1899.

3840.

- W. McClintock. 3840. Have you ever tried lucerne? No.  
 3841. Do you know of anyone who has tried it? No.  
 26 Aug., 1899. 3842. Have you ever sunk for water? No. I have seen shafts 150 feet deep and no water.  
 3843. Has there been any attempt to cultivate fruit there? Yes; we put in fruit trees and they are all dead. We planted peaches, apricots, pears, apples, cherries, and plums. The only things which were of any good were figs.  
 3844. How long is it since you tried fruit growing? Seven years.  
 3845. Mr. Watson.] You have tried a little cropping for nine years? Yes.  
 3846. And you have only had one success out of nine? Yes; we did not get the seed back during the unsuccessful seasons.  
 3847. Were your failures equally upon plain and timbered land, or was there any distinction? We never tried the plain country; we tried the timbered country.  
 3848. Is that, in your opinion, the best country? Yes. We looked for the pick of it right on the bank of the creek.  
 3849. Were you growing for home consumption? Yes, for horse feed.  
 3850. Were the whole of the nine years bad seasons? No.  
 3851. Which year was it in which you got a crop? It was a medium season; it was not a wet season nor yet a dry season.  
 3852. Then we might fairly assume that in order to get anything like a crop from the timbered land of the Bland you require a season to suit it? Yes.  
 3853. Have you had any experience of the flooding of the Bland? Yes, on one occasion it was running under the houses for three days.  
 3854. Do you think there is any beneficial effect from the flooding? No; there is no silt from it; it is back-water. If you laid down a piece of fencing wire the silt would not cover it.  
 3855. Is the effect of it to sodden the ground? Yes; it does more harm than good.  
 3856. How deep is the flooded country ordinarily? You could ride for a mile or 2 miles and your feet would be in the water. A boat would be the best thing to use for a few miles.  
 3857. But for a great distance it would not be so deep? No. It would vary from 3 and 4 inches to a foot; but there would be hardly any current. On one occasion we had sheep in a paddock of 640 acres, and 135 were drowned. That was not upon the creek banks; they could go back a mile from the banks. They were unable to find a place upon which to camp, and were drowned.  
 3858. I believe that whichever way Wyalong is reached by railway, you will use Stockinbingal as your outlet? Yes. I think, however, that the line from Temora to Wyalong would be the best for the country. I know the country right out to Cudgellico, and I do not think there is any country in New South Wales which better deserves a railway. If a line is constructed from Grenfell to Wyalong it will not put any people on the Bland country at all.  
 3859. Do you know the piece of land to which one of the witnesses referred as having been offered for sale? Yes; one corner of it is within half a mile of the proposed line.  
 3860. The fact of no bids having been made would indicate that it is not large enough to support a family? It will not do that.  
 3861. Were the terms liberal? Yes; any terms you like.  
 3862. If it had joined your present holding would you have taken it up to consolidate it? Yes.  
 3863. Would a man be able to make a living upon it as an isolated block? If he were a shrewd, careful man he might; but he would require to be very careful. The people who have been on it for a lifetime have left it "broke."  
 3864. You favour the construction of a line from Temora to Wyalong, and thence to Hillston, rather than making Grenfell the starting-point? Yes; Grenfell as the starting-point will be a blunder.  
 3865. Do you think that even if the country beyond the Bland is good, the country from Grenfell to the Bland will not contribute much to the support of a railway line? It will not.

MONDAY, 28 AUGUST, 1899.

[The Committee met at the Municipal Council Chambers, Temora, at 10 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Wyatt de Little, manager, Temora station, sworn, and examined:—

- W. de Little. 3866. Chairman.] Where is Temora station? Six miles north of Temora.  
 28 Aug., 1899. 3867. Have you any statement to make? Yes; I have been in the district since 1885. I know the survey line from Temora to Wyalong. The line passes through good agricultural land the whole way, with the exception of a few quartz hills and a little belar country. The land is undulating, and mostly held by selectors and the Crown. There are no difficulties in the way of construction. I know of only one place which would necessitate a deep cutting—1 to 2 miles south-east of Barmedman. Ironbark sleepers can be obtained within 10 miles for almost the whole length of the line. Good ballast is plentiful along the line for at least 25 miles. The line could be built along the Temora-Wyalong road, which is sufficiently wide for a railway, and then to leave a 1½-chain road. Thus there would be no purchase of private lands; and if the road in question could not be used for its whole length, it could be used where private lands, which are few, adjoin the surveyed line. The absence of extensive cuttings, earthworks, bridges, no purchase of land, and the presence of material in plenty, should make this one of the cheapest lines to construct in New South Wales. The line is required for the carriage of passengers, machinery, and goods to Wyalong; also stores, machinery, &c., to settlers along the line, and in the back country; for removal in good seasons of fat stock for freezing or for butchers at the Sydney or Melbourne markets, whichever happened to be the better paying at the time; and in bad seasons for the removal of starving stock

stock from the back country to the mountains; for the transport of sleepers, of which a large supply can be obtained from the practically untouched ironbarks to the west of this line, and for the carriage of grain. The making of this line would open up thousands of acres of agricultural land now practically unworkable on account of its distance from a railway. Before the railway was built to Temora, I used to pay 2s. per bag cartage to Cootamundra; now 1s. 10d. per bag will land a bag of wheat in Sydney from Temora station. Another gold-field may at any time be found between Temora and Wyalong. I know the surveyed railway line from Wyalong to Grenfell, *via* Bimbi, as far as the Bland Creek. In my opinion the objections to this line are: (1.) West from Bimbi to Wyalong the land is mostly held by large land-holders. (2.) The greater cost of construction on account of the line passing through a large extent of private lands; the area required would have to be purchased; the absence of ironbark timber, also ballast, which would have to be obtained at either end of the line; and the expense of bridging over the flat country from the Bland to the Back Creek. This area is, in time of general floods, under water, and any attempt to build embankments would lead to destruction of the embankment, or the flooding of a large extent of country to the south of the line, either of which occurrences would lead to a serious loss to the Railway Department. Temora station, originally 150,000 acres, forms only a small part of the watershed of the Bland, and I know from experience the volume of water which flows down the Narraburra, Walladilly, Mandamah, and Duck Creeks. The latter empties itself on the flat country to the south of the proposed line, and when the Back Creek and the Bland are also in flood, all these waters meet. The Bland country is not, in my opinion, suitable for agriculture. The land from Back Creek to Wyalong is mostly agricultural, but would be served as well by the Temora-Wyalong line. The Bland country is not fit for dairying, except in good seasons. The box country, as on the Temora-Wyalong line, stands a drought much better than the Bland; is also better for storing water. (3.) The Temora-Wyalong line is the direct outlet for produce from Wyalong, giving the producer, who has to pay for the building of the line, the choice of Melbourne or Sydney markets. I consider it would be a national line. The Grenfell-Wyalong line would be in the interests of Sydney alone. (4.) If the Temora-Wyalong line would not pay, neither would the Grenfell-Wyalong line. If the latter were made it would cause the Temora-Cootamundra line to be also non-paying. (5.) My employers have no interests in the extension of the Temora line; neither have I.

W. de Little.  
28 Aug., 1899.

3868. Do you hold any land of your own? No.

3869. To what use is the station which you are managing put? Grazing and agriculture. We have 2,400 acres under cultivation this year, and I am clearing 720 acres more.

3870. What is the area of the holding? 15,600 acres of secured land, and 17,000 acres of Crown land.

3871. Had a line from Cootamundra to Temora not been constructed, would that land have still been used for sheep? Yes. Before that line was made I do not think I had 300 acres under cultivation. Now it is proposed to clear the whole of the secured lands on the station—15,000 acres.

3872. You say that the land from Temora to Wyalong is first-class agricultural land? With the exception of a few patches of the belar country, and a few quartz hills.

3873. I suppose you have no doubt that what has occurred within a reasonable distance of Temora will also occur if a line is constructed? Yes.

3874. Have you been west of Wyalong? I have been a little to the north-west and to the west. Through Kildary, Mandamah, and Buddigower it is all agricultural land. I have been as far as Narrandera and Rankin's Springs.

3875. Have you been along the surveyed route from Wyalong to Hillston? I have been from Wyalong through Nariah, and, as far as I have seen, it is all good agricultural land.

3876. In order to develop that country for agriculture do you think there is a necessity to build a heavy or a costly line, as is proposed—£2,400 a mile? I think the first cost is always the most reasonable one. There may be heavy traffic. Of course, it would not cost so much to build a line from Temora to Wyalong as it cost to build one from Cootamundra to Temora.

3877. Out of the 17,000 acres of Crown lands which you hold, on how much could a man make a fair living? 640 acres.

3878. Would that be enough along the whole of the route from Temora to Wyalong? Yes, within 10 miles of the line. As a rule, the selectors are without capital, and the more land they take up the more capital is necessary to develop it.

3879. *Mr. Shepherd.* Are you already well served by a railway? Yes.

3880. One of your objections to the Grenfell to Wyalong route is on account of the large estate;—do you not consider that the property you are managing is a large one? It is not a large one compared with the others. It is also in detached blocks, and the probabilities are that as soon as it is cleared it will be sold. I believe that is the object of the owners.

3881. Are you thoroughly acquainted with the Bland country? Only where I have been—through Oakhurst and part of East Bland and Curraburrama. I have never resided upon it.

3882. Can you speak as to its capabilities? I have been connected with grazing and agriculture for twenty years, and when I go through land I always take notice of it. If I go through country and do not see crops upon it I ask the reason. When I went through the Bland country I saw that it was not fit for agriculture; it is a splendid fattening country in good seasons.

3883. Could it be largely used for fattening stock? Yes; that is what it is fit for. Of course in seasons like the present the stations there have very few sheep upon them.

3884. Does not that remark apply to the whole of the district? It does not apply to the Temora district. On Temora station I have carried one sheep to 3 acres all through the drought.

3885. At Warwick in Queensland it is estimated that the country will carry six head of sheep per acre when the trefoil is at its best? Yes; but I do not think the Bland country is anything like the Warwick country. The Warwick country is agricultural. It is undulating, and grows wheat largely.

3886. The trefoil of the Warwick country grows as high as 2 and 3 feet, and it produces an enormous amount of fodder:—do you not think that the Bland country would produce something similar? The growth on the Bland country is not all trefoil. There is a lot of grass upon it.

3887. I understood that all the plain country on the Bland grew trefoil? The black soil does. The belar country does not grow trefoil.

3888. How many years of drought have you experienced since 1885 over the whole of the district traversed by the proposed routes? In the year 1888 there was a bad drought and the last four years have been droughty. The last two years have been the worst I have seen. I prefer this country to the Bland country. One acre of cleared land here, after it has been ploughed and allowed to go to grass

W. de Little. again is equal to any which can be found on the Bland. We can carry a sheep to the acre on this country after it has been ploughed, during the worst of seasons. We can fatten sheep here almost as well as on the Bland, although not so quickly.

28 Aug., 1899.

3889. *Mr. Watson.*] Do you think that this country when cleared is as good as the Bland for fattening? Yes.

3890. With the additional advantage that you will have good growing country here for a greater period of the year than on the Bland? Yes; and it will stand a drought better. The trefoil is not good, excepting from springtime to the end of summer, when it blows away.

3891. Can you say whether you get on the Bland a rainfall equal to that of Warwick? I understand that the Warwick country is first-class agricultural and grazing land. The Warwick rainfall would be better than the Bland rainfall.

3892. Do you think there is as much plain on the Warwick country as there is on the Bland. I dare say that the Warwick country has more soil in it.

3893. If your opinion as to the fattening properties of the land about here after clearing is correct, you will be likely to get as much fat stock from it as you would from the Bland country? Quite as much. I sold 2,500 sheep off the shears at Temora three years ago for 10d. per head. I sold them because I was afraid of the drought. Last year I had 7,700 sheep running on the secured land—15,000 acres, and on 4,500 acres of Crown lands—and I never fed them. In addition I had 1,600 lambs. I lost 200 sheep out of that lot, and most of them were killed by wild dogs.

3894. Have you made any calculation as to the price at which you could afford to sell wheat—say, a 10 or 12-bushel crop—in an ordinary season? I find that the Americans cannot grow wheat under 2s. 8d. a bushel landed on the coast. I find from my average during the last five years that I can grow it at 2s. per bushel landed in Sydney.

3895. If you get 2s. a bushel in Sydney, you will not lose anything? No; that is the minimum price.

3896. What do you pay for carriage to Sydney? Slightly over 4d. a bushel.

3897. With the approved methods which are daily coming into use, do you think people who farm will have a fair chance of competing in the world's market? Yes; I think we can produce cheaper wheat than they do in America.

3898. Does the 2s. to which you have referred include interest or rent? No; it is the cost of putting in a crop and taking it off and carrying it to Sydney. I allow for depreciation of plant and for repairs. It does not include the cost of the land.

3899. What do you think per bushel would pay your rent? Fourpence per bushel. That would bring the price up to 2s. 4d. Of course that estimate is based on my lowest average return. My average from 1889 has been over 12 bushels per acre. From 1889 to 1894 we had splendid wheat seasons. When I went to Temora in 1889, there were only 20 acres under cultivation. Between 1889 and 1894 I have seen 40 bushels of oats to the acre on two occasions; also 25 bushels of wheat to the acre on two occasions. The average cost of production for five years has been 14s. 11d. per acre. That includes everything from Temora station to the Temora railway station, and the gross return has been 31s. 6d. per acre. That leaves a net return of 16s. 7d. per acre per annum.

3900. That is sufficient to justify you in continuing cultivation? Yes. In 1896 I cleared 187 acres for the stump-jump-plough to see if it would pay. The cost of clearing was 9s. an acre. The cost of putting in the crop was 9s., and the cost of taking it off was 6s. I got 16½ bushels to the acre, and sold it for 4s. 4½d. The gross return was £3 8s. 8d. per acre, and the expenditure was 24s. per acre including the cost of clearing. Under those circumstances I reckon that I got back the price of the land from one crop. That shows the possibilities of the country.

3901. Do you think we are justified in regarding 2s. 6d. per bushel as a minimum price? I base all my estimates on that amount. It will pay to grow wheat, with an average return of 10 bushels, at 2s. 6d. a bushel. I have kept a record of the rainfall on Temora station since 1884. The average for fifteen years is 20·24 inches. The lowest rainfall was in 1888, when we had 10·12 inches. In 1897 the crop was a good one—11½ bushels per acre, which is 2½ bushels above the average for the last five years; but in 1898 I lost 2s. an acre.

3902. What rainfall would be sufficient to enable you to get a decent crop? Fifteen inches, if it fell at the right time. We generally get rain in Autumn, and also in September.

3903. Is it the rule to get the rain at a time when it will do most good to the crops? It has been.

3904. How far from a railway station could a man do reasonably well at growing wheat? Up to 15 miles, perhaps 20 miles. Every mile beyond 20 means so much off the profit.

3905. How far could a man travel in a day with a load? Fifteen miles each way is a fair distance to allow.

3906. *Mr. Shepherd.*] How do you find wheat-growing compares with sheep-breeding? Wheat-growing pays better than sheep-breeding.

3907. To what extent? I could not tell you. Last year, for instance, there was a loss on both sheep and wheat. The year before that there was a loss on sheep and a good profit on wheat. I have been increasing my area under cultivation and decreasing the number of sheep carried.

William Ness, farmer, Temora, sworn, and examined:—

W. Ness.  
28 Aug., 1899.

3908. *Chairman.*] How far is your holding from Temora? Five miles north.

3909. How long have you been farming there? For seven years, but I have been twenty-one years in the district. There were only two or three farmers here when I first came.

3910. Was it their success in wheat-growing that induced you to cultivate? Yes.

3911. Have you been doing fairly well at it? I have made both ends meet, although we have had four very bad seasons of late. Last year I only produced 2 bushels to the acre.

3912. Do you think you will be justified in taking up further land for wheat-growing? Yes, if I had the capital and a reasonably cheap method of carrying produce to market. Wheat-growing would be a failure without that.

3913. If wheat were 2s. 6d. per bushel at the Temora railway station, how far would it pay you to carry it? Twenty miles.

3914. Supposing it were 2s. a bushel? It would hardly pay at all at 2s. a bushel.

3915. Even if you were only 6 miles away? Under those circumstance, I should require 2s. a bushel.

3916. Do you think that with the best machinery, and a fairly good road, you could carry wheat for 20 miles for a return of 2s. 6d. per bushel? Yes; if we could get cheaper machinery. In America you can buy a binder for £25, and here we have to pay over £50. Therefore, we cannot compete with them. If the ring in these colonies were broken up, and we could get machinery at a reasonable price, we could easily compete with America. I may state I am fairly well acquainted with the Bland country. I am a native of Young, and know all the watersheds which come down to the Bland. The watershed starts between Maringo and Young, and between Murrumburrah and Young finds its way into the Bland Creek. The water from Wombat and Cootamundra meets at Morangarell. The water travels along the hilly country to the Bland very quickly. When it gets on to the Bland, the country being level, the creek runs out, and it spreads all over the flat. Anyone travelling across the Bland in dry weather would never dream that there could be such an extent of water upon it after a rainfall of 3½ inches. I heard some evidence on Saturday with regard to the Bland being good stock country. I do not agree with that statement in every particular. I agree that it is good fattening country for a few months of the year, but I do not consider it a success for sheep. In wet years they get fluke and footrot. The Bland is good enough for fattening store wethers and store cattle in the spring, but you cannot keep them there from one year's end to the other. You could not raise stud-sheep on the Bland, no matter what trouble you went to.

W. Ness.  
28 Aug., 1899.

Robert May, miller and auctioneer, Temora, sworn, and examined:—

3917. *Chairman.*] Have you any information to furnish to the Committee? I have been in Temora for twenty-one years, and am one of the oldest residents of the district. With the exception of twelve months, I have been farming during that time. I made farming pay fairly well. Of course, there were some very dry seasons. When I first came here we had a couple of very dry seasons, but latterly we have not felt them so much on account of being better provided with water, and the country being improved. When I came here the country about Temora was similar to that towards Wyalong—it was a wild bush. It was dense pine bush, and what is called sifting bush. In those days we had to cart our wheat to Cootamundra, a distance of 37 miles.

R. May.  
28 Aug., 1899.

3918. What were the prices ruling then? [Four shillings to 5s. a bushel. The average price of late years has been pretty low. During the last two seasons it has been down to 2s. and 2s. 6d.]

3919. Have you any farm lands now? Yes; I am farming about 160 acres. The year 1888 was a very severe one. In that year I was buying wheat myself. The crops around Temora for a distance of 20 miles averaged from 7 to 8 bushels to the acre during that year. The last two seasons have been the most severe since I have been here.

3920. How far out from Temora does the general cultivation extend? From 40 to 50 miles in some directions. Between Temora and Wyalong there is not a great deal of cultivation.

3921. From how far is wheat brought to Temora? I have had it brought to our mill, a distance of 80 miles. It has been brought from Ariaiah during two seasons.

3922. What kind of country is there between Temora and Ariaiah? It is very good land. There is some splendid agricultural land about Buddigower; 3 acres of it are equal to 4 acres about Temora for wheat-growing.

3922½. Is the rainfall about the same as it is here? It is scarcely as good; but you can grow wheat with 14 or 15 inches of rain if it falls at the right time. I have been across a portion of the Bland from Morangarell to Barmedman.

3923. How far from Temora do you first strike the Bland country? Twenty-two miles. I offered a Bland property at William's Crossing for sale on Saturday. It was over 2,000 acres in extent. I am told that it is the pick of the Bland. I have seen a statement to the effect that of that 2,000 acres not more than twenty-five were suitable for agriculture.

3924. *Mr. Watson.*] What were you offered for it? There was not a single offer.

3925. What were the terms? Six shillings an acre will make it freehold. We were willing to take instalments extending over ten or fifteen years. The Bimbi route of railway passes through it. It is distant about 30 miles from Temora. I send a good deal of flour, pollard, bran, &c., from Temora to Wyalong. I have sent 482 tons in twelve months. I have never sold a single property on the Bland country. With reference to the carriage of coal my opinion is that coal will not be required here for fifty or sixty years. Coal can be landed here at 23s. and 24s. a ton, and you can get box-firewood for 4s. and 5s. a ton. As there are many thousands of tons yet, I do not think the coal will trouble us much.

3926. Have you had experience as a farmer in South Australia? Yes, and in Victoria.

3927. How do you think the land from Temora to Wyalong, and out west compares from an agricultural standpoint with the land in Victoria? The land here is far superior to the mallee lands in Victoria. Every acre of land between Temora and Wyalong will be put under wheat in the course of time. It can easily be rolled down.

3928. Some of the mallee we have seen is rather heavier than the Victorian mallee? Yes; but there are only patches of it. Before they put the heavy roller over it they nick it, and the roller smashes it down. Then it is set on fire.

3929. Will the stump-jump negotiate the big mallee stumps? Yes. Some of the best wheat grown in Victoria is grown in the mallee districts of Wimmera.

3930. *Chairman.*] Does the Victorian Government run railways to that sort of land? Yes.

3931. *Mr. Shepherd.*] What distance is the wheat-growing country in South Australia from a railway station? I have carried wheat there a distance of 60 miles.

3932. Do you think that 15 to 20 miles is a good paying distance for the carriage of wheat? Yes.

3933. What description of wheat is grown about Temora? The Purple Straw and the Allora Spring. I tried an experiment from the Allora Spring wheat this year and I find it is quite as good as the other.

3934. Has rust ever made its appearance in the district? Rust was here in 1889. That was the year after the drought. It has never made its appearance since. In the year to which I refer we had from 35 to 36 inches of rain.

Stanley Eugene Gelling, forwarding agent and produce merchant, Temora, sworn, and examined :—

- S. E. Gelling. 3935. *Chairman.*] Have you any statement to make ? During the last twelve months we have forwarded 1,100 tons of general goods, including corn, chaff, and potatoes from Temora. We have had 90 or 100 tons of ore from Wyalong to Dapto. We have also had 50 tons of skins from there. Of course, there are job lines of which we do not keep an account, and they will amount to about 20 or 30 tons.
- 28 Aug., 1899. 3936. *Mr. Dick.*] If a line were constructed from Grenfell to Wyalong, would a great amount of the goods you now receive be sent along the route ? I dare say they would.
3937. And the line from Cootamundra to Temora would, therefore, lose a portion of its revenue ? Yes.
3938. Would it not amount to this—that we should have two branch lines competing for the one trade ? That is what it means so far as that class of goods is concerned.
3939. How many stations out back would take their wool to Wyalong from Temora if a line were constructed from Wyalong to Temora ? Billabong, Oakhurst, Back Creek, Barmedman, Trungley, Ungarie, Wollongough, Merringreen, Yalgogrin, Youngara, and others too numerous to mention.

James MacNamara, farmer, Duck Creek, sworn, and examined :—

- J. MacNamara. 3940. *Chairman.*] Where is your holding ? About 12 miles north of Temora.
- 28 Aug., 1899. 3941. Have you any statement to make ? I have land on the Bland Creek within 5 miles of where the proposed line will run. None of the Bland land is suitable for agriculture. I tried to cultivate it on several occasions. I had wheat in five times, and I never got more than one crop, and that was washed away by the floods.
3942. Have you ever heard anyone say that the Bland country is fit for agriculture ? No.
3943. Have you heard the evidence given respecting the flooded state of the Bland country ? Yes ; I have seen the floods there for thirty years.
3944. *Mr. Watson.*] What depth would the water be in flood time a mile back from the creek ? On the plains it would be 3 feet deep in places. I have seen the plains covered to such an extent that you could row a boat from Able's Ridges, on the Back Creek, to the Weddin Mountain. There have been several such floods as that. That country is so low that when all the creeks are flooded together it must of necessity be under water.
3945. We have had some conflicting statements as to the distance the line would go across the country which you say is unsuitable for agriculture ;—how far is it from Grenfell, coming round to the north of the Weddin, before the bad land commences ? Sixteen to 18 miles. That continues to the Bland Creek, and crosses it to beyond Back Creek. That land, with the exception of little patches, is unsuitable for agriculture.
3946. *Chairman.*] That is, 30 miles across ? Yes.
3947. *Mr. Watson.*] You speak as one who has practical experience in the Bland country, and who has lived upon it for many years ? Yes. At one time I was connected with the two Wyalong stations, and cultivated land there, and had good crops.
3948. Generally speaking, how do you regard the land between Temora and Wyalong ? It is all suitable for cultivation, with the exception of a few patches of belar country and a few ironbark ridges.
3949. I believe there is some of the belar country at Back Creek ? Yes.
3950. Is there much of it at Caragabal ? Yes ; there are a few patches of gilgai country between Temora and Wyalong, but not many. The whole of the lefthand side of the route is good country. The greater portion of the land between Temora and Wyalong is fit for agriculture ; the poor land is in very small patches.
3951. Have you seen anything of the land from Wyalong westward ? Yes.
3952. Is a fair proportion of it good for agriculture ? Yes. I think the rainfall there is sufficient to enable wheat to be grown.
3953. *Mr. Dick.*] Is the Bland country good fattening country ? Yes.
3954. For how many months in the year is it available for fattening purposes ? It is first-class fattening country all the year round in wet seasons. It cannot be too wet for the land.
3955. How many wet seasons out of five have they there ? It is generally a wet season every two or three years, but during the last five years the country has been without a wet season.
3956. Would you say that, on an average, the Bland would be available all the year round for fattening purposes one year out of three ? Yes.
3957. For how many months during a bad season would the Bland be available for fattening purposes ? Three months. That country suffers more in a bad season than this. This season I had 450 sheep on 900 acres at Curraburrama and they all died. I had 1,200 sheep at Narraburra, and I did not lose any. I lost all I had on the Bland.
3958. *Mr. Watson.*] Do they suffer more on the Bland from drought than you do on finer country ? Yes.
3959. *Mr. Dick.*] Would the Bland country be suitable for dairying ? I do not think it would.
3960. Do you disagree with any statement to the contrary ? Yes.
3961. Was last year the worst you have had about here ? Yes, both for agriculture and pasturage.

William Thom, general manager for James Thom, storekeeper, Temora and Wyalong, sworn, and examined :—

- W. Thom. 3962. *Chairman.*] Have you prepared any statistics with reference to your traffic ? The total amount of our tonnage between Temora and West Wyalong was, by ordinary teams, 567 tons for twelve months.
- 28 Aug., 1899. Twenty tons went by coach. To Barmedman and Reefton we sent about 100 tons.
3963. Has there been any increase in business in this district of late years ? Considerable ; and there is no doubt that the construction of a railway from Temora to Wyalong would increase it further, on account of the country becoming more settled. At present the farmers are not able to compete with other markets on account of the land freight.
3964. Do not the farmers on the Grenfell-Wyalong route suffer in the same way ? I do not think the settlers on that route are as numerous as they are between Temora and Wyalong.

Peter Meagher, manager for John Meagher & Co., storekeepers, Temora and West Wyalong, sworn, and examined:—

3965. *Chairman.*] Have you prepared any information for the Committee? Yes. The tonnage which our firm sent to West Wyalong between July, 1898, and June, 1899, was 1,100 tons 7 cwt. 2 qrs. To Barmedman and the vicinity of Barmedman we have sent 209 tons. That tonnage represents goods sent by carriers. The stuff for which people send—and that is a large item—is not accounted for. We merely account for way-bills sent by paid carriers. Of course, if a farmer comes in for wire, and that sort of thing, and takes it away himself, it is not accounted for. A lot of goods come from Melbourne to Wyalong *via* Cootamundra and Temora at present. From Cootamundra to Wyalong there are only 70 miles of carriage. If the goods had to be sent from Cootamundra to Harden, Young, Koorawatha, Grenfell, and thence to Wyalong, they would have to go over 100 miles more of country. The same remark applies to passengers. Of course the saving of time and extra passage money should be taken into consideration in connection with the construction of a railway. People travelling from Albury to Wyalong would be taken right out of their course if a line is constructed from Grenfell. They would have to pay extra passenger fares, and would lose a great deal of time on the journey. My opinion is that, if the proposed line is constructed, passengers from the district to which I have referred will still travel to Temora, and proceed to Wyalong by coach.

P. Meagher.  
28 Aug., 1899

3966. *Mr. Watson.*] If passengers from Sydney were in a hurry, would they not do the same? I think it is quite possible, unless a special railway service were arranged.

3967. *Mr. Shepherd.*] What effect do you think the opening of a railway from Temora to Wyalong would have on Temora? The outlook for Temora is not too promising. We cannot say that we should benefit very much. It is a natural thing not to wish a line to pass your doors, because if it does you must lose a lot of traffic, as well as the sale of feed to carry it.

3968. What passenger traffic is there between Temora and Wyalong? I do not know. I may state that our firm sends a large number of small parcels to Wyalong by coach. My estimate of the goods sent to Wyalong does not include those parcels—only what we send by teamsters.

3969. *Mr. Dick.*] What effect will the construction of a line from Grenfell to Wyalong have upon the Cootamundra to Temora line? I think it will have a very depressing effect upon it. The Temora to Cootamundra line has not been a paying one; but I am informed that it is losing less than any other branch line. The Railway Commissioners were here a short time ago, and expressed their surprise to me at the amount of business done. The traffic which goes in a year by coach to Wyalong is not ascertainable, because the coach proprietors will not divulge it. Of course the running of the coaches is their bread and butter, and they do not wish a line from Temora to be constructed. We know, however, that the traffic is considerable.

John Louis Tréflé, journalist and farmer, Temora, sworn, and examined:—

3970. *Chairman.*] Have you any information to furnish to the Committee? The evidence I wish to give has reference, principally, to the tonnage of the goods carried between Temora and Wyalong. The tonnage is as follows:—Wright, Heaton & Co., 1,641 tons; Gelling and Sons, 1,051 tons; Meagher & Co., 1,309 tons; Man Sing & Co., 209 tons; and J. Thom, 667 tons; making a total of 4,887 tons. Mr. May sent out 492 tons which I have not included, because it is principally produced locally. The 4,887 tons consists of stuff which came over the Temora line from Cootamundra. That would go by way of Grenfell if the proposed line were constructed, and would rob the Temora-Cootamundra line of that amount of traffic. That does not include a large amount of stuff which is carted by carriers and private individuals direct. There are no records of that kept; neither does it include a great amount of forage. A little of that is included in the return of Gelling & Sons, but very little. I will quote some figures from the rate-books to show what may happen if a line is constructed to Wyalong from Grenfell. The passenger fare from Cootamundra to Wyalong *via* Koorawatha would, on the present basis, be: first-class return, £2 7s.; Cootamundra to Temora, first-class return, 11s. 6d. Coach to Wyalong, £1. That makes the cost of travelling from Cootamundra to Wyalong by coach and train £1 11s. 6d. Thus, in the event of a line being constructed from Grenfell to Wyalong, a man would save 15s. 6d. by coming to Temora and continuing his journey by coach. In the event of the proposed line being constructed, and heavy traffic taken off the road from Temora to Wyalong, the road will be very much improved for light traffic, especially in good seasons, and the charge for travelling by coach would possibly not be more than 15s. At present, owing to the bad roads and the high price of feed, the charge is £1 return, but with better roads I think we might safely say that it would be reduced to 15s. Under the circumstances it appears that a man travelling to Wyalong from Cootamundra, by way of Temora, would save about £1. The first-class return fare from Temora to Melbourne is £5 2s. 3d. Allowing the return fare from Wyalong to Temora to be 15s., that would make the cost of a return ticket from Wyalong to Melbourne—coach and train—£5 17s. 3d. If the line were built *via* Grenfell, a first-class return ticket from Wyalong to Melbourne would cost £6 15s., or 18s. 9d. more than if the passenger took the coach to Temora, and proceeded on his journey from that point. With regard to goods: if a line be built *via* Grenfell, as soon as we have Federation and trade commences with Melbourne, carriers will carry from Coolamon or Temora and compete against the line. With regard to freight, I would point out that third-class goods from Albury to Wyalong, *via* Grenfell, would have to pay £7 7s. per ton. From Albury to Coolamon, £3 12s. 7d. per ton. There would be a difference of £3 14s. 5d. A man could land goods at Coolamon £3 14s. 5d. a ton cheaper than he could land them at Wyalong. Even in times of drought the carriers have often charged as low as 26s. a ton from Temora to Wyalong. I should imagine that the carriers from Coolamon to Wyalong—a distance of 65 miles—could carry goods for £2 a ton at the outside. That would leave Wyalong purchasers a profit of £1 14s. 5d. per ton in favour of bringing their stuff *via* Coolamon to going round by way of Koorawatha and Grenfell. With regard to second-class goods, the freight from Albury to Wyalong *via* Grenfell, will be £5 5s. 10d. a ton. From Albury to Coolamon, £2 12s. 7d. a ton, a difference of £2 13s. 3d. a ton,—which on the basis of the previous calculation would leave a profit of 13s. 3d. a ton to purchasers at Wyalong, admitting the carriage from Coolamon to Wyalong to be £2 a ton. In my opinion the teams would in fair seasons carry the goods from 25s. to 30s. a ton across that country. Mr. Meagher pointed out that he had hundreds of tons of goods carried last year at 26s. a ton. I know of my own knowledge that the general charge

J. L. Tréflé.  
28 Aug., 1899.

J. L. Tréfilé. charge for carriage, even in a time of drought, was not more than 30s. a ton, until the Carriers' Union was formed. At a meeting of the Carriers' Union held last night complaints were made that members of the union were carrying for 30s. a ton, and that one had accepted a contract to carry at 25s. a ton to Wyalong. In view of these facts I think a line from Grenfell to Wyalong would be open to competition from the carriers for all the southern traffic. Under Federation the traffic of this part of the country would be somewhat divided between Melbourne and Sydney. It would be against the interests of the people who would be taxed not to have a line to connect them with Temora, which would give them the choice of two markets, whilst it would at the same time place Sydney under no disadvantage. Carriage to Sydney from Wyalong would be as cheap *via* Temora as it would be *via* Grenfell. With regard to stock: the carriage of a truck-load of stock from Albury to Wyalong *via* Grenfell, at the present rates would be £6 5s. 4d.; from Albury to Coolamon £3 10s. 10d.; difference £2 14s. 6d. It would thus be fair to assume that stock which would be naturally trucked at Wyalong from Melbourne, would pay the people better if they were driven across and trucked at Coolamon, as they would thus save £2 14s. 6d. per truck. With regard to sheep: a truck-load of 100 sheep at £2 14s. 6d. would run to about 6d. per head. If a man, instead of trucking 1,000 sheep from Wyalong to Melbourne, were to drive them to Coolamon, he would save £25.

28 Aug., 1899.

3971. How much will they lose in condition? They would not lose much in fair seasons in being moved that short distance.

3972. Do you call 65 miles a short distance? Yes; many stations have to drive them more than that. Practically, all the traffic south of Wyalong would be tapped by Coolamon. If a line were constructed from Temora to Wyalong the fare would be so near a reasonable charge that it would not pay to send across to Coolamon, and the traffic would come through Temora. Thus the railways would be earning a good deal which they would miss altogether if the line were built by way of Grenfell. If the line is built from Grenfell to Wyalong the Temora terminus will be placed in a position in which no other terminus in New South Wales is placed. All the back country traffic will be cut off. All railway termini in New South Wales, in addition to their local traffic, have a large amount of back country to gradually drain. For instance, wool comes for 70 or 80 miles into Temora. If the proposed line be built Temora will be circumvented, as it were, and there will be nothing but the local traffic to depend upon, and that will injure the town greatly. We could never, under those circumstances, support a daily train, and it would place the line on the list of hopelessly non-paying lines. In fact, it would become the worst paying line in New South Wales.

3973. We have it in evidence that there is splendid agricultural land west of Temora;—do you not anticipate that some day it will be tapped by means of a railway? Yes; but the wheat traffic is practically confined to three months in the year, when the Department is taxed to its utmost. I have seen two trains a day going from Temora, and then they did not take the wheat away fast enough.

3974. For how many months of the year does the wool traffic last? About two months. When that is gone our ordinary merchandise will not keep one train a week running.

3975. Do not those conditions apply to all lines? If you rob us of all our natural back-country trade which Temora has at present, we shall have nothing to depend upon but local traffic. The local merchandise for this place can be carried by one train a week. Most of the railway termini in the Colony have local merchandise and a big area of back country. We have a stretch of back country here, and a number of squatters go to Temora and deal there. We shall lose a lot of our merchandise traffic by the construction of a line from Grenfell to Wyalong. We shall lose the wool traffic from the back country, and when we lose all that, and all the Wyalong traffic, there will be very little traffic for the Cootamundra to Temora line, except during three months of the year, when the wheat and wool come in together. I have been farming for years, and I have carried wheat to Temora railway station, and have some experience of the matter.

3976. Is it not a fact that, no matter where we construct pioneer lines in agricultural districts, the bulk of the traffic will be carried during a few months of the year? I am pointing out the effect of the construction of the proposed line on the existing line which has its terminus at Temora. A lot of the traffic on that line belongs to the Temora back country. If a line be constructed from Grenfell to Wyalong it will, practically, circumvent the Temora line and place it, as a terminus, in a worse position than any other in New South Wales. All the other termini, in addition to local traffic, have a back country to drain. The construction of a line from Wyalong to Grenfell will cut the Temora to Cootamundra line clean away from the back country. It will even cut off stations only 20 to 30 miles away, and will turn their trade the other way. The staff which now works the line from Cootamundra to Temora could—if the line were extended to Wyalong—work the line to that place. At present the staff remains at Temora, and the men say they would prefer to go on to Wyalong. It would be a saving to the Department to have one train to work the whole of the line from Temora to Wyalong. The inward tonnage is: Wright, Heaton, & Co., 320 tons; Gelling and Sons, 115 tons. I might point out that if a line were constructed from Temora to Wyalong there would be an increase in the tonnage inwards in ores, as the cartage of ore from Wyalong to Temora is £1 per ton, and from Temora to Dapto 15s. 9d. per ton. I have been written to by the holder of one of the principal estates on the Bland country, through which the proposed line would pass, asking me to oppose its construction, as he does not wish it to be carried through his property. I am not, however, at liberty to make his name public.

3977. *Mr. Watson.*] Is there any land open for selection on that holding? I do not think so. I have a general knowledge of the Bland country; I have lived in this district for twenty-three years, and I think that the country from Temora to Wyalong is good agricultural country, excepting where it is too sandy, or where the gilgai holes are too wet. There is, however, very little of that country.

John James Miller, farmer, grazier, and auctioneer, Cootamundra, sworn, and examined:—

J. J. Miller. 3978. *Chairman.*] Are you prepared to give evidence with regard to stock and agriculture in connection with the proposed railway? Yes; I believe Wyalong is in every way entitled to a railway. I speak from an experience of the country extending over twenty-five years. I have a knowledge of the country about Cudgellico, Hillston, Mossgiel, Ivanhoe, and the Bland. I consider that when a line is constructed from Temora to Wyalong it should go on to Lake Cudgellico, Hillston, across the river to good country on Mossgiel, and subsequently to Ivanhoe and Menindie. We have not only Wyalong to take into consideration, but

28 Aug., 1899.

but all the country at the back, which has been entitled to a railway for years past. There is good agricultural and grazing land about there. My opinion, as a practical man, is that the natural connection is by way of Temora. Vested interests have sprung up. People from Cootamundra and Temora have settled there, having been led to believe that a line would be constructed to them from Temora. People have taken up land there, and they have been neglected. Their business communications with Temora have been kept up. Some people on the other side of Temora bank in Cootamundra, and they have business transactions with Temora and Cootamundra. If a line is constructed from Koorawatha to Grenfell and thence to Wyalong, those business connections will, to a great extent, be broken up, not only with Cootamundra, but with Gundagai, Tumut, and Melbourne. A great many selectors are finding their way to this district from Victoria, and their business transactions are naturally with Victoria. It will be an anti-federal step to drag business out of its natural channel. There is no doubt that a line from Grenfell to Wyalong will be an anti-federal one. It will take business out of its natural channel. A big business has sprung up with graziers and the Victorians. The Victorians have had to pay full rates this year from Temora to Albury for their stock. One lot from Wyalong was loaded here, and they were compelled to pay full rates to Albury. We have had to send hay from Temora to meet sheep coming from Wyalong. If a line had been constructed from Temora to Wyalong the sheep would have been trucked there, and an immense amount of loss would have been avoided. If a line is constructed from Koorawatha to Grenfell and Wyalong, the stock-owners will be compelled to load at Wyalong, and carry their stock to Grenfell, Koorawatha, and Harden, back to Cootamundra, and thence to Albury. That is a distance of 101 miles, whereas by coming by way of Temora the distance would be only 70 miles. Reference has been made to connecting this country with the mountain country. We have a large extent of good mountain country on the other side of Tumut, and it was the means of saving thousands of stock last year. The country at the back is subject to drought. The stock from there is supposed to go to the mountain country to be saved. It would be a hardship to the stock-owners if they were compelled to send their stock by way of Koorawatha to Harden, and thence to Cootamundra and Tumut. This remark does not apply to times of drought only, because even in good seasons the mountainous country will be utilised. This district will take advantage of the opportunity of sending stock, principally by rail, to Tumut, and a large extent of mountain country will be brought into use in conjunction with the drier country. This year one owner of stock from this side of Condobolin had to truck his stock from there to Orange, thence to Blayney, Harden, Cootamundra, and back on the Temora line. If a line had been constructed to Wyalong, or a little further out, he could have brought his stock to Temora without following that circuitous route, and he would thus have saved expense. The Railway Commissioners will, no doubt, endeavour to make revenue out of the removal of starving stock. It sometimes takes two or three months to get sheep from the back country to the eastern country. There are losses *en route*, and heavy driving expenses. The expense is so great the Railway Commissioners would find that there was a good business to be done in carrying store stock at all times. They can carry them at cheaper rates than those they impose at present. The Temora-Wyalong line would be a line of that kind. It would bring stock from the back country to the grazing properties on the east. Some years ago 5,000 head of stock were brought from Cultower, on the Darling; and 2,000 were lost between that point and Nymagee. If a line from Temora to Wyalong, and thence to the west had been constructed, they could have been picked up and saved. A great thing to be considered is the situation in which the stock-owners will be placed in connection with the mountain country. I may say that I have known the Bland country for a number of years, and I can corroborate what previous witnesses have said in regard to it. It is not suitable for agriculture. There is a considerable extent of clayey plain there—20 miles across. It has been stated that it will be a good dairying country: I have had experience in dairying, but I do not think it will be suitable. It is very hot there in summer, and dairy-stock must have succulent food, which is not obtainable there in warm weather. It may be a good fattening country, but it will not do for milk. A great extent of the country would not be suitable for agriculture, whereas all the country from Temora to Wyalong, and for some distance beyond, is suitable for wheat-growing.

3979. Do you know the country out west from Temora? Yes.

3980. Do you know the Hay district? Yes.

3981. Is there a large amount of good agricultural land in that district? Yes; it is good wheat land right up to Hillston. It is good land all the way from Gunbar to Cudgellico, and with the exception of a few ranges here and there the whole of it is wheat land. It is good chocolate soil, and good fattening country.

3982. I believe that between the Hay line and the Lachlan there is some good country? Yes. Pretty close to the Hay line you have plains, but when you get about Gunbar you have good timber country.

3983. How far north of the Hay line have you to go before you get into the good country? There are plains of 25 miles before you get upon the proper agricultural land.

3984. Would a line from Temora to Gunbar have good agricultural land on the south, all the way? It would go through a belt of pretty thick mallee.

3985. How far does agricultural land extend between Temora and Mirrool? It is all good agricultural land between here and Mirrool Creek.

3986. We have it in evidence that fat stock brought to Temora come by way of Gundagai? Yes; a large amount of store stock has been trucked to Gundagai, and thence to Tumut.

William Falconer, contractor and timber merchant, Cootamundra, sworn, and examined:—

3987. *Chairman.*] Have you any evidence with reference to the timber and other business relations between Wyalong and Cootamundra? Yes. I may mention that I have resided at Cootamundra for the last twenty-five years, and am well acquainted with the districts between Cootamundra and Wyalong. In my opinion, a railway from Temora to Wyalong would be the best and most profitable, as it will open up good agricultural lands most of the way. There are also large belts of Murrumbidgee pine for building purposes, also ironbark and white box suitable for railway sleepers. There being a large demand for the pine at Temora, Cootamundra, Murrumburrah, Gundagai, Adelong, Tumut, and surrounding districts, for building purposes, it will bring a large revenue to all the lines. If the line is run *via* Grenfell to Wyalong it will be most inconvenient to the travelling public from all stations on this side of Harden, as they will have to go there by mail train at night, change on to the Young line, go on to Koorawatha, and stay there until next morning, whereas if run *via* Temora, we can go straight through and back in the one day if required.

J. J. Miller.  
28 Aug., 1899.

W. Falconer.  
28 Aug., 1899.

W Falconer. required. Being connected with mining at Wyalong, I go out once a month, and it will cost just as much by rail *via* Grenfell as it would *via* Temora, and thence by coach. I am of opinion that if the line is run *via* Grenfell, there will be competition with the teams and coaches from Temora against the railway. Cootamundra is the natural outlet for railway communication between Sydney, Melbourne, and Adelaide. Being half-way between Melbourne and Sydney, it will suit the convenience of the travelling public, besides opening up the back country. The line can be cheaply constructed, being practically level the whole way to Wyalong. Sleepers, fencing, and gravel can be obtained on the route. The country between Temora and Wyalong is more or less auriferous, and if prospected, there are likely to be some good finds made. Should the line be constructed *via* Grenfell, I am of opinion that three trains per week will be sufficient for the traffic, both to Temora and Wyalong, whereas if run straight through from Cootamundra it will keep the line fully employed every day, and can be run with the same engine-driver, stoker, and guard, and less rolling stock.

28 Aug., 1899. 3988. Can you give any opinion as to whether the Construction Branch have over or under-estimated the cost of a line from Temora to Wyalong. I think they have over-estimated. If they did away with the fencing it would make it cheaper still.

3989. Do you think it wise to run unfenced railways through agricultural country, and country which is likely to be fairly heavily stocked? No.

3990. What would fencing cost per mile? About £40.

3991. Can you endorse the evidence of previous witnesses? Yes.

3992. *Mr. Watson.*] Do you consider that if a line is constructed from Temora to Wyalong, a fair amount of timber will be carried over it? Yes. It will open up a large trade in sawn pine. If it goes round the other way it will cut off all that trade, because there will be too much trainage upon it. There is a wide belt of pine running from Coolamon through the country close to the line.

John Thom Stratton (Stratton and Sons, millers and grain merchants, Cootamundra), sworn, and examined:—

J. T. Stratton. 3993. *Chairman.*] Have you any information to furnish to the Committee? We do a great amount of business on the Temora line, and also towards Wyalong. We feel that if a line is not constructed from Temora to Wyalong it will not only depreciate the earnings of the Temora line; but will also depreciate the value of our mill. We have sunk a lot of money in Cootamundra. It will also affect the mills from Murrumburrah to Albury. We receive a large amount of grain direct from Gundagai, and after it is crushed it is distributed by rail over the district. If the proposed line is constructed that trade would be lost. The line from Cootamundra to Temora does not pay, and we think it advisable to extend it to Wyalong.

28 Aug., 1899. 3994. Where do you send the bulk of your flour? To Temora, Barmedman, and Wyalong.

3995. You do not depend on the local consumption of flour? No; but we depend on the local wheat.

3996. Do you think you are able to hold your own in the local markets? We cannot do it under free-trade; but we can do it under protection.

3997. If a line is constructed from Grenfell to Wyalong it means that the business which comes to you over the Temora-Cootamundra line will to a great extent cease? Yes; unless we can get the carriers to compete against the railway, which, I expect, they will do. I endorse what Mr. Miller said about the proposed line being an anti-federal one.

Frederick Pinkstone, journalist, Cootamundra, sworn, and examined:—

F. Pinkstone. 3998. *Chairman.*] Are you prepared to give evidence to show the effect of the construction of the Cootamundra to Temora line on the trade of the district? Yes. I might point out that the first selection made in this part of the country was in 1879. At that time there was not a single centre of population between Cootamundra and Wyalong. Now we have several centres, including Temora, Barmedman, and Wyalong, with a number of intermediate settlements, promoted chiefly by the railway and by gold discoveries. I think railway extension is absolutely necessary for the benefit of these districts.

3999. Do you wish to say that the business built up on the Cootamundra to Temora line will be injured by the construction of a line from Grenfell to Wyalong? It must be injured. The Temora extension was started to connect Tumut with the Lachlan country—to connect the summer country of the Murrumbidgee and Tumut with the drier country of the Lachlan valley, the idea being to enable the inner districts, which were thought then to be the only ones which could grow wheat, to send breadstuffs out to the Lachlan, and to enable the pastoralists of the Lachlan in dry times to send their stock to summer country. Since the line has been constructed there has been an enormous traffic in stock to the summer country. Many thousands of stock have been saved by these two short extensions. If the gap were filled up between Temora and Wyalong it would enable nearly every sheepowner on the Lower Lachlan country to take advantage of it. They are not likely to do that, however, if they have to send sheep by way of Koorawatha. It would be cheaper and more direct to bring them along the other route. If you can put stock into a train and ship them straight to the summer country it is a great advantage and will save a lot of loss. If sheep are irregularly fed and watered the wool staple is seriously injured. Therefore, if they can be trucked direct to the summer country it is a great advantage.

4000. Do you mean to say that it would pay to construct a line simply to carry sheep? No; there are other things which have grown up as the result of railway extension. Besides the sheep traffic, a very large trade has sprung up between these districts in fat stock. For instance, all the country about Coolac, Jugiong, Gundagai, up the Adelong Creek to Tumut, is devoted very largely to the fattening of stock for market—stock which have generally been sent to Melbourne and Homebush. Since the construction of the line, however, during many months of the year no fat stock reached Homebush, and scarcely any reached the Melbourne market, for the simple reason that they are absorbed in this country. There are large populations to feed, and they can consume a lot of that fat stock. The buyers come to Temora and Cootamundra, purchase the fat stock, and take them away. In addition we have a large business in wheat. Messrs. Stratton and Sons, encouraged by railway extension, came from Victoria to Cootamundra, and established one of the finest milling plants out of Sydney. They take the wheat from these districts and send it to the most northern and southern parts of Australia, and to all the islands as far as New Caledonia. The local market for wheat is very often above the Sydney market. I have known the market in Cootamundra to be 1d., 2d., and 3d. above the Sydney market.

Generally

Generally speaking, wheat is worth 25 per cent. to 50 per cent. of the freight between Cootamundra and Sydney, on account of the good central market we have, and on account of the enterprise which has been shown by the millers from Young to Wagga Wagga. There are big mills at Young, Murrumburrah, Cootamundra, Wagga, and Temora. All these compete with each other, and can absorb a large amount of the wheat grown in these districts. By opening up markets outside we are in a sense independent of Sydney. Then there is a large traffic between these districts in chaff. Chaff is grown in these districts, and is expensively consumed in the south-east in the summer time. We get the benefit of that trade. The stud stock in these districts have, to a large extent, to be hand-fed. Nature requires a rest in October and November, and also in March and April, and sometimes May, and during these months stock have to be hand-fed. Hence we do an enormous trade in chaff with the southern districts. That all percolates through Cootamundra. The populations of the whole of the districts from Cootamundra to Wyalong are engaged in farming pursuits and in mining, and they use a large number of draught horses. These draught horses, for farming purposes, cannot be fed on wheat, but must be fed on corn. The corn comes principally from Tumut, which grows the finest quality of maize in the world. Not even the kiln-dried maize of the northern states of America can beat the Tumut maize. Hence there is a large demand for it, and a large business has been promoted by the Railway Department between Tumut and this district, which does not produce maize to any extent. We consume maize, and so do Barmedman and Wyalong. The further the wheat extends in this country the further will maize-growing in the Tumut district develop. We grow oats in this district, but not extensively. It is used more as a changing crop for sweetening the land. Wheat is a much safer crop for several reasons. If wheat goes below 2s. 6d. a bushel they prefer to feed the stock for dairy and fattening purposes with it.

4001. Is a farmer likely to bring maize from Tumut in order to feed stock, if he grows oats? If the oats were grown for grain it would have to be crushed, because it would foul the paddocks to such an extent as to do serious injury to wheat cultivation. They have to get something which is foreign to their own paddocks, and the Tumut maize is just the thing the draft horses want, both for cultivation and mining purposes. I have kept a record of the rainfall since 1885, and, in view of the character of the seasons, I think dairying is almost a hopeless industry in this part of the country. The chief industries here are sheep raising and agriculture. In connection with sheep, of course, we have a variety of industries. For instance, we have the skins, the wool, and many products, which are important industries in themselves. This trade must be injured by the construction of a line from Grenfell. I firmly believe that if it is constructed the road will beat the railway. The railway is too far north to compete with the road traffic.

4002. *Mr. Watson.*] There will be a considerable amount of traffic to Wyalong *via* Temora, even if the proposed line is constructed? Yes. I do not think the traffic to Wyalong will be reduced? I think the road will bring the traffic from Barmedman this way. Men cannot afford to grow wheat and carry it even 10 miles. Men in this district, 20 miles from a railway, have, during the last four seasons, made nothing. Men living on the railway have done well. The other day there was the sale of a farm within 3 or 4 miles of Temora. The purchaser gave a good price for it. He bought the farm because he will be able to get a siding on his land, and he intends next year to cultivate 2,000 acres. That man will not go 12 miles from a railway. He had a large farm—one of the largest between Gundagai and Wyalong—and it is only 6 or 8 miles from the line at Wallendbeen. Nevertheless, he abandoned it for sheep, and has come to this district to purchase land contiguous to the line for the purpose of growing wheat. He rented land at 5s. an acre from the Mackay's, at Murrumburrah, and made profit, simply because he was able to save in carriage. It is generally conceded that, under Federation, the Federal territory will be somewhere between the southern line and the coast. If it is, the tendency of all traffic should be to the main Southern line, and not away from it. I have a statement showing the progress of agriculture promoted by the construction of the Cootamundra to Temora railway since 1894. The total number of acres under cultivation in 1894 in the Harden, Clarendon, and Bland districts was 133,957; in 1895 it was 129,345; in 1896 it was 114,301; in 1897 it was 145,732.

John Gazzard, Railway station-master, Temora, sworn, and examined:—

4003. *Chairman.*] Have you any statistics showing the local traffic on the Temora line? Yes. From J. Gazzard. September, 1897, to August, 1898, inclusive, we carried 57,268 bags of wheat. That is the only return I have compiled during the thirteen months I have been here. The wheat traffic from December last to 28 Aug., 1899. July last, inclusive—which is a fair season—was 8,300 bags. I estimated, after seeing the millers and making inquiries from the agents and buyers, that there would be 70,000 bags carried, and the number of bags sent was as I have stated. That was due to the effects of the drought.

4004. Have you made an estimate for the coming year? Yes. Of course, everything depends on rain in October. With a good season there will be 100,000 bags.

4005. How do you arrive at your returns? The police informed me of the number of acres under cultivation, and I also interviewed the millers. There are 26,000 acres under crop, which the Temora station can fairly command.

4006. Has the other traffic fallen off proportionately? The wool traffic has. In 1893, the first year the line was opened, we carried over 11,000 bales. Last year the number of bales carried was 4,200. There has been a repetition of bad seasons since 1893. The general traffic has not fallen off. The cash returns for twelve months ending July were—Coaching, £4,287; goods traffic, £18,105. Those amounts do not actually represent the earnings of the station. Part of it is due to the main line.

4007. Do you know by how much the construction of a line from Grenfell to Wyalong would reduce your returns? I should think fully one-half, except in regard to wheat. Our passenger-traffic revenue depends very much on Wyalong. We should lose some wheat traffic, of course.

4008. Would that be made up with the greater area which will be put under wheat within reach of the line? Yes. About the same number of passengers go to Melbourne and Sydney.

4009. I believe a great number of people have found their way to the district from Victoria? Yes. At the same time, we have a good traffic towards Sydney, although as many go to Melbourne as to Sydney. Nearly all the mining population of Wyalong belong to Victoria.

4010. *Mr. Shepherd.*] Have you sent any starving stock from Temora? No. We got a lot from Hay, but they went back again.

- J. Gazzard. 4011. The wheat sent away during the last twelve months does not represent the natural production? By no means.
- 28 Aug., 1899. 4012. Is much timber brought here from Sydney and other parts for building purposes? Not a great deal.
4013. Do you send any from here? Very small quantities have gone.
4014. *Mr. Watson.*] The actual falling off in wheat last year, as compared with the previous year, was 50,000 bags? About that.
4015. That, I suppose, would materially affect the earnings of the branch? Yes.
4016. What would the carriage on 50,000 bags of wheat amount to? 3s. 6d. a ton. That means about £1,000 for the lot.
4017. Practically, then, the Cootamundra to Temora line earned £1,000 less in carriage of wheat last year than it did in the previous year? Yes.

TUESDAY, 29 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Rev. John Milne Curran, Lecturer in Geology and Chemistry, Technical College, sworn, and examined:—

- Rev. J. M. Curran. 4018. *Chairman.*] A little while ago the question of constructing a railway to Wyalong was before a former Committee, and some doubts were then expressed as to the permanency of Wyalong as a gold-field;—you have had opportunities of making an examination there? Yes; I had opportunities in the year 1895, when the field first opened. I think I was on the field off and on between two and three months. At that time my opinion of the field was summed up in a very short report which was submitted to our people, and it appeared in the *Sydney Morning Herald* of 26th February, 1895. My opinion of Wyalong was expressed in one sentence, "That Wyalong had come to stay." We had no doubt left in our minds as to what the results were going to be, because the Technical Education authorities agreed to have me take an assay plant to the field, and assist the miners as far as we could possibly do. At the time there was a period of great depression in Sydney, and the idea was to try and find employment for men anyhow and anywhere. I was given *carte blanche* to do the best I could, and having an assay plant and an assistant on the field, I was able to form an opinion on the spot as to what it was going to be. I was very favourably impressed. In my previous examination I was asked if I thought the district would make progress. I remember distinctly saying that I did not think that there would ever be more people on Wyalong than there were at that time. I did not think the population would increase from a mining standpoint, although I believed that settlement would take place in the country about. I do not now think the population will ever attain to the number to which it had attained at that time, if the place depend simply on mining. As far as I remember, that is a summary of my evidence.
4019. In the early days of a field there is generally a large population attracted there? Yes; we find a great number of people going there.
4020. And a number of men who are not miners, and who are hardly looked upon as likely to stay? Yes. What struck me about Wyalong was that there were comparatively very few miners there in the early days. Everything was against regular miners going there; the formation was so unusual; the conditions under which gold occurred were very unusual, and the methods of prospecting there were curious. There was really no systematic method by which men could find a reef. I think Mr. Neeld himself saw the first quartz brought to the surface through a tree being blown down, so that it was really not a field for regular miners to be attracted to in any sense.
4021. How long is it since you were there? Since 1895 I have visited the field twice in my private capacity.
4022. The Committee were at Wyalong recently, and we made inquiries in reference to the permanency of the field. Most of the holders seem to have no doubt about its permanency; but we found on inquiry that each of the shafts at the 500-foot level had struck a blank. They have not found anything; but they think they have a good lode channel;—do you think it is possible that at that depth the reefs have pinched out? I do not think there is any probability of it. There may, perhaps, be a floor coming in at that depth; but I think that they will pick up the reef again.
4023. You think it is quite probable where they happened to crosscut or strike it they have just struck a blank, and that it will make again? Yes.
4024. The character of the lodes is that they make and pinch out? They make and pinch and make again.
4025. You have no doubt about the permanency of the field, and that the lodes will carry to a depth? That is my opinion.
4026. *Dr. Garran.*] You judged early that Wyalong would be a permanent gold-field;—what is there in Wyalong different from Temora to make you come to that conclusion? In the first place, the country about Wyalong is all granite. The country about Temora is all slate and diorite. The conditions in which reefs were formed in Wyalong were such that these fissures must have been formed at a period long before the granite became decomposed. The granite is now decomposed to, say, 150 or 200 feet. The fissures could not be formed in the granite as it is now; the granite must be solid. For fissures to form in solid granite, it means, relatively speaking, very large earth movements to cause these channels. In the slate country, I should say, very much less movement would cause fissures, and in the slate country the fissures need not be necessarily connected, but simply be puckerings. In the granite country the breaks and the character of the reefs, I think, bear that view out entirely. That is one reason. Another reason is that I always find, when we get such minerals as sulphide of zinc and lead phosphate with gold-bearing quartz, it is invariably a good sign of permanency. I never saw any thoroughly good mineralised stone

stone from Temora—what you might call a true mineralised gold-bearing stone, in reefs or lodes of any size.

Rev.  
J. M. Curran.  
29 Aug., 1899.

4027. Did you visit Temora in the early days? Yes, about fifteen or sixteen years ago.

4028. What opinion did you form then? I really did not form any opinion. I felt rather confused about the whole place. The impression was inclined to be favourable; but I could form no opinion, as there were too many divergent conditions.

4029. The two gold-fields are quite different in their character? In every way.

4030. To what cause do geologists attribute these fissures in the granite? Earth movements.

4031. Not to contraction and expansion—heat and cold? I doubt it very much. The depth at which they were formed would hardly support such an idea.

4032. Is the gold supposed to have been deposited by infiltration from the surrounding rocks? Probably, if by surrounding rocks we mean rocks that are closely related to, as well as actually in contact with, the reefs; also the rocks surrounding the hundreds of feet of reef now denuded away.

4033. The width of the lodes to-day would depend on the width of the crevices? I should think the lodes are very much smaller than the original crevices on account of the lateral and vertical movements of the sides of the fissures.

4034. The two sides will work up and down? Yes, and they have also moved along their length.

4035. If the fissures were formed, as you suppose, would it be reasonable to imagine that they went down to a considerable depth? Certainly.

4036. They are not superficial fissures? No. Take a field such as Mount McDonald. The gold occurs in slate there, and the slate runs in a trough under the granite. I should think, when they come to the granite, there will be no more gold. But there is no presumption we could fall back upon to say why gold should give out in Wyalong.

4037. What do you suppose is underneath this granite? No man knows.

4038. What do you think is the thickness of the granite? It is the thickness of the crust of the earth—it goes in 30 or 40 miles at the least. There is no rock we know under it.

4039. The limit to mining is simply the limit of our capacity to go down and work at the depth? Yes.

4040. Will you explain why we cannot get an equal depth in the fissure at Temora? All the fissure-reefs I saw at Temora seemed to be formed more through openings in stratified rocks.

4041. There would be a slight puckering of the rock there? Yes. At Temora, too, some of the best reefs I saw there simply formed at the junction of slate and diorite.

4042. Is it not a general rule that you get the gold at the junction of slate and diorite? Yes; it is a very common occurrence. It is by no means a permanent condition, not nearly so good as Wyalong would be, I should imagine.

4043. If gold is found in this way in the granite near Wyalong, what is there to indicate how much of the surrounding granite may be expected to be auriferous also? Outside the auriferous area fissures were probably not formed.

4044. There is a good deal of granite around Wyalong? Yes. I do not think the gold goes very much further from Wyalong as a centre than what they have discovered.

4045. Can you give any geological reason why granite should cease to be gold-bearing at that particular point? The present auriferous area is much fissured, and was probably a focus of earth movements.

4046. The area of the profitable gold-bearing country to-day depends on the area of the fissures of a long time ago? I think so.

4047. No fissures, no gold? No; no payable gold.

4048. Yet the granite itself may be as auriferous as the granite was years ago near Wyalong, only it has passed its gold into the fissures? I doubt if there is gold in the granite at all in Wyalong? I do not think the granite itself has given much gold to the reefs.

4049. Where does the gold come from? There is a good deal to be said on many phases of the question.

4050. Does it come up from below? I should say so—in solution.

4051. Not drawn from surrounding rocks? Not from surface rocks surrounding. There is one peculiar rock at Wyalong—diorite—sometimes called by other names. That I would take to be the source of the gold. It is what we call very heavy and basic rock, compared with granite. Crude as the idea seems to be, there is something in it, that metals are distributed in the earth according to their specific gravity. I think rocks from a greater depth would be more likely to bring gold with them.

4052. The tendency of your question is that Wyalong, although a permanent gold-field, is a limited one as to its area? Yes.

4053. And you do not know of any locality in the immediate neighbourhood of Wyalong which is equally good, or likely to be equally good? Not immediately around Wyalong.

4054. Where is the nearest to Wyalong? Barmedman on one side, and Yalgogrin on the other. I was rather impressed with Yalgogrin.

4055. Is Yalgogrin similar country? No; it looked magnificent as a gold-bearing piece of country. Most of the reefs I saw were in slate. The whole conditions were auriferous-looking. I am rather disappointed that it has not come forward very much better than it has.

4056. In going west from Wyalong there is not very much seen of auriferous country? Yalgogrin is due west. Beyond Yalgogrin you get into rocks where I do not think there is any chance of getting gold.

4057. If there is gold there, it has been overlain by alluvial washings? Even the bed-rock is not gold-bearing along these central ranges of the Colony. They are mostly Devonian sandstones.

4058. Are these Devonian sandstones which you speak of the hardest sandstones, which have stood the weathering? They are not very hard, but relatively they are harder than what is washed away.

4059. They are survivals of a plateau? Yes.

4060. They all represent a higher elevation than what there is now? Yes.

4061. They do not rise many feet? No.

4062. Just enough to form a watershed? Yes; sometimes you wonder where the watershed is there. There must be a watershed I suppose—it is a very deceptive country. The country has been worn away about Wyalong, I should say, by marine action in Cretaceous times. Therefore, the gold which should have gone into rivers and gutters has simply been spread over a beach formation. Instead of being, so to speak, gathered together in gutters, it has been spread over old sea-beaches.

4063. When the denudation is by fresh water, and above sea-level, we get it in gutters? Yes.

4064. When it is by marine water it spreads? Yes.

4065.

- Rev. J. M. Curran. 4065. It is the spread of gold which induces you to think that it has been under sea-water? Not altogether; Cobar stands at a higher level. It was probably washed by Cretaceous seas. I do not, therefore, see why that country to which I refer should not have been also subjected to marine action in Cretaceous or Cretaceous-Tertiary times.
- 29 Aug., 1899. 4066. *Mr. Shepherd.*] Have you not been at Wyalong since 1895? Yes; but not officially. I have been there on two occasions on private business.
4067. Did you go down any of the shafts on the occasion of your last visit? Yes; at Pine Ridge only.
4068. What was the depth of the deepest shaft you went down? 130 or 140 feet. It is about  $2\frac{1}{2}$  miles from the township.
4069. They are working one shaft now at a depth of 300 feet, and they seem to have a very good reef on it, but the reef is very hard? As far as that goes, we get abundant samples sent from there, and I know the character of the stone referred to.
4070. Although they have been working fifteen months, they do not appear to have tested the reef at a deeper level than 300 feet? Probably they are rather frightened; the conditions are so unusual. I know many were frightened to go below water-level when I was there.
4071. The reef they are working in is perfectly dry;—they also have two other shafts—one 600 feet deep and the other 500 feet deep; but they do not appear to have come on the reefs at that depth;—I think your opinion is not favourable to the field being regarded as a permanent one? I think it is permanent; but I do not see how it is going to support a very large population of miners. I could not think why it would not be permanent.
4072. Do you think it is likely that these reefs will be payable at a greater depth? I think they would.
4073. I suppose you have not had any practical experience of mining? I have not had any practical experience in mining.
4074. *Mr. Dick.*] What is your opinion of Barmedman field? When I was about there, there was very little to be seen. I was rather struck with the Fiery Cross country, and with the minerals which came from that country; but the shafts were full of water, and there was no chance of knowing how things were.
4075. From information we received there, it seems that operations were suspended on account of the water;—do you think that if that difficulty were got over, the reefs below the water level are likely to prove payable? I have seen very magnificent samples of gold-bearing stone from Barmedman.
4076. Do you remember whether they were mineralised? Yes, highly mineralised.
4077. Is that usually regarded as a good sign? Yes, of permanency.
4078. Is the field at Reefton of the same nature? No, it is very different. When I saw that field it was rather more like the conditions in which gold occurs in, say, Cobar, or even Temora. The reefs were all in soft, yellow slate.
4079. Taking that stretch of country from Temora to Wyalong, may it be reasonably expected that mineral developments will take place along that line? Certainly. It is all country where you might expect anything in the way of a mine to be discovered.
4080. Can you offer any opinion as to whether that district has been fairly prospected? I think it has been fairly prospected; but against that fact look at Cobar. When I lived at Cobar, there was not a gold-mine in the district, and it was supposed to be as well prospected as a country could be; but events showed it was not.
4081. Is that mineral belt from Temora to Wyalong of any great width—that is east and west? I hardly could give you an opinion. There are really three different belts, and I do not think there is any connection between the belts.
4082. Do I understand that you do not anticipate much from reefing developments immediately around Temora? Really, I do not expect very much there.
4083. *Mr. Watson.*] Do you consider sinking to a depth of from 150 to 250 feet sufficient prospecting? Yes; if you are following a reef, I should think it would be quite sufficient. I quite understand that if you are simply sinking a shaft to cut a reef the statement would not hold.
4084. Assuming you to have good gold above, would you think that was fairly prospected if you lost the run of gold, although still holding the reef at (say) 150 feet? No, I would not.
4085. You think it would be worth while following up the reef? Yes, provided that you had good gold above.
4086. I think you said that you did not remember any instance where good reef gold in a well-mineralised matrix was obtained at Temora;—did you hear of Mother Shipton's? Yes; I have seen samples and been underground.
4087. They got rich gold near the surface? Very rich alluvial. I do not think they ever got any considerable quantity of quartz with much gold in it, and it is a very problematical question where alluvial gold has come from, indeed.
4088. I have been shown specimens which were supposed to be from Mother Shipton's, and the quartz was heavily charged with gold? I have seen some rather good quartz from Mother Shipton's, and also from another abandoned shaft on the railway line which someone took up again recently.
4089. Did you notice any of the reefs at the lower end of Temora? No; I have not seen any reefs in the lower end at all.
4090. There are some reefs there which have assayed 12 and 14 dwt. per ton? Yes; I have heard that they have got something rather like that.
4091. Do you think there is sufficient distance between Upper Temora and Lower Temora to give a possibility or a probability of a change in the character of the reefs, the distance being about 4 miles? I could scarcely answer that question, as I do not know sufficient of the later developments there.
4092. We were informed at Reefton that they had got mineralised ore there at the 300-foot level, that is in slate country;—is that a good indication following on what you saw of the reef originally? I think it is. What is there is very good looking, but there is not enough of it.
4093. You think that at Reefton there might, perhaps, be a few mines which might pay well? Yes, a few mining camps.
4094. *Mr. Trickett.*] When you were before a former Committee you stated that you thought that the Wyalong stone must be treated on the field;—but they seem to be sending a good deal to Dapto for treatment? At the same time I think it would pay them better if they could do it on the field. It is the hope of, I think, everyone who owns a mine to treat the ore on the field. There is really no reason why they could not or should not treat the stone locally. 4095.

4095. It is a question of plant and outlay? It is a question of their agreeing amongst themselves to support works which could treat ore of that sort. It is a matter of brains more than actual capital. You want a good man, and you cannot get a good man under £1,000 or £2,000 a year who will do that sort of thing, and one mine cannot afford to give that salary.

Rev.  
J. M. Curran.  
29 Aug., 1899.

4096. Do you think there is any prospect of any other minerals being found in the district between Temora and Wyalong? No. I do not think it is a copper country.

4097. You think it is purely a gold country? I think so.

4098. Before a former Committee you stated that you thought the mining population of Wyalong was about at its normal state—about 5,000 people; since that time it has rather decreased;—I suppose you are still of opinion that the field is of such a character that it will not attract a very large mining population? No; the highest population which the mining industry will support was the population which it had when I was there in 1895. I do not think there will ever be so many there again.

4099. When you were there in 1895 you stated that there were between sixty and seventy claims on payable gold;—on the occasion of your last visit, did you notice whether the number had been diminished or increased? A great many less; nothing like that number, I should think.

4100. *Mr. Watson.*] I suppose, when you were there previously, a great number had been working at shallow reefs in broken country? Yes.

4101. What has since become one property belonged then to three, four, or five prospectors? I suppose so.

4102. *Mr. Trickett.*] Before the former Committee you said that you did not see that the development of the field was in any way being retarded by reason of its not having railway communication;—have you seen any room to change your opinion? From a mining standpoint, I cannot see what advantage it would give them in the way of developing the field.

4103. It is not likely, if they build a railway from Temora, that the development of the mines would be in any way increased? I do not see that it would affect the mines at all. It might affect other industries, but the mines would go on just the same, I should imagine.

4104. Have the conditions, in regard to water supply in the district improved since you were there before? No; I think the trouble is as intense as ever it was. There is always the danger of everything coming to a standstill from the want of water.

4105. *Chairman.*] We gather, then, that, so far as Wyalong is concerned, you think that reefing will be permanent there—that it is doubtful at Barmedman and at Reefton, and that there is very little chance at Temora for reefing? I think it would be rather strong to say that in regard to Barmedman and the Reefton mining camp on the way out there. There are great possibilities in both places. As far as reefing goes in Temora, I think I might say safely, I do not think there is any great development to be expected there. I think it would be rather hazardous to say that Barmedman might not turn out to be a very good gold-producing centre.

4106. Possibly it may be? It is quite possible. You might even say that there is a reasonable possibility of believing such a thing.

4107. We are considering a proposal to construct a line of railway from Grenfell to Wyalong;—do you think the construction of the line would benefit mining at all;—I think I understood you to say that it would not? That is what I think. I cannot see how the mining industry could take any great leap forward if the railway were built.

4108. Do you think, from the character of the stone there, it would be necessary to smelt? I do not think so. I do not see how they could very well smelt the ore. It is a very different thing at Dapto, where they have other ores to smelt with—that is, if they do smelt Wyalong stone at Dapto.

4109. So that, if it did resolve itself into a question of smelting, the ore would be carried from Wyalong? Even then, I think, it would; but I do not think the smelting proposition will ever do much for Wyalong.

4110. We must not hope to get much revenue from traffic in either coal or ore over the line if constructed? I do not think so. I do not see how there would be any considerable consumption of coal.

4111. *Mr. Levien.*] I suppose that with a permanent field like Wyalong there is a better chance of success for a railway than there is with a field about which there is no certainty;—there is always a constant traffic between the two places? In a general way it would have a better chance of success; but I cannot see how it would benefit the mining materially.

4112. But the population and the merchandise would provide a large traffic to a permanent field;—you would say that Wyalong is a permanent field? Yes.

4113. Both the Rev. Mr. Campbell and yourself think that it is a permanent field? I see no reason why mining should not go on there for many years.

4114. Considering that it is a permanent field, with its population and the merchandise which will be required, do you not think it has a good chance of success? I think the district would benefit by a railway; but that is hardly a help to mining. It opens up a commercial question.

4115. You look upon it as a permanent field in a limited way? Yes.

4116. What is your opinion about Barmedman? I think I might expect anything from Barmedman. It would not surprise me to hear that good discoveries were made in that district.

4117. So far as you can offer an opinion, do you think Barmedman will be a permanent field? It is only a very vague opinion one can give as to a possible field. If any gold were discovered there below water-level in some of the old shafts, I should consider it a very hopeful sign.

4118. And as regards Reefton, what is your opinion? It will be a good mining camp, I should say, for some time.

4119. It is rarely that you find three fields so closely associated as you find these three fields, and having a chance of success? Yes; it is rarely you find three fields so close together, and so different in character, too.

Arthur Sharp, District Surveyor, Forbes, sworn, and examined:—

4120. *Chairman.*] You are District Surveyor stationed at Forbes? Yes.

4121. How much of the country to be served by the proposed line is in your district? The whole of it.

4122. Will you give the boundries of your district? It extends south to within 5 miles of Temora—it runs north of east to about 6 or 8 miles west of Koorawatha—it follows the Dividing Range right down to the Lachlan, including the whole of the land district of Grenfell.

A. Sharp.  
29 Aug., 1899.

4123. Can you describe the nature of the country between the Lachlan and the proposed line? Yes. Following the line from Grenfell, you pass through good agricultural country for about 20 miles when you

A. Sharp. you strike the Bland Plain country which I consider only pastoral country. It is very rich pastoral country, but is not adapted for agriculture. That country would extend for about 25 miles. For the last 10 miles you get into agricultural country again before you reach Wyalong.

29 Aug., 1899.

4124. The Bland country is first-class sheep country? Yes.

4125. Is there much good land lying between Lake Cowal and that line which you see on the map running north from Grenfell to Forbes? There is some very good country in between those two points, until you get within 20 miles of Lake Cowal, when you strike the Bland country again.

4126. *Mr. Watson.*] That would be about half way between the imaginary line and the lake? Yes.

4127. *Chairman.*] If we have been told that the good agricultural country extends almost to the shores of Lake Cowal, you do not think that is so? Certainly not on the east side. On the west side it extends much closer; but on the east side that is low-lying country, swampy country, not what I consider agricultural country at all. It is very rich pastoral country, but it is not adapted for agriculture.

4128. *Mr. Trickett.*] As regards a railway line from Grenfell to Wyalong, you start with about 22 miles of good country? Yes; about 25 miles of good agricultural country.

4129. Consisting of red-soil, suitable for the growth of cereals? Yes.

4130. Then you go through this large patch of Bland country for a distance of 25 miles? Yes.

4131. And for the last 10 miles on to Wyalong you come into country which you think is suitable for agriculture? Yes.

4132. Although somewhat different in character from the country at the other end? Yes.

4133. It is more of a mixed character—some red soil and some mallee country, which would be suitable for crops? Yes.

4134. *Mr. Watson.*] The mallee is rather in narrow belts, as a rule? Yes; but there are some good large belts about Wyalong. Some of it is good, and some of it is absolutely worthless.

4135. Starting from Grenfell to Wyalong, of the northern route, and the Bimbi route, which do you think would benefit the larger area of agricultural land on either side of the line? I should say about equal; I do not think there would be very much difference.

4136. On the northern route you have the Weddin Mountain on the left side, and on the southern route you have it on the right side going out? Yes; you must go round either north or south.

4137. With regard to this Bland country, we have had many opinions;—what do you think of that country as regards its agricultural capacity? I do not think it is suitable for agriculture; it is too stiff.

4138. Is it likely to be flooded? Yes; it is low-lying. It holds water; it is clay-pan country.

4139. Do you think it would be a class of country across which there would be any great rush of water in a time of heavy rain, which would injure a surface line of railway? Yes. In 1885, when the Cootamundra railway accident took place, that was all a sea of water for miles wide; it filled the lake. It catches all the water from up near Cootamundra. There is a tremendous watershed.

4140. To what depth was the water where the railway line would traverse? I should say from 1 foot to 5 or 6 feet in the depressions.

4141. For a railway line the depressions would be filled in? Yes.

4142. But on the ordinary level the water was about a foot in depth? Yes.

4143. Was not that a very extreme fall of rain? It was a very exceptional fall.

4144. Do you think, under ordinary circumstances, a surface line of railway, with ample water channels at frequent intervals, would stand the ordinary rush of water? Yes, provided that the get-aways were sufficient to keep the water from going over the line.

4145. With plenty of water channels at frequent intervals would it stand the ordinary rush of water? Yes.

4146. The Bland Creek does not run generally? No.

4147. It only runs in times of heavy rains? That is all.

4148. As a rule the water-holes of the river are at considerable intervals? In an ordinary season you can get water in every quarter of a mile along the river.

4149. Have you ever seen any crops growing on this Bland country to any extent? No. The only place at which I have seen crops growing is Billabong station, which is below Marsden. The crops were not a success, and the station manager told me that he found it much cheaper to buy from farmers who have selections out towards Wyalong on the sandy country than to attempt to grow his own, as the crops were so risky.

4150. Having described the country to Wyalong, will you now describe the character of the country in the direction of Hillston from Wyalong? It is very scrubby country. It is all timbered country as far as my district goes, that is about 30 miles west of Wyalong.

4151. Will you describe the country between Yalgogrin and on towards Rankin's Springs? It is all timbered country, mostly encumbered with scrub; very excellent soil for agriculture for the greater part of the area. It is difficult country to treat for grazing purposes, because of the noxious growths. They require constant expenditure, and the country is not sufficiently heavy-carrying to keep down this undergrowth; but I think it would grow first-class wheat on three-fourths of the area.

4152. Is there any wheat cultivation out on that area? Yes, I have seen a crop growing at Ungarie, 30 miles north-west of Wyalong, and it was as fine a crop as ever I saw in my life.

4153. In a good season you have seen a splendid crop of wheat there? Yes.

4154. Is the country at Ungarie of the same character as the country in the direction of Rankin's Springs? As far as my district goes it is similar country—open box and oak forest with belts of mallee interspersed occasionally with patches of boree.

4155. With regard to this scrub country, it is a fact that it is allowed to become overrun by scrub and vermin, by reason of the squatters not being certain of their tenure, and not being prepared to go in for expensive clearing? There is no doubt that has a great deal to do with it. On Buddigower, which comprises 80,000 acres, there is a large area—three-fourths of it—of first-class agricultural country. It is a leasehold area which was thrown open three years ago. They would not pay for the land for grazing purposes.

4156. If it is such good agricultural land as you describe why is it not taken up;—is it not available for agricultural purposes? Yes, but there is no market. It is too far from a railway to cart the stuff.

4157. Going from Wyalong to Barmedman, will you describe that country for a distance of 10 miles on either side of the suggested route? On the western side it is practically all timbered country, and a good deal

- deal of mallee within that distance of 10 miles. On the eastern side, three-fourths of the country is heavily timbered, but it has a fairly good soil for cultivation. The other fourth would be clay soil. A. Sharp.  
 4158. In going from Wyalong to Barmedman we did not notice so much cultivation as we did in going from Barmedman to Temora;—do you know the reason of that? Yes. You are passing through leasehold areas nearly all the way from Wyalong to Barmedman, and where you are not passing through leasehold areas, you are passing through a stock route which you cannot see across. 29 Aug., 1899.
4159. So that that land has not been available for agriculture? Not close to the road.
4160. Then going on from Barmedman down to Temora, will you describe a stretch of country for say 10 miles on either side of the suggested route? It is all timbered country, good red soil, well adapted for agriculture, except on the hills, such as about Reef-ton, where there is some barren country.
4161. Off the hills it is all good country, and there is a considerable amount of agriculture going on? Yes; as you get in towards the railway.
4162. Take the country from Temora outwards towards Wyalong for a distance of 20 or 25 miles, and taking the country from Grenfell outwards towards Wyalong for a distance of 25 miles, do you think the circumstances are very much the same with regard to agricultural advantages? Very much the same, if anything I should say a little in favour of the Temora side, because the Weddin Mountain takes up a large area, more, I think, than there would be within the same radius from Temora.
4163. But the class of country available is of much the same character, is it not? It is of much the same character—really good wheat land.
4164. Have you known the district well since the line was extended from Cootamundra to Temora? Yes.
4165. What has been your observation of the effect of that railway upon agriculture, between Cootamundra, and between Temora and Barmedman? I could not say so much about the country between Cootamundra and Temora. From Temora and Barmedman West, out in the direction of Aria-h, there has been a large increase in agriculture.
4166. More so than on the direct line from Temora to Wyalong? I think so, because it is easier country to clear.
4167. Will you describe the country? It is pine and box country; but it is not so encumbered with noxious scrub; it is easier to deal with.
4168. Do you know the country to the west of Koorawatha? Yes; as far as my district goes; as far as the top of the range I know it.
4169. Do you know the wheat areas there belonging to Mr. Greene, Mr. Wood, and the other holders? Yes.
4170. How would you compare that patch of country, as regards its agricultural advancement, with the country which you have described, out between Temora and Aria-h? I should think that one would be about as good as the other. I should think that the Aria-h country would be as good as Mr. Woods'.
4171. Just about the same? I think so.
4172. Do you regard all that country you have been speaking of as being of a somewhat similar character as regards its agricultural prospects? Yes.
4173. Do you think the fact of the rainfall being lighter as you get westward is a detriment to the wheat crops, or is that patch of country such that where you get rain in one part you do not get rain in another? There is not a great deal of difference, I think, in the rainfall of the whole district.
4174. We hear it contended that with regard to some of the starting-points of these railways, such as Grenfell and Temora, as you go west the rainfall becomes less, and that places to the east, such as Grenfell, Koorawatha, and Temora, would be the means of feeding the western parts in dry season;—do you not think they are sufficiently close together that when there is likely to be a drought in one part of the district, there is likely to be a dry season in another part? I think so. A thunderstorm makes all the difference in wheat-growing.
4175. Taking the ordinary rainfall, until you get possibly out towards Rankin's Springs, do you not think that the rainfall of that district which we are now considering is pretty much of a muchness? Yes.
4176. So that as regards one part getting a benefit from another part in a dry season, there is not very much chance for them to get a market out west? Not as regards the country shown on the map. It is all practically the same. In one year it might be better in one place than in another; but in the next year it might not be.
4177. How does this belt of country which we are now considering compare with the wheat-growing country as you get up nearer to the Lachlan River, about Forbes? The country about Forbes is of a different nature; it is more black soil.
4178. Better for wheat growing? I do not think so. It is better for grazing.
4179. Crops have been fairly successful up there? One failure in six or seven crops, not more.
4180. They are entirely dependent on the rainfall; they do not go in for irrigating their crops? No; nothing to speak of. I do not know of any wheat that is irrigated.
4181. I suppose, as a Government official, you would not care to give a straight-out opinion as to which line would be the better one to construct? My opinion is that the line from Temora would be the best one, for the reason that, on the other, for a distance of 25 miles east and west, and about 30 or 40 miles north and south, I do not see that it could be much more productive than it is. Another reason is that on that line there are such large estates to go through. You may say that Mr. Gibson, Mrs. French, Mr. Chisholm, and Mr. Donkin have nearly all the Bland country. I suppose there is an area of 150,000 acres of freehold land in four estates. That condition of things does not prevail at all on the route from Temora.
4182. Would that be regarding the railway as merely going as far as Wyalong, or as having in view a further extension to the west? Either. If it is to go beyond Wyalong, which I presume it is, I think it should still go from Temora, because it would open up more Government land, and country that is capable of a good deal of production, but which is now only a breeding-ground for vermin.
4183. Mr. Shepherd.] Is the whole of the Bland country of a similar character as regards soil, or does it vary? It is practically the same; it is more swampy in places, of course.
4184. I suppose it is pretty well equally divided between plain and bush? Yes; a good deal of the country has a little timber on it; but the soil is practically the same. It is a wet, clayey soil, which holds the water. It grows splendid grass.
4185. It is a sort of blue, tenacious clay? Yes.

- A. Sharp. 4186. Are you aware whether any attempt has been made to cultivate? No; except at Buddigower, below Marsden, where it is a crumbly black soil, not a hard black mud.
- 29 Aug., 1899. 4187. With what success at that place? The station manager told me he found it so precarious that he had given up all idea of cultivation since the farmers came out near Wyalong; he found it much cheaper to buy stuff from them than to grow it.
4188. How does it answer as pastoral country? Splendidly.
4189. I suppose in a fairly good season it affords pasture pretty well all the year? I have seen grass as high as myself on the plains there.
4190. Chiefly trefoil, I suppose? There is trefoil, and there is what they call "plain grass," which runs to a head like oats.
4191. Have you ever seen Mitchell-grass in that part of the country? I could not say, as I do not know Mitchell-grass.
4192. As a pastoral country, you think it is excellent? Yes.
4193. How many cattle or sheep will it carry to the acre? It is estimated at about  $1\frac{1}{2}$  acre to a sheep, and at about 10 acres, or perhaps a little more, to a grown bullock.
4194. I thought it was generally considered that one large beast takes as much as three sheep? I think about seven.
4195. As regards dividing the country, where a regular system of railroads exists, do you not think it is an advantage, as nearly as possible, to run parallel lines, so as to tap the distant country from the main line? Yes.
4196. Which line would divide the country best in this instance—a line from Grenfell, or a line from Temora? The Grenfell line would, looking at the matter in that way, as far as Wyalong.
4197. There is very little doubt that ultimately the line from Koorawatha will be continued, and taken probably on to Hillston, and then the line from Wyalong to Temora would strike off from that line almost at a right angle? It is a long way from a right angle.
4198. At all events, adopting a principle of that kind, it appears to me that a line from Koorawatha to Hillston would more equally divide the country than would be the case if you constructed a line to Temora, and left all that country open? I quite admit that, if the other conditions were similar. There is so much in favour of the Temora line that I think it should be taken from Temora.
4199. You think in the interests of the country generally the Temora-Wyalong line is the better one of the two? I think so. Taking a line north and south from Wyalong, as regards most of the people west of that line, their interests lie more southerly than northerly, and if the line were taken *via* Grenfell, there would still be a large traffic by coach to Wyalong and Temora.
4200. *Mr. Watson.*] A competitor with the Grenfell-Wyalong railway? Yes. The Commissioners would get all that traffic if they took the line from Temora, whereas they would lose a great deal of it by taking the line from Grenfell.
4201. *Mr. Shepherd.*] You are well acquainted with the whole of that country right out to the Lachlan? Yes.
4202. Is it a fact that there is good agricultural country out all the way to the Lachlan? Yes; till you get within 15 miles of the Lachlan, and leaving out the hills, it is really good agricultural land. It is all country that is easily cleared for agriculture.
4203. Compared with the coast country, it is very easily cleared, because the timber is so easily burnt off? Compared with coast country, it is very easily cleared.
4204. Is that black-soil country met with to any extent in any other portion of that line: we were told that a little way out from that line from Barmedman there was a good deal of black soil? Yes; you strike what you call the Bland country about 3 miles from Barmedman—at Mr. Rickardson's station.
4205. Is there any great extent of that country? Yes; you skirt it all the way.
4206. *Mr. Dick.*] You were asked whether you do not think, as a matter of policy, it would be better to split the country up by a system of parallel lines;—does not such a system presume that the whole of the land is uniformly good? Yes; I explained that with equal conditions that argument holds good, but not otherwise.
4207. Is it not also presumed that there are no great differences in the way of mountains, watercourses, and lakes? Yes; the conditions must be absolutely equal.
4208. Could you offer any opinion as to why a considerable amount of the leasehold area in this district is held under a system of annual leases, and why so much of the country to the west of Wyalong is untenanted? Because the expense of getting it into a fit state for grazing purposes is so heavy that it does not pay with the tenure they have, and also because it is infested with anthrax and wild dogs; but at the same time it is admirably adapted for agriculture.
4209. Do you think a system of close settlement with small holdings would alter the conditions of settlement out there? I do; I think it would be taken up if they had railway communication within a reasonable distance.
4210. I think you stated that the good agricultural land extended west from Grenfell for a distance of from 20 to 25 miles;—do you not think that for all practical purposes that good land would be served, as far as traffic is concerned, by a terminus at Grenfell? Yes.
4211. Then, with an extension from Temora to Wyalong, would not the good country around Wyalong also be similarly served by a terminus at Wyalong? Yes, for a similar distance.
4212. That leaves an intermediate stretch between Grenfell and Wyalong—practically the Bland area—through which a railway would not pass;—do you think, as it is pastoral country, that area would be sufficiently served by a terminus at Grenfell and a terminus at Wyalong? Certainly I do.
4213. We had it from several witnesses that the low embankments which it is proposed to construct along the Bland country for the railway would, in the case of even an ordinary flood, be almost entirely washed away, and that the rails would be left practically hanging to the sleepers, with no support at all between them;—do you think the country there is of so soluble a nature as to bring about that result in times of flood? I do not think so, except in a big flood. As long as the flood did not come over the rails, I think it would be all right.
4214. In any case you think considerable openings would be necessary to allow the water to get away? Certainly.
4215. If there were not sufficient openings provided, a railway line from Grenfell to Wyalong would act practically as a long dam, which would intercept the course of water practically at right angles? Yes.
- 4216.

4216. *Mr. Watson.*] Will you roughly describe the country which is drained by the Bland, south of the proposed line? Commencing at Bumbaldry, 15 miles west from Cowra, the water runs into the Bland, and also from the town of Young; then again from near Cootamundra, and then again from Temora, and at Duck Creek, between Reefton and Morangarell. A. Sharp.  
29 Aug., 1899.
4217. That is an extensive area of country? It is a very large area.
4218. Therefore, I should imagine a very great body of water will pass down the Bland occasionally where it is proposed that the line will cross? Yes.
4219. Do you think the gentleman who has been conducting the survey recently across that tract of country, having seen it only in the driest season, would really have no conception of the Bland under wet conditions? I do not think so. They would have the levels to guide them, and they would get particulars as to flood-marks from the local people; but looking at it alone they could not realise the difference.
4220. Do you not think it would almost require that the two conditions should be seen to appreciate the difference between them? I think so.
4221. With regard to the cutting up of the country, you are of opinion that, notwithstanding the fact that the line from Grenfell to Wyalong may look to divide the country in a better manner, the local conditions are so emphatically different that it is a wiser proposition to go from Temora? Yes.
4222. You have no doubt either that with a railway connection, no matter from which point westward from Wyalong, that country can be opened with profit to the State? Yes; from Temora to Wyalong.
4223. In any case, supposing the railway goes to Wyalong, an extension westward would pay—at any rate, would open up a big lot of country? It would pay in this way: It would bring into profitable occupation country which is now a wilderness.
4224. I do not suppose a single settler going there under present conditions would have much chance of success against dogs and rabbits? No.
4225. He would require to have near him neighbours who would assist him in keeping down the vermin? Yes.
4226. So that it is impossible without a very large expenditure of capital, I should imagine, to expect that country to be profitably worked without railway communication? I think it would require a railway to reclaim it; otherwise I do not think it will ever be occupied.
4227. *Mr. Levien.*] You have looked at the matter from every standpoint, and if you had a recommendation to make you would recommend a line from Wyalong to Temora? Yes.
4228. How many years have you been in that part of the Colony? I have been District Surveyor for eight years, and I have been a surveyor in the district for twenty-two years.
4229. You have a thorough knowledge of the district, and that is what you would honestly recommend? Yes. The Temora line can never pay unless it is extended. As regards the Grenfell to Koorawatha line, I think it is only a matter of time when it must be extended to Dubbo.
4230. *Mr. Trickett.*] Suppose a railway is wanted out to Ariah and Gunbar, where will that go from? If those two lines are going to be made, a line from Temora to Wyalong will not be necessary.
4231. *Mr. Watson.*] If a line to Ariah were necessary, could it not junction at Temora and still go through good country all the way? Yes. There is a cocks spur line from Cootamundra to Gundagai, which runs into mountain country, and which has been much used this last year by starving stock. When there is a drought in this western country that cocks spur line could be used to take stock from the dry country up on to the mountains by a direct route, whereas it will never pay to go all the way round with the stock.

WEDNESDAY, 30 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Samuel Nixon, farmer, Gunbar, sworn, and examined:—

4232. *Chairman.*] You are a farmer residing at Gunbar? Yes.
4233. You are also President of the Gunbar Railway League? Yes.
4234. You desire to give evidence at this inquiry? Yes.
4235. *Dr. Garran.*] What do you cultivate? I have 1,675 acres of land under wheat.
4236. During the last four dry years, have you been able to grow wheat? With the exception of last year, I have had payable crops.
4237. What do you call a payable crop? From 10 to 11 bushels.
4238. Is it good wheat? It is first-class wheat. The wheat has been sold in Sydney by Harrison, Jones, and Devlin, and it has always fetched top price.
4239. Is it a hard, flinty wheat? No; that country grows a soft milling wheat—a dry wheat.
4240. Wheat that millers like? Yes.
4241. You have no difficulty in getting top price for your wheat? No. It always commands top price. Is it similar to wheat grown north of Adelaide.
4242. What is the sort of soil you cultivate? It is a red loam.
4243. Is it clay underneath? Yes, in my own case the subsoil is of a clayey nature. It retains the moisture well.
4244. But it is not too wet? No, we never have it too wet.
4245. How many inches of rain do you get in the year? Our average rainfall is between 15 and 16 inches.
4246. Do you get it at the right time of the year for your wheat? Generally. Out of seventeen years farming at Gunbar I have had one total failure, and one partial failure.

S. Nixon.  
30 Aug., 1899.

- S. Nixon.  
30 Aug., 1899.
4247. What are the times of the year when you most want the rain for wheat? We require rain to bring it up between May and June.
4248. Do you not first want the rain for the ploughing? I usually fallow the land. I usually plough in spring, and keep my land fallowed. My style of working is to have between 3,000 and 4,000 acres cleared, and I crop 1,000 or 1,500 acres alternately, as a rule. By that means I am enabled to get my crop in early, and also plough when the land is in the best condition. By using six and eight-furrow ploughs, which I usually do, I can get my land turned over very cheaply.
4249. Can you plough before any rain has fallen, after the crops are taken off? Yes; by using plenty of strength, and keeping the shares in good order.
4250. You do not actually want rain to plough? No; it is not absolutely necessary.
4251. Do you want rain for sowing? No; I usually sow at a dry time. I prefer to sow then.
4252. When do you want rain—when the seed begins to spring? Yes; we would prefer rain about April or May to bring it up. We usually start sowing at the end of March.
4253. When after that do you want more rain? Every month or so.
4254. You do not get rain every few weeks? No; in this season, since the 3rd January, we have had about 5 inches. Our crops are looking very well indeed.
4255. Do you want rain when the wheat is forming in the ear? Yes; September and October is the most critical time.
4256. Do you want rain again before it finally ripens to swell it to the full size? No. If we get two falls in September and October our crop is assured.
4257. You let it ripen without any more rain after October? Yes.
4258. So that all you want is rain between March and October? That is all.
4259. And it does not matter to you if, for the rest of the year, it is quite dry? No.
4260. From that statement I should say that you look upon Gunbar as an agricultural district? Yes.
4261. Some witnesses seem inclined to think that the agricultural district ends a little after we get beyond Wyalong, and that the pastoral district begins there;—you do not take that view? No. I would like to explain one remarkable feature of the Gunbar district—its producing qualities with a slight rainfall. Fifteen inches of rain with us will give payable crops; but I see that about Wagga and Junee the same rainfall will result in failures.
4262. Does it come at the right time of the year for that? As a rule it does.
4263. Would the good land and the climate also carry agriculture right on to Booligal? No.
4264. Why not? Gunbar is getting on the edge of the cultivated lands—that is, the agricultural land; and then you get into open plain and salt-bush country, which is totally unsuitable for cultivation.
4265. You look upon Gunbar as being upon the margin of cultivation? Yes.
4266. Had you had any experience of wheat growing in Australia before you went to Gunbar? In South Australia I had.
4267. In what part of South Australia? Over the northern areas. I had also nine years experience in the Deniliquin district.
4268. You sometimes had less rainfall in the northern areas of South Australia than you have in Gunbar? On an average, we had far less.
4269. Then Gunbar is a better agricultural country than the northern areas of South Australia? Very much so.
4270. But you were within Mr. Goyder's limits in the northern areas? Yes.
4271. Yet you did not get enough rainfall? Not sufficient.
4272. Have most of the farmers cleared out of those northern areas now, or are they struggling on? Many of them are struggling on.
4273. How many have given it up? I have been away from that district now for twenty-one years.
4274. From what you know of the northern areas, has the attempt to make that an agricultural district, under Mr. Goyder's advice, been a success on the whole? The northern area got beyond Mr. Goyder's rainfall, but up to that rainfall it has been a success—that is, up to Mount Remarkable.
4275. You think his judgment was sound? Yes. I was there at the time he limited that district.
4276. Has the Government pushed beyond his limit? Yes.
4277. Where they have gone beyond his limit the attempt to establish agricultural settlement has not been a success? No.
4278. If we are to learn from the experience of South Australia, it will be to attempt not to push agriculture in districts not fitted for it? Just so.
4279. But as far as you can see, is all the country between Temora and Gunbar fitted for agriculture? The greater part of it is. There are a few stony ranges; a very small percentage is not suitable.
4280. That is a matter of soil, but I am speaking of a matter of climate? As a matter of climate, and a matter of rainfall, it is well adapted for that purpose.
4281. But not far beyond Gunbar? No, the soil is unsuitable beyond Gunbar.
4282. Was Gunbar a good pastoral country before you took your land up? Years ago it was much better than it is now. Gunbar has deteriorated very much within the last seventeen years, since I have been there.
4283. From what cause? Chiefly from the rabbits.
4284. Not from overstocking? No.
4285. Can you keep the rabbits off your own wheat? Yes; I find no difficulty with wire netting.
4286. They do not climb over the wire netting? A certain percentage does, but the number is very few.
4287. They do not crawl under it? We have to watch; it requires great supervision.
4288. Have you suffered from the sand blowing up against your fence this season? Yes; but most of the Gunbar country is sheltered. Out towards Booligal the fences are completely blocked.
4289. Is it timber which shelters the Gunbar country? Yes; the Gunbar country and all the Temora country is sheltered by timber.
4290. I understand that you favour the idea that the line to Temora should be continued to Gunbar? Yes.
4291. And in the main you think that it will go through an agricultural district? Yes.
4292. From Temora to Ariaah, is that country all fairly good? I have had no experience of that part.
4293. But there is a good deal of settlement about Ariaah? I believe so.
4294. Do you know the country between Ariaah and Mount Elliott? No; but I know the country from Mount Elliott to Gunbar.
- 4295.

4295. What is it between Mount Elliott and Gunbar? Good agricultural country.
4296. Where do you send your wheat when you sell it? It goes to Sydney *via* Carrathool, on the Hay line.
4297. How far is your place from Carrathool railway station? Forty miles.
4298. It will pay you to cart wheat 40 miles to a railway station? Up to this time it has paid me. I have had the advantage of the wool teams. I have got my wheat carted the 40 miles at an average cost of 1s. 8d. a bag, but I can see a great difficulty from now; in fact it is a source of anxiety to me how I am to get my wheat in now. The teams have lost the stock by the drought, and they see so little wool to cart now that those who have survived are leaving the district.
4299. But still the wool teams which go from Gunbar to Carrathool could not take your wheat in addition to the wool? The harvest comes a month or so after the wool-carting.
4300. The same teams do it, but at different times of the year? Yes; and they have been carting it at a low rate.
4301. Do these teamsters own land up there—are they settled in the district? Very few.
4302. Are most of them without a home? A few of them have settlement leases about Hay.
4303. They are simply wanderers with their teams? Yes.
4304. What price will pay you, after deducting all costs, and leave you a livelihood? At Gunbar, from 1s. 9d. to 1s. 10d. a bushel.
4305. You could make a profit out of that price? Well.
4306. With a yield of 11 bushels to the acre? Yes.
4307. And if this railway were extended to Gunbar, and your produce were carried at the ordinary low rates which now prevail, you would gain, I suppose? Yes.
4308. It would cost you less? Very much less.
4309. Because if this railway were made you would have to send from Gunbar to Temora by rail? Yes. At present it has been costing me the same rate to send it 40 miles by team as it has to send it over 400 miles by the railway. It has cost me about 5d. to Carrathool, and a fraction over 5d. from Hay or Carrathool to Sydney.
4310. That shows the value of railway communication to the working farmer? Yes; it is simply the difference between success and failure.
4311. I suppose the price you get is only got in dry weather, when the roads are naturally good? That is all.
4312. They could not do that in very bad weather? No.
4313. After rain are the roads bad about your place;—is it a sticky country? If we have the wet the roads are very bad.
4314. Then if this is to become an agricultural district a railway is almost essential to the development of it? Yes.
4315. There has been a great deal of evidence brought before us in favour of making a line to Wyalong from Temora;—if that were done, do you think it would militate against an extension to Gunbar? I think so.
4316. Why should it, as it is in quite a different direction? It is not so direct as it would be from Temora.
4317. But supposing there is a railway made from Temora to Wyalong, and it can be shown that there is certain settlement all the way to Gunbar, why should it be impolitic to make a railway to Gunbar because there has been a railway made to Wyalong? It may not. It appears to me that it would be so; I may be wrong.
4318. Is that the general feeling at Gunbar? I think so.
4319. Are there any other farmers around Gunbar besides yourself? There is an area of about 12,000 acres under crop around Gunbar.
4320. Are they mostly South Australians? A number of them are South Australians and Victorians.
- 4321-2. Did they come over about the same time as you did? Many of them came over after I did. They came on my recommendation.
4323. Your impression is that you have prospered much more at Gunbar than you would have done if you had stayed in the northern areas of South Australia? Yes. I know that many of my friends who remained there have failed; but those of us who have come from there have all been successful.
4324. You see no reason to regret your removal? None whatever.
4325. Did you free-select your land? Yes.
4326. Did you take up leases round your selection? Yes; three conditional leases.
4327. Do you continue to hold under your original tenure? Yes.
4328. How much did you take up originally? I took up 620 acres conditional purchase and 1,300 odd acres pre-emptive leases.
4329. You very nearly exhausted your right at starting? Yes.
4330. Did the others who came across begin on the same large scale? Yes; it is necessary to have a large area.
4331. It will not do to begin with 40 acres, and wait to be able to extend your holding? No; nothing under 2,000 acres is any good there.
4332. Did you ever have any trouble with the pastoralist on whose run you settled? Yes.
4333. Was it a fight from the beginning? Yes; I was cut off—dummied all round.
4334. You struggled through in spite of it? Yes.
4335. Was not that rather a hard business to have to fight up-hill like that against a powerful man? Yes; but fortunately it is stopped now.
4336. It does not strike you as the best possible method to settle a poor man on the soil, to set him to fight a squatter? No.
4337. You got through? Because I happened to have money. I came up with a few thousand pounds and got through; otherwise I should not have done so.
4338. If you had not started with sufficient capital, you would have gone down? With sufficient capital and with experience too.
4339. Has there been any movement along the line of road between Temora and Gunbar in favour of the extension of this railway? I think for the whole distance.

S. Nixon.  
30 Aug., 1899.

- S. Nixon.  
30 Aug., 1899.
4340. The previous proposal for a railway to Ariah, was not from Temora but from Coolamon on the other line;—would you approve of a line from Coolamon to Ariah? I could not say. I know nothing about that district, and, therefore, I am not capable of giving an opinion.
4341. What seems to you the best way to get to Gunbar is an extension from Temora? Yes.
4342. And that is the general idea, as far as you know, along the whole line of road? Yes.
4343. If that line were made, do you think there would be, in the course of the next five years, a fair amount of settlement on that route? Within the last few years a number of Victorian men have come up there. They have all spoken highly of the land. But the trouble has been the difficulty of getting their produce to market. I am satisfied that within a very few years there will be an immense population there.
4344. You think that when the leases have run out, if the people had a notion that within two years there would be a line made from Temora to Gunbar, the available land would be taken up within the next five years? I am quite sure of it.
4345. If you have not worn your ground out in fifteen years, when do you expect to wear it out without manuring? I think with my style of farming—cropping every second or third year and grazing—I can keep the fertility in the soil; that has been my experience.
4346. Practically, you give your land a fallow every two or three years? Every two or three years. I am adopting every three years now.
4347. You plough it up and let it go into grass? Yes.
4348. Do you sow grass? No. The wind soon covers it with natural seed.
4349. Do you know what sort of natural grass it is? Silver grass, barley grass, trefoil, and crow-foot. Cultivation improves the country.
4350. The old grass-seeds are in the ground, I suppose? Yes.
4351. The grass is good enough for cattle and sheep? Yes.
4352. Are they fond of it? Yes; it is very fattening.
4353. Do they fatten on it? Very much so.
4354. Could you make hay of this grass? No.
4355. Does the first hot wind dry it up—brown it? No. There are a few root grasses, which hold fairly well—white head and spear grass stand well.
4356. How long through the summer does it stand good for feed? Our stock generally do on it till the cold weather sets in.
4357. Right through the summer? Yes.
4358. You do not overstock it? No; the main thing is not to overstock it.
4359. The secret of success is not to over-exhaust your ground by cropping, and not to overstock it? Yes.
4360. If people will do that, you think that they may go on for a long time? I think so.
4361. *Mr. Levien.*] How long have you lived in that district? I have lived in Gunbar and Deniliquin for twenty-six years.
4362. What is the character of the country between Wyalong and Gunbar? I can only speak of the country for about 40 to 50 miles east of Gunbar. I do not know anything of the country beyond that point towards Wyalong, except from hearsay.
4363. What is your opinion of the country itself? I believe it is good agricultural country.
4364. Supposing you had to give your real opinion as to the construction of a railway from Temora to Wyalong, or from Grenfell to Wyalong;—in the interests of the whole country, which line would you suggest? I think I would say to go straight from Grenfell to Wyalong, as it is the most direct route.
4365. Where do you live? Ten miles north of Gunbar township.
4366. It would be no benefit to you which way the line went to Wyalong? None whatever.
4367. Do you know Mr. Sharp, the District Surveyor for the Forbes district? No. We are out of his district.
4368. Mr. Sharp, who lives at Forbes, admits that he has had great experience, and he suggested yesterday a line from Wyalong to Temora;—what do you say about that? I daresay he is right.
4369. Mr. Sharp suggests a line from Temora to Wyalong;—you would not oppose his opinions, would you? The only thing, I think, in favour of Temora —
4370. You said just now that you would agree with Mr. Sharp? I said I would agree with him; but a line from Temora may serve more settlement. I am hardly competent to speak of that end of the line. I do not know enough about it to speak.
4371. He has expressed an opinion right away? I think it should go straight across from Grenfell, *via* Wyalong, to Gunbar.
4372. But you know nothing of that part of the country at all? I know nothing whatever of the country between Wyalong and Gunbar.
4373. So that you do not give any decisive opinion which line is the better? No, I do not. I am not capable of giving an opinion as to which line is the better.
4374. Which line do you advocate? So that it came to Gunbar, it would be indifferent to us which way it came.
4375. You are looking to your own interests, I suppose? Yes; and in that case I am also looking to the interests of the country.
4376. Considering that Mr. Sharp, who has been for many years in the Public Service, suggests that the line should go from Temora to Wyalong, and that it ought to go from Wyalong to Forbes, what do you say? I am not capable of speaking, because I do not know the country.
4377. *Mr. Dick.*] Your fear is that if the Temora-Wyalong extension be constructed, it may delay or altogether prevent the extension from Temora to Gunbar? Yes.
4378. If you will glance at the map you will see that the Parkes-Forbes extension did not prevent the extension from Parkes to Condobolin? No.
4379. And the conditions of those two lines, as far as their directions were concerned, are very similar, except that one goes north and the other south, to the position of the Temora-Wyalong extension and the Temora-Gunbar extension? Yes.
4380. Do you not think it is reasonable to assume that if the Temora-Gunbar extension would stand on its own basis as a line, and is necessary in the interests of agricultural development, the Temora-Wyalong extension would not interfere with it at all? It appears not, if you adopt that rule; it appears not in that instance.

4381. I think you said that you thought the Grenfell-Wyalong extension would be preferable to the Temora-Wyalong extension? Yes; it appears to be a more direct route on the map. I am going by the map. S. Nixon.  
30 Aug., 1899.
4382. That is your only reason? That is my only reason. I am not acquainted with the district.
4383. Of course, local conditions would entirely govern the choice of a route to Wyalong? Yes; I suppose they would.
4384. *Mr. Levien.*] You live at Gunbar, and I suppose when you come down you generally come by Temora? No, by Carathool.
4385. You know nothing whatever about that country? I know nothing of the country to the east of Mount Elliott.
4386. *Mr. Shepherd.*] Your property is 40 miles from a railway station, and you are satisfied to carry grain for that distance? I have been, up to this time, having the advantage of the wool teams.
4387. Do you think you can carry on successfully at half that distance—say 20 miles? Yes; grain may be profitably grown within 25 miles of a railway station.
4388. During a period of seventeen years, you have had only one total failure, and one partial failure? Yes; in 1888 I had a total failure, and last year only a partial failure.
4389. Do you include the last four years? Yes.
4390. Do you always adopt the plan of ploughing in spring, and allowing the land to fallow from spring up to the sowing season? Yes.
4391. You find that plan to answer? Yes.
4392. You have a sub-soil of clay;—what depth of loam have you over the clay? I should say from 6 to about 10 inches.
4393. You do not cultivate as deep as the clay, I suppose? No; we must not cultivate too deep there.
4394. What kind of plough do you use—a five-furrow plough? Six-furrow and eight-furrow ploughs.
4395. You get over an enormous amount of ground? Yes; I have the seed-sowers on the ploughs. If I plough in the beginning of winter, I plough and harrow at one operation.
4396. You received your farming education in South Australia, which is a very good school? Yes.
4397. You say that the country about Gunbar has deteriorated very much during the last seventeen years? Very much indeed.
4398. Have you noticed whether any kinds of grasses have disappeared during that time? The summer grasses have all gone. There was a time when, if we got a summer rain, we had a number of grasses, but they have totally disappeared.
4399. Did you ever have the Mitchell-grass there? No; a few roots came. They were dropped by travelling stock, but they died.
4400. Have you noticed the grasses which cattle or sheep are most fond of are those that disappear first? No; it is the summer grass.
4401. What grasses did you say are the most valuable there? Barley-grass, white-head grass, and spear-grass.
4402. What kinds of timber have you growing there? The forests are mostly pine and belar, but we have apple-bush, wilga, needle-bush, and any of the small scrubs.
4403. None of them would be suitable for railway sleepers? No.
4404. Do you know much about the country out to the Lachlan? I know the Lachlan country well. I was appraising for all the special areas in that district three years ago.
4405. The country right out to the Lachlan is something similar to the country at Gunbar, I suppose? North of Gunbar it is—to Hillston; but not towards Weelbar or Booligal.
4406. You know nothing about the country from Temora to Wyalong? Nothing whatever.
4407. Knowing that there is a probability of a railway being constructed in that direction, have you studied out the question as to which route would be likely to serve you best, and also serve that part of the country best? Not very much.
4408. Of course, you would prefer a line going down somewhere to Hay? No; I want a line going more direct—a line from Temora, not from Hay. It would go through agricultural country, and we could do so much better.
4409. How is the country about Gunbar watered? We depend chiefly upon tanks and deep wells.
4410. No creeks or rivers there? None whatever.
4411. Have you attempted to sink for water there? I have sunk four deep wells.
4412. Without success? I got water in them all. In the one I sank last summer I got stock water; but in the others the water was too salt. At Gunbar township there is an unlimited supply of shallow water, about 15 feet deep.
4413. *Mr. Levien.*] What kind of water is it? It is splendid, fresh water. It is soft water, and there is any quantity of it.
4414. *Mr. Shepherd.*] Does it appear to be supplied by a spring;—does the hole fill again immediately after being emptied? It appears to be in a basin. They cannot bale it down; there appears to be such a large supply. It is about 15 feet from the surface.
4415. *Mr. Levien.*] How do you get the water? By sinking. They lift it up with a windlass.
4416. Does it appear to be an everlasting supply? It appears to be so. There are no irrigation works about there. A well at a public-house watered hundreds of head of stock last summer.
4417. Is it all good water? It is all first-class water.
4418. How many of these springs are there? There are three or four wells out there.
4419. All the summer? Yes; it seems to me there is a sort of underground water. You can trace that water. You can also trace a sort of low watercourse by the native willows. It does not appear to be of great width; but it extends, to my knowledge, from 15 to 20 miles through the run.
4420. How many feet do you sink for water? It varies from 12 to 20 feet; on an average it is about 15 feet. There is any quantity of it.
4421. Does it take any particular direction? Yes; it runs from about south-east to north-west. It takes a narrow strip across the run.
4422. It requires no force to bring up the water? No.
4423. They would have to lift the water by buckets? Yes.
4424. *Mr. Shepherd.*] Do the holes ever overflow during heavy rains? No; it is a sort of underground watercourse. 4425.

- S. Nixon. 4425. *Mr. Levien.*] It would all have to be pumped up then? Yes; it is first-class, soft water.
- 30 Aug., 1899. 4426. Have you ever sent down any samples of this water for analysis? No; it has been so good that there has been no occasion to test it.
4427. Have you ever followed it down from Mount Elliott? No.
4428. *Mr. Trickett.*] I understand that you come here to-day, as a resident of Gunbar, to advocate that if any line of railway is constructed striking out in that direction it should take as direct a route as possible;—is that what you wish to convey? I suppose that is the substance of it.
4429. On the map do you see the Hay line marked in black, and a line marked from Grenfell to Wyalong, and a line from Wyalong to Hillston, which are the lines suggested? Yes.
4430. If a line were constructed from Grenfell to connect Wyalong and go out to Hillston, would it serve you in any way? No.
4431. I understand that you are inconvenienced by having to travel about 40 miles to the Hay line with your wheat? Yes.
4432. What distance do you think it would be a fair thing to you to have to convey your wheat to a railway, having in view the extensions which are now going on to wheat-growing centres? About 25 miles.
4433. That is the ultimate distance? I should think that would be about the limit.
4434. That being so, would not a line from Temora to Ariaiah and to Gunbar pretty well split the districts between the Hay line and the Grenfell-Wyalong-Hillston line? It would.
4435. And would that line bring in an area of country which is midway between the two lines I have mentioned, and which, at the present time, is not served by other means? According to my idea that is where the line should go.
4436. That, I understand, was your contention to-day? My contention is that the line should go from 10 to 15 miles north of Gunbar. That would split the two. It would embrace the cultivation land on both sides of the line. By going to Hillston you go on to the outskirts; you are going on to the northern limits of the wheat-growing land; you are also getting on to the border of the Western Division, where the land is locked up under lease for twenty-eight years.
4437. For how many miles, then, north of Gunbar, do you think it is a better class of wheat-growing land than you get at Hillston;—when does it get into the inferior wheat-growing parts? All north of Hillston.
4438. From Gunbar easterly to Mount Elliott you are well acquainted with that part of the country? Yes.
4439. Is there not to the north of that line a large tract of country suitable for wheat-growing? A very large tract.
4440. Extending pretty well up to the Hillston district? I am acquainted with this country from the line I have mentioned up to Lake Cudgellico.
4441. Is that all good wheat land? The most of it is. There is a large patch of mallee about Monia Gap.
4442. Whichever way it may go ultimately, whether it goes to Wyalong, or whether it goes to Ariaiah, ought it, do you think, to go on beyond that point to serve large centres of wheat-growing land, where there is likely to be a considerable population? I certainly do. I think it would be a great mistake to stop short of that point.
4443. At either Wyalong or Ariaiah, if it came on from Temora? Yes.
4444. It ought to go on beyond? Yes; it would be only half doing things if it did not.
4445. Some people contend that there should be a line of railway either from Coolamon to Ariaiah or from Grong Grong to Ariaiah? Yes.
4446. If either of those two lines were constructed it would seem to be an off-shoot from the Hay line, and would only serve a very limited part of the land around Ariaiah; is not that so? I do not think I am capable of expressing an opinion, not knowing that country.
4447. From looking at the map, it appears to be an off-shoot from the Hay line? Yes.
4448. If either of these lines were constructed, would it not be necessary later on to send some more off-shoots northerly from the Hay line, or else construct a line from Ariaiah to Gunbar? Yes. I think to construct a line west from Temora is far preferable to constructing these branch lines.
4449. Looking at the map, and the positions I have indicated, if you want to serve that tract of country, instead of shooting off from the Hay line at either Coolamon or Grong Grong, and treating the districts similarly, as you go further to the west, would it not be better, at the outset, to take a straight line from Temora to Ariaiah and Gunbar? Decidedly so. I think these branch lines are a mistake.
4450. They will be a lot of expense, whereas one straight line from Temora westward to north of Gunbar would answer all purposes? It would suit very much better.
4451. As far as you know, would that line from Gunbar be a difficult one to construct? It is very level country. I think there are one or two slight ranges.
4452. Has your experience, with regard to the success of Gunbar as a wheat-growing district, been the experience of other farmers there? Quite so.
4453. They have all done well? They have all been successful. There are a few that came there in debt; there are a few that have gone under; but the men who came there unencumbered are all prospering.
4454. *Mr. Watson.*] What you have just stated to Mr. Trickett about the desirability of taking a line across from Grenfell to Wyalong, and out that way is, I suppose, founded upon the mere appearance of the map? That is all.
4455. And in ignorance of local conditions altogether? Yes.
4456. I suppose, as a business man, if you were doing anything of this sort in your own interests, you would look to local conditions before adhering to mere map projections? Certainly.
4457. If local conditions were unfavourable in any extensive way, you would refuse to abide by map appearances? Certainly.
4458. Coming to the question of railway extension towards Gunbar, I think you said you thought that 25 miles would be the limit for the cartage of agricultural produce to a railway? Yes.
4459. May we assume that any one within a distance of 20 miles would be fairly within the influence of the railway line? Yes.
4460. Taking 25 miles to be the maximum limit, could we reasonably say that within a distance of 20 miles the country would be fairly served? Yes.
4461. Do you think the line to Gunbar from Ariaiah, as shown on the map here, is sufficiently far removed  
northwards

- northwards from the Hay line to give intervening space enough between the two to keep both lines going? Honestly, I do not think so.
4462. You think it would be better if taken further north? I think it should turn north from Mount Elliott. S. Nixon.  
30 Aug., 1899.
4463. Knowing that country near Mount Elliott, can you say is there any engineering necessity to go to the south of Mount Elliott; is that dividing range shown there of any importance;—is it only a low chain of hills, or merely a water divide? It is a range of hills; but I think there are gaps which a railway could get through.
4464. You think it would be preferable to keep a bit further to the north? It would be.
4465. The drainage area of a railway requires a fair distance to be between that line and any other line in order to give a payable quantity of traffic? I am aware of that.
4466. Towards Hillston from Wyalong there are two projections, namely, a line *via* Lake Cudgellico, and a line *via* Rankin's Springs? Yes.
4467. We were informed at Wyalong recently that a more middle course, or a line between the two surveyed lines would be preferable, with the view of opening up the good country;—can you offer any opinion as to that? I think the southern line would serve the country better than the northern one, *via* Lake Cudgellico. I think this northern one is still too far north. There is a lot of land about the Lachlan which is not suitable for cultivation.
4468. The line *via* Lake Cudgellico, in your opinion, would go over a lot of country which would not be productive from a railway standpoint? Between Lake Cudgellico and Hillston.
4469. There would not be enough traffic coming from it? No; it is not agricultural country.
4470. I think you said that nothing under 2,000 acres is sufficient at Gunbar for a man to make a living on? Not to rear a family properly.
4471. Were you thinking of that in relation to your present distance from market, or was that with the construction of a railway? Both.
4472. Even with the construction of a railway you still think it would require 2,000 acres? I do,—that is to keep the land cropping, and to keep it in its fertility. It is necessary to fertilise the ground, or you must only crop periodically with grazing. My idea of enough land is for farming and grazing combined.
4473. We have evidence that Between Temora and Barmedman if a railway were constructed, 640 acres would be sufficient to keep a man;—as that amount is found sufficient around Temora in many cases, does that argue that the land there is better than the land around Gunbar? No. There are many farmers around Hillston and Gunbar who have the same ideas, but I differ from them. I think that in a few years they will have worn the land out.
4474. Even with 640 acres—surely a man can make a living without cropping all his area each year? You want to crop from 200 to 300 acres.
4475. Supposing he crops 300 acres, he has the other half of his area which he can fallow? You should have some for grass. You would want at least 900 then and without any grass. I maintain that a man should combine grazing with farming. There are men around Gunbar with 640 acres who have been there many years, and they are pulling along. They consider they are prosperous, but as the family grows up they will want more land. In South Australia I have seen the evils of these too small areas in dry country.
4476. When you speak of enough to carry a man along, do you anticipate that he must always allow sufficient to provide for whatever possibilities of family there may be? Yes; and for coming down to Sydney in the summer, and taking his family down to Manly for two or three months, he does not want to be stuck up there all his time; he wants to be able to come down to the sea coast in the summer. If it were not for the fact that my family and I can afford to come down here for a few months in the summer, I would fling it up.
4477. Supposing you have one man to over 2,000 acres, and anything like a close network of railways, do you think there would be sufficient traffic then to keep the railways going? I think so. I think you would get just as much for the railways as if you had double the population. I am speaking of our own district; I would not apply that to a district where you have from 20 to 30 inches of rainfall.
4478. *Mr. Levien.*] Can you give any idea of the number of settlers down that way? No.
4479. Say within 10 miles of Gunbar? No. I made up a list before I came away, and worked out the acreage; I cannot state the number from recollection.
4480. *Mr. Watson.*] From Gunbar right down to Carrathool, is it good agricultural land? No.
4481. How far towards Carrathool does the good land go? From 12 to 15 miles.
4482. Does that pastoral land continue easterly along the Hay line a similar distance from it, that is including the Mirrool country? You get into different country when you get up there.
4483. How far would that tract go? From Carrathool up to near Whitton it is 70 or 80 miles.
4484. For a distance of 70 or 80 miles you have only pastoral country immediately north of the Hay line? I should consider that in a wet season it will grow crops; but it is of a clayey nature.
4485. You could not build much on that for ordinary agriculture? No.
4486. About Mirrool Creek, is it good land? I was down there only once. I saw some good agricultural country as nearly as I can remember when I came down years ago.
4487. Your idea is that if the line is taken from Temora in the direction of Gunbar it should be taken more northerly so as to get well into the centre of the productive district? Yes.
4488. Do you know any reason why a junction should not be made at Temora, and lines projected in the direction of both Wyalong and Ariah? I do not follow you.
4489. I think you said that you came here to give evidence owing to a fear that if the line were taken to Wyalong from Temora, it would put out of court a proposal to take a line from Temora towards Gunbar? I think it would be likely to postpone that line.
4490. Do you know any tangible reason why there should be an objection to making a junction at Temora? None.
4491. Or why the suggestion to take a line from Temora to Wyalong should postpone the commencement of a line out in the direction of Ariah? I think it would. I thought it was not likely that they would have two lines running out from Temora.
4492. They have done something like that in other places? I can see that they have.
4493. That is the only objection you have? That is the only one.
4494. *Chairman.*] The proposal before the Committee is to construct a line from Grenfell to Wyalong, and

- S. Nixon. and the ultimate object is to go out towards Hillston. You are in Sydney, I believe, as a member of a deputation to urge that there should be constructed a line of railway from Temora to Gunbar?  
30 Aug., 1899. That is so.
4495. And you think that if the line were constructed from Temora to Wyalong it would have some effect against your proposal? Yes; I thought it would.
4496. You state that, in your opinion, 25 miles is the limit at which a man successfully cultivate wheat from a railway? Yes.
4497. If a line is constructed from Temora towards Wyalong, more than half of that line will, as it were, run to waste; if a line is thrown out from Temora towards Gunbar—say to Barmedman, 25 miles—it is within a reasonable distance of Temora? Yes.
4498. So that would be served, and if they construct a line from Temora to Gunbar that country would be doubly served, would it not? Yes, it seems so by that map.
4499. Is that one of the reasons which you had for thinking that it would militate against the success of your proposal? I thought so. I did not think it was likely that the Department would construct two lines running out from Temora.
4500. Taking a line between Gunbar and Mount Elliott, how far to the south of that line would the good agricultural land extend? About 20 to 25 miles to the south; but, as they get towards Gunbar, it would narrow down to about 12 or 15 miles.
4501. Outside that distance of 10 or 15 miles, what is the nature of the country? Twelve miles from the line it is red loam, and after that it becomes clay plain between there and Carrathool.
4502. It is all good pastoral country? Yes.
4503. Was there any idea of carrying on agricultural pursuits out on the Hay line when it was constructed? I think not.
4504. The traffic on that line, I presume, is principally wool? Wool and stock. A lot of wheat has gone to that line from Gunbar; what wheat has come down has come chiefly from our neighbourhood.
4505. Would the country that you do know—that is, the country north of Mount Elliott, and on towards Lake Cudgellico—be served by the extension of the line from Grenfell to Wyalong, and fairly split up the good country you know of? It would not serve that country.
4506. Would a line from Wyalong to Hillston serve the good country you know of? Yes, partly.
4507. Which part? It would serve to 25 miles south of the proposed Hillston line.
4508. Leaving out the land within 25 miles of the Lachlan, would that line fairly intercept the good land which you do know of;—could you get good wheat land for 25 miles on either side of the line? No, I consider it is going too far north.
4509. How far south of Lake Cudgellico does the good agricultural land extend? I only went about 12 miles, and that is all good agricultural land.
4510. Did you say it was good agricultural land right along there for 12 miles north of the lake? At the lake it is. It is good agricultural land to the river, but as you get towards Hillston the land becomes of a clayey nature near the river.
4511. What distance back from the Lachlan would that strip of land extend? It is difficult to answer that question correctly, because it varies so much.
4512. You could not say how far the pastoral land or the land which is not fit for agriculture extends from the banks of the Lachlan? I could not say.
4513. Do you think it extends 20 miles? I think not.
4514. Ten miles? In some places it runs nearer that distance, in other places it may be 20 miles. The distance varies very much.
4515. Are you acquainted with the land about Rankin's Springs? Yes.
4516. East of that you do not know anything about the country? No.

Alfred George Humby, farmer and sawmill proprietor, Bolero, sworn, and examined:—

- A. G. Humby. 4517. *Chairman.*] You are a farmer and sawmill proprietor? Yes.  
30 Aug., 1899. 4518. You reside at Warri? I reside at Bolero, beyond Warri. I selected on a station called Bolero, which adjoins Mumbooldool.
4519. You were appointed a member of a deputation to wait upon the Minister to bring forward the claims of a line of railway from Temora, *via* Warri, out towards Gunbar? Yes, representing the settlers out on North Barrallan and Binya.
4520. Will you state to the Committee the reasons which you have for advocating that line? Because I believe that on that country it will be found that a line will carry very much the largest freight from the first, and because I am afraid that if a line were carried from Temora to Wyalong, we should be, perhaps, put back for a few years, thinking that that part of the country between Temora and Ariaah might be served sufficiently by that extension from Temora to Wyalong if the route were carried that way.
4521. As far as that reason is concerned, you would be about on all-fours with the people who are between Temora and Wyalong; suppose the line is run out from Temora to Ariaah and not to Wyalong, then those people on that stretch of country will have just the same right to complain? They would be quite right. I think they ought to have a railway at Wyalong.
4522. Do you think that Wyalong could be served by a line from Grenfell? Most decidedly, I do.
4523. How would you describe the country between Temora and Ariaah—as all good agricultural land? There is a range a little out from Temora towards Ariaah, and, with the exception of that range, I call it all good agricultural land.
4524. How far north and south of that line would the good land extend? I should say 20 or 30 miles north and 30 miles south. Right through there it is all good country.
4525. Do you know the country between Ariaah and Mount Elliott? I know that country pretty thoroughly.
4526. How would you describe that country? From Ariaah on to Warri it is all first-class agricultural country, and from Warri on to Bolero, Mumbooldool, North Barrallan, and Binya I do not think you could beat the country.
4527. Suppose a line is constructed from Ariaah to Mount Elliott, how far south of the line and how far north of it would there be good agricultural land? From where I live at Bolero it is all good land right through to the Hay line. I do not think you could find any bad land there at all scarcely.
4528. Right through to the Hay line? Yes. 4529.

A. G. Humby.

30 Aug., 1899.

4529. How far do you live west of Ariah? About 10 miles.
4530. From there down to the Hay line you say it is all good land? Yes.
4531. And it is all fit for agriculture? Yes; it is all fit for the plough.
4532. Going west of that again, what is it like? Going west from North Barrallan I think you will find some of the finest agricultural country. I hold in my hand a letter from the agricultural expert excusing himself for his inability to attend our deputation, and saying, if you will allow me to use his own words, "however, I shall be delighted to give all the information I can *re* your magnificent wheat-growing district." That applies to Warri and right through. I drove him all through the country last October.
4533. *Mr. Dick.*] Is that letter from Mr. Thompson? Yes. I believe he reported officially on the country last October.
4534. *Chairman.*] Do you know the country as far as the Binya Range? Yes.
4535. Would there be any engineering difficulties to overcome to get across that range? There are gaps in the range where the line could be taken through.
4536. As far as you know of the country between Temora and the Binya Range, would a line traverse good agricultural country all the way? All the way.
4537. And how far north and south of that line would the good agricultural country extend? From my own knowledge I should say about 20 miles north and 20 miles south.
4538. That would be a belt 40 miles wide? Yes. There is a belt of mallee land in that country; but there is a great diversity of opinion in reference to its suitability for agriculture.
4539. But you get belts of mallee in pretty well all parts? Yes; and the mallee land can be cultivated pretty well as any other country we have.
4540. Is it very difficult to clear? No.
4541. Do you think it would be taken up and cultivated if there were a railway constructed there? I am quite sure of it. I had some on my land; I cleared it and cultivated it.
4542. Do you know the country west of Grenfell? I know Wyalong and Yalgogrin, and round that neighbourhood; but I do not know anything of the Grenfell country.
4543. What sort of country is it for agriculture going west from Wyalong;—do you know Rankin's Springs? No; but I know the country well between my place and Wyalong, through Buddigower and Yalgogrin.
4544. Is that country fit for agriculture? On Yalgogrin and part of Buddigower it is; but there is a great deal of rough country on Buddigower itself,—very rough, stony, ironbark ranges.
4545. You do not know anything of the country west of Yalgogrin? Not much.
4546. I take it that your opinion is that all that western country which is said to be fit for agriculture, would be best served by parallel lines, and not by cross-country lines? By lines similar to those shown on the map.
4547. That is one of the reasons which brought you down as a member of the deputation? Yes.
4548. Have you any reason to advance for an extension of the line from Temora to Gunbar, as against one from Temora to Wyalong? No. I think, as the settlers about Mandamah and Broken Dam would be served by that line, in all probability it might be that it would serve our purposes, and we might be put back for a few years from the advantage of a line.
4549. Which would suit you better—a line from Coolamon, or a line from Temora? From Temora. I certainly advocated the Coolamon-Ariah line, because I did not know anything better at the time; but when the proposal came out to extend the line from Temora, after looking the thing thoroughly in the face, I saw that that was for all purposes the best.
4550. A line from Coolamon would not serve that part of the country so well as a line from Temora? It would serve us at Warri equally as well; but looking at it from a general point of view, I think it would open up more country, and do more good to bring it from Temora, and it would serve our purposes just as well.
4551. In the construction of light lines, or agricultural lines, do you think it would be better policy to construct them parallel, running west into that good country, rather than to build cross-country lines? Decidedly, because you would have to construct so many of these cockspur lines to get people within reach of them. I think it would be much better to run the whole line right through; it would serve more country, because it would serve country to the north again, unless you went up the wrong way with the line.
4552. What sort of timbered land is it in that country? Pine timber.
4553. Any ironbark ridges or ranges? There are some, but they are limited. There is a very large quantity of timber there. It is not generally known, perhaps; but I will undertake to say that for five years from its starting, there ought to be 20,000 tons of pine timber sent along that line annually.
4554. Does the pine grow to a good size there? To a fair size. There are some very beautiful forests on Yalgogrin, and on North Barrallan, that the proposed line to Gunbar would pass close to. It would open up a very fine industry, and the pine timber business would be a very profitable source of freight for a railway.
4555. *Dr. Garran.*] What is the pine used for? For building purposes. It is pine which is proof against the white ant.
4556. Is that the pine which spreads so much, and becomes almost a nuisance? It is.
4557. It is not scrub where you are? There is any amount of scrub.
4558. Must you thin that out to make a good forest? Not necessarily.
4559. Do the good trees grow if you do not thin it out? The strongest seem to survive. If you want to use land for grazing or agriculture, you must get rid of it.
4560. Is this pine forest spreading naturally? I do not know that it is.
4561. *Mr. Watson.*] You stated, I think, that you were afraid that if the railway were taken from Temora to Wyalong, people would contend that the Broken Dam district would be served by that line? Yes.
4562. And, consequently, that no line would be taken towards Ariah? I am afraid that it would be a block in the way.
4563. Do you think, as a matter of fact, the Broken Dam people would be served by a line between Temora and Wyalong? They would not be served so well, certainly.
4564. Do you think they would go in towards that line, or continue to go towards Temora, the present terminus? It looks by the map as though it would be an equal thing.

- A. G. Humby. 4565. That map brings your land within 20 miles of the Hay line, but that is not true, is it? That is wrong.
- 30 Aug., 1899. 4566. As you cannot go by the maps, what is your own opinion of the country;—do you think the people of Broken Dam would come into Temora with their produce, or would they go to a line which would connect Temora and Wyalong? I think as many of them would call at Temora as would go the new line, because they would be at an equal distance from the two.
4567. So that, as a matter of fact, your fear in that regard should prove groundless; people would not be justified in stating that the Broken Dam district was served by the construction of a line from Temora to Wyalong? Some of it would be served, certainly.
4568. How far towards Broken Dam do you think it would be served? You can easily see that between Reefton and Barmedman there is a certain amount of settlement, and certainly that would be served to a certain extent.
4569. As a matter of fact, the Barmedman people and the Broken Dam people are just about the same distance from Temora? I should think so.
4570. Do you know the country between Temora and Wyalong? Yes.
4571. You ought to be able to say, then? As nearly as I can see, they would be.
4572. Suppose a line were taken from Temora to Wyalong, would you still say that a line from Broken Dam to Ariah was necessary? Certainly I would.
4573. I think you stated that Wyalong would be served from Grenfell, but that you did not know the country across from Grenfell? I do not know the Grenfell country.
4574. I think you stated that a system of parallel lines running out or approaching a common centre would be a proper thing? Yes.
4575. In that case would you prefer to always follow parallel lines or to be guided in some cases by local conditions? You would have to be guided by local circumstances, I suppose; you cannot lay down a hard-and-fast rule, but for their own proposals I think the parallel lines or those two lines are far the best.
4576. You think it will suit you? I think it will suit not only myself, but the whole of the settlers of our district.
4577. It is to be assumed that if the line were constructed the people of Wyalong would have higher or lower freights, according as the line paid? I think it would be likely to pay just as well if taken from Grenfell as from Temora.
4578. How can you say that when you admit that you do not know the country? I know that some of the country between Wyalong and Temora is very unsuitable for agriculture, if you are depending on that.
4579. I want to know how you are able to express an opinion if you do not know the country between Grenfell and Wyalong? I think it should serve as well from Grenfell to Wyalong as from Temora to Wyalong. Looking at it from the agricultural aspect, I do not see how it can be a good payable line from Temora to Wyalong, because I know there is a good deal of country between Temora and Wyalong which is not suitable for agriculture.
4580. You do not know how much on either line is suitable for agriculture? Not on the Grenfell extension.

THURSDAY, 31 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Alfred George Humby, farmer and saw-mill proprietor, Bolero, sworn, and further examined:—

- A. G. Humby. 4581. *Mr. Levien.*] How many years have you been in the district? Eight years.
- 31 Aug., 1899. 4582. From what colony did you come? Victoria.
4583. You have had a good deal of experience in farming, I suppose, in Victoria, and also New South Wales? I had no experience of farming in Victoria. I was a carriage-builder in Melbourne.
4584. What have you gone in for in this Colony? While I was in business in Melbourne I bought into a saw-milling industry in this Colony.
4585. As a saw-mill proprietor, I suppose you have acquired a fair idea of the capability of this country for farming, and also its timber-carrying capacity? I have made a special study of both subjects.
4586. I suppose the timber business is more in accord with your own inclinations? At first the timber was; but circumstances forced me to turn my attention to farming.
4587. How many acres do you hold? In the first instance, I selected 2,000 acres, and I have over 300 acres under cultivation.
4588. Supposing your selection of 2,000 acres were absolutely under cultivation, what would it carry;—could it all be put under agriculture? It could all be put under cultivation for wheat.
4589. How about oats? Oats grow there; but we have turned our attention to wheat more than oats.
4590. How many bushels to the acre would it yield? In good seasons, my neighbours have had as many as nine bags per acre, but in a season like the last, the yield was reduced to about half a bag or 2 bushels to the acre.
4591. In a fair season, what would it yield on your own land per acre? I should say four or five bags.
4592. I suppose you have given a fair consideration to the question of the Grenfell-Wyalong line and the Wyalong-Temora line? I have.
4593. Your place is out at Gunbar? No; on a line between Warri and Mumbooldool. My place is a good 10 miles from Ariah, westerly.
4594. Describing a circle there, what kind of country is it? It is all good agricultural country.
4595. Setting aside a feeling of sentiment, or a desire to serve your own interests, in the public interests, which

- which line would you recommend, supposing you had the duty of making a recommendation, in respect to these two alternative lines? I should say at once the line from Grenfell to Wyalong.
4596. And that is a greater distance from your place? Yes.
4597. Why? Because the proposed line we are agitating for with that line from Grenfell to Wyalong would open up the country to everybody between the two lines. I reckon that if a line ran from Grenfell to Wyalong, and then a line ran out from Temora as we propose, it would take in everybody. But should the line run out from Temora to Wyalong, it would not have the desired effect.
4598. So that if you had to decide the question, you would favour the Grenfell-Wyalong line, not the Temora-Wyalong line? Most decidedly.
4599. As the railway stands, which is the nearest station to your place? Narrandera. We have to send all our produce to Narrandera. We are about 45 miles from Narrandera, and 55 miles from Temora.
4600. I suppose you would rather have both of these lines disposed of, and make a line from Ariaah right away to Narrandera? No.
4601. Supposing the Government put forward a proposal for a line from Ariaah to Narrandera, a line from Wyalong to Temora, and a line from Temora to Grenfell, which would you vote for? I do not think I should vote for any of them, because they would be of no use to us.
- 4602-3. You would not vote for any one of the three? No. When you asked me whether I should vote for a line from Wyalong to Temora, or a line from Grenfell to Temora, I imagined that you were speaking in connection with this line as well. I gave my answer, making up my mind that both lines were requisite.
4604. Supposing the Government proposed to make the three lines, which line would you choose? I should choose one which would go through our own country.
4605. To serve your own interests? Certainly.
4606. Therefore you favour your own line from Ariaah to Narrandera? No, from Temora, westward. I do not see what advantage it would be to have a line from Narrandera to Ariaah, because it would not benefit the people at Warri much, or the people between Warri and Temora.
4607. In the public interest you favour the Grenfell-Wyalong railway? As far as that railway is concerned, I should say the Grenfell-Wyalong line certainly was the best.
4608. Are you a free selector? Yes, I selected under the late Land Act. I have leased lands also. The holding embraces about 8,000 acres, 2,000 acres are conditional purchase and conditional lease, and the majority of the remainder is improvement lease.
4609. *Dr. Garran.*] Did you take up your land for cutting timber or for cultivation? I took it up to reside on it and cultivate it. I started to cultivate it from the beginning.
4610. The cutting of timber and the saw-mill business was not your primary object? I connected the two.
4611. Does clearing the ground of timber count as an improvement? I should say so. You cannot clear the ground without taking the timber off.
4612. You say you have some ground on improvement lease? Yes; and one condition of the lease is that the land is to be cleared.
4613. Can you find a fair market for your timber? We could do so.
4614. Have you found a market as far as you have gone? There is a market for a great deal more than we can get to a railway.
4615. Where does it go to? It would go to all parts.
4616. To Temora? It would be a good way to send it through Temora, because a great deal of it goes up towards Sydney, and would go into the Sydney market.
4617. It goes to Carrathool? No, I have never sent any there for years.
4618. To Narrandera? That is where it has to be trucked.
4619. How near to Sydney does your timber come down? It has come to Sydney itself.
4620. If it is so good as to resist the white ant, would not there be a demand for it in Sydney itself? Yes, if it were generally known that it does resist the white ant; but somehow or other it has not become known as it ought to be.
4621. Do you know whether any is sent to Queensland, where they are much troubled with the white ant? No.
4622. Would it be worth while to send it there? I should think so.
4623. I want to know whether, if you had a railway, it would be worth while to cut and export any of that timber? Decidedly it would.
4624. And a railway would facilitate that business? It most undoubtedly would.
4625. Was the whole of the ground timber-covered? No, nothing like it; only a small portion of it.
4626. You have no right to cut timber outside your own property? Not without a license from the Crown.
4627. Is the timber country round you taken up by other people? No; there are very large forests of timber reserved by the Crown for saw-milling purposes.
4628. Is part of this Warri forest reserved? There is timber on Warri, Yalgogrin, Barrallan—in fact, on all the surrounding country, but it cannot be done anything with. It is practically useless to the Crown, because no one can touch it.
4629. Because there is no market? There are plenty of markets, but you cannot afford to pay the royalty on the timber, and the large freight there is to get to the railway.
4630. In the absence of a railway you cannot afford to pay the royalty? No.
4631. If you had a railway you could afford to pay the royalty? Yes. I paid a large price for this business to the man who was conducting it at Devlin's Siding. He was paying a large amount in royalty to the Government, and I was advised badly to allow the mill to be sent out to this far distance from the line, because the pine on the Hay railway was getting scarce. I have been practically shut out of the market. I have ruined myself in the attempt to compete by carting timber down to the railway. It has cost me 25s. a ton, whereas it used to be put on the trucks at Devlin's Siding for about 3s. a ton.
4632. If the Government made a railway from Temora to Warri, even if it lost a little on the annual working of the line, it would gain in the carriage of timber, and also gain in the royalties which it would receive? If a railway were constructed, say as far as Mumbooldool, the first section—and the majority of the timber is beyond Warri—I guarantee that in the first five years 100,000 tons of timber could be put on the railway.
4633. You are sure that there is an expanding market for that timber? There is.

A. G. Humby.  
31 Aug., 1899.

- A. G. Humby. 4634. At the rate at which you have been going, how many years would it be before you cleared those forests right off? I made a calculation with the ranger a short time since, and we came to the conclusion that there is enough timber there for half a dozen mills to cut for ten years.
- 31 Aug., 1899. 4635. That is at the rate you mentioned just now? Yes.
4636. How many square miles are there in these forests at Warri? I dare say it embraces an area of 20 or 30 square miles at, and surrounding, Warri.
4637. Is it nearly all good, marketable timber? A great quantity of it is. It is not all pine. There are other timbers intermixed with the pine, which are not valuable.
4638. Is it fit for posts and rails? Yes.
4639. It does not rot in the ground fast? No; it is the best timber we can find.
4640. Is it used at all by squatters for fencing? There is nothing but pine used in that district for fencing.
4641. When the ground is cleared of this timber is it good agricultural land? It is beautiful loam country.
4642. What is there underneath? The loam is deep. I have not got down to know what is below the loam.
4643. You have never sunk a well? Yes; I went through a lot of white pipeclay.
4644. That would hold the water? Yes; it is a country which absorbs all the rain.
4645. Have you ever had it too wet for the growth of crops? Never.
4646. It does not dry very quickly on the surface? No; it is a class of country which retains the moisture.
4647. For that reason it is good for cultivation? Yes.
4648. You would not want subsoil draining at all? No; it does not require it.
4649. Have you tried orchards and vineyards on that ground? Yes; I have tried fruit-trees, which grow remarkably well; so do vines.
4650. Is it good for market gardens—for vegetables? I believe anything you like to plant will grow in it. I have carried on a good many experiments at one time and another, at the suggestion of gentlemen like Mr. Thompson, with fodder plants and sorghum, and that kind of thing. It is wonderful country to grow them.
4651. Does it grow good sorghum? Yes.
4652. How many times did you cut your sorghum? Twice a year.
4653. Does it grow lucerne? I have tried lucerne, but I have been unfortunate. I have tried lucerne in a season when it has been dry.
4654. Will it grow trefoil? It grows that well.
4655. Are cows fond of trefoil? Yes.
4656. Do sheep eat it? Yes. It is a great country for growing anything in the shape of vegetables. I remember during one of these droughts taking about 8 tons of citrons and melons for the use of the pigs off a little square of about  $\frac{1}{2}$  an acre.
4657. How has this sort of soil stood the drought for the last four years compared with other countries? I think it has stood it well.
4658. Have you had any wheat-crops grown close by? Yes; the majority of the farmers were able to save their seed last year, whereas in many instances even that could not be got in other districts.
4659. And the year before that? It was a fair crop.
4660. Worth reaping? Certainly.
4661. If, when you have cut down the timber, you leave the ground alone, will fresh young trees grow up of themselves? Yes; there is a great deal of box country.
4662. If you only cut the box trees down, young box will grow up again? Yes.
4663. Will young pine grow up again? No, unless it is seeding.
4664. Does it seed naturally? It comes up in a most remarkable manner. I think the wind blows the seeds about, and often it comes up where we least expect to see it.
4665. If you cleared 1,000 acres of pine, and left it alone, you could not count upon another pine forest growing in the same place? I think not.
4666. If the Government want to keep the pine growing, they will have to seed it? They will have to adopt some plan. I do not mean to say that they will have to sow seed; but they will have to take care not to allow trees under a certain size to be cut.
4667. There is always such an amount of young growth that it would reproduce the forest? Yes; my experience extends over eight years, and I find that the pine is still going on growing all the time.
4668. If this line from Temora were continued as you propose, where would be the best stopping-place in the first instance? I should propose to take the line at least to Mumbooldool.
4669. Is that beyond your place? Yes; about 6 or 8 miles.
4670. Why do you talk of Mumbooldool as a temporary terminus? Because you asked the shortest distance I could say. I do not think you ought to stop short of that point on any consideration.
4671. How far would that be from Temora? About 60 miles.
4672. You think an extension of 60 miles from Temora would be justifiable straight away? I do, indeed.
4673. And that it would not prove an unprofitable line in the long run? I do not think there is any fear of that happening.
4674. Would it help to make the existing Temora line more payable? I think it would, certainly.
4675. It would throw more traffic on it? Most decidedly. The whole of the timber traffic of that district would be brought there. There would not be a cartload sent from Narrandera, and the whole of the wheat, which would be a very large item, would go there.
4676. If you send your timber down to Cootamundra, will any of it go south, towards Albury as well as towards Sydney? Some of it may; there is not very much of a market in that direction. Some goes towards Sydney.
4677. Would you get a market at Goulburn? Yes; at Murrumburrah, Yass, Boorowa, Goulburn, and all those places towards Sydney.
4678. Is it soft wood, and easily worked? It is something between softwood and hardwood.
4679. Is it fit for joiners' work—for making doors? No.
4680. Is it fit for skirting boards? It is fit for skirting boards, mouldings, floors, roofings, joists, and rafters.

rafters. It is used by the Educational Department—and it is the only Department which does—in A. G. Humby. preference to any other timber they can get.

4681. Have they built any schools with the timber? Yes; nearly all the schools in the country are built with it. 31 Aug., 1899.

4682. They have stood the weather and the white ant? Yes. I once prepared a report for the Forestry Department, and Mr. John Kent, the Chief Architect for the Education Department, said, in his evidence, that he had found no timber like it for resisting white ant, and either damp or dry-rot.

4683. Are there any other forests of this kind nearer to these markets than Warri would be? No; they were cut out in the earlier days.

4684. As far as you know, that is the best good forest near to Sydney? Yes. I had the assistance of Forest Ranger Tate in making that statement.

4685. As you go west towards Mount Elliott and Gunbar, are there any more patches of pine? There is a great quantity of timber as the line approaches Barrallan, Binya, and Gunbar.

4686. Are there patches of pine all the way to Gunbar? Very large reserves of pine.

4687. Does any grass grow in the pine forest while the trees are standing? Yes; but it is patchy.

4688. Will a cow eat it? Yes, it is a sweet grass.

4689. Is it a very thirsty tree for drawing up water from the soil? Some people have an idea that it is injurious. They say that pine poisons the grass around. I do not believe there is much in that idea, for I have seen young grass growing up close to the trees as well as it would if there were no trees there.

4690. Have you seen the cattle browsing right up to the roots of the trees? Yes.

4691. A previous witness said that if the line from Wyalong to the Lachlan were extended, it ought to go rather more north than going to Hillston;—do you think that would be an improvement? I am hardly able to say, as I do not know anything of that country. I only know the country from Temora on to Warri and Mumboodool, and out as far as the Binya Range, where Mount Elliott is.

4692. Do you think it will be perfectly safe to extend the railway as far as Binya some day? Certainly.

4693. You think it would lead to settlement? Yes, and there is a great deal of settlement there now.

4694. You know the demand which is said to exist for land in this district generally;—do you think when the leases fall in, if a railway were made from Temora to Binya, settlement would take place all along that line within the next five years? I am positive of it. I live on the main road, and a great many people come up that way, and have done so for the last four or five years, looking for land, and immediately they get out they say, "We can never look at this land," and they are off to somewhere else. They are frightened to take up the land.

4695. They do not condemn the land? No, they speak highly of the land. They do not take up the land on account of its distance from a railway.

4696. Did you know Temora before the railway was made to it? Yes.

4697. Has the making of that line greatly stimulated cultivation and settlement near Temora? I believe it has.

4698. Sometimes railways have been made in the hope of stimulating settlement, and they have not done so? Yes; but there is such a large amount of settlement in this district we are referring to that it should be a proof that it does. We have battled along, and some of us are not fit to fight with long haulage. But there is not a doubt in the world that every acre of land would be taken up as soon as a railway were decided upon.

4699. All the good land within 15 miles of the line on either side would be taken up? Within 20 miles. But, on the other hand, I can assure you that many settlers out there have told me that they do not know how they are going to see their way through another season. They have been so tried by the long distance from the railway, and the trials they have undergone, that they have almost made up their minds to throw up the land, and let it go back to its natural state. The people I refer to are settled more towards Binya.

4700. There are some settlers between Warri and Binya? A large number. Round about North Barrallan and Binya I got some statistics from seventeen or twenty settlers. They own about 20,000 sheep between them; they have at present about 5,000 acres under cultivation, and they state that they would cultivate to the extent of about 14,000 acres if a railway were run out.

4701. These people at Binya are quite as near the Hay line as Mr. Nixon is? They are about 40 miles away.

4702. He has weathered it all with that distance of 40 miles from the railway? He happened to be in an enviable position, in that he came there with capital.

4703. You are of opinion that, to start well, a man should have a fair amount of capital? He must have some capital. Every man who goes on the land wants a little capital, and some help.

4704. What capital does a man want to take up 2,000 acres in that country? He could go very comfortably into it with £500.

4705. Would that see him through the first year? Yes; it would help him to see a return from the soil.

4706. Without going into debt to the store? I should think so.

4707. As regards most of the men who are in trouble, have they started with less capital than that? I think so.

4708. As far as you know, want of capital has been one of the causes of the failure of many of the farmers? Want of capital combined with the difficulties of getting their produce away.

4709. Mr. Nixon, with all these difficulties in the way, has thriven there for seventeen years? He was in an enviable position, for he said yesterday that he came there with some thousands.

4710. As regards these men who have failed, are they men who had had farming experience in Victoria or South Australia, or were they new to farming? They had had experience. I do not say they have failed, but they have had the hearts knocked out of them.

4711. You have seen a good deal of farming in Victoria and New South Wales;—do you think previous agricultural experience is essential to a man's success, or will a smart man get on, even if he has not been brought up to farming? It is not absolutely necessary. Previous experience helps him undoubtedly; but I had never had any experience in agriculture myself; I was forced into it.

4712. Have you found that the want of agricultural experience has been a great hindrance to you? It may have been, the first year or two.

4713. You made a few mistakes for which you had to pay? Yes; I got the seed in too late, and did several little things of that sort.

- A. G. Humby. 4714. *Mr. Watson.*] In the district round your place, how many acres of land do you think a man with a family would require to have in order to make a reasonable living? It depends upon what he is going in for. If he simply wants to cultivate, and keep a number of horses, and a cow or two for his family, and does not want to go in for sheep, he ought to get on very well with a 500-acre farm—and less than that area.
- 31 Aug., 1899.
4715. It is to be assumed that he will go in for what will keep him properly? If he wanted to run 500 sheep in connection with his farm, he would want to have from 1,500 to 2,000 acres.
4716. What would be a reasonable area to set aside if you opened the land for settlement with railway communication? A man can get a good living on 500 acres.
4717. When Mr. Nixon told us yesterday that at Gunbar it would require 2,000 acres, the presumption is that the land round Warri is better than the land round Gunbar? It would lead you to suppose so.
4718. Nearly all the pine and box country is good for agriculture? Yes.
4719. That is pretty well the universal experience? Yes.
4720. You stated yesterday that some portion of the land between Temora and Wyalong is, in your opinion, unfit for agriculture? I did.
4721. Is not pine and box with oak a leading characteristic of the country between Wyalong and Temora? There is a good deal of box, and all that sort of thing.
4722. There is a lot of pine there? I did not refer to the nature of the soil when I spoke yesterday; I referred to the country itself. It is full of gilgai holes and coolamon holes, and it is a most unsatisfactory kind of country to cultivate.
4723. What proportion of it do you think is gilgai holes? A very large proportion, and besides that there is a lot of rough, stony country in it.
4724. If the District Surveyor has stated in evidence here that nearly the whole of that land is fit for agriculture, excepting a very small portion, do you not agree with him? I should say that he has seen more of it than I have, and must be able to give a better report.
4725. Did you travel any more than along the road when you went between those two points? I have travelled on the different roads between Temora and Wyalong, and round about Wyalong.
4726. I think you stated yesterday that you had not been between Grenfell and Wyalong? No.
4727. And that your approval of the line from Grenfell to Wyalong was simply based on the appearance of things on the map? No. In the best interests of the country, I said.
4728. Assuming that your motive is to consider the best interests of the country, in approving of the proposed line, you would have to be guided by the map if you did not know the country, would you not? Yes.
4729. Whatever approval you are giving to the line from Grenfell to Wyalong, you are giving from the appearance of things on the map, not knowing the country? As far as from Grenfell to Wyalong, certainly.
4730. Is there any reason why the Government, if it would appear that both lines were going to pay, should not construct a line from Temora towards Hillston, and also a line from Temora towards Gunbar, that is making a junction at Temora? No; I form my opinion from the answer which the Government made when we made the proposal to construct a line from Coolamon. They said that lines which ran at angles to one another like that did not pay.
4731. That I take it was the individual opinion of some Members of the Public Works Committee? I think it was the Committee who expressed that idea.
4732. You mean the Sectional Committee who were there? I believe so.
4733. Is the angle there much more acute than the angle shown by the Forbes line, and the Condobolin line from Parkes? It would be more acute between Barmedman than it would be between Forbes and Bogan Gate.
4734. Supposing a line were taken from Temora to Wyalong, do you think the Broken Dam people would use that line, or would they continue to go into Temora? I think they would continue to go to Temora.
4735. So that it would not draw any traffic? I do not think so.
4736. You know the projected line from, say, Ariaah towards Gunbar, and the general route which it follows? Yes.
4737. How far on an average would that line be from the Hay-Narrandera line? At some points it is nearer; but taking an average, I think, you will find that it is 40 miles.
4738. Taking the distance between Narrandera and the point where it passes your place, the line on the wall map is 10 miles out, according to this scale? It is.
4739. And it is very likely that is 10 miles out further up? It is.
4740. If you cannot trust the map in that respect, it is dubious whether we can trust to it with respect to the angle of projection between Temora and Wyalong, and Temora and Ariaah, I should imagine? I think it has been carried a little too far to the south; that is all.
4741. You think that if the line is taken from Temora towards Ariaah it would be payable? Yes.
4742. *Mr. Shepherd.*] The place where you are situated is almost equi-distant from Temora, Narrandera, and Wyalong? It is about the same distance to Wyalong and to Temora, but it is 10 miles further to Wyalong and Temora than it is to Narrandera.
4743. Do you ever deliver timber or grain at any other station than Narrandera? At Narrandera and Grong Grong, which are the same distance from us.
4744. Not at Temora or Wyalong? No; we could not look at it.
4745. Neither the Grenfell-Wyalong line nor the Temora-Wyalong line will assist you? No.
4746. It is in the interests of the country generally that you believe that the Grenfell-Wyalong line would be better than the Temora-Wyalong line? Yes.
4747. Why? Because I think there would be more probability of the Government carrying the other line along, and it would improve a larger area of country and benefit a much larger number of settlers.
4748. And by running out these parallel lines some time hence, the Temora line may be continued on to Gunbar, and the Wyalong line up to Hillston, and then pretty well the whole of the country between these two lines would be served, and also this lower line? It would put anybody who could settle on that land within 20 miles of a railway.
4749. You think those parallel lines are better than these cross lines? There is no doubt about it. It serves a larger area of country, and, of course, a larger number of settlers.

4750. Does it pay you to grow wheat and deliver it at Narrandera, 45 miles distant? No. I began cultivating there because I found it was necessary to grow food for the horses that were carting timber; and then bit by bit the timber trade has got knocked down to such an extent that we can hardly cart anything at all. What with the bad seasons and the competition by those who are able to pick up a few logs near the railway, and that kind of thing, it led me to go into farming. I cleared 200 or 300 acres, and got it in. But there is about half-a-crown to pay on every bag of wheat you can send to the railway, and it is a question whether it would pay—in fact, it would not pay to grow it to send in there.
4751. You say that in a good season you produce as much as nine bags to the acre? I have never done it, but my neighbours have.
4752. It is the best return we have had yet? I can name a neighbour who took 900 bags off 100 acres.
4753. Is the country all round you for the same distance equally good? It is similar country.
4754. And onward as far as you are aware, the land towards Gunbar seems to be good? Yes. On North Barallan, where there is a very large tract of Crown land available for settlement, I believe there is some of the finest agricultural country in New South Wales. It is spoken of by the Government officer, Mr. Thompson, as magnificent wheat-growing country, and in his report he states that if a railway were run into this district he believes it would be one of the most prosperous in New South Wales.
4755. What does it cost you per bag to deliver your wheat at Narrandera? It would cost half-a-crown a bag.
4756. That is rather too much to pay to compete with those who are living nearer than you? It is.
4757. What does it cost you a ton for timber? Twenty-five shillings.
4758. If it could be brought within 20 miles of a railway you would be able to carry on more successfully? Yes; it would reduce the rates by one-half, and one could work at a profit then.
4759. Is the country pretty well watered about Warri? Only by means of dams.
4760. There is no natural, running water? No; that has been a fearful drawback, what with the drought and the bad roads, to the poor unfortunate carriers. One-half of their load has been tanks of water which they have had to carry during the last year or two.
4761. You think the gilgai country, as a rule, is not good for agriculture? I would not like to say what the nature of the soil is; I would not like to touch it. I would rather go and clear the despised mallee country than go on to the gilgai country.

William Boyd, farmer, near Warri, sworn, and examined:—

4762. *Mr. Trickett.*] What are you? I am a farmer, residing near Warri, a little south-west of Ariaiah.
4763. You have come here, I believe, to advocate that, in any scheme of railway extension to the west of Temora, your district should have consideration? Yes.
4764. What grounds do you advance in support of your claim? I think that if this proposal were carried out to construct a railway from Temora to Wyalong it might injure our chances of getting the line carried from Temora westward.
4765. The Temora-Wyalong line would be utterly useless to you? It would be of no use.
4766. Instead of carrying the line at an acute angle from Temora to Wyalong, you advocate that a line somewhat parallel to the Hay line should be constructed in the direction of where you live? Yes.
4767. What claim has the country out your way to a railway? It is all good agricultural country. There is a great deal of farming going on round about Warri; there is a lot of land under cultivation.
4768. When you were examined on the Coolamon-Ariah proposal you gave some figures showing that agriculture had largely increased from year to year in that district? Yes.
4769. On that occasion you said that in 1895 there were 10,225 acres under cultivation, and in 1897, 14,250 acres;—do you know what the area under cultivation is at present? I could not say. We have collected no statistics on the same area of land since that year.
4770. Has it increased, do you think? It has increased. I should think there would be a 10 per cent. increase, anyhow. We have increased our own area since then.
4771. What do the farmers about Ariaiah and Warri do with their wheat? It goes to Grong Grong and Devlin's Siding, on the Hay line.
4772. That is a distance of about 40 miles? It is about 35 miles.
4773. Do they find that rather a prohibitive distance to go? It is expensive. From where we are situated it costs us 1s. a bag, that is 3d. a bushel, to cart wheat to the railway siding, and we are south of Warri a few miles.
4774. I notice that a number of you gentlemen have come to Sydney to interview the Minister on the subject;—what districts do the deputation represent? They represent the branch leagues from Broken Dam right through to Gunbar. I represent Warri and Mumbooldool.
4775. Do you regard the whole of that tract of country as agricultural? I cannot speak of the country beyond Mumbooldool, which is about 15 miles west of Ariaiah.
4776. What is the country like as far as Mumbooldool? It is good agricultural country. I suppose nineteen-twentieths of the country would be put under the plough. There are a few ridges, but nothing to speak of.
4777. Do they get fair average crops there? They average about 4 bags; that is about 15 or 16 bushels to an acre.
4778. That is looked upon as a pretty good average? It is a pretty good average.
4779. Has it given that average, notwithstanding the dry weather, for the last three or four years? No. Last year it was almost a total failure. It ran from about half a bushel to a bushel to the acre last year, and the previous year from about two and a half to three bags to the acre. Before that time we had averaged up to five bags to the acre. The seasons of 1892, 1893, and 1894 were all good seasons.
4780. Will there be much Government land available there for farming at the end of this year? Yes. I have some statistics. Starting at a point about 10 miles west of Temora, I have some statistics in relation to the country for a distance of 40 or 50 miles along our suggested line, and extending back from the line 15 miles on either side.
4781. Can you state what lands will be available for close settlement within that area? Within that area the freehold, conditional purchase, and conditional lease lands total 403,934 acres, and the Crown lands 276,943 acres.

4782.

- W. Boyd. 4782. Do you regard the bulk of that land as fit for agricultural purposes? The bulk of it is fit for agriculture.
- 31 Aug., 1899. 4783. Among how many holders is the conditional purchase land distributed? I could not tell you without reference to my books.
4784. Can you tell us how much of that land will be available for selection within a short time? I think the bulk of these leases fall in next year. They are all in the Central Division. I notice that the cultivation lands in that stretch of country measure 45,843 acres.
4785. When you were examined before a former Committee you said that about 225,000 acres held by pastoralists would be available for settlement at the end of 1899;—are they included in the area which you have just described to the Committee? No; those figures refer to a different area. The figures I have just given refer to this tract of country on the map, beginning at a point 10 miles west from Temora, and extending west for a distance of 40 miles, with a total width of 30 miles, whereas the other figures were collected for the area between Coolamon and Ariah, including the country on either side of the Coolamon-Ariah line for a distance of 15 miles. Some of the figures I then collected are included in the statistics I have given to-day.
4786. Some of the country which is included within the influence of the suggested line from Coolamon to Ariah is not included in the country which you have just mentioned? That is so.
4787. As regards serving the greatest quantity of agricultural land, which do you think will be the better line to construct—the Temora-Ariah line or the Coolomon-Ariah line? I think the Temora-Ariah line will be the better one to construct in the interests of the country.
4788. Why? The Coolomon-Ariah line goes out at an angle, whereas the Temora-Ariah line divides the country up a great deal better, although personally the former would suit me a great deal better than the latter.
4789. Which of them is the shorter line? I should think the distance is about the same.
4790. If a line were proposed from Temora to Ariah, would you go on in a straight line to Gunbar, or would you go a bit north of the line marked on the wall-map? It appears to me that it is really too close to the Hay line. I think if it went a little further to the north it would be better, although I have no knowledge of the country.
4791. Is there a considerable area of Crown lands to the north-west of Ariah suitable for agriculture? There is a good stretch of Crown lands.
4792. How far does it go up? I suppose it goes pretty well up to the Lachlan. I suppose there are more or less Crown lands right through there. I cannot speak of the country beyond Yalgogrin going north.
4793. As regards lands which have been thrown open from time to time in your district, have they been well balloted for when thrown open? Yes; in a few instances there may be odd blocks not taken up; but the bulk of them have been taken up.
4794. Has any land been thrown open lately? There was some land thrown open at Yarrenjerry a short time ago under settlement lease. The area was about 7,000 acres, and it has all been taken up.
4795. Are the farmers improving the land? They have not got on to the land yet; it was only taken up a couple of months ago.
4796. The last witness was asked what he thought would be the minimum area which a farmer could do with in that district;—what is your view on that point? I put it down at 1,000 acres.
4797. Would the settler require to till all the land, or would he use some for agriculture and some for stock? He would have to combine agriculture with grazing.
4798. You think that 500 acres would be too small an area? I think so.
4799. If he had 500 acres he would want to cultivate pretty well every bit of it? Yes.
4800. It would not leave him any grazing ground at all, and that, you think, it is necessary for him to have? Yes.
4801. How many sheep to the acre can you run on improved land? About a sheep to an acre and a half.
4802. Is the country about Warri and Ariah well improved;—is it held by squatters, or is it becoming worse by reason of the scrub? It is fairly well improved. All the secure lands, of course, are well improved.
4803. What is the condition of the Crown lands held under lease? Owing to the shortness of the leases there have been no improvements made on those Crown lands for a number of years. They have been gradually getting worse.
4804. Owing to the shortness of the leases, and to their having no tenant right, [it has been getting worse? Yes.
4805. Have you any figures relating to the wheat production in your district? Yes; in that area I spoke of we produced 145,546 bags of wheat in one year. These figures were collected on the 16th March, and we allowed four bags to an acre. Last year the wheat crop was a failure.
4806. Will you hand in the return which you have compiled? Yes; it is as follows:—

STATISTICS collected, *re* Temora-Gunbar railway, on 16th March, 1899. Commencing at a point 10 miles west of Temora to a point 50 miles west of Temora and 15 miles on each side of the proposed line.

Freehold and C.P. and C.L. lands.....	403,934 acres.
Crown lands .....	267,943 „
Cultivation .....	45,843 „
Number of sheep .....	214,115
„ horses .....	1,535
„ cattle .....	1,120
Bags of wheat.....	145,546
Bales of wool .....	3,715
Average amount of goods received yearly .....	1,396 tons.
Quantity of other produce—hay, chaff, hides, skins, &c.....	3,716 „
Number of fat sheep yearly .....	41,350
Probable increase in cultivation if a line is constructed .....	97,670 acres.
Population .....	947

4807. Will you tell the Committee how these statistics were collected? The statistics were collected by my brother, who was employed to visit the whole of the settlers in that area.

4808. You put down the probable increase in cultivation, if a line is constructed, at 97,670 acres;—how do you arrive at an estimate of that kind? The settlers promised my brother when he went round to collect the statistics that they would put in that additional area if the line were constructed.

W. Boyd.  
31 Aug., 1899.

4809. Have they brought into the railway most of the wheat which they have grown? I think so.
4810. Or has it been used largely for hay? A great lot had to be cut for hay last year.
4811. But in a favourable season was it taken to the railway? It was all brought in to the Hay line.
4812. A portion of that traffic would go into Temora? From about Broken Dam; but as you get further along there, it all goes in to the Hay line.
4813. Notwithstanding the fact that they have to cart their wheat such a long distance, the farmers as a rule have managed to keep their heads above water? They have been going back every year for the last four or five years.
4814. That is owing to the successive droughts? Owing to the droughts, and to the long haulage.
4815. Have you heard the farmers say what they would consider to be on an average a payable price to receive for their wheat in bags on their farms? My opinion is that about 2s. 6d. on the farm is about the lowest rate.
4816. Some witnesses have stated 2s.;—do you think that is cutting it very fine? It is cutting it fine.
4817. Do you know anything of the features of the country between Temora and Aria;—as regards railway construction, are there any difficulties in the way? I have not travelled that far. I can only speak of the country 10 miles east of Aria up as far as Broken Dam. It could be easily constructed as far as Broken Dam, which is about 18 miles from Temora.
4818. From Aria to Broken Dam, would it be an easy line to construct? Yes.
4819. Which would be the shorter route to Sydney—the Aria-Coolamon or the Aria-Temora? The Aria-Temora.
4820. Then I understand with regard to the broad question, you agree with the former witnesses that, in the interests of your district, and in the interests of the country generally, a line parallel to the Hay line, and going from Temora to Aria, and out west, would be more advantageous than a line from Temora to Wyalong? That is my view.
4821. *Mr. Dick.*] Do you think an extension from Temora, say 50 miles along that proposed route to Gunbar would, of itself, prove a payable line within a very short time? I think so.
4822. If that line were constructed, do you think the further construction of the Temora-Wyalong line would interfere with its revenue-producing capacity? I do not know the country, but I understand that it is not developed to the same extent as the country for the first 50 miles is.
4823. Presuming that a line is constructed from Temora, 50 miles out towards Gunbar, and that an agitation were got up to construct a line from Temora to Wyalong, do you think the construction of the Temora-Wyalong line after the construction of the first section of the Gunbar line would interfere with the revenue-producing capacity of the first line? I think it would to a certain extent, till we got outside the influence of the Temora-Warri line.
4824. Say outside Barmedman? Yes; it would interfere with it to that extent out in that direction.
4825. Do you mean that the Barmedman people would probably take their stuff to Broken Dam if the Gunbar line were first constructed? I do not know the exact distance; I suppose it would depend upon the distance.
4826. The distance is about 17 miles;—is it not a fact that even now both Mandamah and portion of the distance from Temora to Wyalong are already within the influence of the Temora terminus? I think so.
4827. And for the first 15 miles of the proposed Gunbar extension very little new traffic would come from that line? That is right.
4828. So that it is the part beyond, say Broken Dam, and out towards Gunbar, which would bring new traffic to that proposed extension? Yes.
4829. How could the two lines in any way interfere with one another if that were the case? I was afraid that the extension would interfere with it.
4830. You think the angle between the Temora-Wyalong line, and the Temora-Gunbar line is too acute? Yes.
4831. Is it not a fact that, no matter at what angle the line went, both the Temora-Wyalong line and the Temora-Gunbar line, for 20 miles at least, would still be within the influence of the present Temora terminus? Yes; I suppose the traffic would still go into Temora.
4832. Do you think the Gunbar extension can stand on its own bottom as a developing line, or a profit-producing line? I do.
4833. You do not think it is rather close to the Narrandera line? I do not think so.
4834. Do you know the surveyed route for some distance? Yes.
4835. How far on an average do you think it is from the Narrandera-Hay line? From Aria it is about 38 miles, I should think.
4836. Do you know the country 20 miles west of Aria? Yes.
4837. How far do you think a point on the proposed route 20 miles west of Aria is from the Narrandera line? About 35 miles, I think.
4838. That does not leave room between the two lines to enable each to have a sufficiently large area from which to draw traffic? I think so. I think the development will be sufficient; I believe that if that land were all thrown open there would be sufficient settlement there to provide traffic on both lines.
4839. For agricultural purposes, how far from a railway do you think a new line stimulates production? From 15 to 18 miles.
4840. No further? Twenty miles, I suppose.
4841. It stimulates active agricultural expansion for that distance? From 15 to 18 miles is about a reasonable distance to cart wheat. Of course, production would go on further out again. At the present time it is going on 35 and 40 miles back from the railway; but at a disadvantage. Wheat-growing is carried on 40 and 45 miles back.
4842. *Mr. Watson.*] You said you thought the acute angle at which the two lines might go out from Temora—the one towards Wyalong and the other towards Aria—would minimise the amount of traffic available for each? Yes.
4843. If you come too close to the Hay line with your railway, further on, the area available for each line would be smaller? Yes; it reduces the traffic on the Hay line.
4844. Suppose there were no railway between Temora and Wyalong, and there were a railway from Temora to Aria, would not Barmedman still take its traffic in by the main road to Temora? I suppose it would, as Temora is the largest town.

- W. Boyd. 4845. It is about the same distance away as to Mandamah, and they would be nearer Sydney by going to Temora? Yes.
- 31 Aug., 1899. 4846. They would be nearer their market, and consequently, they would be more likely to go to Temora? Yes.
4847. In the same way, if the Temora-Wyalong railway were carried out, and no railway were made to Ariah from Temora, the Broken Dam traffic would still go to Temora? Yes.
4848. So that the run of traffic from either of those places would not be interfered with by the construction of a line to the other? I do not think it would.
4849. Admitting that it is an unwise thing to start at an acute angle, if you can avoid it, with a second line of railway, would not the wisdom of that to some extent be governed by local circumstances? Yes.
4850. Supposing you had a tract of country to pass over on the alternative route, which was unproductive from a railway point of view, which was not agricultural land, would it still be a wise thing to follow blindly your map projection? I do not think so.
4851. In that case, I suppose, you would think it wise to modify it in order to fit local conditions? Yes, to a certain extent.
4852. We cannot always be guided by the map alone? No.
4853. You admit that the traffic from the direction of Barmedman and Broken Dam respectively is so far distinct that each will continue to work independently of the other, probably towards Temora? I think they will draw in towards Temora without any railway extension.

John Holloway, pastoralist, Mumbloodool, sworn, and examined:—

- J. Holloway. 4854. *Chairman.*] What are you? I am a pastoralist, residing at Mumbloodool, which is 35 miles almost due north of Narrandera.
- 31 Aug., 1899. 4855. How far is it from Temora? I think it is 47 miles by the railway survey-peg from Temora to Mumbloodool.
4856. Are you a member of the deputation sent here to ask for an extension of the line from Temora out towards Gunbar? Yes.
4857. Will you state as concisely as you can your reasons for advocating that line? My reason is that there is so much good agricultural land, which may be made profitable to the country, and will carry a big population if they have means of getting their produce to market. I think there is no better land anywhere in New South Wales for wheat-growing than a good deal of that country. Another reason is that nearly all the leases will fall in next year, and unless they have a railway it is better to leave the country in the hands of the original occupiers.
4858. Keeping the line you advocate 40 miles distant from the Hay line, do you think there will be a sufficient area of good land to justify the construction of a light railway in that direction? I think there would. The railway could be made very cheaply, as it is very level country; there are no cuttings in that neighbourhood.
4859. Keeping 40 miles away from the Hay line, would that secure sufficient good land to the north of the line to pay for its construction—that is, in conjunction with 20 miles to the south? I think so. There is a good deal of Crown land available, and if a bit of money were put on to the land nearer to the railway—which people would be very willing to pay—it would help to pay for the railway very much indeed.
4860. You have no hesitation in saying that there is sufficient good land 20 miles north and 20 miles south of the line you advocate to warrant its construction? That is my opinion.
4861. Do you know the country between Grenfell and Wyalong? I have been over it, though I do not know it very well. I have a general knowledge of the country between the Lachlan and the Murrumbidgee. I have passed over it a good many times in different directions, and I have passed over the country between Grenfell and Wyalong, but it is a good while ago since I did.
4862. Do you know the country between Wyalong and Hillston? Fairly well.
4863. Would not a line going west from Grenfell in that direction serve an equally good tract of country? I think it would. I think the land is nearly as good; there may be some ironbark hills. I would advocate two lines myself to serve all the country between the two rivers, or nearly all of it. I think it would be better policy for the Government to have two lines running parallel nearly west—nearly the same way as the Lachlan and Murrumbidgee run—to get the traffic of all the land between the two rivers.
4864. You think it would best serve the interests of the country to have those two parallel lines, in order to develop the whole of that country? Exactly; I think short cockscur lines would be of very little use, and eventually would not be a success.
4865. Do you think the traffic would justify the construction of two lines in that way? I do, as I have such faith in the land, which is very good, indeed.
4866. Do you usually get sufficient rainfall, and at the proper time of the year, to successfully grow wheat? Until the last four years it has been. The rainfall has averaged about 20 inches, and the crops have been very good until the last few years. I have known over eight bags to the acre to be grown on Mumbloodool. I have cultivated one piece of land for hay for nearly seventeen years. It is a small bit, certainly. We only use it for hay; it grows a very good crop.
4867. From your knowledge of the country you think that the construction of two lines, running west from our present system, would be justifiable? I do. There is a great deal of very good land which would be tapped by the line from Grenfell to Hillston. I have been over there a good many times about Bygalorie and what they call the Humbug Creek. It is beautiful land. Bygalorie is all basaltic rock country, and very good formation. It is 40 miles nearly south from Condobolin. It is not far from Ungarie. There are over 30,000 acres of basaltic country. I have seen that country when I have been going through to see my son at Kiacatoo, which is 20 miles south of Condobolin.
4868. How would you describe the whole of the country which you have been across? The whole of it is very good land indeed. On North Yalgogrin there are some ironbark hills, but that is the only poor land there is going across there.
4869. What percentage would there be of good agricultural country? It is nearly all good, I should think. Only about 3 or 4 per cent. is not good.
4870. Would you care to express an opinion as to the advisableness, or otherwise, of continuing the line from Temora to Wyalong, and then going out towards Hillston? I do not think it would be good policy to build a railway from Temora to Wyalong, and then to Hillston.
4871. Why not? I think it is better to have two parallel lines.
4872. You have no doubt about that? That is my conviction, and I have lived in the neighbourhood there for nearly twenty-seven years.

J. Holloway.  
31 Aug., 1899.

4873. Have you grown wheat? Yes, but not to any great extent. We have grown wool mostly.
4874. *Mr. Watson.*] You seem to favour the construction of a line from Grenfell to Wyalong, as far as the present proposal is concerned? Yes, and to carry it on then towards Hillston by all means.
4875. Because you think that will split the country up better? There is some beautiful country out that way.
4876. Where is it? I think it is on the Humbug Creek.
4877. That is west of Wyalong; but the Committee are considering the best method of reaching Wyalong, keeping in view an eventual projection in any direction which it may be thought fit to adopt;—do you know the country between Grenfell and Wyalong? Yes; but not very well. I would not speak very positively about it now. I knew it before it was occupied—before it was improved in any way.
4878. The District Surveyor, when he gave evidence here a few days ago, stated that that line between Grenfell and Wyalong would, for 25 miles, pass through country absolutely unfitted for agriculture, good pastoral country, but country absolutely unfitted for agriculture;—that would not be so remunerative from a railway standpoint, I suppose, as country which would produce wheat? I do not think it would.
4879. It has been stated by engineers, in their evidence, that the line from Grenfell to Wyalong will cost nearly £50,000 more than the line from Temora to Wyalong, and I want to know whether, if the statement as to the land is true, bearing in mind the fact of the extra cost, those points might not weigh against the appearance of the map projection? Possibly.
4880. Is it not a fact that the only objection which the people along the Temora to Gunbar route have to Wyalong being reached from Temora is that they are afraid that it will prejudice the chance of an extension in their direction from Temora? Undoubtedly that has some weight.
4881. Is it not a fact that the Sectional Committee, when the Coolamon-Ariah proposal was under consideration, intimated that they were in favour of a projection from Temora to Gunbar, and from Koora-watha to Wyalong, and led the people at Ariah to understand that that is the way they are likely to get a railway? That was proposed, I think, by that Sectional Committee; but, independently of that, I think that is the best way to occupy all that country.
4882. I do not suppose we should have seen any of you gentlemen here, but for the fact that you were afraid that it might prejudice your chance of having the line extended in your own direction? I came here, not because I was afraid, but because I was requested by the Chairman to come. I came here as an old resident to assist you with information as far as I could. I did not volunteer to give information.
4883. Some members of the deputation which was appointed to wait upon the Minister volunteered to give evidence on a question which is not directly before the Committee, but which is within our purview; I think you stated just now that you think the main objection to any line going from Temora to Wyalong, as far as the Ariah route is concerned, is the fear that it will block extension in their direction from Temora? It is very likely.
4884. *Dr. Garran.*] You have been growing wool, I understand, but you have also grown a little wheat? Yes.
4885. With your knowledge of the soil, which do you think is the best use to put the land to—to grow wheat or to grow wool? To grow wheat, if we can get it away.
4886. Given adequate transit, wheat is the most profitable use to which to put the land? Undoubtedly.
4887. And although, as a pastoralist, it is not to your interests to break up pastoral occupancy, you agree with all the people who say that it is a fine agricultural district? Yes.
4888. And your opinion is, that the settlement will be close enough to make a cheap line remunerative? Yes.
4889. And that, in the interests of the country, it will be best to run these lines from east to west in preference to having short cockspur lines from the Hay railway? I think that would be more profitable with wheat in the first place. Later on, perhaps, there might be a necessity to join them by short lines.
4890. Is your land secured, or leasehold land? We have 18,000 acres of secured land, and about 60,000 acres of leasehold land, which will fall in next year.
4891. The leasehold land will, perhaps, pass from you? It will not next year, because the Government have resumed 20,000 acres, and it is available for settlement now.
4892. *Mr. Watson.*] That gives you an extension for the balance? Yes; an extension of fifteen months.
4893. *Dr. Garran.*] You are aware that we have made some railways, notably the Narrandera-Hay line, in the hope of inducing agricultural settlement, and have failed? Yes; but that is very easily accounted for. It is not agricultural land which it passes through. It goes through large pastoral freeholds. Had half that money been spent in constructing a railway between the two rivers—the Lachlan and Murrumbidgee—it would have paid over and over again.
4894. Is the land itself agricultural? Not on the Hay railway.
4895. So that if the pastoralists wanted to break it up into farms, it is not suitable for farms? It is not, near the Hay line.
4896. But this line you are speaking of from Temora towards Gunbar would run through agricultural land? It will run through good agricultural land.
4897. You do not think it would be a disappointment? No; I am sure it would not be, as far as the land is concerned. Wheat-growing has got beyond the experimental stage out there.
4898. Has the line from Cootamundra to Temora induced smaller settlement? Yes.
4899. As much as you expected it would before it was made? I think so. I do not know very much about that country. I know some gentlemen who live there.
4900. Yet it is not a remunerative line? I think it is a remunerative line, and if it is not, it is simply because it has not been carried far enough. I think an extension of 50 miles would have made it remunerative.
4901. You think it is too short a cockspur line? Yes.
4902. If you carried that line on to Binya, the engine could go to Cootamundra one day and come back the next? Quite so. I think it would pay very well.
4903. I suppose if it went on to Gunbar the engine could go the whole distance one day and come back the next? I dare say it could.
4904. So that we have been too timid rather than too bold in that direction? I think so. I think if we had gone another 50 miles it would have been very much better.
4905. *Mr. Watson.*] Do you know how far Binya is from the Hay line? Speaking from memory, I think it is 26 miles.

- J. Holloway. 4906. Do you know that range where Mount Elliott is marked on the map? Yes; Binya Range.  
 31 Aug., 1899. 4907. Is there any necessity to go south of that range? I do not think there is. I think they could worm a way through the hills very well. There is beautiful land in what they call Pleasant Valley, amongst those hills.  
 4908. How wide is it from east to west? I do not know. It is broken hilly country for some miles; but between the hills it is very good land indeed. There is a great deal of settlement there too.  
 4909. Apparently the line was brought so far south with the view of getting round the southern end of Binya Range? I know no other reason why it did not go 10 miles further north.  
 4910. *Chairman.*] You said, in answer to Mr. Watson, that your main objection to the construction of the Temora-Wyalong line is, that it would probably interfere with the construction of a line from Temora out towards Gunbar;—we are to take it that you are speaking personally when you make that statement? Yes.  
 4911. The objection you would have to running a line from Temora to Wyalong would be that it would not properly split up all that western country? Exactly; and it would keep a lot of that country back from having a railway for many years.  
 4912. Which country? The country towards Gunbar. I think it would be detrimental to a great part of that country for years to come, and the benefit which would enhance the other country is problematical.  
 4913. The line crossing that country in a northerly direction, you think, would not be in the interests of the Colony? I do not think it would.  
 4914. Suppose there were a proposal to run a line from Ariaah out north towards Yalgogrin, do you think that would be a good proposal? I do not see what object there would be in doing that. There is a great deal of country there, which is abandoned for the present anyway. All Buddigower is abandoned; it is a big scope of country, and on North Yalgogrin there is some of the worst land to be found out there.  
 4915. *Mr. Trickett.*] You were asked about the country between Grenfell and Wyalong, and I understood you to admit that for about 25 miles out of Grenfell, it is fairly good agricultural country? I do not know much about it.  
 4916. Do you think if a projected line is proposed to be run through good fattening pastoral country, that should be a reason for blocking the railway from going through that pastoral country;—do you think the pastoralist has got to a stage when he should be ignored in our railway construction? No. There seems to be very little money available for railways; it is very hard to get them. We should get them in country which would enable them to pay their way the quickest, and they will only do that in red pine and box soil. They will not in that black country on the Bland.  
 4917. And let the squatter get his stuff to market in the best way he can? He has so little to get to market. A 320-acre farm would produce as much weight for a railway as a squatter will off his 60,000 acres.  
 4918. Supposing there happens to be a great tract of suitable agricultural country beyond a stretch of 25 miles of good pastoral country? By all means go across it.  
 4919. You would not cut off the agricultural country out west from a railway, because it would have to go through 25 miles of pastoral country? Certainly not.  
 4920. You would not go so far as that? Certainly not. A pastoralist wants a show as well as a farmer; but I think a railway is so hard to get that it should be made where the land will give the best returns to the Department.  
 4921. *Mr. Levien.*] I suppose these farmers are pastoralists too? Yes. As far as I am concerned, I would put every acre we have under wheat if we had a railway.

Charles Snell Chauncy, surveyor and farmer, sworn, and examined:—

- C.S. Chauncy. 4922. *Chairman.*] What are you? I am a surveyor and a farmer.  
 31 Aug., 1899. 4923. Were you one of the deputation appointed to wait upon the Minister in reference to railway extension to Gunbar from Temora? Yes.  
 4924. Will you shortly state your reasons for advocating that proposal? Because of the distance we are from the railway line, making it unprofitable to grow wheat; and because the line will pass through nearly all good agricultural land. Nine-tenths of the land is fit for good wheat culture.  
 4925. Do you know the country generally north of the line you suggest? I know the country north from Ariaah to a little above Mount Elliott, and round Yalgogrin, and down towards Narrandera.  
 4926. Do you see the line marked broad red on the map from Grenfell to Wyalong? I have never been to the east of this line from Ariaah to Yalgogrin.  
 4927. Would the railway which you suggest split in halves a fair amount of good agricultural land if constructed? I think so.  
 4928. Have you any knowledge of any railways which have been constructed in order to promote agriculture? No, except from hearsay.  
 4929. So that you could not say whether the construction of railways has stimulated agriculture? Not from personal knowledge. I believe it would stimulate agriculture if we had a railway.  
 4930. Is much of the country you are acquainted with heavily timbered? Yes; it is nearly all heavily timbered with box and pine and pine scrub.  
 4931. Is that the country which they are clearing for wheat? Yes.  
 4932. It is not quite so heavy as the big scrub in the north? No.  
 4933. You have heard the evidence which has been given by the other witnesses this afternoon? Yes.  
 4934. Generally, do you corroborate their evidence? I quite corroborate all I heard.  
 4935. *Mr. Shepherd.*] As a surveyor, if you were employed to make trial surveys there of your own option, without any direction whatever, how would you start to work to reach the western country from the present railway? I think I would about follow the route which is shown in red on the wall map. I think it is taken by about the best place. I think that is shown to be a little nearer to the Hay line than it really is in places.  
 4936. Do not you think a system of parallel lines from the main line from 30 to 40 miles apart, right into the country you want to reach, would be the better plan to adopt? I think so. Parallel lines, I think, are the best.  
 4937. That would serve the whole country, then? Yes.

4938. You would be within 20 miles of a railway through the whole of that country? I think so. More than 20 miles from a railway is too great a distance to cart wheat payably.

4939. And the fact of a block of pastoral country happening to come in, you would not consider a sufficient reason for blocking the railway altogether? I think not.

C. S.  
Chauncy.  
31 Aug., 1899.

Samuel Harrison, farmer and grazier, Broken Dam, sworn, and examined:—

4940. *Chairman.*] What are you? I am a farmer and grazier, residing at Broken Dam.

4941. Were you also one of the deputation appointed to wait upon the Minister? Yes.

4942. Will you please state your reasons for making the suggestion to the Minister? Now that these railways are before the Committee, we thought it was a very good time to get this line submitted. We have been advocating for a long time an extension from Temora westward, and I think it is a very good time to bring it before the country. It would open up a lot of country through there. The Broken Dam Railway League, which I represent, is a very old league. For 20 miles north of Broken Dam there are a number of settlers, and I consider that in the interests of that part of the Colony, and in the interests of the country generally, the line should be extended from Temora out west.

4943. Have you any further statement to make? No; except to say that we did not take any statistics for the country within 10 miles of the present line at Temora. We made an allowance for that stretch of country.

4944. You have heard the evidence given by previous witnesses? Yes.

4945. Are you able to corroborate what they have stated? Yes; a lot of what they said about the Wyalong line. My league does not interfere with the Wyalong line or the Grenfell line; we do not care if you put a line to both places.

4946. *Mr. Trickett.*] You would not mind if they had a line to Wyalong, so long as you got a line to Arianh? No; we would not mind, whether or not, as far as that goes.

4947. *Chairman.*] How long have you been at Broken Dam? Fifteen or sixteen years.

4948. Have you a general knowledge of the country that will be served by the line you propose from Temora towards Gunbar? Yes.

4949. How would you describe the country about there? There is a lot of very good country. There are patches of bad country, but not much.

4950. Is it better or worse than the land which is now served by the railway from Cootamundra to Temora? It is much about the same, I think—better, if anything.

4951. Have you any doubt as to whether ultimately wheat-growing out in that direction will pay, provided that they get cheap means of conveyance? I have been growing wheat ever since I have been there.

4952. Have you done pretty well? I have made a living at it.

4953. You have had pretty bad times of late? Yes; for the last four or five years.

4954. Since the railway to Temora has been constructed, you have had a majority of bad seasons? Yes.

4955. *Mr. Shepherd.*] I suppose all you gentlemen who have attended on this deputation were appointed by the residents in the immediate districts from which you come? We were appointed by our different leagues.

4956. *Mr. Levien.*] I suppose you would sooner have the proposed line from Temora to Wyalong than a line from Grenfell to Wyalong? It makes no difference to me.

4957. Suppose you had to make a choice between the two lines, which of them would you sooner have? In that case I should go for the Grenfell line, because it is the most direct route to Hillston.

4958. Neither of the two lines is of any use to you? No; it would not affect us at all.

4959. You want a railway for yourself? That is it.

4960. *Mr. Watson.*] You said that if you had to choose you would take the line from Grenfell to Wyalong, because it goes more direct to Hillston. Do you know the country between Grenfell and Wyalong? I have been across it; I have been to Grenfell and across there.

4961. By which way did you go when you went across? I went right through from Temora to the Bland.

4962. You never went across direct from Grenfell to Wyalong? No.

4963. Do you view the Bland as agricultural country? It is very good grazing country.

4964. You do not think it is agricultural country? No; but when you get towards Grenfell it is good agricultural country.

4965. Do you think that the construction of a line from Temora to Wyalong should prevent the construction of a line from Temora to Arianh? No.

4966. You live at Broken Dam, and at present you take your produce to Temora? Yes.

4967. Where would you take your produce if a line from Temora to Wyalong were constructed? To Temora.

4968. You would not take it to Reefton, or any place like that? No.

4969. If a line were constructed from Temora to Arianh, where would the Barmedman people probably take their produce to? To Temora.

4970. So that these lines would not attract traffic one from the other in the event of both being constructed? No.

S. Harrison.  
31 Aug., 1899.

TUESDAY, 5 SEPTEMBER, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Charles Henry Hayward, secretary, Smelting Company of Australia, Ltd., Dapto, sworn, and examined:—

4971. *Chairman.*] What position do you occupy? I am Secretary to the Smelting Company of Australia, Dapto.

4972. Have you any figures showing the number of tons of ore brought from Wyalong and treated at your

C. H.  
Hayward.  
5 Sept., 1899.

- C. H. Hayward.  
5 Sept., 1899.
- your works? Yes. For the six months ending 31st December, 1897, 465½ tons; for the twelve months ending 31st December, 1898, 560 tons; and for the eight months ending 31st August, 1899, 205 tons.
4973. Was that all received from Wyalong? Yes.
4974. Do you know anything of the nature of that ore? Yes. The contents of the whole of the tonnage I have mentioned are 10,165 ounces of gold, and 1,116 ounces of silver.
4975. What was the railway freight paid on those 1,231 tons of ore? £889 14s. 7d.
4976. What was the value of the ore? The Smelting Company paid for the ore, £36,228 10s. 9d.
4977. Do you know whether there is anything in the nature of that ore which would preclude it from being successfully treated on the field? No; I think it could be treated on the field.
4978. *Dr. Garran.*] Did your company buy that ore on its own account? Yes.
4979. It was not sent to you for treatment? It was sent to us for purchase. We do not treat any ore for anybody. We buy all ore.
4980. It was your ore when you treated it? Yes.
4981. Was there any difficulty in treating it? From our point of view, no.
4982. Did you have to blend it with other ores to treat it successfully? Yes.
4983. Then it was more easily dealt with by you, where you had a blend, than it would have been on the ground, where you could not have blended it? I should certainly say so.
4984. For you said just now that there was no difficulty in treating the ore on the ground? Perhaps I was wrong there; there may be some difficulty; but I understand that it could be treated.
4985. But it is advantageous, in treating that ore, to blend it with some others? Certainly.
4986. Then, on the whole, it will be more successfully dealt with in a large establishment like yours than on the ground? I should think so.
4987. Suppose there were a railway to Wyalong, would it facilitate greatly the sending of the ore to Dapto? Most certainly.
4988. And in the absence of the railway, it might be cheaper to deal with it at Wyalong? Yes.
4989. So that the tendency of a railway would be to send the ore to the place where it could be best dealt with? Certainly.
4990. Then, in that case, the railway would be a benefit to gold producers, and also a benefit to the smelters? Certainly.
4991. You do not find it in any way a specially difficult ore, I suppose? No, nothing out of the ordinary. I may say that nearly all the ores we have are refractory ores.
4992. It was concentrated before you got it from Wyalong? The great bulk of it was not.
4993. Then it was what we may call crude ore? Yes.
4994. Was not a great deal of unnecessary carriage paid on waste material? There must have been.
4995. Would it not be far cheaper to give it a first treatment on the ground—to concentrate it? Yes.
4996. If there were a railway would the effect probably be that it would be dealt with first on the ground, in the way of concentration, and then the smallest possible bulk sent forward for treatment? Yes.
4997. Have you had ore from different mines at Wyalong? Yes.
4998. Is there much difference in the different mines, or are they very much alike? It is pretty well all the same class.
4999. If you could get more of that kind of ore you could advantageously deal with it? Certainly.
5000. *Mr. Watson.*] Do you require fluxes other than different kinds of ore in your treatment at Dapto? Yes; we use iron flux and lime flux.
5001. Have you got these fluxes in close proximity to your works? No; they are brought from about 130 miles. The ironstone mainly is brought from Carcoar, and the limestone is brought from Portland Siding. It is a marble lime.
5002. Do you know of any smelting works in Lithgow? Yes.
5003. Do they treat ores at those works? I believe they do; but mainly they draw from some mines controlled by themselves in the vicinity. They are not so much smelting works as our own are, although they work somewhat on the same lines.
5004. Do you think their facilities for getting varieties of ore, and, consequently, cheapening the process, would be eventually as great as your own? That depends upon what facilities there are for getting such things as coke, flux, and coal. I do not know the Lithgow works sufficiently well to know what the facilities are for this purpose. Our strongest point is that we get our coal so cheaply, and get our coke so close at hand.
5005. At Lithgow they have coal, and, possibly, they can get coke cheaply, so that the only question would be whether they could get the flux as easily as you could? I could not say that.
5006. Do you think you have as large a chance, or a larger chance, of getting varieties of ore from different parts of the colonies as the Lithgow people would have? I fancy so, because we bring large quantities of ore from South Australia. We bring large quantities from New Caledonia, and, of course, we get large quantities from West Australia. They are all discharged at Sydney, and the freight is not very heavy from Sydney to Dapto.
5007. When you speak of ores from South Australia, do you include Broken Hill ore brought from South Australia? Yes; I mean Broken Hill ore.
5008. The great varieties of ore which you get I should imagine would afford an easier method of getting the same result? Yes; it cheapens the cost of treatment, certainly, because what is good in one ore will help what is bad in another.
5009. So that the probabilities are that from your position you would be able to compete successfully with any works established at Lithgow? I think so.
5010. Will the harbour at Port Kembla, when it is completed, assist your company at all? Greatly.
5011. From Sydney to Dapto the distance is 56 miles, and from Port Kembla to your works at Dapto, would be how far? The distance from Port Kembla to our works direct would be about 4 miles.
5012. That is a material saving as far as sea-borne ores are concerned? Yes.
5013. It increases your chance of successful competition with any similar works which might be erected inland? Certainly.
5014. During this inquiry we have been told that it might be of advantage to the people of Wyalong to be more closely connected with Lithgow with a view of sending ores there;—what I wish to get at is whether you would be able to compete successfully with Lithgow, even if there were a railway nearer the
- the

the point from which you get the ore? I think so, because it is not only the matter of bringing the ore, but the getting of your produce away too, which has to be considered.

5015. With your works within 4 miles of Port Kembla Harbour, you would have a big advantage in that respect? Certainly, the freight on the products is very much higher, proportionately, than the freight on the ore.

5016. They charge a high freight on valuable goods, whereas on crude ores the freight is very low? Yes.

5017. A saving of 50 or 60 miles in the carriage of ore after once being trucked towards the smelting works would not make a great difference in the cost of carriage, would it? Fifty miles would only mean a trifle.

5018. Taking a run of 350 miles? It would make a difference of about 2s. a ton in the railway freight on the ore alone.

5019. So that in taking ores from Wyalong to Lithgow, they will save a certain amount on the ore as compared with your firm; but they will lose a certain amount of carriage on the bullion, because it has to be carried 96 miles towards Sydney? Yes.

5020. They will not be in any worse position then? They would, because the freight on the bullion would be so much higher than the freight on the ore. They may gain a little in the freight on the ore, but they would lose that in getting their produce away. For instance, the freight on ore from Sydney to Dapto is only 2s. 4d. a ton, but the freight on the bullion is 10s. a ton.

5021. I suppose it is because of the extra care which has to be exercised in the carriage of bullion? It is a different class of traffic under the regulations.

5022. There is no doubt in your own mind as to your ability to compete with places situated such as Lithgow is, even in respect of treating ores from the interior? I think so, because our works are very large.

5023. You know that at present they are treating a very large proportion of Wyalong ores on the field? That is on account of the absence of the railway, I take it.

5024. They pay an average of £1 per ton freight between Wyalong and Temora by road, and about 14s. 6d. per ton from Temora to your works, so that the 40 miles carriage between Wyalong and Temora costs more than the 300 miles carriage from Temora to Dapto? Yes; if that freight can be done away with to Temora, it means that the lower grades of ore which we do not get now would get down. This statement which I have shows that the average grade of the ore we get from there is 8 ounces.

5025. That is a high grade? Yes; on account of the expenses. If these freights were done away with, or were very much reduced, I think we should get a larger quantity of low grade ores.

5026. To that freight of 14s. 6d. between Temora and Dapto, may we assume that the Railway Commissioners, for the extra 40 miles, would put on another shilling? Presuming that the same rate would apply, it would be 1s. 8d.

5027. With a freight of 16s. 2d. a ton from Wyalong to Dapto, do you think you could compete successfully with works on the field with regard to treating refractory ores? I am sure we could.

5028. Why is that? Because of their smaller opportunities of getting ores for blending and so on, and the extra expense of working up there on a small scale? I know the rate they charge, and we can compete with them now in ores of fairly good grade. It does not pay them to send to us ore of 2 or 3 ounces.

5029. At present on the field they are doing most of their reduction, as far as I can learn, by battery treatment, by chlorination, and by cyaniding? Yes.

5030. Do you think the smelting would give better results in regard to the general class of Wyalong ores if you could get a cheap freight to your works? I think so; but apart from that the treatment is not at the risk of the persons owning the ore at all—that it is at the risk of the smelting company.

5031. What I want to get at is whether their present methods would be able to compete with smelting at the distance you are from Wyalong, or whether smelting being so much cheaper, or giving a better result, it would be to their advantage to send the ore away, and not treat it by cyaniding and chlorination? I think it would be an advantage to send the ore to us, because I know the deductions which the works up there make for loss in treatment, are greater than what we make. That seems to show me that they have a greater risk of loss, and not such good extraction as we have in smelting. We lose no gold at all in smelting; every bit of gold is got out; but by their system of chlorination there is a certain loss in the gold.

5032. You think with railway communication it would pay the mine-owners of Wyalong to sell to your company rather than treat their ore by the present method? I think so, unless that may be on a pretty low-grade ore, such as an ounce ore—they probably would always treat that on the ground.

5033. That would be too low to send to you? Yes, perhaps.

5034. Do you think with the quantity of ore available at Wyalong—all of one class—it would be worth anyone's while to erect smelting works there; I mean in the face of certain competition with companies such as your own and that at Cockle Creek? I do not think so, for this reason—that to smelt you must have lead ores, and they would have to carry their lead ores all the way up there.

5035. You do not think they could profitably smelt with their own ores and coke and flux only? I am sure they could not; they must have lead for smelting.

5036. Supposing smelting to be necessary for the future development of Wyalong, we might almost dismiss the probability of it being done on the field, and of their needing coal for that purpose? Yes; I do not think they would ever smelt on Wyalong field.

5037. We can reasonably dismiss it from our minds if it means the taking of lead ores there? Yes.

5038. *Mr. Shepherd.*] There has been a considerable falling off in the quantity of ore taken from Wyalong to Dapto? Yes; this year.

5039. Can you account for that falling off? I take it that it was due to the increase of the chlorination works on the field, and, it may be, to the falling off in the grade of the ore. The richest ore has nearly always come away, but, of course, the poorer grade ore does not. I understand that during the last twelve months they have been doing a great deal of exploration work there, and have not been putting out a high-grade ore. The lowest grade which has been met with in driving has been sent right into the plants on the field.

5040. You attribute the falling-off to the improved mode of dealing with the ore at Wyalong, I suppose? No; I think the rich ore, such as was previously sent to us, has not been mined during the last six or nine months in such quantities as it was before.

5041.

C. H.  
Hayward.  
5 Sept., 1899.

C. H.  
Hayward.  
5 Sept., 1899.

5041. Do you think it is likely that if a railway were made from Wyalong to Temora there would be a greater inducement to send quantities of ore? I do, if the freight is suitable.
5042. The freight would be considerably less? Yes.
5043. I think you said that your company purchase the ore, that you do not crush it? We crush a portion of the ore for the purpose of sampling. We establish what is in the ore, and we buy it on that. The seller has nothing to do with what we get out of it. We simply prove to him what there is in it, and pay for it.
5044. It would really depend upon your company as to the quantity of ore which would be obtained from Wyalong? It depends upon what rates we would give them for the purchase of it.
5045. It would be a matter of business, I suppose, between you and the mine-owners at Wyalong;—the mine-owners do not send the stone there to be crushed on their own account, do they? Yes.
5046. I understood you to say they did not? We buy it on our sampling at our works; we do not buy it on the field. They send the ore to us, and very often send down a man with it to see it proved, perhaps at first, until they are satisfied, and then they will send consignments along without sending anybody with them.
5047. The mine-owners are really responsible for the stone which is sent from Wyalong—they send the stone at their own risk? Yes.
5048. There would be an inducement to send ore of less value if they could get a lower freight? It is entirely a matter with them whether they can treat the ore to better advantage up there than with us. They will go where they can get most money for the ore.
5049. Do you not think, as time goes on, their mode of treating stone at Wyalong will be more perfect, and render it less likely that they will care to send the stone away from there? I can hardly say how they are likely to treat it in the future. There is no cheaper way of treating ores than by smelting in large quantities; and I think they are not likely to smelt there on account of the difficulty of getting lead ore. Smelting is the cheapest way in which you can treat ores.
5050. Is coal superior to wood for smelting? It is.
5051. That would be a considerable item as against Wyalong if they had to use wood instead of coal? You can use wood for smelting; but it is not so good as coal.
5052. So that they really would be in favour to some extent of sending the ore to Dapto as before? Yes.
5053. *Mr. Trickett.*] What ingredients do you use for smelting at Dapto? Coal, coke, limestone, ironstone, scrap iron, and the ore itself.
5054. *Mr. Watson.*] And the lead ores? I take it that you would put that in with the ores themselves.
5055. *Mr. Trickett.*] The coal you get locally? Yes.
5056. What are you paying per ton for your coal? We have three different kinds. We have small coal, which costs us at the works about 4s. 6d. a ton. The coal which we use in our boilers for steaming will cost us about 5s. 6d. a ton, and the large coal, which we use for better class work, will cost us about 7s. a ton.
5057. What is the better class work? We use large coal mostly in our refining operations, where we want cleaner coal.
5058. Where do you get the limestone? It comes from Portland, on the Western line.
5059. You have a contract with some people at Portland to supply your limestone? Yes.
5060. Where does your ironstone come from? From Carcoar.
5061. I suppose, if it has been sworn that small coal can be got at Lithgow at 2s. a ton, you would not care to dispute that fact? No; I do not know.
5062. If it has also been sworn that the average price of coal at Lithgow is from 3s. 9d. to 4s. a ton, I suppose you would also admit that fact? I do not know.
5063. Do you know as a fact whether the coal at Lithgow, taken altogether, is not cheaper than the Illawarra coal? If the average price is as you say.
5064. You do not know, as a fact, that it is? No; I do not know what the coal costs.
5065. Is there any scarcity of water at your works, or have you an abundant supply? We have an abundant supply of water.
5066. From your own catchment area? We have our own reservoirs, and we use salt water for the smelting operations proper.
5067. With regard to the treatment of ores at your works, and the treatment of ores at Lithgow, if extensive works were established at Lithgow, with limestone within a distance of 14 miles, with coal at the lowest price, and with ironstone at Carcoar, which is nearer Lithgow than Dapto, in all probability smelting operations could be carried on there as cheaply as, if not cheaper, than at Dapto? You forget that they have to take their lead ores all the way there and bring their bullion back. They might get their fluxes cheaper, but the smelting works could not run Wyalong ore by itself.
5068. Are there districts in the interior of New South Wales where lead ore is procurable? The whole of the lead ore comes from South Australia.
5069. Lead ore, apparently, would be the only ingredient which would have to be taken to Lithgow, if the facts are as I have said? No; they would have to take other ores to mix with the Wyalong ore, besides the lead ore.
5070. What ores do you mean? All sorts of ore.
5071. Where do you get your all sorts of ore from? From New Caledonia, Tasmania, and West Australia.
5072. How do they reach Dapto? From Sydney, by train, at a cost of 2s. 4d. per ton.
5073. How much would it be to Lithgow? That would be 4s. a ton.
5074. Suppose you save 3s. in coal on every ton of ore treated, that would soon make up that difference, would it not? You are assuming that you use a ton of coal to a ton of ore.
5075. No; 3 tons for every ton of ore; an expert before a former Committee said that it takes about 3 tons of coal for every ton of ore? That was a different proposition from the present one; that was a question of treating Broken Hill sulphide ores by themselves as ores; but the company's proposition now is different from what it was originally.
5076. Does it not take as much coal? No.
5077. Is there very much difference? Yes. I cannot remember the figures just now.
5078. What does it cost you to bring your limestone from Portland to Dapto? The freight on the limestone is about 10s. a ton.

5079. So that, with smelting works at Lithgow, which is only 14 miles from Portland, they could effect a considerable saving in that item? As far as limestone is concerned.

5080. Limestone is a considerable item in smelting? Yes.

5081. In answering a former question as to the comparative cost of the treatment of the Wyalong ores at Dapto and at Lithgow, had you considered all the figures which I have now put before you as regards Lithgow? Even at the reduced price of the flux and the coal, I still think our position at Dapto would enable us to treat ores as a whole more cheaply than they could be treated at Lithgow.

5082. What do you mean by your position as a whole? I mean our proximity to Sydney, chiefly, our being in the middle of the coal, and our having to bring lead ores such a short way. The ores which come from West Australia have only to be carried a short way too, and our Tasmanian ores have only to be brought a little way. If Lithgow started smelting, in all probability they would have to carry all these outside ores to their works, and bring the bullion all the way back to Sydney.

5083. That would only mean a difference of 1s. 4d. a ton carriage? On the ore going up, but not on the bullion coming back. Then, again, we are relying a good deal on Port Kembla Harbour. With a harbour close to us like that, we should be saved a great deal of expense.

5084. You will get everything brought to your place? Yes; the limestone and the ironstone, instead of coming by rail through the Colony, as they do at present, will probably be brought round the coast from other places.

5085. You will have to pay harbour dues there? There will certainly be some harbour dues payable; but, of course, on ores we have to pay these dues in Sydney now.

5086. I understand, then, that the reason why you think you can work this stuff more cheaply at Dapto is because you are in a larger way than they would be likely to be at Lithgow by reason of your getting South Australian ores to deal with;—if it be a question of only treating the Wyalong ore, do not the circumstances at present seem to be in favour of the Lithgow place? But is not the question of treating Wyalong ore bound up in the matter of what other ores you may receive to treat with them.

5087. Is it because you work your establishment as a whole, and blend all kinds of ores together, that you think you can carry on better than they can? Probably the source of our cheap treatment is the great mixtures of ores we have, and the large quantities we have.

5088. But if large works were established at Lithgow, and they could get hold of the stuff, I suppose they could do very much the same as you do? I do not think you would be able to have as large workings further away from the coast as you would at the coast. I think that if it had not been for the idea of having a harbour at Dapto, the smelting company would probably never have gone there; they would have established their works round the harbour at Sydney. The nearer you can get to the coast for smelting works, the better it always is, even if you have to go inland for your flux; but as a rule you can bring this round the coast. If our works were on Sydney harbour, we should not bring our limestone from the country at all; it would come round from South Australia.

5089. Do you think, now that Federation appears imminent, in all probability there will not be large smelting works started down at Port Pirie;—do you not think they are likely to enlarge their smelting works, as coal transit is very cheap? The freight on coal is not very heavy; but that would not effect any ores mined in New South Wales.

5090. No; but I suppose the strength of your position at the present time at Dapto is the large amount of ore which you get from Dapto, from the south, and from Broken Hill? Probably.

5091. Where does the bulk of the stuff that you treat come from? The bulk of it comes from Broken Hill.

5092. Are you able to say whether the coast coal has any superiority over the Lithgow coal for smelting purposes;—have you had any tests made? No.

5093. You are not able to tell us how many tons of coal are now required to smelt a ton of ore? No.

5094. *Mr. Watson.*] Is there any objection to disclose how much coal you use? No.

5095. *Mr. Trickett.*] Perhaps you will be good enough to send in the information? Yes, I will.

5096. Is the bulk of coal used greater than the bulk of material used? No; we use, roughly, about 200 tons of coal per week, over 100 tons of limestone per week, and between 100 and 150 tons of coke per week, so that the coal is not more than the other things.

5097. But then with regard to the stuff treated? The quantity of ore treated is very large. For instance, during the last twelve months we treated about 30,000 tons of ore.

5098. Are you able to answer this general question: Is it cheaper to take the ore to the coal to be treated or to bring the coal to the ore? It has always been said by metallurgists that it is cheaper to bring the ore to the coal than to carry the coal to the ore.

5099. If that were so, and if the coal were cheaper in a certain locality, and also the other materials, it would seem as if it would be an advantage to take the ore to the place where all these things can be conveniently got? I am not a metallurgist, so that I cannot say much on that point.

5100. *Chairman.*] Is it your opinion that the ores of New South Wales, to be economically treated, must be blended with ores from New Caledonia, Broken Hill, or South Australia? Yes. I think the more you mix the ores the more economically you treat them. At Dapto we have very large beds of ore. All the ore coming in is put into a bed containing, perhaps, 5,000 tons. All that is spread out in layers: that stuff is thoroughly mixed, and is broken down from the front, and it all mixes itself. You may get a certain percentage of limestone flux in the ores which you do not pay for, but which has a general effect on the mixture, and you get some of your fluxing material, iron and lime, for nothing. We certainly have to buy a certain quantity of lime and ironstone, but a lot of the ores contain a certain amount of flux. Therefore, the more you mix your ores, the more cheaply it seems you can work them.

5101. So that the advantage to Lithgow, apparently by reason of its proximity to coal, iron, and limestone, is more than counterbalanced by the necessity there is to bring ores from the other countries you spoke of, and the fact that these ores contain fluxes as well as fuel;—I suppose some of them do. There would be no fuel in them.

5102. Do not some of these sulphide ores contain a certain amount of fuel? Sulphur fuel; but we burn that off before we treat them. The Wyalong ores are carrying a larger quantity of sulphur than they did at first, and that renders their treatment more difficult.

5103. From the experience of your company, then, you do not fear any competition from Lithgow? No; and if you give us a harbour we shall not fear competition from anybody.

- C. H. Hayward.  
5 Sept., 1899.
5104. If there were smelting works established at Lithgow, you would still be able to compete for Wyalong ore? I believe so.
5105. *Mr. Watson.*] Taking 450 tons of flux and fuel as against 600 tons of ore treated, do you think that would be a fair approximation of the relative bulk of the two main elements? I should think so.
5106. That is a very large reduction as compared with what was mentioned in connection with the treatment of Broken Hill ores? Yes; but it is a different proposition altogether now.
5107. I presume that your company, when casting round for a site, as business men, considered other places where coal was in abundance? I think there were certain matters of policy which determined the site.
5108. Such as getting near the sea-board? Yes.
5109. In any case you will be materially better off as far as competition is concerned when the Port Kembla Harbour is completed, bringing you, as it will, within 4 miles of the water? Undoubtedly.
5110. Do I understand you to say that the sulphide ore from Wyalong, and similar ore from other parts of the country, are treated more cheaply if mixed with lead ores which come from New Caledonia or Broken Hill? Yes.
5111. *Chairman.*] You have brought a return? Yes; it is as follows:—

ORE received from Wyalong in periods as shown below.

Year.	Weight of Ore.	Contents.		Rail Freight.	Cost of Ore.
		Silver.	Gold.		
	tons.	ounces.	ounces.	£ s. d.	£ s. d.

\* To 31st August.

Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- C. McD. Stuart.  
5 Sept., 1899.
5112. *Mr. Trickett.*] You accompanied the Committee during the month of August in their inquiry into a railway from Grenfell to Wyalong? Yes.
5113. And after leaving Grenfell you accompanied two Members of the Committee; with a view of inspecting the southern route, generally known as the Bimbi route? Yes.
5114. Upon arriving at Wyalong they brought up a description of the route, of which you have a copy? Yes.
5115. Will you kindly read that description? It is as follows:—

RAILWAY FROM GRENFELL TO WYALONG.

ON Monday afternoon, 21st August, 1899, Messrs. Trickett and Dick left Grenfell to inspect and report on the Bimbi route. Leaving Grenfell, and passing the railway-station site, they followed the main road in a southerly direction about 8 miles, and close to the proposed railway line—the country, on either side, was of a rich agricultural character; here and there, there being patches cleared, and under wheat. They then kept on, in a southerly direction, and wide of the railway line, for about 3 miles, to Tyagong Creek, and, on Aramagong station, saw a large tract under wheat—all red soil. They then turned to the west, down the creek to the junction of Tyagong and Burrangong Creeks, about 11 miles from Grenfell and near to the proposed line. They then proceeded westerly, close to the proposed line, until reaching Bimbi. On Aramagong West, they saw a large tract under wheat, about 800 acres, and also various other large patches of wheat-cultivation along, and within sight of, the route. It was pointed out that the whole of the country, on either side, was suitable for agriculture. Many wells were seen, providing ample water at slight depth.

After leaving Bimbi (on the 22nd of August), they made a divergence in a southerly direction through Mr. Caldwell's property, passing large areas under wheat, and some in preparation for crops; thence they passed through Euroka station, on to the main road from Bimbi to the Bland Creek, due west; crossing the T.S. route from Marsden to Morangarell (about 41 miles from Grenfell and 20 from Bimbi), and nearly midway between the northern and southern surveyed lines; thence crossing the low country between the Bland and Back Creeks, a direct westerly course was followed on to Wyalong, and in close proximity to the two surveyed lines.

As before stated, the country between Grenfell and Bimbi is suitable for agriculture, and of a reddish, sandy loam, limited, on its northern side, by the Weddin Mountains, but stretching out indefinitely on the south and east, and large areas of country under wheat were passed. After leaving Bimbi, more wheat and the same class of good agricultural country were seen for about 5 miles up to the Bland, where the soil changed to a greyish colour and of a slightly clayey consistency, and suitable for pasture. After leaving Back Creek, about 14 miles from Wyalong, agricultural country was again encountered, extending up to Wyalong, and varying somewhat in character and consistency.

W. J. TRICKETT.  
W. T. DICK.

24th August, 1899.

5116. Having accompanied myself and Mr. Dick, do you agree with that description of the country on the route which we travelled? Yes.
5117. Independently of the features of the country as regards its natural advantages, are there any difficulties, from a railway construction point of view, on that southern line? I do not consider there are any.
5118. From Grenfell to Bland Creek, about 40 miles from Grenfell, it is all fairly good country for railway construction? Yes.
5119. It is more favourable on red-soil country than on the Bland Plain country? Yes.
5120. Would there be any great difficulties in constructing a line on the Bland country? I do not anticipate any very great difficulty, if you allow sufficient waterways to take the flood-waters away; the flood-water is no great depth.
5121. Would you have to raise the permanent way there to any considerable height? Not to any great extent.

C. McD.  
Stuart.

5 Sept., 1899.

5122. What height of an embankment do you think would be a fair thing to contend against ordinary falls of rain? I should say 2 feet at the shallowest places. Of course, it would be a little more where the water is deeper. Two feet, as a sort of average of the plain, would, I think, be a fair thing.
5123. The embankment would be made of earth itself? Except in the case of the hollows, where you would put sufficient bridges to carry the water away.
5124. Would you require the sleepers to be very close together? Not more so than usual—about 2 feet 4 inches apart. We use 2,464 sleepers to the mile right through.
5125. From your knowledge of that class of country, you think that with an earth embankment 2 feet high, and with sleepers at that distance from one another, and with waterways at frequent intervals, it would be sufficient to resist any ordinary fall of water there? I do.
5126. Without danger to the line? Yes.
5127. That class of country known as the Bland country, as regards the construction of a line, is common to both the northern route and the southern route? Yes; they are so close together that there is not much difference between them.
5128. So that this does apply to both lines? Yes.
5129. Then, after crossing the Bland Creek, and going to Wyalong, the two lines are so close together, coming actually together at a place about  $3\frac{1}{2}$  miles west of the line, that, as regards that end of the line, the mode of construction would be the same? Practically the same.
5130. As regards that half of the line, did you see anything which would be very costly in the way of construction? I did not.
5131. As you approach Wyalong by the road which we went you encounter a few gravelly ridges through the mallee country—are these avoided by the line? Yes.
5132. And the ruling grade all through will be still maintained at about 1 in 100? Yes.
5133. That also applies to both lines? Yes.
5134. So that, taking the southern route as far as Bimbi and the northern route as far as Piney Range, that is the only part of the country where really a kind of conflict comes in as to which way the line should go? That is right.
5135. And that conflict is governed, not by reason of any difficulty in railway construction, but by the question as to which is the better route to adopt to serve the larger area of country? Yes.
5136. On these questions you do not wish to express an opinion? No.
5137. Have you had any experience of railway construction on country similar to the Bland country? No.
5138. Do you know if the Department has had any? I do not know many cases where they cross directly flooded country. On the Byrock-Brewarrina line they will have a great deal of that sort of country to cross between the Bogan River and the overflow of the Barwon.
5139. Do you remember that when we were in Grenfell some of the settlers out towards Piney Range suggested that by keeping more southerly than the Departmental route, indicated by a broad line on the wall-map, a considerable saving of distance could be effected; but you pointed out as an objection to that that there would be some tunnelling required? Yes.
5140. Will you state your views on that point? The place they mentioned is the foot of the range which you cross immediately after leaving Grenfell.
5141. By taking the course which they suggested, you would shorten the distance by about 2 miles? You would be on the same level at the foot of the incline, and on top of the range you would have an extra depth of 100 feet, owing to the shortening of the distance.
5142. There would probably be a cutting of 100 feet deep on the top of the hill;—that means a tunnel? Yes.
5143. Would that give you the same grade? Yes; if you put in a tunnel.
5144. At Grenfell you gave a rough estimate of what it would cost? From £20,000 to £25,000 with approaches. You would save 2 miles in length, and over £2,000 a mile, and against that you would have an extra expenditure of £20,000.
5145. Mr. Shepherd wants to know whether, instead of the deep cutting, you could not construct a tunnel;—would that be expensive? A tunnel would be the same price as a cutting 60 feet deep. If it came to cutting 100 feet deep, it would be much more expensive than a tunnel.
5146. *Mr. Trickett.*] A cutting would mean considerably extra expense? Yes. A cutting 60 feet deep is at the same rate per yard as a tunnel.
5147. You said that if you made a 100-foot cutting you would still have a grade of 1 in 100? Yes.
5148. In making a line through that class of country, it would not be desirable, in a short length like that, to make a comparatively steep grade? No.
5149. You would upset the whole theory of the project? Yes.
5150. Would the crossing of Bland Creek involve any difficult railway construction? I do not think so. It would be a little more expensive per mile for that short distance—that is all—owing to the extra waterways.
5151. And the approach would have to be a kind of viaduct for a considerable distance? There are no very long bridges on it.
5152. It is not a broad creek? No.
5153. From our observations there after rain, and from evidence we heard, you are not very likely to be very often troubled with excessive floods over that country? I should not think so.
5154. It is proposed to have two stations, one at the Government township of Wyalong, and the other at the mining township of Wyalong, the terminus being at the mining township? Yes.
5155. If it were contemplated by the Committee to recommend the Grenfell line, and to go by way of Bimbi, do you, as an engineer, see any objection with regard to the approach to Grenfell and leaving it? Yes. The position of Grenfell at the present station site is only suitable for a northern line leaving it. If you keep the station site in the same position and go by Bimbi you go out by a back shunt; you go out from the wrong end of the station.
5156. You would have to approach Grenfell from Kooravatha with the engine in front, and you would have to back out? Yes, with a back shunt.
5157. Is that a very undesirable thing? Yes.
5158. If that were not done, and the Bimbi route were adopted, your station would have to be altered to the south of its present position in Grenfell, or possibly considerably to the south again, and avoid Grenfell

- C. McD. Grenfell altogether? I do not think it would necessarily avoid Grenfell. You would have to alter the position of the station.
- Stuart. 5159. Do you think the best site has been selected in Grenfell for the station? I think so.
- 5 Sept., 1899. 5160. The Committee, accompanied by yourself, came to Temora. Will you give us a description of that suggested connection; say from Wyalong to Barmedman;—how does that line strike you as being suitable for railway construction—that is, from the engineering point of view? There are practically no difficulties. It is a surface line, you may say, nearly all the way.
5161. With good hard country to construct your line on? Yes.
5162. From that point there is no difficulty at all? No.
5163. Now, from Barmedman to Reefton, what is it? It is the same.
5164. And from Reefton to Temora, what is it? It is the same.
5165. There are no difficulties in the way at all? There are no difficulties with the exception of that belar swamp between Wyalong and Barmedman, where the gilgai country is. That would be a little difficult; but not very much.
5166. How long is that? I do not think it is more than 3 or 4 miles. There would have to be a little extra care there.
5167. But taking the line as a whole, it is one which presents no engineering difficulties at all? Yes.
5168. From your observations, which line struck you as the better one for procuring water for the engine—the Grenfell-Wyalong or the Temora-Wyalong? I do not think there is much difficulty on either line; it is a matter of tanks.
5169. Tanks will have to be constructed on either line? Yes.
5170. So that they are about equal in that respect? Yes.
5171. The Bland Creek, on the Grenfell line, cannot be looked upon as a permanent water supply? No.
5172. So that in that respect tanks would have to be constructed at convenient distances on the line? Yes.
5173. The same, in fact, as had to be done on the Cootamundra-Temora line? Yes.
5174. That was an expensively-constructed line? Yes; it was constructed on the old system—it was a fenced line.
5175. Unnecessarily so for the amount of traffic? To a certain extent. It is a very good line, and very well constructed. It is ballasted right through.
5176. If either of these lines were constructed, no such expensive construction could take place? I think not.
5177. *Dr. Garran.*] If you avoided Grenfell altogether, could you cut off any distance by going from a point on the Koorawatha line to the Bimbi line, leaving Grenfell to the north altogether? I do not think it would be advisable to do so.
5178. You could make a saving in distance? You might.
5179. How much? I could not say. The country has not been examined, with the exception of the line going through Grenfell.
5180. Would it be a desirable thing to do? I do not think it would, because Grenfell is a flourishing township.
5181. Which route do you prefer? I would rather not express an opinion upon that point.
5182. On engineering grounds, is there any great difference between the direct route and the Bimbi route? No.
5183. By the route you have adopted to get over that spur, you cut out a bad grade on a bad curve? Yes.
5184. There is a slight increase in the distance on the northern line? No; the Bimbi line is the longest.
5185. But there is a slight increase of expense on the northern line? Yes.
5186. How much? It is £700, and the Bimbi line is 3 miles 16 chains longer than the other.
5187. And the crossing of the Bland is not more expensive on the northern than on the southern route? No; it is about the same.
5188. Have you gone into the cost of this extension yourself? Yes.
5189. Has your experience of other cheap lines been sufficient to make you feel pretty certain about the cost of this one? Yes.
5190. What lines are you being guided by? The Jerilderie-Berrigan, Berrigan-Finley, and the Nevertire-Warren. These are all cheap lines, and the estimate for this line is made out on the same principle. I think we may fairly say that the estimate is a fair thing.
5191. Do you think you have had experience enough now in the construction of cheap lines to enable you to state within a very moderate degree of error the cost of a line? I do.
5192. *Mr. Dick.*] In any case, whether the Bimbi route or the northern route be adopted, will not the line practically act as an embankment against the flood-waters of the Bland? I do not think so. The flood is not more than 6 inches deep over the highest point of that plain, and there will be a water-channel cut on each side parallel to the line to make the embankment, and there will be waterways in all these hollows. I think the water will get away as quickly as the water comes down.
5193. The water-channel cut parallel to the line will be at right angles to the flood-water? Yes; but it will lead the flood-water into the openings.
5194. The country being so level, and the flood-water moving so slowly, will not the line tend to keep the water on these flats still longer? I do not think so. If I remember rightly there is a fall in the country—in the direction of the creek—of 2 feet to the mile, so that the water cannot lie very long on the ground except in the hollows.
5195. I suppose you have heard it stated that on some occasions it is possible to sail in a boat from close to Barmedman right up to Lake Cowal? Yes.
5196. That must be back-water—that is water which is dammed by the lake? It must be if they can do that.
5197. The watershed at Bland Creek is a pretty large one? Very large.
5198. You do not anticipate that this line will in any way tend to back the waters up? No.
5199. Will it be necessary to construct a viaduct along any portion of these two routes? No.
5200. Not to carry the line on piles at all? Only in the hollows. You will have to bridge the different hollows to let the water through; but they are not of any great extent.
5201. Can you give the length of these pile viaducts which will be necessary? I will obtain the information for the Committee.

C. McD.  
Stuart.

5 Sept., 1899.

5202. In answer to Question 58, "What have you allowed in the way of bridgework for the crossing of the main Bland Creek?" Mr. Deane said in his evidence: "I have not worked it quite out in that way, but I think it will come to about 1,000 feet of viaduct and bridge. For the main opening there, I have about 240 feet, and then a viaduct on each side would probably be between 700 feet and 800 feet altogether?" That is made up of several small bridges. It is not a continuous viaduct. It is the accumulation of the small openings on the flat. The main bridge is 240 feet long.

5203. From an engineering point of view, do you think the Bimbi route, by reason of its avoiding the necessity for crossing the Weddin Range, is an easier route—a more suitable route than the northern one? I will not say that is a more suitable route, but it is slightly easier.

5204. Would you care to offer any opinion as to the amount of agricultural land served by each of these lines? No; I could not do that, as I only saw the land as I drove through. I do not know the quantity.

5205. In answer to a question by Dr. Garran, you said you thought it would not be advisable to tap the Grenfell-Koorawatha extension some distance east of Grenfell, and thereby get a straight line? I do not think it would be advisable to leave Grenfell out.

5206. For what reason? Because it is a township.

5207. From the railway point of view, what advantage does that offer? I think you must consider vested interests to a certain extent if you can possibly do so.

5208. From the point of view of railway revenue, would it make any difference? I do not suppose it would.

5209. *Mr. Watson.*] Have any of your officers been across that Bland country during wet seasons? I do not think so.

5210. Consequently, as regards the height of previous floods, they have had to rely on information supplied by local residents? Yes.

5211. All these local residents on the Bland are in favour of the railway? I suppose they are; but still I think they would give reliable information.

5212. There would be a disposition, I suppose, to minimise the difficulties amongst the majority who are most immediately concerned? I do not know. You do not go at it in that way.

5213. How do you get at it? You generally go to an old resident who knows the district, and you get the most reliable information you possibly can from inquiry. You try to get him to show you marks on the trees.

5214. I think you said that at the highest point on the plain the water in flood-time does not exceed a depth of 6 inches;—do you think it would be likely to be higher at Morangarell than it would be lower down the creek? I think the further you go down the creek the higher the floods are likely to be.

5215. Some of the witnesses at Temora, including one or two who were not interested in the proposed line by one route or the other, seem to be of opinion that the engineers have underrated both the area of the watershed and the depth of flood-water on the Bland? Yes.

5216. When the district surveyor from Forbes, whose district the projected line traverses, was before the Committee the other day, he pointed out on the wall-map how far the watershed extended, and stated that he thought a flood would be a rather severe test of a very low embankment. There is another possible deviation incidentally mentioned in reply to Question 155 by Mr. Deane, where he refers to that middle route running out from Grenfell, and rejoining the northern, or more direct route, as you term it, some miles out;—he states that that can be constructed at a reduced cost of £5,450, as compared with the northern route, or about £5,000 less than the Bimbi route? That is right.

5217. I understand that the reason for not adopting that is that it is desired to get as far towards Forbes as possible? That is it.

5218. Can you tell the Committee how that central route compares with the other, leaving out the Forbes aspect of it? As far as curvature is concerned, it is about the same as the northern route; but there is more earthwork on the northern route, which is the reason of the saving of £5,450; and, of course, the northern route for  $4\frac{1}{2}$  miles is common to a line towards Forbes.

5219. Supposing you wanted afterwards to bring a line from Forbes towards Koorawatha, would it not be as easy to junction on the western side of Grenfell, where this middle line rejoins the northern survey, or is it too far away from Grenfell? No. If you go off the middle line, and that line were made to go towards Forbes, you would have to run across the country for about 5 miles in a northerly direction, and then join on at the foot of the incline. You would not attempt to go over the range a second time.

5220. If the middle route were adopted, would it not be possible then to make the Forbes connection sufficiently far west of Grenfell to avoid having a duplication of lines? You could do so; but it would increase the distance from Forbes to Grenfell by rather more than was advisable.

5221. You state as a reason against the adoption of the middle route that the northerly line more equally divides the country? Yes.

5222. What distance would the middle route be from the mountains on each side while it was going through the gap? The distance would be practically the same for both lines.

5223. I think you stated that the only objection, from an engineering standpoint, to the Temora-Wyalong line is that you have to cross a bit of belar and gilgai country before you get on to Barmedman from Wyalong;—is it not a fact that you also have that, to some extent, on the Grenfell-Wyalong line, between Back Creek and Wyalong? There is a little bit. I do not think the other thing is worth putting down as an objection against the line.

5224. *Mr. Shepherd.*] This Bland country seems to have been a stumbling-block in the way of a line from Grenfell to Wyalong all along? Yes.

5225. You say that you see no difficulty whatever in crossing it? I do not see any difficulty; you must expect to meet something.

5226. Some witnesses have gone so far as to say that it will have to be piled right across? I do not think so.

5227. And that the country is so flat that there would be no rush of water to injure any embankment there? That is right.

5228. Do you think a cheaper kind of sleeper could be used on such a line? I do not know that it would be advisable. We hand the lines over to the Commissioners, and we would not like to give them an inferior sleeper.

5229. If a less speed were required, I suppose a cheaper sleeper would answer the purpose? Yes; but it is a shorter-lived sleeper.

5230.

- C. McD. Stuart.  
5 Sept., 1899.
5230. There is no doubt that an immense saving could be effected by simply having split sleepers? Yes.
5231. I think the cost of the sleepers is estimated at £21,806, and I should imagine that split sleepers could be purchased for about a third of that price—that is, for about 1s. each? Very probably. There is not much good timber in the immediate vicinity of the line.
5232. Split sleepers could be procured at much less cost than ordinary sleepers? Yes.
5233. If a less speed were required, I should think they could be used with safety? Yes; but the Commissioners would object, because it would cost them so much more for maintenance, which is a very serious consideration to them.
5234. *Mr. Trickett.*] The cost of a tunnel would be about three-fifths of the cost of a cutting 100 feet deep? Yes.
5235. *Mr. Watson.*] Are you aware that the sleeper-getters around Temora, after a short experience, say that box sleepers are more difficult and expensive to get than ironbark sleepers in that district? I have no doubt that they are hard to work.
5236. A box-tree seems to yield so few sleepers? Yes.
5237. *Chairman.*] How long have you been in the Railway Construction Branch? Seventeen years.
5238. Taking a stretch of country 20 or 25 miles across, and that country being described as excellent fattening country, do you consider that would be a bar to the construction of a railway the length of the one proposed? I do not think so.
5239. Do you know of any railways which have been constructed to serve pastoralists only? In the first instance, most of the lines were all constructed for pastoralists.
5240. Are any of them paying? Yes; the Narrabri-Moree line is a pastoral line, and it is paying well.
5241. Can you give the names of any others that are paying? The Bourke line you may call a pastoral line, and it pays very well. I believe Bourke and Narrabri are the two best-paying stations in New South Wales. Of course they tap a very large extent of country.
5242. Mr. Deane, in his evidence, stated that he loaded his officers' estimate of the cost of crossing the Bland and Back Creeks by £1,500? Yes.
5243. From your view of that country, do you think that would be sufficient? I think so.
5244. In your experience of New South Wales, have you ever come across a soil which would not make a firm foundation for a railway? Never.
5245. As regards the fears of some of the local people, that the embankment would give way, and that they would lose the railway, do you think they are well grounded? I do not think so.
5246. It was reported that a hut had disappeared? Very likely, on the bank of the creek.
5247. Is it likely, when your officers were investigating out there, that that fact would come to their knowledge? It may have. I should not be surprised at it.
5248. Their general instructions are to get the best information possible with reference to flood-waters? Yes. They have to wait on people to locate the height of flood-waters in most parts of the country.
5249. You generally find men ready to go out and tomahawk a tree where the flood has been? They can generally get information without difficulty.
5250. You think that the question of a get-away for the flood-waters has been properly investigated by your Department? I believe so.
5251. You have constructed lines over country which was pronounced to be flooded country and boggy? We have; but not crossing the flooded country at right angles, if you except the crossing of some of the main lines.
5252. It was stated that the flood-water runs at the rate of a mile an hour;—what sort of an embankment would that carry away? I do not think it would do any material harm.
5253. You had an opportunity of comparing both lines;—now, which line, in your opinion, would be the better one to construct—the Grenfell-Wyalong, or the Wyalong-Temora? I do not think that is a question for me to answer.
5254. I do not mean as a matter of policy, but as far as engineering difficulties are concerned? There are practically no engineering difficulties on the Temora line.
5255. Would £100 a mile be an extraordinary difference? It is not a very big difference; but, of course, the Temora line is slightly the easier of the two.
5256. *Mr. Shepherd.*] To reach the back country from the main line, do you think it would be better to run parallel lines, 30 or 40 miles apart? That is a question on which we are not supposed to have an opinion. It is for Parliament to say which they consider is the best way to open up the country.
5257. If you were asked to go and survey certain lines for the purpose of opening up the back country, would it not be your duty to open it up in that way which you thought would be the best and cheapest way? Certainly; if you want to bring the produce to Sydney, there is no doubt that lines running east and west are the best; but a day may come when you may want to bring the produce to Melbourne.

WEDNESDAY, 6 SEPTEMBER, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LYNDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane.  
6 Sept., 1899.
5258. *Chairman.*] The Committee have been informed during the inquiry that lines of railway have been constructed at a considerably less rate per mile, to open up agricultural areas, than the estimated cost of this proposed line, and an American gentleman stated in his evidence, that for about £500 a mile, in America, they could lay down lines which would suit agriculturists, and did suit agriculturists, namely, pioneer

pioneer lines;—have you thought the matter out in connection with the cheaper lines of railway for agricultural areas in New South Wales? I do not know any better system than what has been already instituted. A line to cost £500 a mile would be a useless line for running our rolling-stock on; it could only have about 10 or 12 lb. rails. The permanent-way material on the Grenfell-Wyalong line will thus, alone, cost £637 per mile, that is for 60 lb. rails, and the freight will cost £145. The permanent-way materials, delivered at Grenfell, will thus alone cost £782 per mile; so that I do not see how it is possible to make a line at £500 a mile, which is of any use.

H. Deane.  
6 Sept., 1899.

5259. The average cost of this proposed line is £2,411 a mile, and this gentleman said that in the matter of sleepers a great saving is effected; that instead of putting down dressed sleepers, they were put down virtually in the rough? I do not think he knows the conditions of this country. In America, sleepers are very cheap; there are very extensive forests, and the trees grow very close together, and you can start cutting away at the timber in a face. And within an acre you have a great number of trees which you can use. In this country if you have one or two good trees in an acre, it is just about as much as you would find in most of the forests, certainly in the interior. There is no timber to speak of in the interior here except ironbark, and red-gum on the rivers. I have given opportunities over and over again to contractors to send in tenders for box and other classes of timber besides ironbark, and have obtained very little result. Some years ago, when the Culcairn-Corowa line was open for tender, as well as other lines, an opportunity was given, and the result of it was that practically all the sleepers delivered were ironbark. The contractors found they could not get box timber or any other to serve the purpose. With regard to red-gum sleepers, it is well-known that they, as a rule, have to be sawn. I have had red-gum sleepers supplied at various places, but they have always cost us about 3s., that is to say, more than the average of the ironbark sleepers.

5260. And not so good? And not so good, because they are not so reliable. The timber is a durable timber, but it is not so strong; it has veins in it; it is liable to snap across or to open.

5261. With regard to station buildings? That is a matter which the Railway Commissioners alone have the power to decide. If you take my estimate for the direct route from Grenfell to Wyalong, and add the first six items together, they come to £1,743—that is the average cost of the running-road per mile. If that were quite flat country, it would be a little cheaper, because the earthworks would be still lighter, but I do not see how you can get out of any of the other expenses. As regards sleepers, I have some diagrams here to show you what has been done in the way of cheapening the cost. Here is a diagram of the original rectangular sleeper 10 x 5, which was used from the very commencement of railway work. Then the sleepers were reduced to 9 x 4½, and still rectangular; then I reduced them still further. I have not had the sapwood taken off, but practically they are 9 x 4, which gives about the least quantity of wood you want as a support for the rail. There is no use in letting the rail rest on the sap, because it decays and disappears after a time, and the least height I have given at the side, namely, 3½ inches, is to ensure not having merely half-round timber. You cannot have the sleepers less than 4 inches thick, and have any hold for the spike—the spikes are only about 4¼ inches long. If you do not have the sleeper 4 inches thick the rail is not properly held down, so that it is not safe to have a thinner sleeper. If you had a thinner sleeper the rail could not be properly secured. I do not think any saving can be effected in the sleepers. I have put in about 2,500 to the mile. We used to put in less than that, but in this class of line—this earth-ballasted line—I have put in more sleepers to make up for the inferior support, and I am quite sure it is a proper thing to do, because the maintenance of the line is very much less expensive than if you have the sleepers further apart. The cost of the sleepers in this country depends largely on carriage. I believe a good many of the public imagine that this is a well-timbered country, that there are vast forests of ironbark in the interior. There never was a greater mistake. There used to be a great deal of timber forests on the coast, but there always was very little in the interior, and the ironbark patches are few and far between, and they are getting cut out yearly to a very great extent, so that the timber-getters have to go further and further into the bush, and now have to go 20 and 30 miles even where the forests originally came right on to the line, before they can get a decent piece of timber. If a man has to bring his sleepers in 20 miles, I believe the carriage will cost him 1s. each, and for every 13 miles it has to be carried on the railroad it costs 1d., so that if you have to get your sleepers, and bring them to distant points on the railway line the matter of freight is a serious consideration. That is what puts the costs of the sleepers up. Only the other day I got tenders called for sleepers for The Rock to Green's Gunyah railway. Only one tender came in, and that was for red-gum, from Hardy & Co., of Wagga Wagga. We received no tender for ironbark, box, or anything else, although I gave every opportunity to offer different classes of timber.

5262. The price of the sleepers here is stated to be 3s.;—is that the cost of them in position? Yes; it costs about 2d. to adze them, and put them in position.

5263. That is not included under the head of freight a little higher up? No; that item, freight, is on the steel part of the permanent-way alone—the rails and the fastenings.

5264. In framing this estimate, you think you have cut down the price as low as it can possibly be cut down? I think so; I do not see how any cheapening can be made that would produce economy. I have here a tracing showing the cross-section of my embankment for these earth-ballasted lines. The darker colour represents the earth ballast. The whole width of the top of the embankment is 17 feet, and the difference of the level at the crown of the embankment to the edge on the outside is 6 inches. In adjusting the formation, my practice is to keep that centre point of the formation between 6 and 12 inches above the surface of the ground. If it is 6 inches above the surface of the ground, this outside edge runs out actually on the surface. If it is 12 inches above the ground the bank is only 6 inches high on the outside. Then the side cutting from which this is made with the ploughs and scoops helps to drain the line. It has been thought that in America they make lines cheaper than this. In America I got a good deal of information about these earth-ballasted lines and cheap railways, and what I found was that instead of allowing only 6 inches fall from the centre to the outside, they always allowed 12 inches, so that in that country the embankment was set up higher.

5265. *Mr. Watson.*] Their rainfall as a rule would be higher? I have taken advantage of that. On the outside they have a big ditch, and the cuttings, which I only make 18 feet in width at level of the centre of the formation, would be, allowing for a ditch 3 or 4 feet in width, 25 feet. So that you see the expense of making these lines in America is much greater than what I have considered necessary here. In fact, I find—I think it is marked in that report of mine, but I would not be quite certain—that the earthworks of these light American railways are reckoned to come to an average—the lightest of them—of about £400 per mile,

- H. Deane. 5266. *Chairman.*] The cost of earthworks per mile is estimated at £450? Yes; my earthworks you will find come to between £150 and £250 per mile. I have reduced my designs to suit the country, and I have taken advantage of our dry climate to reduce the cost to a minimum. I should not advise making any further reduction. I do not see how it can be done, and keep the line in proper order.
- 6 Sept., 1899. 5267. Would that describe the embankment crossing that Bland country? Over the Bland country I should raise it up a little. The embankment would be the same on the top, as it is the type of embankment. The height would vary according to the circumstances. What I have aimed at in regulating the formation of this line is to keep the centre of the embankment between 6 and 12 inches above the surface of the ground, say at an average of 9 inches. At the first starting of this system I kept it higher, but since then I have made the average lower, because I believe it is quite possible to make a safe job without so much earthwork. I have here a few particulars as to the cost of sleepers, if you would like me to give them.
5268. We shall be obliged if you will? On the Nevertire-Warren line the average cost of the sleepers was 2s. 2½d. at Dubbo, and the freight came to 4¼d., the total cost being 2s. 7¼d. We got some of the sleepers, I think, at about 2s. 1d. at Dubbo, and then we had to pay the freight. The sleepers on the Berrigan-Finley line were obtained at various prices. Some red-gum sleepers from Tuck Brothers, at Berrigan, cost 3s. 3d. delivered. They were red-gum. Then A. B. Espley contracted to supply some of the sleepers between Sydney and Morrisset. They cost 1s. 10½d., but on this there was 1s. 8d. freight. The freight is the thing which kills the economy. Then we bought some sleepers from Hodgson and Snelling at Temora. They cost 2s. 6d. at Temora, but the freight on them was 1s. 1d., making the total cost 3s. 7d. On the Tamworth-Manilla line we let contracts for the delivery of sleepers before the main contract was let, so as to have a supply of them ready, and they were mostly got along the line between Sydney and Singleton; the lowest price was 1s. 9d., to W. J. Chapman. They were delivered at Wyong, Tuggerah, and Ourimbah, and the freight came to 1s. 1d., making the total cost 2s. 10d. On some of the others which were delivered higher up, at Ravensworth, the freight came only to 9d.; although the sleepers cost 1s. 11d., the total cost was only 2s. 8d. Then, on the Narrabri-Moree railway, two contracts were let, and I remember recommending that a price of 2s. per sleeper should be given; but we did not get them for that price, and eventually a contract was entered into at 2s. 6d. per sleeper for about half the number, delivered at Narrabri, and afterwards the supply of sleepers for that line was completed at 2s. 3d. I think the information I have given will give a fair idea of the value of sleepers in this country. You see, the lowest price delivered at the station is on the Northern line, about Wyong, Tuggerah, and Ourimbah, at 1s. 9d.; then at Dubbo, at from 2s. to 2s. 2½d.; and at Narrabri, at 2s. 3d. All these places are pretty close to the sources of supply, and the prices fairly represent the value of the timbers cut, with the short carriage to the railway station. On most of the new lines there is a considerable amount to pay for freight.
5269. We want a little more information about the flood openings;—some witnesses have said that there is a very heavy body of water coming down that Bland country in flood time, and I notice that in your former evidence you loaded your field officers' estimate with £1,500 to provide get-aways for the waters? Yes.
5270. Would there be any danger of such a permanent way as you have there being carried away or injured by a flood such as you spoke of, or have you made sufficient provision to carry the flood waters off? I consider I have made sufficient provision; but if the water went over it, it would be a matter which would be very easily repaired. One very great advantage in keeping the formation low is that if gaps are made you can restore the line immediately.
5271. But did you put on that £1,500 because you thought that there was not sufficient provision made, or why was it done? I put it on to have what I considered a proper margin for safety over and above what the surveyor recommended.
5272. You are quite certain that the banks will bear any pressure which the flood will bring to bear on them? Yes; they would not give way on that account. Of course, exceptional rains might cause the water to rise over the top; but it would not do much damage then. It is not like it is with a high embankment.
5273. *Dr. Garran.*] As a general rule, if you save too much on the first construction, you have to pay for it afterwards in maintenance? Yes.
5274. Therefore, your object is to hit a happy medium between making your line too cheap and slight and wasting money on needlessly heavy work? Yes.
5275. As an ounce of practice is worth a pound of theory, how does the thing work out in the cheap lines which you already have got at work;—you have some of these cheap lines at work? We have.
5276. What is your experience? Our experience is very good. The maintenance of these lines turns out to be the cheapest of any made lines. That, of course, is partly due to the small traffic; but it is also in very great measure due to the low embankments, and the durability and suitability of the construction.
5277. These lines have had to carry cattle-trucks fully loaded, I suppose? Yes.
5278. And also wool-trucks fully loaded? Yes.
5279. And general goods-trucks fully loaded? Yes.
5280. Have they stood that strain fairly well? Yes.
5281. And they have had to carry a lighter class of engine? Yes. I have not the list here, but I think the C class is a very fair representative of the locomotives used. The axle loads are about 12 or 13 tons.
5282. The engine is really heavier on the rails than any loaded truck you have? Yes.
5283. So that the test is the engine, not the train? Yes.
5284. These lines have stood that test? Pretty well.
5285. Have you had any heavy rains in any part to make the ground soft at all since you opened these cheap lines? Yes; not as good a test, perhaps, as I should like to see, but in the case of several of the lines there has been wet weather extending over several days, and heavy falls of rain, which have tested the waterways.
5286. You cannot say that you have put your cheap work yet to its full test? I think it has fairly been shown to be trustworthy.
5287. But if we get one of our very heavy three days' rains, soaking the ground and softening your embankment, will there be a fresh risk that you have not yet met with? I scarcely think there will.
5288. You have discovered no weak point in your method of construction? No. I am quite convinced that it is the proper one.

H. Deane.  
6 Sept., 1899.

5289. The sleepers have not sunk? No. Sometimes we come across soft places in banks where there is pipeclay, and material like that, which is very difficult to deal with. In that case it is better to lift the road right out, and put on some ballast; but these places are as a rule very short, and there are few of them.
5290. As a rule you have no stone ballast at all? No.
5291. And you put in a little where you find very soft places? Yes.
5292. You find that you can get along without stone over the whole of the line? Yes.
5293. These three dry years, I suppose, have been rather favourable to you as hardening your permanent way? I think so. It has been no detriment.
5294. They have settled down? Yes. You must remember—and I think it is a very important point—that these embankments are made with scoops, and are rolled afterwards, so that they are pretty well consolidated before the rails are laid on them.
5295. What is the weight of the roller? Five tons.
5296. That is very little compared to your engine? The pressure is 5 tons on a narrow strip across the embankment. It is pretty heavy; it is not distributed along the line.
5297. How many sleepers would the weight of the engine be distributed over? Without the tender, about seven or eight sleepers.
5298. You think our experience so far has fully justified the calculations of the Department as to the right strength to choose for these cheap lines? Yes; I believe that.
5299. And you are prepared to recommend that still for the future? Yes.
5300. You do not think it is too cheap? No; it is not too cheap.
5301. You do not think we can cut that down with any advantage? No; I do not. I should suit it, of course, to the circumstances of the case. In very dry countries I should keep very close to the surface. In undulating country, and in wet places, one would naturally keep a little higher.
5302. In crossing this Bland country, if there is a flood-out with the waters some 6 or 9 inches, although it might not rise over your bank, would it not soften all the soil in that bank and make it more tender? I do not think so. I do not think the water gets in. Where we have cut away embankments to put in new water-ways, our experience has been that the water gets in a little way and makes a sort of puddle, and protects the inside of the bank.
5303. It would not get as far as the ends of the sleepers? I do not think so.
5304. All the solid part of the line which has to carry the weight would not be touched? No; as a rule it is not touched unless it is sandy, and then, of course, the wet sand will be better able to carry weight.
5305. *Mr. Trickett.*] You went pretty fully into this matter in your report of March, 1895, when you came back from your American and European trip? Yes.
5306. In your report you state that the additional sleepers in America make up in weight what we gain by using heavy sleepers;—how do the sleepers for light lines differ in number here? In America they vary in number from 2,500 to 3,200 to the mile, and here the maximum is about 2,500 to the mile. On the Nevertire-Warren line I put in rather more than that number. I had such a fearful account of the wetness of that country that I thought it better to put them closer together.
5307. I suppose if they went up to 3,200 to the mile in America, they would cost pretty well as much as our 2,500 superior sleepers would do? Yes; these soft-wood sleepers in America are very cheap.
5308. I suppose they do not last very long? No. They have three classes—pine, redwood, and white oak. White oak is supposed to be the best, and is most used in the Eastern States. Redwood, the same as that which is used so much in Sydney, in a dry climate is a very durable timber, but all these soft timbers suffer by being cut into by the rails or the plates.
5309. In your report you also say—"The close sleepers have also this advantage, that where the formation is somewhat weak, as it is in new lines, the weight on the embankment is better distributed";—would not that apply to such lines as the one which we are now considering? Yes.
5310. Why would you not put them closer together? I have more sleepers on this line than we used to put. The number used to be about 2,000 to the mile.
5311. What did you put on the Narrabri-Moree line? About 2,500 to the mile.
5312. Has that been found to be sufficient? Yes; I find that number very satisfactory.
5313. You have not had to increase the number of sleepers on that line? No.
5314. We often hear about these light lines of railway in America, are they not always commenced in a cheap way, and then have to be improved, as a rule, afterwards? Yes? That is the general practice. They make very cheap timber bridges and openings at first. They can get the pine, what we call Oregon, at a very low figure.
5315. This gentleman, who ventured an opinion when we were at Barmedman, talked about French-polishing the sleepers, would any timber less prepared or adzed than what you laid down be effective? I do not know that we French-polish the sleepers; they are only split out with the axe; they are not even sawn. There is very little dressing. If the men did not dress them to a certain extent they would not pack away in the waggons. If they were of all shapes the men would not be able to pack them and carry them. That is what I found on a contract for one of the lines. Although the men were permitted to leave the top of the sleeper with more sap on, for their own sakes they dressed it down, so as to save the cost of carriage, and to be able to carry more sleepers on a dray than they otherwise could do. In their own interests they dressed the sleepers down.
5316. Then, again, the American rolling-stock over these primitive lines is specially constructed for going over rough lines, is it not? There is no doubt that American rolling-stock is more flexible than the English style, and easier on the road.
5317. I suppose you think anything of a less stable character than you have suggested for a line of this kind would not be satisfactory to the public? I do not think so.
5318. The Railway Commissioners, I suppose, do not care to take over a very rough line? No.
5319. They keep in view the fact that they have to maintain the line and give satisfaction to the public? I do not see that they can have anything more satisfactory than this. I know that they are very well satisfied with this class of construction, that it is cheap to maintain, and there certainly is nothing wasted over it.
5320. But you could not suggest anything cheaper;—you do not think that any further economy can be practised with these light lines than you have already done? I would not recommend any further economy. Of course, you might do away with the embankments altogether, and lay the sleepers on the ground, but that would be a fatal mistake. That, I believe, has been tried, and proved to be a fatal mistake. Or you could

- H. Deane.  
6 Sept., 1899.
- could follow the irregularities of the ground more and save a little, but then you would not get your grades right; you would not be able to drag the same loads with the engines.
5321. I suppose there would soon be a great outcry from the passengers if they were going to be bumped over a railway line the same as over a road? Yes; it would be very bad on the draw-bars and couplings.
5322. All this talk we so frequently hear about laying down sleepers somewhat similar to what we use as posts for fencing is idle talk—it could not be carried out? No, I do not think it could, because you have to adze your sleepers. You have to cut away a certain amount for the bed of your rails, and when you have done that you would not have a sufficient depth for the spikes—they would not hold.
5323. Have you had any experience of these light lines being laid at right angles to the current of flood water on plain country, such as the country from Grenfell to Wyalong? We had the Narrabri-Moree line, although that is not exactly the same. That is now a better class of line. It is ballasted, more or less. I think every precaution should be taken about the water. If there was a mistake, or an error of judgment, on the Narrabri-Moree line it was in not sheeting both ends of the bridges. Where the gaps occurred was where the ends of the bridges had not been sheeted. They are now protected by timber sheeting. Some of the bridges were protected at one end but not at the other, because the water was in the habit of striking the bank harder at that end than at the other; but during the flood the water came from the opposite direction and carried away the unprotected end.
5324. Taking the proposed line from Grenfell to Wyalong, and the suggested line from Temora to Wyalong, is there very much difference, do you think, in regard to engineering difficulties between the two lines? No; they both come under the same class. I think there is a little difference in the estimate, but there are no difficulties.
5325. The Grenfell-Wyalong line is a little more expensive? Yes; on account of the waterways.
5326. Would there, in your opinion, be any great risk to either line from flood? I should not say so.
5327. *Mr. Watson.*] Speaking of these light lines, did you ever inspect the Joadja Creek tramway, which leads to a shale and coal mine? No; I have not seen it.
5328. I have not seen this tramway, but I have been told that it was laid down for between £900 and £1,000 per mile, and that over a very rough country they carry great loads of minerals? Very likely they have light rails, such as would not be suitable for rolling stock.
5329. Even then there is a great difference in the cost over rough country compared with light country, such as that which either of these suggested lines would traverse? I am not in a position to make a comparison. I daresay it could be easily explained how the difference arose. There must be something very light and weak about it, because the 60-lb. rails and fastenings cost £637 per mile in Sydney.
5330. The Railway Commissioners, in their report on the Temora-Wyalong proposal in 1895, state:—
- It is estimated that the line should, if constructed as a pioneer line, as described by the Commissioners, in a paper dated the 10th October, 1892, and referred to in their annual report for the year ending June, 1891 (copies attached), be made, and all necessary accommodation provided, at a cost of £85,000.
- Your revised estimate, made in the same year, was over £92,000 for that same line;—there is a difference of £7,000 between what the Commissioners said it should be done at and your own estimate—a difference of £175 per mile;—can you tell the Committee on what basis they were working? I think the original distance was given as 38 miles, and it turned out afterwards to be 40 miles. Of course, an estimate very largely depends on what the Railway Commissioners want in the way of accommodation. My second estimate, £92,000, was made on a length of 40 miles. The Railway Commissioners did not take any exception to that, I think. I went into the matter of station accommodation with them, as I generally do.
5331. I was wondering whether it was possible that you had provided for larger earthworks on the Temora-Wyalong line than the Railway Commissioners had in their estimate? I do not think so. I do not think they have any information about this line apart from what I have. I cannot explain how they got hold of that £85,000.
5332. Their report is dated a year earlier than the time when it was presented to the Committee, and the time when your report was presented? Yes. On the basis of 38 miles it comes to over £2,200 per mile.
5333. I think you said that, from an engineering standpoint, the character of the country between Temora-Wyalong and Grenfell-Wyalong is much the same, with the difference of the provision on the Grenfell-Wyalong route for crossing the larger creeks? Yes; I do not think they differ materially.
5334. I think other engineers who have given evidence here, if anything, have said that the Temora-Wyalong line might be a little the easier? Very likely.
5335. In view of that, can you explain how, in 1895, you stated that the earthworks for the Temora-Wyalong extension would cost £260 per mile, while in the estimate now before us for the Grenfell-Wyalong line you only set down £198 per mile, a difference of £62 a mile in the earthworks alone? I think there are some cuttings at Barmedman and other places probably.
5336. Are there none going out of Grenfell towards Wyalong? Yes; there are some cuttings there too.
5337. I think you will find that there is very nearly a similar number of them;—what I was driving at was whether it would be possible with the revised estimate to get the earthworks between Wyalong and Temora done as low as on the other? On the other hand, on the Temora-Wyalong line, if the earthworks, are a little high, I think the permanent way material is a little low.
5338. Has the price of that gone up since then? Yes; I see the Temora-Wyalong rails are put down at £4 10s. in Sydney. I know that we are reckoning in this estimate of 1899 that the rails would be more than that, because you see the whole permanent-way material is £637 a mile, as against £511, and Grenfell to Wyalong, including freight, it is £782, as against £645; so that by rights the Temora-Wyalong line ought to be increased on that head, although it might be diminished in earthworks.
5339. Then the difference would remain probably about the same as you estimated when you were last before the Committee—that the average cost per mile from Temora to Wyalong would be about £100 less, and the total about £44,000 less than the capital cost of the other? Yes; I think it would stand at about that figure. The comparison, I think, is about right.
5340. You have made attempts recently to get box sleepers in lieu of ironbark sleepers? Yes.
5341. Has there been any difficulty in getting them? Yes; we have never succeeded in getting them.
5342. I have been told quite recently by men engaged in getting box sleepers in the Temora district, that it is much more difficult to get box sleepers than ironbark sleepers—that is to say, that there are fewer trees out of which it is probable that you can split timber? That is so, I am sure. The box trees are small, as a rule, and where they are of any size, they are very pipey.
5343. And also curly-grained, some of them? Yes.
5344. That does not encourage us in the idea that we can rely on box to any great extent in the interior when the ironbark is cut out? No.
- 5345.

5345. Do you know whether there is any difference in the price at which you are offered box sleepers at all;—do you recollect whether it was lower or higher, or the same? No. I think, if I remember aright, on the Culcairn-Corowa line, where I gave an opportunity to tender to supply those as well, the price was the same.\* 6 H. Deane. Sept., 1899.
5343. I suppose there is no doubt but that the ironbark is the better lasting timber in the ground? Yes; I believe on the whole it would be a little better; but box is a very good timber.
5347. *Mr. Dick.*] With respect to the alternative routes, Grenfell to Wyalong, and towards Marsden and round by Bimbi, what difference is there between those two lines, from an engineering point of view? The Bimbi route is longer, but the grades are better. From an engineering point of view, it is rather a better route than the other.
5348. Could you say why the Department has pinned its faith to the northern route? Because it is in a better direction; it divides the country better.
5349. In what way? It divides it up more equally. In going towards Bimbi you approach Young, and you get nearer to Temora. The northern route divides the country better between (say) the Temora line and the Lachlan.
5350. That would only be an advantage if the whole extent of that country were of a uniform character from a revenue-producing point of view? If there were plenty of good country to the north of it, do you mean.
5351. If it were a fact that the Bimbi route more equally divides the portion of that intervening tract, which is good from the agricultural point of view, the advantage which you mention that the northern line possesses would no longer be possessed by it? Yes.
5352. In other words, if there is inferior country to the north, the Bimbi route would be the better of the two? If the northern line were just along the edge of the inferior country, I should probably recommend the more southern one.
5353. Would there be any great disadvantage, from a railway point of view, in leaving the Grenfell-Koorawatha extension some distance south-east of Grenfell, and continuing along through Bimbi towards Wyalong? Yes; you could not do it well, because the ground where you turn off is high. You have a great drop getting down into the valley, and you would have bad grades. If you wanted to leave Grenfell out, and go through Bimbi, the proper thing would be to follow Tyagong Creek, all the way.
5354. That would be too close to the Grenfell-Koorawatha extension? Yes.
5355. You do not think much of the objection which some of the witnesses have urged, that the earthworks on this proposed line would probably act as an embankment to back up the waters in the watershed of the Bland and Back Creeks? No, I am not afraid of that; but both lines are in about the same position with regard to that.
5356. It would not hold in the case of the Temora-Wyalong line? No.
5357. In your estimate, you say that there is 1,000 feet of bridge work and openings;—does that merely include the two approaches to the bridges, or does it also include bridging part of the Bland Creek in its lowest portions? You see, in answer to Question 58, I said: "For the main opening there I have about 240 feet, and then a viaduct on each side would probably be between 700 feet and 800 feet altogether."
5358. That is on each side of the bridge? Yes.
5359. There will be no viaducts anywhere else along the Bland Plain? There will be smaller openings probably.
5360. *Mr. Shepherd.*] Is it not a fact that accidents on railways are much more frequent in America than they are here? I have no returns to go by; it is generally reported to be so.
5361. It is generally suggested that it is so? Of course that may arise from a variety of circumstances.
5362. I was going to ask if you attributed that to the cheaper style of railways which they construct? No; I should think it would be more due to their train-despatching. In the case of bridges giving way, it may be due to a cheap style, which we could not tolerate; but, generally speaking, I should say that the larger number of the accidents in America is due to their system of train-despatching and signalling; it is not so complete as ours.
5363. Is the same speed kept up on the light lines here as you have on the better lines? No; it is limited to about 20 miles; in some cases less.

Edward McCarthy Allman, Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

5364. *Chairman.*] Have you prepared a statement in regard to the road expenditure in the district to be served by the proposed Grenfell-Wyalong railway? Yes.
5365. Will you be good enough to read the return? It is as follows:—

E. McC.  
Allman.  
6 Sept., 1899.

RETURN of Expenditure—Roads likely to be affected by proposed Railway from Grenfell to Wyalong.

Schedule No. 98-9.	Miles.	Road.	1 January, 1894, to 30 June, 1895.	1895-6.	1896-7.	1897-8.	1898-9.	Total.
			£	£	£	£	£	£
384	41	Temora to Wyalong .....	953	6,750	1,347	1,944	1,924	12,918
395	28	Grenfell to Goolagong .....	185	176	123	161	137	782
473	30	Forbes to Bogolong.....	.....	.....	.....	139	135	274
1474	30	Young to Grenfell.....	1,049	652	635	600	566	3,502
1477	22	Young to Bumbaldry.....	188	217	156	294	811	1,666
1481	15	Burrangong to Emu Creek .....	.....	.....	.....	.....	179	179
1486	25	Brundah to Monteagle Platform.....	.....	.....	.....	.....	182	182
1487	42	Caragabal to Clifton .....	58	644	382	378	392	1,854
1491	51	Grenfell to Marsden .....	.....	.....	92	347	236	675
1492	23	Grenfell to Bimbi .....	360	136	116	136	170	918
1493	10	Grenfell to Weddin Gap .....	152	227	75	63	59	576
1498	63	Stockinbingal to Marsden.....	.....	45	120	116	170	451
7	31	Cowra to Grenfell .....	2,332	1,359	943	1,218	1,476	7,328
		Total .....	£4,277	10,206	3,989	5,396	6,437	23,977

\* NOTE (on revision):—I find that the prices paid on the Culcairn to Corowa line, where second-class sleepers were specified, were 5s. 9d. for ironbark, and 4s. 9d. for other hardwood.

- E. McC. Allman.  
6 Sept., 1899.
5366. Is road-making in the district to be served by the proposed railway expensive? Not particularly so. I have not very much experience of the country between Grenfell and Wyalong, but I know the country between Temora and Wyalong.
5367. Can you give the Committee any idea whether there has been any formation in the road-work across the Bland country? I cannot give you any information from personal knowledge. The local officers would be better able to furnish information.
5368. Can you give information with reference to similar country? I have not been through the country between Grenfell and Wyalong.
5369. It is black-soil country, which is subject at times to being inundated to a small depth, and the flood-water has a current of about half a mile an hour across the direction of the road;—what I wish to get at is whether you have any formation in similar country which stands flooding the same as that country does, because it has been stated that the formation in this Bland country will wash away? It depends a good deal upon the nature of the soil, I should say. If it is a dry clay soil it would not be likely; but if it is a loose friable stuff it might. I should not think it would be likely to wash away to any extent, because it must be a slow-moving current there, I should think.
5370. Have you formed any embankment on black-soil country? Not in the western flooded country. I have seen the black-soil country flooded in the Richmond district.
5371. Is there a much stronger current there at that time? In the place I am most familiar with, there is very little current—chiefly back water which would not do the road the slightest harm at all.
5372. This being mostly back water, you think it would not do the road any harm? I do not think it would be likely to suffer to any material extent.
5373. *Dr. Garran.*] What is about the probable cost of a road, per mile, over such country as has been described to you? It is difficult for me to answer that question, because I do not know what facilities there are for procuring stone or gravel; but for forming only, I should say about 30s. or £2 a chain—that is, if it were thrown up from trenches. I suppose it is a very flat country; but if it is merely formed from ordinary water tables, it would cost considerably less than that.
5374. What does it cost you on the road from Wyalong to Temora per mile? That depends upon whether you use gravel or metal in construction. I should say, with gravel, from £4 10s. to £5 a chain probably.
5375. You really have only made the bad places? We have not made all the bad places; a good many of them have been constructed.
5376. They have cost you about that? That would be for gravel construction. Metal, of course, would cost probably £7 or £8 a chain, according to the facilities for getting stone.
5377. The rest of the roads are in their natural condition on the Temora-Wyalong route? It has been cleared throughout, and the greater part of it drained.
5378. Nothing done to the surface otherwise? Only in these particular parts. I think the Committee have had a return showing the whole of the work done on that road. If they have not, it is procurable.
5379. That, on the whole, is easier country to make roads over than the country between Wyalong and Grenfell? There is no difficulty, except that it is bad soil between Wyalong and Temora, in places.
5380. You have no such country as the Bland to cross? No; the Mandamah Creek is the only water-course worth speaking of there.
5381. There is nothing that you can call specially bad country to cross? It is heavy country for traffic in parts.
5382. Is it easy to drain? Not particularly easy. A good deal of it is very flat; still you can get a fall in it, I should think.
5383. Supposing you had to make a good metalled road from Temora to Wyalong, knowing what you do now of the cost, what would it cost you to make that road? I cannot say how much of it has been metalled; I think it is about a third.
5384. You cannot say how much a mile it would take;—I want to contrast a good metalled road with a cheap railroad? I should say it could be done for about £8 a chain—that is, £640 a mile.
5385. That is a good road? Yes.
5386. What will that require for maintenance, to keep it in good condition for fair traffic, per annum? A good deal will depend upon what the road is made of. On that road there is some of the best gravel I have seen in the country. Near the Half-way House it is excellent gravel. On other parts the material is not so easy to get, and it is not so good either.
5387. Is it ironstone gravel? I hardly think it is. It is a sort of quartz gravel, but very good indeed. Between Temora and Barmedman that is procurable.
5388. Would from £10 to £20 a mile keep it in tip-top order? I think it will run into £25 a mile.
5389. You could make a good road for £640 a mile, and keep it in good order for £25 a mile? About that.
5390. *Mr. Dick.*] I understand you to say that you have practically made a third of the road between Wyalong and Temora, and that it is in good trafficable condition? Speaking from memory, I think it is about a third. We have the exact figures in a paper which can be supplied.
5391. The total amount spent on that road during the last four years is £12,000? Almost £13,000.
5392. That is far in excess of any similar length of road in the same district? Yes; very much in excess.
5393. And, even were the whole of it placed in good order at a cost of £640 a mile, it would then take £25 a mile per annum to keep it in order? About that, I should say. I do not say that that is absolutely the case. It requires a good deal of consideration to say exactly what it would cost.
5394. For the whole of the expenditure the Government would derive absolutely no revenue whatever—that is, from traffic? Certainly not, as far as the road is concerned.
5395. Presuming that the line were constructed from Grenfell to Wyalong, is it not a fact that a good deal of the Wyalong traffic—that is, traffic brought about by the relations of Wyalong with all the southern parts of the Colony—with Cootamundra, Junee, and right down to Melbourne—would still go over the Wyalong-Temora road, even after the construction of the Wyalong-Grenfell railway? I cannot say positively, but I fancy that a good deal of it would. It would be shorter going in this direction than going round by Grenfell and Koorawatha.
5396. If that railway from Grenfell to Wyalong were constructed, the Wyalong-Temora road would always be, to some extent, a rival to that Government railway? It is impossible to say that, but it might be so.
5397. It is your opinion that to some extent it would be a rival to that railway? To some extent, I think it would.

MONDAY, 11 SEPTEMBER, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

William Longworth, general manager at Lithgow for the Great Cobar Copper-mining Syndicate, sworn, and examined:—

5398. *Chairman.*] You are general manager at Lithgow for the Great Cobar Copper-mining Syndicate? Yes  
5399. The Committee have been told that you contemplate going in somewhat extensively for smelting at Lithgow;—is that a fact? Yes.

W.  
Longworth.

11 Sept., 1899.

5400. And that your intention is to treat all classes of ore there? Yes.

5401. Do you know anything of the Wyalong ores? No; I have never been there.

5402. We have also been told that, in order to successfully carry on smelting operations, it is necessary to have ores from other colonies besides our own ores? It would all depend upon the class of ores you were going to smelt. Under certain conditions we can smelt any class of ores if we can get the fluxes.

5403. Are the fluxes and fuel necessary for successful smelting operations in close proximity to your proposed works? Yes; nearly as close as it is possible to be.

5404. You have limestone and ironstone within a reasonable distance? Yes; and they can be delivered here very cheaply.

5405. Would that counterbalance the disadvantage you would be under in being so far from the seaboard? To a great extent it would.

5406. In the event of the ores at Wyalong proving too refractory for local treatment, do you think the ores would be sent to Dapto or to Lithgow? That will all depend upon who would treat them in the cheapest way. I think Lithgow is the proper place for them to go to.

5407. Do you think you could treat them more cheaply at Lithgow than at Dapto? I think so.

5408. Why do you think that Lithgow would be more likely to attract ores from Wyalong than would Dapto? In the first place, ores coming down the Western Railway would save from 4s. to 5s. per ton railway freight between Lithgow and Dapto. Again, I see enormous quantities of limestone daily going by Lithgow, in the train, for Dapto. We shall be able to get that limestone at Lithgow much cheaper than they can at Dapto, and the same with ironstone. These are the two main fluxes which we require.

5409. Do the Dapto people get their fluxes from west of your works? I see a lot of ironstone and limestone going down by train almost daily.

5410. Can you treat the ores of this Colony without having to get ores from the seaboard? It would all be a matter of how you were situated. I do not know of any ore in Australia I could not deal with at Lithgow under our circumstances, and particularly after we get our electrolytic plant.

5411. Then, if no ores come by seaboard, you could successfully treat ores of New South Wales? Yes; we could mix anything with the copper except lead. If we had lead ores we could deal with them by themselves.

5412. Are there no lead ores in New South Wales? There are many places where lead ore is known to be. I do not know of any places which are being worked at present, except at Broken Hill.

5413. *Dr. Garran.*] Do you require lead ore for the treatment of ores? No; having copper, we should use copper in place of lead.

5414. But you might have ores sent to you which would require lead? It is possible, but I do not know of any. The copper is almost as good a medium for taking up any precious metals as lead is. It is more difficult to extract precious metals from copper than from lead under methods which are mostly going now, but with the electrolytic plant it is simpler to take the precious metals from the copper than from the lead, with the system in use.

5415. Then, when your electrolytic plant is established, you will never want to have any lead ores? We do not know that we require to bring in any lead ores.

5416. But, if you did want lead, you would have to bring it from Sydney? Yes, but if the Cobar to Broken Hill line were constructed, we could get it from Broken Hill.

5417. It would not be a very heavy charge? No.

5418. Do you mine your own coal? Yes.

5419. Is the coal suitable for smelting? It is very suitable.

5420. Is any of the coke made at Lithgow sold, or is it all used in the locality? It is mostly sold. There has not been much made. A new oven has just gone up lately.

5421. We have had some evidence to the effect that the coal is not well cleaned at Lithgow for coke purposes? It makes what we would term a high ash coke. Still, if they would go the proper way to work, and make it cheaply, it would counterbalance that.

5422. Do they clean it sufficiently for your purposes? I do not complain of that. It is not as suitable for taking to Cobar, or anywhere distant, as it is for using on the spot. We can use it with most advantage on the spot.

5423. It is good enough for your purposes? Yes.

5424. You do not make your own coke? No.

5425. Do you send coke or coal to Cobar? Yes; coke.

5426. Do you get ores from Cobar to smelt? We have had one or two parcels. We have had very little from Cobar, because we deal with it there.

5427. It would pay better to take coke to Cobar than to bring Cobar ores to Lithgow? Yes.

5428. It has paid the Broken Hill mines better to send their ores to the seaboard, where coal is cheap, than to bring coal to their works, has it not? That is the way they are doing now at Broken Hill.

5429. If it pays them better to send the ore to the coal, how is it that it does not pay best at Cobar to send the ore to the coal? That is a big question. They are working with quite a different material from what we are.

5430.

- W.  
Longworth.  
11 Sept., 1899.
5430. Are your works purely smelting works, or have you any cyanide or chlorination works? Purely smelting works.
5431. You do not treat ore in any other way than by smelting? That is all.
5432. As far as you can see at present, you are in as good a position to treat western ores of all kinds that would pass through Lithgow as any smelting establishment on the coast would be? I think so.
5433. Have you made any attempt to get any of the Wyalong ores to treat? No; I have never tried. I have sent our tariffs to different places; but I have never made any great push for ores. We have had lots of parcels of different ores from different places, and gold ores, too.
5434. Have you had enough to keep your works busy? Our works are mostly kept busy with our own product from Cobar and Nymagee.
5435. You have ores of your own coming from Cobar and from Nymagee? We have.
5436. You have not been pressed to look about for other work? No; we have made no great efforts.
5437. If it should come to you on remunerative terms you would be prepared to do the work? Yes.
5438. *Mr. Trickett.*] How many furnaces have you? We have sixteen reverberatory furnaces and one water-jacket furnace at Lithgow.
5439. What ingredients do you use there? Coal, coke, lime, and limestone.
5440. The limestone, I suppose, is got from Portland, in the vicinity? Yes.
5441. What else do you use? That is about all.
5442. Do you use ironstone? We have plenty of iron in our own material.
5443. Then the material you bring from Cobar contains all the other necessary ingredients for smelting? Yes.
5444. What does the coal you use for your furnaces cost per ton? It costs us 3s.
5445. Is that slack coal or best coal? It is small and round coal mixed.
5446. That is a pretty cheap rate? Yes.
5447. It is your own mine that you get your coal from? Yes; but you could buy coal for 4s.—3s. 6d., I think, on a big contract. When I was buying coal I paid 4s. for rough coal and 2s. for small coal. It would average about 3s. a ton.
5448. How many tons of coal are used for smelting a ton of ore? It would mostly depend upon the class of ores.
5449. There is no fixed rule? No.
5450. Do you know what coal is required to treat your stuff per ton? It would come to about ton per ton of the material; but the matte requires much more coal in proportion to the amount of stuff treated than what raw ore would.
5451. What is matte? It is the product from the ore after it has been through the blast furnace the first time.
5452. You started to erect these furnaces towards the end of 1896? Yes, I think so.
5453. Have you built more furnaces than you intended at that time to do? I hardly know what we did contemplate at that time. We started with eight, and we have got up to sixteen.
5454. Since the Cobar works have been started working again, have you treated all the stuff at Lithgow? No; we treated it all at Cobar at first.
5455. Do you have to send any other material than coal to Cobar for the purposes of your furnaces? We do not send any coal for furnace work at Cobar; we send coke.
5456. Limestone? No; we do not use any limestone there.
5457. Coke is the only material you send away to Cobar? That is all, other than the stores.
5458. Have you had any experience in the treatment of other refractory ores? I have treated several parcels. I have not had a very wide experience.
5459. Do you know the Dapto works? I was there when they erected them; but I have not been there since they started to work.
5460. Is Mr. John Howell in any way connected with your works? No.
5461. At one time he contemplated sending stuff to Lithgow for treatment, did he not? I could not tell you.
5462. You were speaking about an electrolytic plant being erected at Lithgow;—is that likely to come off? Yes; part of the machinery is ordered.
5463. How will it be worked? By steam power.
5464. Do you think when it is erected it is likely to induce a large quantity of ore to be sent to Lithgow for treatment? I do not think it will have much effect further than this, that ores we might refuse now we would take then. From what I have been told, Wyalong ores are highly charged with arsenic. Arsenic is an element which we do not care to put in with the copper; but when we have the electrolytic plant going, it would not matter to us then what arsenic is put into it, as we could separate it again; whereas if we put it into the copper now, and sent it Home, they would charge us at the other end for separating it.
5465. Is the electrolytic process cheaper than the treatment at Dapto? It does not come into competition with Dapto; it is for other purposes. It is for the purpose of extracting the gold and silver from the metallic copper—for getting the copper almost perfectly pure.
5466. It is not for the purpose of treating gold-bearing stone? No. Suppose we had a parcel of gold-bearing stone, we simply put it with the copper. The copper takes up the gold and the silver just in the same manner as quicksilver takes it up; then we get it as metallic copper; after that it is taken on to the electrolytic work, and the copper is dissolved. The copper is deposited on the cathodes, and the gold and silver which may be in it sink to the bottom of the tanks and are collected separately.
5467. Is that a more expensive process than the chlorine process? I do not think it will be.
5468. It would seem to be a process very suitable for dealing with very mixed ingredients, according to your statement? Yes.
5469. Is it in contemplation to enlarge the operation of your works at Lithgow, so as to invite the treatment of ores from districts, such as Wyalong and other places? Yes.
5470. Is that what you intend to bring about after you get this electrolytic plant erected? We are quite prepared to treat any ores sent from Wyalong or elsewhere which will pay us.
5471. But you are not able to say, I suppose, whether you could treat them more cheaply than they can at Dapto? I could not say that.

W.  
Longworth.  
11 Sept., 1899.

5472. You could not give us facts or figures? No.
5473. *Mr. Watson.*] I suppose the primary object of establishing your works at Lithgow was to treat the matte which your own company send down from Cobar and Nymagee? Yes.
5474. Any treatment of ores from outside would be subsidiary to that business? Yes.
5475. I suppose, in some circumstances, it would pay you to buy copper ores from other places, so as to get a larger bulk, and reduce the proportion of cost to yourself? Certainly.
5476. I think you said that you do treat copper ores from outside? Yes, lots. We have about 100 tons lying there now from other places, including some from Queensland.
5477. Have you had any other kinds of ores? We have had some parcels of gold ore, that is all.
5478. Of what character was the gold ore you had—was it mineralised, or what kind of mineral did it have? I have had some containing iron pyrites, and some containing a little arsenical pyrites.
5479. Where did these ores come from? One lot came from Hill End, and another lot came from Sunny Corner.
5480. I understood you to state that you had sent out to mine-owners a circular expressing your willingness to treat any kind of ore, and stating your charges? Yes.
5481. It is to be assumed that when you sent out that circular, those charges were the lowest charges at which you could do the work profitably? I could hardly say that. We generally get as much as we can.
5482. Knowing that you had to compete with others who were taking ores for treatment, one would naturally expect that whatever charges you quoted would be as low as you could do the work, leaving a profit to yourselves? It generally depends upon how anxious you are to do the business how low you are ready to go.
5483. In this case you were anxious to do the business? Yes.
5484. And the presumption is, that you made the charges as low as you could do the work? We quoted what we thought was a fair and reasonable charge.
5485. You know that *via* Temora you are 90 miles nearer Wyalong than Dapto? I think we are more than that.
5486. It is 96 miles from Lithgow to Sydney, and 50 miles from Lithgow to Dapto; I do not know how it would be if they sent their ores round by the Southern line, but if they come by the Western line they will be about 126 miles closer by the present method of reaching Wyalong? Yes.
5487. Have you had any ores from Sydney? No.
5488. From the fact that you have had no ores from Wyalong, notwithstanding that you are over 100 miles closer to Wyalong at present, your tariff of charges was not as low as that put forward by the works at Dapto, seeing that they have had ores from Wyalong? Yes.
5489. The presumption is that it paid Wyalong better to pay the increased cost of carriage to the works at Dapto than to send the ore to your works for treatment? Judging it in that way you would think it was. There are a lot of other things which people who send ores do not know, in order to find out which is the cheapest place to send to.
5490. Some of the mine-owners at Wyalong, I presume, would receive the circular you sent out? Yes.
5491. Yet, with the knowledge of your tariff, they have continued to send their ores to Dapto; we were told by the Secretary of the Smelting Company of Australia the other day that their limestone for fluxing purposes comes from Portland, which is west of Lithgow, but that after the construction of the harbour works at Port Kembla they would import their limestone from the seaboard, which would make a considerable saving to them in the cost of that material laid on the ground;—and we were also told that it was easier to treat any kind of mineralised gold ores when mixed with lead ores than by any other method;—do you think that is likely? It is a good deal a matter of opinion.
5492. Have you had any experience of lead ores? I have not smelted any lead ores yet.
5493. You could not offer an opinion as to whether they would flux better with difficult gold ores than copper would? I think if I had the choice of the two, and I had a good electrolytic plant going, I should put them in with the copper ores.
5494. Do you think you would be likely to get the same results more cheaply by putting them in with the copper than with the lead? Yes; under circumstances.
5495. I suppose you cannot be positive on that point, seeing that you have had no experience of lead ores in any quantity? I think I understand the whole routine close enough to know.
5496. Is it not generally understood amongst people engaged in the reduction of ores that the greater variety of the ores you have to treat the better, and more economical results you can obtain? Yes.
5497. We were informed by the Secretary to the Smelting Company of Australia that they are now buying, and have for some time past been buying, ores from Noumea and many parts of Australia, in addition to large supplies of lead ores from Broken Hill, and that was put forward as a reason why, in his opinion, they would be better able to treat refractory gold ores than any works situated inland, where there are not the same facilities for getting over-sea ores;—do you think that is likely? Of course, if they are able to land their ores at Illawarra close to their works, and have not got to rail them from Sydney, it will make a considerable amount of difference to them; but they have not got as much pull as they think there. For instance, it costs them from 2s. to 2s. 6d. a ton by rail from Sydney to Dapto. It would cost about 3s. 6d. a ton from Sydney to Lithgow, at  $\frac{1}{2}$ d. per ton per mile.
5498. At that rate it would be 4s. a ton;—but even then a large proportion of the 2s. 6d. which they pay at present would disappear after the construction of the harbour at Port Kembla, which is authorised? Yes.
5499. It would bring their work within 4 miles of the water, according to a statement by their secretary;—that would account for a very large proportion of the 2s. 6d. which they now pay on oversea ores? Yes; but against that there is the cost of fetching the limestone from Portland.
5500. Their secretary has stated that, after the construction of Port Kembla Harbour, the limestone would come by sea at a much cheaper rate;—what do you consider it would cost them? I could not say. They bring their ironstone from Cowra.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Grenfell to Wyalong.

APPENDIX.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

## PROPOSED RAILWAY FROM TEMORA TO WYALONG.

(PETITION FROM CERTAIN RESIDENTS OF COOTAMUNDRA, YOUNG, AND WYALONG, PRAYING THAT THE SCHEME BE AGAIN REFERRED TO THE PUBLIC WORKS COMMITTEE FOR INQUIRY AND REPORT.)

---

*Received by the Legislative Assembly, 8 November, 1899.*

---

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales.

WE, the undersigned Petitioners, beg to approach you with a request that you will consider the matter of referring the Temora to Wyalong railway to the Public Works Committee for inquiry and report.

YOUR PETITIONERS HUMBLY SHOWETH:—

1. That a previous Committee inquired into this proposal, and recommended that the work be carried out when Wyalong had established its permanency.
  2. That consequent upon such report Crown lands have been taken up and homes established along the route from Temora to Wyalong.
  3. That the locality of Barmedman, through which this proposal passes, will suffer for all time if this line is not constructed. The Crown Lands Office is situated here, and has created it a centre for the transaction of business.
  4. This route will land passengers on the Southern line at Cootamundra, halfway between Sydney and Melbourne, leaving them free to avail themselves of any of the train services to either Sydney or Melbourne or Gundagai. The Grenfell connection will land them on a branch line at Koorawatha, nearly 100 miles further away from Cootamundra.
  5. That the connection *via* Temora is the natural one.
  6. That the connection *via* Grenfell is anti-federal in principle.
  7. That the distance from Temora is 40 miles, as against 60 from Grenfell.
  8. That the Temora route will open up more Crown lands, and tend to develop the public estate.
  9. That the Temora route will have the effect of bringing the dry district west of Temora in direct communication with the summer or mountain country at Tumut *via* Cootamundra and Gundagai. This benefit is of incalculable value to the country.
  10. Ballast and timber required for work of construction are available in large quantities along the route.
  11. That the Temora route will open up more land suitable for agriculture, and thereby maintain a heavier population.
  12. That the Grenfell route in unfair competition with the present Temora railway will render the present Temora service non-paying for all time.
  13. The report of the Public Works Committee in favour of the Grenfell route was decided by the vote of the Chairman. The three Members of the Legislative Assembly, Messrs. Watson, Dick, and Levien, voted against it, whilst the three Members of the Council voted for it. In view of such an equally divided opinion on the matter, we feel we are justified in demanding a fuller inquiry, and we ask for nothing but what is reasonable and just—the fullest inquiry into both routes; this has been denied us hitherto.
- We, therefore, most respectfully urge upon you the importance of our request, and we pray this proposal will be submitted by your Honorable House to the Public Works Committee for inquiry. And your Petitioners will ever pray.

[Here follow 950 signatures.]

Archibald Campbell Berry, senior-constable, Gilgandra .....	114-116

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## RAILWAY FROM DUBBO TO COONAMBLE.

### REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Dubbo to Coonamble," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

#### QUESTION OF RAILWAY EXTENSION FROM DUBBO TO COONAMBLE.

1. This proposal, the Committee are informed in the official statement placed before them by the Under Secretary and Commissioner for Roads, Department of Public Works, was included in the Government railway policy of 1886; but, with the exception of attention being called to it by deputations to the Minister for Works, it appears to have been laid aside until its reference to this Committee. In 1898 a proposed line from Warren to Coonamble was referred to the Public Works Committee previous to the present one, and they, reporting that it was inexpedient to construct that line, recommended that a survey should be made of a line from Dubbo to Coonamble. In that inquiry the Sectional Committee, "finding that most of the statements made before the full Committee with regard to the productiveness of the Coonamble district and the possibilities of further development were borne out by the inspection made by them, concluded that the question whether Coonamble and the district intervening between it and the Western railway system is entitled to railway communication was decided." They therefore set themselves to discover the best route by which a railway to Coonamble should be constructed, and they came to the conclusion, which was adopted by the full Committee, that a line to Coonamble from Dubbo could be located through land more suitable for agricultural settlement than that on the Warren route, and that a careful investigation should furnish a route in which there were no serious obstructions, so as to be in keeping with the cheapness necessary in the construction of lines for the development of the western country.

#### DESCRIPTION OF THE RAILWAY.

2. The line, which is of the class known as light railways, commences at the east end of Dubbo railway station, and for 30 miles takes a generally northerly course, crossing the Talbragar on the way. From the 30-mile point it runs nearly parallel with the general direction of the Castlereagh River, at a distance from it of from 2 to 4 miles, the township of Gilgandra, on the river, being passed

40 miles from Dubbo. At 78 miles the river is closely approached, and following its course the line ends at a suitable place half-a-mile from the bridge across the Castlereagh leading into Coonamble, 93 miles 45 chains from Dubbo, and 371 miles 14 chains from Sydney. The works are light, the ruling grade is 1 in 100, and the curves are easy. The greater part of the land passed through is alienated.

#### ESTIMATED COST.

3. It is estimated that the line will cost £207,285, or an average rate per mile of £2,215 9s. 6d. For the first 40 miles—from Dubbo to Gilgandra—the cost is somewhat higher than for the remainder of the distance, the Dubbo to Gilgandra section being estimated at £2,420 13s. 6d. per mile, and the Gilgandra to Coonamble section at £2,062 4s. 6d. The larger cost of the first section is due to the earthworks, the drains, and the bridges being considerably more extensive than they are on the second section. The estimate shows that the earthworks on the first section will cost £308 per mile, while those on the section beyond are estimated at £154. At the same time it will only be where creeks, and flooded or uneven country, are crossed, that the height of the earthworks will be greater than it is the practice to make them on light lines of railway. Generally, the height, over level ground, will be from 6 inches to a foot. The most important watercourse crossed on the route is the Talbragar, over which a bridge will have to be constructed, at an estimated expenditure of £3,800. Before reaching Gilgandra the upper waters of the Marthaguy are encountered, but they are small, and do not necessitate any great outlay. After reaching Gilgandra there are no watercourses of any consequence met with. Ballast will be used on the line only where it is absolutely required. Allowance is made in the estimate of cost for ballasting about one quarter of the total length of the railway.

#### RAILWAY COMMISSIONERS' REPORT.

4. The report of the Railway Commissioners on the proposed railway points out that the estimate of traffic, which is based on existing circumstances, falls short of the sum required to pay the annual interest on capital and the working expenses by £1,570; but the Commissioners consider it reasonable to assume that the construction of the line would lead to a development of the country, and a consequent increase of business, and they regard Coonamble and the surrounding district as entitled to railway facilities. The annual cost in connection with the line, based on a tri-weekly service, is £13,437—capital expenditure at 3 per cent., £6,218, and cost of maintaining permanent way and traffic and locomotive expenses, £7,219. The traffic estimate is £11,867, comprising merchandise and live stock, £8,526; passenger traffic, £1,975; mails, £1,116; and parcels, &c., £250.

#### THE COMMITTEE'S INQUIRY.

5. In their investigation of this proposal the Committee have had under consideration the different routes by which Coonamble might be reached by a railway from the Great Western line, and have taken steps, which they hope will become a precedent, to obtain from the Railway Commissioners reports upon the routes alternative to that from Dubbo.

Having considered the necessity for expert evidence as to the probable traffic returns from the construction of the alternative lines—Mudgee to Coonamble, and Warren to Coonamble—and generally as to the nature of the districts through which those lines, if constructed, would run, it was decided to communicate with the Right Honorable the Premier and Minister for Railways requesting him to have the Chief Traffic Manager of the Department of Railways, or some other officer competent for the duty, instructed to visit the districts and obtain this information for the Committee. To this a reply was received that in relation to the proposed railway the Railway Commissioners would deal with alternative routes similarly to projected new lines, and make a personal inspection and subsequent report; and in due course a report was made, and the Chief Traffic Manager, who accompanied the Commissioners in their inspection of the Mudgee route, gave evidence on the subject.

The

The opinion of the Commissioners upon the Warren route is contained in the report of the inquiry respecting the Warren-Coonamble railway proposal, and therefore in respect of that route a second report was not considered by them to be necessary.

Witnesses representing Narramine, and favourable to the route from Narramine to Coonamble, were examined in the present inquiry, and evidence regarding the Dubbo and Mudgee routes was taken at Dubbo, Gilgandra, Gulargambone, Coonamble, Tooraweenah, Munderooran, Cobborah, Gulgong, and Mudgee.

A careful inspection of the Dubbo and Mudgee routes was made, and in view of evidence advocating railway communication with Coonamble, *via* Munderooran, the country along the surveyed Dubbo to Werris Creek railway route as far as Munderooran was examined.

#### DIFFERENT ROUTES FOR A RAILWAY TO COONAMBLE.

6. Four routes for connecting Coonamble with the Great Western Railway have been before the Committee, viz. :—

Dubbo to Coonamble.  
Mudgee to Coonamble.  
Narramine to Coonamble.  
Warren to Coonamble.

#### THE DUBBO TO COONAMBLE ROUTE.

7. When inspecting the route from Dubbo to Coonamble the Committee, for a large extent of the distance, divided into two parties, and examined the country within a radius of several miles on each side of the surveyed line.

They found that a large proportion of the land between Dubbo and Gilgandra was of a good description. Much of it is heavily timbered with box, pine, and some ironbark, and is very suitable for agriculture. Even in the case of the ironbark country, it is only where the timber is found upon stony ridges that the land is inferior. As showing the value of the country along this section of the route, evidence was given before the Committee to the effect that heavily-timbered land, formerly regarded as useless, had recently been taken up and successfully cultivated by immigrants from other colonies. Ironbark timber, of course, is of considerable value for railway purposes. Between the Talbragar and the Castlereagh Rivers there is an extensive ironbark forest, a portion of the western edge of which is skirted by the railway in the length between Dubbo and Gilgandra, and this, from the quality and value of the timber upon it, is referred to by the District Surveyor at Dubbo, in a report made to the Committee, as a "national forest," particularly in regard to the supply of railway-sleepers which it is capable of providing. For many years past, the Committee are informed, exceptionally large quantities of sleepers have been obtained from this forest; and at one time the Railway Commissioners proposed to construct a tramway from Dubbo along the Coonamble-road to Brocklehurst, and thence into the forest, a distance of about 25 miles. The construction of a railway from Dubbo to Coonamble would, of course, render such a lengthy tramway unnecessary.

From Gilgandra on towards Gulargambone, and thence to Coonamble, there is between the railway route and the Castlereagh River a strip of first-class agricultural land, about 3 miles in width, and there is similar land on the east side of the river. Back from this the country, generally described, is of the best description for pastoral purposes, with a considerable area—principally open box country—suitable for the growth of cereals and vines.

The Dubbo District Surveyor, in his report, states that within a limit which embraces all the alienated and Crown lands for 20 miles on each side of the railway line there is approximately an area of 3,096 square miles, or 1,981,440 acres of agricultural country. This, he explains, includes patches of open plain, pure black-soil country, and some "monkey country," but these are separated and not of large extent. With the exception of the ironbark forest between the Talbragar and the Castlereagh, the whole of the country within 20 miles on each side of the proposed railway may be said, the District Surveyor reports, to embrace either good agricultural land or exceptionally good pastoral country, the latter carrying rich pasture excellent for sheep for either fattening or breeding purposes. Most

Most of the pastoral land is in the hands of holders of runs of large size ; but there is a considerable amount of settlement that would be within a convenient distance of the railway, the settlers following the occupation of grazing, combined with a little farming ; and as the leases in the Central Division, which contain a considerable amount of land suitable for agriculture, will shortly be available for selection, and the demand for land in the district is constant, the number of settlers is certain to increase. Cultivation on the present holdings, the Committee were informed, would be much greater if the means for sending produce to market were such as to justify putting more land under crop. Around Coonamble, and in some other places, as much as 40 bushels of wheat to the acre have been obtained, and, according to evidence given before the Committee, farmers have even carted their wheat a distance of 48 miles to Dubbo. Fruit of various kinds is grown without difficulty.

One thing which strikes the observer in this western country very forcibly is the remarkable change that has taken place among the settlers in their opinions as to the capabilities of the soil for cultivation. Not many years back scarcely anyone could be found who thought the land was suitable for anything but grazing sheep ; now, the cultivation of wheat, vegetables, and fruit is rapidly increasing and extending into other districts, notwithstanding that in some places the rainfall is scanty and the seasons uncertain. Sixteen years ago, the District Surveyor at Dubbo states, a time when no farming had been tried in this part of the Colony, it was pointed out by him, judging from the rainfall and the nature of the soil, that the country in the locality could be far more profitably developed by agricultural pursuits than by sheep-grazing ; but it was not until settlement had increased, and new men practically acquainted with agricultural pursuits had acquired land there, that agriculture began to attract attention and the occupation to be followed systematically. A number of settlers seen by the Committee, who had come into the Dubbo-Coonamble districts from Victoria and South Australia, were making a far better living, they stated, than they made in the places from which they came.

According to information from the Department of Lands, there are, within 20 miles on each side of the railway route, except where the distance is narrowed to allow for the influence of the Great Western Railway, 1,177,000 acres of alienated land, 115,800 acres of settlement and improvement leases, 520,000 acres of reserves, and 650,600 acres of Crown lands. The Crown lands within leases which expire between 1899 and 1900, and therefore will soon be open for settlement, comprise 540,000 acres ; the lands held under occupation license, 43,200 acres ; and lands untenanted, unless it may be by annual lease, 67,400 acres. The reserved land includes a railway reserve containing 73,000 acres, which runs for practically the whole length of the proposed line, though the surveyed route does not follow it for any considerable distance.

#### THE ROUTE FROM MUDGEES TO COONAMBLE.

8. The surveyed route for a railway from Mudgee to Coonamble is 147 miles in length, as compared with 93 miles 45 chains, the length of the proposed line from Dubbo ; and the line is estimated to cost £478,936, or £271,651 more than the Dubbo-Coonamble Railway. It is officially described as moderately undulating for about 36 miles, and from that point, as the ranges are crossed, and up to 117 miles from Mudgee, it varies from fairly light to ridgy. Thence to Coonamble the line would be a surface one. For about 8 miles from Mudgee the route runs close to the main road, and at that distance the Cudgegong River is crossed. Gulgong is reached on the west side of the town, and the route then proceeds in a north by west direction, crossing Wyaldra and Tallawang Creeks, and passing over the Goodiman Range. Cobborah is passed at a distance of about 2½ miles to the south-west, where the Talbragar is crossed. At a distance of 54 miles from Mudgee the Wallaroo Range is passed over, and 14 miles further on the surveyed line from Dubbo to Werris Creek is intersected. The township of Mundooran is passed on the south side, and 71 miles from Mudgee the line crosses the Castlereagh River. Twelve miles from the river the route passes over the Wallamburrawang Range,  
and

and a few miles further, a creek of the same name. For the last 40 miles the route runs in a generally straight direction, Coonamble being reached on the east side of the river, at 336 miles 778 chains from Sydney. The ruling grade of the line would be 1 in 80.

The Railway Commissioners, in their report upon this route, express a high opinion of the country traversed, and say that the route is one worthy of the most thorough investigation.

The evidence given before the Committee, and their personal inspection of the country, amply demonstrate that it includes a large extent of good agricultural land to which a railway would be an advantage, and that as far as Cobborah, and centres east and north-east of it, towards Coonabarabran, there is a considerable amount of settlement. Pastoral properties of extensive area comprise most of the land along, and in the vicinity of, the railway route from the point where it enters the Central Land Division, the leasehold portions of which will fall in during the current and next year, and, as in the case of the leases along the Dubbo route, will then be open for settlement. At and around Cobborah there is a considerable amount of agriculture. In that locality, and for some distance in the valley of the Talbragar, which the railway would intersect, farms are fairly numerous, and there is a large quantity of land suitable for cultivation. Between Cobborah and Gulgong there is good country, a fair proportion of which is under wheat; and round about Gulgong are many cultivated paddocks, though at the same time there is plenty of inferior land. Between Gulgong and Mudgee there is also inferior land, and it is observable that though the alluvial land is within easy reach of the railway at Mudgee, by excellent roads, cultivation is not carried on to anything like the extent it might be. As on the Dubbo-Coonamble route, open box country is met with—used principally for grazing purposes, but containing a percentage of good agricultural land, and there are some rich river and creek flats. Along much of the surveyed railway route from north of Cobborah, however, on one side or other, and occasionally on both sides, rough country approaches the line to within a few miles, materially limiting in that way the extent of land likely to contribute traffic to the railway, and there are several large areas of untenanted land east and west of the route, unoccupied, apparently, because of their unsuitableness for settlement.

From the evidence of the Chief Draftsman, Department of Lands, it appears that within an area of 20 miles on each side of this route, the alienated lands comprise 2,059,000 acres; lands held under settlement, improvement, and scrub leases, 241,800 acres; Crown lands, 1,194,200 acres; and reserves, 573,200 acres. The Crown lands are made up as follows:—Leasehold areas expiring in 1899 and 1900, 552,000 acres; held under occupation license, 155,000 acres; and untenanted, unless on annual lease, 487,200 acres. The untenanted land is of an inferior description, and though it has been open for a long time, has not, with the exception of annual leases here and there not requiring residential tenure, been taken up. For 48 miles, at intervals, the line would pass through a railway reserve.

#### THE NARRAMINE TO COONAMBLE ROUTE.

9. The route from Narramine has only been explored. Starting from the western side of Narramine station, at 301 miles from Sydney, the line by this route, according to the report of the railway surveyor who examined the country, runs in a north-westerly direction, and taking advantage of the Crown land skirts the resumed area between that and the river. Thence bearing to the east it crosses the Macquarie River  $15\frac{1}{2}$  miles from Narramine, and passing close to Burraway station, and bearing northerly, it strikes travelling stock reserve 1,680, which it follows in a slightly north-west direction. Bugabadah Creek and the Marthaguy Creek are crossed, the latter where the township of Collie is situated, and thence the line takes a course almost due north, crossing Merigal, Bullagreen, and Merri Merri Creeks, and joining the Dubbo to Coonamble survey close to the junction of the main roads from Dubbo and Warren to Coonamble. From this point the Dubbo-Coonamble survey is followed until the line terminates at Coonamble on the western side of the Castlereagh River, 93 miles from Narramine, and 394 miles from Sydney. The country passed through is described as well adapted for railway construction, and on the whole will compare favourably with that on the other routes to Coonamble.

THE

## THE ROUTE FROM WARREN TO COONAMBLE.

10. The route to Coonamble from Warren is 63 miles 33 chains in length. It crosses the Macquarie River at the north-west end of the township of Warren, and after joining the main road to Coonamble 2 miles from Warren, it runs for 42 miles in a north-easterly direction, mainly within a travelling-stock reserve. Leaving the reserve, it proceeds direct to Coonamble, where it ends on the western side of the town and of the Castlereagh River in a temporary common. The only matters that appeared to the Public Works Committee, who inquired into this railway proposal in 1898, to be favourable to its adoption were the shorter length of line and the smaller total cost, as compared with the length and cost of the Dubbo proposal; but against these there were the considerably longer distance to Sydney and the inferiority of the route for settlement and production in comparison with that from Dubbo.

## EVIDENCE IN FAVOUR OF THE DUBBO-COONAMBLE ROUTE.

11. In addition to what has been said of the satisfactory nature of the land on the route from Dubbo to Coonamble, there are several other important circumstances favourable to this route. But first it may be stated, on the authority of the District Surveyor for the Land District of Dubbo, and of other witnesses examined, that if the railway be constructed along the Dubbo route large areas adjacent thereto, which are now used for sheep grazing only, will be cleared and placed under cultivation, and ultimately this part of the Colony will support a large population. The red soil of the district is undoubtedly well suited for wheat and hay growing, and the black soil, though not suitable for wheat, is well fitted for fattening stock. Recently, the Committee are informed, areas of open plain country, with dark chocolate soil, have been successfully cultivated. Extensive agriculture is not only possible, but certain.

Then apart from agriculture, there come into view, in a comparison between the Dubbo and the Mudgee routes (the only two routes which call for close consideration), the following points which favour the route from Dubbo:—

- (1.) The line by the Dubbo route involves less construction than that by the route from Mudgee, and it connects directly with the main Western Railway as compared with a connection with a branch line.
- (2.) It is very considerably cheaper.
- (3.) The Dubbo route is that which is favoured not only by the people along the route, but by those of Coonamble, who are the principal persons concerned in the railway proposal.
- (4.) The line from Dubbo would serve, not only the country in its immediate vicinity, but also, north of Munderooran, much of the land the requirements of which a line from Mudgee would be expected to meet; and in addition to this, it will be within a convenient distance of the country through which a line from Narramine would run, and, to a considerable extent, of that which would be served by a railway from Warren to Coonamble.

The Dubbo route is 53 miles 35 chains shorter than that from Mudgee, and by connecting Coonamble with the main Western Railway it gives the Coonamble people and those along the route the advantage of not only the Sydney market, but of markets in the west and south. The President of the Sydney Chamber of Commerce, who is a large buyer of wheat and a mill-owner, impressed this very strongly upon the Committee, and the same point was urged upon their attention by witnesses at Coonamble.

The junction at Dubbo, it is pointed out, will put the wheat-growers on the proposed line of railway in touch with very important markets at Bourke and other western centres, which, in bad seasons, will be a splendid outlet for fodder, bran, and other produce, and it will also provide for trade in the future with markets in the south. Compared with these advantages, the connection with Mudgee, it is contended, would shut out the farmers from any market but Mudgee or Sydney. The farmers who would be served by the line from Dubbo, it is urged, could not afford to send their wheat westward, *via* Mudgee and Wallerawang, in competition with the produce sent towards Bourke from Bathurst and Orange. The Dubbo millers, who purchase the western farmers' wheat, find their best market for flour in the west.

As

As for the cheaper construction of the line from Dubbo to Coonamble, compared with the cost of constructing a line from Mudgee, the estimate in the case of the former is £207,285 (or £2,215 per mile), and in that of the latter £478,936 (or £3,258 per mile)—a difference of £271,651, more than double. This alone represents an increased annual payment of interest at 3 per cent., amounting to £8,148, in addition to which the cost of maintenance would be largely in excess of that in connection with the line by the route from Dubbo.

The residents of Coonamble and the surrounding district, though presumably ready to accept railway communication from any point, are strongly in favour of the line from Dubbo, which they urge will not only give them the desired opening to different markets, but will make the country along the line one of the greatest wheat-producing areas in the Colony. Every witness who presented himself for examination by the Committee at Coonamble expressed himself as favourable to the connection with Dubbo. The longer distance to Sydney by that route as compared with the distance by way of Mudgee was not lost sight of; but this, it was pointed out, was met to a large extent by the quicker transit on the main line, which railway passengers would much prefer, and by the opportunities afforded for more extended markets for produce.

With regard to the position of the line from Dubbo, and its influence upon the surrounding country, it is only necessary to observe the position in which it is located to see at once how wide its influence will extend. From a few miles north of Mundooran on to Coonamble, the line by the Dubbo route may, as far as relates to the land within the railway influence, be said to serve the same country that would be within the influence of a line from Mudgee. The distance between the two routes rapidly decreases from Mundooran onwards, until, as they near Coonamble, they so closely approach each other that practically for this length the line from Dubbo would serve all the country within the influence of a line from Mudgee. It would, at least, serve all the land between the railway and the foot-hills of the mountains to the eastward. There is much to indicate that the railway from Dubbo to Coonamble will attract traffic not only from Mundooran and localities north of it, and along the Mudgee route, but also from agricultural centres to the east and north-east. The President of the Sydney Chamber of Commerce states in his evidence that wheat has been carted to a railway at a profit to the farmer for a distance of 50 miles, and evidence given along the Dubbo route shows that in sending wheat to Dubbo it has been carted 48 miles. These are, of course, extreme distances; but if the farmers of the districts to be served by the proposed line are content to cart their wheat 25 miles, the Dubbo-Coonamble railway should meet the wants of a very large extent of the country which a line from Mudgee to Coonamble would be expected to benefit. As for the country along the Narramine route, much of it is now within the influence of the Great Western Railway, and what is not is within easy reach of the railway route to Coonamble from Dubbo. Further west there is the country that would be traversed by a line to Coonamble from Warren, and a considerable portion of that is not too far away to be beyond the influence of the Dubbo line.

Added to what has already been said in favour of adopting the route from Dubbo, there is the fact that the value to the State of the large areas of good lands now included in pastoral leaseholds, but shortly to be available for settlement, will be greatly increased by the prospect of the railway being constructed; and this increase it is fair to regard as a set-off to the extent of the sum it represents against the cost of the railway.

#### CONCLUSION ARRIVED AT BY THE COMMITTEE.

12. The Committee have arrived at the conclusion that, in the public interest as well in the interests of the districts most concerned, it is expedient the proposed railway from Dubbo to Coonamble should be constructed. The justifiableness of the claims of Coonamble to be connected with the railway system of the Colony being admitted, the only question for consideration is that of route; and from the evidence before them, and their visit of inspection, the Committee are of opinion that the connection should be with Dubbo, that route, in relation to the country

country requiring railway facilities for its development and progress, being the most central, the widest in its range of influence for traffic, the best for providing openings for markets, and, in comparison with the route which is its only rival, by far the cheaper in cost of construction and maintenance.

It is possible it would be an improvement in the route if the line were taken nearer to Gilgandra than the present survey represents its position to be, by which alteration more country to the eastward would be served, and the Committee think this suggestion might be considered.

It is also worth considering, the Committee are of opinion, whether, in addition to constructing the proposed railway from Dubbo to Coonamble, it would not be advisable to extend a line from Mudgee to serve the country east of Cobborah in the direction of Dunedoo and on towards Caigan. Gulgong is within easy distance of the railway at Mudgee, with which it is connected by exceptionally good roads, and a line such as that suggested is not necessary as far as Gulgong is concerned; but it would meet the wants of the country beyond that town, and there is sufficient agricultural land within the limit of the influence of such a railway, to make the line pay without interfering with the traffic that should find its outlet by the railway between Dubbo and Coonamble. Such a line, too, might, in the future, be extended with advantage northwards in the direction of Coonabarabran.

#### RESOLUTION PASSED.

13. The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings of Thursday, the 13th instant:—

Mr. Watson moved,—“That, in the opinion of the Committee, it is expedient the proposed Railway from Dubbo to Coonamble, as referred to the Committee by the Legislative Assembly, be carried out.”

The motion was seconded by Mr. Shepherd, and passed on the following division.

Ayes, 6.	Noes, 1.
Mr. Perry,	Mr. Dick.
Mr. Shepherd	
Dr. Garran,	
Mr. Trickett,	
Mr. Watson,	
Mr. Levien.

Sydney, 25 July, 1899.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### RAILWAY FROM DUBBO TO COONAMBLE.

THURSDAY, 9 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Dubbo to Coonamble.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Do you produce a statement in regard to the proposed railway? Yes. I have been asked to present the following statement on behalf of Mr. Hickson, who is unable to be present:—

H. Deane.

9 Mar., 1899.

#### DUBBO TO COONAMBLE.

THIS proposal was included in the Government Railway policy announced by Mr. Watson in the year 1881.

A survey was authorised on the 12th June, 1883, by the then Minister for Works (Mr. F. A. Wright), and completed during 1885. It was also amended in the year 1893.

Several deputations have waited upon the different Ministers for Works urging the construction of the line. Mr. Lyne, when waited upon, stated he had advocated this route, but thought the Dubbo to Werris Creek line should be constructed first.

Mr. Young also promised a deputation which waited on him in August, 1896, that he would endeavour to ascertain which was the best way of connecting Coonamble with the railway system, and he would have that route submitted to the Public Works Committee.

The Public Works Committee who recently reported on the proposal from Warren to Coonamble were of opinion that it was not expedient to construct that line, but recommended the survey of a line from Dubbo to Coonamble.

The Engineer-in-Chief for Railway Construction, who recently went over the route with the Railway Commissioners, Messrs. Fehon and Kirkcaldie, and the Chief Traffic Manager, Mr. Harper, stated, in a report to the Minister, dated 8th December, 1898, that without expressing any opinion as to whether preference is to be given to the Warren to Coonamble or Dubbo-Coonamble route, the latter is very satisfactory. Whilst traversing it, large quantities of wool were coming down from the Coonamble district and beyond. The preference to this route during the present season, however, seems to be due to the fact that grass is more abundant than along the Warren to Coonamble. The rainfall also between Dubbo and Gilgandra and along the Castlereagh River seems to be somewhat in excess of that on the Warren-Coonamble route. This superiority of climate has, during the present season, enabled some very good crops of wheat to be produced.

As it is desirable to keep the railway in the best possible position for receiving produce, Mr. Deane is of opinion that the line, instead of being moved westward, as recommended by the Works Committee, should, if possible, be kept nearer to the Castlereagh, between Gilgandra and Gulargambone, so as to make the carriage as short as possible from the districts on the east side of the river; at the same time such a position would equally suit the west side. The Engineer-in-Chief for Railway Construction considers the line as laid out to be the cheapest possible, and has supplied me with the following estimate and description:—

Length, 93 miles 45 chains; estimated cost, £207,285 or £2,215 per mile, exclusive of land and compensation.

This proposed light railway begins at the east end of Dubbo Station, at 277 miles 49·054 chains from Sydney, and takes a generally northerly course, crossing the Talbragar River at 281 miles 65 chains, this direction being maintained generally to 307 miles. From this point the line is nearly parallel to the general direction of the Castlereagh River, at a distance of from 2 to 4 miles from it, the township of Gilgandra on the river being passed at about 317½ miles. At 355 miles the river is closely approached, and following its course the line ends at 371 miles 14·42 chains, at a suitable place half a mile from the bridge across the river leading into Coonamble.

The greater part of the land passed through is alienated. The works are light, and the ruling grade is 1 in 100, with easy curvature.

By direction of the Minister, the Railway Commissioners, on the 29th November last, were asked to report in terms of the Public Works Act. This report was supplied on 13th December, 1898, and is as follows:—

Proposed line of Railway from Dubbo to Coonamble—93 miles 45 chains.

IN accordance with the provisions of the Public Works Act of 1888, section 13, we beg to report as under:—

#### Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a single line of light railway, exclusive of land and compensation, at about..... £207,285

#### Annual Cost—

Capital expenditure at 3 per cent..... £6,218

Estimated cost of maintaining permanent-way, and for traffic and locomotive expenses ..... 7,219

Total annual cost ..... £13,437

H. Deane.  
9 Mar., 1899.

Traffic Estimate—

Merchandise and live stock.....	£8,526
Passenger traffic .....	1,975
Mails .....	1,116
Parcels, &c. ....	250
Total annual traffic .....	£11,867

It will be observed that the estimated traffic, which is based on the circumstances as at present existing, and local rates for merchandise, falls short of the sum required to pay the annual interest on capital and working expenses (which latter only provide for a tri-weekly service) but it is reasonable to assume that the construction of the line would lead to a development of the country, and consequent increase of business.

Coonamble and the surrounding district is entitled to railway facilities, and as the previously-proposed connection from Warren has been rejected by the Public Works Committee, we think the route at present under review is worthy of consideration.

The location of the line, if constructed, should be as near as possible to the west bank of the Castlereagh River. The east bank would be preferable, but the cost of construction would be considerably greater.

CHARLES OLIVER,  
Chief Commissioner.

W. M. FEHON,  
Commissioner.

DAVID KIRKCALDIE,  
Commissioner.

Finally, Mr. Secretary Young, on the 22nd December, 1898, moved in the Legislative Assembly that this proposal be referred to the Public Works Committee.

I put in the report I made for the Minister on the 8th December, 1898, which is referred to in Mr. Hickson's statement. It is as follows:—

Department of Public Works, Railway Construction Branch, Engineer-in-Chief's Office,  
Sydney, 8 December, 1898.

MINUTE Paper:—Subject—Dubbo to Coonamble Railway.

I HAVE the honor to report that I went over the route of the above line last week with the Railway Commissioners, Messrs. Fehon and Kirkcaldie, and the Chief Traffic Manager, Mr. John Harper.

Without expressing any opinion as to whether preference is to be given to the Warren to Coonamble or the Dubbo to Coonamble route, I beg to state that the latter is a very satisfactory route. Whilst traversing it we met large quantities of wool coming down from the Coonamble district and beyond. The preference to this route during the present season, however, seems to be due to the fact that grass is more abundant than along the other. The rainfall between Dubbo and Gilgandra, and along the Castlereagh River seems to be somewhat in excess of that on the Warren-Coonamble route, as it is added to by thunderstorms generated in the hilly country immediately to the east.

This superiority of climate has during the present season enabled some very good crops of wheat to be produced, and it was reported to the Railway Commissioners that on the eastern side of the river especially the land is very suitable for cereals.

As it is desirable to keep the railway in the best possible position for receiving produce, I am of opinion that the line, instead of being moved to the westward, as recommended by the Public Works Committee, should, if possible, be kept nearer to the Castlereagh, between Gilgandra and Gulargambone, so as to make the carriage as short as possible from the districts on the east side of the river. At the same time such a position would equally suit the west side.

The line as laid out seems to be the cheapest possible. To shift it about 3 miles nearer to Gilgandra would add slightly to its length—perhaps about 1½ mile—but would probably not add materially to its cost per mile. Mr. Stuart has examined this district very thoroughly, and reports that the line as laid out of Dubbo passes through only about 15 miles of poor country, and that this poverty is only partial.

A line starting from Dubbo and following a course further to the west would involve greater constructive difficulties, and the extent of ridgy country would not be much reduced.

H. DEANE.

The Under Secretary.

Submitted.—R.H., Under Secretary for Public Works and Commissioner for Roads, 13/12/98. Seen. May be kept available for my use when submitting railway proposal.—J.H.Y., 14/12/98.

I hand in a compilation of parish maps, a plan of the line on a scale of 10 chains to an inch (that is in two parts), and a longitudinal section to a scale of 2 chains horizontal, and of 100 feet vertical. I also hand in the Book of Reference. I also hand in the following estimates:—

DUBBO TO COONAMBLE.—Part No. 1.—Dubbo to Gilgandra.

ESTIMATED cost of a single line of railway 40 miles in length, with 60-lb. rails. Ruling grade, 1 in 100; sharpest curve, 20 chains radius.

Description.	Estimated cost.	Average per mile.
Earthworks .....	£ 12,338 2 6	£ 308
Box drains and timber bridges .....	7,298 19 3	182
Bridge over Talbragar River .....	3,800 0 0	95

	<b>Total</b> .....	93 45	207,285 0 0	2,215 9 6

2. *Mr. Trickett.*] According to the Departmental statement, it would appear that the proposed line will be run at an annual loss of £1,570? Yes.

3. Before going into details, do you care to amplify the opinion as to which is the more desirable line to construct—the one under consideration, or the Warren to Coonamble line which we recently considered? I can point to the differences in class of country, and make a comparison of the estimates.

4. But on general grounds, would you venture an opinion? I would rather leave the matter of traffic to the traffic officers.

5. Will you distinguish between the two as regards the character of the country passed through, and the comparative difficulties of construction or otherwise? The special advantage of the proposed line from an agricultural point of view is that it taps a larger agricultural district. Crops are grown alongside the Castlereagh on the western side, but the country on the eastern side is particularly suitable for agriculture. The further you go west, the more you get into the river and creek flats and black soil, and, of course, at the same time, you get into a drier climate. It has been particularly observable this year that the climate, in consequence of the proximity of the ranges, was superior to that of the country further out, a great many thunderstorms having occurred, which enabled the people in some cases to produce almost record crops.

6. That would apply from Gilgandra out to Coonamble, but the same conditions would hardly seem to apply between Dubbo and Gilgandra? From Dubbo, for some distance towards Gilgandra, the line passes through a rather ridgy and sandy piece of country, but there is not much of it. I was informed—in fact, one could observe it to a small extent, though not very thoroughly, as I had not time to go to the right and left of the line—that those ridges are very patchy. The sandy ridge is comparatively narrow in extent, and the good country comes up in tongues into it. From Gilgandra onwards it is noticeable that the line as proposed will have no watercourses of any consequence to cross. The divide between the Castlereagh and the Macquarie is right along the left bank of the Castlereagh. You will see that the Marthaguy Creek and others take their rise close to the Castlereagh—in fact, the left bank of the Castlereagh is higher than any of the country, and not being intersected by watercourses, the whole of the water draining over the area to the left runs away into the Macquarie. After you get to Gilgandra, there are no watercourses of any consequence to cross. Before we get to Gilgandra, we get upon the upper waters of the Marthaguy; but they are small, and there is no great expense. The most important creek crossed is a little out of Dubbo—the Talbragar.

7. How is the difference in the average cost per mile between Dubbo and Gilgandra, and between Gilgandra and Coonamble, accounted for? The country is more uneven as you leave Dubbo, and there is more to be spent in the way of culverts and bridges. The estimates will show that the earthworks on the first section have been estimated at £308 per mile, and the earthworks on the section beyond it at exactly one-half—that is £154. Box drains, timber bridges, and the bridge over the Talbragar River come to £277 per mile in the case of the first part, and only £67 per mile in the case of the second part.

8. Would you characterise the line from Dubbo to Gilgandra as a light line of railway? Decidedly.

9. What height will the earthworks be? My practice is to keep them as low as possible—from 6 inches and a foot over level ground, excepting where you cross creeks and flooded country. 10.

- H. Deane.  
9 Mar., 1899.
10. Would that be high enough for that class of country? Yes; the lower you keep them the better they are to maintain.
11. Would the earthworks on the northern end of the line be of the same height? About the same. Of course, in the first part, the country being more uneven, there will be small cuttings and banks to make.
12. What is the experience up to the present time of these light lines of railway? Very good so far. On the Narrabri to Moree line a good deal of ballasting has been done, but the traffic there has grown to an enormous extent—beyond what was anticipated. The Parkes to Condobolin, Nevertire to Warren, and Jerilderie to Finley lines remain practically in the condition in which they were built.
13. Are they still stable and sound? Yes.
14. Have they had any severe tests in the way of waterwashes? Of course, we have had no really wet periods, but there have been some heavy rainfalls.
15. And what rainfall we have had has not done any damage? No. In one or two places on the Parkes to Condobolin line there is a pipeclay formation, which has had to be strengthened a little with ashes and so on, but nothing more than that.
16. Do I understand, with regard to the line from Narrabri to Moree, that if the traffic had remained as it was when the line was first opened it would have been of sufficiently permanent construction? Yes.
17. Has there been an increase of speed on that line? I am not sure about increased speed, but there has been a very large increase in the traffic.
18. Has that necessitated the permanent-way being made more substantial? It has necessitated ballast being put on. On that line the waterways have been added to. There were some washaways about eighteen months ago. Those constructed have been made good, and some additional waterways, but the whole of the expenditure on the line is still considerably less than my estimate.
19. Do you think the initial cost of our light lines is likely to be increased other than by increased heavy traffic? No.
20. Do they answer all the purposes of a light line of railway for comparatively light traffic? Yes.
21. Does not this country somewhat resemble that between Narrabri and Moree, so far as its slanting character is concerned;—is there not likely to be a large run of water across the line? No; very little water runs across the line. The only watercourse of importance is the Talbragar River, and further on, when you get halfway along the line near Gilgandra, you come to the divide between the waters of the Castlereagh and the Macquarie. The left bank of the Castlereagh River is the divide between the waters of the two catchments.
22. It is not likely to be a line which will be largely influenced by a big body of water attacking it? No. On the Narrabri to Moree line we cross all the watercourses at right angles. There is no possibility of heading them, and where we cross them, they are already important streams.
23. Are those the places which you have chiefly had to improve? Yes. I think it is almost safe to say that there would not be any stoppage of traffic at all when the washaways occurred, excepting in one place, because the bad damage was done at the ends of bridges where sheeting had been omitted. The water came in a direction totally opposite to that from which it was expected to come. It frequently does that in a flat country.
24. I believe that some of the squatters, in constructing their dams, actually got the fall the wrong way? Yes; where the country is very flat, it is impossible always to tell in which way the water will come.
25. At what rate of speed do you propose to run on the line? I put down a limit of 20 miles.
26. Was that the maximum on the Narrabri to Moree line? Yes; that has been the maximum from the commencement of this system.
27. *Mr. Watson.*] I thought it was 15 miles? It was raised afterwards.
28. *Mr. Trickett.*] Will the proposed line carry an ordinary engine and rolling-stock? So long as the load on the axle does not exceed 12 or 13 tons. I should not like to see the heaviest engines go over it.
29. Being a branch railway, that, I suppose, is not a disadvantage, seeing that you can adapt the engines to the traffic? Yes; and of course there are no steep grades, such as 1 in 50.
30. What is the ruling grade? I have made it 1 in 100.
31. That is pretty near level, is it not? It is a very good grade.
32. Is it proposed to fence the line? No.
33. Is it proposed to run trains by night? No; that is not desirable on an unfenced line.
34. Will the line be formed by the natural soil, or will you use ballast? I should not use ballast, excepting where it was absolutely required. I have allowed for about one-quarter of the length being ballasted. The station yards will be ballasted, and any soft places along the line; otherwise ballast will be dispensed with. We should use what is called earth ballast, which is rather an incorrect term. It really consists of selected earth, which is placed between the sleepers and rounded over, so as to throw the water off.
35. *Mr. Watson.*] Is it puddled at all? No.
36. *Mr. Trickett.*] Is this a black or red-soil country? There is very little black soil there—only a few patches.
37. Does not the soil upon which you place the sleepers solidify and cake? Yes, so as to form a sort of crust which throws off the water.
38. What distance do you put the sleepers from each other on a line of this character? About 2-foot 2-inch centres—that is from centre to centre of the sleeper. That makes them 17 inches apart.
39. Are they much closer than on a ballasted line? That is the distance I have been adopting all along, with the exception of the Nevertire to Warren line, where they are closer.
40. But that is particularly swampy country? Yes, in flood times a great deal of water lies about, and I thought it better to have more sleepers. The rails I am using are 30 feet long, and I put fourteen sleepers to that 30 feet length. On the Nevertire to Warren line there are sixteen sleepers for the same length.
41. What will be the weight of the rails? 60 lb. of steel.
42. What is the weight on the main line? 71½ lb. The rail to be used is a very satisfactory one, especially with the closer sleepers.
43. Will they be sufficiently strong to carry all the traffic likely to be developed for some time to come? Yes; I should not like to see the P or T or J class of engines go over the line, but it will be quite safe to use engines weighing 12 or 13 tons to the axle.
44. Is that the weight of the engines on the Narrabri to Moree line? Yes.

H. Deane.  
9 Mar., 1899.

45. Do you find any damage done to the light lines of railway by drays or anything else going across them? I have not observed much of that, but what is noticeable is that in sheep country the sheep tread it down a bit. In crossing the line they carry with them a certain amount of the surface. Of course, when the banks are soft, and cattle get upon them, they make a mess, but on the whole there is practically no damage done.

46. Not sufficient to affect the stability of the line? No.

47. What is your experience with regard to the maintenance of a line of this character? It is the lightest to maintain of any. The cost of maintenance on these light lines has come to about £30 per mile, which is a good deal less than the cost on any other class of line.

48. I notice in the statement you have handed in that the total cost of maintaining the permanent-way, and for traffic and locomotive expenses, is £7,219;—as this line will be 93 miles long, £2,790 a year will be the cost of maintaining it? I suppose so. I had nothing to do with the estimates. I only go upon the information given to me by the Permanent-way Branch. It has been the practice to divide these new lines into lengths of 10 or 12 miles, and to put three men upon each length. It runs to about one man to every 4 miles, or a little less.

49. I suppose you have watched the item of maintenance in connection with these new lines;—can you tell us how it compares with the maintenance of ballasted lines? In order to make a comparison you have to take everything into consideration—traffic and everything else; but I think it must be apparent to anyone who considers the question that it would be impossible to lower the maintenance on any line below that figure.

50. In view of your past experience, are you prepared to recommend a single line of railway for this class of country? Yes; I think it is a very suitable type of construction in the western country.

51. Is this a cheap time for constructing railways? Yes. Sleepers, however, are going up in price. The ironbark is getting very much reduced in quantity.

52. *Mr. Watson.*] That is within access of railway lines? Yes. Of course there is still a good deal of ironbark on the coast; but there are no extensive forests in the interior which have not been, to some extent, already tapped.

53. *Mr. Trickett.*] In the estimate of the Warren to Coonamble line, you put down the sleepers at 3s. each, and in the estimate of the line under consideration at 2s. 6d. each? Yes. In this case we go nearer to the ironbark forest. All the sleepers we used on the Nevertire to Warren line came from Dubbo.

54. If they had gone by way of Warren the carriage would have made up the difference? Yes.

55. Do you use rough sleepers? Yes, round-top sleepers.

56. Have they been found to answer? Yes; very well.

57. Do you leave the timber on the top side undressed? A little is taken off. I specify that the sleepers must not be more than a certain thickness. If they are thicker than that the men adze them off. The sleeper-getters also like to do that on their own account if they have long cartage, because it lightens them.

58. Looking at the map it is easily seen that, as a direct line of railway from Sydney to Coonamble, the Dubbo to Coonamble route apparently compares favourably with the route from Warren to Coonamble? Yes.

59. Have you the difference in mileage handy? Yes; the distance from Sydney to Coonamble *via* Warren is 417 miles, as against 371 miles *via* Dubbo—a difference of 46 miles.

60. Is the country between Warren and Coonamble of the same class for the construction of a railway? No; it is a good deal wetter, because you cross a good many creeks and watercourses.

61. I notice that in giving evidence before a former Committee you put down the average cost per mile of the Warren to Coonamble line at £2,365, as against £2,215 per mile for a line *via* Dubbo? Yes.

62. But the difference in the total cost of construction of the two lines is largely in favour of Warren *via* Coonamble? Yes. That is on account of the distance.

63. Will you explain to the Committee the advantages of taking the line *via* Dubbo? The advantage from an engineering point of view, is that the country is drier. You do not have as many watercourses to cross as you have on the Warren to Coonamble route.

64. The country is drier, but the rainfall would appear to be greater? Yes; when I say drier, I mean, of course, that the country is more easily drained.

65. Could you give any opinion as to the agricultural probabilities of the two localities? Judging from my own observation, the Dubbo to Coonamble country is the better for agriculture.

66. I suppose that if the land between Dubbo and Coonamble is all alienated, and that between Warren and Coonamble is not alienated, it would make a difference in connection with the cost of the resumption of the land? Yes. On the Warren to Coonamble route we go very considerably along travelling-stock reserves and roads. That advantage we cannot take on the Dubbo to Coonamble route. On the other hand, I think it must be acknowledged, that the land being very much improved by the railway, not more than a nominal amount of compensation should be paid for resumption.

67. In the light of that experience—although in December, 1897, the route from Warren to Coonamble was apparently advocated by the Department and the Commissioners—do you think it would be advisable to construct a line from Dubbo to Coonamble? I will ask the Committee to excuse me answering questions of that nature. All I should be justified in saying is contained in the Railway Commissioners' report.

68. Do you think you have kept the estimate of cost as low as possible? Yes.

69. You have not any unnecessary station buildings? No. The station works are very low.

70. You have put down an item for station works, including junctions and sidings;—what does that mean? It means earthworks, metalling, and rails. The other item only includes the buildings.

71. What is the supply of water between Dubbo and Gilgandra? A dam or an excavated tank must be made.

72. I suppose there is ample water between Gilgandra and Coonamble? There is the river which, I think, will be sufficient to draw upon. Of course, the river water has recently given out at Coonamble. I believe that is a very rare occurrence. The river has a bed of sand, and the water often disappears below the surface of it, but by sinking you can invariably find it again.

73. *Mr. Levien.*] What is the character of the country between Warren and Coonamble? Very good for the most part. It is flat, and largely of black soil.

74. Do you think it is better adapted for agriculture than the country between Dubbo and Coonamble? The latter is better, excepting where the country gets a little ridgy, when it would not be so suitable. Of course, black soil is not suitable for cereals.

75. Are there many reserves along the proposed line? I think not.\*

76.

\* NOTE (on revision):—I find the Railway reserve along the route is practically untouched.

H. Deane.  
9 Mar., 1899.

76. Is the land nearly all alienated? I do not think there are more than the usual reserves.
77. Are there any travelling-stock reserves? There are on the eastern side of the river. On the western side there are only 3 and 5-chain roads, but they run in the wrong direction for railway purposes.
78. What kind of country is there between Mudgee and Coonamble? It is nearly all good country.
79. Which of the three routes to Sydney—*via* Warren, Dubbo, or Mudgee—contains the best agricultural land? On account of the length of the line between Mudgee and Coonamble there would be a great deal more there. Between Mudgee and Mungahara there is a great deal of land which is suitable for agriculture; and further on, after crossing the Castlereagh, towards the Warrumbungle Range there is very good country.
80. Is there more Government land, in the shape of reserves on that short area than on the other two areas? I think a good many of the reserves have been cut up and alienated.
81. Is the country from Mudgee to Coonamble flat? No, it is more uneven. Between Mudgee and Gulgong the construction is costly as the country is not very even; between Gulgong and Cobbarah you have to pass over a range; and between Cobbarah and Mungahara, you have also to pass over a range. From Mungahara going north-west you have another rise—the country is hilly.
82. What kind of timber country is it? There is ironbark between Cobbarah and Mungahara, and also from Mungahara to about one-third of the distance to Coonamble. You pass through narrow belts of ironbark on the proposed line.
83. Would there be any heavy cuttings and creeks between Mudgee and Coonamble? Yes; it would be more costly construction. Between Mudgee and Gulgong the earthworks are estimated to cost £1,528 per mile; between Gulgong and Cobbarah, £947 per mile; and between Cobbarah and Mungahara, £1,703 per mile. Between Mungahara and Coonamble the cost is very much less, because one-half or two-thirds of the route is pretty flat. The average there is £428 per mile.
84. When was that estimate made? Two and a half years ago.
85. What is the distance from Mudgee to Coonamble? 147 miles—that is, about 54 miles more than from Dubbo to Coonamble. If that country were only just being settled, and the proceeds of the land sales could be devoted to railway purposes, it would be worthy of consideration.
86. You would not care to say which of the three routes—Warren to Coonamble, Mudgee to Coonamble, or Dubbo to Coonamble, you yourself would recommend? I have already asked the Committee to excuse me answering questions of that kind, but I am satisfied that the Dubbo to Coonamble route is a good one. As regards the Mudgee to Coonamble route, it will be observed that it is very expensive. It would cost more than twice what the Dubbo to Coonamble line would cost.
87. I suppose, as a matter of fact, that from Dubbo to Coonamble the population is greater than from Warren to Coonamble? There is no doubt there is more population between Dubbo and Coonamble. Between Warren and Coonamble the land is held in larger holdings.
88. I suppose the country along the proposed route of railway is somewhat similar to what is to be found between Narrabri and Moree? No; I could not class it as the same. Between Narrabri and Moree it is nearly all black soil, and this is higher, drier, and sandier.
89. Is it chocolate country? Some of it.
90. What kind of cereals do you think that country is adapted for? Wheat grows very well.
91. *Dr. Garran.*] From Gilgandra to Coonamble, the proposed line follows the river? Yes.
92. Have you taken care to keep the line above all flood level? Yes.
93. Will it run on the dividing ridge you speak of? Yes.
94. So that, however great the rainfall, the line will not be flooded? No.
95. Looking at the matter from a construction point of view, it would cost the country now a great deal more to get to Coonamble from Mudgee than from Dubbo? Yes.
96. Therefore, the reasons for the Mudgee route ought to be very strong to induce you to choose it? Yes.
97. Is there at present more settlement along the route from Dubbo to Coonamble, than there is along the route from Warren to Coonamble? I think there is, for the reason that the country between Warren and Coonamble is in larger holdings.
98. I suppose the selections are a pretty good guide as to the quality of the land? Yes.
99. Where you see the land taken up largely, you presume that it is good? Yes.
100. Is there room for great expansion in agriculture between Dubbo and Coonamble? Yes; I think there is very little doubt about it.
101. Is the Castlereagh River one capable of being dammed, so as to store the water for the use of settlers, by means of irrigation? I should think not. The banks are high, and the water would have to be pumped. The bed of the river is of sand. You would have to go down a considerable depth to get to an impervious bed below.
102. Then, we cannot look for a dense settlement? I should think it is very unlikely that the river can ever be used to a large extent. It is doubtful whether it would pay to irrigate land for crops there.
103. You have now had some years of experience with regard to our light lines of railway? Yes.
104. Have you found that you can construct the line satisfactorily at the prices you have formed in your estimate? Yes, very fairly.
105. If your estimates had been wrong on any point, where have they been wrong? Perhaps I might be allowed to make a statement. The Narrabri to Moree line was constructed under the estimate, and in spite of all additions that have been made, it is still under the estimate. The Parkes to Condobolin line is still under the estimate. The Jerilderie to Berrigan line is slightly under the estimate. We got an extra 10 per cent. for that line, but it was not drawn upon. The estimate of the Berrigan-Finley line has been considerably exceeded by extra works. The Railway Commissioners found that the Berrigan station was totally inadequate as a terminal station; and, in order not to make the same mistake at Finley, the works were considerably increased. Consequently, the bit from Berrigan to Finley will have largely exceeded the estimate, but, taking the line altogether as one line from Jerilderie to Finley, it will come out all right.
106. The excess of expenditure on the Berrigan to Finley line is at the terminus? Yes. It means that the station works, the water supply, the turn-table, and engine-shed, which, if Berrigan had been the terminus, must have been placed there, have been placed at Finley.
107. You did not make the terminal expenditure at Berrigan? No; it was always held over.
108. Have any of these cheap railways been subjected to the test of a very heavy rainfall? We have, I think, had sufficient rainfall to test them. We have mostly had dry weather, but there have been heavy storms of rain.

H. Deane.  
9 Mar., 1899.

109. Do you think they have been subjected to a full test? I should not like to say that. I have been hoping for the last two or three years that we might get a wet period, because I am very anxious to see where the weak points are. I do not pretend that there are not weak points. The lines must have them, but it has always been considered that if there are weak points they can easily be strengthened.
110. To that extent our experiment is not yet a complete one? No, I do not think it is.
111. I suppose it is an advantage to have three or four dry seasons during which light lines may settle before the rain comes on? Yes, there is some advantage in it. The banks consolidate.
112. A new line which had not become consolidated would be more severely tried by rain? Yes, I think it would. On the other hand, I always have the banks well rolled, and get them consolidated in that way as much as possible.
113. Which class of soil do you think is the most tender? Looking at the matter from the point of view of softening from rainfall, I should say that the black soil is really the most tender; but for scouring away and loss by the erosion of water running alongside it, and so on, some of the red sandy soil would be the most liable to damage.
114. I suppose that the line will, from Dubbo to Gilgandra, be on sound land? Yes.
115. Will it be on a sandy bed from Gilgandra to Coonamble? It is a sort of red sandy loam along the banks of the river.
116. Is it good soil for the purpose of the construction of a railway line? Yes.
117. I suppose that the line, as you would construct it, would be equal to all anticipated traffic? Yes.
118. If we get unexpected traffic, as we have done on the Narrabri-Moree line, it will pay to improve it? Yes; there will be no additional cost. It is important to note that when you want to improve these lines there is no cost in improving them over and above what they would have cost at first to put in the same amount of work.
119. Has the additional cost of the Moree line been charged to the first cost of the line, or has it been paid out of working expenses? A good deal of it has been put to the loan fund as new work and improvements.
120. What has it brought the cost of the line up to now? The cost of the line is, I think, about £145,000. The original estimate was £153,000.
121. If the traffic which has come upon the Narrabri to Moree line could have been foreseen, you would have made a saving by constructing a line on the more solid basis in the first instance? I do not think so. I should simply have put more ballast on. Possibly it would have cost more, because that line was laid by contract, and contractors always have a higher price for ballasting than the price for which it could be done afterwards by the Commissioners' trains.
122. Then it is not a bad speculation to make a line thoroughly economical in the first instance, and to improve it afterwards if the traffic warrants it? No.
123. We do not lose money by an economical construction in the first instance? No.
124. The line you propose to construct will carry the traffic and will be fairly durable? Yes.
125. It will not cost any special amount for maintenance? No; the smallest on record.
126. That is more satisfactory than you originally anticipated, is it not? Yes; I was afraid that, in connection with the Narrabri to Moree line, the maintenance might be high. Experience has proved that it is low.
127. Is it not a fact that engineers originally used to deprecate cheap lines because of the cost of maintenance? Yes.
128. I gather that you do not find that to be the case? Not in the dry western country.
129. I suppose it would be difficult on the coast? I should not like to adopt this class of line on the coast. I would not mind the low earthworks. I should prefer to have them, if I could get them; but I would not like to do without ballast.
130. For any part of the country, where there is less than 20 inches of rain per annum, you prefer these cheap lines? Yes; it would be a fair thing to say that.
131. So far as your testimony as an engineer of some experience goes, you evidently recommend the country to continue the construction of these cheap lines in the west? Yes.
132. I suppose you have no hesitation in advising that? Not the slightest.
133. *Mr. Watson.*] I gather from the statements you have made that the greater part of the land through which the line will pass is alienated? Yes.
134. Are you prepared to give any evidence on that point? I have a Book of Reference, by means of which the statement of Mr. Hickson can be verified. If the Committee wish it, I can do as has been done in connection with other lines, and give the length of line passing through alienated and Crown lands respectively.
135. I notice that the parish maps you produce show something in the nature of a railway reserve running, approximately, between Dubbo and Coonamble—not on this particular route, but near the route;—do you know whether that reservation was made sufficiently early to prevent the alienation of the land within its boundary? No; already some of the land had been alienated.
136. Does the railway reserve referred to contain any appreciable area of Crown land, as compared with the Crown lands on the route you have selected? I do not suppose there have been any Crown lands sold there since it has been proclaimed, unless the Public Works Department has been specially asked to consent to the sale. There are blocks here and there, which were alienated before the reserve was made, and they run right across it. I may state that I would not recommend that reserve as a route for the line. Although upon the map it looks to be more direct, and seems to offer some temptation to get along a portion of the line without actually paying for land, yet, in my opinion, the location of the line would not be as good. It would be more costly, because it would be away from the watershed a little further down, and would cross more of the small waterways at the heads of the creeks. We should lose in that way as much as we should gain in the cost of the land. That matter has really been considered; otherwise there would be no reason for departing from that old route.
137. After you get about 341 miles from Sydney, you reach the railway reserve, and follow it pretty well into Coonamble? Yes.
138. Prior to that, what is the average distance of the proposed line to the east of the railway reserve? About  $1\frac{3}{4}$  miles.
139. I notice that the Railway Commissioners, in their report, put down the interest on capital expenditure at 3 per cent.? I should not like to offer an opinion about that. Mr. McLachlan is the spokesman for the Railway Commissioners, and no doubt he would give good reasons for the interest being put down at 3 per cent.

- H. Deane.  
9 Mar., 1899.
140. In the estimate of capital cost, no allowance is made for the resumption of land? No.
141. Have you any data upon which to found an opinion as to what that will amount to? No.
142. Allowing 3 per cent. as the interest on the capital cost of the line, the annual cost will be £13,437; as against that the Commissioners put down £8,526 for merchandise and live stock, £1,975 for passenger traffic, and £250 for parcels; the total annual traffic, without mails, will amount to about £10,700; with the mails it will amount to £11,867—still leaving a deficit; if the cost of resumption is going to be heavy, it will leave a higher deficit? It ought not to be heavy. I should think a great deal of the alienated land would be obtained free of cost.
143. Where it could not be obtained free, do you think an exchange could be effected of some of the Crown lands adjoining? I believe that in many instances it could. It has been done elsewhere, so that there is experience with which to back up one's opinion.
144. The map shows a blank for the first 20 miles out of Dubbo? That is ironbark ridge country. The greater portion of that is Crown lands, but it is of very little use. It would require no resumption.
145. Do you know how far to the Dubbo side of Coonamble the artesian basin extends? I cannot tell you. Probably it would not extend beyond the flat country.
146. Allowing that Dubbo is comparatively near the source of supply for sleepers, does not 2s. 6d. seem to be a rather low rate at which to average their cost right through to Coonamble. They have to be carted to Dubbo first, and eventually they have to be taken from there to Coonamble? For the sleepers for the Nevertire to Warren line I paid about 2s. 1d. each.
147. Do you think they are equally, or nearly, as cheap about Dubbo? Those to which I have referred came from Dubbo. Then I have to add the freight from Dubbo to Warren. Here, however, there will be no freight.
148. Do you think they are just as cheap now as they were then? You might have to pay 1d. or 2d. more, but I think 2s. 6d. is a fair estimate. We shall be closer in to the ironbark than we have been on any line hitherto.
149. Is it not a fact that the rise in the price of sleepers is due not to the forests being cut out, but to their being cut out near the proposed railway line? I think that means exhaustion of supply. For instance, there is a belt of ironbark running across from near Dubbo right up north towards Narrabri, and then further on you find patches of it near Warialda. Supposing the distance from Dubbo to the north-western line is 120 miles, when that is untouched you have 120 miles fair, but when you cut away 20 miles at each end you only have 80 miles or two-thirds left. Of course, the question of the supply of timber for sleepers is a serious one.
150. I believe that along the proposed line there is some ironbark 15 or 20 miles out of Dubbo? Yes. The best of it has been cut out, but lying off the line there is some good ironbark.
151. At any rate, some portion of the line will be nearer the supply of ironbark than is the town of Dubbo? Yes. There is no ironbark at Dubbo itself. The ironbark forests never reached the town.
152. *Mr. Shepherd.*] Are facilities afforded on any of these light lines for the supply of water? Yes. I try and obtain a water supply every 20 or 30 miles.
153. There will be no necessity for erecting dams? I think it is likely between Dubbo and Gilgandra the best means of getting the water we require will be by making a dam on one of the creeks.
154. What is your opinion of a line from Dubbo to Werris Creek? A survey has been made across there. A very good line is to be obtained.
155. Is not the country there of a superior character? I believe there is a great deal of very good country.
156. Is there any cultivation on any of the suggested routes? I saw some cultivation near Gilgandra—chiefly wheat.
157. What stock is run in those districts? Mostly sheep.
158. *Chairman.*] In the statement you have presented to the Committee, you say that Mr. Lyne, when waited upon, stated his advocacy of this route, but that he thought that before it was constructed there should be a connection between Dubbo and Werris Creek;—would you advocate that that should be carried out? My own opinion would be that both lines would stand on their own merits.
159. Would there be any Departmental reason for constructing a line from Werris Creek to Dubbo before constructing the one under consideration? I do not think so. I know of none.
160. Do you know why it was suggested? I fancy the reason Mr. Lyne expressed himself in that way was because he thought the country between Dubbo and Werris Creek wanted a railway more than the country between Dubbo and Coonamble.
161. Would it have any connection with the movement of the stock? Yes. Of course it would connect the western district with New England.
162. From that I should judge that a line from Dubbo to Werris Creek would be greatly used to facilitate the movement of stock? No doubt it would.
163. Mr. Young stated, in reply to a deputation, that he would endeavour to ascertain which was the best way of connecting Coonamble with the railway system; in going over the various routes, do you recommend the one under consideration as the best; I judge from what Mr. Young said that he would obtain the advice of the Departmental officer, and whatever his decision was, he would refer it for the consideration of the Public Works Committee? The question of deciding is very much involved in the question of the probable traffic. It is scarcely an engineering question, unless you have to compare the cost of the two lines—the Mudgee to Coonamble and the Dubbo to Coonamble lines.
164. Will the gradients and curves be easier on the line under consideration than on any other you know of? The gradients would be about the same as on the Warren to Coonamble line, but they would be lighter than on the Mudgee to Coonamble line.
165. Have you been along both routes? Yes.
166. How does the country between Dubbo and Coonamble compare with that between Mudgee and Coonamble? I should say that the country is very good in both cases, with the exception of some few patches. I should like to add to my evidence with regard to grades that the Mudgee to Coonamble line has been laid out with grades of 1 in 80, so that it is not far below the proposed line so far as grades are concerned.
167. You went over the route with the Railway Commissioners—Messrs. Fehon and Kirkcaldie—and reported to the Minister as follows:—"Without expressing any opinion as to whether preference is to be given to the Warren-Coonamble over the Dubbo-Coonamble route, the last is very satisfactory";—  
that

- that is rather a vague way of recommending anything? I think that is a misquotation. What I wrote was, "I beg to state that the latter is a very satisfactory route." H. Deane.
168. You did not express any opinion as to whether it was preferable? No. What I meant to say was that if you had to get from Dubbo to Coonamble, the route chosen was a satisfactory route. 9 Mar., 1899.
169. Would you care to say whether, from an engineering standpoint, the proposed route is preferable to the other? From an engineering standpoint I could undertake to make a satisfactory line in all three directions. The matter is simply one of cost. Of course, the Warren to Coonamble line would be the cheapest. The country is wetter than along the proposed route, but a good line could be made. Perhaps in some places the proposed route may be said to be more satisfactory than the Warren to Coonamble route, because it would be less liable to damage by heavy rains. It is almost impossible to foresee what the extent of floods may be. Consequently, the Warren to Coonamble line might be laid out ever so carefully, and floods might come and do a little damage. There would be less chance of that on the proposed line than on the Warren to Coonamble line.
170. The last Public Works Committee expressed the opinion that it would be better to move the line westward, and you, I believe, after careful investigation, came to the other conclusion? Yes. My reason for coming to that conclusion, after talking the matter over with the Railway Commissioners and Mr. Harper was that as regards serving the country, it was better to get near to the agricultural country than to the wool country. The further west you go the more essentially is the country wool-producing, and you get away from the part which is more suitable for agriculture. Agricultural produce stands less carriage than does wool. Again, as I have already pointed out, the nearer you keep to the bank of the river, within certain limits, the higher and drier the line becomes.
171. Then, after carefully investigating the matter from all points, you have come to the conclusion that you had better keep to the eastward than to the westward? Yes.
172. Is there a fair proportion of land along the proposed line suitable for agriculture? Yes; and there is a considerable quantity on the other side of the river, which may be said to be really along this line. It is served by this line. The river is passable in a great many places.
173. If the proposed line is constructed, do you think there will be a fair traffic from farm produce? Eventually.
174. In connection with the details of cost, I find that for a line from Warren to Coonamble, you allow for earthworks, £197 per mile. Between Dubbo and Gilgandra you allow £308 per mile? That is because the country is rougher along the first part; it is more ridgy.
175. Would that also account for the difference in the estimate for box-drains and bridges? Yes.
176. In connection with level crossings, cattle-stops, and fencing, I notice a difference again;—your estimate is £105 per mile in connection with the proposal before the Committee, and £40 per mile in connection with the Warren to Coonamble proposal? The reason of that is that on the Warren to Coonamble route we go largely along the road and by the sides of travelling-stock reserves. There are very few fence crossings.
177. You do not propose to fence the line? No.
178. What will be the cost per mile of fencing? About £80—£40 on each side.
179. What sort of fencing would it be? A six-wire fence. Perhaps it could be made a little cheaper than given. A railway fence is necessarily not quite so cheap as a squatter's fence, even if it is not more substantial. Generally, we make them more substantial than do the squatters. If you have a fence, you should have a good one. It is a more important thing to keep cattle from straying on to a line where there may be a risk to life by a train running over them than it is to keep cattle or stock from getting from one paddock to another. Again, the squatter, as a rule, runs his fences in straight lines sometimes for miles. A railway line, however, is crooked, and that, of course, makes a considerable difference in the labour of erection. The price I mention is an average.
180. What lines have you experience of in connection with construction without fencing? The Narrabri to Moree line, the Parkes to Condobolin line, the Jerilderie to Finley line, and the Nevertine to Warren line.
181. And on those lines the Commissioners abstain from running traffic at night? Yes, practically.
182. Has there been any accidents to trains owing to any of those lines not being fenced? I do not think so.
183. Cattle and sheep at night naturally prefer an embankment? Yes; I do not think it would be safe to run traffic at night without the lines being fenced. The Commissioners are contemplating asking for fencing to be constructed along a portion of the Moree to Inverell line, which will be run over at night. There does not appear to be any danger in the daytime.

FRIDAY, 10 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

184. *Chairman.*] I believe you have given considerable study to the question of ballasting railways? Yes. H. Deane.
185. Will the ballast for the proposed line be easily obtainable? The ballast I should use for the most part would be what is called earth ballast. At the further end of the line, the only thing obtainable in the nature of ballast, would be the coarse sand from the Castlereagh River. Nearer to Dubbo, you can get hard sandstone in the ridges. 10 Mar., 1899.

H. Deane.  
10 Mar., 1899.

186. Have you tested the question whether ballasted lines in the long run would be the most economical? I have considered that matter. Under the conditions of the western country, and of light traffic, there is no deterioration in such a line as the one proposed. If it can be maintained for £30 a mile—that is to say, cheaper than the other lines—there can be no question that it is economical to adopt this type of construction, even looking at the question of the permanence of the line.

187. I believe that some time ago you visited America, and gave special attention to unballasted lines there? There is a great deal of railway in America which is unballasted. A great many lines are made without ballast, and are ballasted afterwards if the traffic becomes heavy. There are, however, a great many lines which remain unballasted to this day, and probably they never will be ballasted.

188. Was it intended to ballast those lines, when they were first constructed? I do not think so. It was only contemplated to ballast them if the traffic increased very largely.

189. I suppose unballasted lines require more sleepers? I have put in more sleepers, because I thought that the lines being unballasted, it was necessary or desirable; but I am strongly of opinion that even when lines are ballasted, an additional number of sleepers helps to keep the cost of maintenance down; in other words, the lines are more easily kept in repair if well supported by a large number of sleepers.

190. Would not the life of a sleeper embedded in an earthen embankment be much shorter than the life of a sleeper properly ballasted? Possibly, if you use an inferior class of timber, but I do not think that would apply to ironbark. The sleepers are kept well drained by the ends being kept free. It is true that in damp weather the damp earth is in contact with the sleepers, but where you have durable timber like ironbark, I do not think it would make any appreciable difference.

191. Is the country between Coonamble and Mudgee of a better class than that between Dubbo and Coonamble? All the country is pretty well taken up.

192. Would the country between Dubbo and Coonamble carry a bigger population than the country between Mudgee and Coonamble? I should think that the Mudgee to Coonamble country would carry a thicker population per mile, because there is, I believe, more land in proportion suitable for agriculture.

193. Had you any means of ascertaining, when you visited the district, the opinions of the Coonamble people with reference to the best route? I think they are satisfied to get any line. It is generally considered that Walgett might be the ultimate end of this line, but that question has not been definitely decided. There is, of course, the alternative of connecting Walgett with Narrabri. Last Session the Public Works Committee had under consideration a line from Narrabri to Pilliga. I may state that I have brought with me some information which was asked for yesterday. I have obtained a return showing the approximate aggregate lengths along the proposed line of Crown and alienated lands passed through. The length of Crown land is 28 miles 45 chains, and of alienated land 65 miles. No railway reserve appears to have been proclaimed along the amended route, but that along each side of the original trial survey apparently still contains a considerable area of Crown land. I also hand in the following table of distances:—

	Miles	Chains.
Dubbo to Coonamble .....	93	45
Narromine to Coonamble .....	93	...
Warren .....	63	33
Mudgee .....	147	.
Dubbo to Werris Creek .....	157	35
Sydney to Coonamble, via Dubbo .....	371	.
"    "    Narromine .....	394	.
"    "    Warren .....	416	66
"    "    Mudgee .....	337	..
"    Werris Creek, via Dubbo .....	439	20

I also have a return of the rainfall of the district. I was in communication with Mr. Russell this morning, and I have, with his concurrence, consulted the reports for 1897 of the mean annual rainfall. He has also kindly furnished me with the rainfalls for the year 1898, which have not yet been published:—

*Dubbo to Coonamble Railway.—Rainfall of District.*

	1898	Mean Annual
Dubbo .....	26.38	23.36
Narromine .....	23.11	20.53
Trangie .....	19.86	23.28
Nevertire .....	22.52	21.36
Warren .....	15.42	19.90
Coonamble .....	13.90	22.46
Gulargambone .....	19.71	30.68
Gilgandra .....	24.48	26.84
Mundooran .....	27.68	27.79
Coonabarabran .....	26.94	31.92

The general conclusion to be drawn is that the country lying from Dubbo north and east of the line has a much better rainfall than further out to the west. I have also obtained some information about resumptions on the Parkes to Condobolin line. I might say with regard to the Nevertire to Warren, Jerilderie to Berrigan, and Berrigan to Finley lines, that there was a condition in the Act that the land was to be given free or in exchange, but on the Parkes-Condobolin line there was no such condition. The betterment principle was applied to the land resumptions on that line, with the result that no compensation has been paid for land other than town allotments, in the cases dealt with. Two resumptions have still to be completed, and it is anticipated that no compensation will be awarded in either case. I may mention that compensation to the extent of £20 has been paid to the owner for the abolition of a dam in the vicinity of the line, which it was considered might be a source of danger to the permanent way.

194. *Mr. Dick.*] Between the northern and the north-western lines on the one side, the western line on the other side, and the Barwon River on the north, there is a large triangular country which is not provided, excepting indirectly, with railway communication with Sydney or Newcastle;—have you considered the question, from the point of view of policy, of this line competing with other rival lines which will split up that great triangle, and give the maximum amount of communication to the maximum amount of country—in other words, is the proposed line the best for splitting up that part of the country lying between the two lines now constructed? I think it is, taking it on the whole. The proposed line deals pretty well with the country between the Barwon, the Namoi, and the western line, west of Dubbo; and

and that country to the east of Dubbo which is more suitable for agriculture might very well be served by additional, shorter lines.

195. Cocks spur lines? Not that. The Mudgee line, for instance, might be continued to or past Gulgong—say, as far as the Talbragar River.

196. Would not that be a very expensive piece of line? Yes; but it is a portion which would very likely pay in the course of a very few years on account of the settlement.

197. If that is the case, and the Mudgee line is continued to Cobborah, and thence to Coonamble, do you not think that a larger area of country would be served than by a line from Dubbo to Coonamble? I think a line from Dubbo to Coonamble would be better. I think, however, it would be a little premature now to consider the construction of a line to Cobborah, but it will have to be considered at some future date, as well as a line from Dubbo or Wellington to Werris Creek, which would traverse a very good patch of country. If the line from Dubbo to Coonamble is made and the other lines mentioned are made, there will be no waste of railway construction.

198. Do you think a line from Muswellbrook to Cassilis, and thence on to Coonamble, is within the range of possibility? The country from Muswellbrook to Cassilis is very rough. A survey was made a good many years ago, and it was very difficult to get across there even with grades of 1 in 40.

199. Is the country more difficult than between Mudgee and Cobborah? Very much. On the surveyed line from Mudgee to Cobborah I obtained 1-in-80 grades.

200. What about a line from Singleton to Cassilis—do the same obstacles exist? I think so.

201. I suppose that if the proposed line were constructed it is more than likely that in the near future a further extension north would be made? It would be a very suitable way of getting to Walgett.

202. Would it be the most suitable? I think myself it looks rather like it. A survey is now being made from Narrabri past Wee Waa—one alternative going on the north of the river and another on the south, the latter crossing the river at Wee Waa and meeting the other, thence proceeding to a point about 10 miles from Walgett—at Euri Euri. That was recommended by the last Public Works Committee. Of course, if that were constructed it would obviate any necessity of continuing the proposed line beyond Coonamble.

203. If that survey proved that a practical line could be made, would it alter your view as to the necessity of the extension from Dubbo to Coonamble? No.

204. *Chairman.*] It would mean carriage for all time 50 miles further to Sydney? Yes.

205. Which is the nearest port for the Walgett trade? Newcastle.

206. What is the difference in distance between the Newcastle and Sydney ports? About 75 miles.\* The distance from Walgett to Sydney is 405 miles; from Walgett, *via* Pilliga, is 467 miles, but from Newcastle it is about 100 miles less—367 miles. There would be a difference of 40 miles there.

207. There seems to be a conflict of opinion with regard to the rival routes. A short time ago the Railway Commissioners were in favour of an extension from Warren to Coonamble. Mr. Jones was in favour of an extension from Mudgee to Coonamble. Now we have a proposed extension from Dubbo to Coonamble; can you offer an opinion as to the reasons which have prompted these gentlemen in arriving at their opinions? I am afraid I could scarcely do their opinions justice. No doubt the Railway Commissioners will explain why, in the first instance, the line from Warren to Coonamble was recommended, and subsequently the line from Dubbo to Coonamble. I think they have very good reasons to recommend now the line from Dubbo to Coonamble.

208. Mr. Jones seems to be definite in his opinion that the line should go from Mudgee to Coonamble;—is it the expense which stands in the way of that line? No doubt it will have a great deal to do with it.

209. Is it characteristic of the country that as you go east of the proposed line it gets drier? No. If you cross to river, and go on the left side, you will find that the country is not so level. There are a great many watercourses—small and great—flowing into the Castlereagh from the north, so that that part of the country is scoured to a much greater extent than that over which the proposed line passes.

210. *Dr. Garran.*] Was the Mudgee branch at one time thought to be a rather dangerous line? Yes; it used not to be worked at night, but it is worked at night now.

211. If there is any objection to it on that ground, it would be a reason against making it a trunk line? Yes; but I know that trains run upon it at night now. Some years ago I was asked to take the matter up, and I laid out some deviations, which were carried out, and since then trains have been running at night.

212. Is there not a great deal to be said in favour of the extension from Mudgee to Coonamble, apart from the question of expense? The country is very suitable for agricultural settlement.

213. And it is fairly between the two trunk lines already made, and would open up quite as much country as any other line? Yes.

214. If a line were made from Coonamble to Warren, that would make the construction of the line from Mudgee more likely at a subsequent date? Yes.

215. If we make a line from Dubbo to Coonamble, it will make the chances of the Mudgee extension smaller? I think the Mudgee line must be extended for some little distance—certainly to Gulgong, and probably to the Talbragar.

216. And that would be easy country to settle? Yes.

217. But it is not supremely easy country for a railway? No; it is very undulating and ridgy.

218. Could you construct it for £3,000 per mile? The first part would cost very much more. The estimate for the Mudgee to Gulgong line came to nearly £5,000 per mile; from Gulgong to Cobborah a little over £3,000 per mile; so I suppose it would be done on an average for from £3,500 to £3,700 per mile.

219. You are inclined to think that, all things considered, the Mudgee line as a present line is rather out of the question? Yes.

220. And our choice lies between the Dubbo and the Warren extensions? Yes.

221. Do you think that if we choose the Dubbo instead of the Warren extension it will decrease the chances of a Mudgee extension hereafter? I do not.

222. Of course it will not do to run parallel lines too closely together? No; I look upon it that the Mudgee line, after passing through Gulgong, might, instead of making for Cobborah, turn a little to the right, and make more for Coonabarabran.

223. About what distance might two parallel lines be made from each other, so as to enable each to pay? It is generally reckoned that they should be 40 miles apart so as not to make the cartage for agricultural produce more than 20 miles.

224.

\* NOTE (on revision):—Walgett to Sydney, shortest distance, *via* Mudgee, 405 miles; *via* Dubbo, 439 miles. Walgett to Newcastle, shortest distance, *via* Narrabri, 367 miles.

- H. Deane.  
10 Mar., 1899.
224. Evidence has been given before a former Committee to the effect that if a farmer can take his dray to a railway station and get home again at night he is fairly well served? Yes.
225. You think that if the proposed line is made now it will not altogether foreclose the prospects of a Mudgee extension hereafter? No.
226. That will stand on its own merits, and have fair claims? Yes.
227. Supposing the extension from Coonamble to Walgett is superseded by the new line, would it be worth while to go from Coonamble towards Brewarrina? No; because I have instructions to make a line from Byrock to Brewarrina.
228. And that will meet all the claims of Brewarrina? Yes.
229. Then there would be no railway between Brewarrina and Walgett? It is very unlikely, I think. It is possible that the Warren line might be turned up along the Macquarie or the Marthaguy.
230. Supposing we find it desirable to accommodate the Macquarie Valley country, the only plan would be to extend the line down the valley of the Macquarie? Yes.
231. *Chairman.*] A line going from Sydney through Coonamble *via* Mudgee would I believe be 34 miles shorter than a line going from Coonamble to Sydney *via* Dubbo? Yes.
232. I think Mr. Jones prefers the Mudgee to Coonamble line on account of the better class of country through which it would pass? Yes.
233. Can you give any reason why the line is to be taken from Dubbo to Coonamble;—is the principal reason the fact that you already have a line to Dubbo, which is a nearer point to Coonamble than Mudgee? That is one reason—a good reason in itself.
234. Is that the principal reason? It is a fair compromise between the shorter line to Warren and the longest and most expensive line to Mudgee.
235. Seeing that the traffic is to come mostly from Coonamble and the country about there, does it not appear to be unreasonable to handicap the people of the district for all time simply because a line had been already constructed to Dubbo? As a matter of moral right I think they might be called upon to pay as high a total charge over the more expensive line as over the cheaper line.
236. I believe that the country from Dubbo to Gilgandra is very poor? There are patches of poor land.
237. I believe there are only small patches of it which are of any good? There is a ridge which you would traverse part of the way by the line, but it is not of any great extent, and it chiefly covers that part of the line which in any case would be unproductive—that is, the first part of the line. When you get about 20 miles out you are over that ridge, and I suppose the line would not be made if it were only a question of 15 or 20 miles.
238. The line from Mudgee to Coonamble being more expensive to construct than the one under consideration, you think that the people of Coonamble would not be under any great disadvantage in having the further distance to go? No. It would be better for them to have that than to be blocked altogether by the larger expense.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

- H.  
McLachlan.  
10 Mar., 1899.
239. *Dr. Garran.*] The Railway Commissioners, a year or two ago, recommended the construction of a line from Warren to Coonamble? Yes.
240. Did they estimate a loss on that line? No; a slight profit, as compared with the Dubbo route.
241. They have now made another report, in which they do not propose to construct that line; but they do not express themselves quite so strongly in its favour as they did in regard to the Warren line? No; commercially the result will not be quite so satisfactory; but they look upon Coonamble as a promising district, and, as a matter of fact, they are favourable to either route, leaving it to the Government, as a matter of policy, to consider which is the best to adopt.
242. Do they look for their profit to the terminal or roadside traffic? There would be a great deal of through traffic from Coonamble.
243. For that reason they preferred the shorter route, from Coonamble to Nevertire? They looked at it in this way: In one case you have to make 60 miles of railway, and in the other nearly 100 miles. The country in both directions is very good, particularly between Warren and Coonamble. It is one of the finest pastoral countries we have.
244. Is it fair to ask whether, at the present time, if the Commissioners had their own choice, they would prefer the Warren line? I think the Commissioners are fairly divided as to the merits of the matter. They simply report on lines as submitted to them. First, they had the Warren to Coonamble, and now they have the Dubbo to Coonamble line submitted to them. Their opinion is that a line to Coonamble is warranted; and so far as they are concerned, they think the prospects of either route justify construction, leaving it to the Government to consider, as a matter of policy, which it considers best in the interests of the country.
245. If the line from Warren is not extended, would that be a reflection at all on the construction of the line to Warren? No; because, in the first instance, the extension from Nevertire to Warren was dealt with on its own merits. There is a considerable traffic between Warren and Nevertire, and in unfavourable weather the road gets very bad. One reason which led to its being taken up was that an agitation for the line was commenced about the time the Commissioners were considering the question of constructing pioneer lines. A contractor offered to build it at a very cheap rate, and the outcome of that was that, to some extent, as an experiment, in connection with the pioneer system of railways, they built the Nevertire to Warren line. But it was almost on its own merits recommended.
246. Is it paying? We have only had seven months' experience of traffic there.
247. Of course, it is a very short cockspur line, and, as a rule, they are not very remunerative? No.
248. So far as traffic is concerned, are you fairly satisfied with it? Yes.
249. Do you get some of the Coonamble traffic upon it? Yes.
250. Does the coach traffic at present go from Warren to Coonamble? It goes alternatively *via* Warren and Dubbo.
251. There is no strong desire on the part of the Railway Commissioners to extend the Mudgee line to Coonamble? No. I may say that one reason which influenced the Commissioners in regard to the line from Warren to Coonamble was this: If you make a railway from Warren to Coonamble, and some day make one from Mudgee, through some good country, towards Coonamble, the country would be so much better

H.  
McLachlan.  
10 Mar., 1899.

better spaced. If you made one from Mudgee to Coonamble, you would run an almost parallel line with the Dubbo line. That is one consideration which originally influenced the Commissioners when they were recommending the Warren to Coonamble line.

252. If we now make a line from Dubbo to Coonamble we rather check the extension of the Mudgee line? I think so, for the present. The original objection to it was that it would mean such a very big capital expenditure. At the same time it is the nearest way of getting from Coonamble to Sydney.

253. If a line is made from Warren to Coonamble, there is more chance for the Mudgee extension? I should think so. Of course it may be a good many years to come; but looking much ahead that would seem to be so.

254. Do the Commissioners prefer an extension from Coonamble to Walgett, or one from Narrabri? That is a matter which they have not looked at. For the present they are in favour of the railway terminating at Coonamble. They have no idea at present of going on.

255. It would be a terminus for some years to come? Yes.

256. And a good terminus? Yes.

257. And it would sweep a large circle of country? Yes, it would drain a big area of country.

258. It would take away a little of the Nevertire traffic? Yes. Another reason the Commissioners had was that they would get the traffic over a much longer length of line.

259. Is the Mudgee line now easily worked? Yes, we are having no trouble.

260. Does it require much watching? I do not think so. Naturally it is a more difficult line, and wants more attention than a line on even country.

261. At any rate it is not a good line for trunk-line traffic? We have as heavy grades on the main trunk line as we have on the Mudgee line.

262. And as bad curves? Nearly as bad.

263. There is nothing in the Mudgee branch to make it unsuitable for carrying heavier traffic than it carries at present? I do not think so.

264. Does it cost more to maintain than any other line? It costs more than a line on flat country; but we have never had the relative costs worked out.

265. If you had heavy and new traffic would the cost of maintenance become greater? I should hardly think so, unless it were exceptional.

266. Do you think the line is in a fair condition to bear increased traffic? Yes.

267. I believe some alterations have been made? Improvements have been made in the line since 1890.

268. Without expressing any preference, the Commissioners are now favourable to the formation of a line from Dubbo to Coonamble, because they want to get to Coonamble? Yes; they think the district itself justifies a railway. If the Government is in favour of a line being constructed from Dubbo to Coonamble, they also are in favour of it.

269. When you convey produce by a roundabout road, do you get the advantage of the extra length of haulage? As a rule we do. The rate per mile would not be as great on a long as on a short journey. But we should get the advantage of the longer hauling, unless it were in competitive country, where we should have to make a maximum rate. Of course we charge for the service rendered.

270. Does that apply to the Moree and Inverell line? That has not come into our hands yet.

271. The line from Moree to Inverell was, I believe, justified on the ground that, although a longer line to construct than one from Glen Innes, it was, nevertheless, easier to construct; the Department gains the benefit of the cheapness of the line, and yet it saddles the producer with extra carriage? There was not only the consideration of the cheaper cost of construction, but also the consideration of the greater service to the people living in the western district. For instance, it gives Inverell a market to the west, which is rather an important consideration.

272. The original survey from Dubbo to Coonamble was a little more to the west, and a railway reserve was made;—do you know anything about that reserve? It is a matter which the Commissioners, as a rule, would not deal with.

273. In one or two reports they have recommended that the land should be made to pay for the railway? Yes, in connection with the Lismore-Tweed line particularly.

274. If this line, which is still unalienated, could be sold on terms, and the proceeds applied to the construction of the line, we might make this line for nothing? That is the Commissioners' idea—that a railway should get some credit for the enhanced value it gives to the Crown lands.

275. Do you think they would approve of this policy being carried out? They are always in favour of it. They always endeavour to make the railway earn interest on the capital expended, and the rates are made with that end in view. If they had no interest to pay they would be able to give cheaper rates.

276. If we could add 100 miles to our railways which would cost nothing, it would help to balance the non-paying lines? The Commissioners would be pleased to support such a policy at any time.

277. They had the opportunity of referring to that matter in their report, but they do not allude to it;—do you know whether they have considered it at all? No, they have not.

278. Was their attention drawn to this reserve being in existence? I am not aware.

279. Supposing this land were sold to pay for the railway, would you recommend that the sale should be with the Railway Commissioners or with the Lands Office? I think the Commissioners would rather not enter into the matter. They would sooner see the Government take it in hand.

280. If that policy were carried out, do you think the Railway Commissioners would ask for the whole of the proceeds, or only for the excess over £1 per acre? The idea they had is that the railways should receive some benefit from the enhanced value of the land.

281. The surplus over £1 per acre would be looked upon as incremental value given to the railway? Yes.

282. And they think they ought to get that? That is their idea.

283. Supposing the land brought 20s. or £2 an acre at auction on account of the railway betterment, that extra money would go towards the cost of paying for the construction of the line? Yes; it would reduce the capital cost.

284. Possibly you might only have half the capital to pay, or none at all? Yes. I may say the Commissioners always endeavour to reduce as much as possible the capital cost of the lines, and they have done that by charging the lowest rates for the material which has to come up for the construction of the lines.

285. Supposing the proposed line, under the conditions named, were made for one half the cost, or even for nothing at all, would you give the people who send their produce over it the whole benefit of the saving,

H.  
McLachlan.  
10 Mar., 1899.

saving, or would you charge them the ordinary mileage rate? On new lines the Commissioners have considered the question of a system of local rates. The object of that is to make a line pay its interest. Supposing we had no capital to pay, the Commissioners would probably make the rates through rates, which would be a reduced rate for the people using the line.

286. But you would not make them below the through rate? I think not.

287. Do you think the people would be fairly served if, under these conditions, they were charged through rates from Dubbo to Coonamble? I think so; and they would be well satisfied.

288. Of course the whole of the country should get the benefit of this policy, because it is the land of the country which is sold? That is so.

289. The gain to the Coonamble people would be that they would not have to pay special rates? Yes.

290. But they could not expect to pay less than the through rates? I think not.

291. So far as the Commissioners are concerned, it is a matter of indifference to them whether the line is constructed from Dubbo or Warren? Yes; they would be quite prepared to accept either.

292. And they think the Warren line would pay them immediately, and that the Dubbo line must wait a few years before it pays? The difference, very largely, is in the less interest on the shorter line.

293. A previous Committee recommended the Dubbo line in preference to the other;—I suppose the Commissioners have had the evidence and arguments which influenced them under their notice? Yes.

294. And that may have influenced them in giving their assent to the construction of the line from Dubbo? Yes.

295. At any rate, they did not report against it in favour of the Warren line? No; they think the district is entitled to a railway, and they are quite prepared to favour the Dubbo to Coonamble line. They recognise that there are important considerations in favour of such a line, particularly the fact that it brings you 43 miles nearer to Sydney.

296. Have you eased most of the curves between Sydney and Dubbo? A great deal of work has been done.

297. You have a fairly good line to Dubbo, and one quite capable of carrying any increase of traffic likely to come upon it? Yes.

298. Is Dubbo likely to become a railway centre more and more? Yes; it is an important station now.

299. There may some day be an extension of the Parkes line towards Dubbo? That is very much ahead.

300. And there may be a line from Dubbo to Werris Creek? That also is very much ahead.

301. They are not immediately required? No.

302. They would not serve any new country to any great extent? They would open up country, but the question is whether it would pay to make them for that purpose.

303. There is no cross-country traffic of any value? Not a great deal.

304. The only cross-country line we have of any importance is one from Blayney to Murrumburrah? Yes.

305. And that has not turned out so successfully as was expected? It is a great relief, but financially it has not been a great success.

306. The original idea was that there would be an immense traffic in cattle from the north;—has that idea been realised? A great deal of traffic in cattle goes from Bourke to Albury, but no doubt the stock tax prejudiced it a great deal.

307. Did the stock tax visibly affect the traffic in cattle towards Albury? I think it did.

308. So far as cross-country line experience has gone, they are not a profitable kind of railway to make? No.

309. The construction of extensions into country not at present served by a railway is more likely to be fruitful? Yes, where the country is good.

310. And the proposed Dubbo to Coonamble line is a fairly promising one? It is.

311. *Mr. Leven.*] Is there more population between Dubbo and Coonamble than there is between Warren and Coonamble? I think there is more between Warren and Coonamble.

312. Which is the better country for cereals—between Warren and Coonamble, or between Dubbo and Coonamble? I daresay immediately outside Dubbo you would find the better country, because there is a better rainfall there. After you get a fair distance out of Dubbo the land is not so good. I do not think, however, that Mr. Harper includes any big return from cereals in his traffic estimate.

313. Do you expect the main traffic to come from beyond Coonamble, or between Dubbo and Coonamble? Beyond Coonamble.

314. What sort of traffic would come from Coonamble to Dubbo? Principally pastoral.

315. Has there been much advocacy of the construction of a line between Coonamble and Walgett? We have not heard anything about it. The Public Works Department would hear of it first. The agitation at Walgett is for a connection with Sydney *via* Narrabri.

316. Do you think it would be advisable to run our railways along the railway reserve? Naturally; if you run along Government land you pay no compensation.

317. When you send surveyors out, what instructions are given as to a starting and a terminal point? That is a matter for the Engineer-in-Chief. We simply come in when the line is handed to us.

318. Do you not make inquiries as to the best route before the surveyors are sent out? No; that is not referred to us. The station buildings and sidings are fixed by the Commissioners, but the location of the line is determined by the Government after the Public Works surveyors have reported.

319. Does not the Public Works Department confer with the Commissioners as to which should be the starting and the terminal point? They would confer as to the terminals, but not as to the direction of the line throughout.

320. *Mr. Shepherd.*] Do you find that accidents are more frequent on unfenced than on fenced lines? Perhaps a few more sheep are killed.

321. What is the rate of speed on unfenced lines? The maximum would be about 25 miles an hour. The original idea was to run about 15 miles an hour. Those lines are almost dead level, and you can sometimes see for miles ahead.

322. Has it been found that unballasted lines are more damaged by flood than ballasted lines? We have not had a great deal of experience in regard to pioneer lines. That, however, is an engineering question. As a matter of fact, we have had some experience on the Moree line. We strengthened the line a little, more particularly on account of the traffic becoming heavier than we expected. The engineers, I believe, did not think that it in any way prejudiced the line.

323. Are the Railway Commissioners supposed to make good the stock destroyed by the trains? If they were

were destroyed through our carelessness I think we should do so. I do not think the question has ever been fought out. Still, as we have power to run unfenced lines, and we exercise every reasonable care, we should hardly be legally responsible.

H.  
McLachlan.  
10 Mar., 1869.

324. *Mr. Watson.*] Have you had many claims against you? Occasionally we have claims on account of animals being killed, but we have not had a great number.

325. *Mr. Levien.*] I understand that when Mr. Lyne was Minister for Public Works, he informed a deputation that he advocated the proposed route, but thought the Dubbo to Werris Creek line should be constructed first;—I suppose the Railway Commissioners have some knowledge why Mr. Lyne said that? No. Of course the Railway Commissioners do not enter into matters of policy.

326. Then you do not know upon what ground Mr. Lyne founded his observations? That probably would be the opinion of his Government, or his individual opinion.

327. *Chairman.*] Has the question of removing starving stock come before the Commissioners? Yes, so far as the existing lines are concerned.

328. The line under consideration would be of little use in connection with the removal of starving stock? It would—the country between Dubbo and Bathurst being fairly good. The country on the other side of Coonamble is in a bad state. You could probably get cattle to a better and higher country.

329. *Mr. Watson.*] I understand that the Commissioners would obtain some benefit if the Warren route were constructed, and a greater portion of the existing line would be used for the conveyance of goods to Sydney? Yes.

330. Would it not be possible, if there is a good land between Dubbo and Coonamble, that a larger amount of local traffic would ensue from having a greater area of country to tap? Yes. If you had good agricultural land from Coonamble to Dubbo no doubt you would get a good local business all the way; but, as a rule, local business does not pay. It is the through traffic which pays. For instance, Coonamble would be the centre of a big area. You can get an idea of our local business on the lines from Blayney to Harden, which, to a large extent, is serving local interests only. It is very good country—better than you will find between Dubbo and Coonamble, and yet there is a big loss on the line.

331. Might not that be due to the heavy character of the country through which the line passes? Yes; the cost of the line was heavy, but, as a rule, it costs more to construct a line through good country than through flat pastoral country.

332. And that is really the objection to the extension from Mudgee to Coonamble? The Mudgee line would be longer, and would go through more expensive country, although better producing.

333. Do you think the fact that Coonamble being 40 miles nearer Sydney, *via* Dubbo, would have any effect in increasing the total through traffic? I would not like to say that it would develop more business; at the same time it must be admitted that that would be an economical advantage to the local people.

334. Occasionally people would be encouraged to send stock by Dubbo, as the extra 40 miles of carriage might cause them to think twice before going the other way? I would not like to say that it would really turn traffic one way or the other.

335. Is it not a general rule that the cheaper the means of access to market the greater is the development of the back country? Yes.

336. As a general principle, it is wiser for the Commissioners and the Government to give the cheaper means of reaching market? The Commissioners would admit that. There is certainly a strong local advantage in that regard.

337. And also a national advantage in the development of the general estate? Yes. I do not suppose the difference in rate between Coonamble-Dubbo-Sydney and Coonamble-Warren-Sydney would, on wool, be 5s. per ton, and that would not be likely to develop traffic.

338. If the through trade is to be confined to wool, it would not make much difference in the way of encouraging the production of it? No.

339. But if we found later on that through the development of the artesian-water system irrigation could be undertaken, I should imagine that on the class of produce, which would then be sent over the railway, the reduction might be a considerable amount? Produce is a commodity which cannot stand a great deal of carriage. Of course there would not be 5s. a ton difference in produce, but even 1s. a ton in the carriage of produce is some consideration. Certainly the shorter route has many advantages from the local point of view, as well as the national point of view.

340. You have stated that the Commissioners would prefer that some amount of the betterment accruing through the construction of a railway should be credited against the capital cost; in making that remark, you were not thinking only of the betterment accruing to Crown lands? That is the only thing we were dealing with at the time.

341. But in this instance, the line will, over three-quarters of its length, pass through private land? Yes; if you look at the report of the Railway Commissioners on the Green's Gonyah Railway you will find that they advocated that a certain amount per acre should be charged against land-owners, so that any loss accruing in the annual working might be made up until the line paid.

342. Do you think that is a reasonable restriction to put upon any line to open up new country? Yes; the Commissioners thought that the people generally should not be penalised, as it were, for the sake of giving a certain local advantage.

343. Therefore, they are in favour of that course being followed in respect of any new lines, their object being that the working expenses be paid each year? Yes; but they would like each case to be considered on its merits. In this case there is a big difference. The line, for instance, is supposed to pay from the start. There is very little difference between the annual cost and the traffic, and that is without allowing for any benefit which will accrue to the main line. In a case like this, I do not think the Commissioners would recommend any tax on local owners.

344. If the tax were imposed, as was done in the case of the Green's Gonyah line, it would, at any rate, be a dead letter if the line paid? Yes. The Green's Gonyah arrangement was to be made conditional on the line not paying.

345. I notice that the Commissioners have put down the interest rate at 3 per cent.;—do you think they are justified in doing that, seeing that the last loan cost us 3¼ per cent. without expenses? I think money could be got now at 3 per cent.

346. Clear of all charges? The charges are only on the initial issue, and form a very small item on a loan extending over thirty years.

- H. McLachlan.  
10 Mar., 1899.
347. Do you not think that it was cutting it rather fine to put down your interest charges at 3 per cent. ? I believe that 3 per cents. are over £100 now. It is a reasonable thing, I think, for the Commissioners to calculate the interest at 3 per cent.
348. Amongst the items of estimated revenue is the sum of £1,100 for mails;—have you any idea what it costs at present to convey the mails from places which will be served by the line? As a rule, we get £12 10s. per mile per annum on such branch lines.
349. Does that apply to the main line? No; it is more on the main line. On the main line we have to run heavy vehicles purely for mail purposes, and we charge more.
350. Would it be a fair thing to put against the item for mails what it at present costs the Postal Department to serve those places? No.
351. In some instances the amount estimated to be received from mails has been a book entry? Supposing the railways were a private concern, it would not be a book entry, but hard cash. We reckon we charge a reasonable sum for the accommodation we give.
352. If the Postal Department are at present getting the mails carried for £100, and you purpose charging them £400, owing to the mileage rate, surely the difference of £300 could be fairly termed a book entry? I could not say that. You might get a man on horseback to carry the mails at a cheap rate, and it might take him a week to do it. If the Postal Department have the benefit of a better service they should pay more for the accommodation given.
353. There are instances in which the amount paid prior to the construction of a railway was about one-fifth of what the Commissioners have charged. Allowing that the Commissioners give the opportunity of a better service, there is still a wide difference between what was previously paid and what is at present paid. In that case it is hardly fair to estimate that as revenue proper? You must look upon it in the light of a railway being a commercial concern.
354. In that case the railway would be subject to the competition of any one else carrying the mails? I do not think there would be much competition; the public would soon demand the quicker service, even if they had to pay more for it.
355. Do you think the construction of the line would give an impetus to agricultural productions? It would to a certain extent, and there would be increased passengers and parcels traffic.
356. But wool and stock would be probably much about the same? They might be. Of course you might get tallow, bones, hides, and other things down, which might not pay to cart at present.
357. Has it been the practice to credit a branch line with any extra traffic it brings to a main line? No; we let each branch line stand on its own merits.
358. I notice occasional agitations for reduction of freight and passenger fares on the main lines, because of their paying character, and I should imagine, from what you have said, that if the matter were properly analysed the main lines do not pay quite as much as they would appear to pay, and should be debited with what accrues to them from the branch services? Just so. Take the suburban line out of Sydney, which is a case in point.
359. That appears on paper to do wonderfully well, and yet a portion of the traffic which accrues to it should be credited to other lines? Yes; there is no great profit in the purely suburban passenger service.
360. *Mr. Trickett.*] I notice that the Commissioners are very mild in their recommendation of the line—they simply say it is worthy of consideration? Yes; but I know that they look upon the line favourably.
361. Do they look upon the line as one which rests on its own merits, or as one worthy of extension to Walgett? They look upon it as one upon its own merits, not with any immediate idea of extension.
362. Have they given any consideration to a line from Mudgee to Coonamble? Yes; they think it is very good country, but the cost is rather prohibitive. I think it means nearly £500,000.
363. Do you think it is probable that if a line is constructed from Dubbo to Coonamble there will be a line from Mudgee to Coonamble? I do not think there will be in the immediate future. In the future, no doubt, you may have a line stretching north from Mudgee.
364. Then, if the proposed line is constructed, it may be looked upon as an intermediate line between one to Nyngan, on the one hand, and the Northern line, on the other, for many years to come? Yes.
365. You think the cost of a line from Mudgee is prohibitory at the present time? That is the idea the Commissioners have.
366. Do you propose to impose special rates on the proposed line? Yes, there would be certain local rates.
367. *Mr. Dick.*] Is it your opinion that in the immediate future the line will be extended beyond Coonamble? No; but that is a matter of policy for the Government.
368. What led the Commissioners to abandon the idea of constructing a line from Mudgee to Coonamble? Principally the question of expense. The matter was only referred to them in an indirect way, and in their opinion the cost was prohibitive. They always report on a line referred to them directly. They were asked to report on a line from Warren to Coonamble, and they recommended it. They are favourable to a line being run from Dubbo. They have a route submitted to them, and they do not care about touching on alternative routes.
369. Can you offer any opinion in regard to the construction of a line from Singleton to Cassilis? No; the Commissioners have not been consulted about it.
370. *Mr. Watson.*] Have the Commissioners been buying sleepers at Dubbo recently? Yes.
371. What have they been paying for them? The price for 9-foot sleepers would average about 3s. 3d.
372. Is that the class of sleepers which will be used on the proposed line? No; say half-round 8-foot sleepers, which can be obtained at Dubbo for about 1s. 10d.
373. *Chairman.*] According to reports, the country between Dubbo and Gilgandra will carry little population;—taking that for granted, and it is shown that the land from Mudgee to Coonamble is much better than the land from Dubbo to Coonamble, would that alter the policy of the Railway Commissioners? I think not.
374. Would it not, in the long run, pay to construct a more expensive line through good country than one through country which would not produce well? In the long run it might be better for the State; but, as a rule, local business does not pay. It is the aggregation of business from a big district which helps to make a railway pay.
375. You look upon Dubbo, then, as being a depôt for a large extent of country? Yes; and we can reach it in the one case by the expenditure of £200,000, and in the other case by the expenditure of £500,000.

376. If you could pick up a considerable traffic between Mudgee and Coonamble, and could not pick it up on the other route, would not that make a difference? It would; but not sufficient to compensate for the very much heavier expenditure in the first instance.

377. It is possible to provide for traffic, by means of a line from Mudgee to Coonamble, which will deal with the Coonabarabran country;—that being so, would you not get more traffic over the whole line which would pay you better than going through country which would not pay at all? Personally, I do not think the extra traffic would compensate for the excessive extra cost; but the matter has not been looked at by the Commissioners in the light of traffic. It has not been referred to them, and they do not attempt to collect information for themselves.

378. *Mr. Watson.*] Is there anything in the Public Works Act which prevents the Commissioners giving a report as to traffic, and so on, respecting an alternative route? The Act says the Commissioners shall furnish a report as to the traffic, which, I think, refers only to the particular route.

379. Supposing the Commissioners were requested by the Committee to give an estimate of the traffic over an alternative route, would they consider it within their functions? I think not. They would then go into matters of policy, which are for the Government to determine.

H.  
McLachlan.  
10 Mar., 1899.

TUESDAY, 14 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GAREAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

380. *Dr. Garran.*] In December, 1897, you gave evidence before the Public Works Committee with regard to the construction of a railway from Warren to Coonamble? I am not sure of the date.

381. You mentioned, then, that it would not be possible to get anything more than through rates because of the road competition, and you estimated the rates for second and third class goods at 45s. a ton? Yes.

382. Has any change taken place in railway rates since then? Not generally.

383. Then your through rates from Dubbo to Coonamble would be 45s. now for second and third class goods? No; not from Dubbo to Coonamble. My statement had reference to the proposed line from Warren to Coonamble. I desire to put in the following estimate of traffic on the proposed railway:—

*Estimate of traffic, proposed railway extension from Dubbo to Coonamble.*

In connection with the proposed extension of the railway from Dubbo to Coonamble, I beg to report that upon the basis given hereunder it is estimated that the revenue will be £11,867 per annum.

General goods in less quantities than truck loads:—50 per cent. at 5d. per ton per mile; 25 per cent. at 4d. per ton per mile, and the remaining 25 per cent. at 3d. per ton per mile.

“A” class traffic:—Local rates.

Live stock:—Through rates.

Wool:—The difference between the maximum rate from the Western line and that from Dubbo to Darling Harbour.

Summary.

Goods, stock, and wool .....	£8,526
Passengers .....	1,975
Parcels, horses, carriages, and dogs .....	250
Minerals .....	1,116
Total .....	£11,867

The average rate on the basis I have given would work out at 32s. a ton.

384. That is less than the rate from Warren to Coonamble, which was 45s.? No.

385. How is it that it is so much lower now than it was then? I do not think it has been made lower. As a matter of fact it has been made higher. I do not think I said the average rate would be 45s. a ton. You will find the details, which I gave on page 13 of the report of the Committee on the proposed railway from Warren to Coonamble.

386. Do you think 32s. a ton will cut out the road competition? That I do not know. I would not like to say that.

387. On a previous occasion a couple of witnesses stated that the road competition would be severe. For instance, Mr. Polin, a storekeeper of Coonamble, stated:—

During the last five or six years, teams have competed with the railway right on to Sydney, and goods have been delivered at Coonamble by teams for less than we could get them by rail.

Do you know whether that is a fact? We heard a lot about that matter, and if I could furnish the evidence I furnished to one of the Committees in connection with the same question, it could be seen what the amount of the competition was. Two lots of goods went from here to Coonamble.

388. Another witness, Mr. Hermann, a storekeeper of Coonamble, stated that if the Railway Commissioners adhered to the present rate, carriers must compete with them. He also stated that last year carriers went from Coonamble to Dubbo, and brought loading back several times for £2 per ton? I believe the charge is less than that now. As a matter of fact last year, goods were carried between Coonamble and Dubbo for 30s. a ton.

389. The tendency is for the road carriage to get cheaper as the roads get better? Yes; as long as you can balance the traffic you have.

390. Do you think you would be able to cut out that road traffic if you charged 32s. a ton? The rate of 30s. a ton was only in one direction, but as a matter of fact, the charge for back loading might be £2 10s. per ton.

391. Do you think you could get wool from Coonamble by rail as opposed to drays? I think so

- J. Harper.  
14 Mar., 1899.
392. Are there not several of your extensions from which you have not knocked off the teams immediately? I cannot call to mind where it has not been done.
393. Have you not had road competition from Forbes to Parkes? We had before the line was handed over to the Commissioners, but not since. We have competition—if it can be called competition to-day—that is to say, an isolated team, which happens to be in the hands of a local storekeeper, which will travel under conditions about which we do not care to inquire, but of which we know all about.
394. You think, then, that with your rates you would get the trade? Yes; I think we shall get whatever traffic there is.
395. I suppose that in wet weather the Coonamble-Dubbo road is better than the Coonamble-Warren road? In wet weather the road between Coonamble and Dubbo is sounder than the other.
396. Then, in a wet season, you would have less reason to fear competition if a line were made from Warren to Coonamble than you would have if a line were made from Dubbo to Coonamble? Yes.
397. In both dry and wet seasons the road from Coonamble to Dubbo is a good one? I do not know, because the circumstances of a country for travelling alter so much. For instance, last year the bulk of the traffic from Coonamble came *via* Dubbo, for the simple reason that the roads, owing to the drought, were better in the direction of Dubbo than in the direction of Warren. Next year the conditions might absolutely change.
398. We are told that the country from Dubbo to Gilgandra is rather poor? So it is.
399. And that we cannot expect much local settlement? No.
400. Therefore, you will not get much local trade? No.
401. Do you expect any local trade between Gilgandra and Coonamble? Yes. There is a good deal of good land to the east of the Castlereagh, and to some extent to the west of it.
402. I suppose the trade from Coonamble will not be all through trade? No. It is a difficult thing to say what traffic will develop in a district like that. Every day the artesian water supplies are being developed there.
403. If the farmers grow wheat it will pay them to take their stuff to the railway rather than cart it from Dubbo. I think so. I think our rates would be made so favourable to them that they would find it better to carry their wheat by rail.
404. Sometimes farmers do not appear to consider spending a few hours of their time carrying their goods, if they have horses and carts ready? Our experience is that when they find out the difference between the cost they have to incur in connection with their own carriage as against the carriage by rail, they use the rail.
405. I suppose that during the last three dry seasons, road competition has fallen off? Yes.
406. There is no grass on the road? I may say we have never regarded it as competition.
407. Has there not always been a local trade on the Western line? Yes; but we have never regarded it as competition. We have never altered our rates for the purpose of meeting what, by some people, is called competition.
408. Still it has taken a certain amount of trade from you? Yes; and it has cost the country a good deal in the direction of keeping the roads in order.
409. Do you think there will be more local trade on the proposed line than there would have been on a line from Warren to Coonamble? I do not know. Personally, I think that if a line is built from Dubbo to Coonamble to-morrow the day will come when an extension will be found necessary from Warren—not necessarily to Coonamble, but to serve the Marthaguy and the other creeks in that direction—I think that if to-morrow you decide—this is simply an expression of opinion—upon the construction of a line from Dubbo to Coonamble, you will find that application will be made for an extension towards Mundooran and south of Coonabarabran.
410. That is to say that, as the country becomes settled, no one line will satisfy the entire requirements? I do not think so.
411. That, however, would not come against the construction of the proposed line if it were wanted on its own account? No.
412. Could not you very well say that, if the line as first proposed by the Railway Commissioners, from Warren to Coonamble, had been constructed, before long there would have been one required from Dubbo to Coonamble? I would not like to say that the pressing necessity has arisen yet for the construction of the proposed line. I think it is a matter for reflection as to how the area to which I have referred should be served.
413. Some people are strongly in favour of an extension from Mudgee, on the ground that although the cost would be greater, the settlement and ultimate traffic would be greater;—do you hold that view? No, I do not. I cannot conceive that the conditions are favourable at the present time for the settlement of the necessary population along that route, which will be necessary to pay the very heavily increased cost of construction.
414. Suppose we construct a line from Dubbo to Coonamble, it would still be possible some years hence for a sufficient justification to arise to warrant the construction of a line from Mudgee towards Coonabarabran? Yes.
415. Not going to Coonamble, but dealing with the district between the Northern line and the Dubbo-Coonamble line;—would not that be possible? It would be possible. At the same time we should have to consider the question how to provide for that piece of territory in the Marthaguy and Macquarie districts.
416. That is a difficult country through which to make a railway? If you run parallel with the rivers, I do not think it is difficult country.
417. Have you been over that country? Yes.
418. I suppose that crossing the rivers would necessitate heavy expense? Yes.
419. If you run between the rivers, you might keep on a high and dry ridge? Yes.
420. Do you think a line from Warren to Coonamble, and another from Mudgee northward, would suit that district better than one from Dubbo to Coonamble? I think that is a matter worthy of more consideration than I, in my official position, have been able to give it. I have been limited in my directions. The Committee have liberty to make what investigations they see fit.
421. I should like to know whether you think the construction of a line from Dubbo to Coonamble would be adverse to the future interest of lines which ought to be constructed? I submit the matter to the Committee just in the way in which it occurs to me. The Committee have the whole of the possible routes

routes under consideration, and I have not. I have only before me the two routes with which I am dealing—the Warren to Coonamble route, upon which I have already given evidence, and the Dubbo to Coonamble route. I would say, however, with regard to the intermediate country between Mudgee and Coonamble, that my experience tells me that some day a railway will have to be built there.

J. Harper.  
14 Mar., 1899.

422. What is the distance across country from the Dubbo-Coonamble line and the Northern line (say) to Werris Creek? The distance from Dubbo to Werris Creek is 157 miles.

423. So that there is a belt of country at least 120 miles in extent between these two roughly parallel railways? Some day or other a demand will arise for the accommodation of that wide district, even supposing we construct the line under consideration.

424. There is, I take it, a good deal of fertile land between those parallel lines;—do you think it would have to be accommodated from Mudgee or from the Northern line? I could not say. We do not know what developments are going to take place in traction and other directions,

425. It is possible that mineral districts may be discovered? Any amount of contingencies may arise.

426. Still, we may look upon it as certain that that breadth of country must be served? It must.

427. So that the construction of a line from Dubbo to Coonamble would not block the future serving of that country in any way? No; the only thing is that it would probably add to the working expenses if a line, which might be developed within easy access of the coast, took the traffic from it.

428. You refer to the connecting of the Northern line with the sea-port? Yes.

429. If that were done it might happen that communication would be made with the Northern line? That I could not say.

430. It would make it more probable? It would if the distance were shorter and the grades easier.

431. If we decide on the Dubbo to Coonamble line, we do not spoil the chances of serving that country hereafter? No; but I take it that, like myself, the Committee are anxious to do the best they can in the interest of the country. This is a very wide and open question. As I have said on previous occasions, I think matters of general policy in connection with railway construction should be submitted to the Committee for investigation. Personally, when I am giving evidence about a single line, I cannot decide whether or not that line should be built.

432. What I want to know is whether you think the Warren to Coonamble line would be less likely to block future useful extension than the Dubbo to Coonamble line? I must ask you to judge of that for yourselves, because my position is this: If the Dubbo to Coonamble line is built, you have the question of the Nevertire to Coonamble line, or the serving of that territory in the district of the Marthaguy Creek to consider.

433. The district between the line to Bourke and a line to Coonamble is not so wide a district as the other one;—it is all within easy distance of a railway station? No; as a matter of fact, it is further away.

434. If a squatter is within 50 miles of a railway station, is he not fairly well served? Yes.

435. If a line were constructed from Brewarrina to Coonamble, how many squatters would there be within 50 miles of it? Those people who occupy the lower Macquarie, the Marthaguy, and other creeks, are certainly not likely to go to Brewarrina with their produce. They would always look for communication in the direction of their market.

436. And where do they go now? To Warren.

437. And they used to go to Nevertire? Yes.

438. Then the Macquarie trade brings with it the Nevertire trade? A portion of it comes into Narromine; but I refer to the other tributary creeks of the Macquarie and the Castlereagh. They follow the line to the river to avoid crossing them.

439. And to accommodate that district a line should run in the same direction as the valley, north and south? I am not going to say that, but what I say is that Coonamble should have a railway. It is the centre of a sufficiently important district to justify the construction of a railway there. As I have not had the opportunity, personally, of investigating the whole of the routes, I should say that any route which can be found to be the best to Coonamble is deserving of investigation.

440. Supposing a line were constructed from Warren to Coonamble, it would still mean the construction of a line to the Macquarie to meet the view you have expressed? I think a westerly line would have to be built at some future time—that is, from Warren. I do not think the people holding the country on the creeks and rivers to which I have referred would be content to do without railway communication.

441. That is to say, that the Lower Macquarie must be provided for sooner or later? Yes.

442. Supposing you make an extension to Coonamble, not to Walgett, but further to the north-west, would that suit them? I do not think so, because you would miss most of the country which requires serving.

443. I mean an extension running pretty well due west or north-west from Coonamble;—would that not accommodate the country of which you have spoken? No; the country of which I have spoken would naturally send its produce to the shortest distance from the market.

444. That is to say, south of the line of which I speak? Yes.

445. None of that traffic would have to go more than 50 miles to get to Warren? People who own the traffic do not care very much about going back, especially when the traffic is to be carried by road. Of course, it is all a matter of opinion as far as that is concerned. I can only bring to bear the light of experience on the matter.

446. You do not see any strong objections to the route from Dubbo to Coonamble? No. I think that if railways are to be constructed, that is purely and absolutely as a matter of policy,—the matter is one for you gentlemen to judge of, and not for me.

447. Dubbo, I believe, promises to become a centre? Yes; but I do not see that the fact of Dubbo being a centre has any bearing on the construction of the line.

448. Mr. Jones, in a comprehensive report, proposed an extension from Young northwards to Dubbo, continuing thence to Werris Creek? He may have done so; but I can scarcely see what association Dubbo can have with the construction of a line from there.

449. That was proposed, and if it were carried out it would make Dubbo a very great railway centre? For what purpose.

450. The idea was to get across country from Werris Creek to the Southern line? But what object would be served.

- J. Harper. 451. One object was to accommodate the intervening country, another was to truck cattle to Melbourne, and another the conveyance of starving stock from dry country in dry weather? Of course that is for you gentlemen to judge of.
- 14 Mar., 1899. 452. Is not Dubbo more likely to become a centre than is Nevertire or Warren? I would not like to say that in Warren.
453. Have you travelled over the country between Dubbo and Coonamble, and the Northern line? Yes.
454. Is there a great deal of good land there? Yes.
455. Is it sure to be occupied? Yes.
456. And it must be supplied with a railway by some route or other? Most of the good land is to the east of the line.
457. Is it lying on the track of the Mudgee to Coonamble line? No; most of the good land is between Mudgee and the Castlereagh. That is good agricultural land. The good pastoral land is west of the surveyed route.
458. Then, a line north from Mudgee through Gulgong to the Castlereagh would accommodate that district? Personally—I am not speaking officially—I regard the construction of that line as a certainty.
459. Supposing we make a line from Dubbo to Coonamble, there must be some reason for making one from Mudgee to Coonamble? You will have to get over the claims of the people who live in that district. I do not know how the Coonamble-Dubbo line is going to satisfy people about Cobborah and Munderoran.
460. If a line went slightly north-east from Mudgee, would it go through good country? I do not think it would improve the character of the country a bit.
461. Is the land good? Yes; practically speaking, the greater part of the land between Munderoran and Mudgee is good. It is also good right out until you get to the Warrumbungles.
462. Where are the Warrumbungles? Approximately south of Coonabarabran.
463. Does the range run east and west? Yes, generally.
464. *Chairman.*] Have you been through the country between the proposed line and the Northern line? I have not travelled from Mudgee *via* Gulgong, and Cobborah to Coonamble. I have been in the district of the Macquarie River, and I have travelled from Dubbo, as closely as possible, to the route of the proposed railway. Prior to that I was over the road between the two places.
465. Have you been from Werris Creek to Coonabarabran? No.
466. If a line be made to Coonamble, do you expect to get the Walgett traffic along it? Personally, I do not think it will be long before the traffic goes to South Australia, if the locks are made on the river Darling.
467. You think, then, that the river navigation will be so improved that the river traffic will beat the railway traffic? I think so.
468. Do you find that the river steamers, at your present rates, undercut you from Bourke? They probably will. Of course, we are controlled by conditions, and as long as you have the trade of the river in the hands of people who are also the owners of river steamers, you are likely to have values cut to such an extent that no railway rates will meet them.
469. Are you at the present time under-cut by the river steamers at Bourke? We are, and unfortunately I am afraid that we are going to lose the whole of the south-western Queensland trade.
470. Are you under-cut at Brewarrina? Yes, whenever they have a river.
471. There are stations, then, which send their wool down the river? They have not done so for the last four years.
472. Do you think that competition will reach up to Walgett? I think so.
473. If that is the case, how is it that the lower Macquarie trade does not take to the river? They would have to go back to the river. Anything coming to the river comes in its natural direction.
474. It would pay them to go north if they could send their goods by shipload 25 per cent. cheaper? The loading would be generally in the direction of the railway. They could not carry back 25 miles so cheaply as they could carry 25 miles forward to the railway.
475. When you get any distance south of the railway, you are not afraid of the river competition? No.
476. Have you any definite feeling, as traffic manager, as to whether we should reach Coonamble *via* Warren or *via* Dubbo? My feeling is this: That as the Coonamble people to-day desire the extension from Dubbo, and as they have certain claims to a railway, they should be considered. At the same time, my opinion is that the claims of those who live in the district to the west of the proposed line would have to be considered, and so would the claims of the people to the east of the proposed line. I think that, with the powers the Committee have, they should be able to arrive at a conclusion as to what is the best thing to do.
477. But supposing we make a line from Coonamble to Dubbo, and hereafter make what you suggest—a northern line running down the valley of the Macquarie as far north as is necessary;—would not that better supply the people of the Macquarie than the mere construction of a line from Warren to Coonamble? Yes, it might probably serve the people on the Macquarie better; but there are other people who would have to be considered—the people who live north of the Macquarie.
478. You could carry the line north as far as the traffic would justify? Then you would simply run it into the other line.
479. Would not the people in that direction be accommodated by the Dubbo to Coonamble line? No; they would come into the natural drift of the traffic. It is a very involved question, and I should be glad if the Committee could solve it. As far as I am concerned, I am absolutely candid over the matter, and want to show what the difficulties are from my point of view.
480. Let us suppose that there is a line from Warren to Coonamble, and another from Mudgee towards Coonamble;—would those two lines satisfy the wants of the whole of the district between them? Until you get to the neighbourhood of Gilgandra I do not think you would have many claims pressing upon you. There is a slight difference in the rainfall between the western and more eastern country. On the other hand, they are discovering artesian water there, and they are improving the conditions of carrying stock.
481. Supposing we made a line from Warren to Coonamble, and then made a line from Mudgee northwards, there would still be a considerable piece of triangular country between them;—would they complain of want of railway accommodation? That would depend on how you ran the Mudgee line. You have a fairly good network of cross-country lines in the survey.

482. But they are not all intended to be made? No; they are all intended for consideration; and if I were in a position to discuss with you the relative merits of each, I would be able to express an opinion. I am in this position, that I have been asked to report upon a particular line.

J. Harper.  
14 Mar., 1899.

483. There is a large tract of country between the proposed line and one which would run from Mudgee to Coonamble;—do you think there would be any objection on the part of the Commissioners to your exploring it, with the object of giving us information which we ought to possess? I am not in a position to answer for the Commissioners. As a matter of fact they have to accept the Act as they find it.

484. Have the Commissioners ever been asked to get your report on the country, other than that which would be served by the proposed line? Not as far as the particular country which we are now considering is concerned. Of course, I take it that you do not wish to press me to disclose what are the secrets between the Minister and the Commissioners.

485. I want to know whether the Commissioners have any objection to your going, as their expert, into country other than that which would be served by the proposed line; take, for instance, the country from Mudgee to Coonabarabran, or from Mudgee to Coonamble;—if the Committee desire to obtain your evidence with reference to the class of country to be served there, and the traffic likely to be obtained, would the Commissioners object to your going there to make an examination? They would require to have regard to the Act as it exists, and that leaves absolutely in the hands of the Minister the question of determining the matter submitted to you. We have no voice in these matters at all. Certainly the Committee ought to have all these schemes under consideration.

486. *Mr. Dick.*] You recognise that the question of catering for the large area between the Western line and the northern and north-western country is a large one? It is.

487. You do not look upon a line from Dubbo to Coonamble as a full solution of the problem? No.

488. Have you been over the country from Muswellbrook to Cassilis? I have been over enough to enable me to judge of the general character of the country.

489. What is the character of the country? It is very rough country. It is not a country over which you could build a light line.

490. Do you know anything of the country between Muswellbrook and Merriwa, from a traffic point of view? No. A good deal of traffic comes in there. I have investigated that country as far as Jerry's Plains from Singleton, and I must say that the circumstances are not very favourable there for traffic.

491. What is the character of the country between Cassilis and Mendooran? There is a lot of mixed country there.

492. What is your opinion of the country from Mendooran towards Coonamble? There is a lot of good land there, but I have not examined it from the point of view as to whether it would be good land through which to build a railway.

493. If the proposed line were constructed, it would serve the tract from Mendooran to Coonamble? The people say so to-day. I do not know to what extent they might alter their opinion afterwards.

494. Have you considered, in your estimate of traffic, the possibility of that country being served by the proposed line? Personally, I do not think the traffic from Mendooran would come into the line between Dubbo and Coonamble. I do not think there would be sufficient inducement to carry goods a distance of 40 miles.

495. According to *Mr. Jones'* report, the distance from Coonamble, *via* Muswellbrook, to Newcastle, is 288 miles; the distance from Coonamble, *via* Dubbo, to Sydney, is 369 miles; if these figures are correct, and there is a distance of 81 miles in favour of the Coonamble-Muswellbrook route as against the Coonamble-Dubbo route, what effect would that have on the earnings of a railway, say in a total distance of 400 miles? If the produce were required to be taken to Newcastle for shipment—that is, if it were wool—the advantage would be about 15s. per ton. If it were stock, it would require to be sold probably at Flemington, and would, of course, have to be carried to Sydney. The market for the produce of those districts is not represented by the nearest seaport.

496. Has any officer of the Department ever gone over the route from Muswellbrook to Coonamble? No. It has never been considered by any officer of the Commissioners.

497. The grades are somewhat higher on the Northern line than they would be between Muswellbrook and Coonamble? Of course they would be very much higher on any line approaching Coonamble from the east.

498. *Mr. Trickett.*] Have you any detailed evidence as to the traffic likely to accrue to the line under consideration? I have a return which I will put in subsequently.

499. In a minute handed in by *Mr. Deane* the other day, the traffic estimate is put down at £11,867;—are those the results of your computations? Yes.

500. How far, in that estimate, do you extend your traffic to the north? I have a map, which I produce, which defines the trafficable area. It shows that the traffic would be drawn from about 40 miles north. The map shows the district 40 miles to the north of Coonamble—within 30 miles of Walgett—from which it would be drawn.

501. Do you look upon Walgett as a factor in this railway proposal? No.

502. Why not? In the first place, I do not consider that Walgett represents a very promising town for a railway centre. In the second place, I do not think the interests of Walgett are identical with those of Coonamble, and I do not suppose they ever will be.

503. From how far on either side of the proposed line do you think the traffic will be gathered? It will vary. I could not give a reply in specific terms.

504. How far from Dubbo to the north do you expect to get the traffic? About 12 miles. There is practically no traffic within that distance.

505. Do you think that the anticipated trafficable area will, in any way, conflict with other lines (say) for instance, the Narrabri line? No; it will not divert any traffic from there. It might bring in stock from Narrabri. The people about Mendooran claim that that line would serve them, and that they will come in to use it; but I have my doubts about it.

506. Why will they not? It is too far.

507. What distance? Some of the country is over 40 miles away.

508. What are your views as to the character of the country to be served by the proposed railway? A good deal of it is very rough and bad; that is, between Dubbo and Gilgandra. The country is very patchy along the proposed line. Going westward and northward it improves.

509.

- J. Harper. 509. How does the character of the country compare with that of the country between Warren and Coonamble? For pastoral purposes, as we understand pastoral country, there is simply no comparison. The comparisons are all in favour of the country between Warren and Coonamble; but for agricultural purposes, as we understand agriculture to-day, the Dubbo to Coonamble line offers the greater advantages.
- 14 Mar., 1899. 510. By reason of soil and climate? By reason of soil, so far as we know it.
511. If the proposed line of railway were constructed, would it result in any increase of revenue to the main or Western line of railway? No; it would result in a diminution of revenue.
512. Why? For the simple reason that a certain amount of traffic would be drawn from the already-constructed line from Nevertire to Dubbo. A certain amount of traffic will be drawn, and will go on the line from Dubbo to Coonamble.
513. Then it will result in a diminution of traffic in that direction? Yes.
514. To any appreciable extent? I have dealt with the matter in my estimate. I think it represents a difference of about £2,000.
515. That is rather a serious item? It is certainly one deserving of consideration.
516. The line, I believe, is estimated to pay working expenses? Yes, approximately.
517. Have you formed any opinion as to the probable expansion of traffic? No.
518. *Mr. Watson.*] I understand you to say that your estimate of the loss which would accrue to the main line, in the event of the branch being constructed, is about £2,000? I am only speaking from memory, but I will supply the Committee with an estimate.
519. Does that include the Western line and the Mudgee branch? No; it is the net result. As far as the Mudgee line is concerned, there would be a profit by the haulage over a greater portion of the main line. That is where the matter is rather intricate. For any traffic to be drawn from the Mudgee line you have to give the proposed line credit.
520. The estimate of revenue supplied by Mr. Deane shows that the receipts from freight will be £8,526; passengers, £1,975; parcels, £250; mails, £1,116; total, £11,867;—is that on the basis of through or local rates? Local rates.
521. You anticipate that it will be possible to collect local rates? I think we shall, generally speaking, be able to get local rates.
522. So that to the apparent loss of some £1,300 we should probably add the loss accruing to the main line? No; that estimate is absolutely the net result.
523. Inclusive of the probable loss on the working of the branch itself? Yes; there are no deductions to be made from that. The only thing I have to assume is that the local rates will be paid; but, as far as the figures are concerned, they represent really the absolute carriage we might anticipate on the line.
524. Leaving out of account any increase of traffic which might be brought to the main line, the net loss, through the construction of the branch, will be about £2,000? Yes.
525. Do you think there is likely to be much development in agriculture in the country through which the line will pass? I should say so. Our rates will be low enough to permit of it. There is a lot of good agricultural land.
526. Although we were informed by Mr. McLachlan that local traffic itself does not pay, I take it that if local traffic could be created it might increase the carriage on the trunk line? It would pay by reason of its encouraging the settlement of a greater population, and everything incidental to it.
527. And this loss might possibly be made good if there were a large increase of agricultural production due to the construction of the branch? Yes; but I want you to carefully weigh the question as to whether this is the proper direction for a line to develop agricultural settlement.
528. I understand you to say that there is no probability of an agricultural settlement for the first 30 or 40 miles from Dubbo? Thirty miles—until you get to Coolbaggie Creek.
529. Is there any good agricultural country from there to Gulargambone? It is good so far as chocolate soil is concerned.
530. You think it is wise to keep the line as near as possible to the river? I think so, for the purpose of serving the agricultural areas on the east.
531. So that the difference of a mile or two may be of importance in that connection? Yes, in the carriage of wheat.
532. I believe that the artesian area, so far as it is known, comes as far south as Gilgandra? I may mention that there is a bore at Warren, and also one on the Marthaguy Creek. The existence of artesian water has been proved in that part of the country.
533. I believe that the country between Gilgandra and Coonamble is assumed to be within the artesian basis? Yes.
534. Do you think there is any possibility of increased production by using artesian water in the district? It is quite possible to produce, but I do not know whether it would be a successful method of production.
535. It is not being tried on a large scale? No.
536. Of course, on a small scale it would not mean much, as far as railway traffic is concerned? No.
537. I take it that in the growing of lucerne and the watering of stock the distribution of artesian water might have a good effect on the pastoral industry? Yes.
538. Do you think the country to the west of the proposed branch is susceptible of improvement in that way? Personally, I look to the greatest pastoral future of the country west of the proposed line.
539. Amongst the expenses incidental to the construction of the line is a charge of 3 per cent. interest on the capital cost;—do you know whether that amount has been fixed by the Railway Commissioners? It is the usual amount adopted by the Commissioners.
540. Have you borrowed any money lately at 3 per cent.? I think so.
541. I believe some local loans were raised at 3 per cent.? Yes.
542. But the last London loan was at 3½ per cent.? I think 3 per cent. is a fair thing, because of the security which is given. As a matter of fact, if the railway were to be given as security for the loan, we could raise the money at 3 per cent.
543. Do you think that if the Railway Commissioners were borrowing on the security of their own property they could borrow money at that rate of interest? Yes.
544. *Chairman.*] I believe you went with Mr. Deane through the country traversed by the proposed railway? Yes.

545. Could you corroborate the following expression of opinion by Mr. Deane: that without expressing any opinion as to whether preference is to be given to the Warren-Coonamble, or the Dubbo-Coonamble route, the latter is very satisfactory? I would rather not say anything about it. I would not like to place myself in the unpleasant position of differing with Mr. Deane over the matter. J. Harper.  
14 Mar., 1899.

546. In part of their report, the Railway Commissioners state that Coonamble and surrounding district is entitled to railway facilities? I quite agree with that.

547. They further state: "And as the previously-proposed connection from Warren has been rejected by the Public Works Committee, we think that the route at present under review is worthy of consideration";—it is simply worthy of consideration, then, because the Public Works Committee discarded the Warren-Coonamble line? Yes; it was regarded by each and all of us who were on that particular journey that a railway to Coonamble was justifiable.

548. But the route from Dubbo to Coonamble was only justifiable on account of the rejection by the Committee of the route from Warren to Coonamble? No. That became the route which the Commissioners had to report upon after the rejection of the Warren to Coonamble route, and they thought so much of the claims of the Coonamble district that they said: "We consider that Coonamble is entitled to a railway, and that the claim of a route between Dubbo and Coonamble is entitled to consideration."

549. They did not express any opinion as to the preference of one over the other? No.

550. So that if the Committee rejected the proposal before them, and another Committee had to deal with a proposal to construct a line from Mudgee to Coonamble, the report would be somewhat similar to theirs? Of course that would depend upon what decision the Committee arrived at. To my mind it indicates that the question is an open one, and requires to be approached with a good deal of caution. I may mention, as illustrating how opinions differ, that the late Committee recommended that the proposed line between Dubbo and Coonamble should be kept more to the west for certain purposes. We, in passing through that district, after carefully regarding all the circumstances, and obtaining as much information as possible, came to the conclusion that it should keep more to the east.

551. Why did you come to that conclusion? For the reason I have tried to indicate, namely, that the better land, from an agricultural point of view, is to the east. Every mile you get further east, the better opportunities you give the people engaged in agriculture. It only shows how opinions will differ.

552. The further east you go, the more suitable is the land for closer settlement? Yes; you get into a better rainfall.

553. Therefore, in order to split up that country between the main Northern and the Western line, a line further east would be more likely to be useful? It would serve the bulk of the settlement. The country to the east represents the best agricultural land.

554. You say that you have been from Mudgee to Coonamble? Yes.

555. And it struck you that it was better adapted for small farming than the country west? Yes.

556. Have you any knowledge of the country east of that—the Coonabarabran country? Yes. From Coonabarabran north, you get into very bad country indeed—it is all brigalow scrub. To the north-east, in the direction of Gunnedah, the greater portion of the country is bad and indifferent. In a north-westerly direction towards Pilliga it is indifferent. About Coonabarabran there is some good country.

557. Do you think the construction of a railway to bring any traffic from Coonabarabran would be warranted? I do not think so.

558. Looking at the map it would appear as though the better way to split up that country would be by going from Mudgee to Coonamble? But the Mudgee line would not bring in the traffic.

559. If a line were constructed from Mudgee to Coonamble, could not a cockspur line be run out to Coonabarabran? Personally, I do not think it would be a desirable thing, in view of the difficulties of grade. It would be a very expensive matter to make a line from there.

WEDNESDAY, 22 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

The Hon. George Henry Cox, M.L.C., sworn, and examined:—

560. *Chairman.*] I believe you gave evidence before the Sectional Committee appointed to inquire into the proposal to construct a line from Warren to Coonamble? Yes.

561. Did you make a statement on that occasion? Yes.

562. Do you wish to make a statement with reference to the present proposal? The statement I would make would be almost similar to the one I made then. Before the line to Mudgee was constructed a league, called the Mudgee Railway League, was instituted for the purpose of urging upon the Government the construction of a railway from Wallerawang to Walgett. A line to Mudgee was never contemplated *per se*. It was considered that the line from Mudgee to Walgett would be the Great North-western line—not a branch line at all—and would give access to the metropolis for that very large tract of country between the Namoi on the one side and the Bogan on the other. I shall endeavour to show the Committee that the claims of a Mudgee-Coonamble line are very much greater than those of a Dubbo-Coonamble line. In the first place, I may state that the distance from the metropolis to Coonamble would be lessened 30 or 40 miles by going through Mudgee rather than by going round through Dubbo. That is a matter of very great importance. When the Railway Commissioners were questioned about the matter, they were merely asked whether they thought Coonamble was entitled to a railway, and they replied that it was. We can easily understand that when the Commissioners speak in that way they do not so much consider the benefit to the people of Coonamble as the benefit that would result to the railway system. If the Coonamble people were compelled to pay for an extra 70 miles carriage one way, and an extra 30 or 40 miles

The Hon.  
G. H. Cox,  
M.L.C.

22 Mar., 1899.

The Hon.  
G. H. Cox,

22 Mar., 1899.

miles carriage another way, it would mean, of course, so much money into the pockets of the Commissioners, but it would not be very profitable to the inhabitants of Coonamble. A line from Mudgee to Coonamble would be almost a straight line. If you put a ruler across the map you will see that from Sydney to Walgett by way of Mudgee, Cobborah, Mundooran, and Coonamble is almost a straight line. If you go round by way of Blayney, and then on to Dubbo, you make the distance 30 or 40 miles extra, for which the Coonamble people would have to pay for all time. I may state, in passing, that I am aware that some business people of the Mudgee district are somewhat opposed to the extension of the railway. That, of course, one can understand, because they have an idea that the terminus means a certain business to them for all time. All those who are connected with pastoral or agricultural pursuits, however, are strongly in favour of the extension. The reason is this: That instead of having, as they have now, but one market, they would have two markets—a market to Sydney and a market, at other times, to Coonamble. To show what an advantageous thing that would be at times, I may mention that, in 1888, we had a very severe drought. The earlier portion of the year had been a good one for agricultural purposes, and, as a consequence, we had very heavy crops in Mudgee. Crops of hay were being sold in Mudgee at 30s. a ton. At the same time, at Coonabarabran, which is only 143 miles away, they were fetching £20 a ton. It was almost impossible to carry hay from Mudgee to Coonamble, as, owing to the want of grass and water, the country was like a desert. I should like to refer to the unfortunate position in which the Mudgee line has been placed. When the Mudgee line was first surveyed, the surveyors went along the present mail-track. Of course, it can easily be understood that railway surveyors prefer a nice road for the horses and carts and other paraphernalia rather than broken country. They followed the main trunk road to Mudgee. They found that the descent into the Mudgee Valley was so steep that they would have to hark back. Consequently, they came back as far as a place called Ilford. There, they struck off at right angles to Rylstone. When we saw the plan we deprecated any such extreme angle as that, and waited on Mr. Whitton, to ascertain whether some deviation could not be made. We pointed out to him the position, and he said he thought it was possible that they might make a more direct line. We found out, unfortunately, that this was about the worst thing we could have done. We induced the Commissioners to send out surveyors, and they took a direct line through the valley of Capertee. The line over the Capertee Valley crossed a series of little hollows just under the rocky wall of the mountains. The formation was a jumble of rock, clay, sand, and gravel, all mixed together, and falling over the mountain side at an angle of about 45 degrees. When cuttings were made it was found that when the rain came the material slipped, and filled them up at once. Then the Government had to make another sub-contract with the contractor that he was to make a certain slope. This was done; but that was not sufficient, because the angle being 45 degrees the material still kept falling in. In the Capertee Valley there is a succession of ridges and valleys. All that the contractor had to do was to cut through one hill and fill up the next valley. In the specification, however, no provision was made for culverts. The result was that they had to make other contracts for the construction of culverts. That added very materially to the cost. Who was to blame, no one knows. I think very little was known by the community—that such a blunder had taken place. At last the railway was constructed, and the first heavy rains which came slipped all the cutting into the valleys, and filled them up. This occurred over and over again, and at last the Commissioners had to move the line further out of the way of the slips. The result is that now the rails, instead of being underneath the cuttings, are at the edge of the bank, and if a rock falls down, it falls on the old cutting, and no harm is done. The line now is perfectly safe; but this has all caused enormous expense and loss to the community. The loss in running the Mudgee railway line is, I think, about £20,000 a year. About £500,000 more was spent on the line than ought to have been spent. £500,000 at 4 per cent. means £20,000 a year. If the line had been constructed properly in the first place, it would have now been paying. It has, however, been handicapped with this extra cost, and is a loss to the country to the extent of £20,000 per annum. The only way to remedy this is to extend the line, and to get more traffic upon it. With more traffic upon it I believe it would be a paying line. If it were extended to Coonamble, I feel sure the extra traffic would make it pay. I may mention that even now the £20,000 a year to which I have referred is being gradually decreased, because the line would carry more traffic every year, and the loss which has been sustained hitherto is gradually decreasing. Mr. R. E. Jones was sent by the Government in the year 1890 or 1891 to make an exhaustive survey of the whole of the country to the westward. He had about twenty-three lines of railway to report upon. He sent in an exhaustive and well-written report. He stated that a line from Mudgee to Walgett, a distance of 210 miles, would cost £943,000. Since that time further estimates have been made, and the cost, I think, has been reduced to about one-half. Instead of costing £943,000, it would cost somewhere about £500,000. Mr. Jones, in his report, states:—

This is the first scheme under review to open up the large tract of country existing in the north-west. From Mudgee for 100 miles this line passes through undulating country, a large percentage of which could, if needed, be brought under cultivation. The district between Mudgee and Gulgong is well known for its agricultural products and fruit, especially grapes. The Goodiman Hills (the great dividing range of the Colony), lying between Gulgong and Cobborah, are at present unproductive to a large extent, but there is a fair amount of settlement towards Tallewang, with many patches of good land. In the valley of the Talbragar the soil is first class.

I may mention that since this report was published there has been a large increase of population on the Talbragar, and a large area of country is under cultivation. One selector who went on the Talbragar four years ago had 200 acres of wheat under crop last year, which gave a return of over 20 bushels to the acre. His neighbour had something like 50 acres of wheat, and so on all over that part of the country. This wheat, I need not say, was not grown upon the black soil of the Talbragar plains, but on the red soil—the gentle rises which run from the black soil. The black soil is not cultivated—only the red soil.

563. What is the area of the red-soil country? There is a large extent of it. About Cobborah there are some miles of this fine red-soil country. A great deal of it is now cultivated, and the people make it pay, but they take their wheat, not to Mudgee, which is about 50 miles away, but to Gulgong, which is only about 30 miles away. A mill has recently been put up there, and a large trade is done. A Mr. Young put up a mill two years ago, and I believe he has done remarkably well. After you leave Cobborah there is a piece of poor, scrubby country, with some good timber upon it. Then when you get towards Mundooran you get into very fair country—timbered country, with good soil for agriculture, on the banks of the Castlereagh. Crossing the Castlereagh you get into some really good country again. Here and there there are some ironbark ridges with good country between. Eventually, when you get down

down towards Goorianawa, you get into the fine black-soil country right up to Coonamble, but it is not so suitable for agriculture as the red-soil country. Mr. Jones gives a very fair description of the country right away to Walgett. On page 23 of his report he refers to the country which would be opened up by the Mudgee to Walgett railway. He is, however, a little mistaken in his remarks. He states that Coonabarabran, Goorianawa, and Calga, and other places only 78 miles from Gunnedah, send their wool to Gunnedah. That is a mistake. They send it to Mudgee, 150 miles away, because sending it to Gunnedah means sending it away from Sydney. They prefer, having put their bales upon the waggons, to send it to Mudgee, towards Sydney. The Coonabarabran traffic is with Sydney. Mr. Jones sums up his report as follows:—

Hon.  
G. H. Cox,  
M.L.C.  
22 Mar., 1899.

Mudgee to Walgett.—It will divide almost equally the unserved country, so that on either side nearly all will be within the influence of existing or proposed railways.

Will serve a present population of nearly 16,000.

I am sure the population has increased very considerably since then.

Will pass through the following important towns:—Gulgong, Coonamble, and Walgett, while Coonabarabran will be well served, also many other smaller townships, and the rising mining centre of Stuart Town.

Will develop the important agricultural resources of Gulgong. The Talbragar Valley, Warrumbungles, and Coonabarabran.

Will have a large fat-stock traffic, embracing as it does within its influence close upon 5,000,000 sheep, exclusive of any from Queensland, and as the Mudgee line is the shortest and most direct route to Sydney, it is not too much to assert that it would be taken advantage of more so than any of the other projects, all of which have a longer mileage to the metropolis.

Includes within its trafficable sphere about 12,000,000 acres, of which 9,000,000 are still unalienated.

Will give an increased value of at least £700,000 to Crown lands available for settlement at the expiration of present leases, leaving but £243,000 as the cost of the railway.

Will bring the present expensive branch to Mudgee into full use.

Mr. Jones has a very strong idea that the Crown lands will be very materially increased in value by the construction of a railway, and he contends that when those lands are disposed of, a certain proportion of the expense of the railway should be attached to those lands. He states, on page 2 of his report:

The most valuable factor, however, for consideration is the enhanced value given to all unalienated land within a reasonable distance of a railway—entirely due to the speedy and valuable transit facilities afforded by the latter. Why should persons on the usual conditions obtain land, the value of which is often doubled or trebled by the existence of a railway, and the State be expected to make and maintain such line at a loss? I certainly think that all unalienated lands within 20 miles of pastoral railways should be valued and converted into special areas, the increased amount over the payment that would be received were the line non-existent could be easily ascertained, and, if deemed advisable, credited to the cost of constructing the railway. This is no new idea, as may be seen by the following extract from the Railway Commissioners' Report, dated December, 1888.

I think in the recent legislation of the Legislative Council this was to some extent carried out. The Legislative Council insisted that the people benefiting by the construction of railways should contribute a certain amount so as to prevent any loss to the community. That system will be carried out in connection with the Koorawatha-Grenfell and The Rock to Green's Gonyah lines. Mr. Jones mentions the number of children at school along the route of this particular line at something like 4,000. I am quite sure that in the last eight or nine years that number has increased 50 per cent. There is much more settlement on the land. It is agricultural land, and will support a very large population. It has a fair average rainfall, and it has proved during the last year or two that it can grow large crops of wheat. No doubt that particular part of the country was highly favoured last year, for the crops were exceedingly good, with the result that the farmers of the district are now living under very favourable conditions. When Mr. Harper, of the Railway Department, was examined, he apparently ignored all the traffic which would be gained by this line, because Mr. Jones, in his report, says:

In trying to form some idea of the traffic for a line to Mudgee, I find the wool tonnage for existing sheep would be 2,044 tons, to be carried an average of 50 miles; 4,613, 143 miles; and 4,994 tons from Walgett, 210 miles.

Of course the traffic from Walgett we leave out, but 2,000 tons and the 4,600 tons would come to this particular line. No doubt it may be said that some of it comes now. The traffic comes now from near Coonabarabran all the way to Mudgee. I think, however, it is unfair to put it in that way, because those people who will bring their teams that long distance—150 miles to Mudgee—are perhaps able to do so, because wool is a valuable commodity. It would, however, be impossible for farmers to bring their produce that long distance. When you once get beyond Talbragar, about Cobborah, it ceases to pay to grow wheat. There are, however, large areas in the neighbourhood of Coonabarabran and about Munderoran which are very favourable to the growth of wheat.

564. Do you know the country between Dubbo and Coonamble? Yes; after you leave Dubbo the country is very poor indeed. Directly you get across the Talbragar you get into a miserable piece of country—poor, stony, sandy country, utterly useless even for pastoral purposes.

565. How far does the poor country extend? Right away until you get to the Marthaguy Creek, near Gilgandra. From there onward there are patches of inferior lands, but, generally speaking, it is good.

566. How does it compare with the land more to the eastward? After you leave the flats of the Talbragar you get into poor country until you get near to the Castlereagh.

567. *Mr. Watson.*] How do the grades on the Mudgee line compare with the grades between Wallerawang and Dubbo? I think in one particular place they are somewhat heavier; but the line between Wallerawang and Dubbo has been recently regraded. There is one place on the Mudgee line where the grade is somewhat steep. After leaving Rylstone you go over a gap, and the small engines used on the line have as much as they can do to drag a train.

568. That grade would be against the load to Sydney? Yes; but it can be obviated by a very slight deviation.

569. Would not the cost of construction between Mudgee and Cobborah be pretty heavy? No; it is undulating country. With the exception of the Goodiman Range it is fair country for railway construction.

570. The evidence already given is to the effect that the cost of construction between Mudgee and Gulgong, and, perhaps, to Cobborah, would be extremely high? That is not the case. I think it would cost more than we are at present expending on level lines—£2,000 a mile. No doubt it would cost £3,000 per mile, because the country is not level, but undulating. When you once get on to the Talbragar, and with the exception of a little ridge after you leave Cobborah, you are on a level grade all the way to the Darling.

- Hon. G. H. Cox, M.L.C.  
22 Mar., 1899.
571. Where are the ranges known as the Warrumbungles? That is an isolated range north-west of Coonabarabran.
572. Do you know anything of the amount of Crown land between Mudgee and Munderoo, along the proposed line of railway? I only go by Mr. Jones' reports. He says that out of 12 million acres there are 7 million of Crown lands.
573. That report was made in 1890, and there will have been considerable alterations since then? Yes; in the way of selection, no doubt.
574. Do you think the present loss of £20,000 per annum on the Mudgee line would be made good if that line were extended to Coonamble? Yes; the Railway Commissioners have come to the conclusion that it is better to take railways into agricultural than into pastoral country. In pastoral country you get the whole of the traffic in three months of the year, whereas in agricultural country you get a certain amount of traffic the whole year. Although the railways charge less to carry farm produce than to carry wool, it pays the Department better to go into agricultural than into pastoral country. I feel sure that the agricultural industry would increase enormously if the Mudgee railway were extended.
575. You think there will be an extension of wheat-growing beyond the Talbragar if the Mudgee line is extended? Yes; I feel sure that the £20,000 now lost on the Mudgee line every year would be gradually wiped off. It is being wiped off even now, because agriculture is increasing to a large extent. I feel sure that with an extension of the line the loss will eventually be wiped out.
576. Do you rely for the extinction of that loss solely upon the extension? It would come much quicker with it.
577. You think the extension would help to extinguish the loss? Yes.
578. We have it from Mr. McLachlan that local traffic, which, I presume, would be the leading feature of the line, does not pay to any material extent? They all say it does. If you speak to the Railway Commissioners about the apparent invidious way in which they treat pastoralists as compared with agriculturists, and tell them that the agriculturists pay such very low rates, which must entail a loss, they reply that no produce is carried at a loss.
579. I understood Mr. McLachlan to say that local traffic, generally speaking, did not pay, as there was so little of it; if that is correct, it is an important factor in the proposition which you are advocating, because it would be mainly upon local traffic that you would depend to make good the extra cost of construction involved in the longer length of line? If we are gradually decreasing the loss on the Mudgee line, it shows that the local traffic does pay. The loss in the first instance was £30,000, and it is now £20,000 per annum. That shows that the local traffic does pay.
580. I understand you yourself to say that there is a considerable amount of traffic accruing to the Mudgee line which is through traffic; according to my understanding of Mr. McLachlan, local traffic would mean traffic which accrues to the line between Mudgee and Wallerawang; the terminal traffic would be regarded as through traffic? The traffic between Wallerawang and Mudgee amounts to next to nothing. That part of the line goes through an almost uninhabited country.
581. The statement of Mr. McLachlan was that, generally speaking, local traffic does not pay, and that the construction of the extra length of line would only be justified on the score that it would attract sufficient local traffic to make good the difference? I contend that the extension of the line would so add to the agricultural traffic that it would pay, and pay well.
582. You think, then, that the construction of the extra length of line would be justified? Yes. There is good agricultural country right away to Coonabarabran. There is good soil, and there is a good rainfall.
583. Are you charged through rates from Mudgee to Sydney? Yes.
584. Notwithstanding the loss? Yes.
585. I understand that, as a general rule, local rates, or extra charges for a local line, are imposed in cases where those lines do not pay? The pastoralists have to pay pretty smartly for the carriage of their wool from Mudgee to Sydney. They could not possibly carry by teams; therefore, they have to put up with it.
586. You think that they pay extra as compared with the smaller distances on the western line? Yes. It costs them 30s. a ton to send their wool from Mudgee to Sydney. It only costs 8s. 9d. a ton to send hay or wheat the same distance.
587. That distinction applies to all the lines? Yes.
588. What I want to know is whether there is a greater charge per mile between Mudgee and Wallerawang than over a similar distance on the western line? I could not say.
589. You say that a line from Dubbo to Gilgandra would, for the first 40 miles, pass through inferior country? Yes.
590. Is it a fact that by taking the line a little further to the west, *via* Gilgandra, better country could be obtained? That I could not say.
591. *Mr. Dick.*] You state that the line you favour, from Mudgee to Coonamble, and thence on to Walgett, is designed to serve that tract of country between the Bogan, on the one side, and the Namoi, on the other;—have you ever considered that that country, from a geographical point of view, seems designed to find an outlet for its produce at Newcastle? It does not seem so by the present course of traffic. As I have stated, the produce from the north of Coonabarabran, instead of going into Gunnedah, goes to Mudgee.
592. You have stated that the distance from Coonamble, *via* Dubbo, to Sydney is 30 or 40 miles less than the distance *via* Mudgee? Yes; it means that the Coonamble people would have to pay for all time for an extra 30 or 40 miles of line.
593. Reasoning in the same way, I would point out that the distance from Coonamble, *via* Muswellbrook, to Newcastle is 60 miles shorter than the distance from Coonamble, *via* Dubbo, to Sydney;—do you think, other things being equal, it would be more advisable to connect Coonamble with Newcastle than with Dubbo? No; as a rule nearly all the traffic centres in Sydney. Two-thirds of the wool now grown in the country goes to Sydney. If it went to Newcastle it would come on to Sydney.
594. There is a good deal of wool shipped from Newcastle? And a large quantity comes from Newcastle to Sydney.
595. Does no wool go from Baradine and that district to Gunnedah? All that wool comes from Mudgee. The Goorianawa, Calga, and other brands all come to Mudgee.
596. *Dr. Garran.*] You say that the black soil will not pay for cultivation? No, it is too deep; it dries up too quickly. There is no bottom to it.

Hon.  
G. H. Cox,  
M.L.C.

22 Mar., 1899.

597. Is the country between Warren and Coonamble black soil? Yes.
598. Does it grow wheat? No.
599. Then a railway there would not develop cultivation? No.
600. Supposing the Dubbo-Coonamble line is made, do you think it will prevent the line from Mudgee being extended hereafter? I am afraid it would materially interfere with it.
601. Do you think, if the Warren to Coonamble line were made, it would prevent the extension of the Mudgee line? No; but it would have the effect of saddling the unfortunate Coonamble people with an extra 70 miles of trainage for all time. In addition to that, there are no less than thirteen creeks between Warren and Coonamble which will have to be crossed.
602. I understand your advocacy of the Mudgee extension is not so much for the sake of Coonamble as it is for the sake of the intervening country? Yes.
603. If we had an extension from Mudgee, would it not be as well to keep midway between the two lines shown on the map as much as possible? It would do so.
604. How far is it across country from Cobborah to Dubbo? About 50 miles.
605. How far is it from Cobborah to Werris Creek? About 150 miles.
606. Then Cobborah is not midway between the two? No.
607. If we went from Mudgee, would it not be well to go to the east? The difficulty would then be in the country. The difficulty in making a railway from Dubbo or Wellington is the ridges at the head of the Coolah Creek.
608. You can go from Mudgee to Coolah without difficulty? Yes.
609. But you could not go north? No.
610. I understand you to say that north of Coonabarabran there is the Warrumbungle Range? That is only an isolated ridge.
611. Can you go round it? Yes.
612. How would the country between Mudgee and Coonabarabran do for a line? That, excepting that it makes the line somewhat longer, would be better, because on the river at Coonabarabran there are pieces of exceedingly good country, although at the same time there is some very bad country.
613. Supposing we went from Mudgee to Coonabarabran, we could still go to Coonamble if we liked, or direct to Walgett? Yes.
614. And we should not go very far from Coonamble then? No; but Coonamble is a more important centre than Coonabarabran.
615. A natural centre? Yes.
616. We could go from Coonabarabran to Coonamble? Yes.
617. If a line were made from Mudgee to Coonabarabran, and then to Coonamble, what then? It would simply mean so much longer for the Coonamble people to travel.
618. What about the intervening country? There would be no great traffic.
619. Is the country between Mudgee and Coonamble by the direct line distinctly superior to the country further east? Yes. About Coonabarabran there is some very good land, and also some exceedingly inferior land.
620. The Coonamble people, I suppose, are getting a little impatient? Yes.
621. If the line from Warren to Coonamble had not been reported against, I suppose it would have been constructed by this time? I can assure you that the Coonamble people have always been in favour of being connected with Mudgee.
622. They seem to be ready for any line? Any line if they can get it. Some time ago there was a league there, and the whole of the people were in favour of being connected with Mudgee rather than with Dubbo.
623. But were they not in favour of the Warren line then, whilst now they are in favour of the Dubbo line? They would much sooner be connected with Mudgee and Cobborah than with Dubbo.
624. Do you not think that it will take a much longer time to make the Mudgee to Coonamble line? No doubt, because it would be a longer line to construct, but it would benefit a much larger district. If you commence the line at Dubbo you will benefit no one at all. Directly you start from Mudgee you benefit the country between there and Gulgong, and then on to Cobborah.
625. The Railway Commissioners estimated that a line from Warren to Coonamble would just pay its way? I do not think it would. I do not like to assert my opinion against that of the engineers, but I do not think they consider the enormous expense of construction between Warren and Coonamble owing to the flooded country and the fact that thirteen bridges would have to be constructed.
626. It is now proposed to make a longer line from Dubbo to Coonamble, and there we are faced with a slight deficit;—if we went from Mudgee we should have a still longer line, and a still bigger deficit? No. My impression is that it would be the best paying line of any.
627. It would not matter if we spent a larger sum on the Mudgee extension so long as we get a larger profit;—do you think the larger profit would compensate for the larger capital spent? Yes; because every mile you made on the Mudgee route would add to the settlement. You are in good country as soon as you leave Mudgee.
628. One witness speaks of the land in the Talbragar as very poor? It is exceedingly good all the way from Mudgee to Cobborah, with the exception of an ironbark ridge.
629. I suppose you mean that that part where the line would cross the Talbragar valley is good? Yes.
630. Are there other parts of that valley which are good? It is all good until you get to the other side.
631. One witness has stated that all the way from Coolah to near Dubbo the country is poor? Yes; all the good soil comes from the Liverpool Range. When you get a few miles below Cobborah the good soil ceases, and the country is no good at all. There is hardly any good country between Dubbo and Cobborah.
632. But east of Cobborah it is good? Yes.
633. As far as the washing of the black soil has reached? Yes.
634. Do you think the Mudgee extension would really give us local settlement and local traffic? Yes, undoubtedly. It only awaits the construction of a railway to become very thickly populated. As I have stated, you cannot at present cultivate beyond Cobborah, because it will not pay to bring the produce to market.
635. How has that country stood this year of drought? Very well, indeed. There are very fine crops there this year. We were fortunate, because we had very fair rains.
6. Have the crops at Cobborah been paying? Yes.

- Hon. G. H. Cox, M.L.C.  
22 Mar., 1899.
637. Could you grow wheat at Mundooran this year? Yes.
638. Where does the Mundooran wheat go? I think what little there is goes to Coonabarabran, where there is a mill. It is chiefly grown for local requirements.
639. You are of opinion that neither the Warren nor the Dubbo line should be made? I contend not.
640. Do you think the Coonamble people would patiently wait until the Mudgee extension was made? From the very commencement they have advocated a connection with Mudgee, and they are doing it to this day.
641. I understand you to say that there is no long stretch of bad land between Mudgee and Coonamble, excepting a few miles here and there? That is so.
642. Is the gradient easy after you get to Cobborah? When you do get over the gap beyond Cobborah it is almost level country.
643. Is no part of that country flooded? No; you do not get to the flooded land until you get below Coonamble. When you once get on to near Walgett you get into flooded country.
644. How far from the river bank does the flood extend? About 6 miles.
645. Your opinion is that, notwithstanding all the surveys which have been made, it would be good policy to abandon the other two proposals and adhere to the Mudgee extension? Yes; I think the country has done perfectly right in going from Narrabri to Moree, instead of turning off and going to Walgett.

FRIDAY, 12 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Hon. George Henry Cox, M.L.C., sworn, and further examined:—

- Hon. G. H. Cox, M.L.C.  
12 May, 1899.
646. *Chairman.*] Since you were here before have you had an opportunity of examining any more of the country between Mudgee and Coonamble? No; but I have had an opportunity of speaking to a number of people in reference to this matter, and have got some information which I think it is desirable to give to the Committee.
647. Would the line from Mudgee to Coonamble pass through more privately-owned land than the Dubbo route? Yes.
648. Then the cost would be increased considerably on account of the necessary land resumptions? I think not; the people there are so anxious to get this line extended that landowners whom I have seen are prepared to give their land free. I have here two letters in my possession which I should like to read to the Committee. I have seen two or three other gentlemen, whom I requested to write to me, but at present I have not yet received their replies. Here is a letter from Guntawang, which is owned by Mr. Richard Rouse, as follows:—
- Guntawang, 25 April, 1899.
- My dear Cox,  
Yours of the 22nd instant to hand by yesterday's mail. It struck me that the Commissioners were much impressed with the route Mudgee to Coonamble, and said there was no doubt about the country for settlement, but the extra cost of constructing the line was the obstruction. However this does not hold good, for the line from Dubbo has little or no settlement to be looked forward to. As to the railway line coming through this property of mine, I am quite willing to give the land, which has been surveyed for the line from Mudgee to Coonamble.
- I am, &c.,  
R. ROUSE.
- We ought to get this boon, and I am hopeful.  
To The Hon. G. H. Cox, Burrundulla.
- Messrs. George and Richard Rouse own some land through which the line will pass, and they also informed me last week that they are prepared to give the land free of charge.
649. *Mr. Levien.*] What is your opinion of the land? Mr. Rouse's land is fine, rich, red soil. The line which passes through his land does not interfere with his river frontage. It is at the back of his land, and therefore it really does not cause any loss by severance.
650. Is it rich, valuable land? Yes.
651. *Chairman.*] Is it suitable for closer settlement? Yes.
652. *Mr. Levien.*] If it were put up for sale by auction how much would it realise? £2 or £3 an acre. I have another letter as follows:

Galambine, Cullenbone, 27 April, 1899.

Dear Sir,  
As there are two lines surveyed through my property, one of them cutting off all my back land from the water which of course would make it almost useless to me, I can hardly see my way to give my land for nothing, but would be quite willing to exchange the land taken for an equal quantity adjoining. The other marks interfere in no way with my water, and I would be quite willing to give them free.

I am, &c.,  
J. R. ATKINSON.

Hon. G. H. Cox, Burrundulla.

There is another gentleman through whose land the line will pass—Mr. Lowe—who will give any land that may be wanted for railway purposes free. Those are the only people in the neighbourhood of Mudgee whom I have had an opportunity of seeing, but I know their example will be followed by all the others through whose land the railway will pass.

653. Would it pass through any land of yours? Yes; through about 2 miles.

654. Would you do the same? Yes; I promised that at the last meeting of the Committee I attended. I think my example has probably influenced these gentlemen, because I mentioned, when writing to them, that I would give my land free, and they have taken the same view.

655. *Dr. Garran.*] Is there any railway committee in Mudgee? Not now.

656. Could such a committee be formed to negotiate with the other landowners? Yes; that could be done. We have been in communication with the Coonamble people recently, and have requested them to give their countenance and support in this matter.

Hon.  
G. H. Cox,  
M.L.C.  
12 May, 1899.

657. *Mr. Shepherd.*] Is there much unalienated land on the Mudgee to Coonamble line? There is a great deal. I can only go by the report of Mr. Jones, whose report is here, and I referred to it the last time when I gave evidence. I think he says there are something like 7,000,000 acres unalienated.

658. Would not that depend upon the distance from the line on either side? Of course, that would refer to land which would be benefited by the railway. He would not go beyond a certain distance, probably 15 miles.

659. Is it fairly good agricultural land the whole way? No; there are portions that are not good. There is no part of Australia where you would get 140 miles of good land all the way. But the land all the way from Mudgee to Cobborah, with the exception of one ridge which divides the waters that flow into the Talbragar and Cudgegong Rivers, is all good land. Even that ridge is good in one way, because there is fine ironbark timber there which would be good for sleepers.

660. Is the land generally suitable for wheat-growing? Yes; it is deep red soil. The red soil which is cultivated in Riverina is a sort of sandy loam, totally different from the red soil I speak of. This is all red volcanic soil, deep and full of fertility. I do not want to run down the land in the Riverina, but the sandy loam which they are now cultivating there will not bear many crops without manuring. On this line the soil is volcanic, whereas the soil in the Riverina is merely washings. The soil on this line is eminently suitable for wheat-growing. In view of federation, most of these lands which are now largely occupied for wheat-growing in the Riverina would be more immediately connected with Melbourne, and, when the restrictions are removed, almost all the wheat will go to its nearest port, which is 200 miles away, whereas Sydney is 400 miles away. Therefore, it will be very necessary for us to encourage by all the means in our power the wheat-growing capabilities of our own districts, which must necessarily send their wheat to our own ports. I think that is a matter of considerable importance.

661. *Dr. Garran.*] Does not the Riverina wheat go to Melbourne in bond now? I daresay it does about Corowa.

662. Has there been any amount of wheat cultivation between Mudgee and Coonamble? Yes; not beyond Cobborah, because there is no means of getting to a market. Cobborah is between 40 and 50 miles from Mudgee, and their market is at Gulgong, where there is a mill. There is also a mill at Coonabarabran, but it is only a local one.

663. I want to know whether wheat has been grown on that land for a considerable time, in order to ascertain if the land is suitable for the purpose? No; but it has been grown on the land about Gulgong for many years, and that is just the same sort of land.

664. Does the soil there show any signs of giving out? No; there is no diminution in the yield.

665. Do you not remember that land around Camden and Campbelltown in the early days grew very good crops of wheat for many years? Yes; but eventually it was worked out.

666. But not for a good many years? Yes; but that was a much stronger soil than the Riverina soil.

667. The soil I am speaking of was not a red soil? No, it was strong clay soil. I lately visited another very large wheat-growing district—Grenfell—where, on one estate alone, 12,000 acres are cultivated, adjoining another estate where 9,000 acres are grown. One estate was owned by Mr. Greene, and the other by Mr. Wood.

668. What sort of soil is that? Very light; it is granite country. That gives very nice crops at present, but I ventured to tell those gentlemen that unless they went in for mixed farming and manuring, their crops would not continue to give much return. There is no body in that kind of soil.

669. *Chairman.*] I think you said there was more agricultural land on this line than on the Dubbo to Coonamble line;—of course, here there is a longer length of line, but is there a greater proportion of good agricultural land on the line from Mudgee to Coonamble than there is on the line from Dubbo to Coonamble? Infinitely greater.

670. What is the rainfall? Very good. There is an average of about 26 inches of rain over the whole of that district. Near Coonabarabran it is up to 29 inches. That is on account of the peaks breaking the clouds. It has also been said before, and remarked upon, I think, by the Commissioners on their trip, that directly you start from Mudgee the good land begins and continues for miles; but when you start across the country from Dubbo there is miserable country for 40 or 50 miles. It is quite useless for agriculture or pastoral purposes,—that is between Dubbo and Gilgandra.

671. Have you no hesitation in saying that a line from Mudgee to Coonamble will open up a large quantity of good agricultural land which will contain a big population? Yes.

672. Do you say that those conditions do not exist on the route from Dubbo to Coonamble? Certainly not. I may mention that the Commissioners in their report speak very favourably of the country through which they passed, but they really did not see a large portion of the very good country which this line would tap, that is, the land lying to the south and to the south-west of the Warrumbungle Mountains. They missed all that. It is almost the finest country that can be seen.

673. How far is that from the line? It is within 15 or 20 miles; in fact, I think it would be desirable to make a little detour in order to get into this country, and to keep a little to the north of the surveyed line. That would pass Mundooran a little to the right.

674. *Dr. Garran.*] What makes that country so rich about Coonabarabran? It is all volcanic.

675. Is it composed of washings from the Warrumbungle Mountains and is therefore volcanic? At Coonabarabran East no washings have come there, and the soil is very poor.

676. Does not the eastern side get as much rain as the western? Yes.

677. Is it not similar rock? It is sandstone on that side of Coonabarabran. There is another matter of very great importance. The leases of a great many of the large stations in that district will soon expire. For instance, there is a station belonging to Mr. Brown, Tandaburine, which is composed of remarkably good land. It will fall in next year. When it is thrown open, there will be a wonderful rush to get farms there. But what will be the good of people taking up land there for farms unless they have a railway.

678. *Mr. Levien.*] But will the Government throw it open? There will be such a clamor for it, that they will be sure to do so.

679. Will there be a larger area of farming land within 10 or 15 miles of the line which you recommend than on the line from Dubbo into Coonamble? Yes. This land away from the Castlereagh River is richer than the land on the river, and it would carry a larger population. It is because I wish the Committee to have the evidence of a gentleman who thoroughly knows all that country that I asked the  
other

Hon.  
G. H. Cox,  
M.L.C.  
12 May, 1899.

other day that the Committee should get evidence from Mr. Vincent Dowling. I do not pretend to know anything of the country beyond what I have spoken of. That gentleman, however, knows every mile of the country. I only know the country as far as Mundooran, and around the Warrumbungle Mountains.

680. *Chairman.*] Is there high land north of Coonabarabran? It is all level land. This curious mountain at Warrumbungle rises out of a plain and towers up in great peaks.

681. Do the head waters of the different creeks come from that mountain, some north and some south? Yes.

682. Apparently there is a range in there? There is no range; it is simply an isolated mountain peak, unconnected with any range whatever.

683. *Mr. Shepherd.*] What is about the average yield of wheat in the vicinity of Mudgee? I think I am quite within the mark in saying that it is over 20 bushels to the acre. Last year on two farms, on which I have tenants, the yield was respectively 44 and 46 bushels per acre. Of course that is only a small portion. It happened to be a dry year, and the land consists of rich river flats. In a wet season it would have been all spoilt.

684. Is there a considerable quantity of lucerne grown there? Yes.

685. What is the yield? Six crops in a year, and the average is about a ton per acre per crop.

686. That is a good yield? Yes. Lucerne is a wonderful plant. There is no other plant which has been introduced into the Colony which gives anything like such a good yield.

687. *Dr. Garran.*] Is it very exhausting to the soil? No; its roots go down 8 or 10 feet. The last three years have been rather disastrous years in the country, and there has been a great demand for lucerne. The yield in my district during the last three years has given a net profit of £8 per acre per year.

688. *Chairman.*] Is the Mudgee Railway line considered to be a paying line just now? No; it is quite the reverse.

689. What effect would a continuation of that line to Coonamble have? I am quite sure it would make the railway a paying line. It is gradually paying better year after year. But the limit is so slight that unless it is extended I do not think it will ever be a paying line. I think I remarked in my evidence before that the loss on this line is attributable to the enormous outlay which was made. £500,000 more than ought to have been spent was spent on that length of 84 miles, and that amount, at 5 per cent., means £20,000 a year. That is just the loss which the country sustains by the additional outlay which was made.

690. *Mr. Dick.*] That would be the loss for all time on that section? No doubt; but to recoup the present loss of £20,000 a year I am quite sure it is only necessary to extend the line, because we should then have a largely increased traffic.

691. *Chairman.*] Do you think that an extension of the line to Coonamble would convert it into a paying line? Yes, and I think the Commissioners are of that opinion too.

692. Besides being 34 miles nearer to Sydney than a line from Dubbo to Coonamble? Yes.

693. Would it be an advantage to the Coonamble people? Yes; and they would be heavily handicapped by having to pay for 35 miles extra for all time if the other line were made.

694. *Mr. Trickett.*] The line from Mudgee to Coonamble is 54 miles longer than the line from Dubbo to Coonamble, and it will cost £272,000 more;—have you looked at the question from that point of view, as to whether the game is worth the candle? I have, and I think the Railway Commissioners, who are much more interested than I am, have looked at it from the same point of view, and they have come to the conclusion that the Mudgee line would be the best paying line. Of course, I would prefer that they should be asked their opinion rather than that I should give mine.

695. Have you gone carefully into the matter? No; I am not sufficiently an expert to be warranted in giving an opinion.

696. But, generally, you think that it would conduce much more to the traffic of the main line, and also bring a great deal more land into cultivation than a line from Dubbo? Yes; at present no land beyond what I have now described can come into cultivation, because it is no use trying to grow grain unless you have a market. The land is cultivated on the banks of the Talbragar, because a mill has been established lately at Gulgong, and they have only to carry the grain 30 miles instead of 50 miles. To travel even 30 miles is a big handicap.

697. *Mr. Levien.*] What kind of soil is there along the Talbragar? It is black and red soil; they never attempt to cultivate black soil.

698. It would be better to cultivate that sort of soil than the yellow soil in the western country? Yes. From Dubbo to Gilgandra is a desert; it is a big ironbark scrub.

699. *Mr. Trickett.*] Has Coonamble long been looked upon as an objective point to carry a railway from the Western line? Yes; it is the centre of trade.

700. The only question is which is the best route to choose for connecting with the main line, so as to divide the country in a suitable manner;—do you think the Mudgee line would be the best? I do not think there can be any doubt about it. Anyone looking at the map will see that a line from Mudgee would divide the country between the Macquarie, the Bogan, and the Namoi pretty fairly in half. It would not do so quite fairly, because you cannot go much to the right without getting into rough country. As to the dotted line shown on the chart, I am not in a position to speak decidedly; but I think if there were a little detour to the right it would come into better country than if a straight line were maintained.

701. If a line were constructed from Dubbo to Coonamble would the people to the east of the dotted line about Coonabarabran be in any way benefited? Not the slightest.

702. Do you look upon the land about Coonabarabran as a district which should have railway communication? Yes; it is a shame to get people to go on that part of the country without giving them the means to get to a market.

703. You must regard it as a good thing that the line from Warren to Coonamble has been negatived? Yes. When the Mudgee people many years ago were striving for railway communication they did not look upon the line to Mudgee as a mere branch, but their object was to get a line from Wallerawang on the Western line to Coonamble and Walgett, by way of Mudgee. Mudgee was not the objective point. All the people of Mudgee are quite aware that it would almost have been better to start the railway from Mudgee outwards rather than to come to Sydney. It would have been a far better market for them.

704. Mr. Jones in his report in 1891 seemed to favour the Mudgee line? Yes, very much, and he took a great deal of trouble. It is a most exhaustive report, and he deals with a number of suggested lines.

705. *Mr. Dick.*] Where does the trade of Coolah, Dunadoo, Cobborah, and Mundooran go to at present? To Mudgee.

706. So that the Mudgee line gets that trade already? Yes.

707.

707. As far as the paying qualities of the line are concerned, an extension to Coonamble from Mudgee would not affect that as far as those points are concerned? No doubt. But I contend that the making of the line would increase the trade very much.

708. That trade which the line already has will not go to make up the loss of £20,000 a year? No; it is the increased traffic by settlement which will cause the loss to be recouped.

709. How does the rainfall from Mudgee to Dunadoo compare with that from Dubbo half-way up to Coonamble? I think we have a better rainfall, although it is only a few miles apart. It is extraordinary how much difference it makes. I have a rain-gauge at Dunadoo. I have a station there called Pine Ridge. Then there is a rain-gauge at Mudgee, another at Coonabarabran, and at other places, and they are as near as possible on the same footing. The average is 26 inches. I think at Coonabarabran it is a little more—29 inches.

710. What are the ruling grades on the 84 miles of the Mudgee line? Some of the grades there are, under the old system established by Mr. Whitton, 1 in 40. I think his surveyors were told "Make the line as cheap as possible, but not to exceed 1 in 40." There is one grade of 1 in 40 on that line.

711. Will not all the traffic have to go over the heavy grades of the Blue Mountains? Yes. Very small engines are running on the Mudgee line now; they are too small.

712. Then for all time that traffic will have to get over two sets of heavy grades? Not for all time, for I am sure the Commissioners will regrade that line, as they have on the Western line.

713. Would it not be very expensive to regrade 84 miles? It is not 84 miles. These bad grades are only on certain places. There is really only one place with a bad grade. There was a mistake made going from Wallerawang into the Capertee valley on the eastern side of the range. Under the high range it is rotten country. The line is just running through the debris of the precipice at an angle of about 45. It consists of clay, sand, and rocks. When you get wet weather it all falls in, and fills up the cutting. To avoid that, the Commissioners have now made another line outside that line on the edge of the embankment, so that any slips now come down on the old line of railway, and it has made the present line quite safe. Between Rylstone and Louie you cross a gap called the Tombong Gap, about 8 miles from Rylstone; you get down into the valley, and the grade is 1 in 40 for some distance. That is the back grade.

714. *Mr. Watson.*] Could that be avoided? Yes; by going round a little, instead of direct.

715. *Mr. Dick.*] How many miles would be involved in that deviation? About a mile.

716. *Dr. Garran.*] If the line which you advocate were made, giving a line north of Mundooran, would that be sufficiently near to the settlers on the good land on the Castlereagh to be available for them? Yes.

717. Would they be more than 15 miles from a station? I am afraid they would.

718. If you tried to catch the good country, would the railway lose the Castlereagh country? No; it would be a reasonable distance from the Castlereagh. It is better country there than on the river.

719. Would it throw them out? No. The projected railway does not go immediately on the river. The river winds about, and the railway takes a fairly direct course.

720. If the line which you advocate were carried out, would it tend to distribute the trade better on the Western line than a line from Dubbo would? Yes. I do not want to speak of Walgett, or cause any antagonism. If we wait until we get our line to Coonamble, and the people have their own choice, I am quite sure what their choice will be.

721. *Chairman.*] Mr. Dick asked you if the trade from Dunadoo, Cobborah, and Mundooran already found its way to Mudgee? Yes.

722. Is the best use being made of the land about there? No.

723. Therefore, if the railway is constructed by the route you advocate, the land about those places will be put to a better use? Yes.

724. Therefore, there would be more traffic drawn in from those places to Mudgee? Yes; if the population did not increase we would not be justified in making the railway, because we get that traffic already. But my contention is that the traffic will so enormously increase with the increase of population that the railway will pay handsomely.

725. Do you anticipate that all that country about Dunadoo, instead of carrying sheep, will then carry men? Yes; instead of carrying a sheep to the acre it would then carry human beings, and civilisation would follow.

726. Would there be considerably more agriculture? Yes.

727. Have you been at Gilgandra? Yes.

728. Is that on the eastern bank of the river? Yes.

729. Do you know whether at Gilgandra the settlement is on the eastern bank of the river? Of course, the river is only a mere big channel.

730. On which side of the river is the better country? To the east.

731. At Gilgandra there would only be some 18 miles, according to the map, from the surveyed line *vid* Mudgee to Coonamble? Yes; that is within a reasonable distance. Anything within 20 miles is a reasonable distance even for agricultural produce to be carried.

732. So that assuming that the good country going up from Dubbo did start at Gilgandra, then the people there would be nearly as well served near Gilgandra by the construction of the Mudgee line? Yes; very nearly.

733. And the good country will be better served? Yes; very much better.

734. A certain proportion of the land through which the proposed Mudgee-Coonamble line will pass is freehold? Yes.

735. As you go further west do you get into the leasehold country? Yes.

736. At about what point on that line would the leasehold country start from? It is chiefly purchased land between Mudgee and Cobborah. After you leave that there is very little purchased land; it is mostly Crown land.

737. Do you say that the leases will shortly fall in? Yes; next year.

738. Therefore, that land will be available for settlement? Yes.

739. *Mr. Levien.*] Is the country on the Mudgee route by far the richer land? Yes.

740. If you were investing your own private money in a railway, and you had these facilities given you for getting the land without paying for resumption, which route would you adopt? Many years ago I had an

- an opportunity of buying a station at Tundaburine, and I have regretted ever since that I did not do so. I could have got it at £1 an acre, and I am certain it would now sell at £5 an acre with a railway.
741. Looking at the matter without prejudice, and if you were entering into this as a private enterprise, would you take the Mudgee to Coonamble route in preference to the Dubbo to Coonamble route? Yes.
742. *Dr. Garran.*] If the Government were to decide upon the Mudgee to Coonamble line, and if they made a railway reserve for 10 miles on each side, would there be sufficient Crown lands there to make a substantial contribution to the cost of the railway? If you will look at Mr. Jones' report you will find that he states the Government could make a railway out of the extra price which could be obtained for the Crown lands, owing to the benefit which would be conferred upon them by a railway from Mudgee to Coonamble. I think it is most desirable that the Committee should insist upon that being done.
743. *Mr. Levien.*] Would you recommend the Committee to visit those places? I would recommend it most strongly. I am sure you would come back with the same idea as the Railway Commissioners. I strongly urged the Commissioners to go on from Mundooran to Tundaburine, but they were quite satisfied with what they saw.
744. *Mr. Watson.*] I understand that in going about 30 miles beyond Mudgee, towards Cobborah, you enter the Central Division? Yes; the Talbragar River at Cobborah is the boundary.
745. How many miles is that from Mudgee? About 45 miles.
746. From there westward, is it mostly Crown land under lease? Yes.

TUESDAY, 30 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper. 747. *Chairman.*] At your former examination you were asked if you could give the Committee similar information to what you gave on the proposal to construct a line from Dubbo to Coonamble, taking Mudgee as a starting-point;—have you had an opportunity of preparing that statement? Yes; I have prepared some information.
748. Since that time you have been over the country between Mudgee and Coonamble? Yes.
749. Will you give the Committee the benefit of your researches in that direction? Well, my information must be taken by the Committee for whatever it is worth.
750. Comparing the class of country between Dubbo and Coonamble with the class of country between Mudgee and Coonamble, what is your opinion as to the capacity of the alternative line from Mudgee to Coonamble to carry people? It passes through better country.
751. More suitable for closer settlement? I think so.
752. From a railway traffic standpoint, which would you prefer? That is asking me too keen a question. I do not know that we expect immediate results from the line.
753. You have been over the route of the line from Dubbo to Coonamble, and prepared a statement, and you have also been over the country between Mudgee and Coonamble? Yes.
754. Well, comparing the two classes of country, which do you think is the better for carrying people? In view of the population on the route between Mudgee and Coonamble, as compared with the people on the route between Dubbo and Coonamble, I should think present circumstances point to the fact that, from a railway point of view, coupled with better country, a line from Mudgee to Coonamble would bring in more railway traffic.
755. When you got to Coonamble, I suppose the traffic would be about the same; but suppose you take the line from Dubbo to Coonamble, the Coonamble people would have to pay for a greater length of carriage by going from Dubbo than by going from Mudgee? Yes.
756. Would any difference be made to them in their rates? I should not think so. I should imagine that in the case of a sectional line like that, the more speedily it paid for its maintenance the more speedily would you have any local rates removed from it.
757. So that the probabilities are that if a line is constructed from Dubbo to Coonamble the Coonamble people will have to pay for all time some 30 odd miles more railway carriage? That might be so if the Coonamble people were prepared to sit down quietly and if it was the only means of communication.
758. Would the grades be similar? A grade of 1 in 80 I think Mr. Deane has undertaken to get on the Mudgee-Coonamble line; if so, that is as good as the grade on the route between Dubbo and Coonamble. I think the information is given on page 7 of the report of the Committee on the Warren-Coonamble Railway proposal. I may mention, incidentally, that I gathered from Mr. Deane that the information given then holds good to-day.
759. Have you prepared an estimate of the traffic which can be obtained by constructing a line from Mudgee to Coonamble? Yes; I have prepared an estimate for my own information, which I desire not to be treated by the Committee in any way as the Commissioners' estimate. I wish the Members of the Committee to distinctly understand that to-day I am simply giving my own opinions. Under conditions precisely the same as those which were applied to the Nevertire-Coonamble line and the Dubbo-Coonamble line—I mean deducting what the losses would be on the main line—I think the revenue would be about £18,000 per annum.
760. Can you give the particulars of your estimate? At this stage I prefer not to give the particulars; but after the Commissioners have made their report, I shall be prepared to give the information I have.
761. Would there be any objection to your giving the information from the Commissioners' standpoint? I do not think so. I think you would probably find that their estimate will not differ very much from my estimate;

estimate; but I am in this position, that you have not before you, in accordance with the terms of the Public Works Act, the Railway Commissioners' estimate. J. Harper.

762. I do not think there is anything in the Act to say that you should not give that information to us;— you must give information as to the line that was submitted to us? Yes; but, as a matter of fact, I have not given this information to the Commissioners yet. Allowing for a leakage on the existing main line, there will be a gross revenue of £18,000. It is practically both net and gross in this sense, that it provides for the loss on the existing main line traffic. 30 May, 1899.

763. How would that compare with the estimated revenue from the proposed line from Dubbo to Coonamble? The gross earnings of that line per mile would be less than those on the Mudgee line.

764. Have you prepared a statement giving the cost of working the alternative line? That is another matter which I can only approach approximately, but my personal opinion is that it will not cost more per mile to work that length of 147 miles than it will cost to work a length of 92 miles between Dubbo and Coonamble. I think the annual cost of working the Dubbo-Coonamble line works out at about £76 or £77 per mile. I do not think the annual cost of working this other line will work out at any more than that. In other words, I think the working expenses of a line from Mudgee to Coonamble will not exceed £11,000 a year.

765. To sum up, I take it that you are of opinion that to construct a line from Mudgee to Coonamble will be preferable to constructing a line from Dubbo to Coonamble? No; because another consideration comes in, and that is the question of capital cost. The capital cost of a line from Mudgee to Coonamble is very much greater than the capital cost of a line from Dubbo to Coonamble. The estimate given here by the Construction Branch is £478,936 for the Mudgee-Coonamble line, £207,285 for the Dubbo-Coonamble line, and £150,000 for the Warren-Coonamble line.

766. Would you not charge the traffic to Coonamble with a portion of the cost of the line from Wallerawang to Dubbo? It would have to pay that certainly; but then you see you have that line constructed to-day. Mr. Deane told me the other day that these figures which were given in connection with the Warren-Coonamble inquiry may be accepted:—

1. Dubbo to Coonamble, 93 miles 45 chains; estimated cost, £207,285; average cost per mile, £2,215; ruling grade, 1 in 75; through distance from Sydney to Coonamble, 371 miles.

2. Mudgee to Coonamble, 147 miles; estimated cost, £478,936, average cost per mile, £3,258; ruling grade, 1 in 60; through distance from Sydney to Coonamble, 337 miles.

I believe for all practical purposes that is correct, with this exception, that the 1 in 60 grade which is mentioned there could be improved without very much difficulty, and at the same cost as a 1 in 80 grade.

767. *Mr. Trickett.*] The annual interest on the cost of construction will be £15,000, and you estimate your gross revenue at £18,000? I estimate the net revenue at £18,000. I can speak with a great deal of confidence. I am sure that it will all be realised.

768. At that rate would the total annual loss be greater or less on the Mudgee-Coonamble line than on the Dubbo-Coonamble line? I think it would be greater.

769. We have no estimate of the working expenses of the Mudgee-Coonamble line? Except that which I have given you, based on the same estimate per mile—£11,000 a year.

770. If the annual interest is £15,000, and the working expenses are £11,000, and the receipts are estimated at £18,000, it will involve the possible loss of between £7,000 and £8,000 a year? Yes.

771. When you were giving evidence on the last occasion, you did not seem to have quite as good an opinion of this Mudgee-Coonamble line, for at page 23 I see this evidence:—

Looking at the map, it would appear as though the better way to split up that country would be by going from Mudgee to Coonamble? But the Mudgee line would not bring in the traffic.

? No; but will you be good enough to read the previous question and answer, as follows:—

Do you think the construction of a railway to bring any traffic from Coonabarabran would be warranted? I do not think so.

I do not think so to-day.

772. In answer to the next question you say: "But the Mudgee line would not bring in the traffic";— what traffic does that mean? I do not know without reading back my evidence.

773. *Chairman.*] When the question was asked it referred to the whole of the country between the Great Northern line and the Western line? I think I know what it means. I will explain what it means on this map here. I was asked whether if a cockspur line were made from the Dubbo-Coonamble line to Coonabarabran it would bring in the traffic, and I said it would not; nor would it do so, because the Coonabarabran line is on the northern slope of the Warrumbungle Ranges, and the interests are absolutely different from those of the country which lies to the south.

774. *Mr. Trickett.*] You did not mean by that question and answer to say that a line from Mudgee to Coonamble would not bring in the intervening traffic? No; I would not care about it being put in that way. I wish to disassociate from your minds the idea that the Coonabarabran traffic or anything north of the Warrumbungle Ranges would be likely to come in on that line. I think it is very doubtful that it would.

775. You did not mean that answer to be disparaging to the line from Mudgee to Coonamble? No.

776. *Chairman.*] So that the Coonabarabran traffic would come in on the Northern line? It might, or it might not. At Coonabarabran they would be within about 33 miles of a possible station site on the surveyed route. I think they are to-day about 100 miles from Quirindi. I may say, for the information of the Committee, so as to be absolutely candid, that the Coonabarabran people will not have the Mudgee connection at any price. Probably there is a lot of force in what they say.

777. *Mr. Trickett.*] What do they advocate? They maintain that the northern connection is the proper one.

778. As the result of your recent inquiries, can the Committee take it that you are favourably disposed to a line from Mudgee to Coonamble? I think, in view of the whole of the circumstances, it is a matter which I might suggest to the Committee is worth considering. I feel convinced—and I am only voicing my own opinion now—that if a line were built from Dubbo to Coonamble to-morrow, we would not dispose of the public question of providing railway communication between Gilgandra and Mudgee. My impression is, even assuming that the Committee to-morrow decided upon building a line from Dubbo to Coonamble, that you would still have this district to dispose of, which is east of the Castlereagh. It is a district which is worth a good deal of consideration. It contains a good deal of good land and it has a good rainfall.

- J. Harper. 779. As a means of serving the country and that part generally if a line from Mudgee to Coonamble were constructed, would the same claims be put in on behalf of a line from Dubbo to Coonamble and that part of the county do you think? That, of course, is a question for you, gentlemen, to weigh when you are investigating it locally; but I may tell you that when we were looking into the question of the Dubbo-Coonamble line, the strongest arguments which were advanced by the people of Gilgandra were on account of the agricultural settlement east of Gilgandra.
- 80 May, 1899. 780. You think a line from Mudgee to Coonamble would get a lot of the traffic that would be served by a line from Dubbo to Coonamble? It would get the bulk of it. It would get all the Coonamble traffic; it would get all the Gilgandra traffic. It would get the best portion of the Girilambone traffic. It would get the traffic of the district which the people who advocate the Dubbo-Coonamble route say is the best portion of the district.
781. What is the distance from, say, Gilgandra to where it would strike the Mudgee-Coonamble line? I think between 15 and 20 miles. The best portion of the country is to the east.
782. Later on in this inquiry, will you be able to furnish the detailed results of your recent inquiries? I shall be able to show you every item—where it will be withdrawn from the present main line, and where it will go on to the other line.
783. *Chairman.*] Will you be good enough to state shortly the results of your researches in travelling over this country? As I have tried to indicate, the question is a big one, because it means practically the difference between an expenditure of £470,000 and an expenditure of £200,000, and it involves other grave considerations. My opinion of that country between Mudgee and Coonamble is, that there is a great deal better country between Mudgee and Tundaburine, which is a point east of Gilgandra, than there is between Dubbo and the same point; the rainfall is better, and it has the advantage of being closer to the markets for stock and agricultural produce; and in considering the question of giving Coonamble railway connection, which it has been decided it shall have, it is a line which deserves the most earnest consideration of this Committee. That is all I can say, and you may form your own conclusions. When I was here before, I could not say as much as I can say now.
784. *Mr. Trickett.*] In your recent researches, have you gone into the question of the possible future of this country in regard to traffic? Yes; that is one thing which I specially had under consideration.
785. As a running line, how would it compare with a line from Dubbo to Coonamble? According to the grades given by Mr. Deane, it would be practically the same, with this in it—that between Dubbo and Wallerawang there exists to-day 17 miles of 1 in 40 grades, while between Mudgee and Wallerawang there exists 7 miles of 1 in 40 grades. That is to say, there are 10 miles more of 1 in 40 grades between Dubbo and Wallerawang than between Mudgee and Wallerawang. I mention this because there appears to be a popular idea that the Mudgee line is an impossible thing.
786. You might tell us now, as Chief Traffic Manager, what you think of the Mudgee line now that it is improved as a permanent line? Personally, I think it could be made a good line at, probably, a very reasonable expenditure, but you would require the traffic to warrant this being done. I think that, with probably an expenditure of £100,000 on that line, you could have a grade of nothing worse than 1 in 75.
787. But it was regarded as a dangerous line? It is to-day.
788. In what respect is it still dangerous? On account of the slips.
789. I thought they had got the line away from these parts? So they have, but they will never get out of danger unless they deviate the road where the mountain slopes are slipping away.
790. What would this expenditure of £100,000 involve—a different line? A deviation probably.
791. To get away entirely from those parts which are apt to slip away? So I am told by the engineers. I would not say that it is warranted by to-day's traffic, but given a heavier traffic over the line probably it might be.
792. Do they work the line at night now? Yes.
793. Has it had any severe tests since the alterations have been made? It is being tested every week. There are always slips taking place; they occur in wet weather and dry weather. We run a pilot every night in front of each train.
794. Would that expenditure of £100,000 to improve that line make it longer than it is? I do not think it would add more than a mile to its length.
795. If we were considering a line from Mudgee to Coonamble, should we also have to take into consideration the extra sum of £100,000 for diverting the line to Mudgee? Not necessarily. The question of safety is really a minor consideration; it is only the infrequency of the trains which leads to the necessity of making frequent inspections.
796. There is no fear of any great calamity happening on that line? No.
797. Is there much unalienated land on the line from Mudgee to Coonamble? I did not go into that phase of the question, but judging from local inquiries I made, I think there is a lot. There are a number of leases falling in during the next two or three years. If you are going to seriously look at this line you might consider the question of keeping it, starting from Gulgong, further east. I should imagine that that would be a better location for the line.
798. In regard to the construction or in regard to the land? I think both as regards the construction and as regards serving the country. It struck me in travelling through that country that if the line were located further east it would be better.
799. Instead of going to Cobborah you would keep out more towards Coolah? I should be inclined not to pass through Cobborah at all; that is purely my personal opinion. There is a very good tract of country round Coolah.
800. Is there much agriculture carried on along the route of this line of railway? Yes.
801. What does it consist of? There is a mill at Mundooran, a mill at Cobborah, a mill at Coonabarabran, two mills, I think, at Gulgong, and so keen are they on milling in that district, and having a population of some 14,000 or 15,000, that they draw wheat from a comparatively long distance—from a point midway between Gulgong and Wellington towards Gulgong.
802. And wheat-growing is favourably carried on there? Yes.
803. Did you ascertain what is about the yield? They claim to have a yield of about 20 bushels per acre. I would not like to say that it is so. No doubt they have a lot of good country.
804. *Mr. Levien.*] Without railway communication it is no good to them? No.
805. *Mr. Trickett.*] This tract of country is fairly watered by streams? Yes.

806. Which part of the line would it be most expensive to construct, as far as you could notice? That portion between Mundooran and Cobborah. J. Harper.
807. Would there be very heavy cuttings between those two points? Yes; it is heavy when you are in the ranges. <sup>30 May, 1899.</sup>
808. *Mr. Levien.*] Rock or soil? Rock and soil; there is a range which runs east and west called the Goodiman Range.
809. *Mr. Trickett.*] Therefore, as compared with the line from Dubbo, the chief part of the expenditure on this line from Mudgee would be on the first portion? There is a question of acquiring land between Mudgee and Gulgong.
810. But independently of buying land, the chief part of the expenditure on actual construction would be on the first portion of the line? I should imagine that that is where the chief difficulty would come in; but the difference in cost is £1,000 a mile on the total length of the line. Of course, that may come in on some particular section, and it may be altered by reason of their locating the line differently.
811. *Mr. Levien.*] You know nothing about the line between Werris Creek and Coonabarabran? Yes; but there would be a difficulty in getting a line across country from Werris Creek. The Warrumbungle Ranges run practically south-west and north-east, and you have to get through those ranges with your line.
812. How far is it from Werris Creek? From Werris Creek to Coonamble it is 155 miles, and from Quirindi to Coonamble 160 miles.
813. And to Coonabarabran? About 95 miles.
814. *Mr. Trickett.*] Is it a fact that the Mudgee-Coonamble line would cost right through about £1,000 a mile more than the Dubbo-Coonamble line? The figures, as given here, are £3,258, as against £2,215 per mile.
815. When we get over that range, after leaving Mudgee, then is it fairly flat country? It is undulating country.
816. Suitable, as far as you could judge, for one of our newly-started light lines? Yes; there are no very great difficulties.
817. Without going into details, what would be the chief products carried on this railway? I should imagine wheat and maize. They grow a great deal of wheat to-day without railway communication, and it would carry, I think, a good many more sheep than it carries to-day.
818. And stock? Yes; it would carry more sheep than it is carrying to-day. It carries now a very large quantity of stock.
819. It is a large wool-growing centre? Yes.
820. In your inquiries, did you contemplate the extension of this line beyond Coonamble? Only to Coonamble.
821. You have only looked at it as a line to Coonamble? Yes.
822. I asked that question because Walgett has always been considered the point of attraction in running out in that direction? I do not think it is worth considering the question from our point of view.
823. *Mr. Watson.*] You say there is a good class of country for agricultural purposes between the two points? Yes.
824. Does that continue right from Mudgee as far as Mundooran? Not continuously. There are patches of country. There is a range running south-west—the Goodiman Range—which intersects the good country; and there is country there not of much value except to grow ironbark.
825. How far would that good country extend? Taking the existing route of the line, I should imagine you could reckon upon fully 20 miles of land on either side.
826. I mean in a direct line;—how far along the route would the good country extend—say to Cobborah? Yes; there is good country as far as Cobborah, and then between Cobborah and Mundooran you get into a range of country running south; but after passing Mundooran you get into the very best of the country.
827. Do you think, in view of the very heavy, increased cost of constructing the line to Coonamble from Mudgee, the increased productiveness of the country through which it will pass will make that cost good? I am inclined to think so. From the way in which I have gone through the country, I should not like to pronounce too strong an opinion; but personally I think it is a matter deserving of the utmost consideration.
828. If Coonamble were the only objective you would prefer to go from Warren? Yes.
829. A more complete view of the situation, from a railway standpoint, would be, I presume, to tap the country outwards from Mudgee, even if you did not go as far as Coonamble? From a public point of view, I think so.
830. Leaving out of account Coonamble as the objective for the present, do you think, from the traffic point of view, it would be possible to run a line out from Cobborah towards Mudgee? I do not think it would be wise, unless you had some other objective point.
831. Have you had anything to go upon in regard to projecting a line as surveyed there from Muswellbrook to Cassilis? No.
832. You have no information in regard to that? No.
833. I am informed that there is some good country round there;—have you heard that there is? Yes.
834. The idea has been mooted on several occasions, I understand, of reaching Coonamble from that point? I do not know; probably it has. I do not know what benefit would result to Coonamble. Taking the most favourable extension which can be made, the position to-day is this: the distance from Coonamble to Quirindi is 160 miles, and from Quirindi to Sydney 243 miles, and that practically makes Coonamble by that route 403 miles from Sydney.
835. You do not seem to think there is any value in reaching the port of Newcastle, so far as stock is concerned? I do not think so; 75 per cent. of the wool which reaches Newcastle comes to Sydney for sale.
836. *Mr. Dick.*] I think we can conclude from your statements that, on the grounds of public policy at any rate, the Mudgee extension would be preferable to the Dubbo-Coonamble line? My opinion is that it is a line which requires and deserves very great consideration indeed; because I think that if either one or other of the lines which have been before the Committee were built, the claims of that line would be pressed, and pressed with a good deal of force.
837. You do not think any determination should be come to in regard to the Dubbo-Coonamble line until the claims of the other line are carefully investigated? I do not think so. At the desire of the Committee

- J. Harper. I went over this country, and as the result of my visit I am more impressed than ever with the necessity of giving this line the fullest consideration, after seeing the character of the country and comparing it with the other country.
- 30 May, 1899.
838. *Mr. Levien.*] You mean consideration of the Warren-Coonamble line and of the Dubbo-Coonamble line? Yes.
839. *Mr. Dick.*] I think you said that it would require an expenditure of £100,000 to cut out the heavy grades and make the Mudgee line safer than it is? I said that by the way. I did not say safer, because the line as worked is safe now. It could be improved to the same grade which is promised on this projected line, at a probable cost of £100,000. But I am not going to say that that expenditure would be necessary in order to carry the traffic. I went on further to say that we had to get over 10 miles of worse grades on the main Western line from Dubbo.
840. Is it a fact that the worst part of the Mudgee line, a length of about 7 miles, can be wholly obviated by a deviation? I do not know.
841. Do you know if the engineers have had a scheme before them? We have had a lot of schemes. I do not know that there is anything very practical about them. I think the Commissioners have in view, when traffic warrants the expenditure, some scheme for improving the Mudgee line.
842. Where does the traffic from Gulgong, Dunadoo, Cobborah and Muntooran go to now? All the traffic from Muntooran, Cobborah, and Dunadoo, comes in through Gulgong to Mudgee. Of the Coonabarabran traffic, half goes to Mudgee and half to Gunnedah.
843. All that traffic would not be new traffic on the Mudgee line? No, it would join an extension further on. The Coonabarabran traffic is divided almost equally between Quirindi and Mudgee. The stock traffic of the district comes in to Mudgee.
844. Did you observe any evidence of the adaptability of part of that country from Mudgee to Coonamble for closer settlement? Yes; I think it is country which will be very thickly settled by-and-by.
845. Is it all country of fine character? There is a very large percentage judging by the country generally in the interior.
846. *Chairman.*] The country on the Mudgee-Coonamble line is much better fitted to carry a class of producers than the country on the Dubbo-Coonamble line? Yes, that is so.
847. In going over both routes did you notice the proportion of red soil to black soil country? Yes. It is country you can scarcely judge of as between black soil and red soil, because you can see both good red soil and good black soil on the route.
848. Is the black soil country on the Mudgee-Coonamble line good agricultural country;—did you see any of it cultivated? Yes, and carrying very heavy crops.
849. So that there is a much larger proportion of land fit for cultivation on the Mudgee-Coonamble route than on the Dubbo-Coonamble route? Yes, and it is carrying a larger population to-day.
850. You are quite clear on that point? Absolutely clear.
851. Had you any opportunity of ascertaining whether there was a difference in the rainfall? Yes.
852. There is a large number of stock on good grass about Muntooran? Which came from west of Coonamble.
853. The soil being good, I suppose the rainfall must also be good? It is claimed by the people of the district, and our railway records show, that it has a consistently good rainfall. I never remember having had to send any food for starving stock to that district. It is claimed by the residents of the district that they have never known what a failure of the harvest has been.
854. The Railway Commissioners say the line from Mudgee to Coonamble would open up and develop a more extensive and better agricultural area, and further, that it would help materially to more satisfactory results in connection with the working of the Mudgee line than have hitherto been experienced. From that statement are we to understand that if a line is constructed from Mudgee to Coonamble it will benefit the country traffic as a whole? It would make up full train loads on the Mudgee line which would warrant us in putting engines of a heavier class on the line.

WEDNESDAY, 31 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Alexander Wilson, stock and station agent, sworn, and examined:—

- A. Wilson. 855. *Chairman.*] Are you acquainted with the country which will be served by the proposed railway from Dubbo to Coonamble? I know the country from nearly every point of view. I know the whole of the country from the Western line to the Northern line. I have traversed that country in six or eight different directions almost completely, and sometimes bits in between.
- 31 May, 1899.
856. Taking the country along the proposed line from Dubbo to Coonamble, will you give your opinion of the value of that country as far as regards carrying people? Rather more than half of the land from Dubbo, with the exception of a few miles north of the Talbragar, is mostly very good agricultural land. From Dubbo to Gilgandra it is good agricultural land; some of that land is not quite first-class, but a great deal of it is land capable of great improvement, and with a good deal of value in the soil. You pass through a bit of bad country, but that is only for a very few miles, and you are at the edge of it. It is all bad to the eastward; there is no bad country to the westward scarcely; there is just a bit of bad land north of the Talbragar.
857. After leaving Dubbo, what sort of country is it going north? For about 16 or 17 miles it is all very fair agricultural land. For a distance of 8 miles from Dubbo it is good country; then for a distance of 6 or 8 miles it is all mixed country; but there is some very good land even within that stretch.

858. When you get north from Gilgandra, what sort of country is it? On the west side of the line from Gilgandra northward you might say that the whole way to Coonamble it is either fair wheat-land, or first-class pasture land. It is all flat country with very little natural water supply. A. Wilson.  
31 May, 1899.

859. What is the country on the east side? On the east side of the Castlereagh, about half-way to Coonamble, it is all fairly good agricultural land for some miles back from the river, turning off into poor piny and stony hills for a few miles back; from there on you get rich black-soil—boree plain, extending for some distance and widening out as you go down, spreading out more towards Coonabarabran. Closer in for about half the distance from Gilgandra towards Dubbo on the west, and extending for some distance, it is mostly very fair agricultural land, and some of it is first-class. On the east, from where you begin to approach near to the Castlereagh River going north, it is mostly poor, grass-seed country. It is of very little value for anything. It is very poor, sandy soil with no heart in it.

860. Do you consider the country between Dubbo and Coonamble is sufficiently good to warrant the construction of a railway? I have had that opinion for a good many years.

861. And Coonamble would be a depôt for the country to the north? Coonamble ought to be an important centre for a considerable population, chiefly pastoral, but with some land very well suited to agriculture.

862. Does any traffic from Walgett come in towards Coonamble? Yes; most of the heavy traffic that comes into Walgett goes through Narrabri, except when the river is up, which, of course, is always an important consideration. The road from Narrabri to Walgett is one of the old main pastoral roads, and a direct road was only opened up from Coonamble to Walgett fifteen or eighteen years ago.

863. Are you acquainted with the country from Mudgee to Coonamble? I have been from Mudgee to Gulgong frequently, and to Cobborah and Munderooran; I have not followed that line exactly into Coonamble, but I have been to Coonabarabran, and I have been all through the patch of country in between those two lines, that is in the great bend of the Castlereagh.

864. How would you describe the character of that country? From Mudgee to Gulgong, which is an old-settled district, you get some very good land, and some very poor land. Close about Gulgong there is a considerable area of very good arable land. After crossing a creek some 3 or 4 miles from Gulgong, the land is rather inferior until you get on to the alluvial flats on the Talbragar. It is rather inclined to be piny ridges, and although well grassed at times it is not good country. Some of it is fair wheat-land, but will require considerable expense to clear. It is pretty thickly timbered with fair-sized trees and considerable undergrowth of pine and other scrubs.

865. *Mr. Watson.*] Do you think it would stand continuous cropping if cleared? No; it is land which would be very fair arable land with ordinary treatment.

866. It would want long spells? Yes; if you take three or four crops it would want some recuperation before you could get another crop. There is no strong land there at all except that there are patches on the Talbragar of really first-class alluvial deposit; sometimes there is none and sometimes there may be a few thousand acres. I think, perhaps, the largest patch, and certainly the best, is the property of Mr. Rouse, at Cobborah. I think it consists of 8,000 or 9,000 acres of chiefly old grants, which I find are pretty good evidences of the value of the land in out-lying places, especially if taken up by a Rouse or a Lawson. There is a very fine patch there. The moment you cross the Talbragar, going along to Munderooran, it is really very poor land; it is not worthless, but where it is fairly flat, and is not too heavily timbered or scrubby, it is of the same light character, although a good deal of it is fair wheat-land. Unless wheat is at a higher price than it seems likely to be, I doubt whether there is any money in it for some time to come. From Munderooran, for a good many miles, it is of the same class—rough, and grass-seedy.

867. Light soil? The same light, indifferent soil, and it continues hilly, ridgy country right away till you get on to the same big plain approaching Coonamble. There are occasional patches through there of decomposed trap soil, volcanic patches of 500 or 1,000 acres occasionally, extending for a good few miles through that country on Yarragreen and Tundaburine. That patch of country is all pretty well closely settled. From a few miles north of Munderooran till you get out to the open country towards Coonamble it is all pretty well closely settled. It is settled by men with from 1,000 to 2,560 acres each.

868. *Chairman.*] Are there many patches of that volcanic soil? No; there are, perhaps, half a dozen. I do not suppose they would run to more than 10,000 acres. Round about, they are striking features cropping up, otherwise it is rather poor country.

869. *Dr. Garran.*] In your travels about this country, I presume from your occupation you have looked at the land more through the spectacles of a pastoralist than through the spectacles of an agriculturist? Most of my visits have been to see what value was in the land. I was always a bit of a farmer, even when I was a pastoralist, and my work has taken me a great deal into the settled districts. I always make it a feature in my reports to say what land I think is valuable. For instance, whether it is lucerne land, wheat land, or corn land.

870. You judge the land from a double point of view? Certainly.

871. Do you know the original proposal to reach Coonamble was from Nevertire to Warren? Yes; I gave evidence at the inquiry.

872. Do you know that a previous Committee reported against that proposal? Yes.

873. Do you know the route from Warren to Coonamble? Yes.

874. Is the soil there black soil mostly? It is nearly all black soil on that low-lying somewhat wet plain known as the Macquarie Plain.

875. It is all alluvial, I suppose? It is all alluvial; it is not rich alluvial, but it has considerable strength.

876. Do you consider that wet, black soil suitable for wheat cultivation? No; I have formed the opinion, and my experience shows, that it is practically unsuitable for growing wheat.

877. If that line were made it would not settle small, wheat farmers? No, as an extensive business I think they would be very unwise to start. Of course, there are patches of red forest occasionally in these places, and that is very fair agricultural land.

878. Which do you think on the whole is the better soil—the alluvial soil and the washing of the hills, or the disintegrated red trap soil? For cultivation purposes the disintegrated red trap soil is the better.

879. Is not that also the best for pastoral purposes? That is rather a difficult question, because so much depends upon the seasons.

880. Does it not grow a sweeter grass? It does, but if you get an abundant season there is an enormous growth.

A. Wilson. growth on that heavy black plain; in fact you could hardly describe its capabilities. On the other hand, a moderate rainfall which will produce a useful effect on red land is absolutely worthless on black soil.

31 May, 1899.

881. Is it too hard for the rain to get in? No; I think there is something in the soil. In winter time it is rather cold, and it is much more friable on top. It does not make a firm covering for the seed and the roots. In bad seasons it produces very little vegetation—we describe it as practically coming out of the ground; whereas with a firm soil the moment you get sufficient rain some growth takes place at once.

882. Will that black soil grow lucerne? It will, but it is not at all suited to lucerne. The clay is too near the surface. It has only a comparatively thin covering of black rich soil on top.

883. Is it rather a critical business for a farmer to work that black soil? It is practically unfit for farming.

884. And even for pastoral purposes it is only at its best in particular seasons? That is all.

885. Whereas the red soil is always good when you have a fair supply of rain? It brings out a very much better average result.

886. If we look to the settlement of population, we should do better to take the railway through a red soil district than through a black soil district? Even apparently through a poorer country.

887. Then on the whole you do not think the previous Committee erred in judgment in deprecating the extension of that line from Warren? Certainly not. I gave evidence unfavourable to it.

888. Are you aware that the immediate proposal before the Committee is to make a line from Dubbo to Coonamble, and that as a rival route there has been suggested an extension of the line from Mudgee to Coonamble? Yes.

889. We are to some extent now considering the respective merits of those two routes? Yes.

890. Previous witnesses have differed rather from your estimate of the value of the land immediately north of Dubbo. We have been told that the country from Dubbo nearly to Gilgandra consists of ironbark ranges? I have ridden over a good part of the road, and I saw little or no ironbark.

891. Is it not a great place for ironbark? Yes; this patch of country to the east, and a long distance to the east, will be of no value for anything but timber for a long time to come.

892. Of course when you say to the east you mean the country between Dubbo and Cobborah? From Dubbo to Mundooran.

893. It is a great place for getting sleepers? Yes.

894. And even in the valleys is the land poor? There are no valleys. It is poor land all the way, because where there is soil it is that red soil with very little in it, and it grows nothing but spear grass. I think there is a good deal of iron in the soil.

895. The washings of that particular formation do not make a good soil? No.

896. Suppose these ranges north of Dubbo exist, are the valleys between them fertile? The ranges are not of any altitude. It is only undulating country. I do not think any of the hills would be more than 300 feet or 400 feet above the general level. There might be odd places where it is a little more.

897. We have been told not to expect settlement or cultivation between Dubbo and Gilgandra? I know there is some very excellent arable land for a good many miles. I have ridden there, and I have ridden off the track, too. I always reckon that I form a very much better idea of country from riding about than from travelling in a buggy or in a coach.

898. I suppose the road surveyors like to get the sounder country? Yes.

899. That is very often the least productive country? Very often.

900. So that you have to go off the route to see the richest land? Yes.

901. Then we have been told that between Gilgandra and Coonamble the land is well fitted for settlement for pretty well the whole distance? So it is. Of course a great deal of the land as you get near Coonamble is alienated in large blocks.

902. Coonamble is on a rich plain? Yes; and practically that is the character of the surrounding country for a good distance.

903. Does that plain begin at Gilgandra? You might almost say you are on the edge of it at Gilgandra, because all down the Marthaguy Creek there are streaks of plain mixed with valleys, and it gradually trends out into more open country.

904. You formed the opinion that the land between Gilgandra and Coonamble is fit for fairly close settlement? Yes.

905. Now, we come to the extension of the Mudgee line. Your description seems to imply that the land is variable in quality for the whole distance—nearly until you get to Coonamble Plain? Once you leave Gulgong it is not very variable; it is of a very low average quality.

906. All the way? Practically all the way.

907. Is half the land you pass through on either side good and half bad? A great deal of it is very fair grazing land, especially where it has been improved, as it has been, owing to the settlement on the Yarragreen Run and some of the surrounding places.

908. *Mr. Watson.*] Towards which centre? North-east from Gilgandra; I fancy the red line on the map would go right through the heart of Yarragreen run.

909. *Dr. Garran.*] I asked that question because previous witnesses led us to think that the special recommendation of the Mudgee line is that it will go through better country on the whole than the Dubbo line, and will lead to more permanent settlement hereafter? I am sorry to say I cannot endorse that opinion.

910. Your opinion is that taken altogether the Dubbo-Coonamble line, mile for mile, would settle more land than the Mudgee-Coonamble line? I am. There is this to be said, that the best of the country is at either end, and the Mudgee end of course commands practically all Gulgong, and that is only 18 miles. The good country at the other end will be fairly served by the line under your consideration, and the great bulk of the intervening land will provide very little traffic.

911. Have you covered the country at all between Coolah and Gilgandra? Certainly; I have ridden over that country exactly in that way.

912. Will you describe the country as you went? You cross the Trap Hill about 4 miles out of Coolah, and from there the whole way to Gilgandra I do not think there are 500 acres of good land altogether. One large station there ruined the last owner, and practically he had to give it up to Mr. Thomas Buckland; I think there was no stock on it at all.

913. If that is the case, Mundooran would not have been able to feed stock sent from the west? The country all about Mundooran is really poor. A. Wilson.
914. We have had it in evidence that during this very bad season one squatter sent 25,000 sheep and that he pastured them at Mundooran? That is the sort of country on which the grass is never eaten unless there is nothing else to fall back upon. It is all poor grass-seedy country that ordinary residents cannot make a living off. There has been practically no stock of any consequence as a regular thing in that district for some years. I could refer you to stock returns from some of these places. For that reason this seedy-grass has probably stayed on the country there. 31 May, 1899.
915. Do you mean to say that the far western sheep are so hungry or so hardy that they would eat what local sheep will not eat? They would eat anything; they would eat scrub, box-grass. It is like a starving man in a boat chewing leather, and that is the condition of millions of sheep in the Colony at the present time.
916. Is that how you account for it? Yes.
917. Do they not go to the mountains in drought; to country which has been practically unoccupied for years—why do they go there? Because there is no other resource for them.
918. Suppose in going north or north-west from Gulgong, the country is so inferior as you say, shall we do any better by keeping more to the east? There is a little more settlement on Talbragar.
919. There would be no object in making Coonabarabran the point to aim at for the line, I suppose? You get into considerable difficulties up that way.
920. You get into the Warrumbungle Range? You get into a sort of pocket of that range.
921. So that you could not get out? No.
922. Coonamble is the point at which we must aim? Certainly.
923. The only question would be between taking a direct line, as marked on the map here, and bending a little to the east for a portion of the route? Yes.
924. Shall we gain by making such a loop? I can see no possible advantage to be gained.
925. So far as you know, the route laid out on that map is as good as we can take? I have a very decided opinion to that effect.
926. You would not deviate that line? Certainly not.
927. You think that is the best line between the two points? Of course there are other reasons which I think should weigh with the Committee in coming to a decision.
928. What reasons? I think, in the general interest of the country, it is well to maintain the importance of well established towns and not drag everything to Sydney. On many occasions, of course, there will be a great deal of traffic between Coonamble and Dubbo, which would not occur if they have to go to Sydney or continue to make the journey under existing conditions.
929. Is Dubbo a great farming centre? No, it is rapidly developing; but just round the town of Dubbo it is not.
930. Have they, this season, been sending produce up north and north-west? The Bourke people told me that they have been supplied better and more cheaply with produce from below Dubbo this year than ever they have been.
931. We have had one witness who said that he could get the stuff more cheaply from Dubbo than they could grow it at Bourke; do you think that possible? Certainly, because of the difference in climate.
932. We have had that stoutly denied by another witness? If you take into consideration the losses in the years when you had no crops at Bourke, I am quite certain that the average would come out not in favour of Dubbo but in favour of the country within 30 or 40 miles of Dubbo, Narramine, and Trangie.
933. The Upper Macquarie, say? Once you get past Warren there is practically no cultivation.
934. You can put Warren as the limit of the country which can supply fodder to the north-west? Yes; there would be little patches of country, but practically this is all flooded country in wet seasons, right away to the Barwon.
935. Is Dubbo a better place for getting fodder in for a place like Walgett than Mudgee would be? I think it would be altogether in favour of Dubbo.
936. Could you cultivate wheaten hay all the way to Coonamble? You could, but when you get on that black plain I reckon that unless you can get patches of hard, red, box country it is not worth the trouble.
937. Between Gilgandra and Coonamble could you grow lucerne hay for the squatters to the north-west? You could grow wheaten hay; there is very little lucerne country anywhere down there.
938. Could you grow garden vegetables for sending north? Yes.
939. Any quantity? Yes; it is only a question of water.
940. Can they grow vegetables at Walgett? Yes.
941. Without irrigation? In an ordinary season.
942. How far must we go back towards Sydney before you can grow lucerne hay? It is a question of soil practically. About Narramine they grow very fair lucerne, and there are some very fine patches of lucerne land about Dubbo and up to Talbragar. These flats, of course, are limited.
943. Can they do so at Wellington? Yes.
944. Between Wellington and Dubbo? Yes; there are very fair lucerne paddocks. I do not call it first-class lucerne land; but still it does give very fair returns.
945. But taking the country between Wellington and Narramine, may that be considered a fodder-producing country? Yes. I suppose half of it is under crop.
946. What sort? Nearly all wheat.
947. For hay? It all depends. A great deal of it is for hay. Hay from that district has been coming to Moree, Narrabri, and Tamworth this season.
948. *Mr. Levien.*] From where? From west of Orange. I bought hay there to send to Moree; I found that I could buy it more cheaply from Milthorpe, Orange, or Wellington, than I could buy it on the Northern line.
949. Railway freight and all included? Yes.
950. *Dr. Garran.*] Where did you buy this wheaten hay? I bought some from Milthorpe and some came from below Wellington.
951. *Mr. Levien.*] You sent the hay to Sydney, and thence to Moree? Yes; and it cost me less than I could buy the same stuff for in Tamworth. I applied to Garvin and Cousens, and when I wrote to tell them how it worked out, they ordered several trucks of hay to be sent up.

- A. Wilson. 952. *Dr. Garran.*] Apart from irrigation, the squatters to the north must depend for their fodder on the land to the south-west? My opinion is that that is the only route to Walgett.
- 31 May, 1899. 953. The squatters to the north cannot grow their own wheat and hay without irrigation? Practically, west of Nyngan I doubt very much if they can, because there are so many seasons of drought.
954. They must depend for their fodder upon the farmers to the south-east? I think so.
955. You think there will be a permanent trade in fodder from those districts with the north-west country? There must be always a considerable trade. It varies enormously according to the seasons.
956. Supposing this line were made from Mudgee to Coonamble, would not there be a good trade in lucerne and wheaten hay with the north and the west? I do not think there would. There would certainly be the natural growth even of that country, as I have described it, to supply all the west. I do not think Mudgee would supply any market out there, except in an excessive drought like the present one.
957. What part of that line would find a market to the north-west? I reckon there would be enough grown on the patch of country between Mundooran and Coonamble.
958. All the land between Mundooran and Coonamble would be a fodder-producing country? No; for the first few miles out of Mundooran the land is very poor, but afterwards all this country between the projected line and the Castlereagh would be very fair wheat land.
959. All that is good fodder country? No, there are some hard ridges in between; but there is a considerable extent of good land.
960. By the time you have reached Coonamble have you got to the northern limit of the hay-growing district? If you put it as a business affair I say yes.
961. Can settlers go north of Coonamble and hope to grow hay at a profit to sell to the north-west? Certainly not. For one thing, it is nearly all flooded country in a wet season, and it is all that low black flat soil.
962. To sum up, of the two lines to Coonamble, which do you think will be the more valuable to the north-west country in respect to the supply of fodder? I should say the Dubbo line. For one thing, the area of available country at Mudgee is so restricted. It is only a narrow valley for 25 miles or so.
963. The land round the foot of the Warrumbungle Range, on the western side, we are told, is rich—is that so? That is the upper edge of the same great western plain, but that does not commence until you are a bit away from Coonamble.
964. Would that grow good fodder? That is exactly the same country as a great deal of the Liverpool Plains, and I consider it is not suitable for cultivation at all. It is first-class grazing land.
965. Are there not any flats at the foot of the ranges? Near the ranges there is a little farming done; but once you get on to that western decomposed trap formation, my experience is that it is not suitable for cultivation with a profit.
966. Then, close settlement is hardly possible on the Warrumbungle Range? West of that range they are nearly all large properties; nearly all the good country is alienated.
967. But it is first-class pastoral country? Yes.
968. There will be no use in the railway edging close to that country for the sake of settlement? Not a bit.
969. So that we may as well take the surveyed line as the best line? That is my opinion.
970. Do you think the Coonamble line ought to go on to Walgett or to stop where it is? I think it ought to go on to Walgett.
971. Would you go right into Walgett or stop short of the flooded land? That is a question which will require a great deal of detailed inquiry. I am speaking from superficial knowledge, having regard to the cheaper access and the shorter distance to the sea-board.
972. Is there any part between Walgett and Brewarrina, on the south side of the river, where there would be a high dry site for the railway terminus? There might be a spot or two; there are different spots of high land there; but nearly the whole of that country, almost without exception, is liable to inundation.
973. The whole of the south bank? Yes.
974. You think Walgett is a natural centre? It is a natural centre which should be considered; and it is the head of navigation for all practical purposes. You have your main roads on both sides of the river north and west, and two roads going out in different directions to the north-west. You have the main road up the Namoi and the main road into Walgett; it is certainly a place to be considered.
975. You have said that in the earlier days Walgett was always approached from Narrabri. If we now make the approach from Coonamble should we not take trade away from Newcastle and bring it more direct to Sydney? I suppose it would suffer slightly in that way.
976. If the Walgett people are connected with Narrabri they would have a shorter road to use by way of Newcastle than by way of Bathurst? Slightly.
977. And cheaper transit? Certainly.
978. Do you know whether they have any preference in the matter? My opinion is that in most of these outlying places if they get a reasonable show for a railway they will grab at the first.
979. I suppose the gain of a railway is so enormous that to have a railway at all is more important to them than the choice of a route? That is the general opinion before the railway comes; they are not always of that opinion afterwards.
980. If the railway comes they will get their stores up by dray if it is a little cheaper? They will do all sorts of things until the railway comes; they will make any sacrifice to get a railway.
981. That implies that the evidence of people who live in the towns is to be taken with a little discount? I think you have had enough experience of that. I have given some little study to this question, and about a year ago I addressed to the Minister for Works a letter in which I gave a good deal of information as to distances, and made comparisons of all the routes you have suggested. I think the Minister promised to have an examination made of the country between Coonabarabran, Gunnedah, and Quirindi, in this connection, before the matter was finally brought up. I wrote rather a long letter to the Minister, and it was published afterwards.
982. In that letter, if I remember aright, you recommended a line from Curlewis westward? Yes.
983. That line would be more northerly than any line you have been describing here to-day? That line follows what you might call the natural contour of the country. It crosses the Dividing Range between the Namoi and the Castlereagh. I consulted Mr. Stawell, who surveyed this line, and he told me that he believed my selected route was the best for crossing that ridge, but that he found—he made an exploration of the

- the route—it was taking him too much to the north-west, and that therefore he could not possibly make use of it. He admitted that it was the proper place to cross the Warrumbungle Range.
984. *Mr. Watson.*] Why start from Curlewis in preference to Werris Creek? Railway managers will tell you that it is always a bad thing to start a line at a sharp angle from an existing line. One of my principal reasons for suggesting this route is that the whole of the land from Werris Creek to Coolah is in the hands of large owners, almost without exception, and besides it is nearly all a purely pastoral country. It is a rich pastoral district, and is practically in the hands of four or five persons. Curlewis is a sort of mixed country which did not tempt the early settlers, but it is proving to be land suited for close settlement. For a good many miles out of Curlewis it is all held in holdings of from 1,000 acres up to 2,560 acres, perhaps more. You scarcely touch any large estate from Curlewis until you get to Bomerah. You follow the natural contour of the country. You pass through the best portion of Yarragreen and the upper end of Tandaburine.
985. *Dr. Garran.*] You say you follow the natural contour of the country;—do you follow the range or the valley? No; it is all pretty flat country from Curlewis. Gilgandra and Curlewis, I think, are almost of the same altitude.
986. Suppose this line from Dubbo to Coonamble were made, and there came another from Curlewis to Gilgandra, would not that answer all the purposes of a direct connection with Dubbo? It is, I think, nearly 16 miles further by that route to Werris Creek than the so-called direct route.
987. This cross-country line is recommended as a starving stock route? I have a considerable opinion of it in that respect.
988. Would it not be as useful to go from Curlewis to Gilgandra for that purpose as to go from Werris Creek to Dubbo? Much more useful, because you are keeping much nearer the stock country, the country which is liable to suffer from drought, and if it is going from the north you see how little of a detour you have to make.
989. Even sheep from Bourke and Nyngan and Cobar would only have to come down to Dubbo and go up to Gilgandra to get along to that country? It is a fairly direct route to New England.
990. If the route itself were preferable to the other, both on engineering grounds and on account of the character of the country, it would answer the purpose of the line equally well? It would answer the purpose, I contend, better. There is a great deal of stock interchanged, according to the seasons, between these districts and those districts, and that enables them to keep in touch. You avoid all the large holdings by that route, and each line leaves the other practically at a right angle. Another point in its favour is that there is good coal at Curlewis.
991. Supposing we made the Mudgee line instead of the Dubbo line, then your cross-country line from Curlewis to Munderoran would not answer the same purpose? It could not be made to fit in to answer the same purpose.
992. Supposing that cross line were a desirable line for natural purposes it would fit in better with a Dubbo line than with a Mudgee line? It will not fit in with a Mudgee line unless you go right on to Dubbo with a through line.
993. *Mr. Levien.*] Is there any agricultural land between Curlewis and Munderoran as you pass through these large estates? For a few miles outside Curlewis it is all agricultural land. A great deal of the land on the western slopes is medium agricultural land. By my route I do not think you go through 3 miles of any estate. The only plain you cross is from below Wondabah house till you get to Tamerang mountain. That is the only piece of Liverpool Plain country which you touch on the whole route; the other is all box forest.
994. *Dr. Garran.*] How is the country between Quirindi and that point? As soon as you get away from the country surrounding Quirindi, where there is a fair settlement, for 6 or 8 miles you get on to very heavy rich Liverpool Plain country.
995. Near the Australian Agricultural Company's estate? You pass along the northern boundary of some of their estates, Walhalland, Mooki, Kickerbil, Bywarrah boundary, Coomoo Coomoo, Yarraman, Mooredevil, Rockgeidgil, Bundella, on to Oakey Creek.
996. For many things that would be a better line than a line going to Werris Creek straight? I think not, if there is to be a stock connection across country.
997. You think the Quirindi line is not a preferable line? I hardly think so, especially as it would pass through large properties the whole way.
998. Taking your line from Curlewis to Gilgandra, is there sufficient good unsold land on either side of that line for 10 miles to make a handsome endowment towards the cost of its construction? No; I think the main body of it, the Bomerah Run, has all been disposed of under the present Act. The leases of two or three places, more particularly Yarragreen, fell in three or four years ago, and it was all taken up under the conditional purchase clauses of the previous Act.
999. We could not look to any receipts from land sales to contribute towards the cost of making that line? Not to any extent.
1000. It will have to be made on its merits as a traffic line? As a traffic line, and any value it has as a connection between the northern and the western systems.
1001. A line made for starving stock is not a line which we hope to be used every week or every year? It is not profitable for the country at any time.
1002. Apart from the starving-stock business, do you think there will be a reasonable cross-country traffic to justify a light line from Curlewis? I think it would develop into a very satisfactory line.
1003. The Walgett people would then have a choice of ports? Yes.
1004. So would the Coonamble people? Yes.
1005. *Mr. Watson.*] How far is it from Curlewis to Gilgandra? 110 miles.
1006. *Mr. Levien.*] When all is said and done, will not all these railways pass through big estates? No. Take the Curlewis line; I think 3 miles is the most it will pass through any one holding.
1007. It will be all Government land that a line from Curlewis will pass through? No, small holdings. Wondabah is all cut up now. I think it crosses one or two blocks of Trinkey, and two or three blocks of Bando.
1008. Did you ever send in a plan of your line to the Department? No.
1009. You can send in a plan? I could have brought a plan here to-day if I had thought that it would be useful. I will send up a plan if it is required.

- A. Wilson. 1010. *Chairman.*] You acquired your knowledge of this country from having to inspect and report? Yes, in a great many cases; it compels you to have a knowledge which no mere observation will give you. It is a responsible examination I make, and I have to put my opinions on record afterwards.
- 31 May, 1899. 1011. *Mr. Dick.*] You seem to have an undoubted preference for a line from Dubbo to Coonamble? Yes.
1012. Do you base that preference upon general grounds of public policy? No; first, as an approach to Coonamble distinctly. I have held that opinion for years, and have expressed it publicly; on that ground alone I hold that it is the best route.
1013. You know there is a large triangular piece of country lying between the Western line and the Northern line, and the North-western line, which at present is unserved by any railway? Yes; I have taken that fact into consideration.
1014. The problem is, how is this large section of land to be best served by a railway? By this line from Muswellbrook to Coonabarabran *via* Cassilis; at some time, in the not very distant future, that line might be justifiable, and the existence of the line I have indicated will in no way render that unnecessary; at least, I conceive that if the country develops, as it probably will do, that line may be justified, and that will not unduly compete with any of the existing lines.
1015. Why do you think the necessity for a Dubbo-Coonamble line is at present more pressing than the construction of a line from Muswellbrook *via* Cassilis to Coonabarabran? For one thing, the question of cost makes an enormous difference.
1016. That would be the same whether the line is constructed now or in the future? Yes. Other considerations are the number of people to be served and the possibility of the line paying, and the distance from a market of any kind; these are considerations which weigh with me in forming the opinion that Coonamble is certainly entitled to be served by the readiest and best route. Out there there are no roads, only tracks, whereas the road from Mudgee to Cassilis is a beautiful road. A great deal of the passenger business goes to Mudgee. No doubt the valley of the Goulburn is a Hunter River settlement.
1017. Have you noticed that Coonamble, Cassilis, Muswellbrook, and Newcastle are almost in a direct line, whereas to go to Sydney from Coonamble you have to go practically round the arc of a large circle? It is a pretty direct line from Coonamble to Newcastle. I did not work out the figures of that line, because no figures were available. Without a survey it is a very unknown country to plunge into without a railway. We have to get over a great stretch of rough country from Cassilis to Coonabarabran.
1018. Where is the rough country? Pretty well all the way from Cassilis to Coonabarabran, because you are following the line of the main range. You cross a very considerable range to get out of Cassilis, and you cross a very high range between Talbragar and Coolaburragundi Creek. Then of course to get out of Coolah you have to get over a very high ridge nearly 2,000 feet high on the surveyed line, and then you have to practically follow broken country along this Warrumbungle Range to get any where near there.
1019. You made a statement, I think, that it would not be much further from Walgett to Newcastle, *via* this proposed connecting line, than from Newcastle, *via* Narrabri to Walgett? Yes. I was surprised to find how near it was.
1020. Will you state the distances from your published letter? From Walgett to Newcastle, *via* Narrabri, it is 361 miles. Then from Newcastle to Werris Creek it is 153 miles; from Werris Creek to Curlewis, 182 miles; from Curlewis to Gilgandra, 110 miles; and from Gilgandra to Walgett, 122 miles; or a total length of 418 miles.
1021. I think you have an objection to sending railway lines through large estates? I think it is bad policy distinctly.
1022. By large estates, I suppose you mean large pastoral estates? Yes, especially when the country is almost purely of a pastoral character.
1023. Is it not a fact that pastoral products are the best paying products which a railway line can cater for? I should not think so. The product bears the highest rate of carriage, I suppose, or nearly so, but then the annual output is comparatively small. Shearing lasts only four, five, or six weeks, and there is no traffic for the rest of the year except perhaps a little stock. Poor agricultural country will give both a passenger and a mixed traffic. An acre of this country will grow 4 or 5 lb. of wool in a year and it would take a lot of acres to make a big traffic, not that I wish to disparage the encouragement of the pastoral industry.
1024. From actual observation you are able to tell us of the character of the land between Dubbo and Gilgandra? Yes, except a little bit where I have not happened to go.
1025. It has been stated in evidence here that from Dubbo for some distance towards Gilgandra the line will pass through a rather ridgy and sandy piece of country, but that there is not much of it? That is almost exactly what I said.
1026. What are we to gather from the statement that "there is not much of it"? For one thing, you are just crossing the tail of this large patch of more or less really poor country. You just get the left wing of it. If you went a few miles further to the west, you would not touch that country at all.
1027. What is the character of the country immediately west of the section from Dubbo to Gilgandra? Nearly all this country is good agricultural land till you get out near Gilgandra.
1028. Do you know why it is proposed to keep to the eastern wing of that sandy country rather than enter the good country to the west? If you go further to the west it will involve further cost in crossing the Macquarie. That route has been the main line of traffic for many years.
1029. Do you not think that mile for mile you would have more agricultural settlement on the Mudgee line than on the Dubbo line? It is rather a difficult question to answer, because for the last 30 or 40 miles, as you go into Coonamble, the land is mostly in the hands of a few proprietors, and the line will not induce much settlement there.
1030. That will be the same in the case of both lines? It will. I should say that mile for mile the country along the Dubbo-Coonamble line will be more productive—that fewer acres would maintain a family.
1031. Do you think that that line, if constructed, would absolutely preclude an extension from Mudgee? No. It is quite possible to my mind to conceive, and at no very distant date, an extension from Mudgee to Coonabarabran, or from Muswellbrook through Cassilis to Coonabarabran. I contemplate that possibility, as I mentioned in my letter.
1032. From your own observations, which of those lines would offer the greater engineering difficulties? The Muswellbrook-Coonabarabran line, because you have to cross the main range to get from the eastern to the

the western waters, whereas at Mudgee you are over the main range. Between Cassilis and Coolah there are two or three leading ridges. From Hall's Creek to Coolah your line will be along the foothills of the main Liverpool Range, crossing a great many creeks and considerable ridges.

A. Wilson.  
31 May, 1899.

1033. *Mr. Watson.*] And consequently expensive? I should think the most expensive sort of construction you could have.

1034. *Mr. Dick.*] Would that proposed connection between Curlewis and the Western line offer any facilities other than a facility for the transit of starving stock? For one thing, the whole of that route would be in the hands of small holders; and for another thing, a cross country connection avoids getting on to the mountains at all. You keep on the natural level of the interior fairly well. Another thing which I think would probably be of some importance is the coal at Curlewis. It is the only good coal which so far has been developed west of the range.

1035. Would not the line you indicate have to cross Warrumbungle Range two or three times? No; only once.

1036. At a point in a direct line between Coonabarabran and Cassilis? Yes; it would cross the Warrumbungle Range about 20 miles on the Cassilis side of Coonabarabran.

1037. Could not the Cassilis extension cross the Warrumbungle Range at the same point. No.

1038. You could not carry the Cassilis extension to the east of the Warrumbungle Range? No.

1039. You would have to make a considerable detour? You would.

1040. Is the country through which that detour would pass, good agricultural country? No; the only bad bit of country along that line is along the tail of the Warrumbungle Range.

1041. *Mr. Watson.*] Does your projected line pass through any good agricultural country? It passes through what I call fair agricultural land the whole way, with the exception of the Warrumbungle Range. I am distinctly of opinion that it makes the best cut through that country.

1042. *Mr. Trickett.*] When the Warren-Coonamble line was under consideration you gave similar evidence to that which you have given to-day? Practically the same.

1043. You also indicated the line which you seem now to favour between Curlewis and some point on a line from Coonamble to Dubbo? Yes.

1044. So that your opinions have not changed in any way? No; anything I have learned since has only confirmed my former opinion.

1045. How does the rainfall compare between the Dubbo-Coonamble line and the Mudgee Coonamble line? I think the rainfall at Mudgee would be from 4 to 6 inches greater than the rainfall at Dubbo. Once you get out to Talbragar it is much of a muchness in this patch of country.

1046. When you get beyond Cobborah it would be pretty well a uniform rainfall whichever route you took? Yes. There is a great similarity about the country. Once you get on the plain the rainfall immediately becomes less.

1047. Starting from Wellington to Nyngan on the west, and then going from Muswellbrook to Narrabri on the east, and starting somewhere in the direction of Mudgee on the various lines which have been brought under our notice—the Warren-Coonamble, the Dubbo-Coonamble, the Mudgee-Coonamble, or the Curlewis to some point between Coonamble to Dubbo—which of these lines do you think would serve that tract of intervening country the best? Two lines of railway would be necessary—one from Dubbo to Coonamble and one from Curlewis to a point between those two centres, and I suggest Gilgandra, because it is a centre of population.

1048. Looking at it from this point of view, that if only one railway were to be constructed to serve the intervening country I have mentioned, with Coonamble as its objective point, which do you think would be best? From Muswellbrook, *via* Cassilis, to Coonamble.

1049. Do you think it is a tract of country which can possibly be served by either of the existing main lines? I do not.

1050. *Mr. Watson.*] I think you said you thought it would be a proper thing to extend the Coonamble line to Walgett? The country between Coonamble and Walgett is nearly all low-lying pastoral country.

1051. Do you think it would be advisable to run a railway right on to Walgett from Coonamble? I think the day is not far distant when it would be justifiable to do so.

1052. You are aware that in ordinary seasons Walgett sends a good portion of its traffic down the river? I have always kept that point in mind, as it is at the head of navigation.

1053. Do you think a railway could compete with the river traffic, especially as we are to have a railway to Brewarrina? That is another question. I think the railway to Brewarrina is a mistake, and to some extent militates against this extension from Coonamble towards Walgett.

1054. In view of the certain construction of a line to Brewarrina, do you still think it advisable to take a line on to Walgett? It is about 80 miles from Brewarrina to Walgett—two short days' journey. It is mostly very good country right up into Queensland. If we were at Walgett I have no doubt that we should get still more of the Queensland traffic.

1055. If you were going to approve, as a private speculation, of the construction of a line of railway towards Coonamble, would you make Dubbo or Mudgee your starting point? I would not consider any place but Dubbo.

1056. No doubt the main portion of the traffic over any line in that direction will be collected at, and sent on from, Coonamble? Yes.

1057. Coonamble will be an important depôt, and it will have their traffic along whatever line is taken into Sydney? Yes.

1058. In the construction of a railway, you would not depend to any large extent upon the traffic which you could pick up between Coonamble and the junction with the main line? No.

1059. At whatever point you junction with the main line, the greater portion of the traffic over the extension will come *via* Coonamble, and, therefore, will not be picked up *en route*? Yes.

THURSDAY, 1 JUNE, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

- C. E. Rennie.  
1 June, 1899.
1060. *Chairman.*] You are Chief Draftsman in the Department of Lands? Yes.
1061. Have you prepared a map showing the country to be served by the proposed railway from Dubbo to Coonamble? Yes; the map I produce shows the tenure of the lands within 20 miles on each side, except the south-west side, where the width is narrowed to allow of the influence of the Western line from Dubbo onwards. The space between the two lines is divided equally. The lands within that limit comprise alienated land, 1,177,000 acres; settlement and improvement leases, 115,800 acres; reserves, 520,000 acres; and Crown land, 650,600 acres. The alienated land is shown by blue tint, the settlement and improvement leases by blue hatching, the Crown lands by brown tint, and the reserves by green tint. The Crown lands within the leases which expire between 1899 and 1900 comprise 540,000 acres, the lands held under occupation license 43,200 acres, and lands untenanted, unless it may be by annual lease, 67,400 acres. I might add that the railway reserve, No. 1,612, which was notified approximately along the route from Dubbo to Coonamble contains about 73,000 acres. The trial line now under consideration is within the boundaries of that reserve for about 14 miles—that is, in broken pieces. Here and there it goes into the reserve to a total length of 14 miles, and the length of the reserve itself is about 92 miles.
1062. *Mr. Watson.*] The reserve practically continues all the way with the line? Yes; but it is broken here and there.
1063. *Chairman.*] The line, as proposed now, leaves the reserve? Yes.
1064. The broken pieces, if added together, make about 14 miles; so that although the railway reserve is 92 miles long, the proposed line only follows that reserve for about 14 miles? Yes.
1065. How much land did you say is available for settlement? About 650,600 acres.
1066. Those lands are not occupied at all? Those lands will include leasehold areas and occupation licenses.
1067. Are there any propositions to withdraw any of the lands from lease? Many of the leaseholds are now being inspected and prepared for subdivision when the leases expire next year. We are now taking steps to have them inspected and ready for subdivision.
1068. I suppose you anticipate getting increased rentals if the railway is constructed? I could not say that. I suppose it might be reasonable to believe that it would improve the conditions of settlement. Whether the total rent would be increased it would be hard to say.
1069. You do not know the quality of the land along the line? No. The only indication I could give of its quality would be a statement of the rents.
1070. Starting from Dubbo and going towards Gilgandra how do the rents compare with the rents further along the line? From Dubbo towards Gilgandra the rents run from 2½d. to 2¾d.; and from Gilgandra, they range from 2¾d. to 4¼d.
1071. From that statement, you would judge that the land up to Gilgandra is not so good as the land further on? No; it is better further on.
1072. Would land that would bring in a rent of 2d. be considered good land or comparatively poor land? Comparatively poor land.\*
1073. Do you produce a map in reference to the alternative line from Mudgee to Coonamble? Yes; the area is taken out for 20 miles on each side of the line. The alienated lands comprise 2,059,000 acres; lands held under settlement, improvement, and scrub leases, 241,800; Crown lands, 1,194,200 acres, and reserves, 573,200 acres. The Crown lands are made up as follows:—Leasehold areas expiring in 1899 and 1900, 552,000 acres; held under occupation license, 155,000 acres; and untenanted, unless on annual lease, 487,200 acres. That line passes through the railway reserve for a distance of about 48 miles in broken pieces.
1074. Can you state the length of the line running through alienated land? I have not had that information taken out.
1075. How are the various forms of holdings indicated on this map? The brown tint shows the Crown lands; the blue tint shows the alienated land; the blue hatching shows the lands held under settlement, improvement, and scrub leases, and the green tint shows the reserves. Here the pastoral rents range from 1d. near Cobborah to 4¼d. near Coonamble. The pastoral holdings commence at the boundary of the Central Division.
1076. *Mr. Watson.*] How far is that boundary beyond Gulgong? About 15 miles.
1077. And at that point the Central Division pastoral leases commence? Yes. There are rents as high as 4¼d. near Coonamble, close to the line.
1078. The land about there is common to either line? Part of it would be; I could not say how much from the map.
1079. *Chairman.*] What are the rents about Munderooran? The rents range from about 1½d. to 2½d.
1080. Judging from those rents, would you say that that land is poor too? It is comparatively poor. There is a considerable area of land untenanted, unless it may be by annual lease, on the southern side of the line, west and south-west of Munderooran.
1081. Do you know the character of that country? No; but I believe it is scrub country. I know, generally, that the land is inferior in those two patches of country.
1082. Otherwise, the land would have been alienated long ago? Yes. There is no land taken up there at all, although it has been open for a long time. I believe there are annual leases here and there; but they do not require residence.
1083. There is a greater proportion of alienated land on the Mudgee line than there is on the Dubbo line? There is more alienated land on this line.
- 1084.

\* NOTE (on revision):—Rent is not in itself conclusive evidence of relative value.

1084. I mean in proportion to the length of the line? There is not very much difference in the proportion, because there only about 2,000,000 acres on this line, and nearly a million and a quarter on the other.
1085. *Mr. Watson.*] Once you get out of the Eastern Division the proportion is about the same? Yes.
1086. *Mr. Shepherd.*] Are you personally acquainted with that county? No.
1087. You judge of its value chiefly by the rentals? Yes; I am really giving the rentals as an indication of the character of the country. I have not sufficient local knowledge to speak authoritatively about its value.
1088. And the proportion of unalienated land on each line is about the same? We were speaking just now about the alienated lands. As regards the unalienated lands, when you get beyond the Eastern Division the proportion is much about the same, I think. Perhaps there is rather more unalienated land on the Mudgee line than on the Dubbo line.
1089. Judging from the rentals, should you imagine that there is more good land on the Mudgee line than on the other? I hardly think so. There is more good land on the Dubbo line, I think, than on the Mudgee line.
1090. Do you think it is possible that any of these lands have been taken up in view of a railway coming there, and that a higher rate possibly has been given on that account? It would be hard to say.
1091. You are aware that very often areas are taken up in anticipation of a railway coming in that direction? Yes.
1092. I wish to know if you are of opinion that any of these blocks have been taken up with that expectation? I hardly think so, to any extent.
1093. *Mr. Watson.*] The pastoral leases which will run out in 1900, and which cover most of the Crown lands within the area specified, were entered upon a good while ago? Yes; they are leases of long standing.
1094. Consequently they would not have been taken up with a view to gain an advantage from the construction of a railway? It is not at all likely.
1095. In each case the rentals would have been fixed some years ago? Yes; quite independently, I should say, of any probable future railway communication.
1096. The most recent date at which rentals could have been reappraised in that division was at the least five years ago? The general reappraisal took place about ten years ago.
1097. There was a possibility of getting a reappraisal under the Act of 1895, but I think that was confined to the Western Division, was it not? Yes.
1098. In any case there would have been no reappraisal recently with a special view to the possibility of a railway being constructed? I do not think that is at all likely.
1099. From the rentals which you have given it would appear that the land around Mundooran is not as good as the land between Dubbo and Gilgandra? No.
1100. It was given in evidence here that the land along the Mudgee route generally is much superior to the land along the Dubbo route, and more especially superior to that between Dubbo and Gilgandra? Judging by the rentals, that would not be borne out I should say.
1101. Is the land round Mundooran and Gilgandra in the same Land Board district? Part is and part is not. Part of this area is within the Dubbo Land Board district and part within the Tamworth Land Board District.
1102. How near to Mundooran does the Dubbo Land Board district extend? It takes in Mundooran and goes a mile or two easterly from it.
1103. So far as the land to the west of Mundooran is concerned, the rentals would be appraised by the same authority as would appraise the land between Dubbo and Gilgandra? Yes, unless in any special circumstances. It is not likely there were any.
1104. The probability is that the rentals were fixed by the same authority so far as recommendation was concerned? Yes, except one or two holdings immediately north of Mundooran.
1105. Therefore they would have a knowledge of both classes of country? Yes; it would be done by the same chairman with different local members.
1106. You stated that there is a large area of unoccupied land south-west of Mundooran;—it is possible that that land is occupied under annual lease? It may be; but I know that a large part of it is unoccupied.
1107. Is that any considerable area approximately? I could not make a guess; I will supply the area.\*
1108. The presumption is that, as it is unoccupied, it is worthless? Comparatively speaking, yes; it is scrub land.
1109. Do you know the total length of the railway reserve between Mudgee and Coonamble? The length occupied by the railway is 48 miles.
1110. I thought, perhaps, close at hand to the railway there might be a further length of railway reserve which would be available, perhaps, to exchange for other land? Yes; but I could not tell you how much without looking it up.
1111. Can you say whether, in addition to the 48 miles of railway reserve which it traverses, there is any considerable area of Crown land which it passes through? Yes. For the greater part of the way the Mudgee-Coonamble line traverses Crown lands or reserves.
1112. Although not specifically a railway reserve, it goes through Crown lands for a considerable part of the way? I would not say the major part off hand, but it does for a large part of the way anyhow.
1113. Coming now to the Dubbo-Coonamble line,—you stated that there is a railway reserve for practically the whole distance, although the railway does not follow the reserve for any considerable length? Yes.
1114. In the event of alienated land being required for the construction of the railway, there would be land available for exchange or sale for nearly the whole distance, would there not? For a good part of the way there would be land available.
1115. In the event of the line going, as projected, along the western boundary of the Castlereagh, and largely through alienated lands, there would be Crown lands, in the shape of railway reserves, available for exchange? Yes; but it might not be suitable to exchange it, because, unless that reserve joins the lands already held, it would be of no use to give it to the holder; there is only a narrow strip facing the railway required to be resumed or given in exchange.
1116. Do you know whether the holdings, say right out to Gilgandra, are small or large? They are various;

\* NOTE (on revision).—The area referred to contains, approximately, 170,000 acres.

C. E. Rennie. various; there are selectors holdings and there are groups held by pastoral lessees; I could not say the proportion in each case.

1 June, 1899.

1117. Do you know whether the selectors there still remain in occupation or have their selections been transferred? I could not answer that offhand; in fact, it is hard to arrive at the actual ownership; the Conditional Purchase Inspector could give you a general idea of the proportion held by the selectors.

1118. I suppose you could not let us know, without referring to the records, how the rentals run beyond the 20-mile limit north from Coonamble? I could find out.

1119. Are these rentals 15 or 20 miles north of Coonamble indicated on your map? Yes; the rentals within the 20-mile limit are 3½d. and 3¾d.

1120. Further out, I presume there would be a gradual decrease in the rental? I could not say without looking up the rentals.

1121. You are not able to say whether it is as good land further out, from which you would expect a similar amount of stock or other traffic? I would not like to answer the question without having sufficient information.

1122. In any case, the land about Coonamble is for pastoral purposes, bearing a fairly high rental, as considered in your Department? Yes.

1123. As compared with some of the more western country, it is two or three times as much? Yes.

1124. The probability therefore is that it is very good land as far as pastoral purposes are concerned? It is good pastoral land.

1125. *Mr. Trickett.*] With regard to the varied rentals, where do the best rents start—near Dubbo? There is a group of good holdings just to the west of Gilgandra which go up to 4d. and 4½d. These holdings are just on the 20-mile limit; they surround the village of Collie.

1126. That block of land which you say returns good rents is a considerable distance from railway communication? It is 25 miles to Warren from the centre of that group of holdings.

1127. *Chairman.*] Suppose that land is of the same class as the land at Mundooran; the reason why you would get higher rents in that case is that it is nearer railway communication than Mundooran is? No; I think it is mainly due to the character of the country, not to railway communication.

1128. *Mr. Trickett.*] Are we to infer from that statement that railway communication is not a factor in inducing higher Crown rents? I would not say that at all, but I know casually from Departmental reports that the country about Mundooran is inferior. I know that the character of the country about Mundooran is inferior to that of this group of holdings apart from the question of railway communication.

1129. *Mr. Watson.*] Railway communication is not of a special value to pastoral land; the difference in the carriage of wool does not affect the rentals very much? It would affect them to some extent because it must facilitate business.

1130. *Mr. Trickett.*] Railway communication is of greater advantage to agricultural land than pastoral land? I suppose it would be.

1131. On both these lines it appears that about half a million acres of Crown lands will fall in during this year and next year? Yes.

1132. Those lands are comprised within an area of 20 miles from either side of each line? That is so.

1133. Within these respective areas there must be a number of patches of good agricultural land? There will be some.

1134. Is there any provision in the Land Acts whereby these lands could be reserved from alienation until a railway is made available so that we should get more than the nominal rent which we would otherwise get? There is power in the Land law to reserve these lands if the Department thinks fit.

1135. What reserves would you call them? We might make them classification reserves—that is reserves pending determination of the form of settlement.

1136. Has that plan ever been adopted? Not specifically for the purpose of railway communication, so far as I am aware.\*

1137. Seeing that these agricultural patches would be so largely benefited by railway communication do you not think it would be rather a good thing if they could be set aside when a railway is projected, so as to get a fair rent for the lands and help to pay the cost of the railway? All these leases which are about to expire are now being inspected and the lands classified by the inspecting surveyor. He goes over each holding; he inspects the land and classifies it and says how it shall be dealt with—what is the best way to dispose of it, whether by pastoral occupation or agricultural occupation. If in any case it is thought desirable any areas he points out as agricultural lands may be reserved and so kept back if the Department thinks it wise to do so, with a view to railway communication coming along at a later date. But they are all being classified; they are not thrown open indiscriminately. There is still the question as to whether the Government may introduce any fresh policy for the disposing of these leasehold areas.

1138. I suppose one can recognise that agricultural lands which are brought nearer to, and within speedy despatch of, the market are thereby considerably increased in value? I should think so, decidedly. I do not think there is a very large proportion of agricultural land there because, although the land is good, the seasons are so uncertain.

1139. Will you state what are the rentals from Dubbo to Coonamble? Between Dubbo and Coonamble they vary from 1½d. to 4½d., and between Mudgee and Coonamble they vary from 1d. to 4½d.

1140. Is that a sufficient difference in rental to indicate any very great difference in the character of the country? You can hardly put these two statements alongside one another because the length of line is different and the pastoral holdings to which these rents refer are unevenly distributed. For instance on one line you might have only one holding at 4½d. and all the rest at 1½d., while on the other line you might have half a dozen holdings at 4d. and only one holding at 1d.

1141. You could not strike an average? I could take out all the rentals on both routes and strike an average.

1142. It would not be much of a guide? No; because the distribution is so uneven.

1143. *Mr. Dick.*] Referring to the Dubbo-Coonamble line, I think you said that from Dubbo up close to Gilgandra there is a considerable area of poor land, judging by the fact that a lot of it has not been taken up? The most of the land, which is not taken up, is on the Mudgee line—that is between Cobborah and west of Mundooran.

1144.

\* NOTE (on revision):—Railway reserves, that is reserves one mile wide on each side of a projected railway line, have frequently been made, including all classes of Crown land within that limit.

1144. The tintings on both maps refer to the same class of holding, do they not? The brown tint on each map shows the Crown land; all the land to the east of Mundooran, although it is coloured brown, is untenanted; but that other brown tint is occupied as pastoral land. C. E. Rennie.  
1 June, 1899.

1145. Take the Dubbo-Coonamble line; there is a considerable area from Dubbo to Gilgandra coloured brown;—is that under occupation? Yes, with the exception of portions on the extreme 20-mile limit east of Gilgandra.

1146. What is the character of that land, judging from the rentals paid? In a great number of cases it is not so good as that nearer Coonamble. The rents are only about half what they are up at the Coonamble end.

1147. You stated that south-west of Mundooran there is some inferior land;—how far from Mundooran towards the Dubbo-Coonamble line does that inferior land extend? It extends to about 15 miles from the line, south-west and west.

1148. You also stated that round Cobborah there is an area of poor land, too? Yes; the rents are low about Cobborah.

1149. Taking the big wall map, would it be correct to assert that that corner of land, bounded by Gilgandra, Mundooran, Cobborah, and then down to Dubbo on one side, and by the proposed Dubbo-Coonamble line on the other, is of inferior quality? Yes; taken as a whole it is.

1150. On that map, from Mudgee to Gulgong, what is the character of that land? I do not know anything about that country at all. It is nearly all alienated land. All that blue tint is alienated.

1151. The greater part of the leased lands in the Central Division on the Mudgee line will revert to the Crown next year? Yes.

1152. Have any of the leased lands, not in that particular district, but in the Central Division, recently reverted to the Crown? Some leases have expired recently; some leases this year, and some leases last year.

1153. What has been the policy in regard to their future disposition? We have had them inspected and the areas classified and set apart for settlement according to the character of the country. That which is suitable for agriculture is set apart for agriculture, and what is suitable for pastoral tenancy is set apart for pastoral occupation.

1154. Can you offer an opinion as to the possible disposition of the Crown lands in the area along the Mudgee line? I could not venture an opinion.

1155. Do you know whether it is of such a character as to render it fit for agricultural settlement? I could not say.

1156. That area of good holdings round the village of Collie is practically within the sphere of influence of the Warren railway, is it not? The extreme southern edge comes to about 20 miles from Warren.

1157. Does that good land extend close towards the proposed Dubbo-Coonamble line? Yes;—it runs practically the whole width across from the proposed line to the 20-mile limit.

Edward McCarthy Allman, Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

1158. *Chairman.*] You hold the position of Assistant Engineer in the Roads and Bridges Department? Yes. E. McC.  
Allman.  
1 June, 1899.

1159. Have you prepared a statement showing the cost of maintaining the roads in the district affected by the proposed railway from Dubbo to Coonamble? I have a statement here showing the expenditure for the last four years on the roads which may be affected by the construction of that railway.

1160. Will you be good enough to read that statement? It is as follows:—

STATEMENT of Expenditure on Scheduled Roads which may be affected by construction of proposed Railway, Dubbo to Coonamble.

Name of Road.	Mileage.	1895-6.	1896-7.	1897-8.	1898-9 (to date).	Total.
Coonamble to Combogolong .....	41	£ 442	£ 216	£ 286	£ 293	£ 1,237

Total .....	.....	8,836	6,393	6,995	7,650	29,874

- E. McC. Allman.  
1 June, 1899.
1161. Do you also produce a tracing? I produce a tracing showing the position of the roads mentioned in that schedule, and the route of the proposed railway, with a 20-mile limit shown on either side.
1162. Is roadmaking costly in that district? Fairly so; there is an absence of roadmaking material, especially towards Coonamble, I understand. I have no personal knowledge of the district.
1163. Do you think the construction of a railway would relieve the Department of any considerable expenditure on those roads? I do not think it is likely. It is scarcely possible to say exactly how it would affect the road expenditure; but it is not likely, I think, that it would be reduced to any material extent, and it is possible that it might be increased.
1164. If there is closer settlement, or settlement for agricultural purposes, the chances are that there will be an increased expenditure? It is quite likely. Some of the roads, no doubt, will be reduced in their expenditure, and others might be increased in theirs.
1165. *Mr. Trickett.*] Do you know this road? No, I have no personal knowledge of that district. I have never been further from Mudgee than Cobborah in that direction.
1166. Of what class are the roads which you enumerated? They are of various classes. We do not schedule them as roads of different classes now exactly, although some may have a larger expenditure than others.
1167. Do you metal these roads at all? Towards Coonamble, I think, they chiefly use corduroy; about Dubbo, of course, metal is used.
1168. I suppose the traffic is not very great? I cannot speak of that, as I have not been over the roads.
1169. Some parts of this country are slightly flooded? I should imagine so.
1170. I suppose the use of corduroy indicates that it is slightly flooded? It indicates a want of other material chiefly—bad country as far as roadmaking is concerned, and want of stone.
1171. *Mr. Shepherd.*] As a rule, corduroy is not used unless it is over boggy ground? No, unless other material is available. We should prefer stone if we could get it.
1172. *Mr. Trickett.*] Have you observed in the Department that, when a railway is constructed through a district, the road expenditure is increased or decreased? I think experience generally tends to show that there is very little alteration in the expenditure; that probably, if anything, it is rather increased than otherwise.
1173. That would be done by feeding-roads? Exactly. We reduce the expenditure on parallel lines of road and increase it on others.
1174. Is the road from Mudgee to Coonamble of the same character as the road from Dubbo to Coonamble? I do not know; I only know the road from Mudgee to Cobborah.
1175. Will you describe the country you saw on the road from Mudgee to Cobborah? It is fairly good from Mudgee for some distance out towards Guntawang, and further on it passes through a good deal of rather poor country right on to Cobborah, with patches here and there of rather better land; but, on the whole, poor from Guntawang on to Cobborah. Of course some of the roads which are mentioned in this schedule are at a considerable distance from the proposed line, but they are included, as probably bearing on it to some extent.
1176. *Mr. Shepherd.*] Do these figures indicate about the annual expenditure? Yes; it would be about £7,500.
1177. *Mr. Trickett.*] I suppose, except in cases where there is a metal road, the construction of a railway does not save much expense in road construction? I think, on the whole, it does not. Where we save on one road we probably increase our expenditure on another.
1178. *Mr. Shepherd.*] If the railway is running parallel with the road, I think it must relieve the road a good deal? Yes; as a rule, it does, but not always to the extent one might imagine. Suppose there are stations along a railway line at different intervals, you must have a road along the railway to bring the traffic into those particular stations; so that sometimes they use a parallel road a good deal more than would be supposed; but, on the whole, it certainly does reduce the expenditure on a parallel road.
1179. *Mr. Trickett.*] Is this a cleared road from Dubbo to Coonamble? It is almost sure to be cleared, because there is a pretty heavy expenditure on the road.
1180. *Chairman.*] Judging from this list of the roads, would that indicate that there is a considerable settlement in that district? It would seem to do so. I do not know what the settlement or the population in the district is, but it is fairly well served with roads.

---

William Henry Hall, Sub-editor, Statistical Year Books, Government Statistician's Office, sworn,  
and examined:—

- W. H. Hall.  
1 June, 1899.
1181. *Chairman.*] What position do you hold? I am sub-editor of the Statistical Year Books.
1182. *Mr. Trickett.*] Have you brought any statistical information in regard to the production and the population on the route of the proposed line from Dubbo to Coonamble, and also on the route of the alternative line from Mudgee to Coonamble? Yes.
1183. Will you first state the population of districts which will be served by the construction of the Dubbo-Coonamble line? It is as follows:—Gilgandra, 1,420; Gulargambone, 1,200; Muntooran, 750; Quambone, 760; Collie, 500; Coonamble, 2650; total, 7280.
1184. When was that information taken? Within the last couple of months.
1185. How far from Dubbo do you start? At about 25 miles.
1186. Will you now state the area under cultivation, and the yield therefrom in that area? I have taken out the figures for two years so as to show a comparison between the land under cultivation in 1897 and the land under cultivation in 1898? I have taken out the figures of each district for which I have taken out the population.

1187. Will you be good enough to read the statement? It is as follows:—

W. H. Hall.

PROPOSED RAILWAY FROM DUBBO TO COONAMBLE.

STATEMENT showing the Area under Cultivation and Yield therefrom, for the years 1897 and 1898, which would be served by the construction of such a line.

1 June, 1899.

District.	Year	Under Cultivation.																		
		Total Area Cultivated.	Wheat.		Maize.		Other Grains.	Hay.						Green Food.	Area under—					
			Area.	Yield.	Area.	Yield.		Area.	Area Cut and Yield.			Area Cut.	Potatoes.		Grape Vines.	Oranges.	Other Fruit Orchards.	All other Crops.

	1898	570	..	..	..	..	..	543	10	..	..	..	..	..	..	3	5	2	17	
SUMMARY.																				
1897	4,207	1,094	30,368	437	8,843	14	1,729	2,578	77	93	77	66	50	8	..	1	19	51		
1898	7,035	3,134	27,389	428	7,180	6	3,056	1,241	12	..	46	23	242	26	3	5	32	45		

1188. It is only fair to add that the depreciation in 1898 is, in all probability, accounted for by the prolonged drought? Yes.

1189. You did not give us any comparative figures as to the population? No; in a general way I referred to the census, and I found that the increase in the population was slightly in excess of the general average of the colony. That, of course, may be attributed to the throwing open of the runs in the Central Division for settlement.

1190. Now, with regard to the alternative line from Mudgee to Coonamble, have you prepared an estimate of the population which it would serve? Yes. In the district of Gulgong, 3,060; Cobborah, 1,100; Leadville, 800; Mundooran, 750; Gilgandra, 1,420; Gulgongbone, 1,200; Quambone, 760; Coonamble, 2,650; total, 11,740.

1191. Does it show a similar increase? Yes.

1192. And it is accounted for in the same way as the other? Yes.

1193. Have you prepared a statement with regard to mineral production? Yes. So far as I could ascertain, there is no mineral production on the Dubbo-Coonamble line. The statement reads as follows:—

SUGGESTED RAILWAY FROM MUDGEE TO COONAMBLE.

STATEMENT showing the Mineral Production for 1897 and 1898 within the area which would be served by the construction of such a line.

District.	1897.		1898.	
	Mineral.	Value.	Mineral.	Value.
Gulgong	6,000 oz. gold	£ 22,000	4,450 oz. gold	£ 17,244
Cobborah	2,877 oz. gold	10,789	2,395 oz. gold	8,981

1194. Have you prepared a statement showing the area under cultivation along this line? Yes; it is as follows:—

SUGGESTED RAILWAY FROM MUDGEE TO COONAMBLE.

STATEMENT showing the Area under Cultivation and Yield therefrom, for the years 1897 and 1898, which would be served by the construction of such a line.

District.	Year	Under Cultivation.																	
		Total Area Cultivated.	Wheat.		Maize.		Other Grains.	Hay.						Green Food.	Area under—				
			Area.	Yield.	Area.	Yield.		Area.	Area Cut and Yield.			Area Cut.	Potatoes.		Grape Vines.	Oranges.	Other Fruit Orchards.	All other Crops.

- W. H. Hall. 1195. I suppose in this case also it is only reasonable to say that any deterioration in the crops is accounted for by the prolonged drought? Yes.
- 1 June, 1899. 1196. In going through the returns which you have given, has it occurred to you which portion of the country is the more productive as regard these two lines? No, I never looked into that matter. I do not think it would be of much assistance to the Committee, for this reason: that in all these places you will find flats which are particularly suitable for agriculture and you may find perhaps that on one line they may be more settled than on the other. Again, perhaps, there is a greater rainfall on the Mudgee line than on the Dubbo line, and that would assist cultivation to a very great extent.
1197. Do you know the two lines? No.
1198. *Mr. Shepherd.*] You have not at your disposal, I suppose, any returns for the years previous to these four droughty years? Not in that form. We have to destroy the returns.
1199. Can you remember if the average returns were really better before these droughty years commenced? I could not say.
1200. You could hardly take the returns for two droughty years as a fair criterion of the value of the land? No. You would have to go back for at least from five to seven years to get a fair average.
1201. You have not calculated, I suppose, the average between these two lines? No.
1202. The reason why in some cases there is no return for 1898, is because the 1898 season may have been more severe than the 1897 season? Yes.
1203. In such cases the statement would hardly show a fair return for any progress which might be made in those districts? Yes.
1204. A bad season would discourage cultivation altogether? Yes; but I think it is only in the case of Gulargambone that there was no return in 1898 and that only in regard to that area under oranges.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines and Agriculture, sworn, and examined:—

- G. C. Yeo. 1205. *Chairman.*] You are an officer in the Stock Branch of the Mines Department? Yes.
- 1 June, 1899. 1206. *Mr. Watson.*] You know that it is proposed to construct a railway from Dubbo to Coonamble, and that there is an alternative proposal to take the railway from Mudgee to Coonamble? Yes.
1207. Have you got any information as to the disposition of the stock within those districts? I have a return of the stock in both areas likely to be affected. I have a map showing by red tint the area of stock which is likely to be returned over the Dubbo-Coonamble line, and by blue edging the area of stock which is likely to be returned over the Mudgee-Coonamble line.
1208. Taking the Dubbo-Coonamble line, what information have you brought? I have prepared this statement:—

PROPOSED RAILWAY FROM DUBBO TO COONAMBLE.  
NUMBER of Stock and Weight of Wool in area tinted pink.

Year.	Wool.	Horses.	Cattle.	Sheep.
	Tons.			
1895 .....	.....	11,867	29,253	2,238,717
1896 .....	.....	12,126	32,716	2,298,494
1897 .....	5,522	11,301	27,101	2,152,307
1898 .....	5,515	10,860	23,235	2,148,560

1209. Have you a return with regard to the stock traffic? Yes; it is as follows:—

*Stock traffic up the Castlereagh towards Dubbo.*

Year.	Horses.	Cattle.	Sheep.
1896 ... ..	780	7,800	300,000
1897 ... ..	710	5,000	205,000
1898 ... ..	500	5,000	250,000

1210. Has there been any marked falling off in the quantity of sheep or other stock during the last few years? There is a falling off of about 90,000 in sheep from 1895 to the end of 1898.
1211. Even then they do not seem to have done so badly as pastoralists in some parts of the more western country? No.
1212. I do not think you mentioned the exact dimension of the red patch;—how far does it extend on either side of the line and beyond Coonamble? I start at 16 miles from Dubbo.
1213. From there on how far does it extend on each side of the line? West from Gilgandra 32 miles, and easterly from the projected line 60 miles.
1214. It continues at these respective distances from each side of the line until you get past Coonamble? Yes.
1215. How far past Coonamble does it go northerly? 50 miles.
1216. That area which you have described is the area which comprises this stock? Yes.
1217. Do you think that is the maximum area which will be affected by the influence of the line? Yes; more especially having regard to the country to the north of Coonamble.
1218. Do you think the influence of this railway will not extend further than 50 miles north of Coonamble as far as stock is concerned? I do not think so, because they will work up the Namoi towards Narrabri; there are other ways of getting away.
1219. By the Namoi, towards Narrabri, I suppose on the east, and on the other side they would go towards the Western line? Towards Brewarrina.
1220. The red-tinted area is, in your opinion, the fair limit of the influence of the projected line as regards stock? Yes.
1221. Where does that stock go now;—does it go generally towards Dubbo, Mudgee, or the Northern line? Generally towards Dubbo, perhaps some of it would work to Warren.
1222. Do you know if any of it goes towards Mudgee? It goes down to Mudgee; another lot works down through Cassilis and Merriwa.

1223. Is there any considerable portion of that stock sent towards Newcastle? I could not answer that question. G. C. Yeo.
1224. Do you know anything of the character of the country between Dubbo and Coonamble? I have never been there. June, 1899.
1225. Or of the country beyond Coonamble? No.
1226. You cannot tell how far it would contribute fat stock towards supporting the line? No.
1227. Can you say whether there is any marked amount of disease in stock there? No; that is a question for the Chief Inspector to answer.
1228. Does the stock from Walgett come down through Coonamble, or go towards the north-west line at Narrabri? There is a drift from Walgett, by the Castlereagh, to Dubbo.
1229. Has the number of large stock within the area described been stationary during the last few years? Since 1895 there has been a falling-off of about 6,000 in cattle, and of about 1,000 in horses.
1230. Can you give any information as regards the stock on the suggested line from Mudgee to Coonamble? Yes; that area is edged blue on the map.
1231. How far from Mudgee do you start? Starting at a point 20 miles north of Mudgee, it extends 20 miles on each side of the line, and eventually includes all the portion tinted red—that is, the portion to which the statistics I gave in relation to the Dubbo-Coonamble line refer.
1232. The information you are about to give is really an addition to that which you have given? Yes.
1233. Will you read the return? It is as follows:—

SUGGESTED RAILWAY LINE FROM MUDGEE TO COONAMBLE.  
NUMBER of Stock and Weight of Wool in area edged blue. Area about 9,600 square miles.

Year.	Wool.	Horses.	Cattle.	Sheep.
	tons.			
1895 .....	.....	14,614	39,820	2,396,419
1896 .....	.....	14,886	42,338	2,481,958
1897 .....	5,959	13,244	37,091	2,321,397
1898 .....	5,973	13,716	33,602	2,326,891

1234. That return includes all the figures which you gave previously? Yes.
1235. With the addition of the stock within the boundaries of the district you have marked as being affected by a line from Mudgee towards Coonamble? Yes.
1236. It includes what was given before, and in order to get the number of the stock within the added district we should require to subtract the figures which you gave previously? Yes. The same drift of stock which passes up the Castlereagh also affects this area, but there is an additional drift going Coonabarabran way towards Mundooran.
1237. Have you prepared a statement on that point? Yes. It is as follows:—

*Stock traffic from Coonabarabran towards Mundooran.*

Year.	Horses.	Cattle.	Sheep.
1896 ... ..	600	500	40,000
1897 ... ..	500	400	38,000
1898 ... ..	500	600	41,780

1238. You have not been over any of the land along this line either? I have not been in that part of the country at all.

FRIDAY, 2 JUNE, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Alexander Bruce, Chief Inspector of Stock, Department of Mines and Agriculture, sworn, and examined:—

1239. *Mr. Watson.*] Mr. Yeo was unable to tell the Committee, yesterday, the number of fat stock which might be expected to travel along the proposed line from Dubbo to Coonamble, or what influence the construction of a line between those two points would have upon the more easy getting of fat stock to market;—have you any ideas on that point? I should say that the country he pointed out to me on the map is almost wholly fattening country. A. Bruce.  
June, 1899.
1240. Therefore, you think the construction of this railway would result in an increased number of fat stock being carried towards market? I believe it would. It would mean a considerable saving to the owner, and in the condition in which the stock was landed at Sydney.
1241. It is difficult to get fat stock to market in condition if you have too great a distance to take them to a railway? Yes, even in an ordinary season. Travelling stock reserves are either being largely sold or let, so that as a rule, if the stock have to travel any distance on foot, they are greatly deteriorated.
1242. As a rule there is no grass on the stock routes? No; this process of letting the reserves, and of their being skinned by the lessees, is constantly going on more and more. In olden times, when a stock route passed through a run, the cattle got the benefit of the grass on the same footing as the stock on the run; but when they are let in small areas, and the lessee has land alongside, he has it in his power to skin the reserves and leave nothing on them.

1243.

- A. Bruce. 1243. Generally, he eats out the reserves, spelling his own paddocks in the meantime? Yes; and as soon as a flush of grass comes, his own stock are on the reserve and eating it down. If the railway charges could be so fixed that the store stock as well as the fat could make use of the railway, it would be an immense benefit to the pastoralist, and to the country generally. There is a waste going on which is very serious even in ordinary times; and millions of sheep have been lost through the difficulty in getting them from where they were starving to where they could get grass.
- 2 June, 1899. 1244. From what Mr. Yeo said yesterday, I understand, notwithstanding the bad seasons recently, there has been a loss of only 90,000 sheep in the districts which will be influenced by this railway? There have been favoured districts. I suppose it has come under your notice that there was a good crop of wheat in the Narramine district which is not very far away, and this district must have got the benefit of the rains which helped the wheat. I know that they have been comparatively well off.
1245. Do you think that during the last few droughty seasons they have been specially favoured in these districts or is it merely a continuing of their normal condition? The quality of their pasture land had something to do with it, but they have been specially favoured so far as rainfall is concerned, as compared with rest of the Colony.
1246. Have you been over the country between Dubbo and Coonamble? I have been at Warren; I have been through the country from Wee Waa to Coonabarabran; and I know, from the accounts I get, and from people who I know are interested there, that a large portion of it is good fattening country.
1247. What I wish to ascertain is whether you have been out from Dubbo towards Gilgandra, for this reason: that we have been told that the land for that distance of 40 miles is comparatively poor? I have been from Mundooran to Dubbo.
1248. There is a proposal made for an alternative line from Mudgee to Coonamble which would pass through Mundooran;—what is the character of the country about Mundooran? It is not such good country as the country from Warren to Coonamble.
1249. From Dubbo, what is it? It is not good country at a comparatively short distance from Dubbo; it is fair country.
1250. At a short distance from Dubbo is it poor country? Yes, out in an easterly direction.
1251. And in a northerly direction? It gets better as you go north.
1252. How is it about Mundooran? It is fair country; there is some good country there.
1253. Is it good pastoral country? Yes.
1254. It was stated in evidence yesterday by Mr. Rennie, from the Lands Department, that a considerable area of Crown lands about Mundooran is unoccupied; I understand you to say that the country on a line between Mundooran and Dubbo is not good country? It is not good country; it is poor country.
1255. But north-west from Mundooran it is good land? It is good land.
1256. That is following the route of the proposed line from Mudgee to Coonamble? Yes.
1257. Now, referring to the line between Dubbo and Coonamble, do you know whether any of the land on that route is specially productive of disease, or is it sound country for stock? It is sound country. There are some spots about Dubbo which have anthrax on them, but that is to be found in a good many parts of the Colony.
1258. Any foot-rot? No.
1259. You would regard it all as sound carrying country for stock? Yes, and especially as you go north.
1260. Do you think the land to the north of Coonamble is equally good for fattening purposes? Yes, right up to Walgett.
1261. So that we might reasonably expect Coonamble to be made a depôt for the shipment of fat stock if a railway were constructed to that point? Yes.
1262. *Mr. Dick.*] I think you made a statement about the character of the country between Wee Waa and Coonabarabran? Yes, that is poor country. I have been from Wee Waa to Coonabarabran, by Baradine.
1263. Have you any general idea as to the movement of stock in that area—say, from Coonamble north to Walgett, and over towards the North-western line;—does the greater part of it drift down the Northern line? There is a large drift of stock up the Castlereagh.
1264. When you travelled from Wee Waa to Coonabarabran, what direction did you pursue after that? I came on then to Mundooran.
1265. What is the character of the country between Coonabarabran and Mundooran? There was some poor country there.
1266. *Dr. Garran.*] Supposing stock going to market from the Namoi, or north of the Namoi, and aiming at Dubbo to be trucked, would it be a very great gain to take the trucks at Coonamble? Very great.
1267. How much a head would that be worth? At present they would have to go on to Warren. I should think it would be worth 3d. a head on sheep.
1268. Do you think it would cause more stock to be sent if they could take the train at Coonamble? I think it would do more in saving condition than in the number of stock, because you would need to get rid of the stock somehow.
1269. All the stock which now trucks at Dubbo would certainly truck at Coonamble? Yes.
1270. So that the Commissioners would get the whole of the freight on that line? Yes.
1271. Do you think there would be a fair amount of business of that kind? Yes. There is a large area of first-class country to the north of the Darling from which the stock would come there.
1272. Is there much fat stock sent to Sydney now by road? None where they can get the rail.
1273. In a very good season, when there is plenty of water and grass on the road, is there still a quantity of stock sent by road? It is very seldom that there would be grass where the owner would not lose much more by travelling than by putting them on the train.
1274. Travelling by road has almost gone out of fashion for fat stock? Yes.
1275. And the railways have a monopoly of this business? Yes.
1276. I suppose you travel by road a good deal still? Yes. The owners of store stock see the money going away, but they do not see the immediate return, and they do not make use of the railway as I think they might do; but the time must come before very long when store stock will be put on the line as well as fat stock. There is no doubt about that being done, because the reserves are getting into that state that it is starvation to be on the road. I do not know if anything could be done in the direction which I suggested

A. Bruce.  
2 June, 1899.

suggested some time ago that for store stock on the level country there ought to be a differential rate. I believe an engine can take three times the load on level country that it can on even a moderately-steep gradient. If that were done there would be no use for reserves except on cross-country routes, and the condition would be kept on the store stock. You may buy store stock now half fat on the station, but when you get them on the run they are as poor as rooks, and it is a matter of perhaps four or five months additional keeping of the sheep to bring them up to the condition they were in when they left the place from whence they came. I saw a statement in a paper not long ago that in America they carry goods at a farthing a ton per mile. For the carriage of our cattle, taking Nyngan as a medium distance, we are paying a penny and a fifth per mile. In America the railways are not Government concerns, but are constructed by private enterprise, and conducted on ordinary business lines. There ought to be some means, I think, of our stock-owners being put in the same position as the men are in in America. If the rate were reduced to one-half I have no doubt that all the store stock would be got on the line. I am not in a position to speak with any certainty, but I believe, on the level country, where there is no rise in the gradient, it would pay the Department very well to carry in that way if they got sufficient loads. That should be a mere matter of arrangement. For instance, if they were carrying out the traffic on three lines, say to Bourke and Cobar and Coonamble, the trucks could be engaged all the week by working two days in the week on each of the three lines. At any rate, there ought to be some means found to reduce the cost of carrying stock. One of the greatest wastes going on in this Colony is putting the stock on the road.

1277. Is there much store stock going from the New England country out west? Not out west. To a large extent the fattening of store stock is carried on on the eastern side of the Colony. The outlying western stations do not fatten sheep as a rule. They sell them as stores. Then, again, if in time of drought the stock were carried from, say, Hay to the point where the gradients are heavy, they would be brought to where there was some feed, and they could from there proceed to the mountains. All the country from Narrandera to Hay is a perfect waste now, and in other directions it is the same.

1278. The Commissioners have made heavy reductions for starving stock, and you want them to make a reduction for store stock? Yes, as a regular thing on the level as compared with what they charge on bad gradients—that is to say, from Hay to Junee, from Bourke to Dubbo, and from Werris Creek to Moree.

1279. Still, if store stock lose a little condition on the road, they have time before them to fetch that condition when they get on to the fattening land? That might lose a season, and very frequently they do; and after an animal is starved like that it is a long time before it makes up. Again, if you put sheep on the road, the fleece is destroyed to a large extent. Burrs as well as dust get on the fleece, and altogether there is a great deterioration in the fleeces.

1280. Would that be so immediately after shearing? Not so much, but they are removed at all seasons of the year.

1281. But, of course, with regard to fat stock coming down, if they lose their condition on the road there is no time to fetch that up? No; it is directly seen, and they feel it.

1282. But the other is lost? Yes, they are losing quite as much, and not seeing it.

1283. Your opinion is, that as much money is lost by travelling store stock on the road—wasting it—as there would be by travelling fat stock on the road? Certainly.

1284. Although the squatter does not see it? Yes.

1285. Of course if a fat sheep loses 3d. or 6d. a head in coming down to market, you feel that loss directly? Yes, the buyers would soon tell them.

1286. But if he loses it on store stock, he hopes to make it up before the time comes for fattening? They do not see it. If they get the number home that is practically all they look at.

1287. With regard to the line from Dubbo to Coonamble, is the country beyond Coonamble fattening country? Yes, due north from Coonamble.

1288. Where do they get their store stock from? It would be further out; sometimes, perhaps, Queensland stock.

1289. Is the very dry country between Coonamble and the Darling fattening country or store country? You might say that it is all fattening country. It is not turned wholly to that account now, for in a great deal of it breeding goes on. It is all a class of country which would fatten.

1290. Do they mostly breed their own stock or do they buy store stock? I think they breed a great proportion.

1291. There is not much movement of store stock into that western country;—there is no business of that kind to be got by the railway? The railway would eventually get the carrying of them from where they are wanted. In America the stock are all moved by rail.

1292. Is there any movement of store stock out into our far west from the more settled districts? There is of breeding stock.

1293. I mean store stock? That comes to the same thing; it is looked at in the same light. The breeding stock might go out there; but the flow of store stock is the other way.

1294. I can understand their sending breeding stock up; but what I want to get at is, do the far western people breed enough stock for their own purpose or do they import store stock? They breed.

1295. But there is no movement of store stock out to the far west? Except at occasional times.

1296. Is there any business for the railway taking store stock to the west? I should not say that there would be much traffic in that line.

1297. Then the far western people send their store stock eastward to be fattened? As a rule.

1298. You think that with fairly low freights the railway would pick up a great deal of that business? Yes, and help in times of drought.

1299. Has it paid the western country which has been within reach of a railway to send starving stock to the east? If the drought had broken up within a reasonable time it would; but with a continuous drought such as we have had, lasting you might say for three years, I am afraid they will lose all the expense they have gone to in trying to get food for their stock.

1300. Then practically they have not sent much starving stock away? In a good many cases they left it too long, and they could not; the stock died on the run.

1301. Do you think a westward extension of our railways would save any great quantity of stock? A great quantity.

1302. Would it pay the squatters to send them away? It would pay them well.

1303.

- A. Bruce.  
2 June, 1899.
1303. Is there room in the east for that stock to come in and pay? Yes, unless in an exceptional general drought. There is always room in the mountains and on the eastern side of the Colony in dry times.
1304. Is not the eastern part of the country as fully stocked or as over-stocked as the western part? No; immense numbers of stock go to the mountains where they do not, as a rule, keep sheep, except for a few months in the height of summer.
1305. That is about the Australian Alps district? Yes.
1306. Is not New England pretty well stocked? Yes, it is fairly stocked; but they could take more for the time-being.
1307. Could they take a million sheep from the west? More than that, I should think.
1308. In addition to what they have been feeding of their own? Yes.
1309. That seems rather extraordinary? They could do that.
1310. Do they not keep fully stocked up? No; they are in times of drought content with country upon which they would not in ordinary times put a sheep.
1311. Can they carry in summer time in New England a very much larger quantity of stock than they can carry in winter time? Very much.
1312. So that in summer time they have grass to spare? Yes. On the other hand, there are times out west when they could carry an immense number more of sheep than they can do on an average.
1313. Take the three seasons through which we have been passing. If in the first season the western squatters had sent their stock to New England they would not have been able to get them back for three years? No; as it happened they have not had a three years' drought in the north-east part of the Colony.
1314. I am talking of the western squatters—could they get their sheep back, say, on to the Darling? I do not know if they send sheep from much farther west than the Barwon. As it happened, at the beginning of these three years they were fairly well off, and it is only lately that they have suffered so much.
1315. Your previous answers would imply that if the north and north-west squatters had sent their sheep over during the summer they would have had to get them back again in the winter? Yes. What I wish to say shortly is this, that there is not the opportunity of moving sheep from one place to another that there used to be; but as the railways progress these reserves will not be needed, and, with all due deference, I put before you the suggestion that store stock will have to go upon the railways, and that provision should as far as possible be made for that turning up.
1316. I quite understand you, but I am supposing these railways made, and I am supposing the reduced rates and other inducements for the western squatters to send their starving stock in a very dry summer to the mountain country, and then I ask must they have them back in the winter, or could they afford to let them stay over there for three years? They must take them from the mountains about this time of the year.
1317. They cannot permanently keep them there? They are leaving the Australian Alps now.
1318. Where are they going to? It is very hard to say; they do not know where to go.
1319. They cannot go back to the runs? No.
1320. There is not a blade of grass there? No; their owners are riding all over the country to find places to put the sheep.
1321. Of course this has been a very exceptional series of bad years? Very.
1322. Do you remember anything like it before? No.
1323. Do old squatters remember anything like it? As a rule, no; but some say the years 1838 to 1840 were as bad.
1324. The country was not stocked up then as it is now? No.
1325. Taking the ordinary dry seasons, the small droughts we have, you think the extension of the railway into the pastoral districts, with fairly low prices for store sheep, would lead to a great saving of sheep? There is no doubt that it would lead to a great saving both in lives and in condition.
1326. A saving in the quality of the sheep as well as the number? Yes, and especially in that of the fleec.
1327. *Mr. Trickett.*] Is that opinion founded upon experience? Yes, and from looking at it in this light—that at Home, a person who buys a store beast counts every ounce of condition which is on it, and expects not to lose a pound till he gets it to his farm and starts it off feeding. Here that has not been the case; but anyone can see on looking into it how much waste goes on in starving stock, and taking all the condition off them by the time they get home.
1328. That idea you have just expressed about the saving in the condition of the sheep has always been urged in favour of the construction of the various lines which we have been considering for a number of years? Yes.
1329. Has the construction of the lines relieved the squatter in that direction? To a considerable extent.
1330. On what lines? On the Hay line they are moving their sheep; I had a large number of certificates to issue through my inspectors for starving stock. There has been a very general movement in that way; they have been sending cattle even from the coast district by train to Tenterfield, and travelling them down the Clarence for pasture.
1331. Has the Cobar line been used? I cannot recollect any case of that inspector issuing a certificate for starving stock.
1332. Has the Parkes line been used? Yes.
1333. Has it been of advantage there in that respect? Yes, and at Dubbo, and Forbes, and Condobolin the inspector has been issuing certificates for starving stock.
1334. *Mr. Shepherd.*] I suppose you are thoroughly acquainted with the whole of the country between Dubbo and Coonamble? No; I know the country from Dubbo to Warren, and from Wee Waa to Coonabarabran, by Munderoran; but I do not know the country between. I have been from Munderoran to Dubbo.
1335. You are not personally acquainted with the country between these two routes? No; only from what I know of the character of the runs and the stock which comes from them.
1336. Do you know what are the chief grasses in that part of the country? No.
1337. Do you know if salt-bush is grown there to any extent? Yes, at one time. I look more at the character of the country. A great deal of it is black soil country.
1338. Have you noticed any deterioration in the character of the pasture in any part of the country from over-stocking or continuous stocking? Yes; I know more from hearsay than any other way. I have not been out so much as I was at one time, but I know that is going on, and it stands to reason that it must be.
- 1339.

1339. Have you any idea of the extent of the country which would be served by a railway from Dubbo to Coonamble—that is, in different directions beyond Coonamble;—for instance, do you think that the people below Walgett would use the Coonamble line? It would draw to some distance south and east, and to a very large extent from the north. A. Bruce.  
2 June, 1899.
1340. Is this part of the country stocked chiefly with sheep or cattle? Almost entirely with sheep.
1341. Do they seem to fatten fairly well? Yes.
1342. And they are sent pretty largely to market? Yes.
1343. If a railway is constructed I suppose it would be largely used for conveying sheep? No doubt it would.
1344. The travelling stock reserves, I understand, generally have poor pasture on them; they seem to be overrun rather too much;—is that not so? Yes; the greater part of them are under lease.
1345. I understand that these lands were reserved entirely for travelling stock? They are reserved from sale, not from lease. Travelling stock are supposed to get a share of the grass which is on them, but they are still under lease. Up to a year or two ago there were 7,000,000 acres in the travelling stock reserves, and out of that area only 600,000 or 700,000 acres were reserved from lease. In all the western country there are mile wide drift-ways, and these are all under lease. I think the greater part of the travelling stock reserves in the Central Division are also under lease. The small reserves in the Eastern Division are, as a rule, not under lease, but the area is very small in the Eastern Division.
1346. Do you not think it would be desirable to entirely reserve these travelling stock reserves? Yes.
1347. Because if they are allowed to be used by settlers it is quite likely that beasts travelling on them would be starved? It is not necessary in the Western Division, because, as I said, they are in large paddocks, and travelling stock get the same privilege to grass as stock in the paddocks; but it is different in the Central Division and in the Eastern Division, because there they are small, and let to people who have not large areas of land, and who have it in their power to skin them if they choose.
1348. It seems that there is a large extent of unoccupied country on both the proposed railway lines; have you had any report as to the character of that unoccupied country;—is it utterly useless? It is utterly useless or it would be taken up. There are something like 20,000,000 acres, including the mountains, in the Colony unoccupied.
1349. It may be that it is not taken up because it is not well watered? That would be one drawback.
1350. The character of the country might be fairly good, but if there is no water it would be utterly useless? Yes; but if it is not poor as well as dry they would take it up and conserve or sink for water.
1351. *Mr. Dick.*] You informed us that it is a somewhat important function of railways to bring starving stock and even store stock from the dry districts in a drought to places where they can get feed? Yes.
1352. And the shorter the distance over which the sheep can travel for that purpose the better? Yes.
1353. Taking the district of which Bourke is the centre, in which direction would they most easily arrive at places where they could get food during a drought—to the south down towards Dubbo, or to the east towards the Northern line, presuming that a railway were constructed in either case? During these late droughts they moved in large numbers in the direction of Mudgee, and beyond Mudgee to the hilly country. If the railway were extended to Walgett from Narrabri, then of course they would go by the Namoi towards New England.
1354. You mean that if the railway were extended out towards Walgett? Yes.
1355. Do you think that a railway if constructed in that direction would be the means of saving a lot of sheep, and as a consequence a great amount of wool? Yes; it would effect a great saving, and there would be a large increase in the trade if store stock could get on the line and be moved easily from one place to another.
1356. If a line were constructed from Werris Creek westerly, or west by south, do you think that would have the effect of relieving the drought-stricken districts? Yes; they could get away in that direction towards the mountains.
1357. *Chairman.*] You have had a considerable experience over the whole of New South Wales? I have been over a good deal of the Colony.
1358. You have been on most of the railway lines as far as they have gone? Yes.
1359. Judging by the returns of the various lines which have been constructed, are you of opinion that the construction of a railway from Dubbo to Coonamble would be warranted by the probable traffic on the line? I would not like to offer an opinion.
1360. Judging from what has happened in the past, do you think it would? I would not like to offer an opinion, but I come back to what I said: that in looking at this question you must consider the fact that the store stock must get on the railway before many years pass.
1361. Do you think the district between Dubbo and Coonamble is as deserving of a railway as other districts to which railways have been taken? I only see the matter from one point of view.
1362. That is from the standpoint of travelling stock? Stock generally; but I may say, speaking broadly, that stock are the only sources from which revenue could be got if you get beyond the wheat-growing country.
1363. Is not that the case with nearly all the other lines in that direction? Yes.
1364. They are not constructed for agricultural purposes but for stock purposes? Yes.
1365. Judging the matter in that way, do you think there would be sufficient traffic from that district to warrant the construction of a railway? I think other crops might be grown as well as wheat.
1366. I mean from the stock standpoint? If there were by any means a junction from which these lines could be served by a twice-a-week train, then I should think the thing would pay. For instance, if there were a junction at Nyngan and the same plant could serve three lines, I believe that stock alone would almost make the railway pay.

William Boyce Wilkinson, stock and land agent, Dubbo, sworn, and examined:—

1367. *Mr. Trickett.*] What occupation do you follow? I am a stock agent and land agent at Dubbo. W. B.  
Wilkinson.
1368. For how long? Twenty years. 2 June, 1899.
1369. I suppose you are favourable to the project to construct a railway from Dubbo to Coonamble? I am not favourable to the construction of a railway from Dubbo to Coonamble, although I am a resident of Dubbo.

W. B.  
Wilkinson.  
2 June, 1899.

1370. Will you kindly state your views on this proposal? I know every inch of the country not only from Dubbo to Coonamble, but right through to Mungindi. Between a point about 8 miles from Dubbo and Gilgandra there is a vast area of poor country on the right-hand side of the line. Towards Munderooran also there is an ironbark forest country. Here and there you may get a few acres fit for cultivation, but then only in small areas. The only advantage it has is that there is a large ironbark forest; the Railway Commissioners, some years ago, offered to spend £20,000 in putting a tramway down into this forest. A good deal of it is virgin forest which has not yet been tapped. I have now described the country as far as Gilgandra as the eastern side.

1371. Will you describe that patch on the western side of the proposed line? Starting from Dubbo on the western side for about 12 miles the country is better, especially towards the river where you see the best farming land we have in the district. When you get to about 12 miles from Dubbo then this poor country stretches on to the eastern side of the line and you have to go further in before you get this good country on the western side. You have to go in 4 or 5 miles before you get on to good country, although you get a little bit of wheat country about 25 miles from Dubbo. Then from Gilgandra on both sides of the line, you get all good pastoral country, and along the banks of the river, of course, good wheat-growing country, but anywhere when you get off to the westward of this line you get on to purely pastoral country and not such good rainfall. As you get on the eastern side towards the Warrumbungle Range, you get into all farming land, except at the top of the hills, some of which may be only second-class pastoral country. That takes you on to Gulargambone. Thence you cannot go very wrong for rich pastoral country till you get to Coonamble. There is no difference in the pastoral land once you get a few miles beyond Gilgandra, but you get no very good agricultural land owing to the seasons and to there being a great deal of black soil. It cannot be tilled to your satisfaction. You get then purely pastoral land. My experience is that the land about Coonamble is purely pastoral land. In good seasons, no doubt, you can grow very strong crops. There has been a line spoken of leaving the Western line at about Narramine, and going almost in a direct line to Coonamble. Being a land agent for some of the principal people there, I prepared a plan showing how the railway would not go through any alienated land. Leaving the main line at 6 miles on the eastern side of Narramine, and crossing the Macquarie, you get into about 70 miles of roadways and travelling stock reserves, where there would be no alienation at all. There is an artesian bore sunk at about 13 miles west of Gulargambone.

1372. I understand you to admit that starting from Dubbo there is some good agricultural land? For about 10 miles out.

1373. Does that district, for 10 miles out, comprise what is known as the parish of Terramungamine? It would go past that.

1374. Is that within the area you spoke of? That parish would about cover it.

1375. In that district there is an area of about 25,000 acres taken up in small holdings? The only land which has not been taken up in small holdings is land under leases which will not expire till next July.

1376. There are a great many farms of 100 acres and 200 acres there? Yes; they lie principally on the western side, within about 10 miles of Dubbo.

1377. Do I understand you to say that, from there northward, right up to Coonamble, there is no such favourable district as that for agricultural purposes, to your knowledge? Nothing like it on that line.

1378. Not even in small patches? Not even in small patches.

1379. It is to your mind purely a pastoral country? No; there are patches of agricultural land. As far as my experience goes, and it is a pretty long one, when you pass Gilgandra you get out of agricultural country, both from the seasons and from the nature of the country. In good seasons it will grow heavy crops.

1380. From Dubbo to Gilgandra, barring a distance of 10 miles north from Dubbo, there is nothing to compare with that large patch which has been largely developed as an agricultural district? No, especially on the western side of the line.

1381. And after you get to Gilgandra, and go further north, you get into pastoral country by reason of its being dry country? Yes; from climatic causes, and from the nature of the soil. There is a great deal of heavy black soil which is not good for agriculture.

1382. Have you anything more to say about that part of the line? I think I have exhausted that line. From Narramine to Coonamble you have good country on either side of the surveyed line.

1383. Would you, if you were advising a railway, take a straight line from Narramine to Coonamble, or would you strike Gilgandra *en route*? No; in preference to the Dubbo-Coonamble line I would advocate a line from Narramine to Coonamble in a straight line, not only because of the very good country it goes through, but because, owing to the stock reserves and other roadways, there is no land to purchase—travelling stock reserves and roadways run the whole distance. The line I have always advocated and worked for is a continuation of the Werris Creek line towards Munderooran, which is a national line, and tapping the Coonamble line at about Munderooran.

1384. In taking a line from Narramine to Coonamble, would there be any object in striking Gilgandra;—is it of sufficient importance to divert your line from Narramine? No; because the country to the west of Gilgandra is very poor till you get out 20 miles. You would have to go 20 miles to the east of Gilgandra before you got out of this class of country. There is nothing to be gained by taking a line from Narramine to Gilgandra, and from there on to Coonamble. The traffic on the western side of the line to Gilgandra would not be of much service. This land between Gilgandra and Munderooran is practically unoccupied, and from about 17 miles east of Gilgandra it is heavy ironbark country.

1385. This line you mention goes through a large extent of Government land? Yes.

1386. If it is such good land, how is it that it has not been taken up? Because it goes through travelling stock reserves and roadways. It has been taken up wherever it was possible; some of the leases do not expire till 1900.

1387. How far on that line would the agricultural resources be good enough to induce people to settle? It would give out at about 20 or 25 miles from Narramine.

1388. Should you get as good a class of land there as that which is already cultivated at 10 miles from Dubbo? No; because we get some of the river land here; barring the river land we should.

1389. In that particular part of the country wheat-growing has been a success recently? Yes; but not much below Narramine, you might say about 12 miles down the river from Narramine. That would be 12 miles north-west and west, and about 20 miles north. You get a better rainfall as you go north.

1390. Do you think wheat-growing would be extensively carried on along the line which you propose? I think so, up to 20 or 25 miles of it.

1391.

W. B.  
Wilkinson.

2 June, 1899.

1391. Have the crops been payable ones there in fair seasons? Yes, we have been very fortunate for years in that district; even last year we had a good crop.
1392. How long is it since wheat-growing has been carried on there to any large extent? To a large extent only during the last four or five years.
1393. And the graziers are giving their attention to wheat-growing now? Yes. I think they all recognise now that they will have to put large areas under crop and save their crops for dry times for feeding their stock. They are putting thousands of acres under crop for that reason.
1394. Looking at the matter from the railway standpoint, as this wheat-growing land only extends about 25 miles from Narramine, it would not be of very much advantage to the railway in that respect? I do not think so. The Coonamble people think it is agricultural land.
1395. Looking at it purely from the standpoint of the freights it would provide for the railway? In good seasons I have no doubt that heavy crops would grow, but it is not what I would think is good agricultural land, taking into consideration the seasons which you are likely to expect.
1396. Are there any engineering difficulties on that line from Narramine to Coonamble? No; there is simply the crossing of the river. If you started from Dubbo you would have several creeks to cross which you avoid on this route. Starting from Narramine you have both these large creeks to cross—I mean Coolbaggie Creek and Talbragar River.
1397. *Mr. Watson.*] Have you not then to cross Marthaguy Creek and another tributary of the Macquarie? They are practically without banks. From Narramine to Coonamble you would only have to cross the Marthaguy Creek, which is a very small one. It is not flooded or flat land; it is not flooded land like the land between Warren and Coonamble.
1398. *Mr. Trickett.*] Do I understand that the line you favour is a line from Narramine to Coonamble? In preference to a line from Dubbo to Coonamble.
1399. But it is not the line you favour? No.
1400. You have another line to suggest to the Committee? Yes. There are several lines surveyed from Dubbo to within the neighbourhood of Mundooran. This Werris Creek line, I think, comes within 2 miles of Mundooran. The valley of the Talbragar is all wheat-growing land, and there are farms for the whole distance as far as about 28 miles—all small farms. These farms extend all the way up till you get to Cobborah. There is a surveyed line which crosses the Talbragar at 30 miles from Dubbo, and does not go to Cobborah; it goes easterly in a straight line to a point about 2½ miles east of Mundooran. This wheat country extends all up to the Talbragar, and all round through this district, the Murrumbidgee holding. This area between Dubbo and Cobborah and between Cobborah and all round the other survey to Wellington—the whole of the area between those two surveys is all wheat land, and is cut up in small farms.
1401. Is it already producing wheat? Yes, wherever people have had a chance to secure an acre. All the leases in that area do not expire until July, 1900, so that any alienations which have taken place have only taken place on the resumed areas. In July, 1900, there are 750,000 acres of land on the northern side of Dubbo to be thrown open.
1402. So that that line would really bisect very rich agricultural land? Yes, for 30 miles; but when you leave this point where you cross the Talbragar—it is about 30 miles below Cobborah—to get across on to the water-shed of the Castlereagh, you must cross the same bar of ironbark country as I spoke of, between Gilgandra and Dubbo, only with better patches of agricultural country in it—larger flats.
1403. When you get to Mundooran in that way with your line you propose to go on to Coonamble? Yes, and with a branch line to Mudgee.
1404. The country from Mundooran to Coonamble is, I suppose, of much the same character as the country from Gilgandra to Coonamble? No; from Mundooran, until you get within about 30 miles of Coonamble, it is principally a wheat-growing country and not a first-class pastoral country. It is a heavy carrying country, but not a fattening country till you get within about 35 miles of Coonamble, and the pastoral country commences then on a run called Tundaburine.
1405. So that the line you indicate passes through a much greater area of agricultural land than either the line from Dubbo to Coonamble or the line from Narramine to Coonamble? Yes, and it has a better rainfall. The Warrumbungle Mountains run out to a bluff between Coonabarabran and Coonamble, and end there, and all the flats and all the holdings underneath these ranges get a better rainfall and a fine rich deposit of land. For instance, near a township called Tooraweena is some of the richest land I ever saw in the Colony.
1406. Do you know whether that country will be available for close settlement at the end of 1900? Some of it has been settled upon from Mundooran out to about 25 miles; a great deal of it has been thrown open, and is held in small holdings now under the 1835 Act. Then further on some of the leases expire in this July, and the balance expire in 1900.
1407. From Mundooran to Coonamble—would it be an easy line to construct? Of course the gradients would be more than on any of the western lines, because it is undulating country, whereas this is flat country, but it would be far better for closer settlement owing to the rainfall and being agricultural land.
1408. Of course the remaining portion of the road from Mundooran to Coonamble is really a continuation of the scheme which some people favour: that is, a line from Mudgee to Mundooran? Yes.
1409. Having explained that part of your scheme, will you now describe the country from Mundooran to Werris Creek? This route, which has been suggested *via* Cobborah and *via* Coolah, I would not recommend, for this reason, there are some very great engineering difficulties between Coolah and Dunadoo, except you take this route which they suggest, following round the valley of the Talbragar the whole way.
1410. What are the engineering difficulties? They are steep and bluff ridges and poor country.
1411. Would you take this northern route, indicated on the plan, from Mundooran? From what I know of the country I would, because it follows up the valley of the Castlereagh for some distance, and this range of mountains about the neighbourhood of Coolah ends in a bluff. By that route you have hardly to cross these mountains at all. There is a gap there with hardly any gradients past a place called Weetalibar.
1412. From there to Werris Creek it is pretty good country? Yes; magnificent country. The country from Werris Creek to Coolah, as far back as twelve or fifteen years, has been sold in large areas, where they had freehold land, at £2 10s. an acre for pastoral purposes.
1413. What is its carrying capacity? It would be, I suppose, from a sheep and a half at any rate to the

W. B.  
Wilkinson.  
2 June, 1899.

acre. It is some of the finest country in New South Wales—plain country, slightly undulating. The stations which bought at that price have been prosperous; they have held the land for years; they did not resell.

1414. Do they get pretty regular seasons there? The seasons are better there than to the westward. This spur of the Liverpool Range seems to draw the rain.

1415. Why do you favour that connection from Werris Creek to Mundooran? I look upon that line as a national line. It is a line without any gradients. It will take all the stock from the north and also the northern colony, with a contingent down south. It is a line where one engine can take about three times the load that an engine can take on the other line from Werris Creek through the coast ranges and on to Sydney.

1416. You regard that line as a national line, connecting the Great Northern line with the Great Western line? Yes; and as a line bringing the northern people into communication with the western people, without having to go round by the coast.

1417. We were told by a witness yesterday that at times fodder is brought from Wellington and Dubbo down the Western line and taken round to Tamworth;—are you aware of that ever having been done? No; it is madness. Whoever said so must have been misunderstood.

1418. It was Mr. Alexander Wilson who made the statement? I will leave it to the Committee; it is hardly worth arguing.

1419. You are not aware of that having been done? No; and if it had I must have heard of it, because, for a number of years I was a forwarding agent as well as a land agent. It might go from Wellington to Cobarah and thence to the Liverpool Plains.

1420. *Mr. Watson.*] The statement of Mr. Wilson was that wheaten hay was bought at places between Wellington and Orange, and was taken right round by rail to Tamworth, more cheaply than they could have bought the same fodder in the Hunter valley and taken it to the same point on the Northern line? Before I went to the Dubbo district I lived at Gunnedah for a number of years, and there is no better wheat-land in the country than there. There was more wheat-land then under cultivation in the neighbourhood of Gunnedah than there was round the district of Dubbo and Wellington. Some of the finest wheat-land in the Colony is to be found about the Peel River, and there would be no necessity for taking wheaten hay from the Western line to the neighbourhood of the Peel River estate.

1421. *Mr. Trickett.*] Having told us what you think would be the best route to take from Dubbo to Coonamble, can you tell us what kind of traffic we are likely to get by such a line? From that distance out from Dubbo, to, say, within 35 miles of Coonamble, it is principally agricultural land. Further on, you would get the same class of traffic—that is, fat stock and store stock, which is very little—as would come on these western lines.

1422. Your line would bring a great deal [more agricultural freight to the railway than either of the other routes? Yes.

1423. Would the freight be chiefly towards the main line, or would there be any outward freight in the direction of Coonamble to any extent? No; especially if the seasons were at all dry. All the wheat and fodder grown in Gulgong and Mudgee, and the valley of the Talbragar, we cannot bring into communication with Coonamble and those people who are buying wheat-fodder now.

1424. So that in dry seasons you think a great deal of fodder would be sent north? It must be in dry seasons, where they have no opportunity of sending now except by team.

1425. From Dubbo? From Dubbo, and up the valley of the Talbragar and Mudgee and Gulgong in this Mudgee to Mundooran line, and from this point, Talbragar, to Mundooran, and also from Dubbo to Gilgandra, there is a bar of poor country which either of these three lines must go through, although it is much narrower on the eastern one. The only line which will escape this bar of ironbark country is the line from Narramine to Coonamble.

1426. Do you know anything about the line from Mudgee to Cobarah and thence to Coonamble? I know the country it traverses.

1427. Will you describe that country? From Mudgee to Gulgong, until you get within 10 or 15 miles of Cobarah, it is all agricultural land, with some high top ridges which are only second-class pastoral lands.

1428. Does it compare favourably with the land from Dubbo to Cobarah? No, for this reason: from the point where it crosses the Talbragar it runs up a very fertile valley, whereas the other line crosses watersheds. The line from Mudgee to Mundooran would bring Coonamble into more direct communication with the metropolis; and if the line from Mudgee to Wallerawang is only a light line, the passenger traffic could go from Coonamble, *via* Mudgee, and the heavier traffic, with very little divergence if the Werris Creek line is built, could be carried on our main Western line, avoiding all those landslips which sometimes take place on the Mudgee line.

1429. Then, if the Mudgee *via* Cobarah to Coonamble line were constructed, your idea of connecting the Northern line with the Western line would not come in, would it? Oh yes; I would suggest its construction as part of the scheme.

1430. If the Mudgee *via* Cobarah to Coonamble line were constructed, the Werris Creek to Mundooran line would have to be continued on to Dubbo to meet your views as well;—you would want a kind of cross-line? Yes, for this reason: that all this country is a fine wheat-growing country. These people have no communication at all—they have no means of selling their fodder except they send it to the coast, or else they travel up round by Wallerawang and Bathurst, to get communication with the Western line. It brings all this agricultural land into communication with the western country.

1431. If the Dubbo *via* Cobarah to Coonamble line were constructed, and the Mundooran-Werris Creek line were constructed, would the district between Mudgee and Cobarah be fairly served? Yes.

1432. In what way? They would be in very easy communication with the railway. To make the scheme complete you must carry out my suggestion. I think from Dubbo to Coonamble, *via* Mundooran, is not much more than 35 miles out of a direct line.

1433. If you went from Narramine to Coonamble it would not be any further to the Dubbo people than by the way you suggest? No; I am not speaking in the interests of Dubbo. It is a line which I have always fearlessly advocated in the Press and in public.

1434. Are you in a position to say which line of the three will be the most expensive one to construct? Of course the cheapest line, at per mile, would be the line from Narramine to Coonamble; there are no engineering difficulties at all.

W. B.  
Wilkinson.

2 June, 1899.

1435. The next cheapest would be the Dubbo-Coonamble line, and I suppose the most expensive would be the Dubbo *via* Cobborah to Coonamble line? Yes. You must not forget that this length of 40 miles is part of a national scheme which should not be wholly charged to the line from Coonamble to Dubbo.

1436. How does the rainfall in the various districts served by the three lines compare? There is not very much difference in the rainfall. It does not come at such seasonable times in one district as in the other. In the Coonamble district they get a good deal of tropical rains which do not reach Dubbo. In the neighbourhood of Coonamble the rainfall may be as good as ours is. We get rain round this district from Dubbo to Cobborah, and round Mendooran they get the end of the coast rains, which come at more seasonable times. With farmers it is not quite so much the quantity of rain you get as the getting of the rain at the time when it is required by the crops.

1437. The advantages of railway communication from an agricultural point of view are apparent;—will you give us your ideas of the advantage of a railway from a pastoral point of view? It is confined only to the carriage of fat stock and wool.

1438. Store beasts are travelled? Yes, except in time of drought, which, of course, cannot be reckoned, because they are carried at a rate which will not pay the railway.

1439. From what one can see of the different phases, the project cuts both ways: we hear it contended often that a railway in very dry seasons will be the means of bringing large quantities of stock down to favoured districts, and then, on the other hand, we hear that good fodder will be grown down south and conveyed to the places where the starving stock are;—which would be most availed of? I listened to Mr. Bruce's evidence. His argument would apply a good deal down south, where they have that vast country—the Australian Alps and the snowy country; but I know that if you increase the advantages of bringing store stock to the mountains in the summer-time—in the mountains we have, or anywhere in that district—there is not sufficient area for them. Without railway facilities, we can absorb all the mountain country with stock from no further west than Coonamble. Any from a point further west than Coonamble would not find room for any pasturage to the mountains, simply because there is no room for them. Our mountains, to a certain extent, all the year round are stocked. Down at Kiandra and the Australian Alps they are not. There is nobody with any stock further west than Coonamble who could get any land on any of the hilly country which Mr. Bruce has spoken about in the neighbourhood of Cobborah or Coolah, simply because there is not enough country for them.

1440. *Dr. Garran.*] But could they on New England? The same thing applies in New England. It is fairly stocked, I suppose, to about 2 acres to a sheep, which does not apply down south. Mr. Bruce forgets that that mountainous country on the north cannot carry any more stock.

1441. *Mr. Trickett.*] In a big general drought, this theory about a very extensive carriage of starving stock to well-watered districts is rather exaggerated? It does not apply to our northern districts. It may apply to Kiandra and the Australian Alps, but not to ours, because it is fairly stocked as it is.

1442. We may conclude that in bad seasons the chief sources of revenue, except the carriage of beasts to market, would be the carriage of fodder up to the districts where it is required? Yes; and the carriage of starving stock would be all over in about three weeks. The country would be all absorbed in about three weeks.

1443. As a land agent of large experience, what stock traffic do you think would be diverted towards a railway at Coonamble? Presuming that the railway comes to Wee Waa, or that it was a terminus, I do not think it would bring any traffic, or very little traffic north of the Namoi, to Coonamble. The traffic would end at about Pilliga.

1444. *Mr. Watson.*] Taking the North-western line with a terminus at Moree, and with Narrabri as the nearest point to Wee Waa, from that point of view how do you think a railway at Coonamble would attract traffic in stock? I think it would take all the traffic between Coonamble and Pilliga, and on the south side of the Namoi, towards Walgett, and then all the traffic on the north-western side of the Barwon. The balance of the traffic, I think, would go into Moree or Narrabri.

1445. Westerly from Walgett, how far would the attraction extend, do you think? Anticipating the construction of a railway line to Brewarrina, it would follow down the Barwon, I should say not more than 15 miles below Walgett, and take in part of the Lower Macquarie, about 15 miles below Walgett, on the Barwon, and thence to a point south-west, half way between the Barwon and Nyngan Railway Station.

1446. *Mr. Trickett.*] One of the main stock routes passes through Walgett? Yes; two main stock routes meet at Walgett, namely, one—the Mungindi—which comes from the Queensland border, and one which comes up the Barwon.

1447. Should we get some of that stock from the Queensland border? Yes; you should get all the Queensland border stock between Collarendabri and Currawillinghi and the Narran Lakes.

1448. Stock west of the Narran Lakes would go into Brewarrina? Yes.

1449. Is the district which would feed this railway regarded as one of the best wool-growing districts in the Colony? I think it is the best fattening district; it grows wool, but not wool of the right quality.

1450. I suppose you favour railway connection with Coonamble? Yes. I do not think a railway from Coonamble to hit the Western line at Nevertire would ever compete with a direct line, or ever compete with the road traffic from Coonamble to Dubbo.

1451. The Warren-Coonamble line you entirely disapprove of? Yes. The carriers on our line are farmers who have their own teams, and grow their own feed. During the wool season they are idle on their farms, and they can carry the goods over the road (and they travel night and day, and feed their horses) at a rate which the railway could never compete with, taking into account the extra distance they would have to travel.

1452. *Mr. Watson.*] Would there not be a through rate from Coonamble to Sydney which would knock off a bit of the extra distance? Yes; but the railway would never compete with the road traffic. We can get road traffic from Coonamble to Dubbo at 2s. and 2s. 6d. If the farmers were not carrying they would be idle.

1453. *Dr. Garran.*] If these farmers who are residing on a road can always beat a railway, your proposed line from Dubbo to Mendooran, running as it is through a perfect nest of farms, would not be able to compete with these farmers? No; I do not say that, because that is on a direct line. I say, taking this line from Dubbo to Nevertire, and this line from Dubbo to Coonamble, with 30 or 40 miles extra carriage the railway could not compete with the carriers.

1454. *Mr. Trickett.*] If this railway were constructed to Coonamble either from Dubbo or Cobborah, by direct

W. B.  
Wilkinson.  
2 June, 1899.

direct line, and it would be largely availed of for trucking sheep, do you see any probability of any other line or route being adopted which would interfere with it, or stop that always being their road out in the direction of Walgett? No; I do not think so.

1455. It is likely to be a permanent direct line out to that northern country? I think so.

1456. No other line could compete with it;—presuming the Wee Waa line is carried on to Walgett, it could never compete with this line? South of the Namoi there is a stretch of country where it would take from 30 to 40 acres to feed a sheep. The line from Narrabri to Walgett, or to Pilliga, until you get into the flat country outside the scrub area, could only be availed of by people on the north side of the Namoi. This is unproductive country lying idle now. From Coonabarabran to the Namoi—I have travelled the road with stock a great many times—until you get within 3 or 4 miles of the Namoi, there is nothing but white sand, spinifex grass, and scrub. As you get on to the west you get on to Liverpool Plains country.

1457. Would the line you suggest traverse much swampy country—the line from Dubbo and Cobborah and Mundooran to Coonamble? It is all rich country; it is all undulating country.

1458. It has been stated here in evidence that there is a good deal of corduroy-road construction out near Coonamble? As you get near Coonamble you get some difference in the black soil. After you get here you get into wet country in wet seasons; it is dry enough now.

1459. It is not flooded country? No; possibly you might come to a wash from a mountain which would only be for 100 yards, but that is all.

TUESDAY, 13 JUNE, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

H. C. Russell,  
C.M.G.  
13 June, 1899.

1460. *Vice-Chairman.*] It is proposed to construct a railway from Dubbo to Coonamble, and I think it would be as well, as the Committee are considering a Warren-Coonamble line, a Dubbo-Coonamble, and a Mudgee-Coonamble line, if you could state the rainfall at Warren, Coonamble, and Walgett, and working over towards the Mudgee line? The rainfall at Warren is 19·52 inches for twelve years; at Nevertire, 20·98 inches for ten years; at Nyngan, 20·44 inches for fourteen years; Merryanbone, which is nearly due north-west of Warren, 21·32 inches for thirteen years; at Eenaweena, due north of Warren, 19·89 inches for seventeen years; at Combogolong, north of that again, 24·27 inches for thirteen years; at Nelgowrie, a little north-east of that, 20·94 inches for eighteen years; at Coonamble itself, 22·01 inches for nineteen years; at Nebea, a station due north of Coonamble, 22·84 inches for eighteen years; at Warrana, a station a little to the east of Coonamble, 21·89 inches for seventeen years; at Calga, to the south-east of Coonamble, 21·62 inches for twenty-five years; and at Merigal, about 30 miles nearly due west of Coonamble, 23·75 inches for fourteen years. That fairly represents the lower part of the line from Warren to Coonamble, and the surroundings of Coonamble. If I were to go on now south-west, it would bring us to Dubbo.

1461. Will you state the rainfall in that direction? The rainfall at Gilgandra is 27·60 inches for fifteen years; at Biambil, 25·63 inches for thirteen years; at Wambangalang, due north of Dubbo, 28·50 inches for thirteen years; at Dubbo itself, 23·48 inches for twenty-six years; at Terramungamine, 20 miles west of Dubbo, 23·10 inches for ten years; at the Springs, about 15 miles due south of Dubbo, 25·92 inches for seventeen years; at Wellington, which is about 30 miles south-east, 24·49 inches for seventeen years; and at Dundullimal, which is about 10 miles east of Dubbo, 24·81 inches for thirteen years.

1462. Will you now give the rainfalls starting from Mudgee? The rainfall at Mudgee is 27·13 inches for twenty-five years; at Katella, which is about 15 miles south-west of Mudgee, 28·39 inches for ten years; at Pine Ridge, due north of Mudgee, 26·26 inches for sixteen years; at Cobborah, in a direct line towards Coonamble, and about 30 miles distant from Mudgee, 29·63 inches for nine years; at Mundooran, in the same line north-west, 27·78 inches for twelve years; and at Coolah, a little to the east of Mundooran, 30·59 inches for fourteen years. Going north again, at Oakey Creek it is 28·18 inches for seventeen years; at Silent Dale, west of that about 30 miles, in the same latitude, 26·55 inches for nine years; at Ulamabri, 30·86 inches for ten years; at Gummin Gummin, 30·30 inches for thirteen years; at Calga, 21·62 inches for twenty-five years; at Warrana, 21·89 inches for seventeen years; and back to Coonamble again, 22·01 inches for nineteen years. That is as north as I can follow up the stations here on the three lines.

1463. Would you mind giving us the rainfall from Coonamble to Walgett? I am not prepared for the inquiry; but it makes very little difference. The rainfall going north from there would be about the same as it is at Nebea.

1464. At the places which you have mentioned, about south of Coonamble, the rainfall is heaviest? The heaviest rainfall is in the neighbourhood of Mudgee, because the land is highest there. The lands rise as you go to the east there, anyway away from Warren, and the rainfall is gradually increased. For instance, at Coolah, which is one of the most eastern stations, it is 30·59 inches. At Oakey Creek, another station to the eastward, it is 28·18 inches; and at Gulgong also, on the eastern side, it is 28·80 inches.

1465. Taking the three lines then, apparently the greatest rainfall is between Mudgee and Coonamble? Yes, considerably.

1466. Then, is the next largest from Dubbo to Coonamble? Dubbo comes in midway.

1467. And as you get out to the west it gets drier? Yes.

1468. Warren has the lowest? Yes; it is 19·52 inches.

1469. At what time of the year is the chief rainfall? The best rainfall occurs within the first five months of the year. 1470.

H. C. Russell,  
C.M.G.

13 June, 1899.

1470. Is that a good time for agriculture in that district? No; it is unfavourable for agriculture.
1471. Is it too late in the season? It is too late.
1472. Is the rainfall occurring at that time favourable or otherwise to the growth of cereals? I believe not; I have not had much experience except in my youth; I grew up among the corn-cobs. September, October, and November seem to be the best months for wheat-growing; but to this district, especially as you get on to the high lands, the rainfall is better distributed than it is a little further north. Directly you get amongst the hills you get more favourable conditions for rain; you get more rain, and the rain is better distributed.
1473. From what you have been informed, could you not tell us whether a rainfall of 20 inches and over is not fairly favourable to the growth of wheat? No; the general experience in Australia has been that a rainfall of 20 inches is about a minimum for the safe growing of wheat.
1474. It ought to run up to 22 inches? It ought to be over 20 inches, and, in addition to that, the rainfall ought to come in the latter half of the year.
1475. Are these calculations obtained from the various station-holders? Yes; nearly all the names mentioned here are station-holders who have been keeping a record for me for many years—some of them for nineteen years.
1476. Seeing that the time of the rainfall, apparently, is not very favourable to wheat-growing, does it not seem somewhat strange that they are going in largely for the growth of wheat, in the neighbourhood of Dubbo, for instance? Yes; I could hardly express an opinion, except that the probability is that the high lands are helping them. I know that Mudgee has been considered a wheat-growing country for a long time. I suppose Dubbo has a somewhat similar climate. There is another thing about it there which does not appear on the face of things. The main range is lower to the due east of these districts than anywhere else, and when the coast rains ever do get across the mountains, that is the place they do get across. With a south-east gale it is quite a common thing for the coastal rains to cross the lower part of the main range about Mudgee and thereabouts, and travel across to the north-west, so that they have that additional advantage. In the highest parts, up about Armidale, and thence north-west, the coastal rains never go across the mountains.
1477. I suppose you are not able to give any information as to the soil up there? No.
1478. *Mr. Shepherd.*] Have you any record of the fall of rain in the various months from January to May? I have not the information here, but I could supply that. I know, from having worked at it a good deal, that to the north-west part of this district which is under discussion, it is looked upon as a matter of course that if they do not get their rains in the first three or four months of the year the probability is that they are going to have a bad season; that is not so much for wheat-growing, because, heretofore, the opinion has been expressed in regard to its grass-growing qualities.
1479. The months you have named would be very good months for rain if it were followed up a little bit? Yes.
1480. If there are seven months dry after May, there would not be sufficient to ensure the crops? No; elevation is a very material matter. As you go eastward you get on one of those pine ridges just about the top of the range there. Cassilis is only a few miles to the east of that again.
1481. Do you know if the rainfall between Mudgee and Coonamble, where a larger fall takes place, extends over a longer period, or is the fall confined to the same months? It is a little further to the west, and therefore a little more unfavourable than the Mudgee line. Mudgee is nearer to the main range. The average rainfall at Dubbo, for instance, is 23·48 inches; whereas the average rainfall at Mudgee is 27·13 inches, which is nearly 2 inches greater. At Mudgee the record runs for twenty-five years; Mr. Cox began keeping a record long before I got any records from there.
1482. The fall takes place in about the same months as in the other localities, but it is heavier, I suppose? Yes; it is heavier. That is considerably in excess of the quantity which is wanted, and therefore you may expect more rain, and probably enough to grow wheat in the latter part of the year with a rainfall of 27 inches.
1483. Of course, January would be too late to mature a crop if it has been starved all the time from May? Yes; I suppose with that climate the wheat would ripen a month or two earlier than it would in the south.
1484. *Mr. Dick.*] Can we take it as a general statement that the rainfall, as you go east from the proposed Warren-Coonamble line towards the proposed Mudgee-Coonamble line, gradually improves? Yes.
1485. And as you go still further east, I suppose a still greater improvement would take place? Yes.
1486. Have you the record for Cassilis? No, not here. It is over the range; it is on the descent to the sea. Cassilis gets a great many rains, especially the south-east rains. Any south-east rain gives Cassilis an abundance of water supply.
1487. Have you the record of Merriwa? No; I have not the record for any of the stations to the east of those I have given.
1488. Is the distribution of rain altered much as you go east from the proposed Warren-Coonamble line? Yes; the more westerly line is the least favourable, owing to the distribution of rain; they depend more on tropical rains which come in summer-time. Generally in February their great supply of rain comes in.
1489. Could you give the record for Cassilis and for Merriwa from this copy of your "Results of Rain, River, and Evaporation Observations made in New South Wales during 1895"? Yes.
1490. Will you give the record for Cassilis? The Cassilis record has extended from 1870 to the present date, and the average rainfall is 25·13 inches. At Pine Ridge—right on top of the ridge—it is 26·65 inches. The Merriwa record extends from 1882, and the average rainfall is 23·73 inches.
1491. At Coonabarabran? The record begins in 1879, and the average rainfall is 32·35 inches; I forget the elevation, but it is very considerable there. It is on the Warrumbungle Range, and directly you go up the rise of the hill you get more and more rain.
1492. *Mr. Watson.*] Your statement that a rainfall of 20 inches was understood to be the minimum for wheat-growing is to be taken in connection with the time at which the rain falls? It is largely affected by the rainfall. It is an "average" rainfall of 20 inches that seems to be about the limit of profit. Of course, in those years there would be some with a good deal less than 20 inches.
1493. Will you state the rainfall at Narramine, Nevertire, and Nyngan, on the Western line? At Narramine the rainfall is 21·58 inches, extending only over four years; at Nevertire, 20·98 inches, extending over eight years; and at Nyngan, 20·44 inches, extending over four years.
1494. So that although Nyngan is further west than some of the stations you quoted in relation to the Warren-Coonamble line the rainfall seems to be slightly heavier there? At Nyngan it is 20·44 inches.

H. C. Russell, 1495. I thought at some of those stations you quoted 20 inches was the average? It varies a little. The average for Nyngan is given from this record, which goes up to 1898; but in this book the record only goes up to 1896. The average for Nyngan for the whole period is 20·44 inches; and for this shorter period it is 21·76 inches.

C.M.G.  
13 June, 1899.

1496. For a longer period at Warren, which is east of Nyngan, it was a little over 19 inches? 19·52 inches.  
1497. There are local differences which are exceptions to the general rule of lowering all averages as you go west? Yes; and that is generally in cases of elevation.

1498. It is a fact that latterly they have been growing wheat along the Western line at Narramine, Never-tire, and Nyngan? Yes.

1499. So that it would seem they are not beyond the pale of possibility? No; wheat has been grown as far west as Hay.

1500. That would be in an exceptional season? Only in an exceptional season.

1501. At two out of the three centres I named, they have been going in rather extensively for wheat-growing—at Narramine and Nyngan? Within the last three or four years, and these have been unusually dry.

1502. I understood you to intend to convey that the whole matter of wheat-growing largely depended upon when you got the rains? Yes.

1503. They could do with less than 20 inches if they got the rain at the right time? Yes. In Victoria they are said to grow wheat on 12 inches; but then the rainfall in Victoria is much more reliable than it is in this Colony. The southern parts of this Colony have a much more evenly distributed rainfall than the northern; they are less liable to severe drought.

1504. In this case they have to depend on the rains which come in from the north? Yes.

1505. Which very often, being tropical rains, come in the summer-time and not in the early spring, when we want them? Yes. The southerly rains—that is, the winter rains—which are so valuable in Riverina, often do extend as far north as Dubbo, but they are just on the margin. For instance, this rain which is falling to-day has come with a southerly wind; it is a southerly rain which has gone right over the Colony; it is very little, it is true. Sydney has the heaviest rainfall, but still it has spread all over the Colony, except in the extreme west at Broken Hill.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined:—

J. Clarke.  
13 June, 1899.

1506. *Mr. Dick.*] Can you furnish the Committee with details of the probable earnings of a railway from Dubbo to Coonamble for the carriage of mail-matter? I have prepared a statement.

1507. Will you read the statement? It is as follows:—

PARTICULARS OF MAIL CONTRACT.

Contractor's.		Postal Lines.	Dis- tance in Miles.	Frequency of Communi- cation.	Mode of Conveyance.	Annual Amount pay- able to Contractors.	Date of Termination of Contracts.
Name.	Address.						
196 Wm. M. Keogh	Warrana, Coon- amble.	Dubbo, Brocklehurst, King- albung, Gilgandra, Cur- ban, Gulargambone, Ben- nett's Flat, and Coonamble.	106	No. of times per week. Three ...	4-horse coach.	£ s. d. 1,000 0 0	31 Dec., 1901.

Number of mails, including parcels, exchanged on the line, with the approximate weight, per week:—166 bags = 48 cwt.  
STATEMENT showing the number of Letters posted at the post offices on the line, and the Revenue derived from the Post and Receiving Offices, during the year 1898.

Name of Office.	Number of Letters posted.	Revenue.			
		Postal.	Telegraphic.	Money Order and Postal Notes.	Total.
Dubbo .....	359,660	£ 3,067	£ 980	£ 166	£ 4,213
Brocklehurst .....	1,590	12	.....	.....	12
(Kingalbung) .....	.....	5	.....	.....	5
Gilgandra .....	35,940	618	132	29	779
Curban .....	5,390	51	7	.....	58
(Armatree) .....	.....	5	.....	.....	5
Gulargambone .....	20,100	318	102	21	441
(Bennett's Flat) .....	.....	5	.....	.....	5
Coonamble .....	159,700	1,221	692	86	1,999
	582,380	£5,302	£1,913	£302	£7,517

1508. For that service of 106 miles, £1,000 a year is paid by your Department for the carriage of mails and mail-matter? Yes.

1509. For the same distance on a railway line what charge would be made against your Department? We would start with a charge of £12 per mile per annum.

1510. You would pay £1,272 a year by rail as compared with £1,000 a year which is paid now? Yes.

1511. *Mr. Leven.*] But it would be a daily service? It would not be a daily service if this railway line were run only tri-weekly.

1512.

1512. *Mr. Dick.*] Can you supply the time-table? It is as follows:—

*J. Clarke.*  
18 June, 1890.

TIME-TABLE.

Leave Dubbo .....	Tue	Thur	Sat	10:15 a.m.	Leave Coonamble .....	Fri	Tue	Thur	3:30 p.m.
Arrive Brocklehurst .....	do	do	do	10:45 do	„ (Bennett's Flat) .....	do	do	do	5:45 do
„ <i>Yellow Creek Hotel</i> .....	do	do	do	1 p.m.	Arrive Gulargambone .....	do	do	do	8 do

„ (Coonamble) .....	do	do	do	6 do	Arrive Dubbo .....	do	do	do	2:30 do

1513. It is a tri-weekly service, and for a charge of £12 per mile per annum you would have a daily service? It does not follow.

1514. Is it likely that you would have a daily service between two such centres as Dubbo and Coonamble, if the trains were running? It would depend on the railway service.

1515. Do they pay just the same if it is a daily service as they do if it is a tri-weekly one? The same; it is an average sort of payment.

1516. Does this charge of £12 per mile include the carriage of the mail matter from places close to the railway line to the train? No; we should have to arrange for all that. If the railway ran, and there were mails off any distance, we should have to send to and from the places.

1517. Now, looking at the route of the proposed line from Dubbo to Coonamble, you see that Gilgandra is between 4 and 5 miles from the proposed line;—would the officers of your department carry mails from Gilgandra to the nearest railway station? We should.

1518. On horseback, I suppose? The probability is that it would be by a conveyance of some sort. You get it done more cheaply very often by conveyance.

1519. Would it be done by contract or by an officer of your department? We should call for tenders.

1520. Have you any idea of what it would cost? A daily service for a distance of 5 miles would cost £30 or £40 a year.

1521. I suppose in the case of Terabile very nearly the same thing would hold? We have no office named Terabile, which is a railway or local name I suppose. We should have to arrange for any of those centres in that way in addition to paying the railway charges.

1522. *Mr. Watson.*] You also have a service from Warren to Coonamble? Yes; I have prepared a return.

1523. Would you mind reading it? It is as follows:—

PARTICULARS OF MAIL CONTRACT.

Contractor's		Postal Lines.	Dis- tance in miles.	Frequency of Communi- cation.	Mode of Conveyance.	Annual Amount pay- able to Contractors.	Date of Termination of Contract.

J. Clarke. 1524. How do you account for the disproportion between the amounts paid for the carriage of mails from Dubbo to Coonamble, as compared with the amounts paid for the service from Warren to Coonamble,—being £139 in one case as against £1,000 in the other? Because there is about twice the weight of mail matter.

13 June, 1899.

1525. There is more than twice the amount of mail matter on the Dubbo-Coonamble route, because of the number of small centres at which they have to call? I am not so sure about that, because the Monday, Wednesday, and Friday mails from Sydney would be much heavier than the Tuesday, Thursday, and Saturday mails. Wednesday is the weekly-paper day, and on that day I suppose the weight of the mails, and so on, would be about more than the rest of the week, as so many large bags go out.

1526. Suppose a railway were taken from Dubbo to Coonamble, would you still have to maintain a through service from Warren to Coonamble if you had daily communication with Coonamble *via* Dubbo? I think so.

1527. Are there any centres of importance along your Dubbo-Coonamble line which it would be necessary to reach from Warren? There must be a certain amount of correspondence.

1528. That is, irrespective of the through traffic between Warren and Coonamble, there is an intermediate traffic? I fancy there must be.

1529. Have you any information as to the mail connections between Mudgee and Gulgong, Cobborah, and towards Coonamble? Yes; I have prepared a return.

1530. Will you read the return? It is as follows:—

1531. *Mr. Levien.*] How do you arrive at the weights of these parcels? When we receive a communication from this Committee we telegraph to the different centres to report what average weight of mails are sent to and fro.
1532. They did not weigh the parcels? No.
1533. They guessed at their weights? They are the approximate weights.
1534. *Mr. Watson.*] What do you pay for the yearly service from Mudgee to Gulgong? For service six times a week by Log Paddock, £81; and for service by Slasher's Flat, £20.
1535. And from Gulgong to Cobborah? From Gulgong to Cobborah, Muntooran, and Gilgandra, £223 19s.
1536. The total cost of the services would be £324 19s.? Yes.
1537. These services take you from Mudgee right up to Gilgandra, where it joins the Dubbo-Coonamble main route? Yes.
1538. Where does your service which reaches Coonabarabran start from? From Muntooran or Merrygoen.
1539. Does it terminate at Coonabarabran, or go right on northerly? It goes to different places; we have a line to Pilliga from Coonabarabran.
1540. It is a bi-weekly service? Yes, it is about twice a week in that direction.
1541. North from Coonamble have you a direct line towards Walgett? Yes.
1542. What does it cost? £249 a year.
1543. Do you go from Narrabri to reach Walgett with this main line of mails? From Narrabri towards Walgett, and half way to Coonamble.
1544. In the event of a line being taken from Dubbo, *via* Coonamble, to Walgett, it would be unnecessary to send the main quantity of mail matter *via* Narrabri? It would go by train.
1545. What are you paying for the conveyance of mails between Narrabri and Walgett? £1,350 a year.
1546. So that the total cost of reaching Walgett is, approximately, £1,600 a year? Yes.
1547. *Vice-Chairman.*] Is that charge of £12 per mile, per year, for the carriage of mail matter on a branch line a uniform charge which is paid? Yes; that is from the main line. On certain lines which were opened up to 1885, we pay £45,000 for the lot. Then, on all lines which have been opened since that year there is a uniform charge of £12 per mile per annum for a tri-weekly or daily service whichever it may be up to a certain weight, and over a certain weight we pay £20 per mile. And on the main lines, where we employ a travelling post office—that is where they have to supply a mail van, and we have the sorting done by mail-guards, and so on, we pay £36 per mile per annum.
1548. But £12 a mile, I suppose, is generally the rate you pay on a new line to begin with? Yes.
1549. Does that include the parcels? No; the parcel post came into operation in October, 1893, and after a good deal of correspondence they agreed to accept £3,500 a year for that service all over the Colony.
1550. On a line from Dubbo to Coonamble, a length of 93 miles, what would be about the amount paid for the carriage of parcels? I could not say; it would depend on the line. On some lines there are very many more parcels sent than on others.
1551. Will it be a case of payment by results? No; the lump sum covers all parcels. An increase in the parcels does not cause an increase in the cost.
1552. It is no advantage to the railway? No; we only carry up to 3 lb. or 11 lb.; the weight of a parcel depends upon whether it is to be sent out by a horse mail or by a conveyance.
1553. The distance from Dubbo to Coonamble is 93 miles by the railway survey, therefore you would pay on that line £1,116 a year for the carriage of mail matter? Yes.
1554. The distance from Mudgee to Coonamble is 147 miles, therefore you would pay the Railway Department £1,764 a year for the carriage of mails on that line? Yes.
1555. The distance from Warren to Coonamble is 67 miles, therefore you would pay £804 a year for the carriage of mails on that line? Yes.

J. Clarke.  
13 June, 1899.

MONDAY, 26 JUNE, 1899.

[The Committee met at the Court-house, Dubbo, at 2 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

William O'Neill, farmer and grazier, Narramine, sworn, and examined:—

1556. *Chairman.*] What are you? I am a farmer and grazier, residing at Narramine. I represent the people of Narramine and of the district. I have been deputed to come here by the railway league at Narramine, who, I believe, have been in correspondence with your secretary for some time on the question of the extension of railway communication to Coonamble.

W. O'Neill.  
26 June, 1899.

1557. You are prepared, I understand, to place your views on this question before the Committee in the form of a statement? Yes. In the first place I wish to place before the Committee the following statement of the traffic at Narramine railway station in the year 1893, and in the first six months of the year 1899:—

NARRAMINE Railway Traffic, years ending May, 1893 and 1899.

Year.	Goods Traffic.			Stock forwarded.				Wheat— Bags.	Wool— Bales.	Passengers booked.
	Inwards.	Outwards.	Revenue.	Horses.	Cattle.	Sheep.	Figs.			
1893 .....	Tons. 1,400	Tons. 3,700	£ 6,000	21	271	30,000	50	No. 1,500	No. 8,000	No. 2,600
1899 (6 months) .....	3,600	11,000	12,000	429	543	47,000	74	47,000	6,000	6,000
Increase .....	2,200	7,300	6,000	408	272	17,000	24	45,500	.....	3,400

- W. O'Neill.  
26 June, 1899.
1558. What area of country provides that traffic? The goods traffic took in about 50 miles in 1893. I think since the Parkes line was opened the goods traffic has not extended further than 26 miles.
1559. You mean an area of 50 miles due north? Due south, not north; because the Parkes line has taken a lot of that traffic away. Very little of this traffic comes in from the north.
1560. The traffic from the south side would come in whether this line is constructed or not? Yes.
1561. How much country north of the line towards Coonamble is under cultivation? It extends about 15 miles; but there is very little cultivation because it is too far away from a railway station. All the settlers who come in from Coonamble, *via* Narramine, are always complaining of the want of facilities to get to market. It is populated generally with a lot of enterprising men, quite as capable of producing within six years on that line, what the people round Narramine have done during the last six years. I have no doubt that the men are quite as energetic, quite as industrious, and equally intelligent; and the land is equally as good, if not better, in some places.
1562. How do you account for so much development south of the line, and so little north of the line? Merely because the railway has come out to us; the railway has done everything for us. Wool has gone off here by 2,000 bales, and wheat has increased by 45,000 bags.
1563. If you have increased your production 20 miles south of the line, why have you not increased the production north of the line? Until the last three years there were no facilities for getting across the river; but now there is a little bridge, and cultivation has increased considerably. That it would extend all the way down the line to Coonamble, and the other side of Coonamble, I have no doubt. It is all good wheat-land.
1564. It is merely a matter of roads? It is merely a matter of conveniences to get the stuff to market.
1565. Do you know the country well between Narramine and Coonamble? Yes.
1566. We want to ascertain the area of land which, in your opinion, is fit for smaller settlement, and of that which is purely pastoral land;—will you describe the character of the country between those two points? From Narramine to the Merri Merri Creek—a distance of 25 or 26 miles—it is rich alluvial soil; from that it is intersected with myall plains, rich red-soil flats lightly timbered, and splendid wheat-land.
1567. How far does that description of country extend? For about 30 miles from Narramine—to the Marthaguy Creek. I have no doubt that artesian water extends all the way to Coonamble; it has been found in several places.
1568. What area of land is there that is fit for agriculture? I do not think there is a great area that is not fit for agriculture right on to Coonamble, if I may except a small strip of the Monkey Scrub, which I believe this line would cross at the east end. It is a sand-bed; it appears to me to be an old watercourse, which has been filled up with sand. There is water all over this Monkey Scrub. I think this line would just touch the Monkey Scrub; that is the only piece of land on the route which is unsuitable for wheat-growing.
1569. How much of that land is there? Very little; I do not think it would extend above half a mile, or a mile at the very outside.
1570. You spoke about artesian water. Has it been practically tested south of Coonamble? It has been tested south of Coonamble on the Marthaguy Creek—that is, just immediately west of a line going from Narramine to Coonamble—and splendid artesian water was found. I have no doubt that it extends all the way to Coonamble. I was the first person that advocated artesian boring; and, without wishing to be egotistical, I might go further, and say that I was the means of getting a provision introduced into the Land Bill which Mr. Brunner brought in when he was Minister for Lands. At that time I advocated that bores should be put down at Coonamble, Nevertire, and Nyngan, and artesian water has been found in two places out of the three.
1571. At what depth? I forget the exact depth; but the bore is not very deep at Warren. I do not think it is very deep even at Wonbobbie, on the Marthaguy Creek.
1572. Is there a flow of water from these bores now? I think there is at both Wonbobbie and Coonamble.
1573. Are you acquainted with the country between Dubbo and Coonamble? Yes, as far as Mr. Body's station, 35 miles out.
1574. How would you describe that country? I would describe the first 6 miles of the country as very good wheat-land, and the next 30 miles I should describe as very inferior land.
1575. Comparing that line with the line you advocate, the land is not so good? No. It is a different formation altogether; it is a different kind of soil.
1576. You advocate the starting of the line from Narramine in preference to any other point of the Western railway? I believe, in the public interest, Narramine is the best place to start from. If I were speaking merely in my own private interests, I do not think it would be the best starting place; it would cut up my land, and I would not get sufficient remuneration; but I put that consideration out of the way altogether. My opinion is that it would be the best feeder which the Western line could have.
1577. Can you advance any other ground in support of that route than just your bare opinion? From my knowledge of the land, I believe it is the best route, most decidedly.
1578. What about engineering difficulties? There are none.
1579. It would cross the Macquarie River and two creeks? That is the only engineering difficulty, and I believe it is a matter of £10,000. The creeks to be crossed are only mere culverts.
1580. Do you know the country between Warren and Coonamble? Yes.
1581. How will the land between those points compare with the land more to the eastward? The land more to the eastward is more fertile.
1582. That is to say, the line you advocate passes through land more fertile than the other would? It is more fertile for agricultural purposes.
1583. *Mr. Shepherd.*] You say the line from Narramine to Coonamble is superior to the line from Dubbo to Coonamble? Most undoubtedly.
1584. What is the distance from the Narramine line to the Dubbo line? Twenty-one miles.
1585. And yet you say the country varies so very much that the country from Narramine to Coonamble is very much superior to the country from Dubbo to Coonamble? Most decidedly. The country from Narramine to Coonamble is all a splendid, fertile, agricultural country, while the country, for the first 30 miles out of Dubbo, is an ironbark forest; you might say too sour and hungry for any kind of agriculture whatever.
1586. And then between that and the Warren line it gets poorer? The land is not so fertile; it is more difficult to work for agricultural purposes.
1587. So that there is really a good strip of country up to the Narramine line? Yes.

1588. What width is that strip on either side of the proposed line? You might say that it is 15 or 20 miles on each side. W. O'Neill,  
26 June, 1899.
1589. *Chairman.*] Suppose you were north of Coonamble, and wanted to get your produce away to Sydney or to your markets, which do you consider would be the best line to take from Coonamble, which, as you know, is a *dépôt* for a large area of country? There is no doubt that Dubbo or Narramine would be the proper outlet from Coonamble to Sydney.
1590. But your preference for the line you advocate is based solely on the ground that there is a better class of country between Coonamble and Narramine? Yes; together with what I believe to be a better class of settlers.
1591. A better class of settlers? A more energetic class—men with more go and intelligence, although I am not saying anything about the men between Dubbo and Coonamble.
1592. I suppose it does not matter much where the men are? I am personally acquainted with these men, and I know that they would produce on the north side of the Macquarie River equally as well, and become equally as industrious as the men on the south side of the river. All they want is facilities to clear their land and cultivate it.
1593. Do you think there is a better class of settlers along that Narramine line than along the Dubbo line? I am certain there is.
1594. Do they come from different countries? I do not know.
1595. Do you base your calculations on the present population and settlement about Narramine, or on the prospective population and settlement? A good deal on the facilities which are afforded them. I know that the population about Narramine would be very little indeed but for the railway. The railway has made Narramine and all the people round it.
1596. *Mr. Watson.*] Is there any land north of Narramine which by the construction of a branch line would become settled and thus add to the general prosperity of the country;—is it open for settlement now, or would it be if the line were made? I think the greater portion of it is settled. Certainly there is a lot of leasehold areas, but I am not conversant with them. Very likely the Government will take its own course in dealing with them afterwards.
1597. These leasehold areas should be open to settlement in a couple of years at the outside;—are any of these leasehold areas within a reasonable distance of Narramine? I think two or three of them are.
1598. What area would they represent? I am not quite certain.
1599. What land do you think would be available for close settlement if a railway were taken through there? 30,000 acres on Burraway were thrown open two or three years ago. I think there must be 40,000 acres of leasehold on Burraway run.
1600. That would be on the track of the line you advocate from Narramine? It would go right through Burraway.
1601. With regard to the land which is already settled on—do you think that the construction of a railway would give any impetus to cultivation? There is no doubt that it would.
1602. Is there much cultivation on the north side of the Macquarie now? Just merely a fringe of the river here and there.
1603. You think it is land which is suitable for cultivation? Most undoubtedly.
1604. And that a railway would conduce to cultivation? It would conduce to very much cultivation on that side.
1605. Have you heard of a proposal to take a railway from Werris Creek to either Dubbo or Narramine, and thence down to the Southern line? Yes; it has been talked of in Dubbo for thirty years.
1606. Have you any knowledge of the country between Dubbo and Tomingley, and between Narramine and Tomingley? Yes.
1607. How does the country on the one route compare with the country on the other? I should call the country from Dubbo to Tomingley no good at all.
1608. Is it rough country or flat country? It is a sandy, ironbark, scrubby waste, between Dubbo and Tomingley.
1609. You think it is not good country? Not for agriculture.
1610. What is it good for? If it were cleared, it might become fair pastoral land. It would take an immense amount of money to keep it in a condition as good as even ordinary, pastoral land.
1611. What is the character of the country between Narramine and Tomingley? It is rich, alluvial soil.
1612. Much more fit for settlement? It is all fit for settlement; except the tops of two small ridges of 20 acres each, perhaps. With that exception, every bit of it is splendid agricultural land.
1613. From your point of view, Narramine would be a better junction for any line to Sydney? In the public interests, I believe so, most decidedly.
1614. *Chairman.*] How is land mostly held along that line from Narramine? Some settlement leases have lately been opened on Burraway, but all the rest of the land is, I think, either Crown land or conditional purchase land.
1615. What would be about the average price which the selector would require for his land if resumed for railway purposes? I do not know. Land has been offered along that route, down all these creeks, for 10s. and 15s. an acre—for conditional purchase, conditional lease, and all, with, in some instances, the stock given in.
1616. *Mr. Watson.*] Although it was taken up at £1 an acre nominally? Yes.
1617. They bought at the rate of £1 an acre, with interest added, and they take 15s. for their interest after how many years occupation? They would two years ago.
1618. How many years had they been on the land? I really could not say.
1619. Speaking roughly, was it five years, ten years, or fifteen years? From 1884, certainly. A good deal of the land has been taken up under the 1884 Act.
1620. *Chairman.*] Suppose the Government decided to construct a line to Narramine, and it were necessary to resume some of that land, have you any idea what they would ask for the land? I do not think they would ask any more. I believe they would be glad to get a railway even without that if it were resumed.
1621. Would it go through your holding? It would go through some of my land.
1622. What should you require? It would only go through my land for half a mile; and that would be through the township you might say. I should want about £70 or £80 an acre.
1623. Have you got much of it? No; if the line were 3 chains wide it would be about 12 acres very likely. I am not quite certain whether it would go through my land.
- 1624.

- W. O'Neill. 1624. If it did, would you require that sum? Yes.  
 26 June, 1899. 1625. *Mr. Levien.*] Suppose the line went through your holding, would you be inclined to give your land for railway purposes? I would certainly make a reduction to the Government, but I would not be inclined to give my land. I do not approve of the betterment system.  
 1626. Suppose you got your land from the Crown for £1 an acre, and that it is worth only £1 an acre, you do not feel inclined to give the land wanted for the railway for nothing? Certainly not.  
 1627. *Mr. Watson.*] Does your land consist of town allotments, or is it country land? Some of it would be town lots; it would depend upon where they turned off, and it would be for only a short distance any way.

Edward Cahill, stock and station agent, Narramine, sworn, and examined:—

- E. Cahill. 1628. *Mr. Dick.*] Have you had an opportunity to examine the wall map showing the three rival routes to Coonamble? Yes.  
 26 June, 1899. 1629. In your opinion, which line is likely to prove the most profitable? I think the line *via* Narramine.  
 1630. On what grounds do you base that opinion? Because it passes through better country than the others do, and because the distance from Coonamble to the Western line is shorter by that route than it is by the other routes, except by the line *via* Warren. According to the map, the distance is not much over 80 miles, and there are no engineering difficulties to be surmounted except the crossing of the river, and it is very superior land for cultivation.  
 1631. Practically you base your opinion on four grounds—first, that the country is better; secondly, that the distance is slightly shorter; thirdly, that there are no engineering difficulties on the route; and, fourthly, that the country, which is better, is suitable for agriculture? Yes, and the few extra miles to the Coonamble people—I think it only makes a difference of 12 miles to them. The benefits to the State would greatly outweigh the extra haulage.  
 1632. You understand that a railway serves a certain tract of country on each side? Yes.  
 1633. If you will look at the wall map, you will find that the Narramine-Coonamble line practically entrenches on an area which is supposed to be served by the Nevertire-Warren extension? On one side.  
 1634. Do you not think that a line further eastward would serve a larger area of country than would a line from Narramine to Coonamble? No; because the country on the east side of the Dubbo-Coonamble line is not so good as the country on the west side. The country on the east side is unproductive, and, therefore, railway communication is no good, except for getting timber.  
 1635. Do you include in that charge of inferiority the whole of the land from Dubbo to Coonamble? No—for the first 40 miles at any rate.  
 1636. That leaves about 42 miles of good country on the Dubbo-Coonamble route? Yes.  
 1637. Will not that line serve a larger area to the east than a Narramine-Coonamble line would do? I think not, because the Narramine line would tap country on both sides.  
 1638. But a good deal of that land on the west side of the Narramine line is now served by the Warren extension? No.  
 1639. How far for agricultural purposes do you think a railway acts as an influence? From 20 to 25 miles at the outside. If you have to draw wheat more than that distance it is unprofitable.  
 1640. Is it not a fact that the further you go west, taking the three rival routes, the smaller is the annual rainfall? I believe it is; but, taking the line from Warren to Coonamble, the difference in the rainfall is not very great for 40 miles to the east of that line.  
 1641. Still, it must have some influence? Yes; but an average rainfall of 18 inches is plenty for growing wheat.  
 1642. You say that for 40 miles along the Dubbo-Coonamble route we have inferior ironbark country? Yes, particularly on the east side.  
 1643. In the course of this inquiry, this evidence has been given:—"The map shows a blank for the first 20 miles out of Dubbo? That is ironbark ridge country. The greater portion of that is Crown lands but it is of very little use," and other evidence shows that after that 20 miles of country there is good agricultural land;—do you agree with that opinion? Not altogether.  
 1644. You stick to the 40 miles? On the east side. There is a vast difference in the country on each side; the further west you go the better is the country.  
 1645. You think there is no inferior land along the Narramine-Coonamble route? No; very little, if any.  
 1646. Taking the route from Dubbo to Coonamble *via* Munderooran, are you acquainted with the country along that route? I do not know the country well enough to give evidence as to its character.  
 1647. The Coonamble-Narramine route would mean extra haulage for all time for these people? Yes; but very little—so little that it is not worth mentioning. The extra haulage would not be more than 12 miles. The line will run through country vastly superior to the country on any of the other routes.  
 1648. There is no flood country in that tract between Narramine and Coonamble? No, except on the bank of the river; there are a few creeks to cross.  
 1649. You say that there are no engineering difficulties on the Narramine-Coonamble route? No, excepting at the river.  
 1650. Are you an engineer? No; but level country cannot require much engineering, I should think.  
 1651. Are there any engineering difficulties along the Dubbo-Coonamble line? Nothing very extra, I should think, but certainly more ridges than on the other.  
 1652. Do you call a ridge an engineering difficulty? It has to be cut sometimes and manouevred about to get round it.  
 1653. *Mr. Levien.*] Have you any land? I have a little.  
 1654. Have you any idea whether the line will pass through or near your land? Nowhere.  
 1655. Suppose it were to pass through your property, would you be inclined to give your land? I would give land for the railway.  
 1656. What do you value your land at? I gave £4 10s. an acre for my land, which is to the south of Narramine; it was a private purchase.  
 1657. And even though you purchased privately, you would be prepared to give the land on the betterment principle? Particularly if I were any distance from the township, or from the existing railway line—more so than if I were near a township.  
 1658. *Mr. Watson.*] Do you know anything of the country between Dubbo and Munderooran? I know a certain part of that country, but not sufficient to give an opinion about it.  
 1659.

1659. You said that the only expensive item in the construction of a line from Narramine would be the crossing of the Macquarie River;—do you regard the crossing of the other creeks on that route as unimportant? As compared with the other lines I do, because the further west you go the flatter the country is. There are no big creeks to cross; they are very small creeks, and in some places you cross almost without knowing that they are creeks.

E. Cahill.  
26 June, 1899.

1660. If you were informed that the line between Dubbo and Coonamble was taken more easterly with a view to getting round the heads of these creeks, and thus avoiding the expense of bridging them, do you think that would be a proper idea? No; certainly not.

1661. You do not think they are sufficiently important to necessitate a detour? No; I think there would be 10 miles of line saved which ought to nearly pay for the bridge.

1662. *Chairman.*] Do you know what the country east of the Castlereagh is like? Not above Gulargambone.

1663. Between Gilgandra and Gulargambone what is the country like 20 miles east of the Castlereagh? It is good country.

1664. The sphere of influence of the proposed Railway from Dubbo to Coonamble—say 20 miles east of the route—would embrace a large tract of country, would it not? Yes.

1665. The further north you go both lines serve the same country? Yes.

1666. Taking the proposed line from Dubbo to Coonamble, what is your view of the country on both sides of that line north of Gilgandra? It is good country. The further you get down the Castlereagh the better is the country.

1667. So that the only advantage which the Narramine line would have over the Dubbo line would be that the country nearer to Narramine is better than the country between Dubbo and Gilgandra? Vastly.

1668. Have you any statement which you wish to make? No, except that the reason why the country north of Narramine has shown such poor returns is because the settlers on the north side of the river could not get to the railway with their produce when the river was not bridged. To get to the railway before the river was bridged was impracticable.

1669. *Mr. Watson.*] How long is it since the river was bridged? They have only been using the bridge about five months, because after it was put up there was no road on the other side of the river to get out to the country.

1670. *Chairman.*] Is there much clearing going on now? A good deal; one man has cleared 1,200 acres since the bridge has been opened.

1671. Others, I suppose, are following in his footsteps? They are beginning to follow in his footsteps. There is a lot of Crown land on the route of the line between Narramine and Coonamble.

Richard M'Gee, Railway Station-master, Dubbo, sworn, and examined:—

1672. *Chairman.*] For the carriage of goods, inwards and outwards, what revenue have you received? For the year ending 31st May the revenue was £25,406 2s. 5d. in 1897; £26,792 15s. 10d. in 1898, being an increase of £1,386 13s. 5d.; and £30,670 17s. 11d. in 1899, being an increase of £3,878 2s. 1d.

R. M'Gee.  
26 June, 1899.

1673. How many bales of wool did you carry? Outwards, 18,039 bales in 1898, and 25,981 bales in 1899. I did not take the number of bales inwards; it is usually a couple of thousand.

1674. Have you a return of the live stock? It is as follows:—

LIVE STOCK—Inwards.

Years.	Horses.	Cattle.	Sheep.	Pigs.
1897 .....	48	863	18,963	55
1898 .....	770	908	22,866	59
Increase .....	722	45	3,903	4

LIVE STOCK—Outwards.

Years.	Horses.	Cattle.	Sheep.	Pigs.
1897 .....	152	2,755	106,048	71
1898 .....	268	6,113	155,216	28
Increase .....	116	3,358	49,168	...

For the five months of this year, ending May 31st, the traffic in live stock was as follows:—Outwards—379 horses, 1,476 cattle, 152 calves, and 53,743 sheep; being an increase of 24,460 sheep, 495 cattle, and 250 horses; inwards—362 horses, 372 cattle, 15,396 sheep, and 34 pigs, being an increase of 9,700 sheep, 58 cattle, and 336 horses.

1674. What was the coaching revenue during those years? For 1897 it was £7,904 6s. 3d., and for 1898, £8,249 3s. 3d., showing an increase of £334 17s. We issued 8,800 tickets in 1897, and 9,672 tickets in 1898, being an increase of 872 tickets. The sale of tickets for the first five months of this year shows an increase of £102 8s. 5d. over last year's revenue. During February of last year a cheap excursion train was run which brought in a revenue of over £200; but notwithstanding that fact the revenue for the first five months of this year shows an increase of £102 8s. 5d. We do not count a return ticket as two.

1675. *Mr. Watson.*] Taken altogether, these statistics show a steady increase in the amount of traffic at Dubbo? I think so; I take it as such.

1676. Do you think any of the increase this year as against other years is due to the severity of the drought and the consequent shipping of stock, or would you put it down as merely normal? I should think it would be about balanced, because in previous years, when we did not have a drought, the meat works and boiling-down place attracted the stock inwards. This year this establishment is not working, and

- R. M'Gee.  
26 June, 1899.
- and I think the severity of the drought in other parts of the colony did bring the stock inwards ; but I do not think the traffic outwards is affected.
1677. You do not think the increase is at all abnormal? No.
1678. You think it is steady, and is due to the progress of the district? I think it is steady, and is owing to the increased settlement which has taken place.
1679. There has been increased settlement during the last year? I think there has.
1680. Can you say whence the great amount of this traffic is derived—we are not particularly anxious about the district south of the existing line; but we wish to know what proportion of that traffic comes from the north—that is, from the country towards Munderoran, and thence describing a route round to Coonamble, and down to the Western line? I think about 75 per cent. of the country traffic would come from the north.
1681. Of the proportion which comes from the north, would the larger amount come from the country towards Cobborah and Munderoran, and round that way, or from the direct track from Coonamble? As we know it, it is principally from Gilgandra, Gulargambone, and Coonamble.
1682. And they seem to make Dubbo their objective? Yes.
1683. What class of traffic is it generally to and from Dubbo—case goods? Yes, general goods.
1684. Do their general goods come through Dubbo, and thence go by team to Coonamble? Yes; and station supplies.
1685. That is, in preference to the Mudgee route? Yes.
1686. Do you know whether any goods come *via* Dubbo which go further out than Coonamble to any distance? Yes, they go out beyond Coonamble.
1687. Not as far as Walgett, I suppose? We have sent goods to Walgett, and we have received wool from Walgett.
1688. But usually, I suppose, goods would be sent *via* Narrabri to Walgett? Yes.
1689. As regards places between Coonamble and Walgett, do you think that they go *via* Dubbo? Yes; we should stand a good show of getting that traffic—we do, really get most of it now.
1690. Would it be in a specially dry season, when the Barwon was low, or during a normal season, that you would get wool from Walgett? In a normal season.
1691. I thought that, perhaps, the river would beat you? It might affect it.
1692. Do you have a lot of wheat shipped at Dubbo in the season? It is increasing.
1693. Do you know whether any of the wheat which is shipped here comes from as far as Munderoran? I could not say.
1694. You would have an idea if it did come from there, would you not? Not personally, without inquiring into the matter; I have merely a record of the number of bags.
1695. It has been stated in evidence that a great deal of the produce grown about Cobborah and Munderoran goes towards Mudgee now? I have no idea; I think it will come here.
1696. Would it be likely to come here? I think so.
1697. Do you get any of the Coonabarabran traffic? We get some of that.
1698. Of what character is it? General goods.
1699. Do you get any wool? We get wool from that district too.

Alderman James Andrew Ryan, financier and landowner, Dubbo, sworn, and examined:—

- Alderman  
J. A. Ryan.  
26 June, 1899.
1700. *Chairman.*] What are you? I am at present a financier and landowner. I carry on the business of a financier in Dubbo, and I have land outside Dubbo. I have resided in Dubbo for nearly thirty-three years.
1701. *Mr. Shepherd.*] What have you been chiefly engaged in during that time? For twenty years I was farming and raising stock, and ever since that time I have been off the land. My land is now leased to tenants.
1702. Are you thoroughly acquainted with the country between Narramine and Coonamble, and the country between Dubbo and Coonamble? Yes; I have been on every station between Dubbo and Mount Harris on the Macquarie, and between Dubbo and Coonamble.
1703. What kind of country is it between Dubbo and Coonamble? From Dubbo you pass out to the Talbragar. The land is all held in small areas; it has been sold as a freehold. The land is all first-class between Dubbo and the Talbragar, a distance of 4 miles. Beyond the Talbragar again, it is also first-class agricultural land following the course where the line has been surveyed along the Mogriguy Creek. The valley of the Mogriguy Creek is a volcanic basin. It is about 12 or 13 miles from Dubbo. Then the line keeps slightly to the left; it crosses the dividing water-shed between the Mogriguy Creek and the Coolbaggie Creek. A portion of the land across that way is forest land. There are also some patches of volcanic soil, too.
1704. It is all good land up to that point? Yes; it is within a distance of, say, 3 or 4 miles of the creek; but away from that there are ironbark forests along the line. A good deal of the land on the Coolbaggie Creek is scrub land; but a lot of this has been selected and cleared, and is proving to be first-class agricultural land, that is, for the production of wheat and hay. Land that was rejected by graziers thirty or forty years ago is proving now to be the best agricultural land.
1705. *Chairman.*] The reason why so many people have described it in the past as being poor land or worthless land, was simply because the land was not improved? The graziers considered it was poor land because it was not good grazing land with the timber on it.
1706. What class of timber is it? Box, pine; in some places box and ironbark mixed, and just where the ironbark does occur it is very sandy soil, but even that will produce crops. These are the principal timbers which are growing along the line.
1707. *Mr. Shepherd.*] What distance does that take us from Dubbo? Twenty-two or 23 miles—beyond the Coolbaggie Creek. Along the Drillwarrina Creek it is all good agricultural land as far as you like to go on either side of the creek, but it has been heavily timbered land. It is very expensive to bring this land under cultivation, but after it is brought under cultivation it is first-class productive land. Then between the Coolbaggie Creek and the Marthaguy Creek the land is all good, agricultural land. It is being taken up round there and brought into cultivation. The line would cross the Marthaguy twice, as there is a loop in the creek. It would take you on to the country between the Marthaguy Creek and the Castlereagh River. You can describe it all as good land, that is, within the influence of the line for a certain distance.
- 1708.

Alderman  
J. A. Ryan.  
26 June, 1899.

1708. It is your opinion that the whole country between Dubbo and Coonamble is good land? It is all good land; it can all, with an expenditure of capital, be brought into productiveness. On the eastern side of the line, between Dubbo and the Marthaguy, there is a very valuable ironbark forest which will produce a lot of timber for the railways. That land may not be brought under cultivation for a long time, if ever. It is a most valuable forest timber; it is all arable land.

1709. How far does this good land extend on either side of the proposed line? On the western side, as you go down, you get on the heads of these creeks running down towards the Macquarie. They would have to be crossed by a line from Warren to Coonamble. All the land on the heads of the creeks is good land.

1710. Is the country from Dubbo to Coonamble chiefly red, loamy soil? A good deal of it is black volcanic soil, and a good deal of it is red loam. In the ironbark forests it is a decomposition of sandstone.

1711. Is there much land under cultivation on this particular line? People went in more for grazing; they are only now bringing the land under cultivation. Wheat-growing has enabled them to expend money to improve the land.

1712. The land under cultivation now is chiefly devoted to wheat-growing? Yes.

1713. What is the average production? I could hardly say what the average is, but I know that up to 32 bushels an acre have been got off land along the Mogriguy Creek. Mr. Tripp, a farmer on the Mogriguy, got 32 bushels of wheat to the acre, which he advertised for sale as prime seed-wheat. And Mr. James Reid, a farmer on the Mogriguy, took first prize for wheaten chaff at the Dubbo show this year.

1714. *Chairman.*] Is there any amount of good, volcanic country? Yes; and away on to near the Coolbaggie.

1715. *Mr. Shepherd.*] Will you now describe the country from Narramine to Coonamble? After crossing the Macquarie at Narramine it is box and pine country with a loamy soil. I dare say that most of it could be brought under cultivation in time; it is fairly good land.

1716. Does that extend the whole distance? When you get further out you would get on to these creeks. There is some very good land along the creeks, but some of it would be flooded country. I have crossed the route at various points.

1717. The land extends on both sides, similarly to what it does on the line from Dubbo, for some considerable distance? Yes.

1718. Is there any particular difficulty in railway construction on either of these lines? You would have less bridging to do on the line from Dubbo to Coonamble than on any other line which is proposed, because when you reach the southern bank of the Castlereagh, near Gilgandra, the line runs parallel with the bank of the river. There are no creeks running into the Castlereagh on the western side. The west bank of the Castlereagh is the highest point, and it is really the watershed of all these creeks which fall from the west. On the eastern side there are a number of creeks coming in which will have to be bridged if the line is taken on that side of the Castlereagh.

1719. Have you any idea whether the owners of the land on this line will be willing to give the necessary land to the Government in the event of a railway being made? No; I could not say.

1720. Do you own much land on either line? My land is situated between 5 and 6 miles from Dubbo, not far from the proposed railway.

1721. How do you feel disposed to deal with the Government? The line would not go through any of my land. There is one line which passes through some land for which I am the trustee; the first line which was measured goes through my married sister's land; but the second line goes outside it.

1722. Are you acquainted with the proposed line from Mudgee to Coonamble? I have been over a good deal of the country at various points—Gulgong to Mudgee, Gulgong to Cobborah. I have ridden from there to Coonamble; but perhaps not just where the line goes.

1723. How would you describe the country from Mudgee to Gulgong? It is good country from Mudgee to Gulgong, but a little way after passing Gulgong I should describe the country as very poor country. It is rather hilly country; it is what they call speyey country in wet weather; it is very poor country. Along the valley of the Talbragar there is a narrow strip of very rich soil.

1724. Disregarding all private interests, which line do you think would best serve the country? Speaking in the interests of the country, I say that the line from Dubbo to Coonamble would. It was one of the first lines proposed a number of years ago. It was proposed long before the Byrock-Brewarrina line was thought of. It is a mystery that it has ever gone so long without being constructed. I think it is certainly the best line to construct. I think the Coonamble country ought to be brought into union with the main Western line. It is of great importance to all the places east of here to Bathurst that they should be brought into communication with the Coonamble country. There always has been a good trade in produce and one thing and another between all the towns from Bathurst to Dubbo and in the Coonamble country, and if the line were taken from any other point it would cut off all the trade communication which has existed for thirty odd years to my knowledge. Besides, I think, the southern trade from here, that is in the direction of Melbourne, will, as time goes on, increase. There has been a good deal of stock traffic here in the past to my knowledge, and the stock which used to travel by the roads in old times, will, I think, in the future, all go by rail. I think all stock-owners are disposed to send stock by rail when they can do so. There will be, no doubt, a large trade in years to come between those northern districts and Melbourne. The more these lines are made to converge somewhere about here the better I think it will be for the railway system of this colony. It should touch this main Western line at Dubbo.

1725. To which station does the chief traffic from Coonamble go now? Dubbo seems to be the central point of the traffic, because, notwithstanding the fact of the railway being taken to Warren from Nevertire, the trade from Coonamble to Dubbo has increased since that extension of 12 miles has been made. Stations that previously used to send their wool to Nevertire now send their wool to Dubbo by team.

1726. *Mr. Watson.*] Why is that? It is level country, with a good road and no creeks to get stuck up in, as there is in other country.

1727. *Mr. Shepherd.*] Are you acquainted with the country within a radius of 20 miles beyond Coonamble? Yes. When you get down below Coonamble you get into country where the water of the Castlereagh spreads out. It is all magnificent grazing country, no doubt; but you cannot call it agricultural country. In very wet seasons it is almost a sea of water.

1728. So that really an extension of the railway to Coonamble would not bring very much traffic in grain or agricultural produce from beyond Coonamble? No.

- Alderman  
J. A. Ryan.  
26 June, 1899.
1729. You believe the extension of railway communication to Coonamble will largely increase the cultivation area? Yes, between Dubbo and Coonamble. Narramine has got a great name for wheat-growing during the last few years. In the neighbourhood of Gilgandra, and all round there, they have land which is quite equal to the land at Narramine, and which is capable of producing from 40 to 50 bushels of wheat to the acre.
1730. Is there much land alienated between Narramine and Coonamble? I could not tell the quantity which is alienated; but all the land which was available for selection has been taken up.
1731. Agriculture is increasing? Yes; it is increasing out this way, although they have to send wheat in 30 miles by team. They are growing wheat round Gilgandra, which is 40 miles away.
1732. Is not that considered rather an excessive distance from a railway-station for growing wheat? Yes, and they have to get very heavy crops to make it pay.
1733. *Mr. Levien.*] Have you ever been over the route between Werris Creek and Dubbo? No; only to Cobborah; but I will give you an opinion about the Dubbo-Werris Creek line. It ought to be thought of fifty years hence when there is population to make the line pay.
1734. Do you not think it may become the main line from Queensland to Victoria when the great cause of Federation is consummated? Yes, it will be a grand thing; but my opinion is that we should build commercial lines which will pay.
1735. You do not believe in this line at all? Certainly it would never pay in our time. It would be a grand thing to have this line if we had the money to build it; but there is nothing at present, in my opinion, to warrant its construction.
1736. Is there not any sheep traffic? Nothing to make a line pay.
1737. What kind of country is it for agricultural purposes? Some of the country is very good. There is some good pastoral land and some inferior country. I do not know what it is on the other side, except from reading the papers.
1738. You have never been further than Cobborah? No.
1739. *Mr. Watson.*] You stated that pastoralists who previously had sent wool to Nevertire had, since the construction of the Warren extension, commenced to send wool to Dubbo. What reason can you give for that change. Would not the presumption be that they would not go past a railway line? From what I have heard from people down there, it is such good country to carry on that carriers are able to carry as cheaply as the railway. The extra distance it would have to go to reach Nevertire would be equal to, or, perhaps, greater than, bringing it direct by team to Dubbo.
1740. Am I to understand that these pastoralists would have altered their place of shipment whether the Warren extension were made or not? It has not had the effect of taking the wool round by Nevertire.
1741. It has not had the effect of causing those who previously went to Nevertire to go to Dubbo? No; I suppose it was a matter of £. s. d. with the others, and they got it carried cheaper by the teams to Dubbo.
1742. Have the roads been especially good for teamsters to travel on during the last year or so? Last year they were very good for teams, but this year it has been very dry.
1743. Was there any question of back loading which might be a factor in reducing the freights this way? No; the same thing would apply to either Nevertire or Dubbo as regards back loading.
1744. Still, you say that there is a great proportion of the wool traffic from north-west of Warren which now comes to Dubbo? Yes; and there has been a good deal of loading going back; but I think the route from Dubbo is particularly suited to the construction of the railway line. It is very level country; there is very little bridging to be done, and they will be able to get all kinds of timbers that will be required.
1745. Do you anticipate that the land between Dubbo and Gilgandra will contribute anything towards the up-keep of a railway? Yes.
1746. Irrespective of timber? Round Gilgandra it will grow into a very considerable town.
1747. The country between the Talbragar and Gilgandra is acknowledged to be the poorer land, comparatively speaking;—do you think that country in itself will contribute towards making the railway pay? Yes.
1748. Do you think that land will be a factor in making the line pay later on? Yes; it is not so bad, but what it can be made productive. I suppose there is not one acre which you cannot break up with the plough when the timber is off it. There is a little bit of sandstone outcrop here and there perhaps.
1749. It has been suggested, with a view of reaching Coonamble, and with a view also of connecting some day with Werris Creek, that Coonamble should be reached from Dubbo, *via* Mundooran;—what do you think of that project? I would say it is ridiculous. I have noticed myself that the bulk of the trade of Australia goes to the seaboard; that is the main traffic as between the seaboard and the point desired to be reached. The more direct way you can get there, if the country is not too bad to get over, the better it must be for the railway system.
1750. You would not favour the adoption of that route as a means of reaching Coonamble? I think it is a ridiculous proposal.
1751. In view of your knowledge of the intervening country, you think it is a ridiculous proposal? Yes; the bulk of the trade is between the seaboard and the points desired to be reached. If you build a railway in the wrong place you will simply have the teams competing with the railway taking the products along the natural route.
1752. Referring to the question of wool coming here from north-west of Warren, is it a fact that the reason why that wool at one time went towards Nevertire was owing to some disagreement between the carriers and the pastoralists? Yes, nearly all the wool came here originally. There was a carriers' strike here, and the result was that the agents in Coonamble simply opened a new line to reach the railway with another set of men.
1753. Which temporarily diverted the traffic? Yes, from Dubbo.
1754. And the traffic is now coming back to its original course? Yes.
1755. *Chairman.*] You are well acquainted with the whole of the country on each route which has been mentioned? Yes.
1756. During the last year or two it has been very dry weather? Yes.
1757. Have you been over the country lately? No; I am speaking of my knowledge of the country years ago. I have travelled over the Talbragar, and camped on it. I think I could describe every bend in the Castlereagh; I am in communication with the people, and know what is going on.

1758. Do you know the difference in rainfall between a line west of the Castlereagh and a line from Narramine towards Coonamble? The difference is some few inches. The rainfall on the line between Dubbo and Coonamble is more than ample for wheat-growing.

Alderman  
J. A. Ryan.

26 June, 1899.

1759. To produce the best quality of wheat you do not require a very heavy rainfall? Twenty-six inches is more than enough to grow wheat well.

1760. Now, west of the line which has been advocated from Narramine to Coonamble, is the rainfall sufficient for wheat-growing? It is sufficient for wheat and hay-growing.

1761. Have you been out that way this season? No.

1762. You do not know what the crops have been like this season? No; I hear that the crops are looking very nice since the rain. In the interests of the country, I think it is better that the line should start from Dubbo. I do not see what advantage the country could gain by taking the extra few miles from Narramine, and then branching off. There has never been a track direct to Narramine. In the other case, we have the route which has been followed by the traffic. We have a splendid water supply in Dubbo. I think it is a very important point for the Railway Department to make the junction of any important line at a place which will carry a large population. Nevertire is out on a dry, wind-swept plain; in summer time there is no permanent supply of water, and it would be a very undesirable place at which to establish a town. At Dubbo we have a splendid location and climate, and suitable water supply. Another advantage which Dubbo offers is that sidings could be made, and the industries which will grow up with the place, in course of time, could have their sidings, with a good water supply. The line runs parallel with a never-failing river. It would tend to the starting of works which will employ people in time to come, such as wool-scouring and boiling-down, frozen-meat works, flour and saw mills, butter factories, &c.

1763. *Mr. Watson.*] Will you be allowed by the Health Board to use the water from the Macquarie for this purpose? It would be pumped from the river.

1764. But you would not be allowed to let the water go back to the river? Certainly not.

1765. *Chairman.*] What terms do you make with your tenants? They pay me so much per acre for the land.

1766. You do not lease your land on the halves system? No; the tenants pay an annual rental.

1767. Your land is, I think, within a short distance of Dubbo? Yes; so that the building of the line would have no influence. So far as I am concerned, as a landowner, I have no interest beyond being the owner of that land. I may tell you that I am an advocate for the State taxing the value of the land; I am a single-taxer.

1768. You think that if this line were constructed there would be no difficulty in finding other Crown tenants all along the line, and that it would be the means of breaking up large estates? I am certain that the land would be taken up and cultivated. Mr. Barnett, who has a station 30 miles from Dubbo, is turning his land from grazing to agriculture. He reckons that agriculture will pay him even at that distance from Dubbo.

1769. Agriculture would support a much larger population? Yes; the holdings will be devoted to combined grazing and farming. We shall never get away for many years from stock raising.

1770. *Mr. Watson.*] Even with a railway? They will have to depend largely on stock. They will grow stuff to feed their stock on. The land will eventually go into larger holdings again, I think. The small holders will sell out to the larger ones as time goes on.

1771. *Chairman.*] The construction of a line from Dubbo to Coonamble is, in your opinion, warranted? It is, inasmuch as there is a lot of good country to develop; and I think it is the most suitable point at which to bring that country into union with the Great Western trunk-line.

Thomas Henry Purvis, hotelkeeper, Dubbo, sworn, and examined:—

1772. *Chairman.*] Have you a knowledge of the country to be served by the proposed railway? Yes; I have been over a great deal of the country between Dubbo and Coonamble.

T. H. Purvis.

1773. Have you been over the country between Narramine and Coonamble? I have.

26 June, 1899.

1774. Have you also been over the country from Mudgee to Coonamble? I have not been out along the Mudgee line.

1775. Comparing the Dubbo-Coonamble line with the Narramine-Coonamble line, which country would you say is more worthy of development by railway? I think the land is very much alike; after you get out a bit there is not much difference in the land.

1776. Then the advantage would lie with the line from Coonamble to Dubbo inasmuch as there would be shorter haulage? Yes; and I think there would not be so much bridging to be done as there would be on the other line. There are a good many creeks and swamps to cross on that line which you would not have to cross on this line.

1777. A line from Narramine would be much more expensive to construct than a line from Dubbo, although it would be shorter? Yes; because there are more creeks and swamps to cross which you would not get on this line at all.

1778. Do you know the country for 20 miles on each side of that line? Yes.

1779. Would you describe that country as being good agricultural country? Yes, if it were cleared; it is good red soil. From Dubbo, the land on the left hand side going down is the best.

1780. If a statement has been made to the Committee that the land from Dubbo to Gilgandra is very poor agricultural country, you would say that it is not correct? It is not correct. The Coonamble road runs along the edge of the ironbark; but off the road for a considerable distance it is all good agricultural land all the way along.

1781. Is the land taken up? No, not much of it; there is a great lot of it open there for settlement.

1782. Say, for 20 miles from Dubbo, is the land taken up? There is some, a little over 20 miles, taken up; but all between Dubbo and Coolbaggie is not taken up.

1783. Why? It belongs to Terramungamine run.

1784. The leases in this division will all fall in within three years;—has anybody expressed a desire to take up that land? The land will be taken up very quickly when it is opened. People have taken up a lot worse places than that round here.

1785. So the reason that it is not being cultivated is that it is part of a leasehold area? Yes, it belongs to the station.

- T. H. Purvis. 1786. Have you seen similar land cultivated? Yes.
- 26 June, 1899. 1787. And successfully cultivated? Yes; there is some being cultivated out opposite Mr. Barnett's. On the north side of the Coolbaggie it has been cultivated, and looks beautiful. It is very grassy country, too.
1788. Your remarks apply to the country as far as Gilgandra? Yes.
1789. Beyond Gilgandra again what is the country like? It is all open plain from there down.
1790. It is more pastoral country? Yes; but on the banks of the Castlereagh it is all good land for cultivation.
1791. But as you get back from the river, say 20 miles back, what is it like? It is plains, pine scrubs, and Budda scrubs. Part of it is good agricultural land, but not all of it.
1792. Is there much traffic coming down that line? A good deal from Coonamble, but it mostly comes on the eastern side of the river.
1793. Is there any traffic from Walgett now? A good bit; I am agent for the coaches; a great many persons come in by coach and go out by coach.
1794. If a line were constructed to Coonamble that town would form a depôt for a large scope of country to the north? It would.
1795. Would you take Dubbo to be its natural outlet on the Western line? I should think so.
1796. Have you been out lately on this line? I was at Coonamble four months ago.
1797. Have you been out on the other lines lately? I went down one way and came back by the Merri Merri close to Warren.
1798. Have you been along the Marthaguy Creek lately? I came up the Marthaguy.
1799. Which country stands the drought best—the country along the Castlereagh or the country along the Macquarie? Lower down it is much the same country, but up higher it is better. Down about the Marthaguy—down about Wonbobbie, it is much the same sort of country.
1800. Does the pasture look much about the same just now? It was very bad when I was down there. It was very good all round about Dubbo and all out in the scrub country when it was bad down there.
1801. That means that the further east you get the better the rain and the better the grass? Yes; up this way.
1802. So that you would not advocate going west of Dubbo? Not to cultivate—not very far.
1803. *Mr. Levien.*] You are not a landholder? No.
1804. If you had land between Dubbo and Coonamble, would you be inclined, as a citizen, to let it go on the betterment principle? I would.
1805. And you think it is a fair thing, in the interests of the people, to let the line go in that direction, and to allow the Railway Department to have this land? Yes.
1806. *Chairman.*] Did you ever run coaches? Never.
1807. You do not know anything about the coach traffic? No; but I have been down along the line in the coach.
1808. You know nothing about the land between Werris Creek and Dubbo? No.
1809. *Mr. Watson.*] Do you know the land round about Dubbo pretty well? Yes.
1810. How long have you been here? Forty-two years.
1811. You have a fair idea of the capacity of the land for pastoral pursuits? Yes.
1812. You have been looking at the land mainly from the pastoral aspect? Yes; and the land I have seen cultivated—land which in the olden days we used to think was not the best.
1813. From a pastoral standpoint, you think that the northern and western country is good? Yes.
1814. Do you reckon that the country between Dubbo and Gilgandra is good pastoral country? Parts of it are.
1815. Do you think that any of the country is fit for cultivation? Yes; there is plenty of cultivation along the line.
1816. *Chairman.*] Have you any statement which you would like to make with reference to your knowledge of the country? No.

Alderman Richard James Joseph Ryan, solicitor, Dubbo, sworn, and examined:—

- Alderman R. J. J. Ryan. 1817. *Mr. Dick.*] You are a resident of Dubbo? Yes, for twenty years.
- 26 June, 1899. 1818. You have a good local knowledge of the districts to be served by these rival routes? I have a very good knowledge of the country between Dubbo and Coonamble.
1819. Is there a conflict of opinion concerning the first section of the Dubbo-Coonamble route, that is, practically, as far as Gilgandra;—do you agree with the last witness that a great deal of that land is fit for agriculture? Yes, but that matter is open to contention, I admit. That country is not as good as it is about Narramine. There are parts of the country along there which, perhaps, may not produce a good crop; but taking it on the whole, if that land were opened up and cleared, I have no doubt that it would be highly productive. Following the road itself, you have the worst part of the country in view. You have to keep off the road a bit to find the good land. As you get towards Gilgandra, you will find the land all being cultivated; land which at one time was thought not worth being cultivated is now being cultivated. From Bobarah, 30 miles from Dubbo, the land has been taken up and very extensively cultivated; from there to Gilgandra it is all being cultivated fairly well, except land which is held under lease. Several farmers from South Australia have bought land between Dubbo and Gilgandra. I wish to emphasize this fact, that if this line between Dubbo and Coonamble is ignored, the vast tract of country you see on that wall map must be served by some means. If the line goes from Dubbo to Coonamble, the intervening country between the line and Narramine will be served. But if the railway goes from Narramine to Gilgandra, what is to serve the eastern portion of that area on that map. It will be left absolutely unserved. If you look at that red line on the map, you will see that it will fully and amply serve the Narramine people; but if the line goes from Narramine, there is all that vast extent of country over to Cobborah, Munderoran, and Gilgandra, and Terrabile, which will be left unprovided for.
1820. What is the character of the country round those points which you have just mentioned? It has been used for pastoral purposes more than anything else; but pastoral pursuits are giving way rapidly to agriculture by reason of the falling in of the leases and the introduction of the halves system.
1821. You see that the dotted route from Dubbo would run to Munderoran and thence go on to Coonamble;—have you considered the effect of such a route as that upon that area of country which you desire to be served by a railway? I have only considered it as part of a national line to Werris Creek. There is no provision

provision made for the intervening country. That has been for years the recognised route between Dubbo and Coonamble, and all the traffic will be diverted and upset if you do not have the railway taken along that route. The red line touches all the places of importance. The line to Narramine would paralyse all the trade and commerce of the places between Dubbo and Coonamble on the east.

Alderman  
R. J. J. Ryan.  
26 June, 1899.

1822. Have you considered the possible extension of a line from Mudgee to Coonamble? No; I have always considered that as one of the things which would be in the air.

1823. You practically agree with a number of the witnesses we have had this afternoon that from Dubbo to Coonamble, practically the whole way, there is a large area of good land fit for agriculture? There is no doubt whatever about it.

1824. And the requirements of that district of which the route is practically the dividing line will be best served by going from Dubbo rather than from Narramine? Yes; it is apparent on the face of it that it must be served by some means. I have not the slightest doubt that if the line went from Narramine to Gulargambone you would have opposition traffic, in the shape of teams, between that point and Dubbo.

1825. What would enable them to successfully oppose the railway? The traffic they would get, the business they would have. I am sure the wool would come this road.

1826. *Mr. Watson.*] If there were through-rates from Gulargambone to Sydney *via* Narramine would teams be able to take the wool to Dubbo? I am quite positive about it. A considerable amount of wool goes along that intervening part which the Narramine line would never get. All the wool from Terrabile would never touch the Narramine train.

1827. Where does the Cobborah and Mudooran traffic go to now? A good deal of it goes down to Gilgandra, and a good deal of it goes to Mudgee. We hardly regard Cobborah as part and parcel of Dubbo, because virtually it belongs to the Mudgee district. There is some vehicular traffic between Gilgandra and Mudgee, *via* Mudooran, but I fail to see that there is heavy traffic.

1828. Is it a fact that the first section of the proposed line goes along a high ridge? It is undulating country. I should not call it a ridge; it is good high country.

1829. The Narramine-Coonamble line would necessarily have to cross a number of small creeks and water-courses? Yes.

1830. Whereas the Dubbo-Coonamble line, at any rate for the last two-thirds of the distance, avoids them wholly? I cannot speak personally as to the latter part of the distance.

1831. Between the Talbragar and Gilgandra, and over towards Mudooran, the country is mainly a railway reserve? I think there is a big forest reserve for railway purposes. That is where they have been cutting most of their timber.

1832. Do you know the character of the land in that reserve? No; not more than from what I have heard Mr. Thomas say.

1833. It is under pastoral lease? I understand that it is.

1834. The presumption is that it is of some value for grazing? Yes. The reason why a good deal of it has not been cultivated is because it has been under lease. There is a rush every Thursday when there is land thrown open; 200 or 300 applicants for a lease.

1835. A good number of the pastoral leases in the Central Division will be thrown open for settlement during 1901, so that if a railway were constructed it would be in time for the development of that land, and the State would get whatever benefit accrued from increased values? Yes; there is no doubt that the land would be increased in value.

1836. You know the land between Narramine and Coonamble? Only by hearsay.

1837. *Mr. Levien.*] I suppose you are not a single-taxer? No; I would rather tax those who are.

Augustine Heard Fearon, manager, Bank of New South Wales, Dubbo, sworn, and examined:—

1838. *Chairman.*] How long have you been in this district? Twelve and a half years.

1839. Do you know anything about the country between Dubbo and Coonamble? I have travelled all over it.

A. H. Fearon.  
26 June, 1899.

1840. How would you describe that country? Between Dubbo and Gilgandra it is all forest country, timbered with box, ironbark, budda, and pine. The bulk of it is from fair to very good agricultural land between Dubbo and Gilgandra.

1841. How do you value it? I completed the purchase of a selection here the day before yesterday at 25s. an acre, conditional purchase and conditional lease. There is £1 an acre to pay to the Government, and I suppose about 14s. on the conditional purchase, which consists of 640 acres. That would be about £2 an acre for improved freehold.

1842. Is there a great anxiety to get land here? There is a great demand for country.

1843. For agricultural purposes? Yes, and grazing as well.

1844. Do you call the land between Dubbo and Gilgandra fair agricultural and grazing land? From fair to very good.

1845. Then, from Gilgandra on, what is it like? On the banks of the Castlereagh—I suppose up to 20 miles on each side of the river—it can all be considered agricultural land.

1846. That is, east and west of the Castlereagh it is all very good country? It is very good grazing land. I think a great deal of this country would be agricultural land in time if they had facilities for getting produce away.

1847. Capable of supporting a large population? Yes, a very large population. The land between here and Coolbaggie for 20 odd miles, which I believe the proposed line goes through, all belongs to Mr. F. E. Body. He has just made a proposal to the Government to exchange all the land which the railway goes through—that is, about 25,000 acres—for land further down and nearer his present homestead.

1848. Where is the land for which he proposes to exchange these 25,000 acres? He has a place called Terramungamine, and a place called Bandemar. The land he would take in exchange is more on the Narramine route.

1849. I suppose it is better than the land he is giving up? No; he is a grazier, and does not go in for farming. He says the railway will interfere with him rather than benefit him. He thinks he will have a better chance of consolidating where the Government is getting the big end of the stick. He is giving up all the fences and water, and ringbarking, for country which is practically unimproved beyond the ringbarking.

- A. H. Fearon. 1850. Have you any idea of the traffic along that line from Coonamble to Dubbo? I have a very fair idea of the traffic. There is an immense wool traffic in the season, and there is a large amount of produce which comes down there. Nearly all the produce between Dubbo and Coonamble comes by this line. At the present time there is an immense number of teams carrying forage. I live a few miles down the line, and I see the traffic daily. I travel the line a good deal between Dubbo and Coonamble.
- 26 June, 1899.
1851. Do you think the present traffic is sufficient to justify the construction of a railway to Coonamble? My own impression is that the line would pay working expenses straight away. There is sufficient population on the line to do it.
1852. Have you any knowledge of a line which has been constructed, say, from Dubbo to Nyngan—that is, before the line went further on than Nyngan? I was not in the district before it went further on.
1853. You could not say whether you could anticipate as much traffic along this line as was anticipated from other lines when they were constructed? I should think there would be more traffic. There is a very large population settled in Coonamble and immediately around Coonamble, and a good deal would come in from Walgett.
1854. So that if the construction of a line to Bourke were justifiable, the construction of a line to Coonamble would be more justifiable? Yes; there is a great deal better country round Coonamble than there is round Nyngan or Bourke, and it has a better rainfall. I think Coonamble is certain to be a big centre some day. There is some very fine country round that place.
1855. Do you know whether much of the Walgett traffic comes in this way? A good deal of the Walgett passenger traffic comes this way; I do not think a great deal of the wool comes this way. There is wool which comes from several stations 40 or 50 miles north from Wingadee and Bullarora belonging to Tobin & Sons and other stations. The country to the west of the proposed line from, I suppose, 20 or 30 miles west, is good agricultural land all the way. As regards the country east of the line, there is a good deal of ironbark, but I think it is held that it will turn out to be land capable of producing wheat. A large number of farmers tell me that they are growing wheat there. A man named Hall told me that he got 40 bushels to the acre off ironbark country.
1856. That is in country which was considered no good at one time? Yes.
1857. Do you know whether any of that ironbark country has been under tillage long? This man told me that he had been tilling it for the last three or four years, and that last year it produced 40 bushels to the acre.
1858. He has an idea that the land will last? He says so. The land we used to think so utterly worthless has turned out to be the best country. We have had thousands of sheep and cattle from Bourke and all parts of the Colony grazing this year within a radius of 50 miles of Dubbo.
1859. You describe that land from Dubbo out as being from fair to very good land? Yes.
1860. So that if the Committee has been informed that it is next to useless, the opinion of the informants must have been formed from the box seat of a coach? I think so.
1861. In travelling the line between Dubbo and Gilgandra, you go along the worst portion of the country;—the best land for a race is not the best land for agriculture? It is generally the worst. The road was formed in the old days by the coach, which kept to the ridges.
1862. Any investigator of the country if he sticks to the road cannot form a good opinion as to the capabilities of the land? No.
1863. If anyone gives an adverse opinion as to the character of the country, it must have been formed by observation from the road? I think so.
1864. Is there a tendency to cut up land into smaller areas? Yes; people are beginning to sublet on the halves system; they are making a very good arrangement.
1865. Do farmers who are farming on the halves system appear to be satisfied? They are making a very good living.
1866. You think they will be permanently settled on the land? I think so. I know several who have made enough in three years to buy farms for themselves, and that off land which is no better than the land to be served by this railway.
1867. There is no doubt in your mind that this line if constructed will open up a large quantity of land to the smaller settler? I am quite satisfied that it will, more especially if this proposal of Mr. Body is sanctioned by the Crown. 25,000 acres of land will then be thrown open for settlement. That land commences 6 or 7 miles out of town and goes out for 24 or 25 miles till it crosses the Coolbaggie Creek.
1868. Do you know the country between Narramine and Coonamble? Yes.
1869. Would you describe that country as better or worse than the other? It is very similar land, probably a little better than the other.
1870. Do you know the land on the east side of the Castlereagh? I have travelled two or three times on the east side of the Castlereagh past Tooraweena. I have been in the mountainous country there.
1871. Is it similar land? There is very fine country between the mountains and the Castlereagh.
1872. Would a line from Dubbo to Coonamble better supply that good country than a line from Narramine to Coonamble? The Dubbo line will go right through the centre of that country. A line going on the east side of the Castlereagh would serve a good deal of land on the west, but it would be blocked by the mountains on the east.
1873. Would the broad red line on the wall map serve a greater quantity of good country, on both sides of the railway, than a line from Narramine? Certainly it would.
1874. As a bank manager you have good opportunities to know the state of the district? I travel about the district two or three times a year.
1875. There has been to your knowledge a fair increase in population? Since I came to Dubbo our business has increased three times.
1876. And you think this railway would develop a large amount of good country? I am quite sure of it.
1877. You have stated that a number of people are prepared to go on land directly they get facilities to carry products to market;—in your position as bank manager you have inquiries made continuously with reference to this matter? Yes; I think that if 25,000 acres were thrown open to-morrow every acre of the land would be taken up in small areas—in blocks of 500 or 600 or 1,000 acres. It would settle a large number of people.
1878. So that of these three lines to Coonamble you think that the country at large would be better served by a line from Dubbo than by either of the other two routes? I think it would serve more country.

1879. I suppose you have no land on the line which would lead you to be biased? No.

1880. *Mr. Shepherd.*] We have had a statement made to the Committee that ironbark country is absolutely impossible for agriculture;—do you concur in that opinion? We were under that impression until late years, but they have found from practical experience that it will grow wheat.

1881. Ironbark country varies just as much as other country does? No doubt it does.

1882. I think the ironbark country is found chiefly on the line from Dubbo to Coonamble? It is more to the east.

1883. There is little or none between Narramine and Coonamble? There are belts of ironbark which you pass through in going along the Narramine route.

A. H. Fearon.

26 June, 1899.

TUESDAY, 27 JUNE, 1899.

[The Committee met at the Court-house, Dubbo, at 10 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Edwin Henry Utley, Mayor of Dubbo, sworn, and examined:—

1884. *Chairman.*] Do you know the country to be served by the proposed line from Dubbo to Coonamble? Yes. E. H. Utley.

1885. Starting from Dubbo, will you describe the country within a radius of 20 miles on each side? Starting from a point at Caledonia, the proposed line would serve the country on the north-east side out to the Warrumbungle Mountains. 27 June, 1899.

1886. How far are these mountains from that line? They lie due south of Coonabarabran. On the main road from Dubbo to Balladoran the mountains are seen in the distance, about 25 miles to the east. When you are standing on the hills of Balladoran you can see the mountains. All that country going away from the Warrumbungle Mountains—that is, the Tundaburine country—will be served by the railway. Until very recently all the wool from Tundaburine station came to Dubbo. Unfortunately there was a strike a few years ago, and the wool went to Mudgee, but occasionally it comes this way now.

1887. That station lies about half way between Coonabarabran and the Castlereagh? It lies more to the west—towards Coonamble. All that country out to Coonabarabran, and portion of the Coonabarabran country, will be served by the railway. We have had wheat occasionally coming from Coonabarabran to Dubbo.

1888. Do you know the road from Mundooran to Coonamble? No; I have not been over the road, but I know where Mundooran lies.

1889. Have you been along that country? I have been through the same country.

1890. How would you describe it—as good agricultural land? Portions of it. It is very heavily timbered country, and the low flat ground is good land; but there are stony ridges here and there which would be no good for agriculture at all.

1891. What is the proportion which is good for agriculture? The larger proportion would be good land. All the flat land is good, especially good for wheat-growing, when it is cleared; but it is heavily-timbered. It is a sandy soil.

1892. The heavily-timbered country about here has been proved to be good agricultural land? Yes, beyond a doubt. Victorian people were the first to open it up and clear land here. Until recent years the people in the district did not care about the timbered country; but when some Victorians came over here they went straight for the timbered country.

1893. And now they take heavily-timbered country in preference to open plain country? Yes, for wheat-growing.

1894. And the greater portion of this country you describe as being heavily-timbered, and, therefore, fit for agriculture? Yes. It is expensive to improve this country, but when it is done it will be splendid wheat-growing land.

1895. Now, on the western side of the proposed line, how would you describe the country for a distance of 20 miles to the west? A great deal of this country is very thickly-timbered, but it is very rich land. That which is thickly-timbered is loamy, sandy soil, intervening with black soil and volcanic clay. It is very rich land when it is cleared.

1896. Some of that country has been cultivated? Yes.

1897. With what result? Last year was rather a dry season; but in the previous year as much as 40 bushels to the acre were taken off the land.

1898. Was the year before last year also a dry season? It was rather dry. Our rainfall was not up to the general average.

1899. *Mr. Shepherd.*] Do you know what yield they got in the last crop? Those that cut for wheat got about 30 bushels to the acre—most of them; but a lot of wheat was cut for hay.

1900. *Chairman.*] Do the farmers seem satisfied that it is good wheat-growing country? Yes, very much so.

1901. Where is the market for their wheat? Dubbo is their market.

1902. If they took this country, and put the greater portion of it under wheat, you would have to seek some other outlet;—would it pay you out there to grow wheat to send, say, to Sydney? Yes; that is our natural market. We have no other market outside our local market.

1903. Do they send to Sydney now? Yes; all our surplus goes to Sydney.

1904. You think that there will be an unlimited market for wheat? Yes.

1905. That is, if there were a large surplus of wheat they could still go on growing wheat out in this district if they had to find a market in Mark Lane? Yes; they have to depend upon an export market.

1906.

- E. H. Utley. 1906. A good deal of wheat and forage is sent to other parts of the colony? Yes; this last year I know that very nearly 1,500 tons of chaff went from here right round to Narrabri.
- 27 June, 1899. 1907. Feed-stuff? Yes.
1908. *Mr. Watson.*] Would it pay them to take chaff from Dubbo to Narrabri in preference to getting it from the Hunter valley? It was first quality stuff, and it was put on the trucks here at a price which would compete against any other district.
1909. It would be an enormous railway freight from here to Narrabri? It was heavy; but the stuff had to go to Sydney to be sold, and it was just as well to send it to Narrabri.
1910. *Chairman.*] A man could produce here on account of the price of land being very much lower than the price of land on the Hunter? Yes; the cheapness of the land and the large areas they can get under crops will enable them to compete at a lower price.
1911. Now, taking the broad red line on the map, from Dubbo to Coonamble, should you describe that line as fairly splitting up the best agricultural land in the district? I should; I should say that it would serve the most people and open up the best land. It really goes right along the western slope for 50 miles.
1912. You were in the room yesterday when Mr. O'Neill gave some evidence in favour of a line from Narramine to Coonamble? Yes.
1913. Mr. O'Neill stated that the land along that route was much better, from an agricultural standpoint, than the land on the line from Dubbo to Coonamble;—is that so? I do not think it is so. I think the land is equally as good. It runs so parallel that practically there is no difference, in my opinion.
1914. The land is equally as good on the line from Dubbo as it is on the line from Narramine? It is all the same land. There is only a difference of a few miles between the lines. The Narramine line runs almost into that land. At the most it would not be more than 20 miles away from it.
1915. Do you know the land on the western side of the Narramine-Coonamble line—that is, the land between that route and Warren? Yes; it is intersected by good agricultural land and first-class grazing-land. You get further on to the Myall Plains, black level country, and there is more of it fit for pastoral pursuits than for agricultural pursuits, but it is intersected by land fit for agriculture. All the timbered land, in my experience, between Narramine and Warren, is fit for agriculture.
1916. Taking the three routes to Coonamble, viz., from Narramine, Dubbo, and Mudgee, do you think the country to be served would be much the same by either of these lines, or which line do you think would serve the larger proportion of good agricultural land? I would certainly say that a line from Mudgee to Coonamble would open up a large area of agricultural land, and also a line from Dubbo would. Of course, a line from Mudgee would be longer, and go through more country, but it would cross more mountains. In the case of the line from Dubbo to Coonamble, practically the whole of the country is fit for agriculture unless it is odd, stony ridges here and there. I consider that a line from Dubbo to Coonamble would serve more population and bring about more settlement.
1917. *Mr. Watson.*] More than a line from Mudgee to Coonamble would do? Yes.
1918. In what way do you account for that? It has always been a natural outlet from the Western line to Coonamble, and the people have gradually settled on that road. The road runs almost paralld with the Castlereagh River.
1919. The other line would go near these places too, would it not? Yes.
1920. Do you count your population at the terminus—at Dubbo and Mudgee—or are you counting the people along the respective routes? I would say that a line from Mudgee to Coonamble would eventually probably carry more population; but at the present time a line from Dubbo to Coonamble will serve most people and be the greatest convenience to settlers.
1921. *Chairman.*] We have to look to the requirements of the future, and we want to know which line in your opinion would develop most country? Looking at the matter in a broad way, I should say that a line from Dubbo to Coonamble and from Coonamble on to Walgett would open up more country than a line from Mudgee would.
1922. Once you get to Coonamble by one route or the other, the question of going to Walgett will be common to each line? If the line were taken from Mudgee to Coonamble, and this country between Dubbo and Coonamble were left out, there would be a very considerable amount of very rich, agricultural land left out, which would have to have a railway sooner or later.
1923. If you made a line from Warren to Coonamble you would serve a lot of good country and leave out the country which is along the line from Dubbo to Coonamble; and if you constructed a railway from Dubbo to Coonamble, there would be a good deal of country unserved which lies away to the east; so that that objection would apply to each proposal? Yes. My opinion is that it will open up a very extensive portion of the country, and very good country. It has been the opinion in the past that the country between Dubbo and Gilgandra was worthless, or no good. At every opportunity the settlers had to take up that country it was snapped up immediately. Every inch of this land between Terramungamine, which is 8 or 10 miles out, and Gilgandra, if it were thrown open to-morrow, would be taken up immediately.
1924. That is from Dubbo to Gilgandra? Yes. There are buyers here from South Australia and other colonies looking for land in that direction now.
1925. It has been stated in evidence that the country between the Talbragar Creek and the Coolbaggie Creek is unfit for agriculture; you would say that that was a mistake? Certainly. There are hundreds of acres under cultivation, some of the prettiest cultivation paddocks you would see in a day's walk in the colony.
1926. Is there much land under wheat in that particular locality? Those I know have cropped in this year. They are clearing a lot of land, and they would have a good deal more only for the dry seasons. The seasons have been so dry, and they had such difficulties in hauling down the timber and clearing the land that it has stopped a good deal of cultivation; but, speaking roughly, I should say that between Dubbo and Gilgandra there are 8,000 or 10,000 acres under cultivation which would be served by a railway from Dubbo to Coonamble. In fact the Berida country lies away to the south-west of the line. It is, I suppose, the finest land in the whole of the country; experts say it is the pride of the north-west. That country would be served by the Dubbo line. It is 50 miles from Dubbo.
1927. *Mr. Shepherd.*] You state that there are from 8,000 to 10,000 acres under cultivation between Dubbo and Gilgandra. What is the average size of the holdings? 640 acres and 2,000 acres in one or two blocks; they are rather large. At the far end towards Gilgandra the holdings are larger than they are close to Dubbo.

1928. They average from 640 acres upwards? I do not think there are any holdings less than 640 acres. It is mostly held in full blocks. E. H. Utley.  
27 June, 1899.
1929. The distance from Dubbo to Gilgandra is 40 miles; at what distance from a railway-station do you consider it will pay to farm? I think within a radius of 15 or 20 miles a man could manage all right.
1930. And yet they are cultivating land 40 miles from a railway-station? Yes; they are cultivating land on the Castlereagh, which is lower down the river. At Curban, which is below Gilgandra, they are growing wheat.
1931. Is there any cultivation between Gilgandra and Coonamble? Yes; all the way along the river more or less.
1932. Does the produce generally go to Dubbo? A lot of it goes to the west. What is not required for local requirements or for western markets—that is, for Walgett and out that way—goes on to Dubbo.
- 1932½. That would be considerably further then? Yes.
1933. Are you acquainted with the country round Walgett? I have been over the country.
1934. What kind of country is it? When you leave Coonamble you still keep along the bank of the Castlereagh; it is very rich grass country all the way. It is all open plains and little sandhills, and budda country. It was always considered first-class pastoral country.
1935. Not so good for agriculture? Not so good between Walgett and Coonamble; it is very rich pastoral country. In going from Coonamble to Walgett you pass through Wingadee and Bullarora holdings, which are considered the best pastoral properties in the Colony.
1936. What is the distance from Dubbo to Narramine? About 25 miles would be the distance for some considerable way from Narramine towards Coonamble.
1937. These two lines run very nearly parallel up to 25 or 30 miles, I should think? Yes.
1938. You say the country is pretty well of a similar character? Yes, practically the two lines are so close to one another that there is no difference in the rainfall, and no difference in the soil; it is practically the same country.
1939. What description of timber is growing there chiefly? There is not much timber. It is not of any value for public works or buildings; it is only pine in the country between the two lines or on either side of the Narramine line.
1940. Will it not be suitable for railway sleepers, or anything of that kind? There is a little to be got, but not much.
1941. So that in the event of a railway being constructed the timber would have to be brought from some other place? Yes, the timber would have to come in from the north.
1942. Are you acquainted with the country from Warren to Coonamble? Yes.
1943. What kind of country is that? That is similar country to the lower Castlereagh. It is considered rich pastoral land.
1944. Is there any cultivation going on there? I think there is a little.
1945. Have you any idea whether it compares with the cultivation on the Dubbo line and the Narramine line? I am sure that the cultivation on either the Narramine line or the Dubbo line is much more extensive than it is on the Warren line.
1946. And it is yielding a better return? Yes; it has a better rainfall.
1947. I think you said that the timber is about the same between Warren and Coonamble as it is on the other routes? The country is less timbered from Warren to Coonamble than it is from Narramine or Dubbo to Coonamble. You are in the more open, plain country.
1948. What is the best timbered country within easy reach of Dubbo? The forest lies due north of here. The sleepers come now 35 or 40 miles to the Railway station at Dubbo. You are in the middle of the forest at Mundooran. Between Murrumbidgee and Mundooran the best timber has been cut away.
1949. How wide would that belt of timber be? Practically, 20 miles wide. In some places it is less than 20 miles, and in others it is wider. If the railway was taken anywhere from near here to Coonamble, it would put the sleepers very close to a lot of it. We should get sleepers and timber in also for probably 25 per cent. less than we do. I am sure of that, because I deal extensively in timber. I supply most of the hardwood which is required for roads and bridges in the west. I know we could supply it much more cheaply, if we had not so far to cart it by team. It would be a very great consideration to us if we could get nearer the timber.
1950. You have to cart the timber all the way from the forest; you are not able to use the railway? We should if we had a railway from Dubbo to Coonamble. We have to cart our timber 40 miles, and special timber 45 miles in some cases.
1951. What is the description of the timber? All ironbark.
1952. You find the ironbark country good for cultivation? Yes; it is heavy country to clear, but it is first-class country for wheat-growing, bar the stony ridges. There are odd ridges which are no good.
1953. What kind of country is it here where ironbark is growing? It is all undulating country; with little bits of ridges, perhaps, stony on top, and you go, perhaps, a mile and a half through alluvial flats. When that is cleared it is rich, black, loamy sand.
1954. Are you acquainted at all with the country on the Mudgee line? I know a good portion of the country.
1955. Have you been along the route of the proposed line? No; I have been out to it. I have seen the survey marks in going through the country.
1956. The country between Mudgee and Gulgong is, I believe, first-rate agricultural country? I have been from Gulgong to Mudgee, and I think it is very good land.
1957. Have you been much beyond Gulgong, towards Coonamble? Yes, I have been out in what they call the Tallewang country and the head of the Talbragar, where the road crosses the Talbragar River.
1958. Is it fairly good agricultural country all the way? Yes, we get into the mountains up there. There are ranges of mountains which intervene; but the land outside the mountains is rich land.
1959. Between Coonamble and Walgett are you acquainted with the country? Yes.
1960. Is that country good for agriculture? Portion of it would be.
1961. Is it pretty well timbered? No; there is no timber for any commercial purpose there, only the ordinary stunted timber. It is open pastoral country, not thick scrub.
1962. Suppose you were not interested in any portion of the district, which line do you consider it would be to the advantage of the country, generally, to construct? I would say a line from Dubbo to Coonamble, and from Coonamble on to Walgett at once.

- E. H. Utley. 1963. You really think that a line by that route would serve the country best? I think a railway pushed right to the Queensland border would serve the country, and pay a handsome profit right from the start. I consider the country is kept back from the want of a railway.
- 27 June, 1899. 1964. *Mr. Watson.*] You would not get much traffic while the export duty on wool continues to be levied in Queensland? No; I think Mr. Eddy's idea was to push the railway on to the border.
1965. *Mr. Shepherd.*] Do you think that opening that line from Mudgee to Coonamble in a few years' time may, possibly, be of greater advantage to the country than opening a line from Dubbo to Coonamble? I think the greatest advantage to the country would be to construct this line at once, and also the Mudgee line, because both lines will open up great tracts of valuable country. It would allow settlers to get their stuff to market.
1966. It is your opinion that the Dubbo-Coonamble line would be the best line to open at once? I do; I think it is the most urgent line at the present moment.
1967. You think it would bring in the largest return, and open up the largest area of country? Yes. It is evident that the Government has foreseen that a line would be constructed some day from Dubbo to Coonamble, because you may notice a tremendous area of railway reserve along the route.
1968. *Mr. Watson.*] Have you been between Dubbo and Mungahraabie? Yes.
1969. And you know the country from Mungahraabie on to Coonamble? Yes.
1970. A suggestion has been made to the Committee that instead of going direct from Dubbo to Coonamble, the line might go from Dubbo *via* Mungahraabie to Coonamble, with a view of subsequently making the Dubbo-Mungahraabie section a portion of a more extensive line towards Werris Creek. Do you think that is a practicable proposal? I do not; I think that taking the railway round by Mungahraabie is getting away from the settlement and the people who would be served most by the railway from Dubbo to Coonamble; it is practically going from Dubbo in a direct line to Mungahraabie. After you leave the Talbragar Creek, about 12 miles hence, you are practically in the thick forest where there is no settlement at all.
1971. You say that from the Talbragar to Mungahraabie there is no settlement? Very little.
1972. Any good land? It is not bad land; it is fair land, but it is very thickly timbered. I know it is the opinion of a certain citizen in Dubbo—of course his ideas are very peculiar in railway matters—that a line should be constructed from Werris Creek to Dubbo, and that we should construct the first section of that line to Mungahraabie, in making the Dubbo-Coonamble line. I think that is in the clouds. If the matter is gone into very carefully, I question whether a line from Werris Creek to Gilgandra would not be the most productive. I am certain that it would go through the richest country.
1973. A suggestion has also been made to the Committee that, instead of going to Dubbo with the Werris Creek line direct, they should junction with the Dubbo-Coonamble line at Gilgandra? Yes.
1974. You have an idea that it would go through better country, by the route, than it would if brought further south? Yes, you get out into very good country there.
1975. You think the Werris Creek-Dubbo section, if made at all, should be made more to the north-west? Yes.
1976. You stated that in the present season some produce had gone from Dubbo *via* Sydney to Narrabri? Yes; I think pretty well 1,500 tons had gone round to Narrabri.
1977. If it would pay to send produce from Dubbo to Narrabri *via* Sydney, you think there ought to be a fair opening for produce from Dubbo to the same place by a direct line between Dubbo and Werris Creek? Yes, at times there would be. They were suffering a drought up at Narrabri, and we had stuff here to send there. At times they would be supplying us.
1978. Have you been across any of the country between Gilgandra and Gunnedah? No; I have not been out that far. I know that on the western slopes of the Warrumbungle Mountains it is all rich land, because the Calga and Tundaburine runs go out that way.
1979. But in any case you think that if a line from Coonamble to Dubbo were constructed it would not be out of harmony with a general scheme to connect the Western and Northern railway systems? No; I think the most direct and cheap way is to go from Dubbo to Coonamble.
1980. *Chairman.*] Is there any other information which you would like to give the Committee? No.

William England Morgan, editor, *Dubbo Dispatch*, Dubbo, sworn, and examined:—

- W. E. Morgan. 1981. What are you? I am editor of the *Dubbo Dispatch*. I have been in this district for thirty-three years.
- 27 June, 1899. 1982. You made a statement to a former Committee on the question of railway extension to Coonamble? Yes.
1983. Will you be good enough to make a statement in reference to the present proposal? I do not know whether it is any good dealing with the matter from the ancient history standpoint, but I think for the purposes of this inquiry it would be just as well to understand the history of the agitation for this railway. In 1879 or 1880, when Mr. Watson was Treasurer, and Mr. Lackey was Minister for Works, a proposal was made by Mr. Lackey to build a railway from Dubbo to Coonamble. Mr. Watson introduced a Loan Bill providing for the construction of the line, but there was some little political rumpus which caused the Parkes Government to retire, and the matter rested in that way until 1884. In that year Mr. Wright, Minister for Works, in the Stuart Government, brought forward a very extensive railway policy in which he included a line from Mudgee to Coonamble, and the Legislative Assembly defeated that proposal by fifty-seven votes to thirteen. Then Mr. Lyne became Minister for Works. In 1886 there was a great deal of agitation in both the northern districts and the western districts as to railway communication. The northern districts required railway communication with Walgett. Mr. Wright, I may mention, proposed a line, not to Coonamble, but to Walgett, Coonamble being a touching point on the way to Walgett, and it was defeated. There was a great deal of agitation in the northern and western districts at the time, and Mr. Lyne, in response to that agitation, and in carrying out the policy of his predecessor, Mr. Lackey, made a proposal which, I think, was announced in the Governor's Speech previous to that little squabble between Dibbs and Jennings which caused the scattering of the host. Mr. Lyne proposed a line from Dubbo to Coonamble, and a line from Narrabri to Walgett. That was considered a very fair settlement of the difficulty on both sides, and I have no doubt that if Mr. Lyne had remained in office, and this political disturbance had not occurred, the scheme would have been accepted.

accepted by the people and adopted by the Assembly. The matter then remained in *statu quo* until 1890 when Mr. Bruce Smith was Minister for Works. A gentleman named Jones, connected with the Roads Department, was sent by Mr. Bruce Smith on a roving commission, and he prepared a report which I suppose the Committee have had before them. It is unnecessary for me to say anything further than that he proposed to get rid of the difficulty as to rival routes—by first building a line from Dubbo to Werris Creek, and at a particular junction near Cobbora, or its neighbourhood, a line would branch to Coonamble. He then proposed a line from Mudgee to this junction, and then there would be a common line from Mudgee and Dubbo to Walgett, *via* Coonamble. But the Bank failures, and other things occurred. The next thing we heard of the matter was a proposal to run a railway from Warren to Coonamble, and the Committee know how that proposal has been dealt with; and now we have reached, I suppose, the final stage. That is the history of the agitation. In 1879 or 1878 Mr. Lackey was asked by the Coonamble residents and the Dubbo residents to build a road. The traffic was increasing largely, and the roads were perfectly untravellable, and he was asked to spend some money on the road between Dubbo and Coonamble. He said, "Gentlemen, I think it would be a very great waste of money if I did so. To make a road of any value would require an expenditure of over £1,000, or £1,500 a mile, because for a considerable portion of the distance you have to take the metal to the road. I think the cheapest plan would be to build a railway." The argument which held good then I think holds good to-day. Only a portion of this road, as you will see in your travels, has been formed; a large portion of the road remains to be formed. With our more economical mode of building railways, it would be far better to put down a railway than to make a road. A railway will eventually return something, even if at first it is on the wrong side of the ledger; but a road is a continuous source of expenditure, and returns nothing to the revenue.

W. E.  
Morgan.  
27 June, 1899.

1984. Having related the history of the agitation for railway communication, will you now say all you can say in favour of the route which the projected line will take? Although certain officers of the Department, who evidently do not know their own minds, or if they know, manage to conceal the knowledge with remarkable facility; although they have reported favourably on every line put before them, yet, at the same time, one or two of them seem to think that this Dubbo line has a double-dose of original sin, and should be cast out altogether. Their objection is that the stretch of country between Dubbo and Gilgandra is unfertile and unproductive; that it will not maintain any population, and that in order to reach the plains you will have to go through what they call 40 miles of bad country. When you make an examination of the route, as I suppose you will do, you will find that a good deal of what is said by them is not at all reliable; that they are simply going on the old traditions of thirty or forty years ago, when a road with the hardest and the best bottom was picked out by the old carriers to carry their waggons, and the good country was left on either side. In going between Dubbo and Gilgandra to-morrow, you will find that, although where the mail track runs, things do not look at all very pleasing, yet at the same time, on either side of the road, there is a magnificent lot of good country; in fact, what we used to call bad country thirty or forty years ago is now rushed at Mr. Carruthers' consultations, with the chance of 100 to 1 that the man who does want a bit of land does not get it, and that the man who does not want it gets it. The whole of the country between Dubbo and Gilgandra is gradually becoming settled. Out about the Coolbaggie district, which is about 16 or 17 miles from Dubbo, there is a very large settlement; a number of men from South Australia, Victoria, and other places have gone there. From Coolbaggie a road runs from the Marthaguy Creek straight towards Collie. By that road comes in the greater part of the traffic along the Marthaguy Creek; it comes in to Dubbo in preference to going to Warren. From Dubbo to Coolbaggie with the exception of one little plot of ground the land is very rich on either side of the road. At Balladoran, further on from Coolbaggie, there is a good deal of settlement, and a number of large "boss cockies" are gathered about there. As you go from there north-west towards Gilgandra and Coonamble the holdings become larger, for the very simple reason that where grazing has to be followed it requires a much larger acreage than where farming simply has to be depended upon.

1985. *Mr. Watson.*] At Coolbaggie and Balladoran do they go in for agriculture? They are going in for agriculture. Mr. Brown, of Branston, and several other settlers have cleared a lot of ground, and a gentleman from South Australia, named Wheaton, has cleared a lot of ground. All these gentlemen who come here and purchase land along that country intend to go in for mixed farming, that is for sheep and grain growing. From there to Gilgandra there is not much agriculture, but that simply arises from the fact that the opportunities have not been afforded in the shape of improved means of transit. If improved means of transit were provided there is no doubt that the ground would be cultivated; they depend more on wool-growing than wheat-growing.

1986. It is too far from the railway to grow wheat for export? I should say so. I do not think a farmer can grow wheat 50 miles from a railway and cart it to the station, especially as prices are.

1987. If they get famine prices for their wheat they may be able to do it? They may do it with the aid of bonuses or bounties, otherwise I do not think they will. I will not use the word "protection." As correcting what seems to be either a wilful error or a sort of crassness which cannot certainly be accounted for in reading some of the evidence given before the Committee a few weeks since by officials, I may point out that a great deal that has been said with regard to a line from Mudgee to Coonamble, run along from Gulgong to Mudooran and thence to Coonamble as a drag-net for traffic, would apply with equal force to a line from Dubbo to Coonamble, as you will see. They speak of the traffic to be got from Mudooran, Coonabarabran, and the Warrumbungle Mountains. First and foremost with regard to Coonabarabran. It is admitted that Coonabarabran has no sympathy at all with the Western line: its sympathy runs with the Northern line, and its people have done their business with the Northern line for years—with Gunnedah or Quirindi, and the Mudgee railway will not take the traffic from Coonabarabran. Notwithstanding that there may be a slight difference in distance to Mudgee, the Coonabarabran people will not go to the Mudgee line while they have Gunnedah so close to them. They are not going to disrupt all their commercial relations for the sake of saving a few miles haulage.

1988. *Mr. Watson.*] *Via* Quirindi they would be much closer to a port? Yes, and they would have less railway mileage to travel, and cheaper freight *via* Morpeth and the Northern line.

1989. You do not anticipate that any traffic would be dragged from about Coonabarabran by the construction of a line from Mudgee to Coonamble? No. At the present time all this Warrumbungle country sends in its stuff to Gilgandra, and it goes up to Dubbo—I mean the country which lies to the south-west of the Warrumbungle Mountains.

1990. Is there a bridge across the Castlereagh at Gilgandra? Yes. All that traffic would be quite as close

W. E.  
Morgan.  
27 June, 1899.

to the Dubbo railway line at Gilgandra as it would be to a railway line from Mudgee, and that railway line would do quite as much to bring that particular traffic as would any line from Mudgee to Coonamble.

1991. The first proposal, as you may see from a glance at the county map, was to keep more westerly, with the line following the old railway reserve; but the present proposal is to go much nearer to the western bank of the Castlereagh—first with the view of avoiding the low-lying country and the necessity of crossing creeks as far as possible; and, secondly, with the view of getting so close to the Castlereagh that it would be possible for the people on the eastern side of that river to take advantage of the railway;—do you think that deviation is justified from those standpoints? That is a matter of perfect indifference, because a few miles one way or the other makes no difference to people who have a railway.

1992. It involves going into private lands as against Crown lands; and if it makes no difference, it may be preferable to follow the Crown lands? None of these lands are worth much more than £1 5s. an acre. There would not be much difference in the cost of resumptions. There is really no appreciable difference. Whatever local difference may exist among the residents, for the general purposes of a railway, there is no difference whatever route it goes.

1993. Do you think it is preferable to get as near the Castlereagh as possible? I think it is always wise to keep near the rivers, because in this country for many years the course of settlement has followed the rivers. If you want your railway to pay, if you can make your railway convenient to the public without at all increasing the cost of it, I think the convenience to the public should be considered.

1994. You know that it has been in the minds of the officials for a good while that Walgett should be reached by railway; supposing the line to Coonamble to be constructed from Dubbo, what way would you suggest to reach Walgett? I think the natural course to reach Walgett will be from Narrabri. I do not say that, just for the purpose of policy, the railways of the country should be built to drag traffic to any particular city. The natural port should get its chances as well as the large city.

1995. You think that Newcastle is the natural port for that country? You have only to look at the map to see that it is the natural port for that country. The whole of this Walgett country has been settled by Maitland people. The original settlers at Wee Waa, Pilliga, and the Barwon, as far as Brewarrina, Bree, Narran, and Culgoa, came from the valley of the Hunter River. When I first came to Dubbo, David Cohen and Co. were doing business down as far as the Marshes on the Macquarie. Newcastle, when I came here, was almost the port of Dubbo. They simply went from Dubbo to Cobborah, from Cobborah to Cassilis, and thence on to Muswellbrook. Dubbo should never have been on the Western line.

1996. From your evidence, I gather that you think there is plenty of room, from the point of view of gathering traffic, for a railway to Coonamble and a railway from Narrabri to Walgett? I do.

1997. The intervening country is sufficiently productive to make Coonamble a depôt even if the Walgett traffic does not go that way? Yes. There is some talk of a coal-mine between Dubbo and the Talbragar, and a sort of mineral water. Suppose you build that railway from Dubbo to Mundooran—granting that it is the most favourable railway in the country to build—see the large tract of country it would leave unprovided for.

1998. Do you think that with a line from Dubbo to Coonamble, and a line from Narrabri to Walgett, there will be sufficient production on the land round Coonamble to make that place a depôt independent of the Walgett traffic? Certainly. You have no idea of the fertility for grazing purposes of the country to the west of the Castlereagh; and to the east of the Castlereagh it would bring a lot of traffic within the sphere of its influence.

1999. Do you think there is a probability of a line from Dubbo to Coonamble becoming payable shortly after its construction? Taking for the basis of my opinion the figures of the Railway Department, in which it is stated that the line from Warren to Coonamble will pay from the commencement, I am positive that the line from Dubbo will also pay from the commencement; because if 63 miles along a sparsely populated country will pay—and no matter how cheaply you build the railway, I do not think it will be built a bit more cheaply per mile than the Dubbo line—if a line of that character will pay, where there is little or no farming and very little population, however good the country may be, certainly the line from Dubbo to Coonamble will pay from its inception.

2000. The Railway Commissioners anticipate a loss of about £1,500 per annum to begin with? I have nothing to do with their anticipations. I do not think they will be found to be realised.

2001. You think the line will pay better than that? I do. I simply use the common-sense argument. Take their own figures and their own opinions: if 63½ miles of railway construction along what may be called, as far as population is concerned, a barren country, will pay from the inception, 93 miles of railway construction along a country fairly well populated, and in an old-settled district, will also pay in the same way; because, as I understand it, this line is to be built on the pioneer principle of £2,300 per mile. Of course, if the line remains at Coonamble, it will be for the future to say what feeders, or anything else, may go out. I think it will be very many years before it will be required—that is, supposing the Committee or the Government do not go on with the line to Walgett, which I think will be very inadvisable. I think Walgett should be connected with Narrabri. It will be for the future to see that.

2002. *Chairman.*] Where does the produce from Cobborah go now? It goes principally to Gulgong. That is a matter entirely regulated by the price. Mr. Young, a storekeeper at Gulgong, generally gives 2d. a bushel more than is given in Dubbo. There is no sentiment in farming.

2003. Where does the produce from Mundooran go? I think there is very little produce to go anywhere. I do not think farming has reached any point there.

2004. Where does the produce from Gilgandra go? It all comes to Dubbo. With regard to Mundooran, I think it is as well the Committee should be told that the desire of the Mundooran people for years has been to open up communication with Dubbo. There is a shorter road from Mundooran to Dubbo, they point out, which could be opened if the Works Department would do so. For years they have been endeavouring to get this road opened; they have sent various petitions to the Government, and written to the Municipal Council to assist them in the matter. Most of the people on the western slopes of the Warrumbungles—that is, east of the Castlereagh, such as about Calga, Goorianawa, and the various stations—have for years changed their postal routes. They get all their letters and mail parcels by Gilgandra.

William Ernest Binning, Road Superintendent, Dubbo, sworn, and examined:—

W. E.  
Binning.  
27 June, 1899.

2005. *Chairman.*] You are Road Superintendent, stationed at Dubbo? Yes. I have been in charge of the roads of this district for two years and eight months.

2006. I suppose you have travelled all the roads in your district a few times? All the classified roads, but not the short tracks across country. 2007.

W. E.  
Binning.

27 June, 1899.

2007. You have had good opportunities to observe the character of the land through the whole of this district? A fair opportunity.
2008. Is it fair country for road-making in that part of the district which will be served by the line from Dubbo to Coonamble, taking in the country from Dubbo to Gilgandra? It is not.
2009. That road is not good road-making country? It is expensive road-making country. About half of it is very heavy, black-soil country.
2010. Land that is fit for cultivation is not very good for road-making? No; it is so heavy that it would require, say, from 2 yards to a yard of metal where an ironbark ridge or sandy country would only take a yard.
2011. Have you seen any of this country ploughed up? Yes.
2012. Does it grow good crops? Yes. The agricultural land is of splendid quality.
2013. Would you describe the country generally between Dubbo and Gilgandra as being good agricultural country—that is, from fair to good? No; not right through—about half of it is. On the line of road it is not. For the first 10 miles on the road it is very good, but for the next 20 miles it is not very good.
2014. East and west of the road, what is the country like? West of the road it is very good, but east of the road you get into the ironbark country.
2015. Has any cultivation been attempted in the ironbark country to your knowledge? Very little. The only agriculture worth talking about between Dubbo and Gilgandra is on the Talbragar.
2016. For 30 miles along the road you have described the country;—from that point, how would you describe that country? You come into good land again; from Balladoran you come into good land all round there.
2017. And that carries you right on to Gilgandra? Yes, for another 12 miles.
2018. You have a classified road from Gilgandra going west, between the Marthaguy and the Boothaguy or Calf-pen Creek? There is a classified road, but it is in the Coonamble road district.
2019. Have you been along that road? I have been as far as Berida, 18 miles along that road.
2020. How would you describe the country along the road to that point? It is splendid country. Berida is one of the best stations; it is the biggest place on the road.
2021. Going east from Gilgandra, you have a road to Mundooran and on to Cobborah? Yes.
2022. How would you describe the country about that district for, say, 20 miles out from Gilgandra? That is all good country; you are on the Castlereagh all the way. It is all splendid country.
2023. Until you approach Mundooran? Right into Mundooran it is all good country, but from there into Cobborah it is not such good country.
2024. Do you know anything of the road from Mundooran to Coonamble on the east side of the Castlereagh? I have not been to Mundooran; I have been to Gilgandra. There is some high land between Cobborah and Mundooran.
2025. After we get past Gilgandra we are out of your district? Yes.
2026. Have you been along the road from Gilgandra to Coonamble? Yes.
2027. It follows the river bank? Yes, practically.
2028. You have a road on both sides? Yes.
2029. Have you noticed any difference in the land on the other side of the Castlereagh? I have only travelled on one side of the river, and mostly at night-time.
2030. Would it be a difficult river to bridge? No; it is a very big river, and it would take a very big bridge.
2031. What would it cost to cross the river? The road bridge at Gilgandra must have cost over £10,000, and a railway bridge would cost about £20,000, I should think. The Gilgandra bridge is the largest timber bridge in the district.
2032. I am speaking of a bridge to bring the produce across the river? A wooden traffic bridge with approaches would cost about £10,000.
2033. Do you know of any other bridge across the Castlereagh? Yes, at Mundooran, and at Coonamble.
2034. Are there any good crossings on the Castlereagh? Very good.
2035. So that produce grown on the east side of the Castlereagh could be brought over to the railway without erecting expensive bridges? Yes, excepting, of course, at flood-time.
2036. It would not necessitate the construction of expensive bridges to enable the farmers to get their produce on to a railway line from Dubbo to Coonamble? No; it is a sandy bed, but still they can get across. There are a lot of good crossings on the Castlereagh, and the banks are not high.
2037. No matter on which side of the Castlereagh the line is constructed the farmers can get reasonably good crossings? Yes.
2038. How far is Dubbo from Cobborah? Forty-seven miles.
2039. And how far is Mundooran? It is 22 miles from Cobborah.
2040. How far would they be from the Narramine route? They would be altogether outside the sphere of its influence; they would go to Mudgee; they would never think of going to Narramine.
2041. So that a line from Narramine to Coonamble would not help those people at all? Not in the slightest way.
2042. *Mr. Shepherd.*] What are the chief products reaching Dubbo from the line from Dubbo to Coonamble? Wool and ironbark timber.
2043. Have you any idea what quantity of wool comes in? No; I am quite certain that that road brings more traffic into Dubbo than all the other roads put together.
2044. Is there no grain? Not a great deal.
2045. How much land do you suppose is under cultivation for, say, 15 miles on each side of the line from Dubbo to Coonamble? I could not attempt to answer the question.
2046. You have been over the line? I have been along the road and in and out here and there, but I could not tell you the acreage.
2047. Have you been along that marked line from Narramine? No; I have not been along any of the railway routes. I have only been along the roads as travelled.
2048. Are you aware whether the area under cultivation has increased to any extent? It is increasing very rapidly, year by year.
2049. Is any crop, beyond wheat, cultivated to any extent? Nothing beyond wheat.
2050. And the product per acre, I suppose, is pretty satisfactory? It is.
2051. Do you know the average yield? No; it is 15 bushels, I think.
2052. *Chairman.*] You are able to judge whether the district is advancing, by reason of the increased demands

- W. E. Binning.  
27 June, 1899.
- demands for money for road-making? Yes. Cultivation is increasing very rapidly, not only in this district, but all round, everywhere. There has been a wonderful increase during the last few years.
2053. That would be your justification for increasing the road votes? Yes.
2054. And the increase in cultivation has necessitated the Department making special grants? Yes; it is pretty well all necessitated through the increased cultivation, as so much land has been thrown open lately.
2055. The Works Department have had to make special grants in order to provide for the traffic of the settlement which has lately taken place? Yes.

George Henry Taylor, Returning Officer, Dubbo, sworn, and examined:—

- G. H. Taylor.  
27 June, 1899.
2056. *Chairman.*] You are Returning Officer for the Electoral District of Dubbo? Yes; and for many years I was returning officer for the Bogan electorate.
2057. How long have you been in the district? I have been in Dubbo thirty-six years, and I have been in the district for considerably over forty years.
2058. Will you state the number of electors on the roll? There are 2,454 electors on the roll. There is a revision to take place shortly, and there are nearly 300 names waiting to be enrolled.
2059. Does that show an increase of a settled character? Yes; considerably so. At the referendum on the 3rd June, 1898, 1,062 votes were recorded, and at the last referendum 1,519 votes were recorded, making an increase of 457 votes.
2060. That would show an increased interest in the Federation question rather than an increased population? An increased population as well. There was great interest taken in the previous referendum.
2061. Have you any idea of the increase during the last five years? It has been considerable. Five years ago it was part of the Bogan electorate.
2062. What has been the increase? The increase has been something considerable, especially in this district. There is a very large population getting round this district, and you can tell that by the attendance at each meeting.
2063. *Mr. Watson.*] There is not a great deal of country along the route of the proposed line which is within the borders of the Dubbo electorate; the electorate only goes 8 or 9 miles along the route of the proposed railway? Yes.
2064. So that the greater portion of the population it would serve would be included in the Coonamble electorate? In the Coonamble and Wellington electorates, I think.
2065. *Chairman.*] Is Gilgandra in the Dubbo electorate? No.
2066. How far north of Dubbo does the electorate extend? The last polling-booths are 25 miles north. Coolbaggie is the last polling-place in that direction.
2067. In that portion of the district which is in the Dubbo electorate, has the increase been in any way marked? Yes; there is a larger population all round Dubbo.
2068. And an increase in the cultivation? Yes.
2069. I suppose your knowledge of the country is not limited by the boundaries of the electorate? No; I have been a resident of Dubbo for thirty-six years, and, previously, I was on the Merri Merri for six years. It was my duty, as manager of a station, to know the country between from Merri Merri to Coonamble, and across to Warren, and also to Mudgee. I know the Mudgee line. Quambone, the station I was on, was the largest cattle-station in the district, and the owner was a very large cattle-buyer. He bought all the cattle which came into the yards from different owners. He used to send 1,000 head to market, and I used to take them principally to Mudgee.
2070. From an agricultural standpoint, how would you describe the country on the line from Mudgee to Coonamble? From Mudgee to Gulgong it is fairly good country; from Gulgong to Mundooran it is very bad; and from Mundooran on it is pretty good, but not close to Mundooran. After you get down towards Gilgandra it is pretty good country.
2071. Will you now describe the country on the Dubbo-Coonamble line in sections;—from Dubbo, 20 miles out, what is it like? For 9 or 10 miles it is very good agricultural land—all farms. For the next 20 miles it is principally ironbark country along the road; but off the road it is very good land. It has been taken up and opened up considerably.
2072. That would be west of the proposed line? On the west we get into ironbark country along the road, but some distance off there is some very good box country which would make very good agricultural country.
2073. Have you seen any of that ironbark country cultivated? Yes.
2074. From a point at 30 miles from Dubbo to Gilgandra, what is the character of the country? I have not been that road lately. Mr. Brown, of Branston, and others, have very large farms.
2075. How would that country compare, generally, with the country from Mudgee? I think it is far better country, because the country on the other route is mountainous and not fit for a bandicoot.
2076. From Gilgandra on to Coonamble, is the country much the same on both lines? Exactly the same.
2077. From Narramine to Coonamble, how would you describe the country? It is good land, but very swampy.
2078. Is there much cultivation on that line? I believe there is. I have not been down there lately. I know there is a great deal of cultivation about Narramine. I have been to Narramine, but not out further.
2079. You think that the settlement has been increasing, and is of a permanent character? I have no doubt of it.
2080. In your position, you are able to give a decided opinion on that point? There is no doubt about that.
2081. Before a former Committee you said, with reference to the Mudgee-Coonamble line, that you did not think the Government would go to the expense of building 50 miles of railway over mountainous country at a cost of £500,000;—is it very mountainous country from Mudgee? All along the Goodiman Ranges. The Cudgegong River would have to be crossed; it is not so large a river as the Macquarie, but it is very rapid in flood time.
2082. Of the three routes to Coonamble, you decidedly favour the route from Dubbo? I do not think there is any comparison between the two in the interests of the public at large.
2083. You say that from a thorough knowledge of the three routes? Yes, from a forty years' knowledge.
2084. Does the principal portion of the traffic find its way to Mudgee now; I think a little disturbance diverted traffic from Dubbo? I believe it did; I believe wool was taken.
2085. Do you know whether that traffic has found its way back to Dubbo? Mr. Tobin told me that he sent all his wool to Dubbo, and Mr. Jones is strongly in favour of the Dubbo route.
2086. Does the traffic from the Marthaguy find its way to Dubbo? Yes.
- 2087.

2087. In preference to Narramine? Yes.
2088. They strike a better road, I suppose? Yes.
2089. *Mr. Shepherd.*] You say that on the line from Narramine to Coonamble, a good deal of the country is swampy? Yes, in wet weather.
2090. What extent of that country is swampy? A good deal of it; I cannot say exactly what extent. It is very low, flat country.
2091. For the whole distance? No.
2092. Does that extend on either side of the line to any great extent? In the low, flat country.
2093. A portion of it is good agricultural land? Yes.
2094. In the evidence which you gave in 1898 you stated that some of the country was regarded as quite unfit for agriculture at one time, and that ultimately it turned out to be excellent agricultural country? Yes; forty years ago they told me it was impossible to grow wheat or garden stuff on the Merri Merri, but now you will see the finest gardens there.
2095. You also stated that the country between Warren and Coonamble could not be beaten for pastoral purposes, but that it was unfit for agriculture? Yes.
2096. Has any change taken place in your opinion since that time? No; there is no agricultural land except patches here and there. For pastoral country it cannot be beaten.
2097. What is the character of the country? Salt-bush, open myall country, and monkey sand ridges.
2098. As a rule most good pastoral country is good for agriculture also? I do not think myall country is.
2099. I suppose the chief traffic on the Dubbo line, which you seem to prefer, is in wool, timber, and grain? Yes.
2100. Have you any idea what quantity of wool is produced there? No.
2101. Is the timber exhausted, or is there still a large quantity of it? There is still a large quantity, only they have to go out further for it; it will last for years. Some years ago there was some talk of laying down a tramway at a cost of £20,000 into the forest.
2102. It would be all fit for railway purposes? Yes.
2103. Is the country pretty well watered? Yes.
2104. It has not been found necessary to remove stock from this district? Not for water.
2105. The district has almost grown up under your observation? Yes, for fifty years.
2106. And there has been a general advance all along the line? Yes. When I came to Dubbo first there were only one public-house and one store.

G. H. Taylor.

27 June, 1899.

Charles Cadell, stock and station agent, Dubbo, sworn, and examined:—

2107. *Chairman.*] What are you? I am a stock and station agent, carrying on business in Dubbo. I have been here nine years.
2108. Have you a thorough knowledge of the district? I have.
2109. Have you any knowledge of what traffic comes into Dubbo? Yes, of the stock and produce traffic.
2110. Is there much passenger traffic finding its way to Dubbo from districts north or north-west? Yes; a great deal of passenger traffic.
2111. Where does it come from principally? All along the Castlereagh, Gilgandra, and in to the right of the road to Coolbaggie country.
2112. Does the Coonamble traffic come here now? Yes.
2113. It still comes here, notwithstanding the shorter distance to Warren? Three coaches a week in and out come here.
2114. Are they fairly well patronised? Always loaded.
2115. So that there is a considerable passenger traffic? A considerable traffic, I should say. Lots of people come in their own conveyances. I am only speaking of public conveyances.
2116. I suppose they would use a railway if constructed? I have no doubt about it.
2117. Where does the stock traffic find its way? To Dubbo. I think Dubbo is one of the biggest centres of stock loading both for Flemington and to Victorian markets. A lot come in from the Coonamble district to Dubbo.
2118. Now, taking the country west of Coonamble, where does the traffic find its way? To Dubbo principally.
2119. Not to Nevertire or Nyngan? No; it comes this way.
2120. Between Coonamble and Walgett, north and west of Coonamble, the trend of the traffic is to Dubbo? Some goes Mudgee way, but that is more when the water is scarce. They follow the Castlereagh up towards Cobborah.
2121. Has the feed been better for a year or two on the eastern side of the Castlereagh than on the western side? We have had pretty severe seasons. I should think it has been pretty well the same. It may have been a little better under the mountains, which seem to attract the rain.
2122. Supposing there were more traffic this last year from Coonamble to Mudgee, the slightly better rainfall to the east of the Castlereagh, and consequently the better feed, would account for it? Yes.
2123. Do you think the pastoralists would use the railway from Coonamble to Dubbo, rather than the road, for stores as well as fats? I am speaking more of fats. As to stores, it would be too much expense to rail them.
2124. They have been railing starving stock at starving stock rates? A terrible lot from Wingadee, which is 25 miles north of Coonamble. I think Tobin & Sons have had about 70,000 sheep for agistment in this district and the Cobborah district.
2125. All the traffic, at any rate from as far north as that, would find its way to Dubbo? It would, to Walgett; it is so far to come in here. A lot of Queensland cattle are railed here, which come in across the Border. It is a good open road where they go, they having the watercourse to Gilgandra—the stock generally hug a watercourse; but for 40 miles from Gilgandra in, there is no big watercourse.
2126. If a railway is constructed, the fats would be shipped on the train? There is no doubt about that.
2127. You have found that that is the practice? Yes.
2128. As far as stores are concerned, they would rather travel them? Yes, the way prices have been till lately. I think after this dry weather there will be better prices; but as prices have been so low, and the railway rates so high, they could travel the stores much more cheaply.
2129. Is there any other information which you would like to give? No, except with reference to the produce. A lot of chaff grown in this district has been sent right round to Narrabri, and up to Moree. Chaff has also been sent from here to Jerilderie and Deniliquin, and down that way.

C. Cadell.

27 June, 1899.

- C. Cadell.  
27 June, 1899.
2130. We have had a statement made to the Committee that the country to be served by the proposed line is fairly good agricultural land? I can endorse that statement. There is a little bit of forest just out of Dubbo, but it is good for timber.
2131. That occurs on the route of every railway line? Yes; it is all good pastoral and agricultural land.
2132. Comparing this line with other railway lines you have been on, how does it stand? It is just as good, as far as I can see. It is all good country from Gilgandra to Coonamble; it is first-class pastoral country.
2133. *Mr. Watson.*] Do you think, if a line is constructed, there will be a market for fodder and other produce from here out north and west of Coonamble? Certainly. There is more traffic on this road to Coonamble than there is on all the other roads put together, as you will see if you go along the road. You can go along the road and see four or five teams with chaff alone going out to Coonamble. They are having a very severe season in that district just now. It has been very heavy for produce, and they wanted a lot out there.
2134. I suppose there is always a demand for some produce? Always; in fact, Mr. Tobin, of Wingadee (one of the largest landholders out there), wants 50 tons of lucerne hay, and we cannot procure it at present, because there is not much lucerne grown in this district. I had a wire from him yesterday to send 50 tons of lucerne hay.
2135. *Chairman.*] These have been exceptionally dry seasons;—they do not buy feed in decent seasons? No. They have had two bad years in the Coonamble district.
2136. Knowing what has been done on other railways, are you of opinion that if this railway is constructed there will be sufficient traffic to pay expenses? I think it will be a good paying line.
2137. If other lines pay, you think this line will pay? Certainly.
2138. *Mr. Shepherd.*] Do you say that there is a great deal of lucerne grown here? No; I say that there is a big demand for lucerne. The river flats are not under lucerne yet, except in very small areas.
2139. Is any lucerne grown here at all? Yes.
2140. In which direction? It is generally grown on the flats. They have never got off the flats yet. It is grown in small patches by farmers.
2141. Is the chaff which is produced here chiefly wheaten chaff—not oaten chaff? Wheaten chaff.
2142. I think wheat is almost exclusively grown here? Yes; I think the land, so far, is rather too strong for oats.
2143. At what season of the year do you generally have the rain here? Generally between January and May.
2144. Is it generally dry after that? No; I have been here for the last ten years.
2145. Is the rain sufficient to keep the crops growing? I think we have had fair average crops in the district.
2146. Do you consider saltbush a valuable fodder-plant? Yes; it has got such a gruelling that it is nearly all eaten out.
2147. Is there any attempt at conserving it—at paddocking and spelling it? I think not. It is only in odd places you can see myall conserved.
2148. We had some evidence a short time ago to the effect that 1 acre of trefoil is worth 3 acres of saltbush;—do you endorse that opinion? I do not think so. Saltbush only grows in patches here. The country has been so heavily stocked that it is nearly all eaten out.
2149. Is it a dwarf saltbush? It is. There is only an odd old-man saltbush. The saltbush is eaten out completely, for the cattle follow the roots down.

Craven Hyde Fitzhardinge, solicitor, Dubbo, sworn, and examined:—

- C. H. Fitzhardinge.  
27 June, 1899.
2150. *Chairman.*] You are a solicitor, practising in Dubbo? Yes; for the last twenty-seven years.
2151. You have a good knowledge of the district, then? Yes; I have travelled all over the district.
2152. Have you travelled through the district to be served by the Dubbo-Coonamble railway? Yes.
2153. From how many points? From Dubbo to Coonamble, from Warren to Coonamble, from Dubbo down the river to Burroway station, and then to Wonbobbie, and then across to Coonamble.
2154. Have you been on the route of the proposed line from Mudgee to Coonamble? Only as far as Gulgong. Mudgee used to be our circuit town. We used to have our Supreme Court cases tried there, and we went *via* Gulgong twice a year in the early days.
2155. The proposal before the Committee is to start the railway from Dubbo, and to hug the Castlereagh on its west bank;—how do you view the proposal? I think it is an excellent route, and it is a route which should be followed.
2156. Are you decidedly of opinion that that should be the route adopted? From my observations of the district, I have no doubt about it.
2157. Will you give the Committee your reasons for preferring that route to the other routes? It is the most direct route to, I may say now, the federal markets of the Colony. It heads the waters from the engineering standpoint. It runs along a high bank of the Castlereagh, the left bank, which is high, with a good sound bottom. There are no engineering difficulties whatever. The span over the Talbragar will be very easy, and of no account, because the banks are so very high and hard. As to the Narramine route, you would have a very expensive bridge to cross the Macquarie, equal to, I am sure, if not greater than, the Dubbo bridge, which I think cost from £80,000 to £100,000. You then strike rotten country for 10 or 15 miles out, and then you go through similar country to that on the Coonamble route. On the Narramine route there is more grazing country than on the Dubbo route—that is, near Dubbo. On the Dubbo route there is more agricultural country and fruit-growing country. It would be excellent fruit-growing country on the Dubbo route as well as agricultural, for it is higher and sandier, with a clay bottom. Going up the Talbragar—I have not been to Munderooran—I went from Dubbo to Cobborah, and from Cobborah to Merrygoen, and from Merrygoen to Coonabarabran twice. That is good country, but it is very hilly, and I think greater engineering difficulties would be met with than on the other routes. It is good agricultural country and good fruit-growing country.
2158. Have you had any opportunities of knowing whether there is much demand for land about the district to be served by the Dubbo line? There is a great demand. At the recent ballots there have been as many as 240 applicants for one piece of land; in fact, it is a regular consultation. Some men have been waiting two years for land. On the Dubbo route there is a proposal to exchange 22,000 acres of land. I think the Committee ought to direct that land to be cut up in smaller areas than the areas into which they are now cutting up the land. I think the present areas are too large.
2159. About how many acres would maintain a family? I think at the most 640 acres. They are giving them 2,560 acres—immense areas. 2160.

C. H.  
Fitzhardinge.  
27 June, 1899.

2160. Do you know of any small farms which are supporting a family along the Coonamble route? Mr. Bonafurs has 400 acres out near Gilgandra, and he is piling up the dollars by growing and selling chaff. He has been able to buy out two selections with the money he has made out of the chaff he has taken to Coonamble.
2161. Do you know any tenant farmer in the district who has made money by working land on the halves system? That custom is only coming in here. Mr. Mack, of Narramine, has started the system; others are following.
2162. Have the tenant farmers been able to improve their position by agriculture in the district? Decidedly; but directly they improved their position they get land of their own, because land has been so cheap. I refer to these homestead selectors and settlement lessees.
2163. That may be considered as evidence that the population is permanent, and that agriculture is a success in the district? It is a success in the district.
2164. *Mr. Shepherd.*] For about what rent do they generally get decent land? They get 2,560 acres from the Government for about £37.
2165. I mean, what rent do private people get? They get about 5s. an acre.
2166. *Mr. Watson.*] For better land, I suppose? It is improved land, and is fenced in.
2167. Is the Crown land you speak of ringbarked? No; it is in its virgin state. If it is rung they have to pay for it. If there is a tank on it, they have to pay for that.
2168. If it is rung, it is worth more than the actual price of ringing? Yes, if it has been rung for any time.
2169. *Chairman.*] The route of the proposed railway is the main overland route? Yes.
2170. Has the traffic been diverging much of late years? I do not think so; it still comes here.
2171. Some of it used to go down Narramine way? It used to do.
2172. *Mr. Shepherd.*] About how much per acre does it cost to ringbark country? From 9d. to 1s. 6d.; it will cost more for pine scrubs. All the overland stock passes my house, and therefore I have good opportunity for judging the state of the traffic. Immense numbers of Queensland cattle pass my house for Wodonga and Albury.
2173. Is it generally found that a pine dies when it is cut down? Yes; as a rule, it will not shoot again.
2174. *Chairman.*] Have you any other information to give? I would like to say a word about the Mudgee route. From Mudgee to Gulgong it is very rough country that I have been over. I was passing over that country when that unfortunate barrister, Mr. Bellefante, was drowned in one of the creeks. It has been bridged since then.

William England Morgan, editor, *Dubbo Dispatch*, Dubbo, sworn, and further examined:—

2175. *Chairman.*] I understand that you wish to supplement your evidence? This morning when I was giving evidence I forgot to make a request respecting the evidence which Mr. Dayrell, who is absent, gave before the Sectional Committee on the Warren-Coonamble proposal. Mr. Dayrell is the manager of the Co-operative Milling Company at Dubbo, and the whole of his evidence at the previous inquiry is so very good as regards the wheat production of the district to be served by the proposed railway, that I think it would be well if it could be reprinted. I should be pleased if the Committee will allow his evidence to appear as an Appendix to the evidence which they take. [*Vide Appendix.*]
2176. Is there any other evidence which you wish to give? You asked an important question of a previous witness; Mr. Utley, and I, expecting a question to be asked, did not volunteer a statement with regard to a railway from Mudgee and a railway from Dubbo. Apart from the actual local surroundings of the case, a railway from Mudgee to Coonamble would for all purposes be a local railway, because it would leave the Coonamble people, and the people on the route, only one market. There, very frequently, the seasons are so bad that it is absolutely necessary to remove stock to districts where they can get pasture. If the railway only ran from Mudgee to Coonamble, they would be forced to take the Mudgee line; they would have nowhere else to go but Mudgee, which has but a limited portion of country. A line from Dubbo to Coonamble suits not only the Dubbo district, but also the Wellington district, the Orange district, and the Carcoar district. The same thing in regard to their markets. If a farmer in the Coonamble district had produce to sell, or fat stock to send away, he would perforce be confined to either Mudgee or Sydney with the Mudgee line; whereas, if the Dubbo-Coonamble line were constructed, he would have a choice of markets. A farmer, if he could not sell his stuff in Dubbo, would have the southern markets and the western markets from Dubbo towards Bourke at his command. He would have a market at Dubbo, Wellington, Bathurst, Carcoar, Blayney, and Cowra; and if he wanted to send cattle to Melbourne he could send them by the Blayney-Harden line. And as a succouring stock line, it is certainly a national line as compared with the other,—which, if it is examined more closely, apart altogether from the cost of it, will be seen to be only a local line; it will simply serve Sydney and Mudgee.
2177. So that the connection with Mudgee would only be a line to suit a man when he wanted to send his stuff to Sydney or to Mudgee? In a season like the present, when men like Tobin and others have been losing thousands of sheep, and taking hundreds of tons of hay and tons of treacle to keep alive their stock, they would only have a limited market to choose from, whereas here they would have a wide market. I suppose it is hardly worth while for me to touch on the question of the difference in the cost of the two lines.
2178. A line *via* Mudgee will save for all time 37 miles of carriage if they want Sydney for a market? Granted.
2179. Your contention is that Sydney is not their natural market, and that the difference in distance is more than compensated for by the fact that by going to Dubbo he gets an extended market? Yes.
2180. He still has the Sydney market, with the 37 miles extra carriage added, but in addition he has a choice of markets? Yes.
2181. So that that would fully balance whatever little loss there may be for extra haulage? I grant that *via* Mudgee it is nearer to Sydney, if Sydney is to be the alpha and omega of all railway policies. I think something else is to be considered. I think, after all, if the matter is dealt with from the purely commercial standpoint, the carriage on the extra mileage should not be more than the carriage from Mudgee, that is if the Commissioners were to take it in that way, and the increased cost of the line from Mudgee to Coonamble would more than counterbalance any increased freightage between Coonamble, *via* Dubbo, to Sydney.
2182. The railway rates, you contend, from Coonamble to Dubbo, on account of the lesser cost of construction, should be certainly not more than the rates from Coonamble *via* Mudgee and Wallerawang? Yes.

W.E. Morgan.  
27 June, 1899.

W.E. Morgan. Yes. The Commissioners, or Parliament, I think, have already approved of what they call local rates. If people want a railway, and it will not pay at the ordinary rates, they should pay a local rate, to minimise the loss, considering the railway carriage will be considerably less than road carriage.

27 June, 1899.

Alderman Daniel Soane, Member of the Land Board, Dubbo, sworn, and examined:—

- Alderman D. Soane.
- 27 June, 1899.
2183. *Chairman.*] What occupation do you follow? I am not doing anything now, but I am a Member of the Dubbo Land Board.
2184. Are you a landowner? I am a landowner and an Alderman of Dubbo. I have been in this district for about forty-seven years.
2185. You have a thorough knowledge of Dubbo and the surrounding district? Of the whole of the district. In the early days I was a great deal with my uncle, a commissioner of Crown lands, and I have been an appraiser of runs also, and have settled disputed boundaries all over this country.
2186. You consider yourself quite competent to give an opinion as to the value of lands? Yes.
2187. And an opinion as to what they are best suited for? For fourteen years on the Land Board I have had to deal with the rental of land, and everything in connection with Crown lands—leases and otherwise.
2188. There is a considerable amount of Crown land about Gilgandra? Yes.
2189. The country on the other side of Gilgandra is in the Coonamble district? I do not deal with that, but I know the country well.
2190. What rentals do the Crown lands bring? About 3d. an acre, according to the capacity of the land. We have to take into consideration the land between Dubbo and Gilgandra, not for grazing purposes altogether but for agriculture.
2191. Most of the witnesses are agreed that the country north of Gilgandra is good pastoral country? Yes, it is.
2192. But most of the country between Gilgandra and Dubbo is fairly good agricultural country, although some witnesses have said it is not;—will you be good enough to describe the country between Gilgandra and Dubbo? I have a thorough knowledge of that country. There is a deal of scrub on the land.
2193. Taking the country within the sphere of influence of the present line, say, 20 miles on each side what is it like? First of all you go through the Terramungamine holding. It is not always the same kind of land on that holding, but it is fairly free from what you would call barren or rocky country.
2194. Is it good for mixed farming? Yes, it is agricultural country; but a great deal of it is covered with scrub. Where the land has been scrubbed and ringbarked by the lessee, it is greatly improved and is fit for agriculture and also for grazing a great deal. I do not think you can find land more suitable for mixed farming—that is, for agriculture.
2195. If brought within 25 miles of a railway you think it will be improved and put under crop? I have no hesitation in saying that the whole of that country will be taken up. Nearly the whole of the available lands, since I have been a Member of the Land Board, have been taken up between Dubbo and Gilgandra, except odd pieces. As I said before, some of the lands are not quite so good. There are only one or two annual leases between those two points.
2196. It has been stated here that for any land that has been thrown open there has been a considerable rush, and that ballots have taken place for almost every piece;—do you endorse that statement? I do; but I would say more: A great deal more would have been taken up under the third section of the Act, but that no land has been withdrawn from the holdings between Dubbo and Gilgandra. If one-half of the runs had been withdrawn from lease, as has been done in the case of many runs, the whole of the land would have been taken up now.
2197. You anticipate a rush for the land when the leases fall in next year? As soon as it is available every acre of the land will go. It is a kind of land which, strange to say, Victorians seem to like to settle upon. From their experience on the other side—about Mirrool Creek, Narrandera, and about there—they seem to like this country for mixed farming. The scrubs are not bad.
2198. About how much do you think would be a fair area to enable a man to get a living for himself and family? About 1,000 acres, to combine agriculture with grazing. I take it that most of that country would be farmed; that is provided that a railway runs there.
2199. Now, with regard to the country further on, is that all good, sound, agricultural country? There are patches of black soil; but I saw wheat grown on black soil forty years ago in that country.
2200. Is it heavy black soil? It is small plains. That country is patchy, red soil—sandy, red, loamy soil, and little patches of black soil in between, which makes it very suitable for mixed farming. Out below Gilgandra, and round about the Castlereagh, that is the kind of country you see. When you get down about Gulargambone you get into salt-bush country, the hard red plains. You get out of this sandy, loamy country, but it is all good land for agriculture; it simply requires rainfall.
2201. The farmers are doing well on similar country? Very well indeed, even on the other side of the river. At Bungey, on the Marthaguy, 12 miles below Gilgandra, Cheetham grew wheat forty years ago; and on the other side of the river, at Armitree, Jude, who sold out to Richardson, had wheat growing.
2202. Judging from your experience of other railways, you think that if this railway is constructed a big local traffic will be built up? I am positive of it. Speaking of the available country, and the country that will be available by surrender and exchange, I have knowledge that on Terramungamine certain proposals had been made to the Government to surrender a great portion of the best land adjacent to the proposed line. Some 40,000 acres will be available.
2203. That is a matter which will come before the Land Board? The Minister has the power to act, and I believe he will have no objection to this suggested exchange, which will give a frontage to the proposed line for about 30 miles.
2204. Do you think that exchange would be beneficial to the prospects of the railway and to the public interest? Certainly; and I think it would be readily accepted by the Minister. I think, if it were accepted, there would be sufficient land to locate forty or fifty families of farmers between Dubbo and Gilgandra on each side of the railway.
2205. But it is proposed to exchange only 25,000 acres? I should think there would be 40,000 acres on each side of the line in addition to the area proposed to be exchanged. There are about 70,000 acres altogether

altogether on that run. About that particular part there is sufficient land to support fifty families. Following on, at Balladoran the lands are pine scrub, but good soil for agriculture. On each side you would get land the same way. There is a large portion of the leasehold area of Balladoran which has never been interfered with.

Alderman  
D. Soane.

27 June, 1899.

2206. Your experience on the Land Board has led you to this conclusion: that there will be, if the land is thrown open, probably more applicants for land than there is land to go round between here and Gilgandra? Yes; from my knowledge of the present occupants of the land, who took up inferior land. A great deal of inferior land has been taken up there, and it is greatly improved. Land which we would not look at is now called magnificent country.

2207. Do you know anything of the land on the line from Narramine to Coonamble? Yes.

2208. Is the land there much about the same? From Narramine to Coonamble you get more into the black-soil country. If you cross at Narramine you keep the lower road altogether.

2209. Do you know anything of the people on both lines? Yes.

2210. Are they a better class of farmers on the Narramine line than on the other? There is scarcely any farming on the Narramine line; it is only grazing.

2211. If it has been stated in evidence that these men are better farmers, more intelligent farmers, than the others, what do you say? At Narramine itself they are a grand class of farmers.

2212. You think that if the country is thrown open, the right class will take up the land and make the best use of it, and that that will be a sufficient reason for constructing the railway? I do, indeed.

2213. You think the country is there to be developed, and that it would be developed? Certainly it would. As to the Narramine line, on the Burraway and Bundemar, two squattages on the route towards the Castlereagh, there are only one or two selectors farming; nearly the whole of the land is held by the lessees.

2214. These leases will be falling in next year, and if the land is good enough, I suppose it will be taken up? But it is nearly all black soil, which is difficult to cultivate.

2215. The country lying between the Dubbo-Coonamble line and the Narramine-Coonamble line is good agricultural country? It is.

2216. And that country to the west of the Narramine line, by reason of its being heavy black soil, is not so good? Yes.

2217. It is good fattening country, but not good agricultural country? Yes. I managed a station for many years, and I may say that the Bundemar country is some of the very best country in the Central Division for grazing. All red country is the very best and richest for cultivation.

2218. Now, taking the country to the east again of the proposed line from Dubbo to Coonamble, is that similar? It is. It may not be quite so good further out. For 15 miles it is about equal, and then you get into this ironbark forest.

2219. Which extends up to Pilliga? It extends to Mundooran.

2220. We have been told that that belt of ironbark country runs right away north for many miles? A line from Coonamble to Pilliga would go through that magnificent forest.

John Murray, farmer and produce merchant, Dubbo, sworn, and examined:—

2221. *Chairman.*] What are you? I am a farmer and produce merchant, living in Dubbo. My farm is on the Wellington Road, about 3 miles from Dubbo. I have been in the district for twenty years.

2222. Have you been much through the district? Not so very much. I have been from Dubbo to Coonamble only once along the line, but I bought produce from several farmers between Dubbo and Gilgandra, and even at Gilgandra I have bought wheat and chaff from Mr. Peter O'Neill and several other farmers between here and there.

27 June, 1899

2223. Are they farming much land out in that direction? I could not say exactly.

2224. Is there an increase in agriculture in that direction? Very much indeed.

2225. Are the farmers doing pretty well? They seem to be doing very well.

2226. Is there likely to be a settled population? I am sure there will be; they only require a few good seasons. All the available land between Dubbo and Gilgandra, even the worst of it, can be taken up; it is only a matter of a little time.

2227. Do they grow pretty good milling wheat? First-class. Our local millers have purchased this wheat on several occasions. The quality of the wheat is good. It is as good as we can grow on the Talbragar or here.

2228. What is the size of the holdings? I dare say some of them run from 320 acres up to 640 acres. Most of them got their preleases.

2229. Have you any knowledge of a farmer who is doing well on 320 acres? He cannot do very well on 320 acres. If it were first-class land he would want about 640 acres.

2230. You think it is the minimum amount a man could do with? He could do very well then. He could raise some stock and have a fair sized farm at the same time.

2231. One thousand acres would be ample for a man to do fairly well on? I should think so. I know I could do a large business with Coonamble if it were not for the roads. It is almost impossible to get carriers to take loading after rain.

2232. Are you sending stuff from Dubbo to Coonamble by road? Yes; I have got contracts for the last five or six years. I supply the police there.

2233. Is there much traffic from Dubbo to Coonamble? There is a lot, I think. I do not know any road in the Colony on which there is more traffic at the present time.

2234. Does not the Warren railway supply Coonamble? Yes; no doubt a portion of the wool goes into Warren, but the greater portion of the produce would come through Dubbo—in fact, the whole of it, pretty well, if we had a railway. As it is, we send the chaff away every time we get an opportunity.

2235. Does the bulk of the wool traffic still come to Dubbo? It has this season.

2236. It was temporarily diverted? A couple of years ago it was diverted; but it is coming back.

2237. If a railway is constructed, do you think that traffic will be borne on the railway? I am sure it would.

2238. In some places they tell me that the teams can compete with the railway? It would not be the case here—not with our land.

- J. Murray. 2239. So that the traffic between Dubbo and Coonamble would be carried by the railway, if constructed? I am sure it would.
- 27 June, 1899. 2240. And Coonamble would be a depôt for a considerable area of country to the north? It would.
2241. Have you ever thought out whether it would pay the country to construct this line, or whether there would be a loss on its construction? I should much rather say it would be a benefit to the country.
2242. Do you think it would be a benefit, not only to the locality but to the country generally? Yes; it is the cheapest and most direct line.
2243. *Mr. Watson.*] Do you think there ought to be enough traffic to make it pay? I am sure of it. I think it would pay from the start, to judge from all the traffic I see coming in. Coonamble was my best market this year, if I could only supply it with forage. Chaff is now £8 a ton.
2244. If you had enough to supply it with? We have plenty to supply it with, but we cannot get carriers to take it away; the carriers are almost impossible.
2245. *Chairman.*] This is an exceptional season; now, in fair seasons, would there be sufficient traffic, in your opinion, to justify the construction of the railway? There would.
2246. From travelling stock and from wheat-growers along the line? I have forwarded forage, chaff in particular, from here to Walgett. I have sent chaff from here to Narrabri—not only I, but Mr. Samuels and Mr. White.
2247. They only do that in very dry seasons? We did it this year, and I did it two years ago.
2248. We want to construct our lines, not to assist drought-stricken districts alone, but to settle a population who can get a living in ordinary seasons;—do you think that this would be a line which would do that? I think it would pay from the start; there is nothing to prevent it.
2249. Any 1,000 acres within a 20-mile radius of the line would support a family? It would. Land which we would not look at ten or fifteen years ago people are taking up. It is turning out to be the best wheat land we have.
2250. Was it on account of the land or the trouble in clearing land? The expense of clearing; it was scrub country, principally pine.
2251. The enterprising man has proved that by spending a little more on the scrub land he can more than recoup himself by getting a better crop? Yes; they pass over the plain country, where there is no timber, and get on to the timbered country, which they clear. They will tell you that land which will not grow timber will not grow wheat. Victorians are all going for the heavily-timbered country.

Francis Cridland, hotelkeeper, Dubbo, sworn, and examined:—

- F. Cridland. 2252. *Mr. Watson.*] What is your occupation? I am an hotelkeeper in Dubbo. Previously I was a carrier and a selector. I was also an hotelkeeper between here and Coonamble.
- 27 June, 1899. 2253. You have a pretty good knowledge of the country round about? Yes.
2254. Have you been over the roads between Dubbo and Coonamble, and between Mudgee and Coonamble? Yes; I have been from Mudgee to Coonamble by road several times, and from Dubbo to Coonamble scores of times.
2255. Which do you think is the better route for a railway to take—that is, in view of the possible good to be done to the community generally? I should certainly think from Dubbo to Coonamble.
2256. Is that because of the greater number of people to be served by that line? I think so. I think it would open up a lot of country towards the Warrumbungles and across the Castlereagh.
2257. You think the influence of this line from Dubbo would reach as far as the Warrumbungles? I am very well acquainted with a man who has a big holding, and he tells me that if the line went down there he would have 800 acres or 1,000 acres under cultivation. His place is about 35 miles from the proposed line.
2258. He thinks it would pay him to send wheat in that distance? That is what he tells me.
2259. Are the roads about there good, or can they be made good? He said the roads, except in coming across the Castlereagh, would be good roads—that is, between Gilgandra and Gulargambone.
2260. Do you know what is paid for the carriage of goods between Dubbo and Coonamble? I have heard of different prices; I have not done any carrying lately. A man told me in a letter yesterday that they were carting it down, before this rain came, for half-a-crown a hundredweight from Dubbo to Coonamble.
2261. That seems pretty cheap? It is cheap. I have been carrying down there when I got £1 a cwt.
2262. There has not been sufficient rain lately to give grass for big stock? No; they were only doing it to keep their horses alive. They could not turn their horses out.
2263. Why was it necessary for them to take the stuff at so low a price,—could they not get a fair price? No.
2264. Would that be a fair criterion of what the rate of carriage would usually be by team? No.
2265. What would it usually be? From 5s. 6d. to 6s. per cwt.
2266. Have you been through the country between Dubbo and Gilgandra otherwise than by the main road? Yes.
2267. We have been informed that the character of the country just off the road is a good deal better than that of the country which the road follows;—do you think that is right? Yes, particularly to the west.
2268. As you go westerly the land is much better than it is on the road? Yes.
2269. And east of the main road is it any better or is it the same? It is all ironbark forest.
2270. Is the class of country which carries ironbark fit for agriculture when it is cleared? Parts of this forest are of that quality.
2271. On the map you will observe a large railway reserve, tinted green, which follows the line up for 20 miles towards Gilgandra; it was reserved for timber purposes, was it not? There is a great deal of land reserved out that way.
2272. Will that country contain any decent land? No doubt parts of it could be made fair land, but other parts I think could not be improved, as it is gravelly, stony country.
2273. It would not be much good for settlement? Only some of it.
2274. On the route from Mudgee to Cobborah the country is credited with being fairly good? It is good from Cobborah on towards Mundooran.
2275. It is very rough country? It is all broken, hilly country.

2276. Do you think this line, if constructed, would be taken advantage of by people at Mundooran to any extent, or would they prefer to go to Mudgee? They would come here. F. Cridland.
2277. Have you been over the country between Narramine and Coonamble? Yes. 27 June, 1899.
2278. What do you think of that country? It is mostly a black-soil swamp.
2279. Generally speaking it is open plain? Yes.
2280. It is not usually held to be suitable for agriculture? No; it is first-class grazing land.
2281. If it is grazing land, I presume it would be served by the construction of this line? No doubt.
2282. You may be much farther than 20 or 30 miles away, and still benefit by the construction of the line if you are grazing? Yes.
2283. Probably the northerly portion of the district between Narramine and Coonamble, if it consists almost entirely of grazing country, would be benefited by the construction of a line from Dubbo to Coonamble? Yes. Three miles out of Narramine you get on to the black-soil plains.

Henry Beecroft Copeland, Crown Lands Agent, Dubbo, sworn, and examined:—

2284. *Chairman.*] What are you? I am Crown Land Agent stationed at Dubbo. I have been here a little over two years. H. B. Copeland.
2285. You have been here sufficiently long to give you some idea as to the country about—you do not stop at home I suppose? I have to stop in the office a good deal. I do not get about much. 27 June, 1899.
2286. Is there much inquiry for land in this district? Yes.
2287. And when the leases fall in next year do you anticipate any great rush for land? I do.
2288. There is a continual rush, I suppose, if there is any land available? Very big rushes.
2289. You have had to ballot several times? Yes.
2290. About how many applicants turned up? If the land is any way good at all, you may reckon upon 200.
2291. Have you any idea as to the quality of the land along the proposed route? No.
2292. Have you heard whether it will be in demand? I have not got any information about the quality of the land along the proposed route.
2293. Has there been any land thrown open along there since you have been here? I do not think there has been.
2294. It has been the policy of the Government to keep back the land along there pending the settlement of the railway question? I believe so.
2295. And from information you have gained in your office, you have no doubt that when it is thrown open it will be eagerly sought for? Yes.
2296. How far does the Land District extend? It is a fair size. Gilgandra is on the edge of the district. Mundooran is just on the edge of the district, and Cobborah is just inside the boundary.
2297. All these places will be served by the construction of this railway? Yes. The Land District goes up past Trangie but not as far as Nevertire, and it goes out to Peak Hill on the south side.
2298. Is the settlement of a permanent character? Yes.
2299. Do you register many transfers of holdings? A great number of transfers.
2300. How do you account for that if it is settled? They are mostly transfers by way of mortgage.
2301. Not sales? There are a fair number of sales; but the majority are mortgages.
2302. What class of men are the newcomers? All agriculturists.
2303. So that the lands are being transferred from large holders to smaller holders? I could hardly say that. It is done in the ordinary way of business.
2304. The men have made money? Yes; and some of them are prepared to take up settlement leases under the new Act.
2305. There is no difficulty in finding purchasers? No.
2306. Has there been land taken up between Cobborah and Mundooran? No. There has been some land thrown open down Cobborah way under the settlement lease and homestead selection provisions; but there is little or no land available for conditional purchase.
2307. Has any land been taken up for homestead selections? What has been available, with the exception of one or two blocks.
2308. *Mr. Watson.*] Some of them are still remaining open? One or two blocks only. I think there are only half a dozen blocks in the whole of the Land District available.
2309. *Chairman.*] Have you any idea of the reason why they were not taken up? Because they happen to be particularly bad.
2310. There was some land about there which was fetching a rental of about 1d. an acre? I should think it would fetch about that.
2311. But that is the worst of the country? Yes.
2312. *Mr. Watson.*] Have you not got some land now near Mundooran which is absolutely unoccupied? There is a little of it. A lot of it has been taken up lately as annual leases.
2313. *Chairman.*] Are they improving this land? For a little rough grass.
2314. You think there is a sufficient area of country in there to be developed to warrant the construction of this line? I have very little knowledge of the amount of country; but I am quite certain that if there is any country there it will be taken up immediately it is thrown open. I am safe in saying that any land which is made available will be taken up—that is, judging by the number of applicants that have always been here for land.
2315. You have no doubt whatever in your mind that if the land is made available, the right class of people will get hold of it, and make the best use of it? No.
2316. That has been your experience? Yes.
2317. You think that they will find traffic sufficient to justify the construction of the railway? Judging by the class of people who have already taken up land, I am quite certain that they will make the traffic.
2318. If any line of railway can be made to pay, you think that this line can be made to pay? From what has been done in the past, I should think so.

Alderman Daniel Soane, Member of the Land Board, Dubbo, sworn, and further examined:—

- Alderman D. Soane. 2319. *Mr. Watson.*] Are you aware whether some land was thrown open recently for settlement between Munderoran and Cobborah? There are two or three settlement leases open now, but no offer has been made for them.
- 27 June, 1899. 2320. At what rental? At a rental based on a capital value of 6s. to 6s. 8d. an acre, showing that they are very poor lands. There is a great deal of rock in that country. It is not country similar to the country between Dubbo and Gilgandra.
2321. That country would be right on the route of the Mudgee-Coonamble line? A great deal. I may state that at the last sitting of the Land Board there were several annual leases applied for which had been thrown open on the road from Cobborah to Merrygoen and Munderoran. In the first instance, they were thrown open at a rental of 1d. per acre, and after taking the evidence of the conditional purchase inspector and others the Board reduced the rental to  $\frac{1}{2}$ d. an acre.
2322. Immediately west of Munderoran there is some bad country? From Munderoran to Gilgandra it is all bad; on each side of the river it is thick pine scrub and barren country. On the north side a great deal of the country is rocky, extending back for 8 or 10 miles in places. It is a different country altogether from the country between Dubbo and Gilgandra.
2323. On the whole, you think it is not nearly so good as the country between Dubbo and Gilgandra? It is much inferior, because it has so many rocks. It is country which could not be improved. It is similar country to a place called Goodiman Range, on the Mudgee route. The land improves as you work east towards Coolah; you get into better country then. Further up the Talbragar you have a better country. From the Goodiman Range to the Castlereagh at Munderoran and from there to Gilgandra it is all a bad class of country.
2324. *Chairman.*] Would the Goodiman Range involve engineering difficulties? They would be much more difficult there than they would be down below.
2325. More expensive? A great deal more expensive, but the country is very poor, so much so that the land has not been alienated. It is under a very small rental; it is under annual lease.
2326. You have no hesitation in saying that, as a rule, the class of country between Dubbo and Coonamble is superior to that between Mudgee and Coonamble? In every way it is.
2327. That is, looking at the matter from both the pastoral and the agricultural standpoint? Quite so. The country between Dubbo and Gilgandra can be improved and made good land, but the other cannot. It is impossible to improve rocky country.

WEDNESDAY, 28 JUNE, 1899.

[The Committee met at the "Munderoran Hotel," Munderoran, at 7:45 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Richard Shannon, grazier, sworn, and examined:—

- R. Shannon. 2328. *Chairman.*] What are you? I am a grazier, residing at Biambil, 8 miles from Munderoran. I have been in this district for thirteen years.
- 28 June, 1899. 2329. You desire to make a statement to the Committee? Yes; I am of opinion that the extension of the railway from Mudgee to Coonamble would be in the interests of the country much more than a line from Dubbo to Coonamble. It would be a better paying line. As this is a purely agricultural district, with a good rainfall, we can grow any kind of crop—wheat, maize, potatoes, onions. It is good to fair pastoral country. If the line were constructed from Dubbo to Coonamble the traffic from Tooraweena or thereabouts would still go to Mudgee, for the reason that the route would be 35 miles shorter. The teams could easily compete with the railway.
2330. How far is Tooraweena from Mudgee? From Tooraweena it is 105 miles to Mudgee.
2331. How far is it to Coonamble from Tooraweena? I have never been from Tooraweena to Coonamble, but I should say it is about 51 miles.
2332. You are of opinion that if the line is constructed from Dubbo to Coonamble the agriculturists would rather convey their produce 100 odd miles to Mudgee than go 50 miles to the railway at Dubbo? I do believe that; they can compete with the line.
2333. Do you know where it is proposed to construct the railway from Dubbo to Coonamble? The line will pass about 10 to 12 miles west of Gilgandra.
2334. *Mr. Watson.*] How far is Tooraweena from Gilgandra? Thirty miles.
2335. Although they would be about 42 miles from the railway when it is opposite Gilgandra, you think they would still go on to Mudgee rather than go to that nearest point on the line? I am quite sure about that.
2336. Are you aware that the Mudgee line would only satisfy them if they wanted a market to Sydney, whereas the line to Dubbo would open up other markets—the western market for instance in Bourke? That is quite right.
2337. Do you know anything of the country to the north, getting on towards Coonamble? I do not, but I have heard that it is first-class country, that there is nothing to beat it in New South Wales.
2338. As pastoral country? Both pastoral and agricultural. The country from Tooraweena to Coonamble cannot be beaten in New South Wales either for pastoral purposes or agricultural purposes.
2339. Your opinion is, that there is a large quantity of land there which is awaiting development, and which can only be developed by the construction of a railway from Mudgee to Coonamble? Quite so.
2340. You do not think that they would go across to the line if it could be reached in 30 miles? I do not think so.

2341.

2341. Speaking for yourself, you would rather go to Mudgee at any time, although Mudgee is so many miles further from you, than go across to a line from Dubbo to Coonamble? Yes, and if I were a resident of Tooraweena I would, for the route must be 40 miles shorter than the Dubbo route. R. Shannon.  
28 June, 1899.
2342. How would you view a proposal to construct a line starting from Dubbo and going round towards Cobborah, in order to tap that country along the Talbragar and then up towards Mundooran, as part of a Werris Creek line;—would that suit this district? It would not suit this district at all, because we trade entirely with Mudgee here. It is only in time of drought that it would suit us to send our stuff out to Bourke and all those places.
2343. Your market just now is only a local market, and that is in Mudgee? Mudgee and Sydney.
2344. If you develop the whole of this country, Mudgee could not consume what you would produce, and therefore you would have to find a market in Sydney? Sydney is our market, and all our stuff goes by way of Mudgee. We do not get anything from Dubbo; there is no trade at all with Dubbo.
2345. Do you know anything of the country on the west side of the Castlereagh? Yes.
2346. Will you describe that country? There is some first-class agricultural country through it, and some very inferior country; it is patchy country.
2347. How does the country which lies generally west of the Castlereagh River compare with that which lies east of the river? All the country on the right bank of the Castlereagh, for a distance of 20 miles, is better than the country on the left bank of that river. The right bank, I presume, is the bank when looking down stream.
2348. How is the land held about this district? Conditional purchases, freeholds, and conditional leases.
2349. In what sized holdings? Some of the holdings are up to 7,000 and 8,000 acres, and some of the stations are 30,000 acres.
2350. What is about the minimum-sized holding which will enable a man to get a living for himself and family, provided that he has a railway? He will get a good living on 1,000 acres here, I reckon.
2351. You think that 1,000 acres would be sufficient? Yes; if we had a railway.
2352. Have you had an opportunity of speaking to the residents about here with reference to the construction of a railway? No.
2353. Suppose a line were run through your property, would you be inclined to demand a large amount of compensation for the land taken? No; I am quite willing to give the land free.
2354. Do you know if other people are of the same opinion as yourself? I have not spoken to any of them on the subject; but I think a good many of them would. I suppose the Government would not take more than 3 chains wide.
2355. No. You, at any rate, would give the land necessary for a railway without charge? Yes.
2356. If a railway is constructed, do you think there will be sufficient produce grown within a reasonable radius to provide a revenue that will go somewhat near to covering the working expenses? Yes, I am quite sure of that. There is a good deal of land that would be cultivated if the line were constructed between Mudgee and, say, Tooraweena. I cannot speak for the other side of Tooraweena. After you pass 20 or 30 miles of Tooraweena, I think it is purely pastoral country to Walgett. I understand that it is proposed to send this line on to Walgett.
2357. Coonamble at present is to be the terminus? If so, it is suitable for agriculture all the way, and it would pay.
2358. You think it would raise sufficient produce to enable the railway to pay? I am certain it would.
2359. The intermediate traffic would help up the Coonamble traffic? Yes.
2360. What is about the average crop per acre here? Twenty bushels, taking an average for a number of seasons. We have had 30 and 35 bushels to the acre in this district; but taking one season with another the average is 20 bushels.
2361. Has the price up to the present been sufficient to encourage the farmers to go on with the cultivation of wheat? No.
2362. When you say no, I suppose you are counting the present cost of getting to market? Yes.
2363. If the railway is constructed the cost of marketing would be less? Yes.
2364. Do you think then, it would pay you to go on cultivating at present rates? It would. By cultivating the land in this neighbourhood it improves the grazing capacity of the country after it is let out; it will carry double the stock.
2365. How far from the right bank of the Castlereagh does the good land extend eastward? It is patchy country; there are large stretches of good country.
2366. When we are here at Mundooran the river is generally running towards the west, and when it gets to Breelong it begins to run in a northerly direction, so that there is a strip of country in there and running north from that. I want to know how wide is the agricultural land running north towards Coonamble? I could not tell you.
2367. Is it 20 miles wide? It is fully that.
2368. Is it 40 miles? I daresay it would be 40 miles.
2369. What area of land have you got? I have 12,000 acres, but it is not all secured land.
2370. What portion of that area do you think is fit for agriculture if you had a railway? I should say from 5,000 to 6,000 acres.
2371. Have you been cultivating in addition to grazing? Yes, for hay entirely.
2372. So that you cannot speak of any experience in cultivating wheat and sending it to market? No; but I can speak as to the experience of my neighbours.
2373. So far you have only cultivated for hay;—was it grown for consumption or for sale? For consumption by my stock.
2374. Do you think there would be a fair proportion of your land put under wheat if a railway were brought along? Yes.
2375. And so with regard to surrounding lands? Yes.
2376. Do you know anything of the land between Mundooran and Mudgee? I do.
2377. Will you describe the land between Mundooran and Cooborah? It is from fair to good pastoral land, and a large area of it is good agricultural land. There are patches of inferior country through it.
2378. Rough? The small patches are.
2379. Do you think the land from Mundooran to Cobborah is as good as the land from Cobborah to Gulgong? It is about the same, but there is better land to the left where the line goes. Out towards Tallewang

- R. Shannon. Tallewang and Tuckland there is first-class agricultural country. These places are between Cobborah and Gulgong.
- 28 June, 1899. 2380. I wanted more particularly to get your opinion of the general character of the country between Munderoran and Cobborah? It is fair to good country; I cannot call it all good country.
2381. Is it good grazing country? It is fair grazing country. There are patches of from fair to first-class agricultural land through it.
2382. Would the agricultural land predominate, or would it form only a comparatively small portion of the whole? A small portion. I know that the greater portion of it is more fit for grazing than for agriculture.
2383. *Chairman.*] Have you any other statement to make? There is splendid timber all along this line for sleepers and that sort of thing. There are first-class forests. Between Munderoran and Dubbo there is a 30-mile ironbark forest.
2384. Has any of that country ever been cultivated? No, not in that forest. Between Munderoran and Coonabarabran I know that patches of ironbark have been cultivated, and that it grows splendid crops of wheat.
2385. Is the soil generally the same as that you spoke of? No; it is red soil.
2386. You say that some of this ironbark country has been cultivated towards Coonabarabran, and has given splendid crops;—is the soil on which that ironbark is growing similar right through the whole of the country? No.
2387. How would you describe the ironbark country you spoke of between Munderoran and up towards Coonamble? There is a lot of that ironbark country very good for agriculture.
2388. You think the ironbark country between Munderoran and Coonamble could be cultivated? Some of it.
2389. Generally speaking, do you think it could be cultivated? Yes.
2390. I suppose the ironbark country you speak of consists of ridges, and opens out in places? Yes.
2391. The ridges, I suppose, would not be good for cultivation? No.
2392. But the flats would be? Yes.
2393. Would a fair proportion of the ironbark country be fit for cultivation where the railway would be likely to serve it? It is not good pastoral country, but there is some of it which is very good agricultural country.
2394. Is there much of it which you would consider to be good agricultural country? There is not much of it.
2395. *Mr. Dick.*] At what was the unimproved value of your freehold land assessed under the Land and Income Tax Act? I am not quite sure, but I think it was put at £2 an acre by the Commissioners at the first going off, and I got it reduced to about 35s.
2396. Do you know, as a matter of fact, whether much of the land in the district round about is assessed as high as that? Some of it is assessed at from 5s. to 10s. higher, I think, but it is better country. It is first-class country; there is no better country in New South Wales than that.
2397. Is there a considerable area of land which was assessed at 35s. and upwards in the district? No. I should say there would be from about 30,000 acres to 40,000 acres between Munderoran and Coonabarabran.
2398. You feel quite sure that if this railway were constructed from Dubbo to Coonamble, although you would be 55 miles from the line, you would still prefer to incur the extra expense of hauling to Mudgee rather than take the shorter route of 55 miles? Yes. I am only 260 miles from Sydney, where I live; and Dubbo is 278 miles from Sydney.
2399. You think the increased cost of carting would be more than counterbalanced by the decreased cost of railway freight? Yes.

Patrick Brennan, grazier, sworn, and examined:—

- P. Brennan. 2400. *Mr. Watson.*] What is your occupation? I am a grazier, living at Silentdale, about 20 miles north towards Coonamble.
- 28 June, 1899. 2401. The proposal referred to the Committee is to construct a railway from Dubbo to Coonamble, and as an alternative scheme it has been proposed that the line should be taken from Mudgee towards Coonamble; looking at these two projects from the point of view of opening up country and the possibility of paying working expenses, which of them do you think should be constructed first? I consider the Mudgee line should be.
2402. What are your reasons for holding that opinion? There is a very large area of country about here which is very good. From Munderoran to Coonamble I do not suppose there is better country in the Colony. It would make the road so much shorter. Sydney is our market.
2403. I suppose you do not anticipate that a connection with the Western line would be of any great advantage to you? No benefit at all.
2404. It has been put forward, as a thing to be aimed at, that the connection with the Western line would give the possibility of reaching a variety of markets which would not be the case if you were connected only with Sydney;—do you think there is anything in that view? No; I think Sydney is the main market.
2405. You probably think that in the future we shall have to look abroad for our returns from wheat? Yes.
2406. Therefore, the nearest way to Sydney is the best way from your point of view? Yes.
2407. Do you know the character of the land between Mudgee and Munderoran? I do.
2408. Taking that route in sections, how would you describe the land between Gulgong and Cobborah? It is good, because it hugs the Talbragar pretty well all the way from Gulgong. Then it comes into Tuckland.
2409. On the whole, you say the land between Gulgong and Cobborah is good? It is good on the whole.
2410. And between Cobborah and Munderoran is it as good as the land between Gulgong and Cobborah? No; I do not think it is as good.
2411. You think you would have comparatively poor land to pass through till you get to Munderoran? Poorer land.
2412. Now, out to your own district—that is, 20 miles further north from Munderoran—how is the land from an agricultural standpoint? It is good agricultural land. 2413.

2413. In the event of a railway being constructed from Dubbo to Coonamble, how far would you be from the Castlereagh at the nearest point which it would strike? It would be a long way. I am about 55 miles due east from Gilgandra. P. Brennan.  
28 June, 1899.
2414. So that it would be of no value to you? No; I would never trouble it.
2415. How far would you be from the line if it were constructed from Mudgee to Coonamble? About 8 miles.
2416. In the case of the line being constructed from Mudgee, you would have a chance to cultivate, which otherwise you would not have? I should.
2417. Do you go in for cultivation now? No; except for a little fodder.
2418. Do any of the people near you go in for cultivation? No.
2419. What would be the furthest distance from a railway it would pay a man to grow wheat and cart it to a railway station (say) with the present price? Twenty-five miles, I suppose.
2420. Would the proposed line go through any part of your property? I do not think so.
2421. A proposition has been put before the Committee to the effect that a portion of the survey from Dubbo to Werris Creek might be followed, as far as Mundooran, from which point the railway would go to Coonamble;—do you think that that would be of any value to the people of this district? No.
2422. Why? Because of the long trainage and long drawing.
2423. As your object is to reach Sydney, it means going so much further round? Yes.
2424. Do you think there is any possibility of your district being developed if you do not get a railway in the direction you have just spoken of? I do not believe there is.
2425. And you think it will continue as a pastoral district only in the absence of railway communication? Yes.
2426. Are there any other reasons which you can urge for the consideration of the Committee? Yes. When I send stock to Mudgee they are fat when they leave, but when they get in they are what I call good stores. It is pretty well a lane now all the way to Mudgee. If I rear a lot of lambs I would not send them at all—they could not get in; but with a railway I could get a wire on Tuesday and have them in Sydney on Thursday morning.
2427. How long does it take you to get your fat stock from here to Mudgee? You cannot get them in in less than eleven or twelve days. When I get in with them the market is glutted.
2428. I do not suppose feed is too plentiful on the stock route? The road is pretty well a lane all the way. It is fenced in between here and Mudgee.
2429. You think there would be a fair traffic in fat stock if the line were constructed? There would.
2430. This is supposed to be a pretty fair fattening district? Not two months ago I sold my fat stock at home sooner than take them in. I know I sold them at a loss.
2431. Where were they intended for by the purchaser? He sold them amongst the farmers, and some of them he sold to the meat preservers. He had another place on the road where he could spell them and keep them.
2432. With the possibility of reaching Sydney in a short time, do you think you could fatten stock and get a lot more to market? Yes; and I could make a lot more money too.
2433. *Chairman.*] You have had two or three very bad seasons in this district? Yes.
2434. When you do not have bad seasons there is plenty of grass along the road;—should you still use the railway if you had a choice, or should you use the road? By all means we should use the railway. People eat down the grass on the road.
2435. *Mr. Levien.*] Do they take the fat stock from Coonamble to Mudgee by this road? They take a great many.
2436. They would not use the railway for stores? Not if they were able to travel.

Thomas Luckie, grazier, sworn, and examined:—

2437. *Mr. Dick.*] What is your occupation? I am a grazier, residing at Hazelmere, which is about 13 miles north-east from Mundooran. T. Luckie.  
28 June, 1899.
2438. Would your place be near to the alternative route from Dubbo *via* Mundooran to Coonamble? Yes.
2439. Do you think a line in that direction would be likely to develop a large area of agricultural country? I consider it would.
2440. Would it develop more or less country than a line from Mudgee to Coonamble? Less.
2441. Could you say whether it would be less per mile of railway construction? I think it would be less per mile.
2442. Of the original proposal marked in broad red on the map and this alternative proposal, which do you think would serve the larger area of country? I consider that the line *via* Mundooran would serve a greater agricultural area and would cause considerably more agriculture.
2443. Do you know anything of the character of the country from Dubbo as far as Gilgandra in a direct line? No; not a great deal. I have been through it once or twice, but I would not like to venture an opinion about it.
2444. Do you know the country from Mudgee up towards Coonamble? Yes; I know it fairly well.
2445. Do you think a railway from Mudgee to Coonamble would prove more profitable and a better agent for developing country than either of these alternative routes? Considerably so.
2446. Practically, along the whole of the Mudgee route, would there be land capable of agricultural development? Not the whole of the land, but the greater proportion is agricultural land.
2447. Would you care to state what the unimproved value of your land was assessed at by the Taxation Commissioners? I could not say for a certainty, but I believe it was 30s.
2448. In the event of that alternative route going through your property, would you be prepared to hand over what was required for railway purposes to the Government? If the bit of the land that was cut off were completely useless to me—that is, if they took a few acres off—I should want a slight compensation. I should only ask for the actual cost of the land and the fencing along on either side. If it came through so that it would not interfere with either side of it, cutting it into medium-sized paddocks, I would willingly give the land free of cost.
2449. Would you offer the Committee any further reasons why you think, in the interests of the country, the Mudgee-Coonamble is better than either of the other two routes? I think it would open up a greater

- T. Luckie. greater area of country—more suitable country for agriculture. It is a shorter route to the leading market—Sydney—and it offers people that grow produce here a fair market out towards Coonamble for fodder in bad seasons.
- 28 June, 1899.
2450. Would the direct line from Dubbo to Coonamble be of any value to you in your present position? Not the slightest value.
2451. Would you still continue to trade with Mudgee? Yes.
2452. It would pay you better to do that although you would be so much closer to a railway line? Yes; I would be going the wrong way to get to a market. I think it would be cheaper, or equally as cheap, to send it to Mudgee.
2453. From every point of view, both as a matter of personal interest and as a matter of public policy, you think it would be better to construct the Mudgee line? For the welfare of the country at large, I think the Mudgee line should be constructed.
2454. It would not suit you to go to Gilgandra? I would be going away from a market.
2455. *Chairman.*] It is not proposed to fence this railway;—how do you view that idea? I suppose the people who have stock adjoining the line would not be responsible for any damage.
2456. No; but would they not look to the Railway Commissioners for damage to their stock? I do not doubt but what they would.
2457. Have you had any experience of unfenced lines? Practically none.
2458. Is it not a fact that cattle or sheep will camp on an embankment if it is there to camp on? In some instances; but where the country is hilly I do not think they will make a great practice of it.
2459. Have you any knowledge of the country still east of you? A very fair knowledge.
2460. Would you describe the country about Dunadoo—the local name is Redbank—as being good agricultural country? There is some first-class agricultural country, and some very fair pastoral country. Along the Talbragar it is first-class agricultural country.
2461. How would you describe the whole of that country to the east of a railway line from Mudgee to Coonamble—that is, between Dunadoo and Coonamble? From Dunadoo, or Redbank, to Merrygoen, some of the country is fair and some of it is very inferior; but from Merrygoen up to Tannabar, the greater part is very good agricultural land. There are patches that are hilly and not suitable for agriculture. Then on to the heads of the creeks, towards Tenandra, there is first-class agricultural country and pastoral country also. From here to round Tundaburine I think there is not much better land anywhere.
2462. If a line is constructed from Mudgee to Coonamble, do you think that land would be put under the plough? The greater portion of it.
2463. Instead of being not much used, and being used for pastoral purposes, you think it will be cut up and will carry more men to the acre than it does just now? Considerably.
2464. At the present time, I suppose, it is used principally for sheep? Solely.
2465. Because you could not get away to market at anything like a reasonable cost? Very true.
2466. You think that if a line is constructed that land will be cut up and put under cultivation? That is my firm impression.
2467. And that it will pay to cultivate? Yes.
2468. Are there any tenant farmers out in this direction? Farming is only carried on on a small scale. There are tenant farmers, but only on a small scale.
2469. Do you know of any tenant farmers within 20 miles of an existing line? I cannot say that I do.
2470. Within 20 miles of Mudgee or Dubbo? I do know of tenants at Burrandulla Flats, within 20 miles of the Mudgee line, and they cultivate.
2471. Do you think they are doing well? The greater number of them are doing well.
2472. Is cultivation increasing or decreasing about there? I could hardly say whether it is increasing much.
2473. You think that generally the tenant farmer is fairly prosperous? I consider so.
2474. Are any of them making sufficient money as tenants to purchase land and better their position later on? Yes; and I have known some do it.
2475. You think they can do it here? I am sure of it.
2476. *Mr. Levien.*] Do you know anything about the country between Werris Creek and Dubbo? I have a slight knowledge of it, but I do not think I have sufficient knowledge to give a very reliable opinion about its character.
2477. *Mr. Watson.*] How is the land held about here principally—conditional purchases, conditional leases, or pastoral lessees? There is a fair amount of freehold land, conditional purchase and conditional lease land, and leasehold land.
2478. A number of Crown reserves? There is a fair number of Crown reserves.
2479. Is there much leasehold land falling in next year? Considerable.
2480. Is that good land for the most part? Yes; I think some of the holdings are getting land exchanged; and from what I can understand, they are giving up the pastoral land and taking agricultural land. While it is fit for both purposes, I think that would be injurious to settlement, because they are getting it closer to the line.
2481. Is the leased land which is to be given up in 1900 fairly fit for settlement, if the railway were to be brought along? The greater part of it is first-class land for settlement, both large and small holdings.
2482. Are there any Government reserves near here which are at present unoccupied? Not that I am aware of. All the land is taken up under either annual lease or occupation license. There may be some between here and Dubbo, but that is the only direction in which I think you can find unoccupied Crown lands.
2483. There is none in a north-western direction from here that you know of? No. There may be some areas, but I do not think they are very large.
2484. They are not important enough to be looked upon as a feature? No.
2485. They are merely outcrops of rock or sand ridges? Generally speaking, it is scrub country; but that country which is unoccupied is first-class timber country. It is worth a good deal in itself for timber.
2486. Is timber beginning to get cut out about here, or is there still a fair quantity of ironbark? There is a fair quantity still; in fact, the reserves between Gilgandra and Tooraweena are hardly touched. That country is in a virgin state.

John Buckley, farmer and grazier, sworn, and examined:—

2487. *Chairman.*] What are you? I am a farmer and grazier, residing at Bone Bone, 23 miles from J. Buckley. <sup>23 June, 1899.</sup>  
Mundooran.
2488. *Mr. Watson.*] In what direction is your place from here? North, perhaps a little to the north-east.
2489. Are you engaged principally in grazing or agriculture? Principally in grazing.
2490. Have you done any farming with a view to trying outside markets, or have you cultivated simply for fodder purposes? I tried, but I found that it would not pay me; it was too far to cart the stuff.
2491. What is the cost of carriage by team from your place to Mudgee? £2 to £3 a ton for any produce.
2492. Does that apply to wool as well as wheat? Yes.
2493. Where do you send your wool? To Mudgee.
2494. Would it cost more or less than that to send it to Dubbo by team? I could not say. It would be going away from the market for a certain distance to go from our place to Gilgandra.
2495. You have not attempted to send any carts *via* Gilgandra to Dubbo? No. If we sent it this way to Cobborah and thence to Dubbo, it would be just the same distance as it would be to Mudgee, and there is much less trainage from Mudgee.
2496. You think that the cost of road carriage prohibits the growing of produce for outside markets? Yes.
2497. I suppose you confine yourself now to growing fodder for yourself, and for the local market? Yes.
2498. What yield of hay do you get in an ordinary season? About a ton and a quarter to the acre, as a general thing.
2499. Have you tried lucerne? Yes.
2500. How does it thrive? I never had it fenced in from the marsupials; it would have cropped very well if I had. I had been feeding them all my time, so that I had not done any good with it. I have done very well with wheat, maize, and oats.
2501. You are not able to offer an opinion as to how lucerne would do if it were properly protected? I could not. I have tried lucerne and done no good with it because it was not netted or paled.
2502. Do you know the country generally between Dubbo and Coonamble;—have you ever been on that route at all? No.
2503. Do you know the country between Mudgee and your own place, and thence on to Coonamble? Yes.
2504. We have been informed here to-night that, taken all through, the land between Mudgee and Mundooran is fairly good country? The land from Mudgee to Redbank, to the Talbragar, is very good grazing country, and first-class agricultural country all the way, as far as I know, or ever could see, and then there is a small patch of poorer country from there down to the Merrygoen. There are patches of very good country, and patches of very inferior country, of course, and some hilly country, and ironbark country. The ironbark hills are almost useless for anything except timber. There are small patches of ironbark hills, and small patches of flats, which are very good for agriculture, but not much good for grazing.
2505. Do you agree with the opinion that some of the ironbark country, more towards the flats or slopes, is fit for cultivation? The ironbark valleys are the best lands you can get for wheat growing.
2506. You mean the open ironbark forests? Yes; it is the best wheat country you can possibly get, I believe.
2507. From Mundooran on towards Coonamble, there is a big extent of agricultural country? Yes.
2508. How wide is the belt of country which would be served by a line from Mudgee to Coonamble, or to your own place—20 or 40 miles? Forty miles.
2509. How far would the Warrumbungle Mountains be from a line which would run from Mudgee to here? I suppose they would not be 8 or 10 miles at one point.
2510. What would be the average distance of the Warrumbungle Mountains from the line? About 15 or 16 miles, I suppose.
2511. What would be the average width of good country along the mountains? I should say from 20 to 25 miles.
2512. You would have from 15 or 16 miles of country between the projected line and the ranges? Quite that.
2513. So that there is a fair scope of land for a railway to serve, in your opinion? Yes; a real good scope of land on the eastern side.
2514. Do you think there would be much agricultural development with the construction of a railway right out as far as your place? I think there would be a considerable lot. I go in for a lot of agriculture, and I have a big family who are all inclined to go in for agriculture. I have a son on a settlement lease, closer to Tooraweena. He has a good area of cultivation land, and he is inclined to go in for cultivation if he had any market.
2515. I suppose your experience is the same as that of others who have been grazing after cultivation—that the cultivation land carries more sheep after being cropped than it did previously? I am quite sure of that.
2516. Consequently, it is possible to work to much better advantage if you combine agriculture with pastoral pursuits? Yes; you can use land for agricultural purposes for three, five or seven years, and then use it for grazing for five or seven years, and turn it into agriculture again, when it is as good as it was at first. In the meantime, you have carried twice as much stock as you could before it was cultivated.
2517. You think from both points of view there will be large development from the construction of a railway? I am quite sure of it.
2518. In several recent Acts authorising the construction of railway lines, Parliament has inserted a provision that the line shall not be constructed unless the people are willing first to give the land necessary for its construction, and secondly to submit to a tax to make good any deficiency in its earnings. How do you view that proposal? The first condition I could understand right enough, and I would be quite willing to give the land; but the other condition I can hardly understand. I would not know how much it would come to. It might be possibly more than I could afford to give.
2519. In the case of the railways I referred to, the maximum was put at 1d. per acre for land within 5 miles,  $\frac{1}{2}$ d. per acre for land within 10 miles, and  $\frac{1}{4}$ d. per acre for land within 15 miles? I would be quite satisfied to do that.
2520. That would be the maximum charge in case the railway did not meet the running expenses. You think

- J. Buckley. think the railway would be worth that much to you? I think it would be worth a good deal more than that to me.
- 28 June, 1899. 2521. Do you think there would be much probability of that tax being levied here? I do not think we should ever have to pay the tax if we got the line.
2522. You think that with Coonamble as a terminus, and with the traffic you would get from the intervening land, the line would be likely to pay? I think it would be almost certain to pay well.
2523. And in case there were a deficiency? I would be quite satisfied to pay what you have mentioned.
2524. *Chairman.*] Do you know anything of the country about Coonabarabran? I saw a good deal of that country. I have been living within 20 miles of it for the last fourteen years.
2525. Is there a good stretch of country from Coonabarabran down this way? Yes.
2526. Would you be as well served by a line running from Coonabarabran down to Mudgee as you would by a line from Coonamble to Mudgee? I think so. The line I want is a line from Mundooran to Mudgee. That line would serve me.
2527. But from your knowledge of the country, would a line from Coonabarabran serve you? I think a line from Mundooran to Coonamble would be far better than a line from Coonabarabran; it would open up a lot of better country.
2528. Have you been to Coonabarabran? Yes.
2529. I suppose you could not say how they would view a proposal of that sort, or whether they look to the Great Northern line as their market? They look to the Northern line. I went down the other day, and they wanted me to sign a petition for a line from Muswellbrook *via* Cassilis and Coolah to Coonabarabran.
2530. Have you been along the Castlereagh to Coonamble? Yes.
2531. Close to the bank of the river? Yes.
2532. How far back from the bank of the river, going eastward, does the good land extend? Once you get the other side of Tooraweena it is almost all good land out for, I should say, 30 miles; and on this side of the mountains, of course, it is all the same.
2533. Have you ever been on the left bank of the Castlereagh? No; I have not been through that country much. I have been down to Gilgandra and Gulargambone. I have not traversed the river down. I have never been westerly at all. I could not speak of that country. I have just travelled through parts of it.
2534. Is any of your holding in the ironbark country? No.
2535. Have you ever seen any of the ironbark country cultivated? Yes.
2536. With what result? The open ironbark forest, with red soil, generally speaking, will give about 35 bushels of wheat to the acre and about 50 bushels of maize to the acre.
2537. Then the theory that ironbark country is no good for agriculture has been exploded? Yes. The ironbark country, where there is stone and undergrowth, is no good for anything, but the open ironbark and red-soil country is splendid agricultural country anywhere it is found.
2538. Have you had anything to do with sleeper-cutting? No.

FRIDAY, 30 JUNE, 1899.

[The Committee met at the "Telegraph Hotel," Gilgandra, at 7:30 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.	

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Ernest Joseph Wheble, grazier, sworn, and examined:—

- E. J. Wheble. 2539. *Chairman.*] What are you? I am a grazier, residing at Everton. I have been in the district about eighteen years.
- 30 June, 1899. 2540. You have a thorough knowledge of the district, I presume? Of the country between Gilgandra and Dubbo.
2541. Starting from Dubbo, for the first 10 miles, what is the character of the country on the western side of the line? Nearly all that is good farming country. Part of it is very stony—I think bluestone. That portion would not be any good for agriculture, I think, as it is too stony.
2542. What is the character of the land for 20 miles back? I have never been down very much along the Macquarie, but I have driven through there. It is box country. Nearly all of it is good farming country.
2543. You have seen it cultivated I suppose? I have seen little bits off the road.
2544. Do you know any of the farmers there? I do not know their names.
2545. Do you know whether they are satisfied with their prospects as farmers? I do not know the men at all except right on the Macquarie. I know a few of the names there. That, of course, would be further back than what you say.
2546. You do not know much about that country then? No.
2547. Coming further this way, towards Gilgandra, what is it like? After the first 10 miles the next 3 miles, I should think, is about the worst portion, if any, for farming on the road. I do not think this strip of inferior country extends more than a couple of miles off the road.
2548. Then coming further north again what is it like? After the 13 miles from Dubbo it becomes fairly good for 3 miles. There is a good deal of ironbark through that country, but it is mostly fairly good.
2549. That which you describe as ironbark country is fairly good for agriculture? Yes.
2550. Have you seen any of it cultivated? Not there.

2551.

2551. Have you seen any similar country cultivated? I had a small bit I used to cultivate which is very similar. It used to grow fairly good crops. It is in the middle of the ironbark country. There is only just a small bit I had for hay for my own use. E. J. Wheble.  
30 June, 1889.
2552. You are satisfied that it is good country for growing wheat? I have at times grown splendid wheat on it. I had only one failure as far as I can remember, but it was put in very late that year. Every other season I used to get a bit of hay. I had more hay than I wanted then; in fact that is what made me stop cultivating it. I found I was feeding the mice.
2553. You think that this country which you describe as ironbark country would be fit for wheat growing? The greater part of it. I do not say it would last as long as the other country.
2554. Then coming still further north, what is the country like? After 16 miles from Dubbo the country nearer the road is better country, you get away from most of the ironbark then. For 4 miles the country is better; there is more box country. It is not so heavily timbered either. I think most of that country is very well suited for farming.
2555. How far north would the country you are now describing extend? It is rather hard to say, because there is a good deal of very inferior country in that. The good country is narrow there, it is not 20 miles wide.
2556. What is the proportion of bad country within that 20 miles? There must be 10,000 acres or 12,000 acres in one patch which is of very little use for agriculture. That would bring us about 30 miles from Dubbo.
2557. Coming further north, what is it like? As far as Gilgandra it is nearly all good agricultural ground.
2558. Do you know anything of the country north of Gilgandra, that is towards Coonamble? I cannot say that I do. I have been down near the river a certain distance.
2559. Do you know anything of the country on the eastern side of the broad red line? I could not speak as to 20 miles wide. I have never been up the Talbragar at all.
2560. Comparing the land you do know with the land you have described on the western side, is it as good, or is it much about the same? No; there is a bit of a difference, though, of course, there are patches in it equally as good.
2561. Do you know the country on the right-hand side of the Talbragar? No.
2562. Speaking of the country you have just described, how many acres do you think would reasonably support a man and his family—would give him not merely a bare living, but something to put away besides—that is, with a railway? I see a great many men with 2,500 acres doing apparently very well about here; they are mostly new settlers.
2563. That is for sheep, and a little bit of cultivation for themselves? Yes; but there is no cultivation worth speaking of.
2564. Do you know any one with less land than that who is making a living off it? Yes, a few. There are not very many.
2565. At any rate you think, to average the country right through, we can regard 2,500 acres as sufficient to maintain a family on, assuming that a railway is built? Yes. I never did any farming myself. I do not think less than 2,500 acres would do. I think a combination of the two is wanted.
2566. And you think that they could do very well? Yes.
2567. Do you think, if the land now held under lease were thrown open, there would be any demand for it? Yes.
2568. Do you think it would be rushed? It would be all taken up except perhaps a few very inferior portions.
2569. It would take longer, I suppose, if there were no railway, or if the whole of the lands in this division were thrown open? Yes, the lands would be taken up, because it is all taken up now which can be taken up.
2570. You think that if a railway were constructed a much larger population would be settled here? No doubt.
2571. And that there would be a considerable local traffic which would make the line pay? Yes.
2572. *Mr. Levien.*] At a similar inquiry you said that you had 32,000 acres of leasehold land, and that it will carry about 16,000 sheep? With the other it will.
2573. In reply to Mr. Hassall's question, "What proportion of your land is suitable for agriculture?" you said, "Most of it," do you say so still? I do.
2574. If most of your land is suitable for agriculture, and you could get a railway here, it would be of some benefit to you, and make your land more valuable, would it not? Yes.
2575. I suppose you would go in for more agriculture than you do now? I would. I have not gone in for any, you may say.
2576. How many bushels of wheat to the acre do you think it would give? I have never done any farming; but so far as I can hear from others about here I reckon it would average about 15 bushels to the acre, taking one season with another.
2577. If the railway passes through your holding, will you be prepared to give the necessary land to the Government? Yes; and if I did not give it I suppose you would take it.
2578. *Mr. Watson.*] Would it go through a portion of your land? Yes; the survey goes through a portion of my property.
2579. The land then would be a bit more valuable than it is now? Yes.
2580. Do you think the traffic on the line would be sufficient to make it pay, if it were taken right through to Coonamble? I think it would.
2581. Would you be prepared to back your opinion in that respect by expressing a willingness to pay a betterment tax in the event of there being a deficiency in the earnings of the railway? I should.
2582. The betterment tax which has been imposed in respect of several recent railways is 1d. per acre for land within 5 miles,  $\frac{1}{2}$ d. per acre for land within 10 miles, and  $\frac{1}{4}$ d. per acre for land within 15 miles? I should be willing to pay that tax as to the freehold and conditional purchase land.
2583. Do you entertain any doubt of the railway paying, allowing for the collection of traffic from the Coonamble side? I think it ought to pay well.
2584. Judging from what lines you know of elsewhere, you think this line ought to pay from the jump—that is to say, that the country here would be as well developed as elsewhere? I think it would pay well.
2585. *Mr. Trickett.*] When Mr. Harper was examined on this proposal, he was asked this question: "What

E. J. Wheble. "What are your views as to the character of the country to be served by the proposed railway?" and his answer was, "A good deal of it is very rough and bad—that is, between Dubbo and Gilgandra";—do you think that is a fair description of the country? No. There is a certain amount of country that is bad along there, and I pointed out to you as well as I could where it was; but beyond that, the other I consider is good.

30 June, 1899.

2585. It is not fair, you think, to say, as a general description of the land, "a good deal of it is very rough and bad"? No; I think by going along the road you see the very worst.

2587. But with regard to the badness of the land, where agriculture has been attempted between Dubbo and Gilgandra, has it been successful, as far as your observation goes? Yes.

2588. Have very many tracts of country been taken for agricultural purposes along the road? After you get a little bit away from Dubbo, there are six or seven portions of land I know which have been cultivated successfully. Some of them started years ago, and cultivated, and kept on. I have seen really good crops grown on them, and on the country which is not supposed to be good for agriculture.

2589. Mr. Harper also stated that by reason of the country being poor between Dubbo and Gilgandra, the Government could not expect much local settlement, and could not get much local trade;—do you think that would be the case? All the land which has been available for settlement has been taken—every acre of it, I think.

2590. The character of the country as one goes along may not look particularly inviting; but when it is cleared and treated for agriculture, has it been a success in every instance you know of? Yes.

2591. Does that apply to land in the part which would come within the influence of the railway? I do not exactly understand the question.

2592. Mr. Harper says it is poor land all the way between Dubbo and Gilgandra;—do you think that that is not a fair statement, and that the land between Dubbo and Gilgandra, coming within the influence of the railway—say for 20 miles on each side—is fairly good, or good agricultural land? I do not think he was correct in what he said; I do not think he ever saw it.

2593. You do not think he went away from the line? No; he never went on the line at all, I expect.

2594. *Mr. Watson.*] Would it not be probable, if a man followed the road, he would be influenced by the fact that on the stock route there is no ringing at all done? Most decidedly.

2595. And consequently the land is absolutely unimproved? Exactly; he sees it unimproved as he goes along the road.

2596. *Mr. Trickett.*] You have been here for seventeen years;—can you give us one instance where a man has gone in for agriculture, and it has proved a failure by reason of the bad character of the soil? No; I do not know of one case.

2597. You, not being a farmer, would only use the railway for sending wool? At present; but if the railway passed through my place, there is no doubt that I would go in for farming. At the present moment I would not go in for farming unless there were a railway.

2598. The reason being that you are too far away from the railway? I am too far away, I consider.

2599. Do you still send your sheep into Dubbo to be boiled down, as you did when you gave evidence before? No; I have sent several lots down to Sydney since. I sent down 4,000 fats during the last year.

2600. Even during this prolonged drought the Dubbo district has got on very well as regards sheep? I think so. There has not been much loss about here that I know of. In answer to that question about boiling down, I may say that I never tried to fatten any wethers before. I would rather sell them as stores at that time. Even then, for the sheep I did send, I got a very good price—perhaps more than I would get in Sydney, or as much anyhow—at the commencement of the boiling down, when the fat was high.

2601. If you got a railway passing through or near your estate, you would be more inclined, I suppose, to send your stock to the Sydney market? Yes; it would be a great advantage. You could often send away a few at a time, and in the end send away a good many; but now a man has to hold until he has a certain number. It is not worth his while to send a few when he has to drive them.

2602. In your evidence at the previous inquiry you said, "Any fat stock I have sent to the boiling-down establishment at Dubbo"? That is the only lot I ever sent away.

2603. In seventeen years? Yes; I always sold them as stores rather than fatten them.

2604. Suppose a man were 15 miles on this side of Dubbo, do you think he would be likely to use the railway, or would he drive the stuff into Dubbo if it was going to Sydney? Most decidedly, I should think he would use the railway if it were alongside him.

2605. It would pay him better to do that than to lose his time? Yes.

2606. We are told that the road between Dubbo and Gilgandra is an excellent road in all weathers;—is that so? I never heard that before. I should think it is nearly always bad; whether it is wet or dry it is all the same.

2607. The Warren-Coonamble line, I suppose, would be really of no use to the people about Gilgandra? It would be of no use at all.

2608. Would the Mudgee-Coonamble line be of use? I suppose it would be of use to them.

2609. That is, to the north it would be of use; but between Gilgandra and Dubbo it would be of no use to them? No.

2610. Do you think if a railway were made between Dubbo and Coonamble the team competition would still beat the railway? No; I believe it would if the line were made from Warren to Coonamble.

2611. *Chairman.*] Have you paid any attention to the trend of the traffic since the Warren railway has been constructed;—does the traffic from Coonamble go down to Warren, or does it go to Dubbo? I do not think it has made any difference; I do not think the branch from Nevertire to Warren has diverted any traffic.

2612. As regards the traffic north of Coonamble, is Dubbo its natural depôt? Yes; it always has been.

2613. Did the construction of the line to Warren, which would bring Coonamble somewhat nearer to the railway system, divert the traffic at all? I do not think it did.

2614. And the traffic still goes to Dubbo? Of course a great deal of the traffic was diverted before that branch was made.

2615. By what? By some disagreement which they had there between the Carriers Union and the wool-growers.

2616. Is it finding its way back again to Dubbo? Yes; it has been during the last year or so.

2617.

2617. *Mr. Shepherd.*] How much freehold have you? About 6,500 acres; also some conditional purchase and conditional lease. E. J. Wheble.
2618. What is its carrying capacity? When it is fully improved it would take about an acre and a quarter—something over an acre—to carry a sheep in a fair season. 30 June, 1899.
2619. Have you any of that land thoroughly cleared? None.
2620. What does it cost you to clear the timber off the land? I never did any.
2621. Have you cultivated any at all? Ten or 12 acres.
2622. Have you grown any fruit at all? Very little. The orange-trees seem to do well, but the peaches do not.
2623. How long is it since you first planted fruit-trees there? Ten years, I should think.
2624. You cannot give an idea I suppose of the return from your fruit-trees per acre, or anything of that kind? No; I have only a few trees round the house.
2625. What wool did you produce last year off the whole of your holding? I had 100 odd bales last year.
2626. Do you keep any cattle? Only a few; only a milking herd.

John Wheaton, farmer and grazier, sworn, and examined:—

2627. *Chairman.*] What are you? I am a farmer and grazier, residing at Drillwarren, which is 14 miles south of Gilgandra, and 26 miles north of Dubbo. J. Wheaton.
2628. *Mr. Trickett.*] What is the extent of your holding? Two thousand five hundred and sixty acres, conditional purchase and conditional lease. 30 June, 1899.
2629. How long have you held the selection? About two years. In that time we have cleared 200 acres. It was all fenced when I took it up.
2630. What have you done with the land? We have put 150 acres under wheat. We had 8 bushels to the acre last year. I did not have 150 acres under wheat last year.
2631. Will you describe your experience on the selection? My boys and I cleared 80 acres. I have not paid for any clearing. I sowed the land. I cannot say I cultivated the land, because some of it was not put in until the middle of July. We thought it was an excellent crop, considering the way it was put in and the season we had. We have been clearing and scrubbing ever since then, and we have about 200 acres cleared now. The season has been bad, and we have only been able to put in 150 acres this year. It is not sown as they cultivate in South Australia. In that colony successful growers only cultivate once in three years. They fallow up at this time of the year; they scarify and work it again. Several South Australians said I would not get my seed off the ground. I brought my stock and implements from South Australia. I have only had one crop.
2632. How is that getting on? It is only just up, and some of it has been put in nearly as badly as it was last year.
2633. This season has been a very disadvantageous one for you? Yes.
2634. How does the land here compare with the land in South Australia for wheat-growing? There is really no comparison. It is before the general run of the best land in South Australia for farming—that is, the whole of the land from Yellow Creek to Gilgandra. The quality of the land is better, and the rainfall is better.
2635. You were a farmer in South Australia, and having come here and inspected this part of New South Wales you were satisfied to take up 2,560 acres? Yes. I sacrificed 2,000 acres in South Australia to take up this land. I sold out for £1 an acre less than I gave for the land seven years before.
2636. Had you seen other farms here? No; only round Dubbo and going through in the railway. I went out to Berida and travelled 30 or 40 miles round Dubbo. I did not go to Narramine.
2637. Were you so satisfied with what you saw as to the wheat-producing capacity of this country as to come over here and take up this land? Yes.
2638. What is the general character of the country about here for wheat-growing? My opinion is that it is all first-class land for wheat-growing. There may be a few ridges in some of the places, but it will be, practically, all taken for cultivation. In all cultivation districts there are always a few ridges which are almost useless except for a little grazing or anything of that kind.
2639. Do you know the proposed line between here and Dubbo? Yes.
2640. How far are you from that line? It runs across the corner of my paddock.
2641. If you were asked to give a general description of the country for growing cereals for a distance of 15 miles on either side of the railway from Dubbo to Gilgandra, how would you describe that country? I would describe it as all first-class agricultural land—that is, with a few exceptions. You might get some small blocks in an area of 2,000 acres, which would not be much good.
2642. How long were you farming in South Australia? I was farming on my own land for twenty-six years.
2643. After twenty-six years' experience of farming in South Australia, would you consider it a fair description of the land between here and Dubbo to say that, on the whole, it is poor, ridgy country and not likely to develop settlement? No; and anybody who said so has never had any experience in farming, taking the land with the rainfall on it.
2644. You know Mr. Brown's property at Branston, which is within 6 miles of the proposed railway? Yes.
2645. What is your opinion of that as a wheat-growing area? I consider it is first-class land. There is a lot more of it further to the west than that. I was looking at the land, and it appeared to be all first-class agricultural land. Two of the South Australian wheat farmers were looking at the ground at the same time.
2646. Could you say how far west? I think it is 6 or 7 miles.
2647. In your search for land, what area of country did you go over between Dubbo and Gilgandra;—did you have a good look all round the country? I was looking round for three weeks, but I could not tell what land I saw.
2648. I wish to ascertain whether the area you traversed will come within the influence of this railway;—did you go beyond Gilgandra when looking for the land? No; I went to Berida, which is 15 miles west of Gilgandra towards Warren.
2649. If you had not secured your present holding, did you see numbers of other places between Gilgandra and Dubbo which would have been suitable for your purpose? I did not inspect any with a view to purchase. If I had not secured that holding I was going to take up a small area close to Dubbo and my sons were going to come over, and we were going to ballot for land. 2650.

J. Wheaton. 2650. But did you see lots of good agricultural land? Yes. I saw lots of places which were really good, but not to inspect them with a view to purchase.

30 June, 1899. 2651. As a practical farmer, do you think this district is likely to be a progressive one as regards wheat-growing? I am sure of it. The same districts in South Australia which have gone ahead have not half the show which this district has had. As soon as a railway is built you have double the produce grown, and you can send stuff to market. The wheat-farmer can send in poultry and pigs, and he can have small gardens and send in everything which is likely to be wanted. I lived where there was a railway close to me, and it seemed to double the produce which was grown in the district, although it was an old settled district. When the railway was extended everyone was growing a little and sending away stuff.

2652. For farming operations, has your experience been that a railway is necessary for getting the produce to market? Yes; my experience is that if you want to get produce to market you must have a railway within 15 miles—that is, to grow other things besides wheat. You can take wheat further than that distance. The secret of success in farming is to make little things help to pay, and in a bad season if you have other things coming in you can keep things going.

2653. Is it not an advantage for wheat not to be carted too far? Most decidedly. The less distance you have to take it to a railway the better. Wheat does not get injured in transit. What causes all the success in farming is rather the poultry, and pigs, and butter, and cream. We can take wheat further than we can take those things; you cannot send those things far, as they would be injured in transit.

2654. Is it such a district that a man with a small beginning may expect to go on improving his prospects? Yes. There is a man adjoining my holding who started on 1,000 acres. He had just about enough to start. He is in a very fair position to-day on 1,000 acres, and he has had only sheep. He is going in for cultivation now in the prospect of a railway coming, but he is getting rather slack, as he is afraid that there is not going to be a railway.

2655. What was the average yield of the wheat crop in South Australia where you were? In the district I lived in the average was about 8 bushels. I lived in a favoured part of South Australia.

2656. What was a payable crop? That was only grown once in three years. Sometimes there would be more and sometimes a bushel or two less, but the district would average about 8 bushels.

2657. From inquiries in this district, what do you find has been the average crop here when the land is kept in a fair condition—is not just scratched over, as you appear to have done with yours? Last year some land which was put in fairly well went 15 bushels, and the year before several places went 20 bushels, and some places 30 bushels, but my belief is that if it is worked properly one year with another they can average from 15 to 20 bushels. That is a good payable yield if you can get 2s. 6d. a bushel.

2658. You would look upon 15 bushels as a good payable yield for an average? Yes.

2659. Is this a kind of soil which you think will last for cropping? I feel sure that it will last for cropping—that is, with fair treatment.

2660. Would you consider last year a fair season? No; because it is the driest on record for the time of year when we wanted rain.

2661. So that if the crops gave even a small yield during such very bad droughts as we have had, it is an indication that the district generally is one in which crops will thrive in ordinary circumstances? Yes.

2662. Is there anything else you wish to mention? I wish to mention that east of me there is a bit of country—what they call the Old Arbor country—which has a terribly bad name. My father has had some experience in farming, and when he was over here last year I told him I would show him what was called the worst land in New South Wales, and he said if I live another ten or fifteen years, and the people have a chance, the whole of that land will be occupied and made payable. It is not first-class land; a lot of it is box land, and there are some ironbark ridges, but not stony; they are sandy. On the eastern side of this Old Arbor country there are farms all round. Two men who came from South Australia twelve months ago took up some of the ground which is thought worthless; but it has a bad name, because there are so many dogs there. That is on the east side of the line. There are four or five farms round there. I have inspected several of them. I was speaking with a man who wanted to look at them. I believe it is first-class country there.

2663. Even although the country is pointed out now as a very bad bit of country, you think that in time it will be utilised? I am sure it will. A lot of it is box flats, which will be first-class land.

2664. As showing the suitability of the land for growing cereals, is it not a fact that many farmers have come here from South Australia and Victoria, and settled in the district, and are doing well? Yes. I have known six round Dubbo within the last two years who have come from South Australia, and they are all thoroughly satisfied.

Walter Gentle Brown, grazier and farmer, sworn, and examined:—

W. G. Brown. 2665. *Chairman.*] What are you? I am a grazier and farmer, residing at Branston, near Coolbaggie. I have been residing there a little over nine years.

30 June, 1899. 2666. *Mr. Shepherd.*] What is the extent of your holding? 10,240 acres of conditional purchase and conditional lease between my father and myself. We have no freehold.

2667. How much land have you cleared for cultivation? 150 acres.

2668. What has that cost to clear? What has been done by contract cost 14s. an acre.

2669. Have you had the land cropped for any length of time? We have had a small portion of it cropped for about nine years.

2670. What has been your average yield? It has been all cut for hay up to last year. I suppose the average yield is close on to 30 cwt.

2671. What was the yield of wheat for last year? Last year it ran from 2 bushels up to 10 bushels.

2672. Do you consider that satisfactory? We do not consider 2 bushels satisfactory.

2673. Did it pay you for cultivating the land? It did not pay all the expense. We just cleared that area; it was new ground ploughed up and put in.

2674. Did you attribute the small yield to the bad season? Yes.

2675. Have you had a succession of bad seasons here, similar to what we have had all over the Colony? We have had them for five years now.

2676. How many sheep have you? 6,400 is the number returned for the year. We had eighty-four bales of wool last year.

2677. What do you estimate that to be worth? About £800, at the price ruling last year. Now it would be worth a good deal more. 2678.

2678. Do you find any difficulty in conveying your produce to Dubbo? We have no difficulty, as there are always plenty of teams to Dubbo. W. G. Brown.
2679. Would you be induced to cultivate a larger area if you had a railway? Yes; in fact, we would go in for more cultivation whether there were a railway or not. 30 June, 1899.
2680. I suppose the distance is almost too far to pay you to grow wheat? It is rather far, but it could be done right enough. Where we are is 22 miles from Dubbo. We pay £1 a ton for carriage.
2681. Have you grown anything but wheat there? We have grown maize and sorghum.
2682. How has your maize crop turned out? Generally speaking, it has not turned out very well. It has not been properly cultivated, and that is principally the reason why it has not turned out well. The sorghum has done very well.
2683. Have you averaged the produce of the maize? No; we have only just grown a little of that. We never kept any record.
2684. How much sorghum have you had under cultivation? In some years we put in 3 or 4 acres, and cut it for greenstuff.
2685. I suppose you did not estimate the yield of the young sorghum? No; we never kept any record.
2686. Do you find the sorghum answer well? It does very well.
2687. I noticed that you have a small fruit garden;—do you find the soil answers well for fruit-growing? For most trees it suits very well.
2688. What kind of fruit do you consider you can grow there successfully? Peaches, apples, apricots, oranges, and mandarins.
2689. Do you think it would pay you to grow these fruits if you had a railway? Yes; especially apples and oranges.
2690. You think it will induce you to grow more largely for market? It might be an inducement, but we are not likely to do it.
2691. I understand that you have come from South Australia? No; I am a Victorian.
2692. You know the country generally between Gilgandra and Dubbo? Yes; on the western side I know it very well.
2693. Taking the country in sections from Dubbo, how would you describe the land for 15 miles on either side of the proposed line? On the western side, between Gilgandra and Dubbo, it is all fairly good country, some of it being very good; but, as regards the eastern side, I cannot say much about the country. I have not been far across the road—only in places. The country on the western side, with few exceptions, is good pastoral land, and very good agricultural land.
2694. Some of it, I suppose, you do not consider fit for agriculture? On the western side I consider 90 per cent. of it is fit for agriculture.
2695. There is a large trade in sawn timber and sleepers between Gilgandra and Dubbo? There are a good many sleepers cut.
2696. Do you think the supply is nearly exhausted, or is it likely to last for many years? I think on the eastern side, upon the Castlereagh, there are a good many sleepers left there yet.
2697. Are you acquainted with the country between Gilgandra and Coonamble? I have never been north of Gilgandra.
2698. You are of opinion that a railway will pay if it is constructed from Dubbo to Coonamble? Within two or three years after it is constructed it would almost be certain to pay.
2699. You do not think it would pay from the start? It might; but I would not like to say it would pay for the first couple of years.
2700. Do you think it would induce a larger population to settle? Decidedly, if the land were made available.
2701. Are you acquainted with many of those who have taken up land, and are cultivating it, between Gilgandra and Dubbo? I know a good many of them.
2702. Do they generally seem satisfied? They are all well satisfied.
2703. Are they inclined to extend their cultivation areas? They are all extending their cultivation every year.
2704. Would you be induced to extend your cultivation area largely in the event of a railway being made? Yes; we intend to go on extending it.
2705. Do you not think your yield is likely to increase beyond 10 bushels an acre? I hope so.
2706. We have had evidence to the effect that as much as 40 bushels an acre have been produced between Gilgandra and Dubbo;—have you any hope of producing anything like that yield per acre? It would be an exceptionally good season if it produced 40 bushels. In 1894 we used most of the wheat crop for hay; but a small portion which we converted into wheat yielded 25 bushels to the acre. Last year our hay crop gave 2½ tons to the acre.
2707. Have you ever attempted to improve your land by manuring with green crops or anything of that kind? No; we never use any manure.
2708. Have you cropped every year? For nine years one paddock has been cultivated.
2709. Without giving it any spell? No spell whatever.
2710. *Chairman.*] Do you wish to make any other statement? No.

James Bell, selector and grazier, Balladoran, sworn, and examined:—

2711. *Chairman.*] What are you? I am a selector and grazier, residing about 2 miles from Balladoran, which is 30 miles from Dubbo. My selection consists of 2,560 acres. J. Bell.
2712. *Mr. Watson.*] So far, have you been using your land only for grazing purposes? Yes; I have not tried any cultivation yet. 30 June, 1899.
2713. How many sheep can you run on that area usually? I have not got it all improved yet; but according to the last return I made I had within a few sheep of 2,000.
2714. It is not stocked to its full carrying capacity yet? Nothing like it.
2715. You have not got it all rung yet? I have; but there is a lot of scrub up again.
2716. When it is scrubbed you think it will carry more sheep? I think so.
2717. Did you hear the evidence which was given in respect of the character of the land generally between Dubbo and Gilgandra? Yes; I have heard a good bit of the evidence given here to-night.

2718.

- J. Bell.  
30 June, 1899.
2718. Do you endorse the statements which have been made in respect to the general suitability of the land for agricultural development? I do. I do not think any of the witnesses have spoken too much in favour of the country between Dubbo and Gilgandra.
2719. Summed up, the evidence so far has been to the effect that while there are bad patches, or poor patches, here and there, the greater part of the land improved is fairly fit for agricultural development? I think it is, as far as my experience goes.
2720. Do you know whether there is any large area of Crown lands still to be thrown open between those points? I believe there is a very large area.
2721. Do you think if it were thrown open, and a railway were constructed, there would be a fair demand for the land? I think it would be eagerly sought after.
2722. You think the Government would get a better price for the land with a railway than without one? I do.
2723. Do you reckon that the probable amount of traffic, both local and from and towards Coonamble, would be sufficient to make the railway pay if constructed? I live pretty near the road, and there is a heavy traffic along the road.
2724. I suppose it is fair to assume that there will be a greater amount of traffic drawn by the railway than will go along the road? No doubt there would. I am quite sure that if the railway were made there the acreage of wheat would increase in a very few years to a wonderful extent. From living in the district I know the opinions of the people. I know most of the people between here and Dubbo.
2725. Do they seem to think that they would increase the cultivation areas with a railway? Yes.
2726. Do you think a railway from Mudgee to Coonamble would be of any value to the people down about Balladoran? I do not think it would be of the slightest value to the people down there.
2727. The railway would be too great a distance from them to be of any practical value? Most certainly.
2728. If that line came within 35 miles of you, it would not be of any value? No; I would sooner go towards Dubbo.
2729. Is there anything else you would like to say in respect of the proposed line from Dubbo? No; only that I am of the opinion that if it were built the area under wheat would be increased in a few years to a large extent.

Sydney James Barden, grazier, sworn, and examined:—

- S. J. Barden.  
30 June, 1899.
2730. *Chairman.*] What are you? I am a grazier living at Myall View, 8 miles from Gilgandra, towards Coonamble.
2731. Have you done any farming? Yes.
2732. Do you know the country well between your place and Dubbo? Fairly well. I have been in the district twenty-four years.
2733. Can you give a general description of the land to be served by the proposed railway? The greater portion of the land between Gilgandra and Dubbo is suitable for agricultural purposes.
2734. Would the other portion be of any value whatever—say, for pastoral purposes? It is. I included that with the agricultural land.
2735. Would you describe the country between Gilgandra and Dubbo as being eminently suitable for mixed farming? I do; but, of course, there are patches which are not suitable. You will find these patches in the most favoured districts.
2736. Those portions which would not be suitable for wheat-growing would be suitable for pastoral purposes? The greater portion of them.
2737. Have you ranged much over this country? Yes; a good deal.
2738. How far west from the proposed line have you been? Beyond Warren. I know the country between Gilgandra and Warren well.
2739. Taking the country for 20 miles west of the proposed line, the remarks you have just made as to the character of the country would apply? Yes.
2740. Taking the country to the east of that line from here towards Dubbo, what is it like? It is good agricultural land.
2741. How should you describe the land between the Castlereagh and the Warrumbungles? I should describe most of that country as first-class land for agricultural purposes and good grazing land; also of course, there are patches which are not first-class.
2742. And also suitable for mixed farming? Very much so.
2743. How is the land generally held on the route of the proposed railway—in large or medium-sized holdings? It is held in large holdings and small holdings. There are numbers of small holdings.
2744. I mean is it held, not under lease, but as conditional purchase or freehold? There is a great deal of conditional purchase land.
2745. Have they large holdings—2,560 acres? Most of them have been increased to 2,560 acres.
2746. Can a man get a decent sort of living off 2,560 acres at present without a railway? Yes.
2747. If a railway were constructed, it would induce him to put his land to a better purpose? Yes; I think he would get a better living off a fourth of it, if he were farming, with a railway.
2748. Supposing he had more land than he could well farm himself, would there be any difficulty about getting tenants? I do not think there would be the slightest difficulty.
2749. Are there any tenant farmers in the district? I do not know of any so far.
2750. How far would it pay to carry produce to a railway? I think once you go beyond 20 miles it is rather far.
2751. You think that up to 20 miles you can manage? Yes.
2752. You have grown produce? I have grown a good deal of stuff which I have had to send 48 miles to Dubbo.
2753. It all depends upon the price whether it pays you to send to market? Yes; 3s. will pay me. I had to pay 6d. per bushel for carting.
2754. Have you any idea what the rate per bushel would be on the railway? No.
2755. Did that crop pay you? Yes.
2756. If it paid you to market your produce at Dubbo, 50 miles away, by ordinary team, the construction of a railway would be an inducement to you to increase your cultivation area? It would.

2757. When you were before the former Committee you had 100 acres under cultivation, and you said you would be inclined to increase the area? Yes; I have 300 acres under cultivation this year, and if a railway were guaranteed, I would have 1,000 acres in a very short time. S. J. Barden.  
30 June, 1899.
2758. With ordinary carriage by team, what minimum price would pay you to grow wheat? Two shillings and sixpence; it would pay me better than sheep.
2759. You think that if a man had a fair area to farm, 2s. 6d. a bushel would pay him? I am sure of it.
2760. You are quite clear in your own mind that the land is fit for wheat-growing? It is highly adapted for wheat-growing.
2761. It has proved that it is so? Yes.
2762. If a witness has stated that the land between Gilgandra and Dubbo is, generally speaking, poor, he makes a mistake? I think he had little or no experience in farming.
2763. Would the land on the eastern side of the Castlereagh average better or worse than the land on the western side? There is a greater extent of agricultural land on the eastern side, but it is not better than the frontage to the western bank. It runs back to the foot of the Warrumbungles.
2764. How far would that be in a direct line? Twenty-five miles.
2765. You think that whoever reported that the land was not suitable for agriculture, generally speaking, could not have made a proper examination of the country between Gilgandra and Dubbo? I think so.
2766. A witness made this statement to the Committee:—
528. I understand you to say that there is no probability of an agricultural settlement for the first 30 or 40 miles from Dubbo? Thirty miles—until you get to Coolbaggie Creek.
- ? The land is very good. Of course, there are patches of bad land which you will find in all countries; but taking it on the whole, I think it is highly adaptable for agricultural purposes.
2767. How would you describe the country along that road? Of course there are patches along the road—just a few acres—which are very bad.
2768. You think this information was gained by just driving along the road? I do.
2769. Had he gone wide of the road he would have found different country on either side of the road? Yes.
2770. How would you describe the country to Coonamble? I would describe the country on either bank of the river as high-class agricultural land. After you get a few miles from the western bank of the river going down, say, 20 miles from Gilgandra; after you get out 10 or 15 miles it opens out into what you may call pastoral land entirely, black myall plains.
2771. Is it good fattening country? Nothing better; but along the banks of the river, right away to Coonamble, it is all agricultural land.
2772. How wide would the strip along the banks of the Castlereagh be? I should think it would average a mile; that is, what we call the river flats. Then, on the eastern bank, it extends right away to the Warrumbungles, both high-class grazing and agricultural land.
2773. The leases are falling in next year? Some of the leases are falling in this year.
2774. Have you any idea if the Department is preparing a subdivision of these leases? They have already been surveyed.
2775. Are you getting ready for the subdivision? No; but I think lots of my friends are. I feel sure that the whole of the land, as soon as ever it is thrown open, will be snapped up.
2776. Do you think there will be any difficulty about getting any of the land? I do.
2777. You think there will be more than one application for a block? I think it will amount to a very large ballot for a considerable time. The land has been locked up so long that there will be a rush for it.
2778. Would you say that 90 per cent. of the blocks will be balloted for? Yes, for a certain time. I suppose the rush will work off in time.
2779. That land will be rushed by what you term small landowners in this district? Yes.
2780. Have you had any experience of the results that have followed the construction of a railway in other districts? No; but I have a pretty good idea that things will improve here very much.
2781. You have been along the route of the railway? Yes.
2782. Comparing it with the country through which other lines have gone, if it is found that it has been a wise policy to construct those lines you would not hesitate to say it would be a wise policy to construct this line? I feel sure that this will be a paying concern from Dubbo to Coonamble.
2783. If you get rid of any localism in your mind, would you say, on national grounds, that this line should be constructed? I think, as a national affair, it would pay.
2784. You think it would be a good speculation? Yes.
2785. *Mr. Watson.*] You stated that you paid 6d. a bushel to the teamster to take your wheat 48 miles to Dubbo;—what is the trainage per bushel from Dubbo to Sydney? About 7d., I think.
2786. So that for 277 miles carriage by rail you would pay 7d. a bushel, and for 48 miles carriage by team you would pay 6d. a bushel? Yes; and in some seasons you would pay more.
2787. The presumption is that 48 miles carriage by road is nearly prohibitive, unless the prices are fairly good? It is.
2788. *Chairman.*] If a railway were constructed, and we had really good seasons, would you truck your fats rather than drive them? Yes. It would be a great benefit in many ways. Without a railway you have to wait until you have a certain draft which it will pay you to take into Dubbo; whereas with a railway, if you had 100 fat sheep, you could truck them at once. Again, if you had ten horses, or nine or ten head of fat cattle, you could truck them. The cost is too great to drive a small number.
2789. Suppose a man had a large number of sheep, would it not pay him to drive them? You may be fattening sheep; but you may have only 100 of them fat at a time, and the same with horses and cattle.
2790. It would always pay a man to truck his fat stock in preference to driving them? Yes; more especially where the country has been taken up.
2791. *Mr. Trickett.*] The Government have stated that if this line is constructed the average rate for goods will be 32s. per ton;—what is the rate now from Dubbo to Coonamble? I think it is £4 at present. The usual rate is about £3 a ton.
2792. If a railway were constructed, and only 32s. a ton were charged, on an average, for carrying goods, do you think there would be any possibility of the teams under-cutting the railway? Not a possible show. In bad seasons they cannot travel; they have to camp if there is any wet weather. It is not possible for a team to travel with a load then.
2793. So that if the railway were constructed, and that rate charged, the Government would have a monopoly of the carriage? Certainly. There is no possible chance of teams competing with the railway here. They will not do the roads, I believe, with the expectation of getting a railway here. I have been growing stuff for twenty odd years, and during that time I have never known a total failure in growing

- S. J. Barden. growing crops. If I did not grow a crop which produced wheat, it produced a certain amount of hay. I cannot call to mind any one total failure.
- 30 June, 1899. 2794. *Chairman.*] Have you cropped the same land pretty frequently? It has been cropped every year for twenty odd years. You can go down 10 or 15 feet.
2795. *Mr. Levien.*] Did you ever try oats? Yes; but they grow too strong unless you take the poor soil for them. I have never used any artificial manure.
2796. *Chairman.*] What has been the average yield in a fair season? From 15 to 17 bushels. I have had as high as 35 bushels and as low as 8 bushels, which I did not consider worth stripping.
2797. During the present time? During the period of twenty years.

Stephen Chandler, farmer and grazier, Yalcogrin, sworn, and examined:—

- S. Chandler. 2798. *Chairman.*] What are you? I am a farmer and grazier, residing at Yalcogrin, 7 miles north-east of Gilgandra. My place is on the eastern side of the Castlereagh; it is on the Coonamble Road.
- 30 June, 1899. 2799. *Mr. Trickett.*] What is the size of your holding? 16,000 acres, consisting of freehold, conditionally purchased and leased Crown land. My holding carries about 3,000 sheep at the present time.
- 2800 Your flock has been very much reduced, I suppose, by the drought? No.
2801. How is it, then, that it is not carrying what it used to carry? I had between 500 and 600 head of cattle on the land this season, besides the sheep.
2802. What do you consider the full carrying capacity of your holding for sheep? If it were improved, about a sheep to the acre, I think, in fair seasons.
2803. Is yours an average of the land on that side of the river, or is it better than most of the land? I think it is about an average.
2804. Have you gone in for any farming? Yes; I have about 100 acres sown this year. I have been farming for seven years there, but only on a small scale.
2805. Has it been successful? I consider so.
2806. What crops have you grown, and what has been the average yield? Hay and wheat I have been growing, except this year. What wheat I grew for grain went from 16 to 30 bushels to the acre, and this last year it was very light.
2807. Do you look upon it as first-class agricultural land? Yes, in places; of course, there are patches, some good and some bad.
2808. Is the character of the land generally in the district such as to induce a large agricultural population? I think so.
2809. What are your future operations likely to be—enlarging your grazing or your agriculture? Enlarging the agriculture.
2810. Do you find that pays better than grazing? Yes.
2811. What distance have you to cart your wheat to Dubbo? Forty-eight miles. It is rather too far to cart.
2812. What do you pay for cartage? I never pay for any. I always draw with my own team.
2813. What is the rate of freight for that distance? For other loading I have been paying £2 a ton and 35s. a ton.
2814. How long have you been cultivating wheat in this district? Seven years.
2815. Have you enlarged your operations from time to time, or did you stop with the 100 acres? No; I had 10 acres at first.
2816. You have gone on increasing the area? Yes.
2817. Have you used or sold the wheat which you grew? I have used it for flour, seed, and horse-feed.
2818. Are you likely to enlarge your operations with a view to sending wheat to market? Yes.
2819. Are you preparing in that direction now? Yes; I am getting some land cleared.
2820. What does it cost you to clear land per acre? It has cost me from 15s. to a £, and one very thick bit I have let at 27s. 6d. an acre; it is pine and box country.
2821. Does it cost about the same for both? About the same.
2822. That would be land which has been ringbarked for some time? Yes; it has been rung for some time, but there is green timber through it still—seedlings which have grown up.
2823. Does that add to the cost? Yes, a good lot.
2824. Generally, do you not look ahead, and have the country all rung, so as to save the expense of clearing? I have not done so. The country has all been rung, but suckers have grown up and seedlings.
2825. Is it better to ringbark country some time before you clear it, or to clear it as green country;—suppose you were to clear the country right away, would that be very expensive? It would be more expensive than if it were cleared some years after it was rung.
2826. A farmer who came here and look up land would have to tackle the clearing at once? Yes.
2827. What would it cost per acre to clear green country? It depends upon the timber. I suppose it would run from 25s. to 30s. an acre.
2828. What do you think of the prospect of this railway, if constructed, advancing this district? I think it will advance the district a great deal as regards farming.
2829. It would create closer settlement? I think so.
2830. Have you had any experience of a district which has progressed by reason of the construction of a railway? In other parts where I have been it always has improved it in that way. I have been up in the Carcoar district, the Molong district, and the Forbes district.
2831. Those districts have all advanced as railway communication has been extended to them? I fancy so.
2832. Were you engaged in farming in those districts? Yes.
2833. For wheat-growing, how does this district compare with those districts? I consider it is quite as good as any of them for farming.
2834. Do you know the country pretty well between Gilgandra and Dubbo? I cannot say I know the country very well—only just along the road.
2835. Do you think it is good or bad country for agriculture? I think in parts it is very good, and in parts pretty rough again.
2836. But, taking it as a whole, you would not condemn it as land which is not likely to advance settlement? No.
2837. How far should you be from this railway? I think I should be 10 or 12 miles distant.
2838. If you were within 6 miles of a railway, and the average rate for goods from Coonamble to Dubbo were

- were 32s. a ton, I suppose you would avail yourself of the railway sooner than pay 35s. or £2 a ton to S. Chandler. cart your stuff to Dubbo? Rather.
2839. It would be a great advantage to you? Of course it would.
2840. You would willingly pay £1 or 25s. a ton? Yes.
2841. Do you know of any farms in the district which have been failures? I cannot say that I do.
2842. The people who have come here have come to stay, and have remained here? Yes; those I know seem to be well satisfied to stay here.
2843. Do you wish to make any other statement? No.

S. Chandler.  
30 June, 1899.

Alfred Mortimer, selector, near Gilgandra, sworn, and examined:—

2844. *Chairman.*] What are you? I am a selector, residing on the west side of the Castlereagh, 2 miles A. Mortimer. from Gilgandra. I have held the selection between nine and ten years.
2845. *Mr. Watson.*] What have you been doing with your land? I have been cultivating for grain. It is too far from the railway to cultivate for hay. It 30 June, 1899.
2846. Have you grown for grain many years? For the last nine years.
2847. Do you think it will pay to take wheat that distance to market with ordinary seasons? It will pay a little, but it will pay better if we have a railway close to us.
2848. What has been the average yield of your wheat crops, speaking roughly? I have never got less than 20 bushels per acre; I had 20 bushels per acre last year. I produce a sample of my wheat.
2849. We can take it, then, that you have a particularly good bit of land? I do not think so. I got the refuse. They had selected all round me before I took up land.
2850. Is this supposed to be a fair sample of your wheat? Yes. I have been stripping on the different farms for the last five or six years.
2851. You do not think your land is extra good land as compared with the rest of the district? It is more sandy—more monkey. Sandy ground, in my opinion, is the best land here, and it will prove so ultimately. I have stripped for everybody from here towards Coonamble. I do not think I have stripped in a fair season less than five bags per acre. I have stripped as high as ten bags per acre.
2852. That is on the banks of the river? Yes.
2853. That is rather better than it would be further back? The further back, I think, the better.
2854. Is the land heavier nearer the river? On the river, and in all seasons, it grows the least crop. It is all black soil—it is not adapted for agriculture; but a mile or so back from the river, where the box country is, it produces a better crop.
2855. Do you mean to say that the average for the district, with ordinary seasons, would be over 20 bushels an acre? Yes, where I have been. I have stripped for a good many gentlemen here, and I do not think there is one for whom I have stripped less than five bags per acre, and for some as high as ten bags per acre. I have stripped nearly ten bags for Mr. Barden. In a season like last year they went in for hay.
2856. Do you always get enough rainfall here to give you a good crop of hay? I believe, with cultivating, we could do without rain at all.
2857. You think the land about Gilgandra is better than the land nearer Dubbo? There are some portions towards Dubbo which are very good indeed.
2858. Taken generally, it would not be so good towards Dubbo as it is round Gilgandra? I think it is.
2859. On the whole? I cannot say exactly on the whole, but there is some splendid land between Gilgandra and Dubbo. There are miles and miles, on one side here, which it would be hard to beat in the country, or in the world.
2860. On the east side there are some scrub ridges here and there? Small patches.
2861. Do you think it would be fair to assume that, with the construction of a railway, a great deal of that land between Gilgandra and Dubbo would be utilised for wheat-growing? It will be all rushed for wheat-growing, every acre of it, and for miles down the river. It is adapted for wheat-growing. The district is only in its infancy yet.
2862. You have heard what the other witnesses have said this evening in regard to the general character of the land? Yes.
2863. Is there anything which you wish to say on that point by way of emphasis? The following is what I got from a well-known firm of seedsmen in Sydney. It speaks well for the character of the land in the district:—
- Dear Sir,  
Many thanks for the apples and peaches, which came safely to hand. The peaches are certainly the finest we have seen; the apples are also very good. We are exhibiting them in our window with your name and address on them, and hundreds of people have a look at them every day.  
Mr. Alfred Mortimer, Lockwood, Gilgandra.
- 202, Pitt-street, Sydney, 9 March, 1899.  
Yours faithfully,  
P. L. C. SHEPHERD & SONS.
2864. I take it from this post-card that you have experimented with fruit? Yes.
2865. Are you satisfied with the results of your experiment? Yes.
2866. Have you attempted to make a business of fruit-growing? I cannot sell my produce here; there is no outlet for fruit.
2867. Do you think a railway would encourage the production of fruit? Certainly.
2868. I should imagine from this post-card that you can grow very good fruit here? We can, and we do.
2869. Do you think that fruit-growing can be gone in for extensively with easy access to market? I am certain of it, and it would pay handsomely.
2870. What kinds of fruit would be best suited to the district? Peaches, apricots, and such like fruits.
2871. You think the rainfall is sufficient for growing those fruits? I think we can do without rainfall if we had high cultivation. We do not look for weather. The only thing we object to is the boggy roads.
2872. Is it a generally accepted idea that, with ordinary seasons and with ordinary prices, from 20 to 25 miles is the limit to the sphere of the influence of a railway upon agricultural production;—with ordinary land and an ordinary season, do you think that would be a fair assumption? It is too far. You could manage with wheat, but you could not manage with other things, such as chaff, and fruit, and vegetables; it is too far to take those things by team.
2873. Consequently, for proper farming, you require to be closer than 25 miles to a railway? Yes; as close as we can get.
2874. The more mixed the farming the greater probability of success, I should imagine, where the climate is favourable? Yes. You see, when a railway runs close to us we can always run a few sheep or a few head of cattle on our cultivation and send them away. We cannot do that now, on account of the long distance which they have to be driven to be trucked.
- 2875.

- A. Mortimer. 2875. Is it also your experience that land which has once been cleared and cultivated will, if allowed to go back into pasture, carry more sheep than land which has not been cleared? Considerably more. I have seen land in New Zealand fattening twenty sheep per acre.
- 30 June, 1899. 2876. Is there any other information you can give us as to the prospects of the railway if it is made? I think that where there is one family now there would be fifty families settled down if we had a railway.
2877. Where are you going to put them? There is plenty of land all round; all it wants is energetic men to use it.
2878. Not yet taken up? No; as good land as is taken up and used now.
2879. Crown land which can be opened for settlement? Yes; some of it is scrub and thickly timbered. If it will grow scrub and timber it will grow anything you like to put in; I think there is really a good future for this district.
2880. If the railway were constructed from Mudgee to Coonamble would it suit you or the people about here? It would be no good at all; we still should have to go to Dubbo. It would be 27 miles from my place to that line.
2881. You would sooner go to Dubbo? Yes; here and there we have a little macadamised road.
2882. Would it not be any advantage to get a connection with the Western line rather than with a line direct to Sydney? Yes; and that is where the Dubbo line would come in so handy for me. The storekeepers at Coonamble are getting their goods from Dubbo in preference to getting them from Warren, on account of the extra haulage. I feel confident that the line would pay 10 per cent. on the capital, because there are no engineering difficulties to be encountered on this route. It is level country, and there are few bridges to build.
2883. *Chairman.*] You think a connection with Mudgee would not suit you at all? No; it would do us harm.
2884. You speak of yourself;—would it suit the district? No. When we can grow produce—for instance, hay—and keep it for years, and there comes a drought in Coonamble, we can take the hay down with our teams. If a line came from Mudgee it would do us harm, because when we had stacks of hay for a dry season it would spoil our market in Coonamble.
2885. The reason why you prefer the Dubbo-Coonamble connection is that it would be a better one generally for the district, and that if you had the Mudgee connection you would only have Sydney for your market; whereas if you had the Dubbo connection, and there were any demand for your produce west towards Bourke, you would get that market and still have Sydney for a market;—is that so? Yes.
2886. Would you truck fats, do you think, to the metropolitan market from here? That I could not say.
2887. In addition to that, the Dubbo connection would give you a quicker connection with the Victorian market? Yes.
2888. So that you would have three markets by the Dubbo connection as against one market by the Mudgee connection? By having the Dubbo line we should have two markets—the west and Sydney.
2889. With the possibility of a third market—the Victorian? I cannot see so far ahead. As we get more land into cultivation we shall keep stacks in reserve. It is impossible when it is wet to use the Mudgee line.
2890. As a district railway, to serve a large district, do you think 37 miles extra carriage to Sydney, *via* Dubbo, would be counterbalanced by the fact that you would have other markets besides the Sydney market open to you by the Dubbo connection? Decidedly I do.
2891. Have any other crops been tried here besides wheat—potatoes, for instance? The seasons are so uncertain. I have grown good crops of corn, but we cannot depend upon the season.
2892. Have you seen any of the ironbark country cultivated? Only in small patches. There are different classes of ironbark land—some are gravelly, and some are sandy. Sandy ironbark will grow good crops. Little quartz gravelly ironbark is not so good.
2893. Of what description is the greater proportion of ironbark country—poor or fair? The greater proportion is fair. Where the ironbark country is, there are always patches along the creeks where the land is really good. Then again you come to a gravelly hill, where it is poor.\*

James Lewis, farmer, sworn, and examined :—

- J. Lewis. 2894. *Chairman.*] What are you? I am a farmer, residing at Clearview, 9 miles east of Gilgandra, up the river. I have been in the district about twenty years, and I have been on this new place seven years.
- 30 June, 1899. 2895. What class of country have you? Light soil.
2896. Have you any of that ironbark land? A small portion; a few odd trees here and there.
2897. Have you cultivated any of that land? No.
2898. Have you heard the evidence which has been given by other witnesses this evening? Yes.
2899. Can you confirm what has been said by the witnesses? A great portion of it I can.
2900. What portion of it can you not confirm—have there been any exaggerations? I do not know. There are things, perhaps, I could not be certain about.
2901. You mean that there are some things which are not within your own knowledge, and that as to the others which are within your knowledge, you can confirm them? Yes.
2902. Have you any doubt as to the future prosperity of this country? Not the slightest.
2903. If the railway is constructed, are you prepared to increase your cultivation? Yes.
2904. Have the results of your operations up to the present been of such a character that it would induce you to increase your cultivation? Yes.
2905. There is no doubt about that? Not the slightest.
2906. Have you any fresh evidence which you would like to give? I had about 47 bushels to the acre the year before this last year, and the lightest I had was 30 bushels.
2907. How many acres did you have in? I had about 70 acres in.
2908. And the 70 acres averaged over 30 bushels to the acre? Yes.
2909. Have you any knowledge of anyone who is farming ironbark country? Yes.
2910. I am told that you did some stripping for a farmer there? Yes. I did some stripping for a neighbour. His holding is all ironbark where this cultivation was. 2911.

\* NOTE (*on revision*):—There is one thing I would suggest, that is to bring the railway nearer to Gilgandra, so that the settlers on the east side of the Castlereagh River would have the benefit of the bridge at Gilgandra; there is no bridge constructed between here and Coonamble, and I think a slight deviation is all that would be required.

2911. How much did he cultivate? About 4 acres. He is only a new settler.
2912. Do you know his holding pretty well? Yes.
2913. Would half his holding be equal in quality to the 4 acres he cultivated? I believe it would. I consider he has ten times better land than he cultivated. He has a lot of good, box country. This bit happened to be close to his house, and he started to cultivate there.
2914. What was the result of that experiment? I think it went about four bags—that is, about a bag to the acre. It was kept down by the wallabies. It got too late in the season to do any good, as there was no rain.
2915. Have you any knowledge of any one else who has tried to cultivate that ironbark country;—there is a big strip of ironbark country on the eastern side of the Castlereagh, is there not? Yes; there is a good piece of ironbark country on that side, and there is a lot of good box flats on that side, too. There are more box flats than there is ironbark country—that is, for a certain distance out from this road.
2916. Do you think there are 400 square miles of that ironbark country on the eastern side of the line? I do not think there is—not within 10 miles of this line.
2917. The Committee has been informed that there are about 400 square miles of worthless land? There may be between Gilgandra and Mendooran. It is nearly all ironbark country over on that side after you get 10 miles away from the Coonamble Road.
2918. Would you take up any land in that ironbark country if you had a chance? Ten miles from this road I would, because there are parts of it where you can get good, box country, and there are parts of the ironbark country which are good. It has a sort of loamy soil.
2919. Could you get sufficient out of a 2,560-acre block to keep yourself and family on? Yes; and it would be a very big family if you could not. Several men I have been stripping for during the last five or six years live within about 10 miles of that country. There is some of the finest country out that way that I have ever seen.
2920. Where is it? It is 10 miles east from Gilgandra. It is out towards Bearbong—Steve Johnson's, Keith's, and Yeo's.
2921. What result has it yielded? From five to six bags to the acre this last season, which was a bad one. On one place the greater part of it was new ground, too.
2922. You say that there is a large quantity of land of the same description, which will produce that yield? There is. A man could get 2,000 or 3,000 acres in one flat without getting an ironbark tree.

J. Lewis.

30 June, 1899.

James Barling, grazier, Bongeabong, sworn, and examined:—

2923. *Chairman.*] You gave evidence before a former Committee on the proposal to construct a railway from Warren to Coonamble? Yes.
2924. You have had an opportunity this evening to look through the report of that evidence? Yes.
2925. Are you prepared to verify that evidence? In every respect, irrespective of the answers to questions 1146 and 1147.
2926. You stated that the carrying capacity of your land was 14,000 sheep in all seasons; we have had a severe spell of dry weather, and you wish now to modify that statement? Yes; during this past season 10,000 would be too many for the land to carry.
2927. Up to 1898 your experience was that it would carry 14,000 sheep? Yes.
2928. But owing to the unprecedentedly long spell of dry weather you have had, you found that it would not carry that number? It would hardly carry that number. I had to get rid of a number of the sheep. In other respects I can verify every statement I made to the former Committee.
2929. In answer to question 1204, you stated that you were preparing about 120 acres for agriculture;—have you cropped 120 acres? I have cropped 100 acres.
2930. Did it come up to your expectations? It is only just out of the ground. From present appearances it is very favourable.
2931. Any statement you made to the former Committee has been borne out, with the exception that the dry weather has altered the situation? Yes.
2932. *Mr. Trickett.*] Have you observed, as a resident of the district, that agriculture is progressing in the district? Altogether so. If the railway is constructed, I guarantee that I will go in largely for agriculture, and very shortly I shall have 1,000 acres in cultivation.

J. Barling.

30 June, 1899.

SATURDAY, 1 JULY, 1899.

[The Committee met at the "Telegraph Hotel," Gilgandra, at 9.30 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

WILLIAM THOMAS DICK, Esq.

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Henry Machin, farmer and grazier, sworn, and examined:—

2933. *Chairman.*] What are you? I am a farmer and grazier, residing at Ranter's Creek, about 14 miles south-east from Gilgandra.
2934. What class of country are you holding? It is all good agricultural land, every acre of which I hold myself. It is timbered with box, bull-oak, and ironbark.
2935. Is there much ironbark? I suppose, out of the 1,600 acres I have, there are 400 or 500 acres of this flat ironbark country with bull-oak all through it, and box-trees here and there. It is not what you call ironbark solely and purely.
2936. Is it a fair average of what they call ironbark country? It is a fair average. The only difference in the run of the ironbark country is that you will get stony ridges here and there; that you would not call a fair average, as it is no good.

H. Machin.

1 July, 1899.

2937.

- H. Machin. 2937. In what is termed the ironbark country in this district, is there much of that ridgy land that is worthless? Not a great quantity of it. From my place to Balladoran, you cross one ridge about 15 miles that you would not call any good. I suppose there is a ridge about a mile wide in the 15 miles.
- 1 July, 1899. 2938. You will be quite safe in saying that less than 10 per cent. of the land is all ironbark country? There is not 10 per cent. of it that is taken up; but taking it all through, Crown lands and all, I would say there are from 15,000 to 20,000 acres selected round there.
2939. How many selectors have taken it up? The Macdonnells, three Mechins, the Tibbetts, Mr. Evans, and Mr. John Duncan. It will all grow wheat. The worst land here is not half as good as the average land in Riverina. I have had considerable experience in wheat-growing in the Corowa district.
2940. How would you compare it with the Corowa district? This has a better rainfall. I do not think the land here, on the whole, is so good, because down there it is all good nearly; you can travel over 100 miles, and it is pretty well the same land all the way. The better rainfall here gives you an advantage. It is a better wheat country here.
2941. You have grown wheat yourself? I have grown wheat for hay only yet. I am only a new settler. I went there in 1894.
2942. What has been the result of your operations so far? I have had a few sheep on the land all the time I have been there. I have also been clearing a piece of land, and got in a little wheat for hay. What wheat I have had in has grown as well as I could wish. I have also several neighbours growing wheat splendidly.
2943. Some of your neighbours have been there longer than you? A year or two only. We all went there practically at the same time.
2944. Have they grown wheat in small quantities for grain? I do not think any of them have grown much for grain.
2945. You are all practical wheat-growers, I suppose? Every one of us.
2946. Are you quite satisfied with your prospects? If we can get a railway to help us to grow wheat.
2947. How far will you be from the surveyed line? As the crow flies, my place is within 10 or 11 miles of the line. Mr. Terry, the surveyor, told me that the nearest point to me would be somewhere near Balladoran.
2948. Your place is about 10 or 11 miles east from the surveyed line? Yes. Mr. Terry, the surveyor, said it is about 10 miles as the crow flies. It is all Crown lands.
2949. Have you any knowledge of the country further east than where you are? Over as far as the Talbragar.
2950. That will be further south-east than where you are? I think so.
2951. How would you describe that country? When you get to the head of Ranter's Creek, there is a rough range—I suppose 2 or 3 miles across; then you begin to fall over towards the Talbragar; then there is a dividing range.
2952. There is a ridge dividing the Talbragar from the Castlereagh? Yes.
2953. Can you tell us generally how that range runs? No.
2954. Do you know the road from Gilgandra to Munderoran? As far as Breealong, about 16 or 17 miles.
2955. Would anyone travelling from say a little east of where you mention towards Munderoran, and travelling down towards Dubbo in a south-west direction, keep on that bad land? I do not think so.
2956. Have you been out as far as New Breealong? That is the run I am on.
2957. Would a line in that direction traverse that bad country you speak about? No; the ridge is more over towards Murrungundie.
2958. Would a track from Murrungundie to Munderoran cross the ridge or run along it? You would cross the ridge; it is a comparatively narrow strip.
2959. Do you know whether any of the settlers in your direction have thrashed out any wheat to try how much per acre it would produce? Not in the bunch of selectors that are there. A little nearer Dubbo they have. I think Reid's place would be the nearest, and that is within 12 or 14 miles of Dubbo.
2960. How many bushels to the acre did they get? Mr. Reid is away now, but he told me that he had as much as 40 bushels to the acre. I told that to some of them in Riverina, and they did not believe it.
2961. Did you believe it? Yes.
2962. You think the ground is capable of producing that yield? I do, because I have seen over 30 bushels to the acre obtained in Riverina.
2963. That is a very exceptional crop? It was only a small patch which produced at that rate per acre. The average has been something over 20 bushels; that is not too bad.
2964. What weight of hay per acre do you think a fair average crop? From a ton and a half to 2 tons, I think. Not in a season like last year, but in an average season.
2965. Would you grow wheat? That is what I intend to do.
2966. If you had a railway, would you? I should grow as much as I can with my own labour. To go in extensively for wheat-growing without the railway would be too much for me, as the cartage is too heavy.
2967. Your neighbours would do the same? Mr. Tibbetts told me he has let 60 acres, and there is more open to let if they like to take it.
2968. What is about the average cost of clearing that ironbark country? Mr. Tibbett's is paying 12s. 6d. for clearing dead timber. I do not know what it would cost to clear green timber. I do not think it would pay to clear green timber. I tried to clear a little, and I gave it up. I am waiting until the timber dries.
2969. What did you pay for ringbarking? 11s.
2970. How long do you wait before it is ready to treat for clearing? Four years would be plenty.
2971. You use it for grass in the meantime, I suppose? Yes; it is all rung there. All the country which is taken up is mostly ringbarked.
2972. Generally speaking, what is the nature of the country on the side of the river on which you are within a reasonable distance, say 20 miles of the railway line? It would be called by the old hands about here rough country; but compared to what I have been used to, we do not call it rough country. In Riverina where land is valuable you would clear anything, but up here Riverina men would call it very good country. A lot of the old settlers about here unless they could get a plain or river flat would not look at it. Several of the old hands have told me that I would starve.
2973. Still they were quite wise in taking the flats? Certainly, but still I think they would starve before they would touch the timbered land.
2974. They did not believe it was fit for anything? No. They will assure you that if you ringbark ground you spoil it; I have been told that since I came up here. 2975.

2975. You have given them an object lesson, and if there is any similar land thrown open for selection, do you think they will take up any? Certainly.
2976. Even the old men who swear by the flats? No; they are too old.
2977. It requires youth and pluck to tackle that country? Yes. It is not a matter of doubt what can be brought out of the ground. They have never seen anything brought out of rough or timbered country, and they think it cannot be done.
2978. But after, you have shown them what can be done? I have not been here long enough yet; if I live I will show them yet.
2979. Generally speaking, you think the country to be served by this railway is equal to any other agricultural country? I am quite certain of it.
2980. And on account of the rainfall you think it is somewhat better than the Riverina country? Certainly. We are all agreed on that about here, and we are all Riverina men out on this side, I think, without exception.
2981. *Mr. Watson.*] Some of the evidence, so far, has been to the effect that for the first 40 miles which the line from Dubbo to Coonamble would traverse—that is, up to Gilgandra,—the country on either side is inferior, and is not likely to assist settlement;—would you feel justified in supporting or contradicting that statement? I would contradict it emphatically.
2982. You think then that the land on either side of the line for the first 40 miles is likely to assist settlement? Certainly.
2983. And help in supporting the up-keep of the railway? I am quite sure of it. I think a lot of the misunderstanding has arisen from old hands speaking comparatively when they say it is “inferior land.” It is inferior land compared with the Macquarie flats; but, as for being inferior land, compared with what I have seen in Australia, it is not inferior. Compared with picked places there is no doubt that it is inferior.
2984. And productive too? Yes.
2985. *Chairman.*] Will it compare favourably with that land which you have seen cultivated in other parts of New South Wales? It would.
2986. And successfully cultivated? Yes.
2987. Have you any other statement you would like to make as to the country generally, or any matter which might be of use to us? No. The men who have come from other parts of Australia and New South Wales are all satisfied; every man I meet is satisfied, and most of them are practical wheat-growers.
2988. Is the whole of your family over here? No; there are only three of us in the country. We are Englishmen. I have only been out here fifteen years. I have been at farming ever since I came out.
2989. Some of the pastoral leases will be falling in very shortly here, if the land is thrown open would you recommend any of your friends to come here? Certainly.
2990. Have you any of them waiting? I could not say that I have anyone in view at the present time.
2991. But you would recommend your friends to come to this district? I would.
2992. And leave Riverina? It depends. If they had a good place in Riverina, I would not recommend them to leave it. I do not think it is wise to be shifting about if you are doing very well. As to getting hold of land in Riverina it is out of the question, because the land is too dear.
2993. *Mr. Watson.*] There are plenty of young men growing up round here who will want land shortly? Yes; but most of them who are brought up about here do not care about it. They have not seen how money can be made out of wheat-growing. I know the friends of mine in Riverina have cleared £4 an acre out of wheat. If you tell these people that land earns £4 an acre, they would say it is not worth the trouble. I think when they see there is money in wheat growing they will take to it. It was just the same in Riverina a few years ago. It was said that wheat would not grow there; it has been proved to the contrary.

Arthur Frederick Garling, storekeeper, Gilgandra, sworn, and examined:—

2994. *Chairman*] Were you examined by a former Committee on a proposal to construct a line in this A.F. Garling district? Yes.
2995. If I mistake not, did you not give some evidence as to an alternative line to Dubbo? Only in 1 July, 1899. reference to the Mudgee line.
2996. You were then of opinion that the Mudgee connection would suit the district better? No; I thought, from a national point of view, it was the line, but since I have studied the different routes and different markets I am altogether of a different opinion. If we have a line to here from Dubbo, we have the Bourke market and the Sydney market; we have a market out north, and we also have access by the Blayney-Harden line to the Victorian markets if they have a bad season there.
2997. When you gave evidence before the former Committee, you had not looked at the question sufficiently closely? No. At that time I had only been a short while in the district. Another thing to be considered is the fact that the Mudgee line, as it is proposed, runs along at the foot of the mountains. There is nothing whatever to feed that line from the east beyond 2 or 3 miles, so that it would be almost a dead letter after the enormous expense of constructing it.
2998. The Mudgee connection would only serve a strip of country between the Warrumbungles and the Castlereagh? That is all.
2999. What is the average width of that strip? I suppose it is from 20 to 25 miles. If the Mudgee line were constructed, the teams would compete against that line, because we are only 40 miles from Dubbo. If they had to cart 20 odd miles from here to the railway to the east, and to pay the extra railway freight, which would have to be comparatively high on account of the expense of construction, the teams would compete, and we should still use the Dubbo line, so that the Mudgee line would be of no use whatever to us. Constructed where it is proposed to be constructed, the teams would carry the stuff to Dubbo, and we should get it away more quickly and cheaply. As it is, I have stuff now coming from Sydney to Dubbo in preference to Mudgee. We shall save 9d. a ton on this stuff, which is going up to Box Ridge, near Gummin. In wool bales, and things of that sort, we can save 9d. a ton after paying the £3 freight by team from Dubbo.
3000. Have your views in reference to the Mudgee connection being a better line, from a national standpoint, been altered also? Yes. After leaving Mudgee, when you pass Gulgong and Tallewang, you pass through a lot of bad country till you get to about Cobborah, and then you strike good country on the banks of the

- A. F. Garling. the Talbragar, and then leaving Cobborah, towards Merrygoen, you pass through a lot more mountainous country. Just at the back of Merrygoen there is a piece of very fair country, and then, almost at the back of Merrygoen, when you are about half way across, you drop into a lot of very barren country, which seems to extend for a long way across and right down past Mundooran—right away down till you get on towards Breelong. You pass through an ironbark forest just this side of Mundooran; it is rather of a barren nature, a sort of white soil with pebbly stones in it, and large ironbark trees. It is the sort of white soil in which you find ironbark growing. This soil is not of much use for agricultural purposes, although it contains a splendid lot of ironbark. Going on down the river, when you get near Breelong, about 12 or 15 miles from here, you fall into good country, and it is good country the rest of the way then to Gilgandra. Then, from there you can extend across on to Tooraweena, along the foot of the mountains. Riding north from Breelong you go through Bearbung, Tooraweena, and Tundaburine, till you get to Box Ridge by Gummin. That carries you to the foot of the mountains. Then you can go down past Tenandra, Mr. Irvine's place.
- 1 July, 1899.
3001. Going north-west from Box Ridge, through Tenandra, what is that country like? It is all good country. That good country extends right across to Gulargambone. The distance between Tenandra and Gulargambone is about 21 miles.
3002. How far is Gulargambone from the surveyed line? The surveyed line from Dubbo to Coonamble runs very close to Gulargambone. That line would serve the whole of these people, from the mountains down, provided that it was not carried too far west from here.
3003. It is within, say, a couple of miles of the Castlereagh;—you think it would serve the whole of that country from Tenandra? Yes, because already they have to cart a great deal of their wheat and produce to Dubbo. Last year I bought most of the wheat, and it was carried. A great deal of wheat, grown right up about Gummin, was brought to Dubbo.
3004. From Tenandra to the surveyed line the distance would not be more than 25 miles? No, it would be within 25 miles.
3005. Would that be too far to carry wheat? No; considering that wheat was carried to market last year by team from Box Ridge and about there, which is between 80 and 90 miles, it would be very easy. The price was 3s. 9d. last year, and the roads were fairly good.
3006. In an ordinary season when wheat would be from about 2s. 6d. to 2s. 9d.? It would be almost useless to grow wheat there when the market would be about that price. If they had a railway within 20 or 25 miles they could easily manage to cart that distance, and make wheat pay better at 2s. 9d. than they would at 3s. 6d. now.
3007. Going further on towards Coonamble, what is the country like? I think in fair seasons they can grow very good crops, but it would not stand the weather so well there. The soil would be too rich in a wet season and too hot in a dry season.
3008. It is good fattening country? It would be splendid fattening country all through Calga. After getting through the Calga boundary, I consider it is sheep country then.
3009. You have fairly described the whole of the land now between Mudgee and Coonamble on the eastern side of the proposed line? Yes; to a distance of about 25 miles.
3010. Do you know the country on the western side of the line? Parts of it, I do. I have been as far as Collie.
3011. Generally speaking, is it equal to, better than, or worse than, the country on the eastern side? Parts of it are equal, but taking it right through it is not equal, but still it is good agricultural land right through to Collie, with the exception of a few places. From Mr. Barling's place right out to Berida it is all very good land, and right on to within 2 or 3 miles of Collie, which is about 20 miles from here, I consider there is splendid wheat-growing land. I have been a little distance in this north-western direction, and it is all very good land—that is, to the left of the Castlereagh.
3012. That is all good wheat land? It is all very good wheat-growing country in through there. Many parts along the river, I think, will be good maize-growing land in ordinary seasons.
3013. Do you know anything of the country as you get on towards Dubbo? Yes; I have been through from Gilgandra to Dubbo a few times.
3014. But off the road? Not off the road a great distance. I have not been much off the road, but still I can form a very fair idea of the country by what I have passed through.
3015. What is your opinion of that country? Most of the country is very good. About Balladoran it is particularly good, and also between here and Balladoran.
3016. Do you know anything of the railway reserve through there? I have not been through it. I know the place where it touches near Bobarah, but I do not know the rest of the reserve. The worst land between Gilgandra and Dubbo is, I consider, about from 10 to 13 miles on this side of Dubbo. There is a strip there about 3 miles wide, which I consider the worst land between Gilgandra and Dubbo. It runs almost east and west.
3017. Have you had any experience of railways running through other parts of the Colony? Yes.
3018. Suppose this line is constructed, would the country it passes through compare favourably with that traversed by other railways? Very favourably with many parts.
3019. Do you know of any agricultural district with railway communication where the railway is paying? Yes; I should say the line from Dubbo up through Wellington and that way is paying very well.
3020. Do you know that country? Yes.
3021. Would this country compare favourably with that country? Yes; a great deal of this country will compare very well with the country between Dubbo and Wellington.
3022. When you say that it will compare very well, do you think the average country here is equal to the average country there? Not quite equal to the average, although in plenty of places it is as good, because there are more of the flats—more flats in under the foot of the mountains. If you took out the mountains you would find the percentage of land here quite as good as the percentage there.
3023. Do you deal at all with sleeper getters? A little.
3024. Do you know what half-round sleepers would cost put on the line here? I suppose about 1s. 6d. each.
3025. *Mr. Watson.*] What do they get for taking them into Dubbo? 1s. 6d. a sleeper, and it takes nine sleepers to make a ton.
3026. *Chairman.*] What do you think a half-round sleeper will cost delivered on the line? I do not know rightly what they get for the sleeper, but I think it is 9d. each they get for cutting.
3027. 1s. 9d. would lay a sleeper on the ground at that rate? Close to the line. In many parts I think sleepers could be cut almost on the line. 3028.

3028. Would 2s. 6d. a sleeper, when it is put down, be reasonable? Yes; half-a-crown, put on the line. A. F. Garling.
3029. *Mr. Trickett.*] As a resident of Gilgandra, how do you view the proposal that the line should avoid the town and go some few miles to the west? I think that would make too great a gap between there and the mountains. I think the nearer to the town it can be brought the better, for various reasons. First, it would more evenly divide the country. It would go through a tract of country which will be productive, and it would give people on each side a railway within about 25 miles. Then, again, we have the water here for settlement. The town would have the benefit of water by the river and wells. When you get a few miles out they have not the same chance of getting water. Then, again, the ballast could be got from the river-bed for railway purposes.
3030. As regards the nature of the country for railway construction, how will the country close to the town compare with the country further back? I do not think there will be much difference in the facilities for railway construction. If anything, closer to the town you would be nearer to the ironbark forest.
3031. Is there not a ridge in front of the town which would be very suitable for constructing a line on? There is a little ridging which would be a very good place for constructing a line.
3032. How do the two lines compare as regards soundness of country for railway construction? I think about even. If it were brought across to the eastern side of the river, I think there would be a little more trouble, because there is some flat land, and they would have to form a sort of viaduct to carry the line across it.
3033. I do not speak with regard to crossing the river, but with regard to coming close to the town;—do you think it would be better to go right across the river? I think so, and cross the river just a little way down, and then run slightly on the eastern bank of the river through by Gulargambone.
3034. What about the extra expense of bridging? I think that would be comparatively nothing.
3035. A bridge would be a big item in the cost? You would save that cost in the haulage of timber.
3036. Because you would have creeks and so on to cross? If you avoided one little bridge you would have to create another.
3037. *Mr. Watson.*] You have more creeks to cross on the eastern side than on the western side? You have, but they are very small creeks.
3038. *Mr. Trickett.*] In your opinion, is the town worthy of being touched by the line? Yes; it should not be left out, because it is centrally situated. It is in a central position from Collie, Mundooran, Tooraweena, and all these other places. It is the crossing-place from here to Warren.
3039. Is it a long established township? Since it was a station at one time.
3040. How long has it been a township? You could scarcely call it a township till the last few years. It has been more of a little village; it is only growing of late. Just recently there has been a very good Government building put up in the way of a Court-house, and now they are increasing the size of the School-house.
3041. When these Central Division leases are thrown open, I suppose this part will increase in population? It must increase.
3042. This town will be looked to then as a larger centre? It will be a centre, and a rather important centre too, I think, where the town is situated. It is adapted for that on account of the water facilities.
3043. But I understand that one strong ground you urge is that keeping the line more to the east would split up the country better? It would be more evenly divided.
3044. You have changed your views with regard to the Mudgee line;—you might as well state what you think of the Warren-Coonamble route—whether it would be of any use to people between Dubbo and Gulargambone? It would be utterly useless; it is between 60 and 70 miles from Warren to Coonamble, and the teams are carrying from Dubbo to Coonamble, 100 miles, because of the extraordinary freight, and then the team freight on top of that. The people in Coonamble find it better to get their stuff up by this way now.
3045. I suppose you endorse the general opinion that the more you get to the east the better is the rainfall for agricultural purposes? Yes.
3046. *Chairman.*] Have you any statement to make? No; I have brought in some samples of wheat which were grown to the east of this place, up through Bearbung. It will show the Committee that the land produces very good crops. Last year there were very good maize crops grown at Bearbung, 10 or 11 miles south-east of here. Then grapes—some of the finest grapes I have ever seen—have been grown in this district, about 6 miles out from here to the Marthaguy Creek, by a man named Ranson. In 1898, off 2 acres he took £70 odd.\*

Archibald Campbell Berry, senior-constable, Gilgandra, sworn, and examined:—

3047. *Mr. Watson.*] Have you any statistics with regard to the progress of this district? Before a former Committee in 1898, I gave a lot of statistics; but now I have only the actual area under wheat for grain last year, and the yield, as supplied by me to the Government Statistician. A. C. Berry.
3048. Will you read the figures? The return for the year 1898–9 is as follows:— 1 July, 1899.

	Total Cultivation.	Wheat.	Yield.
	acres.	acres.	bushels.
County Ewenmar, Police District Dubbo .....	460	309	1,264
"    "    "    Coonamble .....	909	326	2,938
"    "    "    Dubbo .....	88	60	360
"    "    "    Coonamble .....	817	220	2,077
"    "    "    Coonamble, Collie .....	134½	.....	.....
"    "    "    Dubbo .....	173	112	392

\* NOTE (on revision):—There were one or two remarks I omitted which are reasons why the railway should be made touch the town, viz.: (1) The large bridge leading into the town across the Castlereagh, which is used by traffic from Mundooran, Tooraweena, Box Ridge, Gulargambone, and Coonamble. (2) There is a Government town at Gilgandra, where a line would pass by on the western side of the town; there is a slight rise about 400 yards from the town suitable for a station; and by crossing the river about a mile below the town, the line would then for most of the way pass along stock reserves, thus saving resumption.

- A. C. Berry. 3049. That would show a range of between 8 and 10 bushels to the acre for last year? Yes.  
 3050. From your knowledge of the district, do you think that might be taken as anything like an average or a poor return? It is much below the general average.  
 3051. Owing to the exceptionally bad season? Yes.  
 3052. At a former inquiry you produced some general statistics with regard to the district? Yes.  
 3053. Can you produce those figures as being relevant to the present inquiry? Yes; I hand in the following statistics relative to the land and cultivation:—

## County Ewenmar, Police District of Dubbo, 1896-97.

Number of holdings.	Alienated lands.		Crown lands.	Total area under cultivation.	Area under wheat for grain.	Total yield of wheat.	Remarks.
	Freehold.	Rented.					
47	acres. 93,324½	acres. 5,280	acres. 262,676	acres. 187½	acres. ....	bushels. ....	The major portion of these Crown lands is far better cultivation land than grazing land.
42	80,090½	5,400	248,410½	231	48	1897-98. 908	The reduction in land this year from last is caused through sales, and the areas being taken in another police district.
32	47,601	990	63,233½	479	75	1,052	County Ewenmar, Police District of Coonamble, 1896-97.
31	42,239½	2,898½	82,432	518½	241	4,787	1897-98. A much larger increase of cultivation will be shown next year.
46	14,816½	780	79,641	276½	77	920	County Gowen, Police District of Coonamble, 1896-97. A very large portion of these Crown lands is more suitable for cultivation than grazing.
49	18,352½	1,364	69,881½	567	222½	4,337	1897-98. A much greater increase in wheat cultivation will be shown next year.

These holdings in both counties are within 40 miles of Gilgandra, and would all assist in supplying produce for the proposed railway. There is an estimated population of between 1,500 and 1,600 within the boundaries of the district.

3054. These statistics were prepared during 1898;—has there been any evidence of increase in population and settlement since then? There is a slight increase.  
 3055. Whatever change has taken place has been in the way of increased settlement and population? Yes.  
 3056. You have a good opportunity to come in contact with the farmers and other people settled round the district when you are collecting statistics? Yes; these statistics are collected from them personally every January.  
 3057. Have you had a number of conversations with them about the necessity of getting better communication? Yes; they have often spoken to me about it.  
 3058. Does there seem to be a willingness to go in for closer cultivation if a line is constructed? Everyone that has spoken to me on the subject has expressed his intention of cultivating very much more largely if he could get easier communication with the market.  
 3059. Do you act as Crown Lands bailiff? Yes.  
 3060. I suppose, then, you have a general knowledge of the character of the Crown lands? Yes.  
 3061. What percentage of them do you think would be fit for settlement if the Government threw them open? Fully 75 per cent. of the land is suitable for settlement, and there is quite 60 per cent. of that on the eastern side of the river suitable for cultivation.  
 3062. You think 75 per cent. of the land is suitable for settlement—that is, for combining grazing with agriculture—and fully 60 per cent. of the Crown lands on the eastern side of the river is fit for cultivation? Yes.  
 3063. Of the Crown lands on the western side of the line, what percentage would you put down as being fit for agriculture there—that is, in view of the later developments on the timbered lands within 20 miles of the railway? Between the Marthaguy Creek and Coolbaggie Creek, I think there is fully 50 per cent. suitable for agriculture—that is, down from Kickabil. You can go west as far as the eastern boundary of Bundemar station, and still get land fit for agriculture. There are selectors there now. I should say it would be about 15 or 20 miles west of the line. There is a fine lot of land down Bugabadah Creek.  
 3064. From your knowledge of the land generally around this district, you think it is such as to justify the construction of a railway? Yes; I think so.  
 3065. Is there anything else you would like to mention? There is some land up about Old Arbor which the majority of the people here are frightened of.  
 3066. Is that ridgy country? It is, but there are some fine flats in it. It is situated south from Breealong, and due east of Balladoran.  
 3067. Did you hear the evidence given by Mr. Mechin? No.  
 3068. Is that land about Old Arbor heavily timbered? Yes.  
 3069. Is it open country or ridgy scrub? Some of it is ridgy scrub and box flats. There is one place they call the Whipstick. It is very thickly timbered; it grows very thickly, but it is only whipsticks and roping-poles. It will be easily cleared. There is some bendee country about there too.  
 3070. Do you think it is the amount of timber on the land which frightens people from taking it up, or are they afraid of the character of the soil? I think it is the timber, because the soil, in my opinion, is good.  
 3071. Is it not a fact that there are some settlers out there? On Ranter's Creek, but nothing between Ranter's Creek and Balladoran.  
 3072. Is that near the place you call Old Arbor? It is about 3 or 4 miles from Old Arbor.  
 3073. Do you think others would take up land if railway communication were made near it? There are two or three about here who have actually expressed their intention to go in for land if there were a railway here.

3074. At present it is unoccupied Crown lands? The greater portion of the land dotted on the wall map is timber reserve. There is a lot of country there which is really useless as a timber reserve. There is one flat I know which would average quite three-quarters of a mile wide, and it must be 3 or 4 miles long. A. C. Berry.  
1 July, 1899.
3075. That is about 3 miles along the Castlereagh River;—you think that land is useless as a timber reserve? It is all box, yarran, and budda country.
3076. That is not worth keeping as a timber reserve? No.
3077. But it is suitable for settlement? Yes.
3078. In your opinion, a portion of that reserve might be thrown open without any danger to the forests? Yes; and even in through the ironbark ridges. The ironbark ridges out there are not gritty; they are a red loamy soil, and in between the timber is hop-bush, pine, and budda. It is rather a sandy nature; I think it is suitable for cultivation. A man named Paine had 6 acres under cultivation up there last year. Although it was a bad season, he took 16 bushels off 6 acres. You can see some of the ironbark trees standing in the paddock where he cultivated. Other settlers who have gone in for wheat-growing stick to it.
3079. Taking the general run of the country between Dubbo and Gilgandra, has it been your experience that those men who have attempted to make something of the land by cultivation have been satisfied? Yes; they are increasing their areas every year since I have been here.
3080. So that all who have tried cultivation have been comparatively successful? They are apparently satisfied with the results.

[The Committee met at the "Telegraph Hotel," Gulargambone, at 7:30 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

WILLIAM THOMAS DICK, Esq.

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

James William Taylor, near Gulargambone, grazier, sworn, and examined:—

3081. *Chairman.*] What are you? I am a grazier residing at Warrie, 4 miles north of Gulargambone, down the river. I have 16,000 acres of land. J. W. Taylor.  
1 July, 1899.
3082. Have you cultivated any of that land at all? Yes; I have 150 acres sown now.
3083. Have you had any cultivation before this year? Yes; I put 100 acres in last year.
3084. What was the result? I had not a very good result last year.
3085. You ascribe that result to the dry weather? The fact of the matter is that I did not put it in early enough, and even if I had, I think the season was very much against it. But the year before I had a very good crop. I only put in 8 acres. I sowed only half a bushel to the acre. I did not have it in until August; and I cut  $3\frac{1}{2}$  tons of wheaten hay off 8 acres.
3086. That I suppose led you to increase your area? That is just the reason why I went in for it.
3087. Did you use that wheaten hay yourself, or did you find a market for it? I kept that for my own purposes, and it came in very acceptably too.
3088. The result of that experiment led you to plant a greater area? Yes; it showed me exactly what the ground could produce. The result proved that I could put the land to better purpose than grazing.
3089. It has been suggested to the Committee as an alternative scheme that the connection should be with Mudgee in lieu of Dubbo;—how do you view both lines? I do not know anything about the Mudgee line. I have never been down that way. I think on account of Mudgee being in such a very deplorable state it would perhaps hinder us a long while in getting a railway. The Mudgee line is in a very rickety state. I know all this district not only from Gulargambone to Dubbo, but from here all the way to Coonamble. From Coonamble to Dubbo it is magnificent agricultural land, every acre of it.
3090. A railway coming by this way would throw open any amount of country? Beautiful agricultural land. I know nothing about the Mudgee line.
3091. How far would the Mudgee line be from you? It would be about 16 miles, I suppose.
3092. How far would you be from the Dubbo line? It goes right through my run.
3093. Through your freehold? No; not through an acre of freehold.
3094. So that there would be no land for the Government to resume there? No.
3095. Divesting your mind of that aspect of the case, will you tell the Committee what you know of the trend of traffic, and where it finds its way? The traffic is very great indeed from all these places to Dubbo, more especially in the wool season. I have counted as many as twenty-six and twenty waggons loaded with wool from different stations in one day going from here to Dubbo.
3096. Does any of it find its way over to Warren? No; there is very little going there this year. I am not sure about last year, but all the wool came Dubbo way this year.
3097. At any rate, as far as this place is concerned, there can be no doubt at all that the preference would be for a Dubbo connection? Not at all. I am quite sure we are all very much in favour of the Dubbo route. I know that I am for one.
3098. Have you any other reason for giving a preference to the Dubbo route? No; except that it would save a tremendous lot of haulage. The Warren-Coonamble line I do not think would be altogether a favourable line at all.
3099. You have no market west? No. There is such an extra haulage on the route.
3100. Dubbo is a bit west of Mudgee, and the distance would be a bit longer if you found a market in Sydney;—would Sydney be the market which you would be generally using? Yes; that is the principal market.
3101. Do you think if the Mudgee connection were made you would use that line, or are you too far away to use it? Most certainly I would use it.
3102. *Mr. Trickett.*] What is the freight from Gulargambone to Dubbo now? I think it is about £2 7s. 6d. a ton—that is what it was last year, but it is sure to be more this year.
3103. What would be about a fair average? I do not think it has ever been less than £2 5s.

- J. W. Taylor. 3104. Do you think if a railway were constructed from Gulargambone to Dubbo road-carriage would be an extensive competitor? I think it would not.
- 1 July, 1899. 3105. It has been stated by Mr. Harper that the average freight from Coonamble to Dubbo would be about 35s. a ton over the railway;—do you think, with that average charge per ton, there would be any possibility of the teams competing with the train? Not at all.
3106. Therefore, if the railway were constructed, and the Government stuck to that rate of freight, it would command the greater part of the freight, you think, up to within, I suppose, a few miles from Dubbo? I think it would command nearly all of it.
3107. What do you look upon as the chief feeder for a railway from a district like this? I think the extensiveness of the agriculture. I think this district will be nothing but an agricultural district if we have a railway. There is no doubt that it would be a splendid way for us to get our sheep away. It costs us about 2s. 2d. or 2s. 3d. a head for every sheep we land in Sydney with the present state of the stock route.
3108. Are there many sheep sent from here to Sydney, or do a lot of the sheep go to the boiling-down works? There is a good number of sheep going to Sydney, and there would be a lot more sent if we had ways of getting them down. There is no feed on the stock route at all. If we send our sheep they are famished when we put them in the trucks at Dubbo; they are almost unfit for market by the time they get to Sydney.
3109. Are cattle grown here much? Not just about here; but I think there are a number of stations down below Coonamble which go in very extensively for cattle.
3110. Have you watched the development of agriculture in this district? Very minutely.
3111. With regard to a great deal of unattractive looking land, what has been the result when it has been taken up and cleared? It gives excellent results.
3112. Pine country? Splendid results.
3113. And ironbark country? Yes. Of course, there is not very much ironbark just here; but I have known that country to give splendid yields of wheat.
3114. How far would you be from the Mudgee line? Only about 16 miles. I think it comes through Mr. Irvine's place—Tenandra.
3115. Of the three routes to Coonamble, which line, in your opinion, will be the best as splitting up the country when it comes abreast of Gulargambone? In that way, I suppose, the Mudgee line would be the best. I think it would split up a good lot of country.
3116. Is there much good land between where the Mudgee line is marked and the Warrumbungle Range? I do not know; I have never been across that way.
3117. But the railway could not be of any service to the country on the other side of that range? I really could not tell you that.
3118. Do you know the exact route of the Dubbo-Coonamble line? Yes.
3119. What do you think of that line as regards its route, and as regards its going away from Gilgandra;—do you think that is desirable, or would it be better to bring it up to the town? I think it would be better to take the line where it is marked on the map.
3120. You think it should go as straight as possible? Yes; I am sure it would be the cheapest and best way. The route is a straight line, and would not interfere with the township in any way.
3121. The line is surveyed about a couple of miles from Gulargambone? Yes, it is about 2½ miles from here.
3122. Does that meet with the general approval of the people here? Yes, principally; but I think most of the residents at Gulargambone would rather see the line come down on this side of the river.
3123. Even with the railway constructed as proposed, you would have to cross the river from the town? Yes.
3124. There is no bridge? No bridge?
3125. Is the river always crossable? It has been crossable here for the last three years.
3126. But in ordinary weather, when you get your ordinary rainfall, can you generally get across, or would it necessitate the construction of a bridge if the traffic increased by very much from this side? It would necessitate the construction of a bridge. There are tremendous quicksands in this river when it is running. It is very dangerous.
3127. Independently of the Sydney market, which you said you make for, is there any other outlet for the produce or the stock of this district? Dubbo.
3128. Is there a market out towards Coonamble and beyond there? I do not know, except for fodder. We are going to erect a mill in Coonamble. We are talking very much of it, and it would be a big thing to send wheat over to the mill at Coonamble.
3129. About what is the carrying capacity of the country here for sheep? I think about a sheep to the acre.
3130. That is in an ordinary season? Yes; year in and year out.
3131. Assuming that it carries a sheep to the acre, would it be better to keep on with the sheep or to clear the land and go in for agriculture? Decidedly agriculture.
3132. Can you state how many bushels of wheat to the acre have been obtained here in a fair season—that is, for a crop of some extent? I have been told that about this district there have been yields as high as 40 bushels to the acre.
3133. That would be rather out of the way;—what would be about the average? I should think this country would yield an average of 22 bushels to the acre.
3134. That is a very good yield, is it not? It is; but I think this country is quite capable of doing it.
3135. But a farmer getting regularly a yield of something under 22 bushels would look upon the crop as a paying crop? I think 16 bushels to the acre is a very paying crop.
3136. What price per bushel could be looked upon as a fair average price to remunerate a farmer? I consider that if we get 2s. 7d. a bushel it would pay us.
3137. Is that the price which is generally procurable, as far as your observation has gone? The price of wheat recently has been much higher than that. I think an average price of 2s. 7d. a bushel would pay a person to go in for growing wheat.
3138. Is there any other farm product which you think would be gone in for to any large extent? Yes; lucerne and corn. I think nearly everything in the way of produce could be grown in this country.

3139. Has anyone tried to grow lucerne and corn? Yes; we have had some wonderful yields of corn in this district. Mr. Skuthorpe on the adjoining station, Gulargambone, had a yield of 70 bushels to the acre. J. W. Taylor.  
1 July, 1899.

3140. As we went from Dubbo to Gilgandra we were told, and saw evidence, of increasing agriculture;—I suppose they have not got out here to any extent yet? From what I hear a number have gone in very extensively for cultivation of late. I think Mr. Keogh, of Warrina, has over 100 acres in, and Mr. Tobin, of Wingadee, has 70 acres. He bought a property on the river here recently—he is going in very extensively for farming, I believe.

3141. About what percentage of the land within 10 or 15 miles of the railway about here do you consider fit for agricultural purposes? I am quite certain there is about 80 per cent.

3142. Up this part of the line? Yes.

3143. Although some little while ago this pine and scrub land was always looked upon as unfit for agriculture;—has actual experience in this district shown that when it is cleared and ploughed it produces good results in wheat-growing? Yes.

3144. That is actual experience, not conjecture? Yes. That pine country not only in this district, but in other districts gives good results.

3145. *Chairman.*] Is there anything else that you would like to say? No; I think I have told you all I can tell you, with the exception that I am quite certain in my own mind that a railway will pay from the very start from here to Dubbo. I am not speaking from a selfish point of view, because it is perhaps more than likely I may not be in the district very much longer.

3146. Is there much Crown land in the district? There is a tremendous lot of Crown land.

3147. The leases will be falling in within twelve months;—do you think there will be any great demand for that land for agricultural purposes? That all depends. I really believe it will be in demand.

3148. You are pretty certain that there will be a demand for the land if a railway is constructed? If a railway comes I am certain of it. I really believe that this district will be another Narramine.

3149. If it does not come I suppose it will remain pastoral land? Yes; it will be no good for cultivation. Unless the railway comes we cannot get our stuff away.

3150. I suppose if you go in for agriculture here it will carry a much heavier population than it does when it is under sheep? Yes; and we should be able to carry more sheep than we do. We could have agriculture at the same time.

3151. *Mr. Trickett.*] Is it bad country for travelling on by team, when you get a slight rainfall? It is terrible country.

3152. That is a great hindrance to your getting your produce regularly to market? Yes; it is not only a hindrance to the transit of the produce, but it is a hindrance to a person if he wants to drive. I left here in the coach one night at 9 o'clock, and at half-past 3 o'clock in the morning we were only 4 miles from here, and this part of the country between here and Armitree Plain is comparatively good to what it is in the black soil.

John Kearney, farmer, Gulargambone, sworn, and examined:—

3153. *Chairman.*] What is your occupation? I am half a farmer; I used to be a storekeeper here; I sold out, and retired from the business. J. Kearney.  
1 July, 1899.

3154. *Mr. Watson.*] You are still farming? Yes; I am living on the farm, which is on a township about a mile from here. I have been in the district twenty-one years.

3155. You are acquainted with the different proposals to reach Coonamble by railway? Yes.

3156. Leaving out of account the proposed line from Warren, will you give your opinion as to the desirability of adopting the line from Dubbo or the line from Mudgee? I am in favour of adopting the Dubbo line.\*

3157. Can you give any particular reason for that preference? Nothing personal.

3158. But you must hold some reason for preferring the Dubbo route? I think it would suit this place and Coonamble much better than any other line which could be constructed, and they would have the railway much sooner anyway.

3159. Leaving out of account the question of time, do you think it would be a better line to construct from the local point of view as well as the national point of view? From the national point of view the Mudgee line is the better. I think it would open up more agricultural country, and country of a better class too for agricultural pursuits.

3160. What part of the line between Mudgee and Gulargambone would be better fitted for agricultural pursuits? I may say all the portion lying west of the Warrumbungle Mountains.

3161. Where would it start—that is, towards Mudgee? I think it would start somewhere about Cobborah.

3162. You think there is good country from that onward? There are little ranges of mountains intervening—ridges and that sort of thing. There is some rough country in there, too; but there is a great deal of agricultural country lying in there.

3163. How far east of the line surveyed between Mudgee and Coonamble would the Warrumbungles lie? In places not 6 miles, in places not 3 miles.

3164. Could the average distance from the Warrumbungle Mountains to the line be called 10 miles or 15 miles? It would average about 6 miles until you get into ridgy country.

3165. There would be an average of 6 miles of good country on the eastern side of the line? In some places 10 miles; in some places not 3 miles; but an average of about 6 miles.

3166. There would not be a great deal of traffic drawn from an area of country 6 miles wide on the eastern side of the line? No; unless it were wool. There are a great many wool producers on that side of the line. There are Mr. Ferguson, Mr. Brown, Mr. Dowling, Mr. Irvin, Mr. Featherstonhaugh, and all along to Goorianawa and Calga.

3167. On one side of the line you say you have an average of 6 miles that is fit for agriculture? I did not say it would be all fit for agriculture. I said an average would be between the ridges and the line.

3168. Is it fair to assume that the greater portion of that country is fit for agriculture? I presume that part of it will be fit for agriculture.

3169. On the western side of that line would there be a wider area fit for agriculture? Yes; it would be very nearly all fit for agriculture right in to the Castlereagh. 3170.

\* NOTE (on revision):—I should prefer the Dubbo route if it came close to the river at this place or crossed the river at Curban.

- J. Kearney. 3170. How far west would that extend—20, 25, or 30 miles? No; it is only 15 or 16 miles from here to the railway line.
- 1 July, 1899. 3171. I am speaking of the country down a bit further;—what would be the average character of the country along the line on the west side? Of the country on the other side of Mudooran I know very little. I know there is a great deal of land lying down the Talbragar, which is fit for agriculture, and a great deal up the Talbragar too. That would be on both the east and west sides of the line.
3172. How many miles would be the limit from which the line could draw this traffic on the western side for agricultural purposes—20 miles or 30 miles? I suppose the line would be supplied 30 miles away.
3173. If on one side you have 6 miles of agricultural land, and on the other side 30 miles of agricultural land, would it not be a better idea to take the line further west, and thus more nearly cut the good land in halves? I daresay it would, but anyone who would bring produce from the mountains would have to cross the Castlereagh, if the line were on the other side—and that is an argument for the Dubbo line—and that is not always crossable.
3174. At the present moment we are not thinking of the crossing of the river, which, after all, means only the matter of a bridge. The point I wished to get at was, whether you thought it would not be a proper thing to take a line as nearly as possible right through the centre of your agricultural area? I think it would be the wiser plan.
3175. And more likely to result in a large quantity of traffic for the railway? Yes. The line from Dubbo will, in my opinion, split the agricultural country up better than the other, because there is only a strip 5 or 6 miles wide on the eastern side of the Mudgee line.
3176. While on both sides of the Dubbo line you have an area of very good agricultural country? There are 30 miles on each side.
3177. You think the Dubbo line would better split up the agricultural country? I think so. It would better divide it, anyway.
3178. And, presumably, it would have a better chance of paying from that cause? Of course it would. It would be supplied from the mountains as well as from other sources here.
3179. The objection you urge against that is the necessity of crossing the Castlereagh? Yes.
3180. At Gilgandra there is a bridge;—is there any other bridge between Gilgandra and Coonamble? The next bridge is at Coonamble.
3181. Looking at the matter from the agricultural standpoint, at the time you are drawing wheat, is the river difficult to cross in an ordinary season? It is always difficult to cross in dry seasons as well as wet, more so in the wet seasons because of the quicksands.
3182. But in a dry season it is difficult to cross? It is. It is a bad river to cross at any time of the year.
3183. There are no natural rock bottoms you know of which would assist the crossing? No; there are 6, 7, and 8 feet of sand under your wheels wherever you go, in places 20 feet of sand.
3184. In ordinary seasons is there much water in the river after harvest when wheat is being drawn? I have never taken notice of it. Within the last four years we have seen the river running, I think, about once or twice in the winter.
3185. That is rather out of the ordinary? That is out of the ordinary because we have seen it a banker here often and often and had it uncrossable for weeks at a time.
3186. That is usually in the winter? Yes.
3187. You would not want to be drawing wheat at that time? No.
3188. Do you think you would get a load of wheat across there at the present time? It would be according to what quantity you would consider a load.
3189. Say 5 tons? It would take two teams of horses to draw 5 tons across the river.
3190. Would it not be possible for a man, when he was drawing wheat, to double-bank when he got to the river and get across in that way? That is what he would have to do. They have repeatedly done that. Hardly any team is fit to cross the river singlehanded.
3191. If agricultural settlement developed rapidly on the eastern side of the river as a consequence of railway connection being made, it is possible that the Roads Department might put in one or two bridges along the line? Yes.
3192. Do you think that would involve a very great outlay? It would involve a very great outlay because it is a very wide span to cross. Any crossing on this river is very wide.
3193. Did you ever hear what the bridge at Gilgandra cost? No.
3194. You think there would be a necessity to bridge one or two of the crossing places if agricultural settlement increased? I do indeed, and here in particular.
3195. How close would it be necessary to have bridges to assist agriculturists on the eastern side? I think that would entirely depend upon where you had your sidings or stations.
3196. Assuming that the sidings or stations are made to suit the bridges, where do you think you would need them, say, from Gilgandra to here? One at Curban, and one at Gulargambone.
3197. Do you think there would be much agricultural development between Gulargambone and Coonamble? There is a great deal of cultivation down that way.
3198. How many bridges do you think you should need? I do not think they should require any bridges.
3199. These two additional bridges you think would be sufficient? For the present, any way. As agriculture extended, I suppose that requirement would be met.
3200. If two additional bridges were made, do you think the line on the western bank of the river would fairly serve the settlers on the eastern bank, and for some distance back? I do indeed. I am further of the opinion that if the line were taken across from the western to the eastern bank of the river at Curban, there would be no necessity for road bridges.
3201. How would the settlers on the western bank of the river get on? I think there are but very few from Curban down to Gulargambone. All the men who go in for agriculture live about Curban.
3202. Is there any good land between Curban and Gulargambone on the western bank side of the river? Yes; but it is not utilised.
3203. We are assuming a different state of things, and that the good land will be utilised? There is plenty of good land there.
3204. So that although there may not be settlers to-day, the probability is if the line were taken on the eastern bank of the river, there would then be settlement on the western bank to provide for? Yes; there would.

3205. In either case you are faced with the difficulty of getting access to the line from one bank of the river? Yes; we should still require one bridge.
3206. You would require one road bridge and railway bridge which takes the line across? Yes.
3207. A railway bridge would be more expensive than a road bridge in all probability? Yes.
3208. You are faced with that difficulty whichever way you look at the matter? Yes; but still all the timber requisite for the construction of a railway bridge is to be found within 4 or 5 miles of Curban.
3209. Summed up, then, you are in favour of the construction of the line from Dubbo to Coonamble? I am.
3210. But, in default of that, you would like to see one constructed to Mudgee? I should like to see railway communication to Coonamble from that point.
3211. I gather from your evidence at the previous inquiry that you are not in favour of the route from Warren to Coonamble? Under no consideration.
3212. It would be of no value to the people of this district? We should never use it, except for parcels.
3213. The only line which would serve you would be a line from either Dubbo or Mudgee, and you prefer the line to go from the latter point? I prefer the former.
3214. Is there anything else you would like to add? No.
3215. You heard what Mr. Taylor said of the productiveness of the district generally;—can you substantiate his evidence? I can endorse all he said as to the productions of the district.
3216. And what it could do if you got railway communication? Yes; in favourable seasons.

J. Kearney.  
1 July, 1899.

Thomas Hetherington, grazier, near Gulargambone, sworn, and examined:—

3217. *Mr. Dick.*] Have you resided long in this district? Eight years.
3218. Do you know the country to be served by the proposed railway from Dubbo? Pretty well.
3219. Do you think the construction of a railway along that route would lead to development in agricultural pursuits? Yes; I think it would lead to a very extensive development.
3220. Is it good agricultural land all the way as far as Coonamble? Generally it is.
3221. Have you anything to add in support of the line from Dubbo to Coonamble which has not been given by any of the previous witnesses? No; I have nothing particular to add.
3222. Do you go in for any cultivation yourself? I go in for a little.
3223. If the railway were constructed, would you be led thereby to go in for agriculture to a larger extent? Yes.
3224. Do you think, in order to make the land in this district pay the agriculturists, it is absolutely necessary that you should have a railway? I think so. We shall never make the land pay for agriculture until there is a railway.
3225. You would be practically about 12 miles from the route of the proposed line? Yes; about 12 miles from here.
3226. Taking the country east from Gulargambone, right out to the Warrumbungles, is it in the main good agricultural land? It is principally all agricultural land from Gulargambone right out to the Warrumbungles.
3227. How far east is that? It must be a little over 20 miles, I think.
3228. Taking that stretch of country between the proposed line through Gulargambone and Gilgandra on the one side and the Warrumbungles on the other, is it in the main good agricultural land? Yes.
3229. Is it likely to be brought into immediate development by the construction of a railway? Yes.
3230. You know, of course, that there is an alternative route suggested from Mudgee? Yes.
3231. Have you had any opportunity of considering that project? I do not know much about that line; I have never travelled it.
3232. In the case of a bad season there, do you think you would find a market for fodder crops out among the pastoralists centred round Coonamble and to the north? Yes. There would be a market in dry seasons for chaff, and so on.
3233. *Chairman.*] Is there anything else you would like to say? You referred a while ago to agriculture in pine country. I have cultivated a piece of pine country to a small extent, and it yields very good crops.
3234. Is the result of your experiment encouraging? It is very encouraging.
3235. Have you ever tried to cultivate ironbark country, not the ridges? I do not know anything about ironbark country.
3236. Have you ever seen any of that country under cultivation? No.

T.  
Hetherington.  
1 July, 1899.

John Edwin Williams, first-class constable, Gulargambone, sworn, and examined:—

3237. *Mr. Shepherd.*] You have prepared, I understand, a return showing the agricultural statistics of the district? Yes; a return from the collections made in January.
3238. What is the extent of the district in which you collect the returns? It extends down the river—that is, north towards Coonamble—as far as Bennett's Flat, which is 14 miles from here; it goes 24 miles west of Gulargambone, as far as Curban on the south-east, 17 miles; to the Warrumbungle Mountains on the east, and as far north as Wingidgeon, 40 miles from here.
3239. Will you now be good enough to read to the Committee the return which you have prepared? It is as follows:—

J. E.  
Williams.  
1 July, 1899.

STATEMENT of agricultural returns collected by Gulargambone Police, January, 1899.

Area—510 acres for hay yielded.....	193 tons.
560 „ wheat yielded.....	2,000 bushels.
160 „ miscellaneous crops, including maize, almost a total failure.	

Total..... 1,230 acres.

The area under cultivation this year is about the same as last year; it may be a little more, but the difference is not much. The wheat crops at present look well.

Approximate estimate of population, 1,180.

3240. You have gone round and seen the people in the district under your supervision? I have travelled to each person's place.

3241.

J. E.  
Williams.  
1 July, 1899.

3241. Do these people seem satisfied with their prospects? I have only been here a little over a year. It has been a drought nearly all that time, and naturally the people are suffering. Their prospects are not very good. In a great many instances they have had to remove their stock. Their crops were not satisfactory this year. Those who were cultivating were very dissatisfied with their returns.
3242. Do you think they are looking forward to better times, or are they thinking of trying to leave the district? I do not think they are trying to leave the district. I do not know anyone settled on the land who is speaking of leaving the district.
3243. They attribute the smallness of their returns to the drought? Yes.
3244. Under more favourable circumstances they would expect a very large increase? Yes; many of them have told me they have had splendid crops off the same land when they have had suitable seasons.
3245. As you have only been here a short time, you are not aware of the character of the crops they get? No; I have never seen any very good crops.
3246. Have you any other information to furnish in connection with the progress of the district or the likelihood of its progress? No.
3247. You think there is a slight increase in the area under cultivation this year as compared with last year? Yes; there are persons preparing land. It is principally at the foot of the Warrumbungle Mountains, on the east side, where the increase is taking place.
3248. Has fruit been grown in the district to any extent? No; it is not grown to any extent.
3249. Just a few peaches grown here and there, I suppose? Yes. I do not think there is 1 acre of an orchard or a vineyard anywhere in the district; just a few fruit-trees here and there.
3250. Did you think that the few trees you saw are doing well? Yes. I saw some very fine fruit this year, particularly grapes. This is a great grape country; the vines do well here.
3251. You think, on the whole, the settlers in the district are looking forward hopefully to better times? That is my opinion.
3252. What is about the size of an average holding? There are a good number of leasehold areas from 2,500 acres to as high as 4,000 acres.
3253. Are there many freeholders amongst them? A great number of freeholders.
3254. Have you any idea of the extent of the holdings of the freeholders? I can tell you the area of freehold land in the district, but not how it is distributed amongst them.
3255. Will you give the area? The total area of alienated land in the district I have described is 113,882 acres, of which 1,733 acres are let from private owners.
3256. Have you ever been engaged in agricultural pursuits? Not very much. I have done a little maize-growing. I assisted when I was at home.
3257. I supposed you are able to form an opinion of the character of country when you see it? I do not profess to be a judge, but still I think I would know good land from bad land.
3258. What is your opinion of the land in this district? I think the timbered country in this district is all good agricultural land, but the plains, in my opinion, are not good for agriculture. They are scalded—they seem to burn up too much; they get too hard during the summer.
3259. Do they produce good grass? Fair. Since I have been here I have never seen any great length of grass, but it has been a dry season.
3260. For agricultural or pastoral purposes they are not so good as bush land? The graziers say the myall plains are the best grazing country. Out on the Warren line this year the only man who had a crop of hay had it in a sand bed. It was a pine scrub which had been ringbarked and cleared. He put in 8 acres of scrub land and 8 acres of plain land for wheat. From the 8 acres of plain land he got no return, and from the other he got nearly a ton to the acre.
3261. How do they usually provide water for their stock? Large tanks and dams. It is very good holding country in most places, especially in these plains.
3262. Water is readily got by sinking? Not always. It is surface water they get in the tanks; they depend on the rains.
3263. At what depth do they generally get water by sinking? Just about Gulargambone they get water within 15 feet. I have known places where they have bored down 150 feet, and could not get water in numerous places.
3264. Is it a fact that by sinking a very short distance in the river beds and the creek beds they can get a large supply? In the river. I do not know about the creek. In the river above here you can scrape sand out with your hands and get a drink of water.
3265. Have you any knowledge of the Crown land which is likely to be thrown open to selection within the next year? Portion of it I have, and that is the Tundaburine holding.
3266. Does that prove good land generally? Very good agricultural land.
3267. There is a very large extent of it, I believe? Yes; I do not know how much is going to be thrown open. There are 75,000 acres of leasehold there, but I do not know how much of that area is conditional lease.
3268. *Mr. Trickett.*] Do you think the land which is going to be thrown open there would be more suitable for agricultural than pastoral purposes? I am not quite sure where he is going to consolidate. There is a lot of leased land in box-timbered country, which is very good agricultural land. There are some selectors there who have really good crops, and if that portion—and there are thousands of acres of it there—is thrown open it will make splendid farms; but if it is out on the plains it will not be so good to the farmers.
3269. *Chairman.*] Suppose the pastoralist acquired by consolidating all that good land, do you think it would pay to rent land here? Yes; in that particular place a man who was paying a good rent, I do not know the exact rent, made a good living on 200 acres rented from Mr. Brown. He had it all under cultivation, and he seemed to consider that it paid him. He has got a lease now at Narramine.
3270. Where did he find a market for his produce? At Coonamble this year. He never harvested it himself; he sold it as it stood to a firm of forage dealers in Coonamble.
3271. They bought the crop for hay, I suppose? Yes, very little of it was harvested for wheat.
3272. You have heard it stated that in all probability land such as you have described—good agricultural land—will be devoted to agriculture, and pastoral pursuits will be given up on that land;—do you think that will be so? I do not know. If it is in small holdings no doubt it will. If it is thrown open in small holdings it will be cultivated. If it is in larger leases I think it will be used as pastoral land. I have

have heard that it is to be thrown open in blocks of 300 acres or 400 acres to suit farmers. It is not surveyed yet.

J. E. Williams.  
1 July, 1899.

3273. You do not know sufficient of agricultural pursuits to be able to say whether an area of 300 acres or 400 acres is enough for a man to get a decent living out of? Yes, under agriculture in that country it is enough. The man who rented 200 acres made a good living.

Gideon Rutherford, station manager, near Gilgandra, sworn, and examined:—

3274. *Chairman.*] What are you? I am manager of Tugland, for Messrs. Goldsbrough, Mort, & Co.

G. Rutherford.  
1 July, 1899.

3275. In what direction is Tugland? It is 8 or 9 miles on the road from Gilgandra.

3276. Will you make the statement which you wish to make? I came to Tugland about two years and ten months ago. It was a very bad time, as everyone knows. I was very busy. I only had one man to help me on 15,000 acres, but I determined to have a little bit of a crop if I could. I had not time to plough the land, so I sowed seed on an acre of ground and harrowed it in. I got over a ton of wheaten hay off it. I have some of the wheaten hay still.

3277. Was the land you sowed a fair sample of the whole of the land? It is a very fair sample of the box country. One great mistake is made by all the witnesses I have heard so far. They describe the ironbark country here as the same as the ironbark country in Victoria, which it is not. In New South Wales it is a red ironbark, and when it is taken out the land will grow a good crop; but in Victoria that country is utterly useless when you do take it up. The ironbark here, as far as I see, is very rotten. It is not the same kind of ironbark as grows in Victoria, or on towards the Murray. I have been down there and round Lake Cudgellico. It is not the same ironbark as is grown round there; it is a very different kind. When it is taken out here I am under the opinion that the land will grow very nice crops.

3278. Is the soil it is growing on different? Certainly. This ironbark country here will grow kurrajong, but the ironbark country down there will not. Most farmers look for kurrajong country to grow a crop in.

3279. How much land have Goldsbrough, Mort, & Co. in that holding, and what do they use it for? The greatest part of the holding is put to the use of grazing. This last year I am trying to put in 100 acres of cultivation—not in the kind of country which has been described, but in myall plain country. But the rest of the country, I should think, is about 15,000 acres of grazing country—pastoral, if you like to call it so.

3280. What is the carrying capacity in ordinary seasons? About 3,500 sheep.

3281. It carries about a sheep to 3 acres in an ordinary season? Yes; but you must recollect that 10,000 acres of it are not improved.

3282. *Mr. Watson.*] The reason why it is not improved is because the lease will fall in shortly? It falls in this month.

3283. What do you think the improved country, just about where you are, will carry in an ordinary season when it is ringbarked? I think country which is improved will carry a sheep to 2 acres, if watered; if 3s. 6d. an acre is spent, it will carry two sheep to the acre.

3284. *Chairman.*] About what proportion of that lease which is falling in is good agricultural country, do you think? I consider all of it would be.

3285. *Mr. Shepherd.*] I should like to get some particulars about the crop you got by simply harrowing the ground:—in the first place, what kind of harrow did you use? Just the ordinary barrow.

3286. Was it loaded at all? I stood on it.

3287. Did you harrow and cross-harrow? No; I simply harrowed once.

3288. Did you roll the grain under? No.

3289. Did you ever hear of a crop of wheat being produced in that way before? I never did. I considered that the cost of the wheat was so little that I would risk it. The ground was almost like sand at the time. I knocked up the sand, and I got a very good yield, much better I was told than people who ploughed their ground that year.

MONDAY, 3 JULY, 1899.

[The Committee met at the Council Chambers, Coonamble, at 10.30 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

William Makin Thomas, staff surveyor, Department of Lands, Dubbo, sworn, and examined:—

3290. *Chairman.*] How long have you been stationed in the district? Three years.

W. M. Thomas.  
3 July, 1899.

3291. During that period have you had the opportunity of visiting most parts of the district to be served by the proposed railway from Dubbo to Coonamble? I have been over the whole of the district repeatedly.

3292. With the aid of this map, which shows the land for 20 miles on each side, will you describe the country to be served by the line? For about 10 miles from Dubbo the land on the western side is chiefly good agricultural country. For 15 miles beyond that—that is up to about 25 miles—it is patchy; but there is very good agricultural country and there is some of it poor. About two-thirds of that country will be agricultural country, and the remainder will be poor country. From there until you enter the valley of the Castlereagh, about 36 miles from Dubbo, you get agricultural country. From that point to Coonamble, on the western side, you will have first-class agricultural country and pastoral country. Almost the only limit to your agricultural country is the rainfall. The country on the bank of the Castlereagh, for about 2 miles to 2½ miles from the river, is the richest of alluvial country, formed by the washing down of the sandstone hills and the rich detritus from the volcanic range of the Warrumbungles and the old sandstone range. That is a rough description of the western side of the line. Now, on the eastern side for the first 10 miles out of Dubbo, the land is good, agricultural land, but there is only a narrow portion of that which will be served by this railway. For the next 15 miles—that is to a point 25 miles from Dubbo,

W. M.  
Thomas.  
3 July, 1899.

Dubbo, the land on the eastern side is very patchy. On the banks of the Coolbaggie there is some good agricultural land, and there are strips of good agricultural land intersecting the great ironbark forest; but the ironbark country itself—not the box-country in which ironbark grows, but ironbark country, with a soil formed of poor, white clay mixed with ironstone gravel—that country is only fit for growing what it is growing at present, namely, ironbark, and it is more valuable for that purpose than any other purpose to which man can put it.

3293. What area of that country is there? There will be fully two-thirds of the country on the eastern side, in that 15 miles which will be from fair to poor for agricultural purposes.

3294. *Mr. Watson.*] The remaining third is what? Country which will produce sufficient to pay any man to take it up and work it at once, and compete successfully with the good land on the other side.

3295. *Chairman.*] The remaining third consists of box flats? Yes, and alluvial country close to the water-courses. In these questions it is a matter of comparison largely.

3296. *Mr. Watson.*] That description brings you to a point 25 miles from Dubbo on the eastern side? From that point to the Castlereagh at Gilgandra, about one-half of the county on the eastern side will be good agricultural country.

3297. *Chairman.*] How will you describe the other half—from fair to poor? A good deal of it is only fit for growing timber. From Gilgandra to Gulargambone you have the same, rich, agricultural country on the banks of the Castlereagh, and for an average of about 4 miles east of this bank. East of that strip again is poor scrubby country, unsuitable, I think, for agricultural purposes, and only capable of small stock-carrying capacity. From Gulargambone to Coonamble you have a rich, agricultural country, and rich, pastoral country also.

3298. Within 20 miles north of Coonamble, what is the character of the country? For 10 miles from Coonamble, north-west, about one-third of the country will be suitable for agriculture; the rest is chiefly very rich pastoral country. In my opinion the black soil plains are not suitable for agriculture, but experience may show differently. They have never been properly tried yet. The formation of black-soil plain is this: The subsoil is a hard, dark blue or black clay; and the surface soil is extremely fine, owing to the slow flow of the water which has formed it. The sand from the old sandstone range and the heavier portion of the detritus from the volcanic range have been caught before reaching the black-soil plains, leaving an extremely fine earth only to be deposited on them. This extremely fine earth, together with the heavy clay subsoil, is a big impediment to the proper drainage necessary for agricultural land. That is my reason for saying I think these black-soil plains will not be suitable for agriculture. They are as rich pastoral country as one can get. For the other 10 miles, one-half is largely scrub country, suitable for agriculture, but with a somewhat limited rainfall. The rainfall is about 22 inches; but it is not a question of the quantity—it is a question of the diffusion. The remaining area is excellent, pastoral country.

3299. Are you acquainted with the country along the line from Mudgee to Coonamble? Only the portion which is within the Dubbo district.

3300. *Mr. Watson.*] Will you state the boundaries of the portion you know according to this map? The country from Cobborah to about 20 miles north of Mundooran would not be served by the Dubbo-Coonamble line. Around Cobborah there is a valley of very rich agricultural land with a good rainfall—that also applies to the country immediately around Mundooran; but there the extent of agricultural land is smaller.

3301. What is the character of the country between Cobborah and Mundooran? The country between Cobborah and Mundooran I do not know so intimately. From Mundooran, north-west towards Toorawcena, the country is poor scrubby ridges. Round Toorawcena and following the course of the small watercourses there are areas of good agricultural country. From there you reach land which I know will be served fairly well by the Dubbo-Coonamble line, and you are on the edge of the Dubbo district. Coonabarabran is outside the Dubbo district. While we are on the question of rainfall perhaps I may be permitted to hand in an analysis of the rainfall during agricultural months, for twenty-five years, in the Coonamble district east. I have given the averages for the months of March, April, May, June, September, and October. I have also analysed these months in pairs—March and April, May and June, September and October, and in a summary I have given my own opinion of these averages—that is, that it will give nine years of good crops, five years of bad crops, six years of small crops, and five years when there will be practically no crops. I would point out that this period of twenty-five years which I took as being a quarter of a century begins with 1874, 1875, and 1876, which were three bad years, and ends with 1897, 1898, which were three years of shortage in the rainfall. In preparing this summary I took that fact into account.

3302. Will you be good enough to read the return? It is as follows:—

ANALYSIS of Rainfall during Agricultural Months, for twenty-five years, in the Coonamble District East, *i.e.*, from 1874 to 1898 inclusive.

Month.	Average rainfall.	Average wet days.	Years when rainfall was—			Years of useless rain.
			Below the average.	Equal to the average.	Above the average.	
	in.					
March .....	2.13	4	14	0	11	9
April .....	1.50	3.5	13	6	6	8
May .....	2.03	5.0	13	3	9	11
June .....	1.65	5.0	10	5	10	7
September .....	1.35	4.5	14	1	10	13
October .....	1.77	4.0	10	5	10	8
March and April .....	3.61	7.4	15	1	9	5*
May and June .....	3.70	10.0	13	2	10	3*
September and October .....	3.12	8.5	11	7	7	5*

\* Below 1.5 inches.

Average annual rainfall=22 inches.

*Summary.*—Nine years, good crops; five years, fair crops; six years, small crops; five years, no crops.

The years of useless rainfall, *i.e.*, a rainfall less than 1.5 inches, in either pair of months—March-April, May-June, September-October—were 1874, 1875, 1876, 1880, 1885, 1888, 1895, 1896, 1897, 1898. Total, 10

It will be noted that this period begins and ends in three bad years.

The

W. M.  
Thomas.

3 July, 1899.

The rainfall is so uncertain in March, sometimes so heavy and sometimes so small, that in the twenty-five years' period there are no years within a small decimal of the average. Our good average months, when the rain is well diversified, are April, May, June, and October. The number of years when the rainfall was above the average was in March, 11; April, 6; May, 9; June, 10; September, 10; and October, 10. In ascertaining the years of useless rainfall, when the rainfall was so small and so distributed as to be useless, I had to take both things into account, so that I cannot give the quantity. I had to use my own discretion. If there were ten wet days, and  $1\frac{1}{2}$  inch of rain, and the ten wet days were distributed over the whole month, that is of very little use; but if there were three wet days, and  $1\frac{1}{4}$  inch of rain, that is a useful rainfall. As regards the groups, March and April I took to be the ploughing months, May and June the sowing months, and September and October the months when the crop must get the rain to fill the ear. From the data that in ten years the rainfall was in any one or more of the groups below  $1\frac{1}{2}$  inch for the two months, I have drawn the deduction that, out of twenty-five years, in nine years there will be good crops, in five years fair crops, in six years small crops, and in five years practically no crops.

3303. *Chairman.*] That statement covers the country to be served by the proposed railway? It covers the smallest rainfall country—that is, the country from Coonamble east. That would not apply to the country from Gilgandra towards Dubbo, where the rainfall is heavier and more diversified.

3304. *Mr. Watson.*] Would it apply to the country immediately east of Coonamble, right down to Gilgandra? It would apply to all that country and the country in towards Coonabarabran, increasing slightly as you reach Gilgandra and as you go up towards the mountains.

3305. *Chairman.*] I suppose you have often come in contact with the settlers? Yes.

3306. Taking into account the rainfall, have they expressed any opinions to you as to whether agriculture would be a success if entered upon in those portions which you have described as being fair agricultural country? You want another element; you want the market and the possibility of reaching the market.

3307. If a railway is constructed you will get that market? Yes; and only small areas have been cultivated owing to that want.

3308. Successfully cultivated? Yes. It has been proved that artesian water can be obtained at Gilgandra; the water just trickles over. It may be used as a pumping station, as many of the artesian wells are used to-day in America. That town appears to me to be on the southern edge of the artesian water. Then as you approach Coonamble you are coming right into the bed of the artesian water. In those years when the rainfall was short it could be supplemented and will be supplemented after the country is opened up by irrigation from artesian water. The opening up of the country will give a settler the opportunity to make artesian water pay by giving him a market for his produce. A flow equal to the flow from the Coonamble bore would supply the deficiency of rainfall in all the short years in my analysis, except the very bad ones. I estimate that 3,000 acres can be irrigated from one bore at a cost of 9d. per acre per annum. I reckon that a bore can be put down for £1,000, and I am sure the time is not far distant when a bore will be put down here for less than a £1,000. I allow £50 a year for distribution, that is for constructing the necessary distributing channels and keeping them in repair. They will want constant attention. I also allow £50 to pay the interest on the capital invested.

3309. *Mr. Trickett.*] Would not that extra charge of 9d. per acre be so heavy as to affect the pockets of the farmers? The charge of 9d. per acre will reduce the value of the land; it will not affect the farmer's profits. It simply means that he will not pay the capitalised value of 9d. per acre for that land, as compared to the country where the rainfall is sufficiently diversified to equal what will be produced by irrigation.

3310. You are satisfied that that water would be useful for the purposes of the crops? Experience has shown in Coonamble that the bore water is most useful for all cottage garden purposes and for the growth of lucerne. Other crops I do not think it has been tried upon. If it will grow those things I think it will suit wheat also.

3311. *Chairman.*] How long has it been used here? Between three and four years.

3312. Does the water contain anything which in time would cause the crops to deteriorate? I could not say. Not living here I have had no practical experience. When passing through Coonamble I have seen patches of lucerne irrigated from the bore water.

3313. *Mr. Watson.*] In that rough estimate you gave of the cost of insuring a sufficiency of artesian water to supplement the annual rainfall, did that charge of 9d. per acre include only the interest on the cost of putting down the bore and the cost of the distribution channels, or did it also include the labour of (say) one man to attend to the bore? It only included the cost of putting down the bore and distributing the water. What I had in my mind when I made the estimate was that the time is close at hand when every group of four selectors in this district will put a bore down as near as possible to the common corner and arrange to distribute the water among them. Each farmer would attend to the distribution of the water on his land.

3314. *Chairman.*] There is a large area of Crown lands falling in shortly? A large area.

3315. Are you doing anything in reference to those lands now? I am designing them for subdivision in the portion east, but chiefly north and west of Coonamble.

3316. I suppose in preparing your subdivision you are guided by the experience of the district as to the area required to enable a man to get a good living and something beyond that? Sufficient to give a man a comfortable living, and so that he will remain on the land if possible.

3317. An area sufficient to enable him to maintain himself and a decent-sized family? Yes.

3318. And what area, on an average, would you consider sufficient? Two thousand five hundred and sixty acres is a suitable area for agricultural and pastoral purposes combined.

3319. Under the present occupation, how many men would be employed on, or what produce do you think would be obtained from, that area? That would depend partly upon the capital expended.

3320. Are there not holdings here with 75,000 acres? Yes.

3321. How many men are employed in working a holding of 75,000 acres? From twelve to sixteen hands would work 75,000 acres. I think ten hands for 50,000 acres would be the average in this district for pastoral purposes.

3322. If a railway is constructed, then, you are of opinion that the country will be so developed that it will carry double the population it now does? More than double.

3323. It will carry at least double the population? Far more than that.

3324. *Mr. Watson.*] A man with 2,560 acres would have to employ labour, so that if it is suitable for agriculture it would carry far more than double the population? Yes; it would be one man to 5,000 acres at present. You can say safely that you will increase the population five times.

3325.

W. M.  
Thomas.  
3 July, 1899.

3325. *Chairman.*] There will be a settled population on that land of at least twice the number? No; you can say that there will be a settled population of at least five-times the number. I am sure I am well within the mark. At the present time ten hands are employed to work 50,000 acres. Give each family 5,000 acres, which is double the area I spoke of, and average a family at five persons, and you have five times the population on the land.

3326. From your evidence I gather that you are of opinion that the construction of a railway, on account of its tending to develop country, would be justifiable in this district? I am quite certain it will. You will not only increase your pastoral and agricultural population five times, but you must have distributors to serve those people; you must have towns also, so that my estimate that it will induce five times the population is actually small.

3327. *Mr. Watson.*] Is that after you allow for the proportion of land which, in your opinion, is unfit for agriculture? Yes.

3328. *Chairman.*] You think the general increase in population right through the district, including towns, will be five times? Yes.

3329. *Mr. Trickett.*] When you were examined by the previous Committee, you stated that you were pretty confident that good crops would be expected in the district for two years out of every three? Yes.

3330. The paper which you have handed in gives good crops for nine years, fair crops for five years, small crops for six years, and no crops at all for five years; so that there are only fourteen years of good and fair crops in a period of twenty-five years;—that hardly comes up to your former calculation? Not quite, but very nearly.

3331. It is only fair to state that at both the beginning and the end of your term of years there had been three very bad seasons? Yes.

3332. With ordinary good seasons right through, do you think the former statement would be borne out, say two good crops out of every three? Yes; I think if I had the rainfall for four or five years previously those figures would prove that my first statement was correct.

3333. I do not quite understand how you are going to apply your irrigation idea;—will you explain how a block of about 3,000 acres could be treated by irrigation? I contemplate that a group of four or five selectors on adjoining selections would put down a bore in the most suitable place to distribute the water over these four or five selections. That water would be used for watering their stock, and, in years when it was necessary, for supplementing the rainfall for cultivation.

3334. The water in each case would have to be carried for a considerable distance in pipes or open channels? In open channels. If the bore were situated near the common corner, the furthest distance it would have to be conducted along on any one holding would be about  $1\frac{1}{4}$  mile, so as to irrigate over the whole of that area of 750 acres.

3335. That expense would have to be borne by the whole of the selectors? Yes.

3336. Would it be very great? I have included the cost of that work in the charge of 9d. per acre.

3337. When you were examined by the previous Committee you handed in what appears to me to be rather a concise report on the character of the land on the three routes;—I wish to know if you are prepared to hand in that report as a part of your evidence to-day, and if you endorse the facts that are therein stated? I endorse all that is stated in the report, which I have much pleasure in handing in:—

Surveyor W. M. Thomas, to the Chairman of the Parliamentary Standing Committee on Public Works, reporting upon the character of the country and the settlement on proposed railway lines from Dubbo to Coonamble, Warren to Coonamble, and Mudgee to Coonamble, within the Dubbo district.

Sir,

Dubbo, 29 March, 1898.

In compliance with instructions from the District Surveyor of Dubbo, I have the honor to furnish you with the following report upon the character of the country and the settlement that will probably furnish the carrying trade for each of the proposed lines, Dubbo to Coonamble; Warren to Coonamble; Mudgee to Coonamble, within the limits of the Dubbo District, and until that source of probable trade becomes the same for all three proposed lines.

The plan furnished with Mr. Surveyor Mackenzie's report to you in December last, on this subject will, I submit, serve as an illustrative reference for this report.

1.—Dubbo to Coonamble.—The first 50 miles from Dubbo—The total area that will be drawn from on the eastern side of this proposed line is about 1,300 square miles. Of this area, about 300 square miles consist of good agricultural and pastoral land, undulating, and either now or before it was cleared, timbered with yellow box, apple-tree, belar, and white box; and situated in the valley of the Castlereagh and Talbragar Rivers, the Coolbaggie Creek, and their feeders.

2. About 220 square miles are State forests reserves, chiefly ironbark. Into this forest, so large is the supply of valuable timber, the Railway Commissioners at one time proposed to construct a tramway from Dubbo, and the necessary land reservation was made for that purpose. This tramway, I understand, was to carry railway sleepers to the main line.

3. About 350 square miles are oak, pine, and wattle scrub, and open box country, fair grazing land when ringbarked, and when cleared, capable of producing fair crops of wheat and hay.

4. The remainder is poor scrub country.

5. All the good land and part of the fair land within this area are now settled; the Castlereagh, Talbragar, and Coolbaggie frontages thickly so.

6. The rainfall is from 23 to 25 inches.

7. On the western side of the 50 miles of proposed railway line, it will draw traffic from about 600 square miles. Of this area about 150 square miles are open pastoral and agricultural land. About 250 square miles are fairly good timbered agricultural land, and the remainder is poor sandy or ironstone gravel country.

There is one ironbark and pine forest of 12 square miles. The average rainfall is from 20 to 23 inches. On the good and fair country an average holding is about 2,000 acres.

8. Of the remaining 40 miles of this Dubbo to Coonamble line the country within the Dubbo district from which it can draw is chiefly first-class pastoral plain country interspersed with timbered and dry ground, which forms shelter and refuge for stock in wet seasons.

It will carry a family to about 3,000 acres. The average rainfall is from 20 to 23 inches. The portion of the timbered and red-soil plain country that lies in the district of heaviest average rainfall within this area will probably be found suitable for agriculture.

9. Warren to Coonamble.—On the eastern side this line will draw trade from about 2,000 square miles, chiefly open and plain, red and black soil, myall and white-wood country, interspersed with belts and patches of scrub and timbered lands. The timbered country and the red-soil plains are suitable for agriculture. The remainder is first-class pastoral country, except about 100 square miles of poor scrub lands.

This area contains three successful artesian bores at Tenandra, Bourbah, and Coonamble respectively. The average rainfall is from 20 to 23 inches, and the area capable of supporting a family will average about 2,560 acres.

10. On the western side the subject line will draw from about 1,200 square miles of country almost wholly red and dark-soil plains separated by only narrow belts of timber, except where the monkey scrub runs through it about a mile wide. The average rainfall is from 18 to 21 inches. A small portion of this contiguous to a railway line may be cultivated, but probably the major portion will for many years be chiefly used for grazing, for which it is eminently adapted. This area would appear to be wholly within the artesian water supply basin limits.

About 3,000 acres are requisite to support a family.

W. M.  
Thomas.  
3 July, 1899.

3338. When you gave evidence on that occasion your attention was drawn to four lines of railway between Dubbo and Narramine, marked A, B, C, and D;—line A, is I think, as nearly as possible, the line which we are now considering? Yes.

3339. Line A was described as a line which “goes pretty well north from Dubbo and a little west of Gilgandra, on to Coonamble”? That was the line I referred to.

3340. That was the line which you then favoured, and which the Committee seemed also to favour? No; I think you will find that the line I favoured, and which the Committee seemed also to favour, was B line.

3341. Line B was thus described—“This line leaves the main North-Western Railway about midway between Dubbo and Narramine, crosses the Macquarie just below the junction of the Coolbaggie, runs almost direct north to the Marthaguy, crossing it about 2 miles east of Berida station, and meeting line A 9 miles further north”;—you then favoured that line, and you still favour that line as the route from Dubbo to Coonamble? Yes. The starting point is not a matter of importance to me; that is a question for engineers to settle, in view of engineering difficulties. My object in favouring that line was to get west of the surveyed route about 5 to 7 miles, so as to keep well in to the good agricultural country, and get away from the margin of the poor ironbark forest—to have a line that would serve a good depth of agricultural country on both sides.

3342. I wish to draw your attention to this paragraph in the official history of this proposal:—

As it is desirable to keep the railway in the best possible position for receiving produce, Mr. Deane is of opinion that the line, instead of being moved westward, as recommended by the Works Committee, should, if possible, be kept nearer to the Castlereagh, between Gilgandra and Gulargambone, so as to make the carriage as short as possible from the districts on the east side of the river; at the same time, such a position would equally suit the west side. The Engineer-in-Chief for Railway Construction considers the line, as laid out, to be the cheapest possible, and has supplied me with the following estimate and description.

Does this route, which you sketched out then, and which you now seem to favour, agree with that idea? Yes; my object was to serve all the agricultural country east of the river, including Tundaburine, and at the same time serve the agricultural country on Berida, that is on the west side of the line. The Railway Commissioners estimate that the working expenses—that is the total annual cost, will amount to £13,437, and the receipts to £11,867, leaving a loss of £1,570 a year at the start. Having studied the district as you have done, and having in view all its best possibilities, do you think that that shortage in the receipts of the line would be likely to be made up within a reasonable period? In view of my own information as to the rapid increase in population here, I am confident that that shortage will be made up. If the annual shortage is £1,570 it means only an increase of 12 per cent. to balance the accounts. I am quite confident that if their estimate is based on the present production of the district, the construction will increase that production far more than what is equivalent to 12 per cent.

3343. *Mr. Watson.*] There is one statement in your evidence which struck me, and that is the statement as to the country between Gilgandra and Gulargambone;—after you get 4 or 5 miles to the east of the river the land then is poor, as far as agriculture is concerned? Yes.

3344. Generally, it is poor land? Yes.

3345. We have been led to believe, by the greater part of the evidence given so far, that the land between the Castlereagh and the Warrumbungles, to the foot of the ranges or hills, is good;—you do not coincide with that idea, apparently. The argument used by those who favour the construction of the Mudgee line, is that it would tap good agricultural country to the east of the Castlereagh, between Gilgandra and Coonamble? The following leaseholds, Tuckland, Bearbung, Bundybundally, Mundar, part of Tooraweena, and part of Yalcogrin, consist chiefly of poor scrub land.

3346. Some scrub land when cleared is good enough for agriculture;—what is the character of the soil within those holdings? This country is ridgy, cold clay, and ironstone gravel, and sandstone ridges.

3347. Is the land along the foot of the Warrumbungles good land? It is as rich as can be got—that is on Tundaburine and Calga.

3348. How far from the Dubbo-Coonamble line, at the nearest point, would it be to this good land at the foot of the Warrumbungles? On the average about 22 miles. That strip of poor country which I have described lies in between, during a portion of the route, the good land at the foot of the Warrumbungles, and the good land on the bank of the river.

3349. So that you would have an oblong block of bad country sandwiched between two strips of good country? Yes.

3350. What would be the average width of the land at the foot of the Warrumbungles that is good? About 7 or 8 miles.

3351. Do you think that strip of good land would be outside the influence of the Dubbo-Coonamble line if constructed? I do not. It will be sufficiently close to be served, and added to its proximity is the fact that this poor country, unsuitable for agriculture, makes the best of roads.

3352. Is it an absolute block of inferior country, or are there patches of fair country between the ridges? Taking it as a whole, its inferiority is somewhat a matter of comparison—that is, it is inferior to the good agricultural country adjoining it, and consequently will not be classified with it. The block of inferior country is not an oblong; it is more triangular, with its apex west of a point on the Castlereagh, about 6 miles south of Gulargambone.

3353. Is that country uniformly inferior, or are there patches of fair land through it? There are patches of fair land through it.

3354. So that even that block, you think, would help to contribute some traffic to the railway, assuming the better land to be settled first? As population increases a considerable area of that land would come under occupation also. On Bundybundally there are several settlement leases of about 3,500 acres. If I remember aright these blocks have been open for occupation for nearly twelve months, and in spite of the rush for land they still remain unoccupied.

3355. Although offered at a low rental? Yes.

3356. Can you state from memory what capital value has been placed upon them? I think 12s. 6d. is the capital value placed on them, and the rental will be 1½ per cent. on that. That land on Bundybundally would come under the head of my last description of the land; it contains patches of land very suitable for agriculture.

3357. Do you think the railway would have much effect on the prospect of getting tenants for those settlement leases;—do you think they would have any better chance, or is the land so bad that it would not have much effect in that respect? The railway will assist in getting tenants most certainly; but it will not be occupied while there is better land to be obtained.

3358.

W. M.  
Thomas.

3 July, 1899.

3358. Where is Bundybundally situated? It is about 14 miles due east of Curban or Terabile. The Mudgee-Dubbo line runs across the corner of the Bundybundally leasehold.
3359. When compiling this table of the areas which would be served by the line, and their respective qualities, to what distance from the line did you go on each side? Ten miles only; as Mr. Ewing, the late Chairman, requested me to do.\*
3360. It has been usual in these inquiries to assume that the land for 20 miles on either side of the route would be served by the projected railway, if not already served by a line. It is well, therefore, to have it distinctly stated that your estimate embraces only 10 miles on either side? I think it is stated that it is based on a 10-mile radius.\*
3361. With a 20-mile radius? The quantities will be slightly qualified.
3362. Do you think the areas of good land, as shown in this tabulated report, would be doubled by taking a 20-mile radius? The areas of good land, speaking generally, on the western side of the proposed line, would be, approximately, doubled, by taking in a 20-mile radius, but not so on the eastern side.\*
3363. Would there be any increase there? There would be an increase in the area of good land within the 20-mile radius, as compared with a 10-mile radius. For the last portion of that description in my evidence there would be an increase, approximately, of double the area given; but for the remainder the increase would not be nearly so great; in some portions the increase would be very small, because my object was to keep the line away from the bad country.\*
3364. And with a 25-mile radius you would touch upon even better land to the east than that you would with a 20-mile radius? Averaging the bad portion between Gilgandra and Gulargambone, the area affected on a 25-mile radius would include the first-class agricultural land at the foot of the Warrambungles.
3365. The line as shown on this map keeps a little to the west of both Gilgandra and Gulargambone. Assuming that the general direction of this line were decided upon,—that is to start from Dubbo and follow a general course towards Gilgandra, as against keeping further to the west generally,—do you think it would be worth while to attempt to get closer to Gilgandra;—do you know any reason why that centre should not be touched? My own opinion is that the line would catch more produce, in other words, serve more people, when placed west of Gilgandra, in about the position shown by line B in the previous Committee's report.
3366. But I wanted you to assume, for the moment, that line A—that is the line shown by the broad red mark on this map—is decided upon, would it then be worth while to deviate slightly in order to reach the centre of Gilgandra? I think not. I think it would be better as it is, because of the good agricultural land lying in to the immediate west. If your railway line is so far off as to force them to carry direct to Dubbo, or send to Warren, you are handicapping a lot of very good land.
3367. Do you prefer, in any case, to leave Gilgandra a little on the east? To leave Gilgandra on the east you are coming in close to the river at Curban. That will serve this strip of good agricultural land on the Warrumbungle, quite as well as if you come in at Gilgandra.
3368. You must recollect that there is no bridge at present at Curban, while there is a bridge at Gilgandra for the people to get across to the railway from the east? Yes; but the cost of constructing a bridge over the river will not be a great item.
3369. With increased settlement it is probable that the Roads Department will see to that being done? Yes.
3370. *Mr. Levien.*] In this inquiry a witness has stated that Gilgandra is "on the eastern bank of the river";—what do you say about that statement? The town of Gilgandra is on the western or left bank of the Castlereagh.
3371. So that he must have known little or nothing about the settlement there, to make that statement? Or else nothing about the points of the compass.
3372. In answer to the question, "On which side of the river is the better country," he says, "To the east";—what do you say? I say the larger area of better country is on the west. Immediately adjoining the river the country is equal on either side.
3373. Referring to the country from Dubbo to Gilgandra, this witness is asked this question: "It would be better to cultivate that sort of soil than the yellow soil in the western country?" And the answer is, "Yes. From Dubbo to Gilgandra is a desert; it is a big ironbark scrub." What do you say? I say he only saw a portion of it.
3374. This statement is made by a gentleman who thinks he knows all about it; is he wrong do you think? He is quite wrong in that statement. It is quite possible for a man to travel from Dubbo to Gilgandra, and during 15 miles of his route to go through an ironbark forest; but he would not travel on the proposed railway line.
3375. Your opinion then is that this gentleman is wrong in what he says? My opinion is that he is wrong, and the large number of settlers occupying the land between Dubbo and Gilgandra, and growing cereals upon it, justifies my statement.
3376. *Mr. Dick.*] I think you stated that you are engaged in subdividing the large leasehold areas which are to fall in within a very short period? Yes.
3377. Is it for the purpose of cutting them up into small holdings? Yes.
3378. I think you stated that as the result of that change the population in the district would largely increase? It will largely increase.
3379. That increase will be due to cutting the leases up into smaller holdings, and not to the construction of the railway? The increase will partly be due to the cutting up of the leases, but the railway will assist materially in making that increase in population still greater.
3380. In that calculation you made about the increase, I think you said the result would be that the population would practically quintuple? Yes.
3381. I think you said that at present it takes ten men to work 50,000 acres? That is about the average occupation employment on a pastoral holding.
3382. Is it the custom for men engaged in that sort of work to have their families on these large holdings? Some of them have.
- 3383.

\* NOTE (on revision):—My replies to these questions are not strictly accurate in so far as relates to the radius adopted for the areas treated of in the tables. My verbal evidence at the previous inquiry on 30th March, 1898, was based on a 10-mile radius, *vide* question 1461, page 48, No. 1 Report, of 30th June, 1898; but the tables were compiled on a varying radius, as will be seen from the areas quoted in the column "Probable supply area for carrying trade." In that respect the tables explain themselves.

W. M.  
Thomas.  
3 July, 1899.

3383. That would somewhat impair your calculation? That would modify it, perhaps, but that calculation, as I remarked at the time, was based on the pastoral and agricultural occupation, and did not include the towns.
3384. I quite understand that; but it also seemed to assume that the ten men who now worked 50,000 acres are all single men, whereas those who are to take up blocks are all men with five children apiece? When I mentioned towns, I should have explained that I had thrown the towns in to balance the families of the present employees on the stations.
3385. With respect to that scheme you spoke of for supplementing rainfall by irrigation, what kind of crops can be irrigated in this district? Maize, wheat, hay, potatoes, oats, and all vegetables.
3386. For all that kind of agricultural produce, assuming that the railway is built, where would the growers find a market? The hay and maize would find a fairly considerable local market, and also the potatoes. The market for the wheat must be Sydney, and outside the Colony—of course from Sydney—for a great quantity of it. A small quantity of the wheat would be used locally, but the larger quantity would be sent away.
3387. What would you call your local market for hay—what would cause a local consumption of hay? A consumption north and west of Coonamble, where the rainfall is more uncertain and smaller, and renders the country unsuitable for agriculture.
3388. This statement is given in evidence by Mr. Harper:—

412. Could not you very well say that, if the line as first proposed by the Railway Commissioners, from Warren to Coonamble, had been constructed, before long there would have been one required from Dubbo to Coonamble? I would not like to say that the pressing necessity has arisen yet for the construction of the proposed line. I think it is a matter for reflection as to how the area to which I have referred should be served.

That is the great area of country lying between the Western line on one side and the Northern line and the North-west line on the other;—would you agree with a statement that it is still a matter for consideration how that large area of country is to be split up by railway, or would you pin your faith direct to the Dubbo-Coonamble line as a means of splitting it up? After fully considering the whole question, I am of opinion that the Dubbo-Coonamble line will best serve the interests of the residents on the subject area.

3389. You have, I suppose, considered the various proposals which have been put before the country for the splitting up of that area? Yes; I have given them consideration, and I may say, until I went into the matter very thoroughly, I was of opinion that the Coonamble-Warren line was the best one in the interests of the people; but when I examined the matter thoroughly, I came to the conclusion that my first opinion was erroneous, and that the Dubbo-Coonamble line will best serve the interests of the residents on the subject area.

3390. Do you think the teams could successfully compete with the Dubbo-Coonamble railway in good seasons? In good seasons they might; but the term "good seasons" has a very limited meaning. The good season for carriage purposes will be when there is an abundance of grass on the road, and yet the rainfall has not been sufficient to make the roads heavy. I find that a fair average for the cost of carriage between Dubbo and Coonamble by team is £2 10s.; from Coonamble to Warren a fair average is about 35s., and the railway carriage, I understand, from Dubbo to Coonamble will be 32s. a ton. A comparison of these figures will show that teams are hardly likely to compete successfully with the railway. At such a time as I had previously defined as a good season they might; but these periods would be so brief that teams would not probably be found on the roads at all.

3391. Am I right in taking it that it is your opinion that this line would take to extra local markets, wool, wheat, and meat, practically? Practically, wool, wheat, meat, and hay, when we had a good season and Riverina had a bad one. Just as at present hay is going from Dubbo to Wee Waa and Pilliga *via* Sydney and Narrabri and Gunnedah—just as at present, owing to the good season, Dubbo can supply hay to those places, so when we had a good season and Riverina had a bad one, by means of this line and the Blayney-Harden line, we could supply hay to Riverina.

3392. Has much been sent *via* Sydney, Narrabri, and Gunnedah? I could not give you the quantities, but I know that it has been sent. I have not been in Dubbo for four months. I understand, in the district where I heard it, that there were some consignments sent direct from Dubbo.

Herbert Mandeville Nash, licensed surveyor, Coonamble, sworn, and examined:—

H. M. Nash.  
3 July, 1899.

3393. *Chairman.*] What position do you hold? I am a licensed surveyor in the Coonamble district. I have been eleven years in this district, nearly, and I have been qualified nearly twenty-three years.

3394. Perhaps you would prefer to make a statement to the Committee which would enable them to better understand this question? I do not think I wish to alter any portion of the evidence I gave at the last inquiry.

3395. Have you seen a copy of your evidence at that inquiry? Yes.

3396. Do you verify that evidence, or has experience taught you that there is any wrong statement in it? No. On reading over the evidence I do not see anything for me to alter; but there is one remark I would like to make in reference to the country between Gilgandra and Dubbo. Since the last inquiry was held I have been over that land, and in view of my having given that evidence, I made myself a little better acquainted with the land.

3397. What is your opinion now of that land? I think it is not nearly so bad as I then stated it was, although I do not pretend now to have a very deep knowledge of it. I think that a good deal more of the country, if it were cleared, would be suitable for agriculture than I thought when I gave my previous evidence. As far as this present line is concerned, I am only well acquainted with the country from Coonamble up to Gilgandra.

3398. Are you well acquainted with the route all the way from Coonamble to Gilgandra? I think I know it pretty well.

3399. Are you able to give the Committee any opinion as to whether the line should be built on the west side or the east side of the Castlereagh? I am quite satisfied in my own mind that it will be advisable to make the railway on the west side, as is proposed.

3400. You have examined that country between Coonamble and Gilgandra since your appearance before the last Committee, and you have modified the opinion which you then expressed? I have modified it considerably. At the previous inquiry I said I might give an opinion but that it would not be entitled to much weight, as that country was out of my jurisdiction.

3401. Now your opinion carries some weight? I think it is a little more valuable.

3402.

3402. In the country you described as being bad, have you seen any of the land put under crop since your previous examination? No. H. M. Nash.
3403. Do you know whether anyone has taken up any of that land for that purpose? Not of my own knowledge. The principal reason why I would like to modify my previous evidence is that there is a good deal more box and forest country than I thought there was, and I know that box forest country, when it is cleared, is well suited for agriculture. 3 July, 1899.
3404. Is there anything else you would like to add to your former evidence? No. I have listened very carefully to Mr. Thomas' evidence. I know other parts of the district perhaps better than he does, and I indorse his evidence as to the part from Gilgandra to Coonamble.
3405. You were in the room while he was giving his evidence, and you corroborate all that he has stated? Yes; and I do that with eleven years' knowledge of this district; that is, of course, as far as that knowledge goes.
3406. You think that if the railway is constructed it will tend to closer settlement in this district? Yes.
3407. Have you any knowledge of country which is being served or opened by a railway in other districts? I was up at Temora at the time of the big rush. I remember Temora when there were only about 100 acres of agricultural land all round it. I laid out a lot of gold-mining reserves in 1880, and since then it has obtained a railway, as far as I can judge, by reason of its agricultural advance quite as much as its gold.
3408. Have you seen Temora since the line was constructed? Yes.
3409. What has been the result? I hardly knew the place, it was such a contrast from what it was in 1880.
3410. Has cultivation greatly increased? Yes.
3411. Taking the land to be served by the proposed line from Dubbo to Coonamble, do you think the same result would be got? I do not know that it would make so much difference here—that is, generally.
3412. How does the land to be served by this line compare with the land which has been served by the Temora line? Some of this land is much better I think, and some of it is not as good.
3413. As regards railway traffic, if it were justifiable to construct a line from Temora, in your opinion would it be justifiable to construct this line? I certainly think so.
3414. *Mr. Watson.*] You stated that you were at Temora during the original rush;—going through that country—I suppose you went from Cootamundra—you would see ironbark and some rough country? Yes.
3415. And a lot of scrub, even on the flats—sifted bush and other kinds of scrub? Yes.
3416. Hardly attractive-looking to a man going there at first? Quite so.
3417. Do you think that in its then state that it was much better country than the ironbark country on the route of this line? In its then state it looked to be hardly good for anything.
3418. Are you aware that agriculture has developed very largely down that way? I do not know of my own knowledge; but I know, by reading, that a perfect transformation scene has taken place.
3419. A lot of country which it was originally thought was unfit for agriculture, and not of much value, even for sheep, has since been proved to be of great value for agriculture? Quite so.
3420. When you said at the previous inquiry that the country between Dubbo and Gilgandra is comparatively poor, I suppose at that time you had only travelled along the stock route, or the main road? That is all.
3421. Through absolutely unimproved country? Yes; it was pretty nearly all unimproved. It was not ringbarked.
3422. Consequently, there would not be much grass there at any time? No.
3423. Since then you have had an opportunity to look more closely into the character of the land between those points? Yes.
3424. And you think you have reason to alter your opinion? To modify it a good deal.
3425. That means, I suppose, that you have seen since then a larger area of better country? That is it.
3426. There are two kinds of ironbark country, I understand, between Dubbo and Gilgandra—one kind consisting of ridgy country, growing only ironbark, and the other flatter country, growing also other timber? Yes.
3427. Do you think the open or flat ironbark country would be of any value for agriculture, if cleared? I think it might; but my opinion would not be worth much. I do not know instances where it has been tried.
3428. You heard what Mr. Thomas stated with respect to a triangular piece of poor land east from Curban, and east also from Gilgandra;—do you coincide with that statement? As a matter of fact, I measured up Bundybundally. I know there are good patches, and I agree with what he said about that; but taking it as a whole, it is not worth much.

Edward Whitney, grazier, sworn, and examined:—

3429. *Chairman.*] What are you? I am a grazier, residing at Nebea, about 12 miles north-east from Coonamble. E. Whitney.
3430. Have you a fair-sized holding? I have about 40,000 acres of secured land—that is, freehold, conditional purchase, and conditional lease, and about 40,000 acres of leasehold land. We have been making some exchanges lately, so that I cannot be quite positive about the acreage. 3 July, 1899.
3431. What is it fit for—pastoral pursuits, or agricultural? For both, I think.
3432. Could it be subdivided so as to settle men on it at mixed farming? I think so.
3433. In fair-sized areas? Yes.
3434. What area would you consider sufficient to carry a man and his family? From what I have seen, they seem to do very well on 2,560 acres, where they get fairly suitable crops; but I think, considering the rainfall, even a little larger block than that would be better.
3435. It will give them a better chance to put away something? Yes; they can live on it, and some have done very well.
3436. Do you send away much wool? About 800 bales; but of course we should not be able to send away as much as that next year when we lose the leasehold.
3437. Off the land you hold, including freehold and leasehold, you send away about 800 bales? Yes.
3438. Where do you send your wool to? To Dubbo always.
3439. Is there any wheat grown out your way? I have not known of any wheat being grown for grain, but we have grown wheat for hay. 3440.

- E. Whitney. 3440. Do you think it would pay you to grow wheat out there to send away? It might with a railway. It certainly will not now; there is no demand. Although we got an exceptionally high price this year for our own chaff, still there is only a very limited demand in Coonamble.
- 3 July, 1899. 3441. Suppose a railway were constructed to Coonamble, do you think it would pay to cultivate for hay, bearing in mind that your market will probably have to be in Sydney? That is rather a hard question to answer.
3442. I mean taking an average of years? As far as I can understand a very much larger area has been put under cultivation this year than hitherto, and if that were to go on indefinitely it is just possible that there would be over-production. In that case it certainly would not pay to send so far away, but with the ordinary production and the country consumption I should think it would. They can grow wheat to pay at Narramine, and the extra distance would not make such a great difference, I should think.
3443. Where do you truck your sheep? We sell all our sheep as stores as a rule, but any sheep we have sent down have always gone by Dubbo.
3444. The line which is referred to the Committee is a line from Dubbo to Coonamble, and an alternative route is suggested from Mudgee to Coonamble;—would the route from Dubbo serve this part of the country better, do you think, than the route from Mudgee? I am sure it would, because we may get the one in three years' time, and the chances are we will all be grey-haired before we get the other.
3445. Suppose there were a certainty of getting either one or the other within a reasonable time, would it? I do not know that it makes a very great difference to us.
3446. The line to Mudgee would give you Sydney as a market, whereas the line to Dubbo would give you the choice of two or three markets? Yes.
3447. Would that be an advantage, do you think, to the people here? Certainly.
3448. That being so I presume you would prefer a Dubbo connection? Certainly; there is no doubt about the Dubbo line in preference to the Mudgee line.
3449. At the previous inquiry you were examined; have you anything to add to your evidence on that occasion? I think not, but I am quite prepared to answer any questions. The question, I take it, is not so much whether we ought to have a railway, as whether we ought to have the railway by one route or the other.
3450. No; we want you first of all to prove the necessity for a railway to Coonamble? In a season like this a railway would have been of very great service to us, and at the same time it would have been of service to the people of Sydney. If we had a railway I could now, although we are suffering from a drought, send fat sheep down to Sydney, but I have not got a sufficient number of them to make it worth my while to travel them over bad roads. Although the sheep might be in fairly good condition here they certainly would not be in good condition by the time they arrived in Dubbo, but they would be in quite good enough condition if I could get them into Sydney in two days by rail. It is a very different thing from travelling them over roads which are eaten bare, and taking a fortnight or more to go down.
3451. What do you think they would lose in value by travelling to Dubbo? In a season like this, allowing that the sheep are not real prime to start with, it would simply make the difference between fetching a price as saleable sheep and not fetching a price at all.
3452. Taking a good season with plenty of grass what would be the difference? In a good season with plenty of grass it would make very little difference—it would make a difference, but not very much. The sheep would not depreciate to the extent of becoming unsaleable.
3453. Suppose a railway were constructed, and you had a series of really good years, would you be likely to travel your fats in preference to trucking them here? I cannot say without having tried, but I think in all probability we should prefer to truck, and instead of sending down a large mob to send down the tops very often.
3454. *Mr. Watson.*] Instead of a large number of varying quality? Yes. I think one thing which will be almost certain to make the railway used is the fact that the Lands Department has been letting the stock routes, so that in many cases they are not of much use to travelling stock. Travelling stock can go over the routes, but there is nothing for them to eat.
3455. You think that the subdivision of the public estate will pretty well ensure traffic going on to the railway because each person will have fewer fats to send at a time, and it will not pay him to take them by road? I certainly think that where it would pay him to send down 2,000 sheep, it might not pay him to send 500. As far as the driving is concerned, the cost of taking 2,000 sheep would not be any more than the cost of sending 500.
3456. Does the wool from this district go to Warren since the extension from Nevertire was constructed? I think some considerable amount of it did go there, but we have never sent any. To some extent we have been in the hands of Wright, Heaton, & Co. We have made a contract with that firm, and they sent the wool to whichever station suited them best.
3457. *Mr. Watson.*] Which station has generally suited them best? So far, they have always sent our wool by Dubbo.
3458. *Chairman.*] Does the general traffic go by that way to Dubbo? I think so. In the case of fat sheep I think nearly all go that way.
3459. Which connection—Dubbo, or Mudgee, or Narramine—do you think would be best to suit the people of Coonamble and the people about Coonamble? I have never been through the country which a line from Coonamble to Narramine would traverse, but I do not see what would be gained by taking the railway that much further west. I should think Dubbo would be decidedly the best connection. There is good agricultural land all the way along the route which the line would probably follow.
3460. *Mr. Shepherd.*] You say you think 2,560 acres would be a sufficient area for a family;—do you mean that it is sufficient for pastoral purposes or for agricultural purposes? For pastoral purposes.
3461. And if the land is suitable for agriculture, what area do you estimate will be sufficient to support a family in the event of a railway being brought here? I should hardly like to say without thinking out the matter very carefully, because the price a man would get for his produce means such a great deal. Suppose the whole district were put under cultivation instead of sheep and cattle they could not possibly expect to get the same price for their produce as they do now.
3462. But there is such an enormous outlet for the wheat. If you had a railway you would not be confined to the district at all, or even to the Colony; you might always calculate upon getting from 2s. 6d. to 3s. a bushel, I should think? 400 or 500 acres I should think would be ample for a man. In Grenfell there

F. Whitney.

3 July, 1889.

there are numbers of settlers who have only 100 acres and they are making a very good living out of that area.

3463. Do you think the land here equal to the land at Grenfell? I think the land here is equal to anything in the world. The rainfall is the chief trouble; but I have always understood that wheat can be grown in 16 in. of rain, and our average during the past twenty years has been over 22 in.

3464. Have you much of your land rung? A considerable amount.

3465. I suppose you have never attempted to clear up the land—that it is left in the way in which most of the ringbarked country is left? We have been clearing up a considerable amount of the freehold land.

3466. You run a sheep to how many acres? We have always gone in for understocking. At present I have not more than a sheep to 2 acres.

3467. In your previous evidence you said that you ran about a sheep to  $1\frac{1}{2}$  acre, and from that to  $1\frac{1}{4}$  acre;—I suppose you have not altered the estimate since then? No; this year has been exceptionally dry, and I have kept the numbers down, and then our lambing has been 20 per cent. less than we usually expect.

3468. Do you allow your sheep to run over the whole area, or have you the property divided? We have it subdivided into many paddocks.

3469. Do you spell them alternately? I will not say that we have done that altogether; but every now and again we do give a paddock as much spelling as we can. We cannot very well spell it completely.

3470. The great advantage in having paddocks is to enable you to spell your grass? What I mean is that we have not given any one paddock six months' spell. It is a rule with us to give them a spell until after the next rain, and after rain falls to give it, perhaps, a fortnight or three weeks without putting sheep in.

3471. One great advantage in spelling is to enable the grass to seed, so as to increase the pasture? Yes. I may say, from the subdividing of the paddocks, we have been able to send away just the same number of bales as we did before 1884, when a large amount of land was taken away from us.

3472. About what does it cost you to ringbark the land you have? The highest we have paid has been 1s. 6d., and the lowest, 9d.

3473. What is the character of the timber on the land? It was mostly belar and budda that we ringbarked.

3474. Have you much timber which would be useful for commercial purposes—ironbark or box? We have no ironbark at all; but we have, and have had, some very good pine. A large amount of the pine which has been used for the saw-mill in Coonamble during the last twenty years has come in from our land.

3475. Do you think it would pay to send sawn pine from Coonamble to Dubbo by railway? I should be doubtful of that, simply because there are large pine forests, I understand, between Coonamble and Dubbo. There is a good deal of black pine, which is not of much use.

3476. How is your property watered? Entirely by tanks and dams.

3477. No natural flow? No.

3478. You have not tried sinking wells, I suppose? The only wells we have had have been soakage wells, 14 or 15 feet deep, and then they hold no permanent supply.

3479. You have no watercourse running through your property? Yes; but it only runs in floodtime.

3480. Have you not tried to find water in the bed of the watercourse? Yes. There is no water there; you get on to clay bottom very soon.

3481. What is the general character of your 40,000 acres of secured land;—is much of that land fit for agriculture? I think so.

3482. So that in the event of a railway coming here, you would be able, probably, to deal with your land as many stockowners are doing now—to let it out on the share system, which seems to be coming into fashion very quickly? I am quite certain that the land is suitable enough for agriculture. I am not sure if we should prefer to cultivate on those lines.

3483. From the information you have gathered amongst the residents, do you think there is a disposition to go in for agriculture in the district? I think so, but they are perfectly hopeless till they see some outlet for the produce.

3484. If a railway were opened, do you think there would be a very large increase in the agricultural area? Yes.

3485. I suppose wheat is the only crop which is cultivated here;—do the growers seem pretty well satisfied with the results? I think so; but as far as I know, people have only grown wheat for their own requirements.

3486. Have you heard of any holding being forfeited in the district? No; I do not know of any.

3487. You are aware that in about twelve months there will be a very large area of Crown lands thrown open? I am sorry to say I am.

3488. Do you know if many people are likely to take up land here when they get the opportunity? I do not know of many myself; but I know that every time land is thrown open there is always a great number of applicants at the ballot-box.

3489. At all events, you think it is likely that there will be a large number of applications? I have made up my mind to lose every acre which will be thrown open. I think it will all go the very day it is made available.

3490. I think you stated that you are not very particular as to which line is opened—the Mudgee line or the Dubbo line? I should like to see a railway from anywhere; but if we have to wait till we get a connection from Mudgee, I should give up any idea of a railway at all.

3491. You are almost sure to get one line within a reasonable time; but, of course, you will not get both lines;—in the interests of the whole Colony, which line do you think would be the better one to open? I think decidedly the Dubbo line.

3492. Why do you think that line is preferable to the other? I always understood that there was some idea, sooner or later, of having a line from Werris Creek to Dubbo, and from there on to Melbourne. It seems to me that, if we can connect at Dubbo, it will be far better than going to Mudgee, and then having to work round to the Western line.

3493. *Mr. Watson.*] I understand you to say that you think a railway would pay if brought to Coonamble? I think so.

3494. Suppose you were looking at the matter purely as a private speculation, on which route, from your general knowledge of the country, would you prefer to run the line? I think I should take the Dubbo route, decidedly.

- E. Whitney. 3495. Therefore you think that is the line most likely to pay? Yes.
3496. *Mr. Trickett.*] You have gone in for some agriculture? On a very small scale. We have had 15 acres in, and this year I put in about 50 acres. Last year, owing to the dry season, I got no crop at all to speak of, but the year before I got a return of, I think, between 2½ and 3 tons to the acre.
3497. In a good season you had a crop? Yes; we had between 2½ and 3 tons of hay to the acre.
3498. Did you treat any of the crop for wheat? No; we cut it entirely for hay. Wheat was practically useless to us. There was no flour-mill or means of utilising the wheat.
3499. As regards the sheep land, what profit per acre do you think you get out of that area? We reckon the gross return of a sheep at about 3s. 11d., and it would take from an acre and a quarter to an acre and a half to carry a sheep.
3500. Which would leave a return of between 2s. and 3s. gross per acre? Yes.
3501. How would that return compare with the return per acre from similar land used for agricultural purposes? I have been selling the bigger bulk of the hay I got two years ago at as high as £7 10s., but the lowest I got was £3 10s.
3502. *Mr. Watson.*] What price is hay here now? I think chaff is about £7 or £8; that is the price I sold it at in Coonamble.
3503. *Mr. Shepherd.*] In your previous examination I see you said that some of the farmers reckoned your crop at about 35 to 40 bushels to the acre—is that correct? Yes. That was only remarked by men who were passing. If I thought that any persons knew anything about the matter I asked what they thought it would yield. We never tested it in any way.

Thomas Dun Bertram, medical practitioner and Mayor of Coonamble, sworn, and examined:—

- T.D. Bertram. 3504. *Chairman.*] You are mayor of Coonamble? Yes, and a medical practitioner practising in the town. I have little to add to the evidence I gave at the previous inquiry.
3505. *Mr. Trickett.*] You have been residing here a little over six years? Yes.
3506. Will you give the Committee some statistics in regard to the town? The town was incorporated in 1880. The municipality comprises 23½ square miles. The population in the town is about 1,800, and in the district between 8,000 and 9,000. The general rate is 1s. in the £; the lighting rate 3d. in the £; and the water rate 1s. in the £. The municipality has a debt of £1,000. The annual rental of the improved lands within the municipality is £11,700, and the capital value of the same is £117,000. The capital value of the unimproved lands is estimated at £32,500. The general rate and the water rate yield over £1,100.
3507. The water scheme was carried out by the Government at a cost of £5,594, and you had the usual term of 100 years in which to pay the principal and interest? Yes. We are well ahead of our obligations; our revenue more than meets the annual charge.
3508. The return from the water rate shows a profit? It shows a decided profit. In regard to the debt of £1,000, a sinking fund has been established within the last year to pay off the debt. We got £100 to the credit of that fund within a year.
3509. Since you have been residing here has the town progressed in population? Very decidedly it has. I should think there must have been a 25 per cent. increase in the population during the term of my residence.
3510. You are competent and able to speak as to the health of the town? It is a provokingly healthy town.
3511. As a doctor and as the mayor of the town you must meet a great many persons;—could you tell us what is the consensus of opinion as to the route for a railway to connect Coonamble with the main line? I honestly believe the vast bulk of the people here will be thoroughly satisfied with the connection from Dubbo.
3512. Suppose a resident wishes to visit Sydney, how long does it take him to go there and return, in fair weather? To get there it takes him two days, and to return it takes two days,—so that to go to Sydney and to return, unless you break your neck at it, it takes a week, and that allows you only two and a half days in Sydney.
3513. To go right through, it is a very tiring and fatiguing journey? It is.
3514. With increased accommodation, I suppose there are a good many people with means who would largely avail themselves of the opportunity to take trips to the metropolis? I have no doubt of it. There are many persons who spend the summer here, who would go away for the hotter part of the summer, I believe, if they had proper facilities for travelling. Mr. Donald Fletcher, of Ballagula, the president of our Railway League, is, I am sorry to say, unavoidably absent in Sydney; he is an expert. He has experimentally grown, I think, all sorts of crops. He believes this district will become one of the greatest wheat-producing districts in the Colony.
3515. Is there anything else you would like to state? There is a proposal afoot to establish a flour-mill here. I am thoroughly satisfied that it would have been carried through but for the drought. The provisional committee who were appointed considered it advisable not to proceed with the matter till the drought had broken. But even with the drought, and bad as it was, I suppose very nearly half the shares in the company could have been allotted there and then.
3516. I suppose, in your travels through the district you must have noticed that agriculture has advanced? It has. There was not, practically, any agriculture when I came here; but it has gone on increasing, and is increasing every year.

Peter Aloysius Polin, storekeeper, Coonamble, sworn, and examined:—

- P. A. Polin. 3517. *Mr. Dick.*] Have you lived here long? About twenty-three years.
3518. Then, I presume, you have a pretty fair knowledge of the district? Fairly good.
3519. Your business relations, I suppose, extend some distance round Coonamble? About 30 miles in every direction.
3520. Has the district progressed during the period of your residence? Wonderfully so.
3521. Do you expect the district to go ahead in the same way in the immediate future? I think so.
3522. Do you think its progress is likely to be arrested if the railway is not constructed? I think it will be fairly stationary. Of course, the throwing open of these Crown lands a year hence will bring a population here if the railway does not come.

3523. Do you think the progress of the town would have been even more rapid than it has been, had a railway been extended to the district some years ago? Certainly it would.
3524. Do you think it is necessary, for the success of this small holdings policy, that a railway should be constructed? Yes; I think one would help the other considerably.
3525. You do not think small holders could get on without a railway in this district—that is, men who go in for agriculture or mixed farming? I think they could to a certain extent; but of course they would not have the same facilities for getting to a market as they would have with a railway.
3526. In other words, you believe a railway is really necessary for the success of that new policy in this district? I thought it was necessary twenty years ago.
3527. Still you admit that during that period the town and district have progressed wonderfully? Yes.
3528. Can you give us any idea of the goods traffic from Dubbo to Coonamble? I cannot say that I can. I gave evidence before the last Committee, and I think I stated the amount of carriage which we paid yearly.
3529. In your evidence you stated that, "from July, 1891, to July, 1897, the amount we paid for carriage from Sydney to Coonamble was £7,364 18s. 11d.";—have you been paying more or less since 1897 for the carriage of goods from Sydney? About the same.
3530. Do you think there has been an increase in the amount of goods brought into the district from Sydney and other places along the line during that time? I think so.
3531. Do you think the Dubbo connection, as it would give you practically a connection with two markets, would be more advantageous to Coonamble than the Mudgee connection? I think so.
3532. In other words, you prefer the Dubbo route to the Mudgee route? I would, as a business man.
3533. Do you think it is the best route in the interests of the country at large? I do.
3534. Do you think it is likely that the carriers could compete between Dubbo and Coonamble with the railway if constructed? It would depend on what the Railway Commissioners charge.
3535. The railway rates from Dubbo to Coonamble will be as follows:—For 50 per cent. of the goods, £1 18s. 9d.; for 25 per cent. of the goods, £1 11s.; and for the remaining 25 per cent., about £1 3s. 3d.; the ordinary through rates give an average of 32s. per ton;—under those circumstances, do you think that in fair carrying weather the teams could compete with the railway? I think it would be an impossibility at that rate.
3536. Is it a fact that in 1898 goods were carried from Coonamble to Dubbo for 30s. a ton? I believe they have been. We never had them carried for that price. The lowest price we paid was £2 a ton, and we have paid as high as £20 a ton.
3537. You never paid anything less than £2 a ton? That is the lowest.
3538. Did that low rate of £2 a ton occur in the case of back loading—in the case of wool going down and goods coming back? I think it is a starvation price to carriers. There is not a carrier who could make money at it.
3539. *Mr. Watson.*] When you got the carrying done for £2, were they getting back loading? Yes.
3540. *Mr. Dick.*] It was return traffic? Yes.
3541. It has been stated by one witness at this inquiry that, "as a matter of fact, last year goods were carried between Coonamble and Dubbo for 30s. a ton,"—that is a statement the truth or untruth of which you have no knowledge of;—you have never heard of it being done? I have heard that the Chinamen had loading delivered from Dubbo to Coonamble for 30s.
3542. For what portion of the year, as a rule, are the roads here fit for travelling by teams? They are fit at all times; but, of course, the winter is the worst time for travelling.
3543. They are practically fit at all times for the carriage of goods? Yes.
3544. For what portion of the year are the roads in such a condition that carriage becomes very cheap? It depends upon the season; it depends upon whether there is grass.
3545. For what portion of the year are the grass and the roads in a good enough condition to bring the rate down very low? Probably in the summer-time, if there is plenty of feed.
3546. Could we say for three months of the year? More than that—six months.
3547. Then, if the railway were constructed and the train took the whole of the carriage during the remaining six months, do you think you would have teams along the line for the good six months competing with it? Not at the rate of 32s. a ton. They could not live at it.
3548. Would the removal of the teams from that long stretch of country—from Coonamble to Dubbo—have a somewhat serious effect upon the intervening townships? I do not think it would interfere with them.
3549. *Mr. Shepherd.*] Do you think that the carriers have accepted a very low freight rather than return empty;—do you think it is possible that that may have accounted for the low freight? It may. If a man has a team of horses in good condition he must accept any price before he would turn them out to starve.
3550. Suppose a man had been engaged to take a load to Dubbo he would rather take a very low freight, I should think, than come back empty? I have known them many times to come back empty rather than take 30s. a ton.
3551. *Chairman.*] Is there any other statement which you wish to make? I think if the railway had been running during the last twelve months it would have brought an enormous quantity of forage into this district. I think there have been over 1,000 tons of forage used within a radius of 20 miles during the past twelve months.
3552. You mean that that would have been local traffic;—that produce grown to the south, that is, towards Dubbo, would have been brought here? Yes.
3553. That would have given a railway between Dubbo and Coonamble carriage amounting to £1,000? I believe so.
3554. Do you think there is sufficient country about here to be developed, and that it would be developed by a railway, if constructed, so as to enable that line to pay? I do indeed. I have not had much experience in farming, but fifteen or sixteen years ago I had 20 acres under cultivation, and I got 80 tons of chaff off it.
3555. Have you seen other districts through which a railway has been constructed with which this district would compare? I cannot say that I have. I have not had much experience in that respect.
3556. *Mr. Trickett.*] Do you look upon Coonamble as a large distributing centre? I do.
3557. For what distance round are goods sent from Coonamble? Thirty miles. 3558.

P. A. Polin  
3 July, 1899.

- P. A. Polin. 3558. Your operations extend over that distance? Yes; perhaps further.
3. July, 1899. 3559. From what distance to the north do you think wool would be brought to the railway? I should think from about 40 or 50 miles.
3560. How much per ton does it cost you to get your goods from Sydney? It would average from about £9 to £9 10s. at the present rate of road carriage.
3561. Of that sum, how much goes for road carriage on an average? £2 during the last twelve months; but I have paid as high as £20 a ton from Dubbo to Coonamble.
3562. I suppose there is very little doubt that if a railway were constructed from Dubbo to Coonamble, and you could get your goods carried for an all-round price of 32s. per ton, you would avail yourself of the railway? Certainly, or even more than that. The convenience in itself would be very great. Carriers at times may be a month or six weeks on the road. I have known them to be two months on the road from Dubbo to Coonamble with loading.
3563. Wheat-growing in this district is a recent development? Yes.
3564. Do you look upon that development as a very great advantage to the district? Certainly.
3565. Do you think there would be any market for produce of that kind outwards, or would it always be towards the metropolis that it would go? I think there would be a great local consumption.
3566. Within say 30 or 40 miles of Coonamble? All the wheat which has been grown locally so far has commanded a ready sale at from 4s. to 6s. a bushel.
3567. That is a top price? Six shillings would be a top price; I have paid that for wheat.
3568. Is it a good quality of wheat? Very good.
3569. It does not suffer from rust or anything of that kind? No.
3570. *Mr. Watson.*] You stated that you prefer the Dubbo connection as a business man;—you are aware, I suppose, that the Mudgee connection would mean a saving of 37 miles of carriage to Sydney? Yes.
3571. Are we justified in assuming that you think the additional markets opening to the westward from a connection with Western line will compensate for that extra 37 miles of carriage to Sydney, *via* Dubbo? Notwithstanding that the Mudgee line will be so much shorter than the Dubbo line, I think the carriage on the Dubbo route will be much lower.
3572. Why? The Commissioners are working the lines on economical principles, and therefore if this line costs more the carriage must be more.
3573. I dare say you are aware that in the case of most branch lines—nearly all, practically—a local rate is put on until the line is made to pay? Just so.
3574. The sooner the line pays the sooner that local rate is abolished in favour of a through rate, which is lower? Yes.
3575. Do you think there is a probability of getting a through rate sooner if it is taken *via* Dubbo than if it is taken *via* Mudgee? Certainly; the cost of construction must be considerably more on the Mudgee route than it would be on the Dubbo route.
3576. The line would have to earn additional interest each year to compensate for that? Certainly.
3577. The extra distance in construction might be compensated for by the additional lands which would be opened up, and which would help to give traffic to the railway;—which route do you think is the more likely to open up country? I think the line from Coonamble to Dubbo will open up sufficient country to make it a payable line of itself.
3578. Do you know the country between Coonamble and Mudgee well? Fairly well; I have been through it several times.
3579. Do you think if a line were constructed from Dubbo to Coonamble there would still be sufficient country left to the east to justify the extension of the Mudgee line towards Cobar? I am not competent to express an opinion on that.

Thomas William Medley, Inspector of Stock, Coonamble, sworn, and examined:—

- T. W. Medley. 3580. *Mr. Watson.*] Will you be good enough to state the boundaries of your district? Taking Coonamble as the centre of my district, I go down south of Gulargambone 30 miles; across from Gulargambone easterly to outside Calga boundary, about 24 miles; northerly 30 miles; westerly 50 miles; north-westerly 50 miles; and south-westerly to a point within 12 miles of Warren.
3. July, 1899. 3581. How many sheep are there in your district, and what is its area? The area of the district is 2,769,944 acres, and it contains 1,637,160 sheep, 6,180 horses, 14,254 cattle.
3582. Last year you stated that there were 235 pigs in the district? I did not return them in this annual report.
3583. Do you think that number would be approximately correct? Yes; there are not a great many in the district.
3584. Since you gave evidence before the former Committee there has been a falling-off of 100,000 in sheep, 2,000 in cattle, and 800 odd in horses? Yes.
3585. You attribute that falling-off, I suppose, to the severity of the drought? To the drought.
3586. How do these returns compare with the returns during the last ten years;—has there been an increase? There has been a steady increase ever since I came here.
3587. A steady increase in the carrying capacity of the district? Yes.
3588. To what is that attributable—to a better understanding of how to utilise the land? I think so. The country has been cut up a great deal, and the selectors have made better use of the land.
3589. You think that smaller settlement allows of better use being made of the land, even for pastoral purposes, than the system of large holdings? Certainly.
3590. Do you think the small settler improves his property more in proportion to the size of it than the large holder does? I think he does.
3591. Perhaps he is able to pay greater attention to the breeding and care of the stock generally? He pays a little more attention.
3592. In any case you think it is a fact that the system of small settlement permits of a greater quantity of stock being carried, even if it used for pastoral purposes alone? Yes.
3593. In what way could the country within your district be classed;—is it sound, healthy country for stock? Yes, very sound. When I first came here there was hardly anything wrong with it, except the Cumberland. Since then we have had a little fluke, and worms, and that sort of thing introduced from other districts.

T. W. Medley.

3 July, 1899.

3594. Have you had anthrax? It has always been here.
3595. Is it very prevalent? It has been in a good many places.
3596. Is it peculiar to any class of country within the district—the plains or low country—or is it common to all the district? Some of the country which appears to be the best is the worst for the anthrax. In many cases the best of land appears to be infected with anthrax.
3597. I think you said that in some portions of the district, where it was formerly very prevalent, it has now almost disappeared? From what I can ascertain, in places where twenty years ago it was very bad, of late years there has been very little of it.
3598. And it has made its appearance in other parts where it was not previously? Yes.
3599. I have been informed that you have experimented in irrigation to a small extent? To a very small extent—only half an acre of garden.
3600. Was it sufficiently large for you to form any judgment as to the possibilities in that connection? Quite.
3601. What is your opinion of the possibilities for irrigation with artesian water? I think if it is properly carried on, with proper drainage, it pays well without a doubt.
3602. Did you have any experience of irrigation before you tried this experiment? No.
3603. The authorities say it is a common error with people who first attempt irrigation to use rather much water;—your own experience was of a similar character? I think so, to my cost.
3604. You tried lucerne, I believe;—was that successful in the way of yields? It did well for the first three years.
3605. What returns did you get? I could not tell you about the tonnage, but as often as I got round to one end I could cut it at the other end. Of course I was not cutting it for a large number of stock. It did well. At the end of that period of three years a portion of the paddock got too much of the water and the other got too little of it, so that it all died out. It had not been properly attended to; I could not attend to it properly. I do not think the roots got down deep enough.
3606. Is the soil itself not deep enough, do you think? It is pretty well known that lucerne roots go down about 7 feet. I think the soil there is not that depth; therefore, I do not think it lasts so many years. The general life of lucerne is, I believe, seven years.
3607. You think the soil where you experimented was not deep enough for the purpose? Not for lasting.
3608. Do you think the water you put on went right down? Yes.
3609. Is it a clay bottom? I have never gone deep enough to see that.
3610. What depth was the soil there? I never went more than about 2 feet in it.
3611. But in many places in this district the soil is of a greater depth than 6 feet or 10 feet, is it not? Yes; on the banks of the creeks and rivers it is deeper. It is a sort of wash, a great deal of it. I believe in some parts close to my place it is deeper, but back in this paddock I am more on the flat.
3612. Is the place where you tried the experiment black soil, in plain country? It is not quite black; it is more loamy.
3613. Did your experience suffice to convince you that it is possible to make a success of irrigation if properly carried out on a comparatively small area? Without a doubt.
3614. Did you try any other kind of crop besides lucerne and fruit trees? In the first year where I put the lucerne in I grew wheat, and I never saw a finer crop anywhere—not in Victoria.
3615. You cut that crop for hay? Some of it I thrashed out.
3616. Have you any idea how much water you used in proportion to the area of land? I can hardly say how much. I had no method of measuring the water. I find it very good for the flowers.
3617. They do not seem to suffer from the quality of the water? Not in the least. We have all kinds of flowers there.
3618. Referring to stock matters, do the people go in much for fattening here with a view to reaching the market? A great deal.
3619. And travelling them to the nearest railway? Yes.
3620. Which point do they generally make for with a view to marketing fat stock? The larger quantity of fat stock which go from here go *via* Dubbo to Sydney.
3621. Seeing that the distance to Dubbo is greater than the distance to Warren, which we may look upon as the nearest railway station, I suppose there must be more grass on the stock route? It is a better route than the Warren one. There are not many of them going from this side to Warren with stock.
3622. How long does it generally take them to get fat stock from here to Dubbo? From about fifteen to sixteen or eighteen days, generally.
3623. Do they deteriorate much on that trip? That is very much according to the season. Sometimes there is plenty of grass on the roads, and at other times there is very little grass, and very little water.
3624. In an ordinary season there must be some deterioration, I should imagine, in taking fat stock that distance? Very slight, I think, in an ordinary season, if they are taken carefully.
3625. Do you think with an ordinary season the owners of stock here would prefer trucking their stock at Coonamble, and having them sent through to Sydney in, say, a couple of days, rather than have the almost three weeks' journey, which travelling to Dubbo would involve? I think they would certainly truck here a great number of them.
3626. You think the major portion of the fat stock, leaving stores out of account, would be trucked here? I think so.
3627. In ordinary seasons do they fatten many cattle? Not a great many cattle.
3628. There is a fair number of cattle in the district, I notice? There are a good many fattened; but I think, as a rule, they have not such a great number of cattle in the district.
3629. Eighteen thousand? But it is a large district, and a rich one.
3630. You do not know of their fattening many cattle for the market? There are small lots.
3631. Do you know of any station where they make the fattening of cattle their main object? No. For the most part they confine themselves to sheep as far as fattening is concerned. I think Wonbobbie fattens more than most.
3632. How many cattle would they have, roughly? 400 or 500 at most. They get stores on, and turn them off fats.

- T. W. Medley.  
3 July, 1899.
3633. As far as the railway is concerned it would have to rely on fat sheep only for traffic;—it could not expect much traffic from fat cattle and fat stock? Mostly sheep. There is a great proportion of sheep sent from this district.
3634. In a fair season this is a good fattening district? Very good.

John Cook, hotelkeeper, Coonamble, sworn, and examined:—

- J. Cook.  
3 July, 1899.
3635. *Chairman.*] You desire to make a statement, I understand? Before I came here to live, I did a great deal of travelling between Coonamble and Dubbo, and I know a good deal of the country on both sides of the river. I have been farming pretty well all my life. I think I have a good knowledge of the soil—that is, agricultural land.
3636. Were you in the room when Mr. Thomas gave his evidence? Part of the time.
3637. Did you hear what he said in reference to the land and its capabilities? I heard part of his evidence.
3638. Did you agree with what you did hear? I agree with a lot that I heard him say.
3639. Do you think you heard the principal points he made? Yes; regarding the land about Gilgandra.
3640. And the whole district? Yes.
3641. And you quite agree with him? I do.
3642. About what proportion of the land about here do you think will be fit for agriculture? A great quantity of it would be. The best of the land about here has never been tested. The best land for cultivation in this district is timbered country. A lot of that country has not been cleared—sandy loamy soil, of which there is a great quantity all round Coonamble. It is land which holds moisture well.
3643. How would you describe the Crown lands in this district? I have not a great idea of the Crown lands. I suppose a lot of the good land has been got already; but I think there is a lot of good land available yet, or will be available.
3644. Do you know if anybody is waiting to get hold of some of this land when it is available? I know a great lot.
3645. Do you think there will be much of a rush for the land? I think so.
3646. For 1,000,000 acres? Yes.
3647. What proportion of that area do you think would be taken up for mixed farming? Three parts of it, I think.
3648. Have you noticed any very great increase of population about the district? There has been a good increase, but the district is paralysed from the want of a railway as far as the farming industry is concerned. There would be a lot coming here if we had a railway. I am farming a little, but I would do a great lot if there were a market, and a lot of other people would do the same.
3649. You are simply kept back by reason of the fact that you have not got cheap carriage? Certainly; we have not got a market.
3650. Are you quite satisfied that agriculture has passed the experimental stage here, and that you would be able to compete with others; because if you go in for much cultivation about here, you will have to take another market besides the local one? Certainly we would, and that is what we want.
3651. Do you think the experiment has proved that it would pay to cultivate and send your surplus to Sydney and compete there with other districts of the Colony? I think so.
3652. You are quite satisfied on that point? I am quite satisfied that there is soil in this district which is suitable for farming; and a large quantity of it, too.
3653. Have you studied prices of late years in the metropolitan market? Yes.
3654. Having that knowledge, you are of opinion that it will pay to produce in this district, and send your surplus as far as Sydney? It will pay to grow produce here as well as it will in any other part of the Colony.
3655. *Mr. Trickett.*] How long have you been here? I have travelled in this district off and on twenty-five years. I was farming in Dubbo eighteen or nineteen years.
3656. It has been stated by Mr. Harper that they expect to get over £1,000 for the carriage of minerals;—what minerals are there in this district which could be carried by rail? I could not say. I have not had any experience of minerals.
3657. Have you heard of any minerals? I have heard of a little about the mountains and different little places, but nothing worth speaking of.
3658. I suppose if there had been, you would have been sure to hear of it? Rather.
3659. *Mr. Dick.*] You have had a good deal of experience in the carrying trade? Yes, and farming; more particularly in farming.
3660. You know something about carrying at any rate? Yes.
3661. You have stated that there would be a good local market in this district for agricultural products? At times; it depends on the seasons.
3662. Have they not got that good local market now? Yes.
3663. How is the railway going to improve that market for them? The drought is causing a good market at the present time.
3664. Is this what you wish to convey: unless you have a drought, you have not a local market? If we have a good season we should have a lot of stuff to send somewhere—that is, if there were any large quantity grown, we should have to have a market to send it to.
3665. From your experience of carrying, do you think there would be any chance of successful competition on the part of carriers with this line from Dubbo to Coonamble? I do not think so.
3666. Not with an average rate of 32s. per ton which the railway is to charge? I do not think so—not with me anyhow. I have teams still.
3667. Do you mean to say that you could not compete at that rate? I would not try.
3668. Is that from a patriotic motive or from a £ s. d. motive? I could find something better to do than using them in that way.

Henry Lyons, agent for Messrs. Wright, Heaton, & Co., Coonamble, sworn, and examined:—

3669. *Mr. Shepherd.*] How long have you been residing in the district? About twenty-three years.
3670. Have you been engaged in carrying all the time? No.
3671. How long have you been connected with the firm of Wright, Heaton, & Co.? About seventeen years.
3672. I suppose you are pretty well acquainted with the district in every direction? I am.
3673. Where does your principal loading come from? From Dubbo.
3674. Have you a large business with Mudgee? No; very little.
3675. Have you taken loading in any other direction? Yes; our firm also takes loading from Warren, but there is very little coming that way—a few tons now and again.
3676. Have you an estimate of the tonnage you have carried between those two points during the last few years? No.
3677. I suppose there has been a general increase for the last seventeen years? Yes.
3678. What do you think has been the average tonnage for the last five years? I could not tell, as the records are kept in Dubbo and Sydney.
3679. But you have a rough idea, I suppose, of the average tonnage? I do not know.
3680. For instance, how many times a week are you in the habit of despatching—taking one week with another? The Dubbo office keeps the records. The teams load in Dubbo; and it is only in the wool season that teams load here.
3681. I suppose a great many of them, in returning, take back sleepers and sawn timber? Yes, close to Dubbo.
3682. Of that you would have no record? No.
3683. What is about the average rate of freight per ton between Coonamble and Dubbo? I should say from £2 10s. to £3 when there is no wool going up.
3684. I suppose in the wool season you generally have better feed on the line, and freight is a little lower than at other times? The freight is sometimes a little lower for goods coming down from Dubbo; they get loading both ways, and they take it at a little lower freight.
3685. At what season in the year is the carriage at the lowest point? From when they start shearing—sometimes in August, sometimes in September—to about December.
3686. I see from your evidence at the previous inquiry you have carried goods for as low as £2 a ton;—under what circumstances was it done? I expect the carrier agreed himself.
3687. You strike an average between £2 10s. and £3? Yes, all the year round.
3688. Do you know what the rate of freight is between Mudgee and Coonamble? No.
3689. I see you said in your former evidence that the rate was about £2 10s.;—has there been any traffic of late years between Mudgee and Coonamble? No, not that I know of. We never get anything coming from Mudgee. There used to be a little flour coming up at one time from Gulgong, but that was years ago. There has been nothing coming up since then.
3690. Do you think the carriers would endeavour to compete with a railway between Dubbo and Coonamble, or do you expect that they would give up altogether? At 3s. a ton they could not compete. They would not put their horses in to compete.
3691. So that the railway would get the whole of the traffic? I think so.
3692. Do you think the railway, if opened here, would increase the produce? I think so. I fancy there will be more settlement about the district if the railway is opened.
3693. It would encourage agriculture, for instance? I think so.
3694. And possibly more money would be spent on the sheep runs, and so on? There is not the slightest doubt.
3695. It would give an impetus to the place altogether? Yes.
3696. In the interests of the whole Colony, not considering the interests of Dubbo alone, which line do you think it would be best to adopt—the Dubbo, the Warren, or the Mudgee? If we could get a railway in the same time from Mudgee as we could get it from Dubbo, I would be in favour of the Mudgee line.
3697. In the event of only one line being opened you would give the preference to the Mudgee line? Yes. I believe there is more agricultural land between Coonamble and Mudgee—over at the base of the mountains on the east of the Castlereagh.
3698. Do you think it would open up a larger area? I think so.
3799. Both agricultural land and pastoral land? I do not know about pastoral land—I think that is all pretty well taken up; but agricultural land it would be for small settlement.
3700. The railway will probably serve the country for 20 miles on either side; do you think the whole of that area of 20 miles on either side would be available chiefly for agriculture? I think the most part of it would be.
3701. For the whole distance? Yes.
3702. There is really no barren country at all? There is barren country in places, but I do not think there is much.
3703. About what percentage is there? That I could not tell you.
3704. Have you any idea of the general feeling in Coonamble as to the two lines;—which line of the two would be preferred? I think the Dubbo line.
3705. But you think the Mudgee line would be the better one? In the interests of the whole Colony I do.
3706. Could you describe the character of the country between Coonamble and Mudgee? I have not been over there lately. It is a good many years since I went through it; but it is good agricultural country nearly all the way.
3707. Is it well timbered? There are some parts well timbered. There is myall for part of the way; there is box when you get towards Cobborah and Gulgong; there is some ironbark there too.
3708. How far does the cultivation extend from Mudgee in this direction? I think it extends along the Castlereagh, very nearly up to Mundooran, off and on in places.
3709. How far would that be from Mudgee? About 70 miles.
3710. Is there anything else you would like to say? I do not think so, except that you can ascertain from the Dubbo office or the head office what tonnage comes through to Coonamble.
3711. *Mr. Trickett.*] In answer to Mr. Shepherd, you said you would like the Mudgee line if you could get it? In the same time as the Dubbo line.

H. Lyons.  
3 July, 1899.

- H. Lyons. 3712. By that I suppose you meant that the Mudgee line is so much more expensive that you hardly see a probability of a line being made from there? That is what I meant.
- 3 July, 1899. 3713. What is the distance from Mudgee to Coonamble? It is about 172 or 173 miles by road.
3714. The estimated cost of the Mudgee-Coonamble line is between £3,500 and £3,700 a mile for 150 miles, and the estimated cost of the Dubbo-Coonamble line is £2,400 a mile for 93 miles;—I suppose you have these figures in your mind when you say that you hardly think that a line will be made from Mudgee? Yes.

Daniel Neil McAlary, grazier, Weetalibah, sworn, and examined:—

- D. N. McAlary. 3715. *Chairman.*] What are you? I am a grazier, residing at Weetalibah, 19 miles north from Coonamble. I hold about 7,300 acres of conditional purchase and conditional lease land.
- 3 July, 1899. 3716. Are there many settlers in this district with a holding of much the same size as yours? The average selector has a smaller area than I have. Some of the holdings are larger, but not many, I suppose.
3717. Do you think the proposed railway will be a benefit to you and others holding a smaller area than you do? I think it would be a very great benefit to us if we had a railway.
3718. You would be able, I suppose, to send fat stock to market? Yes.
3719. Are you able to do so now? Unfortunately we are not, through the want of a railway. As a general rule, small holders with a small lot of sheep cannot get a fat mob large enough to pay for driving the distance we have to send. I have found out that it will not pay to send less than from 1,500 to 2,000. It is very rarely that a small holder will have that number ready at once to send away. As a general rule, we can, all through the year, get 200 to 300 to fill three or four trucks, and in three or four weeks we can get a few more in that way.
3720. You would take advantage of a market when it was to send your fat stock away? Yes.
3721. At the present time you cannot take advantage of a market? No.
3722. How many fats could you get ready to send away at once? As a general rule, I have not had more than about 500 at any time. I did on one occasion send away as many as 1,200 at once.
3723. In a good season would it not be possible for a few of you to combine and send 2,000 or 1,500 away by road to Dubbo, even though a railway were here? I do not think so.
3724. You do not think there is a probability of anything of that sort occurring? I am sure I would not. I have had that much experience in sending fat stock to market to know that once they leave the soil they are accustomed to the sooner you have them in the market the better.
3725. You think that even in a very good season they would fall off quite sufficiently, at any rate, to prevent you from using the road instead of the rail? Yes. Any person experienced in stock must know that once they leave the place they are accustomed to they are falling off in condition all the time till they get to market.
3726. So that there is no probability of what I suggested occurring when the railway is constructed? I do not think there is the slightest probability.
3727. Have you had any experience in farming? Just a little. The only thing I ever grew was a little hay.
3728. I suppose the reason why you cut for hay was, not that you were afraid that it would not make grain, but that you had no market for wheat? Yes.
3729. What did it shape like when you cut for grain? It looked very well; it was a good crop.
3730. Have you any idea what it was likely to yield? That I could not say.
3731. Are there any of your neighbours who have grown wheat? Yes; men who had been practical farmers in other parts of the Colony told me that they grow better wheat here than they could in other parts, such as Riverina and Brookong.
3732. Experienced farmers have informed you that there are better possibilities here than in some other districts which are considered favourable? Yes.
3733. Are you likely to go in more extensively for agriculture if a railway is constructed? It is my intention to cultivate about 500 acres, and possibly more, if the line is constructed.
3734. I suppose others will do the same? Others have told me that they will do so.
3735. You have heard some of the evidence given here to-day;—do you corroborate what has been said as to the nature of the land, as far as your knowledge goes? I corroborate the evidence of those who consider that a large portion of the land in the district is fit for cultivation; I corroborate that part of their evidence.
3736. Is there any statement you wish to make? This year we have had a very bad season, and if we had had a railway I think a large number of the valuable stock which have perished in the district would have been saved. Some would have sent their stock to market as fats; others would have brought in artificial feed for their valuable stock, but through the expense of getting feed here, and the way we had to get it, they thought it would pay them better to let the stock die. At the present time many of the small holders are in a fix just now through being overstocked. They would not have been in that fix if they had had a railway to send away their stock and their fat sheep. It did not pay them to send away little lots, and that causes them to be in a fix, with the possibility of a large number of their stock perishing in the winter.
3737. That would mean not only a saving to you, but some benefit to the consumer in Sydney? Yes, and to the country. Stock, instead of being allowed to die in large numbers in the paddocks, would be sent away, the producer would get something, the consumer would get some benefit, and the Government would benefit.
3738. How many sheep to the acre do you carry? About a sheep to the acre in an ordinary season—not such a season as we have passed through.
3739. You have increased your holding lately? Yes.
3740. Have you increased the number of your sheep too? Yes.
3741. So that you can carry the same number now as you carried when the last Committee was here? The same proportion. The last land I got is not thoroughly improved. A very large proportion of the land was covered with green timber when I got it. It has not had time to improve since then. At the present time I have about a sheep to the acre upon all my country, and about 160 head of cattle.

3742. Would a connection with Mudgee suit you as well as a connection with Dubbo? I do not think so. I think the Dubbo connection would suit better.

3743. I want you, if you can, to put aside any idea of the now-or-never business;—what we want to get at is what route would be the best, not only in the interests of this district, but in the interests of the country? I am still of opinion that Dubbo is the best route.

3744. We cannot call every person as a witness;—would you like to say that you think others around you are of the same opinion? There are some of a different opinion; but certainly the majority of the people I see say they are in favour of the Dubbo connection.

3745. For what reason? It gives us, in my opinion, more markets. It gives us the Sydney market, and a market on the Western line to Bourke. Sometimes we have a good season here when they have a drought at Bourke, and if we had a railway, we could send our produce to Bourke and other stations along the Western line. We should also have a better chance of communicating with the southern side by the Blayney-Harden line. That, in my opinion, is a very great consideration to us.

3746. I suppose you also think you would have to pay more carriage, seeing that the Mudgee connection would cost £1,000 a mile more than the Dubbo connection? Yes; I am of opinion that it would cost us more to send our produce to Sydney *via* Mudgee, owing to the heavy local rates.

3747. *Mr. Shepherd.*] You have a higher average per acre than any witness we have had yet;—you have one sheep to the acre, and you have a number of cattle as well as sheep on the land? The cattle I have not had long.

3748. Is your land all cleaned up? It is not cleaned up, but I am very particular about the ringing.

3749. Do you kill all the injurious timber and grub up any young stuff which comes up? Yes; I send my men out with mattocks, and they take up all the seedlings. I allow nothing to grow which would prevent the feed from growing. I allow no timber to grow except the edible scrub.

3750. Very few persons pay any regard to those things;—half the land seems to be taken up with rubbish—undergrowth and broken limbs? I consider it more necessary to keep down the undergrowth than even to ringbark, because, as a general rule, if you ring country and neglect it afterwards it is worse than if you never touched it at all.

3751. You are evidently deriving a benefit from that policy, by having a larger carrying capacity than anyone? It is about ten years since I settled on my country, and I have had men over a good part of it three times in that period.

3752. What do you consider the best time for ringbarking? It is greatly owing to the season. Some people will say that if you ring at certain times it will not sucker. I have tried by ringing at that time; in some years it would sucker and in other years it would not. A good deal depends upon how the work is done, and a good deal depends upon whether it is a wet or dry season.

3753. If you ringbark six or eight weeks after rain you are more likely to be successful than if you ringbark at any other time? I think so.

3754. *Mr. Watson.*] Is your place on the river? No; it lies exactly between here and Pilliga. I am away off the river. I am at a place called Weetallibah Creek.

3755. It can hardly be classed as part of the river flats? No.

3756. There is no plain country amongst it? Yes; it is myall, belar, and budda country mixed—open plain country.

3757. Would your place be a fair average of a good area of country, or is it better? I think so. There is a lot of Crown land to be thrown up next month right alongside me, which I consider quite equal to my country. Of course it is not equal to it now, because it is growing a lot of timber.

3758. If it is improved it will be as good as your land? I see no reason why it should not, as it is only divided from my property by a fence.

3759. You think that a great portion of that part of the district is as good as your land? I do. Many of my neighbours—some of the smaller holders—as a general rule, carry about the same amount of stock per acre.

John Rigney, grazier, near Coonamble, sworn, and examined:—

3760. *Mr. Trickett.*] What are you? I am grazier, living about 10 miles east from Coonamble.

3761. You have a holding of 11,200 acres? Combined. It is a family selection, and is used chiefly for sheep-grazing.

3762. How many sheep to the acre do you carry? Two sheep to 3 acres—that is, about 1 acre and a half to the sheep.

3763. Is your land fully improved and cleared? Yes.

3764. Is that about its average carrying capacity? Yes.

3765. Where do you send your wool to? To Sydney *via* Dubbo.

3766. What carriage do you pay from your place to Dubbo? I could not say. I contract with the agents to take the wool right through to Sydney for about £6 10s.

3767. What do you think of the proposed railway from Dubbo to Coonamble? We want a railway to Coonamble. I am not altogether in favour of the Dubbo route. I think the Mudgee route is the best route for agriculture. It would open up more country—it would be for the good of the country entirely, and it would be a nearer way to Sydney.

3768. I suppose if you could not get a line from Mudgee you would not object to a line from Dubbo? No.

3769. We have heard a great deal from other witnesses about the advantages of having more than one market if the railway is constructed from Dubbo to here;—what do you think of that? There is no doubt we should.

3770. Do you send all your stock and wool to Sydney? Yes.

3771. How do you send live stock? To Rylstone. We have sent occasionally to Dubbo.

3772. How far is it to Rylstone? 160 miles from here.

3773. Do you find that a good line? Yes, in ordinary seasons.

3774. Do not the sheep suffer very much by being driven all that distance? They fall away.

3775. Would it be an advantage to you if you could send them direct all the way by train? Very much.

3776. What number do you send when you drive them to market? From 2,000 to 3,000.

3777. I suppose with a railway it would be a great advantage to the smaller settlers to be able to send small lots of stock to the market? Very much.

3778.

D. N. MoAlary.

3 July, 1899.

J. Rigney.

3 July, 1899.

- J. Rigney.  
3 July, 1899.
3778. Have you gone in for agriculture at all? Yes. When I first came to the district I went in for agriculture, and I was very successful with wheat and hay growing. I do not go in so much for it now.
3779. Have you increased your area in that respect? No; when I first started I used to breed sheep, and when I left off breeding and started fattening I left off agriculture at the same time.
3780. You abandoned agriculture because you do not go in for that line? I am going in for it again. I am making a start this year on my place.
3781. What description of country is it? It is myall country, with a black soil.
3782. Would that be good for wheat-growing? Yes.
3783. Does it cost very much to clear? I am one of the lucky ones. There is very little timber on our country. It is plain country.
3784. Are you going in for agriculture for the purposes of your stock, or for the purposes of sale? For stock.
3785. Do you think you would be likely to go in extensively for selling if there were a good market? There is no doubt that a railway would bring it on.
3786. Is that the generally-expressed opinion in the district? I think so.
3787. You heard Mr. McAlary's evidence;—do you agree with that generally? Yes; except as to carrying capacity.
3788. His land must be specially good and specially improved? I think he has been one of the lucky ones—getting sometimes 3 or 4 inches of rain when his neighbours get none.
3789. I suppose you agree with other witnesses, too, that to cultivate land for wheat pays better than running sheep on it? Combined.
3790. Is it well-watered country where you are? No; it is watered by artificial dams.
3791. It is good country once you get water? It holds well.
3792. Do you think this country about here is country which will be useful for the development of small holdings? Yes.
3793. Do you think it would encourage men with small capital to come here and take up small holdings, and largely increase the population of the district? Yes.

William Farrell, sheep-farmer, near Coonamble, sworn, and examined:—

- W. Farrell.  
3 July, 1899.
3794. *Chairman.*] What are you? I am a sheep-farmer, at the back of Bundy, 14 miles west from Coonamble.
3795. You were examined before the previous Committee? Yes.
3796. Were you supplied with a copy of your evidence? Yes.
3797. At that time I think you favoured the Mudgee connection? I do not think so. I said there was no doubt that the Mudgee line would be the best. The league did not ask for any route.
3798. You stated in your evidence, I think, that you thought the best line, from a national standpoint, was the Mudgee line? That is what I thought.
3799. Are you still of that opinion, or have you been led by further experience to modify it? At that time I did not know that the land between Coonamble and Dubbo was good for agriculture; but I have learned since from men who lived there, and different men who have travelled through the country have told me, that it is good agricultural land.
3800. Therefore, you now modify your opinion, and prefer the Dubbo line? Yes.
3801. Have you anything further to add? No.

Martin Gilligan, farmer and grazier, near Coonamble, sworn, and examined:—

- M. Gilligan.  
3 July, 1899.
3802. *Chairman.*] What are you? I am a farmer and grazier, 13½ miles west of Coonamble.
3803. Have you been present during this inquiry to-day? Not quite all the time. I came here just as Mr. Thomas was leaving the chair, and Mr. Nash was taking his place.
3804. So far as you have heard the evidence, do you agree with it? I quite agree with it.
3805. What area do you hold? I have 5,000 acres. At the present time I only carry about 3,400 sheep. I have lost a lot through the drought.
3806. Are you carrying now 4,000 sheep? With lambs and all, I am carrying about 3,400.
3807. It is generally considered good fattening country about here? The principal part of it is pastoral land, and what is not fit is then tip-top for what I call pastoral purposes. I have had forty years' experience of farming.
3808. Have you done any cultivating? Yes. In good seasons I have had very good results; but of late the seasons have not been too good, and, of course, the results have not been too good. I have only been cultivating a small lot, but I intend to extend my farm to 100 acres. I cultivated 12 acres last year. I put in 20 acres this year, and I have men clearing up to the extent of 100 acres for agriculture.
3809. To grow grain or hay? For grain, if I can get a season to grow it; for hay, and have wheat also.
3810. Generally speaking, are the holdings suitable for mixed farming? The plain country cannot be beaten in Australia for grazing, and the timbered country cannot be beaten in Australia for agriculture.
3811. Does the country lend itself, when subdivided, to both agricultural and pastoral purposes? Every station I see in the district is suitable for both purposes. There is timbered country, and there is plain country, and they are suitable for agriculture and grazing.
3812. So that if the leases which will fall in shortly are subdivided into smaller holdings, you think the district will lend itself to small holdings or closer settlement? I am quite certain that the district is suitable for closer settlement—2,560 acres in each block. It will be the making of Coonamble.
3813. I suppose you are quite satisfied with your prospects? Quite so.
3814. Generally speaking, are the people prosperous in this district? Very prosperous, indeed, in good seasons; but this season has been bad all through the Colony. In a good season they are all prosperous. They all have money, in Coonamble any way; it is a prosperous place.
3815. No persons are throwing up their holdings and clearing out because they cannot make a living on them? None that I am aware of; they all seem to be doing well.
3816. You consider there is a good future before the district if they get the means of carrying their produce to market? I am quite certain there is a good future before the district if carriage is made easier. I have done a lot of carriage myself from Dubbo and different places. 3817.

3817. If, instead of horse teams, you get a railway, you believe the place will go ahead? I believe a railway is badly needed. M. Gilligan.
3818. Any chance of its paying? It must certainly pay; I cannot see why it cannot pay. I have been driving my own sheep on different occasions from here to Mudgee, Dubbo, Rylstone, Luie, and different places. The country is nearly all fenced off into lanes. The stock, when they leave here, must be picked fats, but when they get to Sydney they are only stores, as the result of travelling through lanes. In the course of a few years I do not think people could drive their stock at all to market by road; they must use the railway. 3 July, 1899.
3819. You think that if they desired to dodge the railway in a good season they could not do so? No; because they will be in lanes very shortly all the way; at present they are half the time in lanes.
3820. *Mr. Shepherd.*] Have you farmed anything but wheat? Not up country, but down country I farmed all kinds of grain. I have farmed here only for hay.
3821. You have not tried to grow oats? In one year only, and then only an acre; it did not come to perfection.
3822. Is it generally a failure in the district? No; it is so late in a bad season, it stands the weather.
3823. Have you tried any millets, sorghum, or planter's friend? No.
3824. All your farming, I suppose, is for home consumption? Yes.
3825. What has been your average crop per acre? I have not had very good crops; but I have cultivated a farm for Mr. Keogh, at Warrina. I have cut over 4 tons of hay and oats to the acre. I have not done so on my own farm.
3826. Is your land all cleared? No; some of it is plain. I have enough cleared country now to make the farm paddock larger.

TUESDAY, 4 JULY, 1899.

[The Committee met at the Council Chambers, Coonamble, at 10:30 a.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

William Pedley, cordial-manufacturer, Coonamble, sworn, and examined:—

3827. *Chairman.*] What are you? I am a cordial-manufacturer in Coonamble. I have lived here for seven years. W. Pedley.
3828. Do you consider it is a progressive district? Yes. 4 July, 1899.
3829. I understand that you have done a little farming as well? I started farming this year. I had a trial on a small area three years previously.
3830. Have you tried the effect of irrigation? Yes; I fenced in half an acre of black ground. I put in barley and lucerne, and I cut it six times that year. I then put in some planter's friend or sorghum. I let some of it grow to see how it would grow, and it grew about 9 feet high. It has been growing ever since, and it continues to grow well.
3831. Was that grown on the black soil? Yes; in the town.
3832. Which is supposed to be unfit for agriculture? The land was sold to me as no good. It is low ground; it is in a swampy place.
3833. Did you keep any account of the cost of irrigating and cultivating? No; I was using the bore water.
3834. Would it pay to grow grapes here, and use the bore water for irrigation? I am positive that it would. That half acre saved me £1 a week all the summer.
3835. What you mean is, that otherwise you would have had to purchase fodder to the extent of £1 a week all the summer? Yes.
3836. Have you any idea what it cost you;—it is quite possible that it might have paid you better to buy? It cost me absolutely nothing but the price of the hose, the seed, and the putting in in the first onset. I could not tell you the quantity of water I used, as I had no meter. I put on the water as I thought it was required. I just gave it a good watering about once a week.
3837. Have you tried other farming in the district? I have put in trees round the edge of the crop, and they seem to thrive well.
3838. Are you quite satisfied that agriculture will pay here? Yes; I think, as a rule, they have sufficient rain, provided that they fallow the land.
3839. With a railway to enable you to get rid of your surplus products, you think it will pay? Yes.
3840. Are you prepared to increase your cultivation area if a railway is constructed? Yes, I have increased it so far; but, as it happens, I am hemmed in with all private property. I have increased, and I am still trying to increase, the area.
3841. In your opinion, which connection would best suit the wants of this district? To the best of my belief, the Dubbo line.
3842. Why? Because we should have more markets by that connection, and would be more in touch with the railway system of the Colony. We could get more easily to all the other districts *via* Dubbo than we could *via* Mudgee. By the connection with the Western line at Dubbo we could get to Bourke, Orange, and Parkes, and from Blayney we could get across to Harden or Melbourne; whereas by the connection with Mudgee we should have to go to Wallerawang and then go straight back to Orange, Parkes, and Bourke.
3843. *Mr. Dick.*] Do you know that if you had to send all your produce to Sydney *via* Dubbo you would have 34 miles more trainage than you would have if it were sent *via* Mudgee? I reckon that by catching these branch lines a good many of the fellows would never want to go to Sydney; they would get better prices on one side or the other as a rule, and have the Sydney market to fall back on to if the prices elsewhere were not sufficiently good.
3844. Are you prepared to say that it would be better for all time if you want to send anything to Sydney to

W. Pedley.  
4 July, 1899.

to pay the 34 miles extra trainage? It would be better for me to get the Dubbo connection, because the other markets it would give me counterbalance that extra trainage to Sydney. It would give me more markets than the other would.

3845. You do not look to Sydney as your sole market? No, not if you sell to the best advantage.

3846. Have you any other statement to make? As far as I know, the town is kept back greatly without railway communication. There is other business here that cannot go on for the want of a railway. For instance, there is all the machinery lying in the town for establishing a creamery. For five years I have had lying here everything but the separator; but through not having an outlet it is too venturesome to establish a creamery. I reckon that if that industry were started it would be a big benefit to the people of the district. As a rule, about here the milk is either given to the calves or half of it is thrown away. There are not many pigs to feed with the milk.

3847. Are there any other industries kept back from the want of railway communication? I reckon there are vineyards kept back, and also the fruit industry. I am going to put down a vineyard and start an orchard with the expectation of getting railway communication.

3848. We may gather from your statements that if railway communication is given from Coonamble there will be a general all-round advance in production? Yes.

3849. Has there been much increase in the population here since you came? There has been a big increase in population; also a good growth in the town.

3850. That increase, you think, will be much greater if you get the railway? Yes.

3851. *Mr. Shepherd.*] What kind of gardening are you engaged in? I have a general assortment—principally lemons, oranges, and grapes, which seem to thrive well here.

3852. From what I have seen here the citrus fruits seem to do better than the stone-fruits;—is that so? As far as I know of them, they seem to get along pretty well. I have seen as good stone-fruit here as I have seen in any part of the Colony.

3853. What is the extent of your orchard? I am trying to make it up to 10 acres—that is, both vineyard and orchard. I am only starting this year.

3854. You are thinking of starting a nursery, I believe? No; I have not got that far advanced yet.

3855. Have you an idea of the area of each class of fruit you have in the 10 acres? I am only starting to put in this season—5 acres for fruit, and 5 acres as a vineyard. The man who was on the farm previously had a vineyard. It is hardly worth speaking about, as it has been neglected.

3856. Do you find any difficulty in getting water to water your holding? No; I am right on the bank of the river. I am going to put on an engine and irrigate.

3857. I hear that they bring butter here from Sydney, is that the case? I believe it is at present.

3858. Do you not think that is a curious thing for a district which is considered such a splendid agricultural district? Under the circumstances I do not. They do not fetch it as a rule, but it has been very dry of late, and the dairies sooner than knock the cattle about to get a drop of milk are saving them.

3859. Is there any cheese manufactured here? Not that I am aware of.

3860. Is there any attempt to grow artificial grass—cocksfoot or rye grass? I could not say.

3861. What is the extent of your holding altogether? 145½ acres.

3862. Do you run any sheep? No; I keep a few cattle.

3863. How do you find them answer? I bought some recently very poor and very cheap. They have only been there three months at the outside, and they are rolling fat on it now.

3864. Have you knocked about much in the country? A good deal.

3865. By and by, when there is a large increase in the cultivation here, you will have to go beyond Dubbo for a market? Yes.

3866. You will have to look to Sydney for a market for surplus products? Yes.

3867. Although a line *via* Mudgee is much shorter to that place than a line *via* Dubbo, still you prefer the Dubbo connection? Yes; with the Mudgee connection we should have to depend on the Sydney market absolutely; we should not have a chance to get to the other markets.

3868. Has there been any attempt to grow lucerne here? I have grown some. I cut six crops off it last year.

3869. What is the average per acre for each crop or for the year? I could not form any idea of the weight. I had one horse to feed at the time, and I cut it for the horse as it was required, and I could not keep it down.

3870. *Mr. Trickett.*] What is the character of the soil you have been irrigating? Black soil.

3871. Do you look upon the black soil as better than the red soil? I believe the red soil is a lot superior to the black soil.

3872. On the inferior black soil the results have been most satisfactory? Yes.

3873. I suppose it is much more expensive to work than the red soil? I do not think it is, because, as a rule, there is a lot of clearing to be done on the red soil, and the black soil generally is plain country.

3874. But when it is cleared black soil is more expensive to work than red soil? It is harder to work.

3875. Have you tried any of the red soil? Yes; I have 70 acres in this year.

3876. You have had no results from that yet? No; the crop is growing at The Ten-mile.

3877. Is the black soil of a clayey nature? It is very clayey. It all crumbles away when water gets on it. It is not clayey with water.

3878. Did you hear Mr. Thomas' evidence yesterday about the irrigation? No.

3879. Do you think that irrigation on a large scale would be practicable here for settlers with bore water? If they had the water, yes.

3880. We have been told in other parts of the country that this clayey black soil is not very good for irrigation purposes, because it cakes on the top;—is that the case? No; it cakes generally outside on the run with the rains, and getting trodden down; but the black soil, as a rule, as it dries, cracks and opens, and gets loose again.

3881. And the water gets into it? Yes. My opinion of the black soil is that if you get sufficient water to keep it in its proper order, it is as good a soil as can be got. It is of a clayey nature, but when the water comes on it, it separates like flour.

3882. Have you heard that bore water contains any ingredients which are bad for agriculture or crops? No.

3883. Not too much salt to do any injury? No; the only thing that is bad in it is if you do not get enough of it.

3884. As far as your experience of the using of this water has gone, it has been entirely successful? Yes.

Clement

Clement Dillon, Crown Lands Agent, Dubbo, sworn, and examined:—

3885. *Chairman.*] Have you prepared a statement showing how the land is held? I have not prepared any statement. I am prepared to give a little additional information to what I gave at the last inquiry, as to the area which has been taken up since, and showing that there is a demand for any land to be thrown open.

C. Dillon,  
4 July, 1899.

3886. Will you be good enough to give that information? I have a return of the areas taken up under conditional purchase, conditional lease, and settlement leases last year. There were 25 conditional purchases, embracing an area of 10,607½ acres; 21 conditional leases, embracing an area of 13,664¼ acres; and 14 settlement leases, embracing an area of 51,386½ acres. There is a big area taken up under annual lease, but that does not induce settlement. The areas that I have given would induce settlement. On the 14th April last there were three settlement leases made available on Avoca—Mr. Connell's run. For sixty-three blocks 134 applications were lodged. Of course, each application did not represent an individual; there were about fifty-five applicants for the three pieces. Then, on the 1st June of this year, there were 2,100 acres thrown on Geanmoney for conditional purchase and conditional lease.

3887. In what direction is it situated? It is about 14 or 15 miles out of the town towards Warrie. I think the railway from Dubbo would go through it.

3888. Were those lands eagerly sought after? There were sixty-eight applications, and the money lodged amounted to £5,967 9s. On next Thursday there will be two blocks thrown open for settlement lease on Terambone—one containing 2,398 acres, and the other 2,510 acres. I should say there will be over fifty applications for those two blocks, which are situated about 35 miles from Coonamble.

3889. Do you know whether most of these applicants are already holders of land in the district? Some of them were; there are a good many strangers. I have inquiries from different parts of the country and from Victoria as to lands becoming available. I have had one or two inquiries from Queensland.

3890. Does that complete the addition you wish to make to your previous evidence? No. On the 10th of August there will be four blocks thrown open for settlement lease on Nebea holding. This is the land which adjoins Mr. McAlary's holding. I have the plans here if the Committee would like to see them.

3891. Will you give us the particulars of one block? The first block contains 2,553¼ acres; the capital value is £3,191 11s. 3d.; and the annual rental will be £39 18s. They give a description in the *Gazette* of the character of land, soil, and water supply for each block.

3892. Would you describe it generally as good agricultural or pastoral land? All good pastoral land. They do not describe it as suitable for agriculture at all in this description, which reads as follows:—“Level country throughout; partly rich black soil, hard red loam and sandy red soil chiefly to the north-east: about 2,000 acres of open forest country, interspersed with plains, is timbered with myall, rose-wood, box, willow, berrigan, yarran, leopardwood, belar, and gum; and about 750 acres of thick forest, timbered with pine, oak, box, rosewood, belar, and willow; all sound pastoral land.”

3893. Although it is described as pastoral land, yet, from that description, a portion of it would be fit for agriculture? Yes. There will be a great number of applicants for that block.

3894. Your district embraces the country within a radius of 40 miles from Dubbo? Yes.

3895. Will you now give some information as to the settlement previous to the period with which you have just dealt? Up to March, 1898, there were 1,465 conditional purchases in this land district representing an area of 445,363 acres, and 765 conditional leases with an area of 715,942 acres. There were thirty-two settlement leases with an area of 89,149 acres, thirty-five annual leases representing 35,065 acres, and eleven homestead selections representing 413 acres. These latter lands were suburban areas about the townships of Gilgandra and Gulargambone. In addition, there were the lands embraced in improvement purchases, auction purchases, volunteer land orders, special purchases, and special leases. The area of these lands would amount to some thousands of acres, but we have no record in the local office of the exact figures. Besides these, are the leasehold and resumed areas of pastoral holdings. There is a *Gazette* notice showing the pastoral leases. It does not give the area, but the majority of the leases fall in on the 10th July, 1900. There will then be a good deal of land available for settlement lease and other applications.

3896. Has there been any noticeable change from pastoral pursuits to agricultural pursuits since you have been here? I think so. I know there are some small areas which have been bought in round the town and put to use for agricultural purposes, and in several places out of town areas have been put into agriculture—for instance, at Warrina. On Nebea Mr. Whitney has put in an area for agriculture. Up at the Ten-mile Mr. Pedley bought land which he has put under cultivation. I do not know the area of this selection.

3897. Do you think they are bettering their position by going in more for agriculture? I should certainly say so.

3898. Is the district sound financially, do you know? I believe so.

3899. Are there many transfers by way of mortgage? There are a good number of them, and there are also a good many absolute sales. I think they will be about equal.

3900. Are the purchasers new men to the district? Some of them are; I cannot say there are a great number of them.

3901. I suppose the new men are showing the older men that the land can be put to a better purpose, and that that accounts for the increase in agriculture? That is so. I know there has been a demand by new men for areas adjoining leaseholds with a chance of increasing the area.

3902. Have you anything further to add? No; only that with a railway I suppose there would be double the number of applicants for land. The difficulty and expense of getting here prevent people from coming along.

3903. Do you know whether the people looked upon railway extension to Coonamble as hopeless, and that the land taken up lately has been taken up regardless of whether there will be a railway or not? I think the land which has been taken up lately has been taken up regardless of whether there will be a railway or not. I think that if half the land which is available in Coonamble were thrown open it would be pushed for whether a railway came or not.

3904. If a railway were constructed to Coonamble the greater portion of that land would be put under agriculture? I think a great part of it would be.

3905. That would create traffic for the railway? Yes.

- C. Dillon. 3906. *Mr. Trickett.*] What is the average upset price per acre of country land in this district? Twenty-five shillings an acre at auction, and generally for settlement leases that is the upset price put on the land.
- 4 July, 1899. 3907. What money is paid yearly through the Crown Lands office here, independently of rents from pastoral holdings? There is a proportion paid here and a proportion paid direct to the Treasury. For the four years I have been here the average paid to this office and to the Treasury for conditional purchase lands and other lands, excepting pastoral leases, has been about £40,000 a year.
3908. Have there been any applications under the recent Act in this district for assistance to settlers? Only four, to my knowledge—only four came to the office and got forms. The application is made direct to the Secretary, Advances to Settlers Board, Sydney. Of course, others may have got application forms elsewhere.
3909. Are not the applications referred to you for inquiry? No.
3910. Are you aware whether any have been made? I only know of four.
3911. Since you gave evidence here in March, 1898, have the prices for town and suburban lots increased or decreased? They have increased.
3912. Can you state the average acreage held by the smaller settlers in the district? From my recollection of the books I should say the majority of them hold the full area of 2,560 acres.
3913. Have you ever heard any expressions of opinion amongst these farmers and settlers as to whether 2,560 acres is an area on which a man can make a fair living? Yes; I think the majority of them are satisfied that they can make a fair living off that area.
3914. That is, a fair living to begin with, and they look to go on increasing their holdings if they can? Yes.
3915. Is there a tendency with the settlers here to increase their holdings? They would all like to increase their holdings if they possibly could.
3916. What I mean is, they do not go backwards—they do not disappear from the district? No; there have not been many disappearances.
3917. Is the general opinion that you hear through the district that wheat-growing would pay them better than running sheep if they had means of getting to market? I think the smaller holders would go in more for agriculture than they do now.
3918. Is that the opinion which the people have generally expressed to you in your trips round the district? Yes.

Robert Crawford, contractor, Coonamble, sworn, and examined:—

- R. Crawford. 3919. *Chairman.*] You are a farmer? No; Government contractor in the district. I have been farming
- 4 July, 1899. in Bathurst.
3920. *Mr. Watson.*] Were you sufficiently long at farming to be able to give an opinion upon the suitability of soil for agriculture? I think so. I had thirty years' experience in Bathurst.
3921. You feel competent, therefore, to give an opinion in regard to agricultural land? I think I can give an opinion. I have been in the district eight years.
3922. Have you been fairly over the district within a reasonable distance of the town? Within a long distance—to Dubbo, to Warren, and out all round the district for miles, and also Mudgee way.
3923. You have a pretty extensive acquaintance with the district? I am acquainted with nearly the whole of the district—a good way in some parts, and not so far in other parts.
3924. How do you regard the land generally round Coonamble from an agricultural standpoint? As good as ever I looked at. In fact, I have seen some of the best land here that I have ever seen, and that is the scrub land.
3925. Do you think it is superior to plain country? I am sure it is for agricultural purposes.
3926. Do you think it will be possible to do anything with black soil for agriculture? In fair seasons it is very good.
3927. Do you think the probability of getting a return is sufficiently great to encourage a man to gamble on the chance of a fair season in spite of these broad plains? I think so; I have seen very good crops on the black plains. I have seen Mr. Donoghue, of Bourbah, get a splendid crop. I brought a sample of wheat to Coonamble—the mayor and several persons here saw it—as good as I ever saw, from Mr. Hourigan's, at Bullagreen.
3928. With ordinary seasons, in how many years out of ten may a man reasonably expect to get a crop on black soil? I should say in six years out of ten.
3929. Judging by your experience of the rainfall in the past, you think you can get a wheat crop in six years out of ten? I think so.
3930. In the other four years do you think a man can get a sufficient crop of hay to pay his expenses? I do not think he will get very much; if a drought sets in you get very little. I have seen very much more drought here than I have seen in Bathurst.
3931. Do you think it would be a sufficient return—that is, little more than a crop on the average in every two years—to cultivate black soil without irrigation? I think it would.
3932. Is the return so great, when you do get a crop, that you can afford to lose a crop occasionally? I think so. There are splendid crops grown here.
3933. What do you think a wheat crop would go in a good season? I should think it would go easily from 30 to 40 bushels from what I have seen. I have seen crops cut for hay here which would go 40 bushels. I would consider it would go 40 bushels.
3934. It is a very big crop? It is.
3935. That is about 1 ton of wheat without counting the straw? Yes; at Mr. Laracey's, 8 miles from here, I have seen a crop which we considered would give 35 bushels, and at Mr. Tracey's I have seen the same sort of crop.
3936. Assuming that a man got a return of 20 bushels to the acre every second year, do you think it would pay? It would hardly pay at the present price of wheat.
3937. What do you think of the timbered land in the district? I think it would take only a very small rainfall to grow crops in the timbered land.
3938. Is it expensive to clear as a rule? No; it is splendid land to clear.
3939. Assuming that it has been ringbarked for some time, and that the trees have died, what would it cost to clear that land fit for an ordinary plough? Fifteen shillings an acre. 3940.

3940. Would that apply to land on which budda scrub grows? Yes; I have seen it cleared at Narramine R. Crawford. for 15s. an acre.
3941. There is no budda there? No; it was heavier timber than that. 4 July, 1899.
3942. You think that budda scrub could be cleared for 15s. if it were dead? I do.
3943. How many crops in ten years might a man reasonably expect to get on that timbered land? I should think on the timbered land it ought to average seven good crops out of ten.
3944. Roughly, you might say that there would be two crops out of three? Yes.
3945. Because the timbered land requires less rainfall? Yes.
3946. On an average, what crop do you think you might fairly expect to get in each of those seven years? From what I have seen it would run 25 bushels easily, I think.
3947. We may assume, then, that there is very little doubt in your mind about the prospects of cultivation as far as the timbered land is concerned? I have no doubt in the world.
3948. Do you know the country east of the Castlereagh, from Coonamble to Munderoran? Yes.
3949. How would you describe that country? There it is a different sort of country—red, and black, and sandy.
3950. How would you describe that country generally—good, medium, or indifferent? I would call some of it very good, and some of it very bad.
3951. Were you here yesterday when Mr. Thomas gave some evidence? I was not.
3952. For the first 5 miles he said it is good country, river flats gradually changing into ridgy country with clay and ironstone gravel, which continues for about 20 miles, and from there to the foot of the Warrumbungles it is good agricultural country? That is correct.
3953. What would be the width of good country at the foot of the Warrumbungles going west? I should say 5 or 6 miles.
3954. In view of that description, which side of the river do you reckon it is best to bring the railway on? On the western side.
3955. You think the country on the west side is better than the country on the east side? I do. There are patches on the east side equal to, or perhaps better than, the land on the west side, but, taken as a whole, the west side has a lot of the best land.
3956. You think, therefore, that a line which followed the western bank of the river would serve a greater area of good country? I am positive that it would.
3957. Do you know the country between Gilgandra and Dubbo? I do.
3958. What is your general opinion of that country? There is some very good wheat land in that country. People say it is no good, but there is very good wheat land; all the red-box country there is good wheat land.
3959. What proportion do you think the agricultural country would bear to the whole—a fourth, a half, or three-fourths? I think it would be a third.
3960. You think there is a third of the country between Gilgandra and Dubbo which would be suitable for agriculture? Yes; I have seen splendid wheat grown in it. Last year I saw 18 bushels to the acre grown right in the ironbark country.
3961. Last year was not a specially favourable one? No; it was a bad year.
3962. And yet in the open ironbark country—country where ironbark grows with box, pine, and other trees—it averaged 18 bushels to the acre? Yes.
3963. With your knowledge of the country, which place would you say is the better starting-point for a railway to reach Coonamble? Dubbo.
3964. Although it would involve a little longer haulage to Sydney, yet you think Dubbo would be the proper starting-point? I do.
3965. You think the extra length of the line would be compensated for by other advantages? Yes.
3966. What advantages? We would get access to the markets in the whole of the western district.
3967. You think that advantage would be sufficient to counterbalance the extra cost? I do; it would more than counterbalance the extra cost.
3968. Do you think a line from Dubbo is more likely to pay than a line from any other point on the railway system? I do; there will be three times the passenger traffic and more. You see there are so many towns out that way—Bathurst, Orange, Dubbo, Wellington, Parkes, Forbes, Bourke, and Cobar—and it would lead to the whole of those towns. The Mudgee line would only lead to Coonabarabran, Gulgong, and Mudgee, and if you wanted to go to any of the towns on the Western line you would have to go to Wallerawang and turn back.
3969. You think the passenger traffic is worth considering? I am sure it is.
3970. You think the passenger traffic is worth considering as long as it does not unduly overshadow the other aspect—the carriage of freight? They would have the market there. They could not have any market there if the line went *via* Mudgee, because they would have to go down to Wallerawang and turn back to the west. With the Mudgee connection there would be only Sydney, and the whole of the western towns would have Sydney as well as this district would.
3971. You would have these western towns closed to you if the line went to Mudgee? Yes.
3972. Therefore, from all points you are in favour of the Dubbo connection? Yes. I would farm here myself only that there is no railway. As soon as a railway starts a mill will start. I am only waiting for the railway to start to begin farming myself.

William George Taylor, grazier, near Coonamble, sworn, and examined:—

3973. *Chairman.*] What are you? I am a grazier, living at Bimble, about 4 miles north-east from Coonamble.
3974. *Mr. Trickett.*] Will you give the particulars of your holding? You have my former evidence, and I unhesitatingly say that this is the best grazing district in New South Wales. 4 July, 1899.
3975. Basing your opinion upon a comparison with other districts that you know? Yes; with others that I know perfectly well. I am not speaking ignorantly; I am speaking from knowledge.
3976. What is the extent of your holding at present? About 60,000 acres. Last year I shored 67,000 sheep, and I sent between 1,100 and 1,200 bales of wool down to Sydney.
3977. That shows a very large carrying capacity for the country, does it not? I have about 33,000 or 34,000 acres of secured land, and the balance is Crown land.
3978. In a good season, what do you estimate the carrying capacity of the country to be? With a good season, if I have the sheep, I can shear 70,000 sheep without trouble. 3979.

- W. G. Taylor.  
4 July, 1899.
3979. That is over a sheep to the acre? Yes; I am giving myself away to you, probably.
3980. For the purpose of the information going to Parliament, will you tell us what other districts you compare this district with to show its superiority? Some portions of the Wellington district. It is quite as good as the Darling Downs, if we get the season.
3981. That is a big order? I said that before, and I say it most unhesitatingly now.
3982. You have been in the district for twenty-five years? Since the 21st May, 1874.
3983. Will you tell us some other parts of Australia with which this district will compare? I say, unhesitatingly, that this is the best pastoral country, with a decent season, I ever have known.
3984. How often do these good seasons occur out here? They occur just as frequently as I have seen them in Riverina. I was in Riverina since 1863.
3985. This last season has been very bad? Terrible—the worst ever I knew. I lost more sheep last year than ever I lost before.
3986. That does not make you want to leave the district? No. I will hang on yet a little while, if the Almighty spares me.
3987. With a few good seasons, you will soon pick up what you lost last season? Yes; I do not think the bank will foreclose, anyhow.
3988. Do you confine your operations to grazing only? I have done so. When Mr. Young, the late Minister for Works, was up here I, for the first season in this district, had 7 acres of wheat in. It was not very good at the start, but it was a remarkably good season, and it was a great surprise to everybody. It was inches and inches over the posts of an ordinary 6-wire fence. I am making things bad for myself, but good for the district.
3989. You had a most satisfactory crop off the area? It was a most satisfactory crop. I had no idea of cultivation. Farmers who came to cart away the wool said they believed it would go  $3\frac{1}{2}$  tons to the acre. That is the evidence I gave on a previous occasion, and I repeat it; I really believe it did.
3990. On what class of country was that grown? On what we call black soil. It is not exactly black soil; it might be called a mixture. It is one of those absorbent soils which requires any quantity of water.
3991. It is not that clayey black soil which you get in other parts of the country? No. It would stick to the wheels, but once it gets all right it is very nice indeed. It is wonderfully productive.
3992. Do you think that with better means of communication you would be induced to go in for wheat-growing? No. You have put me on a sort of pivot just now. To irrigate our soil would take such an awful lot of water; but when it is saturated from the heavens, or watered sufficiently from a bore, it can produce anything which ever the world wanted. To irrigate the soil you would have to carry buckets of water. It does not want much water for red soil.
3993. Last year when you were examined you said you would go in for wheat-growing? I said I would. I had only 7 acres in then, and I have 29 acres in now, and a very nice show it is getting. I am going in for a little more again.
3994. Would you go in for wheat-growing to assist to feed your flocks or to sell? I would do nothing of the kind. I would do it to keep my stock round the house all right—such as horses, cows, and, probably, a few favourite sheep. But to think of feeding the flock is a ridiculous thing; better skin them than feed them.
3995. You would not be likely to become a wheat farmer with a view to send your wheat to market? I would do that. I have said these last two years, amongst my private friends, that were I younger, I would go in for wheat-growing to a large extent, because wheat-growing can produce you 10s. an acre, and we cannot do that by growing wool.
3996. Having been in the district for so many years, what do you think of the country between Coonamble and Gilgandra? From Coonamble to Gulargambone or up to Curban, it is perfectly good for anything you require, either for pastoral purposes or for cultivation. Up to Gilgandra, it is perfectly fit for either of those two purposes. On the straight road from Gilgandra to Dubbo, by the coach route, it would grow wheat when cleared, but it would not last very long. I know the country on both sides of the road. I have been over it and over it again, and I say, within a mile, or 2 or 3 miles off the road, it is most excellent country for either purpose.
3997. Do you agree with the opinion that the land on the western side of the proposed line is the best? I do, unhesitatingly.
3998. Why? I call it the best land, because there is more of it, and because it is much easier engineering. On the eastern side it is exceptionally good, and it would only be a madman who would say anything else; but the engineering difficulties are so much greater on the eastern side than on the western side that I do not think we, at the present time, ought to attempt such a thing.
3999. How does your wool go to market? I let a contract to Permewan, Wright, & Co., and they took the wool by whichever route suited them. I had nothing to do with the matter. They took it on one occasion to Warren, because there was a little trouble with the carriers. The farmers and carriers up Dubbo way said they would not do it unless it was so and so, "Very well," we said, "we will bring carriers here and send it to Warren." A couple of years ago, I believe, the biggest part of the wool went to Warren; but last year all the wool which I had, and which was a very fair lot, went to Dubbo, and this year it is let again at the same rate, and, I presume, it will go to Dubbo. I send as a general rule a fair lot of wool and a fair lot of sheep, generally 18,000 or 20,000 a year when the seasons are fairly good. I can send far more if I get what is called a good season. Supposing a railway were here, I would send them direct to Dubbo by trucks, for the simple reason that we would land our sheep with what is called the sap in them. Although we might not really make so much by it as we would if we could land them decently by road, still the people who buy say "they come from so and so, and we know what they are." At a place like mine, and at places round the neighbourhood it is all the same. There they come in out of the paddocks to-day, and they are put into the trucks to-morrow; you cannot do very much better than that.
4000. That strikes one as very reasonable, but we often hear it said that if a line like this were constructed you would still drive your sheep to Dubbo with a good road? I cannot say what others would do, but I will tell you what I would do: I would take them out of the paddock, count them, and put them in the trucks.
4001. As a practical man wishing to get the best return from your stock, you certainly would not drive your sheep to Dubbo, but would truck them at the nearest possible place to get them most quickly to market? Certainly.
- 4002.

4002. What do you think of the Mudgee route? I must say the Mudgee country and all that is very, very good. I have been all over that country.

4003. What do you think of the line to Mudgee as a line, independently of cost? So far as the country is concerned, I do not think the Mudgee route is to be compared in the least with the Dubbo route. I know the distance is shorter, and all that sort of thing; but the engineering difficulties are so large that for the present generation it would never be good enough. The time will come, of course, when we shall have net-works of them.

W. G.  
Taylor.

4 July, 1899.

4004. May I take it that for the present time, looking at all phases of the question, you think the Dubbo route is the best route of the three? Most unhesitatingly, I say so.

4005. Do you endorse the opinion that the railway would be a very great advantage to the smaller holders of land for the purpose of getting their small shipments of stock to the Sydney market, where it is impossible to send them now? I do. Supposing this line were made, you would have hundreds of settlers where you have only twenty within 3 or 4 miles of the route.

4006. Is there any other statement you wish to make? I heard you ask a witness a question which I think he did not answer as nicely as he ought to have done. I have been here since 1874. The town has been built since that year. Two or three old houses which were tumbling down were bought by a speculator, and the town from here to the post-office has all been built in that time. On one occasion I, with others, waited upon the Minister for Works in Sydney with our Member, a very intelligent, good man, and he told the Minister he believed the population had in twenty years increased almost 50 per cent. It had increased 650 per cent. There is not a man in the room who is listening to me but must know for a positive fact that that is true, and I have given a very small estimate. It is easy for the Committee to find out whether I have made a false statement by going over the route.

Sidney Richard Skuthorpe, solicitor, Coonamble, sworn, and examined:—

4007. *Mr. Dick.*] Have you been living here long? I have been associated with the district since infancy, and I have been practising here for six years.

S. R.  
Skuthorpe.

4008. You have a pretty good knowledge of the surrounding district, I suppose? Yes. It has grown with me or I have grown with it. I can remember back as far as 1872.

4 July, 1899.

4009. We have been assured by a number of witnesses that a considerable amount of the land fronting this line and Coonamble is fit for agriculture? Yes.

4010. We were also told yesterday that there is a large local market for fodder and products;—is that the case? That is correct.

4011. If there is a large local market and a large area of land available for agriculture can you tell us why the local supply has never been equal to the local demand? Of course, during the last twelve or eighteen months the district has grown, and the demand has grown. The demand has been excessive during the last twelve months through the dry seasons, but previous to that I think the local supply was equal to the local demand, and as there are no means of access to outside markets there was no inducement for people to go in and produce more than was likely to be consumed locally.

4012. Previous to this last bad season the local supply was equal to the local demand? Practically.

4013. Is there a large amount of agriculture being carried on in the district? It has increased considerably during the last twelve months.

4014. Taking it all in all, is it not an exceedingly trifling amount compared with the area which is available for agriculture? It is comparatively trifling for the reason I have just stated—that until the drought set in here the local production was equal to the local consumption, and there was no inducement to people to produce more largely on account of not having access to outside markets.

4015. Can you tell us whether previous to the last eighteen months any large amount of fodder was brought into the district, say from Dubbo or other places? In dry seasons.

4016. Only in dry seasons? Only in dry seasons.

4017. Do you think the construction of this line would stimulate agricultural pursuits all along the route? I am sure it would. I know that not last season but the season before one farmer out on Tundaburine had a large supply of wheat which he sent to Dubbo. I do not know of my own knowledge, but I was informed that it was equal to any wheat which had been taken to the Dubbo mill for sale, and superior to a good deal of it.

4018. Can you give any information as to the number of seasons, say out of ten, in which you would get a paying crop in this district? In seven out of ten years, I consider.

4019. There are practically three routes which all terminate at Coonamble—one from Warren, one from Dubbo, and one from Mudgee;—which route do you think would best serve the district? The Dubbo route.

4020. Was that your opinion during the first inquiry? It was my opinion, although I did not express it then, because I was under the impression that I was morally bound, through being connected with the league here, not to favour any particular route. It was part of the league's platform that no particular route should be advocated. I consider that I am free now, because the Minister has adopted this line by referring it to the Committee; I consider that I am free to express an opinion as to which line I think the best.

4021. The answer to this question does not compromise you—"On which of the routes is the best country situated? There is less bad country on the Warren line than on either of the others, and less on the Dubbo line than on the Mudgee line"? I answered that question in that way because it was put directly to me.

4022. You do not think the fact that there is a larger percentage of good land along the Warren line would warrant you in advocating that line in preference to the Dubbo line? I think from other circumstances the Dubbo line is preferable.

4023. Do you think the carriers would be able to compete with the Commissioners for the wool traffic along this line? I do not think the carriers would. An odd carrier might at times take a load.

4024. Have you any idea of what the carriers do charge for carrying wool from Coonamble to Dubbo, and from the intervening districts to Dubbo? I should think from £2 to £2 10s. My people are in business at Gulargambone, and for the goods they get from Dubbo they pay from £2 to £2 10s.

4025.

- S. R. Skuthorpe.  
4 July, 1899.
4025. Do you observe on the map a triangular piece of land between the proposed extension from Warren—the red line indicating the proposed route from Dubbo to Coonamble and the Western railway? Yes.
4026. A great amount of that land, as far as wool production is concerned, is already supplied by the Warren extension, is it not? A good deal of it would go to Warren and a good deal to Narramine and Dubbo.
4027. A good deal of it is already supplied by the Warren extension? I think the trend of that traffic would be not towards Warren, but towards the Western line at those other stations.
4028. But taking Warren as the centre of a radius of about 40 miles all round, is it not a fact that that part is already supplied by the Warren extension? Within a radius of 20 miles.
4029. Is not 40 miles the usual distance for which a railway is supposed to serve the wool traffic? Within 20 miles, I should say.
4030. Then, with respect to the Western line, the country for 20 miles north of that line is already supplied, I suppose? More than 20 miles north at the present time.
4031. Do you alter your limit as to the Western line? No; for Warren. Probably within a radius of Warren the traffic would go to Warren. Outside of that limit the trend of traffic would be to the stations getting nearer to Sydney. For instance, Coonamble is nearer to Warren than it is to Dubbo, but still the bulk of the wool from here goes to Dubbo.
4032. Where does the wool from the intervening district, say half-way down from Coonamble to Warren, go? I believe the wool from about half-way goes to Warren.
4033. There is a fairly large area to the west of the proposed line already supplied with a railway, as far as wool is concerned? If this line were constructed, I consider that it would draw the wool from a greater distance than half-way between the two.
4034. Seeing that a considerable area of the country on the proposed Dubbo-Coonamble route is already supplied with railways, as far as wool production is concerned, does it not seem feasible that the extension from Mudgee to Coonamble would serve a larger area of country now unserved than a connection from Dubbo to Coonamble would? I do not think so, because that country which the line from Mudgee to Coonamble would pass through does not carry nearly so much stock. There is a large area of country there, as was pointed out to you yesterday by Mr. Thomas, which is practically unoccupied. He mentioned yesterday that he was not certain about the capital value of a lot of that land. He thought it was 12s., but I have looked up the *Gazette* notice, and there are about 10,000 acres of which 5s. is the capital value put upon it. Although there was a very extensive demand for land in this district, that land lay there from two to three years; in fact, one of those blocks was only applied for the other day.
4035. *Mr. Watson.*] What is the rental? One and a quarter per cent. on 5s.
4036. About three farthings an acre? Less.
4037. *Mr. Dick.*] In other words, you think the best extension is the one from Dubbo to Coonamble? Yes.
4038. *Chairman.*] Is there any other information you wish to add? Only my reasons for holding that opinion. If the line were extended from Mudgee the distance to Sydney would be shorter, and I think that is the one recommendation in its favour, as I said in my former evidence; but, as against that, I believe the actual travelling time would be less, because I understand that on the line from Mudgee to Wallerawang they travel very slowly. The cost of construction would be something like £80,000 more than the cost of constructing the Dubbo line.
4039. *Mr. Trickett.*] It would be £271,000 more? We would have that much more capital to pay interest on, and, as was pointed out yesterday, until a branch line is paying there is a local rate levied on goods transmitted by that line. I consider the Mudgee line would take considerably more time to become payable than the other line. The Dubbo line would give us access to the southern markets, to Melbourne, and to all the large towns on the Western line. My people have sent stock to towns on the Western line—to Dubbo, Orange, and Bathurst. By the Mudgee route they would be confined to the one market—Sydney. But by the Dubbo route they would have these large towns. They would have the possibility of a market, I consider, for any agricultural produce out in the western district, about Cobar and Bourke, and they would also have access to the Melbourne market. Wingadee is one of the few stations which carry any number of cattle in this district now. At the present time, and since I have been here, they have sent their fat cattle from here to Dubbo, and trucked from there to Melbourne. I consider it is only because Dubbo is the nearest station that they were sent there; that if there were a station here they would be trucked from here. With regard to the agricultural possibilities of the district, at Gulargambone farming has been carried on there on a small scale by my father for a number of years, principally for hay, but on one or two occasions the crop has been cut for grain, and over 40 bushels to the acre have been yielded. At the present time I am experimenting. I have about 8 acres under malting barley, and from having seen previous crops of barley growing, I consider it is likely, with a fair season, to yield a profitable crop. I do not know whether the Committee are aware that malting works have been established at Mittagong for malting barley. It was the establishment of these malting works which induced me to get the barley put in as an experiment at Gulargambone, to see if it could be produced.
4040. *Mr. Watson.*] Do you think the land is suitable for barley? In this past year I have seen small patches, which were merely sown for greenstuff; some of it had been left to go to seed, and the product of that was really superior to the seed I got to plant this year. It is New Zealand seed I have now.
4041. Was it superior as in quality or quantity? Quality. I could not say how much it yielded per acre; but the grain was very full and very perfect. It had a good colour.
4042. *Chairman.*] Is there anything else you wish to say? We have land at Gulargambone, and are prepared, if we had an extension and had a chance of getting access to outside markets, to put the bulk of that land under cultivation.
4043. Do you know whether the settlers along the route would offer any very great obstacle to the railway going through their land? I do not think so.
4044. In the shape of an exorbitant demand for compensation? I think not; the land is used for pastoral purposes now.
4045. *Mr. Watson.*] If a clause were put in stipulating that the land shall be given free outside the township allotments as has been done in the case of several lines recently, do you think they would respond to that? I hardly think that that would be a fair provision. In some cases, perhaps, it would be a small holder's land which it would pass through, and the benefit he would derive would be small in comparison with what would be expected from him.

4046. In some cases where it was done it was found that the large holders were sufficiently anxious to get the line to compensate the small holder themselves? I hardly think it would be a fair provision; but as far as these two lines are concerned, I consider that within the Coonamble district the resumptions would be as great on the Mudgee extensions as on the other. I do not think there would be any excessive claims made for resumptions.\*

S. R.  
Skuthorpe.  
4 July, 1899.

Richard Grove Francis, senior-sergeant of police, Coonamble, sworn, and examined:—

4047. *Chairman.*] You have charge of the collection of the agricultural statistics here? I have.  
 4048. How many holdings are there within your district? There are 148 holdings, with areas from 1 acre up to 311,254 acres.  
 4049. Will you define the district in which the information is collected? Starting at Tooloon, about 15 miles west from here, it is bounded by the following runs:—Talagar, Geanmoney, Warrana, Nebea, Terembone, Billeroy, Bullarora, Wingadee, Combogolong, Beanbah, Bundy, Nelgowrie, and Narraway. It is chiefly on these runs that the small holdings I spoke of are to be found.  
 4050. Within what radius? Tooloon, where I started from, would be 15 miles west. Nebea is about 14 miles north-north-east, Terembone is about 30 miles north-east, and Combogolong about 50 miles.  
 4051. Taking a centre, what would be the radius from that centre to the boundary of the district? It is about 60 miles from outside to outside, so that the radius will be about 30 miles.  
 4052. Will you describe, generally, the nature of the holdings? The majority of the country, I think, is almost unsurpassable as far as fattening country is concerned. There are some patches on which there are scrubs which would be good agricultural land. From what I have seen of it, and my experience of it, the land which is most condemned is most fertile as far as agriculture is concerned.  
 4053. Is a large proportion of the land of that description? A good proportion of it.  
 4054. Have you got the agricultural returns? The record for last year was about 600 acres within the radius I gave.  
 4055. Grown, I suppose, for their own use? For their own consumption.  
 4056. Has the district progressed much of late years? As far as the small holdings are concerned, it has.  
 4057. What were the principal crops? Wheat, and in some places oats; but wheat is the principal crop for hay.  
 4058. I suppose you very often come in contact with the settlers about here? Yes.  
 4059. And you have confidential talks with them occasionally to ascertain their ideas generally? Yes.  
 4060. Do they give you any idea as to whether they are prosperous or otherwise? So far as I know, I think the small holders are prosperous. I cannot say as to the larger selectors.  
 4061. Have any persons been starved out of the district? No.  
 4062. They are all fairly well satisfied with their prospects? Yes.  
 4063. Have they told you in conversation their intentions in the future in the event of a railway being constructed? No.  
 4064. Have you any idea whether they will go out of sheep into wheat? Yes; I have heard some say they would convert a part of their holdings into wheat.  
 4065. That means, I presume, that there will be more men employed? I think so.  
 4066. *Mr. Watson.*] Do you reckon that this is a good fattening country? Yes.  
 4067. Do you have a quick growth of grass sometimes, and therefore a lot of grass? The growth sometimes is wonderful; it is very rapid.  
 4068. In that case it would be an advantage to a man to get stock quickly to market so that he might have a chance of putting on other sheep and taking advantage of the grass while it was at its best? Decidedly.  
 4069. Do you think the rapidity of the growth of grass and the possibility of fattening is more permanent a feature here than in any other district? More so than in any other district I know of.  
 4070. You think that feature is one which should commend itself with regard to railway construction? I do.  
 4071. *Chairman.*] Have you any other information to furnish which would enable the Committee to arrive at a proper determination? I do not think so.

R. G. Francis.  
4 July, 1899.

Jonathan Davey Young Button, solicitor, Coonamble, sworn, and examined:—

4072. *Chairman.*] You are secretary to a Coonamble flour-milling company now about to be formed? I am.  
 4073. When was the movement started? At the end of 1897.  
 4074. It has not resulted in anything just yet? It has resulted in a meeting. Those who interested themselves sent out a circular letter to each landholder in the district within a radius of 40 miles, asking him whether he would be likely to go in extensively for wheat-growing in the event of a milling company being floated, and we met with a very liberal response, quite good enough to assure us that there would be sufficient wheat grown to make the company a payable one on the lines which were suggested. I hand in a copy of the circular letter and a summary of the replies received from these landholders:—

J. D. Y.  
Button.  
4 July, 1899.

[Copy circular sent to each landholder within 40 miles of Coonamble—393 sent—141 favourable replies received, 2 unfavourable.]

Sir,

Coonamble, 4 October, 1898.

At a large meeting of residents held at the Council Chambers, Coonamble, it was decided to take into consideration the formation of a flour-milling company at Coonamble, and a committee was elected for the purpose of collecting information to lay before an adjourned meeting.

Would you kindly state whether, in the event of a mill being established, you will be likely to grow wheat, and what area you might put under cultivation; also what quantity of flour you consume per annum.

The above information is required to place before the adjourned meeting of those interested in the movement.

In the event of the matter being proceeded with, a prospectus will be forwarded to you in due course.

We are, &c.,

T. D. BERTRAM,  
Chairman of Provisional Committee.

J. D. Y. BUTTON,

Hon. Sec. pro. tem.

EXTRACT

\* NOTE (on revision) :—I consider the proposed railway, if constructed, would be largely availed of for the carriage of fat stock, as the stock routes from Coonamble to Dubbo, Mudgee, and Warren were, except in wet seasons, very badly supplied with water.

J. D. Y.  
Button.

EXTRACT from Report of Provisional Committee *re* Coonamble Flour-Milling Company, after replies were received to the annexed circular of October, 1898.

4 July, 1899.

RESPECTING the replies to hand *re* circulars—141 favourable replies were received, stating areas then under cultivation or about to be cultivated this year (*i.e.* 1898), two unfavourable replies were received; twenty-six stated that they had a total area of 3,011 acres already prepared for seed and cultivated, and were prepared to increase their total areas to 7,018 acres. The other persons who replied promised to cultivate areas from 50 acres to 400 acres; one 3,000 acres, if a flour-milling company were established in Coonamble.

It will be noted that about 250 failed to reply to the circular, and this result we attribute to the fact that the circulars were sent to landowners, whereas many lands are held under lease, and not occupied by the owners—many of the tenants cultivate. From the replies received we can only give you a small idea of the area that will be cultivated; and we would point out that we are in the middle of a severe drought.

We then issued a prospectus calling for shares up to a certain date. I received a number of applications, and was interviewed by a number of persons who offered to take shares, but requested the provisional committee to extend the date of closing the share list until the drought was considered to be over, as they intended to take shares, but in the face of the drought were not prepared so to do. The date originally decided upon for the closing of the list was the 1st June. Prior to that date the provisional committee met and decided to extend the date until the end of this year. There is no doubt, in my mind, that the company will be formed and that the shares will be over-subscribed.

4075. Would the construction of this railway help in any way? I should say so, most decidedly, as we would have a better and larger market for flour. Of course, in considering the formation of that company we only took into consideration an immediate market.

4076. Milling would be one of the added industries if a railway were constructed here? Yes.

4077. As a solicitor, you have acquired a good knowledge of the position of the settlers? I have been practising here for seven years, and I have had a very considerable insight into the position of almost every settler in the district. I consider that almost every one of our settlers is in a very sound and good position. It is a district which, I think, would hold its own with any district in the colonies; I thought that when I settled down here, and that opinion has been confirmed.

4078. Is there room for another lawyer? There are three here; I do not think there is room for another at present; with railway connection there might be.

4079. Is there anything else you wish to add? Yes; with regard to the probability of the railway being used for the transmission of stock. The bulk of the stock from here travel to Dubbo, and with part of that particular route I am intimately acquainted. Except in wet seasons, there are long distances which have to be travelled there without a chance of the stock getting a drink of water. For instance, from here to Gulargambone, 28 miles, there is only a small supply of water just for a short time after rain; and from Gulargambone to Gilgandra there is another stretch. Of course, as you have seen here, the river which was originally supplying the place has pretty well silted up, and there is no supply there. I think stock-owners would use the railway in preference to the stock routes, for the reason that the stock routes are almost devoid of water except for a short time after rain.

4080. So that you think there is very little probability of the pastoralists driving their stock to Dubbo, in preference to trucking them here? Yes.

Thomas William Medley, Inspector of Stock, Coonamble, sworn, and further examined:—

T. W. Medley.

4 July, 1899.

4081. *Mr. Watson.*] You are aware of the number of stock which go through this district towards the market from the outlying districts generally? Yes.

4082. Whence do they come usually? From Queensland way, right out to the border.

4083. A great lot come from Queensland through here? Yes; stores.

4084. Assuming a railway to be constructed as far as Coonamble, from how far north, north-east, and north-west do you think fat stock would be drawn towards the railway station at Coonamble;—would it be 30, 40, or 50 miles? More than 40 or 50 miles, I should think. Some may go *via* Narrabri, but a great many come in this way.

4085. From how far back do you think the fat stock would come—from half-way to Walgett? Fully.

4086. And taking a line between Walgett and Coonamble, and then crossing by another line half-way between those two points, how far east and west do you think that line would extend as covering the influence of the Coonamble terminus for the gathering in of fat stock? I should think from 45 to 50 miles.

4087. So that you have a triangular piece of country, with its apex resting on Coonamble, and with a width of 40 or 50 miles at its base? I should think it would be 80 miles at the base, that is 40 miles on each side of the line.

Rev. John Alfred Cooper, Coonamble, sworn, and examined:—

Rev. J. A.  
Cooper.

4 July, 1899.

4088. *Chairman.*] You desire to make a statement to the Committee? Yes. Within 36 miles of Coonamble, and over 50 miles from Warren, there is a township called Quambone, which is not shown on this map. Quambone Station was recently purchased by the Cooper's Dip Company with a view to experimenting. It has been thought that their advent will give an impetus to the trade of the township. Within the last two years this township has grown to its present size. Oranges have been grown at Quambone, and purchased, because of their excellent quality, by Sydney firms. I purchased a piece of land there two years ago, and half an acre fetched £11. I have heard an expression of opinion in regard to this part of the country being useful to pastoralists about Bourke and other places in the event of our having a successful season and of their suffering from a drought. It could offer them runs for their starving stock. With regard to speed,—I should imagine, having formerly had experience in railway matters, that we could reach Sydney *via* Dubbo just as quickly as, if not more quickly, than we could *via* Mudgee, notwithstanding that the distance *via* Mudgee is shorter, and for this reason—that the gradients are not so steep, and we form a junction with the trunk line at a shorter distance than we should *via* Mudgee; and, as I understand, the Mudgee-Wallerawang line is only a branch line. It has also been thought that, with a view to make the line as national as possible, and, in view of Federation I may say, it

it would be a better thing to have connection with Cobar, with a possible extension of railway to Wilcannia and Broken Hill. It was asked by a Member of the Committee whether foreign grasses had been grown in this district. I have heard the Ryder Brothers, of Calga, say they have grown them successfully. The maintenance of the line from Mudgee to Coonamble would, I should imagine, be a much more expensive matter than the maintenance of a line over flat country from Dubbo to Coonamble.

Rev. J. A. Cooper.  
4 July, 1899.

4089. At what place were you stationed before you came here? I was at Cobar for twelve months, and I have been here eight years.

4090. Comparing this district with the other districts in which you have been, would you consider this a more or less prosperous district? I should consider it much more prosperous. Certainly I was in Cobar at a very bad time, when the mines were shut down and the rabbits were very numerous; but, as far as the seasons have gone, I can corroborate what one witness has said. The seasons here have been certainly no worse than they were when I was living in Bathurst, but better on the whole; and I have known that when in Bathurst they have been having a drought, and not a blade of grass, we have had a splendid season up here.

WEDNESDAY, 5 JULY, 1899.

[The Committee met at the "Tooraweena Hotel," Tooraweena, at 8 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Angus Nicholson, settlement lessee, near Tooraweena, sworn, and examined:—

4091. *Chairman.*] What are you? I hold a settlement lease of 4,500 acres on the Uargon Creek, which lies about 6 miles south-east. I am using the land principally for grazing.

A. Nicholson.

4092. What is its carrying capacity? Definitely I cannot state, but the manager of the station, previous to my taking up the land, told me he thought the ground would run, in an ordinary season, one sheep to the acre. From practical experience he is perhaps right.

5 July, 1899.

4093. I suppose you have not held the land very long? About three years.

4094. Will you describe the character of your holding—whether it is good agricultural or pastoral land? About one-third of my holding is fit for the plough after the necessary improvements are made. From my experience in Victoria, I think it would yield in a fairly good season or a general season between six and seven bags of wheat to the acre. It has been remarked to me by various neighbours that I hold very good land for that special purpose.

4095. Have you cultivated any land yourself? Only this year, and it is a very small area. I am now clearing the land.

4096. What have your neighbours done in that respect? My brother-in-law has lived in this district for eighteen or twenty years; his principal product has been lucerne, but the seasons are variable and do not suit it properly although in a good season it will grow lucerne. The ground is rather rich for wheat, but in the statement made by the Government Surveyor, the lease adjoining my holding was put down as lucerne flats, still this lessee is holding the same sort of land as my brother-in-law is.

4097. Is there much land similar to yours which is held under pastoral lease? Yes, more or less. All three lessees adjoining me could cut out of their holdings 1,000 acres each if it were necessary or if they felt disposed.

4098. What do you mean? Each of the three could cut out of his holding 1,000 acres for the purpose of agriculture or wheat-growing. Mr. Beames adjoins me on one side and my brother-in-law adjoins me on another side, and both of them have land running on both sides of me similar to mine. Another neighbour and my brother-in-law, I believe, could get more than 1,000 acres fit for agriculture. It runs unevenly. My holding has a flat running for a stretch without any hills and then it breaks into hills.

4099. You stated that each lessee, in your opinion, could cut 1,000 acres out of his holding which will be fit for agriculture, what proportion does that area represent to the holding? Mr. Beames' lease contains 4,000 acres and my brother-in-law's lease contains 2,600 acres, not mentioning his private land. Mr. Travers, I think, has 5,000 acres in his settlement lease—I do not mention Mr. Buckley's settlement lease, because his land is not suitable for wheat-growing. It is termed a lucerne flat, but I think it is much misrepresented. It would grow lucerne with good seasons. My brother-in-law has gone in a very great deal for lucerne. He has various stacks, but still he has been a good while accumulating them.

4100. I suppose the rainfall here is not sufficiently heavy? It is not sufficiently heavy and is not seasonable enough. I believe it would be good land for lucerne, but the difference between this place and Mudgee is vast as to rainfall. It is all or none apparently from what I have seen of the rainfall during the last six years.

4101. Are there very many large holdings about here? Five thousand acres is the largest holding. I think Mr. Travers' lease is the largest in the Yarragrinn holding.

4102. About 5,000 acres is the largest settlement lease? I think so.

4103. There are some pastoral leases falling in next year? Yes.

4104. Would there be any demand for that land if it were thrown open? A great demand over and above what the Government could grant.

4105. You think the demand would be greater than the supply? I do. I am almost positive that there is still a demand for land in the roughest part of this country, for the simple reason that there is no other land available but heavy scrub country.

4106. That is without reference to any railway question? Yes, without reference to anything at all.

4107. How far from Tooraweena is the surveyed line from Mudgee to Coonamble? I suppose you would touch it within 4½ or 5 miles to the west of this place.

4108. How far are the foothills of the Warrumbungles from Tooraweena? Three miles to the nearest point. From the railway line to the foothills of the ranges it is about 7 miles.

4109.

- A. Nicholson. 4109. Have you been across from Tooraweena to the Castlereagh at all—to Gilgandra? Yes.
- 5 July, 1899. 4110. Or to the country in between? To Mundooran and Coonabarabran and to Curban.
4111. On the river? No. I have been between Gulargambone and Gilgandra, and Curban lies between the two. From Tooraweena, *via* Bearbung, to Gilgandra is, I believe, as good for wheat-growing as any land. There are two strips of country between Tooraweena and Gulargambone of the same character, but it is more scrubby. This Bearbung country is light land—more box and budda.
4112. Suppose the country was improved, do you think it would be fit for agriculture too? I do; but I fancy from the look of the country the Bearbung country is the best of any.
4113. Is it between Gulargambone and Terrabile Creek? It runs down the Uargon Creek. It is south of a line from here to Gilgandra.
4114. You say that it is good country all down there? Following the road. I have never been through it. I have been to Gilgandra, and I thought it was splendid country for wheat. Although nobody from here seems to take it, I think there is land available there. By the Dillies it is splendid wheat country. The land surrounding the Dillies has been left because it is overgrown with scrub. Within the last three weeks two leases have been taken up in the mountains here, which land, to my thinking, is far inferior to the land down there. It is not so dense in the scrub, which is a consideration to a man when he is beginning. From an agricultural standpoint a railway is really not an object to settlers in this district, for they have no market for their produce. I have no intention, under present circumstances, of cultivating my land. I am going to make it carry as many sheep as possible; still I believe that cultivation is the more productive of the two if you can get rid of your produce.
4115. You think if a railway is constructed it will enable you to put your land, perhaps, to a more profitable use? Greatly.
4116. And with a sufficient area of land to carry a number of people to make the railway pay, do you think? I do, providing the land is cut up in proper areas to suit the various people who are looking for land. I believe it is being cut up into farmers' holdings. A small area is more suitable for a farmer than a large area. I think the most applications are for small holdings. I am a Victorian, and the largest holding in Victoria, when I left there, was 320 acres, the largest a man could select. It appears to me that men in Victoria can make a better living on their 320 acres than men can do over here on 1,000 or 2,000 acres. Still, from what I see of the land, it is richer and will stand more cropping than any Victorian land, except Gippsland; but along the Goulburn Valley and through by Echuca and Shepardtown the land has been cropped, and farmers, on their 320 acres, are in a position to come over here and buy land.
4117. Were they tenant farmers? They were Crown tenants. I have a brother-in-law there who, previous to my leaving the Colony, was offered £8 an acre for his land, and he would not sell. If wheat would pay him, I fancy it should pay us here.
4118. *Mr. Trickett.*] What about the rainfall? I believe it is a matter of seasons. From what we read rain is periodical: we have dry seasons and wet seasons. We have a continuation of from five to six or seven years' dry weather; we are having that now. Previous to six years ago my neighbour, Mr. Schumack, had so many potatoes to the acre that he would not go to the trouble of digging them. He would tell me to dig what I wanted. He used to tell me to dig the potatoes, and I could always dig to the extent of a quarter of a hundred weight.
4119. *Chairman.*] You told the Committee that men have done so well in Victoria that they were able to come over here and take up land for themselves;—how would you compare the seasons in the part of Victoria from which these men came with the seasons in this district—is the rainfall there better than it is here? It is more regular.
4120. Do you think the seasons there are as bad as you have here? There is one year I can remember. In that year, from January to March, I think, the ground was not wet with rain, and then it grew a good crop. Still, the season from then to the proper growing time might have been suitable for wheat.
4121. Generally speaking, are the seasons in Victoria better than they are in this district? I would not say they are. I have seen 16 bushels to the acre got off the same sort of land as I am now holding, and I have seen 28 bushels to the acre got.
4122. What would be a payable crop for this district? I think five bags, or 20 bushels, to the acre is a payable crop on an average. I fancy that if you take the good seasons with the bad ones this district will yield 20 bushels to the acre. At times it is exceedingly more than that.
4123. Do they get an average of 20 bushels to the acre from the district in Victoria from which you came? Yes, I believe they would get that.
4124. How far would it pay you to carry wheat to a railway? At the present time the only object for which I would carry wheat would be for the flour. I think the price of wheat is 3s. 6d., 4s., or 4s. 6d. in Coonabarabran, and you can take a load from here to Coonabarabran with five horses.
4125. How far do you think it would pay you to carry wheat from here to a railway? That would depend greatly upon the price in the market.
4126. When it is grown you have to do something with the wheat, and taking one season with another, what would you call a fair price, and how far would it pay you to cart your wheat to a railway station? I think to give a man anything like a profit for his trouble he would not have to exceed from 10 to 20 miles; I would say 20 miles—that is, on the lands which will be flat if the railway should happen to go along the route which is surveyed to suit this district.
4127. So that if a line were constructed you think there would be a probability of land on either side for 20 miles being cultivated for wheat? I think so.
4128. That you think would be the limit? I think it might extend further between Mudgee and Mundooran.
4129. Do you know the line at all which it is proposed to construct from Dubbo to Coonamble? I have not the slightest knowledge.
4130. Tooraweena is about 24 miles from the nearest point which that railway would touch;—supposing you had good roads to that railway, do you think you would be able to convey your farm produce there? From this district I do not. You must take into consideration the position of the market. If our market is to be Coonamble it is a very insignificant one, for, I believe, three loads of produce from this district glut Coonamble. You might sell the next day, and you might not.
4131. Coonamble is only a limited market? Yes. If we had to convey our loading from here to a railway

railway siding that distance away it would give us a very poor show to compete with Dubbo. If we had A. Nicholson, to supply anywhere near Mudgee, Dubbo could put us out of it properly. If we had to forward on to Walgett, the carriage from here to there would exceed the carriage on the railway from Dubbo to that station, I believe. From what I can hear, the principal farmers of the Dubbo district are within a very short radius of Dubbo railway station or other sidings convenient to them, which makes a great difference between us and those who are competing against us.

5 July, 1899

4132. Mudgee, I suppose, would be your best market? Mudgee or Sydney, I think, is the best market for a product grown here—in fact, for all. All wool from this district goes to Mudgee. Dubbo is never thought of. Within the last two years there has been wheat sent to Dubbo for the simple reason that the road from here to Coonabarabran is so rough that a man with five horses cannot take what I have seen drawn by one horse in Victoria, and travel at the same time 24 miles a day. Victorians with one horse can draw twenty bags of wheat to a station 12 miles distant, and return the same day. On the point of population within a radius of 12 miles, there has been an increase of two to one during the last three years, for the simple reason, apparently, of Curban being thrown open for lease.

4133. From what I can gather you think the line from Dubbo to Coonamble would not be of much use to you? I do not.

4134. Suppose you had good roads, the same as you have in Victoria, what then? My object is to get rid of my produce. I would never think of growing wheat only with the run of this line from Mudgee to Coonamble. That is my view, unless things should alter greatly to what I expect. There is no doubt but that the wool I should grow would go to the railway, but I do not think it would be troubled with the grain. My brother-in-law, who is one of the oldest farmers here, made the remark to me only the other day, "When shall we get a market for wheat?"

4135. If he had a line constructed from Mudgee to Coonamble he would grow wheat? I fancy he would; I feel that I would.

4136. Is there any other information you would like to give? I think this Mudgee line would not only be an advantage to me individually, but would mean the addition of a good few townships within the vicinity of this district and further along the line. I believe that if the line is not constructed there never will be those places. I have been told that the Mudgee-Coonamble road is the oldest surveyed road, and as regards the opening up of country, I believe the Mudgee line will be more beneficial to New South Wales and to the interests of the Government than either of the other two lines.

4137. *Mr. Trickett.*] It would necessitate great extra cost? The cost at present might be a thing to be considered, but my point of consideration is the future. The expenditure will be laid down, and the Government will probably lay out a lot of money on whichever line it constructs. I have no hesitation in saying that this district, from Tooraweena to Coonamble or to Box Ridge, through back on to Mundooran, and into Mudgee, will never be properly opened up and worked as it should be, until there is a line running through there. The feeling of the public of this district is that, if this line does not come, the district will be shut out. We now have the Coonamble market more or less. This year is the first year I know of in which it has been touched by any other district.

4138. *Mr. Watson.*] Have you seen the land about Gilgandra? I cannot say that I have seen all the land; I have seen some of it.

4139. Do you think it is good land? The land close to Gilgandra is not equal to the land, I think, 8 or 10 miles on this side of Gilgandra—that is, on the eastern bank of the river. I think Mr. Johnson's place is on Uargon Creek. I think it is as good for wheat as any I have seen.

4140. Is this land about here, on which you and others are settled, as good as the land about Gilgandra North? Better than that close to Gilgandra. I do not say it is equal, taking it as a body, but from Bearbung down past Johnson's place for a few miles it is better. In my holding, for about a quarter of a mile, it is black-soil plain, and for a half a mile on the opposite side to my boundary fence it is all nice sandy land, not loose, but with a fair substance. It passes through my boundary into Mr. Beames'.

4141. You state that the land here is better than the land about Gilgandra, as far as you know? Yes.

4142. It has been stated in evidence by some of the farmers round Gilgandra that for some years past they have been carting wheat 48 miles to Dubbo, and making it pay;—I wish to know from you why, if they have worse land than you have here, and it pays them to cart wheat 48 miles, it would not pay you to cart wheat 48 miles with your better land? For the simple reason that the demand at Gilgandra for their flour is greater than our demand is here.

4143. How do you account for the fact, as stated by yourself, that it will not pay you to cart wheat from your superior land, 24 miles to a railway station, with a view to shipment to outer markets, while it has paid the people of Gilgandra, with poorer land, to cart wheat twice the distance to a railway, with a view to shipment to outer markets? From what I can see of it, it is their only living.

4144. They know how to farm;—do you think it would pay good farmers holding a reasonable area in this district, close to the foothills, to take wheat 24 miles by road to a railway station—that is, with the class of land and the rainfall you have here, and allowing that you have a decent road? I think that if Gilgandra men can make it pay at that distance at the same price, if that price stood at the same thing for us, we should do it with just as much ease as they can.

4145. Especially if you have only half the distance to cart? Yes.

4146. You think your land is sufficiently good to enable you to do that? I do.

4147. How far west from the foothills of the Warrumbungles—that is, towards the Castlereagh—does the good wheat-growing land extend—6, 10, or 15 miles? It breaks off. I have a patch; I suppose I can get 1,000 acres or more out of my holding. You cross the creek, and you get into my neighbour's place, where you meet with a different class of country.

4148. There is a strip of uniformly good country lying at the foot of the ranges? Yes.

4149. How wide is that strip, going west? It would exceed 10 miles.

4150. You would get good average land for 12 miles at least round towards Gilgandra;—after that there is a strip of poor land, is there not? You might not call it poor.

4151. How many miles does the ironstone gravelly country extend? From what I noticed when going to Gilgandra I think I got out of good country about 6 or 8 miles on this side of Gilgandra. How the river runs with that country, I do not know. From Tooraweena to Gilgandra, I believe you would get fair land until within about 6 miles of Gilgandra for wheat-growing—perhaps closer to that place—but I do not

say

- A. Nicholson. say you would get it in a body. From what I know of the country the land generally is not of the same nature all through.
- 5 July, 1899. 4152. You have not been to Curban? No.
4153. Near the Terrabile Creek some settlement leases have been open for some little time, and have not yet been taken up;—do you know that land between here and Terrabile Creek? No.
4154. *Mr. Trickett.*] Did I understand you to say that you do not believe in mixed farming—agriculture and sheep-farming combined? From my point of view it rests with the nature of the land you hold. It is not likely that I, having land, would let it lie idle. I believe if my holding of 4,500 acres was suitable for wheat-growing, and there was a market equal to the occasion, it would pay me, from what I know of wheat-growing, better to grow wheat than to grow wool in fair seasons.
4155. Therefore, I suppose you would continue your sheep-farming on the portion which is suitable for that purpose, and go in for agriculture on the other part? I believe I would go in for agriculture. I am not going to say definitely that I would.
4156. Suppose you had a railway to-morrow within a reasonable distance of your holding, would you gradually go in for wheat-growing on the portion which is suitable for that purpose, or would you go in on a large scale, looking upon it as a more profitable field of operations than for sheep-breeding, all over the run? I would go in for wheat-growing or dairy-farming. My own object is dairy-farming independent of a railway or not, but it would be more profitable to me or anyone else to take up that business if they could get places to send their produce to.
4157. You look upon sheep-growing as the least profitable of any use to which you can put your holding? I do not say it is the least profitable, for the reason that in one year it might pay me well with wheat, and another year I would be a long way out with wheat.
4158. That would be the same with the sheep? Yes.
4159. What was your object in coming here—was it to become a sheep-farmer? My first object was to be a blacksmith, and when I took up my land my sole object was sheep-farming and dairy-farming; that has been my object for years past.
4160. The land is well situated for sheep-grazing? Portions of it are well situated for that purpose.
4161. Some of the best, I suppose, in the Colony? I was told by the manager of the station that it was the best paddock on the station, and his opinion was based on the stock it carried from one year to another.
4162. You have black soil and red soil here;—do you, as a Victorian farmer, think that these soils are both suitable for wheat-growing? From my experience of wheat-growing, I do not.
4163. Which soil do you think is suitable? Classify the land. I think the land which is a little sandy is better for wheat-growing; taking the seasons one with another, I think it will be more successful than the heavier soil will be. In Victoria on the open plain, which is very stiff and heavy, if you get plenty of rain you might get 32 bushels to the acre; but if it should happen to be the other way, you might not take off a bushel to the acre.
4164. Therefore, the redder soil you think is the better of the two? That is my idea; but it is a matter of opinion, I believe. That is the land I intend to cultivate should I go in for wheat-growing.
4165. What is the capital value of the land you hold? £1 an acre.
4166. Have you made many improvements? I have ringbanked and fenced, and put in one tank and a well. I have cleared nearly 10 or 11 acres.
4167. Which you intend to plant? Yes, as soon as I can get it done.
4168. Have you any sheep on your holding? I should have about 1,900 now.
4169. I suppose you would increase the number as you prospered? Yes.
4170. It could carry a great deal more than that number? I expect the land to carry a sheep to the acre with the improvements.
4171. *Mr. Dick.*] You are a practical farmer, are you? As regards farming ground, it is little I have done; but I was with my brother-in-law for four years, and he made his living solely by farming.
4172. You understand something about wheat-farming, do you not? I do.
4173. You have had considerable experience among wheat-farmers? Yes.
4174. *Mr. Shepherd.*] You say you believe the line from Coonamble to Mudgee is the best of the three? I think so.
4175. Have you been along the line from Warren to Coonamble? No.
4176. Or along the line from Dubbo to Coonamble? Not right through.
4177. How do you come to the conclusion that the line from Mudgee to Coonamble is the best of the three? I base it on the experience of my past life in Victoria—that a trunk line extended has always proved more beneficial to the Colony than branch lines. I think that the Mudgee line extended would be our direct market to Sydney, and that if we sent our goods from here *via* Dubbo to Sydney there would be an expensive tariff or an extra rate charged which we could avoid if the line came past us here. There is a direct scope of country from here to Mudgee, and through to Coonamble, which would be opened out by the Mudgee line, but which would be left without railway communication if the other lines were run.
4178. You give this opinion, then, irrespective of the quality of land? I have no idea of what the other country is, only from what I have heard. I have been told that the country from Gilgandra to Dubbo is of a sandier nature, and from what I saw of the country from Tooraweena to Mudgee, I think the land, generally speaking, will grow a great amount of wheat.
4179. From Gilgandra to Dubbo you do not know anything about the country? No.
4180. And you have not been from Warren to Coonamble? No.

William Irvin, farmer, Tooraweena, sworn, and examined:—

- W. Irvin. 4181. *Mr. Dick.*] How long have you resided in the district? I was born here. I have been living on Tooraweena for twenty years.
- 5 July, 1899. 4182. Are you a grazier? I am a farmer. I have only a small holding. I have 1,800 acres now; but 640 acres is what I had until the last three months—I got 1,200 acres more.
4183. There are practically two rival routes to Coonamble, namely, one from Dubbo and the other from Mudgee? Yes.
4184. Do you know sufficient of the country along both routes to offer an opinion as to which is the better? I think so. I think the Mudgee line is the best line for agricultural purposes. The Dubbo line

W. Irvin:  
5 July, 1899.

line is not much for either grazing or agriculture to Gilgandra, but further down, for grazing purposes, it is good principally all the way; and for farming along the river, I should say for about a mile on each side, it is good.

4185. Where to? From Gilgandra to within about 15 miles of Coonamble—that is, with the exception of places which would not be fit.

4186. Would you say this—that the great body of the land to be served by the Dubbo-Coonamble railway is fit for agriculture? It is more fit for pastoral purposes I should think.

4187. How would you describe the character of the land from Tooraweena to Coonamble;—is the bulk of that land fit for agricultural purposes or pastoral purposes? For about 20 miles from Tooraweena to Coonamble it is all good for agriculture and for grazing too; and from that down there are only places which might be fit for agriculture, but it is all fit for grazing. There are what we call the red plains, which are good for growing wheat. The red plain grows wheat very well in a fair season, but the black plain will not grow wheat in any season. For about 20 miles from here towards Coonamble it is really good for anything; it would grow anything.

4188. Would you call it first-class agricultural land? Yes.

4189. For the first 20 miles from here, along the Mudgee-Coonamble line, you say it is good agricultural country;—how far to the west of the mountains does the tract of good land extend on an average? I should say fully 20 miles.

4190. Then, taking the country from Tooraweena to Mundooran, how would you describe that land? It is principally all good farming land, and very good grazing land too in places.

4191. And thence on to Mudgee, what is the character of the land? On towards Mudgee it is somewhat hilly in places, but it is fairly good country all through.

4192. Are we right in supposing that you describe the tract of land to be served by a line from Mudgee to Coonamble as being, from Mudgee up to 20 miles past Tooraweena in the direction of Coonamble, good agricultural land? Just so.

4193. *Mr. Trickett.*] Have you farmed your land for many years? For the last fifteen or sixteen years. Taking one year with another I averaged about 16 bushels of wheat to the acre. We have had as high as 40 bushels sometimes, we have had 20 bushels, 25 bushels, and down, I suppose, as low as 12 bushels. We have had from 16 to 20 bushels to the acre on an average.

4194. What have you done with your produce? I have sold it in Coonamble and Coonabarabran.

4195. In the local markets? Yes.

4196. Anywhere else? No; I have taken no wheat anywhere else, because we consume a bit with the carriers.

4197. Have you confined yourself to farming? I have some sheep. I have not farmed except a small area; there is no market close at hand, and I could not very well depend on the farming altogether.

4198. Has the district increased as a farming district? It has increased greatly everywhere within the last four or five years.

4199. I suppose the only way for the district to increase largely would be to provide the means of getting their produce to the metropolitan market? That is the only way. If there were means to get the produce to the general markets, I believe there would be thousands of acres under wheat, whereas now there are only a few hundred acres under wheat.

4200. Do you agree with Mr. Nicholson that the red soil is the most suitable for wheat-growing? For wheat-growing I believe it is the most suitable.

4201. What about the dark soil? On my farm I have red soil and dark soil. In the dark soil I have had a crop of corn for three years; it grows wheat very well, but it is rather strong for wheat when it is first ploughed. It grows corn and potatoes better than it grows wheat.

4202. Is it more difficult to till? No; it is about the same on my farm, but some of the farmers round here say it is more difficult.

4203. Would the same rainfall suit both classes of soil? Yes; I do not see that it makes any difference.

4204. Could a farmer rely upon getting a crop in two years out of three here? Yes, he could.

4205. Is that a fair average? That would be a fair average crop.

4206. Supposing you had a regular market, what do you think would be the lowest price you could afford to take for your wheat? I think it would pay to sell at 2s. on the ground. If a man grew in large quantities it would pay him to sell for less, at 1s. 6d., if there was a large demand.

4207. Is the wheat healthy which is grown here? Yes; there is very little rust or anything of that sort.

4208. *Mr. Watson.*] Do you know the country between Tooraweena and Curban? I know all the country; I have been across there.

4209. Do you know any settlement leases which have been open for some time between here and Curban? There is some country in the scrubs which has not been taken up.

4210. What sort of country is it? It is very scrubby country; it would be good country if it were rung and cleared.

4211. Supposing you were told that it is ridgy country containing clayey soil and ironbark gravel, would you think that was a fair description of it? No; I think it is a sandy flat country, though in parts you may meet with small hills.

4212. Do you know what timber is growing on that land which is not taken up? Forest oak and pine, and in some parts budda and ironbark. It is principally forest oak and pine.

4213. There is not much ironbark there? No; there is very little ironbark between here and Curban. There is a little not far out from Curban, but only in small strips.

4214. Do you know what capital value is placed on those settlement leases which are lying open there? No.

4215. We were told that it is 5s. an acre? That may be. Between Tooraweena and Gilgandra there is a strip of country which runs from Bearbung Creek on to opposite Curban. I suppose it is 15 miles long and 6 or 7 miles wide. Taking it all through it is very scrubby and bad country.

4216. How far away from the river at Curban does the good land extend? I should say a mile would be about the outside of it.

4217. Do you think the strip of good land on the eastern bank of the river is not a mile in extent? No, not about Curban.

4218. Then there is a strip of bad land, you say, 6 or 7 miles wide which is poor country? I should call it poor country. In places it is not poor; but taking it all through it is poor country. 4219.

- W. Irvin. 4219. And the balance coming on towards Tooraweena you say is good country? It is all fairly good. There are patches scrubby and bad, as there are everywhere; but, taking it all through, I would call it good country.
- 5 July, 1899. 4220. How far have you had to cart your wheat hitherto? Fifty miles to Coonabarabran, and 52 miles to Coonamble.
4221. What prices have you been averaging at those two points? We have been getting 3s., and we have got as high as 4s. 6d. and 5s.
4222. Did it pay you to take your wheat that distance and sell it at 3s.? Yes, I used to draw the wheat myself, and it paid me.
4223. Do you think it would pay you to cart wheat 24 miles on a good road and sell it at the general price which obtained in the open market? I think a man would make it pay; it would pay better than drawing it to Coonabarabran.
4224. You do not think 24 miles of carriage on a road would handicap you altogether out of the competition? No, not on a good road.
4225. With fair roads to the railway station you think that 24 miles road-carriage would not put people on either side out of the competition? I do not.
4226. That is, if the line were constructed from Mudgee to Coonamble, you think people who have good land about Curban, or thereabouts along the Castlereagh, could bring their produce to the railway? Certainly, I do.
4227. That is, with a good road? Yes.
4228. And, *vice versa*, the other way about? Yes, either way.
4229. Do you know the route which the surveyed line from Mudgee to Coonamble takes? I have seen the pegs, and been along a good part of the line; I know it pretty well.
4230. You know how the Warrumbungles generally run? Yes.
4231. Could you say how far, on an average, the surveyed line would be from the foot-hills of the Warrumbungles? It would average, I should say, fully 12 miles. Tooraweena is about the nearest point, and it is about 7 miles from here to the line.
4232. And the country round the foot-hills, speaking generally, is good? It is good round the foot-hills; it is about the best.

Henry Irvin, farmer, near Tooraweena, sworn, and examined:—

- II. Irvin. 4233. *Chairman.* What are you? I am a farmer, principally, residing within half a mile of Tooraweena. My holding consists of 650 acres, and I have been living here about fifteen years.
- 5 July, 1899. 4234. How much land have you under cultivation? About 58 acres. I have between 300 and 400 sheep.
4235. Can you make a living off that area of land? Yes, I make my living off it, principally.
4236. What is your market? Coonabarabran is the principal market for the wheat. We sell locally at times, and send it to Mudgee.
4237. Do you find it pays you fairly well? Yes.
4238. It would pay you better if you had only 24 miles to take it? Yes.
4239. What is the distance from this place to Coonamble? Fifty-two miles.
4240. I should imagine that, in wet weather, the roads are very bad? They are very bad, almost impassable with a heavy load, in wet weather.
4241. Are you acquainted with the country between Mudgee and Coonamble? Not very well.
4242. What portion of that country are you well acquainted with? From Tooraweena to Coonamble, or from Mundooran to Coonamble.
4243. Starting from Tooraweena, how would you describe that country? From here to Coonamble it is suitable for both grazing and agriculture.
4244. For what distance on either side of the railway would you consider the land to be good, say, for the first 10 miles? For 10 miles on each side of the line it is good for agriculture.
4245. What would the next 10 miles of country be like? It is good for either agriculture or grazing.
4246. And from that point, 20 miles from here, to Coonamble, how would you describe the country? It is all fair land. It cannot be beaten much for grazing purposes. I think it ought to be very fair for agriculture.
4247. To what extent do these plains go on either side of the surveyed line? They run on to the Castlereagh on the western side, and to the foot of the hills on the eastern side. The distance would be 10 miles on the western side, and between 20 and 30 miles on the eastern side.
4248. You think the whole of these plains are good for pastoral purposes? Yes.
4249. Do you ever find any difficulty in getting carriage for your produce, or do you take it yourself? I have to pay for carriage, as a rule.
4250. What rate do you pay from Tooraweena to Coonamble? I have not sent any produce from here to Coonamble. The rate is about 1s. per cwt. to Coonamble and 9d. a bushel to Coonabarabran. The rate for wool is about 3s. per cwt. to Mudgee.
4251. What effect do you think the opening of a railway would have upon the whole district;—would it encourage population? Certainly.
4252. Do you think it will have the effect of bringing a larger area under cultivation? It is certain to do that.
4253. Do you know if there is any demand here for pastoral or agricultural areas? There would be a demand if the land were available.
4254. Do you think a railway would really have the effect of increasing the population and enlarging the area under cultivation? Yes.
4255. Do you know the country between Tooraweena and Mudgee? Not very well.
4256. Do you know the country from Tooraweena to Cobborah? Fairly well.
4257. How would you describe that country? It is good country for grazing or agriculture. It is more scrubby than the land between here and Coonamble would be; it would not be hardly so suitable for grazing, but I think it is equal for cultivation.
4258. The same width of good land? Yes.
4259. Do you know what the country is like from Cobborah to Gulgong? From what I have heard I think it is about the same description of land.
- 4260.

4260. Did you hear what the other witnesses said? Yes.

4261. Do you generally corroborate what they say? Yes, pretty well. The land right from the line to Gulargambone and Curban is all suitable for cultivation. Right from the foot of the Warrumbungles the land is all suitable for agriculture. On the opposite side of the river it is black clayey soil, or else low sandhills.

4262. Have you any other information which you think we ought to have? I think not. Certainly this Mudgee-Coonamble line means less railway freight for any man who has to send produce to the Sydney market; it means less railway carriage by Mudgee than it does by Dubbo.

4263. That is, the distance is less? It is a great deal less.

4264. The cost of the Mudgee line is about £1,000 a mile more than the cost of the Dubbo line;—do you not think you would have to pay a higher rate on the Mudgee line than you would have to pay on the Dubbo line? I do not know. I could not say anything on that point.

4265. Generally speaking, your reason for preferring the Mudgee connection is that it is a shorter route to Sydney? Yes.

4266. And you think Sydney would be your only market for your surplus products? Yes; the only substantial market we could realise in.

4267. *Mr. Watson.*] Do you think it would be of any value to the farmers here to have a chance of sending their produce Werris Creek way, or by a short cut to the Southern line—for instance, to send fat stock towards Melbourne by the Blayney-Harden connection and the Southern line, or, on the other hand, towards the western market at Bourke; do you think they would occasionally take advantage of either of those markets in addition to the Sydney market if they had a connection with the Western Railway? I could not say whether they would or not. The question is, would it be a market they could rely on. No doubt they would take advantage of that market when they could get rid of their produce.

4268. Do you think the possibility of their reaching the other two markets occasionally would be any compensation to the people of this district for the extra 37 miles of railway carriage involved in going *via* Dubbo? Not much, I think.

4269. You do not think it would be a sufficiently large matter to weigh very much? No.

William Thomas Hitchen, hotelkeeper, Tooraweena, sworn, and examined:—

4270. *Chairman.*] You are a hotelkeeper, residing at Tooraweena? Yes; I have been residing in the district for about eighteen years.

4271. *Mr. Trickett.*] You are well acquainted, I understand, with the district right from Tooraweena to the Warren line? Yes.

4272. Starting first with the Mudgee line, what is the character of the country it passes through? I have been hawking with traps for a considerable number of years in the district. I was mostly stationed at Gilgandra, where my home was, so I know a good deal about the country. I think for about 15 miles on this side of Coonamble the country would be more suitable for grazing than agriculture; but from a point about 15 miles from Coonamble to Tooraweena, I think the whole of the country would be splendid for agriculture. Of course, there are small patches which would not be suitable; but, taking it as a whole, I think it would be very good for agriculture, from the mountains right on to the Castlereagh.

4273. It is largely composed of red soil? It is mostly red soil the whole of the way. In some places it is all of a red sandy nature. It is terribly timbered. The thickly-timbered country is mostly good for agricultural purposes, where it is not good for grazing, and the most of the country on the other side of the Castlereagh, for a considerable distance, is nearly all black soil, which will not grow crops up this part; it is only good for grazing. There are small strips down the bank of the Castlereagh, on the western side, which are very good, but beyond that it is mostly myall country—plain country—and would not be good for agriculture at all.

4274. You say black soil will not grow crops;—is that statement made from your own observations during the time you have been in the district? The crops in the black soil grow for a little while, and they seem to perish off with the least thing, but in the sandy country they all grow much better. In this district they have always done so. There are some very large holdings between Tooraweena and the Castlereagh; it is terribly scrubby, but it is splendid country for agricultural purposes. I can mention two big holders, between Tooraweena and the Castlereagh, who came from the Victorian side, and said if there was a market they would put land all through the country under agriculture; now they have no market.

4275. How would that strip of country be best served—by a railway from Mudgee to Coonamble? This line would be running right through about the centre of the country. It has nothing to serve on the other side of the Castlereagh, as far as agriculture goes.

4276. Will you describe the character of the country from Tooraweena to Cobborah? It is mostly all red, timbered country.

4277. Suitable for agriculture or grazing? For agriculture, mostly, if they had any way to get rid of their produce.

4278. You have had something to do with finding a market in Coonamble for the wheat of the farmers here, have you not? I opened a produce store in Coonamble this year.

4279. Was it the means of their being able to dispose of their wheat? It was.

4280. Were they able to cart their wheat 52 miles, and sell it profitably there? I bought at the door, and carted it down, or got teams to cart it down.

4281. Did you get a profit out of it? I got a reasonable profit out of it.

4282. Seeing that there is no mill at Coonamble, what did they do with the wheat there? They fed their horses on it during the dry season, as it was cheaper than corn.

4283. Have you thought out the question of how far it would pay a farmer to cart his wheat? I have heard selectors round about say that if there was a market or a train from Mudgee to Coonamble they would go in largely for wheat and other kinds of produce.

4284. With a view of sending their stuff to the central market? Certainly.

4285. Between the surveyed line from Mudgee and the mountains on the east, how would you describe that country? It is all principally red country.

4286. Is there a large extent of it? There is a good extent of it. We are just about the end of the mountains here. It crops off and goes towards the Coonabarabran district.

4287.

H. Irvin.

5 July, 1899.

W. T.  
Hitchen.

5 July, 1899.

W. T.  
Hitchen.  
5 July, 1899.

4287. Do you agree with the last witness as to the extent of that country—that it is about 6 miles wide at this end, and increases to about 12 miles further down? At this end it is the extent of the country, and it widens out as it goes north.

4288. Is it all a good character of country? It is a splendid character of country. Some of the biggest crops ever grown in the district have been grown at the far end of these ranges—the biggest yield of wheat at all events. I believe Comber got 42 bushels to the acre last year at the far end. That is about 20 miles north of Tooraweena.

4289. You seem to speak rather disparagingly of the land between Gilgandra and Dubbo;—our observation, and also the evidence we have taken, is that agriculture is going on very considerably there, especially wheat-growing? It is about Gilgandra and the banks of the river, but not on the western side. On that side it is all myall plains which will not grow crops, but about the banks of the river it is certainly very good, and about Gilgandra. The myall plain starts about 8 miles below Gilgandra, and then it is a strip of myall country right through to Coonamble, and as far west as you like to go, which is not suitable for wheat; but from the Castlereagh to the Warrumbungles the whole of the land is very suitable for farming, at all events. It is only timbered country which wants clearing. It is mostly red loamy ground. There may be patches a little bit stony. There is not a hill between the whole lot.

4290. Do you come in contact with many people who want to take up land in this locality? Yes; there are a number of people waiting now for the Tundaburine holding and other holdings between here and Coonamble to be thrown open.

4291. And they will take that land up, railway or no railway? Yes.

4292. The difference will be that if there is no probability of a railway they will go in for sheep farming? They will have to.

4293. Otherwise, do they say they will go in for agriculture? There are people on the land now who would go in largely for agriculture if there was direct railway communication; otherwise they will not.

4294. Do these people, you think, understand that it would be a very expensive line from Mudgee to Coonamble, and that probably the rates of carriage would be rather higher than usual? They are quite well aware that it would be a more expensive line to construct, but they all say that it would be the most direct route to get their stuff away, and the cheapest line.

4295. But supposing there was a line from Coonamble to Dubbo they would not have so very far to convey their wheat, would they? No.

4296. Would not that help them a bit—if they had that line, with a good road to a railway station about 20 or 24 miles off? It would certainly help them.

4297. You think it would not be as much benefit as if they had it direct? Nothing like it.

4298. Supposing the question was to assume this shape—either to have no railway at all or to have a railway from Dubbo to Coonamble, do you think they would sooner say, “We will have no railway at all”? They would rather have a railway if it were to come out of Queensland, than have no railway at all.

4299. They do not care where it comes from as long as they get it? They want the most direct route they can get for themselves.

4300. Is this the idea—that if they cannot get the best route they will take the best they can get? That is mostly the way they all talk.

4301. Do you know anything of the country out in the direction of Coonabarabran? Pretty well.

4302. What is it like? From Tooraweena to Coonabarabran, to go direct, it is mostly very rough country.

4303. Starting from Mudgee, and then coming along this line, and going out in that direction, is it all rough country? Not by any means. The rough country does not extend towards Mudgee more than 10 miles south of Tooraweena.

4304. Taking a line from Mudgee up towards Coonabarabran, would that help the people about here? I do not think it would help the people up here.

4305. Coming a little in this direction, and following up the Yarragrin Creek, and then going direct over towards Coonabarabran, would that do any good? If there was a line to come as far north as Yarragrin, and then go towards Coonabarabran, it would benefit the people just here, but it would not benefit the people any further out.

4306. If the railway came to Mendooran, it is not very far from there to Coonabarabran? It would serve Coonabarabran well. It would serve both Mendooran and Coonabarabran. It would come through this district. It is not far to Gilgandra, and Gulargambone is only 30 miles from here, and it is coming pretty close to Baradine. The line would not be any more than 30 miles from Coonabarabran, coming direct from Mudgee here. That is all a farming district.

4307. *Mr. Dick.*] Do you think a line from Mudgee to Coonamble along the proposed route would serve stock-owners along the banks of the Castlereagh? I should think so, splendidly.

4308. I think you stated that the area of good agricultural country, about here at any rate, is practically bounded on the one side by the Warrumbungles, and on the other by the Castlereagh? Yes.

4309. With the exception of a strip from a mile to two miles wide on the west bank of the Castlereagh? That is right.

4310. You also stated, I think, that beyond that strip towards the west the land is not fit for agriculture? It is mostly myall country, which is not fit for agriculture.

4311. *Mr. Watson.*] You say a railway from Mudgee to Coonamble would benefit the people up to the Castlereagh splendidly? I think so.

4312. Supposing you reverse the position,—would a railway along the Castlereagh serve the people from this district? There would be no people on the other side, as far as agriculture is concerned. It is only on one side the agricultural land is.

4313. Would it serve the people on this side of the river? It would serve them to a certain extent.

4314. Would it serve them as well as they would be served by a line coming near here? This would serve them the best I should think. It is the most direct route. It would be shorter for haulage.

4315. Assuming that the people on the Castlereagh would be able to use a line coming past here, would it be possible that the reversed position would suit the people here? Not so well.

4316. Still they could take advantage of it? It would suit them to an extent; it would be better than none. The Mudgee line would be going right through the centre of an agricultural district. I think it would open up splendid land for agricultural purposes which otherwise would not be opened up.

4317. Is there any other statement you would like to make? No.

THURSDAY, 6 JULY, 1899.

[The Committee met at the "Mundooran Hotel," Mundooran, at 7:30 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Christopher Baldwin Manusu, storekeeper, Mundooran, sworn, and examined:—

4318. *Chairman.*] What are you? I am a storekeeper in Mundooran. I have been here for twenty-four years. C. B. Manusu.

4319. *Mr. Trickett.*] You know the district pretty well? Yes. 6 July, 1899.

4320. Do you know the surveyed line for a railway between Mundooran and Tooraweena? I know a good part of it—to within a few miles of Tooraweena.

4321. Starting at Tooraweena and coming this way, will you describe the country? The farthest I have been is down through Bearbung.

4322. You know the country starting about 9 miles on this side of Tooraweena? Yes.

4323. What description of country does the surveyed line pass through between there and East Breeelong? It consists mostly of ironbark, box, and apple-tree.

4324. Is that good country? In parts. On the flats it is really good agricultural country; but the other is not much for grazing purposes.

4325. Is the bulk of it suitable for agriculture, or only parts of it? Only parts of it.

4326. Is it red-soil country? The majority of it is red soil.

4327. Do you regard red soil as better than dark soil for agriculture? Far better.

4328. Does that extend for any distance on the west side of the line? It extends right through to Mundooran.

4329. We want you now to describe a patch on the other side of the line? On the eastern side it is different country altogether. It is myall, and is more suitable for grazing purposes. There are plenty of patches fit for agriculture; but more suitable for grazing.

4330. Is that strip of country mostly alienated? No; there are only about ten settlers on it.

4331. Is the other used for grazing purposes? Yes.

4332. What is about the average size of the selectors' holdings? I cannot tell you.

4333. Can you tell us if they are running sheep, or growing crops? Each selector does a little farming, and has a few sheep. They grow a little wool.

4334. As regards the growing properties of that soil, is it suitable? Yes; it is a good wheat country.

4335. Do you mean that most of that country is good wheat country? As I told you before, the greater part of it is rough country, but there is a lot which, no doubt, could be put under cultivation if they had any outlet.

4336. Is that country in big blocks, or is it scattered about in different parts? It is scattered about in patches.

4337. Going down towards Breeelong proper, is not there a large tract of very poor country? It is between the Castlereagh and the surveyed line. It is rather poor country; it is only suitable for timber.

4338. Coming on towards Mundooran, there is a considerable tract of country between the surveyed line and Wallumburrawang Creek;—what is the character of that country? Ironbark and apple-tree are the greatest features of it. Of course, there are plenty of good patches which are fit for agriculture. A man could get 100 or 200 acres here and there of really good agricultural country.

4339. But that is not as good as what you have recently been describing? No.

4340. What is the character of the soil in that ironbark and apple-tree country you refer to? The apple-tree country, when you get on to any of the creeks, is really good, rich, chocolate soil.

4341. *Mr. Watson.*] What sort of soil is it on the ridges? Spewy.

4342. *Mr. Trickett.*] Is it not stony? It is not very stony—in fact, it is rather free from stone in the ironbark ridges. It is a sort of spewy country.

4343. *Mr. Watson.*] A clayey soil? No; it is of a rather soft, spewy nature. It gets very boggy in wet weather.

4344. Whitish? It is a sort of grey.

4345. *Mr. Trickett.*] Would you describe that country, taking it as a whole, as good agricultural country, or as inferior country? The flats I would describe as good agricultural country, but the ironbark portion I would describe as inferior country.

4346. Which class of country preponderates in that portion you have just referred to—the ironbark inferior country, or the good agricultural country? There is more inferior certainly.

4347. I want you now to describe the character of the country between the railway line and the mountain side—that is, opposite the block which you have just described, on the western side, as being inferior. Starting from Wallumburrawang, and coming towards Yarragrinn, a distance of 12 miles, and 15 miles east from the line, will you describe the character of the country? It is first-class country for grazing purposes. In many places it is good for agriculture—not large holdings, but tip-top. No doubt it is really good for grazing purposes.

4348. *Mr. Watson.*] I suppose it is on the creeks you will get the agricultural land? Yes; in many places you could get good patches here and there. You could get, perhaps, 100, 250, or 300 acres here and there.

4349. *Mr. Trickett.*] As regards the land which would not be used for agricultural purposes, can you tell us what its carrying capacity would be for sheep? I believe the majority of the land would carry a sheep to the acre.

4350. When it is ringbarked and improved? No; I believe the majority of it would carry a sheep to the acre now.

4351. In its natural state? Yes.

4352.

- C. B. Manusu. 4352. *Mr. Watson.*] Is it improved at present ;—is a lot of it ringbarked ? Very little of it. Of course, a lot of the country included in the settlement leases has been ringbarked.
- 6 July, 1899. 4353. *Mr. Trickett.*] Starting from Yarragrin, and taking an easterly circuit towards the Castlereagh, where it bends to the north ;—at Cullabullo, what is the character of the country ? It is all good country.
4354. Going westerly again along the Castlereagh to Mundooran, what is the country like ? That is good country—as good as you can find in New South Wales for grazing purposes. The bulk of it is good for agricultural purposes.
4355. *Chairman.*] Thirty per cent. ? Twenty-five per cent. of that country is good for agriculture. If a man can depend on the season a greater part of that country is good for agriculture, because all the black country with good seasons will grow anything.
4356. *Mr. Watson.*] You want a very drooping season for black country ? Yes.
4357. *Chairman.*] How often do you get a season of that sort out here ? I am sorry to say very rarely.
4358. *Mr. Watson.*] You would not take up black country yourself for agriculture, as you would not get wet seasons frequently enough to make it of use ? No.
4359. *Mr. Trickett.*] You have described that outer circle of country ; is not the inner portion of that circle to a considerable extent bad country ; taking a line from Cullabullo and going towards Bourbeen there is a block of inferior country to the extent of about 6,000 acres ;—is any part of that block fit for agriculture, do you think ? Plenty of it if cleared. It is partly red and partly dark soil.
4360. You know the coach road from 12 miles this side of Tooraweena on to Mundooran ? Yes.
4361. Starting at the same point, and going along the coach road, we come across a great deal of ridgy, stony country, which would be utterly useless for agriculture, and is so covered with stones that it would be hardly fit for grazing ; is there much of that character of country away from the road ? There is not, because the road is generally picked out so as to travel on the stony country, and to avoid the black soil.
4362. Therefore, that country which the coach road travels through is not, in your opinion, to be taken in any way as a guide to the character of the country on either side ? No.
4363. Does that rough country extend far on either side of the coach road ? No, only in patches ; it runs in table-lands. Of course along the ridges on the table-land it is always stony. They generally traverse this part because it is stony ; it is better than travelling across black soil.
4364. Starting on the western side, will you describe the character of the country between Mundooran and Cobborah ? From Mundooran to Cobborah on the western side there is no doubt that the majority of that country is really good. For the first 11 miles on the western side the country is really good. Most of it is good open box country fit for agriculture or grazing.
4365. Does that extend to a good distance on the western side—10 or 15 miles ? No ; in a straight line about 8 miles.
4366. After that you get into a little bit of inferior country ? It is not as good as the country for the first 11 miles.
4367. On the eastern side, what is the country like ? You get some very good country for about 10 or 11 miles, and it has a width of about 6 miles.
4368. And then wide of that you get into inferior country ? No ; you get into some splendid country.
4369. I mean adjoining that strip of very good country, which you say is, six miles wide, do you not get into bad country ? A strip of rather poor country, but not very wide. Of course, once you get on to the Talbragar you get into some magnificent country.
4370. *Mr. Watson.*] That is towards Cobborah ? Up the Talbragar, from Cobborah, it is first-class country.
4371. *Mr. Trickett.*] Then going along through that distance of 11 miles into Cobborah, on both sides of the line is it good country ? On the western side it is fairly good ; but on the eastern side it is just medium, not too good.
4372. Will you just tell us the character of it ? It is mostly ironbark, pine, and apple-tree.
4373. Is much of this country likely to be thrown open soon, or is it mostly under long leases or alienated land ? I think it is likely to be thrown open. There are very few selectors on it, for the simple reason that they have no outlet for their produce that I can see.
4374. Is that the general feeling here—that people would go in for agriculture with a better outlet for their products ? Yes ; they have no outlet. You could buy hundreds of bushels of wheat round here for 1s. 6d. a bushel. I bought a lot the other day. The Mudgee price was 2s. 6d. ; you have to pay 2s. 3d. a cwt. to send to Mudgee, and it takes 2 bushels to make a cwt., so that the freight would be 1s. 1½d. a bushel. You can get wheat here for 2s. 6d. This man was offering his wheat for 2s. 6d. We started a flour-mill, and it was working for a couple of seasons ; I am part proprietor of it now. We could not do anything with the offal. We were selling bran and pollard for 30s. a ton. It would not pay a man to cart it from here to Mudgee, or any place where there was a consumption.
4375. How far have any persons who have grown wheat carted their stuff from Mundooran ? That which I sent away to Mudgee the other day was carted over 80 miles. It is 75 miles by road to Mudgee, and I had to bring it 5 miles up to Mundooran, and had to pay a carrier to cart it in.
4376. Was there any profit in it at the end of the journey ? No ; you could not expect much profit in it to sell at 2s. 6d.
4377. There was nothing in it at all ? No ; a man cannot afford to grow wheat and sell it for 1s. 3½d. a bushel.
4378. Have you ever heard the growers say how far it would suit them to cart wheat to a railway so as to have the advantage of getting to a central market ? No ; I have never heard them pass a remark ; but, I think, if a man is growing the wheat in this part of the country, and carts it about 30 or 40 miles, it is a fair thing.
4379. With a decent road, you think it would pay a man to cart his wheat 30 or 40 miles ? Yes. They all feel inclined to go in here for wheat-growing, but there is no outlet for it.
4380. You have been here many years ;—have you noticed a tendency for the population to increase by new settlers coming in ? Yes. When I came here twenty-four years ago there were only three houses in Mundooran—the hotel, the police barracks, and the post office or blacksmith's shop.
4381. The population has increased in the direction of sheep-farming ? Greatly.
4382. In small holdings ? Yes. Twenty-four years ago, I think, my father was very nearly the first selector on the Castlereagh.

4383. What is your rate of carriage for goods from Mundooran to Mudgee? At the present time from 2s. 3d. to 2s. 6d. a hundredweight. C.B. Manusu.
4384. Is that for a big load? It does not signify if you take 20 tons. 6 July, 1899.
4385. Is it a good sound road, on which teams can travel in all weathers? It is a tip-top road. In Mudgee you can get chaff from £2 5s. to £2 10s. Out here we have to pay £4 10s. and £5 a ton for it. A man from Tooraweena offered me £5 a ton to give him 30 cwt. I said, "No; but if you go in towards Cobborah you can get it." You could sell chaff in Coonamble and make a good thing out of it at £4 a ton if you had a railway, but I do not believe you could buy it there now for £9 or £10 a ton.
4386. For hay and chaff you think there would be a good outward trade in the direction of Coonamble and Warren? I have not the slightest doubt that if there had been a railway when we were working the flourmill and sawmill, we could have done a good thing with timber, bran, and pollard.
4387. All along the line the evidence has been that with a railway they will be able to grow wheat in galore and have their wheaten hay? Perhaps they may. There is no doubt that some of them can, but anywhere in a black soil country they cannot depend on the seasons. If they get a good season they can grow almost anything. Anywhere in the red soil, chocolate country, if they get a medium season they can grow a fair crop; but in the black soil country you can only depend on a good season.
4388. You consider that you have more of that useful chocolate soil about here than they have out Coonamble way? Certainly.
4389. *Chairman.*] Do you know what the country is like on the other side of the Castlereagh, between Dubbo and Gilgandra? It is about the most miserable starved hungry country that you could see between Dubbo and Gilgandra; it would hardly feed a bandicoot.
4390. How far would that country extend? I have travelled it on horseback, with a vehicle, and with stock. I have travelled along that line for several years, and I never could find anything for a beast to eat from Dubbo to Gilgandra. Five miles out from Dubbo it is all freehold property.
4391. Would that be along the stock route or along the road? Go as far as you like from Gilgandra out towards the Castlereagh you would not get anything to feed a bandicoot.
4392. Taking a line from Gilgandra to Dubbo, and then going west of the line, do you know the country? You get some very good country. When you get over to the Marthaguy you get very good country, but on this side it is bad.
4393. On the other side of the Coonamble road, going from Dubbo, it is pretty good country? Yes, Once you get a few miles off the road. Once you get over to the Marthaguy and the Merri Merri it is good.
4394. Do you know Branston, where Mr. Brown lives? Yes; it is fairly good country.
4395. *Mr. Trickett.*] I suppose you are aware that this Mudgee line would be a pretty expensive line to construct? Yes.
4396. It is pretty broken country which it traverses? On the last survey I think they got a very fair route from Mundooran to Coonamble. On the first survey they ran too far up into the Warrumbungles or the Dilly Dilly Mountains.
4397. The last survey has resulted in a much improved route? Yes; Mr. Marshall was the last man who surveyed the line. We directed them to go down from the Bearbung Creek, and go out through Bearbung, and they found a really good line that way, so they reported, I believe.
4398. *Mr. Shepherd.*] Outside these ridges you spoke of, is the good land comparatively level? It is not comparatively level, but it is good open country.
4399. What is the freight from Mundooran to Coonamble? It all depends upon the season. Sometimes if there is plenty of grass in Coonamble they will carry it from there to here almost for nothing, but as it is now you could hardly get them to go there for love or money.
4400. Do you never attempt to send wheat to market from here? They have to send it to either Mudgee or Coonabarabran, because there is no mill here. We had a mill working here, but it is a stone mill. If you had a roller mill here you would never get rid of the offal—flour, pollard, and bran.
4401. What is the general character of the country between Mundooran and Mudgee? Once you get on to the Talbragar, a distance of about 20 miles, there is some splendid agricultural country all the way through.
4402. What is the character of the country between Mundooran and the Talbragar? Going from here through Cobborah to Gulgong or Mudgee you see the worst part of the country; but going to Cobborah and round the Talbragar up to Redbank, and from there through Tallewang and Gulgong on to Mudgee, there is some splendid country; it is all first-class agricultural country.

## FRIDAY, 7 JULY, 1899.

[The Committee met at the "Commercial Hotel," Cobborah, at 2:30 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. WILLIAM JOSEPH TRICKETT.WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Howard Speight, sheep-overseer, near Coonamble, sworn, and examined:—

4403. *Chairman.*] What are you? I am a sheep-overseer, residing 30 miles north of Cooramble.
4404. Your occupation, I suppose, enables you to see a good deal of the country? Yes; I have seen most of the country here. H. Speight.  
7 July, 1899.
4405. Do you know the country between Dubbo and Coonamble? I do; but not well until I get to the other side of Gilgandra. The country between Gilgandra and Dubbo I do not know well except along the road.
4406. You know the country between Coonamble and Cobborah? I do.

- H. Speight.  
7 July, 1899.
4407. Will you describe generally the nature of the country from Gilgandra to Coonamble, and then from Coonamble down on this surveyed line towards Tooraweena ;—which would you consider to be the better land? For agricultural purposes, from Coonamble to Tooraweena?
4408. And for pastoral purposes? I would say the land from Coonamble to Tooraweena is the better land for pastoral purposes.
4409. For agricultural purposes, how far on each side of this Mudgee line would you consider the land extended between Tooraweena and Coonamble—the 20-mile limit does not include all the good land? Practically speaking, the whole of the land to the east of the surveyed line between Tooraweena and Coonamble is good.
4410. I am asking you with reference to the suitability of the land for agricultural purposes? I would not include all the land from Tooraweena to Coonamble as good agricultural land.
4411. What proportion do you think would be good agricultural land within a 20-mile limit ;—have you been farming at all? No.
4412. You could not say how far it would pay a man to carry wheat to a railway? I know they carry wheat here 74 miles at 2s. 4d., and then they cleared 9d. out of it.
4413. What proportion would you consider suitable for wheat-growing on the eastern side of the surveyed line from Coonamble to Tooraweena? That is hard to estimate. I can give you clearer and better evidence as to the country from Tooraweena to Mudgee, because I have been over every acre of it.
4414. You could not say what proportion of the land is suitable for agriculture between Tooraweena and Coonamble? I could not. The work I have been at within the last seven or eight months has been strictly in this district.
4415. Can you describe the country from Mundooran to Mudgee? Yes.
4416. Will you kindly give the Committee your opinion as to that part of the country? It would be really hard to put down a hard and fast percentage.
4417. Approximately, what is it? I should say that at least two-thirds of the country is agricultural land between Mundooran and Mudgee on either side of the line.
4418. Do you know what area of Crown lands is untenanted at the present time? I could not swear to the whole of it. I do not think lately there has been very much Crown land untenanted. I think nearly all has been used for the last six or seven months.
4419. Are there many acres of Crown land? I get my figures from the proper place, and I should say that in the Cobborah district the proportion is about 49,000 acres of freehold land to 192,000 acres of Crown lands.
4420. The pastoral leases are about to fall in in this district? I think so.
4421. Do you think if these leasehold areas are thrown open they would be eagerly taken up? Yes.
4422. By a good class of settlers? Yes; by farming settlers.
4423. Would it be taken up by new comers, or by men who were adding to their holdings? As soon as ever people outside this district know what sort of district it is they will come here.
4424. The land which at one time in this district was considered unsuitable for agriculture has turned out to be the best, has it not? Yes.
4425. And you think there will be a great increase in population when the land is thrown open? I am sure there will if they are given some facilities. Give them a railway, and then an increase must come.
4426. Taking the pastoral country along this line of railway, what do you think is its carrying capacity? If that country is ringbarked, I believe it will carry a sheep to the acre.
4427. Have you any idea what the yield of wheat is? Last year it was 19 bushels to the acre; it has never gone below 15 bushels to the acre, I believe, except in one year when it was damaged by flood.
4428. Where is it principally grown ;—along the river flats? No.
4429. The yield of wheat, you say, has not been less than 15 bushels to the acre ;—there has been no absolute failure then? I believe there has been one failure, from what I can hear. I have seen the returns for the last seven or eight years, and there has been no failure.
4430. Will any of the country be suitable for dairying? Yes.
4431. Has it been tried? About Mudgee.
4432. Has it been tried out this way? They would have no market out this way.
4433. Before you get factories, you generally try and make a bit of butter for yourselves? They can make the butter for themselves; but there has been no inducement offered to them to make any quantity because they have no market.
4434. Going on towards Mudgee, will you describe the character of the country? The land, except on the ridges, is all good agricultural land. This is a peculiar country. You run along an ironbark ridge, and though it is all similar country within a mile of you, there is beautiful agricultural land.
4435. What proportion do the ridges bear to the rest of the country? I should say the proportion of land available for agriculture is nearly two-thirds of the acreage.
4436. What is the character of the country from Cobborah to Coonabarabran? The Caigan country is good country. I have seen this country when travelling from here to Coonabarabran looking for country.
4437. Will it compare favourably with the land on this side of the ranges? I should say it would.
4438. How far from each bank of the creeks does the good agricultural land extend ;—would the land to Coonabarabran via Binnaway compare favourably with the land you have just been describing between Mundooran and Cobborah? I think the Caigan land is better than the Mundooran land, that is at present; but that the Mundooran land is first-class agricultural land, of course after it is cleared and ready for the plough.
4439. How far east of Mundooran is the Caigan land? You come on to the Caigan Estate about 14 miles east from Mundooran, passing through good land the whole way after you get just the other side of Mundooran.
4440. Have you prepared a statement at all for the information of the Committee? Yes.
4441. Will you be good enough to give what information you possess with reference to this proposal? My opinion is that the better extension is from Mudgee to Coonamble, because this country here can feed the back country in such times as we have been having. We have been dragging stuff round from Mudgee to the back country. In the Mudgee district, the Cobborah district, and the districts the line runs through as far as Tooraweena, there has been a tendency to cultivate for a number of years, and three times as much land is cultivated now as was cultivated four or five years ago, and in face of the price

price of wheat this year, about 2s. 4d. a bushel on the average, they are increasing their areas. Because they know they can make it pay at 2s. 4d. a bushel they are increasing the acreage, so that they may earn a bigger income. They know the climate is sure; they have never missed their crops.

H. Speight.  
7 July, 1899.

4442. You say that 2s. 4d. a bushel will pay them? Two shillings and fourpence will give them a return of 9d.

4443. Delivered where? Delivered in either Gulgong or Mudgee.

4444. If they got 2s. 4d. in Mudgee it would pay them? It pays. I do not think it will pay a man to cultivate a small area, but they know the crops are sure, and they say, "If we make 9d. a bushel on 50 acres, and we put in five times the area, we will make five times as much as we got the year before."

4445. Is there anything further you wish to say? They are doing well in the face of these difficulties. Where it is an average carriage of from 50 to 60 miles all round, they can deliver to the Gulgong mill; but it amounts to the same thing. The difference in price is dictated between Gulgong and Mudgee, according to the rate of carriage. They practically have to cart their wheat 50 miles. They are increasing their acreage this year in the face of last season's prices. I come to the conclusion that it must be agricultural land of an extraordinary kind, and that they must get seasonable rain. They have tried wheat-growing for a period, and they find they have only had one failure, which was owing to heavy floods, and which reduced the average all round.

4446. Have you seen any of the black soil cultivated? I have seen more of the black soil cultivated in the flat country.

4447. I suppose there are two sorts of black-soil country? Yes.

4448. What is that plain country like for cultivation? As far as I know, in the plain black-soil country, if you get three out of five crops it is good.

4449. I suppose this season will be a very good wheat season? Exactly; you can grow a crop down here on black soil if you have seasonable rain and plenty of it. Even the rainfall every year may be good, but it may not come at the proper time, and the crops fail. Just when you require the rain it may not come, and the crops fail.

4450. Is there anything else you wish to say? I have been through the district, and I have met men who told me that given facilities and a market they would increase their acreage to an enormous extent, and these are men who at the present time probably have one-fourteenth of their agricultural land under cultivation. A man with 1,400 acres is probably cultivating 100 acres.

4451. Taking a holding of 75,000 acres under sheep, how many persons would it employ, averaging them through the year? I do not suppose they would employ a score of men all the year round, including shearing.

4452. They would not employ twenty men on a 75,000-acre block; suppose that block was cut up into farms, and you say it would average about two-thirds agricultural land, would it treble the population on the area? I am not a farmer, and that is a hard matter to get at.

4453. You could not say whether it would? I would not like to say.

4454. From your observations, do you think it would employ four times as many? From my observations it would employ three times as many, to judge from the number of men working on a farm and knowing the acreage of it.

4455. The construction of a railway would mean that you would fully treble the population? Yes; I should think it would, because on a property of 75,000 acres which is probably owned by one man the work is done from a central point. I have been running my average on the number of men required on a farm during certain times, but a farmer may have a farm of 200 acres which he and his sons may be able to cultivate, and they are not working on the farm the whole of their time. Given a property of 60,000 acres, if you cut that property up into 200-acre blocks it will give you a return of thirty blocks. A 50-acre farm per man employed is a good size average farm.

4456. Although the railway might not pay immediately, you think that by reason of the extra population and the extra amount of land put under cultivation, within a reasonable time it would pay? Yes; I am sure a railway would pay whichever way you took up, but I knew the cost of the line here is much greater than the cost of the Dubbo extension.

4457. From your knowledge of the country, you think there is sufficient good country to be developed to justify the construction of a railway? Yes.

4458. Do you know the cost of carriage from Coonamble to Mudgee? I sent stuff from Gulgong to Coonamble the other day, and it cost me £4 a ton to get it down. I dare say I could get it for £4 10s. from Mudgee.

4459. From Dubbo to Coonamble, what is it? On Tuesday there are two loads starting for me from Murrumbidgee, which is 4 miles on the other side of Dubbo. It is to be carried direct from Murrumbidgee, *via* Dubbo, for £4 a ton.

4460. The same class of goods? Some loading was chaff and the other corn. An objection taken to the loading of chaff in Dubbo made me raise it 10s., although I do not think I could get it much cheaper.

4461. *Mr. Watson.*] Do you think if the whole of the loading had been corn you would have got it done for 10s. a ton cheaper? I might have done so. I tried to get it done for £3 10s. They asked me £4, and that was their objection.

4462. *Chairman.*] Is the rate of carriage higher just now than it usually is? Yes.

4463. What is the average price? The average price from Mudgee to Coonamble I could not say; but the average price from Dubbo to Coonamble, in and out, is about £3 10s., I should say. It is not much higher taking into consideration the wool season when they get back-loading.

4464. *Mr. Watson.*] We have been told that it is from £2 to £2 10s., which I think is too low? I do, too.

4465. *Chairman.*] Have you anything further to say? No, except that the Cobborah district, the Gulgong district, and the Mudgee district have been carrying from 80,000 to 100,000 extra sheep from other districts during the drought.

Thomas Samuel Slack, senior-constable, Cobborah, sworn, and examined:—

4466. *Chairman.*] What are you? I am a senior-constable, stationed at Cobborah. I have been here fourteen years.

4467. *Mr. Trickett.*] You are fairly well acquainted, I suppose, with the district between Mudgee and Coonamble, and also east and west of this place? No; I am only acquainted with the district from Gulgong to Mundooran.

T. S. Slack.  
7 July, 1899.

- T. S. Slack. 4468. In the first place, will you describe the extent of the district in which you collect statistics? My district commences at Redbank, about 12 miles east from here, and runs by the range to Spicer's Creek, thence by that creek to the Talbragar River, and thence by that river up to Dunedoo.  
 7 July, 1899. 4469. How many miles does it comprise? It would be about 20 miles square.  
 4470. Will you be good enough to read the statistics you have prepared? The first return which I have prepared reads as follows:—

Year.	Freehold.	Crown lands.	Total area under cultivation.	Area under wheat for grain.	Total yield of wheat.
1895 .....	44,324	190,967	2,895	1,968	32,216
1896 .....	44,261	177,000	2,658	1,608	23,568
1897 .....	43,902	174,521	3,427	2,420	26,350
1898-9 .....	49,092	182,199	6,257	4,947	93,499

4471. According to these figures the district has been progressing during the past four years? Yes.  
 4472. Was it a very dry season here last year? It was a very dry season.  
 4473. Notwithstanding that, for the dry season you had an average return of about 19 bushels of wheat to the acre? Yes.  
 4474. What were the other crops that came within the return? That I could not say, as the books were sent down to the Government Statistician, and we only kept a return of what I have just stated.  
 4475. Without going into detail, could you tell us what other crops grow favourably in this district? Hay, potatoes, barley, maize, and grape-vine, fruits.  
 4476. Citrus fruits? No.  
 4477. Not much dairy-produce apparently in the district just now? I will give you the return for 1891, to show you its progressiveness in that respect:—In 1891 the district produced 8,974 lb. of butter, 600 lb. of cheese, 18,656 lb. of bacon and ham, 14,811 bushels of wheat, 5,472 bushels maize, 55 tons of potatoes, 56 gallons wine, 18 tons of grapes, £575 worth of fruit, and 100 tons of pumpkins.  
 4478. I suppose, during recent years, you have not had as good returns as those owing to the bad seasons? The produce has increased year by year.  
 4479. You have not got the figures for last year? Not for the dairy produce. Since then we have been supplied with a particular kind of book, which we have filled in and sent down to the Government Statistician.  
 4480. You have not given us the stock returns? I have not got the stock returns, but they can be procured in Sydney. I think last year—a dry season—the Cobborah district within the area I mentioned kept 50,000 head of starving stock from different districts besides its own stock.  
 4481. When you were examined at the previous inquiry, you stated that the area of Crown lands which would fall in in 1900 would be about 174,000 acres? Yes.  
 4482. Could you describe the character of the land that will be available for small settlers to take up? About two-thirds will be suitable for agriculture.  
 4483. Will that be in continuous blocks, or is it in patches all over that area of 174,000 acres? It will not be in continuous blocks; but of that big area two-thirds will be all suitable for agriculture.  
 4484. Is it red soil or dark soil? A vast amount of it is all red, chocolate-coloured soil.  
 4485. Being the best kind of soil for agricultural purposes? Yes. The millers anywhere will prefer wheat grown on the Talbragar to any other wheat.  
 4486. We have heard it stated that black soil is not suitable for wheat-growing—that it is too strong and too difficult to till; is that so? I could not say, because I am not a practical farmer; but the red soil is the wheat country.  
 4487. Is a large amount of that two-thirds area red soil? Yes; a very large amount, as you will see on your way to Gulgong.  
 4488. How do the farmers get on for water for their farms? A great number of them have rivers and creeks, dams and wells.  
 4489. In good seasons they have a fair rainfall, have they not? Yes.  
 4490. Coming at the right time? Yes. In the season which we had last year throughout the Colony, it grew 19 bushels to the acre.  
 4491. Your estimate that a third of the Crown lands which will be thrown open is not fit for agriculture—what kind of country is it—utterly worthless? No; some of it is very good grazing country. Of course, the tops of the ridges carry splendid timber—in fact, between Gulgong and beyond Mundooran there is as much ironbark for sleepers and bridges as will make a railway from Mudgee to the Barwon. They got all their timber there for the sleepers and bridges on the Mudgee line, and also for the greater portion of the Dubbo-Bourke line.  
 4492. Judging by past experience, would that good land be taken up by settlers when it was thrown open? Yes; as fast as it is available it is taken up.  
 4493. Is any of that good land you speak of what we passed over this morning between Mundooran and Cobborah? Beyond what is termed the Gap here. Between the ironbark range, which runs down to Mundooran, and Mundooran, there is some very good agricultural land.  
 4494. We did not see the best of it in coming over the road? No.  
 4495. From what we observed, and what we have been told, between Cobborah and Mundooran there is a range of country which is not particularly good;—when you get on to Mundooran you get into first-class country, do you not? From some distance on this side of Mundooran, 8 or 10 miles, you have good country all the way into Mundooran.  
 4496. What is the population in your district? On the 1st January, 1899, when the census was taken, it was 1,100.  
 4497. Has it been increased from year to year by new arrivals? Yes; the greater portion of the increase has been caused by gold-miners. Within 12 miles of Cobborah there are gold-fields.  
 4498. Last year the population was increased by gold-miners coming to Stringybark? Yes.  
 4499. Is it alluvial gold? Yes; but now, of course, they are commencing reefing operations.  
 4500. Is it looked upon as a pretty permanent field? It will be.

4501. About how many people are there now? At the present time I do not suppose there is more than a population of between 200 and 300. They are hampered for want of water for washing purposes.
4502. Of the three railway routes, which, in your opinion, would be the best? In my opinion, as a commercial undertaking, it would pay far better, and it would be much better, if the railway were to go from Mudgee to Coonamble. It would open up a greater extent of agricultural country.
