4503. The Warren-Coonamble line, 63 miles, is estimated to cost £150,000; the Dubbo-Coonamble line, 93 miles, is estimated to cost £207,000; and the Mudgee-Coonamble line, 147 miles, is estimated to cost £479,000, being about £270,000 more than the cost of the Dubbo line, and about £320,000 more than the cost of the Warren line. Had you considered these figures when you said that you thought the Mudgee connection would be the best connection? I have no hesitation in saying that, as a commercial undertaking, on the extra cost it would pay for all future time better from Mudgee than from Dubbo. Again looking at it as a commercial undertaking, if you take the railway from Dubbo, you are saddling the Coonamble people with a burden of £25,000 a year for all time for extra haulage; whereas the increased traffic which will be brought to the Railway Commissioners would in the future more than recoup them for the extra expenditure it would take for the greater distance. A line from Dubbo to Werris Creek is, of course, one of the lines in the future. That line comes within 12 miles of Cobborah; it follows the Boomley Creek, and then it runs to Muntooran. It leaves Cobborah about 12 miles to the right. Say the line is made from Mudgee to Coonamble; the Dubbo-Werris Creek line, instead of going by Boomley Creek, can go on to Cobborah and branch in to the Mudgee-Coonamble line. There are 10 or 12 miles of level country from the junction of Boomley Creek on to Cobborah. It would utilise this line as far as Muntooran; it could branch off then to Werris Creek. It would save the construction of a line over rough country from Boomley Creek to Muntooran.
- 4503-4. Your views on that point are that, although the Warren-Coonamble line might be a shorter line to construct at the present moment, the Mudgee-Coonamble line would split up the country better, and in the end would be a line of greater general use, and return a better revenue to the State? Yes.

T. S. Slack.  
7 July, 1899.

Joseph Lewis Falconer, drover, sworn, and examined:—

4505. *Mr. Watson.*] Have you a general knowledge of the country traversed by the proposed line from Mudgee to Coonamble, and if so, how far does your knowledge extend over the present surveyed line? I am acquainted with the line through travelling with stock along both sides of it. I have a knowledge of the line from Mudgee right away to Coonamble.
4506. Taking the line in sections, how would you describe the country from Coonamble down to where the first break in the country occurs? The black-soil country would be about 44 miles from Coonamble?
4507. Do you regard the country from Coonamble down to that point as suitable for agriculture? Yes.
4508. Have you had any experience in agriculture? Not a great deal.
4509. What makes you think it is suitable for agriculture? Because it is beautiful looking soil. It is not the real heavy black soil; it is more of a red soil than black soil.
4510. Is it lighter in texture and colour than the usual black soil? Yes; a great deal of it is mixed with sand.
4511. You think it would be fairly suitable for agriculture? Yes.
4512. Coming on from that point towards Tooraweena, will you describe the country? On both sides of the line to Tooraweena it is fit for agricultural purposes.
4513. Is that heavily timbered? It is not heavily timbered. On the other side of Tooraweena for about 14 miles towards Coonamble, it is fairly heavily timbered in places, and from Tenandra to Coonamble, 31 miles, you are getting into nice plain country.
4514. Coming down from Tooraweena to Muntooran, will you describe that country? It is hilly country, and good agricultural land.
4515. All through? Not all through—in parts.
4516. In what proportion do you think? About 55 per cent.
4517. A little over one-half of that country will be agricultural land? Yes; on either side of the line.
4518. Does that half which you think is fit for agriculture consist mostly of creek flats, or is it rising country in some cases? A great deal of creek flats; a little rising country of course—box country.
4519. On both sides? Yes; the line does go through ironbark country in places. It is not a continuation of box country in places.
4520. You allow for that in your estimate? Yes.
4521. You think one-half of the land traversed by that line will be fairly fit for agriculture? Yes.
4522. Coming from Muntooran to Cobborah, will you describe first the country on the east side, out towards Dunedoo and Coonabarabran way? The country is very good towards Coonabarabran; from Muntooran to Caigan is splendid country either for agriculture or pastoral purposes. That is a lighter soil than is on the other side of Tenandra.
4523. Leaving the flats on the Castlereagh and coming towards Cobborah, and still keeping to the east, what is the country like there? It is good country for agriculture off the railway line—you would not come that way. It is going through good country till you rise the gap coming to Cobborah.
4524. That is till you cross the dividing range between the Castlereagh and the Talbragar? Yes.
4525. Except for that portion it is good country? Yes; on either side.
4526. Would that description apply equally to the western side? Yes.
4527. In what way do you account for a portion of land about the Four-mile Creek holding being unoccupied by selectors although it is open for selection? It is on account of the dry season that it is unoccupied.
4528. Is it rough or broken country? It is broken country.
4529. That country has been open ever since 1884? I think it has.
4530. So that it would not be one dry season which would prevent that country from being selected? It runs into a lot of ironbark country. It is a bit sandy there, I think.
4531. You would not class that as good country? No.
4532. Your estimate of good country is irrespective of the area, tinted brown on the map, about Four-mile Creek? Yes.

J. L.  
Falconer.  
7 July, 1899.

J. L.  
Falconer.  
7 July, 1899.

4533. There is some more land on the western side of the line, almost directly south—about 3 to 5 miles of country, marked Richardson, and comprising about 60,000 acres—which also is untenanted;—can you describe what that area is like? I do not know really what the whole of it would be like. There is a good portion of box-flats heavily timbered.

4534. Which ought to be fit for agriculture if cleared? It is heavily timbered, and would be fit for settlement if cleared.

4535. Do you think there are any portions of these unoccupied lands which with railway communication would be settled upon? Yes.

4536. You have been through them largely? I have been through the biggest portion of that land—that is, south-west of Mundooran.

4537. Do you think that with railway communication it is fit for settlement? If cleared and ringbarked it would be.

4538. Is there anything else you would like to add in regard to the desirability of constructing a line from Dubbo to Coonamble, or from Mudgee to Coonamble, and comparing the two lines? Only that the country on this present line from Mudgee to Coonamble, nearly all the way through, would be very good country for agricultural purposes on either side in big areas, but not a continuation of good country. You would be going through a good deal of ironbark country, but on either side there are beautiful flats.

4539. What would the extent of these flats be in one place;—could you get 100 acres, 200 acres, or 300 acres? In places you would get 500 acres and 600 acres—that is, from Mundooran to Yarragrin—and, of course, further on, on either side of the line, the areas of good country would be much larger on both sides. When you get past Wallumburrawang the country on both sides of the line is improved—you would get larger areas of flat land.

4540. You have described the land fairly well from Coonamble down to Cobborah;—can you now describe the land between Cobborah and Mudgee, from the agricultural standpoint? Yes.

4541. What proportion of that land do you think would be fit for agriculture? Fully 60 per cent.

4542. Within how many miles of the railway on either side—10, 15, or 20 miles? Within about 8 miles.

4543. There is a general range of hills and mountains—broken country—starting up on the Coonamble side of Tooraweena, at the head of the Warrunbungles, and that extends, roughly speaking, north-west and south-east along the eastern side of the Mudgee-Coonamble line? It does.

4544. How far on an average would the foothills of that range be from the railway line? On an average it would be about 10 miles.

4545. You think there would be an average of 10 miles of good country between the railway line and the foothills? Fairly good.

4546. The country you have been describing is partly fit for agriculture and partly good grazing land? Yes. There would be places in which it would be very stony.

4547. Still you think there would be an average of 10 miles of fair country between the railway and the foot of the mountains? Yes.

4548. *Mr. Dick.*] Have your travels brought you over the west side of the Castlereagh towards Coonamble, or from Gilgandra to Coonamble on the west side? Yes.

4549. Do you know that country pretty well? Just along the south-west bank of the Castlereagh.

4550. Do you know the country for some distance away from the river—say 5 miles? Yes.

4551. How would you describe the patch of land for an average distance of 5 miles on the west bank of the Castlereagh from Gilgandra to Coonamble? It is fairly good country for agricultural or pastoral purposes.

William Latimer, farmer, Denison Town, sworn, and examined:—

W. Latimer. 4552. *Mr. Dick.*] Where do you reside? I reside at Denison Town, 18 miles east from Cobborah. I have been in the district for thirty years.

7 July, 1899. 4553. Will you in a general way give to the Committee the benefit of your experiences as an agriculturist during that period? Yes. I am a freeholder; my holding consists of close on 1,800 acres. A portion of the holding has a frontage to the Talbragar. The land is well adapted for agricultural purposes.

4554. How long have you been carrying on agriculture there? For the last twenty-five years, on and off. In some seasons I cultivated none; in other seasons I did cultivate.

4555. During the seasons you did cultivate, what was about your average yield? I have grown as low as 12 bushels, and as high as 40 bushels.

4556. What would your average yield be for the period? Fully 30 bushels.

4557. Taking Cobborah as the centre of a radius of about 18 miles, how much of that circle of land do you think would be good agricultural land? I consider there is fully 80 per cent. of it good agricultural land.

4558. On that 80 per cent. of the land, what yield do you think, year in and year out an agriculturist could get? Some of them get as low as 12 bushels, and as high as 40 bushels; I should say, an average yield would be from 20 to 25 bushels.

4559. Going east from your place towards Cobborah and then on towards the Dubbo line, does the land improve in quality? It is about the same.

4560. Right over to the proposed Dubbo-Coonamble line, what is it like? I am not acquainted with that country, I can only speak of the country from Mudgee to Cobborah.

4561. Taking that section of land from Cobborah down to Mudgee, you know the surveyed line? Yes.

4562. For how many miles on each side of the proposed route is there to be found good agricultural land east and west? About 20 miles on each side.

4563. And of that strip, going down to Mudgee, what percentage do you think is good agricultural land? I consider it is pretty nearly all agricultural land; but to be on the safe side I would say 85 per cent. I know that strip from personal experience, and from my long residence in the district. I have been a large storekeeper in the district for twenty-five years. I have been in the hotel business; I have been engaged in farming and pastoral pursuits as well. I am speaking from the general knowledge of a long residence in the district.

4564. Do you think the pursuit of agriculture has been handicapped in that district by the want of a railway? Very much, indeed.

4565. Could you hazard an opinion as to what increase the construction of a railway from Mudgee to Cobborah, and thence onwards, would bring about in agriculture? An enormous increase. Take my own case.

- case. This year I am cultivating about 50 acres, whereas if a railway came to Cobborah from Mudgee I would cultivate nothing under from 1,000 acres to 1,400 or 1,500 acres on my holding. W. Latimer.  
7 July, 1899.
4566. Are there many men in a similar position to yourself? A great number.
4567. How far, on an average, do you think it pays to carry wheat to a railway—that is, in order to give you a fair return? I consider, if a man has to carry his wheat over 25 miles he is very heavily handicapped, indeed.
4568. How far is it from Cobborah to Dubbo? Fifty miles.
4569. Is there any decent sort of road along there? It is a fair road.
4570. What is the distance from Cobborah to Mudgee? About the same distance, I believe.
4571. You think that 50 miles carriage is a serious handicap to the extension of agriculture in this district? Yes.
4572. What is the average rate of freight for wheat from Cobborah to Mudgee and from Cobborah to Dubbo? I cannot speak of the rate from Cobborah to Dubbo, but from Cobborah to Mudgee the average rate, I believe, is about 2s. 6d. per cwt.—£2 10s. per ton. My residence is 18 miles from here, and I do not know what Cobborah people do with their wheat. They sell some in Gulgong, and some, I believe, goes to Dubbo.
4573. Do you think the construction of the Dubbo-Coonamble railway would be of any assistance to the people in this district? None whatever.
4574. A previous witness stated that if a farmer got a net return of 9d. for his wheat it would pay him;—do you agree with that opinion? He would have to be content with it; we would sooner have a lot more.
4575. You think it would be a very poor and discouraging return after paying all expenses? Ninepence profit would be very fair.
4576. Have you had any experience in farming and other districts? None.
4577. Could you give a general opinion, based on your knowledge of the country between Cobborah and Mudgee, of the profit-paying aspect of a line, if constructed? From my experience as a resident of the district, I consider it would pay handsomely, that all available Crown lands would be taken up, and that farming would be carried on on a very large scale indeed, as the district is so suitable for agriculture.
4578. Is there anything else you would like to add? Nothing else.

Charles Stephen Hicks, senior-constable, Leadville, sworn, and examined:—

4579. *Chairman.*] What are you? I am a senior-constable stationed at Leadville, formerly Denison Town. It is up the Talbragar, about 21 miles from Cobborah. C. S. Hicks.  
7 July, 1899.
4580. *Mr. Shepherd.*] Have you any statistics for the district under your charge? Yes.
4581. Will you kindly read the statistics? I collect from the parishes of Talbragar, Wargundy, Rous, Meruthera, Bowman, Terraban, and part of Narragamba, in the county of Bligh. It is a small district. It extends 26 miles from east to west, and 24 or 25 miles from north to south. It is wholly in the Eastern Division. The returns collected in the month of January for the last two years were as follows:—

Year.	Total area under cultivation.	Area under Wheat.	Total Yield.	Average Yield.
	acres.	acres.	bushels.	bushels per acre.
1898 .....	1,480	789	14,322	18
1899 .....	2,307	1,476	21,602	14½

The area of land which ninety leaseholders hold is 75,091 acres of freehold land, and 49,607 acres of Crown land; nearly all that Crown land is under process of alienation. It is chiefly conditional lands, but under our heading it is entered as Crown lands.

4582. *Mr. Watson.*] Do you know what proportion of the Crown land is conditional leases? From 80 to 90 per cent. There are only three large estates in my district. With the exception of them, they are all selectors. I took the trouble the other day to collect the average rainfall, if it is of any use.
4583. Will you be good enough to give the rainfall? The average rainfall taken at Berriwa by Mr. E. J. Lowe for the last sixteen years, is 29 inches and a decimal.
4584. *Mr. Shepherd.*] Are these all the statistics you have prepared? Yes. In January, 1895, the total area under cultivation was only 862 acres.
4585. Has there been a gradual increase year by year? It has not been gradual; during the last two years I find it has been a jump. In 1893 there were only 789 acres under wheat, and last year there were 1,476 acres—almost double the acreage.
4586. What is the population? I estimate the population in my district at about 700.
4587. Is that a considerable increase on the returns for previous years? No; the population is about the same.
4588. Have you any returns of the number of sheep? No.
4589. Is there any other cultivation besides wheat going on? The farmers in the first year after they clear the land, usually put in corn, and in the following year they follow up with wheat.
4590. Do you know what is the return of maize per acre? In usual seasons it is from 25 to 30 bushels per acre.
4591. In travelling about among the farmers, do they seem contented with their prospects? They do not seem contented. The general wish of the farmers is to get railway communication.
4592. I mean, are they satisfied with their prospects—as far as the production of their land is concerned? Certainly.
4593. Are you of opinion that in the event of their getting railway communication they would largely increase their area under cultivation? I am positive that they would.
4594. Has there been any attempt to grow fruit in the district? No; the only fruit grown is simply for their own use. There would be no market if they grew fruit to sell.
4595. Where it has been attempted has it been pretty satisfactory? Certainly.

- C. S. Hicks. 4596. What description of fruits do they generally grow? Peaches, apples, and grapes, which grow splendidly. There is a place about 13 or 14 miles from Leadville, where English fruits grow well; and in the same gardens where gooseberries are growing I see oranges and lemons.
- 7 July, 1899. 4597. Have you much knowledge of the country outside your district? A fair knowledge. I have been in the district eighteen years.
4598. What is your opinion of the country generally between Cobborah and Coonamble? I know the whole country from Mudgee to Coonamble. I was stationed for six years at Mundooran. From Mudgee to Cobborah it is an agricultural country; from Mundooran to Tooraweena it is considered more a pastoral country; but about Tooraweena, again, there is lovely agricultural land, and also at Tundaburine, Gumin, Quambone, and Quondong. From there to Coonamble I take it to be good pastoral country.
4599. How far does that country extend on either side of the surveyed line? A good distance—into the Warrumbungles.
4600. How many miles, on an average, do you suppose it is? About 8 to 10 miles I should take to be the average on the eastern side of the line.
4601. On the western side is it more? It is fully that; it runs over to the Castlereagh River on the western side. The country west of the Castlereagh I do not know much of. I may state that my district does not include all the country which would be served by a railway from Mudgee to Coonamble. There is a strip of country east of my district and west of the Dividing Range, towards Cassilis, and the Cassilis police take those returns. The farmers outside my district, from that to the Dividing Range, now take their produce to and trade with Gulgong. These are not included in my returns.
4602. What distance would that be from the proposed railway? From Gulgong it would be from 24 to 28 miles.
4603. Is there any other information which you think would be of value to the Committee? I can think of none.

John McLean, grazier and farmer, Narran, sworn, and examined:—

- J. McLean. 4604. *Chairman.*] What are you? I am a grazier and farmer, residing at Narran, on the Talbragar, 12 miles west from Cobborah.
- 7 July, 1899. 4605. What is the size of your holding? At present I have 14,000 acres, and I cultivate about 400 acres, chiefly for wheat. It has averaged about 22½ bushels of wheat per acre for a period of ten years.
4606. Do you cut for hay? Sufficient for working the farm. I should say it went close upon 2 tons to the acre.
4607. Do you cultivate your land for anything besides wheat or hay? No. I may add that we cultivate sufficient potato land to serve the requirements of the place.
4608. Have you noticed the return of potatoes per acre? No. In some years they are not quite a success; in other years we get good crops.
4609. The remainder of your ground is under sheep? Grazing.
4610. How many sheep to the acre do you carry? Of course they vary. We sell and buy, and I can hardly form a correct opinion.
4611. Would a sheep to the acre cover it? About a sheep to 2 acres. I make it a practice not to stock too heavily.
4612. Is there much country similar to yours unoccupied? There is none unoccupied in that particular neighbourhood. There is a portion of unoccupied country, consisting of an ironbark range, which comes from Dubbo way, and follows the Talbragar on the northern side right through here.
4613. What extent of that ironbark country is there? I could not say correctly. I have not been over it all.
4614. Can you give the Committee a general idea of how far it extends, and also what you think it is good for—if it is good for anything? My experience has led me to the conclusion that even country which is inferior in good seasons equals the best country in bad seasons, owing to the fact that, by reason of its nature, it is carrying a scrub which is suitable for stock, and which does fairly well in a dry season. I could not describe such country as useless country by any means.
4615. A good deal of the country which you describe as ironbark country, I suppose, grows other timbers? It is intermixed with box, ironbark, and edible scrubs.
4616. Would you consider that heavily-timbered or mixed country fit for agriculture if cleared? No; the country on which ironbark grows in this part of the colony I would not consider suitable for agriculture.
4617. What percentage of occupied land in your neighbourhood is fit for agriculture? Taking the southern side of the Talbragar, the side I live on, I should consider about two-thirds.
4618. How far from the river on the south side does the good land extend? Just from where I live it extends, I might say, right to Wellington. It is not all suitable in continuation for agriculture, owing to box ridges, but they are sound grazing country. The country right through, however, is all good country.
4619. Have you a general knowledge of this district which would be served by a railway from Mudgee to Coonamble—say for 20 miles round Cobborah? I have a thorough knowledge of it.
4620. How would you describe that country? I would simply affirm my opinion that that which is suitable for agriculture could be relied upon for that purpose.
4621. That is, you would be quite safe in getting a return every year from your crop? Yes.
4622. Now, will you describe the other portion? Of the other portion, one-third is good grazing land—that is, on the southern side of the river. On the north side it is somewhat broken country. As I have just said, that range of ironbark country which, from near the proposed route from Coonamble, follows that stretch of country right through almost to here. There are two properties, known as Upper Boomley and Lower Boomley, adjacent to the Cobborah district, which is much better than that further west. There is good country on these two properties, suitable for agriculture.
4623. Does the Boomley Creek run through your holding? No; it runs through Lower Boomley.
4624. You have a good knowledge of the district all round Cobborah? Yes; I have been over that radius in and about Cobborah.
4625. You have been in the room most of the time when the other witnesses have been giving their evidence? Yes.
- 4626.

4626. Do you generally corroborate what they have stated? Of that portion of the evidence relating to the country lying north and north-west from Cobborah I cannot speak personally.

J. McLean.  
7 July, 1899.

4627. Do you generally corroborate their evidence relating to that which you have a knowledge of? I can fairly say that their evidence is good evidence. I think, if anything, they have under-estimated the extent of good country in general.

4628. Is there anything else you wish to state? I can only give my experience for a period of ten years—that is, since I came to live in this district. During that time the rainfall has been such as to give us an excellent yield every year. I examined my private register the other evening, and it shows an average rainfall of 27·4 inches from 1890 to 1898. During that time the rains have been fairly distributed over the year. The rains have been sufficient to germinate the seed, and there has been a sufficient rainfall at the time of the year to develop the wheat.

4629. The rains generally are seasonable, I suppose? Yes.

4630. You are quite satisfied with your prospects, I suppose? Perfectly satisfied—that is, if you could get reasonable communication.

4631. With reasonable communication your prospects would be ever so much better? Undoubtedly. It was told to me by old residents, when I came here ten years ago, that the only thing against us here in wheat-growing, is the distance they have to cart their wheat to market, which is, indeed, a very large item.

4632. *Mr. Watson.*] Have you found that to be so? I found it to be perfectly true. It is a great handicap, and it means extra capital wasted as it were, or extra capital required to compete with other wheat-growing centres. It only requires a railway within a reasonable distance of this district to make it one of the most fertile wheat-growing districts we have.

4633. *Chairman.*] We have taken 20 miles as being the distance which men might reasonably be expected to carry their wheat, and to make wheat-growing pay;—is that distance within the mark? Yes. I will show you the disadvantage which all of us have to bear with. Both myself and my partner have had to get a twelve-horse team for twelve weeks this season and last season to take our wheat to a railway station.

4634. Where did you go to? This year it went to Dubbo, because we could not find suitable storage at any other place. In the previous years it has gone to Gulgong and Mudgee chiefly.

4635. Do you sell in Dubbo, or send it away? Last season's crop is not sold yet. Most of our wheat has previously gone to Mudgee. We must make up our minds to cart our wheat to Mudgee in the future, owing to the fact that our local buyers will be fully supplied with wheat grown nearer to them than here. It will be a question of exporting for all of us here very shortly. It is a question of carting our wheat to the nearest railway which will convey it in the cheapest way possible to Sydney—and that is to Mudgee. I look upon Sydney port as our future distributing centre, whether we sell in Sydney or export.

4636. How much would you require to get at the barn for your wheat before you would begin to make a profit; in other words, what would be a paying price at the barn for your wheat, threshed and ready to put on the waggon? At 2s. it pays.

4637. Under that price it would not pay? I would not like to say that either.

4638. I suppose it depends upon whether it is a 40 bushels crop or a 20 bushels crop? Yes; and the quantity under crop.

4639. But you think 2s. a bushel would be remunerative? Yes; if I had a guarantee of 2s. a bushel for the next ten years, I would increase our area to its utmost limits. The prospect of the wheat acreage being increased is beyond doubt. There is evidence wherever I go that justifies anyone in saying so. I have sold £500 worth of machinery to five farmers to prepare for the coming harvest.

4640. Machinery which you were previously using, or machinery which you got new for them? One line of harvesting machinery, and that does not by any means represent the increase in general. It simply represents an item of increase within a few miles of my own homestead.

4641. *Mr. Watson.*] Assuming the line from Dubbo to Coonamble to be constructed, do you still think it would pay to make an extension of the Mudgee line from Cobborah, or through Cobborah further on;—do you think the area of country between Cobborah and Mudgee is sufficient in itself to help to carry the extension of the Mudgee line? I do.

4642. You still think there would be enough extra traffic coming to such a line as to justify its extension from Mudgee, even if it did not go to Coonamble? I consider that if the Dubbo-Coonamble line is built there are still sufficient resources in this district from Mudgee out here, or, perhaps, a little further, to justify the building of a line from Mudgee. I consider that it would contribute more revenue than would pay the interest on the cost of construction, and so forth, because the fertility of the district for a radius of 20 miles round here is very good indeed.

John Pattison Yeo, farmer, Elong Elong, sworn, and examined:—

4643. *Chairman.*] What are you? I am a farmer residing at Elong Elong, about 13 miles to the west of Cobborah.

J. P. Yeo.  
7 July, 1899.

4644. *Mr. Trickett.*] How long have you resided at Elong Elong? All my life.

4645. Are you still working with your father on his land? Yes.

4646. What is the extent of that farm? We have 300 acres under cultivation, and about 4,000 acres under sheep.

4647. What is the carrying capacity of the grazing land? A sheep to 2 acres.

4648. Is it highly improved land? No; to a great extent it is ringbarked. It carries a sheep to 2 acres in all seasons.

4649. To what crops is the agricultural land devoted? Wheat, corn, and potatoes.

4650. What is the result of the wheat crop? An average of about 20 bushels to the acre.

4651. Is it good corn land? Yes, very good.

4652. Do you grow the corn on red soil or dark soil? On both.

4653. Do you find that both soils are suitable for wheat growing? Yes.

4654. What do you do with your produce? We take it to Dubbo and also to Gulgong.

4655. Do you always get a market for it in those places? Yes.

4656. Do you find that it is a handicap to cart it that distance? A great handicap.

4657. Do you agree with the last witness that 2s. a bushel for your wheat on the farm would be a good paying price if you got that all through? Yes, if we were sure of getting that.

4658. Has your market always been either Gulgong or Mudgee? Yes.

4659. With a railway going further inland, do you think there would be any market for hay, wheat, or corn, up Coonamble way and beyond? Yes, a great lot.

- J. P. Yeo.  
7 July, 1899.
4660. Especially, I suppose, in a bad season? In a season like that which we have passed through.  
4661. If you could get it carried along in large quantities there would be a ready sale for it? Yes, a ready sale.  
4662. Have your crops been successful in two years out of three, or what? Taken as a whole they have all been successful.  
4663. They have never been a failure? They have never been a failure for the last forty years.  
4664. Even during the last two or three years you have had crops which would pay? Yes.  
4665. You know the country round pretty well? Yes; within 21 miles of Cobborah, I suppose.  
4666. What proportion of that country do you think would be suitable for cropping? About two-thirds.  
4667. You heard the evidence of the last witness? Yes.  
4668. He is a practical farmer, like yourself? Yes.  
4669. Do you agree with the evidence which he gave? Yes.  
4670. With better means of communication, would your father and yourself put more land under wheat? Yes, we would increase the area to an enormous extent.  
4671. Is it healthy country for growing wheat? Very healthy.  
4672. No rust or other thing to speak of? Nothing to speak of.  
4673. You are well satisfied, having lived here all your life, to go on farming with very fair prospects? Yes.

Alexander Douglas, grazier, Boomley, sworn, and examined:—

- A. Douglas.  
7 July, 1899.
4674. *Mr. Watson.*] You do not go in for growing wheat? Not very much. Last year I had about 40 acres, and the same this year.  
4675. Do you grow for your own use chiefly? We put 40 acres in principally to make a start in agriculture.  
4676. Were you satisfied with the experiment? Yes.  
4677. Will you be good enough to state your views on this question of railway communication? With regard to the country on the line from Dubbo to Coonamble, and on the line from Mudgee to Coonamble, my opinion is that the Mudgee line is the line which should be constructed. For the welfare of the colony at large the other line should be set aside absolutely. From Mudgee to Mundooran I consider it is a really good agricultural district. There are, certainly, portions of that country which are of a scrubby nature—ironbark hills and all that—but when you come to ride through the district you find the land equal, in my opinion, to anything in the Colony for producing wheat. We have this red soil—that is red clay—which is the best ground for producing wheat. On the other side they certainly have good agricultural land—you must admit that—but they have a wide strip of ironbark country between Gilgandra and Dubbo, which has to be passed through, and which to my mind is very poor producing land. I have been thinking, since I came here to-day, about the ironbark country between Narramine and Coonamble, and there is only a small strip at the junction of the Coolbaggie and the Macquarie, which is really good land. But the line would have to pass through the ironbark country. On either side, down as far as Burraway, it is all open ironbark country.  
4678. Is that all the information you can give us in regard to the two routes which we are considering? That is all the information I can give, unless it is in reference to the Werris Creek line.

George Paterson, farmer, near Cobborah, sworn, and examined:—

- G. Paterson.  
7 July, 1899.
4679. *Chairman.*] Having heard the evidence of Mr. Latimer on this subject would you endorse the remarks he made about the necessity for building this line? Yes.  
4680. Can you advance any further reasons, or give further information in support of that contention? There is one thing I found out here, after being a long resident, and that is that we farmers are greatly handicapped. If we grow hay, chaff, forage, or anything like that it is of no use to send it to Mudgee, because it is like taking coals to Newcastle to take it there. There is no market for the produce, and the local consumption is so small that, of course, we only grow what we require for ourselves. You are well aware that if the line were extended from Mudgee onwards we would have a market out back for any over supply we grew in here, which market we have not got at the present time.  
4681. Do you run any sheep on your holding? Only a few. I have only a small place—320 acres.  
4682. What would be the effect of a railway, as far as fat stock are concerned? That is what is urgently required.  
4683. How far have you to drive your sheep now to get them to a railway? 50 miles.  
4684. That takes all the fat off the sheep? It ruins the sheep, to a great extent, to take them that far.  
4685. Do you think there would be a considerable number of fat sheep shipped on the railway? There is no doubt about it.  
4686. Is this a good fattening district? Certainly.  
4687. Is it good for large cattle too? It is good country for growing large cattle as well as sheep.  
4688. You think the progress of the district has been kept back for years from the want of a railway? I am certain of that.  
4689. If a railway were constructed you think an immediate impetus would be given to the progress of the district? Yes. The valley of the Talbragar would attain a prominence which it has never reached yet.

James Nott, farmer, near Cobborah, sworn, and examined:—

- J. Nott.  
7 July, 1899.
4690. *Chairman.*] What are you? I am a farmer residing 7 miles east from Cobborah—between Cobborah and Dunadoo.  
4691. *Mr. Shepherd.*] What is the extent of your holding? 2,350 acres.  
4692. Is it all ringbarked? Yes.  
4693. How much land have you under cultivation? I have 130 acres of wheat in this year.  
4694. Only wheat? Only wheat now. I will put in corn by-and-bye, no doubt.  
4695. What has been the result of your labours in cultivation? I have been farming in this district for thirty-two years, and I reckon that I have got an average of 19 bushels to the acre every year since I have been here.  
4696. Will you state the highest yield and the lowest yield you have had? There were two total failures in the period of thirty-two years. The highest yield was 50 bushels, and it has never been under 12 or 13 bushels.  
4697. In a good season, I suppose you can always rely upon getting a good return? From 35 to 40 bushels in any fair season.  
4698. What does it cost you to clear your land? It has cost me as much as £4 an acre.  
4699. What description of timber is it growing? White box and yellow box. 4700.

4700. What is the distance you have to send your produce to market? From about 1869 to 1879 we used to always go to Dubbo. They used to give us 3d. and sometimes 6d. a bushel more than they gave for wheat which was grown in Dubbo, because it was of better quality.

J. Nott.  
7 July, 1899.

4701. What freight have you usually to pay? I paid as high as 1s. a bushel in those times, but now it is 6d. a bushel.

4702. Do you consider that a paying price? It is not altogether a paying price, because I think it is too far away from a market.

4703. Still you can live? We have to live.

4704. How many sheep do you run? I run about 1,200 sheep and a hundred head of large stock—horses and cattle.

4705. What quantity of wool do they produce? Last year I had £180 worth of wool from them.

4706. Has the land been just ringbarked and left, or have you cleaned it up? I have been cleaning it up for years and scrubbing it. It is all flat land.

4707. You have really given your land a good chance? Yes.

4708. Would you be inclined to largely increase your cultivation in the event of a railway being constructed here? Yes; I have no doubt I would increase at the rate of 100 acres a year for the next ten years on my holding.

4709. Do you think that that would be the idea of most of the farmers in this district? Yes.

4710. Do you think there is every probability of doing really well in the event of a railway coming? Yes; I think if the railway did come from Mudgee to Coonamble the population would be increased. The population between Mudgee and Coonamble is more than double the population between Dubbo and Coonamble. The Mudgee line would serve more than double the population which the Dubbo line would serve. From Cobborah to Leadville, taking 5 miles on each side of the Talbragar for a distance of 20 miles east, I reckon there would be 150 square miles of really good agricultural land.

\*George William New, farmer and grazier, Cobborah, makes the following statement:—

I AM a farmer and grazier, residing in this district continuously for the past thirty-five years. I have travelled the road between Mudgee and Coonamble for at least twenty years; also the road from Dubbo to Coonamble. I consider a line from Mudgee to Coonamble would pay well. I consider nearly two-thirds of the country within a radius of 20 miles of the proposed route from Mudgee to Coonamble to be fit for cultivation. Along the route from Dubbo to Coonamble there are large tracts of very inferior country, particularly between Dubbo and Gilgandra. The average rainfall is not nearly so great along the Dubbo route as that from Mudgee. I am certain that a line constructed from Mudgee to Cobborah would prove payable, as there is a very large tract of good country, suitable for wheat-growing, which would be put under cultivation, thus largely increasing the present traffic from Mudgee; such produce would never be sent over any line *via* Dubbo. The farmers and graziers are greatly handicapped by not having railway communication. Some of the farmers in this district are now obliged to cart their wheat 75 miles. The hope of getting the railway extension from Mudgee has induced farmers to nearly double their acreage since last season. There is a large tract of land lying between the Talbragar and Gulgong, averaging about 12 miles in width, which is first-class agricultural land, of which from 12,000 to 15,000 acres of Crown land will be open for settlement within the next twelve months. Last year I had 60 acres under cultivation; this year I have about 160 acres, and I expect to have about 600 acres next year.

G. W. New.  
7 July, 1899.

\*William Meers, farmer and grazier, Cobborah, makes the following statement:—

I LIVE 10 miles south-west from Cobborah. When I came to Sandy Creek six years ago there were 300 acres of land under cultivation. Last year there were 1,600; this year there are 2,000. Myself and my son own 1,800 acres of land, and there are 1,400 of this fit for cultivation. I have ten or twelve neighbours; there is quite 70 to 80 per cent. of their land fit for cultivation. I know the country between Mudgee and Cobborah; it is a farming district. I also know for 20 miles on each side of the proposed railway line from Mudgee to Cobborah; it is thickly populated with farmers and graziers; from Mundooran to Coonamble I do not know the country. I thoroughly believe a railway from Mudgee to Coonamble would pay. All we want is better facilities for taking our produce to market. If a railway from Mudgee to Coonamble were constructed, where there are 6,000 acres under cultivation now, in ten years there would be 40,000 acres. I believe a man can keep a family on 200 acres of good cultivation land with railway communication. One acre of good cultivation land is equal to 5 acres of grazing land. I know the country between Dubbo and Gilgandra; it is very scrubby, but good wheat land.

W. Meers.  
7 July, 1899.

\*Harry Albatross Patrick, grazier, Digilah, sworn, and examined:—

1792. *Mr. Hussall.*] Where do you reside? At Digilah, about 16 miles from here.

1793. What is the character of your holding;—is it leasehold area or selections? My brother and I in company hold a leasehold area, three occupation licenses and annual leases, and about 5,000 acres of freehold land, making an area, approximately, of nearly 60,000 acres.

H. A. Patrick.  
1 April, 1898.

1794. Is that country up on the Castlereagh River or near it? It commences within about 2½ miles of the Castlereagh River and extends across the Talbragar to within 16 miles of Gulgong.

1795. It is devoted principally, I suppose, to sheep-farming? Yes.

1796. Have you gone in for agriculture at all? Only for station use.

1797. You have heard the statements made by Sergeant Slack and Mr. Paterson with regard to the capabilities of the district? Yes.

1798. Can you endorse those statements from your own personal observation and knowledge? Yes, I agree with the statements generally, though not as to every item.

1799. Where do you differ? I think there is a greater area of valueless land included in the Crown lands than was stated.

1800. The sergeant said that out of 174,000 acres about 25,000 acres were valueless? There is a greater area of valueless land than 25,000 acres. At least one-fourth of the 174,000 acres would be valueless, except for the production of timber and minerals, the timber being principally ironbark and pine of excellent quality.

1801. Is the estimate of 60,000 acres of land suitable for agriculture a pretty fair estimate? No; I would not estimate the area at so much as that. I would reduce it to 40,000 acres. The balance of 80,000 acres would be fairly good grazing land, hilly—stony.

1802. But improved, would carry a fair number of stock? Yes.

1803. About a sheep to 3 acres? Yes, if improved by ringbarking.

1804.

\*NOTE.—Among the witnesses examined at Cobborah were Mr. G. W. New, farmer and grazier; Mr. W. Meers, farmer and grazier; Mr. H. A. Patrick, grazier; and Mr. J. Yeo, farmer and grazier,—but the shorthand notes of their evidence were lost by the shorthand writer. In consequence of this, they were asked to furnish a written statement of the information given by them when examined, and Mr. New and Mr. Meers complied. Mr. H. A. Patrick gave evidence in the Warren-Coonamble inquiry, and, in the absence of a statement from him, the evidence given by him in that inquiry, which is substantially the same as given by him at Cobborah, is republished.

- H. A. Patrick.  
1 April, 1898.
1804. With regard to the value of this country, the extent of which you put down at 40,000 acres, although it may be practically valueless for either agriculture or grazing, it might still be a valuable asset to the State, on account of the timber it contains, which would be a source of great revenue, and afford employment for labour? Decidedly so.
1805. In fact, it is one of the best ironbark forests in New South Wales? Yes.
1806. You know the country very well, say, from Dubbo, in the direction of Werris Creek? Yes; I know the country very well lying between Dubbo and Werris Creek. A line between those two points would traverse good country, following the valley of the Talbragar to Cobborah, and on to the Castlereagh River. Thence it would go through the ironbark belt, previously alluded to, on to Coonabarabran, through fair country, and from Coonabarabran, after leaving the Warrumbungle Ranges it would traverse the Liverpool Plains, with first-class country right through to Werris Creek.
1807. Would a line running through there be of any service to this district? It would be of some service, but it would entail a great deal more haulage. It would be a very expensive way of sending produce.
1808. A cross line of the character thus indicated would not, in your opinion, serve this district so well as a line running through from Mudgee to Coonamble? No; it would not benefit this part of the country nearly so much.
1809. Would it be of any benefit at all? I believe it would. It would open up the country and give more speedy means of communication north and south, but not direct with the metropolis, nor into the interior.
1810. How long have you known this district? About twenty-five years.
1811. Have you seen the growth of settlement in it? Yes.
1812. You can corroborate what has been previously said in that respect? Yes.
1813. That the land, when available, is greedily taken up? Yes; there is a great rush for the land as soon as it is thrown open. There are from twenty to sixty applications for every block.
1814. The principal pursuit of the people is grazing? Grazing, combined with agriculture,
1815. Do the people around here seem fairly prosperous? Yes; there are very few failures. They are not rich, but they all seem to get a fair living. The industrious settler seems to be fairly snug.
1816. I suppose your information with regard to the carriage paid for wool is practically the same as that given by previous witnesses? Yes.
1817. You send your wool to Mudgee? Yes; that being the nearest railway station.
1818. Is there a good road from your place to Mudgee? Yes; there is a very good road from Mudgee to within 6 miles of my station. In my opinion, some of the otherwise worthless country in the district bears minerals of various kinds, and some of it contains good deposits of coal. Prospecting operations have been carried on, with good indications of gold, silver, copper, and other minerals. There is a good coal deposit of 6 feet in the Buthow Creek near here, which I have just reason to believe is equal in quality to the best Newcastle coal. This should have the attention of the Government, as, in my opinion, it is a valuable treasure for the future of the Colony, being on Crown lands.

SATURDAY, 8 JULY, 1899.

[The Committee met at the Council Chambers, Gulgong, at 7.30 p.m.]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Richard Rouse, grazier, near Gulgong, sworn, and examined:—

- R. Rouse.  
July, 1899.
4714. *Chairman.*] How long have you been in the district? All my life.
4715. Therefore you have a thorough knowledge of the district? Yes.
4716. You are in favour, I suppose, of the extension of the railway from Mudgee? Most certainly.
4717. Will you kindly state your reasons for favouring its extension? My reason for supporting the construction of a railway from Mudgee to Coonamble is simply this: that the district most certainly demands it. In days gone by when we had no railways at all, or no railway beyond Wallerawang, this district was a very vast and important one in consequence of the natural traffic which came from other districts to the north. The natural traffic from Walgett and Coonamble, the lower Castlereagh, and the upper part of the Namoi all came through the district of Mudgee. Since the railway has been carried away west, and north and north-west, our district has been, as it were, isolated. But, notwithstanding that fact, I claim, as one with a great deal of experience, that the country between Mudgee and Gulgong, the country between Gulgong and the Talbragar, and the country from there to Mundooran and on under the western slopes of the Warrumbungle Range is the best agricultural district in Australia, bar nothing. We, in this particular portion of the district, between Gulgong and Cobborah, possess the finest agricultural land I believe in Australia, and all we want is a railway from this place to open up and develop the resources of this particular spot. From my practical experience, as far as the settlement of the soil is concerned, there is no railway that can be constructed which will give a better return as regards traffic than the railway which is proposed from Mudgee to Coonamble. It opens up a vast amount of country—a country which is undeniably good. To my mind the thing cannot possibly be disputed. Let any unprejudiced individual travel over the country, and I do not think that anything could be said against the construction of a railway from Mudgee to Coonamble. The natural features of the country certainly dictate that we ought to have this railway. Naturally anyone will say that I am an interested individual. So I am, because I have lived in this district all my lifetime. All I possess is centred in this immediate district. I am prepared to aver, and I am positively certain when I make this statement, that there is no agricultural land in the whole of New South Wales better than this particular district through which a railway from Mudgee to Coonamble will pass. I know the country well from Gulgong to Cobborah, from Cobborah to Mundooran, from Mundooran to under the western slope of the Warrumbungles, and the country on either side of this particular line I am positively certain would be opened to settlement to such an extent that if the Government liked to dispose of the land all along the route the proceeds would pay for its construction. The natural track from the lower Castlereagh, Walgett, Coonamble, and the upper part of the Namoi to the Sydney market is through Mudgee; but since the western railway has been carried on, and the N. W. railway has been carried still further, the traffic has been diverted to either one side or the other, and we are simply left out in the cold. If a paternal Government intend to settle the lands of this country, and they are so great on closer settlement as they appear to be at the present time, there is no railway that can be constructed in New South Wales, which, in my opinion, will be a better paying line than a railway from Mudgee to Coonamble. I am quite prepared to answer any questions which the Committee may put to me.
4718. What is the principal use to which the land along that line is put now? A great deal of it is put to agricultural purposes. The only market we have is the Sydney market.
4719. You think if a railway is constructed it would stimulate agricultural pursuits? I am certain of it.

R. Rouse.  
 8 July, 1899.

4720. The people of this district, of course, will have to find a market other than New South Wales for their surplus;—do you think this district could successfully compete in the markets of the world? I am quite certain of it.

4721. Is the quality up to the requirements? The land in this district is the best wheat-growing land in New South Wales.

4722. There is a large amount of leasehold land falling in very shortly in this district? We are in what we call the settled districts, but as soon as you get half way between Gulgong and Cobborah, all leasehold land—that is, in the unsettled districts—is falling in, and I am sorry to say there is no earthly chance for pastoralists to get a renewal of lease, because the land is so good for agriculture. I speak as one who has an interest in the transaction. Even if the Government make any concessions with regard to the central lessees, I do not think they will make any concessions in this part of the world.

4723. You hold some of these leases? I do.

4724. You think the land is so good that the Government would not be justified in renewing your leases? Honestly, I do not, from the agricultural point of view.

4725. Suppose the Government decide to throw it all open, do you think it will be immediately taken up? Every bit of it. They will be tumbling over one another, the same as they do in all other parts of the country, to take it up. I am positive that they will. The other day one-half of a run which I held close here was taken away and thrown open for agricultural purposes, and, I suppose, there were about twenty applicants for every block.

4726. Recently? Yes; and every acre of land will be taken up along this line as fast as ever it is thrown open.

4727. Has it been taken up by agriculturists? No.

4728. Or for pastoral purposes on a small scale? No; for the two combined. The effect of all these dry seasons is simply to force people into agriculture, and that will be the end of the whole concern. On this country, which, in my early days, was thought not fit for agriculture, the amount of agricultural land, or land which is used for agriculture, is something extraordinary. When you get down on to the lower Castlereagh I do not consider that is good agricultural land. But from here, till you get over to Coonamble, I am positive that the whole lot of that country will be taken up in agricultural areas.

4729. I suppose you think the best thing a man can do is to go in for mixed farming? No doubt about it.

4730. What area do you think would be sufficient to allow a man to get a good living for himself and family, and something more than a living;—supposing the public estate was cut up, what do you think would be a fair area to allow one selector to take? For what you call mixed farming, I reckon that any man who got 3,000 acres of land would have a good holding; he might cultivate one-half of that area.

4731. Taking the district from Gulgong to Cobborah, what proportion of that land do you think would be suitable for agriculture, if it were cut up into 3,000-acre blocks? Seventy-five per cent. of it.

4732. Do you know whether any of the wheat grown in this district has found a market in other parts? We grow a tremendous lot of wheat in this district, and we have to do the best we can with it. We have a mill in the town. An immense amount of wheat is bought here, ground, and sent away to the best market the miller can find. A great deal of it, of course, goes towards Sydney, because we cannot get out west from here. If we had a direct railway out to Coonamble, and in that direction, nearly all the stuff we raise here would be sent outwards.

4733. If the land is pretty good right up to Coonamble, depend upon it they would have the pull on your people here inasmuch as they would be closer? We will chance all that. If each individual locality cannot live on its own it should not have a railway at all. Immediately round here this district can supply its own railway; Cobborah will do the same; Muntooran will do the same. We will chance all the rest of it outside.

4734. Finding an outside market, do you know whether any of the agriculturists are satisfied that their prospects will be good? I am certain that they are.

4735. So that if a railway were constructed you think this district would support it? I am positive of it.

4736. Do you know what the loss is already on the Mudgee extension? I believe it is a considerable loss.

4737. Do you think the extension of that railway west will in any way reduce that loss? I am certain that will cover it, because I say, without any fear of contradiction, we live in the best district in New South Wales, and have the best average rainfall. In my experience of over forty years, I have never known more than two failures of a crop in this district in all that time—in fact, only one failure since we have had Sir John Robertson's Land Act of 1862.

4738. Then we are to take it that it is your opinion that if the line is constructed to Coonamble you will convert the line from Wallerawang to Mudgee from a non-paying to a paying one? I am certain of it.

4739. Can you tell us what is the carrying capacity of this country for sheep? No; I am not sufficiently well up in the subject. This country here, as it is, will carry a sheep to the acre easily.

4740. In any season? I take the average season.

4741. It has been stated in evidence that if a railway is constructed the farmer, or the small sheep man, will truck his stock from the nearest railway station;—supposing the seasons are good, and there is plenty of grass along the route, do you think they will truck their stock? They would certainly truck their stock. No man can travel sheep along the road now.

4742. Why? Because of the state of the stock routes. Everywhere along the line everybody has sheep or cattle on the stock route; there is no grass. You cannot send any sheep down the line now from Mudgee to Sydney. In the best seasons you get you cannot send any down.

4743. Could they not bring them from farms out here to Mudgee? They bring them from farms and truck them at Mudgee.

4744. We are speaking of fats? Yes.

4745. Is it a fact that now the land has been taken up you have small lanes to drive them through, and, therefore, that would prevent them from being driven to a railway station? Yes.

4746. We have been informed that it would pay to travel a couple of thousand; but that now it cannot be done, because they have not got the width of land to feed over? There is no opportunity of driving stock now alongside a railway. In other days we used to send our stock from here to Sydney by the road, but all that thing has come to an end. There is no opportunity to drive stock now along the road, because there is no grass. All the land is taken up along the railway, and the consequence is that they must fly to the railway to send their stock to market. All the stock which we people in this district send to Flemington is all sent by rail. There is not a solitary sheep or beast sent in any other way.

4747. There can be no competition by the road against the railway, and the further the railway is put out the greater settlement and the less opportunity of sending stock by road? Yes.

4748.

- R. Rouse. 4748. Have you any other information to give? My idea is that the settlement of the country demands a railway from Mudgee to Coonamble. We are living in one of the best districts in New South Wales, and all we want is a market for our produce. We want a market out into the west, because, as an old resident, as an old Australian, it does not astonish me one bit that we have had all these seasons of drought. We have had them before. A great many of our people know nothing whatever of New South Wales; men who unfortunately legislate for the country know nothing whatever about the droughts which have occurred before, and this is only a repetition of what we have had in other days, and what we will have to have. What I have found myself is that good seasons never made this country. There is nothing in too much rain; there is no opportunity for industry, and the dry seasons we have had during the last two or three years will merely lead our people up to the idea that they will have to improve, to cultivate; that they will have to keep their stock from starving, because in this country there always has been, from the foundation of the settlement, either a tremendous amount of rain or any amount of drought—drought, as a rule, being in the ascendant. The only way to save this country is to put settlement on the land, and the settlement of the country must be brought about by the construction of railways through all the available agricultural country we have. This country from Mudgee to Coonamble, if it is fairly tested and looked upon dispassionately, simply demands a railway, and I am certain that it will be the best paying railway we have in New South Wales. That is all I have to say.
- 8 July, 1899. 4749. Have you had any experience of country through which railways have been constructed somewhat similar to this country? Yes; I have seen the country up in the north, and I know something of the country to the south, but I build my ideas on the fact that this place has the best average rainfall in New South Wales for a wheat-growing district, and that within the last forty years I have only known two years in which you might call the wheat crop here a failure. I think that is a very good record for a place. Our average rainfall is 26 inches. If we only get 12 or 14 inches from the beginning of winter to the beginning of summer our wheat crop is assured.
4750. We may take it as your opinion that if it was justifiable to construct some other lines which are supposed to pay, the construction of this railway is more justifiable? I am certain of it. All my life I have lived in this district. I have never known any loss of stock in the district worth talking about. While other parts of the Colony have suffered more or less, we have never suffered here anything to speak of. There have been bad seasons when the dams have been dry, but it is not worth talking about. In 1895, when there was a loss of about 15,000,000 sheep in the Colony, our loss here was nothing, and in 1897 it was the same thing. 1888 was the worst year we ever knew. When we had only a rainfall of 10½ inches in this district we lost no stock at all.
4751. *Mr. Dick.*] Do I understand you to say that it will be necessary to give a man 3,000 acres in this district in order to enable him to make a fair living by agriculture? No; for what you call mixed farming. I should say if a man had 640 acres of a good farm he would make a good living out of it.
4752. That is, with a railway? Yes; I am only talking about mixed farming.
4753. You mean that if a man had 640 acres of agricultural land, with a railway, he could make a good living off it? Yes; a first-rate living.
4754. *Mr. Watson.*] You stated that there are some leases which are likely to fall in shortly about the district;—do I understand that these leases are within the Central Division? Yes.
4755. When you said that a number of leases would shortly be open to settlement, and would be eagerly sought for if a railway were constructed, you were referring more particularly to land beyond Mundooran, towards Coonamble? Exactly.
4756. *Mr. Trickett.*] Did you write a letter to Mr. G. H. Cox, offering to give the land free for the railway if it passed through your property? I did, and also intimated that I had heard that Messrs. George and Richard Rouse would do the same thing. I can only speak for myself. Mr. Richard Rouse is here to speak for himself. I told Mr. Cox that if the railway was measured through any portion of my land on the way to Coonamble I would give the land.
4757. Does it go through any great length of your property? A good bit of it.
4758. How many miles altogether? I suppose about 3 miles.
4759. Do you think many of the landholders would do the same thing in this district? I think they will do so.

Richard Rouse, jun., grazier, near Gulgong, sworn, and examined:—

- R. Rouse, jun. 4760. *Chairman.*] What are you? I am a grazier, at Birigambil, about 5 or 6 miles north-west from Gulgong.
- 8 July, 1899. 4761. *Mr. Watson.*] You know the land from Mudgee to Gulgong, and generally along the route of the proposed railway from Mudgee to Coonamble? I do; I have travelled over most of it.
4762. Will you briefly describe the character of the country? I think the land in many instances is very suitable for agriculture; in all instances for grazing. I should estimate that fully a fourth would be thoroughly good agricultural land, and I think it would thoroughly repay the Colony to open up that country with a railway. I think the Mudgee railway will ever be a white elephant while it remains there. I think that if it was taken on to Coonamble there is every likelihood of its paying well. Large areas, I think, would be taken up for agriculture, more particularly for mixed farming.
4763. In your estimate of the proportion of the land which would be suitable for agriculture, would you include the usual distance which a railway is taken to serve on either side—20 miles? Yes; I am sure there would be fully a fourth within 20 miles of each side of the railway. I think it would open up the country in a very desirable way between the Northern railway and the North-western railway. That tract of country, probably 400 or 500 miles wide, would be cut about equally by the proposed line, and would be ample to feed such railway, I should think.
4764. Do you think the construction of the line through to Coonamble would have any great effect upon agricultural production in and around Gulgong? I think it will stimulate it very much. I think the whole of the land along the railway would be taken up readily.
4765. Speaking more particularly of the country round Gulgong, do you think the 18-miles haulage from Mudgee is any great disadvantage to people round Gulgong from an agricultural standpoint? Very much so. Carriage could not be got from here to Mudgee under about 10s. a ton, which must naturally be a great drawback. You have to compete against Mudgee and other districts along the line, and, of course, you cannot do so favourably when you are handicapped by carriage.
4766. Is it not a general assumption that people can afford to cart wheat on decent roads a distance not exceeding 20 miles to a railway station—that is, from either side of the line? Such has not been my experience.
- 4767.

4767. Do you think, then, the fact that they have to draw their wheat 18 miles to Mudgee is so serious a disadvantage to people round here, as to retard settlement? I am quite certain of it.
4768. The reason I asked that question was because I thought that perhaps the people round Gulgong were hopeful that with the construction of a light line right through, a market out west would be of some advantage to them? It would, on account of the frequent droughts out there. We could supply them with produce when they were probably unable to grow it for themselves.
4769. At Coonamble we were shown some land which seemed suitable for wheat-growing—that is, the timbered land on red soil; and we were informed that there was a very great quantity in addition to what we saw, which with a fair season would produce good wheat? I quite think so; but the rainfall is not to be relied on.
4770. You think that even if they did in an ordinary season produce a lot of wheat occasionally, when they had a drought your district would be able to supply the deficiency? I quite think so. On the Macquarie I have seen a crop of wheat looking quite well, and in a week it was almost cut off by the hot winds and dry times.
4771. Did they have any experience of that kind down there last year? I cannot say. We sold our station in that direction some few years ago, and I cannot speak of it now.
4772. What is the average yield of wheat in this district? I do not quite know the yield; but I should think it is from 15 to 20 bushels, taking one season with another.
4773. Have you done any farming yourself? Yes; I cannot say that I have ever had less than 20 bushels per acre, and up to 38 bushels.
4774. You have been growing wheat for some years? I have.
4775. In your evidence at the previous inquiry you stated that you thought at that time, only a year ago, of going in for the share-system of agriculture;—has there been any development in that direction since then? Not exactly close here; but we have done something of that kind at Cobborah, and we are doing the same thing this present season.
4776. You have not gained sufficient experience yet to offer an opinion as to how it works? No.
4777. Do you think that many of the large landholders, if a railway were carried through here, would go in for the share-system of agriculture? I think so. I think the better land would pay them better under agriculture than it would if used for pastoral purposes only.
4778. They would be naturally tempted to let land to people on some such system as that if offers were made? I think so. I am told by those who have tried that system, more particularly on the Southern line, that they have been very successful.
4779. Between Gulgong and Munderooran there is a good deal of hilly, ridgy country, heavily timbered;—is it capable of improvement to any extent, do you think? I think it would be very vastly improved by ringbarking and scrubbing, and that sort of thing. Some portions of it would be very suited for agriculture. I do not pretend to say that all portions would do for agriculture; but the gentle slopes would be suitable.
4780. Do you think that rougher country would be worth while improving, even for sheep-growing? I am quite satisfied that it would. I believe it could be improved to the extent of 50 per cent. by ringbarking and scrubbing.
4781. Out towards Munderooran, on the north-east side of the proposed line from Mudgee, there is a large tract of country, about Four-mile Creek, which, although open to cultivation, is untenanted? Some portion of it is very bad.
4782. Do you think that with the construction of a railway in that direction there would be a probability of that land being taken up? I do not, save perhaps for 5 or 6 miles along that line. I think it is too rough; but I think on this side of it, and beyond it, there would be ample scope for cultivation.
4783. Do you know the district from Gulgong to the nearest station on the Western railway, as the crow flies? I suppose Maryville would be about the closest point, and it is about 40 miles straight from here.
4784. It is generally held that the country for about 20 miles on either side of the railway is fairly within its influence;—do you think that if a line were constructed from Mudgee to Gulgong, and thence to Cobborah, there would be a sufficient tract of country between that line and the Western railway—to allow of each railway getting traffic sufficient to keep things going? I really do think so, because the Cudgebong Creek and Tallewang district between Gulgong and Cobborah is most suitable for agriculture. It would be very hard to find better land anywhere I think.
4785. Is Cobborah further from the Western railway than Gulgong? I should think Cobborah would be about 50 miles.
4786. If the country between Gulgong and the Western railway were sufficiently productive to give traffic to this projected line and the Western railway, that contention would apply even with greater force to the country between Cobborah and the nearest point on the Western railway? I think so. All up and down the Talbragar the land is very fertile, and I am quite sure it would give splendid yields of both wheat and maize.
4787. In view of the fact that it is estimated to cost nearly half a million to construct 150 miles of railway from Mudgee to Coonamble, do you think you know sufficient of the country to express an opinion as to whether it would probably pay? I know the country thoroughly well. I would not like to say that I am competent to judge as to its paying, but I believe it would. Large areas would be under cultivation and under mixed farming; both produce and stock would be sent by rail. The roads are nearly all fenced, and the travelling stock reserves—to my idea so imprudently allowed by the Government to be occupied by the different holders—are so completely eaten out that it is almost impossible to travel stock now.
4788. Is it not a fact that where they are not ostensibly occupied by anyone in particular they are eaten out just the same by adjoining holders? I am sorry to say so. Only a few days ago I represented Mudgee at a conference of delegates in which we advocated that caretakers be put on the travelling stock reserves, and a trifling charge made to travelling stock to cover such expenditure.
4789. But still you think that probably the stock-owners would send at any rate fat stock along the line? I think so. The stock would not suffer to the same extent going by rail, and it would be much quicker. Then, again, travelling a small quantity of stock becomes too costly if sent by road.
4790. There would be no probability of their sending store stock by rail? No, except in drought, when I think it would be taken advantage of.
4791. You think the line would probably pay if constructed right through to Coonamble? I do.
4792. Do you think that if it were constructed for only a portion of that distance—say as far as Munderooran—it would pay? It probably would, but the further it went the better I think it would pay.
4793. That is, tapping such a large and important district as Coonamble is? Yes; it would be a great help to it.

R. Rouse, jun. 4794. Do you know whether many of the landholders whose acquaintance you have would be willing to give their land free if the railway were taken through their holdings? I only know what Mr. George Henry Cox told me. He said he had consented to give the land; and I think he said Mr. Atkinson, who lives between Mudgee and here, Mr. Richard Rouse, of Guntawang, Mr. Ernest Bowman, and Mr. E. J. Lowe had also done so. On behalf of the executors of the late George Rouse I can promise you that they will do the same.

8 July, 1899.

4795. Where would these properties lie mainly? Between Mudgee and Cobborah.

4796. It is between those points, as you may notice by the map, that the greatest amount of private land is passed through by the projected line? Decidedly.

4797. From that on you get reserves, or other Crown land, nearly all the way? Yes.

4798. It would be only between Mudgee and Cobborah that private land would be to any great extent required? Yes. I do not think it would interfere with private land very much except there.

4799. You think there is a probability of the Government getting the private land free between those two points if the line is constructed? I think so, from what Mr. George Henry Cox told me.

Christopher Reid Young, storekeeper and miller, Gulgong, sworn, and examined:—

C. R. Young. 4800. *Mr. Trickett.*] You have been here about thirty years, and have been engaged in business all that time? Yes, since 1870.

8 July, 1899.

4801. When the former Committee was here you made a statement; will you make a statement now? In the first place, we have a railway made from Wallerawang to Mudgee. If it never was intended to make an extension from Mudgee, I do not know what the line from Wallerawang to Mudgee was built for. It would be put down, I think, as a very foolish transaction, because, when the railway arrives at Mudgee, taking into consideration the country it has come through from Wallerawang, it is only arriving at the beginning of good land. It reminds me of a man sinking, at great expense, a very deep shaft, providing a heavy water-pump and so forth, tunnelling out east, west, south, and north, and after, with a great deal of labour, striking gold, then leaving it for something else. Since the former Committee visited Gulgong we have not gone back at all. I endorse what I said then. I endorse everything the Messrs. Rouse said; it is of no use to go in for repetition. In this last season, when there was a drought all over the country, and great loss suffered, we had the greatest crop that ever we had in this district. It was a most prolific crop, going up to 40 bushels to the acre. The next best season we have had for wheat during the last thirty years to my knowledge was in a drougthy year too. We had very little rain, but chanced to get that rain in three lots at the right time, and we had then a splendid crop of wheat. That was in a dry season.

4802. Is that a general rule in this district, that you do get rain at the right time? No, not always. It is always the rule that we get more rain generally than anywhere else about. We have a rainfall of 26 inches. In my time we have only missed getting it once. You are aware that it does not take very much rain to produce a good crop of wheat if you get the rain at the right time. There is no doubt that since last year the population is increasing here. In travelling round the district you can notice places getting fenced in, little houses getting built, and so forth, and the acreage put under cultivation increasing every year. I have nothing further to say to show the necessity for a railway.

4803. You stated at the previous inquiry that in March, 1890, you purchased 10,000 bushels of wheat, and that in 1898 you had purchased, up to April, 75,000 bushels? Yes.

4804. Has that number of bushels been exceeded this year? Over 100,000 bushels this year.

4805. Are you still buying wheat? Yes.

4806. Is the quality of the wheat good in this district? Splendid; it is extra good, indeed, this year.

4807. You have had opportunities of testing that at public shows, have you not;—did you not get a prize somewhere? I did for flour at the time I gave that evidence, showing that it is splendid. I have now in the mill an order for 20 tons of flour to go to London. In my previous evidence I said that a gentleman in Sydney had bought some flour from me, because of its dry quality, for sending to Fiji. Another gentleman has purchased 20 tons for London, to leave on the 17th of the month.

4808. Wheat is not subject to much rust in this district? No.

4809. If this wheat-growing is to continue in all parts of this red-soil country where people are advocating railway extension, you, as a large dealer in wheat, possibly have studied the question;—what is to become of all this wheat? The over-supply will have to merge into the world's wheat, and supply wherever there is a shortage. We cannot take that chance without railway communication. They have facilities for getting stuff out on the Western line; but others do not get into competition without a railway. I think those who spend their money outside here taking up land are justly entitled to railway communication.

4810. What do you pay the grower for the wheat? Two shillings and sixpence is the price we pay this season at the mill.

4811. What profit would that give the grower? It all depends upon the quality of the land he cultivates and the class of machinery he uses. You can farm at 2s. 6d. a bushel, and make lots of money if your farm is large enough, and at less than that.

4812. The evidence we had at Cobborah yesterday was that 2s. a bushel on the land right back for a certain distance would pay well in the case of large areas? I believe that.

4813. Would your price of 2s. 6d. a bushel for delivery at your mill give them 2s. a bushel at the present time? Hardly; it depends upon how far out you are.

4814. At Cobborah would it? Yes; about 2s.

4815. But with railway communication to here it would pay them better? Yes.

4816. Therefore you think their statement as to the 2s. a bushel is about a fair thing? It is fair. They would have the benefit then of competition; the freight would hardly cost anything then.

4817. You would have wheat-buyers at all these stations, and that would cause competition? We here, at 2s. 6d. a bushel, have always been in advance of Sydney. The bulk of the wheat comes from between Gulgong and the Talbragar. I have had considerable experience in shipping wheat to Sydney. It takes 6½d. a bushel to clear wheat from Gulgong to Sydney, and that includes commission and loss in weight, which is considerable sometimes; 2s. 6d. a bushel here would be equal to 3s. 0½d. in Sydney, so that we have been actually above the Sydney price.

4818. It also shows that, to get wheat now from Cobborah to Gulgong, a distance of 30 miles, it costs half as much as it costs to take wheat all the way to Sydney by train? Exactly.

4819. There is no doubt, I suppose, that with a railway through a country like this, the farmer would take his wheat to the nearest point at which he could strike the railway? Yes.

4820. It would be to his advantage in that way? Yes.

4821.

4821. There would be no fear of a man carting his wheat 20 or 30 miles, so as to save anything on the railway, because it would be enormously to his advantage to get his produce to the nearest station? Yes; the same as in Victoria. We would very likely be purchasers at all these stations. In Victoria wheat is purchased at all stations and sidings. In all probability, not only would wheat go to Sydney, but would be bought up along the line as it ripened, which makes it a certainty for farmers to bring it along the line. C. R. Young.  
8 July, 1899.
4822. What is the rate of freight between Gulgong and Mudgee? Ten shillings a ton; perhaps a little less for back freight coming out. For loading both ways it averages about 7s. 6d. a ton.
4823. Goods coming to Gulgong, and places along the line from Sydney, would, of course, always be shot down at their destination? Yes.
4824. Would there be any competition against the railway? I do not think so.
4825. Seeing that you have to pay 10s. and 7s. 6d. a ton for a distance of 17 miles, and that the railway freight would be so much less than that, according to current rates, they would employ the railway where possible? Most undoubtedly.
4826. That would apply to a certain extent; but how far on this side of Mudgee do you think the people would convey their goods to Mudgee station? They would go to the nearest siding.
4827. Mr. Harper, in his estimate of the traffic on the Dubbo-Coonamble line, reckons that people will cart their wheat and other goods to Dubbo station, a distance of 12 miles from the Coonamble direction;—do you think they would do the same? I think they would go about half-way, unless there was a better road, or some inducement to make them go a mile or two the other way.
4828. From your knowledge of the district, do you think this railway could expect to get any freight outwards towards Coonamble and beyond? Yes.
4829. In what shape? Station goods.
4830. Of course, the population would increase if the railway were taken out there? It would increase every year. In America they run railways straight out into new country, and population follows. Population would follow the breaking up of the land here.
4831. In a dry season out there would there be a considerable amount of freight in fodder? Of course.
4832. We have been told that it would be a very large item? A big item.
4833. Because you can always get crops here when they cannot get crops out there? Yes. Hay has gone this season from Mudgee all over the country. I think it has crossed on to the Southern line by way of Bathurst from Mudgee.
4834. As regards the mining industry in and about Gulgong, can you give the Committee some information? That fluctuates, of course. It is a little quieter than it was last year, although there is a little impetus now. There is a Government diamond drill here to test the deep leads; it is just commencing work now. From a business point of view, mining is always looked at as a good show—as something which would break out some day and astonish the Colony, although there is not outlet, no speculation.
4835. Has the population in the mining parts visibly increased or decreased during the last year or so? It is a little worse than it was twelve months ago, although the mining population is good. About two years ago there was a little boom, which lasted a bit. There was a nice mine which was worked, and which is still at work. There was a bit of a rush at Yambal and Tallewang. That made a boom about two years ago, which lasted for a while. The same population, or nearly so, is here.
4836. As far as you know, the mining population get a fair living? Yes.
4837. It is generally carried on by an individual or a small party? Yes; there are no large companies at present.
4838. Do you think any other industries are likely to spring up in this district in the shape of dairying? Of course, the railway would make an inducement. In reference to the mining, I may mention that we have two pioneers in the room to-night?
4839. Is there anything else you would like to add? No.

John Tuxford, Gulgong, sworn, and examined:—

4840. *Mr. Dick.*] Have you resided in the district long? Twenty-six years.
4841. You have a fair knowledge of the district to be served by the proposed line? Yes.
4842. Did you hear the evidence given by the previous witness? I did.
4843. Is there any other information you can give which will be of importance to the Committee in coming to a decision on these rival routes;—can you give anything in addition to your previous evidence? I do not think I can.
4844. Would you corroborate in the main all that has been said about this line? Yes.
4845. Would you corroborate the evidence about the prospects of the line proving profitable? I could not corroborate that, because I do not know. I have an idea that it would be profitable in the course of time.
4846. Would you endorse their statements about the character of the country and its capabilities? I can endorse their statements about the character of the Gulgong country, but not as to the country outside.
4847. There is a tract of country lying between Cobborah and Gulgong;—could you give the Committee a general description of that tract of country on both sides of the proposed railway? About Tallewang, and out that side, I could. I only know the country on the eastern side.
4848. Would you describe that country as land good for agriculture? Yes, right through.
4849. What percentage of it? I should say 50 per cent.—that is, for about 12 miles.
4850. At what distance from the line on that side does the agricultural land extend? That I could not say.
4851. Could you offer any opinion upon that? I should say 7 or 8 miles.
4852. Is there anything else you can tell the Committee? No; I have not been out that way. I have only been out Tallewang way.

J. Tuxford.  
8 July, 1899.

George Steele, sergeant of police, Gulgong, sworn, and examined:—

4853. *Mr. Trickett.*] You were examined before a former Committee, and produced some statistics with reference to agricultural returns? Yes.
4854. How many holdings are there in your district? Within a radius of about 10 miles from Gulgong, perhaps a little further in one or two directions, and much less in others, there are about 286 holdings, containing about 75,620 of freehold land. In those holdings 7,128 acres were under cultivation this year, 4,982 acres being under wheat, and the rest principally under maize. The wheat yield was 77,586 bushels.

G. Steele.  
8 July, 1899.

G. Steele. 4855. Have you prepared a table showing the area under wheat, and the yield for several years? Yes; it is as follows:—  
8 July, 1899.

TABLE showing the area under wheat, and the yield for the years 1895, 1896, 1897, and 1898, within a radius of about 12 miles from Gulgong.

Years.	Area under wheat for grain.	Yield.
1895 .....	1,740 acres .....	13,849 bushels.
1896 .....	3,044 „ .....	34,000 „
1897 .....	3,525 „ .....	52,875 „
1898 .....	4,982 „ .....	77,586 „

4856. Has the yield of wheat per acre been steadily increasing? No; it fluctuates. The yield last year was very good.

4857. I notice from the return you have given that it averaged in 1895 about 8 bushels; in 1896, 11 bushels; and in 1897, 15 bushels;—this has been a better year for wheat, has it not? It has.

4858. Have you the returns in reference to the mining? Last year there were between 4,000 and 5,000 ounces of gold purchased locally; that is all alluvial gold, or pretty nearly so.

4859. Were the returns you gave at the previous inquiry calculated in a similar way? Yes.

4860. Then there has been a falling off in the amount of gold? Yes.

4861. How do you account for that? There are a few rushes—Helvetia, and Yamble, and Scrubby Gulley. There was gold won there previous to last year. There was a considerable falling off in those places during 1898. Still the number of miners do not appear to have decreased. This year up to date about 325 miners have applied at the office for miners' rights.

4862. The mining is not on the increase just now? What the amount of gold won this year is I have no idea. I have not made any inquiry at the banks or other places; but the number of men who have applied for miners' rights is more than the number of miners' rights issued up to this time last year.

4863. That would indicate that more men are engaged in mining? Decidedly.

4864. Getting back to agriculture—have you had opportunities of conversing with, and finding out the opinions of men who are engaged in wheat-growing? Yes.

4865. Are they satisfied with their prospects? They appear to be very well satisfied.

4866. There is a very great increase in the production, and also in the area of land under wheat? Yes.

4867. Have you any idea whether they would go more generally into wheat-growing if they had better means of communication with the markets? I decidedly think so.

4868. You think they are quite prepared to enter into competition in the world's market if they get a railway into their district? I should think so.

4869. Have you had any conversation with any of them with reference to that aspect? Yes; I have heard the farmers express the opinion that if they had railway communication they would certainly put in larger areas, under wheat principally.

4870. From your observation is that the general feeling in the district? Yes.

4871. Have you anything to add to the evidence you gave before the last Committee? No.

4872. Is the population generally increasing in your district? It is. The population within 10 miles is about 3,000.

4873. Do you verify the evidence which you gave before the former Committee? Yes.

Harold Dixon Voss, manager, Bank of New South Wales, Gulgong, sworn, and examined:—

H. D. Voss. 4874. *Mr. Dick.*] You are a bank manager? I am manager of the Bank of New South Wales here. I have lived in the district nearly seventeen years.

8 July, 1899. 4875. From your long association with the business people of this district, do you care to offer an opinion on its general stability and its progress? I have not the slightest hesitation in saying that I consider this is one of the soundest and most prosperous districts in the Colony.

4876. How far do your business operations take you out on the route of the proposed railway? Fifty miles—even more.

4877. Taking the farmers and selectors as a class, apart from the larger landholders, can you favour the Committee with an opinion as to their position during the period of your residence here? I consider, almost without exception, they have prospered and progressed very materially since I have been here.

4878. Can you say whether the cultivation and growing of wheat has materially added to their prosperity? Yes; I think that where there has been mixed farming, as a general rule, it has assisted them very materially.

4879. What do you think would be the effect of the construction of a railway from this district to Coonamble? I think it would increase the population wherever there is land to take up.

4880. You think there would be a great demand for any agricultural land which would be thrown open for settlement along the line? I am quite sure of that.

4881. Can you favour the Committee with some information concerning the mining industry in this district, and tell us what you think of its future? About two years ago there was a little boom in mining. They got a few large quantities; but I think even now there are quite as many miners working here, though they are getting smaller quantities.

4882. You think there is a likelihood of a considerable number of miners remaining in the district at work, even without these small booms? Yes, for many years. It is a thing you cannot tell much about; mining is up and down.

4883. Do you know the land between Gulgong and Cobborah, say, for 20 miles on each side of the proposed railway? I have been over a good deal of it pretty well on both sides.

4884. Will you describe the character of that country to the Committee? The Goodiman Ranges are poor, but on each side of the ranges the land is really good farming land. I heard a remark about a detour being made to the north-east of Cobborah. I think they lose sight of the fact that there is a very rich district on the south side of the Cobborah-road—I refer to the Goolma district. The Cobborah-road goes between Goolma and the Talbragar.

4885. How far is Goolma from Gulgong in a westerly direction? 20 miles; that is the best part of the district; it is all good along there.

4886. Would not the traffic from that district, no matter whether you made a detour or not, come to Gulgong? Not if they made the detour.

4887. Gulgong would not be shifted—the detour is further on from Gulgong? That may be possible; by the line going as originally proposed without the detour, you would be between the two good countries.

4888. You are speaking of the former proposal? Yes.

4889

4889. Do you think the former proposal would more equally split up the good country than the line now before the Committee? That is exactly what I mean. H. D. Voss.
4890. In other words, you think the railway should not proceed almost in a straight line from Gulgong towards Mundooran, but should make the detour to the west, as put before a former Committee? I do not think the proposed distance of the detour would affect it at all. I had no idea it was so small. 8 July, 1899.
4891. Can you give the Committee any further information concerning the district and its possibilities which may be of value to them? I do not think I can give much more than I have given before.

William Rudolph Bentzen, Manager, Australian Joint Stock Bank, Gulgong, sworn, and examined:—

4892. *Chairman.*] You heard the evidence given by Mr. Voss? Yes. W. R. Bentzen.
4893. Do you corroborate all he said? I do. 8 July, 1899.
4894. In addition to that evidence, have you anything to state? Mr. Bowman was in to-day, and he would have been here to-night, if he could have stayed. He told me that as soon as it was decided that the railway should come from Mudgee to Coonamble, he would at once call for tenders for preparing 1,000 acres, and put the land under wheat cultivation; also that Mr. Lowe would do the same thing.
4895. In what direction do these gentlemen live? Mr. G. M. Bowman is living north-west.
4896. Anywhere near the surveyed line? I think so. He lives at Wargundy, near Denison Town.
4897. Does Mr. Lowe live in the same direction? His property adjoins Mr. Bowman's. It is station property.
4898. I suppose you know the land sales which take place in the district? Yes.
4899. Do you know whether any persons are leaving the district, by reason of the fact that they cannot make a do of it? There are no such cases. The population is increasing, and people are coming here every day—every month you may say. They are only waiting for the lands to be thrown open here to be able to take up a holding and settle down. Of course the railway will do that.
4900. Generally speaking, the desire is to come, not to leave? Exactly.
4901. You look upon that as being a good sign? Exactly, from a banking point of view.
4902. Is there anything else you wish to add? No.

John Walter Travis, sheep-overseer, near Gulgong, sworn, and examined:—

4903. *Mr. Trickett.*] You are superintendent for Mr. Rouse? Yes. J. W. Travis.
4904. How many years have you been in the district? Thirty-five years in the Mudgee and Bogan districts. Dubbo, Bourke, and Coonamble, and all these places joined together used to be called the Bogan district. 8 July, 1899.
4905. Will you give us your opinion of this district as a sheep-growing country? It is all very good sheep country from Gulgong to Coonamble.
4906. Carrying, in an all round season, about how many sheep to the acre? From a sheep to a sheep and a half to the acre.
4907. You heard Mr. Rouse and the other witnesses give their evidence? I did.
4908. Do you endorse their evidence with regard to the suitability of the district for agriculture? I do.
4909. You think that a considerable portion of the country is suitable for agriculture? Fully one-fourth.
4910. Especially for wheat-growing? Yes.
4911. I suppose in your business you have travelled all over the country pretty well? Yes.
4912. How do you think a railway would benefit this district? I think it would benefit the district a great deal if there were a railway extended from Mudgee anywhere outwards. I think it would benefit the district of Mudgee.
4913. By introducing a closer population? By introducing a larger population to settle down. The country would be taken up, more agricultural land would be used, and stock would be taken to market.
4914. If a man got a picked bit of land, all suitable for agriculture, what area do you think he could do with? I think, for agricultural purposes, if he got a picked piece of land, he could make a good living on 300 acres.
4915. By cultivating the whole of that? Yes.
4916. That would be for an out-and-out farmer? Yes.
4917. Taking the bad land with the good land, how much of that do you think he would want, to go in for mixed farming? 500 acres.
4918. He could have a few sheep, and till how much of that land? He could till from 100 to 150 acres.
4919. And make a living on that area? Yes; and use the other as pasturage.
4920. You have noticed, I suppose, that the district has progressed largely in agriculture of late? Yes; ever since I have known it.
4921. You have heard the witnesses' statements as to the route of the line;—do you think it is well chosen? Yes. I think it is a very well chosen line from Mudgee to Gulgong, from Gulgong to Cobborah, from Cobborah to Mundooran, and from Mundooran to Coonamble. I think that is well chosen, as there is good country on both sides,—in some places for 50 miles, and in some places for only 20 miles.
4922. You could not suggest any better route between Gulgong, and (say) Mundooran, which is the difficult section of the line, which would avoid any large amount of expenditure in construction, as far as you know? No.
4923. It is all broken country? Yes.
4924. *Chairman.*] You stated just now that you thought 300 acres under wheat would be sufficient to enable a man to get a living? Yes.
4925. We want to settle people on the land with a view to do more than make a living;—could a man make more than a living on that area? That depends on a man's energy. If a man worked well, and he happened to be prosperous, he could.
4926. We all know that if a man does not work he will not get anything? If a man is energetic and works his ground—some men can work ground to much more advantage than others—he may make a little more than another; but I do not think any man will make a fortune on 300 acres. I think a man can make a good living on that area.
4927. Nothing beyond a good living? No; and that of course would be on picked country.

John Scully, miner, Gulgong, sworn, and examined:—

- J. Scully. 4928. *Mr. Watson.*] Have you been long in the district? Since 1870.  
 4929. Have you been engaged in mining all that time? Pretty well.  
 8 July, 1899. 4930. You ought to have a pretty fair idea of the mining possibilities of the district? I have a good opinion of the district.  
 4931. There has been a lot of gold produced here? Yes.  
 4932. Mostly alluvial? Yes; but there have been a few reefs.  
 4933. What have been the reefing prospects so far? Very little has been done to them. When they have gone down some way they have got poor. Want of sufficient capital to work the reefs has been the principal trouble.  
 4934. What would you call poor;—what was the width of the reefs which have been opened by various parties? Six inches, 4 inches, 18 inches, 2 feet.  
 4935. What was the yield of the 2-foot reef? 15 dwt. to 20 dwt. The Welcome Reef, I think, went 3 oz. to the ton on my machine at Reedy Creek.  
 4936. To what depth did they carry that gold? I think they carried on to about 150 feet, and they lost the run of it.  
 4937. The reef or the shoot of gold? In all probability the shoot of gold.  
 4938. Generally speaking, there has been no attempt on a large scale to test the reefing possibilities of the district? No. At the Royal George, about twenty-eight years ago, they had a twenty-head battery; and although I have seen an account that it went 2 oz. and 2 or 3 dwt. to the ton for 12 tons, the Royal George got into debt, and the bank sold the stores off. About three years ago I took it up and went on it, formed a syndicate, and a ten-head battery is on it.  
 4939. What is the size of the reef and what does it yield per ton? We had one crushing. We sent 9 tons 17 cwt. to Sydney; it went 1 oz. 4 dwt.; some of it went 1 oz. 11 dwt. per ton.  
 4940. You were so satisfied that you erected a battery? Yes; it is running now.  
 4941. What sort of reef are you on? It varies from 4 to 18 inches, 20 inches, and 24 inches in odd places; it branches in and out.  
 4942. Do you think your battery will be able to save an ounce per ton? In all probability it may.  
 4943. Have you had any crushing yet? We sent 3 tons to Sydney.  
 4944. Have you had any retorting of the amalgam to find out what is going through the battery? Yes.  
 4945. How much is that? I suppose it is about 14 dwt.  
 4946. You do not expect to get as much out of a battery as you would out of a better method of treatment in Sydney? We have as good a method on the Royal George as you have at Sydney.  
 4947. You must go through more than the ordinary battery treatment to get that? We take care of the tailings, and put them through a process as they do in Sydney.  
 4948. In the return you got from Sydney, which went, I think, 1 oz. 4 dwt., did you have included in that the result of the tailings? I do not think it was; but I am not sure.  
 4949. You have no recollection of the tailings having been assayed with a view to find what was left there? I do not think so.  
 4950. That is one instance of where a reef has been worked successfully within the district? Yes; and the Mines Department gave aid. Great credit is due to the Mines Department for granting aid. If they grant aid in many other places, and a little more capital comes in, there is no doubt that a number of reefs will be developed, and will pay.  
 4951. In what way was the aid granted? It was aid to sink.  
 4952. Did you get any aid for driving? No.  
 4953. What depth are you at now? 170 feet is the depth I have sunk in the shaft.  
 4954. You are stopping up above that level? Yes.  
 4955. Speaking generally, what do you think of the mining prospects of the district—good, bad, or indifferent? I am under the impression that it would be benefited by capital coming in.  
 4956. You think there will be an increase in the amount of mining? I do, if capital comes in; but you cannot do it without capital in many of these places.  
 4957. Do you think the prospects of the district are sufficient to encourage capital to come in? I do think so.  
 4958. You think there is a probability of a lot of mining shows being taken up? I do.  
 4959. Therefore, we may expect an increase, you think, in the mining population in the near future? I think so.  
 4960. Are there many men making a living in the alluvial diggings? I have had very little time for going about the district.  
 4961. Still I suppose that, like most old miners, you have a chat with other miners occasionally? It is very little time I have allowed myself the last few years for that. I have been engaged out there at the Royal George. My interests are centred in the Royal George, and I have not got much time to go about.  
 4962. Have you any idea of number of men making a living out of alluvial mining round the district? No; I have not given myself time to learn anything on the subject during the last three years.  
 4963. In any case, with regard to reefing, you think the prospects are sufficiently bright to warrant us in expecting a fairly large increase in population from that source? Yes, supposing the capital comes in to work them.  
 4964. You think it probable that capital will come in? I do think so. I had ten puddling machines and fifteen head of stampers going a few years back.

Charles Edward Hilton, auctioneer, Gulgong, sworn, and examined:—

- C. E. Hilton. 4965. *Mr. Watson.*] Have you any knowledge of the general condition of the mining industry in the district of Gulgong? I have had an experience of about twenty-six years.  
 8 July, 1899. 4966. You have taken an interest in mining all the time? Yes, up till last year.  
 4967. Did you, prior to that time, have an active connection with mining speculation or industry? Yes; I was an active miner. I have had thirteen years practical experience in this district.  
 4968. Will you kindly state your views as to the present position and prospects of alluvial mining in the district—first as to the area on which we may reasonably expect to maintain miners, and the number of men engaged in the district now, with a prospect of permanency? As far as the alluvial miners are concerned, I think the prospects of the district are really in the lodes. The main alluvial leads have been practically worked out. There have been some phenomenal patches in the last few years. They have not been very extensive. 4969.

4969. Are there many men now engaged in alluvial mining? About 400 or 500 round the district, as far as the number of miners' rights taken out is any criterion. C. E. Hilton.
4970. Are the alluvial miners working on new ground principally, or are they principally fossicking about old workings? You cannot exactly call it new ground; it may be feeders. That may lead to other leads being found, or feeders into the old leads which have been worked out. 8 July, 1899.
4971. Will you now give your views on the prospects of reefing in the district? The future of the district I think will be a very great one, to judge from my personal experience, and the knowledge I have of the country for about 30 miles round. The country in this district seems to be broken up for about 300 feet in depth, and the different strata of rock have all got, as it were, amalgamated by this large flow of basalt which has travelled through the country, and by other influences. The reefs have been exceptionally good in some cases. They go down for about 200 or 250 feet, as the case may be, and then they seem to break out in threads, and there is really no indication of a wall. What is really wanted is a vertical shaft to be put down about 600 or 700 feet to get into the permanent country; and there is every probability that the reefs exist there, because in the majority of cases where the reefs have been got there have been kinds of shoots, or throws up, or pipes of quartz. There are also saddle-reefs existing in the district. I was working one last year at Biriganbil Estate.
4972. Do you think the saddle-reefs would close together again at a lower depth? I have every surety of it as far as the country is concerned. The country is getting into a more permanent state as you get down.
4973. Your opinion, generally, is that the district is well worth prospecting from a reefing standpoint? Most decidedly.
4974. And with a probability of success? With every probability. I may say that there is a reef within 2 miles of where we sit. There are about 32 feet of mineralised crushing stuff, and no indications of walls. It has assayed from 5 dwt. up 28 ozs. to the ton.
4975. Where no walls are showing, is the gold-carrying formation in the way of veins distinct from the general formation? It is a true fissure lode. We have had Mr. Pitman up from Sydney, and other well-known experts. I am not interested in the mine. I have been down the mine on several occasions.
4976. You think it looks well? There is no doubt about that, because it has proved itself. It is already pegged out by a small syndicate, and they have been working it for the last two years. They have had an exemption from labour conditions for the last few months, on account of the water and other difficulties.
4977. Did they get a bulk return from it? No; it is a refractory ore.
4978. Have they sent any of the ore to either of the existing works for special treatment, with a view to finding out the best method of extracting gold from the minerals? They have sent samples to the Dapto works and to the Clyde works.
4979. Do you know what treatment would appear to be necessary as the result of having those samples treated—chlorination? Or the cyanide process. The ordinary battery process would be perfectly useless in obtaining the main portion of the gold.
4980. Do you think there is a probability of that mine being actively developed within a reasonable time? I have not the slightest doubt of it.
4981. Can you sum up, in a few words, the prospects for mining in the district, by lode or reefing? The future prospects are undoubtedly the reefs, and the mineralised reefs and lodes are very extensive and numerous throughout a radius of 20 miles. I could mention at least eight.
4982. You expect a considerable development in the mining industry shortly, with a corresponding increase in the population? Yes, on account of the railway coming.
4983. So that the haulage will be cheap for mineral ores? It would be an advantage to a mining industry if it were developed; it would be the making of the mining industry.
4984. *Chairman.*] You stated just now, that as far as sinking had been proceeded with, you got into a very disturbed district;—has there been no attempt made to get into well-settled country to prove the reef? No. They got some very phenomenal patches from the 100 to 200 feet level, and they have laboured under the impression that, by following on the same levels, they would get another patch or series of patches. The syndicates which have been formed have worked the capital out, and the shareholders have been disappointed.
4985. So that no attempt has been made to get into more settled country? No.

Edward McCulloch, Council-clerk, Gulgong, sworn, and examined:—

4986. *Mr. Trickett.*] Were you examined at the previous inquiry? I was examined before the former E. McCulloch. Committee, on the 2nd April, 1898, when I furnished certain statistics.
4987. The figures have increased since that date? Yes; I will forward to your secretary a complete 8 July, 1899. return. [*Vide Appendix.*]

MONDAY, 10 JULY, 1899.

[*The Committee met at the Council Chambers, Mudgee, at 10 a.m.*]

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. |  
The Hon. WILLIAM JOSEPH TRICKETT. |

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

Henry Crossing, commission agent, Mudgee, sworn, and examined:—

4988. *Chairman.*] What are you? I am a commission agent, and I have resided in Mudgee for the last forty years. H. Crossing.
4989. *Mr. Trickett.*] You know the country thoroughly, not only in the neighbourhood of Mudgee but possibly right away from Mudgee to Coonamble? Yes; I have travelled all over that country. I used to travel a great deal some time ago, buying stock. 10 July, 1899.
4990. Supposing a railway were constructed from Mudgee through Gulgong to Coonamble, what increased revenue do you think they could expect to get from the country between Mudgee and Gulgong, taking a radius of 10 or 15 miles on either side of the line? Between Mudgee and Gulgong there is a large extent of agricultural country. 4991.

- H. Crossing. 4991. What area between Mudgee and Gulgong, taking a radius of 15 miles on either side of the proposed railway line, is in your opinion suitable for the growth of cereals and other produce? I have not thought out that particular question.
- 10 July, 1899.
4992. Is there a very large quantity of such land? There is a large quantity.
4993. 20,000 acres, do you think? Speaking roughly, I think there may be from 15,000 to 20,000 acres.
4994. Of that area, how many acres do you think are under cultivation at present? About a third of the area I should think.
4995. About 5,000 acres? I am not prepared to speak very definitely about that.
4996. What is the chief cultivation in that area? Wheat, mostly.
4997. Is it successfully grown? Yes; some of the best wheat land about would be within that area.
4998. How many bushels to the acre would it average? From 20 to 30 bushels to the acre.
4999. Regular crops? Yes; I think they compare favourably with any districts.
5000. What has been the market for that wheat? Mudgee.
5001. Mudgee only? Mudgee and Gulgong now—there is a mill at Gulgong.
5002. Has the supply been enough for the demand in Mudgee and Gulgong? I think it has been more than enough.
5003. What has become of the surplus? A good deal of it has been forwarded to Sydney.
5004. Do you know whether it has been a profitable undertaking to send the wheat to Sydney? At times I think it has.
5005. As a commission agent, do you deal in the wheat business? No.
5006. Seeing that there are from 15,000 to 20,000 acres of land suitable for agriculture in the district I have named, and seeing that the supply is not much over the demand for Mudgee and Gulgong, can you, as an old resident, explain why, with a railway to its door, and this large area of agricultural land within easy access of the railway, agriculture has not been gone on with to a greater extent than it has? The butter industry has been more profitable even than wheat-growing. I think that has a great deal to do with it.
5007. The country is used more for dairying purposes than it is for wheat? Yes.
5008. We have to look at all phases of the question, and the evidence all along the line has been that wheat-growing would be gone in for most extensively, so that the question strikes us at once, when we see agricultural land all round a railway, why it has not been gone in for more, and the answer you give is that dairying has paid better? Yes.
5009. Do you think the dairying industry would continue? I think so. I see no reason to think otherwise.
5010. Has it developed much lately? It has developed considerably during the last few years.
5011. Is your opinion that dairying pays better than wheat-growing based upon what the farmers have told you? Yes. I have had a try at dairying myself.
5012. Supposing you had 300 or 400 acres of this rich land, which is suitable for wheat-growing, would you prefer to go in for dairying or wheat-growing? I would mix it, I think. I believe there is more money to be made out of dairying than wheat-growing, close to a factory.
5013. You have separators in Mudgee? Yes; we have a good factory here.
5014. You export the produce to Sydney? Yes.
5015. Is that found to be a profitable occupation to a farmer? Yes. All our dairy farmers here are in a good position—that is, all those who have anything like a fair place.
5016. Do you see any prospect of these two industries, wheat-growing and dairying, being indulged in to a considerably greater extent, within the area I have stated, in the near future? I think so. Of course it is of no use to produce milk if you are too far away from a factory or market. Factories require to be built in suitable positions.
5017. All the surplus produce on these farms, I suppose, is carted into the Mudgee railway station? Yes.
5018. Supposing a railway were constructed to Coonamble *via* Gulgong, from how far out of Mudgee would the farmers cart their produce to Mudgee station, in lieu of taking it to an intermediate station between Mudgee and Gulgong? I think 8 or 10 miles.
5019. So that if the Railway Commissioners allowed a limit of 12 miles, that would be a liberal one? Yes.
5020. You could not expect to get very much traffic to an intermediate station nearer than say 10 or 12 miles from Mudgee. I think that is somewhere about the distance.
5021. Are there any other industries likely to grow up within the area I have stated that would bring increased revenue to the railway,—that is besides mixed farming? I do not know of anything else, except a little mining.
- 5021½. Do you know the country between Gulgong and Cobborah? Yes.
5022. How would you describe that country, say for 15 miles on either side of the line? From Gulgong there is some very good country, and, of course, there is some not very good. When you get near the Talbragar it is nearly all good country; the Talbragar valley is splendid sand.
- 5022½. Is it a class of country which, instead of being largely used for running sheep, would be used for agriculture? A great deal would.
5023. Upon what do you base that opinion? From knowing the country and from using it. I have some there. I do not do much farming, but I know a lot of farms there.
- 5023½. Your observation has been that the agriculture has been increasing? Yes; all over this district.
5024. Taking the strip from Gulgong to Cobborah, could you state what proportion of the land on either side of the line for 15 miles is suitable for agriculture;—would it be one-third, two-thirds, or three-fourths? I should suggest keeping up above Cobborah considerably, keeping up to Dunadoo, as it would go through better country, and crossing from there to Caigan.
5025. How far to the north-east of Cobborah would that take the line? I should think 7, 8, or 10 miles.
5026. By going up there, do you think you would lose much revenue from the wheat-growing districts on the west side? I think very little, if any, because the land on the east side is far the best. The bulk of the better country lies to the right, and a great deal of good country lies away from Pine Ridge up the Coolah Creek to Coolah.
5027. Keeping to the north-east of Cobborah, you would continue that track to the north-east of Mundooran again? Yes,—about the same distance I should say roughly, coming in at Caigan.

5028. Where would you strike in again on the straight line to Cobborah? I do not think I would strike in until I got out beyond Tooraweena. The country from Mudgee to Dunadoo (a small township on the Talbragar), and thence to Caigan, and thence to Tundaburine, I know well. I have been through that country scores of times. I have been through all the routes under consideration. H. Crossing.  
10 July, 1889.
5029. By going that route would the cost of railway construction be cheaper or dearer, do you think, than by adhering to the line shown to the Commissioners? I do not think it should be more expensive. I do not know about getting through from Caigan to Tundaburine. There will be no difficulties between Mudgee and Caigan. I do not think there are any from Caigan to Tundaburine.
5030. We were told by a witness who came along the road with us from Cobborah that it would effect a very great saving;—do you agree with him that it is much easier country than the country on the other line? I think it is easy as far as Caigan.
5031. Then you come to hills? I do not know exactly the way. I have not been across from Caigan to the main line. I do not think there are any difficulties in the way; I do not know for certain.
5032. At any rate, you think it would not be more expensive than any other route? I think as far as Caigan it ought to be less expensive.
5033. To the east of Tooraweena we have these mountains;—do they not break up the country very much? Not very close to Toorawena. It is a bit hilly out there.
5034. Do they not interfere with the continuous area of good country there? A lot of the hilly country is splendid land.
5035. For what? It is mostly grazing; but a lot of it is suitable for cultivation. These black-soil hills are suitable for cultivation.
5036. On the other side of these hills is it good country? It is not quite so good on the other side; but this is first-class grazing country, and some very poor land.
5037. Do you think any traffic would be drawn from the other side of the hills to the railway? Yes.
5038. Would that diversion you speak of bring in much traffic from the tract of country leading up to Coonabarabran? Yes, it ought to bring in all that traffic.
5039. Between the proposed line and Coonabarabran is there not a large tract of good country suitable for agriculture? Yes; a large extent. Some of the best country in the district is about Weetalibah, and up that way.
5040. Then, from where you strike in again to the railway line, on to Coonamble, what are your views of that country? It is first-class country for agricultural purposes till you get down on the plains. I do not think the plains are so suitable for agriculture, although they are first-class grazing land. Up near the mountains they get a good rainfall, and it is good soil, suitable for growing anything. The Tundaburine country is first-class land.
5041. What do you say about the country on the western side of the line? It is not so good out that side, and hence my idea to keep so much to the right. Where you are not going through good country it is wise to keep as near to the good country as practicable.
5042. You know the coach road from Coonamble to Gulgong? Yes, by the Castlereagh.
5043. One coach road comes in by Tooraweena? Yes.
5044. Say from Tooraweena to Cobborah;—I suppose you would not give that as any indication of the character of the country you spoke of? No; in coming by the main road you see some to the west of it. The land on the western side of the Castlereagh from Cobborah to Gilgandra is bad.
5045. As a commission agent dealing in the sale of lands, have you during the last few years found that when agricultural lands have been offered for sale they have been largely availed of by the farming class? Yes; there is a very strong demand about Mudgee for suitable land for agriculture or dairying.
5046. Of what extent are the holdings about Mudgee? Principally a few hundred acres.
5047. Can a man with a family make a living on 300 or 400 acres? Yes, on less; if he can get good land, he can make a good living.
5048. By farming? By farming and dairying combined, as the two go so well together.
5049. Further out in the country to which you have been referring, from Gulgong to Tooraweena, what area do you think would be requisite for a man to go in for mixed farming? They would want larger areas out there; a great deal depends upon whether factories are built within reach. It is of no use to have a dairy unless you have a factory and a way to get your produce away.
5050. If this railway were extended inland from Mudgee, do you consider that there would be any other market for produce except the Sydney market? In times of drought the outside flat country has been a good market for forage. Coonamble itself has been a great market in years gone by, though not so much lately. They are cultivating more.
5051. Seeing that we have evidence that from the other side of Coonamble right down to Mudgee it is all good land for the growth of wheat and wheaten hay, and so on, I suppose you can hardly look for much of a market out that way? I do not think so, except in very odd times. I think the principal market will be Sydney, because under the Warrumbungles they should grow any amount of produce.
5052. As an old resident of Mudgee, do you regard this line from Mudgee to Coonamble as necessary in the interests of a small area in and round Mudgee for a short distance, or rather in the interests of the country out Coonamble way? In the interests of the country generally.
5053. Do you think that the bulk of the revenue for the railway would come from some distance out from Mudgee? Yes.
5054. Do you deal in stock? Yes.
5055. What would be the probabilities of increase in the stock traffic to the metropolis by railway? I think there ought to be a considerable increase. There is a great deal of stock fattened out on that route. They would all most likely go by rail, except in a very good season. Then some would travel by road this far.
5056. Is there much fat stock sent through Mudgee to Sydney from out that way? Yes; a good many. Sometimes they go into Luie and Rylstone.
5057. Since the Mudgee railway has been constructed, do you think a great many more stock have been sent from Mudgee direct to Sydney than were previously sent, or do they still continue to drive fat stock any distance on towards Rylstone? A good many go to Rylstone and Luie; but not one in a thousand, I think, goes by road right through to Homebush, as they used to do.
5058. The great argument for this branch line is that, directly it is constructed, all the stock that used to

- R. Crossing. to be driven will be trucked locally, and sent right away;—can you, as an old resident of Mudgee, knowing that stock used to be driven a long distance, say whether the tendency has been largely increased to put sheep right into the trucks at Mudgee since the line was opened? Certainly it has.
- 10 July, 1899. 5059. To a very large extent? Yes.
5060. You have no doubt about that? I am sure of it. I will not say at Mudgee exactly; I will say at Mudgee, Luie, and Rylstone.
5061. You see the drift of these questions? Yes.
5062. Whether the railway to Coonamble starts from Mudgee or any other place, do you think it will be better for graziers in all seasons to put their live stock right into the trucks, and save a portion of the journey than drive them along the road? Yes; most of them send small lots now. When they have a railway, they can send small lots, otherwise they could only send in large lots if they wanted them to travel any distance. The bulk are small holders, and it suits them to send a truck-load away instead of waiting until they get a hundred or two to send by road. It costs too much to send small lots any distance by road.
5063. Will you briefly give your opinion as to the merits of the three routes to Coonamble—First, what do you think of the Warren connection? I prefer that connection very much to the Dubbo connection.
5064. Why? Simply because it is a shorter line. It goes through country good for grazing purposes, but the objection to that is that it is a terribly flooded country. I have been through there when you have had to go 10 or 15 miles with the water 3 or 4 feet deep. That would not be very good country on which to construct a railway.
5065. It would be more expensive in the way of bridging? I think it would be very expensive to keep in order.
5066. What do you think of the route from Dubbo to Coonamble? It goes through nearly all poor country until it gets down to Gilgandra.
5067. When you get to Gilgandra, it does not matter much to the people there, whether it is the Mudgee connection or the Dubbo connection? I think the Mudgee connection would suit them better, because it would be a shorter and more direct route.
5068. Do I understand you to advocate the Mudgee line, because it tends to improve a somewhat non-paying line, because it goes through sounder country for railway construction, although more expensive, and because it taps more agricultural land? Yes; it opens up a great deal better country for agricultural purposes than either of the other two lines.
5069. *Mr. Dick.*] Do you view the various proposals to connect Mudgee with Coonamble without any business bias? Yes.
5070. Is it a fact that your business prospects will not be improved by the construction of a line from Mudgee to Coonamble? I certainly do not think they would.

James John Underwood, drover and cattle-buyer, near Mudgee, sworn, and examined:—

- J. J. Underwood. 5071. *Chairman.*] How long have you been in this district? Thirty or forty years.
- 10 July, 1899. 5072. Did you accompany the Railway Commissioners lately to explain this country to them? I did.
5073. Are you well acquainted with the whole of this district? Very well.
5074. Are you well acquainted with the whole of the country which would be served by a line from Warren to Coonamble, by a line from Dubbo to Coonamble, and by a line from Mudgee to Coonamble? Very well, indeed.
5075. Taking the line from Warren to Coonamble, how would you describe that country generally? There is a lot of good country, and there is a lot of bad country; but I think you will have to go through a lot of flooded country.
5076. Supposing the land was cut up into small farms with a view to closer settlement, would a railway serve that purpose? I do not think so.
5077. Could a man get a living off 1,000 acres along that line? I do not think so.
5078. Taking the line from Dubbo to Coonamble, are you well acquainted with the country which would be served on each side of the railway? I am well acquainted with it.
5079. How would you describe that country? That is bad country for agriculture and bad country too for grazing, for a certain distance.
5080. How far would the bad country extend from Dubbo? About 60 miles.
5081. What portion of that would be bad country? The whole of it would be bad for farming purposes, not for grazing.
5082. Taking a belt of country 40 miles wide—that is, 20 miles on each side of the proposed line—what is it like? It is all bad for that distance.
5083. From Gilgandra, how would you describe the country? It is better country close to the river. After you cross the river and come down on the eastern side, it is better country.
5084. And from there onwards, what is it like? It is good country then.
5085. Is it good for agriculture? It is good for agriculture till you get, I suppose, within 30 miles of Coonamble, and then it is suitable for pastoral purposes. I do not think it would grow crops down there, because of the dry seasons and hot climate.
5086. Now, taking the line from Coonamble to Mudgee, the Committee have inspected a good deal of the country between those two points. We came through Warrina, Wongy, Tundaburine, Tooraweena, Munderoran, and Cobborah, and from Cobborah some members of the Committee went towards Merrygoen and the others towards Redbank, meeting again at Tallewang from which place we came through Gulgong to Mudgee;—what would you say to that line as regards its prospects of settling people on the land? It is all good country for agriculture through there.
5087. When you took the Railway Commissioners round, was that the line you went along or did you travel a line more to the east? No; I took the Railway Commissioners from Mudgee to Gulgong, from Gulgong to Cobborah, from Cobborah to Munderoran, from Munderoran to Coonabarabran, from Coonabarabran back by Weetallibah—Mr. McMaster's and Mr. West's—into Coolah, and from Coolah *via* Leadville into Gulgong.

J. J.  
Underwood.  
10 July, 1899.

5088. Which of those two routes would cut up most agricultural country? I suggested to Mr. Harper, if they were going to make the line more to the east of Cobborah, to run from Gulgong across what we call Barney's Range and down by Birrawa. That is going through all first-class agricultural country. It would be giving the Coolah people a far better chance. It would bring them close to the railway, because there is as good land as you can find under the sun at Coolah, and all up in that district. Then, going from Birrawa straight across within a short distance of Caigan, 7 or 8 miles to the east of Mundooran, it will take you through all first-class agricultural country, as good as you could find in Australia, I suppose. Going right through this country, you can come out at Tooraweena. It is not a difficult country to get through to Tooraweena. It is all box country with sloping ridges. There is only one hill to go through, and that is at a place called Wallumburrawang; there is a gap through there, but by going through there you are opening up some thousands of acres of pine land to the right but not much to the left.
5089. Instead of making Coonamble your objective how would you view a proposal to go to Coonabarabran;—would you pass through as much agricultural land if, instead of breaking away into the west to reach Coonamble, you went on towards Coonabarabran? It is not as good. You are going through a considerable lot of bad country until you get to a place called Gorah, belonging to Mr. Nash.
5090. You would keep away to the east until you got to Caigan, which is to the north of Binnaway? Yes.
5091. When you are at Caigan, how far are you from Coonabarabran? Thirty miles. After you get within 15 miles of Coonabarabran you have all bad country into Coonabarabran—bad country for anything—and bad country out of Coonabarabran for a distance of 10 miles. It is all sandy country; it is no good.
5092. There is a belt of ironbark country, some of it being mixed a good deal with other timbers;—in your travels, have you seen any of that country cultivated? No.
5093. We have been told that a good deal of that country is good land for agriculture? I never saw any of it cultivated, but I think there is sufficient land out in that country without cultivating ironbark country, because there is any amount of box and apple-tree country—hundreds of railes of it—out that way.
5094. As a rule, the ironbark country is no good? But there is very little ironbark country from here out to Coonamble.
5095. Keeping the Western line, you get into ironbark country? You get into it by going that way.
5096. How far would the Warrumbungle Mountains be from the line you suggest? They are about 8 miles from Tundabrine.
5097. What would be the average distance of the broken country, or the range from the line? About 7 miles. That range runs in a very peculiar way. It runs from the back of Coonabarabran to Barmedman. All the country on the west of these ranges is good country. From the foot of the hills to the line it is all good country.
5098. Is it very good country for agriculture? Black and red heavy deep soil. People tell you there that they put in 100 acres of land, but that if they had a railway and an outlet for their produce they would put in thousands of acres. They have no show to get anything away from there. If they had a railway it would pay to cart.
5099. The settlers have informed you that if a railway were constructed out there they would increase their cultivation areas considerably? Wonderfully; because they seem to think it pays better than sheep-farming.
5100. Have you had any experience in agriculture? Not much; I have never farmed much.
5101. You could not give the Committee an idea as to the difference between the return from sheep-farming and the return from cultivation? No. I am no judge of agriculture, but I know that some of the finest land in Australia is out in that country, and not a small quantity of it, but a very large quantity. Once the railway went there there is not the slightest doubt but that the country would be populated and opened up.
5102. Have you any other information to give to the Committee? I think if you were to run the line away from the main railway through Gulgong, and come in up by Caigan, and across by Binnaway, you would save £100,000 in cuttings.
5103. Has the drift of stock been diverted from this district to Dubbo by reason of railway? I think not.
5104. Which was the main stock route in the olden times, before we had railway communication to Sydney? Generally from Coonamble *via* Mudgee or Rylstone. There are two stock routes—the Rylstone stock route and the Mudgee stock route. The main trunk line from all the Castlereagh country, and the Namoi country to Sydney was the Mudgee and Rylstone route. From the Gwydir country they used to come in by the Mulga.
5105. Has it been diverted to Dubbo to any extent by the construction of the railway? I think not.
5106. It still comes this way? A good deal of stock comes this way; but it would not come if you had a railway out there.
5107. *Mr. Shepherd.*] I think you said that you have never been engaged in farming? Not much.
5108. Have you had any practical knowledge of the cultivation of soil? A little. I know what wheat is when I see it, and I know what land is, and what it ought to produce.
5109. How did you gain your knowledge of the suitability of land for cultivation? I have had no experience; but I have been mixed up in farming a little, because I have a little farm just for my horses. I know what good land ought to do, and I know bad land.
5110. You consider yourself thoroughly competent to judge good pastoral land, and good agricultural land? I am one of the best judges of good land in Australia, because I have been brought up here in stock-rearing. If you want to rear a bullock you have to rear him on good land, otherwise you would not get a bullock.
5111. You unhesitatingly state that on the proposed line from Dubbo to Coonamble there are 60 miles of country useless for agriculture? Sixty miles of all sandy country.

Henry Crossing, commission agent, Mudgee, sworn, and further examined :—

- H. Crossing.  
10 July, 1899.
5112. *Mr. Trickett.*] I understand that you wish to correct a portion of the evidence which you gave here? Yes. I find that the country for 15 miles on each side of the proposed line between Gulgong and Mudgee gives an area of 380,000 acres. In my evidence I spoke of only 5,000 or 6,000 acres in that area being suitable for cultivation. I wish to withdraw that statement, and to say that I think 30,000 acres in that area, are suitable for cultivation.
5113. How much of that area is under cultivation? I should think about one-fourth or one-third.
5114. Do you still attribute the non-cultivation of the remaining three-fourths to the fact that the land is used for dairying purposes largely? It is used a good deal for grazing.
5115. *Mr. Watson!*] Do you say that 20 miles from a railway is too far from market? It is a good way to draw stuff. Grazing is more profitable at present on that land.
5116. *Mr. Trickett.*] The evidence is that it will pay men to cart their produce from 20 to 25 miles to a railway-station? It will pay sometimes. I do not think there is much in wheat-growing when it has to be carted 30 miles.
5117. Is much of the land between Mudgee and Gulgong Crown land? No, there is not a great deal of Crown land.
5118. Seeing that agriculture is advanced as one of the strongest reasons for the construction of a branch line to Coonamble, either from Mudgee or from Dubbo, could you give any explanation why, out of an area of 30,000 acres suitable for agriculture, and within 15 or 20 miles of Mudgee railway-station, a larger area than 7,500 acres is not used for wheat-growing? No, except that it is on account of a great deal of the land being used for dairying purposes. I have a good deal of land down here which I do not cultivate. Perhaps I do not make as good a use of it by grazing; but I can get a good return out of the land by grazing, and at much less expense and trouble.
5119. What would be the value of freehold land, say, 10 miles out from Mudgee? Close to Mudgee there is a good depth of black soil, which is worth from £25 to £30 an acre.
5120. Five miles out from Mudgee what is it worth? I think good soil is worth £10 or £12 an acre; but the ordinary good wheat soil is worth from £3 to £4 per acre.
5121. As you get out Cobborah way, I suppose the land gets much cheaper? Very much cheaper. Just along the Talbragar there is some very rich black soil, but it is not so suitable for cultivation as the black soil on the river flats here.

Eugene Daly, butcher and publican, Mudgee, sworn, and examined :—

- E. Daly.  
10 July, 1899.
5122. *Mr. Watson.*] Have you been a long while in the district? About forty-five years, I think.
5123. Have you had any experience of agricultural pursuits at all? I have.
5124. Have you been engaged in farming? Yes; I have a farm of 65 acres on the river.
5125. Has your experience been confined to the river flats? Yes.
5126. Have you a general knowledge of the value of land for agricultural purposes? Yes.
5127. Do you know the surveyed route of the railway from Mudgee to Cobborah? I do not know the surveyed route.
5128. Taking a belt of country 40 miles wide from Mudgee to Cobborah—that is, 20 miles from each side of the line;—what proportion of that country do you think would be fit for agriculture—a fourth, a fifth, a third, or a half? I would not like to say how much there is. I know there is a great deal of good agricultural land on both sides of the road.
5129. You would not care to hazard an opinion as to what proportion of the land included in that area would be fit for cultivation? No; but from my experience of it I think the larger portion of it would be.
5130. You think, then, that the flat land and the gentle slopes predominate? I do; there is no doubt about it.
5131. Would you go so far as to say that all the land except the broken country would be fit for cultivation? I do. What would not be fit for wheat and corn is splendid land for vineyards and orchards.
5132. Do you know the land from Cobborah to Munderoran and on towards Coonamble? I have been out that way time after time.
5133. What is your opinion of that land? From Cobborah out close to Munderoran it is very good land; but just before you get to Munderoran there is a bit of land which is not quite so good; it is good pastoral land, but not agricultural land. Within about 6 miles of Munderoran it gets bad.
5134. From Munderoran onwards what is it like? On the other side of Munderoran, again, there is a small piece of bad land following the main road.
5135. Have you been off the main road at all? On each side.
5136. Consequently you have some idea whether the main road is anything in the nature of a criterion as to the quality of the land generally in the locality? In some places it is; in others it is not, because the high hilly ground has been followed so as to get good roads.
5137. In most cases the road would be rather worse than the surrounding country? That is my opinion.
5138. Do you know the carrying capacity of the land which is now used as pastoral land out in that direction? I was never a pastoralist. I have heard that in some places it carries two sheep to the acre, and in some places one sheep to the acre.
5139. Between Cobborah and Munderoran, according to the reports we have from the Lands Department, there is on each side of the proposed line a considerable area of Crown land at present untenanted;—can you assign any cause for that land being not used? Only that the land was not good enough for the pastoralists to take up when they could get better land; and then again that it was not good enough for farmers, being too far away from a market. That is the only reason I can assign. If there were easy communication there is no doubt that every inch of it would be taken up.
5140. On the eastern side of that route from Mudgee, *via* Gulgong, Cobborah, and Munderoran, right on to Tooraweena, where the head of the Warrumbungles is—on the eastern side of that route there is a backbone of ridgy country some distance to the east? Yes.
5141. It is supposed to be the tail end of the Warrumbungles? No.
5142. There is a general range on the eastern side of the projected line, broken here and there by creeks? Yes; on this side of Caigan there is a stony range.
5143. Taking that range generally, what distance, on an average, do you think there would be between the foothills of the range and the route which we spoke of just now to Tooraweena? In some places very

very close to 5 or 6 miles; in other places 8 or 10 miles, and perhaps further in other cases. It is according to the run of the range. As the range comes in the good land is narrower, and as it widens out the good land is wider.

E. Daly.  
10 July, 1899.

5144. Do you think it would be possible, by taking a route considerably further to the east, to avoid close proximity to this range;—would you get the other side of the range I spoke of by going further to the east? I do not think so. I think you would come in between the ranges and the measured route.

5145. You would accentuate what seems to me to be the sole objection to the present route, that you would get closer to the foothills, and consequently have only one side from which to draw traffic? You will have traffic from both sides, no matter which way you take up.

5146. Where you made the foothills you would only have a trafficable area according to your estimates, of from 7 to 10 miles on your eastern side? In some places you would have 20 or 30 miles.

5147. But taking an average? I could hardly give that. I was never over the line to examine it in that way. I know there is a great amount of splendid country on the Talbragar, east of Cobborah.

5148. When you pass beyond that you carry the general range of hills on your right, at a distance of some few miles? Yes.

5149. From that point, then, you would only have to draw traffic from, broadly speaking, the area of land between the railway line and the foothills on the east? Yes.

5150. After you leave the good country which is on the Talbragar, in going towards Mundooran you would carry the ranges on the eastern side of the proposed line;—how far would you be there from the foothills towards Mundooran? It is mostly ridgy all through there; but still there is a good scope of pastoral land.

5151. From Mundooran on to Tooraweena you carry the Warrumbungles on your right generally? Yes.

5152. Can you say what is the distance there between the line and the foothills of that range? After you pass Mundooran you get rid of the ridges pretty well.

5153. They are still on your eastern side going up? Yes.

5154. How far off are they? After you pass Mundooran you open on to plains, except occasional hills.

5155. Can you not see hills all the way between Mundooran and Tooraweena? Yes.

5156. How far off are they, do you think? I could not say.

5157. You have not been over that portion so frequently as to say how far off they are? I have been that way a good bit. I generally have kept to the road.

5158. Taking the line from Mudgee to Cobborah, it will run to some extent parallel with the existing Western railway? According to the map it is 50 miles pretty well.

5159. With a general width of between 40 and 50 miles between the two lines? Yes.

5160. Do you think that the land between this projected line as far as Cobborah and the Western railway to Dubbo is sufficiently good to give a fair amount of traffic to each? I do, because wheat from there now comes to Mudgee by teams, and also goes to the Western line.

5161. Do you think, with the construction of a line onwards, but in any case to Cobborah, there will be a sufficient extension of agricultural and other productions to give traffic to two lines where now there is only one practically? I believe there would, because they would be fed from both sides.

5162. In this case you have 40 miles of country between the two lines, and what I wish to ask is, whether you think it is sufficiently good land to, in all probability, guarantee sufficient traffic to keep both line going? In my opinion it will—abundance.

5163. Assuming the line to be constructed from Mudgee to Coonamble, do you think that it would draw traffic as far west as the Castlereagh River at Gilgandra and onwards? Yes.

5164. There is some good land on the Castlereagh about there, I understand? Yes.

5165. Do you think they would be reasonably served by the construction of a line from Mudgee to Coonamble? I think they would.

5166. You think they could take advantage of it without having too great cartage, as long as the roads were good? They are sure to take advantage of it.

5167. Supposing the line to be constructed from Dubbo to Coonamble along the Castlereagh, do you think it would serve the country eastward of it to the point where the Mudgee-Coonamble survey would intersect it? The best land is on the eastern side. I know that the land from Gilgandra to Dubbo is very bad, sandy rotten country.

5168. There is some cultivation going on there now, is there not? I do not know; I have not been out that way for a great many years. When I went along there you had a job to get along.

5169. You do think that if the line were constructed from Mudgee to Coonamble the people on the Castlereagh, north of Gilgandra, would be served by that line? Most certainly they would.

5170. It would be sufficiently near, with decent roads to the stations, to be of advantage to them? Most certainly.

5171. Taking a line from Cobborah across to Nevertire, on the Western railway, as the base of a triangle, and then taking as the other two sides of the triangle a line from Mudgee to Coonamble and a line from Dubbo to Coonamble, and assuming a railway to be constructed from Cobborah to Coonamble, do you think that the country in between is sufficiently good to necessitate the construction of another branch line with a view to serving that country, and if so, where do you think it should start from? I do not know sufficient about it to say. I follow the roads in my travels pretty well.

5172. You were conversant with the general drift of stock and other traffic before the Mudgee railway was constructed? Yes.

5173. Was the traffic for Coonamble, Walgett, and that district generally, mostly drawn through Mudgee? All through Mudgee.

5174. Was this the general highway for traffic? Yes; that is, what helped to make Mudgee a township. This was the great centre.

5175. Thence it went on to Sydney? Yes.

5176. As far as Mudgee is concerned, has there been any alteration as regards the disposition of traffic since the construction of that railway? A lot; since the Western line has been constructed cattle and sheep which used all to come this way are trucked at Dubbo, Narramine, and all along the line. They take the nearest trucking point. It is the same with agriculture.

5177. How far out do you think the influence of the Mudgee line would extend as regards attracting stock traffic or agricultural produce? Right away to Coonamble and Walgett. It is the shortest route, and they are sure to come that way.

5178. Notwithstanding the diversion you spoke of a few moments ago? Yes.

5179.

- E. Daly. 5179. It still comes to Mudgee? Yes.  
 10 July, 1899. 5180. Whence is that portion drawn which has been diverted to the Western Line? From Coonamble, and from the country lying in between Coonamble and Mudgee, and in some seasons the wool has gone from Tundaburine across to Dubbo.  
 5181. Would it be fair for me to assume that although a certain portion of the traffic from Coonamble and the country between Coonamble and Mudgee has been diverted to the Western Line, yet the greater quantity still comes through Mudgee;—is that what you wish to convey? Yes.  
 5182. Is it not a disadvantage to travel fat stock a great distance by road? A very great disadvantage.  
 5183. Consequently the temptation will be to those who have fat stock to make for the nearest point on the railway line, no matter if it meant a slightly increased carriage once the stock was trucked? Yes; but not at all times. In very good seasons they would travel.  
 5184. The enclosing of land is making it difficult to travel fat stock with any chance of keeping the condition on them? Yes; they make for the nearest railway station.  
 5185. That would account for some of the diversion of traffic you spoke of a little while ago? Yes.\*

James Loneragan, storekeeper, Mudgee, sworn, and examined:—

- J. Loneragan. 5186. *Chairman.*] What are you? I am a storekeeper, resident in Mudgee for seventeen years.  
 10 July, 1899. 5187. *Mr. Shepherd.*] As a storekeeper, I suppose you are engaged generally in purchasing produce, and all that kind of thing? Yes.  
 5188. What is the chief produce you purchase here? Wheat, corn, hay—all kinds of produce, except stock.  
 5189. How far from Mudgee, as a rule, are you supplied with these products? Seventy miles.  
 5190. In the direction chiefly of Coonamble, I suppose? We draw produce, chiefly wheat, from Mundooran, and round about the Mundooran district and Coolah, and from about the Coolah district. That is the extent of our operations. It is about 70 miles from Mudgee.  
 5191. What is the average yield of wheat per acre? Twenty bushels to the acre last year would be the correct average for the entire agricultural district, but previously the averages fell to as low as 10 bushels. The ordinary average would be about 16 or 17 bushels.  
 5192. You really had a larger average last year than usually? Yes; last year was above the average.  
 5193. What would be the yield of maize? The maize crop was practically a failure the last two or three years. In a good season the average crop would be about 50 or 60 bushels. I do not think it would average 20 bushels last year.  
 5194. And what is the yield of hay? I cannot speak so well of hay. Lucerne hay is what we deal in. We bought largely in lucerne hay this year. You understand that lucerne hay offers three, four, or five cuttings in the year, averaging about a ton per acre at each cutting.  
 5195. Are the agricultural holdings, as a rule, large in the various districts which supply you? No; they are generally small.  
 5196. About what extent are they? They run up to 300, 400, or 500 acres; in exceptional cases they are larger.  
 5197. Do you mean that they cultivate that, or is that their entire holding? Generally speaking, the farming is conducted about here by a small class of settlers. The large wheat-grower is not known in this district; he is scarcely in evidence yet. The large holders are just about beginning to cultivate large areas of wheat.  
 5198. About 70 miles, I suppose, is considered almost beyond a payable distance to cart? It is pretty well a prohibitive distance to pay for carting.  
 5199. About what distance from a railway do you consider would be a fair thing to farm successfully? Taking one season with another, wheat should be made to pay, and, as admitted by the farmers, is a payable enterprise 30 miles from a railway.  
 5200. What is about the usual price of wheat here? Last year it was up to 4s. 8d. a bushel here. This year the extreme price we have paid for wheat is 2s. 8d.  
 5201. Are you pretty well acquainted with the country between Mudgee and Coonamble? No; I cannot speak about the country except to Gulgong; I was never beyond Gulgong. I know nothing of the country between Mudgee and Coonamble, except from hearsay.  
 5202. You are not engaged in agricultural pursuits? Not at all.  
 5203. So that you are hardly prepared to give an opinion as to the quality of the country? I could not give an opinion at all.  
 5204. What is the agricultural population of Mudgee? I think about 10,000 or 11,000 in Mudgee proper, and about 7,000 or 8,000 in Gulgong.  
 5205. Do the farmers seem pretty well satisfied with their prospects? They are very well satisfied in this district with their prospects. The last few seasons have been fairly good; this district has been favoured.  
 5206. What effect do you think the opening of a railway to Coonamble would have on the farmers along the road? I think it would do them a lot of good. It would open up a splendid portion of country, so I am told. There are a number of farmers that I know pretty well through business. They speak very hopefully of a connection between Mudgee and Coonamble. They seem to think that if the country along the route between those points were opened up it would benefit their circumstances very much.  
 5207. Do you think it would induce a much larger area to be put under cultivation? I feel certain that it would. Personal friends tell me, and unhesitatingly state, that if they had railway facilities they would open up a large tract of good agricultural land, which they own, and which they are using just now for sheep-farming or stock-raising.  
 5208. In what part of the country are these holdings situated? I speak of the country from Cobborah out towards Tooraweena, chiefly. That is a portion of country with which we have a large business connection.

5209

\* NOTE (on revision):—All I wish to add is that the Mudgee line is the best in the interests of the whole Colony, and the most direct and the shortest line.

5209. All along the line we have been led to suppose that a very large additional area would be put under cultivation in the event of this railway being made; but you have already heard the question put and answered in reference to the area under cultivation in the immediate vicinity of the railway to Mudgee—that is, between Mudgee and Gulgong;—it would appear to be rather disappointing if we take that fact into consideration that there is so little land under cultivation, comparatively speaking, where the people have the advantages of a railway? That matter requires explanation. Mr. Crossing failed to go into that matter in the way in which, I think, he should have done from his knowledge of this district. Speaking personally, he could have stated that he is the owner of 20,000 or 30,000 acres of splendid land, every acre of which is possibly fit for the plough. This is an indication of the land which is held between Mudgee and Gulgong. It is all held by private people, who practically use it for sheep-farming, who have not devoted their attention to agriculture at all with the exception of a little on the river banks. The line goes through the Lowes' land, Cox's land, the Rouses' land, right on to Gulgong, and all this land is practically held for sheep-raising. So that Mr. Crossing was correct in stating that within a radius probably not more than 15,000 acres were used for agricultural settlement. Outside of probably 5 miles from the projected line, on either side, the farmers come in, and they have held their lands under the Land Act of 1861, so that Mr. Crossing was practically right in what he said.

J. Lonergan.  
10 July, 1899.

5210. Do the people, the farmers particularly, seem to be fairly well off? Yes; the farmers in this district are fairly well off.

5211. Is there any other industry besides those you mentioned which is likely to spring up on a railway line between Mudgee and Coonamble? You know when rich agricultural country is opened up it offers settlement for a large number of people, who are necessary to look after the interests of the farming population. I am perfectly sure it will keep a large population round about small towns, such as Cobborah and Mundooran and Merrygoen, which would grow in importance. To illustrate my meaning I would state that Mundooran, or a position somewhere about Mundooran, should offer settlement large enough to support a population in a very few years, if the line were run out, equal to the population of Mudgee, because it is the centre east and west of a large district. And to illustrate that point further I would make this statement: That the line must some day or other go out from Mudgee in the direction of Coonamble. If you construct a railway to Coonamble from Dubbo or Warren, you certainly will not meet the necessities of the people living between Gulgong and Coonamble, particularly on the eastern side of the projected line. It is necessary in the interests of the settlers, and in justice to settlers I take it, that that large important area of country shall be opened by a road, and there is no better means of opening it than by railway. It is well known that through that important district grass is growing on the road. There is no such thing as a macadamised road, except in places between Mudgee and Cobborah and Mundooran. Beyond that, of course, there is no such thing as constructed roads, so that the people have to do the best they can to get their stuff to market.

5212. Then, apart from all private considerations, you think in the interests of the country generally a line from Mudgee to Coonamble would serve the country better than a line from Dubbo to Coonamble? Certainly.

5213. Is there any further information which you can give? I, with other gentlemen in the town, am connected with the milling business. We have a fairly large concern going. We require a very large amount of wheat in the year. We require at least 60,000 sacks of wheat to keep the mill going. The utmost we have been able to get here—that is, at anything like a price which would enable us to compete and sell our flour in Sydney—up to the present has been about 32,000 or 33,000 sacks; so that practically we have not enough within 20,000 sacks of wheat to keep our mill going. I also wish the Committee to understand that we are only working half the day, so that our mill is idle twelve hours out of twenty-four. If we had a railway out to Cobborah it would give us enough wheat to keep this mill going, and we could make it pay, and in the interests of the district, besides making a profit out of it ourselves, it would be very advantageous. We have to get this wheat occasionally round by Wellington from a portion of the district. That would be a feeder to this Mudgee-Coonamble line—that is, Spicer's Creek. We have had several thousand sacks—as high as 20,000 last year—out of that district by road and by rail, round by Wellington, *via* Wallerawang, to Mudgee. We are placed at a considerable disadvantage in working this mill and making it pay, and I am only emphasising what is felt by the other millers in the district. Then, again, we have drawn wheat from Mundooran; but we have to pay the farmers in Mundooran a little more to attract that wheat here than we pay the farmers here, so that practically we are losing by our trading with districts so far away as Mundooran by road carriage. To cart this wheat by road costs 9d. a bushel; but for that distance it could be brought in for about 2d. a bushel by rail. There is another direction in which our district would receive a great benefit by opening up a connection with Coonamble. Coonamble is very much drier than Mudgee; the rainfall is not as heavy. In that very dry country they cannot grow hay except in a fairly moist season. This year we are sending chaff and hay out there, and if we could get cheap and speedy means of travelling, such as a railway would afford, we could send out larger quantities. It practically does not pay us to send forage by road out as far as Coonabarabran or Coonamble to feed starving stock. We have to pay £3 10s. a ton for the carriage of chaff; we are paying it now practically to Coonabarabran, and to between Coonabarabran and Coonamble, and we are sending out there large quantities of it. The growing of lucerne hay is a very important industry in this district, perhaps the next to wheat from an agricultural point of view. We are buyers, and we sent out of the district this year quite up to 2,000 tons. A great deal of that lucerne hay has gone to Bourke *via* Wallerawang. If the line were open to Coonamble we could send lucerne hay out into the Coonamble district. We have sent great quantities of it there. I know that stuff we have sent out of the Mudgee district as far as Nevertire has gone into the Coonamble district. Speaking from recollection, I think we must have sent along the line this year between 700 and 800 tons of lucerne hay alone.

5214. *Mr. Watson.*] This is an abnormal season, as far as the west is concerned, for fodder requirements? Yes; I have not seen the like of it since 1869 and 1870.

5215. Supposing the line to be constructed, it would be seldom that there would be anything like the demand for fodder in the west that there is this year? The demand may be a little every year; but certainly this has been an exceptional year, and the demand has been extraordinary.

5216. Assuming a line to be constructed from Dubbo to Coonamble, do you think it would pay to take another line from Mudgee to Cobborah, with a view to opening up the country between Mudgee and Cobborah

- J. Loneragan. Cobborah and the country on the Talbragar east and west of Cobborah? It would benefit Mudgee probably better than if the line were constructed on to Coonamble. You mean if a line were sent on to Cobborah through Mudgee, and then connected with Wellington or Dubbo?
- 10 July, 1899. 5217. What I meant to ask was: Do you think a line would pay from Mudgee to Cobborah on its own? I think so; it would be just fringing the very good country I spoke of. I am led to believe that the country beyond Cobborah as far as Tooraweena, perhaps beyond Toeraweena, is magnificent for agriculture.
5218. From Mudgee railway station, what would be the average distance to these estates between Mudgee and Gulgong belonging to Messrs. Cox, Rouse, and Crossing—10 miles? The line will run pretty well right through the whole of them.
5219. Do you think that these gentlemen who, though within a comparatively short distance of railway communication, have not gone in for agriculture, would be induced, if a line were taken through there, to open their lands for agriculture? Mr. Richard Rouse, of Guntawang, from whom we have been buying wheat, told me last week that he could make the land pay very well if he had the advantage of railway communication.
5220. How far is he from the existing line? He has to cart 18 miles.
5221. He seems to think that he is almost too far away to make wheat-growing pay? It is only this last season that he has gone in for wheat-growing.
5222. Do you think the construction of a railway from Mudgee to Gulgong will ensure an additional area being put under crop on these large estates as compared with what is being done to-day? I have not the slightest doubt of it. It will pay better than anything else. It will pay a man better to go to the expense of clearing a large tract of country if he has the advantage of railway communication at his door, and it will certainly induce him to go in for wheat-growing sooner than if he had to cart the stuff 18 miles. Mr. Rouse has been sheep-farming and stock-raising all his life, and I take it that he would not care to go out of the ordinary method of making money, to get rid of his stock and go in for agriculture, unless he has great advantages over what are offered at present.

Thomas James Lovejoy, Council-clerk, Mudgee, sworn, and examined:—

- T. J. Lovejoy. 5223. *Chairman.*] Have you prepared a statement for the information of the Committee? Yes.
- 10 July, 1899. 5224. Will you read the statement? The population of the town is about 2,700; the value of the rateable property is £280,946, and the area of the borough is a mile square.

John Henry Toose, commercial traveller, sworn, and examined:—

- . H. Toose. 5225. *Mr. Dick.*] Do you desire to make a statement in reference to the construction of this railway?
- 10 July, 1899. I do.
5226. Will you kindly make that statement? I have been along the line from Dubbo to Coonamble and seen the country; also from Warren to Coonamble and from Coonamble under the Warrumbungle Mountains and round Gulargambone to Gilgandra. Speaking as a traveller, I should prefer the line to go *via* Mudgee to Coonamble, principally on account of its shorter distance,—from 30 to 40 miles as far as I can judge from the map, which means to a traveller from about an hour to an hour and a half extra time in the train. The line from Mudgee to Coonamble will divide the country between the Western railway and the northern railway. I suppose the objective is Walgett.
5227. No? I should say it will considerably relieve the Western line, and also to a certain extent the Northern line, both of which lines are, from our knowledge as commercial travellers, congested, and ultimately, or before very long, to make it safe for travelling, the Western line will have to be duplicated as far as Dubbo, whereas if this line goes from Mudgee to Coonamble it will obviate for some considerable time the duplicating of the Western line from Wallerawang to Dubbo. It will also cause the Wallerawang-Mudgee railway to be made to pay; hitherto it has been a loss to the country of about £30,000 per annum, according to the Commissioners' report. It will cause the stock, wool, &c., grown in Coonamble and round Coonamble to be more accessible to the Sydney market, at least two hours nearer to the Sydney market. It will open up country which is better than the country from Warren to Coonamble, or from Dubbo to Coonamble. The population, I should say, out from Mudgee to Coonamble is double that on the line from Dubbo to Coonamble. As a traveller—as an independent person with no interest to serve—I think the line from Mudgee to Coonamble will serve the country better, being a parallel line opening up better country and serving a population of two to one, than the projected line from Dubbo to Coonamble. I do not think there is anything further that I want to say. I have thought about the matter as I have been travelling through the country.
5228. You prefer the Mudgee line to either the Dubbo line or the Warren line? Yes.
5229. Do you know the country from Dubbo to Coonamble and the country from Warren to Coonamble? Yes, intimately. I have been all through it.
5230. You have a knowledge of the country traversed by the three different routes? Yes.
5231. You stated that this Mudgee line would serve a larger population than the Dubbo line? Yes.
5232. As you have been a long time on the roads, can you tell us from your observations whether the population has increased more rapidly along the Mudgee-Coonamble line than along the Dubbo-Coonamble line;—is there a greater ratio of increase on the Mudgee line than on the other? I should say the increase at present has been in favour of the Dubbo-Coonamble line, but mainly owing, I presume, to the country being opened up there; more selections have been thrown open along there, and greater impetus has been given to farming along that line than along the Mudgee line.
5233. *Mr. Watson.*] This is the longer-opened district? Yes; it seems to me all over the country old mining districts are very slow in going into agriculture.
5234. *Mr. Dick.*] In what way do you think this Mudgee line will relieve traffic on the Northern line? Certain wool will go into Coonamble, which at present goes on the Northern line. Wool within a distance of 30 miles will go to Coonamble instead of going to the Northern line.
5235. Is there ever any congestion of the wool traffic on the Northern line? We know that we get constant stoppages as travellers; we are often half an hour, or a quarter of an hour, sometimes two hours late.
5236. I think you said that the shorter distance means saving an hour to the commercial travellers? An hour at the very least.

5237. Would they travel as fast along this line from Mudgee as they would on the main line? It would give this line an accelerated service. J. H. Toose.
5238. *Mr. Watson.*] You say that out under the Warrumbungles it is excellent land—from the foothills for some miles towards the west? Yes. 10 July, 1899.
5239. Do you think the good land near the Warrumbungles would be within a reasonable distance for cartage to a line from Dubbo to Coonamble? No doubt it would; but it would be a big tax upon them; it would hardly pay unless it was to supply back country in time of drought, because they have a better rainfall along the Warrumbungles than along the Coonamble line, or along the Castlereagh.
5240. Do you think they would require to get the better prices to be able to take advantage of a line going along the Castlereagh than they would if served by a line running from Mudgee? Undoubtedly.

Denis Barry Acton, stonemason, Mudgee, sworn, and examined:—

5241. *Mr. Dick.*] I believe you have a practical acquaintance with the mineral resources of this district? Yes; not so much the minerals as the stone. D. B. Acton.
5242. Will you kindly give us the benefit of your experience in that particular line? Recently, close to Mudgee we have tapped a slate quarry. We have sent samples of that slate to the Public Works Department; it has been tested there, and declared to be equal to the best Welsh imported slate. I have some rough specimens of the slate here, which I shall be pleased to show the Members of the Committee. 10 July, 1899.
5243. How far is the slate quarry away? It is 12 miles west from Mudgee. Close round the town we have material of all kinds necessary for the construction of a railway that can be very cheaply got—stone of all kinds and marble. We have marble mountains here almost equal to the famous Carrara marble mountains, that is in quantity for the production of the very best class of lime. It is a pure marble lime. I believe it is the best lime in New South Wales; in fact, it is the best lime I have ever seen except the famous Irish lime which may be better.
5244. At what price can you supply that lime to the Sydney market? We can sell it here in Mudgee at 6d. a bushel—about 17s. 6d. a ton.
5245. How much does it cost, with carriage and other expenses, in Sydney? I do not know the rate of carriage between Mudgee and Sydney.
5246. Do you think there is any prospect of opening up a large industry in the way of lime-making? If the quarry were taken in hand by practical men, I have no doubt but that a large industry could be established here in making lime. Unfortunately in the past the quarries have been in incompetent hands.
5247. What is the Sydney price for good lime now? About 26s. a ton. We have a superior lime in the bulk. Our lime is lighter than the Sydney lime.
5248. Is marble to be found in this quarry suitable for ornamental purposes? No; I do not think it would ever be of much value for that purpose.
5249. Have you anything else in the way of stone deposits? Along the road, as far as 25 miles on the other side of Gulgong, the material for the construction of a railway is very good and very handy. There is some beautiful stone out on the other side of Gulgong, and the material for brickmaking in Mudgee, and in Gulgong, and out on the other side of Gulgong, is of the very best description. About 14 miles from Gulgong—I suppose it will be about 6 or 7 miles from the projected railway—I believe there exists a great bed of coal. I speak from my experience of a quarry of freestone. The freestone there is identical in color, quantity, and quality with the freestone at Waratah, in Newcastle district, and between the beds of the freestone, even on the surface, we find light seams of coal. In the country I came from, in Ayrshire, in Scotland, exactly the same conditions exist on the top of the coal. Everything appears to be identical with the great beds of coal I have seen elsewhere. I think a very valuable bed of coal will be found on Crown land just out on the other side of Gulgong.

Hon. George Henry Cox, M.L.C., sworn, and further examined:—

5250. *Chairman.*] You desire to make a statement to the Committee? Since I was examined by the Committee some weeks ago, I have been in communication with the various gentlemen through whose properties the proposed line from Mudgee to Coonamble will pass. I think I have already stated that two or three of them will give the land free. I put in a letter to that effect from Mr. Richard Rouse, from Mr. Atkinson, and also, I think, from Mr. Lowe. The two Rouses, of Biriganbil, will also give their land free. But one of the largest owners of land (Mr. J. L. Brown), is near Tundaburine and Caigan. I understand from Mr. Brown that the line will run for about 10 miles through his property. He is prepared to give the land for a line, 3 chains wide through his property; but for any land beyond that width he will expect to be paid. Three chains, I think, is the usual width for a line, except where there are stations and sidings. I have been endeavouring also to get the land through the smaller holdings beyond, but I am not in a position to state what the owners of the land there will do. Not knowing exactly the route which the proposed railway will take it is somewhat difficult to get this information, because I think it will be found, in the event of this line being projected, probably a new survey will be required; and I fancy they will keep a little more to the east than does the line laid down in the chart. It will get into very much better country; it will get more towards the Warrumbungle Mountains where the country is particularly good, and it will not increase the distance perhaps more than 4 or 5 miles. Hon.  
G. H. Cox.  
10 July, 1899.
5251. *Mr. Trickett.*] Would it be less expensive to construct it there? I think it would be less expensive because it is nearer the head of the creek; the creeks would be smaller to cross.
5252. *Mr. Watson.*] The greater portion of the land which it would be necessary to resume or have given to the Government lies between Mudgee and Cobborah, I think? Yes.
5253. Beyond that I fancy either Crown lands or railway reserves will be almost solely used? Till you get to the Castlereagh, when you get into this land I speak of belonging to Mr. Brown. He has a very large estate of many thousand acres.
5254. According to the map furnished by the Lands Department, it would appear that after you leave Cobborah the surveyed route follows either Crown lands or railway reserves, with the exception of a very few miles? It is so.

WEDNESDAY,

WEDNESDAY, 12 JULY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Dubbo to Coonamble.

John Spencer Brunton, President, Sydney, Chamber of Commerce, sworn, and examined:—

J. S. Brunton. 5255. *Mr. Trickett.*] You are President of the Chamber of Commerce? Yes.

5256. You are also the proprietor of the large flour-milling works known as Brunton's Mills? Yes.

12 July, 1899. 5257. You have some information prepared, I understand, as to the railway rates between Dubbo and Coonamble and Sydney? Yes. I understand from the message I received that I was to give evidence as to the probable effect upon settlement of a line from Dubbo to Coonamble. So far as rates are concerned, I do not know whether, if the proposed railway were constructed, there would be local or special rates, such as exist on the line from Jerilderie to Berrigan, and upon other new lines. The rate from Dubbo to Sydney—a distance of 279 miles—would be 12s. 4d. per ton, the equivalent of 4d. a bushel; and upon a line from Coonamble to Dubbo—a distance of 93 miles—the same rate would be 7s. 10d. per ton, or 2½d. per bushel,—that would give a total of 6½d. per bushel to Sydney, or 20s. 2d. per ton. It must be borne in mind in connection with the grain rates that when you get over 300 miles the extra rate for about 100 miles would not exceed about 1s. a ton. I have so far dwelt with the maximum rate; but assuming that the Commissioners fixed a local rate of only 2s. 6d. from Coonamble to Dubbo, that would bring the charge down to 5d. per bushel, or 15s. 7d. per ton; that would be the through up-journey rate. But if the rate were fixed as the through rates which now exist from Hay, Corowa, or Wagga, it would come to only 4¾d. per bushel, or 14s. 10d. per ton.

5258. What are the conditions which would make the rate 6½d. per bushel from Coonamble to Sydney? The existing rate from Dubbo to Sydney is 4d., and a similar rate on the new line would run the charge up to 6½d. I may say that I have no interest in the district at all; but I know that, as a miller, I would sooner give a penny a bushel more for wheat grown west of Wellington than for wheat grown in Riverina. That is accounted for by the virgin soil in which the wheat is grown, by the quality of the wheat—which, of course, depends upon favourable seasons—produced by virgin soil, compared with the rather worn soils of Albury and Wagga, where the wheat for the past few years has been a failure as far as quality is concerned. I know the western wheat-growing districts as far as Narromine, and I know that there has been a large increase of the area under wheat. We have been buying all the wheat we could this last year from the district between Wellington and Narromine. I received 25,000 bags of wheat this year, and I should think the whole range of country from Dubbo to Coonabarabran would be good wheat-growing country. I know the Mudgee line also to some extent; but I do not think the wheat grown there would be likely to be of as good quality as the wheat grown further west. It would correspond more to the northern wheat. The junction at Dubbo would put the wheat-growers upon the proposed line in touch with a very important market at Bourke. In bad seasons, particularly, it would be a splendid market for fodder, bran, and such produce. As showing what we think of the district, we recommended two men who were in our employ for many years to put all their money into a mill at Wellington, which they bought a few months ago. As to the price of wheat, I might mention that in 1895 it was lower than it had been for 100 years, and yet the farmers managed to grow profitably at 2s. a bushel. Although the price was low, they had rather a fortunate season. Notwithstanding the low price, there were pastoralists in Riverina, Mr. MacFarlane of Barooga, and Messrs. Horsfall and Carrington, and others who were farming on the halves system, who had fair return. Since then the market in Australia has been influenced by local conditions. Owing to the failure of crop, the price of wheat went subsequently up to the price of import value, namely, 4s. 9d. or 4s. 10d. a bushel. A rise of nearly 100 per cent. was brought about through the beginning of the run of bad seasons, which began in 1895 as far as wheat-cultivation is concerned. Since then the market has eased back to an average of 4s. Last year, through the scare brought about by the Spanish-American war, which has an appreciable effect upon such a sensitive article as breadstuffs, the price jumped up again; but since then the market has been eased off under the influence of the London market, Australia being an exporting country. Although we do not ship wheat from this Colony, the Victorian and South Australian markets are dependent upon the English market prices, and the price of wheat here is fixed by the price at which it can be landed from Melbourne, the freight being about 2d. a bushel. With our increased cultivation we should have to be guided in price by the London market. The Commissioners have imposed rates which have given every encouragement to settlers upon the virgin soil of which I have spoken. In Victoria, where there are higher rates for shorter distances, we do not hear of any complaint on the score of rates. The rates have been imposed here in pursuance of the policy of the Railway Commissioners in developing and creating settlement in the back country. I suppose the average price of wheat for the last five years would be about 3s. 9d. per bushel, or about 3s. 3d. a bushel up country.

5259. What is the price this year? 3s. per bushel at Sydney. It started at 2s. 8d. per bushel, and it has advanced during the past few months on account of rather bad American crop prospects. The market, however, is now easier, and I do not anticipate much change in price between the present time and the end of the year. Our exportable surplus up to now has been less than 1 per cent. of the United Kingdom requirements, as against 64 per cent. supplied from America.

5260. The inference to be deduced from that is that there is plenty of room for expansion in our export trade? There is no doubt of that. We shall have to be ruled by the English market, and the English price is dependent upon a great many factors. For instance, there may be a failure in the American crop, and that would have a big effect upon the wheat market. There are a number of factors which are calculated by wheat merchants and buyers in London.

5261. When the Committee were recently in the district affected by the proposed railway we were informed

- informed by farmers and others that if the producers could get 2s. a bushel for wheat locally, it would be a paying price for them;—the figures you have quoted seem to indicate that that would be the case? Yes.
5262. They said they would do well if they got 2s. a bushel for the wheat at the barn? That seems to me to be rather a low price; still, if they say so, I daresay it is the case. But with wheat at 2s. a bushel, they would have to get an average of from 14 to 15 bushels an acre to make the crop pay. Last year the crop averaged about 7 bushels; at 2s. a bushel, that would represent 14s. an acre, and I suppose it costs them from 15s. to £1 an acre to plough and market. Bags are now 6d. each.
5263. The prices you have quoted indicate that in many years the farmers would get more than 2s. a bushel? Yes; 2s. a bushel was the lowest price which had obtained for 100 years. It was thought at one time that wheat-growing here would die out, but, if even that were the case, there would always be stock and other forms of produce to take its place, and we are so situated that when there is a failure in one part there is a crop in another. The good prices the farmers have received during the past few years have been due, not to the Home market, but to our own misfortunes.
5264. Are you able to say, from your large knowledge of the subject, that wheat-growing has been a profitable undertaking for a series of years by the wheat-growers in Victoria? I should say that it had been. For the last three years they have had a failure. Victoria this year had a crop of 19,000,000 bushels, and the highest crop they ever had before was 14,000,000 bushels. I am able to say, from being brought into touch with wheat-growing in this Colony, that in the past two years there have been marvellous developments in farming, especially down on the southern side—in the direction of Albury, Corowa, and Cootamundra. They have suffered, more or less, like everyone else, from the bad seasons, but they seem to be holding on all the same. Notwithstanding the bad season, the area under wheat this year is larger than it ever was before.
5265. *Chairman.*] It has been reported to the Committee that the holders of land which is now carrying sheep would eagerly put it under wheat if there were railway communication between Dubbo and Coonamble? I do not think there is very much doubt about that. The trouble has been the want of railway communication and the consequent cost of handling. The experience of wheat-growers in Riverina has proved that that form of production has two advantages. In the first place, it clears the land; they take two crops off it, and they then put in lucerne. They then give to the farmers on the halves system other land to break up, and that is worked for three or four years; so that additional land is constantly being brought under cultivation, both for wheat and lucerne.
5266. *Dr. Garran.*] Of course, to buyers in town it does not matter much whether the railway to Dubbo has to go over bad grades or not;—all that you are concerned with is the price? Yes.
5267. It is the business of the Railway Commissioners to ascertain whether they can carry the wheat at a profit over the steep grades; but the Colony is placed at a great disadvantage in having to cross such rough country with its railway, so far as the wheat-growing land to the westward of the Blue Mountains is concerned? There is no doubt about that.
5268. Other great wheat-exporting countries, such as Southern Russia and America, have no such difficulty to contend with? No; in the case of America there is water communication from Lake Superior down to New York.
5269. And in the case of Victoria there are no difficulties of communication between the Murray and Melbourne, such as those with which we have to contend in this Colony? That is so.
5270. So that the farmers on the other side of the Blue Mountains, who have to sell in Sydney, are at a great disadvantage in having such rough country to cross with their produce? Certainly; it is a question of freight—the price at which the Railway Commissioners can make the carriage of wheat pay over the high grades.
5271. If we are going to construct a railway with the object of settling people upon the land as wheat-farmers, we have to look to the probable permanency of that form of settlement, and it cannot be permanent unless the farmers can grow wheat at a price which will stand competition in the markets of the world? That, of course, is admitted.
5272. In this Colony we are nearly producing up to our requirements, and if we go on in the ratio in which we have been progressing during the last five years we shall soon be an exporting colony? Yes.
5273. And then Mark Lane will rule prices? Yes.
5274. From what you have seen, do you think that farmers between Dubbo and Coonamble could stand that competition? I can only say that at Narromine during the past three years there has been a marvellous development in farming. I know that in one case we have stored on farmers' account 4,000 or 5,000 bags of wheat, for which the growers have not drawn 1s. in advances. Beyond Nevertire it is doubtful whether the soil is as suitable for wheat-growing. It is a little outside of the rain-belt. But up to that point I do not see why wheat could not be profitably grown.
5275. There is a good district between Dubbo and Narromine? Yes.
5276. How long have the oldest farmers been growing wheat there? I cannot say exactly. The Wellington district is a very old-fashioned, conservative district, and it is only within the past few years that there has been any appreciable development there. Mr. Barton, of the Commercial Bank, four or five years ago, took over a property and turned it into a wheat farm. They are now cultivating upon it from 8,000 to 10,000 acres.
5277. Do the oldest cultivators in the district between Wellington and Narromine show any signs of exhausting their land by wheat-growing? No; the rich chocolate volcanic soil cannot be exhausted, I think, in that way.
5278. You have been buying wheat from that district? Yes.
5279. Do you see any difference between the wheat from farms which have been under cultivation, say, ten years, and that from farms which have been under cultivation for only two years? No. The seasons, I think, have a great deal to do with the wheat. The wheat from the Western district is a full grain; in fact, I may say that the best wheat in the Colony has come recently from Dubbo, Wellington, and Narromine.
5280. But in the case of the Riverina wheat, I understand that you have noticed a distinct falling off in quality? Poor seasons and continual cropping have had their effect. The same thing has been noticed in South Australia, where the average crop is growing less and less.
5281. Do you see any sign of exhaustion of soil and deterioration of crop in the district affected by the proposed railway similar to that which you have noticed in the Riverina district? No; during the last few years they have had a run of good seasons in the west.

- J. S. Brunton. 5282. Do you think the quality of the wheat is accounted for by the seasons, or by the soil? By both, I think. I believe they have a rainfall of 24 inches at Wellington, and at Dubbo I am informed that the conditions are such that plenty of water is retained in subsoil.
- 12 July, 1899. 5283. I noticed from Mr. Coghlan's statistics that land in the northern and north-western districts produces more wheat per acre than does land in Riverina? Yes.
5284. And, according to your account, the wheat is quite equal to, if not superior to, the Riverina wheat? Yes.
5285. Do you think that land which has been cropped for, say, seven years in the Riverina is becoming exhausted, or do you think that the deterioration in the quality of the wheat is due to the weather? I think it is due to the seasons to a great extent. There is a good deal of settlement round about Albury and Culcairn. The soil there is getting dirty.
5286. Has that dirty soil merely the effect of mixing dirty stuff with the wheat, or does it deteriorate the quality of the wheat itself? The wheat is damaged by the intermixture of black oats and weed seeds.
5287. But they are separated? Yes; but that is discounted in the purchase. The buyer takes that into consideration.
5288. Is the wheat inferior? No; I have seen splendid wheat from dirty soil. It depends in a large measure upon the seasons.
5289. The land in Riverina, being light, is easily worked? Yes; they use disc ploughs there.
5290. Could they be used at Dubbo? Yes, equally well.
5291. When you speak of Riverina you speak of soil near Albury, I presume, which is red soil;—but the whole of the soil over Riverina is not so red? No;—down Berrigan way there is a sort of sandy loam.
5292. Is there any difference in the quantity of the wheat produced from those two soils? No; in good seasons both are similar.
5293. Although the soil is different? Yes.
5294. There is nothing to choose between the quality of the two wheats in good seasons? No.
5295. But the Berrigan soil would be more quickly exhausted than would the Albury soil? No; I think not. Mr. Horsefall tells me that there is a good subsoil. Looking at the sandhills round about Finley and Berrigan, you would not think them at all suitable for the growth of wheat. I have noticed the same kind of soil at Mulwala; but it seems to be very suitable for wheat-growing.
5296. You think, then, that if a railway were made between Dubbo and Coonamble, and a farming population were settled on the land, there would be a reasonable prospect of their being permanent settlers;—you think they would be able to grow wheat permanently at a profit? I do. In the first place, you put them where they would have the advantage of two markets, and that is one of the reasons why I advocate the Dubbo junction. They have made a good deal of money on the Western line to the west of Wellington during the last two or three years from the sale of hay and chaff. It has been sent principally to Bourke, where they have the market to themselves. If they came to Sydney they would have to compete with imported produce from Victoria, New Zealand, and other places.
5297. Their splendid market for fodder in the west has been due to the serious drought of the past four years? Yes. Unfortunately it seems to be rather the normal condition of things out there.
5298. Do you know, from your conversation with farmers, whether it pays them better to grow wheat for hay or for grain? It is purely a matter of price. This year, when wheat was down to 2s. 6d. a bushel, it would have paid them better to convert it into hay, because they would get a higher price for chaff; but if wheat ran up to 4s. 6d. a bushel, it would pay them, of course, to sell the grain. One reason of the great uncertainty in the production of our agricultural statistics is that they cannot be compiled until it is known whether the crops are to be converted into hay or grain.
5299. As long as there is a demand by the pastoralists to the west and north-west for flour, that would be a better market for the farmers between Dubbo and Coonamble than would Sydney? Yes; there would be an enormous market in Bourke and in the back country for flour. The only wheat we have received has been that which the local millers could not take. The farmers this year believed that, possibly, the market would advance, and they have stored wheat with us under storage conditions. We take it at a certain rate, and they risk the market.
5300. Do the local millers only grind wheat which they can sell in the west, or do they send any flour down to Sydney? They do send flour down to Sydney, but their best market is in the west. They send the surplus to Sydney.
5301. How much more would the farmer get while the market in the west was not overdone than he would get by sending the produce to Sydney? The local miller, to secure wheat for the west, could afford to give 1d. a bushel more than could the city miller.
5302. You think the difference would not amount to more than 1d. a bushel? No.
5303. Then the big market in the west is not a matter of supreme importance to the farmers after all? There will be always a demand for flour in the west, which could be supplied from the districts of which we are speaking. As matters now stand, with through railway rates, flour can come from the Murray right up to Bourke at low rates; but it is being pushed back every year. The Orange and Bathurst millers send flour out to the back country. There is now no mill between those points and Bourke; but when wheat is grown in the intervening districts mills will be placed there. There is no doubt about that.
5304. Still, if the difference is represented by only one penny a bushel, whether the farmer sells in the west or sells in Sydney, the market is not a matter of supreme importance to him? If the market were low, the farmer could, by holding, demand, perhaps, another 4d. a bushel for his wheat, and the local miller could get a supply for the western market as against the Orange and Bathurst millers. Perhaps I can illustrate what I mean by a reference to the Berrigan trade. There is always a fight there. The freight between Melbourne and Sydney is just about the same, and when the line goes to the border it will enable the Melbourne people to get Riverina wheat across their lines, and ship it to England. We have to draw the wheat a longer distance, and the Railway Commissioners will have to lower their rates if they want that traffic. At present the line from Jerilderie to Berrigan is unprofitable, and it may be that it will pay the Commissioners to let the grain traffic go, and rely more on other produce.
5305. I am speaking more particularly of competition between the western and Sydney markets as affecting the Dubbo farmers; even supposing the pastoralists' market in the west to be a good one, practically Mark Lane will settle the price for the Dubbo farmer just the same? That is so.
5306. So that, although the farmer at Bourke or at Tibbooburra wants flour badly, it is the Mark Lane price which governs what the miller will give the farmer? Yes. 5307.

5307. We have to consider that all these farmers will have to produce at the minimum rate? Yes.
5308. And do you think there will be a living for them at that rate? Yes.
5309. Do you know if they can grow wheat all the way from Dubbo to Coonamble, or for only two-thirds of the journey? I do not know the whole of the country; but I should imagine, from what I know of the tract of country across from Dubbo to Coonabarabran, that it would be a wheat-growing country all through.
5310. Gilgandra wheat goes into Dubbo at the present time, so that in buying wheat at Dubbo you may have purchased Gilgandra wheat? Yes; I remember now having seen particulars of wheat from Gilgandra.
5311. Have you ever bought any wheat from Coonabarabran? No.
5312. What is the maximum distance from a railway station at which the farmers from whom you have bought are situated? I should say that the furthest point would be Gunbar—that is, taking the distance from Gunbar to Carrathool. We obtain wheat from that district in good seasons, but we have had nothing from it lately.
5313. *Mr. Watson.*] What would be the distance? About 50 miles.
5314. That would be the extreme of road-carriage you think? Yes.
5315. *Dr. Garran.*] I remember that evidence was given some years ago before this Committee, that a farmer within 15 miles of a railway station was fairly well served? Yes; he would have nothing to complain about. Before the railway was extended to Berrigan all the wheat was carted from that district into Jerilderie.
5316. You have seen wheat grown in different parts of the world;—do you consider that our western-grown wheat is as good as the wheat grown anywhere for miller's purposes? Yes; it has the colour and the gluten in fair seasons. The southern wheat this year has the gluten, but has not the colour. The northern wheat has generally been the second wheat. The rainfall there is heavier, and up to the last two or three years the price used to range about 3d. a bushel below the Riverina and western wheat; but the last two or three years have been dry, and the consequence has been that the northern wheat has been a good useful mixing wheat.
5317. Has there been much importation of Manitoba wheat for mixing purposes? No. The flour, which came here two or three years ago for the first time, was used principally for mixing with the weaker Californian flour. There is now a difficulty in selling it on account of the good quality of our local flour. It is not likely that the baker would give so much more for it if he did not get a better price for his bread.
5318. *Mr. Watson.*] When the flour of which you have just spoken was first imported, there had been a failure of crops here? Yes; some of the imported wheat was taken over the mountains to Vancouver, and another portion of it came to us *via* New York.
5319. *Dr. Garran.*] You imported it for mixing purposes? Yes; for bakers to mix with the softer Californian flour.
5320. The mixing of the different flours has the effect of making a better flour? Yes; that is why town flour usually commands a higher price than does country flour, made with only one particular kind of wheat.
5321. Taken separately, which is the best bakers' wheat—the southern, western, or the northern? I should say this year the western would be the best.
5322. *Mr. Watson.*] Usually the southern wheat is very good? Yes. There is one point I should like to mention to the Committee. I hope they will not lose sight of the advantages of the western market to the producers on the proposed line of railway. It means far more than you can gather from looking at the map. I happen to know the benefits which the farmers in that direction have already derived from the Bourke trade, and those benefits must increase with increased settlement. I do not approve of the connection *via* Mudgee, because it would lose touch with the western trade.
5323. *Chairman.*] From your knowledge of the district, you would prefer the line from Dubbo to Coonamble to the line from Mudgee to Coonamble? Yes.
5324. *Mr. Dick.*] Why do you think the Mudgee line would put the producers out of touch with the western market? Because they would have to bring their wheat from Coonamble *via* Wallerawang to Bourke; and they could not afford to do that on account of the produce from Bathurst and Orange going towards Bourke.
5325. You know that there is a large wheat-growing area near to Mudgee? I do not know the district, but as a rule the Mudgee wheat is not a hard wheat. It is rather a wet district.
5326. Do you know that flour is milled at Gulgong? Yes.
5327. What is it worth? It is a soft flour. I was offered 50 tons of Mudgee flour yesterday at £6 10s., and I was selling our own flour here at £7 5s.
5328. Have you heard that a large order has been received from London for Gulgong flour? A man who is shipping flour to London will not be influenced by locality, or considerations of that sort, so long as the quality of the flour is good. The cheapest flour this year has been from Melbourne and Adelaide, for export; but so far as this particular district is concerned, I would much rather sell in the Bourke market than in the Sydney market in the matter of flour.
5329. *Chairman.*] If you were going to settle in the district to grow wheat, you would prefer to settle within a reasonable distance of the Western line than on the Mudgee line? Yes. There is a great similarity between the Tamworth and the Wellington districts, but of the two, I would rather risk my future on the Western line. There is a rainfall of 24 inches, and although the rainfall at Tamworth is good, on the Western line there is the trade to Bourke to be considered. That is a very important trade, because the good seasons there are only occasional, and the market must, therefore, be a good one.

Thomas Henry Smith, District Surveyor, Dubbo, sworn, and examined:—

5330. *Chairman.*] You have prepared a statement and a map showing, approximately, the agricultural and pastoral land on the proposed line from Dubbo to Coonamble? Yes; the statement I have prepared is as follows:—

T. H. Smith.  
12 July, 1899.

1. In furtherance of your personal request to be supplied with a map showing both alienated lands and Crown lands within a limit of 20 miles on each side of the railway trial line from Dubbo to Coonamble, indicating, approximately, thereon the lands which may be deemed to be situated within a fair agricultural limit, I have the honor to state:—
2. On the accompanying map, marked XO, the 20 miles limit on each side of the proposed railway is shown by firm red lines; alienated lands are shown thereon by pink tinting; Crown lands are white; and the area which may be said to include, more or less, agricultural lands is shown by blue pencil hatching.
- 3.

T. H. Smith.  
12 July, 1899.

3. The Crown lands shown by white embrace reserves from sale, or are within pastoral leases, which will expire in July next year, and will then be available for settlement.

4. Within the agricultural limit, shown by blue pencil hatching, there are, of course, patches of open plain, pure black-soil country, and some "monkey" country, which are not, in my opinion, suited for agriculture; but those patches are separated, and are not of large extent. My original intention was to show these patches on the accompanying map, but I found, unless an exhaustive search were made through the plans of portions measured for alienation in the subject part of the district, it was impossible to locate them from local knowledge; moreover, unless a map of a much larger scale was prepared—which would be expensive and take some time—these patches could not well be shown.

5. With the exception of the ironbark forest country, between the Talbragar and the Castlereagh—which country has not been included within the agricultural limit, as shown on accompanying map—the whole of the country within 20 miles on each side of the proposed railway between Dubbo and Coonamble may be said to embrace either good agricultural lands, or exceptionally good pastoral country, the latter carrying rich pasture, excellent for sheep, either for fattening or breeding.

6. So far as agriculture is concerned, the district, in my opinion, is still in its infancy. Some little time after my appointment to Dubbo as District Surveyor—some sixteen years ago—it was pointed out in my reports that there existed no reasonable doubt but that the district, so far west as Trangie—judging from the rainfall and nature of the soil—could be far more profitably developed by agricultural pursuits than by sheep-grazing.

7. No farming had then been tried. The old residents had no faith in this opinion, and it was not until settlement had increased, and new men, practical in agricultural pursuits, had acquired land, that this part of the district gradually was placed under agriculture. The limit given by me, viz., Trangie, has now proved not nearly far enough west, as good wheat is grown so far west as the Bogan River, near Girilambone. I mention this to show what the district is really capable of, and I have no doubt whatever, if the Dubbo and Coonamble railway is constructed, that large areas adjacent thereto, which are now used for sheep-grazing only, will be cleared and placed under cultivation, and that a large population will be supported. All red soil in this district undoubtedly is well suited for wheat and hay growing. I have serious doubts, however, about the black soil; although rich enough, it is difficult to work, owing to its sticky nature. Recently areas of open plain country, with dark chocolate soil have, however, been successfully cultivated.

8. The country within the 20-mile limit is level throughout, and with the exception of the plain country is timbered with box, pine, apple, gum, oak, belah, &c.

9. In reference to the ironbark country mentioned in paragraph 4, this forest, considering its importance, extent, and the quality of valuable ironbark timber growing thereon (so scarce in other parts of the Colony), may be deemed a national forest. For many years past exceptionally large quantities of sleepers—some millions I should think—have been obtained, and at the present time large quantities are being cut and delivered at Dubbo. In the event of a line being constructed from Dubbo to Coonamble, which would practically skirt the edge of the forest, a considerable saving to the Crown would result in the expense of sleeper-getting. I may say the cost of carting sleepers was found to be so great that the Railway Commissioners proposed to construct a tramway from Dubbo along the Coonamble road to Brocklehurst, thence into the forest—a distance of about 25 miles. The construction of a railway from Dubbo to Coonamble would render such a lengthy tramway unnecessary. I think I hardly need more than briefly refer to the scarcity of ironbark throughout the Colony, and the fact that the Commissioners have now to obtain other and inferior timber for sleepers.

10. The area within the 20-mile limit, as shown by firm red lines on enclosed map, is estimated approximately at 4,450 square miles.

11. The area of agricultural country shown by blue-pencil hatching within the above 20-mile limit is approximately 3,096 square miles.

12. The area of ironbark forest country within the above 20-mile limit is approximately 540 square miles.

13. In conclusion, I would state that parishes of Boyben, Burrendah, Bearbung, and Wallemburawang, in the county of Gowen, are not in my district, and I have no local knowledge of them. These parishes, I think, do not embrace good country, and probably are within the limits of the ironbark forest.

5331. As to paragraph 8 in your statement, you purposely left the rainfall blank? Yes. The reason is, that it is difficult to give an average rainfall for the whole of that district. The annual rainfall for the past twenty-five years at Dubbo has been 23.36 inches; at Quabathoo, at the northern end of the district, it has been 19.91 for the past twenty years; at Coonamble, it has been 22.46 for the past eighteen years; at Gilgandra it has been 27.83 for fourteen years; and at Gulgargambone, 30.68 for ten years. If I were to attempt to give an average I might mislead the Committee.

5332. Have you seen the country upon which wheat is being grown round about Narramine? Yes; I know it well.

5333. How does the land which you have plotted on your map as being fit for agriculture compare with the wheat land at Narramine? Part of it would be quite as good; but other parts would not.

5334. *Mr. Watson.*] The Narramine country is very good? Yes.

5335. *Chairman.*] I suppose there are bad portions in the Narramine country? Yes. When you approach the black-soil country it is not so good.

5336. Would the good land on the proposed line, in your opinion, be equal to the good cultivated land round about Narramine? The bulk of it would be.

5337. You have put down the area of the agricultural limit as approximately 3,096 square miles? Yes.

5338. You have exercised care in compiling that statement? Yes; the figures have been carefully prepared.

5339. The Committee may take the statements as being reasonably correct? Yes. Of course in the area within the agricultural limit there are patches of open, plain country.

5340. But they are so small that you could not very well show them upon the map? That is so.

5341. The area of ironbark country given is 540 square miles? Yes.

5342. In your opinion, that does not detract from the value of the proposal? No; I regard that area as a most valuable forest. It is a national forest of very large extent.

5343. You are of opinion that the Railway Commissioners will for a long time draw their sleepers from that part of the country? I think they will have to do so.

5344. And that will mean so much additional traffic for the proposed railway? Yes.

5345. *Mr. Watson.*] I understand that the blue hatching on the map before us represents the land suitable for agriculture? It represents the limit of it.

5346. Does it include any of what are known as Myall Plains, on the western side of the Castlereagh? Yes; those are the patches to which I refer in one of the paragraphs of my statement.

5347. You do not think they are suitable for agriculture? No. The black-soil plain country is certainly not fit for agriculture.

5348. On the other hand, do you consider that the whole of the land on the eastern side of the proposed line, which is shown in white on the map, without hatching of any character, and which is ironbark country, is all unsuitable for agriculture? No; I would not say that the whole of it is unsuitable.

5349. Taking the ironbark on the eastern side,—on the average, what would you say would be the area unsuited for agriculture compared with the average area unsuited for cultivation in the country marked fit for agriculture on the western side? I could not give you the proportions.

5350. You do not think that the total of your estimate of the agricultural limit near the proposed line is an extravagant one? No, I do not think so. 5351.

5351. Have you been over the whole of that country yourself, or are you relying to some extent on the reports of your officers? I have a good general knowledge of the country. I have not been much in the field during the last five or six years, my duties having kept me in the office; but prior to that I was a good deal in the field. T. H. Smith.  
12 July, 1899.

5352. You have also a general knowledge of the purposes to which similar land is put in other localities? Yes.

5353. So that you are competent to express an opinion as to whether this particular land is fit for agriculture? Yes.

5354. In the discharge of your official duties, you are often called upon to express an opinion as to what land is fit for? Yes; I classify land.

5355. At the present time, is your office preparing areas for settlement within the sphere of influence of the proposed line? Yes; we have been designing all the leasehold areas for settlement. The leases expire in July next.

5356. Would the knowledge that the proposed railway was decided upon have any effect in altering the designs of the various settlement areas—that is, as to the area necessary to support a family? Certainly, and for the reason that the areas might embrace wheat-growing country. The cost of carriage to market would be very great; therefore, without a railway the land would be used only for sheep-growing. If there were a railway, the greater part of such land would be put under agriculture.

5357. So that we are safe in assuming that, if the line is decided upon, a greater number of settlers will be placed upon the land that is to be thrown open next year than would otherwise be the case? Certainly.

5358. Would there be any increase placed upon the capital value of the land consequent upon railway construction? There would be; but the throwing open of the land would really rest with the Minister. If he wished the land thrown open that would be done whether the railway were constructed or not.

5359. You have cast upon you the duty of making recommendations as to the capital value to be put upon the land for settlement? Yes.

5360. With the construction of a line to Coonamble, would a higher capital value be justifiable in respect of the leasehold areas than would otherwise be the case? Yes.

5361. And the State would get a corresponding advantage? Yes; the areas would be reduced in size.

5362. And increased in capital value where they were fit for agriculture? Yes.

5363. *Mr. Dick.*] I see you have marked the whole of the country on the western side of the proposed railway up as far as Gilgandra without exception as agricultural land? The plotting on the map gives the limit of the agricultural land. Within that area, as I have already explained, there are patches of open plain country which cannot be shown on the map.

5364. Would there be any patches of 3 miles by 3 unfit for agriculture? Yes.

5365. Would not that area be visible on the scale on which the map is drawn? Yes. I tried hard to put all the areas on the map; but I found that I could not do it in any way accurately unless I got out all the plans.

5366. Do you know the country to be served by the proposed line from Mudgee to Coonamble as well as you know the country between Dubbo and Coonamble? No; parts are out of my district.

5367. When Mr. Harper was examined by the Committee he gave this evidence:—

We are told that the country from Dubbo to Gilgandra is rather poor? So it is.

Other witnesses confirmed that statement;—do you still hold to the belief that all the land on the western side of the railway within the 20-mile limit is good agricultural land up to the point I have named? Yes; speaking generally, a large proportion, in my opinion, is good agricultural land.

5368. Have you had any experience in agriculture? I have never grown wheat myself, but I have seen a good deal of wheat growing. The whole of the country to which you refer is not absolutely good country. I should say, for example, that Narramine was an agricultural district. Still there are patches there of poor country which would not be cultivated. In the same way there are patches of poor land between Dubbo and Coonamble.

5369. Can you give any reason why the country within a distance of 20 miles of the proposed railway north of the section on the Western line, between Dubbo and Narramine, has not been put under agriculture? A great deal of it may have been under leasehold area.

5370. Can you not say whether that is the case or not? I could say if I had my plans with me, but it is impossible to remember everything of that sort. The bulk of the land, speaking from memory, has only been recently taken up, I think.

5371. Would you describe the country from Gulargambone north to Coonamble as likely to prove profitable under agriculture? I do not see why the red soil country should not be. If there is not a good wheat crop the crop would be available for forage. If there is not a good wheat crop the district would be generally under drought, and in that case there would be a good local market for forage.

5372. Could you inform the Committee what would be the average number of failures in a decennial period in a section of the proposed railway between Gulargambone and Coonamble? I could not; but I know that Mr. Frank Mack of Narramine, when he first put his country under wheat, informed me—I am speaking from memory—that if he got four good seasons out of ten, he would not lose money, and that every good season beyond four would be a source of profit to him.

5373. Have his anticipations been fulfilled? He has had a good season every year.

5374. There is a very much heavier rainfall at Narramine than at Coonamble? Yes; but, on the other hand, there is a better rainfall at Gulargambone than at Narramine. I do not wish to be misunderstood as to the blue hatching on the plan. I have included areas of open plain country, but it would be a very hard thing to show those areas from local knowledge on a map of that small scale. It would be misleading, so I thought it better to give the agricultural limit.

5375. *Mr. Watson.*] Do you think the patches of myall country on the west, which are unfit for agriculture, and which are not shown, would be counterbalanced by patches of good country on the eastern side among the ironbark? No; there is more open plain country on the western side of the line unsuited for agriculture than there would be good country fit for agriculture among the ironbark.

5376. *Chairman.*] There being a less area of ironbark country? Yes.

5377. You were asked whether you could account for so much land fit for agriculture on the western side of the proposed line not having been put under the plough;—do you know anything of Mudgee? No.

5378.

T. H. Smith. 5378. Supposing a man had 30,000 acres of good agricultural land within 20 miles of Mudgee, how would you account for his not putting it under the plough? I could not say. Personal feeling as to business considerations comes into these things sometimes.

12 July, 1899.

5379. The real reason might be that a person having taken to pastoral pursuits would not readily take to agriculture? That might be one reason. He might not like to place his property under cultivation if he had valuable sheep.

5380. Until new men with agricultural ideas come among them, pastoralists do not dream of putting their land under crop? No.

5381. Has not that been the experience at Dubbo;—have not farmers come there from Victoria and South Australia and shown settlers there what can be done by wheat-growing? Yes.

5382. Since their advent the area cultivated has been very much increased? Yes. Sixteen years ago there was no agriculture in my district, and when in my old official reports I pointed to the fertility of the soil, and said the land was well adapted to wheat-growing, I was laughed at by old residents.

5383. What was then predicted is rapidly taking place? Yes.

5384. You meet a good many settlers in the district? Yes.

5385. What is the general opinion of the district as to wheat-growing;—do you think many of the settlers will leave pastoral pursuits and take to agriculture? I think they will. I believe the Dubbo district is more adapted to wheat-growing than to sheep-farming. Narramine, fifteen or sixteen years ago, was a sheep station. I think it carried 45,000 sheep when Mr. Mack bought it. He lost the resumed area by selection, and carried on the other half. When he improved it he carried about 80,000 or 90,000 sheep. He carries a great number of sheep now, but he has also gone in for agriculture. He has a large area under cultivation.

5386. I believe there is a proposal in your district to effect an exchange of 25,000 acres of land with Mr. Body, the land being within the influence of the proposed railway? The proposal has been made but the papers have not yet been sent to me.

5387. Do you know the land proposed to be given up? No; I have not seen the proposal. In regard to the open plains of which I have spoken, I should like to give myself some margin. I think it would be fair to estimate about  $7\frac{1}{2}$  per cent. for open plain country in the areas marked within the agricultural limit on the western side of the line.

5388. *Chairman.*] The land there not suited for agriculture would be admirably suited for fattening purposes? Yes.

5389. *Mr. Watson.*] What proportion of the ironbark country shown on the eastern side of the proposed line would be fit for agriculture? I should say about  $2\frac{1}{2}$  per cent.

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## Railway from Dubbo to Coonamble.

## APPENDIX.

## A.

[To Evidence of Howard Speight.]

TRAVELLING AND TRUCKING OF STOCK.

Sir,

Cobborah, 12 July, 1899.

Please find herewith enclosed some additional evidence for your Public Works Committee to consider.

Yours, &amp;c.,

E. J. WILLIAMS,

Secretary, Cobborah Railway League.

The Secretary, Public Works Committee, Sydney.

Cobborah, 12 July, 1899.

THE following statement by Howard Speight, of Cobborah, taken on oath before the undersigned Justice of the Peace is an Appendix to his evidence given before the Public Works Committee, at Cobborah, on the 7th July, 1899 :—

I, Howard Speight, sheep overseer, residing at Coonamble, on oath saith :—As an Appendix to my evidence given before you on the 7th July, 1899, at Cobborah, I wish to state that at least 100,000 sheep and other large stock travel from the Coonamble and adjoining district to the Aberdeen Freezing Company's Works at Aberdeen, a distance of over 200 miles. In consequence these animals lose over 12 per cent. of their weight, the journey taking at least five weeks. If the railway were constructed from Mudgee to Coonamble, the stock would be trucked from the latter place to Cobborah and driven from there to Aberdeen, bringing a considerable revenue to the State and shortening the time taken in travelling and placing the stock in a better condition on the market.

HOWARD SPEIGHT.

Sworn at Cobborah, this 12th July, 1899, before me,—

H. A. PATRICK, J.P.

## B.

REPORT BY THE RAILWAY COMMISSIONERS ON THE MUDGEE-COONAMBLE ROUTE.

Office of the Railway Commissioners of New South Wales,  
Sydney, 1st May, 1899.

The Rt. Hon. G. H. Reid, P.C., Q.C., M.P., Premier and Minister for Railways.

Railway to Coonamble *via* Mudgee.

WITH reference to the communication of the 14th ultimo, from the Chairman of the Public Works Committee to the Right Hon. the Premier and Minister for Railways, relative to the merits of the alternative routes for a railway to Coonamble, and to our minute of the 27th ultimo, intimating that an inspection of the route from Mudgee would be made and a report subsequently furnished, we beg to state that the route has been inspected, the capabilities of the country studied, and the prospects of traffic carefully considered.

Before proceeding, we desire to express our satisfaction at being afforded this opportunity of stating our views on the alternative routes to Coonamble. Hitherto it has been generally understood that our reports should be confined to the merits of any particular route submitted to us, and we have on more than one occasion laboured under considerable embarrassment by the observance of such a course, and have felt that the value of our reports has been limited by the restriction.

It will be remembered that we have already reported on the proposed extensions—Warren to Coonamble and Dubbo to Coonamble—as separately referred to us. Previously we have mentioned the Mudgee-Coonamble connection as one worthy of consideration, its cost, however, causing it to be looked upon unfavourably in comparison with the route *via* Warren, which involved a very much smaller expenditure.

When dealing with the proposed Warren-Coonamble extension the Public Works Committee came to the conclusion that a connection from Dubbo, although necessitating a larger expenditure, offered greater advantages, particularly in regard to the more direct communication with the metropolis.

In our report on this subject we intimated that Coonamble was entitled to railway facilities, and that the route was consequently worthy of consideration.

Reverting to the Mudgee-Coonamble connection, and bearing in mind the apparent intention of the Government to expend a larger sum of money in giving Coonamble railway communication (to which the district is fully entitled) than would be involved by extension from Warren, we beg to state that we have a high opinion of the country which would be traversed by a line from Mudgee, and the route is one which is worthy of the most thorough investigation and inquiry.

Although necessitating a larger capital outlay than the other schemes recently under consideration, it offers the advantage of giving the more direct communication with Sydney, and it would open up and develop a more extensive and better agricultural area. Further, it would help materially to more satisfactory results in connection with the working of the Mudgee line than have hitherto been experienced.

If it is desired, we shall be glad to instruct the Chief Traffic Manager, Mr. Harper, who accompanied the Commissioners on their recent inspection, to give evidence before the Public Works Committee as to the extent and character of the country which would be served by a line from Mudgee to Coonamble, and probably consequent development of the agricultural industry.

Should the matter then be proceeded with to the stage when it is competent for us to report in terms of the Public Works Act, we shall be glad to do so.

CHARLES OLIVER,  
Chief Commissioner.W. M. FEHON,  
Commissioner.DAVID KIRKCALDIE,  
Commissioner.

## C.

## [To Evidence of William England Morgan.]

EVIDENCE GIVEN BY W. M. B. DAYRELL, IN WARREN-COONAMBLE RAILWAY INQUIRY.

William Mortimer B. Dayrell, manager, Co-operative Flour-mill, Dubbo, sworn, and examined :—

1584. *Mr. Hassall.*] How long have you been in the district? Over thirty years.
1585. You have seen the progress and development of the district since that time? I have.
1586. Can you give the Committee any information as to the progress of agriculture in the district—what it was, say, ten years ago, what it is at the present time, and what are the prospects of its ultimate increase? Ten years ago there were not 30,000 bushels of wheat grown in the district, and this year I suppose there have been fully 400,000 bushels. That is an approximate estimate, judging from what has left the district, and what still remains. That embraces the district around Dubbo, including Narramine, but not going as far as Gilgandra, and under the mountains to Coonabarabran, where there is a good deal of wheat grown.
1587. That wheat has been sent to the Coonabarabran mills for some years past? Yes; and they get it for a very small sum, inasmuch as the carriage is very heavy from Coonabarabran to the railway. We are getting some delivered now. Yesterday we had 6 tons in from Coonabarabran way.
1588. Judging from your experience of the wheat produced, do you think this district is suitable for growing good, sound grain of marketable quality? Undoubtedly.
1589. Such as would sell in any market of the world? Yes.
1590. Of what quality is the flour made from it? It is very good. We can always top the market in Sydney. We have just finished delivering several hundred tons to Mr. William White and others.
1591. Your principal supplies at present are drawn from the immediate vicinity of the town, or within a radius of 30 or 40 miles? Between Geurie and Nyngan.
1592. Where is the principal market for flour? West from here.
1593. What portion of the Colony west is supplied? Every town along the line—Nyngan, Cobar, Coolabah, Byrock, and Bourke; every town in the west that is reached by rail.
1594. I presume you supply numerous orders in that direction? Yes; we truck every day.
1595. And I presume the flour is sent even still further? Yes; it goes away to Queensland.
1596. Does your demand exceed your supply? The company has not been long formed. This is the first season during which we have been able to run night and day. We have no difficulty in placing our flour without sending any travellers out.
1597. In addition to your western market, you also have the Sydney market available? Yes.
1598. So that you can compete successfully down there? Yes; as long as we have wheat on the spot.
1599. I understood you to say that you do not have much wheat coming in from Gilgandra, Muntooran, and down there? Not a great deal; we have had about 300 tons.
1600. Do you get any wheat in from between here and Gilgandra? Yes.
1601. Of what quality is that? Very good.
1602. Will it compare favourably with any other wheat in the district? Yes.
1603. And make equally as good flour? Yes.
1604. Have you any knowledge of the country between Warren and Coonamble? I have.
1605. Do you think that would be a wheat-growing country? No; a great deal of it would not, and some of it would. Take the country between Bullagreen and Bourbah. You go along there in wet weather and you cannot see the track; it is just like a stream. I have been seven or eight hours going from Bullagreen to Bourbah in winter-time.
1606. You think that is country in which it would be almost impossible to grow wheat successfully? You could not do it.
1607. You might grow wheat in patches or in suitable seasons, but to grow it successfully you do not think it is possible? No.
1608. Do you know the country between here and Gilgandra, down the Castlereagh? Very well.
1609. What do you think of that? Of course, there is a lot of bad country, but then, again, there are some very good patches when you get in off the road a bit, especially in on the western side of the line from here to Gilgandra.
1610. You consider that country eminently suitable for wheat-growing? Yes; there is some very good wheat country through there.
1611. Have you any wheat from that locality? Yes; small quantities come in.
1612. The country is not yet sufficiently developed to send in any large supplies? No; a good many selections have been taken up there, and the holders are clearing the land, preparing for wheat.
1613. With regard to the country lying to the east, running from Gilgandra up towards Muntooran, and in that direction, I presume it would be supplied with flour from Coonabarabran? We send a good deal of flour there. For instance, some farmers of Tooraweena bring their wheat in here for gristing. We supply nearly all Gilgandra and Tooraweena. We do not supply Cobborah; they get their flour from Mudgee or Gulgong.
1614. But with regard to the whole of that country from here to Gilgandra, and a little distance on the eastern side of the Castlereagh down by Coonamble, and also the country lying west, practically right through to Warren, and down the river to Bourke and the intervening townships and stations;—I suppose you have an outlet for flour in that direction? Yes.
1615. If any considerable quantity of land were put under cultivation for wheat, do you think the market would be overstocked;—do you think the wheat supply would be greater than the demand? It will be, locally; but we would have to export, and the price then would be regulated by the London market, less freight.
1616. You think the outlet would be sufficient to induce people to go in for the cultivation of wheat on suitable soil? I think so; because wheat is about the only grain you can grow up here with advantage.
1617. And the only grain that will bear the cost of carriage? Yes, and it does not require a very great deal of rain.
1618. Have the seasons been fairly favourable and the crops fairly successful from year to year to your knowledge? For the last two years. This season has been a very good one for quantity, although the quality has not been A1. Still in quality it was far better than the southern wheat. The northern wheat has beaten us this year for quality, for they had more rain, but the quantity here has been very large.
1619. You heard the statement made by Mr. Morgan? Yes.
1620. Can you endorse that statement? Yes.

## D.

## [To Evidence of Edward McCulloch.]

RAILWAY FROM MUDGEE TO COONAMBLE.

MUNICIPALITY of Gulgong, parishes of Gulgong and Guntawang, county of Phillip, area 20,480 acres; incorporated 6th February, 1876; approximate population, 2,200; dwellings, about 500; general rate only of 1s.; fair average annual rental of improved land, with buildings thereon, £8,900; capital value of all rateable property, £210,000; roads and streets, 69 miles 60 chains, of which over 40 miles are metalled.

There is a demand for freehold land, which brings a higher price now than it ever did. Some unimproved land, half a mile from the town, realised, recently, £5 to £6 10s. per acre, originally purchased at Crown land sale, some years ago, for £2 5s. and £2 10s. per acre. All available land for homestead selections has been taken up. There are six residential leases now being improved. A portion of the temporary common, when revoked, will be immediately selected. The district is in a better condition in every way than it was twenty years ago, settlement having taken place in a greater measure than one would anticipate.

E. McCULLOCH.

1899.  
(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

PROPOSED RAILWAY FROM DUBBO TO COONAMBLE.

(REPORT OF THE RAILWAY COMMISSIONERS RESPECTING.)

*Printed under No. 10 Report from Printing Committee, 16 November, 1899.*

Office of the Railway Commissioners of New South Wales,  
Sydney, 14 November, 1899.  
The Hon. W. J. Lyne, M.P.,  
Premier and Minister for Railways,—

We deem it necessary to take the most exceptional course of addressing the Honorable the Premier and Minister for Railways in connection with a contemplated railway extension which has been recommended by the Public Works Committee and submitted to Parliament for adoption. We refer to the Dubbo-Coonamble line.

During our recent inspection and investigation in connection with the proposed cross-country line from Werris Creek to Wellington we were very strongly impressed with the necessity for affording railway facilities to an extensive area of agricultural country, naturally and commercially connected with Mudgee, which would not be served by either the Werris Creek to Wellington or Dubbo to Coonamble routes, but would be amply provided for if the extension to Coonamble were made from Mudgee.

We are aware that the latter was rejected by the Public Works Committee in favour of the Dubbo-Coonamble route. After most thoroughly and carefully considering the question, and fully realising the exceptional course we are taking, we feel compelled to urge that the question of railway communication to Coonamble—which it is fully admitted must be provided—should be reconsidered. While Coonamble is apparently content with the Dubbo extension, there is strong reason for believing that more satisfaction would be felt if it were made from Mudgee, and, in addition, the tract of country specially referred to would be given railway facilities to its natural market; and, further, in the direction of Coonamble a far better and more settled class of country is traversed than would be opened up by the proposed Dubbo extension.

It is true that a considerably larger initial cost would be involved, and a greater length of line would have to be constructed, but Coonamble *via* Mudgee would be brought 34 miles nearer to Sydney, and for all time be thus saved the additional haulage rates over the longer route *via* Dubbo, and we now feel assured that ultimately better results would be obtained both financially and as affording largely-increased facilities for the extension of agricultural settlement.

It is admitted that the Mudgee connection would not serve all the country that would be served by that from Dubbo; but, as previously stated, a larger and better area of country would be opened up, and, as there cannot be a railway extension in the direction of Coonamble from both Dubbo and Mudgee, we feel that, even at this late moment, it is worthy of further consideration whether the connection would not prove the best in the interest of both the larger number and more extensive area of good country by it being made from Mudgee.

Further, it may be added that, as the traffic increases on the Western Line, greater relief would be afforded by the extension of the Mudgee line than by the projection of a line from Dubbo to Coonamble.

It may be inferred that the suggestion now made has some bearing upon the Werris Creek to Wellington proposal, but it is not so, as such a line would in no way be prejudicially affected, indeed rather the reverse, by the adoption of the Mudgee route.

We trust that this representation may not be considered as in the direction of challenging the recommendation of the Public Works Committee, our only desire being to respectfully, but earnestly, represent our views with the object of further inquiry being made, if deemed necessary, before a final decision is arrived at as regards the extension of the railway to Coonamble.

CHARLES OLIVER,  
Chief Commissioner.  
W. M. FEHON,  
Commissioner.  
DAVID KIRKCALDIE,  
Commissioner.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

PROPOSED RAILWAY FROM MUSWELLBROOK  
TO CASSILIS.

(PETITION FROM CERTAIN RESIDENTS AND ELECTORS OF MUSWELLBROOK, DENMAN, GOULBURN RIVER, MERRIWA, AND CASSILIS, IN FAVOUR OF.)

---

*Received by the Legislative Assembly, 25 July, 1899.*

---

To the Honorable Sir Joseph Palmer Abbott, K.C.M.G., Speaker, and Honorable Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Residents and Electors of Muswellbrook, Denman, Goulburn River, Merriwa, and Cassilis,—

RESPECTFULLY SHOWETH :—

That your Petitioners are at a great disadvantage in competing with growers and producers in other districts through the want of railway communication, and are thereby at a great inconvenience in the effort now being made to develop the rich agricultural resources of these districts of Denman, Goulburn River, Merriwa, and Cassilis.

That your Petitioners have been agitating for the construction of a railway through these districts between Muswellbrook and Cassilis for a number of years, with the result that line has been surveyed, locksplitting completed, and trial-holes sunk, and all necessary work done for the construction of the proposed line as far as Cassilis, and the sum of £700,000 voted by Parliament for the purpose.

Your Petitioners very respectfully pray the favourable consideration of your Honorable House so far as to place the matter before the Works Committee for the report as to the advisability of constructing a railway, not alone from Muswellbrook to Cassilis, but to continue the line from Cassilis to Coonamble; and your Petitioners feel sure that they could furnish that body with such evidence as would justify them in making a favourable report that would impress your Honorable House not only with the local but also the national importance of such a line.

Praying your Honorable House will take our Petition into your favourable consideration, your Petitioners, as in duty bound, will ever pray.

[Here follow 642 signatures.]

1899.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

## PROPOSED RAILWAY LINE FROM WELLINGTON TO PARKES.

(PETITION FROM LEWIS MAY, CHAIRMAN, AND H. P. MILLER, SECRETARY, ON BEHALF OF THE  
BALDERODGERY AND MOUNT AUBERY RAILWAY LEAGUE, IN FAVOUR OF.)

---

*Received by the Legislative Assembly, 20 July, 1899.*

---

To the Honorable the Speaker and Members of the Legislative Assembly in Parliament assembled.

The Petition of the undersigned Chairman and Secretary on behalf of the Balderodgery and Mount  
Aubery Railway League,—

HUMBLY SHOWETH:—

1. That whereas the proposed line of railway from Wellington to Parkes, passing through Balderodgery and Mount Aubery, would probably be less expensive to construct than any other continuation of the Werris Creek line, would tap a rich agricultural and pastoral district, and would, in the opinion of your Petitioners, pay interest from its inception and a handsome margin in the near future.

2. The line, some ten or fifteen years since, has been surveyed and marked out.

3. The area of land alienated in the vicinity of the line is about 226,714 acres; 5,000 acres are under cultivation and yielding annually about 75,000 bushels of wheat, say nothing about hay, straw, fruit, &c.; 26,223 acres are fit for cultivation; 72,080 sheep; 691 head of cattle; 653 head of horses; 100 to 150 holdings, and about 650 residents in the locality, ranging from half a mile to 10 miles from the proposed line.

4. The above statistics have been collected by reliable collectors, and that the land through which the line passes is all of first-class agricultural quality, besides having excellent land for grazing purposes, also fruit-growing.

5. Your Petitioners therefore humbly pray that your Honorable House will take the foregoing premises into your favourable consideration, and grant such relief as in your wisdom may seem most expedient and necessary under such circumstances.

And your Petitioners, as in duty bound, will ever pray.

LEWIS MAY, Chairman.

H. P. MILLER, Secretary.

On behalf of Mount Aubery and Balderodgery Railway League.

1899.  
(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

GEORGE AND HARRIS STREETS ELECTRIC TRAMWAY.  
(REPORT ON THE.)

*Printed under No. 10 Report from Printing Committee, 16 November, 1899.*

Sydney, 8 November, 1899.

The Hon. the Secretary for Public Works,—

Sir,

We, the members of the Board appointed to hold an inquiry into the circumstances connected with the construction of the George and Harris Streets Electrical Tramway, and the delay which has occurred in opening the line, have the honor to submit the following report:—

The important nature of the inquiry entrusted to us led us to consider carefully every step we have taken, so that our investigation might be conducted in the fairest and best possible manner, and the conclusions drawn may be definite and beyond dispute.

In dealing with the matter submitted for our investigation, namely—

1. The question of design;
2. The various steps taken from time to time to complete the work in a businesslike and satisfactory manner;
3. The failures which have taken place in the carrying out the necessary tests;—

we first made ourselves thoroughly acquainted with the correspondence and documents laid before us, and afterwards took the evidence as far as possible of all persons connected with the subject of our inquiry. We also made various personal inspections of the power-house at Ultimo, and a careful study of the contract, plans, and specifications. So far we have not been able to make anything more than a superficial inspection of the line and the permanent-way.

The first steps taken in regard to the construction of the line of tramway under consideration appears to have occurred on October 1st, 1889, when the matter was referred to the Parliamentary Standing Committee on Public Works. The Committee reported on July 4th, 1891, that it was not expedient to construct the proposed tramway. On September 18th, 1895, the Minister gave instructions that the necessary information should be prepared to enable him to refer the matter to the Public Works Committee, who, after consideration of the matter, submitted their report on May 21st, 1896, recommending that the motive power required for working the tramway be derived from the power-house of the Ocean-street Cable Tramway, Rushcutters' Bay, the electric current being conveyed from thence to George-street by means of buried armoured cables connected to accumulators, and from thence

The first steps taken in regard to the George-street Tramway.

thence to the overhead trolley wires, conveying the current to the motors on the cars at a cost estimated at £123,000, which was afterwards increased to £130,000, in consequence of an extension proposed by the Railway Commissioners.

The Act authorising the construction of the George and Harris Streets tramway was assented to on 6th September, 1896.

The Ultimo  
power-house  
scheme.

Shortly after the Act was passed the Railway Commissioners, and especially the late Chief Commissioner, Mr. Eddy, began to discuss the desirability of having a central power-house in Ultimo, which should ultimately supply power, not merely for the George and Harris Street tramway, but for the whole of the electrical and steam tramway systems.

After considerable investigation by Mr. Deane, the Engineer-in-Chief for Railway Construction, and the late Mr. Elwell, the Electrical Engineer to the Railway Commissioners, it was ultimately decided to make the necessary arrangements for the construction of the power-house at Ultimo, as the site selected was considered to be suitable, and, moreover, it placed the power-house as nearly as practicable in the centre of the whole tramway system. The visit of Professor Forbes to Sydney about this time was taken advantage of to submit the matter to his consideration, and his concurrence in the proposed arrangements helped considerably towards finally settling the matter.

It will thus be seen that the scheme adopted was vastly more comprehensive than that originally contemplated by the Public Works Committee.

As a first step towards providing power at Ultimo, twelve electrical firms were asked to tender on 13th January, 1897, for four complete sets of engines and generators of 800 kilowatts capacity, or 1,072 horse-power each, which resulted in seven firms sending in tenders on 4th May, 1897. A Committee was appointed, consisting of Mr. Deane, Mr. Elwell, and Mr. W. Thow, Chief Mechanical Engineer, to investigate the tenders and report to the Railway Commissioners. The Committee sent in a report on 15th June, 1897, recommending the acceptance of the tender of Messrs. H. H. Kingsbury and Company, representing the General Electrical Company of New York, the largest electrical engineering company in the world. The Committee further recommended the proposal of the General Electrical Company that the size of the unit be raised from 800 kilowatts to 850 kilowatts be adopted, as this company had recently completed a new and improved machine of this capacity, which was being generally adopted where a machine of about this power was required.

A few other minor recommendations were embodied in the report, which was approved by the Railway Commissioners on 17th June, 1897.

## DESIGN.

### GENERAL DESCRIPTION OF THE GEORGE AND HARRIS STREETS TRAMWAY.

Site for  
power-house.

The site selected for the power-house and car-shed is near to the Darling Harbour railway and the Harbour, and as near as practicable to the centre of the present and proposed tramway systems.

It is conveniently situated in regard to the supply of coal, the removal of ashes, and the supply of water for condensing.

Power-house.

The power-house as it stands at present consists of engine-room, boiler-house, pump-room, and offices. Four sets of engines and generators have been installed in the engine-room, which is of ample size for its purpose. The floors and part of the walls are tiled, and the building is well ventilated and lighted. Two electric cranes have been provided, each capable of lifting 30 tons; and the southern end of the building is closed in with a temporary wall, which can be removed whenever extensions become necessary.

Car-house.

The car-house is 275 feet long by 130 feet in width, and is covered by a roof of saw-tooth design, lighted from the south. It is divided into nine bays, and is capable of housing 108 cars; space being available for an extension up to a capacity of an additional seventy-two cars.

Two travelling cranes, each of 2 tons capacity, are fixed at the rear end of the shed, and extend over three bays for lifting the car bodies off the trucks.

Adjoining

Adjoining the car-shed on the eastern side, dining-rooms, lavatories, and ample sanitary accommodation have been provided for the conductors and motor men engaged by the Traffic Department. Accommodation for the traffic officers is provided in a separate building at the front of the car-shed. The car-house and offices have been provided with an efficient water supply for washing and cleaning cars, and as a protection in case of fire. Electric lighting is provided throughout.

Adjoining the car-house at the northern end is a workshop and store covering an area of 160 feet long and 45 feet wide.

The boiler-house, which is 105 feet long and 86 feet wide, adjoins the engine-room on the eastern side. The engine-room and boiler-house are to be provided with temporary ends of galvanised-iron at the southern end to allow of future extensions; that of the boiler-house is not yet completed. Boiler-house.

Adjoining the engine-room on the northern side is the pump-room, which is 86 feet long and 47 feet wide. Pump-room.

The chimney-stack is situated in the pump chamber, and is 200 feet high from grate level, with a minimum internal diameter of 6 feet. Chimney.

There are fourteen horizontal tubular boilers, of the multitubular return-flue type, each capable of generating 300 horse-power at a pressure of 140 lb. per square inch, which allows twelve boilers to supply the engines, with two as a reserve. Boilers.

The boilers are arranged in two batteries of seven each, the main flues passing along either side of the boiler-house, and converging into the chimney in the pump-room.

In the front of the setting under the ash-pits, and below the level of the floor, is another tunnel, which is floored with a continuous cast-iron floor, having a track cast in it similar to that in the boiler-house, which allows for a small car being run under the hoppers when removing the ashes. The furnaces are provided with the "Alve's Patent Fuel Economisers." The floor space between the fronts of the boilers is covered with cast-iron plates, in which is cast a complete system of tracks for handling the charging-cars, the tracks extending out under the coal pocket. The system for charging the furnaces, and removing the ashes is that manufactured by the C. W. Hunt Company, New York.

The main valve on each boiler is connected by a copper pipe to a cast-iron main pipe, 12 inches in diameter, running the entire length of each battery; each main pipe is connected from its end and middle to cross lines of piping running into the engine-room, and connected to a steam loop 12 inches in diameter under the engine-room floors, from which each engine is supplied through a copper pipe 9 inches in diameter, the steam passing through a separator just before reaching the stop-valve of the engine. From the loop in the engine-room, a secondary system of copper piping for supplying steam to the air-pumps, receivers, jackets, and for heating in connection with the oil filters. Main steam piping.

There are two complete systems of feed mains, one for hot and one for cold water. Feed water piping.

The feed pumps in the pump-room consist of two triplex plunger pumps, capable of delivering 125 gallons per minute against a steam pressure of 140 lb. per square inch. Each pump is driven by means of a 25 horse-power electrical motor through spur gearing. There is also provided one steam pump as a reserve in case of a shut down of the electrical plant. All pumps are connected to the hot and cold water supply. Boiler feed pumps.

Three electrically-driven centrifugal circulating pumps are provided for the condensers, each capable of delivering 2,000 gallons per minute against a head of 36 feet. Each centrifugal pump is directly coupled to a 50 horse-power electric motor; two pumps will be run in parallel, the third being a reserve. The supply of condensing water is obtained from Darling Harbour through a conduit 1,000 feet long, and 3 feet 3 inches in diameter. The hot well is located near the feed-pumps, and the water is discharged from the pumps through a "Reeves" filter before passing into the boilers. Circulating pumps.

There are four engines, arranged in pairs—*i.e.*, right and left handed—of the horizontal cross compound Reynolds-Corliss type, with two surface condensers so arranged that two engines will exhaust into one condenser, or that either engine can exhaust into either of the two condensers. Each engine is directly coupled to an 850 k.w. generator mounted between the two cranks, and is capable of delivering to the armature shaft 1,212 horse-power, with steam at 130 lb. per square inch and a speed of 100 revolutions per minute. Engines.

The

The high-pressure cylinder is 26 inches in diameter, and the low-pressure cylinder 48 inches in diameter; the stroke is 48 inches. The cylinders are jacketed on the barrels and covers, and there is a superheater between each high and low pressure cylinder of the multitubular type, provided with suitable traps connected to drains.

The engines are each provided with two governors, one of the special weighted high-speed type, driven by eccentrics off the main shaft to automatically shut off the steam in case the engines should exceed the normal speed by five revolutions, the other being belt-driven to regulate the speed within 2 per cent.

The makers expect to be able to generate 1 horse-power for  $13\frac{1}{2}$  lb. of steam.

The condensers are of the Wheeler surface type, with "Blake" direct-acting air-pumps, the steam supply being derived either direct from the main or through the jackets of the receiver.

Oiling system.

An elaborate system of oiling arrangements has been provided. The whole of the oil is drained into a common reservoir, and from thence to a filter, after which it is elevated to an oil tank by air-pressure, and from thence it will gravitate to the oil cups of the engine.

Generators.

The generators are of the General Electrical Company's Multipolar type, compound wound, as used by them for electrical traction in America. The armatures are mounted on the engine-shaft, which is supported on bearings of ample area; the pole-pieces are bolted on to the cast-steel framing. The output of each generator is 850 kilowatts at 550 volts and 100 revolutions per minute. Carbon brushes are used to collect the current from the commutator, which is conveyed by means of insulated copper cables to the switchboard, and is there switched on to the various feeders by means of the switching apparatus.

Switchboard.

At the northern end there is a switchboard, provided for the control of the generators and feeders, erected upon an elevated gallery 14 feet above the floor level. The board consists of fire-proof material, viz., polished slate-panels, mounted on iron framing. On these slate-panels, the various switching and controlling apparatus has been mounted, consisting of four generator panels, one summation panel, two accumulator panels, one lighting panel, and ten feeder panels. All the positive leads and connections have been arranged as far apart as possible from the negatives in order to minimise the risk of short circuit. At the switchboard each machine is protected by a safety-fuse, and an automatic cut-out for operating when the current drawn from the machine exceeds certain fixed limits. Each generator is protected from lightning by means of arrestors and choking coils; connections having been made to ensure an easy path for the lightning to earth free from induction. Magnetic blow-outs are used for extinguishing the spark after a lightning discharge. Means have also been provided for preventing the station being shut down should one of the automatic cut-outs open and throw the load thus cut out on the other machines and opening their cut-outs in turn.

Space has been left between the switchboard and the wall so as to allow of all parts and connections being inspected at any time.

Underneath the switchboard there is the cable room, where all the leads from the generators and feeders are assembled together with the balancing cables of the generators, which are fastened on wooden battens plugged into the wall.

Accumulators.

Two batteries, each of 300 cells, have been installed for lighting and testing purposes, and are mounted on wooden stands so arranged that they may be easily inspected and cleaned.

#### PERMANENT-WAY.

Description of route.

The George and Harris Streets electric tramway commences at the eastern side of the Circular Quay, and following the curvature of the Quay passes the wharfs of the various ferry companies; thence by way of Queen's Wharf to George-street and along that street to its junction with the existing tramway opposite the Benevolent Asylum, running parallel with the existing steam tram-lines to a point opposite Terminus-street. Following the existing steam-lines for a few chains it branches off at Harris-street, along which the line runs until John-street is reached, where it terminates.

A junction is provided for with the existing steam tramway running to the Redfern Railway Station, which, continuing through the railway premises, the cars on their return journey will travel by way of Devonshire-street on the existing steam tramway to opposite the Benevolent Asylum, where they again connect with their proper track in George-street.

The distance from Circular Quay to John-street is 3 miles 20 chains, and is double-track all the way; the length of the track, including cross-over roads and junctions, is about 7 miles. Description of route.

The rails used on this tramway are of the girder type, weighing 83 lb. per yard, 30 feet in length, and of specially hard steel. They are laid on concrete 10 inches deep, and kept to gauge with wrought-iron tie-rods. All joints rest on bed-plates, and are provided with fish-plates with six bolts, and Pullen's patent rail-joint boxes are used. Rails.

Krupp switches are being used for all the standard cross-overs. Switches.

On all the sharp curves 80 lb. steel rails, with an 80 lb. rail acting as a guard and secured to the running rail with cast-iron distance blocks and bolts, have been used. These have also been secured to the concrete by lewis bolts and clips. 80 lb. rail on curves.

The Edison-Brown plastic bond has been used on this tramway. As a supplementary return a copper cable having a sectional area of 49 square inches is laid between each track from Circular Quay to Redfern. Each cable is connected to alternate rails on either side so that every car will be connected direct to the cable. These cables are laid against their respective tracks, and cross connected every 60 yards, the connection between the cable and the inner rail being made with a special gun-metal clip bolt. At the intersection of Liverpool and George Streets nine cables are taken directly underneath the Callender-Webber casing, carrying the return current to the power-house at Ultimo, a distance of 900 yards. There are also from Engine-street two cables, and from Harris-street along William Henry-street four cables, which carry the return current. Bonding.

The copper cables for the return feeders consist of No. 13 S.W.G. soft drawn copper wire stranded together. These are connected to the rails by gun-metal clips, and at every second rail there is a cross bond feeder to rail, and every sixth rail there is a cross bond feeder to feeder. Return feeder cable.

The feeders consist of insulated copper cables laid in Callender-Webber casing, the route being taken from the power-house along William Henry-street, and thence *via* Harbour and Liverpool Streets to George-street. Feeder cables and junction boxes.

The feeding-points are situated as follows:—

Intersection of Liverpool-street and George-street.			
"	Hunter-street	"	"
"	Bridge-street	"	"
"	Pitt-street	"	"

At these points the feeders are connected to the trolley-wire, the cable, as it emerges from the casing, being covered with piping to protect it from mechanical injury.

At each feeding-point lightning arresters and sectional cut-outs are provided. These cut-outs enable any section of the live line to be made dead without interfering with the traffic on the other sections. Feeders.

The overhead trolley-wire consists of hard-drawn copper of figure 8 section. The clips and ears used are of Billings' and Spencer's make. The section insulators at the cross-over roads are of local manufacture. The overhead wire is supported in Harris-street, and in the wider portions of George-street, on centre poles. Where the width of the street did not permit this, side poles and stays have been used. Overhead wiring.

The centre, span, and anchor poles are of Mannesmann manufacture, being solid drawn in three lengths of different diameter. The wrought and cast ironwork has been made locally.

In order to provide for the safe working of the traffic opposite the Redfern Railway Station, a complete signal-box has been erected, from which the whole of the points on to the existing steam and George-street trams are controlled. There is also a subsidiary-box opposite the Cyclorama to control the traffic in and out of Harris-street, and also from the Botany-road siding to the existing steam tramway. Signal-boxes.

A complete telephone service has been erected throughout the George-street tramway. Telephone communication with the power and car house is situated at convenient places along the route of the tramway. Telephones.

The

The contract for plant in the power-house, Ultimo.

The prices submitted by the General Electrical Company through Messrs. H. H. Kingsbury & Co. were for the General Electrical Company's electrical generators with engines of either the E. P. Allis Co., Milwaukee, or of the MacIntosh and Seymour Company. The Allis Company's engines were selected by the Committee.

Although blue-prints with all the principal dimensions of the engines and 800 kilowatts generators were furnished with the tenders, in consequence of the substitution of 850 kilowatts generators and the necessary alteration in the sizes of the engines to develop the extra power, it was necessary to wait for the measurements of the larger machinery before arranging for the disposal of space in the engine and dynamo room, and proceeding with the preparation of the contract drawings for the power-house buildings. Again, in order to secure the best materials and workmanship generally, and in consequence of a modification of the governor gear recommended by the Committee, it was decided to send Mr. G. Fischer to America to confer with the engineers appointed to inspect the work, and to settle the design of the governor gear. The time allowed for the completion of this contract was forty-six weeks, to date from the arrival of Mr. Fischer in Milwaukee. His departure from Sydney having been unavoidably delayed, this proved to be 3rd September, 1897; so that the proper date fixed upon for the completion of the contract would be 20th June, 1898.

The considerations which led to fixing such an early date for the completion of this contract appears to rest not solely with Mr. Deane, as the late Mr. Eddy, Mr. Elwell, and the Minister, Mr. Young, all urged that the work should be pushed on as speedily as possible.

Delay in sending plans from America.

During the absence of Mr. Fischer in America, plans were completed and contracts let for permanent-way of the George and Harris Streets tramways and the car-house.

The contract plans of the power-house could not be proceeded with at the same time as the car-house, owing to the delay in sending the necessary dimensions of the plant from America. This information did not arrive until the latter end of December, 1897. A contract had, however, been let for removing the surface material at the site, which was completed on 23rd February, 1898. On 19th March, 1898, the plans of the power-house contract were submitted for the approval of the Railway Commissioners, who, after consideration of the matter, finally adopted them on 13th April, 1898; so that two and a half months were occupied in the preparation of the drawings, and twenty-five days in their consideration by the Railway Commissioners. These plans and specifications for the buildings and foundations were completed, and tenders called on 23rd May, 1898, returnable on 13th June, 1898, which was afterwards extended to 27th June, 1898.

Messrs. J. Stewart and Co.'s contract for power-house buildings.

This contract was let to Messrs. J. Stewart & Co., of Sydney, who have had considerable experience as builders and contractors and have carried out large works in the city.

The time fixed for the completion of the contract was twenty-six weeks from the date of acceptance, or to 29th December, 1898. This time was afterwards extended four months, or to 29th April, 1899.

Meanwhile the engines and generators were being pushed forward with all possible speed, and both the General Electrical and the E. P. Allis Companies state that they incurred considerable extra expense in working overtime, and in extra freight, in order to expedite the delivery in Sydney in time to admit of their erection, and the completion of their contract within the time fixed—*i.e.*, 20th July, 1898.

They commenced to deliver their generators in Sydney on 23rd April, 1898, but at that date the contract for the power-house buildings, in which they were to be erected, was not let, and consequently it was necessary to make arrangements for their storage until the buildings were sufficiently advanced to enable their erection to be proceeded with. Two of the generators were stored in their cases at Garden Island, and two in railway trucks covered with tarpaulins. The storage was a difficult matter, owing to the large size and weight of the machines—the complete generator weighed about 65 tons, the armature alone, 25 tons. On 18th November, 1898, Messrs. J. J. Kelly and A. M. Libby arrived in Sydney from America representing the General Electrical and the E. P. Allis Companies respectively, but they were unable to proceed with the erection of the plant, for the reasons above given, until April, 1899. The roof, however, was not covered in sufficiently

to

to afford any protection to the machinery before the end of May, and was not completed until 17th July, 1899—*i.e.* two and a half months after the extended contract time for the completion of the whole of the buildings.

The contract for fourteen steel boilers was let to Messrs. C. & G. Hoskins, on 24th August, 1897, and completed on 31st January, 1899. Contract for  
boilers and  
boiler setting.

The contract for boiler-setting was let to Messrs. J. Stewart & Co., on 30th January, 1899; the time fixed for the completion of this contract was 19th June, 1899. This work is now practically complete, excepting a small portion in connection with the two end boilers in the eastern battery, which are intended to be provided with mechanical stoking apparatus. Also the permanent arrangements for conveying the coal and removing the ashes on the Hunt Company's system of cast-iron floor tracks and charging cars is not yet complete, but temporary arrangements have been made for partially carrying out this system in connection with the battery of the seven boilers on the western side.

The permanent arrangements for Hunt apparatus are at present in course of construction by day-labour.

The western battery was completed, as far as Messrs J. Stewart & Co. are concerned, on about the end of July, 1899, or about forty days after the time fixed for the completion of their contract for setting the fourteen boilers.

A contract for electrical travelling cranes to be erected in the power-house was let to Messrs. K. W. Peabody & Co. on 11th February, 1898, which was delivered in contract time—August, 1898. Contract for  
electrical  
travelling  
cranes.

A contract for the manufacture and delivery of the columns and girders required to carry the travelling cranes was let to Messrs. R. L. Scrutton & Co. on 17th June, 1898, which was not completed before 22nd December, 1898, three months and thirteen days after the time fixed for delivery. The remaining contracts did not in any way affect the chief causes of delay.

A complete list of the various contracts, giving particulars of cost, dates, &c., is appended to this report.

#### CONCLUSIONS ON DESIGN.

The design of the various works at Ultimo for supplying power and providing accommodation for the rolling stock, and the officers and men engaged in operating the tramways, is very complete. The buildings are conveniently located for economical development of power and its transmission to the various tramways which will ultimately be supplied from this central station. There is also a reasonable provision for future extensions, which should meet the requirements of Sydney for a very long time.

The power-house is equipped in a most complete manner with boilers, engines, generators, switchboard, and various apparatus and appliances in connection with the generation and distribution of the electrical energy. The engines have been designed and built by Messrs. E. P. Allis & Co., of Milwaukee, one of the largest and most successful engine builders in America, who have devoted special attention to the requirements of tramway service, and have built several hundreds of engines for the various electrical tramways and railways in America. The engines at Ultimo are well up to the latest and best practice, and are provided with the Reynolds-Corliss valve gear, complete steam jackets, superheaters, and other appliances for securing economical consumption, so much so that it is expected that 1 horse-power will be developed for every  $13\frac{1}{2}$  lb. of steam supplied when working under the most favourable conditions. The boilers and the methods of charging the furnaces and removing the ashes have been designed with reference to economical steam generation, and they should give a high evaporative efficiency, and a low cost in working expenses.

The electrical generators are of the latest type, supplied by the well-known General Electrical Company of Schenectady, New York, America, for railway traction purposes. They are substantially built to stand the severe strains to which they will be subjected in tramway work, and are mechanically and electrically designed in accordance with the latest modern practice.

The feed and circulating pumps, which are electrically driven, appear to be suitable for the duties they will be required to perform. The three-throw feed pumps with cranks at  $150^\circ$ , gives a fairly uniform resistance to the electric motor, and the centrifugal pumps are specially suited to electrical driving. The Blake steam-feed pump is a wise provision as a reserve.

In

In regard to the methods adopted in wiring behind the switch-board, we consider that these are not in accordance with the best practice, in view of the risks of fire.

The permanent-way, feeders, trolley-wires, and the method of carrying them by means of centre poles with projecting arms, appear to have been constructed with due regard to economy and convenience in working, as far as can be judged from a superficial inspection. In design the methods adopted in Europe and America have been generally followed.

It is necessary to state, however, that the feeder junction boxes have not the required insulation. It was not until the full line voltage was available for testing that this evil was detected. Steps have been taken to remedy this defect, which will certainly cause some delay.

During the trial trip on 6th November of the whole length of tramway, we observed that in passing over the switches in connection with the cross-over roads, considerable jarring occurred; this may probably improve under traffic. The loop at Circular Quay was traversed three times, and the cars passed round smoothly on each occasion. The shunting operations at the Harris-street terminus appear suitable, and generally the trip was successful.

#### CONCLUSIONS IN REGARD TO THE VARIOUS STEPS TAKEN FROM TIME TO TIME TO COMPLETE THE WORK IN A BUSINESSLIKE AND SATISFACTORY MANNER.

It is necessary to point out that the magnitude and cost of the works at the Ultimo Power-house is very much greater than originally contemplated by the Public Works Committee in their report on the George and Harris Streets Electrical Tramway. The scheme submitted to the Public Works Committee provided for the supply of power from the engines in the Rushcutters' Bay Power-house, and left only the generators, belting, feeder cables, accumulators, the laying of the permanent-way and trolley-wires, which Mr. Deane stated could all have been completed in about a year or fifteen months. It has been estimated that the power required to work the George and Harris Streets tramway during the busy portion of the day, when the heaviest traffic occurs, and thirty-six cars are running continuously, is about 600 horse-power. Now, if three of the four units in the Ultimo Power-house are developing the full power, and the fourth one standing as a reserve, they will develop about 3,400 horse-power or over five times the maximum power required to work the George and Harris Streets tramways. It appears, therefore, that the present scheme is vastly greater than that originally contemplated, and the time necessary to complete this work would be correspondingly greater; so that the adoption of the complete scheme at Ultimo is the primary cause for the delay which has occurred in opening the George and Harris Streets tramway.

The second cause of delay was due to the alteration of the unit from 800 k.w. to 850 k.w., as the General Electrical Company did not send drawings of their 850 k.w. machine, or the necessary dimensions of the larger engines required to drive them, with their alternative tender. In consequence of the adoption of the 850 k.w. unit, it was therefore necessary to wait for the arrival of the foundation plans from America before the plans of the power-house buildings could be proceeded with as far as the roof over engine-room was affected. As these did not arrive until the end of December, 1897, and the report of the Committee was adopted by the Railway Commissioners on 17th June, 1897, it follows that six months' delay occurred from this cause alone.

In consequence of this loss in time in commencing the drawings of the power-house buildings, and the fixing of the time for the completion of the engines and generators at such an early date, it was impossible to have completed the foundations and the roof over the power-house in time to proceed with the erection of the plant immediately after its arrival in Sydney.

The delay in completing the engine-room prevented the contractors for the engines and generators completing their work in contract time; for although they delivered the plant in April, 1898, the erection could not be commenced until twelve months later. The roof was not covered in sufficiently to protect the machinery until May, 1899.

Again,

Again, the long time occupied in preparing the necessary drawings and specifications for the power-house from the commencement of the year 1898, and the twenty-five days occupied by the Railway Commissioners in considering the plans before finally approving of them, which together delayed the letting of the contract for these buildings until 27th June, 1898, is much to be regretted, considering the urgency of the matter, and the desirability of proceeding with the erection of the machinery as soon as possible after its arrival, in order to minimise the possible damage to the machinery, more especially the insulation of the various coils in the generator. But it is necessary to consider that Mr. Deane was not allowed a free hand in regard to obtaining the services of extra assistance in preparing the plans, and he has clearly shown that to obtain such extra assistance through the Public Service Commissioners in the usual way would have taken necessarily nearly as long as to prepare the drawings with the staff at his disposal. Again, the time occupied by the Railway Commissioners in order to thoroughly satisfy themselves as to the efficiency of a great system, which they would ultimately have the responsibility of working successfully, economically, and with due regard to the convenience of the public, is difficult to criticise. Moreover, both the Railway Construction Branch and the Railway Commissioners had at the same time other important matters to attend to; so that we consider that this delay is clearly to be attributed mainly to the system under which the work was controlled, rather than to any of the individuals concerned.

We consider also that, in view of the six months which was lost in waiting for the correct dimensions of the plant from America, decided steps should have been taken to inform the manufacturers in America, who should have been required to delay the delivery of the plant until such time as the buildings could be reasonably expected to be sufficiently advanced to receive them, thus avoiding the risks of storage, and reducing the time occupied in drying out. Mr. Deane states that he sent a letter to Mr. Fischer to this effect. This letter, however, does not appear to have reached its destination. It was a mistake, in the first instance, in our opinion, to bind the contractors for the machinery to complete within such a short time as forty-six weeks.

In regard to the magnitude of Messrs. J. Stewart & Co.'s contract, and the extra work necessary in the foundation of the walls of the buildings and the plant, six months appears to have been too short a time; but the total time allowed, viz., ten months, was ample to complete the contract. They claim that the delay in the roof was due to the difficulties they experienced in obtaining the rolled steel sections for the principals and framing, in consequence of the exhaustion of stocks in England owing to the strike, and in America owing to the war. They also claim that the employment of such a variety of sizes in the rolled sections in the roof, some of which were not marketable and had to be specially rolled, caused further delay in obtaining the material, and that they spared no expense in cablgrams in ordering the material, and did their best to expedite the work.

After carefully considering all these circumstances of the case, we consider that the time when the material was ordered was unfortunate, owing to the state of the markets in regard to rolled sections and the urgency of the matter. Messrs. J. Stewart & Co. may possibly be entitled to some consideration in this respect; but there should have been no great, if any, delay in consequence of the variety of the sections or their dimensions, and further, that Messrs. J. Stewart & Co. should have made the necessary arrangements before sending in their tender, which would have enabled them to order the material immediately after they had obtained the contract. We consider that Messrs. J. Stewart & Co. did not use every effort to push on the buildings, and that the chief cause of delay in the power-house is attributable to their inability to carry out their contract in reasonable time.

In regard to Messrs. J. Stewart & Co.'s contract for boiler setting, the delay caused has been stated to be due to the fittings and mountings not being obtainable in Sydney or within the Colony, and that they had to be ordered specially from Messrs. Dewrance & Co., the makers in London. There was also some delay in obtaining the cast-iron floor-plates and tracks in connection with the Hunt's coaling arrangements.

We consider that the delay in the completion of this contract might well have been avoided, but that no serious inconvenience has been experienced, as the western battery of seven boilers is ready for steam.

THE FAILURES WHICH HAVE TAKEN PLACE IN THE CARRYING OUT OF THE  
NECESSARY TESTS.

Upon arrival two of the generators were stored at Garden Island, and two in railway trucks. As far as we could ascertain no steps were taken to inspect the machinery after arrival. It was stored in its cases until ready for erection. No steps appear to have been taken to ascertain whether the generators arrived in a damp condition. When the erection of the machinery was commenced the armatures were unpacked and pressed upon the shafts. As the power-house was not at this time covered in, the armatures could only be protected from the weather by means of tarpaulins. As soon as the frames of the generators were erected, the field coils were unpacked and placed in position.

As the erection of the generators necessarily proceeds with that of the steam-engines, the armatures, after being pressed on the engine shaft, had to stand some time until they could be mounted. One of the armatures, on its shaft, was standing in a cellar when a rain storm filled the cellar with water to a depth "enough to wet one's boots." Another was wet by rain coming on while the armature was being pressed on the shaft.

When the machinery was erected steps were taken to dry-out the generators. This was accomplished by putting them on short circuit, thus passing a heavy current at low voltage through the coils. This process, which is necessarily slow, was continued until the insulation resistance, as measured by a high resistance volt meter, was three megohms. The shunt field coils, which consist of many turns of thin wire, took considerable time to dry out. Until the generators were dry they could not be built up to voltage, and so the engines could not be loaded. When the generators had been sufficiently dried out an artificial load was put on them by means of a water resistance. The steam-engines were run at no-load for some time, and then the load gradually put on. In the case of No. 2 engine, when the load had reached about 500 h.p. the crank-pin bearings became too hot to run. The same thing occurred with the crank-pin bearings of No. 1 and No. 3 engines. No. 4 engine and generator has not been tested nor dried out as the fly-wheel was being turned up. This work has now been completed, and steps are being taken to dry out No. 4 generator. Two of the engines and generators may now be said to be practically in working order.

PROPOSED TESTS OF ELECTRICAL GENERATORS.

Clause 38.  
Output.

The specifications for the generators were as follows :—

The generators are to be of the multipolar type, and are to be designed to be operated at a speed of one hundred (100) revolutions per minute, and to give an output of eight hundred (800) kilowatts each, viz. :—1,450 amperes at 550 volts. Each generator must also be capable of delivering 2,175 amperes for short periods of time—*i.e.*, to take an overload of 50%, without excessive heating.

Clause 39.  
Compounding.

The generators must over compound ten per cent. (10 %)—that is to say, the pressure at the generator terminals with no-load must be 500 volts at the specified speed ; and when a current of 1,450 amperes is being given off, must be 550 volts at the same speed. On being submitted to a test after six (6) hours' continuous work at full-load, each generator must give the above results within one per cent. (1 %) of accuracy, and the rise of pressure due to the increase of current from zero to 1,450 amperes must not be less than 47 volts or greater than 53 volts. The generators shall be so constructed and wound that the increased pressure at any load shall be approximately proportional to the current.

Clause 40.  
Sparking.

The generators must be capable of supplying any current from no-load to twenty per cent. (20 %) above full-load without observable sparking ; and must also be capable of a sudden change from over-load to no-load, and from no-load to full-load without injurious flashing at the commutator, the brushes in all instances remaining stationary.

Clause 41.  
Heating.

The generators must be capable of working continuously at full-load without any portion heating to a greater extent than seventy degrees (70°) Fah. above the temperature of the surrounding air ; and this result must be obtained without the assistance of any fan or other method of cooling the generators.

Clause 42.  
Efficiency.

The commercial efficiency of the generators at full-load must not be less than ninety-four per cent. (94 %)—that is to say, the electrical power measured at the generator terminals must be at least ninety-four per cent. (94 %) of the power communicated by the dynamo shaft.

The

The insulation between either of the field coils and the frame, between the armature and frame, between the commutator and frame, and between the series field coils and the shunt field coils must all stand an insulation test of 5,000 (five thousand) volts alternating current. The test must be made by a transformer of at least 15,000 watts capacity. Clause 43,  
Insulation.

None of the generators have, as yet, been tested to full load for the various reasons already mentioned. This prevents the tests specified as to output and overload, compounding, heating, flashing, and efficiency being made. With regard to the insulation test specified, viz., 5,000 volts alternating current, considerable correspondence has taken place between Mr. Deane and the late Mr. Elwell. It appears that Mr. Elwell was anxious to have the 5,000 volt test applied in Sydney before the generators should be taken over by the Railway Commissioners. Mr. Deane maintained that this high potential test was a workshop test to insure good insulating material being used, and that the test applied by measuring the insulation resistance by means of a high resistance volt meter was sufficient for ordinary running. From the report of Messrs. R. W. Hildreth & Co., Inspecting Engineers for the manufacture of the steam engines and generators, it appears that these high potential tests have practically been carried out in the General Electrical Company's workshops.

In the report abovementioned, Messrs. Hildreth & Co. state:—"In view of the fact that it was not feasible to assemble the generators, it is not possible to make a running and temperature test, and no insulation test was insisted upon by us. This matter of final test was carefully discussed with Mr. Fischer, and it was decided that, inasmuch as complete tests could not be made, it was advisable to hold the makers solely to the final test at Sydney. However, the makers made their usual test as follows:—The armature and spools were in each case subjected to an insulation test of 5,000 volts. The commutators were similarly tested for a flashing test."

As a result of the discussion between Mr. Deane and the late Mr. Elwell, it was decided to reduce the high potential test to 2,500 volts alternating current.

Owing to the unusual treatment to which the dynamos have been subjected, in the opinion of the Board it would not be advisable to apply the high potential test of 2,500 volts until the generators have been running under full load for at least a month and are thoroughly dry. The fact that this test should not be applied until the generators are thoroughly dry does not imply that traffic could not be commenced until the dynamos would stand this test. We consider that when the insulation resistance between the armature and frame, shunt field coils and frame, series field coils and frame, and between shunt field coils and series field coils is in each case greater than 1,000,000 ohms, this resistance to be in each case determined by a high-resistance volt-meter, the voltage being 550 volts, the ordinary traffic might be placed upon the generators.

As the dynamos have been stored for some time and subjected to considerable dampness, special care should be exercised to record the condition of the insulating material daily, with a view to ascertaining whether the generators have suffered any permanent injury.

We have not been able to make the various tests specified for the engines and generators, as the plant is not sufficiently completed, nor in a fit state to admit of such tests, and, moreover, the limited time allowed for this inquiry would have rendered it impossible in any case to have included the results of these tests in our report.

We have the honor to be,

Sir,

Your obedient Servants,

W. H. WARREN,  
Chairman,

J. A. POLLOCK,

B. WALLACH.

## GEORGE-STREET AND HARRIS-STREET ELECTRIC TRAMWAY.

TABLE giving Particulars of the various Contracts.

Contract No.	Contract.	Contractor.	Amount of Tender.	Tenders called.	Date of acceptance.	Date fixed for completion as per Specification.	Time extended to.	Actual date of completion.	Remarks.
			£						
1	Plastic bend .....	Noyes Bros. ....	900	10 Dec., 1896	16 Dec., 1896	18 June, 1897	.....	18 Jan., 1897	
2	Mannesmann poles .....	Foreign Agency Co. ....	1,785	3 Feb., 1897	30 April, 1897	17 Sept., 1897	.....	17 Sept., 1897

21st October, 1899.

# MINUTES OF EVIDENCE

TAKEN BEFORE

## THE BOARD OF INQUIRY

APPOINTED TO INQUIRE INTO THE

# CONSTRUCTION OF THE GEORGE AND HARRIS STREETS ELECTRIC TRAMWAY.

MONDAY, 23 OCTOBER, 1899.

Present:—

PROFESSOR WARREN (CHAIRMAN).  
PROFESSOR POLLOCK, | MR. B. WALLACH.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works,  
examined:—

*Mr. Deane:* The Act authorising the construction of the George and Harris Streets tramway was assented to in September, 1896. At that time it was intended to provide power at the Rushcutters' Bay power-house; but shortly after that Act was passed, the Railway Commissioners, and especially the late Chief Commissioner, who took the matter personally in hand, began to discuss the desirability of having a central power-house in Ultimo. I, myself, was always very much in favour of having the central power-house there, although Mr. Elwell tried to see what could be done in arranging for a central power-house at Rushcutters' Bay, in consideration of the expenditure which had been incurred at that place. However, it was ultimately decided to provide the central power-house as near as possible to the centre of the whole tramway system, and the most suitable place where the necessary land could be obtained, was near the head of Darling Harbour. At the instance of the late Chief Commissioner for Railways, first of all I made many inquiries as to a site available for a large car-house in connection with the system. At one time it was thought that portion of the University grounds would be obtained, and I was instructed to interview the Chancellor (Dr. MacLaurin) in the matter. That idea, however, was eventually discarded, and a proposal was made by the Omnibus Company to sell their land between Mary Ann-street and Macarthur-street. I do not remember exactly the actual steps taken in the first instance to secure the land for the whole scheme, because it was concluded that the proper thing to do would be to keep, if possible, everything together; but I know that the first proposal was to purchase the block between William Henry-street and Macarthur-street, and between Harris-street and Pyrmont-street, which was a square block, and to have the power-house fronting Harris-street, and the car-house down below in the hollow adjoining the railway premises. Eventually, however, it was decided that it would be less costly to take the whole strip between William Henry-street and include the back part of the two blocks between William Henry street and Mary Ann street, leaving the frontage to Harris street—which would be made more expensive to resume—intact. Steps were then taken to secure this property, which was ultimately done, part of it being purchased from the Omnibus Company and part from the Harris Estate. Sketches were prepared showing how the power-house, the engine-house, and the car-shed, might be adjusted; and prices were invited from a number of electrical firms for the supply of engines and generators. When these came in, I think, as it was shown in the papers—about May or June, 1897—I asked that the late Mr. Elwell and Mr. Thow, of the Railway Commissioners' Department, might confer with me, and report jointly on the question and the selection of the particular tenders, and this was agreed to. In March of this year the Minister wished to have a report upon the progress of the works, and I wrote a report dated 2nd March, 1899, giving an outline of what had taken place, and the reasons for there having been so much apparent delay at that time. But before going into that report I should like to make a few remarks as to what I always urged should be done to enlighten the public as regards the work which it had been decided to carry out. The public were led to suppose from my evidence, and from statements made before the Parliamentary Standing Committee on Public Works, that about a year would be quite sufficient to construct the George and Harris Streets tramway, and this would have been the case had the original intention been carried out; but the Public Works Department were never informed until a few months ago—and now they do not really grasp the fact—that the original intention was abandoned. From time to time excuses were made for delay, and new times were fixed for the completion of the work, with which, for the most part, I had nothing whatever to do. The public naturally could not understand the extreme

H. Deane,  
Esq.  
23 Oct., 1899.

H. Deane,  
Esq.  
23 Oct., 1899.

delays that were taking place, not having been made aware that the original intention to construct this line and provide power—at the cost of £130,000—had been abandoned, and that instead of this, works were going on at Ultimo to provide power for converting the whole of the tramway system to electrical traction, at a cost nearly equal to the original sum set down for the construction of the tram-line. I urged the Minister over and over again to enlighten the public, and it seemed that at the time it was not convenient to do so, for political reasons. I have nothing to say as to that. It may be a complete justification for not enlightening the public, but at the same time it was very unfair to me, and I take this opportunity of stating so.

*Chairman*: If the original intention had been carried out, and the power-house at Rushcutters' Bay had been used, that part of the system would have been long since complete? Yes.

And your having to simply put on the generators to supply the necessary horse-power, I take it that all this-trouble would not have existed at all? That is correct.

The work would then be devoted to laying the lines? Simply laying the lines and putting small generators down, which would be arranged to be driven from the main shaft, with or without counter shafts, because there is surplus power available. The greatest power, I believe, that has been indicated at Rushcutters' Bay, including all the work they are doing in connection with the cable tram and Rose Bay electric tramway, and sewerage works, is under 400 horse-power.

What is the capacity of the engines? 750 horse-power each. They were supplied, not to work the Ocean-street cable tramway alone, but the Minister (Mr. Lyne) who was in office at the time gave instructions that power should be provided for a cable extension to Rose Bay, and for a branch cable line to Paddington. Plant was therefore provided for the extra power which was thought to be necessary at the time.

I was under the impression that the engines at Rushcutters' Bay power-house were 1,000 horse-power each? They will develop 1,000 horse-power economically; it is just a question of cut off what they are reckoned to be.

Will you now read your report? It is a statement which was made on 2nd March, 1899, and it only requires a little supplementary information to bring it up to date. It is as follows:—

The original intention was to supply the power for the George-street and Harris-street tramway from Rushcutters' Bay, the estimated cost of doing this, as given to the Public Works Committee, was—

Power .....	£11,150
Feeders .....	6,000

No provision was made for additional building, it being considered that the accommodation provided in the existing building was ample.

The power required to work the George-street and Harris-street tramway, taking into consideration the railway and Harris-street traffic alone, is estimated at 540 h.p. Forty cars were to be provided; so that, taking thirty-six cars as being constantly in active service during the busy times of the day, this would mean an average of about 15 h.p. per car. There is sufficient reserve power in the engines at Rushcutters' Bay to provide for this, so that by adding electric generators driven by a system of shafting, the whole could have been economically arranged. The proper provision to make would be three generators of, say, 300 h.p. each, so as to provide a small surplus and one machine in reserve; but even suppose it had been found more suitable to leave the reserve power at Rushcutters' Bay for the Rose Bay or other extensions, engines and generators of a total of 900 h.p. could be provided at a cost of £9,000, leaving the balance to defray the cost of two additional boilers and other contingencies that might arise. The George-street and Harris-street Tramway Act was assented to on 14th September, 1896.

Soon after this the Railway Commissioners came to the conclusion that as the conversion of the whole of the tramways to electric traction was contemplated, it would be wise to make George-street and Harris-street tramway part of the complete system, and commence the installation of the power at one spot. The matter was, as will be seen from the papers, discussed between the Minister for Works and the late Chief Commissioner, with the result that it was in the end decided to secure land in Ultimo in contiguity to the Darling Harbour Station yard, where eventually power to the extent of 20,000 h.p. could be laid down, as well as accommodation for 200 cars.

The visit of the eminent electrical authority, Professor Forbes, and his concurrence in what was being done, helped to clinch the matter.

It is to be noted that at the time (1st November, 1896), that the money (£130,500) for the George-street and Harris-street tramway was voted, the Railway Commissioners obtained a vote of £150,000 for conversion purposes, and that an Act had been previously passed—22nd October, 1896—to enable them to adopt electricity as a tractive force, and erect overhead electric conductors in the city of Sydney.

As part result of the conference between the Minister for Works and the late Chief Commissioner it was decided that the work of providing buildings and power for the conversion of the tramways should be carried out by the Railway Construction Branch.

As a first step towards providing power at Ultimo, twelve electrical firms, who were considered competent to tender, were, on the 13th January, 1897, invited to send in prices for four complete sets of engines and generators of 800 kilowatts (1,072 h.p.) each. Seven firms responded to this call on the 4th May, 1897, among whom were the General Electric Company of New York, who have carried out, it may be stated, a larger amount of traction work in the world than all other firms put together. This firm is represented by H. H. Kingsbury and Company of this city. The General Electric Company put in a number of alternative suggestions, almost any of which, in the matter of price and efficiency, appeared to be superior to the tenders received from the other firms.

The prices were for the engines and generators as specified to be of 800 k.w. each, but the tenderers added a recommendation that the power of the unit should be raised to 850 k.w., because, although up till recently the 800 k.w. machine was the adopted standard, a new and improved machine of 850 k.w. had now been recently constructed by them, and was being generally adopted where a machine of about that power was required.

The decision as to which of the tenders received should be accepted being one involving considerable responsibility, I obtained the approval of the Minister for Works and the Railway Commissioners to avail myself of the assistance of Mr. Thow, Chief Mechanical Engineer, and Mr. Elwell, Chief Electrical Engineer, in coming to a conclusion. After going into the matter carefully, a joint report was prepared on the 15th June, 1897, and submitted both to the Minister for Works and the Railway Commissioners.

The report recommended the acceptance of one H. H. Kingsbury & Company's tenders, and the size of electrical unit determined upon was the 850 k.w. machine, as suggested by the General Electrical Company. There were a few other minor recommendations embodied, one especially having reference to the governor-gear, which was afterwards made part of the stipulations of the contract. The recommendations contained in the report were approved by the Minister and the Railway Commissioners.

The prices submitted by the General Electrical Company, through H. H. Kingsbury & Co., were for the General Electric Company's electric generators, with engines, either of the E. P. Allis Company, Milwaukee, or of MacIntosh and Seymour. The Allis Company's engines were selected. Blue prints, with all the principal dimensions of the engines and 800 k.w. generator, were furnished with the tenders; but, in consequence of the proposed substitution of 850 k.w. generator, and the alteration in the governor gear, it was necessary to have the measurements of the larger machinery before arranging for the disposal of the space in the engine-house. The importance of having these dimensions absolutely fixed before the design of the power-house could be completed, is evident from an inspection of the plan. It will be seen that the division of the roof into bays, and its height, depend upon the space taken up horizontally and vertically by each engine, and extreme care was required in fixing the positions of the columns along the centre of the building, and the piers of

of the side wall carrying the crane girders. It was not thought at the time that there would be any serious delay, such as afterwards occurred; otherwise it would have been better to postpone giving the first order for the machinery, or allow a longer time for its delivery and completion.

The time allowed for completion was forty-six weeks (the date being fixed at 6th July, 1898); but as it had meanwhile been arranged that my assistant, Mr. Fischer, was to proceed to America for the purpose of settling the design of the governor gear and some other details, as well as to meet the inspectors of the machinery, and thoroughly imbue them with our ideas as to quality of material and workmanship required, the date from which that period was to commence was practically the date of Mr. Fischer's arrival in Milwaukee. His departure from Sydney having been unavoidably delayed, this proved to be the 3rd September, 1897; so that the proper date for completion of the contract would be 20th July, 1898.

There should have been no great delay in furnishing the required dimensions to enable me to go on with the building design; but, as a matter of fact, I only received them about Christmas, 1897.

As soon as the general plan of the machinery was determined upon in June, 1897, I instructed Mr. Fischer to get out a sketch plan, and elevation of the power and boiler house. I find that a copy was furnished to Mr. Elwell, in August, 1897, and as no further suggestion was made, I concluded that, generally speaking, the design of office accommodation was satisfactory.

The death of the late Chief Commissioner on 21st June, 1897, was a most unfortunate occurrence, especially as he had taken so much personal interest in this question, and had assumed the responsibility of settling details. I may say that I was frequently in conference with Mr. Eddy on this and other constructions questions.

During Mr. Fischer's absence in America plans were completed and contracts let for the permanent-way of the George-street and Harris-street tramway, and designs were prepared and contracts let for the car-house, the construction of which involved a very considerable amount of careful thought, as the foundations proved to be exceedingly bad, and nearly the whole place—walls, columns, pits, and roads—had to be placed on piles.

With regard to the power-house, sketch designs were begun, but could not be completed owing to the absence of proper dimensions; and it was only at the latter end of December—after the information had arrived—that designs could be energetically pushed forward. A contract, however, had already been let and carried out for the removal of surface material to foundation level, at the site. This work was completed on the 23rd February, 1898.

On the 19th March, 1898, I formally submitted to the Railway Commissioners, in accordance with clause 28 of the Railway Act, a plan showing the whole arrangement of the power-house site. After considerable discussion, a decision was come to on 13th April, 1898, after which the matter could further proceed. Office accommodation finally determined upon does not differ materially from that suggested in August, 1897, the accommodation proposed being such as to be sufficient when the tramways had all been converted, and when the business done may be expected to be of a very large and important character.

Contract plans for the building and foundations were completed and tenders called on 23rd May, 1898, returnable 13th June, 1898 (afterwards extended to 27th June).

The commencement of the erection of the building having from one cause and another been so much delayed, and some of the heavy machinery having already arrived, I endeavoured to make the best arrangements possible to get the site ready to put some of it in place. Therefore I anticipated the tenders for the building, which were to come in on 27th June, 1898, and, with the approval of the Minister, let a contract for the manufacture and delivery of the columns and girders required to carry the travelling cranes, the use of which, if allowed to the machinery contractor, would go far to make up for lost time. I ascertained that the bars and plates required were in Sydney, and the contract which was made with Scrutton & Co. provided that they were to complete at the end of September, when the building contract was to be ready with the side walls and foundations to put them up at once. Unfortunately Scrutton & Co. were not up to time, as they had failed to secure some of the material which at the outset was actually in Sydney, and when the girders and columns were ready to put in place, the building contractors, Stewart & Co., were not prepared to take delivery and erect. Had everything gone off as calculated by me in the previous June and July, the erection of the machinery could have been commenced about the third week of October, and, as Mr. Allen, of H. H. Kingsbury & Co., assured me, two months would be ample to get two sets of engines and generators in place and working. The building ought also to have been roofed in by the end of this time, and the final completion of the rest of the electrical work, which must be done under cover, could then have been effected.

As to the delay in the erection of the building, some observations are necessary. The contract was let to Stewart and Co. on the 30th June, 1898, rather more than five weeks after tenders had been called. The time for completion was 30th December. One would have expected a contractor of Mr. Stewart's ability and experience to have made such provisional arrangements for the supply of ironwork, bricks, and other material, so that the progress of the building would not be hindered. As it happened, however, several causes of delay have occurred, more or less important. The worst were those connected with bricks and ironwork of roof. With regard to bricks, had I been willing to allow an inferior article to be put in the work, or, in the case of the front elevation, let the facade have a patchy appearance from want of uniformity in colour, the brickwork could, no doubt, have proceeded faster. As it was, in consequence of a quarrel with the brickmaker, failure of kilns, and the inability of the contractor to get exactly what was required, the work has not progressed as it might very well have done. Had these difficulties not occurred—and there is absolutely no reason why, in a city the size of Sydney, they need occur—the walls of the engine and boiler house, and the whole of the front building, the floor and roof, might very well have been completed up to contract time.

With regard to the design of the ironwork for the roof, I took the greatest possible care to see that only standard and marketable sections have bars as shown, and had there been any difficulty about any particular section, I should have been willing to adopt in lieu of it another, which would equally answer the purpose, as I have not infrequently done in the case of bridge work manufactured in the Colony. Had Mr. Stewart at once given an order through Scrutton & Co., or some other leading firm of importers, the matter ought, under ordinary circumstances, to have been in a position to supply him with some of the material to go on with within four months, and in six months the whole route could have been completed. Usually there is no difficulty whatever in buying at a moment's notice in England or America any marketable section of iron or steel, and the quantity required for the power-house roof is not large. In this case, however, it was stated, probably with truth, that the engineer's strike in England and the Spanish war had caused the exhausting of stocks both in England and in America, and the agent had to wait for some of the material to be rolled afresh before it could be shipped out. There is a point, however, about which Stewart & Co. are very much to blame, and the fact has only come to my knowledge within the last two or three days, and that is, that they sub-let their roof-work at the start without the Minister's sanction to Tulloch & Co.—that is to say, not merely the labour of making up in this Colony, but also the provision of the material. This is not only an infringement of the general conditions of the contract, but it is an attempt to relieve themselves of responsibility and trouble in a way they have no right to do. Had I known of this at first, I should have strongly objected to such sub-letting.

With regard to the boiler setting, this might, if urgently required, have been let as long ago as July last as the plans were then practically complete, but there was no necessity to do so. One stack of boilers could easily be got ready in three months, and we did not want them till near the end of the year, and the time was utilised to discuss the coaling arrangements with Mr. Elwell, the question of mechanical stoking and coal-conveying being the subject of very careful inquiry. The questions were gone into from a consideration not only of first cost, but also of economy in working; and it was finally decided to adopt what I had previously proposed to adopt—the Hunt Company's system of cast-iron floor-tracks and charging cars.

Tenders came in on the 3rd January, and Stewart & Co.'s modified tender was, contrary to my recommendation, accepted.

The tenderers afterwards found that they were not in a position to carry their own proposition out, and the contract had to be altered back to agree with my specification; but the new acceptance was only issued on 30th January, twenty-seven days after the tenders came in.

During the construction of the George-street permanent-way contract, considerable complaints arose as to the slow way in which it was being done. Much has been said on this subject, and it is scarcely necessary to refer again to it more than to point out that the work in a street like George-street cannot be carried out like an ordinary tramway in a less important street. Such a street can only be closed in sections, and the contractor is hampered in every way.

The work can only be carried on by day, as it is not safe to do either concrete work or electrical work of special character, except under an illumination which is not obtainable in the streets at night. Further, a good deal more electrical work

work on the roadway was done than the original design provided for. It was intended that the rails should take the whole of the return current; but in view of the enormous traffic that must eventually arise, it was afterwards arranged to put down special copper cables to assist the rails.

There still remains a portion to be done by my Branch after the curve at the Fire-station is completed, namely, the terminal loop and turn-outs at the eastern side of the Circular Quay, which was an arrangement asked for by the Railway Commissioners, and finally approved by them as late as the 15th November, 1898. This involved a lot of difficult and special work, which is still in course of preparation at Cockatoo Island under the supervision of an inspector of my Branch.

I think a perusal of the above will show that there may be a failure of calculation to be regretted, but no cause for blame. It is easy to be wise after the act, and to say that things ought to have been otherwise arranged. It must not be overlooked that the power-house now being installed is in every respect up to date, and till quite recently would have ranked amongst the largest of its kind in the world. In order to give, if necessary, additional proof of how the most able men may be thrown out in their calculation, I may mention that had the power-house been in every respect complete at the end of the year, the traffic could not have been undertaken, as the Railway Commissioners did not have enough cars ready to meet the present conditions of traffic.

This report was, of course, made to meet the demands for information at the time? It has probably been noticed that Stewart & Company's contract for the completion of the buildings was to be carried out in six months. This, of course, might seem rather short time for the completion of such big buildings; but if he had got the whole place covered in, one would not care so much about finishing the inner portion. The main purpose was to get the building closed in, and he was most dilatory in that respect; for, notwithstanding that he had his tender accepted at the end of June, 1898, I think it was March, 1899, before he had got the whole of the ironwork out for the roof; so that whatever arrangements I might have made for the completion of the work were entirely neutralised by that delay. The progress reports which I had made from week to week will show the date on which the roof and the end were completed. There was a terrible delay over this, as well as in the setting-in of the boilers. It appears to me that he has been over his time in both these contracts to a disgraceful extent. I expected very much better from Stewart & Company, because I thought they were energetic contractors and carried out their work well; but in this instance they have been terribly slow.

*Chairman*: The generators arrived, I believe, a considerable time before the power-house was ready for them? Yes.

Could you tell us what became of them after they were landed? Two of them were sent over to Garden Island and taken into the store by the Admiralty. The others were left on trucks, covered over with tarpaulins, right near the power-house.

And the ones at Garden Island have given trouble, have they not? I do not think so. The armatures were found to be a little damp, but they were soon dried. The greatest trouble was with the coils, especially the shunt coils, which are bound with fine wire, and the difficulty in drying these out is to get sufficiently low voltage of long duration. I think it not at all an uncommon thing, for these large machines especially, to accumulate a lot of moisture; and I think that the damp weather that we had in May, June, and July of this year was quite sufficient to account for anything like that. I know we loaned one of our electric pump motors to the firm of H. H. Kingsbury & Company to drive a temporary plant, and although it had been carefully packed and came out in proper cases, and had been unpacked and stowed in the car house under cover, which was built at the time, when it came into the temporary power shed it was in a very damp state; in fact, I do not believe it possible to get any machine and keep it for a month, or a couple of months, in damp weather in Sydney without its absorbing a large quantity of moisture.

Was not Garden Island a bad place to take them in, in consequence of the sea air? I do not think so; the buildings were all closed in. It was the only available place.

The two generators were stored there complete, with armatures and fields? Yes; the other armatures were stored in the open with tarpaulins over them. I think the fields were put under cover either in the power-house or at the stores at Circular Quay. The armatures were left out of doors because they were so very heavy and awkward to handle. I think the cases containing them weighed 22 tons.

They were allowed to remain in the waggons? Yes.

Are we to understand you to say that the armatures are now dry? Perfectly dry; and they show a resistance of 3 megohms, and the fields are also now quite dry and satisfactory.

*Mr. Wallach*: With what voltage do you measure insulation resistance? We take the current off the electric crane line—550 volts.

It is measured with a high resistance volt meter showing 3 megohms? Yes; that is what has been reported to me.

Has the insulations of the field coils failed in any way? No; I believe not at all.

I believe you have snap switches in the coils? Yes.

Do you not think that the use of snap-switches in the field coil might not tend to injure the insulation, owing to the large inductive rush that would be caused by snapping the current in them so suddenly? According to the specification the insulation has to be made so as to stand a test of 5,000 volts alternating current, and I understand from the Inspector's report that these tests were actually applied in the workshop. It is a usual thing with the General Electric Company to make their machines to that test. Mr. Elwell was very anxious about the insulation being right, and he wrote me some time before he died, saying that he thought a 5,000 volt alternating current should be applied to test the insulation. I objected to that, and pointed out that it was the workshop test that they had secured; that if the inspector had done his duty with that high quality of workmanship and material which have already been put into the work, supposing that by any hook or chance there was some slight defect in the perfecting right throughout, to go and put that through when the machine was finished would be a serious matter indeed. Besides it is altogether an unnecessary test to carry out before the traffic is started. The matter was discussed with Mr. Elwell, and I went down to his house, and eventually the Railway Commissioners wrote expressing some annoyance at the position I took up. I did not see any cause for annoyance, as under the contract I had a perfect right to my opinion. They were however annoyed, and having stated that they would not take over the line until the machinery was subjected to a 2,500 volt alternating test, I informed them that if the contractors were prepared to carry it out I should have no objection, but I certainly do not care about it.

*Chairman*: You do not consider the insulation test necessary now? No; I consider the insulation test of 550 volts current that has been made as necessary. I also consider that the load-test is a necessary condition before the line is opened for traffic, and these load-tests as you will see by a reference to the specifications,

specifications, are something of this nature; namely, that we should apply a working load for a definite time, say, 25 per cent. for work for two hours, and 50 per cent. for about two minutes, and then besides the flashing test, which in themselves would throw a great amount of strain on the shunt-coil especially, they would provide all the test you could expect to make. Mr. Elwell and Mr. Brain seemed to think there might be some danger from lightning discharge. We have lightning arrestors at each point where the current is led on to the overhead line, and where each feeder comes on to the switchboard. I do not see myself how it is possible that any lightning discharge can get into the generators.

I should like to say one thing about the ordering of the generators. When these were ordered—I do not know whether it is known to the Board—the Government were anxious to show that they were doing something. I did not offer any objection in this particular case, but I have protested in other cases against ordering things before they were necessary, but as I said, there was an anxiety to show the public that we were doing something, and when that is the case you cannot do things in Government work with the same view to economy of time and interest on money, and so forth, that you can in private enterprise. Later on, when I saw that delays were going to occur—although I did not then see to what extent the delays would reach—I wrote to Mr. Fischer and asked him to inform the General Electric Company that they need not push on with the work, as we should not be ready to receive the machines. Mr. Fischer informs me that he did not receive the letter. Why, I do not know.

*Chairman*: You had the site well agreed upon when you ordered the generators? Yes.

And the excavation work was being carried on? You could not tell before it was decided what the generators would be, or how the space would be utilised. I quite acknowledge that the best way would have been after deciding what machinery we were to have, to work the whole thing out; but that never suits the Government. You are not allowed to wait, and so the orders went out in this case.

Was that at the wish of the late Minister for Works, Mr. Young? Yes. I thought at the time there would be no difficulty about getting cover ready for the machinery by the time it came out; but, of course, in that I was very much mistaken.

*Chairman*: You did not anticipate that the delays would have been as great as they have been after the completion of the building? I do not think anybody could have anticipated the delay. The immensity of the work, the amount of detail that there is in carrying out this work, and the difficulty in getting skilled labour in the office to work out the details were very great indeed. There were thirty-three contracts let, besides considerable work done by day-labour by our own staff.

Is there anything else you would care to state to the Board at this stage; could you furnish any information as to the cause of the failures; we are anxious to find out whether the armatures are in a satisfactory condition now, and also the fields? That, of course, you can easily test, and I shall be glad to render any assistance in testing them. I am perfectly satisfied myself that they are alright.

*Mr. Wallach*: You do not object to the 5,000-volt test because you think the insulation might give way. You object on principle that it is a test which should be only applied in the workshop? Yes. It seems to be analogous to a case of this kind: You have a contract for boilers, you insist on the material in those boilers being of certain quality, having a certain breaking strength and having (say) certain elasticity, and you insist on a certain standard of workmanship. It seems to me that it would be just as absurd for anyone to say, "I will not take over those boilers until you test them up to the elastic limit of the material." Even the late Mr. Elwell saw that by applying this 5,000 volts test by some chance or other a little more than that might be applied and the insulation might break down. I am sure that the Board will agree with me that the specification is made to insist upon a certain high quality of workmanship and material, and the best possible steps are taken to secure them, not because there is any particular virtue in that 5,000 volts—you might have 1,000 volts—but because you want the material and workmanship to be of a certain quality, to provide a large factor of safety.

You would have 550 volts as the maximum voltage, and you intend to make a test at 5,000, five times decimal four. The factor of safety then would be about 15? Yes. I suppose the greatest strain thrown on these generators and coils would be in the case of sudden stoppage.

Of course that would only come on the shunts? Yes. I take it that that is when the machines would fail if they failed at all.

*Chairman*: Respecting the sizes of the machines, were they ordered after consultation with Mr. Elwell and Mr. Thow? We called for quotations for 800-K.W. machines after discussing the matter with Mr. Elwell and the Commissioners. Mr. Eddy was anxious to get four of these machines at once; in fact, he was talking about getting five, but it was, however, considered a proper thing to get four, and so we called for tenders to supply that number. I am afraid you will find the written matter in connection with the inquiry rather deficient.

At any rate, you all agreed about it? Yes; we entirely agreed.

You all agreed as to the size of the unit? There was not the slightest doubt about it, and that the machines were to be 800 K.W.

But why did you order four when two would have been sufficient—one to work the traffic, and one to act as a standby? Because it was intended to proceed at once with the conversion. No time would have been saved as regards that, because we should have had to go on with the building. I have no doubt the late Chief Commissioner had well thought out the question of conversion.

As you will only utilise one machine, and the other is for a standby, how long do you think it will be before the other two are required? Within the next two or three months we shall probably want more than one machine. I have been making arrangements for conveying power to the North Shore system.

What horse-power will be required for the North Shore system, giving 550 for George-street and 400 for the Rose Bay line? The Rose Bay line will be left out of consideration for the present.

So you have only 550 for George-street? Yes; then there is some for North Shore.

But will there not also be, in a very short time, a line to Dulwich Hill? I could not say. I know that, in discussing the matter with the officers of the Railway Commissioners as to the amount of work to be thrown on to these machines, the conclusion arrived at would be that one of the generators would not be sufficient for George-street and North Shore. You must remember the North Shore service is at present very inefficient. It has been acknowledged to be so, and the probability is that as soon as they get additional power the Commissioners will provide 20 per cent. or 30 per cent., or even 50 per cent., more accommodation. Of course the two machines may last for a long time, possibly a couple of years.

Mr. Deane then explained to the Board the contract drawing of the power-house.

H. Deane,  
Esq.  
23 Oct., 1899.

TUESDAY, 24 OCTOBER, 1899.

Present:—

PROFESSOR WARREN (CHAIRMAN).

PROFESSOR POLLOCK.

MR. WALLACH.

Gustave Fischer, Principal Assistant Engineer for Tramways, examined:—

G. Fischer.  
24 Oct., 1899.

*Chairman*: Could you inform the Board if it is true that the generators in connection with the George-street Electric Tram Service were delivered in Sydney on 6th July, 1898? I cannot say exactly if that is the correct date; the papers, however, will show that they did not all arrive at the same time.

They were shipped, I believe, on the 18th March, 1898, and, as the papers show, the tender for the power-house building was accepted on the 30th June, 1898, one week before the arrival of the generators? I could not say the exact date; the papers will show the actual time they were let.

How was it that the generators arrived before the place to put them in was ready? The plans were not ready to call for tenders.

Can you say why the plans were so long delayed? I was absent from Sydney till December, 1897; in the meantime the plans were started, and when I returned they were pushed on with all speed.

Did you send the necessary plans and particulars for the preparation of the tenders for the power-house on 11th October, 1897, from America? I may say that I left Chicago for New York when I had finally settled certain details with Mr. Reynolds on 11th September, 1897, and the Allis Company sent on the plans to me when completed.

Then you forwarded them on to Sydney? Yes; I despatched them on 9th October, 1897. I might explain that as soon as I got to America I made it my business to get east as quickly as I could, so as to forward on the foundation-plan as quickly as possible. I went to Milwaukee and stayed there till some deviations from the original plans were decided upon between Mr. Reynolds, of the Allis Company, and myself.

The particulars sent by you from New York to Sydney were necessary before the drawings for the foundations for the engines and generators could be commenced? Yes.

What was the actual time occupied since receiving those particulars before the contract was let? The papers show from January, 1898, to June, 1898. I think you can take the dates on the papers as correct.

Do you consider that six months was sufficient to complete the building contract? Six months after letting the contract?

Yes? It is doubtful, judging by our recent experience.

Is it actually completed at the present time? No; of course, it could have been completed in that time, under ordinary conditions, to a sufficient extent to be able to make use of it.

And that time would expire on 29th December, 1898? Yes.

Does that mean the extended time or the contract time? The contract time. I would like to explain in connection with the contract there was great difficulty in obtaining the material straight away. It was difficult to obtain bricks, and the contractor says he had great difficulty in getting ironwork for the roofs and girders in consequence of strikes in England having depleted all stock.

Were there any strikes in America at that time? Not that I am aware of.

Were there no bricks to be obtained in Sydney suitable for the work? There was some difficulty at first in getting suitable bricks for the building.

I understand from the papers that Mr. Stewart complained that the sizes of the rolled sections were unusual, and were in great numbers? Of course, the plans will show exactly that there is not a section that you could not find in any manufacturer's ordinary catalogue; and should any such difficulty have been experienced it was Mr. Stewart's business to let us know. We could have easily varied the sections to suit him, but we were never informed of any such difficulty until after the trouble arose about the material not coming forward; then it was too late.

What was the date of the completion of the power-house roof? Do you mean the entire completion, or merely sufficient for covering?

I mean the time for covering so as to prevent the generators from being damaged; I suppose it is now completed? Yes; the corrugated iron was on the whole roof on 10th June.

At what date did you commence the erection of the engines and the generators? Early in March.

How many boilers are ready for use under steam at the present time? Seven; all of which were under steam to-day.

That is one-half? Yes; that is the western battery.

In regard to the method of firing these boilers, the "Hunt's system" of coaling them, I understand, is to be used? Yes. The arrangements in the boiler-house proper are completed, but the coal storage is still in the course of construction. The reason for that is that we could not start working until all the material had been delivered down to the boiler-house, so as not to block the entrance entirely.

What about the removal of the ashes; that comes in under the system? Yes; part of it is also finished, but the elevator arrangements are not yet complete. They are being built now.

How long will it be before the "Hunt's" apparatus for one set of boilers will be completed—that is to say, the whole arrangement for coaling and taking away the cinders just as in complete working order? It will take about three weeks from now. As I pointed out to the Board on Saturday, the temporary arrangement which has been made is quite satisfactory for the present.

There is nothing to prevent the work from being pushed on? I might be allowed to point out that at the present time we have great difficulty in getting first-class skilled labour, and even unskilled labour. We have looked out for good carpenters up till yesterday to make up our complement, and I should like to point out that we have had less carpenters on the coal-bin than we would have liked; that is the reason why I estimate the time to be three weeks.

Are you referring to Stewart's contract? No; we are doing it by day-work to avoid delays with contractors. We have started doing a good deal of day-work lately which saves us the trouble of getting out plans and specifications, calling tenders, and so forth.

How is it that you were unable to commence making these arrangements earlier? Simply because we could not get the boilers and other heavy materials in had we erected the coal-bin, &c., earlier.

You would not commence before they were in position? Yes.

Do

Do you consider the site a difficult one to manage in that way? Not more than what might be expected. One thing depends upon another in getting the work in order. G. Fischer.

Are the condensers, the circulating pumps, and feed pumps all ready? They are all in working order. 24 Oct., 1899.

You do not use condensers? Yes, we do. The reason we are working by exhausting the atmosphere just now is simply because we have no power to work our electric centrifugal pumps until we can get sufficient power from the station.

How long do you think it will be before the steam-pipes are permanently supported? Everything is at present permanently supported from the western side to the main entrance.

The western side is not propped in any way? No, it is only the eastern side. All other piping is permanently supported.

*Mr. Wallach* : Does that include the piping adjoining the eastern and western batteries? That is not complete, as we have to get closure pieces cast. This is not due to accident; the pipes were intentionally left short, because one can never tell in such long lengths to the sixteenth of an inch.

The engines are said to have broken down; I believe there has been a defect in the bearings on the crank-pin? I would not call it a break down; they did not work as smoothly as they ought to have done.

Do they run hot? Yes.

And the engines were brought up? No.

*Chairman* : Well they were slowed down? No; they started heating up and whistling, and were consequently shut down.

All that has been modified? The bearings in two of the engines have been modified.

And they have been since tried? Yes, but only with a light load. It was just to run the bearings down. We yesterday tried No. 3 engine again with the old type of bearing, but she heated up again. I think the lubricant might have something to do with it. I first sent down Englebert's oil, and the engineer of the Allis Company thought it too heavy an oil and stated he would like Harris', so we supplied him with that ever since.

That is for oiling the crank-pins and machinery generally? Yes; except the cylinders, for which there is a special oil. Yesterday I came to the conclusion that we might try Englebert's again to see whether the oil has anything to do with the heating. We will, however, have a load on to-night with the new oil, and I shall be able to see how it will then get on.

The engine-house floor is not yet completed, is it? Yes, except a little tiling to be done where the fly-wheel is being turned up on No. 4 engine. We cannot get at it yet until the driving gear is removed.

Is No. 4 the one you are putting on? No, No. 2, with the new brasses.

And that will have the fly-wheel turned up? No. 4 is being turned up; the others are still in the rough.

So that it will be some time before the whole place is finished off, although you hope the engines will be running this week? Yes. It will take a month or several months yet to clear up everything. It will take a month for each fly-wheel to be turned.

I understand that the Railway Commissioners object to taking over the work until such matters are attended to? I have never heard anything of that; all I can say is that when I was in the United States I saw several engines working heavy traffic in a similar state of completion to ours. They had been running in that condition for eighteen months before I went there, and the other day I received word that their fly-wheels are only now being turned up, and it is now nearly two years since I have returned to Sydney. The largest engine referred to above, I might mention, is one in the main station of the West End street railway in Boston—a 1,500-K.W. machine running at eighty revolutions, and I received word the other day that the engineer-in-charge was only just getting ready to turn up the fly-wheel.

I take it that it is the usual thing with the tramways in America, as far as you have observed, to run trams before the work is quite complete, provided the engines develop their power? Yes; I can mention a station in Boston—Cambridge station—they have 1,200-K.W. machines, the armatures had to be built up in their place. They were too heavy for railway transport. I was there on a Friday inspecting the works, when they were still working on riveting up the fly-wheels, and they were running for traffic on the following Tuesday. The floor in this station was only then temporarily covered with planking, and the completion of the buildings and coaling arrangements in a very backward state.

Can you say of your own knowledge and from your observations in America if the Allis Company's engines are those generally used for railway work? Yes, very largely.

And the type of generator used as supplied by the General Electric Company is also very largely used in America for railway purposes? Yes, with the exception of Westinghouse and a few Walker machines; but the majority of them were of the General Electric Company make.

So far as you know, if the proposed test is successful, there is no reason why the George-street tramway should not be immediately started? None whatever.

How many engines and generators would you have ready this week? Two at least. We only want to run one at a time for George-street. That would be quite sufficient.

What is the horse-power required for the George and Harris Streets tramway? It depends on the number of cars sent out; but it was estimated that the George-street tramway would require about 800 horse-power.

That is the maximum? Yes. The rated load for the engines is 1,250 horse-power each, but we could take a big overload with perfect safety.

So that one engine and generator will develop about 50 per cent. more power than is necessary for a long time to come? Yes.

I wish to ask you something in regard to the generators—as to the time of their arrival and how they were treated to prevent any damage being done to them; what steps were taken to store them when they reached Sydney? The two first sets we managed to store at Garden Island by the permission of the Admiral. They were put under cover there.

Were they kept absolutely dry? There was no possibility of any water getting at them, except the moisture from the atmosphere.

Were those generators considered to be better than those stored in the railway trucks? No; they were just about the same. *Mr.*

G. Fischer.  
24 Oct., 1899.

*Mr. Wallach*: Why were two stored at Garden Island and the other two left in the railway trucks? We only got permission to store two there, and when the other two arrived they were left on the trucks, and covered over with tarpaulins and galvanised-iron.

*Chairman*: What steps have been taken to dry the generators that were wet? It depends entirely on what you call wet. They had absorbed a considerable amount of moisture, but how it got into them I cannot say. One of them got wet from a rain-storm, but it was nothing serious. This armature tested about as well as any of the lot after drying.

Was that the wet one referred to? Yes.

How did the water get to it? We started erecting generators before the roof was on, and we used tarpaulins to put over them in case of a storm. On one occasion the water must have found its way through them.

But would they not be as well protected in the building without the roof as in trucks? In the railway trucks they were still in their casing, and in that case were not as liable to damage as if exposed in the shed.

I am speaking of the whole of the machines? The armature of No. 1 machine was the only one that got any direct contact with water. The others became damp through absorption of the atmosphere.

You call it No. 1? Yes.

It became slightly wet through standing in water? Yes; through the water splashing on it. The armatures of all machines are in good order now.

You took steps to dry them? Yes. We warmed them up.

And that you consider entirely effective? As far as the electrical portion is concerned, I have no misgiving on that point.

You have made some tests, I believe? Yes, from time to time. Taking the results of the three machines at the present time they are about the same. The insulation resistance between the armature and frame is 2 megohms; between the series field and frame, 1 megohm; and between the shunt-field and frame,  $\frac{2}{3}$  of a megohm. Of course, these machines when put to regular work will improve from day to day. Once moisture gets into the shunt-fields it takes time to dry it out.

Do you consider them now thoroughly dry and in every way satisfactory? No; but they will become better from day to day when running on load. The insulation is quite sufficient for running at full load.

Would you apply the test required by the Railway Commissioners? Which test?

Alternating 2,500? We are quite prepared to do it; but I don't think it would be wise.

You consider no test of that kind should be made until you run the machine for about a month? Any machine improves every day, and there is hardly any chance of it breaking down, although, if the Railway Commissioners insist on it, we have everything ready to apply it within a day or two.

*Mr. Wallach*: You say that in the armatures there is a resistance of two megohms. How is that resistance measured; do you arrive at it by measuring with the volt metre? Yes, with the full 500 volts.

Is the connection made between the armature plank, or with that of the commutator against the plank? With the commutator.

So the frame, then, is kept perfectly clean? Yes. The contacts were perfectly good; they were proper metallic contacts.

*Chairman*: Could you furnish the Board with a diagram showing the connections between the switch-board and the machine? Yes.

You have made insulation tests on the series coils, &c.? Yes.

*Mr. Wallach*: When you were testing the insulation of the series coil, was the armature disconnected from it? Yes.

Were they tested separately, disconnected from everything? Yes.

*Chairman*: And the series coil within the shunt-winding? The two windings are on separate spools.

In the shunts, I believe, you have snap-switches;—is it your opinion that these might tend to damage the insulation by heavy inductive rushes passing through the coils owing to the sudden snap of the switches? No; this snap-switch was only in circuit while drying out the shunt-fields.

You do not think there is anything against the use of snap-switches in the shunt-field coils? No, not as explained above. Of course, that is the severest test you can put on to the shunt-fields.

What methods have you taken to dry out the shunt-coils, which, I understand, are the worst? Yes, they are the worst. We used a small 100-volt machine to dry them out.

I mean the shunt-windings? Mr. Goodman will be able to inform you as to them.

When you tested each machine in this way, did each give the same resistance? We tested them all as soon as we stopped; however, they have gone back and took up moisture again.

*Mr. Wallach*: How do you account for that? Only that Sydney is a very moist place, and that it is in the atmosphere.

*Chairman*: Is the permanent way quite complete and satisfactory—that is, admitting the powerhouse to be complete, is there any possibility of anything going wrong in the permanent way? Not to my knowledge.

Are the feeders, overhead conductors, bonding, &c., all complete and ready for traffic? Yes. I might mention that we are having the connection with the feeders altered; but this will not prevent the running of the trams.

There is no doubt, I suppose, that the present rolling-stock will be able to run round the loop which is at Circular Quay? We have already been round it, but are now taking it in hand for some alteration.

You have not tested it since? As the cars went round the old loop, they ought to go round the new one much easier.

There is no doubt whatever about that? None whatever.

What you really did was to put in transition curves? Yes, to ease the curvature at each end. As I explained the other day, we always design sharp curves with transitions; but I gave one of my assistant engineers instructions to shift the location of one track as far back as possible, so as to allow more room for the vehicular traffic; but he took me literally, and cut out the transition curves, so we had to lift a few lengths of rails to put in the transition curves.

There

There are certain cross-over roads from Harris-street to the car-house;—are they complete? Yes. G. Fischer.

There is nothing to prevent you from using them? No, nothing.

You have already made certain trials, and obtained certain results? Every time we have been out 24 Oct., 1899.  
we were perfectly successful, so far as the permanent way is concerned; no one could take exception to the running.

You have not made any tests of the power developed by the engines? Yes; we have had 1,700 amperes on the engines tested.

*Mr. Wallach*: With full voltage? Yes.

Were the motors in the motor-cars at all damp? I have nothing to do with them.

*Chairman*: In whose charge are they? The Railway Commissioners, so far as I know.

Do you consider, then, that the delay has really been caused by the contractor of the building? I think he is, to a large extent, to blame.

Can you tell us the resistance of the rails used for the return current, and the resistance of the copper cables which have been put in to assist the rails in delivering the return current? I will obtain you the information.

Is there anything you would care to state officially in connection with any of the points put before you? Perhaps it would be better to defer doing so for a few days as something may crop up. I should like to say now, however, that so far as the designing of this work is concerned, we had great difficulty in this country to get a proper staff of draftsmen, and it is owing to that that considerable time was occupied in working out the plans for the power-house. It certainly seems much longer than should have been the case.

What, six months? Yes; it is all due to the scarcity of experienced men. The papers will show that I applied for additional help, and it took weeks and weeks before I could get it.

After you came back from America, did you have anything to do with the preparation of the plans? Yes; I took again charge of the work. Mr. Deane looked personally after them while I was away.

WEDNESDAY, 25 OCTOBER, 1899.

Present:

PROFESSOR WARREN (CHAIRMAN).  
PROFESSOR POLLOCK. | MR. WALLACH.

Orlando William Brain, Acting Electrical Engineer, Railway Department, examined:—

*Chairman*: Could you inform the Board how the generators were stored after their delivery by the O. W. Brain.  
General Electric Company;—as you have practically made a complaint that the generators were under 25 Oct., 1899.  
water, you might furnish a brief history of them from the time they were landed in Sydney until their erection into their proper positions? The manufacturer's representative gave me the information. I understood he was sent by Mr. Deane to confer with me as to the reason why the test should not be carried out.

You were informed they were under water;—we could not obtain any evidence to that effect unless you can now furnish us with it—you did not yourself see them under water? I did not.

What reason have you to suppose they were under water? I was informed by the manufacturer's representative. That is the only reason.

Who were the manufacturer's representatives? Mr. H. A. Kingsbury and Mr. Raymond.

So that, from what you have been told, you assume that the generators have been very badly cared for since their arrival in allowing them to get wet? It was because of that that the manufacturer's representatives urged that the tests should not be carried out.

And assuming they were wet, you made certain recommendations for drying them? Yes.

Do you consider they are now fit for taking over for traffic, or is it necessary to wait till they are dry and the test is made? I presume you now wish my personal opinion; if so, may I say that up to the present I have not been previously requested to give my personal opinion on the matter. I advised the Commissioners as to any tests that are made, and the matter of taking over the machines is quite a matter of policy which the Commissioners will decide. If they are informed that certain tests are guaranteed that the machines are in a certain condition they will then decide. I should not presume to dictate to them as to what risks they would run or what degree of safety should be insured before they are used for traffic.

You say you would not give them that advice? No.

What was insisted upon is shown in the specification and reads as follows:—"The insulation between either of the field coils and the frame, between the armature and frame, between the commutator and frame, and between the series of field coils and the shunt-field coils, must all stand an insulation test of 5,000 volts alternating current; the test must be made by a transformer of at least 15,000 watts capacity";—I suppose you do not know how these were decided in the General Electric Company's works, except from their reports? No, I do not.

That test could not be applied without putting the armature on its shaft and inserting it in position in the yoke? No.

So that the test could not have been made unless it is built up? No; but there is no evidence that it was not built up.

You are really acting in the capacity of the late Mr. Elwell, and as he was associated with Mr. Thow and Mr. Deane in determining upon the acceptance of tenders, he was doubtless thoroughly familiar with the specifications, and the questions I have just put to you could have been fully answered by you were you acting all along? Yes.

You are at the present time acting in that capacity? Yes.

And you were closely associated with them all? Yes; but the responsibility, of course, did not rest upon me.

The tests described in specification are not generally made here? No.

They could not have made them except in Sydney. Yes; they do not mention there that the field coils were tested between the series and field windings. It

O. W. Brain.

25 Oct., 1899.

It does not say that at all? No.

Considering the tests specified have not been made, do you not think they ought to be made before the line is open for traffic? As I have already stated, that matter is one which rests entirely with the Railway Commissioners. In the ordinary course of my duties I should not say whether they ought or ought not to be made. I should merely point out to the Commissioners the risk they run by not making them, and it would be for them to consider possibly in this case the relative importance of tests to ensure safety and the necessity of getting traffic started.

Then we may take it that you have expressed yourself fully on that ground in your report? Yes.

You have referred to Mr. Badger's evidence, in which he says he thinks that the proposed tests are not of any great importance, at present at any rate;—you have observed that? Yes; I recollect clearly the whole of my report.

Could you explain to the Board the risks you think would be run if the Commissioners took over the plant without making these tests? There is the risk of the insulation breaking down. The late Mr. Elwell had stipulated for certain insulation tests.

Did not the late Mr. Elwell ultimately decide upon 2,500 volts alternating current? Yes. When we first considered the matter of these tests—of course most of the details, I may tell you, were decided upon in Mr. Elwell's office—we considered what margin of safety should be allowed for insulation tests. Mr. A. W. Jones, the representative of the General Electric Company, stated that his Company were prepared to submit their machinery here to a test of 5,000 volts, and was quite agreeable to it being done. Of course, it was very desirable that at such a distance from the base of manufactures we should have the best class of insulation; consequently we agreed to stipulate that that should be the insulation, and the other tenderers to that Specification had to provide for that insulation in their tenders.

That accounted for the passage I have just read? Yes.

Anyhow it was the origin of it? Yes; I have no doubt about it. I was not present at the various interviews between the late Mr. Elwell, Mr. Deane, and the representative of the General Electric Company. It is possible that that test was put in by Mr. Deane on Mr. Jones' suggestion. It would be undesirable to have one firm making the test while others did not; so it was agreed to call upon all the firms to make it.

It is clear, however, that the General Electric Company practically brought the test up to that voltage, although they do not appear to have tested the machines in a complete state. Yes. The point raised here was that it was not their practice to do it in the station, but that it should be tested at the works.

Does that mean that it is not their practice to test generators when they are built up complete, or only to test the separate parts—the commutator, the armature, and fields? They did not go into that. Their claim was that it was not their practice to make the test outside. It was now a matter with the Works Department.

You do not know for certain? No; my information is purely what they stated to me.

You have spoken of possible risks, the failure of insulation, or other cause from ordinary traffic? Yes.

With 500 volts? Yes; the fact of the machine once giving 500 volts is no guarantee at all for permanent insulation for an indefinite period. On the 18th September, when we were to have started traffic, one of the feed-pump motor's insulation broke down.

On the other hand, it is quite possible that this voltage might be very much increased? Yes. Before we leave the reference to the pump, I should like to say I think the pump was running about a fortnight at 500 or 600 volts, showing that prolonged test was no guarantee any more than in any other class of machinery. It was then supplied with current from the circulating motor driven as a generator. Certain working conditions subject the machine to other strains, and the consideration of greater strains leaves finally the question of the lightning to deal with.

Have you entered at all into the probable increase of the voltage from a sudden breaking of the circuit? No; I have not gone into any figures in the matter at all.

You would have to consider the number of windings? Yes?

*Mr. Wallach*: Is it your opinion that the use of snap-switches in the shunt-field coils are injurious to the insulation? If you mean to break them instantly, I certainly think it would be very dangerous.

Can you say if they are installed at the Harris-street works? No; it is quite contrary to the practice of the General Electric Company. It was suggested by Mr. Deane in one of our conferences that it should be substituted for insulation tests; but I advised that it should not be done.

*Chairman*: Have you any knowledge of the tests actually made on the generators at Harris-street? They have never switched a heavy current on when I have been present.

What do you consider the insulation resistance should be in the generators generally? In replying to that question I should be guided to a considerable extent by the opinion expressed by Mr. Badger in his letter to Mr. Deane, as I have a high respect for his thorough practical knowledge of the General Electric Company's manufactures under working conditions. At the same time, as expressed in my report, I do not consider that a low potential test is a satisfactory test, as it does not necessarily detect a weak point in the insulation of a machine which has otherwise a high insulation.

You have inspected the plant, and are doubtless familiar with all matters connected with the delay;—could you tell the Board what you consider is the chief cause of the delay? That, of course, is a big question—that is, I mean to say there was a very considerable delay before the machinery was got into form at all, and during that time the materials imported had arrived. I was not, however, conversant with the progress of the work at that stage.

*Professor Pollock*: We wish to know why you were not in a position to open on the 1st September? The machinery generally was not sufficiently completed, as you may have noticed from Mr. Thow's report; there was a delay, in the first instance, due to the dampness of the machines.

*Chairman*: You are perfectly satisfied, from your own knowledge, that they were damp? Yes; I was very much afraid from the first, that, owing to the anxiety of the Public Works Department to get the trams started as soon as they were found to stand 600 volts without breaking down, they would want the Railway Commissioners to rush the traffic on them; and with a view of avoiding any supposition on the part of anyone that the Commissioners would adopt that course, Mr. Elwell gave an intimation as early as possible to the Department that the Commissioners would require an insulation test, chiefly because

we

we had an idea from general reports that these machines had been allowed to get very wet. We only wished to defend ourselves against being handed wet machines, and being expected to run traffic at 600 volts. When things were put in order, we arranged at different times for men to go down to attend to the cars when the current was going to be put on. The Public Works Department, however, took the precaution to take an insulation test, and found the dynamos wet; consequently our men were sent back. This was repeated a few times, at all events; and, finally, more serious steps were taken to properly try the machines. Since then, however, the other machines have got sufficiently dry, and full voltage has been put upon them. In every instance we commenced running them some engine brass became heated. The first time we got one car on the line, and were just going to bring it back for trailers, the high-pressure crank-pin of No. 2 engine heated, and the car had to be pushed back by our traffic men. On the following day we had another run; we connected seven cars with trailers up in Harris-street, and the eccentric strap seized, and the sheave slipped on the shaft, and consequently stopped the engine. The Westinghouse, of which you have doubtless heard, that was driving one of our motors for supplying circulating pump motors, was called into requisition, and we brought the cars home one at a time.

Do you mean the motors driving the pumps? There is a little Westinghouse engine, to which we had one of our circulating pump motors attached. This was driven as a generator by the engine, and was used for driving the motors of feed-pumps. I am not sure that we stopped more than once after that with the cars out on the line. An arrangement was subsequently made—I cannot recall all the tests from memory—to put seventy cars on George-street. I opposed this to the Commissioners, and asked that after our experience they should make all tests with the rheostat, in order to escape the possibility of having the cars scattered all over the town. The Commissioners, however, arranged for seventy cars to go out; but, in view of the circumstances, proposed that they should be put out in the small hours of the morning. Of course, during the interval between our original difficulty and this, the No. 2 engine was kept going by a water-hose being kept continually playing on the low-pressure crank-pin. In order to satisfy themselves, the Works Department made a rheostat test during the previous afternoon with the water resistance, and, as I understand, they switched on 1,500 or 1,700 amperes; at all events, the load was stated to be 1,100 or 1,200 horse-power. In the tests subsequent to the original one we had only run to 200 or 300 amperes, with just a light load on the tramway; but on the occasion to which I have referred the switch was closed on the rheostat, and the current mentioned was obtained. The load was put on No. 1 engine, No. 2 engine was supplying the circulating and feed-pumps, both driven electrically, as you know, and at about a quarter of an hour after starting they had to stop in consequence of the low-pressure crank-pin on No. 1 engine seizing. The engine was at once stopped, and it was subsequently discovered that the high-pressure crank-pin of No. 1 engine was in a similar condition to the low-pressure one, and that the high-pressure crank-pin of No. 2 engine had also become badly heated.

The dynamos have given out the power they were expected to? Yes; they have not failed so far, but they have to give 25 per cent. over load for half an hour.

Over 850 K. W.? Yes; but I think they would not give it for that time.

Can you give the Board any general information as to the condition of the generators? I can only say that the delay was not due to any trouble on the part of the generators.

*Mr. Wallach*: Do you consider Garden Island a suitable place to store generators? I have no knowledge whatever of the conditions under which they were stored.

*Chairman*: But having regard to the saline atmosphere? Had I had charge of these machines myself, it is probable that, if there had been any saving in expense, and it could be done with no great difficulty, I should have stored them there myself and have made all arrangements I thought necessary to protect them from the damp atmosphere.

*Mr. Wallach*: With reference to the motors in the motor cars, have you had any trouble with them;—were they damp? Do you mean the particular motor cars here?

Yes? No, none whatever.

I suppose they were installed in the cars as soon as they were unpacked? Yes; they were all ready by the 1st September.

Have you applied any tests to these motors, in respect of their insulation? No.

None whatever? No.

*Chairman*: Do you intend to enter them into the traffic without applying any test? Yes.

Do you regard the break-down of a motor a very serious matter. No; that is a thing which can be remedied at once. We always give motors a few days' trial before putting into traffic, and generally find they do not break down.

There is no insulation test? No.

*Mr. Wallach*: How do you propose to carry out the test if definite instructions to make a high potential test; will it be made after the running with a full load or when they are quite cold? I should think it would be more advantageous to make the test while they are warm and dry.

You would not propose to do it when they are cold? No.

*Chairman*: Would you be satisfied with a 2,500 volt alternating current? Yes.

*Mr. Wallach*: How long are these high potential tests to be applied? I should be satisfied myself with a test of, say, a minute.

*Chairman*: You mentioned in your report that this high potential test should be adopted because of danger of lightning;—would the 5,000 volt alternating current be any guarantee that no damage would accrue if struck by lightning? The only strain they would be subjected to by lightning would be the strain which the lightning arrestors permitted. For instance, you might have lightning arrestors which would relieve anything over 2,000 volts, although, of course, in the case of lightning, one is subject to several conditions under certain circumstances. I do not mean to say that any insulation test you can put upon a dynamo would guarantee it as absolutely safe. No one can possibly tell what may come in the way of lightning. I have had lines repeatedly struck with lightning before anything could be done to rectify the damage to the arrestors, and the arrestor points have been burnt away. One is always to some extent at the mercy of lightning. There is no possible doubt about the voltage of lightning being about 5,000 volts. With lightning up to a certain point, you only make provision against anything you have reason to expect.

In other words, you do not really depend on the lightning arrestors? I do up to a point that I think would meet all the conditions likely to prevail in a place like Sydney.

Do

O. W. Brain.  
25 Oct., 1899.

O. W. Brain.  
25 Oct., 1899.

Do you mean the lightning would burn away the points in the arrestors? Yes; it may be possible that under certain circumstances a smaller charge may be more dangerous than a larger one, as the arrestor might discharge the latter, but not the former.

*Chairman*: Has an auxiliary pump been placed there as referred to in your report? It has been done, I believe, and is pretty well connected up by now.

The steam-pump? Yes.

That is the one you considered necessary? Yes.

Have you anything to do with the permanent-way? Practically, I have not.

But you have, of course, the overhead lines, feeders, connections, &c.? Yes.

Have you made any tests? We never do till we take them over.

Have you made any inspection of the loop at Circular Quay? Yes; I have made a general inspection of the line.

Have you any reason to anticipate that the curves are too sharp at Circular Quay? Do you mean so far as the rolling stock is concerned? If so, I would rather not express an opinion.

*Mr. Wallach*: Can you give the Board an idea when the rolling stock will be complete to take over the traffic? It was ready on the 1st September ultimo.

Are all the cars and everything complete for the George-street line? Yes.

In the test you made of the motor cars, did everything work right? Yes, absolutely so.

I mean the adjustment of the overhead wire and the trolleys? The overhead wire is anything but satisfactory.

Was there flashing at the rails? Yes; that was simply due to the dust and dirt on the car, which is a thing that always happens on new lines.

Were the cars loaded at all when the tests were made? No, not specially; it was not a test for loading.

In what respect is the overhead wire—the trolley wire—unsatisfactory? The trolley wire does not adhere to the wire, it keeps coming off.

That is not due to the wire itself, but to the conductor, is it not? It is in consequence of the location of the wire. It is of the greatest importance to locate the wire properly, and it requires experienced men for the work.

William Thow, M. Inst. C.E., Chief Mechanical Engineer, Railway Department, examined:—

W. Thow,  
M.I.C.E.  
25 Oct., 1899.

*Chairman*: You wrote a report, dated 11th September, in reference to the condition of the works at the Ultimo power-house;—do you consider the design of the plan satisfactory? I do not think I can give you any information about that. I have not criticised the drawings or anything connected with the plan.

Were you not associated with Mr. Deane in regard to the acceptance of the tenders? In the matter of the prices, that is all; it was simply the financial question.

Did you give any advice as to the type of engines to be used? No; that was not submitted to the Railway Commissioners or their officers in any way, so far as I know.

Can you give a description of the engines? They appear to be duplicating-engines, as far as I could see, and similar to those running the South-side Elevated Road in Chicago. I know they are engines of the same make and about the same size, at all events; they are similar in design, and are made by the same firm—the Edward P. Allis & Co. My reason for thinking so is that I noticed two sets of engines in Chicago, which are doing the crack services there—one the South-side Elevated, and the other the Metropolitan Elevated service. Both sets of engines are built by Allis & Co. The Metropolitan are vertical engines, of the steam-hammer or marine type, built upon cast-iron vertical frames.

They are 1,500 K.W. generators? Yes, I think they are not so much as that, but only about 800 or 900 K.W. generators. The South-side are horizontal engines, the same as ours.

That shows that they are good types of engines, and of the best kind used in America? I think they are very good.

Were the boilers manufactured in New South Wales? Yes, I believe so.

Do you approve of them? They are boilers that are likely to give very good results. I see no reason why good results cannot be obtained from them. Some people prefer the tubular types; but in some of the best installations to be seen in America the return flue-boiler is used.

By "tubular" you mean the water-tube type? Yes, the Badcock and Wilcock type.

Do you approve of the method of setting the boilers and connecting up the steam-pipes in this work? I think it is the usual method. My inspection of the power-house was not for the purpose of criticising the machinery or protesting in any way; it was simply to advise the Commissioners as to when they might take the running of the road into their own hands.

The Board would have liked to have had from you the other information? It would be unfair for me to criticise the machinery there unless I was thoroughly acquainted with the details.

Did you notice whether one or more boilers could be used without any inconvenience? I think you could do that.

Arrangements are generally made for that purpose? Yes.

Do you consider it necessary to have the coaling arrangements complete before the traffic can be commenced? No.

Are they at present complete? The understanding I had with Mr. Deane on that subject was this: That so far as the coaling arrangements were concerned, I did not consider that they would have to be complete before the Commissioners could work the road; but what I thought necessary was to make temporary arrangements—which has been done since the date of my report—for getting the coal down to the boilers, and the ashes up.

Is that working now? Yes; and I do not see any difficulty in getting sufficient coal to the boilers now, since these temporary arrangements were provided. It is only a question of putting on sufficient labour to work it.

It was merely a question of extra labour? Yes; extra labourers to work the temporary arrangements. I want to be quite clear on that point. The delay on the part of the Commissioners in taking  
over

over the engines and the power-house generally, has not been due to the mere incompleteness of the permanent coaling arrangements.

Are the arrangements for the boiler feed-pumps, and circulating pumps satisfactory so far as you know? These were not all put into position when I made my first visit of inspection, and when I made my report on 11th September, they were not complete.

W. Thow,  
M.I.C.E.  
25 Oct., 1899.

Was there a sufficient number on that occasion? No, there was not; that was one of the objections I raised to the condition of the plant.

Has a special feed-boiler been added since? There was only one pair of feed-pumps fixed instead of two pairs; there was only one in position, the other was not available for pumping water into the boilers. That provision I did not think sufficient. A second pair of pumps were subsequently put down, and at that time the circulating pumps were not in working order; they had no connection whatever with the condensers.

That connection has since been made, has it not? If it has, it has been done quite recently. I do not know whether they are working the condensers or not. I have not been there for the past few days to see. I think the engines are only worked as high-pressure engines. I do not think the condensers are at work yet.

And you are of opinion that that at least should be complete before the Commissioners take over the line? Yes, certainly; we do not know how they will work until the whole of the machinery has been tested.

The boiler feed-pumps are working by electric motors, and the electricity is generated by the main engines;—is that correct? Yes; that is the arrangement. Of course, when I speak of boiler feed-pumps, I confine myself simply to the mechanical features, and do not speak of the electrical efficiency. The pumps, as mechanical pumps, seem to me to be good serviceable machines. Whether it is wise to drive them by steam or electricity, I do not wish to discuss. If the pumps fail I should expect that they would do so in the electrical gear, and not in the mechanical gear.

Was it for that reason you asked for another Blake pump? I did not ask for it. It was Mr. Brain, I think, who expressed some doubt as to the efficiency of the electrical gear. All I did was to mention the matter to Mr. Deane, who seems to have thought it was a good thing to put down a steam pump as well.

Would you insist on the fly-wheels being turned up and balanced? No; I stated to Mr. Deane that although I should like to see them finished, I did not consider that essential, and, of course, I raised no objection to the Commissioners taking over the engines, or the power-house before the whole of the fly-wheels were turned up.

Do you consider it necessary to have the four engines complete before the traffic can be commenced? No, I should not think so; certainly two of them ought to be in a very reliable condition before the traffic is started. One great objection I raised to the condition of the power-house at the time of my reporting upon it, was the want of proper supports for steam pipes and exhaust and condenser pipes, also the feed pipes from the circulating pumps. At that time they were propped up on timber. That did not appear to me to be safe, owing to the liability of movement to break the joints. The liability is much greater when the supports are not sufficient, and there is a great danger from the bursting or breaking of any of the steam pipes of scalding men who may be in the tunnels.

Is it intended to support the pipes from the roof? Permanent supports have to be put in. Since I made my report they are in a more complete form, and most of the pipes are supported now on their permanent supports. I think there are a few yet to go in; but not many.

Are the headers which go into the engine-house from the boilers, and which are proposed to be supported from the roof, temporarily supported at present? I do not know. What I urged them to do was to put in all their permanent supports as quickly as they could.

Do you know that the engines have broken down on several occasions—that is, that the crank-pins have become hot, and the bearings also? I went to the power-house the morning after the engines stopped unexpectedly on Friday evening, and looked at the crank-pins and bearings. There appeared to have been considerable friction; but there was very little evidence of heat. I noticed the brasses were quite bright. It was not as though the brasses had got hot, for their appearance did not in any way indicate they had become heated. The white metal had been worn, and a small part run out. The crank-pins were bright, but there was no discolouration about them.

There was no very great heating? It could not have been anything great, as there was no appearance of any discolouration either on the crank-pins or the brasses.

Is there any likelihood of an accident owing to the crank-pins not being exactly parallel to the shaft? I had not heard of such a defect. The people who make the engines know what they are about; they are a very high-class firm. I was very pleased with the inspection of their premises. They are evidently men who have thoroughly studied the manufacture of such engines in great detail, and I do not think any such defect is likely unless the crank-pins are known to be out of truth, which I do not expect them to be.

Do you consider the defects which have developed in the engines any way serious? As far as I understand them, I do not think they are. I have not, of course, made any critical examination of the engines. It is not an unusual occurrence when engines are first started for bearings to become heated if a heavy load is put on suddenly. I should like to illustrate it in this way: If a locomotive-driver suddenly started a heavy load he would certainly fracture the couplings and the crank-pins, and bearings might heat. It is just the same with an engine as it would be with a crane. If you start a load on a crane with too great a suddenness you are sure to strain it, although the crane is quite powerful enough to lift the weight. Suddenness of application of load will always cause an injurious strain in a machine.

It seems that the defects are all in the engines so far;—what is your opinion? I think they got over the trouble with the generators—that is, their dampness—and as far as I know they have been running satisfactorily.

Could you inform the Board what is the cause of the delay at the present time in connection with the engines and generators;—is it the defects I have mentioned? It is the imperfect condition of the engines that is delaying it as far as I know at the present time.

*Mr. Wallach*: In ordinary traffic a load on the engine might be applied suddenly through a lot of cars starting at once, that would cause a great increase of weight on the engine? Yes; it would cause an increase

W. Thow,  
M.I.C.E.  
25 Oct., 1899.

increase of the load certainly. I do not think, however, it would cause such an increase as is said to have taken place in this case. I was informed—I cannot say whether it is correct—that the load ran up from 300 horse-power, to about 1,200 or 1,300 horse-power suddenly.

Would the same effect take place if the engines were suddenly unloaded? I do not expect that it would. You have another condition to consider,—these are new machines—everything about them is in a condition to get irritated; whereas with an engine at work for some time, it has its bearings worn to a smooth condition—each part fits the corresponding part well.

THURSDAY, 26 OCTOBER, 1899.

Present:—

PROFESSOR WARREN, CHAIRMAN.

PROFESSOR POLLOCK,

MR. WALLACH.

William George Toop Goodman, Assistant Electrical Engineer, Railway Construction Branch, examined:—

W. G. T.  
Goodman.  
26 Oct., 1899.

*Chairman:* Referring to the insulation of the generators in connection with the George and Harris Streets Electric Tramway, will you be good enough to inform the Board what resistance you actually got when you made the tests? When I first started with the No. 1 generator I made a test of the insulation resistance, and found that it was only about 700 ohms, at which it would not be safe to run.

Where did you find that? On the armature, series fields, and the shunt fields.

On all of them? Yes; the shunt fields were very bad. I found practically the same on No. 2 engine.

Both the series and the shunt fields? Yes; they were all very low—in fact owing to their being so low I did not take the measurement accurately.

Were the armatures at 700 ohms? One of them was—that on No. 1 engine.

*Mr. Wallach:* When you took the measurements, did you take them separately—that is, the armature disconnected from the series coils? Yes; I would explain that at first I took them all together, after which I took them separately. As a matter of fact I tested each field coil separately. I found leakage in all of them.

Is No. 1 generator the one which it is said was standing in water? Yes. No. 1 was the worst of the lot.

It stood in the water some considerable time? Yes.

How did the water accumulate there;—was it owing to the roof not being on the building? Yes.

*Chairman:* You say that No. 1 was the worst when you made the test? Yes. No. 1 was started nearly a week before we started No. 2—that was on the 1st September—and yet I was able to build up No. 2 on the coltage before No. 1.

No. 2 built up the best? Yes. I was able to build it up a week before the other. No. 2 took really a fortnight less to dry out than No. 1.

Have you made a test of any of the others? Yes; Nos. 3 and 4. I may mention that I cannot dry out No. 4 as I am turning up the fly-wheel. I partially dried out the series fields of No. 4 by circuiting the other machines through it. I have been unable to do anything to the armature.

Is that because you are turning the fly-wheel? Yes. Nos. 1, 2, and 3 are all ready for running, and have been built up.

And what test can be obtained from these three now? When I finished with No. 1 the insulation between the armature and the frame was 2.65 megohms, between the series field and frame 1 megohm, and between the shunt fields and frame about  $\frac{3}{4}$  megohm.

Do you consider that resistance satisfactory? Do you mean for running?

Yes? I think so. It is much easier to dry out armatures than series fields or shunt fields. The shunt fields take the longest time, owing to the wire which is wound so closely around them. After they had commenced to dry, the test I obtained was worse than before they started to dry, which I concluded was due to sending the moisture from the inside of the spool to the outside. I used a small 100 volt machine to dry them out, which we borrowed for the purpose, and I coupled the shunt fields—two in each series—so as to get the working current through each coil.

What did you get when you tested No. 2? The armature went up to 2 megohms, the series fields 1 megohm, and the shunt field  $\frac{1}{2}$  megohm. I considered  $\frac{1}{2}$  megohm for the shunt field good enough to start with.

And what did you obtain from No. 3? The armature went 3 megohms, the series field 1 megohm, and the shunt field  $\frac{3}{4}$  megohm.

The shunt field of No. 2 was the lowest? Yes; but it is better now, since it has been running. The results of the tests which I am now giving the Board were taken before the machines were built up to voltage.

Were they the final tests? Yes; they improve each day, according to the running.

Have you any figures to submit to the Board? No. I might add that there is a slight improvement on the shunt field of No. 2.

Could you explain to the Board how you made the tests? I will hand you a drawing, which will show the methods adopted.

Do you consider that the machines are now in good order? Three of them are.

The fourth is not in good order, owing to the fly-wheel not being turned up, and not being yet dry against water resistance? Yes.

Have you finished drying them? Yes.

You are not going to touch them again? No.

You are going to depend on the improvement they will get from being in working condition? Yes.

You have every reason to believe that they will improve? Yes. While they are remaining idle they will get worse. No. 1 has been now standing idle a fortnight, and before I could start it again I shall have to make another test. I have no fear as regards their proper working. All machines of their kind absorb moisture when standing.

As

As soon as the tramway commences running, do you think there would be any objection to taking an insulation test of 2,500 volts alternating current? If the machines improve when constantly at work it would not be necessary to take the test.

Do you mean that when the machines have been at work for, say, a week, with a full load, the test might then be applied? Yes. If the machines were run for a week, with a full load, I would be agreeable to taking a 5,000 volts test.

You are of opinion that the wetting which they received will do no permanent injury? No.

Anything like that will be overcome in future? Yes.

Did you not make a trial yesterday? Yes; we built up No. 2 for the purpose.

Was the trial satisfactory? Yes.

The engine worked well? Yes. On Tuesday we ran the engine from 10:20 a.m. till 12 o'clock at night without any loading. The machine was built up to the voltage. After running the trial trip when the Governor was present, we put a load on gradually increasing from 100 amperes to 500 amperes.

When putting the load on, was it done gradually or suddenly? Gradually. The machines have to stand a sudden load test before we finally accept them.

Is that when the brasses are well worn off? No. When I first closed the switch I got about 100 amperes, and it gradually increased by increments of 50 amperes up to 700 amperes, when the crank-pin became too hot to run.

Have you taken notice of the snap switches on the shunt field coils? Yes.

Have you made any calculation of what voltage you are likely to get by suddenly creaking that circuit? No, I have not. It simply depends upon the exact working conditions at the time.

Does it break on a sudden test? The shunt is simply short circuited through a resistance.

*Mr. Wallach*: Are there any snap switches used in the shunt field coils? No, none.

When you were drying out the field coils, did you use snap switches or did you connect up with snap switches? I just connected up to the switch you saw on the board.

That was a snap switch? Yes.

In drying out the field coils in every generator you used snap switches? Yes; as a matter of fact I never break the circuit.

You never shut out with the switch? No.

You do not cut out the current passing through the field coils with the snap switch? No.

Regarding the storage of the generators, do you consider Garden Island a suitable place to store them? Yes.

Have the generators which were stored there given any different results to those taken on the railway trucks? They are rather better. The armatures are all very much the same. No. 1 was the worst on account of its partial immersion in water.

How do you account for the low resistance in the shunt fields? Only that we have had a rather severe winter, and they naturally absorb the moisture from the atmosphere.

*Chairman*: That is really how you account for it? The enormous number of turns on the shunt-fields make them difficult to dry out, and necessarily longer than it takes to dry out the armatures and series-field. It is probable that after they are running on the line awhile they will come up to the same insulation resistance.

Do you mean that both the shunt field and the series field will dry out until they show about three megohms? Yes.

*Mr. Wallach*: There being no roof to cover the machines, was everything possible done to protect them? Yes.

Were the spools also in pools of water? No.

*Chairman*: How do you account for the excessive damage which was done to them? The moisture of the atmosphere simply soaks into the insulation, and they were in this condition for two or three months, notwithstanding that they were covered up.

Were they unpacked and left standing before preparations were made to build up the generators? They were taken out of the cases and put straight in their place; everything was kept packed till the last moment. I may say that I was never in favour of the erection starting before the roof was on.

*Mr. Wallach*: Have you made any comparative tests on the generators—that is, when they were cold, and immediately after they had been running? Yes; the tests are better when they are cold than those obtained after running.

Could you give the Board an idea of the results you obtained? When I first started drying out the shunt field coils, I stopped the small machine and made a test, with very poor results. That I attributed to the moisture I spoke of being driven out. I then changed to another machine, one that had been standing for some time, and which was quite cold, and I got a much better test.

Then the lowest test was obtained from a generator that had been running for some time? Yes.

Did you eventually get the same results? Yes, I kept on drying them till I did.

And the tests you got were obtained by simply drying the moisture out? Yes.

*Chairman*: What is the resistance of the rails? I could not say at present; I will get you the information.

*Mr. Wallach*: Are the overhead conductors properly adjusted for traffic purposes? Yes, if you mean as far as the feed-points are concerned.

I mean the overhead conductors complete? I cannot say. I have nothing to do with them beyond the feed-points.

Are the feeders ready for work? They are not quite ready; they are now in course of completion.

Are they all completed up to the trolley wires? Yes, they were finished this morning.

In your opinion there is nothing to prevent the work of traffic being commenced immediately on the line—the whole defect being in the power-house? Yes. So far as the outside portion is concerned the line was ready for traffic three weeks ago with certain temporary connection made, which could have been permanently established by this.

Did you notice, in the trial trips you made, if the trolleys jumped from the overhead wire, or did anything happen that would lead you to suspect they were not properly adjusted? I have nothing to do with the overhead wire at all, but I know that the location of the frogs and crossings were tested.

W. G. T.  
Goodman.

26 Oct., 1899.

FRIDAY, 27 OCTOBER, 1899.

Present:—

PROFESSOR WARREN (CHAIRMAN).  
 PROFESSOR POLLOCK, | B. WALLACH, Esq.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, further examined:—

H. Deane.  
 27 Oct., 1899.

*Chairman*: Can you give the Board any further information which would lead you to suppose was the cause of the delay in running the tramway? Since I was last before the Board I have been informed that the crank-pins are not at right angles to the disc—that is to say, they are not parallel to the main shaft. Mr. Libby, the engineer for the E. P. Allis Manufacturing Company, who is in charge of the erection of the machinery for that company, yesterday took most careful measurements, which I understand have been checked by Mr. Fischer, Principal Assistant Engineer, and others. These measurements show that the crank-pins of No. 1 engine are out of line, and as the discs of all the engines were all bored by the same machine at the works, it is only reasonable to conclude that the other crank-pins of the engines will be in the same condition.

Then the cause of the delay during the past fortnight is entirely due to the state of the engines? Yes; the crank-pins began to run hot this day fortnight when an attempt was made to put the test load on. I am informed that up to 500 and 700 horse-power there was no heating.

When was the building supposed to have been completed? At the end of December last year. In the completion of contracts of this kind it is the custom of the Department to be fairly liberal—that is to say, we are, as a rule, satisfied if the building is completed for all practical purposes by the time specified; we are not so particular about the finishing touches being done within the contract time if satisfactory reasons can be produced for delay.

You would be satisfied if it was completed sufficiently for the work to be carried on? Yes.

Supposing that the buildings were completed by the date specified, would the Commissioners have been ready with their rolling stock? I was informed that they would not have been. I know there was a delay in getting some of the parts out—I think it was the trucks from America.

Is the loop at Circular Quay quite complete now? Yes.

Have some switches and other parts been made at Cockatoo Island? Yes; the work has been finished some time.

Is the permanent-way all through complete for traffic? Yes. I may say that the Railway Commissioners asked for an alteration from the original plan at the Circular Quay loop in November last year; the original plan simply showed a plain loop with two roads, but they asked for an alteration showing a third road with two or three cross-overs. I had pointed out to the Commissioners that they could not do all the shunting required when they came to running trams to the various suburbs, unless some such arrangement were adopted for passing the cars and getting them into proper order. It would be inconvenient for the whole of the cars to go out in the same order in which they came in; some of the cars would have to wait while others passed. After considering the matter the Commissioners asked me to lay out the loop and put in these roads as suggested. The plan furnished by the Commissioners showed the roads rather close together, and I then suggested that we should make them about 2 feet further apart, so as to allow of a man standing between them when shunting. They agreed to that, and I sent them a plan showing exactly what I thought they wanted, and they sent it back approved. The loop was laid and contained the crossings in accordance with the plan. Some time ago we took a single car down the line with horses, there being no current on at the time. Everything went well, though not too well, and as motors and trail cars coupled were to be used we afterwards tried the coupled cars, but the results were not satisfactory.

Was that due to the transition curve? Yes, partly. I found it had been cut out; and it was partly due to the cross-overs being rather short, and partly to the construction of the cars, which just seemed, theoretically, to permit the cars to run round. The rails had been laid, however, exactly according to the plan approved by the Railway Commissioners. I was asked to alter them and to ease the curves, which I have done. I might say that it is not an uncommon thing to find difficulty at first in getting cars, and especially coupled cars, round sharp curves.

And more especially when you have short radius? Yes; there is no doubt that this radius is a very short one; it was adopted deliberately after consultation with the Traffic Branch. It is very short and we could not make it any larger because there is no room. The loop also at the Railway Station is very much about the same radius, and it is recognised to be inconveniently small.

I suppose you could not do better? No; we could not do better there. At the end of the tramline to Cook's River, however, which I am going to construct shortly, I have been asked by the Railway Commissioners to enlarge the radius from 70 links to a chain, which will certainly be an improvement.

Orlando William Brain, Acting Electrical Engineer, Railway Department, further examined:—

O. W. Brain.  
 27 Oct., 1899.

*Chairman*: Could you inform the Board if the Railway Commissioners would have been ready with their rolling-stock if the power-house were completed in the time specified in the contract? The Commissioners I know have been very considerably guided in their movements by the progress in the construction of the power-house, and had the power-house been ready they would have made arrangements altogether different to what they did make. They would have, no doubt, made arrangements to have had the cars ready.

The cars were all ready, I understand, on the 1st September of this year? Yes; and they could have been got ready much earlier.

Four sets of engines and four generators have been ordered and put down; I presume that is as much power as you will require for some time; I understand from the evidence given by Mr. Deane, Engineer-in-Chief of the Railway Construction Branch, that the late Chief Commissioner for Railways (Mr. Eddy),

(Mr. Eddy), the late Mr. Elwell, and Professor Forbes, all agreed to the desirability of putting four sets of engines in, having regard to future requirements, notwithstanding the fact that they would not require to use at the present time more than two sets of engines? We hope to start the Dulwich Hill electric tramway with forty more double-truck cars at the end of January, and within fifteen months hence we hope to have 150 eight-wheel cars running in addition to those which will be used on the George-street tramway. What the Commissioners propose to do immediately the George-street line is working traffic is to convert the whole of the steam service trams to an electric service with as little delay as possible.

O. W. Brain.  
27 Oct., 1899.

That, of course, will only necessitate the erection of poles, making the bonds, and so forth? Yes, for the present. Additional machinery will ultimately be required.

Have you not already done considerable bonding in anticipation of the conversion you speak of, from steam to electricity? Yes; a few miles have already been done. Advantage was taken of the opportunity in dealing with the permanent-way to some extent, and we consequently found it more economical to do the bonding possible at once.

Is there a great deal to be done before you can open up the Dulwich Hill line? No; not more than we anticipate being finished by the end of January. The Commissioners have not bound themselves to any particular time for the completion of the work.

Have you any other information you wish to give the Board? When I was previously before the Board I was asked a question as to what guided me in taking any particular voltage as desirable for a high potential test, and, in answer to that, I pointed out that you might fix the lightning arresters to meet any strain above 2,000 volts, and that you cannot guarantee absolute safety with any insulation test, as your arrester points might be burnt away by lightning. If the arrester points are very much burnt away there is nothing to relieve the potential. In making that explanation I intended to point out that it is the general practice of the General Electric Company to fix their arresters with an air-gap of a fortieth of an inch, which, of course, would only break down with something over 2,000 volts potential. When the line becomes charged, in consequence of lightning to the potential corresponding to the air-gap in the arrester, the lightning is discharged, but until it reaches that potential the lightning arrester gives no relief.

Do you mean that your machine may be exposed to 2,000 volts? I mean that until the potential reaches that degree, if the lightning arresters are adjusted for an air-gap which requires a voltage exceeding 2,000, your machine would, of course, be subjected to 2,000 volts before the lightning arrester could relieve the strain; while our arresters are being fixed at the fortieth of an inch, which is something over 2,000 volts, I take the 2,000 volts as being the voltage to which our machines might be subjected in the event of a storm. If they were subjected to a strain the arresters would not relieve it until the potential corresponding to the air-gap was reached. When the Railway Commissioners asked me to explain what potential it was reasonable to assume the machines might be subjected to in practice, I stated that it might fairly be put at 2,000 volts, which accounts for their claim that 2,500 volts would be required to give a margin above the number I had stated. I was not in any way actuated by a wish to over-state the high potential test desirable, and in asking for 5,000 volts I stated all along that we were influenced only by the fact that we had been given to understand the General Electric Company were supplying machines which would stand that test, and as you know, the higher the test the better the security.

How long would any test up to 2,500 be required to last? As I previously stated, I should be satisfied with a test of one minute.

And the test you finally agreed upon is just what may have to be experienced in a thunder-storm? Yes; it is just clear of the lowest limit. In considering risks from lightning you must take into consideration the district the work is in. For instance, in a place like Sydney you would not expect to get the charges on your line to follow one another rapidly; consequently no allowance was made in anticipation of lightning arresters becoming injured during a storm. It was not supposed that a high potential test suggested provided anything materially above what the lightning arresters would permit the machines to be subjected to when they are in good order. I have also been asked whether these high potential tests have been made here.

When you were asked that question the Board wished to know if it is a usual thing to make them at the works or in the power-house? One important point bearing upon that is that the General Electric Company make alternators specially for testing purposes—which they offered to us—from which they do not seem disinclined to subject their machinery to a high potential test. So far as the practice here is concerned one would consider, in making the test, the importance of the conditions. We have never before put machines down on which so much responsibility rested, as in the case of the whole of these machines. So far as my own personal experience goes, that was the practice I had followed in connection with the machines I had to do with up at Hillgrove. I tested them to 4,400 volts. I was then, of course, the manufacturer's engineer, and I was not going to test them more than I thought absolutely necessary for our working conditions. They were 1,600 volt machines.

Were they the machines which Professor Threlfall had to do with? Yes. I may say that after we had lightning discharges and rewound them, I always submitted them to 2,000 volts; that is a very fair margin for working conditions. The 2,200 alternating volts was the test I made simply as the manufacturer's engineer, and was done merely to satisfy myself that everything was all right. In this case I went beyond my usual practice for two reasons. I had an alternating plant there, and took advantage of the opportunity. It was also a matter of more than usual importance, and the firm whose representative I was at the time were under a penalty for stoppages.

Have you been in the service of the Railway Department long? A little over three years.

*Mr. Wallach*: Do I understand you to say that the machines to which you referred were 1,600 volts, and were tested to 4,400 alternators, and that now you propose to test 550 volts machine to 5,000 volts? In the latter instance I accepted a test offered by the manufacturers. It is not an impossible test; machines can be built to work at 5,000 volts when necessary.

Would a machine of 65 volts permit of alternating up to 2,000 volts insulation test? You would probably use your lightning arresters for discharging at a lower potential. Another thing is that a low voltage machine connected on two aerial lines never is particularly safe when lightning is prevalent.

O. W. Brain.  
27 Oct., 1899.

I take it, then, that a low potential machine like a 65-volts machine would catch a 2,000 volts discharge? Do you mean if the points of the arresters are burnt away?

Then you would test a 65-volts up to 2,000 volts? Yes; if it were likely to be subjected to such conditions, the machine would be safer if it would pass this test between copper and earth.

Would you do that as a general practice? I do not think that the ordinary machine would stand it without the base being insulated.

*Chairman*: Is there anything else you would like to explain? With reference to the building up of the machines, I stated in my remarks, when previously before the Board, that an insulation test could not be taken without the machine being built up; it would not necessarily require the armature in the field to take the insulation test. The connection from the armature to the base would be through the shaft, and you could test the armature as it stood in position, and if the field-coils were built up on to the fields you could test the field-coils practically under working conditions for your insulation test. On the other hand—as I remarked the other day—the important test; that is between the series and shunt winding, was not mentioned as having been taken. That test I attach a good deal of importance to, because it is the regular practice in these street railway machines to put the series windings on to the positive brush, and the series is wound over or alongside the shunt winding, which is already earthed. You, therefore, subject the insulation between the two windings to practically the whole voltage of the machine.

Is there any test made here in that way? There has been no alternating test taken here up to the present. They are not in a position to do it.

A direct current is merely sent through? Yes, that is all; they have warmed them up and dried the machines.

Have they now got the alternating plant here? Yes; it is somewhere in Sydney, but I cannot say exactly where.

The 2,500 volts is not so great, is it, as to require a transformer? I should like to say that an alternator has been imported from Victoria, and I think they would probably transform down and put a rheostat in the secondary circuit, and connect on another transformer and transform up again. I was asked as to whether I had any objection to bringing the voltage up slowly. I stated I had no objection if it would stand 2,500 volts brought up slowly.

Were these tests to be made? Yes; I asked the manufacturers if they objected to have it tested, and whether they would allow any margin at all, but they did not think it advisable to say so.

*Professor Pollock*: Would they not give you an answer to that question? No. Mr. Raymond, the manufacturer's representative, said that if the machines were dry they would submit them to a 2,000 or 25,000 volts test. I reported that to the Railway Commissioners, but what the Commissioners wanted was to get the machines dry, and this was the way to do it. I may say that Mr. Raymond has been with the manufacturers a long while, and he is very intimately acquainted with their work. He, therefore, speaks with a good deal of care, and knows what he is talking about.

*Chairman*: Is there anything else you wish to refer to? Something was said, when I was last before the Board, about the series winding—that is the effect of the series winding in the way of increasing the voltage to which the machine was subjected. I was asked if I had formed any idea of what that voltage was. In mentioning that the working voltage of a machine is considerably lower than the voltage to which the machine is subjected when the circuit breaker is opened, owing to the series winding, I should like to explain that this series winding is invariably connected with the positive brush of the machine, so that the extra potential due to the series winding being in the same direction as the voltage of the machine, must necessarily augment it, the series windings of the machines, being such that the rise of voltage is 10 per cent. between no load and a full nominal load, and the circuit breakers being set to act at least 50 per cent. above the full nominal current, the increase of potential must be very considerable. The turns on the field are numerous, and the magnetic blow out on the breaker makes a very sharp break. In the matter of the flashing test, I would like to point out that in the load test I particularly attached importance to the flashing, because, while the machines might possibly carry a load without exceeding the specified increase of temperature, it is still possible for machines of this class and voltage, when subjected to excessive strains—more particularly due to the distortion of the magnetic conditions—to do what we call “bucking”; and a very slight displacement of the brush from its right position will cause our machines to do that. In such a case one would have to be very careful. It is very important that you should not have the circuit breakers set at such a current, as the distortion of the field from the fact of its going from no amperes up to this current might cause “bucking.” It is not unusual to experience this, particularly if the machines are not too well designed. In that case, if you have anything like sudden changes from one current to the other, and do not follow it with the brushes, it will arc right across from brush to brush.

It would burn the commutator? Yes; and the resulting reports would be very disconcerting to the people employed about the works. We know that, the specified current for these machines—from information received from various sources—is the outside current that one could expect from them, and consequently it is important that the Railway Commissioners should know what the machines can really do.

You will make that test before the Railway Commissioners take them over? Yes; I should also like to say that the reason the rheostat test is considered important is that the Public Works Department have suggested that the test should be what is considered a working load. A rule-of-thumb test of 20 amperes per tram was suggested as a fair current to test the machines to. I, personally should not be surprised to see something very close to 40 amperes per tram.

*Mr. Wallach*: What are the horse-powers of the motors? Thirty-five horse-power. We have a motor-car that weighs about 8 tons complete, and which drags a trailer weighing  $5\frac{1}{2}$  tons. As many as ninety persons can be carried on one of these cars.

*Chairman*: Are they anything like the cars on the Rose Bay tramway? Yes; like the large-size ones.

Have you anything further to explain? The fact of complying with the current conditions in the flashing test without excessive heat does not enable one to tell if the machine is going to “buck,” as it is termed, which it is apt to do in making a sudden drop from one current to another; and as the Commissioners are reckoning upon these machines to work specified loads, I attach a great deal of importance to this flashing test.

MONDAY, 29 OCTOBER, 1899.

Daniel Stewart, trading as "J. Stewart & Co.," Government contractor, examined:—

*Chairman*: You were the contractor for the building in connection with the power-house of the electric tramway at Ultimo, which includes the office buildings for the electric generators, &c.? Yes.

D. Stewart.  
29 Oct., 1899.

Your tender was accepted on the 30th June, 1898, was it not? Yes.

The date fixed for the completion of your contract in accordance with the drawings and specification was 29th December, 1899? Yes; twenty-six weeks from the date of acceptance.

Do you consider there was ample time for the completion of the contract? No, there was not.

Yet you undertook the work to be finished in the time specified? Yes; but I got an extension of four months.

Would you kindly tell the Board why you were not able to complete the contract in the time originally agreed upon? I may say that when I started the work I did not expect to be able to complete it in the time, not without a lot of luck. The foundations were to be 2 feet below the floor-level—that is, the foundation for the engine; in fact, the whole of the foundations for the work we show on the plans to be 2 feet below the nearest floor-level; but instead of going down 2 feet we had to go down on an average 14 feet for the engine foundations.

Is that in consequence of the foundation at 2 feet not being considered good enough? Yes; and the excavation necessary for the foundation of the four engines involved the removal of 1,300 cubic yards of material and 1,300 yards of concrete being done.

How long did it take you to put in the foundation? We started that particular work on 8th September, and the foundations were not completed until 13th March, 1899.

Three months after contract time? Yes.

How long would you have taken if the foundations were as shown on the drawing, only 2 feet below the level? We could have completed that easily in the contract time.

That is, as far as the foundations were concerned? Yes. There was an enormous amount of work to be carried out under the schedule in that contract. This work, of course, could not well have been foreseen by the Department, and, as I said, the excavation, and also the converting, involved a considerable amount of work. These foundations could not be put down very rapidly, because they had to be very carefully timbered, and about forty bolt holes had to be put in each foundation. The bolts go right through the foundations, and if these holes are not properly put in, we could not get the plates on. We therefore had to use very great care, and had to work the foundations one at a time.

Is there anything else you would like to mention to the Board in respect of delays on that point? The trenches are shown to be down on an average of 2 feet, but had to be excavated considerably deeper.

Were the foundations all for the engines, or were there any for the walls? I estimated about 1,100 yards additional excavation for the main walls, over and above what is shown on the plans, and the quantity of brickwork corresponding to the excavation had to be put in to come up to the level.

Would not that be put in in concrete? No; we put in brickwork in a good many cases.

In the work under-ground? Yes; my schedule prices were about the same for both items. The Department selected the brickwork in preference to concrete for the walls. The foundations were of solid rock, and were considered most satisfactory. Before we started to erect the roof, we received an order for a separate contract to put up the electric travelling cranes. That order was given on 14th June. It was a difficult job, and involved a considerable amount of delay. It was impossible for us to erect the roof while we were engaged in this work. We erected the travelling cranes to enable the engineers to proceed with the fixing up of their engines.

Could you not have ordered the material for the roof in the meantime? It was all ready.

Was it all delivered? Yes. I might say that that work—that is, erecting crane girders—requiring a certain amount of time, absolutely blocked all the other work in connection with the building from being proceeded with. The principle object was to facilitate the work of the engineers. There is another item in a separate contract amounting to £453 to which I should like to refer.

What was that for? That was for making a tunnel through the centre of the building to William-Henry Street. I mean the main conduit.

Was that not included in your main contract? No; that created a certain amount of delay also.

*Mr. Wallach*: How long did it take you to finish it? About three months. We had to tunnel under the bridge and come up in the street.

*Chairman*: Was the conduit to which you refer for putting in the cable? Yes; it goes right through the building.

Is there anything else? There are some other items of work, such as the tiling of the engine-house floor, &c., which have been considerably delayed owing to the fixing of the machinery; in fact, the floor was quite strewn with materials, and it was impossible to get at it. The basement floor could not be proceeded with until recently owing to the steam-piping not having been completed. The Department have been doing that work themselves—that is, the main basement, the lowest floor of all.

How long do you consider that retarded your work? Our work should have been finished months ago if we could have got at it.

Is there anything else you would like to refer to? Yes; I should like to refer to the erection of the switch-board gallery.

That was extra, was it? No, it was not extra; but I had to write to the Department on that matter. The delay in its construction was also due to fixing up the machinery. The people erecting the machinery had to use a very large hydraulic press. They had to fix it up on the floor, and the result was that it blocked the whole of that portion of the work.

It seems that you got in the way of each other? Yes; we have had to work one to suit the other. My instructions all through were not to interfere with the machinery people, but to facilitate their work as much as possible. There is also the boiler contract, which was a separate contract.

That was a contract accepted on 30th January for £7,135? Yes; the date fixed for the completion was 20th June. I should like to say in regard to that contract that I could see my way to very easily

complete

D. Stewart. complete it in the time, although it was a big piece of work, but the boiler-fitting was specified to be made by Messrs. Dewrance & Co., London. They were not obtainable in the Colony, and, therefore, had to be imported.  
 29 Oct., 1899.

Had all the boiler-fittings and mountings to be imported from London? Yes.

Is that contract yet complete? Yes.

Have you completed the setting-in of the fourteen boilers? Yes; the only things incomplete in connection with the boiler are two of the fronts which were left down, under instructions from the Department.

Are you lining the conduit to take away the ashes with brickwork? That work is being executed under schedule, and is not included in the contract. The principal delay in connection with the boilers has been the fittings to which I have referred, and also the cast-iron floor-plates and tracks.

They are all in connection with the Hunt's coaling system? Yes. Fortunately the agents for these fittings looked well ahead, and if the plans for the Hunt machinery had not been sent Home before the contract was let I do not think we would have had the material yet.

Did that enable them to reach here in time? No, we hardly expected it. The contract was only let in January. Then the fixing of the boilers had to be worked in conjunction with the steam-piping, which latter is a work also being carried out by the Department, and which required an additional amount of excavation, brickwork, and concrete. There were about £700 worth of additional work.

Where was that work effected? Principally under boilers, in consequence of the bad nature of the ground. I think it will therefore appear very reasonable for me to claim the additional time occupied in connection with this additional work. That is all I have to say about the boilers.

I take it that you received the boilers in good time? Yes; they were made locally, by Messrs. Hoskins Bros.

Do you also consider there was ample time allowed for the completion of your contract? Yes, for the boiler contract. As far as the boilers were concerned we were finished in good time. I had necessarily to go a bit slow on account of the steam-piping. The Department had to check my progress with the boilers to enable their piping to be worked at the same time. There has, however, been one set of boilers ready since about the end of July; in fact, I think earlier than that.

Were you made aware of the necessity of completing the roof for the generators, &c., as quickly as possible? Yes.

Were you aware that damage to the generators might result from the delay? Yes.

You then applied for four months' extension of time? Yes.

Was it granted? Yes.

That would extend the date of your contract up to the 29th April, 1899? Yes.

Did you sublet the iron for the roof work to Messrs. Tulloch & Co.? Yes; I sublet the two iron roofs, on the authority of the Government.

Did that include the order for the rolled sections? It included less than half of the material necessary for the work. I imported all the girder plates and the joists through the agency of Messrs. Briscoe, Drysdale, and Co.

You ordered them yourself? Yes; the other portion of the contract was handed over to Messrs. Tulloch & Co.

Did you say you had the authority of the Government to sublet the work? Yes; I have the Minister's approval in writing.

When did the material arrive which you ordered through Briscoe, Drysdale, & Co.? The first lot arrived in November; that is the lot to which you refer.

How long was it before the whole of the material arrived? I may say that the portion sublet to Messrs. Tulloch & Co. was the most important part of the work. That order was placed with Messrs. R. W. Cameron & Co., who are agents for large manufacturers in America. The first shipment was received on 14th January, or within six months after placing the order; the balance arrived in three other shipments; and the whole of it, with the exception of the principal T rafters, arrived during the month of January.

I presume the T rafters arrived in the month of March? Yes. There was tremendous difficulty in procuring them. They had to be specially rolled, and the difficulty was the unusual sections for these T rafters.

Did you only complain of the unusual sections in the T rafters, and not of any other section? It was a very difficult order altogether. There were no less than twenty-eight different sections of material in these two small roofs, and being less than 100 tons in weight, of different sizes, and such a small parcel, and most of it requiring to be specially rolled, manufacturers had some reluctance in executing the order.

Do you mean that for such small quantities there were a large number of sections? Yes; there were very few obtainable in stock, and a glance at the sizes will show that they were altogether irregular.

The Department claim they are the usual sizes, and that they can be found in any manufacturer's ordinary catalogue? What I have stated as to the irregularity in sizes is the opinion they have in America. Personally I may say that we must have spent £30 and £40 in cables in connection with fulfilling the order.

Did you send to America for them? Yes; also to England. The English people would not take the order for the T irons.

*Mr. Wallach*: Were you not informed by the Department that if you had any difficulty in getting the sections specified, that you might apply to them to have the sizes altered? Yes; but the information came too late. We had gone on preparing everything that we possibly could when we got the balance of the ironwork, and had a short time to put it together. The roof of the engine-house was covered in, and the lining of the ceiling completed on 17th July, 1899. That finished the building for all practical purposes.

*Chairman*: So that the engines were being erected, while you were putting on the roof? Yes; as soon as I had the electric traveller in position, they started working straight away.

And the roof was still being proceeded with? Yes; the work of erection was being proceeded with by placing in position one side of the building at a time, so as not to interfere with the work in connection with the machinery. Had we been allowed to erect the roof over the whole building at the

one

one time, we could have completed it a fortnight earlier, and this I pointed out to the Department. The whole of the roofs were, however, erected by the end of May, so that it was a very short time after we got the material till the work was completed. D. Stewart.  
29 Oct., 1893.

*Mr. Wallack* : You say that the roof of the engine-house was finished on 17th July? Yes; the lining of the ceilings I may mention was a very difficult task.

May we conclude from that, that in May all the building was covered in? The roof was commenced during the end of April, and the whole was completed by the end of May.

The building was completely roofed in? Yes; it was finished, as I say, by the end of May.

*Chairman* : Could you inform the Board on what date it was really covered in sufficiently to protect the machinery from the weather? About a fortnight before the time I mentioned as the date of its completion.

*Professor Pollock* : When was the erection of the machinery actually commenced? About the end of January, 1899.

*Chairman* : Where were the electric travellers made? They were made in America.

Could you state where the rolled girders were used, which you obtained through Messrs. Briscoe, Drysdale? They were used in the offices; I suppose nearly 100 tons of ironwork were used in the offices. To show you the difficulty we had in obtaining the plates, I will quote from a letter I received from the manufacturers' agents (Briscoe, Drysdale), dated 16th January, which is as follows:—

In reply to your inquiry as to the cause of delay of the delivery of steel girders, which we undertook to indent for you in July last, we beg to say that our London friends have advised us that, owing to the very heavy demand for steel materials, both from England and on the Continent, being made for some time past from the manufacturers, they have experienced the greatest difficulty in obtaining anything like prompt delivery, unless the sections required chance to be in stock the time the order was received. In the case of your indent, unfortunately, most of the sections ordered, it was found necessary to get rolled, with the result that they were compelled to wait the manufacturer's opportunity to put in the required rolls before obtaining delivery. Of course you will understand that where small quantities of any particular section were required, it would be most difficult to induce makers, under these conditions, to change their rolls in anything like decent time.

That letter was written upon a complaint I made of the delay in delivering the plates.

Where did you say those girders are used? In the offices. I may say that when I applied for the extension of time to the Department the letter which I wrote gave full information; it was dated 17th January, 1899, and was addressed to the Engineer-in-Chief for Railways. It read as follows:—

In connection with our application of 10th January, applying for four months' extension of time for the erection of power-house at Ultimo, we have the honor to inform you that the first shipment of ironwork, ex s.s. "Falls of Keltic," has arrived in Sydney, and we are now getting delivery of the material. In this consignment, we have sufficient material to complete the engine-house roof—

We found out afterwards we were short of the engine-irons—

which work will be at once proceeded with. With the object of procuring the ironwork in the shortest possible time, we placed the orders for the steel girders and plates with Messrs. Briscoe, Drysdale, & Co.; the angle-bars, rods, and T iron with Messrs. R. W. Cameron & Co., who represent large manufacturers in New York, and who arranged with us to cable for the ironwork, and to have it shipped by steamer the earliest possible date.

I made these arrangements with Messrs. Tulloch & Co., and I particularly went with them to Messrs. Cameron & Co. to see that the order was placed.

Have you the date on which the orders were placed? Yes; I will give it later on. We quote extracts from a report received from Messrs. Cameron & Co., who stated in reply to our complaints of the delay in receiving the ironwork, as follows:—

We regret extremely that any delay should have occurred in the execution of this order, but we can assure you that our New York house have done everything in their power to expedite the same, and from correspondence received we are certain that our New York house were constantly endeavouring to get early delivery, and they spared no time or expense towards accomplishing that end. At the time of placing your order the American manufactories were overburdened with work and in many instances could not catch up with their orders, even by working overtime. There were no available stock materials on hand, consequently it takes considerable time for special manufacture. Knowing the urgency and necessity of procuring your material quickly everything has been done that was possible to do in the matter. The second shipment with the balance of your material is in the steamship "Queen Adelaide." This steamer left New York on the 22nd November, and therefore may be expected to arrive at any moment. Messrs. Briscoe, Drysdale, & Co., in their report to us state that their London house advises them that, owing to the very heavy demand for steel material, both from England and the Continent being made, for some time past, upon the various manufactories, they have experienced the greatest difficulty in obtaining anything like prompt delivery unless the sections required chanced to be in stock the time the order was received. In the case of your indent unfortunately most of the sections ordered had to be specially rolled, with the result that we were compelled to wait the manufacturers' opportunity to put in the required rolls before obtaining delivery. Principally through the demands of the English Naval Department which are of an immense nature, the whole of the works in England are full up with orders, and it is a matter of great difficulty to get an order executed in anything like reasonable time. Messrs. Briscoe, Drysdale, & Co. claim to have facilities second to none in the procuring and shipping of ironwork, and they inform us the state of the iron trade is such that they would not bind themselves to procure a shipment of iron such as we require in any given time, and they consider we have been fortunate in procuring the material in the time we have. The late engineers' strike caused the complete exhaustion in all stocks and lines of materials which were generally procurable in stock, and they have now to be specially manufactured. We have the whole of the steel joists and plates now on the ground; and as the balance of the roof material is close at hand, we can state that we are in a position to execute the making-up and erecting of the ironwork with every possible speed. If required, Messrs. Briscoe, Drysdale, and Messrs. Cameron & Co. will verify the statements we have made regarding the difficulty experienced in procuring the ironwork for our power-house contract. We have done all in our power by cabling and other means to expedite the delivery of this material; and we trust, in view of the circumstances, you will consider our application favourably, and grant the extension asked for.

That was the letter I sent in. I could not get any more information than that.

Then you believe that under ordinary circumstances you could have finished the contract in ten months? Yes; six months was rather too fine. The contract price is £20,000, and there was £7,000 or £8,000 additional work also to be done in the time.

What was the amount of the contract? The general contract was £19,789, and the boiler contract £7,135.

*Professor Pollock* : When were the orders given through Briscoe, Drysdale, and Messrs. Cameron & Co.? The end of July.

They were given at the end of July, 1898? Yes, as soon as it was possible. We did not waste any time in placing the orders; immediately I was satisfied the measurements were correct the order was placed.

D. Stewart.  
29 Oct., 1899.

*Chairman*: Did you say you went with Messrs. Tulloch & Co. to Cameron & Co.? Yes; I went personally to R. W. Cameron with Messrs. Tulloch & Co.'s representative. They knew the order was for me, and I impressed on them the necessity of doing their very best to let us have the materials quickly. They said that as they were going to open up a big trade with New South Wales that they would make a special effort in promptly filling the order.

Can you give me the exact date of the order? Yes, 23rd July; that was the date the order was posted.

Was that order for the whole of the ironwork? Yes; the portion ordered through Messrs. Briscoe, Drysdale, & Co. was placed prior to that date. The glass for the roof was not procurable in the Colony and had to be imported.

That is to say, you placed the order for the ironwork as soon as the tender was signed? Yes, as soon as we were satisfied as to the measurements, we placed the order straight away.

*Professor Pollock*: Then you applied for permission to sublet the work to Messrs. Tulloch & Co. much later? Yes; we looked on that as a matter of form with a first-class company like Tulloch & Co. We got permission from the Under Secretary to do so.

*Chairman*: Although the application to sublet to Messrs. Tulloch & Co. was dated later, you had actually let the contract in July, 1898? Yes, and a very stringent contract it was too. The work had to be done in the shortest possible time, and had to be erected complete within two months from time of receiving the material.

Have you yet finished your contract? Yes, with the exception of some small items which we cannot get at until the machinery is really completed, such as the tiling of the floor, which is the principal thing remaining.

*Mr. Wallach*: If you had not been delayed with the ironwork there would have been no necessity for you to apply for an extension of time? I would have had to apply for it in any case. I applied in January last.

*Chairman*: Your principal reason for requiring an extension of time was to carry out the extra work necessary in the foundations for the machinery? I consider the four months' extension which I applied for would give me sufficient time to fix the ironwork, and the balance of time over and above that I think I may reasonably claim to be entitled to in consequence of the additional work which I had to do.

You have done about one-third more work than the main contract devolved upon you? I consider my work was finished at the end of August. I could have been finished by the middle of August if I had not been prevented from getting at the work. For the past two or three months I have been simply studying the Department, merely hanging on to try and get finished. The Department having let such a number of contracts, work has been going on all the time since we started until now; there has been no stoppage of any kind.

Then the carrying out of the other contract has interfered with your work? Yes, very considerably. In fact the chimney was let under another contract. I could not approach that part of the work under three months after I signed the contract; on account of the contracts for the chimney having a steam crane erected there which blocked up the whole portion where the work was proceeding. Where there are three or four firms of contractors working together, it is generally very inconvenient. It is a very big work, and the bulk of it has been done in twelve months' time. Until the power-house was let there was nothing done with the machinery, the conduit or anything in connection with the machinery of any kind. The permanent way was certainly let; but as I say, the bulk of the whole work has been done within twelve months.

The manufacturers in America were unable to promptly fill your orders, owing to the great variety of sections? Yes. It was immaterial what price we offered; it was impossible to get them sooner; immediately they were landed we worked night and day. Messrs. Tulloch & Co. fitted up an electric plant, and the erection was completed in half the time that it would otherwise have been done in.

*Professor Pollock*: When you applied for your extension of time on 17th January, what position was the ironwork in then? We had just received the first shipment then, and were just making a start. In any case, on account of the extensive additions to the foundations, had we received the ironwork earlier we would not have been able to get them finished any sooner.

You stated in your application, when speaking of s.s. "Falls of Keltic," that that was the first shipment of ironwork? We had sufficient material, less the principal rafters, which were not in that shipment. They merely gave us the quantity. We had more than half the material which was required for the two roofs; the main-tee sections they omitted to send.

*Chairman*: Do you mean that you received the total weight? Yes.

But the T-iron rafters were omitted? Yes; they were the last we got, and as I explained it was a very difficult piece of work to get them.

Are there any penalties imposed in these contracts? Yes; on our contract there was a penalty of £50 a week.

You stated that you applied to Messrs. Handyside & Co., and they gave you a time for completing the roof? Yes; they offered seven months; but they would not bind themselves under nine months from the time of receiving the order until its delivery in Sydney.

So that that would have taken much longer than it did? Yes.

When you found that there was great difficulty in getting the T-iron, was it too late then for the Engineer-in-Chief to modify it? Yes.

*Professor Pollock*: The date of the acceptance of your contract was 30th June, 1898, and the date of ordering the material, 23rd July;—do you think that was an excess of time after the acceptance of the contract, knowing that you had agreed to complete the work in six months? I do not think so, because everything had to be worked out carefully. And there was another reason—I had to get prices for this work. I waited as long as I possibly could to hear from England and from the United States. It was merely a week sooner, but for the sake of a week I thought it best to wait and see if we could get the roofs quicker from England than from the local manufacturers. I would like to mention that the first day I got the contract I had the people who were supplying the iron on the scene of the work getting particulars. There was no time unnecessarily wasted; the delay which occurred at the start was absolutely unavoidable.

Did you cable for the ironwork? We did cable for portion of the ironwork, which was first required, and we wrote ordering the second lot, and it is strange, but nevertheless true, we got the material we wrote for before that which we cabled for. With the manufacturers at Home you have to take your turn.

And

And the time you placed your order was most inopportune for getting work out quickly? Yes. I wish to impress on the Board the fact that you cannot place your order straight away from the plans. You must have your work set out. We acknowledged the acceptance of the order on the 1st August as follows:—"We herewith accept your offer to supply steel joists and plates to the undermentioned sizes and lengths, to be delivered by mail steamer. The cost of cabling for same to be borne by us." I may add that in ordering by cable to ensure quick despatch we always make it a practice to prepay the cable. The lines we did not cable for we got first; they were ordered by letter, as I said. This shows how powerless the contractor is in the execution of his orders. Everything was conducted in a businesslike way; there was nothing slipshod about it.

*Mr. Wallach*: You mentioned that on 23rd July the order was placed with Messrs. Briscoe, Drysdale, & Co., and the letter was written on the 1st August acknowledging their acceptance of it;—do you know on what date they cabled Home for the material? It was all done in the month of July. We received acknowledgments before the end of the month.

*Professor Pollock*: Had you any trouble with regard to bricks? Yes; we had great difficulty in getting the bricks the Department required—double-pressed bricks. As a matter of fact there is only one class of brick that will stand their test. That brick is made by Bakewell, and at the time they were very full with orders, which caused considerable trouble in delivering the quantity we required.

*Chairman*: For the first twenty-four days after obtaining the contract for the power-house you were occupied in getting out lists of iron from the drawings, and making general inquiry in regard to placing the order for the material? Yes.

After you had given the order the delays were due to the causes you mentioned in your evidence, namely, strikes, the enormous quantity of work in the factories in consequence of war, the irregular sizes, &c.? Yes. I should like to say that I do not attribute the whole of the delay to the want of the iron-work. There were a considerable number of alterations and additions to the work that would have increased the contract time, even had the ironwork been delivered promptly. These alterations and additions were quite unforeseen and were not provided for in the contract; they were stipulated for in the Schedule.

When you expected the contract to be completed in a certain time, I suppose you were not aware there would be any extras in connection with the foundation? No. Of course, in additional works, one always gets an extension of time. I am well satisfied with the manner in which the plans were detailed, and with the information I obtained at any time from the Department in connection with the work, and all the things which have occasioned delay could not really have been foreseen.

WEDNESDAY, 1 NOVEMBER, 1899.

Present:—

PROFESSOR WARREN (CHAIRMAN).

PROFESSOR POLLOCK, | MR. B. WALLACH.

The meeting was held at the Power-house, Ultimo.

A. M. Libby, Engineer for Edward P. Allis & Co., examined:—

*Chairman*: Can you give the Board any information regarding the treatment the engines have received generally since their arrival in Sydney? I shall be glad to answer any questions with reference to them which the Board may put to me. A. M. Libby.  
1 Nov., 1899.

Did you see Mr. Fischer, of the Railway Department of New South Wales, in America when he was there? No.

Can you say of your own knowledge if your firm made every effort to complete their contract within the time specified? I know that our firm worked night and day to do so, and they also despatched the machinery by the Vancouver mail steamer in order to get it out and erected in time.

Did the forwarding of the goods by the Vancouver mail steamer incur any additional expense? Yes; 3,000 dollars for extra freight.

Have you any idea as to the proportional increase in the expense in pushing on the work rapidly—that is, the extra exertion beyond the ordinary time for the work? It cost about 25 per cent. more than usual.

When did you arrive in Sydney? On the 18th November last year.

How long were you in Sydney before you were able to commence erecting the engines? Four months.

Were you four months doing nothing? Yes; on our contract.

Why was it that you came to Sydney four months before the time of starting to erect the machinery? I came out on the instructions of our firm.

Do you know if any correspondence took place between the Railway Construction Branch here and your firm as to your coming to Sydney? No; you see our contract is with the General Electric Company, and not with the Works Department.

You came out at the instance of your own firm, and not on any request made by the Railway Construction Branch? Our firm received an order from the General Electric Company, and I was instructed to leave for Australia. That is all I know about it. After my arrival here I wrote to Messrs. Allis & Co. asking why I was sent out so soon, and they replied that it was because they received orders to send me from the General Electric Company.

The engines having been erected, and some trouble made evident, can you say what is the cause of the trouble? All I can say is that we are only just ready to run them, and any trouble is due to our pushing ahead before we were quite ready.

Then you do not consider there is any serious trouble with the engines? No. There was a little bother with the crank-pins; that is all that was wrong.

The Board have been informed that the crank-pins are not at right angles to the discs;—is that correct? I cannot say, but I think the Board have been misinformed.

Did you investigate the matter? Yes; I really cannot speak definitely about the machines until they are properly fixed.

Have you not filed the crank-pins? Yes, because they seized and fired, and they had to be smoothed.

You filed them to make them work smoothly? Yes. As I have already said, I cannot speculate upon the trouble which has arisen. When I have everything in proper order I will be better able to give a definite opinion.

Is

A. M. Libby.  
 I Nov., 1899.

Is there anything you would like to explain to the Board in connection with the engines? I might mention that I am very anxious to get my work finished as soon as possible, so that the tramway can be started. I certainly think that I am not encroaching on the time of the Department in any way, as there is yet time due to me for the completion of our contract.

You do not consider the work you have already done unusual? No.

Have you had a wide experience in the erection of these engines? I have had a very wide experience.

Can you give the Board any idea of the number of machines you built for a similar purpose to the one on which you are now engaged? I could not say exactly how many the firm I represent built; I, personally, have built 129.

Were some of that number larger machines than those at Ultimo? Yes; the last one I built was 7,000 h. p.; that was in Louisville, Kentucky, U.S.

Can you mention any other places in America where engines similar to those you are now building are used? There are four at South-side, Chicago, and the Metropolitan West-side Elevated Company have also four. These are all vertical machines.

Are they like those you are now erecting? Yes; but a little larger. They have also the loop in Chicago in connection with the elevated line, that is the power-house which carries the entire loop system where all elevated trams in Chicago are turned. The Boston Elevated Railroad has seventeen of the same size as those at Ultimo, and some larger; Syracuse Traction Company have two like them; the Detroit-street Railway Company, six; The Albany-street Railway Company, New York, two; Brooklyn City Company, four; Kent Avenue, four; St. Louis Traction Company has four, which are on the Cass Avenue line; New Orleans Traction Company, six on the Clybon-street line; Cincinnati Company, nine—some of which are smaller than those in Harris-street; Cleveland City Railway Company, six; Metropolitan-street Railway of New York, eleven, and many others I could mention. The Twin City-street Railways in Minneapolis have nine quite as large as those in Harris-street. The Baltimore and Ohio R. R. Tunnel plant have four and run 110 revolutions.

Do you know of any similar to them being used in any other part of the world? Yes, the London Underground Company have fifteen; there are five in Madrid; three in Cork; four in Dublin, all of which are running; two in Bristol; two in Barcelona; and two in Middleburgh. By the last mail I received a letter, in which our firm state they have sold four to the Glasgow (Scotland) Tramway Company; and I also noticed that the Glasgow *Herald* states that the company I have mentioned have given an order for four of these machines.

Could you inform the Board when you commenced to erect the engines at Harris-street power-house? We started about the 1st April, but it was only in a small way, as we had great disadvantages to contend with.

What were the character of those disadvantages? In the first place the building was not ready.

Were the other contractors in your way? I would not say they were in the way; they had to get their work done before I could go ahead with mine.

They had not finished the foundations for your machinery? No.

Was not one of the foundations completed on 1st April? Yes; two of them were finished when we made a start. The machinery was at one end of the building and the completed foundations were at the other end, and we could not get the machinery across without getting in the way of the other contractors. I simply started the work in order to facilitate matters. I really started four months sooner than I should have done—that is, to do the work on an economical basis, which, of course, is a matter of importance to our firm.

Do you mean that you incurred extra expense in commencing the work of erection of the machinery before the foundations were sufficiently advanced in order to obviate delay? Yes. It cost our firm about 30 per cent. more to do this contract than any other work I know of which has been done by the E. P. Allis Company.

And that extra expense was incurred through your commencing before the building was ready? We started before we ought to have done, to facilitate the completion of the whole work, and it cost us considerably more by doing so.

What time would your firm require to erect four engines similar to those in Harris-street power-house under ordinary circumstances? We could do a similar piece of work in five months; we would not exceed six months at most. That would be without turning the wheels. We have no objection to running our engines without turning the wheels. I know of machines we put in years ago, the wheels of which are not turned yet.

When do you consider that you will have the four engines fully complete for the Railway Commissioners to take over the work—that is, so far as your part is concerned? Sometime next month; I cannot say to a day. I have about three weeks more work on the last engine; the other engines, outside a few adjustments, are all in running order. I may be ready in a fortnight's time, but I would not say definitely.

You have still something to do to the crank-pin of the other engine? I do not know that I have anything to do to it.

Have you measured the others? Yes; but I have not yet tested them with the line.

Have you anything further to say? I am anxious, as I previously stated, to get the work done as quickly as possible. We are running into expense and loss of time. With regard to the other contracts I have nothing whatever to say. It appears to me that neither the Railway Department nor the Public Works Department can reasonably claim that there has been a loss of time. As to our contract alone, I have made up more than a month's time in working both day and night, and even on Sundays, notwithstanding that there was no obligation on me to do so, as far as my time was concerned, for the completion of the work.

You say you have been working both night and day, and even on Sundays? Yes.

Have you any other information you would like to give to the Board? No; except that I would like it to be understood that the Allis Company will see that everything in connection with their work is put right and in good running order before they ask that the engines be taken over. They have no desire to shift their responsibility on to anyone.

J. J. Kelly,

J. J. Kelly, electrical engineer, representing the General Electric Company, examined:—

J. J. Kelly.  
1 Nov., 1899.

*Chairman*: You are in charge of the electrical generators and other parts of the electrical machinery at the Harris-street Power-house? Yes; the generators and switch-board, and the operation of the generators.

Are your machines all ready to be driven by the engines? Yes, as far as I can tell. It is very difficult for anyone to state the condition of the machines until they have been running. It is only then that any defects which may exist can be discovered.

How long do you consider the machines should be running before any defect can be discovered? The possibility of any slight defect in the machines should not prevent the engines from running and putting the machines into practical service, as, should any trouble arise in the working of the machines, it can be easily removed without causing any delay.

Do you know of your own knowledge whether you will be in charge of the machines after they start running for any length of time? I shall be in charge of them until I receive orders not to continue. If the Railway Commissioners accept the plant, then, of course, I shall return to America, unless I receive instructions to remain in Sydney.

You are merely waiting here until the Government accept the plant? Yes.

Is the switchboard fully complete? Yes, as far as my work is concerned. I cannot say if the Government have done their part; they had to do the connecting up from the machines to the switch-board.

Do the Government also make the connections with the lines? Yes; the electrical apparatus for the lines has been ready for some time.

Your work has been ready waiting for the engines to run? Yes.

The fourth machine will take a day or two longer perhaps before it is ready? The fly-wheel has to be turned up.

You are apparently ready to start your machinery as soon as the engines are fit to drive it? Yes, as I stated before, I am ready at any time with my machinery. I may yet have a little trouble—one cannot foretell what may arise in its working—but so far as I am at present aware everything is quite ready for action.

Do you refer to the dynamos that are said to have become wet? No. We have not yet tried the fourth machine. It has been in the condition it is in at present for some considerable time. The whole of the machines got more or less wet after they were unpacked from the cases.

Do you anticipate that any difficulties will arise in consequence of their becoming wet? Not now. We have built up three machines to voltage, and I may say that when they are built up to voltage they are ready for action as far as practical work is concerned. In regard to the high voltage test that is a matter which need not cause any delay, as it can be made while the machines are working the lines.

Have you any objection to making the 2,500 volts test when the machines are dry, which you anticipate will only require about a month to accomplish? We have no objection. If they are working constantly they will no doubt be dry in about a month. That will not interfere with the running of the trams. We have three machines quite fit for work now; the fourth is not yet ready. This machine may have to be dried in the same manner as we dried the other three, on a short circuit.

Have you been running these machines against rheostat? We have been drying them on short circuit instead of sending a current through the line. The current simply went round the machine with a very low pressure.

*Mr. Wallach*: Would you care to make a statement in respect to the storage of the dynamos, and the treatment they received from the time they were landed at Sydney till the time of their erection? They received unusually bad treatment owing to their having been built up while the roof was not finished sufficiently to cover them.

*Chairman*: Do you consider that any serious damage has been done to them in consequence of the bad storage? It is very difficult to tell if any damage has been done by mere observation; that is a thing that can only be discovered after the machines have been in operation.

Have you had them already in operation? Yes; and they appeared to be in good working order.

And because they worked satisfactorily you drew the inference that no serious damage was done by the weather;—is that correct? I really do not think they received any serious damage. All that is injurious is that they take a considerable time to dry out.

You say you ran them on short circuit to dry them;—is it because they built up their voltage that you think no serious damage has been done to them? Yes.

*Mr. Wallach*: Could you briefly trace the history of the dynamos for the information of the Board from the time they arrived, when two were taken to Garden Island and two left on the railway trucks, up to the present time? That happened before I arrived in Sydney.

*Chairman*: Did you arrive in Sydney a short time after the machines were landed? I came to Sydney with Mr. Libby, on the 18th November, and I commenced work on 20th March—that is, I was preparing for the erection of the machines and getting them in from the yard. My work should under ordinary circumstances have been complete in four months from the date of commencement, and with three months' operation of the machines, seven months should be ample for the whole of the work to be done—that is, so far as the practical part of the work is concerned. The machines we put up were practically finished before we started the switchboard, which was owing to the gallery not being erected. It is not uncommon for us to do both pieces of work at the same time.

You have been delayed in the completion of your work in consequence of the building not being complete? Yes.

Supposing the building had been finished, and you had the crane in as well, you could have got in the machinery much easier, and its erection would have been considerably facilitated? Yes; I had to spend a lot of time in covering and uncovering the electrical apparatus with tarpaulins, owing to the heavy rain-storms; and at that particular time we were having successive rains. I had to press one armature on the shaft, and during a rain-storm, as it would not be advisable to stop after a start had been made.

*Professor Pollock*: When you arrived in Sydney two of the machines were stored at Garden Island and two left on the trucks;—did you consider Garden Island a suitable place for the storage of electrical

J. J. Kelly, electrical machinery? I should consider that any place is suitable which affords proper covering to the machinery.  
1 Nov., 1899.

*Mr. Wallach*: Would you have any objection to their being exposed to the sea air? They were in a building, and I do not know how they could be seriously damaged, with proper cover, by the sea air. For instance, they are in a building at Harris-street, where they are erected for operative purposes; and that is almost, if not right, alongside the sea air.

*Professor Pollock*: Are we to understand that the armatures remained in the cases in which they were packed until you were ready to erect them? I unpacked them as soon as I had the opportunity to press them on the shafts.

Were they unpacked then, and mounted in the building before the roof was on, and was that done with your concurrence? Yes; they were all mounted before the roof was on.

Was that not unfair treatment to the machines? It was to a great extent.

*Chairman*: Did you cover them with tarpaulins? I did as best I could. I put on three tarpaulins one upon the other, and the machines then did not escape the damp. After they were mounted they got damp, doubtless from the water which was in the cellar at the time.

Did one of the dynamos have portion of the armature standing in the water? Yes, that of No. 1 machine. I had to put it down the cellar, as the crane was not ready. It was set up on blocks, and covered with tarpaulins, but the rain was so heavy that it soaked through everything. That machine was the last I put on the shaft.

Was it because of the temporary arrangement that it became exposed to the weather? Yes.

Is that machine built up yet? Yes; and it appears all right as far as actual working is concerned. The test proposed might be applied when the insulation is high enough, but that will take time.

You estimate it to take about a month to dry out, with constant work? Yes; it is very difficult to figure it out.

*Professor Pollock*: Was it necessary that you should put the machines up in the wet? If I had refused to make a start the work to be done by Mr. Libby would also have to be deferred. We have, as a matter of fact, to do our work together. Mr. Libby commences certain work first, and then I follow on with a portion of mine before he can proceed further, and if I refused to go on with my work it would mean stopping the whole of it.

*Chairman*: Then you really commenced your work sooner than it ought to have done merely to work in with Mr. Libby, and push on the work. Yes; it is necessary to do that in connection with direct coupled machines. I may explain that I have to put the armature of my machine on to the shaft of the engine, and Mr. Libby has then to put it in the bearings. We have to get the field pieces in the bottom before the shaft goes in, as in this particular instance there was not room enough to leave that to be done afterwards.

*Professor Pollock*: How did you account for the field coils being so wet? They were exposed to the weather in the same way as the armature; in fact, they were more exposed than the armatures. They were first covered with the tarpaulins, but this cover was not waterproof; we had to keep taking the tarpaulins off, to work on the machinery, and as they were put in the cellar they no doubt absorbed the dampness caused by so much water being around them. They had not the chance to dry out that the armatures had.

*Chairman*: Do you say that there was water standing in the cellar? Yes.

What depth was it? The water from the rains collected there; I suppose there was sufficient to wet one's feet while standing there.

*Professor Pollock*: Have you ever before in your experience known machines to be as wet as these? It is my first experience in drying out machines. On one occasion I dried out five machines of very high voltage (1,200), to ensure against any trouble which might arise from dampness.

*Chairman*: Were you in charge of that work to which you have just referred? I merely did the switchboard there.

Is it a usual thing to commence working the generators before the roof is properly fixed over them? No. This is the first case I know of.

*Mr. Wallach*: Did the Public Works Department hurry you on at all with the work? No; I was as anxious to get finished as anyone. Not unlike the engine people and others we are expected to do our work as quickly as we can. There are delays at times which are unavoidable, such as one having to wait for the other in the work.

*Professor Pollock*: Do you anticipate any permanent damage through the wetting the machines got? No; I do not.

THURSDAY, 2 NOVEMBER, 1899.

Present:—

PROFESSOR WARREN (CHAIRMAN).  
PROFESSOR POLLOCK, | MR. B. WALLACH.

Andrew Herbert Byron, engineer and architect, appeared to be examined:—

A. H. Byron.  
2 Nov., 1899.

*Chairman*: I believe you wish to give some evidence upon the George and Harris Street electric tramway? Yes.

What are your qualifications? I am an engineer and architect; I have been twenty-nine years at the profession.

Where were you trained? In the Phoenix Foundry at Ballarat.

That foundry only makes locomotives, does it not? Yes.

Do they make any electrical machinery? They did not in my time—that is twenty years ago.

Does your evidence bear upon the electrical part of the work? Yes, in respect to the charged overhead wire; I consider that that wire should be circular according to the curb rail.

Do you only wish to give evidence in regard to that wire? Yes; I wish to explain how to get over the curves. I have an instrument in hand which cost £18,000, and I have the same thing on it that is

wanting

wanting on the tram-cars. In the first place you want the circle where the pulley leaves the wire; it cuts the current through.

I would like to point out to you that the point you are explaining has nothing to do with the object of our inquiry, which is to go into the design, the cause of delays and failures;—can you give us any information on any of those questions? No.

Then I am afraid that we cannot entertain any other evidence which you may desire to give to the Board.

A. H. Byron.  
2 Nov., 1899.

FRIDAY, 3 NOVEMBER, 1899.

Present:—

PROFESSOR WARREN (CHAIRMAN).  
PROFESSOR POLLOCK, | MR. B. WALLACH.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, further examined:—

*Chairman*: Could you inform the Board whether, when you altered the generators from the 800 K.W. to 850 K.W., you also altered the engines? Yes; they were altered. That was a very important matter, and when Mr. Fischer, my assistant, was instructed to leave for America it was arranged that he should get the new dimensions, because we could not get on very far without them.

H. Deane.  
3 Nov., 1899.

Until the plans for the foundations were prepared you could not start with the engines and the dynamos? We could not get on very far. I was busy getting out sketches for the roof, girders, and columns.

Did you know the span of the roof? Approximately we knew what space we had.

And you got on with the work of the roof? Yes; we made good headway with it; we could not exactly fix upon the spacing of the principals. It was supposed that we could get them about 20 feet apart, taken very much upon the width of the space occupied by the engines. It was a difficult matter, much more difficult than it appeared at first sight. In looking back over the spacing, I found that we made a mistake, as we had everything 6 inches too small, and if it would be found afterwards that the tail rods would not work without becoming foul with the columns it would have been a very serious matter indeed.

Are we to understand, as seen by the papers, that you are not alone responsible for ordering these generators, or for fixing the time for their completion? If it is agreeable to the Board, I should like to make a short statement:—After the Bill authorising the George-street and Harris-street electric tramway was passed the public were informed that about a year or fifteen months would be sufficient to complete the construction of the tramway. Nothing was ever said of any alterations in the plan which were being considered and were only decided upon in June, 1897—that is, nine months after the passing of the Act. The reasons why the public were not informed are briefly these, and I only discovered later that the Railway Commissioners had obtained a vote for the conversion of the tramways amounting to £150,000, which was obtained on certain conditions, namely, that the money should not be touched until the George-street electric tramway was open for traffic. The Premier promised that this condition would be carried out, and I presume it is one of the reasons why the Government would not explain to the public the extent of the works which were in course of construction. The Government, although doing the right thing, would be charged with spending money without authority. To show that I had no doubt whatever that the £150,000 vote would be drawn upon, it was so stated in the report of the Board of Reference which recommended to the Minister that these generators should be ordered; that fact was important. The Minister had the recommendations passed through his hands, and he must have made a similar assumption. I mention that because the Railway Commissioners later on denied that they had ever given any consent to the £150,000 being used for the purpose. The Board will find this in the papers. *Hansard*, however, will show under what conditions the £150,000 were voted. I knew nothing of them; I was not in the House at the time, and it was not my business to read *Hansard*, even in regard to the votes for my own work, and certainly not in the matter of votes for the Railway Commissioners. Presumably the late Chief Commissioner knew all about it, and had probably arranged with the Premier that the bar to it should be removed, and the matter explained, if necessary, to the House. He knew that there was no other money but what was provided for in that vote to devote to the purpose, that is, for the erection of the power-house, and I have not the slightest doubt that Mr. Young, the late Minister, knew that too. We had no other vote; we obtain votes for general tramway construction, but they are mostly for such amounts as £25,000 or £50,000, and there are no large votes like the George-street and Harris-street vote, unless they have been approved after the investigation required by the Public Works Act. All works involving an expenditure of more than £20,000 which are to be carried out by the Public Works Department have to be first submitted to the Public Works Committee. On the other hand, if the Railway Commissioners have large works to carry out they never have to send them to the Public Works Committee. They had also obtained an Act of Parliament to authorise them in putting up the overhead wiring and poles in the city of Sydney.

Where did the money for the overhead wires and the new permanent way come from? For George-street and Harris-street, money was obtained from the special vote of £130,500 for other lines. It was supposed to come out of the £150,000; but they have received a further vote. The Act to enable them to put up the overhead wires in Sydney was simply an enabling act, which permitted them to carry out such works in the public streets. On the loan estimates of 1896 the Commissioners obtained £150,000 for expense in connection with the conversion of the steam-power to electricity.

Have they used it for the conversion work, or has it been used for the new work? I have had £70,000 of it, by arrangement between the Commissioners and the Minister for Works. This has been spent, and the rest of the money wanted for the power-house has been taken out of other tramway votes.

So that your Department and the Railway Commissioners have practically worked together in this matter? Yes.

The Commissioners have really found the money? Yes; I know that that £150,000 was obtained on a low estimate by Mr. Elwell, and not long afterwards he made a further estimate very much higher, of £300,000, which he reckoned would be the cost of converting the whole system.

Was

H. Deane.  
3 Nov., 1899.

Was that estimate to cover the total cost of the business? Yes. About £300,000 or £350,000 was, I believe, his estimate for the whole conversion; that would necessarily be inclusive of the power-house.

*Professor Pollock*: Was there any special vote for the George and Harris Street electric trams? Yes. There was a vote of £130,500, and that included about £18,000 to provide electrical plant for the work.

That amount, together with the £70,000, which you obtained from the Railway Commissioners, is the actual sum that has been spent on the work? We have used a good deal more than that. There are other votes for tramway construction, which have been also brought into use.

*Chairman*: The total amount, then, is over £200,000? Yes; I think it will go up to about £260,000, or a little more.

Will that £260,000 which you estimate include the whole cost of the power-house, and the other work in connection with the tramway? Yes.

Does it include rolling stock? Yes; so far as it is gone. About £23,200 has been provided out of the George-street and Harris-street vote for rolling stock.

That is providing every equipment? Yes; everything necessary for the tramway. The late Chief Commissioner evidently knew the money would be forthcoming, and he was prepared to spend it by commencing the conversion immediately. He was very anxious that the four generators should be ordered at once, and to show you that he was determined that the conversion of the whole system from steam to electricity should be taken in hand without delay, and pushed through with the utmost speed, I might call attention to the arrangement that had been made in relaying Phillip-street and Elizabeth-street, and electric bonding in connection with the duplication of the Glebe Point tramway.

Was that done in Elizabeth-street? I particularly call attention to Elizabeth-street, because it must be remembered that the idea of the Railway Commissioners is at the present time to work the western suburbs scheme first, and, after conversion, they would all converge on to George-street; but the fact that Phillip-street and Elizabeth-street would be connected with the eastern suburban system, eventually shows their intention to proceed with the whole scheme, and carry it out without delay. They would not go to the trouble of electric bonding a road if they were going to wait five or six years before using it.

The work that was actually done in Elizabeth-street was putting down heavier rails and laying joints like channel bars, was it not? Yes.

Did the cost of that work also come out of the tramway vote? I cannot say out of what vote it had been paid.

Does it show clearly that the Commissioners contemplated an immediate conversion of the system? Yes. The late Chief Commissioner displayed great anxiety to obtain all the engines at once, so that there should be no delay, and I would like to call attention to the joint report on the selection of the design made by Mr. Thow, the late Mr. Elwell, and myself.

Was that on the 15th June? Yes; in June, 1897. We recommended, after having consulted the Commissioners, and the Minister for Public Works, that tenders giving the lowest time should be accepted. The late Chief Commissioner knew perfectly well, within certain limits, what the expense was going to be; he at least knew it was going to be very large. I remember distinctly telling him that the power plant would cost between £60,000 and £70,000, to which would have to be added the car-shed, power-house, and other necessary works.

Was the chimney extra? Yes; the engines cost about £40,000, and then there are the boilers, and all the pipes and pumps, and other arrangements.

The amount, then, was more than £70,000? Yes; that amount was not intended to be accurate. I have a distinct recollection, however, of pointing out the cost, and the late Chief Commissioner was perfectly acquainted with the fact.

Did that include the building? No.

Do you say that you had about £70,000 for the machinery, and about £30,000 for the building? The buildings cost about £20,000 odd. I think the extras are only about £3,000; but I am not certain at the present moment. There are a lot of extras, due largely to the matter of the foundations.

Does that make the power-house, with all the machinery, cost about £100,000? Yes; and then there is the car-shed, and all the outside appliances, and the chimney, which cost several thousand pounds, must not be forgotten; altogether about £30,000.

Have you any other information? I should like to point out to the Board that I was in communication with the late Chief Commissioner more than any other official except, possibly, the late Mr. Elwell. He discussed all these matters with me, and frequently Mr. Elwell, who was present. Mr. Eddy knew perfectly well what he was about. He was a very capable man, and would carry through anything he took in hand. I do not think anyone will question that; but, unfortunately, he died at Brisbane soon after he had put his approval to the joint report. He had been in the habit of looking after all these details personally, and did not worry his colleagues about them, not until the whole thing was complete. After he died, Mr. Oliver had to go into the matter, but was greatly handicapped from not knowing exactly what Mr. Eddy had done. He cannot be blamed for that. I was placed in a somewhat false position, because he did not really know what had been done. I well remember how the late Chief Commissioner and the Minister urged that the work should be accomplished in the shortest possible time. I think the report shows that this was so. Mr. Thow and Mr. Elwell were no doubt in communication and consultation with the late Chief Commissioner, and he and the Minister for Works (Mr. Young) had various consultations, which are mentioned in a minute of Mr. Young's, which I will point out to you among the papers.

The Board would like to have that document which you say shows that the Minister, Mr. Young, was also responsible for urging the rapid delivery of the engines and generators;—do you propose to put that in? That, of course, is seen by the Minister's approval of the minute of the Board of Reference; I cannot say if there is anything else which shows it; Mr. Young, however, acknowledges on the minute I mentioned that he had been in consultation with the late Chief Commissioner on these matters, and knew also that it was a question of very great expense. The late Chief Commissioner and the Minister, as I have already stated, urged that the shortest possible time should be used, and if the public were led to believe that the work would be finished in a shorter time than was really possible I beg to disclaim any responsibility for that.

There

There is, naturally, an anxiety on the part of the Minister to please the public, and that often leads to holding out a promise of completion of a work in an impossible short space of time. I have often reluctantly had to give a time estimate, which I felt was most unreliable. It is a great pity that such time estimates should be published as if they were really accurate.

H. Deane.  
3 Nov., 1899.

In carrying out the works, and the whole of the design in connection with this matter, I think it is important to state that under arrangement between the Railway Commissioners and our Department I always had the late Mr. Elwell to assist me in coming to conclusions upon electrical matters. I consulted him at all times, and I believe that on every point in connection with the electrical design of the engines and the plant generally, and also with regard to mechanical details, Mr. Elwell has been consulted. Each item has been carefully discussed and a conclusion arrived at.

Nothing whatever has been done without Mr. Elwell's entire concurrence. We have had considerable discussions on various points, and where we did not absolutely agree we made a compromise; but nothing has ever been done contrary to Mr. Elwell's opinion. Mr. Elwell and I were always on the best of terms, and I mention this because, in going through some of the papers, the Board might conclude we were not so. I emphatically assert that we have never had any unpleasantness in our business relations, and that we have always been good friends. I have looked to him at all times for assistance in matters where electricity was concerned, as well as mechanical matters, and we perfectly understood each other. Even supposing that no arrangement of the kind mentioned existed between Mr. Elwell and myself—that is to say, if the Railway Commissioners had not expressed their desire that I should confer with Mr. Elwell, I should have done so just the same; because I think it is only fair that the man who has to take over the work finally, and be responsible for its working, should know fully what he is going to take over, and should be consulted in the matter of designing. I have done that in the case of tramways, and also in the matter of railways. It has been my practice throughout. As regards the electrical work done by my Branch, I have Mr. Fischer and Mr. Goodman. Mr. Fischer has a very good knowledge of electricity, and Mr. Goodman was taken on specially as a thoroughly trained electrical engineer. Of course, as to mechanical details, I have often to leave them to the officers of my staff; but I go into details myself as far as possible, and as my time allows. There are a great many things I have not time to look at, which I have to leave to my assistant, Mr. Fischer. I have a very high opinion of Mr. Fischer's qualifications, and I have satisfied myself that he can be trusted in such matters.

Have you any further information you would like to give the Board? I shall be very glad to explain any point which may be put to me on which any member of the Board wishes further information.

*Professor Pollock:* In view of the short time specified for the completion of the engines and generators, do you think everything that was possible was done to forward the building and the powerhouse to completion? I think everything that seemed possible at that time was done. Looking back on one's experience, I would certainly have made different arrangements. I would probably have insisted upon the plans being got out before the engines were ordered. I would also have insisted on a longer time being given for the delivery of the engines. I quite acknowledge that I did not reckon it would take such a long time to get the plans ready, and that is, to my mind, the only thing to be complained of in the whole business. At the same time, I was very much taken up by other matters when getting the orders out and fixing the shortest possible time. Amongst other things the City Railway Inquiry was going on.

*Chairman:* Do you consider that you had to wait extra long for the plans to arrive from America giving the size of the generators? Yes.

That was the first serious delay, was it not? Yes. They might, I think, have telegraphed for the dimensions. In the meantime, however, I was not idle, because, in order to save time, I started to get the excavations done and the top material levelled down to the rock. I was much surprised later on, when we commenced the building, at having to put up such a terrible lot of foundations for the generators, in consequence of the unreliability of the rock and the depth we had to go to get to the rock foundation.

Did you put down any borings to ascertain the nature of the foundations? No; it seemed solid rock.

Had you done that you would have known that it would have taken longer? It might have been so, but I doubt it. In boring you might put down a bore in one place and think it sound, while at another point, at no great distance from the first bore, you might get altogether different results.

When the particulars arrived from America did it necessitate five months to prepare the drawings which included the roofs and offices;—could not the offices have been done first? I wanted to get the roof attended to. The offices were not so material. There was a delay of a month in getting approval to the office accommodation and the coaling line. I really thought everything would have been fixed up months before.

Had you all the particulars to start with in January, 1898, for completing the drawings for the roof? Yes. A great many sketches and designs were prepared prior to this, but turned out inadequate, and were put on one side. Designs were got out, and contracts let for car-house, permanent way, &c.

And it took five months before you could call for tenders, and another month to get tenders? Tenders were called on the 23rd May, so it is evident they were only finished in May. From that you might deduct a month as the time occupied by the Railway Commissioners in coming to a decision. On the 19th March I submitted the plans to the Railway Commissioners in accordance with clause 28 of the Railway Act. I thought at the time it would simply be a formal matter, and that I could get their immediate decision and be in a position to proceed.

That was in 1898? Yes, in March, 1898.

Had you the drawings finished then? Yes, practically, with the exception of some details. After considerable discussion they arrived at a decision on 13th April, 1898. Tenders were called on 23rd May, 1898. When the drawings were pretty well finished specifications were prepared: we were very short-handed at the time, and I was very much dissatisfied with the progress that was being made. I had repeatedly urged Mr. Fischer on—I do not wish to blame him in the matter—to get on with these as quickly as possible. I am sure he did his best. We had other works going on at the same time, and it was not as if we had these works in hand alone. Eventually I instructed Mr. Barker, the Chief Draftsman for Railway Designs, and asked him to draft out the specifications, which he did. I may state that in our Department we have always been very short-handed, and it has been most difficult to obtain the right class of assistance.

Could

H. Deane.  
3 Nov., 1899.

Could you inform the Board how it is that you were not supplied with the necessary assistance, seeing that the work was of an urgent character. It is very difficult to get draftsmen or qualified men. To show this I will mention that on the 12th May, 1897, I asked for the appointment of a good survey draftsman and a junior draftsman, to enable the whole of the time of the existing staff to be devoted to professional work. My application was forwarded to the Public Service Board by the Under Secretary on the 17th May, 1897, and the paper came back on 11th August, 1897. I was notified on 14th August, 1897, that the Board had appointed Mr. H. S. Smail engineering draftsman and Mr. S. B. Hall junior draftsman. Neither of these gentlemen took up their work, the Board having also appointed Mr. Smail to a position under Mr. Darley, at a higher salary, and Mr. Hall refused to take up his duties at the salary offered, namely, 8s. per day. Eventually Mr. J. Bowman was appointed in lieu of Mr. Smail, and commenced his duties on 1st September, 1897, and Mr. E. P. St. John was appointed in lieu of Mr. Hall, and commenced his duties on 6th September, 1897. On the 15th January, 1897, I applied for a draftsman with mechanical and electrical knowledge, and on the 27th January I was notified of the appointment of Mr. W. G. Goodman, who took up his duties on the 1st February, 1897. On the 16th April, 1898, I recommended the appointment of Mr. W. T. Moffitt as a first-class mechanical draftsman, and on the 7th May, 1898, I was informed that the Public Service Board had approved of the appointment of Mr. W. T. Moffitt, who took up his duties on the 9th May, 1898.

*Chairman*: Were you not considerably inconvenienced in this particular work through not having good draftsmen? I was. I was always shorthanded. You cannot get good men at a moment's notice, and if you find you are shorthanded you really have to make the best of it.

And you would have to wait for the approval of the Public Service Board, and go through all the formalities, which would take almost as long as to get out the drawings? Yes. In the first case mentioned it was a most exceptional delay. I have never experienced such serious delay at any other time, and it is at the beginning of the work that you feel the necessity of the proper assistance. Under the old régime, if I required a draftsman, and one was to be had, I could get him to work in three days.

In the case of retrenchments in the Service, new men, if required, are not appointed very quickly, and I should like you to inform the Board whether that had anything to do with the time occupied in getting out the drawings. You appeared to have taken altogether five months, inclusive of the period taken by the Railway Commissioners for their approval? Yes. It occupied a much longer time than one could have imagined; no doubt there was a great deal of work to be carried out which was in the charge of Mr. Fischer, and I was consequently urging its completion. Mr. Fischer maintained that it was expedited as much as possible under the circumstances. There was an immense amount of detail to arrange as was seen in the drawings.

Do you consider the time taken in preparing the drawings was unnecessarily long considering the magnitude of the work you had to deal with? It certainly was long; but there was a tremendous lot of detail to work out which necessarily takes time.

Do you consider that the time occupied by the Railway Commissioners, namely, a month, rather unreasonable? I could not understand why such a long time was required for their approval; it appeared to me to be a mere formal matter.

If you finished your drawings on the 19th March, and the Commissioners finally approved of them on the 13th April, that was nearly a month, was it not? Yes.

*Professor Pollock*: Are we to understand that Mr. Fischer was responsible for the preparation of these drawings, and not yourself;—was not Mr. Fischer in America at this time? He was not there in the beginning of the year. I got the dimensions sent me as soon as they were altered. That has been the real cause of the delay; due to the recommendation for an alteration in the type and size of the machines. If it had not been for that we could have got things fairly ready in the time mentioned. We could at least have got the foundations ready unless some other hitch had occurred.

Would it not have given you another six months? Yes.

When you accepted the tender for the generators, you had afterwards to prepare your drawings;—could you not have commenced your drawings immediately after giving the order to the successful tenderer? Yes; we could have started the drawings at once.

*Chairman*: If the original plan of the generators and engines had been adopted, the drawings could have been proceeded with immediately after the tender was let;—is that so? Yes, immediately after the approval was given.

The date of that is the 12th July, 1897, whereas you could not actually commence work until January, 1898? That is correct—six months.

*Professor Pollock*: I should like to put the question I asked you relative to Mr. Fischer in another way;—in view of the fact that Mr. Fischer would be in charge of the drawings and the design for the power-house, was it not unwise to allow him to proceed to America, anticipating, as you may have done, that the dimensions would arrive in Sydney long before he came back? It is very easy to be wise after the event. I was very loth to let Mr. Fischer go. I did not see any reason for his not going, and I talked the matter over with Mr. Thow, and he seemed to think that it would be as well for Mr. Fischer to go to America, seeing that certain alterations were asked for, and to make sure that we got the quality of work we were used to, and also to arrange about the entire inspection of the machinery. I have not the slightest doubt that we could have saved a lot of time, and that if the 850 K.W. machine did not more than proportionately measure more than the 800 K.W. machine, it would be far better for Mr. Fischer not to go, and we could have proceeded with the 800 K.W. machine; but I think the Board will see two very good reasons why he should have gone. The 850 K.W. machine is supposed to be a more modern and better type, and better in proportion than the 800 K.W. machine, and worth waiting for; and, as I said before, I was only one of the Board who determined upon the machine to be used, and who strongly recommended that the 850 K.W. should be obtained, and the late Mr. Elwell urged that we should get the newest type. I quite agreed with him in this, but, as explained, it involved considerable delay.

*Chairman*: Considering the great improvements which are rapidly being made in electrical machinery it was very natural that the 850 K.W. machine should be adopted in preference to the 800 K.W. machine—that is to say, that supposing you have a type of machine which is considered to be the best,

best, and you afterwards become aware that there is a machine much more modern and giving better results, it is desirable, I suppose, that this improved machine should be if possible obtained? Yes. It would have been very difficult for me to have stood out against that opinion, if I had felt inclined to do so. H. Deane.  
3 Nov., 1899.

Have you any other information? I should like to point out that it might be said that we had divided responsibility. I am quite prepared to take my share of responsibility, but in making a joint report I do not see why I should take more than one third of the responsibility. It was probably looked at that if there was a delay it need not have been a very serious one, and if the generators arrived we could put them under cover. I would like to say that I did not think we would have to deal with packages between 20 and 25 tons in weight which would have to be stored somewhere. The armatures in the cases were a tremendous size, and the package measured about 20 feet long by about 10 feet wide, and weighed about 22 tons. I should like to add that I never thought there would be much difficulty about storing the generators supplied. They did come too soon, but I am confident that they have not suffered in the least.

*Professor Pollock*: When the drawings were being prepared, did you seem to realise that the generators would be mounted in a few months? That could have been done. If the drawings were hurried up it would have only been a difference of about a month. Supposing that we had started in July, 1897, one might have anticipated that it would take two or three months to get the drawings out, which would have brought it up to the end of September, 1897; there would then have been plenty of time to get the building and foundations ready for a pair of the generators. I do not think that the calculations were far out in the first instance. If the Board wishes I should like to say something about Mr. Stewart's evidence.

Before leaving the point you have just spoken upon, which does not seem to have been the cause of much delay, the date of the acceptance of Messrs. Stewart's tender was the 30th June, 1898, but the engines and generators were to have been here a few weeks after that—is that correct? Yes; there was all that delay in the first place in the commencement of the plans.

*Chairman*: Ought Stewart & Co.'s contract to have been completed on 29th December, 1898? Yes; but I notice that Mr. Stewart said that the time was too short.

Mr. Stewart informed the Board that, in view of the extra work in the foundations, he felt entitled to the extra time—is that so? I do not think that he ought to have the extra time in view of the foundations, although I must admit that that work was very much heavier than was anticipated. It is all bulk work, and it only required the employment of more men.

Had Stewart & Co. to build foundations for the engines and machines? Yes; they had to do the work for them as well. That is where the extra cost on the contract comes in.

*Professor Pollock*: With regard to the delay between the time of letting the contract for the generators and the erection of the power-house, did the Railway Commissioners seem to have realised that the necessary machinery was going to be landed in a few months when they delayed their decision on the plans for a whole month? Yes, I presume so.

Do you think a great mistake was made in giving such a short time for the building of the engines and generators, which necessitated working overtime and sending out generators by mail steamer? It turns out that it was so. I do not think it was looked upon at the time as a great mistake. The matter was very carefully considered, not only by the Board, but by the Chief Commissioner for Railways, who was consulted; and I know that Mr. Young, the late Minister, was very anxious that the date should be made as near as possible. I wish to add that I do not see that the Company incurred any extra cost through sending the engines *via* Vancouver.

Did you anticipate having the power-house built and covered in before the generators arrived in Sydney? Yes, originally.

*Chairman*: I take it that you approved of the drawings on the 15th March, 1898, and that you obtained the Railway Commissioners' approval on the 13th April, 1898, which prevented the completion of the drawings for the front building? It was arranged that the forty-six weeks allowed should date from the arrival of Mr. Fischer in Milwaukee—that was the 3rd September, 1897, so that the proper date for the completion of the contract would be 20th July, 1898.

That was forty-six weeks allowed from the 3rd September? Yes.

*Professor Pollock*: Do you say that you anticipated having the power-house completed, and the roof ready for the generators, which were expected to arrive here in May? They would want to put them down a couple of months before that date. The power-house would be so far completed so that they could start and get them about two months before that, which would be the 20th May, 1898.

*Chairman*: Are we to understand that the generators were actually in Sydney when the Railway Commissioners were considering the plans? Two of them arrived in May; the others arrived later.

*Professor Pollock*: Do you consider that everything was done that it was possible to do at that time to push on the work? As I previously stated, we were delayed by the alterations in the plan and getting the dimensions. I wrote to Mr. Fischer, telling him to point out to the General Electric Company that we should not be ready for the generators, and that they need not hurry them on; but Mr. Fischer informs me that he did not receive the letter.

*Chairman*: We have been informed that the Electric Company incurred a great amount of extra expense in hurrying on the machines? I suppose they did.

Can you say who sent for Mr. Libby, engineer for the Allis Company, and Mr. Kelly, who represents the General Electric Company? Mr. Allen, of H. H. Kingsbury & Co., wired for Mr. Kelly to come out. He said, "I am going to wire for the electrician to come out; I have got some work that will take him a month or two to do before he starts on the generators"; and when the General Electric Company received his wire for Mr. Kelly to come out they sent Mr. Libby too. So far as I know, Mr. Libby was not wired for.

The Government here are not responsible really for the expenses of these men? No, not at all; we had not given them any intimation that we would be ready. The Milwaukee firm evidently came to the conclusion that if one was wanted the other was wanted. We employed Mr. Libby in putting up the electric cranes.

*Professor Pollock*: Did you sanction the erection of the generators before the roof was completed? I was very anxious that we should get the frames in position.

The engines and generators are built together, are they not? Yes.

*Mr.*

H. Deane.  
3 Nov., 1899.

*Mr. Wallach* : When the generators arrived in Sydney were they unpacked and examined, or the insulation tested? They were left in their cases.

While the generators were being erected were the parts of the machines protected from the moisture of the atmosphere? I think so.

Were they well covered over with the tarpaulins? I could not say. No doubt those in charge of the erection would take every precaution in that way.

*Chairman* : Are the crank-pins out of line as far as you know? I have not tested them myself.

Can you say how the engines have been running? They heated up on one occasion, but I do not think they have done so since.

Has a full load yet been tried? I do not think so. I understand that the load was to be put on this morning.

Can you say if the loop is all right? Yes, I believe so.

There is no doubt about the successful running of the trams? No; none whatever.

Are the wheel bases so long as to cause sticking of the cars on curve? I do not think so. It is about 45 feet, or 70 links radius—that was the radius agreed upon with the Railway Commissioners. There is no difficulty in getting the cars round. The Traffic Department saw them going round. The curve is laid out as asked for by the Railway Commissioners.

The Board have been informed that the trolley-wheel is likely to leave the overhead wire in passing round the curves? That is not correct. The only likelihood of the trolley-wheel leaving the overhead wire is at the junction near the car-shed, and, if it did become displaced, there would be no delay in adjusting it. I understand that everything is right now in that way. The practice is to fix up the wire temporarily at first to see how it works, and afterwards to adjust it.

*Chairman* : Do you wish to make any reference to the evidence given by Mr. Thow? No, except to call attention to the joint report. I am quite sure he went into the design of the engines, a point which he must have forgotten. [*Copy of Minute attached, marked "A."*]

Is there any other evidence given by any of the witnesses who appeared before the Board that you would like to refer to? I was very much surprised at a good many remarks made by Mr. Brain, Acting Electrical Engineer. In answer to a question asking him if, from what he had been told, he had assumed that the generators had been badly treated in allowing them to get wet, he said, "It is because of that that the manufacturers' representative urged the test should not be carried out." I wish to say that there is no foundation for this statement. It is most uncalled for. The manufacturers' representatives have not urged that as the reason why this test should not be carried out. They stated that such tests were quite unusual; but Mr. Kelly told me that he would have no objection to having the test made when they were dried out, although it was a most unusual thing and rather risky to put the high voltage on.

Mr. Kelly informed the Board, when giving evidence, that he would have no objection to making the test when the generators were thoroughly dry, and he believed they would be dried out after running continuously for a month? Yes. I notice also a question put to Mr. Brain to this effect: "Assuming they were wet, have you made certain recommendations for drying them out?" to which he replied "Yes." Well, I have never had any conversation with Mr. Brain on the subject. What information I have received has been given me by Mr. Kelly and our own men. In answer to another question, Mr. Brain says, "If they are informed that certain tests are a guarantee that the machines are in a certain condition, they (that is the Railway Commissioners) will then decide. I should not presume to dictate to them as to what risks they would run, or to what degree of safety should be insured before they are used for traffic." I should like to know what an engineer is for if he is going to make the Railway Commissioner responsible for a technical matter. What is the good of having a man in that position at all. Later on Mr. Brain says, in answer to this question, "That test (that is the 5,000 volt test) could not be supplied without putting the armature on its shaft, and inserting it in position in the yoke?" "No." That is not, in my opinion, correct—I mean the test could practically be applied, because the shaft is not necessary. The armature is fixed on the spider, and if that insulation between the coils and the spider is tested practically the insulation between the coils and the shaft is tested. Another question put to Mr. Brain was, "So that the test could not have been made unless it was built up?" to which he answered, "No." I may say that everything that was usual to be done was done, and the test of the insulation between the coils and the core was carried out.

Do you mean between the two coils—the series coil and the shunt-field? Yes.

*Mr. Wallach* : Would they not require to be built up to do that? Yes; I have not the slightest doubt that they were. Everything that was to be put up together would have doubtless been put together in the shops. The inspecting engineer reported that the usual tests were made.

*Chairman* : Is there anything further you wish to speak upon? With regard to the high potential test, I have not the slightest objection to these tests being made so long as the manufacturers will take the responsibility. I will not take the responsibility of insisting of their being made, and I will not advise that they should be made before the machines are put on the traffic; but if Mr. Kelly, who represents the General Electric Company, has no objection to their being made, I shall have none either. I have asked Mr. Kelly if he would have any objection to the 2,500 volts being made, and he replied that he would not when the machines were dry. There is a letter also from Mr. Lee Murray, which is before the Board, in regard to the matter. I was so annoyed with what had been said that I asked Mr. Badger, and also Mr. Murray, to give me their views, and they endorsed the position I took up. I should like the Board to understand that this 5,000 volts test had nothing to do with Mr. Jones, the representative of the General Electric Company. He never proposed it to me, nor did anyone else; it is understood to be the general practice of the General Electric Company. The condition has been inserted in the specification of the generators at Rushcutter's Bay, Willoughby, and in other places; it was in the specification before these George-street motors were ordered. I find, on referring to the contract for supplying the generators at Willoughby, it was entered into on the 7th May, 1897, that was before the tenders for the large generators came in.

Did you make any tests? No tests were made; the late Mr. Elwell did not ask for any tests, nor did we make any at Rushcutter's Bay. What Mr. Badger and also Mr. Lee Murray say I have not the slightest doubt is correct—that is, that it is not usual to make these tests; they are tests which are only taken in the manufacturer's workshop. Machinery might be brought a distance of a thousand miles, and by applying a test of this kind you may do it more or less damage. I had a conversation with Mr. Brain on this subject,

subject, and I am rather surprised that he should be of the opinion that these tests would be necessary, because I gathered from him that in his experience he had found it to be a dangerous thing to overtax the insulation; that there is a possibility if the slightest flaw existed in the insulation of its greatly increasing. In putting on these high tests you might overtax a particular part, and the result would be that in course of time you would have to get the machine rewound or renewed.

With regard to the matter of the pump, it was said by Mr. Brain that he thought the pump was running a fortnight at 500 or 600 volts? I do not know what argument can be made out of that. No doubt Mr. Fischer could give you fuller information on that point. I am unable to give you any particulars myself. There is another question on which I should like to say a word, because I think it very unfair to allow the remarks which have been made to pass by. I am quite sure that if the late Mr. Elwell were alive to-day he would admit that he said nothing of the sort. The following question asked by your Chairman is the one producing the reply to which I refer:—"You are perfectly satisfied from your own knowledge that they (the generators) were damp?" The reply was, "Yes, I was very much afraid from the first that owing to the anxiety of the Public Works Department to get the trams started as soon as they were found to stand 600 volts without breaking down, they would want the Railway Commissioners to rush the traffic on them; and with a view to avoiding any supposition on the part of anyone that the Commissioners would adopt that course, Mr. Elwell gave an intimation, as early as possible to the Department, that the Commissioners would require an insulation test, chiefly because we had an idea from general reports that these machines had been allowed to get very wet." Now, Mr. Elwell's recommendation to me was contained in one of a series of letters which I received from him from time to time, and one that I had expected from him, as he always had given me his views and opinions in every such instance. He said nothing whatever as to what the Railway Commissioners might require. Mr. Elwell spoke as Consulting Engineer in this business, and he did not mention in his letter that special care should be taken on account of their getting damp, nor did he even hint in any way that he was anxious because the Public Works Department wished to get the trams started before the generators were dried out. This statement is most unjustifiable for Mr. Brain to make, and is excessively foolish. I may say that, as a member of the Institute of Civil Engineers, and as an engineer practising a great number of years in this country, I do not think that any engineer of any standing here would believe that I would sanction any steps of that kind—that is, to endeavour to pass over to the Railway Commissioners machines which were not in a proper condition for running. It would be a stupid act to attempt, and to work machines before they were in a proper condition must naturally bring retribution in its train.

How long do you propose to keep Mr. Kelly here? Until the machines are running satisfactorily—until all the tests have been made. I do not see how he could possibly get away before then. I do not propose to hand over the machines finally, unless the Railway Commissioners are prepared to take over every responsibility and relieve me of looking after the maintenance.

Do you expect to have charge of them even after the traffic is open? There are three months' maintenance which I can hold the contractors to, and as to authorising the Commissioners to take over the machines in a complete state immediately, it is absolutely ridiculous in the face of that three months' maintenance.

Are we to understand that you will not expect the Commissioners to take the responsibility for these machines even after the commencement of traffic? Not finally.

You will not, then, have necessarily given up your responsibility? No; and neither will the contractors have given up their responsibility. But it is quite clear that the Railway Commissioners will have to take them over before that maintenance period has expired. It commences only when the traffic has been started, and lasts three months.

They are not ready for traffic yet until the engines are running properly? No; not until they can bear a load without heating.

Can you give an opinion now in regard to that matter? I hold the contractors responsible if they delay the thing in any way. If they fail to get the machines to do proper work it is their fault and not mine. That also brings to my mind the remark by Mr. Brain in his evidence in answer to this question, "The dynamos have given out the power they were expected?" He says, "Yes; they have not failed so far, but they have to give 25 per cent. overload for half an hour." The stipulation is, I think, that they have to give 25 per cent. for an hour and 50 per cent. for a short time. Then, again, he is asked a question following upon that, as follows:—"Over 850 kilowatts?" to which he replied, "Yes; but I think they would not give it for that time." Now, I think that a very unfair remark, and one which he is not in any way justified in making. He may be right and he may not be right. Again, Mr. Brain speaks of the trolleys leaving the overhead wire. I understand that the trolley wires are all right. It will be remembered that I previously mentioned they were put up temporarily at the car-shed entrance, so as to try them when the cars were on the line; but I think they are all right now. At any rate, it is one of those things with which you are apt to have always a little trouble at first.

*Mr. Wallach:* Was the permanent way completed with feeders? In connection with these feeders, there is a minute which I would like the Board to peruse. It is a letter I wrote on the 18th September as to the tests, and the opening of the line. Mr. Lee, the late Minister for Works, put a note on the minute that he wished the line to be opened on the 18th September, and admitted that I had full power to take any steps I liked in the matter. I had previously pointed that the date could not be definitely fixed. I told him that one of the engines would be put to work for trial about the 1st September, and that was done, and that a week after that another engine would be ready. I pointed out that the engineer in charge of the machinery wanted about a fortnight to dry out the generators; consequently, if that was correct, it would bring the date beyond the 18th September, providing no other hitch occurred and the Railway Commissioners were anxious to get their men at work. I was always of the opinion that the line would be open for traffic about the 1st October. I never anticipated the difficulties which arose afterwards, nor did I expect that the shunt coils would take so long to dry out. I did not expect either that the crank-pins would heat in any way. The minute to which I refer is as follows:—"With reference to the minute of the Railway Commissioners, of the 14th instant, forwarding reports of Messrs. Thow and Brain, I wish to place on record my surprise at the tone exhibited in portions of the correspondence on this subject; but, as Mr. Thow has been instructed to confer with me on the subject of the probable date for commencing traffic, I refrain from making any further

H. Deane.  
3 Nov., 1899.

H. Deane.  
3 Nov., 1899.

further remarks upon it." I have never recommended any particular date for opening the line for traffic nor have I urged that the work should be handed over to the Railway Commissioners in an incomplete state, much less recommended that the generators should be put to work on the ordinary traffic before proper tests have been made. On the contrary, I have pointed out to the Minister the difficulties of the case and the objection there was to fixing a date. The Minister fixed the date on his own responsibility, and I merely undertook to do my best to get his wishes carried out properly. It is idle to say that the floors and all finishing work must be completed before traffic can be started. It would, of course, be more convenient for the Railway Commissioners and the engineering staff, but it is by no means necessary, and works of all kinds throughout the world have put into use before final completion so long as the requisite plant has been available and in good order." (When I went to see Mr. Thow he quite acknowledged that. I asked him, "Could not these pipes have been packed up sectionally in a temporary manner?" and he acknowledged that they could. I said that we should put the permanent packing underneath and then take the temporary ones out, instead of taking the temporary ones out first and then putting the permanent ones in.) "I wish to add that from the commencement of this work, when the sole responsibility of carrying it out was placed upon me by Mr. Secretary Young, until recently, when the late Mr. Elwell's illness became so acute, I conferred with Mr. Elwell on all points with reference to mechanical and electrical detail, and everything that has been done has been previously discussed with him and received his entire concurrence. The only point on which we failed to come to an agreement, and his decease intervened and prevented our doing so, has been the question of the time when the severe insulation tests should be made. My right, as engineer under the contract, to have an opinion in the matter can scarcely be disputed, I think." The reason why I put the last sentence in was because the Railway Commissioners wrote to say that they could not understand the obstruction and want of harmony that had been exhibited by the Department of Public Works.

*Chairman*: Have you anything to say with regard to the junction boxes? It was reported to me that the test insulation did not quite agree with that of the Kelvin instrument; that the cutter did not seem to be quite sensitive enough, the tests made with 40 volts current and 550 volts showed a considerable difference.

*Professor Pollock*: Have you any comments to make upon the evidence given by the contractor for the building—Mr. Stewart? I consider that Mr. Stewart has been a very long time over his work. In regard to certain matters, I can quite sympathise with him, because he has had extra work, and has no doubt experienced many difficulties in getting his material. My experience is that where a work is suitable for carrying out on the day-labour principle, and this is not such a one, that we could get the work done very much quicker than if it were given to a contractor, as we would not have to go haggling about with merchants and contractors. It is far better to pay a little extra and have the work done promptly by a good man than to give it to some one who will do it slowly.

Is it true that Mr. Stewart had great difficulty in getting the ironwork? He should have ordered the ironwork himself. Instead of doing that he sub-let the work to Messrs. Tulloch & Co.

Mr. Stewart informed the Board that he went personally with Tulloch's representative to Messrs. Cameron & Co.? My impression is this: That when a man tenders for a job he ought to know where he is going to get his material before sending in his tender, and what price he is going to pay for it. He, therefore, should have made preliminary arrangements for obtaining the material before he sent in his tender. Had that been done there would not have been anything like the delay which has occurred. I will admit that at the time the engineers were on strike in England, and America was involved in the Spanish War, and the delays no doubt were easily accounted for. Still I think there was a greater delay than there was any justification for.

*Chairman*: Mr. Stewart informed the Board that the Tee-iron size 5 x 4 was not a market size, and that he could not get it out of stock, and that it had to be specially rolled;—is that correct? I do not think so. I gave instructions, which were duly carried out, to take the sizes out of the manufacturer's catalogue.

Although the sizes may have appeared in the catalogue, is it not possible that they would not be procurable at the time from stock? What were we to do? It may be an excuse for the contractor not being able to get the material, but there is no blame attached to us for using them in design.

Would it not have facilitated matters very much if you had stipulated for fewer sections? Yes, if it had been possible.

You would doubtless have increased the weight, but would you have been just as likely to save money by doing so? I do not think that very much could have been done in that way. In speaking of the extra work, I notice from Mr. Stewart's evidence that he says, "The foundations were all solid rock, and were considered most satisfactory. Before we started to erect the roof we received an order for a separate contract to put up the electric travelling cranes." That was not to erect cranes, but simply to use his cranes to put them in position. It is really a matter not worth mentioning. Then he is asked the question, "Could you not have ordered the material for the roof in the meantime?" to which he replied, "It was all ready." The roof material, I may tell the Board, did not all arrive till the following March. Then again he says, "There is another item in a separate contract amounting to £453, to which I should like to refer," and when asked what that was for, he answered, "That was for making a tunnel through the centre of the building to William Henry Street. I mean the main conduit." That was foreign altogether to his other work, and being quite out of the way, could not interfere with its progress. Supposing a man has a contract and you want a little extra work done in the ground alongside him, you arrange with him to do it at a certain price and he makes no complaint about his contract being delayed. His contract is not delayed, as it only means putting on an extra gang of men—not men taken from his other work, but a fresh lot of men for that particular work. In another part of his evidence Mr. Stewart says, "In fact the floor was quite strewn with materials, and it was quite impossible to get at it. The basement of the floor could not be proceeded with until recently owing to the steam-piping not having been completed." I have never complained about the main floor not being completed, or at least delaying the engines. In the finishing parts of his work we certainly would not be hard upon him or any other contractor. What we were anxious to have ready was the main structure, and particularly the roof. Mr. Stewart no doubt tries to justify his delay. I do not wish, as I said before, to be hard on him or any contractor who has been longer than he ought to have been. Then, again, in  
reference

reference to the switch-board gallery, he was asked if the erection of that was extra, and he replied, "No, it was not extra, but I had to write to the Department on that matter. The delay in its construction was also due to fixing up the machinery. The people erecting the machinery had to use a very large hydraulic press. They had to fix it up on the floor, and the result was that it blocked the whole of that portion of the work." I never heard of any complaint on that ground. Certainly there was a hydraulic press used in the erection of the machinery, but it was a small affair, as most hydraulic presses are, and it is very powerful at the same time.

H. Deane.  
3 Nov., 1899.

*Chairman*: Mr. Stewart informed the Board that in putting on the roof he experienced great difficulty through having to do first one side and then another—that is, that the ironwork could not be easily brought across to one side? I told Mr. Stewart that he would have to arrange when doing the work of the roof not to interfere with the other contractors more than possible. If he had been up to time he would have had no delay to experience in that matter, nor would he have had the other contractors in the way. I notice that in speaking of the boilers he said, "I had necessarily to go a bit slow on account of the steam-piping. The Department had to check my progress with the boilers to enable their piping to be worked at the same time." There is nothing new in the arrangement that when a man takes a contract he must work in with those who are doing other parts of the work; the contract provides for it. He had the contract for the building, and he must have known very well that he could not finish all the floors and so forth until the machinery was in its place. It is one of the things that contractors generally keep in view in works of this kind. In answer to another question, Mr. Stewart says, "I sublet the two iron roofs on the authority of the Government." That authority he got eight months after he had done it. If I had known that he proposed to sublet this work in the way he did, I should certainly have objected to it. I am quite sure he could have made a much better arrangement. I will not deny that he is not entitled to every consideration, and certainly the four months extra, but not the rest.

*Chairman*: Did he finish in that four months? No; he did not finish till June; he ought to have finished in April. I notice that he says in his evidence "the roof was commenced during the end of April and the whole completed by the end of May." I suppose he meant the walls and rafters, because it was not covered in. The reports will show that it was not covered in at that date; I think it was about the end of June.

*Mr. Wallach*: Mr. Stewart informed the Board that the roof was commenced during the month of April, and the whole completed by the end of May. Are we to conclude from that that the whole building was covered in? I notice in his evidence that he says, "It was finished, as I say, by the end of May"; that was in answer to the question asking if "the building was completely roofed in." I may say that the temporary end was left open for a long time. What I have always known the practice of energetic contractors to be is that they all make their arrangements, in order to avoid loss of time, before sending in their tender. They arrange that if they get the contract the merchant should be in a position to cable for the material at once.

*Chairman*: Mr. Stewart informed the Board that he paid away a lot of money in cables? Yes, he also told me that; but that was afterwards, when there was some difficulty about the sections. He also says in his evidence, when asked if the other contract interfered with his work, "I could not approach that part of the work under three months after I signed the contract." That should not have interfered with him; and arrangement of some kind might have been made by him.

With reference to the supply of bricks, I must admit that I do not think there is any process more aggravating than dealing with brickmakers, and in this I quite sympathise with Mr. Stewart. It is well known that the brickmakers form rings, and during this contract there was a ring that interfered with him very much. I notice Mr. Stewart says, "Of course, in additional work one always gets an extension of time." That is not always the case. In all contracts the schedule of additional works to be paid for at schedule rates is attached. There is no extra time allowed as a rule, but in the case of any very large extra work he would naturally get an extension. The excavation work at Ultimo was certainly very much heavier than was expected. If bores had been put down it would not have helped very much. We thought we had got to solid rock, but bad joints made their appearance.

*Professor Pollock*: Could you say if Mr. Stewart used every effort to push on the work immediately he received the material? I think he urged on the framing of the roof, but he seemed very long in covering it with galvanised iron, and in also covering in the end. I complained very much about the time occupied in covering in the end, as the rain was blowing in. He was also very dilatory in carrying out the boiler-setting contract.

*Chairman*: Was any delay caused through the boilers not being finished? Until the boilers were finished we could not fire up, nor could we complete the piping.

Do you know if the arrangements in regard to the coaling are now complete? The permanent coaling arrangements are not quite complete; the temporary arrangements are very good—in fact, they are as good as the permanent arrangements in most cases.

Have you anything else you would like to refer to? I should like to refer to the minute I spoke of in connection with the expenditure. I pointed out that the Railway Commissioners threw all the blame on the Works Department in respect to not having provided for the £150,000, and the minute which I wrote is as follows:—

With regard to the large expenditure entered upon to provide for the conversion of the tramway system by the Railway Commissioners, it has been verbally stated that it was the duty of the Works Department to see that the money was available. I wish to point out that it was always understood by the Department that this would be supplied out of the £150,000 vote of the Railway Commissioners. To assume that the late Chief Railway Commissioner did not realise the largeness of the expenditure would be to impute to him an inability to grasp the position, which was quite contrary to his character. I had many interviews with Mr. Eddy, and I know that he thoroughly understood that the expenditure would be very large, and that it would mean a considerable drain on the Railway Commissioners' vote; but he always acted as if the money were available, and I fail to see that it was in any way the duty of the Department to question the power of the Railway Commissioners to provide it, seeing that there was an actual vote for the purpose. That there was any bar against the use of the aforesaid £150,000 was not known to me, nor was it until recently that I was made aware that such was the case.

The Railway Commissioners, of course, know that this Department cannot undertake any large expenditure on their own account without first submitting a proposition for inquiry to the Public Works Committee. On the other hand, the Railway Commissioners had obtained an Act which authorised them to use electric power for traction purposes, and a vote providing money for the conversion of the present tramway system.

H. Deane.

3 Nov., 1899.

To that minute the Minister for Works (Mr. Young) put the following :—

May be forwarded to the Railway Commissioners. I had several consultations myself with the late Chief Commissioner on this subject, and am sure that he entirely understood that, as we were constructing a power-house, and providing for power immensely beyond that required for the George-street tramway, and with the intention of providing the necessary power to work the other tramways when converted, only a reasonable proportion could be charged to the George-street tramway vote, and the balance from funds at the disposal of the Railway Commissioners.

J.H.Y., 24/3/98.

It was then submitted to the Railway Commissioners, who added the following :—

The facts of the matter, so far as they are known to the Railway Commissioners, have been placed before the Right Honorable the Premier and Minister for Railways, and a copy of the minute is enclosed for the information of the Honorable the Minister for Works.

C.O., W.M.F., D.K., 25/3/98.

The minute referred to there was written before mine, and is, therefore, not in answer to it.

*Chairman* : Are the Board to understand that Mr. Eddy, Mr. Thow, Mr. Elwell, the Minister of the day, and yourself, were jointly responsible for ordering these generators at the time? Yes; that is correct.

Is there any other information you wish to give to the Board at this stage? There is nothing further that I can at present remember.

## A.

George-street Electric Tramway.

Public Works Department, Railway Construction Branch, 15 June, 1897.

Memorandum to the Secretary to the Railway Commissioners,

I FORWARD herewith, for the consideration of the Railway Commissioners, the result of an investigation into the tendering for the engines and generators for Harris-street by Mr. Thow, Mr. Elwell, and myself. It will be seen that we recommend the acceptance of one of Messrs. H. H. Kingsbury & Co.'s tenders with certain modifications set forth in the report, and I should be obliged if you would submit the same for the approval of the Railway Commissioners, so that their decision may be communicated to me with the least possible delay.

H. DEANE,

Engineer-in-Chief.

Endorsed. The recommendations of Messrs. Deane, Elwell, and Thow approved.—E.M.G.E., W.M.F., 17/6/97.

George-street and Harris-street Electric Tramway.—Contract No. 3.

*Report on Tenders for Steam-engines and Generators.*

TENDERS have been received from the following firms :—

Name of firm.	No. of tenders received.
1. Messrs. Edge and Edge.....	1
2. Allgemeine, E. G. ....	1
3. Electric Construction Co. ....	1
4. Crompton Co.....	1
5. Messrs. Siemens Bros. & Co.....	1
6. Messrs. H. H. Kingsbury & Co. ....	30
7. The Brush Electrical Engineering Co. ....	3

Details as to the highest amount tendered in each case being shown in attached statement "A."

At an early stage of the investigation we decided that tenders Nos. 2, 3, 4, 5, and 7 need not be further considered, as the amount in each case was considerably higher than those of Nos. 1 and 6, and there was nothing contained in their offers to show adequate value for the higher price.

Before comparing these two tenders it became necessary to select from the varied number of offers received from Messrs. H. H. Kingsbury & Co. the one considered most advantageous to the Department, and, after careful investigation, we came to the conclusion that tender "B," with time of completion in forty-six weeks, would most economically and satisfactorily fulfil the requirements of the case.

Comparison was then made between the tenders of Messrs. Edge and Edge and Messrs. H. H. Kingsbury & Co. (B 46) on a purely money basis, as shown on attached statement "B." In this comparison we deducted the cost of the collector rings, a price for which was asked in order to comply with a suggestion made by Professor Forbes; but which, according to most recent experience, would be found an undesirable adjunct to a railway generator. As there is also a difference in the size of the generators proposed to be supplied by the two firms, a proportional reduction had to be made from the tender of Messrs. H. H. Kingsbury & Co. As both firms proposed to supply engines of the same make, the comparison of the tenders was an easy one; the only other adjustment necessary being for foundation, &c., which Messrs. Edge and Edge had not included as specified; and, further, to make a deduction from their tender for the less expensive fly-wheel recommended by Messrs. H. H. Kingsbury & Co., and approved by ourselves, the result shows that the cost of supplying four 800 K.W. sets by Messrs. H. H. Kingsbury & Co. is £1,832 less than that of Messrs. Edge and Edge. It should also be pointed out that the time of completion for Messrs. H. H. Kingsbury & Co.'s tender is forty-six weeks, while that of Messrs. Edge and Edge is fifty-four weeks.

We have, therefore, no hesitation in recommending the acceptance of one of Messrs. H. H. Kingsbury & Co.'s ("B") tender, with some modifications set out below, to supply General Electric Company's generators with Allis Corlien engines, and we are strongly of opinion that the one offering the shortest time of completion is the most advantageous.

After investigating the details of the engines, we recommend certain alterations which will, in our opinion, greatly improve the working of them. In the first place, the increased size of cylinders as recommended by the General Electric Company, and for which they quote a price. This will add £1,000 to the total cost.

Some other details were pointed out to the agent of the General Electric Company, who was asked to submit prices for these alterations, particulars of which are on attached statement "O," and of which we recommend the acceptance of the following items :—

2. Stuffing-boxes .....	£ 80
3. Pistons .....	32
4. Crosshead .....	48
5. Connecting-rod .....	88
6. Piston-rod .....	60
10. Fly-wheel .....	32
	<hr/>
	340
Deduct item 9 .....	284
	<hr/>
Net increase of tender .....	£56

This,

This, of course, still leaves items 7 and 8 to be determined, which will require consultation with the makers. The cost of this should not, on any account, exceed £500.

The total value of the contract is, therefore, as under :—

Amount of "B" tender .....	£ 37,888
Deduct value of collector rings .....	1,320
	<hr/> 36,568
Add £125 to each cylinder for value of increased horse-power.....	1,000
	<hr/> 37,568
Add value of alterations, &c., as above .....	56
	<hr/> 37,619
Maximum amount likely to be required for alterations to governor gear .....	500
	<hr/> £38,119

In accepting the tender of Messrs. H. H. Kingsbury & Co., provision should be made that in case of their not completing to time they be paid at the lower rate set out by them for the longer period of delivery, instead of inflicting only the penalty of £100 per week as originally included in the general conditions attached to specification.

(Signed) H. DEANE.  
W. THOW.  
P. B. ELWELL.

Sydney, 15th June, 1897.

1899.  
(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

GEORGE AND HARRIS STREETS ELECTRIC TRAMWAY.  
(REPORT OF THE BOARD APPOINTED TO INQUIRE INTO THE DELAY OF OPENING.)

*Printed under No. 11 Report from Printing Committee, 23 November, 1899.*

WE have been asked to report on the following matter :—

- (1.) The question of design.
- (2.) The various steps taken from time to time to complete the work in a businesslike and satisfactory manner, and the delay which has occurred in opening the line.
- (3.) The failures which have taken place in carrying out the necessary tests.

BRIEF SUMMARY OF CONCLUSIONS.

In regard to—

- (1.) We consider the design to be excellent, and it is in accordance with the best modern practice in electrical tramways.
- (2.) We consider that the various steps taken from time to time to complete the work were not businesslike, for the reasons fully dealt with in the report, viz. :—
  - (a) The early ordering of the generators, and urging the contractors to expedite delivery without at the same time making adequate arrangements for the completion of the buildings in which they were to be erected.
  - (b) The letting of such a large number of contracts, thus dividing the responsibility and rendering it difficult to avoid the various contractors interfering with each other.

*Delays.*

- (c) The primary cause of the delay in opening the line was the adoption of the complete scheme at Ultimo, which is over five times greater than that originally contemplated merely for the George and Harris Streets tramways.
- (d) The alteration of the unit from 800 k.w. to 850 k.w., which caused six months' delay in consequence of the necessary dimensions of the larger machinery not being supplied with the tender. Until these particulars arrived from America it was impossible to proceed far with the plans and specifications for the power-house. We consider, however, that, in view of the rapid developments in electrical machinery, the alteration of the unit was wise, but that the time taken to send the particulars was excessive.
- (e) The delay in letting the contract for the power-house buildings after the particulars referred to in "d" arrived from America, caused by the time occupied in the preparation of the plans and specifications and in their consideration by the Railway Commissioners, we consider is mainly due to the system under which the work was controlled rather than to any of the individuals concerned.
- (f) The delay caused by Messrs. J. Stewart & Co. in regard to their inability to complete the buildings in a reasonable time.

As a result of this delay the erection of the engines and generators could not be carried out in contract time; the generators were exposed to the weather, the roof not being covered in, thus requiring a much greater time for drying them out than would otherwise have been necessary.

- (3.) (a) Up to the time of sending in this report the plant was not in a condition to warrant the application of the tests required by the specification. The engines had failed repeatedly to develop full power, owing to heating of the crank-pin bearings. Two of the engines and generators were loaded up to full power on November 8th without heating, and, as far as we could ascertain, were ready for service.
- (b) With regard to the permanent-way, the feeder junction boxes have developed defects in insulation which are at present being remedied by the contractors; the design of those boxes and the method of insulating the joints is defective.
- (c) The switches at cross-over roads did not work smoothly during the trial trip, but these may improve with traffic.
- (d) The loop at Circular Quay can be traversed by the tram-cars without difficulty.
- (e) The methods adopted in wiring behind the switchboard are not in accordance with the best practice, in view of risks from fire.
- (f) We consider that it would not be advisable to apply the insulation tests recommended by the Railway Commissioners—namely, 2,500 volts—until the generators have been running under load for at least a month and are thoroughly dry.

Finally, although a considerable amount of work yet remains to be done at the Ultimo power-house before it is completely finished, we are unable to see any reason why this work should not be in a fit condition, and the feeder junction boxes rectified, so that traffic may be safely commenced in three weeks' time—that is to say, December 1st at latest.

W. H. WARREN,  
On behalf of the Board.

1899.  
(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

GEORGE AND HARRIS STREETS ELECTRIC TRAMWAY.  
(OBSERVATIONS BY THE ENGINEER-IN-CHIEF FOR RAILWAY CONSTRUCTION UPON THE SUMMARY OF REPORT OF THE BOARD APPOINTED TO INQUIRE INTO THE DELAY OF OPENING.)

Printed under No. 12 Report from Printing Committee, 30 November, 1899.

Summary of Report by the Board of Inquiry

Public Works Department, Railway Construction Branch, Sydney, November, 1899.

THE summarised conclusions of the Board, of which Professor Warren was Chairman, having been laid on the Table of the House and published in the daily papers, I beg to make the following observations:—

In the first place I refer to my detailed report of the 13th instant.

1. I submit that I have shown that all the delays in the completion of the work, without exception, have directly or indirectly resulted from the change and enlargement of design, by which an authorised expenditure of £130,500 has been doubled.

2. I have shown that the early ordering of the generators was recommended conjointly by three officers—Messrs. Thow, Elwell, and myself; that the matter passed afterwards through the hands of the Railway Commissioners, Mr. Fischer, and the Board of Reference, and was finally approved by the Minister for Public Works, and that therefore no blame can be attached to any one individual. I further submit that if it had been such an unwise and ill-considered act some one or other of those who had it under review would have raised the question of its wisdom at the time. On the contrary, it appeared then to all to be a desirable step to take. As regards stopping delivery by cable, this certainly did not appear necessary to Mr. Elwell, who was acting in conjunction with me, and on whom I was largely relying in electrical matters. He was to have charge of the whole plant when finished, and was not likely to countenance any action or treatment that would injure the generators. No harm whatever has resulted from the early ordering of the machines that have been got ready and are now in splendid condition.

3. No information was asked from me by the Board during the progress of the inquiry as to the large number of contracts, otherwise the matter could have been explained. There were thirty-three in all. This is not a large number, considering the magnitude of the work. The majority of these contracts could not possibly interfere with one another, and many of them were quite distinct as to location even, while others were for material only, properly ordered from the manufacturers or their responsible agents. I give an analysis of the contracts, so that the matter may be better understood.

*Permanent-way and outside Electrical Works.*

No. of Contract.

4 and 5. Roadway—permanent-way materials supplied by the Department—No. 4, George-street; No. 5, Harris-street.

- |   |   |  |
|---|---|--|
| <ul style="list-style-type: none"> <li>1. Plastic bonds.</li> <li>2. Hannesman poles.</li> <li>6. Tracks at car-house entrance.</li> <li>6a. Points and crossings.</li> <li>13. Ironwork for poles.</li> <li>16. Feeder-cables and junction-boxes.</li> <li>22. Return feeders.</li> <li>23. Material for cross bonding.</li> </ul> | } | Materials only ordered from manufacturers direct or through their recognised agents. |
|---|---|--|

*Overhead Work.*

- 11. Overhead materials.
- 24. Trolley wire.

*Buildings distinct from Power-house.*

- 14. Car-shed.
- 27. Store and repairing shop.
- 31. Offices and W.C. accommodation.
- 19. Portable offices.

*Power-house Buildings.*

- 20. Excavation.
- 21. Chimney.
- 12. Power-house and offices.
- 8. Boiler-setting.
- 25. Steel columns and crane girders (materials only).
- 18. Water-conduit between power-house and Darling Harbour.

Power

*Power Plant.*

## No. of Contract.

3. Steam engines and generators.
10. Accumulators.
7. Boilers.
9. Switchboard and connections.
15. Travelling cranes.
17. Circulating and feed pumps.
26. High-pressure steam piping (steel).
28. Station wiring (material only).
29. Low-pressure steam piping.
- 30 and 30a. Covering for steam piping.

The practice of the Department has always been, for economical reasons, to let separate contracts for each class of work. It is apparent that machinery obtained through contractors for buildings and other works would cost considerably more, as the contractor would expect profit and commission for the transaction. The question is scarcely worth discussion. On the other hand, it is out of the question to suppose that the machinery contractors with their headquarters in America, or elsewhere outside of Australia, could undertake the contracts for the buildings.

There are 10 contracts in connection with permanent way and outside electrical work, 2 with regard to overhead materials, 4 for buildings quite distinct from the power-house and engines, or 16 in all out of the 33. These could not have been profitably reduced in number. In connection with the power plant, there were eleven contracts—steam engines and generators, the accumulators, switchboard and connections, travelling cranes, circulating and feed pumps, and steel high-pressure steam piping, all properly ordered from the manufacturers of these specialities through their local agents. The low-pressure steam piping was a local contract. The covering for steam piping, which can only be put on after steam is admitted into the pipes, and therefore hindered no one, was divided into two contracts to suit local manufacturers, and the boilers were made a separate contract, as is usual and proper. It is clear that any grouping of the above contracts would not have resulted in economy.

The remaining contracts are those in connection with the buildings, first the general excavation by which the site was prepared for the subsequent contractors, thus saving time. The chimney, power-house and offices, water conduit between the power-house and Darling Harbour, are works quite distinct in themselves, and, being on different sites, could not interfere with one another. The boiler-setting was made a separate contract, because it was convenient to do so. The manufacture and delivery to the building contractor of the steel columns and crane girders was made a separate contract, and by this means a great saving of time was effected, for, had the supply of these girders and columns been included in J. Stewart & Co's. building contract, then, judging by the dilatoriness displayed with regard to the roof work, they would scarcely have been in place before May this year, instead of being ready in November, 1898.

4. Delays due to alteration of design.—This was inevitable, owing to the wider policy of the Government of the day and the late Chief Railway Commissioner.

5. I have shown that the only delay—in my report of 13th November—in preparation of plans that can be attributed to the officers of this branch is about one and a half months, and, considering the very complicated nature of the work, I think this extra time was quite justifiable.

6. Drying out of Generators.—No unreasonable delay occurred here, that is so far as any blame can be attached to the Department. All generators and fields absorb moisture during transport and erection. The General Electric Company expect this, and there was nothing very uncommon in the state of the machines. The larger the machine the more drying out it requires, and the shunt coils especially, which are composed of many coils of fine insulated wire, require careful and slow drying out. Neither generators nor coils were exposed to the weather, except to the very limited extent pointed out in my report of the 13th instant.

7. Delays by Contractors.—These include non-completion of the buildings, the accident of heated bearings, difficulties due to failure of joint boxes, the blame for which was in no way chargeable to departmental action.

8. Wiring behind switchboard not in accordance with best fire practice.—I subjoin a report by Mr. Goodman, from which it appears that the completed portions are stated by Mr. Webb, Electrical Engineer to the Fire Underwriters' Association, to be quite in accordance with the best practice.

To conclude: In the Board's summary three lines are devoted to the excellence of the plant; nearly all the rest is taken up in discussing delays and the reputed unbusinesslike management. Not a word is said as to the amount of thought and care devoted to the design and execution of the work, nor to the enormous amount of work involved. The public can judge for themselves by a visit to Ultimo, when they will see an electric installation for traction purposes which, until a few years ago, would have been scarcely surpassed in the world, and has even now only been exceeded in size and scope by some of the enormous schemes being carried out to accommodate the traffic of the giant cities of the United States. They can then decide whether or no too much blame and too little credit has been bestowed on work initiated and carried out by the late Chief Commissioner, Mr. Elwell, myself, and staff.

Two of the engines have successfully passed the load test specified in the contract. The power developed during an hour's 25 per cent. overload test has been 1,553 h.p. in each machine, and this has been done without undue heating of any of the bearings or of the armature and coils. In fact, the machines are in splendid condition and quite up to their work. A third engine is nearly ready.

The feeder junction boxes have been finished and are now being tested.

Everything is practically ready for starting the traffic.

H. DEANE,  
Engineer-in-Chief for Railway Construction.

## OCEAN-STREET CABLE TRAMWAY.

(RETURN RESPECTING.)

*Printed under No. 1 Report from Printing Committee, 3 August, 1899.*

RETURN to an *Order* made by the Honorable the Legislative Assembly, dated the 18th April, 1899, That there be laid upon the Table of this House, a Return showing,—

- “(1.) The number of ropes that have been used in the King-street section of the Ocean-street cable tramway since its construction, and including the one now working.  
“(2.) By whom supplied, and on what terms.  
“(3.) The total life and mileage of each rope.  
“(4.) The cost per mile run of each rope.  
“(5.) The number of ropes on hand or ordered for this section, from whom ordered, and on what terms.”

(*Mr. Whiddon.*)

### OCEAN-STREET CABLE TRAMWAY.—RETURN SHOWING—

The number of ropes that have been used in the King-street section of the Ocean-street cable tramway since its construction, and including the one now working.	By whom supplied, and on what terms.	The total life and mileage of each rope.		The cost per mile run of each rope.	The number of ropes on hand or ordered for this section, from whom ordered, and on what terms.
		No. of days.	Miles run by rope.		
Eight .....	No. 1. Whitecross Co.—Unguaranteed	214	26,534	d. 6·89	There are no ropes on hand, but there are two on order— one from Bullivant & Co. and one from Craddock & Co. Both £30 per ton. Unguaranteed.
	2. Do do ..	177	23,332	7·79	
	3. Bullivant and Co. do (a)	413	52,234	3·23	
	4. Whitecross Co.—Guaranteed to run for 43 weeks (b) ...	430	54,483	3·54	
	5. Whitecross Co.—Guaranteed to run for 10 months (c) ...	214	27,160	6·26	
	6. R. S. Newall and Sons—Unguaranteed (d) ...	91	12,840	11·75	
	7. Whitecross Co.—Unguaranteed (e) ...	119	16,983	10·67	
	8. Whitecross Co.—Unguaranteed	Still running.		.....	

#### REMARKS.

- (a) A piece of this rope was afterwards used in North Shore extension section, giving an additional life of 161 days, and another piece was used in the Ocean-street section, where it ran for 124 days.  
(b) Afterwards made use of in Milson's Point section, where it ran for 85 days.  
(c) Two pieces were subsequently used on the Ocean-street section, giving lives of 76 and 46 days respectively.  
(d) Afterwards used in Milson's Point section for 47 days.  
(e) Purchased from the Melbourne Tramway and Omnibus Company, to whom the rope was guaranteed under their conditions.  
No. 5 cable failed to give the guaranteed life by 90 days, and the Contractor forfeited £104 5s. 4d. in consequence.

CASE OF JAMES COOK AND OTHER EMPLOYEES OF  
THE TRAMWAY DEPARTMENT.

(PETITION FROM JAMES ROBERTS, TRAMWAY MANAGER, PRAYING TO BE REPRESENTED BY  
COUNSEL OR ATTORNEY, OR IN PERSON, BEFORE SELECT COMMITTEE ON.)

---

*Received by the Legislative Assembly, 19 December, 1899.*

---

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in  
Parliament assembled.

The Petition of James Roberts, of Sydney, in the Colony of New South Wales,—

HUMBLY SHOWETH :—

1. That on the fourteenth day of December, in the year of our Lord one thousand eight hundred and ninety-nine, your Honorable House appointed a Select Committee to inquire into and report upon the conduct of James Roberts, Tramway Manager, in relation to James Cook and other employees of the Tramway Department.

2. That your Petitioner humbly prays that he may be represented by counsel or attorney, or in person, before the Select Committee appointed to inquire into and report upon the said matter, with the right to call witnesses and adduce evidence, and to examine and cross-examine such witnesses as may give evidence before the Select Committee.

And your Petitioner, as in duty bound, will ever pray.

JAMES ROBERTS,  
Tramway Manager.

---

VOTES No. 54. WEDNESDAY, 13 DECEMBER, 1899.

16. CASE OF JAMES COOK AND OTHER EMPLOYEES OF THE TRAMWAY DEPARTMENT:—Mr. Watson moved, pursuant to Notice,—
- (1.) That a Select Committee be appointed to inquire into and report upon the conduct of James Roberts, Tramway Manager, in relation to James Cook and other employees of the Tramway Department.
- (2.) That such Committee consist of Mr. Lyne, Mr. Cook, Mr. Wilks, Mr. McGowen, Mr. Millard, Mr. Dugald Thomson, Mr. Wright, Mr. Kidd, Mr. McLean, and the Mover.
- Debate ensued.  
Question put and passed.
- 

VOTES No. 55. TUESDAY, 19 DECEMBER, 1899.

3. CASE OF JAMES COOK AND OTHER EMPLOYEES OF THE TRAMWAY DEPARTMENT:—Mr. E. M. Clark presented a Petition from James Roberts, Tramway Manager, representing that the House had appointed a Select Committee to inquire into and report upon his conduct in relation to James Cook and other employees of the Tramway Department, and praying that he may be represented by counsel or attorney, or in person, before the said Committee, with the right to call witnesses and adduce evidence; and to examine and cross-examine all witnesses that may give evidence before such Committee.
- Petition received.  
Ordered to be referred to the Select Committee.
- 

VOTES No. 56. WEDNESDAY, 20 DECEMBER, 1899.

4. CASE OF JAMES COOK AND OTHER EMPLOYEES OF THE TRAMWAY DEPARTMENT:—Mr. Watson, as Chairman, brought up the Progress Report from, and laid upon the Table the Minutes of Proceedings of, the Select Committee for whose consideration and report this subject was referred on 15th December, 1899, a.m.
- Referred by Sessional Order to the Printing Committee.

---

PROGRESS REPORT.

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 15th December, 1899, a.m., "*to inquire into and report upon the conduct of James Roberts, Tramway Manager, in relation to James Cook and other employees of the Tramway Department,*" and to whom was referred, on 19th December, 1899, a Petition from James Roberts, "*praying to be heard by Counsel, or Attorney, or in person, before the Select Committee,*"—have agreed to the following Progress Report:—

Your Committee, having taken into consideration the lengthy list of witnesses submitted by Mr. James Cook, and the probability of numerous other witnesses being called to give rebutting evidence, together with the statement of the Chairman that Mr. Cook, the Railway Commissioners, and Mr. James Roberts (who has already petitioned your Honorable House on the subject) desire to be represented by Counsel,—have decided that, in view of the early prorogation of Parliament, and the necessarily short time at their disposal, it would be against the interests of the inquiry to initiate the taking of evidence.

Your Committee therefore, in view of the foregoing, beg to recommend that the Committee be reappointed as early as possible next Session.

J. CHRIS. WATSON,  
Chairman.

No. 1 Committee Room,  
Legislative Assembly,  
20th December, 1899.

---

PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 19 DECEMBER, 1899.

MEMBERS PRESENT:—

Mr. Cook,		Mr. Millard,
Mr. McGowen,		Mr. Dugald Thomson.
	Mr. Watson.	

Mr. Watson called to the Chair.

Entry from Votes and Proceedings appointing the Committee read by the Clerk.

Committee deliberated.

Resolved (*on motion of Mr. McGowen*),—That the Chairman prepare a Draft Progress Report.

[Adjourned till to-morrow, at 12 noon.]

WEDNESDAY, 20 DECEMBER, 1899.

MEMBERS PRESENT:—

Mr. Watson in the Chair.

Mr. Cook,		Mr. Wilks.
-----------	--	------------

Entry from Votes and Proceedings, referring the Petition of James Roberts to the Committee, read by the Clerk.

Chairman submitted Draft Progress Report.

Same read and agreed to.

Chairman to report to the House.

NEW SOUTH WALES.

THE DEPARTMENT OF PUBLIC WORKS.

(ANNUAL STATEMENT—1898-9.)

*Printed under No. 15 Report from Printing Committee, 21 December, 1899.*

The Under Secretary for Public Works and Commissioner for Roads to  
The Honorable Edward William O'Sullivan, M.P., Secretary for Public  
Works.

Department of Public Works, 18 December, 1899.

Sir,

I do myself the honor to submit, for your information, the Annual  
Statement relating to the operations of this Department during the year ended  
30 June, 1899.

FINANCIAL.

The gross expenditure for the year amounted to £2,165,818 14s. 11d., of  
which the sum of £813,809 11s. 5d. was provided from the Consolidated Revenue  
Fund and £1,352,009 3s. 6d. from Loan Funds. This expenditure was distributed  
as under :—

*Summary of Expenditure, 1898-9.*

Head of Service.	Revenue.	Loan.	Total.
	£ s. d.	£ s. d.	£ s. d.
Establishment* ... ..	26,366 14 0	.....	26,366 14 0

TOTALS ... ..	£ 813,809 11 5	1,352,009 3 6	2,165,818 14 11

\* Includes Ministerial, Clerical, Accounts, and General (Messengers, &c.) Staffs.

\*382—A

Compared

Compared with the preceding year, these figures show an increase in Revenue Expenditure of £590 17s. 5d., and in Loan Expenditure of £305,751 1s. 7d., making together a total increase of £306,341 19s. over last year's disbursements.

The number of persons or firms, exclusive of officers and wages-men, with whom the Department had financial transactions during the year, was 5,138, while the pay vouchers dealt with totalled, after being summarised, 42,767.

The following tabulated statement shows the distribution of the year's expenditure under the heads of contracts, wages, salaries, materials, &c. :—

Head of Service.	Contracts.			Wages.			Salaries.			Materials, Miscellaneous, Incidental.			Totals.		
	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.
Establishment .....							26,366	14	0				26,366	14	0
Railway Construction .....	43,100	8	8	28,775	14	9	15,840	16	1	91,765	4	3	179,482	3	9
Tramway Construction .....	65,372	5	7	9,281	1	2	3,042	9	10	96,910	0	1	174,605	16	8
Harbours and Rivers .....	169,606	8	5	163,106	5	9	21,172	8	1	178,200	7	11	532,085	10	2
Dredge Service .....	97	16	6	50,215	12	5	3,648	0	0	24,976	9	1	78,937	18	0
Country Towns Water Supply .....	9,904	11	5	10,199	3	6	2,055	0	2	20,630	12	6	42,789	7	7
Water Conservation and Irrigation ...	1,093	18	9	3,471	16	2	5,004	17	5	4,096	3	0	13,666	15	4
Government Architect .....	173,378	15	7	41,224	18	2	16,523	3	7	39,862	8	11	270,989	6	3
Roads and Bridges .....	359,089	0	7	161,832	12	4	38,701	14	9	*84,444	18	10	644,068	6	6
Sewerage Construction .....	157,171	4	10	17,632	6	9	11,269	3	7	16,754	1	6	202,826	16	8
TOTALS .....	£ 978,814	10	4	485,739	11	0	143,624	7	6	557,640	6	1	2,165,818	14	11

\* Includes road subsidies to Municipalities, amounts issued to Trustees, and officers' equipment and travelling expenses.

In addition to the foregoing expenditure, the Department executed works to the value of £28,813 15s. on behalf of other Departments, who defrayed the cost of same out of their own votes.

The number of contracts entered into during the year was 5,053, of an aggregate value of £948,064 7s. 1d. They were distributed as follows :—

Head of Service.	Number of Contracts Let.	Value.		
		£	s.	d.
Railway and Tramway Construction ... ..	93	97,173	18	2
Harbours and Rivers ... ..	103	104,568	16	7
Country Towns Water Supply... ..	12	5,811	2	5
Water Conservation and Irrigation ... ..	3	589	19	6
Government Architect ... ..	424	180,212	8	3
Roads ... ..	4,127	315,952	0	7
Bridges ... ..	260	96,943	13	11
Sewerage Construction ... ..	31	146,812	7	8
TOTALS... ..	5,053	948,064	7	1

At the close of the financial year the number of Contracts in progress was 693, carrying liabilities to the amount of £438,920 6s. 10d.

Summarised

Summarised statements of the operations of the Head Office Banking Accounts will be found in the Appendix.

Before closing this review of the Department's financial transactions during the year, I invite attention to the following tabulated statement of the expenditure disbursed, year by year, during the period of ten and a half years, ended 30 June, 1899 :—

Year.	Loans.	Revenue.	Total.
	£ s. d.	£ s. d.	£ s. d.
1889 ... ..	1,014,153 13 8	984,818 13 9	1,998,972 7 5
1890 ... ..	780,016 10 11	1,149,514 14 3	1,929,531 5 2
1891 ... ..	1,590,122 12 5	1,535,494 6 8	3,125,616 19 1
1892 ... ..	1,886,845 7 7	1,336,649 14 7	3,223,495 2 2
1893 ... ..	1,532,679 2 10	1,025,228 12 1	2,557,907 14 11
1894 to 30 June, 1895 (18 months) ...	1,342,662 18 1	1,243,259 7 7	2,585,922 5 8
1895-6 ... ..	757,461 12 1	1,015,024 0 5	1,772,485 12 6
1896-7 ... ..	856,669 8 2	835,500 15 8	1,692,170 3 10
1897-8 ... ..	1,046,258 1 11	769,780 11 2	1,816,038 13 1
1898-9 ... ..	1,352,009 3 6	813,809 11 5	2,165,818 14 11
Totals ... ..	£12,158,878 11 2	£10,709,080 7 7	£22,867,958 18 9

These figures, which show an average annual expenditure of £2,177,900, exhibit in a striking form the magnitude of the undertakings carried out by the Department.

#### CONSTRUCTION.

The reports from the heads of Branches, appended hereto, set forth in detail the various works completed or in hand during the year, and supply a large amount of varied and interesting information respecting the progress and development of the Colony.

#### RAILWAYS AND TRAMWAYS.

The one new railway line completed and opened for traffic during the year was the Berrigan to Finlay extension, 13 miles 72 chains in length, bringing up the total mileage of existing lines as at 30 June, 1899, to 2,705 miles. The cost of this extension has been £31,653, or about £2,277 per mile.

The following lines were under construction at 30 June, 1899 :—

- Tamworth to Manilla, length 29 miles 42 chains.
- Moree to Inverell, length 95 miles 60 chains.
- Extension to Darling Island.

The first named has since been completed and opened for traffic.

Acts have been passed sanctioning the construction of the undermentioned lines, and preparations are being made to carry out these works by means of day-labour :—

Koorawatha to Grenfell	...	...	length, 28 miles 28 chains.
The Rock to Green's Gunyah	...	„	24 „ 52 „
Byrock to Brewarrina	...	„	57 „ 60 „

The Survey Staff has been kept fully employed in making trial surveys, inspections, &c., of a number of proposed lines.

The completion and opening for traffic (on 4 October, 1898) of the Rose Bay Electric Tramway, which extends from the terminus of the Cable Tramway at Ocean-street to Rose Bay wharf, a distance of 1 mile 23 chains, single track, was reported in my previous statement ; but several improvements found to be necessary in consequence of the, at times, heavy traffic, have been carried out during the year. The cost of this tramway, including the generators, which also provide power for the Double Bay Sewerage Pumping-station, has been £19,800.

The hope expressed in my last report that the then current financial year would witness the completion of the George-street to Harris-street Electric Tramway, was not realised. It is, however, pleasing to be able to now report that this important line was completed and open for traffic on 8 December, 1899. The delays that have taken place in connection with this work have been caused by the radical change made from the original design.

The original intention was to run this tramway by means of electric power supplied from Rushcutters Bay Power-house, and the Act authorising the work was passed in September, 1896. Soon after this the Railway Commissioners, having in contemplation a scheme of converting all the tramways to electric traction, decided that the George-street to Harris-street Tramway should form only a section of one complete system. With this object in view, a sufficient area of land was secured at Ultimo, close to the Darling Harbour Station-yard, whereon could be erected buildings and machinery capable of supplying power to the extent of 20,000 horse-power. The arrangements for running the George-street line are accordingly but a small part of a large scheme for the conversion to electric traction of the whole of the existing steam and cable tramways. The magnitude and exceptional character of the works, now partially completed, are described in Mr. Deane's report, which shows that very special demands have been made upon the resources of the branch in connection with this exceptionally large electric-power installation.

#### IMPROVEMENT, MAINTENANCE, AND CONVENIENCE OF NAVIGATION.

The multifarious works undertaken by this branch are outlined in the accompanying report from the Engineer-in-Chief for Public Works.

It will be seen therefrom that good progress continues to be made with the schemes for improving the entrances to our northern rivers.

At

At the Richmond, the construction of the South Breakwater is being pushed on by night as well as by day, an electric light installation having been established for this purpose. The work already accomplished at this river entrance has practically done away with the delays to shipping that used frequently to occur in former times.

On the Clarence, the building of the Goodwood Island Training-wall and the maintenance of the Southern Breakwater have been the principal works in hand during the year. The opening out of the Woodford Island new quarry is proceeding, and, when completed, should help to materially reduce the cost of the Clarence River works.

Improvement works are being steadily carried on at all the river entrances and harbours north of Newcastle. About 600 men are constantly employed, 400 directly by the Government, and the remainder by contractors.

Dry Docks are in course of construction at the Tweed, Richmond, and Clarence Rivers, of a more substantial character than any hitherto built outside of Sydney, being excavated in rock and lined where necessary with concrete. They will be of sufficient size to take in the large dredges and tugboats, and will thus be the means of effecting a considerable saving, both in time and money, in cases where vessels would otherwise have to be towed to Sydney.

An increase is noticeable in the amount of work done in Newcastle Harbour as compared with the preceding year. Substantial progress has been made with the breakwaters and guide-wall, and the rock excavations and crushers have done good work in deepening the channels and wharf frontages.

One of the more prominent works now in progress is the construction of the "new basin." When finished the new basin will enclose an area of 90 acres, and provide some 6,000 feet of wharf frontage. A cattle-shipping wharf has already been completed, and work has begun on the construction of a coal-loading wharf which will be fitted with six hydraulic cranes.

In Sydney Harbour, demands for increased wharfage accommodation continue to come in. Contracts have been let for the construction at Woolloomooloo Bay of an additional 800 feet of berthing space with the necessary cargo sheds and stores. At Darling Island the concrete wharf wall is being pushed on, and has now been extended to a length of 1,100 feet.

In connection with the dredging operations which are so necessary in all our rivers and harbours, special attention may be drawn to the great success attending the work of the new dredge "Antleon." This dredge is unique in its design, and has more than fulfilled expectations. It will be invaluable in the work of removing the shallow sea bars which obstruct the entrances of most of our rivers.

In the South Coast District an important work has been the erection of Point Perpendicular Lighthouse, which takes the place of the old Cape St. George Light. It is fitted with a first-order dioptric revolving white light, the focal plane of which is 304 feet above high water. Quarters have been provided for a principal light-keeper and two assistants, and the total cost has been a little over £16,000.

A large

A large amount of new and repairing work has been executed at the Fitzroy Dock establishment; special mention may be made of the construction of two new tug-boats, "Phoenix" and "Dooribang," and of a wooden screw steam launch, the "Sol."

The docking facilities afforded by the Sutherland and Fitzroy graving docks have been largely availed of during the year. Including Imperial warships and the Government boats, 155 vessels, aggregating 206,230 tons measurement, have made use of the docks.

#### WATER SUPPLY.

The work of duplicating the 6-foot pipe-line between the Pipe Head Basin and Potts Hill Reservoir, a distance of  $4\frac{3}{4}$  miles, is approaching completion.

New water supply works have been provided for the municipalities of Mudgee and Picton, and extensive additions have been made to existing works at Cootamundra and Forbes. Schemes for supplying Kiama and Wollongong have been prepared.

#### WATER CONSERVATION AND IRRIGATION.

The operation of the Water Rights Act forms a noteworthy portion of the duties entrusted to the Department.

The map which forms an appendix to this report shows that the great majority of the works dealt with are in the Central and Western Divisions, being most numerous in Riverina, and in the dry districts on the Lower Lachlan, and north-west of the Darling.

The fact is often overlooked that the benefits resulting from these works, whether constructed by the Government or by private enterprise, are out of all proportion to their inconsiderable size and cost. Wanting these works, the land in many places would be practically valueless. As an instance of their great value the Willandra Weir, on the Lachlan River, constructed by the Government at a cost, including all subsidiary works, of less than £10,000, diverts water in flood time through 360 miles of channel in one of the driest districts in the Colony. The Middle Billabong Weir, although not quite completed, during a recent moderate rise in the Lachlan diverted a supply of water to a distance of nearly 100 miles. Again, the improvements carried out on the Yanko Creek, at a comparatively small cost, have resulted in providing permanent water to several hundred miles of frontage, even in the driest seasons.

The power vested in the Minister by the Act to make arrangements for the more equal distribution and beneficial use of the available supply of water is one which demands the utmost care in its exercise. Full and accurate data have to be procured and maintained respecting every river that is likely to be drawn on to any extent. Rules have also been framed under which the Minister's powers will be preserved, while at the same time protecting and encouraging private enterprise.

It is gratifying to be able to report that opposition to the granting of licenses for private works not objected to by the Department has almost ceased. The strife which raged for forty years regarding dams on the Yanko, Colombo, and Billabong Creeks,

Creeks, is practically ended. The conditions regulating the use of the waters of these creeks have been accepted by all parties concerned, and works of a higher class are now being constructed.

The severe drought which has for so long a period affected a wide area in the Central and Western Divisions has clearly shown that the equitable distribution of the available supply of water in our rivers is a question of growing importance, and on its satisfactory solution will depend, in a great measure, the extension of settlement and the development of the interior of the Colony.

Under the provisions of Section 4 of the Water Rights Act, works may be constructed by the Government for the use of landowners who are prepared to pay interest on the expenditure incurred. The utility of this section is becoming better known, and several proposals for works to be constructed under its provisions are now being dealt with.

The scheme, which was approved by Colonel Home, for the construction of a system of irrigation canals from the Murrumbidgee River, has been ready for some time to be submitted to the Parliamentary Standing Committee on Public Works. It provides for a storage reservoir of an estimated capacity of nine thousand million cubic feet of water, which would serve to keep up the supply in the river during the summer months. The estimated cost of the scheme is £650,000.

Other schemes which have occupied the attention of the Branch during the year are, the locking of the Darling River from Bourke to Menindie; the survey and estimate of a canal from the Murray River; and the survey and estimate for the diversions of an increased supply of water into Lake Cudgellico.

While I am of opinion that the importance of conserving water in the arid districts of the Colony cannot be over-estimated, I, however, cannot help thinking that the time has not yet arrived for carrying out very large schemes, involving an expenditure of many hundred thousand pounds. There is not, I think, sufficient population to warrant such works at the present time, especially when it is taken into consideration that most of the waters so conserved would have to be pumped from the canals to be used for irrigation purposes. The policy of the Department at the present stage should, to my mind, be in the direction of making small inexpensive dams, somewhat on the lines of those erected by pastoralists and others, on stock routes and other public thoroughfares, as well as in proximity to small centres of population. These dams would meet the existing and immediate demands, and induce settlement, and, in due time, would be followed up by the larger and more important works.

#### GOVERNMENT ARCHITECT.

Mr. Vernon reports that the past year has been a busy one, the total expenditure by his Branch—viz., £281,137 10s. 3d., including costs of services for other Departments—being greater than for any year since 1892. There has been a general improvement in building operations throughout the colonies, and the increased prices for labour and materials have no doubt contributed to the larger expenditure.

The

The new buildings completed comprise :—

	£	s.	d.
13 Police Buildings ... .. Costing	13,014	14	6
5 Post Offices ... .. „	10,591	3	10
7 Court-houses ... .. „	9,457	11	6
New Gate Lodge, &c., University ... .. „	1,952	0	0
Bourke Lands Office ... .. „	3,735	6	5

The more important buildings under construction at 30 June, 1899, were:—

Custom-house ... ..	Additions and alterations.
General Post Office ... ..	„
Treasury Buildings ... ..	„
Coast Hospital, Little Bay ... ..	„
Government House ... ..	„
Kenmore Hospital for Insane ... ..	New building.
Water and Sewerage Board's Office, Newcastle	„
Botanic Gardens—Buildings, &c. ... ..	„

Extensive works in the way of remodelling, improving, and adding to the first-class gaols of the Colony, which were rendered necessary by the altered methods of treating prisoners, have also been carried out during the year. Many of them have been provided with complete electric light installations.

At Kenmore Hospital for Insane, all the buildings intended to be erected for the present on the women's side of this institution have been completed, and a contract has been let for the erection of the corresponding buildings on the men's side.

In connection with the large amount of urgent repairs to public buildings and furniture, which require to be executed often with great expedition, the permanent workshop and store attached to this branch have proved eminently useful and economical.

Two comprehensive schemes for the erection of additional office accommodation—firstly, on land at the junction of Phillip and Hunter Streets, and, secondly, on the vacant land at the junction of Phillip, Bridge, and Young Streets,—were prepared and submitted to the Parliamentary Standing Committee on Public Works. The Committee reported against the first scheme, and decided to postpone the second until the Under Secretary for Lands and myself reported on the existing accommodation in the Works, Lands, and Mines Offices.

In view of the early accomplishment of Federation, Mr. Vernon points out that for the credit of the State it will be desirable to have all those buildings, such as Post Offices and Custom-houses, that will be transferred to the Federal Government, placed in good repair before such transfer takes place. The funds hitherto placed at his proposal for the repair of public buildings generally are quite inadequate for the purpose, and it will be necessary to give this matter early and earnest attention.

## ROADS AND BRIDGES.

The Principal Assistant Engineer, Roads and Bridges, furnishes a concise summary of the valuable work done by this branch towards the opening up of the country for settlement.

During the year 1,139 miles of new roads were cleared or wholly or partially formed; 33 new bridges were opened; 38 old structures were replaced; and 2,573 culverts, aggregating  $4\frac{1}{3}$  miles in length, were constructed.

The following table shows the total roads mileage and the aggregate length of bridges and culverts at 30 June in each year since 1896, and the total expenditure of the Branch for the same periods:—

Date.	Roads. Mileage.	Bridges.		Culverts.		Total Expenditure for the year.*
		No.	Length in feet.	No.	Length in feet.	
30 June, 1896 ... ..	38,952	2,771	260,519	31,073	461,578	£ 776,400
30 June, 1897 ... ..	39,874	2,842	267,964	32,671	486,907	676,210
30 June, 1898 ... ..	41,040	2,881	272,996	34,731	511,393	616,097
<b>30 June, 1899 ... ..</b>	<b>42,179</b>	<b>2,914</b>	<b>275,994</b>	<b>36,158</b>	<b>535,342</b>	<b>645,569</b>

\* Includes expenditure on new bridges completed and in progress.

It will be seen that the length of roads and bridges under control of the Branch continues rapidly to increase. There has been a slight increase in expenditure as compared with the preceding year, but it is essential, in order to keep the public roads of the Colony in fairly good trafficable condition, that large additions be made to the at present limited funds at the disposal of the Branch. The applications for grants amount to millions of pounds every year, and the most rigid economy has to be exercised in the attempt to meet reasonable claims.

The monthly average number of workmen regularly employed by the Branch was 1,046, while an additional 566 received temporary and intermittent employment. The number working under contractors averaged 5,684.

The contracts let during the year numbered 4,387, of an aggregate value of £412,895. Considering the large number of contracts dealt with, it is pleasing to report that in no instance has a contractor exercised his right of appeal to legal process, and in very few cases has it been found necessary to reverse at Head Office the decisions arrived at by the officers in charge of the works.

The advantage of linking the South Coast tourist district with the Blue Mountains by road has been recognised for some time. Last year the first step was taken by the construction of a road through the Macquarie Pass, connecting the coast with the southern table-lands. This year the Wombeyan Caves are being made accessible, and extensive improvements are being arranged for on the existing route

from Jenolan to Mount Victoria. The final step will be the opening of a road between the two great cave centres of the Colony, and when this has been done a tourist route of over 300 miles by road and rail, passing through magnificent scenery almost its entire length, will be available.

In providing access to new country, as yet sparsely populated, but giving fair prospects of development, the policy of the Department has been to select routes capable of permanent adoption and gradual construction as the traffic expands. In the early years roads were not infrequently constructed on such steep gradients that it has been found necessary to wholly or partially abandon them. In all new works every effort is being made to avoid this error, and, in addition, on long-established roads, the steep lengths are being gradually cut out by deviation; and it is hoped by this policy to gradually improve the traffic routes of the Colony and at the same time reduce the cost of maintenance.

On the Northern rivers a problem presents itself which has had the serious attention of the Branch. As nearly all the rich cultivated land adjoins these rivers, while that more remote is low-lying, swampy, and unsuitable for road-making, many of the leading arteries of traffic necessarily run along the river banks. The soil is friable, and its continual erosion has been a source of great expense. In many places the roads have been partly, or wholly, destroyed by floods, and by ordinary wave-action, resulting from steamer traffic, &c. Either protective works or costly resumptions have, therefore, from time to time been found necessary. Hitherto each case of erosion has been dealt with as it occurred, and consequently in some cases the quickest method of reopening traffic has had to be resorted to irrespective of its permanent efficiency. It has long been recognised that the problem should be dealt with in a more systematic manner, and steps are now being taken in that direction. Last year a small sum of money was provided on the Estimates for river-bank protection, and a commencement has been made in its expenditure on lines which it is thought will combine the maximum of efficiency with the minimum of cost. The importance of this work cannot be over-estimated.

In previous reports attention has been repeatedly drawn to the necessity for legislation dealing with the width of tires, and I desire again to urge immediate action. I have no hesitation in saying that, if broad tires were made compulsory, many thousands of pounds could be saved in maintenance every year, and the light traffic would be immensely benefitted without unduly interfering with the interest of waggon owners. On the many roads throughout the Colony on which metalling is impracticable, a few heavy loads, run on narrow tires, are sufficient to ruin them for lighter vehicles, and the many have to suffer for the mistaken prejudices of the few. It has been proved beyond question that on most soils broad tires are an advantage, even to the heavy traffic itself, as the roads are not rutted, and greater loads can be carried with equal tractive power.

In my report for the year ended 30 June, 1896, I called attention to the bad state of the roads in the vicinity of country towns. Most, perhaps all, country municipalities are burdened with an excessive area, and their chronic want of funds debars them from undertaking any work of road repairs except on the short sections passing through the more thickly-inhabited streets. The result is that a long stretch of good road, under control of the Department, is spoilt by a few miles of bad road  
lying

lying within a municipality, and much irritation and delay are caused thereby. It is clear that under existing conditions municipalities are unable to maintain their portions of the roads in proper repair, and a remedy for this evil is urgently called for.

The Assistant Engineer for Bridges (Mr. de Burgh) reports the completion of 71 new bridges at a cost of £59,585 16s. 7d., 38 of which replaced previously existing structures which had become unfit for traffic. The total length of the 71 bridges is 9,791 feet, consisting of 265 timber beam spans, and 14 timber truss spans.

The more important bridges completed were the following :—

The renewal of the timber viaduct in approach to the iron bridge over the Murrumbidgee River at Gundagai, having a total length of 2,719 feet, and consisting of 78 timber beam spans :

Union Bridge over the Murray River at Albury, having a total length of 323 feet, consisting of two timber truss spans of 110 feet each, and three timber approach spans :

Bridge over the Bega River at Bega, having a total length of 433 feet, consisting of four 90-foot timber truss spans, and two 35-foot timber approach spans,

At the close of the year under review there were in course of construction 37 new bridges, estimated to cost £89,950. Of these, the more important are—

Kempsey Bridge, the completion of which may be looked for early in 1900 ; this bridge consists of four timber truss spans of 154 feet each, on cylinder piers, with 305 feet of approach spans, the width of deck being 22 ft. 6 in. throughout :

Dunmore Bridge, Paterson River, which will be completed at an early date :

Hinton Bridge, Paterson River, which completes the line of communication between Morpeth, Hinton, and northwards *via* Phoenix Park, in connection with the bridge over the Hunter River at Morpeth :

Murwillumbah Bridge, Tweed River, the construction of this bridge being rendered necessary by the opening of the railway from Lismore to the Tweed, which has its terminus on the south side of the river, opposite Murwillumbah.

In connection with the Hinton and Murwillumbah bridges, attention may be called to the improved machinery for raising the lifting span, by the adoption of a system of wire ropes in lieu of shafting overhead, a considerable saving in the cost of construction being effected thereby.

Three other bridges in course of erection deserve special notice on account of certain features in their design.

Queanbeyan Bridge, which should be finished early in 1900, is, with the exception of the bridge over the Lachlan at Cowra, the first erected in New South Wales of the composite type, in which steel is used in the bottom chords, and iron-bark for the compression members of the truss. I am of opinion great economy in maintenance may be expected from the use of this type of truss, as experience with timber trusses shows that the lower chords, which are the most difficult portion of the

the structure to replace, are, when constructed of timber, the first parts to decay. The Queanbeyan Bridge has three of these composite truss spans of 91 feet each; but longer spans of the same type will probably be found efficient and economical for the wider rivers.

At Moruya Bridge an important departure has been made in the use of cast-iron piles sunk by the hydraulic process. The old bridge was a very light timber structure, 850 feet in length, erected in 1875, and now quite past service. The river at this place is a sandy estuary, the depth to rock from high water varying from 9 feet at the shore to 46 feet in the centre. It was considered advisable that the piers of the new bridge should be of a permanent character, but the depth to rock made the sinking of cylinders a very costly matter. Piers consisting of three cast-iron piles, each 12 inches in diameter, and having a specially formed shoe  $18\frac{3}{4}$  inches in diameter, have been adopted, the piles after fixing being joined together with steel bracing. These piles are sunk to a depth of 20 feet by means of a powerful jet of water, which, entering the top of the hollow piles and passing through orifices in the shoe, displaces the sand and causes the pile to sink to the required depth.

There can be little doubt that the success which has attended the operation of sinking the foundations of the Moruya Bridge will enable many similar cases to be dealt with more effectively and cheaply than hitherto.

Cockle Creek Bridge is also worthy of notice by reason of the use there of cylinders built on the Monier system instead of cast-iron (whereby a saving of £264 5s. was effected on two small piers alone), and of Monier coverings to protect the timber piles from the attacks of the cobra. The system, which is fully described in the report and illustrated by plate, is very efficient and capable of extended use.

Existing bridges to the number of 642 were overhauled and repaired during the year for an expenditure of £46,107 6s. 2d. All repairs have, as was the case in the previous year, been carried out by the Branch without the intervention of contractors, and further experience of the system has confirmed the anticipations of its suitability. The largest work in the way of repairs undertaken during the year was the restoration of traffic on the Denman Bridge, Hunter River, a great portion of which had been destroyed by floods. Three new piers were constructed (the most important being an iron cylinder pier) and the damaged superstructure rebuilt at a cost of £3,707 12s. 2d.

The duty of inspecting all timber exported to the order of the New Zealand Government, and also certain Harbour Boards, devolves upon this Branch; and whatever views may be held as to the advisableness of sending away large quantities of our best timbers, it is desirable that all such exports should be properly inspected and classed.

In the month of August, 1898, the New Zealand Railway Department placed orders in the Colony for the supply of about 4,000,000 superficial feet of hewn and sawn timber, and about 35,000 lineal feet of round piles (£43,500 worth), and at the request of the New Zealand Government arrangements were made for inspection before shipment by the officers of this Branch. In addition to the services of one inspector (Mr. Kane) sent to the Clarence from New Zealand, this work has required the undivided attention of three officers, as well as the constant supervision of the  
Department's

Department's timber inspector. Up to 30 June the following had been supplied:— 25,000 lineal feet of round piles, 1,250,000 superficial feet of squared and sawn timber, the money value of which, delivered in New Zealand, is £15,000, and it is satisfactory to note that the New Zealand Government state that their views have been met as to the quality of the timber sent forward.

In connection with the new steam ferry punt to carry vehicular traffic at Grafton, condensing engines are being used for the first time, and it is hoped that the public will appreciate the absence of the noise caused by the exhaust in the high-pressure engines in use heretofore.

At Ryde some experiments which have been conducted in the use of oil-engines for the propulsion of ferry-punts are so far satisfactory as to warrant their more general adoption.

Two steam-launches of a somewhat novel design have been built for passenger traffic and towage purposes on the Hunter and Clarence Rivers. These launches are each double-ended, 70 feet long, 15 feet beam, 5 feet depth, with hardwood keel and Oregon side-planking. They are propelled by compound surface-condensing engines, with 8-inch and 16-inch cylinders, 9-inch stroke. The engines indicate 50 horse-power, at 300 revolutions per minute. The boilers are return tubular boilers, 6 feet long, 7 feet diameter, wholly constructed of steel, and designed for a working pressure of 115 lb. per square inch. Propellers are fitted at either end of each launch, 3 ft. 3 in. diameter, 4 ft. 6 in. pitch, which drive the boat at a speed of  $9\frac{1}{2}$  knots per hour. An electric light installation is fitted up, supplying side and mast-head lights, in addition to the lights for deck and engine-room. The launches are provided with coal-bunkers, water-tanks, and cabin for the crew, and have seating accommodation for more than 100 passengers each.

I have commented at some length, in this review of the Roads and Bridges Branch, not only on the work done, but also on the means adopted to carry it out, with the object of showing that the necessity of keeping in touch with modern improvements and adopting the best methods is not lost sight of.

In a new country no improvement in railway or water communication can be availed of to its full extent unless the roads, which feed these lines of communication, advance with them. In this Colony the bridges and ferries form a most important part of the roads. When, by the adoption of improved methods, such as those described in connection with the composite bridge at Queanbeyan, bridges at Hinton and Murwillumbah, the Monier system at Cockle Creek, and the hydraulic sinking at Moruya, present or ultimate economy is effected without loss of efficiency, the usefulness of the Department in opening up the country is increased in a corresponding degree.

#### SEWERAGE CONSTRUCTION.

It will be seen from the exhaustive report of Mr. Davis, Engineer-in-Chief for Sewerage Construction, that good progress has been made during the year by this Branch. The total expenditure on works completed and in progress amounted to £202,826 16s. 8d., while drawings were prepared for thirty-nine contracts representing works valued at £307,414.

The

The year under review marks the completion of the main northern branch of the Western Suburbs system, terminating in Leichhardt near the eastern shore of Long Cove, and of the greater portion of the main western branch, extending from Premier-street, Marrickville, to Bland-street, Croydon. The last section of the western branch, which provides for the sewerage of Burwood, Strathfield, and parts of Ashfield and Concord, is now in course of construction.

The sewers draining the north-western and south-eastern slopes of the Municipality of Balmain have also been completed.

The drainage of Kensington and West Randwick is being provided for by an extension, to the north-west corner of the racecourse, of the intercepting sewer which discharges into the sea at Coogee.

The outfall works at Willoughby Bay, which dispose of the sewage by a process of precipitation and filtration, have been in active operation for some months past, and the results obtained have fulfilled expectations.

Contracts are now in progress for sewers which will serve the greater part of the southern slopes of Mosman and the whole of Neutral Bay district. Designs for the sewerage of Middle Harbour slopes are being prepared, and tenders will shortly be invited for the construction of the first section.

It has been decided to treat the Willoughby and Chatswood sewage by means of septic tanks and Dibden filters, and the plans for the necessary works are in hand. Meantime active progress is being made with the outfall and reticulation sewers. These should be available at an early date for carrying away the slop-waters of the borough to a point where their accumulation will no longer be a menace to the health of the residents.

Treatment works on the septic tank and Dibden filter principle at Rookwood Asylum are nearly completed.

The reticulation of Manly is in a forward state.

The Quarantine Station grounds are being sewerred, and, when the works now in progress are completed, the anxiety which exists with respect to the sanitary condition of the station will be removed.

During the year under review the attention of the Branch has been largely concentrated on the low-level area comprised in the foreshores of the harbour stretching between Double Bay and Balmain. The drainage of Double Bay on the Shone system is completed; that of Balmain is well under way, while contracts have either been let or are in preparation for the drainage of the foreshores stretching between these two points. Tests have been made as to the efficiency of the Shone system at Double Bay, and satisfactory results obtained.

It is gratifying to be able to report that all the municipalities in the metropolitan area, with few exceptions, have, or are in a position to have, the reticulation pipes connected with main sewers. In Strathfield, Homebush, and Concord the main sewers are under construction; those for Five Dock, Canterbury, Enfield, and Drummoyne are in the initial stage of design. It is, however, safe to predict

predict that within the ensuing twelve months all the more thickly-populated districts throughout the whole of the metropolitan area will be enjoying the benefits resulting from the completion of a comprehensive and efficient sewerage system.

A scheme of sewerage for the Illawarra suburbs is being prepared, and will on an early date be submitted for the consideration of the Councils interested.

The scheme designed for Newcastle has been referred to the local authorities.

Newcastle Pasturage Reserve, which comprised an area of 7,782 acres of swampy land, has been successfully drained.

The drainage of some of the more important country towns has occupied the attention of the Branch, and several schemes are now either being constructed, designed, or reported upon. It is found that towns possessing a proper water supply soon feel the necessity of some system of drainage to carry off the waste water.

#### LAND VALUATION.

The subjoined tabulated statement shows the amounts paid during the year in settlement of claims in respect of land resumptions :—

Branch.	Compensation.	Interest.	Costs.	Total.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Roads and Bridges ... ..	2,024 13 10	106 19 4	161 6 5	2,292 19 7
Harbours and Rivers ... ..	76,769 9 2	11,143 16 4	323 19 0	88,237 4 6
Government Architect ... ..	3,189 4 0	70 8 8	57 13 10	3,317 6 6
Railway and Tramway Construction.	18,506 2 4	1,284 4 8	645 12 6	20,435 19 6
Sewerage ... ..	3,103 1 6	181 8 10	170 9 6	3,454 19 10
Water Conservation and Country Towns Water Supply.	213 3 7	11 16 10	17 12 4	242 12 9
Totals ... ..	£ 103,805 14 5	12,798 14 8	1,376 13 7	117,981 2 8

The above expenditure shows a heavy increase—£76,871—over that of the preceding year, which is mainly accounted for by the large payments that required to be made on account of the lands resumed in connection with the electric powerhouse at Darling Harbour.

The report of the Government Land Valuer submits in a concise form the voluminous land transactions dealt with during the year. The principal matters occupying his attention have been the exchanges and resumptions of lands in connection with the new railway lines.

WATER

## WATER AND SEWERAGE BOARDS.

The annual reports of the Metropolitan and Hunter District Water and Sewerage Boards have already been submitted to you and laid before Parliament. Both reports record extensive developments and improvements in the Water, Sewerage, and Drainage systems. The financial results are fairly satisfactory, and there is good reason to expect that within a comparatively short time the large amount of capital invested in these schemes will yield a highly remunerative return.

## GENERAL.

In conclusion, I desire to bear testimony to the energy and zeal displayed by the staff—professional, clerical, and general—in the performance of their varied and important duties, and to express my obligations for the valuable assistance rendered by all in carrying on in a satisfactory manner the enormous business of this Department.

ROBT. HICKSON, M. Inst. C.E.,  
Under Secretary for Public Works and Commissioner for Roads.

## Report of the Engineer-in-Chief for Railway Construction.

Department of Public Works, Railway Construction Branch,

Sydney, 28 August, 1899.

Sir, I have the honor to report upon the work carried out in the Railway Construction Branch during the year ended 30 June, 1899:—

### RAILWAY SURVEYS.

The following work was carried out by the Railway Survey Office Staff, from the 1 July, 1898, to the 30 June, 1899:—

Explorations have been made, and reports, accompanied by diagram plans submitted, in connection with the following projected railways:—

Narromine to Coonamble.  
 Coonamble to Bomera.  
 Culcairn to the Upper Murray.  
 Wellington to Werris Creek.  
 Thirlmere to Burragorang.  
 Casino to Tenterfield.  
 Glen Innes to South Grafton.  
 Guyra to South Grafton.  
 Fairfield to Smithfield and Prospect.

The following inspections and examinations of trial and permanent surveys and one existing tramway were made:—

Temora to Gunbar.  
 Byrock to Brewarrina.  
 Wyalong to Hillston.  
 Parkes to Peak Hill and Narromine.  
 Narrabri to Walgett and Collarendabri.  
 Koorawatha to Grenfell (two inspections).  
 Bullock Creek to Bulbodney.  
 The Rock to Green's Gunyah.  
 Tarrawingee Existing Tramway.

The whole of the field work, and a portion of the drafting, &c., in connection with three permanent and four trial surveys were completed and three trial surveys were in hand but not finished, at the close of the year. For particulars see Appendix.

The plans and sections of the following proposed railways have been under review in connection with the preparation and revision of the estimated cost of construction:—

Bogan Gate to Bulbodney.  
 Dubbo to Parkes.  
 Belmore to Liverpool.  
 Moree to Inverell (Deviation *via* Kelly's Gully).  
 Grenfell to Wyalong.

The necessary drawings, viz., working plans and sections, proclaimed and police district plans, books of reference, land resumption notices, tracings and heliographic copies thereof, have been prepared for the 2nd and 3rd parts of the Moree to Inverell line, and the lithographic copies in book form of the working plans and sections have been completed.

The drawings in reference to the authorised railways, Koorawatha to Grenfell, Byrock to Brewarrina, and The Rock to Green's Gunyah, were, at the close of the year, in a forward state.

A considerable quantity of mathematical work has been done, in calculating the bearings and distances of the boundaries of land resumptions, and connections to same, for descriptive purposes, many of the boundaries being very irregular.

The officers of the Railway Commissioners Branch have been supplied with plans and compilations of county and parish maps, for use whilst inspecting and reporting on projected railways, proposed station sites, &c.

The drafting staff, during the period under review, has barely been sufficient to cope with the current office work, and the arrears of necessary, but less urgent, work have consequently not been diminished.

The staff of the Railway Survey Office consisted on an average of 29 officers, divided as follows:—  
 1 Principal Assistant Engineer, 1 Supervising Engineer, 11 Surveyors, and 16 Draftsmen.

The following tables show the aggregate of each field operation carried out by the field staff during the past year in connection with the trial and permanent surveys:—

### TRIAL SURVEYS.

## RAILWAY CONSTRUCTION.

The following works have been in progress during the year ended 30 June, 1899:—

## Parkes to Condobolin.

The capital expenditure during the year on this line, which had been opened for traffic on 1 March, of the previous year, was only a small amount; the total to date covered by this report being £117,433 7s. 6d., or about £1,871 per mile.

## Nevertire to Warren.

The capital expenditure for the year on this line, which had been opened for traffic during the previous year, was £12,142 7s. 5d., making the total to 30 June last, £36,706 0s. 10d., or about £2,954 per mile.

## Berrigan to Finley.

This line, which was in course of construction, generally by day labour, under the supervision of Mr. F. H. Small, when the previous year closed, was opened for traffic on 30 September, 1898.

In addition to the small contracts mentioned in last year's report, the following were let in 1898-99:—Trucking yards to C. Baker; pumping machinery to Bennie, Teare, & Co.; engine shed to C. Baker.

The expenditure for the year was £15,210 14s., and the total expenditure, £31,653 6s. 10d., or about £2,277 per mile.

## Tamworth to Manilla.

The main line, including a steel bridge of three 60 feet spans with timber approaches over the Peel River, is being carried out under contract by Mr. T. Williams, entered into 29 November, 1897. Some small contracts were entered into during the year under report, as under:—

Trucking yards	...	...	...	...	...	J. Allibone.
Station buildings	...	...	...	...	...	J. Allibone.
Sleepers	...	...	...	...	...	J. Adams.
Pumping machinery	...	...	...	...	...	Bennie, Teare, & Co.
Pumping engine house	...	...	...	...	...	J. Allibone.

On the 30 June the bridges, including the Peel River Bridge, were nearly complete, and the road laying was practically finished; the station work and buildings were well advanced; and the water supply works at Manilla started.

The expenditure during the year was £10,289 18s. 10d., and the total to 30 June, £43,200 4s. 7d.

This line is expected to be open for traffic in September.

## Extension of Railway to Darling Island.

That part of the construction which was let to Messrs. Bromley & Holloway in 1897, with the considerable additions made to it, was completed in September, 1898. A large portion of the work has been done by day labour, under the supervision of Mr. F. E. Wickham. This consisted of the levelling of about 16 acres of resumed land, making of road approaches, fencing, draining, and the ballasting and laying of nearly 2½ miles of sidings.

Two small contracts for sleepers and blue metal were let.

The footbridge, giving access across the yard to the ferry wharf, and some other small works, remain to be done.

The expenditure for the year was £14,204 4s. 6d., and the total to date, £18,686 0s. 11d.

### Moree to Inverell.

This line which is, as regards the general works, being carried out by day labour under Messrs. W. Hutchinson and F. H. Small, was begun early in the year under review. Contracts for sleepers and bridge timbers having been already let, as referred to in last report.

The earthworks are practically complete for about half the length from Moree towards Inverell. The timber bridges are built for about 33 miles from Moree, and pile driving up to Gravesend, while material is being delivered for some distance beyond Warialda. Some of the material for the Gwydir River Bridge piers have been ordered.

The road has been laid to about 33 miles from Moree, including station sidings, except those of Moree.

The following contracts have been let in connection with this line—

241,000 sleepers to various contractors.

Ironwork to A. H. Brown.

Hardwood timber to six firms.

Piles to five firms.

Gwydir Bridge steel superstructure—Supply and erection to Messrs. Mountney & Co

Sheep and cattle yards to J. Neylan.

Station buildings to E. Rowland.

Wrought iron tank to Pope, Maher, & Co.

Pumping plant to Bennie, Teare, & Co.

### Byrock to Brewarrina.

Tenders were accepted for 147,430 sleepers.

### Permanent-way Material.

Tenders were called for 10,000 tons of 60-lb. steel rails and fastenings from America, and these, as well as the 15,000 tons referred to in the previous report, were under delivery.

### Staff.

The officers employed in the supervision of the above works in the field were three supervising engineers, one resident engineer, and four assistants, and one cadet.

Inspectors and sub-inspectors and time-keepers have been employed as required.

The office staff consisted of one supervising engineer, one chief draftsman, and ten draftsmen.

### TRAMWAY CONSTRUCTION.

Works in connection with the following tramways have been in progress during the year:—

George-street and Harris-street Electric Tramway, 3 m. 20 c. (double track); erection of Car House, Power House, and Machinery in connection with the conversion scheme of the City Tramway system, and the George-street and Harris-street Tramway; and the Rose Bay Electric Tramway of 1 m. 23 c. (single track) has been completed, and was opened for traffic on 4 October, 1898.

Permanent surveys have been completed and working plans and sections prepared for the tramway from Falcon-street to the Gore Hill Cemetery, a distance of 1 m. 15 c. (single track).

Surveys are in progress for the extension from George-street to Miller's Point, *via* Dawes Point, 56 chains, and the Neutral Bay Tramway, 70 c. (single track).

Trial surveys, estimates, and reports have been made of the following proposed tramways:—

	Miles.	Chains.	
Rose Bay to Watson's Bay ... ..	3	20	Single Track
Manly to Narrabeen and Newport ... ..	12	0	"
Liverpool-road to Ashfield Station ... ..	0	7	"
St. Peter's Bridge to Cook's River ... ..	2	0	"
Botany to La Perouse ... ..	3	50	"
Leichhardt to Callan Park Asylum ... ..	0	50	"
Willoughby Terminus to Gordon-road, Chatswood ... ..	1	3	"
" " Smith-street, Willoughby ... ..	0	40	"
Enfield to Bankstown, <i>via</i> Pipe Line and Dean-street ... ..	7	30	"
Military-road to the Spit ... ..	1	30	"
Enfield to Mortlake ... ..	4	20	"

### Rose Bay Electric Tramway.

This tramway commences at the terminus of the King-street and Ocean-street Cable Tramway, at Ocean-street, and runs along the New South Head road for a distance of 1 mile 23 chains (single track), terminating at the Rose Bay Wharf.

The following list gives particulars of the contracts in connection with the construction of this tramway:—

Contract.	Contractors.
Plastic bonds ... ..	Noyes Bros.
Generators ... ..	H. H. Kingsbury & Co.
Driving gear ... ..	J. J. Wood.
Accumulators ... ..	Gibson, Battle, & Co.
Overhead material ... ..	Noyes Bros.
Supply of poles ... ..	Stanley R. Booth.
Permanent way ... ..	W. Ewart & Co.
Switchboard and connections ... ..	H. H. Kingsbury & Co.
Accumulator room ... ..	G. T. Savage.
Feeder cables and junction boxes ... ..	J. O. Callender.
Waiting room ... ..	J. M. Wilson.
Ironwork for poles and brackets ... ..	Joyner Bros.

The Edison-Brown Plastic Bond was used for the permanent way.

The

The generators are installed in the Rushcutter's Bay Cable Tramway Power House, and consist of two of the multi-polar belt-driven type, designed to give an output of 150 kilowatts each, viz., 270 amperes at 550 volts. The size of these generators was decided after giving due consideration to the power, which, by arrangement, was to provide for working the air compressor pumps of the Double Bay Sewerage Station. They were manufactured by the General Electric Company of Schenectady, and supplied and erected by H. H. Kingsbury & Co.

The driving gear for the generators, which is driven by belting off the main engines by counter shafting, was manufactured by Messrs. Hudson Brothers (in liquidation, J. J. Wood, contractor), the link belting being manufactured and fixed by Messrs. Ludowici and Sons, of Sydney.

The accumulators are of chloride (the R type) with a capacity of 220 ampere hours. They are placed in a corner of the engine-room of the Rushcutter's Bay power-house, partitioned off with wood and glass construction, and forming a room 22 ft. x 22 ft., the erection of which was let to G. T. Savage. The plates, which number 240, are in glass boxes and ranged on benches in double tier.

The switchboard and connections were supplied and erected by H. H. Kingsbury & Co. The switchboard, which is 8 ft. 8 in. wide by 7 ft. 11 in. high, consists of five panels of slate with enamelled fronts moulded in frames of angle-iron. Raised platforms are provided at the front and back, with a door at each end.

The overhead wiring for single line, including the erection of the poles, was carried out by day-labour, the trolley wire being of the figure 8 section, equal to No. 000 B. and S. gauge, and of specially hard drawn copper of 98 per cent. conductivity (Mathieson's standard).

After starting the traffic, which proved very large at times, it was found desirable to put in extra loops and a double overhead conductor.

The overhead material, supplied by Messrs. Noyes Bros, is of Billings and Spencer's make, and the poles are of tallow-wood. The brackets and other ironwork are similar to those used at Willoughby, and were supplied by Messrs. Joyner and Sons.

The permanent way, the laying of which was entrusted to W. Ewart & Co, contractors, consists of 83 lb. grooved girder rails in 30 feet lengths laid on sleepers, twelve sleepers to each 30 feet of track. The ballast is blue metal throughout, with clay binding; the rail-joints are fitted with Pullen's patent joint-boxes. Three crossing-loops and one loop at the terminus at Rose Bay wharf have been provided.

Owing to the exceedingly sharp curvature of a portion of the road, a deviation, involving the forming of a bank comprising some 9,250 cubic yards of earth, was carried out.

The feeder cables and junction-boxes were supplied by Mr. J. O. Callender, contractor.

The feeder cables start from the terminal box at the power-house. They consist of one feeder for the tramway, and one for the sewerage pumping. They are conveyed in a trench under the footpath to the terminal pillar near Ocean-street, from which point to the pumping station at Double Bay the cable is carried overhead.

The junction-boxes, which are of cast-iron and provided with an inner watertight cover and heavy outer cover are placed about  $9\frac{1}{2}$  chains apart. The terminals are mounted upon bases of porcelain.

The cost of this tramway, including £3,000 to provide the power required for the Double Bay sewerage pumping station, was £19,800. It was opened for traffic on the 4 October, 1898.

### George-street and Harris-street Electric Tramway.

The route of this tramway was described in last year's report.

The following list shows the contracts in connection with the construction of this tramway, and the progress at the close of the financial year:—

No.	Contract	Contractor	Remarks
1	Plastic bond . . . . .	Noyes Bros. . . . .	Completed.
2	Mannesmann poles . . . . .	Foreign Agency Co. . . . .	" "
3	Steam-engines and generators . . . . .	H. H. Kingsbury & Co. . . . .	Being erected.
4	George street permanent-way . . . . .	Wilmott and Morgan . . . . .	Practically completed.
5	Harris-street " . . . . .	J. McSweeney . . . . .	" "
6	Tracks to car-house entrance . . . . .	H. H. Kingsbury & Co. . . . .	Completed.
6a	Points and crossings, King and George Streets . . . . .	H. W. Peabody & Co. . . . .	" "
7	Steam boilers . . . . .	G. and C. Hoskins . . . . .	" "
8	Boiler settings and mountings . . . . .	J. Stewart & Co. . . . .	Work proceeding.
9	Switchboard and connections . . . . .	H. H. Kingsbury & Co. . . . .	Material delivered.

17	Circulating and feed pumps . . . . .	H. P. Gregory & Co. . . . .	Material delivered.
18	Water conduit . . . . .	J. McSweeney . . . . .	Practically completed.
19	Portable offices . . . . .	C. Shuker . . . . .	Completed.
20	Excavation, power-house site . . . . .	C. McClure . . . . .	" "
21	Chimney . . . . .	Phippard Bros. . . . .	" "
22	Return feeders . . . . .	C. Kolling . . . . .	" "
23	Material for cross-bonding . . . . .	W. Hoskins & Sons . . . . .	" "
24	Trolley-wire . . . . .	C. Kolling . . . . .	Erection proceeding.
25	Steel columns and crane girders . . . . .	R. L. Scrutton & Co. . . . .	Completed.
26	Steam piping, high pressure . . . . .	Peabody & Co. . . . .	Material delivered.
27	Store and repairing-shop . . . . .	T. E. Spencer & Co. . . . .	Work proceeding.
28	Station wiring (cables) . . . . .	Indiarubber G. P. & T. W. Co. . . . .	Material delivered.
29	Steam piping, low pressure . . . . .	H. Vale & Sons . . . . .	" "
30	Covering for steam piping (large) . . . . .	W. Adams & Co. . . . .	" "
30a	" " (small) . . . . .	E. L. Renwick & Co . . . . .	" "
31	Office and W.C. accommodation, Circular Quay . . . . .	Eaton Bros. . . . .	Tenders called for.
32	Small valves, high pressure . . . . .	J. Milne . . . . .	Drawings in hand.

All the permanent-way has now been completed, with the exception of the cross-overs and balloon hoop at Circular Quay, where the Railway Commissioners, on further consideration, found it necessary to make some alterations in their original requirements to allow of more accommodation for shunting purposes.

The rails which are being used on this tramway are of the girder type, 83 lb. per yard, 30 feet in length, and of specially hard steel. They are laid on concrete, 10 inches deep, and kept to gauge with wrought-iron tie-rods. All joints rest on bed-plates, and are provided with fish-plates with six bolts and Pullen's Patent Joint Boxes.

On opening up the streets it was found that certain lengths of the concrete-bed was sound and strong enough for the tramway. In these places it was therefore made use of. For the greater part of the length, including the whole of Harris-street and from Queen's Wharf to Bathurst-street, the concrete was too thin laid in the first instance to afford the required support.

As the wood-blocking outside the limits of the tramway at several places along the route was badly worn and decayed, it was found necessary to arrange for the entire renewal of some portions, and the extensive patching of others. This work, which to a large extent was not anticipated, as the extent to which the wear had progressed was not noticeable, caused a serious additional expenditure.

#### *Outside Electrical Work.*

The poles have, with the exception of those required at the Redfern Junction and approach, been erected, and all the underground electrical work has been completed.

The Edison-Brown Plastic Bond, the materials of which were supplied by the contractors, Messrs. Noyes Brothers, is practically completed. Particular attention has been paid to the bonding as this tramway will act as the trunk line for the whole of the Western Suburbs, and consequently there will be a heavy return current. As a supplementary return a copper cable, having a sectional area of 45 square inches, is laid between each track from Circular Quay to Redfern. Each cable is connected to alternate rails on either side so that every car will be connected direct to the cable. These cables are laid against the inner rails of their respective tracks and are cross connected every 60 yards, the connection between the cable and inner rail being made with a special gun-metal clip-bolt. At the intersection of Liverpool-street and George-street nine cables are taken direct underneath, the Callender-Webber casing carrying the return current to the Power house at Ultimo, a distance of 900 yards. There are also from Engine-street two cables, and from Harris-street along William Henry-street four cables which carry the return current.

The copper cables for the return feeders were supplied by Messrs. Koebling & Sons, and consist of No. B.S.W.G. soft drawn copper wire of not less than 100% conductivity (Matthiessen's Standard) stranded together with a suitable lay.

The trolley wire, supplied by Mr. Charles Kölling, was manufactured by J. A. Koebling & Sons, of Trenton, N.J., U.S.A. The sectional area is 167,803 circular miles (equal to No. 000 B. & S.) hard drawn copper of 100% conductivity (Matthiessen's Standard) of figure 8 section. This wire is about to be erected.

The time has now arrived when the generating plant may be described in detail.

#### *Power plant.*

The original intention was to supply the power for the George-street and Harris-street Tramway from Rushcutters' Bay, the estimated cost of doing this as given to the Public Works Committee was—

Power ... ..	£11,150
Feeders ... ..	6,000

No provision was made for additional building, it being considered that the accommodation provided in the existing building was ample.

The power required to work the George-street and Harris-street tramway, taking into consideration the Railway and Harris-street traffic alone, is estimated at about 540-h.p. Forty cars were to be provided, so that taking thirty-six cars as being constantly in active service during the busy time of the day, this would mean an average of about 15-h.p. per car. There is sufficient reserve power in the engines at Rushcutters' Bay to provide for this, so that, by adding electric generators driven by a system of shafting, the whole could have been economically arranged. The proper provision to make would be three generators of, say, 300-h.p. each, so as to provide a small surplus and one machine in reserve. But even suppose it had been found more suitable to leave the reserve power at Rushcutter's Bay for the Rose Bay or other extensions, engines and generators of a total of 900-h.p. could be provided at a cost of £9,000, leaving the balance to defray the cost of two additional boilers and other contingencies that might arise.

The George-street and Harris-street Tramway Act was assented to on 14 September, 1896.

Soon after this the Railway Commissioners came to the conclusion that as the conversion of the whole of the tramways to electric traction was contemplated it would be wise to make George-street and Harris-street Tramway part of the complete system and commence the installation of the power at one spot. The matter was discussed between the Minister for Works and the late Chief Commissioner, with the result that it was in the end decided to secure land in Ultimo, in contiguity to the Darling Harbour Station-yard, where eventually power to the extent of 20,000-h.p. could be laid down as well as accommodation for 200 cars.

As part result of the conference between the Minister for Works and the late Chief Commissioner, it was decided that the work of providing buildings and power for the conversion of the tramways should be carried out by the Railway Construction Branch. It was eventually decided that this power and accommodation on this line should be provided, and that the work should be carried out by the Railway Construction Branch.

The power plant provided consists of four sets of Allis-Corliss horizontal cross compound engines, manufactured by the E. P. Allis Co., of Milwaukee, U.S.A., each direct coupled to an 850-k.w. generator of the General Electric Company's manufacture, with the necessary surface condensers of the Wheeler type, together with Blake air-pumps, feed-pumps, and circulating-pumps. The high-pressure steam piping and valves are manufactured by the Crane Manufacturing Company of U.S.A., and the low-pressure by Messrs. H. Vale and Sons, of Sydney.

The high-pressure cylinders are 26 inches in diameter, and the low-pressure 48 inches, and the stroke of the engine 48 inches, which work with a boiler pressure of 130 lb. per square inch and at a speed of 100 revolutions per minute. The valves are of the Reynolds-Corliss type, both steam and exhaust being made in a single piece free from springs or other complications. The main bearings are 20 inches in diameter and 36 inches long, fitted with top, bottom, and side shells, and lined with babbit metal. The pistons are fitted with followers, bull ring, and packing ring, so designed that they can be examined without removing the pistons from the cylinders. Between the high and low-pressure cylinders a receiver with suitable traps is fixed in the basement below the engine-room floor. Between each two sets of engines a Wheeler condenser, having a cooling surface of 3,400 square feet, also a Blake air-pump of the latest twin-marine type, are fixed. The engines are so piped that any one of the four can be connected to either condenser and air-pump, this arrangement being much more economical, both in first cost and working, than fitting a separate condenser to each engine. The fly-wheel is 20 feet in diameter and weighs 45 British tons. It is built up out of mild steel plates, and constructed in the latest American practice. All the connecting bolts are of steel, and the wheel is keyed on to shaft by small steel keys.

The generators, of which there are four, were built by the General Electric Company of America. They are of the multipolar type, and designed to be operated at a speed of 100 revolutions per minute, and to give an output of 850 kilowatts each. Each generator is capable of delivering 1,545 amperes at 600 volts for short periods of time.

The switchboard, which is 40 feet long and 7 feet 6 inches high, has been delivered by the contractors, H. H. Kingsbury & Co., and the work or erection is about to commence. It will be placed on a gallery 90 feet long overlooking the engine-room 14 feet above the floor. Provision has been made so that the switchboard can be extended as may be required.

The fourteen steam-boilers, each measuring 16 feet long by 7 feet diameter, of 300-h.p., were manufactured by Messrs. G. and C. Hoskins. They are arranged in two batteries of seven each. All have been delivered and tested, and seven have been placed into position. The boiler setting and mountings are now being carried out by J. Stewart & Co., contractors.

The three centrifugal circulating-pumps, and the two plunger feed-pumps, supplied by H. P. Gregory & Co., contractors, were manufactured by the Blake Manufacturing Company of New York, and are about to be erected.

The centrifugal pumps, which are electrically driven, are made entirely of salt-resisting composition, and are capable of raising water up to a level of 36 feet with a discharge and suction nozzle of 12-inch diameter.

Each pump is coupled direct to two general electric motors. The motor armatures are of the standard G.E. 1,000 railway motor type. Each motor is complete with hand-starting rheostat and rheostat for regulating fields within 10 per cent.

The electrically-driven triplex feed-pumps are each capable of delivering 135 British gallons per minute against a boiler pressure of 140 lb. per square inch. The discharge and suction nozzles of this pump are 4 and 5 inches respectively.

In order to expedite the completion of the power-house, a contract for the supply of the steel columns and crane girders was let to Messrs. R. L. Scrutton & Co., and the work has been completed.

The contract for the high-pressure steam piping has been let to Messrs. Peabody & Co., and that for the low pressure to Messrs. Vale and Sons. All the material for both contracts has been delivered at the power-house, and is now being erected by day labour.

The covering for steam piping has been let in two contracts; that for the large pipes to W. Adam & Co., and for the small, to E. L. Renwick & Co. This work will be commenced almost immediately.

The accumulators, which were supplied by W. Adams & Co, contractors, and manufactured by the Electrical Power and Storage Company, have been delivered, and are about to be erected. These are of the E.P.S. (K type) cells. There are two batteries of 300 cell each in glass boxes. The capacity of the larger battery at a discharge rate of 80 or 90 amperes hours, and the smaller at from 15 to 20 amperes, will be 125 amperes hours. Spare parts will be provided for each battery.

#### *Car-house.*

The tracks to the car-house entrance, which were supplied by H. W. Peabody & Co., contractors, were manufactured by Wharton & Co., of Philadelphia; these have been placed into position and the work completed, this portion of the work being carried out by day labour.

The contract for the car-house has been let to J. Stewart & Co., contractors, and the work has been completed.

This car-shed, which measures 275 feet by 120 feet, and is all under one roof of the saw-tooth design lighted from the south, has twelve tracks with pits between the rails to enable cleaners and repairers to get at the rolling gear. This building also contains quarters for motor men and conductors. There is accommodation, under cover, for 108 full-sized cars, and the building can be further extended to contain an additional seventy-two cars.

Rolled joists are fixed the full length of the three bays to carry travelling cranes, and both the entrances and back opening are fitted with steel spring-roller shutters.

The contract for the Store and Repairing Shop has been let to Messrs. T. E. Spencer & Co., contractors.

This building, which measures 171½ feet by 43 feet and adjoins the car-house at the rear, has under its roof, also of the saw-tooth design, a store 36 ft. x 40 ft., workshop 90 ft. x 40 ft., armature winding room 30 ft. x 40 ft., drying-room 10 ft. x 40 ft., and a smithy 14 ft. x 40 ft. This work is being carried on with all possible speed by the contractor.

#### *Power-house.*

The contract for the excavation to the power-house site was let to C. M'Clure, contractor, and has been completed.

The erection of the power-house and offices is being carried out by J. Stewart & Co., contractors. This building, which is 200 ft. by 100 ft., can, if required, be extended to accommodate an additional 15,000-h.p., sufficient land being available.

The

The contract for the chimney has been let to Messrs. Phippard Brothers, contractors, and the work has been completed. This stack is 200 feet above the flue level and contains some 890,000 bricks, and is capable of carrying off the furnace gases produced up to 5,000 h.p.

The contract for the conduit from the boiler-house to Darling Harbour has been let to Mr. Justin McSweeney and the work is practically completed.

This conduit, which is 950 feet long, has been built for supplying water for condensing purposes.

The rolling-stock, consisting of forty motor cars and trailers, is being supplied by the Railway Commissioners at a cost of £23,200.

It will be seen (from the foregoing) that the arrangements for supplying power to the George-street and Harris-street Electric Tramway, forms only a small part of a large scheme for converting the Sydney Steam Tramways to electric traction, and for the supply of electric power not only to them but also to the conversion of the North Sydney cable tramway, and the supplying to the whole system on that side of the harbour of electricity.

The staff employed during the year under review on Tramway construction, inclusive of office work, comprised—

- 1 Principal Assistant Engineer,
- 2 Resident Engineers,
- 2 Assistant Engineers,
- 1 Engineering Assistant,
- 7 Draftsmen,
- 6 Inspectors,
- 6 Sub-Inspectors.

The work in connection with the George-street and Harris-street Electric Tramway being of quite a special nature, some difficulty has been experienced in obtaining suitable engineers and draftsmen to design and carry it out. The staff employed during the year has been insufficient to cope with the amount of work required of it, so that several matters of minor importance have been made to stand over. In spite of temporary assistance by the loan of officers from other branches all have been kept going at high pressure.

H. DEANE,

Engineer-in-Chief for Railway Construction.

## II.

### RETURN of Expenditure on Public Works by Railway Construction Branch from 1 July, 1898, to 30 June, 1899.

## Report of the Engineer-in-Chief for Public Works.

### III.

Sir,

Public Works Department, 3 November, 1899.

I have the honor to forward herewith an outline statement of progress made on the various works under my control during the year ended 30 June, 1899.

The report deals with the works and services under the following heads:—

1. Works for the Improvement, Maintenance, and Convenience of Navigation, including the Dredge Service.
2. Water Supply—(a) Metropolitan; (b) Country Towns.
3. Water Conservation, Irrigation, and Drainage.
4. Works not comprised under the above heads.

#### (1) WORKS FOR THE IMPROVEMENT, MAINTENANCE, AND CONVENIENCE OF NAVIGATION.

For convenience and system in describing the works along the coast included under this head, they are here taken in their order, commencing at the northern extremity of the coast line:—

##### *Tweed River.*

The rocks at the entrance to the eastern channel were removed by blasting during November, and some wreckage was blown up, the total cost being about £136.

A dry dock, 107 feet long x 42 feet wide x 7 feet deep at low water, is being constructed by contract at Terranora Creek, very fair progress being made. £1,355 7s. 10d. has been paid to date, the total cost, including probable extras, being estimated at £5,000. It is intended primarily for the use of dredges and other Government plant.

The sand pump dredge "Actor", which has been continuously engaged deepening and widening the channel from No. 5 to No. 2 wall, has during the past year dredged and deposited on shore 365,250 tons of sand at a cost of 1·71d. per ton, and the grab-dredge "Alpha" has cut channels through the various flats and shoals of the main river and tributaries. The "Alpha's" output has been 42,619 tons; the cost 4·21d. per ton.

A small amount of snagging has been done, and some repairs carried out to light-keeper's quarters, wharfs, &c., at a cost of £80.

##### *Byron Bay.*

Sundry repairs have been effected to the jetty and crane, and the goods shed was taken down and re-erected at a more suitable site, the cost of these works being £167.

The moorings were overhauled, and an additional set laid on the southern side at a cost of £280.

##### *Richmond River.*

North Breakwater.—This breakwater has been extended 242 feet, the tip-head being now 2,920 feet from high-water mark. The quantity of stone used was 37,290 tons, costing £6,923 13s. 3d., or 44·56d. per ton.

South Breakwater.—This breakwater has been extended 407 feet, the tip-head being now 6,553 feet from high-water mark. The quantity of stone used was 59,250 tons, costing £11,347 9s. 3d., or 45·96d. per ton.

South Training-wall.—Several subsidences which took place in this wall have been repaired, 2,998 tons of stone being used at a cost of £550 10s. 7d., or 44·07d. per ton.

Riley's Hill Quarry.—101,840 tons of stone have been quarried and loaded into punts at a cost of £10,219 11s. 8d., or 24·08d. per ton.

Two 10-ton cranes have been added to the plant at this quarry, and also an air-compressing machine for working the drill.

Work on the north breakwater was suspended on 13th April, it having been decided to concentrate all efforts in extending the south breakwater so as to check the inroads of sand which make round its end during southerly weather, and since 1 May work on the south breakwater has been carried on at night by electric light as well as during the day.

New Channel.—The work of removing the patch of indurated sand in the new channel has been proceeded with during the year, the material being broken up with dynamite, lifted into punts by dredges "Alcides" and "Zeta," and deposited behind the sand spits above Ballina, the expenditure on this work being £4,560 0s. 6d. The "Alcides," at a cost of 5·38d. per ton, lifted 83,490 tons, and the "Zeta" 28,980 tons of blasted material, cost per ton 6·44d.

An average of 100 men have been employed on the above works in connection with the improvements to the entrance of the Richmond River.

The construction of a dry dock at Riley's Hill was commenced on the 10 May. This work is being done by day-labour, and the dock is to be of the same dimensions as those now being constructed under contract on the Tweed and Clarence Rivers.

The site has been stripped to formation level, £298 8s. 4d. having been expended to date. An average number of twenty-eight men have been employed.

Removal

Removal of Rocks in Channel at Woodburn.—The work of removing these obstructions was commenced in March. The rock was first broken up with dynamite, and about 230 tons of the broken material has been lifted and conveyed in punts to Buckendoon, where it is used to protect the river bank. £681 16s. 6d. has been expended on this work, and the bulk of the material has yet to be lifted.

Snagging.—Work has been done at the following places to the amounts set opposite:—

	£	s.	d.
South Arm ... ..	1,341	18	4
North Arm ... ..	334	9	9
Dungarubba Creek ... ..	0	10	0
Leycester Creek ... ..	31	4	6
Bungawalbyn Creek ... ..	151	5	7
Wilson's Creek ... ..	47	11	8
Sandy Creek ... ..	135	0	0
	<hr/>		
	2,041	19	10

The work of constructing fascine training-walls in the South Arm was discontinued at end of November, the plant being then removed down river.

Training-wall, North Creek Canal.—A small training-wall was constructed at the northern entrance to the North Creek Canal in order to prevent shoaling there; 1,519 tons of small stone have been used at a cost of £152 13s. 9d.

New Wharfs.—The contractor for the construction of a wharf at Dungarubba commenced work in the beginning of June. One payment has been made amounting to £69 15s. 2d.

A wharf has been built by day-labour at the foot of the new road just below Oakey Creek, on the South Arm, at a cost of £96 0s. 9d.

A loading-place has been made near Tintenbar, on Emigrant Creek, 783 tons of quarry refuse being used. This work was carried out by day-labour at a cost of £117 1s.

A loading-place was made at Chilcott's Reserve, Duck Creek, at a cost of £34 0s. 7d.

Repairs to Wharfs.—Several small repairs were done to the various wharfs on the river, the total cost being £25 7s. 9d.

Repairs to Plant.—An average number of ten mechanics and three labourers have been continuously employed repairing dredges, tugs, cranes, drills, &c., fitting up new machinery, and installing electric light. The floating-plant has also been slipped and thoroughly overhauled. Dredging throughout the year has been carried out on the South Arm by the grab dredge "Mu," 51,045 tons having been lifted, at a cost of 3·40d. per ton, and principally at Duck Creek the "Lambda" dredged 15,478 tons; the cost was 7·28d. per ton.

#### Clarence River.

Goodwood Island Training-wall.—During the year, 81,708 tons of stone have been put in this wall, at a cost of 44·23d. per ton. The wall has been extended 2,725 feet, making the total length 5,550 feet.

Maintenance, Southern Breakwater.—2,213 tons of stone, at a cost of 39·08d. per ton, have been used in the maintenance of the southern breakwater.

Maintenance, South Training-wall.—66 tons of stone, costing 34·66d. per ton, have been used in the maintenance of the south training-wall.

New Quarry at Woodford Island.—The work of opening up the face of the quarry is proceeding. Two wharfs have been erected, and the lines for waggons will soon be laid, and everything got ready for the output of stone as soon as the Green Point Quarry is worked out, which will probably be in about six months time.

New Punts.—Two wooden punts, each of 100 tons capacity, were completed and handed over by the contractor in October. A contract is now in hand for the construction of four wooden punts, of 200 tons capacity each, for the sum of £4,100.

Dredging on the Clarence has been performed by the ladder-dredge "Minos" and the grab "Omega," the former removing 219,500 tons, at 2·53d. per ton, and the latter 39,545 tons, at 3·50d. per ton.

Dry Dock at Ashby.—A dry dock, having the same dimensions as the one on the Tweed River, is being constructed at Ashby, about 1 mile below Maclean. The work is being done under contract, the estimated cost, including probable extras, being about £4,750.

South Arm Rocks.—The work of cutting through this reef was resumed on 20 March, and by the end of the year, 1,165 tons of stone had been removed. The channel is now 90 feet wide and 8 feet deep at low water.

Woolgoolga Bay Jetty.—The work of putting in eleven new piles at the end of the jetty was completed, and the crane overhauled.

Coff's Harbour.—The drifting sand is causing a considerable amount of trouble at this place. Brush fences have been erected to keep the sand from blowing on to the jetty, and the water tanks from which the crane boiler is supplied have been removed further back, and a new well sunk, the sand having choked the old one. The crane received an overhaul, and the caretaker's cottage, shed, &c., were painted by contract at a cost of £13.

#### Bellinger River Improvements.

These works are being carried out under contract, the progress being as follows:—

No. 1 Wall.—1,715 tons of stone were put into this wall, extending it 24 feet, and making the total length 3,284 feet.

No. 3a Wall.—10,894 tons of stone were placed in this wall, extending it 583 feet, and making the total length 3,142 feet.

No. 5 Wall (East).—8,317 tons were used in the construction of this wall, which was commenced during the year. Its length is 1,760 feet.

Barrier Bank.—2,195 tons of stone were used in facing this bank, which is 2,500 feet long.

Payments to the amount of £4,305 6s. were made to the contractor during the year. The depth of water has increased in both the north and south channel.

The wharf at the heads was repaired at a cost of £45 8s.

The dredging at the heads has been carried out by the sand-pump "Theta," at the low cost of 1.07d. per ton. The grab "Beta" lifted 17,962 tons. The cost per ton, 7.44d., was high, owing to the expense caused by removal from Sydney, the dredge being a Sydney one temporarily employed on the Bellinger.

#### *Nambucca River Improvements.*

The output of stone at the Nambucca Heads training-wall has been 20,225 tons, and the wall has been advanced 174 feet, the total length now being 1,885 feet. Seventeen men are employed by the contractor, to whom payments amounting to £3,045 10s. 9d. have been made during the year.

A considerable amount of stone was used in raising and regrading the top of the wall, which had been damaged by a heavy sea as stated in last year's report.

A small amount of snagging was done at a cost of £14 5s.

#### *Macleay River.*

The work at the new entrance to the Macleay River is being carried out by day-labour, sixty men being employed. The output of stone has been 59,300 tons, of which 600 tons were used in making roads, and the balance, 58,700 tons, was put in the training-walls; the cost being £9,205 1s. 7d., or 37.25d. per ton. The dredging inside the entrance, by the sand-pump "Doris," cost 2.69d. per ton for 250,740 tons. Deepening the bar and approach, by the new sand-pump "Antleon," cost 2.47d. per ton for 124,750 tons, lifted from May to end of June. The ladder dredge "Fitzroy," up the river, lifted 193,920 tons, at a cost of 3.46d. per ton.

The south wall was advanced 833 feet, making the total length 1,852 feet. The north wall has been raised 2 feet for a distance of 1,180 feet, and 500 feet has been completed to high-water level, the total length being 4,450 feet.

The quarry is working well, and shows a splendid face, giving good large blocks.

The following contracts have been carried out:—

	Cost.		
	£	s.	d.
Residence for District Engineer ... ..	643	0	0
Wharf at Trial Bay ... ..	288	16	8
Repairs to wharfs generally ... ..	167	5	0
Re-grading approach to wharf at Frederickton ... ..	29	9	3
Supply of ironbark sleepers... ..	107	16	3

Repairs to wharfs have been carried out by day-labour at a cost of £48 4s. 6d.

#### *Trial Bay Harbour Works.*

These works were handed over to the Department of Justice on the 12 July. The following was the state of the work at that time:—

Total quantity of stone in breakwater ... ..	217,443 tons.
"    "    stone run to spoil ... ..	40,560 "
"    "    stripping ... ..	125,172 "

The length of the breakwater was 610 feet.

#### *Hastings River Improvements.*

The contractor for the construction of the training-wall has made steady progress during the year. Forty men have been employed, and the output of stone was 47,319 tons, extending the wall 889 feet, the total length to date being 1,725 feet. The quarry is well opened up, and shows a good face of stone. The payments made to the contractor amount to £9,181 13s. 3d., the contract price for stone being 3s. 8d. per ton.

A wharf has been constructed by contract at Ballengarra, on the Wilson River, for the sum of £293 15s., and some repairs were effected at Tacking Point Lighthouse, at a cost of £38. The sand-pump dredge "Eta," working at the various shingle and sand flats on the Hastings, dredged 168,960 tons; the cost has been 2.67d. per ton.

#### *Camden Haven Improvements.*

The works at Camden Haven are being carried out by day-labour, an average number of forty-eight men being employed. 34,231 tons of stone have been put in the south wall, extending it 1,330 feet, the total length being now 3,450 feet.

The north wall, which was commenced this year, contains 17,727 tons of stone, and is 2,075 feet in length. The total quantity of stone put in both walls for the year is 51,958 tons, costing £6,752 3s. 7d., or 31.19d. per ton. The quarry is working satisfactorily, good blocks of stone being turned out.

The new channel was broken through about the end of May, and is now navigable, and gradually improving. There is 7 feet of water on the bar.

A small amount of snagging has been done at a cost of £18 10s. 3d. The dredging required in connection with the new entrance was done by the sand-pump "Delta," and cost 1.95d. per ton.

### Newcastle District.

#### *Manning River.*

Improvements to Entrance.—These works, which have made considerable progress during the year, are being carried out by contract, an average of about fifty men being employed.

The quantity of stone put into the north training-wall was 33,960 tons, extending it 460 feet, at a cost of £6,226.

The river training-wall was extended 780 feet, the quantity of stone used being 31,606 tons, and the expenditure £3,826 6s. 2d. A viaduct was constructed in this wall, at a cost of £143 7s. 9d., to allow

allow of the area behind the wall being used as a boat harbour. The weigh-bridge and office were shifted to a more convenient position for the present work. Throughout the year the ladder-dredge "Ulysses" has worked at the different river flats, removing gravel and sand. This work, amounting to 268,870 tons, cost 2·93d. per ton.

Repairs to Wharfs.—The wharfs at Taree and Wingham have been repaired at a cost of £32 6s. 10d.

#### *Cape Hawke.*

A contract was let in August for the construction of a breakwater on the south side of the entrance to Cape Hawke Harbour. During the earlier part of the year the contractor was engaged opening up the quarry and laying tram lines, &c.

The first stone was tipped on February 16, and up to June 30 5,627 tons of stone had been put in the wall, which is now 456 feet in length. The expenditure, including cost of erecting weighbridge and office, has been £1,077 3s. 8d. An average number of thirty-one men have been employed. The sand-pump "Rho" was employed during the year at Foster and up the river. The return of work and cost shows 229,800 tons at 1½d. per ton.

#### *Port Stephens.*

Some minor repairs were effected to the light-keeper's quarters at a cost of £7 9s. 8d., and Nelson's Bay Jetty was repaired at a cost of £2 11s. 9d.

The Myall River was snagged from Broadwater to Bulladelah, the expenditure being £32 8s. 5d. The dredging of the river was carried out by the sand-pump "Sigma" and the grab "Kappa." The former dredge removing 150,200 tons, and the latter, for a few weeks at the close of the year, 3,053 tons, at 7·52d. per ton, which includes cost of dismantling and removal of plant.

#### *Newcastle Harbour.*

The breakwater and training-wall at Newcastle are being carried out by day-labour. It will be seen that there is a considerable increase in the output of stone this year, an average number of sixty-five men being employed on these works alone.

North Breakwater.—The north breakwater was extended 486 feet, 17,663 tons of stone having been placed in the wall, at a cost of £4,582 18s. 11d.

South Breakwater.—The south breakwater was extended 87 feet, 12,589 tons of stone having been put in the work, at an expenditure of £2,183 1s. 7d.

South Guide Wall.—This wall was extended 224 feet, 13,038 tons of stone being used; the expenditure was £1,878 12s. 1d.

Rock Excavation.—The "Lobnitz" rock crusher "Poseidon" completed the breaking up of 29,950 tons of rock in the channel leading into the New Basin, and the material was removed by the dredge "Hunter," the expenditure being £1,582 14s. 4d. An area of 20,833 square feet at the wool berths, Queen's Wharf, was also crushed to a depth of 3 feet, the cost being £65 10s. 1d.

The rock excavator "Cliona" completed the work of excavating 2,140 tons of rock along the front of the wharf at the entrance to the New Basin in September, at a cost of £510 4s. 8d., the material being removed by the grab dredge "Nu."

New Wharfs.—A substantial wharf, to be used for the shipment of cattle, was constructed at the north end of the New Basin, at a cost of £2,812 18s. 10d.

In order to meet the increasing demand for coal-loading appliances, it has been decided to construct 1,300 feet of wharf, to carry six hydraulic travelling cranes, on the east side of the New Basin. A contract for the first section (about 600 feet) of this wharf has been let, and the work is in hand, the expenditure, up to the 30 June, being £694 10s. 11. An order for the six hydraulic 12-ton cranes has been placed with Messrs. Sir Wm. Armstrong, Whitworth, & Co., Newcastle-on-Tyne, the estimated cost being £16,500.

Repairs to Wharfs.—The wharfs round the harbour, which measure 12,000 feet in length, were kept in good repair at a cost of £848 7s. 8d.

The Stockton ferry wharf was altered, and a floating stage fixed at a cost of £50 3s. 2d., and three dolphins were erected at Stockton for £34 2s. 9d.

General.—8,350 tons of stone ballast was obtained from ships and lighters and used on the various training-walls in Throsby Creek (west side of the New Basin) and New Island North Harbour, and also as backing for the cattle shipping wharf. In addition to this, 4,220 tons of stone ballast were stacked at the end of the dyke to be used as backing for the wharf now in course of construction on the east side of the New Basin. The average cost of this ballast, delivered on lighter or wharf, was 10d. per ton. 7,209 tons of stone ballast, discharged from vessels at the Stockton ballast jetties, were used as backing to No. 4 and No. 5 jetties.

In order to accommodate the modern class of vessels it was found necessary to provide extra depth of water close in to the front of the wharfs at the dyke. This has been done successfully at No. 10 crane by placing logs behind the front and middle piles to hold up the stone backing. Other berths will be similarly dealt with.

A schooner which had sunk in the north channel was raised and placed on the bank at the New Basin, the expenditure being £77 8s. 6d.

A crane and tram-line were erected near the Pilot Station, on the Queen's Wharf, for the use of the military authorities, at a cost of £28 18s. 3d.

Repairs were effected to the lifeboat slip and the south beacon.

A large amount of work was carried out in connection with repairs to dredges, tugs, punts, &c., and in the construction of trucks, about thirty men being constantly employed.

A total average number of 156 men are employed on day-labour works in Newcastle Harbour, exclusive of dredge employees. The quantity and cost of ladder dredging in the harbour for the year is as follows:—“Newcastle,” 491,400 tons, at 2·78d. per ton; “Samson,” 348,050 tons, at 3·42d. per ton; “Hunter,” 303,800 tons, at 3·45d. per ton. The sand-pump dredging has been 166,200 tons by the “Juno,” at 4·12d. per ton; and 626,500 tons by the “Castor,” at 0·83d. per ton. The work of the grab dredge “Nu” was 24,060 tons, at 8·57d. per ton.

*Hunter*

*Hunter River.*

A levee along the river bank at East Maitland, constructed for the purpose of protecting that town in flood time, was completed in July at a total cost of £1,225 15s. 11d.

The river bank at Bolwarra is being protected by fascine and stone work, the property holders of the neighbourhood paying half the cost, which is estimated at £458 11s. 8d. Work of a similar description was carried out at West Maitland, the cost being £31 10s. 9d.

Repairs to Wharfs.—The wharf at Patterson was repaired at a cost of £16 10s. 5d.

Repairs were also effected to the Larg's Wharf and the Cemetery Wharf, Stockton, the expenditure being £14 3s. 4d. The dredging on the river flats has been done by the "Vulcan" at a cost of 4.39d. per ton; the quantity towed away was 222,100 tons.

*Lake Macquarie.*

A fascine fence 2,230 feet long was constructed at Pelican to keep back the sand which, for some years, has been encroaching on the channel at this place. The sand-pump "Gamma" dredged the channel, depositing the sand behind the fence. The cost of this work, exclusive of the dredging, was £699 13s. 8d. The dredging cost 1.29d. per ton; the quantity pumped from the channel was 240,590 tons.

Repairs were effected to Cockle Creek Wharf and also to Belmont Wharf approach.

## Sydney and South Coast District.

There is a large increase in the work done in this district as compared with last year, ninety-five works were carried out by day-labour, employing 350 men, at an expenditure of £85,420, and thirty contracts were also in hand, the payments on which amounted to £45,000.

*Circular Quay.*

Construction of Berths Nos. 9A and 9B and completion of Wharf between Berths Nos. 8B and 9A.—This work was completed by contract in December, 1898, and consists of a wharf and jetty on piles.

Two cargo sheds, Nos. 11 and 12, were erected under contract on the western side of the quay, the foundation and flooring for which had been put in by day-labour. The approaches to the new wharfs and sheds have been graded and metalled, and a retaining-wall built between Berths Nos. 8B and 9A.

Nos. 5 and 6 Berths, West side.—No. 5 berth has been extended 50 feet by contract, and extra railing put up. The cargo shed on this berth has also been extended 68 feet. An iron fence has been erected enclosing No. 6 berth.

Jetties.—The shed accommodation at Watson's Bay (No. 1) jetty has been increased, and the Manly (No. 2) jetty has been extended 30 feet.

General.—The wood-blocked portion of the roadway has been repaired at the worst places, and the metalled portions have also been kept in order. Minor repairs have been effected to the various jetties, wharfs, and stores.

The expenditure in connection with works carried out at the Circular Quay has been £20,742. An average number of 10 men have been employed on day-labour works.

*Fort Macquarie and Dawes' Point.*

The horse-ferry dock at Fort Macquarie was completed by contract early in the year and is now in use, the expenditure, including the cost of erecting a waiting shed, was £2,239 15s. 6d.

The construction of a similar dock at Dawes' Point has been commenced. The work is being carried out by contract for the sum of £4,394 7s. 9d.

*Woolloomooloo Bay.*

Berths Nos. 1 and 2, Eastern side.—In October a contract was let for the construction of Berths Nos. 1 and 2 for £7,567 2s. 8d. The work is now approaching completion. A considerable amount of work has been done by day-labour, principally in alterations to the retaining-wall at the back of the wharf.

A contract has been let for the construction of two cargo sheds at Berths Nos. 1 and 2, the contract sum being £7,693.

A large cargo store, No. 5, has been erected by contract at the rear of Berths Nos. 3 and 4 on the eastern side at a cost of £5,277 14s. 4d.

Cowper Wharf.—A new weighbridge, with offices, &c., has been erected and the iron railings and gates at the western end have been altered in position to make room for the construction of new offices.

The jetty has been repaired with new girders, decking, and braces, and sundry repairs have been carried out to wharfs, sheds, &c.

The total expenditure at Woolloomooloo Bay for the year has been £14,579 14s. 7d., and forty men have been employed for six months on day-labour works.

*Darling Island.*

The works at this place are being carried out by day-labour.

Good progress has been made with the construction of the concrete wharf wall. A length of 1,100 feet is now completed, the average height being 40 feet.

1,129 blocks containing 13,961 cubic yards of concrete were moulded and fixed in place. 17,500 tons of hand-packed ballast, and 123,614 tons of ballast and earth filling, have been placed behind the wall.

A description of the method of building this wall was given in last year's report.

A new berth, about 300 feet long, has been constructed at the southern end of the island, the material used being timber.

The ferry landing-place has been extended.

An average number of eighty-three men have been employed, and the expenditure has been £26,257 11s. 2d.

*Miscellaneous Works—Sydney Harbour.*

At Pyrmont a retaining-wall is being constructed along the new wharf extension, a waiting-shed for ferry-passengers has been erected, and the coal-jetties have been repaired.

Wharfs have been constructed by day-labour at Allen-street, White Bay, and Erskine-street, and by contract at Cockatoo and Drummoyne.

Alterations and repairs have been effected to the following wharfs:—Augustus-street, Orient Company's, Leichhardt, Blackwattle Bay, Rushcutters' Bay, Cabarita, Gladesville, Watson's Bay, Cockatoo, Dundas, and Abbotsford.

An average of twelve men have been employed by day-labour during the year in building and repairing wharfs in Sydney Harbour.

A staff of six divers and their attendants have been employed as follows:—

The work of deepening the berths in front of Pyrmont Wharf was completed early in the year.

The moorings of the "Sobraon" were overhauled, and those at the Quarantine Station renewed.

Various under-water foundations, &c., have been examined and reported on, and sunken vessels raised, &c.

The grab-dredge "Chi" was variously employed in connection with diving and blasting rock. The material lifted was 7,920 tons, the cost 13·58d. per ton. The "Pi" lifted 35,070 tons at a cost of 13·76d. per ton.

*Shea's Creek Canal.*

The principal work done here has been the maintenance of the slopes above Ricketty-street and the continuation of the pitching of the slopes below that point, a length of 2,200 feet having been pitched. The ground below Ricketty-street has been formed and graded.

A grab-dredge was employed deepening the lower portion of the canal during the first half of the year.

Two new wharfs have been erected.

*Cook's River.*

The dredging by the sand-pump "Neptune" has been continued during the year between Shea's Creek and Botany, the material being pumped on to the resumed area on the left bank of the river. 307,040 tons were so dealt with at a cost of 2·16d. per ton.

The dredge "Omicron" has been working above the dam, and the material dredged has been deposited on the resumed land on the northern side of the river. The quantity dredged was 78,618 tons; the cost, 2·05d. per ton.

A training bank, faced with ballast, has been constructed from the railway embankment to the new dam.

The wharfs at Lord's Road and Cook's River Road have been put in repair.

An average number of fifty-four men have been employed on day-labour works at Shea's Creek and Cook's River during the year.

*Hawkesbury River.*

A wharf has been built at Newport, the cost being £549 19s. 2d., and one is now being constructed at Tuggerah Lake. The wharfs at Mangrove Creek, Sackville Reach, and Colo have been repaired. The sand-pump "Sigma" has just started work at Mangrove Creek, and has dredged and deposited 4,320 tons of clay and silt.

*Shellharbour.*

The concrete breakwaters were lengthened towards the shore, fifteen men being employed for four months. The expenditure was £486 10s.

*Shoalhaven.*

Dredging has been the only work carried out during the year at Shoalhaven, the ladder-dredge "Archimedes" having dredged 203,030 tons. The cost was 4·36d. per ton.

*Moruya River.*

The training-wall from the tower bridge to Deloski's Creek has been continued, being now 6,538 feet in length, and the northern bank of the river at the same place has been protected, 33,685 tons of stone having been used altogether. Fifty-one men and eighteen teams are employed in connection with this work, which is being carried out by day-labour, the expenditure for the year being £5,628 13s. 2d.

The sand pump "Tau" has been engaged dredging along the training-wall, and depositing the material lifted behind it; 170,420 tons have been dealt with at a cost of 2·19 pence per ton.

A wharf has been constructed, under contract, near the township of Moruya.

*Miscellaneous—South Coast.*

George's River.—Wharves have been erected at Lugano Ferry, Rocks Point, Sans Souci, Sandringham, Como, Coman's Point, and Kurnell.

Lake Illawarra.—A jetty was erected, under contract, at Kanahooka Point, and a boat channel was cut by day-labour at the entrance to Mullet Creek—thirty men being engaged on this work for three weeks.

Kiama Harbour.—A pierhead has been built on the western side and a new fender placed round the "basin," an average of ten men having been employed by day labour on the above work for six months.

Minor repairs have been effected to wharfs, &c., at Botany, Wollongong, Ulladulla, Bateman's Bay, Bermagui, and Eden, an average of four day-labour men being employed during the year.

### Darling and Murrumbidgee Rivers.

Bourke Wharf.—The wharf at Bourke was completed, under contract, in October at a cost of £4,454 4s. 5d. Three steam cranes have since been erected; also an office and store-room.

Darling River Snagging.—The snagging of the River Darling, a day-labour work employing sixty-one men, was continued during the year. Two gangs were engaged on the lower portion of the river, from 40 to 190 miles above Wentworth, until January; one gang being then removed to Wilcannia, and working between that place and Menindie, cleared 30 miles of river. Another gang has been working from Wilcannia towards Louth, and has partially cleared 40 miles of the river.

A length of 132 miles from Bourke to beyond Louth has been cleared of snags and rocks, and the dead timber on the banks has been burnt off.

The Bourke and Brewarrina section, a length of 132 miles, has been completed; most of the work on this section was, however, done before July, 1898.

The total length of river between Brewarrina and Wentworth that has been freed of snags and other obstructions to navigation since the work was begun in March, 1897, is 533 miles.

Murrumbidgee River Snagging.—Twenty men have been employed here during eight months of the year, and a distance of 79 miles of the river below Hay has been cleared of snags.

In connection with the snagging of the Darling and Murrumbidgee Rivers, it is pleasing to be able to state that letters have been received from representative persons in the Western District, expressing great satisfaction at the way in which the work has been carried out, and the resulting improvement in the navigation of the rivers.

### Dredging.

WITH the exception of the work of the sand-pump "Jupiter," at Sydney Heads, 436,000 tons at 2.08d. per ton; the "Groper" (reclaiming at Rozelle Bay), 306,590 tons at 2.59d. per ton; and the "Sydney" (deepening at Sydney wharfs), 293,450 tons at 5.81d. per ton, all the dredging carried out has been described under the headings of district work, as well as in the tabulated statements attached to this report; but the important results obtained by working the new self-loading bar sand-pump "Antleon," and the large land-reclaiming sand-pump "Castor," demand more than a passing notice. Hitherto no attempt to deepen, by dredging, sea bars having only 5 feet of water on them, has, as far as I am aware, been made either in Europe or America—all the bars dealt with having sufficient depth to float a dredge drawing 8 feet. To overcome the difficulty, I took advantage of the latest improvements in boilers, engines, pumps, and steel shipbuilding, and had the twin-screw dredge "Antleon" constructed to load herself with 250 tons of sand on a rough bar when steaming slowly over it, and to draw, when so loaded, only 5 feet of water, with a speed of  $9\frac{1}{4}$  knots. No pump dredge of this size with such a draft has ever been built before; and it is gratifying to report that the experiment has been entirely successful, no less than 2,000 tons of sand having been pumped in eight hours from the crown of a shallow and tortuous sea bar where there had been only 5 feet of water previously.

The work performed at Newcastle by the large sand-pump "Castor" is scarcely less important, although in a different direction to that of the "Antleon." The "Castor" has been fitted with a pump, driven by engines of 900 horse-power, and, on a pumping test extending over 202 hours actual pumping; has sent on shore, through 600 feet of 30-inch piping, 138,000 tons of sand at the low annual cost, including all expenses and repairs, of 0.83d. per ton. The future work of this vessel will be to pump on to the new island being formed above the North Harbour all the silt (12,000 tons per day) which the ladder dredges, working two shifts, can lift instead of towing it to sea. Dredges at Newcastle will now no longer be idle during stormy weather, and in a short time the work of reclamation will be sufficiently advanced to permit of jetties being erected at the new island for mooring either light or laden ships, and thus largely increasing the available accommodation for shipping in Newcastle harbour.

## Floating Plant.

A wooden screw steamer named the "Powerful" is being constructed by day-labour from designs prepared in this office. This vessel is 90 feet in length by 22 feet beam by 6 ft. 6 in. deep, and is intended for general use in Newcastle Harbour. She is practically completed, and is estimated to cost £3,000.

The construction of a wooden screw steamer, the "Phoenix," was carried out by contract, the cost being £2,500. This vessel is intended for use in the Dredge Service.

A steel screw steamer, the "Dooribang," 85 feet by 20 feet by 8 feet, and of 250 effective horse-power, is being constructed by day-labour at Fitzroy Dock. She is now nearly completed, the estimated cost being £5,000.

A wooden screw steam launch, the "Sol," 50 feet by 10 feet by 5 feet, was constructed by day-labour at the Fitzroy Dock, the cost being £1,420. She is intended for the use of the Marine Board.

Two ash punts have been built by contract for the use of the Naval Depot at Garden Island, the contract sum being £300.

A wooden pontoon, 54 feet by 26 feet by 4 ft. 6 in., has been built at Fitzroy Dock for use on the works at Darling Island, the cost being £450.

Two relieving pontoons for ferry landings are being constructed, the contract price being £898 10s.

Five small pontoons for dredge and survey work were constructed at a cost of £220.

## Lighthouses.

South Solitary.—The work of constructing new yard doors and laying on electric bells at this lighthouse is being carried out by day-labour; the cost is estimated at £30.

South Head.—A contract was let in April for repairing the Macquarie light-keeper's quarters and adding two rooms thereto, the estimated cost being £309. The work is now approaching completion.

The work of repairing the flagstaff and repainting internally the signalman's quarters was completed by contract for the sum of £60.

The Hornby light-keeper's quarters were painted internally and the flagstaff repaired, the work being done by contract for £160.

Point Perpendicular.—The contract for the erection of this lighthouse was completed on 17 March, and the official opening by the Marine Board took place on the 1 May.

The contract included the erection of a wharf, and some extra work was done, including a new telegraph office, the total cost being £16,280 17s. 11d.

## (2.) WATER SUPPLY.

### Metropolitan.

Centennial Park Reservoir.—Contract No. 3 was completed on 16 October, and the reservoir has been in use since that date. Contract No. 4 was for the erection of a light iron fence round the top as a prevention against accident.

About 8 acres of land surrounding the reservoir have been levelled and turfed by day-labour, fifteen men being employed for five months at a cost of £586 2s. 8d. The expenditure on work in connection with this reservoir for the year was £3,962 2s. 3d. The total cost has been £69,275 2s.

Duplication of 6-foot Pipe Line.—This work, which consists in laying a 6-foot steel main between the Pipe Head Basin and Pott's Hill Reservoir, a distance of  $4\frac{1}{2}$  miles, is being carried out under two contracts, one for all the ironwork, and the other for all other work, such as excavation, brickwork, concrete, etc. The work is approaching completion, the expenditure for the year amounting to £64,830 15s. 9d.

### Country Towns.

#### *Works under Construction.*

Tamworth.—The whole of the works in connection with the Tamworth supply have been completed and handed over to the Council. They were carried out entirely by day-labour.

Mudgee.—The works in connection with Mudgee which were carried out by day-labour have been completed. In connection with this scheme, Marks' Creek, an adjoining catchment, has been tapped and diverted into the storage reservoir. This has been done by means of a small concrete pipe, head dam, and about half a mile of 18-inch diameter earthenware pipes laid on a hydraulic gradient. A caretaker's cottage has also been added to the scheme.

Cootamundra.—The construction of the storage dam by day labour at Cootamundra has been completed. Owing to the exceptionally dry season experienced, a sufficient supply of water has not yet been caught, and the works have not yet been handed over to the Council.

Wellington.—The construction of the scheme for the supply of Wellington was put in hand during the year. The works, consisting of a storage dam, steel-pipe main, and reticulation, have all been carried out by day-labour, and are now nearing completion. The water in the storage dam will be held back by a concrete wall 45 feet in height and curved in plan to a 200-foot radius, the quantity stored being about 30,000,000 gallons. The supply is conducted into the town by means of a 7-inch diameter welded-steel main, and thence distributed direct by the usual 6-inch, 4-inch, and 3-inch diameter cast-iron reticulation pipes. The storage reservoir is situated  $2\frac{1}{2}$  miles from the centre of the town, and at an elevation of about 140 feet above it.

Picton.—The works in connection with the supply at Picton, consisting of a storage reservoir, service main, service reservoir, and reticulation, have been put in hand and are nearing completion. The storage reservoir is being constructed by day-labour, the remainder of the works by contract. The storage reservoir is formed by a concrete wall curved in plan to 100 feet radius and 25 feet in height across the gorge of the Bargo River, holding 14,000,000 gallons. The service main consists of 5 miles of  $8\frac{1}{2}$ -inch

8½-inch diameter riveted-steel pipe and 3 miles of 6-inch diameter cast-iron pipe, and conducts the supply direct to the reticulation and also to the service reservoir which acts as a balancing tank. The service reservoir is circular in form, 75 feet in diameter, 15 feet deep, and contains 400,000 gallons when full. This large capacity of reservoir was constructed to allow of 200,000 gallons being drawn off during the night for the generation of electricity for street lighting purposes.

Forbes.—The great expansion of the town of Forbes during recent years has rendered necessary a corresponding increase in the means of supply and distribution. The Department carried out the extensions to the reticulation, consisting of 10 miles of 9, 8, 4, and 3-inch cast-iron pipes and service reservoir. For the purpose of increasing the capacity and head of the existing reservoir, the present floor has been utilised, as the tank occupies the highest point on the most elevated ground near Forbes, and a riveted-steel tank, 45 feet in diameter and 50 feet deep, containing 300,000 gallons, has been placed inside the existing walls. The whole of the works are in progress.

*Works authorised.*

Kiama.—A scheme for the water supply of Kiama has been investigated and submitted with the estimate of cost to the Municipal Council, who have undertaken the responsibilities of the work, and drawings are now in hand. The supply will be obtained from the Fountaindale Creek. This creek will be tapped by means of a small pipe head dam, and the supply conducted through 4½ miles of 5-inch diameter pipe to a service reservoir of 200,000 gallons capacity, from whence it will be distributed through the usual 6, 4, and 3-inch diameter reticulation pipes.

*Proposals investigated.*

Wollongong.—The question of the expediency of constructing a water supply for the town of Wollongong was referred to the Parliamentary Standing Committee on Public Works, who recommended a scheme capable of supplying, in addition, all of the villages to the north as far as Bulli and to the south to Port Kembla, the whole to be placed under the control of the Metropolitan Board of Water Supply and Sewerage.

The scheme comprised a storage reservoir of 172,000,000 gallons on the Cordeaux River, situated on the opposite side of the coastal range from Wollongong. From thence the supply will be conducted through a tunnel, ¾ of a mile in length, by means of an 8-inch pipe, and then for 5¼ miles by a 6-inch pipe to a service reservoir of 400,000 gallons capacity on the outskirts of the town. The reticulation will consist of the usual 6, 4, and 3-inch pipes.

Bowral.—A design was prepared for the water supply of Bowral, but as the rates available that could be levied under the existing Act would not meet the charges of interest and maintenance, the matter has for the time been dropped.

Tumut.—Alternative schemes by gravitation from Wall's Creek and by pumping from the Tumut River were prepared, surveys carried out, and detail estimates of cost submitted to the Tumut Council. In this case, also, the financial means of the Municipality will not meet the charges, and the matter is in abeyance.

Queanbeyan.—A preliminary investigation was made into the matter of a water supply for Queanbeyan, and a gravitation supply from the Queanbeyan River recommended. This proved to be also outside the financial means of the Municipality, and nothing further has been done.

Goulburn.—The amount of water stored in the present reservoir on the Wollondilly River having been found inadequate for the present population, owing to expansion in the town and new Government Asylums, an investigation was made with a view of increasing it. An estimate has been submitted to the Council for an additional storage that will practically double the present supply.

### (3.) WATER CONSERVATION, IRRIGATION, AND DRAINAGE.

#### (1.) The Water Rights Act.

During the year under review the applications for licenses under the Water Rights Act continued to occupy a large proportion of the attention of this Branch. As was shown in last year's report, the number of applications for licenses up till 30 June, 1898, was 557, and the number of those which had been dealt with till that date was 160. Up till 30 June, 1899, the total number of applications received had increased to 625, while the number of licenses issued up till that date was 351. While the great majority of the applications relate to dams on creeks and rivers, it is worthy of special note that sixty-six were for pumping machinery. With a few exceptions the object of these pumping-engines is to raise water for irrigation.

The beneficial effects of the Water Rights Act have already shown themselves in two important points. Unreasonable objections to the construction of dams and other works for the conservation of water have practically ceased to be raised. As a consequence of this, landholders are now taking up the construction of dams in places where it was formerly unsafe to do so, and the dams now being constructed are of a considerably improved type. This is specially noticeable in the country between the Murrumbidgee and the Murray. As might naturally have been expected, it was some time before Section 4 of the Water Rights Act came to be known and understood by persons who were willing to take combined action towards paying interest on the cost of useful works. The initial difficulties appear to be overcome, as several petitions requisitioning that works should be constructed under the provisions of this Section have been received, and are being dealt with.

A map of the Colony showing, amongst other information, the position of all the works which had been or were being dealt with up till 30 June, 1899, is appended to this report.

## (2.) River Murray.

The Minister having sanctioned the final survey, and marking out of the proposed Murray canal system with a view to the preparation of an estimate, the work has been put in hand. As the survey for the head-work and for the first 2 miles of the main canal necessitated a considerable amount of work in the Colony of Victoria, it was necessary to obtain the sanction of the Victorian Government for this part of the work. The sanction was duly obtained, and two survey parties and one boring party entered on the work, which is now making satisfactory progress.

The framing of Regulations in connection with the irrigation area at Wentworth was considerably delayed owing, chiefly, to the novelty of the circumstances. Largely in consequence of the delay, which was unavoidable, a number of intending settlers, who waited for some time for the opening of the irrigation area for settlement, went elsewhere. The result of this was that only five blocks representing an area of about 55 acres were taken up. It has been recognised that the remoteness of Wentworth, and the lack of information regarding it, have contributed largely to the absence of demand for irrigation lots, and steps are now being taken to have the settlement properly advertised. The lots taken on lease are all under irrigation, and the results, so far as can at present be judged, are quite satisfactory.

## (3.) Edward River.

Two proposals relating to increased utilization of this river have been investigated during the year—one for the construction of a cutting to Talbot's Lake, and the other for a cutting to increase the supply in the Wakool River. The former was found to involve more expense than would be warranted by existing conditions, while the latter is awaiting further information from the landholders concerned.

## (4.) Murrumbidgee River.

The final plans and estimates for the proposed Murrumbidgee Southern Canal were completed, and have been ready for some time for inquiry by the Public Works Committee. The works include a storage reservoir at Barren Jack Mountain, at the junction of the Murrumbidgee and Goodradigbee Rivers, capable of conserving nine thousand millions of cubic feet of water. This reservoir will furnish a sufficient supply for the purpose of the proposed canal during the periods of low river, so that there will be no necessity to interfere with the requirements of the frontagers below the head of the proposed canal. The scheme provides also for branch canals, one of which will tail into the Murrumbidgee at Hay, and two others into the Billabong Creek near Conargo and Wangonilla respectively. Only a low weir will be required on the Murrumbidgee at the head of the proposed main canal, and this will be movable so that the navigation will not be interfered with. The estimated cost of the entire scheme is £650,000, and as the main canal will carry a supply of 1,000 cubic feet per second, it is estimated that water can be delivered from the canal at the rate of 246,000 gallons for 1s. after allowing for interest and maintenance.

A petition was presented by residents of Jerilderie and others asking for the immediate construction of the weir in the Murrumbidgee at the head of the proposed canal, the object in view being the provision of an increased supply of water in Yanko Creek. The Minister, however, decided that the question of the construction of the weir should be considered with that of the general scheme.

On petition from landholders concerned, the question of constructing a cutting from Old Man Creek to Sandy Creek was investigated, and an estimate of the cost was prepared. The estimate was published, and the matter was referred to the Land Board in accordance with section 4 of the Water Rights Act.

With regard to the proposal that the Government should deal with the question of irrigation at Balranald in the same manner as at Wentworth, it was decided that this should depend on successful developments at the latter settlement.

During the year the Yanko Creek Channel was cleared out, and the flow of flood-water to the Billabong Creek was materially improved. The town of Jerilderie, which was formerly dependent on the natural flow of the latter creek, is now chiefly supplied from the surplus waters of the Murrumbidgee.

## (5.) Lachlan River.

As Lake Cudgellico depends on the overflow of the River Lachlan for its supply of water, and as this overflow failed in four years in succession, it was decided to investigate the question whether surplus water in high freshets could not be diverted into the lake. A survey with that object is in hand.

A trust was appointed to take charge of the Island Creek weir.

The dam across the River Lachlan to divert the flow over the Middle Billabong weir has been completed, as has also a regulator for controlling the flow into the Middle Billabong. A cutting from this channel to Marowie Creek is being put in hand, and arrangements are being made for the construction of regulators to control the flow in the latter.

A regulator to control the flow from the River Lachlan into the Willandra Billabong has been completed.

An estimate has been prepared for the construction of a weir on the Nyrang Creek, and the question has been referred to the Land Board for report, as required in section 4 of the Water Rights Act.

The question of completing the Gin Gin Weir and subsidiary work for the supply of water to the Ewenmar, Boothaguy, Marthaguy and other creeks has been referred to the Land Board for report.

## (6.) Macquarie River.

The question of providing a more regular supply of water to the Belaringar Creek has been fully investigated, and a scheme for effecting this has been prepared. The estimate was notified, as required in the Water Rights Act, and the question was referred to the Land Board.

The construction of a regulator to control the flow of the water in the offtake at Warren weir has been commenced.

The question of constructing a cutting from Crooked Creek to Duck Creek, and of a regulator in Gunningbar Creek, has not been finally dealt with by the Land Board.

A concrete dam, about 30 feet in height, has been constructed on Queen Charlotte Vale Creek, at a cost of £540, for conserving water for mining purposes.

#### (7.) Gwydir River.

The construction of a channel for drainage purposes from Midgun Creek to Gilgil Creek is in progress.

The question as to carrying out the general scheme for the drainage of the Gwydir district is under the consideration of the Crown Law Department, the plans and estimate having been prepared.

#### (8.) Macleay River.

The question of the amalgamation of the drainage schemes on the Lower Macleay is on a fair way to settlement, the last of the Drainage Union having sent in a petition to be dissolved, with a view to inclusion in a comprehensive scheme.

#### (9.) Manning River.

The scheme for the drainage of the "Big Swamp," at Coopernook, has been accepted by the parties interested, and the work is about to be started, under the provisions of section 4 of the Water Rights Act. The drainage area is 6,800 acres, of which 2,232 acres are Crown land, and the estimated cost is £7,500.

#### (10.) Darling River.

The question of locking the River Darling from Bourke to Menindie has been under inquiry by the Public Works Committee, and plans and other information have been supplied by the Department as required.

#### (11.) Miscellaneous.

Discharges of rivers have been observed as opportunities offered, and the records of river heights have been maintained. Among miscellaneous questions dealt with have been the provisions of a proposed Amending Water Rights Act, regulations for the recovery of costs of works, and applications for inquiry into several minor works.

### (4.) GENERAL WORKS.

#### Fitzroy Dockyard.

A considerable amount of work of a very varied character was carried out during the year at the Fitzroy Dockyard. In addition to the general routine work, improvements have been effected to the various shops, and the work of levelling the rock on the north side of Fitzroy Dock has been continued. The number of vessels docked has been 155, representing a tonnage of 206,230 tons. An average of 350 men have been employed.

Statements are subjoined showing the various works which have been carried on and the expenditure, also giving particulars as to vessels docked.

STATEMENT of work carried out at the Fitzroy Dockyard during the year ended 30 June, 1899.

## Reclamation Works.

*North Coast District.*

Ballina.—For some time past the residents of Ballina, on the Richmond River, have complained of the nuisance caused by the low-lying swampy land which occupies a considerable area of the town, and it was determined to remedy this by filling-in the hollows with sand dredged from the harbour. The sand-pump dredge "Dictys" commenced this work in April, and was still engaged on it at the end of the year. Payments to defray the cost are being made by landowners in proportion to the quantity of material deposited on their allotments.

*Newcastle District.*

Stockton—36,958 tons of clay, discharged from vessels at the Stockton Ballast Jetties, was used for reclaiming Crown and private land, the owners of the latter paying the Government 2d. per ton for ballast deposited on their allotments.

Carrington.—71,017 tons of sand and 12,135 tons of stone were discharged from vessels at the Bullock Island jetties. This ballast was used to reclaim Crown land at the north end of Carrington.

The sand-pump "Juno" was employed deepening the New Basin and reclaiming the low-lying land between Throsby's Creek and Young-street.

The "Castor" was also at work deepening the New Basin, and reclaimed 10½ acres of land between the west side of the Basin and Denison-street.

North Harbour Reclamation.—A length of 2,780 feet of wall was constructed at the southern end of this proposed reclamation area, 16,120 tons of stone being obtained from the Waratah quarry and 4,018 tons from ships in the harbour. The total expenditure on the North Harbour reclamation works for the year has been £5,468 8s. 10d.

*Sydney District.*

Spectacle Island.—A portion of the foreshore on the southern side of the island has been reclaimed by the construction of a ballast-dyke, with filling behind.

Cook's River.—The resumed area between Shea's Creek and Botany, on the left bank of the river, is being reclaimed by the deposition of the silt pumped by the dredge "Neptune."

The embankments and drains have been maintained, and a brush-fence erected to keep the sand from being blown on to private property.

Long Cove.—A caretaker has been employed constantly attending to the drains, banks, &c. A portion of the embankment on the eastern side of the canal has been faced with stone to prevent damage by the wash of steamers.

Rozelle Bay.—The dredge "Groper" was engaged pumping silt on to the reclaimed area until February. The reclaimed land has been formed and graded, and silt has been removed from the storm-water channel.

White's Creek.—The dredge "Groper" was working here from April. The work at Rozelle Bay and White's Creek has been carried out by day-labour, twenty-three men being employed during the year.

Homebush Bay.—During the last month of the year twenty-four men have been engaged facing up the embankments with stone.

Other

## Other Works.

*Sydney District.*

Garden Island.—A coal-shed, 180 feet x 45 feet, has been erected on the wharf by contract at a cost of £858. Brick bins have also been erected for coals, and the joints on the docking of the wharf have been filled in. This work was done by day-labour, the cost being £60 3s. 6d.

A new floating-stage has been constructed by day-labour and fixed in position for communication between the Guardship and the shore.

Spectacle Island.—The wooden rails of tramway are being replaced by iron rails, and minor repairs have been carried out to buildings, fences, wharfs, &c.

Glebe Island Causeway.—This work, which was commenced in April, 1898, consists in the construction of two high embankments as approaches to the new Glebe Island Bridge. 202,195 tons of ballast filling have been used in the work which is being done by day-labour, 140 men being employed.

A timber staging has been constructed under contract between the western and eastern embankments in order to carry the stone trucks, and the timber abutments of the bridge have also been erected under contract.

Glebe Island Quarry.—During the year 51,890 tons of ballast and 1,483 cubic yards of dimension stone have been obtained at the quarry on the north side of the island, and forwarded by punt to the various sea-walls and other works in Sydney Harbour, an average number of seventy men being employed by day-labour.

Mauly sea-walls.—Those portions of the sea-walls which had been washed away by heavy seas, both on the ocean and harbour sides, have been reconstructed by day-labour, sixteen men being employed for five months.

Snail's Bay.—A new sea-wall has been constructed round the head of this bay, and all the masonry, with the exception of the parapet, is now in place.

Coogee Bay.—The foundations of the sea-wall have been repaired.

Rozelle Bay.—An earth embankment has been constructed at the foot of Booth-street to take the place of a bridge, the cost being £338 17s.

Cook's River.—The contract for the new bridge with sluices was completed, the cost being £10,265 10s.

An embankment with sluice-gates was constructed by contract across Marrickville Flat at a cost of £2,842 3s. 1d.

*North Coast District.*

Trial Bay.—On 24 November, 1898, a contract was let for the erection of ten warders' cottages for Trial Bay Prison, and the work was completed on 16 June, the total cost being £3,589 5s. 9d.

A contract was let in March for the erection of a new wing to the prison, and also extensive alterations and additions to existing buildings, the amount of the accepted tender being £9,638 8s. This work, which is now in progress, in addition to a new wing containing sixty-four cells, comprises six cubicles for single warders, new kitchen and bakehouse, new drainage system, &c., &c. The roofs of both new and old buildings are to be covered with Marseilles pattern tiles, the walls being of block concrete wherever practicable.

## Surveys.

The surveys carried out during the year ending 30th June, 1899, were:—

Harbours and Rivers ... ..	19
Country Towns Water Supply ... ..	13
Water Conservation ... ..	6
Bridges... ..	4
Miscellaneous ... ..	13

Ninety-two cases of private reclamations and special leases and 156 cases of oyster leases have been reported upon.

C. W. DARLEY,  
Engineer-in-Chief for Public Works.

3 November, 1899.

IV.

## Government Architect.

## VI.

## Report of the Government Architect.

I HAVE the honor to submit my report upon the building operations and services rendered by this Branch during the twelve months ended 30 June, 1899.

The year has been a busy one, and the result shows increased activity in building operations, the total expenditure being greater than that for any year since 1892; it appears to be coincident with the general improvement in building matters throughout the Colonies, the increased prices for labour and materials having no doubt contributed to the larger expenditure.

The ordinary Annual Revenue Vote for the year to cover expenditure on the varied services rendered by this Branch and to enable general repairs (and expenses that are not chargeable to Loans), to be undertaken, amounted to £50,000, which is the smallest sum voted for many years. It was, however, supplemented from various sources. The actual expenditure for the year has been as follows:—

	£	s.	d.
On Revenue ... ..	75,212	3	9
On Loan Account ... ..	195,777	2	6
Services for other Departments ... ..	10,148	4	0
Total expenditure for the year ... ..	£281,137	10	3

The accompanying Return gives in detail the buildings upon which the expenditure has been incurred, and comprises about one half of those under the care of this Branch.

Not many important buildings have been brought to a completion during the year, and the expenditure with one or two exceptions has been generally equalised particularly in regard to country buildings. The new buildings completed comprise:—

	£	s.	d.
Police Buildings—			
Booligal ... ..	880	15	9
Albury... ..	1,572	7	3
Cessnock ... ..	693	15	0
Currabubula ... ..	627	2	9
Forbes... ..	1,695	14	7
Ford's Bridge ... ..	541	12	11
Gladstone ... ..	1,230	19	11
Milparinka ... ..	705	13	0
Moonbi ... ..	957	18	3
Manilla ... ..	1,442	3	10
Peat's Ferry ... ..	767	7	10
Quirindi ... ..	1,023	2	5
Tilpa ... ..	876	6	0
Post Offices—			
Alexandria ... ..	1,755	9	7
Arnccliffe ... ..	1,267	10	2
South Brcken Hill ... ..	1,753	15	5
Lismore ... ..	4,454	1	1
Newcastle West ... ..	1,360	7	7
Court-houses—			
Bowraville ... ..	1,636	10	8
Enngonia ... ..	1,060	2	6
Gilgandra ... ..	595	3	0
Kew ... ..	1,616	17	9
Peak Hill ... ..	1,329	10	10
Tinonee ... ..	1,567	12	6
Wingham ... ..	1,621	14	3
Miscellaneous—			
Newgate Lodge, &c., University ... ..	1,952	0	0
Bourke Lands Office... ..	3,735	6	5

The following buildings are in course of extension or erection :—

	Expenditure during the year.		
	£	s.	d.
Botanic Gardens, Buildings, &c. ... ..	3,162	6	8
Custom-house ... ..	2,510	2	11
Darlinghurst Gaol... ..	4,322	14	0
Government House ... ..	4,643	18	2
Government Printing Office ... ..	2,935	9	3
General Post Office ... ..	30,249	9	0
Royal Mint ... ..	1,285	13	8

Bathurst Gaol ... ..	4,323	17	9
Bourke Court-house ... ..	5,774	8	5
Goulburn Gaol ... ..	2,948	0	0
Kenmore Hospital for Insane ... ..	18,200	4	7
Maitland Gaol ... ..	2,626	3	9
Water and Sewerage Board Offices, Newcastle... ..	3,895	2	6
Wyalong Court-house ... ..	1,340	0	0

At Christmas time upwards of 2,500 unemployed were engaged at painting the railings of the public parks of the Metropolitan District, and the expenditure was £10,762 7s. 6d.; the large majority of the men was of course unskilled, but the organisation into gangs under properly qualified foremen protected the Government against loss, and upon subsequent measurement of the work performed, it was found that the results were by no means unsatisfactory. This special effort has placed the Government property in a good state of repair and of appearance.

The second contract for the erection of courts at the National Art Gallery was completed during the year, and the trustees were enabled to obtain possession, so that now in the new portion of the building the pictures are efficiently exhibited in six courts. Plans were also in preparation for No. 3 contract, which includes the eastern wing and sculpture galleries. This work being of a monumental character is necessarily of substantial construction; no pains have been spared to ensure a really good building.

The expenditure under the day-labour system has been carried on uninterruptedly upon the General Post Office, with result that a spacious telephone exchange has been handed over to the Postal authorities, and the additions in George-street on the resumed land have also been completed fit for occupation. The additional storeys and the roof are rapidly progressing, as well as the rearrangement of the engine-room in the basement of the building.

At Government House a large quantity of defective external stonework has been replaced, and advantage was taken of this necessary work to enlarge the south end of the ballroom by means of an Apsidal window, and to provide at the same time an orchestral gallery, the additional space so gained having been very much needed.

The offices in Newcastle for the Hunter District Water and Sewerage Board progressed during the year almost to a completion, and will provide ample accommodation for this Board for many years to come.

The additions to the Treasury, including the new portico facing Macquarie-street, have been carried on continuously during the year, and with the portion of the No. 1 contract completed in the previous year, form the nucleus of an important block of buildings. It is recommended that the next step to be taken should be the remodelling of the old portion and bringing it into unison both as regards accommodation and appearance with the newer portions.

A large and continuous expenditure throughout the year has been incurred in remodelling, improving, and adding to the first-class gaols of the Colony to adapt them to the altered conditions under which the prisoners are now treated. Amongst other matters in connection with gaols, the installation of the electric light has taken a large amount of time and attention of the officers of this Branch; and I am in a position to report that in every case the installation has been successfully carried out. The gaols at Goulburn, Darlinghurst, Berrima, Bathurst, and East Maitland have now complete installations, while the large one at Parramatta Gaol is rapidly approaching completion. A small installation is approved of to be set up in Broken Hill Gaol.

During the year extensive plans for the enlargement and improvement of the Quarantine Station, at Manly, were prepared in accordance with the requirements of the Principal Medical Officer, and preparations made for commencing the work early in the following year.

Considerable alterations and expenditure have been made, and it is intended will still be made, to the Coast Hospital, Little Bay. These buildings are of wood construction, and, owing to pressing emergencies from time to time, have been increased in number and extent, unfortunately without any preconceived plan upon which the additions might be properly made. The consequence is that a large institution exists at Little Bay, faulty in general arrangement and questionable as to permanent stability; but so long as the Government cannot see its way clear to the erection of an entirely new hospital on better lines elsewhere continuous expenditure upon these buildings must necessarily be incurred.

At the Kenmore Hospital for Insane I have to report the completion of all buildings intended at present to be erected on the female side of the institution, and the entering into a contract for the completion of those on the male side. The steps now taken cover the whole of the buildings which it is anticipated will be required for some time. The completion of these works is looked forward to with some confidence, as it is anticipated, that the result both from a technical point of view, as well as from the financial, is expected to be highly satisfactory.

A commencement was made during the year with the erection of two additional storeys to the Custom-house, at Sydney; and, as the same circumstances prevailed as previously at the Government Printing Office and the General Post Office, the Minister determined that the work should be carried out

on the day-labour system. Tenders had been invited and received before this decision was arrived at; and it will therefore, be possible, when this work is completed to make some comparison between the actual cost of the work under the system with what it may be expected to have been if carried out by contract. The whole of the extensive staff of officers located in that building is working without inconvenience, although for some time to come some portion or other will be without a permanent roof.

This branch of the Public Works Department is entrusted with a variety of duties in connection with other Departments and public buildings which give constant employment to the officers, in addition to the actual work of erecting and maintaining public buildings. Amongst other duties performed is the controlling of the electric lighting, from a central station at the Government Printing Office, of an increasing number of public buildings; also of the maintenance and up-keep of the electric-lighting plants in the gaols already previously referred to. It also periodically inspects and improves the steam-cooking plants throughout the numerous gaols and public institutions which are so fitted up, and it inspects and controls all boilers, machinery, and motive power in connection with these institutions. It also sees to all public lighting, by gas and otherwise, of metropolitan parks and public places not under the control of the City Council. Amongst other services rendered by this Branch is the controlling of the passenger-lifts in the Colonial Secretary's, Public Works, Lands, and Mines Offices—four in number—all on the hydraulic principle, and supplied with motive power by the Sydney Hydraulic Power Company. To give an idea of the general use to which these lifts are put, the following return of passengers may be quoted:—

Colonial Secretary's, per week	...	...	...	...	3,577
Public Works	..	..	..	..	3,509
Lands Office	..	..	..	..	3,509
Mines Office	..	..	..	..	3,063
Total	...	...	...	...	13,658

Taking this as a fair average, the total number carried in the course of a year would be 710,216.

The permanent workshop connected for many years with this Branch has of late been made more use of than formerly, as the following statement shows:—

	Wages.			Materials.		
	£	s.	d.	£	s.	d.
January, 1892, to December, 1892 .....	1,054	6	3	998	14	3
"   1893     "   1893 .....	1,237	2	7	336	19	8
"   1894 to June, 1895 .....	2,466	4	2	979	1	2
July 1895     "   1896 .....	2,244	15	10	2,693	13	9
1896-7 .....	2,713	12	11	2,176	5	0
1897-8 .....	6,757	3	2	2,848	4	3
1898-9 .....	9,793	11	6	3,309	18	8

It is under the efficient and practical management of Mr. F. J. King, and the services it renders and the works it performs are of a multifarious character. Originally it was confined to rendering general services for all Departments of the Government service in the metropolitan area, which could be best done by one establishment, and in carrying out small matters of urgent repairs to buildings and furniture that are not put out to public competition. As, however, the buildings became more numerous, larger, and older, it was found desirable to increase its scope so as now to include general matters of repair, redecoration, and improvements, and a large and increasing number of miscellaneous works required to be done, often at great expedition. During the year this included fitting up several public offices for sub-departments, including the new branch of the Free Public Library at the Victoria Markets, and also extensive public decorations on the State occasions of the year. There is no doubt the convenience of the service has been met, and the work done in a thoroughly reliable manner. Only the best workmen are employed, and the materials used are specially selected under the annual contracts, and time and money both saved. The establishment works, however, under some disadvantages,—its premises (the Government Architect's old yard) are too confined and inconvenient, and upon occasions the need of a small machinery plant to save unnecessary hand labour has been felt. This, however, it is proposed to meet in the coming year, and authority has been given to place the necessary sum on the Estimates to accomplish it.

On the formation of the Public Service Tender Board the advisability of discontinuing all detached stores was under consideration, but it was found not only inconvenient to carry this out in this particular case, but the store of builders' ironmongery, timber, paints, &c., was retained, considerably enlarged, and placed in the charge of a competent storekeeper. The returns at the end of the year show a stock of material in hand valued at £2,315 1s. 5d. The stock has been inspected by a Public Works officer and reported as in very good condition, every care having evidently been taken to store in a creditable manner, while the ledger for the last year has been well and neatly written up. Considerable cash returns have been made to the Treasury as the proceeds from the sale by public auction of obsolete fittings and old materials periodically accumulating in the yard.

During the year a scheme was prepared for the housing of the Office Staffs of the Inspector-General of Police, and of the Comptroller-General of Prisons, in a building to be erected on the site specially resumed for the purpose at the junction of Phillip and Hunter Streets. It was considered, however, that the site was too valuable and spacious for the limited accommodation required, and the scheme was extended to include offices for the Public Service Board, Auditor-General, and the Government Statistician, who in all cases are occupying rented premises. The enlarged scheme increased the estimated cost of the building to £44,810, which exceeds the limit above which all such matters are referred to the Parliamentary Standing Committee on Public Works. It was accordingly referred and investigated, with result that that authority recommended to Parliament the reduction of the scheme to its original dimensions. No steps have, however, yet been taken to provide the accommodation for the Inspector-General of Police and the Comptroller-General of Prisons, although badly required in both cases.

A larger and more comprehensive scheme was also placed before this Committee, comprising the erection of a large set of offices on the vacant land at the junction of Phillip, Bridge, and Young Streets, to accommodate the Mines Department, with all its sub-branches and museums, and also the Department of Public Instruction. Elaborate plans were prepared and a large amount of information supplied

relative

relative to the present housing of Government officials in public offices and in rented buildings generally, and although the Department placed before the Committee apparently strong and good reasons for undertaking this scheme, this latter body reported adversely.

It may be generally remarked that the natural growth of the public service in Sydney has to a very great extent been accompanied by disjointed and tentative arrangements for its accommodation. This has often led the Government into considerable expense in renting sundry premises in the city, more or less inconvenient; but it has also induced the enlargement of existing buildings which were designed complete in themselves, and which do not lend themselves successfully to such enlargements.

Another work of considerable importance occupied the attention of this Branch during the year. It comprised a long thought out scheme for the combined erection of a penitentiary for the reception of casual and short-sentence metropolitan prisoners, and a prison for the exclusive treatment of female prisoners under all sentences, and who can be conveniently brought in from the Colony generally. The site recommended by the Comptroller-General of Prisons, the Surveyor-General, and myself conjointly is a piece of land, 50 acres in extent, lying between the Bunnerong-road, Kensington, and the suburb of Randwick. Plans were prepared for both these establishments, and included the latest known details of prison construction, and the whole scheme has been placed before the Parliamentary Standing Committee on Public Works, whose investigations are still proceeding. It may be interesting to note that the opportunity now presents itself for erecting and equipping, for the first time in the British Empire, an entirely new and model establishment for female prisoners.

References were made in last year's report to the necessity of making a revaluation of such Government property in the charge of this Branch as might be transferred under Act to the now expected Federal Government.

Action, therefore, has been taken during the year with regard to the buildings used by the Postal Department, and a complete valuation to date is now ready for use whenever demanded. In this statement it has been possible to arrive at the present value of the buildings themselves, but owing to the fluctuating and, I believe, improving state of the land market, particularly as regards the site of the General Post Office, Sydney, it has not been thought desirable to fix a present arbitrary value; for obvious reasons, therefore, the result of the valuation is not disclosed in this report.

With regard to the condition of public buildings, every effort is being made with the funds at disposal to recover lost ground in the matter of general repairs to the increasing number of those under the charge of this Branch. Considerable advance has been made owing to the policy of permitting the cost of improvements and enlargements to existing country buildings, and of such works as clearly add to their capital value, to be charged against special loans raised on a currency of thirty years, while the establishment of the rule of charging the cost of matters of dilapidation, repairs, and expenses to revenue votes only has in all cases been strictly acted upon.

Under a continuance of this arrangement, and with somewhat more liberal revenue votes for the forthcoming year, it is anticipated that the long-standing list of requisitions from the Departments generally will be overtaken; but the hope of being able to systematically and periodically paint all buildings is, I fear, still a "hope" only.

All buildings to be handed over to the Federal Estate, including post-offices and customs houses, should, as a matter of credit to this State, be placed in good repair before such transfer is effected, and as it will take at least twelve months to do this, the initial step should be taken without delay.

No damage from fire, flood, or other extraordinary causes has been reported during the year. No matters of dispute with contractors in connection with deviations on contract or extra works, existed at the end of the year.

The work of this Branch in the country districts is conducted by twelve district architects, located as centrally as possible in their districts. Their work is of a comprehensive character, and besides superintending the erection of new buildings (plans and specifications for which are prepared in the Head Office), it comprises all matters of general repairs and improvements, the preparation of reports and estimates; also of specifications of contracts, together with supervision, payments to contractors, and the travelling inseparable from the nature of these duties. In some districts the travelling is a very heavy item, involving both expense and time from which the metropolitan work is free. The district architects keep up a complete system of book-keeping, and their daily communications with the Head Office are all conducted on one general arrangement.

The returns from these officers for the year afford the following information:—

Number of officers	...	...	...	...	...	12
Number of works carried out, but prepared in Head Office	...	...	...	...	...	99
Number of works carried out, but prepared in local offices	...	...	...	...	...	280
Total expenditure (not including £43,374 9s. 3d. at Kenmore)	...	...	...	...	...	£98,026
Papers, letters, vouchers, reports, and estimates dealt with	...	...	...	...	...	22,064
Number of miles travelled by railway	...	...	...	...	...	79,853
Number of miles travelled by road	...	...	...	...	...	33,652

The returns also show that half the time at the disposal of these officers is occupied in travelling, and that every £100 of expenditure has necessitated an average of 120 miles of travel. Where continuous supervision is necessary, and where the office work is excessive, additional help is rendered to the district officers.

The personnel of the Office Staff has remained unchanged during the year. Mr. Oakeshott, chief draftsman, and Mr. Truefitt, one of his principal assistants, applied for and obtained leave of absence to visit England; in neither case had the leave expired prior to the termination of the year. Mr. Mitchell has, during the absence of Mr. Oakeshott, very satisfactorily filled his position as acting chief draftsman.

During the year also, the Public Service Board instituted an inquiry with a view of permanently grading all professional officers in the Public Service, and an Advisory Board on behalf of the Public Service Board made long and continuous inquiries as to the position and service of the several professional officers in this Branch. On the announcement of the decision of the Board, and the results of this step, in the *Gazette* of 19 May, 1899, a number of appeals against such grading were sent in by the officers affected, including some from this Branch, and such appeals are now under investigation.

I have pleasure in reporting the general loyalty and efficiency of the services rendered by all officers throughout the year.

W. L. VERNON,  
Government Architect.

RETURN of Expenditure on Public Works carried on by Government Architect from 1 July, 1898, to 30 June, 1899.

## Roads and Bridges.

### VIII.

#### Report of the Principal Assistant Engineer for Roads and Bridges.

Sydney, 6 November, 1899.

I HAVE the honor to present, for the information of the Under Secretary for Works and Commissioner for Roads, a report upon the works carried out by this branch during the year ending 30 June, 1899, together with tabulated statements of the expenditure for that year, the lengths of roads and bridges of various classes directly or indirectly under the charge of the branch, and other statistical information.

#### EXPENDITURE.

From these returns it will be seen that the expenditure on roads and bridges was £645,569 5s. 3d.—an increase over last year of £29,471 10s. Of this sum, £566,510 3s. 8d. were derived from revenue and £79,059 1s. 7d. from Loan Funds. A sum of £291,491 3s. 5d. remained unexpended from Loan Votes, and was carried forward.

Road works absorbed £454,009; bridges, £109,715; ferries, £14,067; and miscellaneous works, £29,161; while £54,076 were expended in salaries, supervision, equipment, travelling expenses, rent, &c.

The sum of £359,214 was expended by contract, and £162,051 by day-labour under the supervision of the Departmental officers, while £20,757 were paid to various municipal councils to assist in the maintenance of roads within their boundaries.

Of the total expenditure, contracts absorbed 55.61 per cent.; wages, 25.10 per cent.; stores, materials, and sundries, 7.66 per cent.; subsidies to municipalities, 3.22 per cent.; and supervision, rents, equipment, travelling, &c., 8.38 per cent.

Thirty-three new bridges were opened during the year, and 38 old structures were replaced at a cost of £59,585 16s. 7d.; while, on 30 June, 37 were in course of erection, at an estimated cost of £89,950 4s. 9d.

The cost of working ferries was £12,839 0s. 10d., and the revenue derived from them amounted to £5,886 15s.

#### STATISTICS.

A total length of 42,178 miles 66 chains of road have been dealt with during the year, classified as follows:—

Scheduled roads receiving a regular annual expenditure	...	28,386 miles 59 chains.
Municipal roads subsidised by the Department	... ..	1,156 ,, 40 ,,
Unclassified roads receiving grants as required	... ..	12,635 ,, 47 ,,
Total	... ..	42,178 miles 66 chains.

Of the scheduled roads, 461 miles, and of the unclassified roads, 237 miles 40 chains, are under the control of trustees, the Department exercising only a general supervision over the expenditure.

There are 2,914 bridges on these roads, consisting of 8,111 spans, having a total length of 275,994 feet, or 52 miles 22 chains. Of these, 71 bridges, having 279 spans and a length of 9,791 feet, or 1 mile 68 chains, have been built during the year.

The culverts number 36,158, of which 1,012 are constructed of stone, brick, or concrete, 22,978 of timber, and 12,168 are pipe-culverts. Their total length is 535,342 feet, or 101 miles 31 chains.

Causeways number 16,006, and have a total length of 388,029 feet, or 73 miles 39 chains.

There are 101 punt ferries and 45 boat ferries in operation, and the Department owns 1 steam-launch, 11 iron punts, 96 timber punts, 3 horse-boats, 74 flood-boats, and 134 other boats.

There are also 13 punt slips for executing repairs.

Two new punts were built during the year, and on 30 June 2 steam-launches were in progress.

The branch regularly employed 57 foreman and overseers, 905 road maintenance men, and 84 others, including ferrymen, &c. In addition to these, an average of 29 foremen and overseers, 370 road maintenance men, and 167 other men received temporary and intermittent employment, thus raising the average number of men regularly earning wages during the year to 1,612.

The average number of contractors and contractors' men employed was 5,684.

The contracts let during the year numbered 4,387, of which 4,127 were road contracts and 260 bridge contracts. These range in value from £2 to £2,546. The aggregate value was £412,895.

Three thousand four hundred and forty-seven contracts were completed during the year, and 476 were in progress on 30 June.

The number of reports, minutes, and returns received and registered at head office was 31,931, and 19,988 vouchers were examined and submitted for payment.

HEAD

## HEAD OFFICE AND FIELD STAFF.

The Roads Staff was on 30 June as follows:—

District Engineers	...	...	...	5
Assistant Engineers	...	...	...	2
Road Superintendents	...	...	...	56
Field Assistants	...	...	...	20
Clerks in District Offices	...	...	...	15
Survey Draftsmen	...	...	...	2
"	"	(temporary)	...	2
Foremen	...	...	...	6

The Bridges Staff was on 30 June as follows:—

Assistant Engineer	...	...	...	1
Engineer in charge of bridge designs	...	...	...	1
Bridge Superintendent	...	...	...	1
Draftsmen	...	...	...	15
Inspector of Ironwork	...	...	...	1
"	"	Timber	...	1
Resident Engineers	...	...	...	4
Clerk	...	...	...	1
Bridge Inspectors and Overseers	...	...	...	4
Bridge Caretakers	...	...	...	7

NOTE.—Since 30 June transfers to another Department have considerably reduced the staff, and several alterations in title have also taken place.

The Colony is divided into 61 road districts, ranging in area from 74,230 square miles in the west to as low as 230 square miles in the more densely-populated areas on the coast. The greatest road mileage in charge of any district officer is 3,801 miles, and the smallest 257 miles.

In the execution of their duties road superintendents travelled 257,279 miles by road and 89,580 miles by rail. Field assistants travelled 94,756 miles by road and 29,269 miles by rail, and foremen and overseers travelled 69,632 miles by road and 6,094 miles by rail. These figures give a total of 646,610 miles travelled—421,667 miles by road and 124,943 miles by rail. The cost to the Department was £5,139 10s., equal to about 2½d. per mile.

## GENERAL.

In view of the rapidly-increasing road mileage, and the limited funds placed at the disposal of the branch, it has been necessary to exercise the most rigid economy in the expenditure. When it is remembered that the applications for grants amount to many millions a year, it will be seen that at once the most laborious and least pleasant duty of officers has been the careful sifting of claims.

The inspection of roads on which expenditure has been applied for, and subsequently refused, has involved many thousands of miles of travelling, and much labour in collecting statistical information as to traffic, produce raised, and persons to be served. It has been, of course, impossible to altogether avoid charges of unfair treatment; but the fact that these have been so remarkably few, and on further investigation have usually proved unfounded, indicate that the officers have carried out their duties with impartiality and discretion.

In view of these facts, it is gratifying to note that the cost of supervision—which includes salaries, equipment, travelling, rent, wages of overseers, &c., &c.—has not exceeded 8·38 per cent. of the total expenditure.

In the expenditure of the annual and special grants the district officers have exercised the greatest care. Although over four thousand contracts have been dealt with, in no instance has a contractor exercised his right of appeal to legal process, and in very few has it been found necessary to reverse at head office the decision arrived at by those in charge of the work.

With regard to the bridges erected during the year, I have nothing to add to the exhaustive report submitted by the Assistant Engineer in immediate charge of such work, and beg, therefore, to forward it without comment for the information of the Under Secretary and Commissioner.

W. J. HANNA,

Principal Assistant Engineer, Roads and Bridges.

Under Secretary and Commissioner for Roads.

## BRIDGE CONSTRUCTION, RENEWALS, AND REPAIRS.

## IX.

## Report of the Assistant Engineer for Bridges.

I HAVE the honor to report that, during the year ended 30 June, 1899, 71 new bridges were completed and opened for traffic, at a total cost of £59,585 16s. 7d. (for details, see Appendices A and B). The total length of these bridges is 9,791 feet, consisting of 265 timber beam spans and 14 timber truss spans. Of these, 38 bridges, having a length of 6,793 feet, and costing £12,797 18s. 8d., were constructed, to replace previously existing structures which had become unfit for traffic.

The more important bridges completed were:—The renewal of the timber viaduct in approach to the iron bridge over the Murrumbidgee River at Gundagai, having a total length of 2,719 feet, consisting of 78 timber beam spans, and costing £12,292 6s. 2d.

Union bridge over the Murray River at Albury, having a total length of 323 feet, consisting of two timber truss spans of 110 feet each and three timber approach spans, costing £6,813 13s. 5d.

Bridge over the Bega River at Bega, having a total length of 433 feet, consisting of four 90-foot timber truss spans and two 35-foot timber approach spans, and costing £4,251 9s. 3d.

The year's work adds 33 bridges to those previously existing, and there were, on the 30th June, 1899, 2,914 bridges, with a total length of 275,994 feet, or 52 miles 22 chains, under the control of the Department.

The materials used in the construction of these works may be summarised as follows:—

Round timber in piles and girders...	...	...	...	62,262	lin. ft.
Hewn timber and sawn timber	...	...	...	159,338	cub. ft.
Ironwork	...	...	...	322	tons.
Masonry	...	...	...	297½	cub. yds.
Concrete	...	...	...	1,066	„

NOTE.—The figures given on above, as also on the returns attached, represent the cost of bridge structures without engineering and incidental expenses.

## WORKS IN PROGRESS.

At the close of the period under review a large number of important works were in progress, viz.:—Thirty-seven new bridges, estimated to cost £89,950 4s. 9d. (see Appendices C and D), of which 20 are to replace previously existing structures, and 17 are at new sites, the more important being—

*Kempsey Bridge.*—Estimated cost, £22,000. It will be noticed that in the report for the year ending 30 June, 1898, reference is made to this bridge, for which a contract had been let. Good progress has been made with the work during the year, and the completion may be looked for early in 1900. The bridge consists of 4 timber truss spans of 154 feet each, on cylinder piers, with 305 feet of approach spans, the width of deck being 22 ft. 6 in. throughout.

*Dunmore Bridge, Paterson River.*—contract cost, £12,433—was also referred to in the last report, and its completion may be looked for in December next.

*Hinton Bridge, Paterson River.*—This bridge is to complete the line of communication between Morpeth, Hinton, and northwards *via* Phoenix Park, in connection with which the bridge over the Hunter River at Morpeth was built last year. It will consist of two 90-foot timber truss spans with a steel lift span, and 340 feet of beam spans in approach, and a contract has been let for £9,845.

*Murwillumbah Bridge, Tweed River.*—The recent opening of the railway line from Lismore to the Tweed, which has its terminus on the south side of the Tweed River, opposite Murwillumbah, made the construction of a bridge at the place necessary. A contract for £12,941 17s. 6d. was let in November, 1898, and the work is proceeding rapidly. The bridge will consist of four 90-foot timber truss spans, and a steel lift span on cylinder piers, with 100 feet of approach spans.

In connection with the Hinton and Murwillumbah bridges, reference may be made to the improved machinery for raising the lifting span, where, by the adoption of a system of wire ropes in lieu of shafting overhead, a considerable economy in construction is effected.

*Queanbeyan Bridge.*—This bridge is rapidly nearing completion, and is of considerable interest, as, with the exception of the bridge over the Lachlan River at Cowra, it is the first in which the composite form of truss has been used in New South Wales, and also because the Pratt style of truss, with vertical posts and inclined tension members, has been adopted, in lieu of the Howe type; in order to obtain a stiff cross-section. The superiority of steel over timber in tension, and the great cost of replacing the timber chords, which, from their position, are the first portion of the truss to decay, points to a great economy in maintenance being effected by the use of this type for important bridges.

*Moruya Bridge.*—The work of rebuilding the bridge which carries the South Coast road across the Moruya River was put in hand towards the end of the year, and a system of sinking foundations has been adopted, which, so far as this Colony is concerned, is new, and gives promise of a considerable saving. The old bridge was a very light timber structure, 850 feet in length, erected in 1875, and now quite past service. The river at this place is a sandy estuary, the depth to rock from H.W. varying from 9 feet at the shore to 46 feet in the centre. It was considered advisable that the piers of the new bridge should be of a permanent character, but the depth to rock made the sinking of cylinders a very costly matter. Piers consisting of three cast-iron piles (see Plan appended), each 12 inches in diameter, and having a specially-formed shoe 18½ inches in diameter, have been adopted, the piles after fixing being joined together with steel bracing. These piles are sunk to a depth of 20 feet by means of a powerful jet of water, which, entering the top of the hollow pile and passing through orifices in the shoe, displaces the sand and causes the pile to sink to the required depth. This system has been successfully used in other countries, but in New South Wales only to a limited extent in connection with timber piles, and then chiefly as an aid to withdrawing them. I made a trial of sinking these large cast-iron piles, prior to their use at Moruya, at Lake Macquarie in May last, when one of them was rapidly sunk 23 feet through sand and clay bands, and was also withdrawn, so successfully as to fully justify the adoption of the system.

An extension of this system of hydraulic sinking has also been used at Moruya to remove timber which may be met with in sinking the piles to reach the rock, when the depth of overlying sand does not afford sufficient holding for the piles, and the ebb and flow of the tide causes the silting-up of any excavation

excavation made unless a coffer dam be sunk at great cost. A steel cylinder, 3 ft. 6 in. in diameter and 25 feet in height, is provided, with an air-lock at one end, and is sunk through the sand till rock is reached by pumping water into the upper part of the cylinder. The air-lock is then brought into operation and the men descending through it cut a hole in the rock and fix the pile, when the cylinder is withdrawn and the operation repeated at the next pile.

The more usual system of sinking such a cylinder to the rock has been to excavate the material inside the cylinder, lifting it through the top, a process much lengthened by the fact that as the material was removed more was often carried in at the bottom by the influx of water. In the system now described, on the contrary, no material is excavated, the water pumped into the cylinder forcing the sand away from the bottom of the cylinder, so that the men descending after the air has been applied, find the rock swept clean of sand, and can proceed with the work of fixing the pile at once.

The plant by means of which these operations are conducted at Moruya is a very compact and perfect one, consisting of a double-action Worthington pump, 10-inch steam cylinders, 6-inch water cylinders, and 10-inch stroke, and capable of working against a pressure of 160 lb. per square inch for the hydraulic process, and a Marsh patent air-compressor, 10-inch steam, and 10-inch air cylinder for supply of air to the air-lock. Both these pumps, which are the best of the class, are supplied with steam by a 12-h.p. vertical boiler, working at a pressure of 80 lb. per square inch.

*Cockle Creek Bridge and the Monier system.*—This bridge (see Plan appended), though not of importance in point of magnitude, being only 343 feet in length, and costing £3,800, is of considerable interest, owing to the use in its construction of Monier cylinders in lieu of cast-iron, and also Monier pipes as a protective covering for the piles. The difficulty of protecting timber piers in saltwater from the attacks of the cobra leads to the use of the cylinders, generally of cast-iron filled with concrete, for important piers such as those under truss spans, and the cost of the cast-iron cylinders has been a very serious item. The success of the Monier system in connection with pipes of all sizes suggested that it might be used as a substitute of cast-iron in cylinders, and it was tried for the first time at Cockle Creek, as now described.

The main piers of the bridge each consist of two cylinders 3 ft. 6 in. internal diameter, and 2½ inch thick, constructed on the Monier principle, and having one layer of wire-netting (1-inch mesh and 16 gauge), and two spirals of 10 gauge steel wire wound completely round the cylinder, the turns being 1 inch apart. The longitudinal connection is formed by six steel bars 1½ inch by ¼ inch placed between the wire spirals; these bars are so arranged that those of adjoining lengths of cylinder can be coupled together by means of a small fish-plate and steel wedges.

In sinking the cylinders the joints were made with red lead to prevent leakage, and it was found that when several segments were joined together, they could be lifted without disturbing the joint. A cast-iron cutting segment was used (see Fig. 4) to protect the bottom edge of the cylinder, and as a precaution against damage by the men's picks, a thin steel plate guard was provided for the inside of the cylinder up to a height of 4 feet, but this was not found necessary. The cylinders were sunk through gravel, sand, and clay, 36 to 41 feet below the water, and as it was found possible to keep them pumped dry if well pressed down by means of screw-jacks, the air-lock was not required. When a satisfactory foundation was reached the cylinders were filled with concrete in the usual way, the inside surface of the Monier being carefully cleaned to get as good a bond as possible with the concrete.

The cost of these cylinders delivered at site was 24s. per foot, as against £3 per foot for cast-iron cylinders of the usual type, making a saving of £264 5s. on these two small piers alone, and there is no doubt that their use in suitable localities will result in a very large saving in future.

Hitherto where protection from the teredo has been necessary for timber piles, muntz metal has been generally employed, or in some cases earthenware pipes filled with concrete, but these latter, owing to their fragile nature, and the difficulty of making a joint with the necessary longitudinal strength, have not proved very satisfactory. At Cockle Creek the experiment was made of using Monier pipes for a pile covering. These are exceedingly strong to resist fracture, and even if cracked do not fall to pieces; they can be jointed so as to have a good strength longitudinally, which makes them easy to handle; and, what is most important, a series of pipes can be forced down with screw-jacks without danger of cracking.

Fig. 1 on plan shows the Cockle Creek Bridge, in which 5 timber piers, having 3 piles in each, or 15 piles in all, have been protected by Monier pipes.

The formation is sand mixed with vegetable matter overlying stiff clay to a depth of about 5 feet, and it was considered desirable that the piles should be protected down to the point where they entered the clay, so as to provide against removal by scour of the soft upper strata. The piles were of ironbark, about 40 feet long, 14 inches diameter at the small and 18 inches diameter at the large end, driven 15 feet into the clay. From the level of the clay to high water, 4 hardwood battens were spiked to act as guides for the pipes, and the piles received a coating of Stockholm tar before driving. Driving having been completed, a small platform was attached to the pile above high water, and upon this were erected, by threading over the head of the pile, a sufficient length of 21-inch diameter Monier pipes to reach from high water to the clay-bed. The pipes were then jointed with a wire-netting cover and cement, the joint being the ordinary Monier pipe-joint, swelling the diameter of the pipe about 2 inches; but I may mention that the contractors for the pipes are now making an improved joint (shown in Fig. 2), which will suit better and be more sightly. While the joints were setting the capwales were fixed on to the piles so as to bring them into position and avoid movement after the pipes were sunk. The platform was then removed, and the pipe-casing lowered by means of hooks under the bottom length of the pipe, until it rested upon the bottom. A jet of water from an inch and a half pipe was then worked round the bottom of the pipe-casing to loosen the material, and pressure was applied by means of screw-jacks at the top, when the casing sank easily to the clay bottom. The space between the casing and the pile having then been scoured out with the jet, was filled with clean sand, finished with 9 inches of concrete at the top to form a cap. The casing presents a neat appearance, and I have no doubt will prove of great durability, probably outlasting the pile.

The pipes used are constructed on the usual Monier principle, being 1½ inch thick, of cement mortar on a groundwork of wire-netting 1½-inch mesh and 16 gauge.

*P. and B. Pile covering.*—This pile covering, of which favourable reports reach us from America, is of a bituminous nature, and it is claimed that the growths of marine plants on it protect it from the friction of sand suspended in the water, which is so destructive to copper. A trial of this covering has been made at Murwillumbah Bridge, and also at Webb's Creek, but no opinion can be formed until a considerable time has elapsed.

## DRAWING OFFICE.

During the months of July to April inclusive almost the whole of the drawing office staff were employed on the plans for the Pymont and Glebe Island Bridges (under Mr. Darley), and this necessarily held back other works; but after April every effort was made to put out as much work as possible. Excepting the Pymont and Glebe Island Bridges, plans were prepared and tenders invited for 74 bridges and 3 punts, with a total contract value of £78,073.

## REPAIRS TO BRIDGES.

During the year a sum of £46,107 6s. 2d. was expended upon repairs to 642 bridges, the system adopted being to invite tenders for supply of material required and carry out the work by day-labour under the Department's overseers. In those districts where timber is not available, or in cases of extreme urgency, the timber is sent from the depôt at Cockatoo Island, where a supply is kept which has proved most valuable. The expenditure on replenishing this stock of timber during the year has been £989 17s. 4d., but it is intended to carry a heavier stock in future, as any sudden demand reduces the present small stock below working limits. Although established in the first case for the use of this branch only, other branches of the Department have found the supply very useful from time to time.

The most important work under the head of repairs was the partial rebuilding of the bridge over the Hunter River, at Denman. The main portion of this bridge consisted of two spans of 90 feet each, on timber piers, and the flood of February, 1898, caused a subsidence of one of the river piers, followed by the collapse of about 70 feet of the superstructure. Three new piers have been erected, the most important being of iron cylinders, while the damaged superstructure has been rebuilt at a cost of £3,707 12s. 2d.

## INSPECTION OF TIMBER FOR EXPORT.

In the month of August, 1898, the New Zealand Railway Department placed orders in the Colony for the supply of about 4,000,000 superficial feet of hewn and sawn timber, and about 35,000 lineal feet of round piles (£43,500 worth), and at the request of the New Zealand Government arrangements were made for inspection before shipment by the officers of this branch. In addition to the services of one inspector (Mr. Kane) sent to the Clarence from New Zealand, this work has required the undivided attention of three officers, as well as the constant supervision of the Department's timber inspector. Up to 30 June the following had been shipped:—25,000 lineal feet of round piles, 1,250,000 superficial feet of squared and sawn timber, the money value of which, delivered in New Zealand, is £15,000, and it is satisfactory to note that the New Zealand Government state that their views have been met as to the quality of timber sent forward.

## PUNTS.

A contract was let, and the work of constructing a new steam punt for the vehicular traffic at Grafton ferry, Clarence River, is in progress. The punt will have a length of 64 feet, width 30 ft. 6 in., and depth 4 ft. 6 in., providing a carriage-way of 17 ft. 6 in. in the clear, and is worthy of note as being the first ferry-punt of the class in which compound surface condensing engines were used. The engines, which will indicate 40 h.-p., have been built by Messrs. Simpson and Strickland, of Dartmouth, while the punt itself is being constructed at Newcastle, N.S.W. It is anticipated that the reduction of noise due to the use of condensing engines will be greatly appreciated by the public, as reducing the risk of bringing restive horses on the punt, while a large saving in consumption of fuel will be effected. The cost of the punt when complete will be £2,700.

Two new punts were completed for Broadwater Creek and Bega River ferries, at a cost of £373 4s. 10d.

## USE OF OIL-ENGINES FOR PROPULSION OF PUNTS.

The need for some intermediate class of ferry-punts, between the ordinary hand-punt, costing about £250, and travelling at a speed not exceeding 1.2 miles per hour, and the large steam punts, costing £2,500, and travelling at a speed of 4 miles per hour, has been much felt. At present experiments are being conducted to ascertain if an oil-engine can be adapted to this purpose. The fact that the standard class of oil-engines do not reverse, and have practically only one speed, renders the problem somewhat difficult of solution, but it is thought that these difficulties are in a fair way to be overcome, and that in the ensuing year practical use may be made of the system.

## STEAM-LAUNCHES.

Two steam-launches, for passenger traffic and towage purposes on the Hunter and Clarence Rivers, are now nearing completion. These launches are each double-ended, 70 feet long, 15 feet beam, 5 feet depth, with hardwood keel and Oregon side planking. They are propelled by compound surface-condensing engines, with 8-inch and 16-inch cylinders, 9-inch stroke. The engines will indicate 50 horsepower, at 300 revolution per minute. The boilers are return tubular boilers, 6 feet long, 7 feet diameter, wholly constructed of steel, and designed for a working pressure of 115 lb. per square inch. Propellers are fitted at either end of each launch, 3 ft. 3 in. diameter, 4 ft. 6 in. pitch, which will drive the boat at a speed of 9½ knots per hour. An electric light installation will be fitted, supplying side and mast-head lights, in addition to the lights for deck and engine-room.

The launches are provided with coal-bunkers, water-tanks, and cabin for the crew, and will each have seating accommodation for more than 100 passengers.

## MISCELLANEOUS WORKS.

The wood-blocking of King-street, Newtown, from Bligh-street to the Newtown railway bridge, was relaid (a considerable improvement in levels being effected), at a cost of £8,266 1s. 2d., and the street which previously came under the control of the Department as part of the main road from Sydney, *via* dam at Cook's River, to Half-way House, was handed over to the Newtown Council, who agree to maintain it for the future.

E. M. DE BURGH,  
Assistant Engineer for Bridges.

## SCHEDULE A.

NEW BRIDGES completed and opened for traffic between 1 July, 1898, and 30 June, 1899.

## Sewerage Construction.

### XII.

#### Report of the Engineer-in-Chief for Sewerage Construction for the Year ending 30 June, 1899.

Department of Public Works, Sewerage Construction Branch, Sydney, 30 August, 1899.

Sir,

I have the honor to submit the following report of the operations of this Branch during the year ending 30 June, 1899.

I have classified my report as follows:—

1. Transfer of Works to the Water and Sewerage Board.
2. High-level Sewerage.
3. Low-level Sewerage.
4. Stormwater Channels.
5. Drainage of Country Towns.
6. Detail Survey of Cities, Towns, and Suburbs.
7. Summary of Work Executed in the Drawing Office.

#### 1. TRANSFER OF WORKS TO THE WATER AND SEWERAGE BOARD.

During the year the following works have been gazetted as completed and transferred to the Water and Sewerage Board, viz.,—

1. 3rd Division of the Northern Branch Western Suburbs Sewerage, commencing at the junction of Regent and Flood Streets, Leichhardt, and terminating in Glover-street, comprising 89½ chains of 3 ft. 3 in. by 2 ft. 2 in. sewer, and 2 chains of cast-iron pipes 18 in. diameter.
2. Long Cove Creek sub-branch of the Main Northern Branch Sewer, commencing at Dover-street, Summer Hill, and crossing the suburban railway near Summer Hill Station, extends in a southerly direction to Long Cove Creek, thence, running parallel to that creek, terminates in Piggott-street, Petersham. It contains 10 chains of 3 ft. 6 in. by 2 ft. 4 in. concrete and brickwork sewer; 5½ chains of 3 ft. 3 in. by 2 ft. 2 in. concrete sewer; 21 chains of 21 inch diameter "Monier" and stoneware pipes, including concrete curves; 7 chains of 16 inch diameter "Monier" and stoneware pipes, including concrete curves; and 4½ chains of 12 inch stoneware pipes, including concrete curves.
3. Low-level Sewer, known as the Homebush Creek Branch, commencing at a point close to Allan and George Streets, Concord, and extending in a southerly direction across the Parramatta-road to the junction with existing stormwater channel close to the railway line.
4. Balmain South-eastern Slopes Branch of the Northern Main Sewer, commencing at Denison-street, Balmain, and extending in a north-easterly direction to Stephen-street, together with sub-branches at Weston and Victoria Streets, Reynolds-street, Rosser-street, Palmer-street, Curtis-road, Stephen-street, and Darling-street, comprising 182 chains of 3 ft. 3 in. by 2 ft. 2 in. sewer, and 11¼ chains of 9 inch pipe sewer.
5. The whole of the works connected with the sewerage of the low-lying areas of Double Bay, including all stoneware and cast-iron pipes, ejector stations, collecting chambers, shafts, manholes, lamp holes, flushing chambers, ventilating tubes, &c.; also all the land, buildings, machinery, storage battery, switchboards, electric motors, &c., connected with the air-compressing plant.
6. Euroka Creek Stormwater Channel, commencing in Lavender Crescent, North Sydney, at the existing stormwater channel under the railway embankment and extending in a north-easterly direction to a point about 1 chain from the centre of Riley-street, consisting of about 18 chains of 2 feet 6 inches diameter circular channel.
7. Careening Cove Stormwater Channel, commencing near the western building line of Denison-street, North Sydney, and extending in a north-westerly direction to Miller-street, a distance of about 5 chains. The work includes an alteration to existing channel in Miller-street for 1½ chains, and the construction of a stormwater channel from the western side of Miller-street in a north-westerly direction to the centre of the footpath on the southern side of Berry-street, a distance of about 6 chains.

#### 2. HIGH-LEVEL SEWERAGE.

##### *Northern Branch Western Suburbs Sewerage.*

The whole of the Main Northern Branch Sewer has been completed, commencing at the Illawarra-road, Marrickville, and extending northerly through Marrickville, Petersham, and Leichhardt, to Leichhardt Park on the eastern side of Long Cove. A branch leaves the main line at Frazer's-road, runs under the railway a little west of Lewisham Station, and is carried across Long Cove Creek on a steel aqueduct 280 feet in length, terminating in Sloane-street.

A sub-branch runs up the Long Cove Creek Valley as far as Piggott-street. Both these branches have been completed, and the latter length has been transferred to the Board.

*Western*

*Western Branch Western Suburbs Sewerage.*

The first, second, and third divisions of the Main Western Branch from Premier-street, Marrickville to Brand-street, Croydon, a distance of 5 miles 19 chains, have been completed.

The fourth division of this sewer which intercepts the sewage of Burwood, Strathfield, and Homebush, and parts of Ashfield and Concord, is now in course of construction. The total length of this division is  $2\frac{3}{4}$  miles, a mile of which is in open trench, and the remainder in tunnel through shale formation.

*Northern Main Sewer (Bondi Outlet).*

Both branches of the Northern Main Sewer which drain respectively the north-western and the south-eastern slopes of the Municipality of Balmain have been completed during the year.

*Waverley and Bondi Eastern Slopes.*

Operations are well advanced in the construction of the sewer which intercepts the sewage from the seaward slopes of Waverley and Bondi. About  $7\frac{1}{2}$  chains of the Bondi end which has been pushed on in advance of the remainder to allow of the reticulation of the area between Old South Head Road and Bondi-road being connected, have been completed.

About 10 chains of very bad ground have been met with near the Bondi end, and extra heavy timbering had to be employed to protect the sewer from the shifting sand, and in addition thereto, in a portion of the length, cast-iron pipes had to be substituted for the ordinary concrete sewer. With the exception of this portion the tunnels have been lined as far as Fletcher's Glen, and driving has been finished in the remaining tunnel within 2 chains of Bronte Creek.

*Randwick and Kensington.*

## 1st Division.

With the exception of shafts at 58'81 chains and 71'27 chains, the construction of this sewer from the present outfall at Coogee to the junction of Avoca and Howard Streets has been completed, and in about two months' time this section will be ready for carrying sewage from the Borough of Randwick.

## 2nd Division.

During the year drawings have been prepared and a contract let for an extension westerly to the Bunnerong-road, then following the centre of that road till the racecourse is reached. From this point the sewer skirts the western boundary of the racecourse and finishes in Alison-road, near the entrance gates.

It will provide an outlet for the sewage from part of the western slopes of Randwick, the Randwick racecourse buildings, and the Kensington township. The first 2 miles will be in tunnel through rock and sand, constructed of brick and concrete, varying in size from 4 ft. 6 in. by 3 ft. 6 in. to 3 ft. 3 in. by 2 ft. 2 in., the remaining quarter mile will consist of 21 and 18 in. pipes in open trench.

*North Sydney Outfall Works.*

The whole of the extensive works which have been under construction at Willoughby Bay, Middle Harbour, for some time past, to treat the sewage from the municipalities of North Sydney, South Willoughby, and Mosman, have been completed and are now in active operation. Briefly stated, the process in operation is as follows:—After the sewage has passed through screens to remove the larger floating bodies, which are afterwards burnt it is treated with lime to facilitate precipitation of the suspended matters in the settling tanks.

After settlement has taken place the clearer liquid flows over a weir situated at and forming the ends of the tanks into an effluent channel which conveys it to filter beds, where it is purified by oxidation and bacterial agencies, and eventually finds its way to the tidal waters as a harmless effluent. The solids on the other hand are deposited as sludge in the tanks, which is drawn off and reduced to sludge-cake by forcing the liquid sludge through filter presses, and the cake is then burnt in destructor furnaces. Sufficient land was resumed to enable the tanks and other works to be erected. This, with the portion reclaimed for filtration, area amounts to about 13 acres. The reclaimed portion—about 8 acres—was filled in with sand and formed into eight filter beds. The treatment works, containing the straining chamber, air-compressing engines, filter presses, sludge receivers, and lime-mixing apparatus, are situated at the southern end of the resumption. Adjoining are five large settling tanks and a sludge reservoir. The open effluent channel conveying the effluent floated off from the tanks runs round two sides of the latter and passes along the sides of the filter beds, distributing its effluent through offset valves and troughing as required. A stormwater channel has been built to conduct the waters of Willoughby Falls Creek through the reclamation to the tidal waters.

The channel is also available as an overflow for the main sewage conduit near the tanks.

The filter beds are protected on the harbour frontage by a rubble dyke, and a jetty has been provided for the purposes of the works. The air-compressing plant consists of a Tangye horizontal steam engine (type "H"), which drives a horizontal double acting air compressor.

On 6 June last tests were made of the machinery. Indicator diagrams were taken of the compressor and engine under varying conditions, viz.:—(1) Full load, driving compressor, and lime mixer; (2) light load, engine driving lime-mixers and shafting only. In each case a constant pressure of 80 lb. per square inch was maintained in the receiver, and a steam pressure of 80 lb. per square inch on the boiler, with a consumption of half a ton of slack coal in ten hours.

The works will be shortly transferred to the Board.

*Willoughby and Chatswood Sewerage.*

A contract was let early in February last, and the construction of the works is now in active operation. The decision regarding the method of sewage treatment was held over pending the result of experiments to be made with septic tanks at Rookwood Asylum, which, as will be seen on reference to another paragraph, are now nearing completion. It has now been definitely decided to adopt the septic tank

tank system in connection with this scheme, and a site has been fixed at the eastern side of Warrane Road, near its intersection with the main creek which empties itself into the north arm of Sugarloaf Bay, Middle Harbour.

The tanks will be capable of dealing with the sewage from a population of 6,000, but are laid out in such a way that they can be enlarged from time to time as the population increases, until the maximum number of 26,780 has been reached.

The scheme now under consideration embraces a main outfall sewer and reticulation sewers.

Satisfactory progress has been made since the commencement of the works in February last, and up to the present time 3 miles 27 chains of pipes have been laid. It is confidently expected that the whole of the outfall sewer and reticulation will be completed by February next.

#### *Neutral Bay and Mosman Sewerage.*

The first division of this sewer has been let, and it is expected will be completed within three months.

Drawings have been prepared, and the contract let for the second division of this sewer. It consists of about 38 chains of 3 ft. 3 in. by 2 ft. 2 in. brick and concrete sewer, and 36 chains of 2 ft. 5 in. by 1 ft. 9 in. oviform "Monier" pipes. At the head of Shell Cove Creek an aqueduct will be constructed of 24-inch steel pipes and masonry abutments.

Drawings have been prepared and tenders will shortly be invited for the construction of an aqueduct to connect the second and third divisions of this sewer where it crosses the tidal waters at the head of Mosman's Bay.

Plans have been prepared, and the contract is ready for calling tenders for the third division of this sewer which will drain the remaining portion of the southern slope of the township of Mosman.

#### *South Willoughby Sewerage.*

Good progress has been made with the sewer which is now being constructed to convey the sewage of South Willoughby to the North Sydney Outfall Works. Two drives have been broken through, and tunnelling is proceeding in the other drives.

Owing to the very hard ground met with, the great depths of the shafts, and the unusual lengths of the drives amounting in some cases to 14½ chains, several months must elapse before the works will be completed.

#### *Middle Harbour Slopes.*

Owing to the rapid increase of settlement on the Middle Harbour Slopes of North Sydney and Mosman it has been decided to push on with the intercepting sewer to drain this locality. Surveys have been completed, and plans are now being prepared for the first section which will discharge into the Willoughby outfall works, and extend thence in an easterly direction for about 30 chains.

It has been deemed inadvisable to construct the sewer beyond this point at present, as, owing to the sparse character of the settlement, the maximum rate of 1s. in the £ would not be sufficient to pay working expenses.

#### *Manly Sewerage.*

With the exception of a few extensions which have been rendered necessary to serve houses erected since the original design was prepared, and to lessen the cost of connection to ratepayers, the reticulation and other sewers have been completed and are now ready for carrying sewage.

#### *Quarantine Ground Sewerage.*

Plans have been prepared and a contract let for an outfall sewer discharging into the ocean at the "Old Man's Hat," Inner North Head, tunnelling under the hill which rises between the buildings and the ocean and connecting with branch pipe lines to intercept the sewage from the first and second-class quarters and the hospital grounds.

#### *Rookwood Asylum Sewerage.*

Up to the present time the earth-pan system has been in vogue at the asylum, the liquid sewage being carried through pipes to irrigation beds near the buildings. The increase in the number of inmates from 790 to 1,200, and the intended further increase to 1,500, have rendered improved sanitary arrangements necessary, and a proper system of pipe sewers is being constructed leading to "disposal" works situated in the asylum grounds, a little more than a quarter of a mile from the buildings, and in the direction of the Necropolis Railway Station. The works consist chiefly of a new form of tank, known as the "septic" tank, and coke filters, the process of treatment being as follows:—The sewage is first passed through wire screens and then into a silt pit where any heavy matter is deposited. From the silt pit the sewage flows under sunken weirs into the "septic" tank. Air and light are excluded from this tank and the sewage will travel so slowly as to remain in it twenty-four hours, during which period it is subjected to the attacks of micro-organisms whose growth is favoured by the condition in the tank.

The septic tanks are in duplicate, one only being used at a time. The effluent passes over a cascade of concrete steps and then into iron troughs and into a distributing pipe from which automatically-controlled valves connect with the three filter tanks.

In the filter tanks the destruction of all organic matter in the sewage takes place. On leaving the filters the purified effluent passes into a pipe drain running along East-street, and discharges into the Parramatta River.

These works are almost completed and are expected to be in operation by the end of August.

#### *Pymont Sewerage.*

The sewer is completed and will shortly be handed over to the Water and Sewerage Board.

#### *Illawarra Suburbs.*

The preparation of a gravitation scheme, including main and reticulation sewers, to discharge on to the sewage farm at Botany, is being proceeded with, and is now almost complete.

## 3. LOW-LEVEL SEWERAGE.

Special attention has again been given to the sewerage of the low-level areas.

Tenders were invited in England and the Colonies for the supply and erection of twenty electric motor pumping sets in duplicate, to lift the sewage to the gravitation sewers, and the tender of a local firm was accepted. Orders were also placed with a Colonial firm for the casting of the iron cylinders which will receive the pumping machinery in situations where the nature of the ground prevents the construction of a concrete chamber.

Drawings and specifications have been prepared for the necessary cables to convey the current from the Tramway Power Station at Darling Harbour and Rushcutter's Bay to the different pumping stations, also for the switch-boards, signalling apparatus, and other accessories.

The following localities have been dealt with during the year:—

*Marrickville.*

The main lines from the pumping station towards Erskineville, with all pipe branches, are now practically complete, and the remaining lines running through the flats towards Cook's River are approaching completion.

The engine-house is in course of construction, and will be completed in about three months. The engine-beds have also been built, the two boilers placed in position and partially built in.

A contract was let for a 22½-inch diameter steel rising main, which has been laid, and through which the sewage will be lifted to the Western Outfall Sewer, thence gravitating to the Sewage Farm at Botany.

*Wentworth Park and Glebe.*

A tender has been accepted for the sewerage of the low-lying areas of Wentworth Park and part of the Glebe.

*Balmain, Annandale, and Leichhardt.*

A contract was let in August last for the low-level sewerage of Balmain, Annandale, and Leichhardt. Four sites were selected along the south-eastern shores of Balmain for collecting the sewage viz.—at Stephen-street, Easton Park, Reynolds-street, and Mullins-street. In the two former cases the machinery chambers have been constructed of concrete, and in the latter of oval cast-iron cylinders. The tunnel under the hill from Stephen-street to Looke's Avenue, and the branch tunnel under the School of Arts to Cooper-street, have been driven, and the lining is well in hand. With the exception of the rising mains, about one-third of the remaining portion of the work remains to be completed.

Three additional pumping sites have been selected, viz.—At White's Creek, near Brennan-street; Johnstone's Creek, near the tramway crossing; and on land to be resumed at the junction of Orphan School Creek and Johnstone's Creek.

The necessary intercepting sewers have been laid out and plans are in preparation. On the completion of these works the whole of the low-lying areas along the foreshores from Waterview Bay to Johnstone's Creek will have been provided for.

*Woolloomooloo and Botanical Gardens.*

The construction of the low-level sewerage works of Woolloomooloo is now nearing completion. Pipes have been laid intercepting all sewage from the existing sewers, which, being of substantial construction, will remain as stormwater carriers only. A cast-iron caisson has been sunk in Forbes-street to receive the pumping machinery.

The tunnel intercepting the sewage from the Botanical Gardens has been completed, and is ready for connecting to the pumping station in Forbes-street.

*Double Bay Low-level.*

A scheme known as the "Shone" system has been adopted for the low-lying areas of Double Bay. For the purposes of the scheme, the area was divided into four sub-areas, each having an ejector station and collecting well, into which the gravitation sewers discharge.

At each station the Shone hydro-pneumatic ejectors are in duplicate, one ejector being ample to deal with the maximum sewage flow, while the pair working together are capable of discharging the maximum flow of rainfall and sewage. The ejectors are driven by compressed air, and their duty is to lift the sewage from the collecting wells, through delivery mains, into the Darling Point branch of the Bondi main sewer. A substantial one-storied building, of brick with sandstone facings and tiled roof, has been erected near Swamp-street off Bay-street, enclosing the air-compressing plant, which consists of two Parker continuous shunt wound motors, actuating two air compressors. By arrangement with the Railway Commissioners the electrical energy is supplied through 19/16 cable from the Power-house at Rushcutter's Bay. A storage battery of 230 Epstein cells has been installed, a primary duty of which is to run the plant at night when the energy from the tramway plant is not available.

The whole of the works has been completed, and on February last tests were made of the efficiency of the plant under normal conditions, with one air compressor and all the ejectors working. The results obtained were considered highly satisfactory.

*Darling Harbour.*

Tenders will shortly be invited for the low-level sewerage of the western side of Darling Harbour. A piece of land has been resumed at Pymont-street, opposite the Tramway Power-house now in course of erection, sufficient to contain the pumping plant, controlling station, and accessory buildings. Intercepting sewers have been designed along Pymont-street as far as Allen-street, and under the railway sidings to the old silt pit in Lackey-street. The old sewer will be widened at this point, and tidal flaps will be built in, controlled by automatic hydraulic valves to restrict the interception to maximum dry weather flow only.

It has been found impracticable to bring the sewage from the area north of Allen-street to this pumping station, and another set of pumps will be erected in the vicinity of Alma-street to deal with that area.

The survey of the scheme dealing with the City side of Darling Harbour, though much hampered by the heavy traffic in the neighbourhood, has been completed, and plans are now being prepared. The area will be served by three pumping stations fixed at suitable positions along the foreshore.

*Rushcutter's*

*Rushcutters' Bay.*

A scheme has been devised for Rushcutters' Bay low levels, and plans are almost completed. Two pumping stations will be erected, one near the north-eastern corner of the Tramway Power-house, and the other near the reserve adjoining Ithaca Road, Elizabeth Bay. Electric energy supplied from the Tramway Power-house at Rushcutters' Bay will be used in actuating the pumps.

*Homebush Creek.*

About 43 chains of 12-inch pipes have been laid along Powell's Creek, Homebush, from the outlet end of the present storm-water channel to a point near Allen-street, to carry off the sewage matter or dry weather flow discharged by the channel into the creek near the Railway Bridge.

Plans for a further extension of 10 chains have been completed, which will take the outlet to the limit of tidal waters.

It is intended that these pipes shall form part of a future low level system for the locality.

## 4. STORMWATER CHANNELS.

*Long Cove Creek.*

A branch known as the Daniel-street Branch of the Long Cove Creek Storm-water Channel has been constructed from the end of existing work to an outlet into the main canal, containing about 6 chains in length of concrete channel pitched at the outlet. For the purposes of the traffic, a covering has been thrown across the main channel at Fred-street and Davis-street, Petersham, built of steel girders and concrete jack arches.

*Bay-street.*

A contract was let in December, 1898, for a storm-water sewer which will serve the purpose of an overflow for the George-street main sewer, and a relief for the present drains in the neighbourhood of Wentworth Park which are inadequate to carry off the flood-waters of an exceptional rainfall. With the exception of about 5 chains of tunnel lining and the building of the outlet, the main line has been completed. The Mitchell-lane Branch has been constructed with the exception of about 6 chains.

An extension of Johnston's Creek storm-water channel is being constructed up the valley on the north side of the suburban railway, finishing at Bruce-street a few chains west of Stanmore Station. Being along streets, the channel will be covered throughout.

*White's Creek.*

The White's Creek Channel is now completed from Rozelle Bay as far as Booth-street.

The channel tapers to 8 feet in width at the Booth-street end, which has been built on land resumed for the purpose, the remainder being chiefly on land reclaimed by the Government at the head of Rozelle Bay. A branch 12 chains long and 10 ft. by 4 ft. in dimensions leaves the main channel near Brennan-street, and finishes at Catherine-street, and is practically completed.

A tender has been accepted for a 9 ft. by 4 ft. channel through the Rozelle reclamation connecting Easton Park Storm-water Channel with the waters of Rozelle Bay.

An extension of the Careening Cove Storm-water Channel in the Municipality of North Sydney has been carried out from Denison-street to Berry-street.

*Necropolis.*

Provision has been made for the storm-water drainage of the new portion of the Necropolis at Rookwood by the construction of a brick and concrete channel half a mile in length, emptying itself into the creek near the railway culvert. Adjacent to the channel a line of pipes has been laid to intercept the drainage from the graves.

*Botany Storm-water Channel.*

Surveys have been made to estimate the cost of a concrete channel to improve the present unhealthy state of the creek discharging into Botany Bay near the engine pond.

*Shea's Creek Storm-water Channel.*

An extension of Shea's Creek Storm-water Channel from the present termination at McEvoy-street to Botany Road is now being surveyed and estimates prepared.

*Johnston's Creek.*

An extension of the Johnston's Creek Storm-water Channel from Booth-street to Parramatta Road has been carried out. Owing to the removal of the Booth-street overhead bridge, and the substitution of an embankment, it was found necessary to cover the channel at that point. The contract included the laying of portion of the low-level pipe sewers of that locality which cross the line of channel.

*Marrickville Valley.*

With the object of mitigating the floods which inundate the Marrickville Valley during heavy rains, and thus indirectly preventing the low-level sewerage pumps, now approaching completion at Meeks'-road, from being overtaxed by an excess of flood-waters, a catchment channel has been designed and surveyed which will discharge into Cook's River near Unwin's Bridge, and thence takes a northerly course approximately parallel to the Illawarra railway, finally bending round the head of the valley and terminating in Victoria-road.

## 5. DRAINING OF COUNTRY TOWNS.

*Newcastle.*

The report on the scheme for dealing with the sewage of Newcastle and the suburbs as far west as Lambton and Waratah has been completed during the year, and copies, with plans, forwarded to the Hunter District Water and Sewerage Board, and to the various Municipal Councils, with a request that they should consider the financial aspect of the question, and report to the Minister.

It was proposed to deal first with the city of Newcastle, Merewether, the greater part of Hamilton, and a part of Wickham.

The

The estimate of cost for dealing with this area, including reticulation, was £75,308 12s. 6d. This was based on the assumption that the sewage could be turned into the ocean without treatment other than screening. As, however, it is possible that some further treatment might become necessary, in order to avoid pollution of the foreshore, precipitation works were designed, the cost of which would bring up the estimated capital outlay to £89,130 2s. 10d. The estimated rate necessary to cover interest (and repayment in 100 years) together with working expenses is, without precipitation works, 6½d. in the £, or with them, 9d. in the £.

At the request of the authorities interested, additional estimates have since been prepared to cover cost of including the whole of the municipalities of Hamilton, Wickham, and Carrington. As these additional areas are almost wholly below the gravitation zone, pumping would have to be resorted to, involving the construction of five pumping stations. The total extra capital cost is estimated at £36,961.

Some of the councils concerned have passed resolutions approving of the submission of the scheme to the Public Works Committee; but no recommendation has yet been made by the Newcastle Council or the Hunter District Water and Sewerage Board.

#### *Cottage Creek.*

A westerly extension of the Hannel-street branch drain, in open concrete channel about 18 chains long, has been constructed during the year.

#### *Newcastle Pasturage Reserve.*

The drainage of the Newcastle Pasturage Reserve has been completed, and the results are highly satisfactory. The work was of a very extensive character, the main drainage canal and two most important branches having a total length of 4 miles 57 chains; the width would average about 40 feet, the lower portion of the main canal being 110 feet wide. For a length of 1 mile 33 chains it was found necessary to protect the banks by fascine work, and also to construct at frequent intervals masonry water-cushion drops to reduce the velocity of the flow. In order to carry the railway and tramway traffic across these canals, several bridges of steel and timber have had to be constructed. The work has been the means of successfully draining 7,782 acres of land that was previously little better than a swamp.

#### *Jenolan Caves.*

Provision has been made for the drainage of the Caves House and adjoining buildings, by a sewer constructed of earthenware pipes from the stables to the bridge near the entrance to the Imperial Caves; from this point the sewage gravitates through steel pipes fixed to the present turbine pipes, as far as the Power-house, and carried thence across the gullies on steel trusses to an outfall into the creek some distance below the bathing-hole. The work, which was carried out by day-labour, also included the fixing of a hydraulic ram to supply water to the caretaker's residence.

#### *Dungog.*

Tenders have been called for the construction of a concrete channel from McKay-street along present bed of creek for about 24 chains, to relieve the present insanitary condition of the watercourse.

#### *Narrandera.*

Tenders have been accepted for the construction of a 9-inch pipe sewer discharging into filter tanks, to be erected near the creek, to dispose of the liquid sewage at present flowing into the river from the township. Plans for a further extension are now in hand.

#### *Wallsend.*

A concrete storm-water channel has been designed and is now being constructed by day-labour through Wallsend Park to the existing concrete channel near the Co-operative Company's railway.

#### *Orange.*

Tenders have been called for a further length of 14 chains of concrete channel, to be constructed from the existing channel in Kite-street to the cricket ground.

#### *Liverpool.*

A scheme has been prepared for the sewerage of Liverpool by means of a main outfall and reticulation sewers discharging on to a filtration area of 3 acres, situated on the left bank of George's River, about ¾ of a mile below the dam.

#### *Parkes.*

Surveys and estimates have been prepared of alternative designs for a storm-water channel, or pipe-sewers with filter tanks, with the object of improving the present insanitary condition of the township of Parkes.

#### *Camden.*

A sewage farm on the banks of the Nepean River with outfall and reticulation sewers has been designed and reported upon for the township of Camden.

#### *Campbelltown.*

Plans were prepared for a pipe-drain from the culvert under the Main Southern Railway along Dumaresque-street to Sydney-road, near Campbelltown platform.

#### *Mulwala.*

A plan was prepared for a small channel to deal with the storm waters flowing through the township.

### 6. DETAIL SURVEY OF CITIES, TOWNS, AND SUBURBS.

#### *Sydney and Suburbs.*

The Detail Survey of the municipality of Willoughby is now nearly completed as far as the locality embraced by the sewerage works now under construction.

Active progress has been made during the year with the Detail Survey of the Illawarra suburbs, special attention having been given to the area affected by the proposed scheme of sewerage.

The

The appointment of additional draftsmen to reduce the arrears of plan-drawing having been made, the extra staff has enabled the current work to be kept well in hand, and reduce to some extent the arrears that had accumulated.

Applications for copies of the detail sheets have increased considerably during the year.

#### 7. SUMMARY OF WORK EXECUTED IN THE DRAWING OFFICE.

During the year drawings were made for 39 contracts, for which 163 drawings and 1,695 heliographs were prepared.

The value of the work designed amounted to £307,414. In addition to this, drawings for work valued at £44,600 are now in progress.

Sixty-seven sheets of the Detail Survey of Sydney and suburbs were drawn containing an aggregate of 877 tenements; 7 sheets were revised, and 71 tracings drawn for heliography.

Nine hundred and ninety-seven helios of the Detail Survey, and 334 helios of miscellaneous sewerage drawings were prepared and issued to the Water Supply and Sewerage Board, other Government departments, and for office use.

Thirty-six resumption and easement plans, and 44 miscellaneous drawings were made, and 181 plans mounted.

J. DAVIS,  
Engineer-in-Chief for Sewerage Construction.

### XIII.

#### RETURN of Expenditure on Public Works by Sewerage Construction Branch from 1 July, 1898, to 30 June, 1899.

## Land Valuation.

## XIV.

## Report of the Government Land Valuer.

I HAVE the honor to submit a report upon the operations of this branch from 1 July, 1898, to 30 June, 1899. Briefly summed up the work may be classified as follows:—

*Railways and Tramways.*—The following lines have been proclaimed and confirmed:—

Gore Hill Electric Tramway.  
Moree to Inverell Railway, Parts 2 and 3.  
Neutral Bay Electric Tramway.

*Notifications of Resumptions* have been issued in respect of the under-mentioned works.

Annandale, Ventilating Shaft.	Hinton Bridge.
Balmain Low-level Sewerage.	Kiama Water Supply.
Becroft, Water Supply.	Limestone Creek, Access to Water.
Cockle Creek Bridge.	Merewether Post and Telegraph Office.
Camden Bridge.	Picton Water Supply.
Darling Harbour Low-level Sewerage.	Parke Water Supply.
Dalwood Creek Bridge.	Pymont Post Office.
Frederickton Police Buildings.	Pymont Bridge.
Gundagai Bridge.	Picton Bridge.
Gwydir District Drainage.	Ranken's (near Casino), Approach to Wharf.
Gloucester Post Office.	Rylstone Bridge.
Glebe Island Bridge.	Rookwood Bridge.
Gundry Creek Bridge.	White's Creek Storm-water Channel.

101 cases standing over from previous years have been finally settled; 82 valuations in various parts of the Colony, ranging from a few pounds up to £35,500, have been made; 61 cases were advanced to a stage for valuation; 40 claims for temporary occupation have been adjusted.

Estimates were prepared of the cost of proposed resumptions for various works as follows:—

Kiama Rifle Range.	Young-street Stores.
Lane at Taylor Bay for Military purposes.	Walcha Lock-up Site.
White's Creek Storm-water Channel.	Port Kembla Harbour Works.
Adamstown Drainage.	City Railway Extension, Scheme 1.
Ejection Station, Darling Harbour.	"    "    "    2.
Wyong Lock-up Site.	"    "    "    3.
Willoughby Sewerage.	Land at Parramatta for Asylum purposes.

*Miscellaneous.*—Many matters of a miscellaneous character, involving much time and research, have been dealt with during the year, as, for instance,—

Report on site for Drill-hall, Albury.  
Claim of the Sydney Freehold Land Co. for damage to property, Annandale.  
    "    for damage to land by construction of Sewerage Works, Ashfield.  
    "    "    "    at Parramatta by construction of Storm-water Channel.  
J. Lugg's claim for compensation for land resumed for Tramway purposes.  
Completing Ramsay's Estate matters—Long Cove reclamations.  
Leichhardt—Long Cove—treating with owners for sale of land.  
Lease of land to Y. Hogan, Orange Water Supply.  
Picton Water Supply, Easements.  
Particulars given to Lands Department as to resumptions from Packer's Grant, Rockdale.  
Sale of land resumed for extension of Supreme Court.  
Sydney Water Supply, list of outstanding claims for Water and Sewerage Board.  
Koorawatha to Grenfell Railway, Exchanges of lands.  
Mosman's Bay, land required from Ferry Co. for Tramway purposes.  
Nowra Water Supply, Easements.  
Centennial Park, damage to land.  
Parramatta Cottage Homes, sale of surplus land.  
Dedication of land Alma and Goodhope Streets, Paddington.  
Completing Margaret Jones' matter, White's Creek.  
    "    Ann Walker's matter, Sydney Water Supply.  
Return of all lands resumed during 1897, for Government Statist.

The principal matters which have engrossed the attention of the branch for the past year have been the negotiation of exchanges of lands in connection with the Koorawatha to Grenfell railway line, estimates of city extension, the adjustment of interests in connection with the Port Kembla harbour proposals, Pymont Bay cases, and the resumptions on the second and third sections of the Moree to Inverell railway.

The Under Secretary for Works and Commissioner for Roads.

EDWARD J. SIEVERS,  
Government Land Valuer.

## Memorandum from Accountant to Under Secretary and Commissioner for Roads.

Public Works Department, N.S.W., Accounts Branch, 11 August, 1899.

HEAD OFFICE BANK ACCOUNTS, 1898-9.

I SUBMIT herewith statements of the operations of the Head Office Bank Accounts in my name, for 1898-9. They are as follows:—

1. General Account.
2. Suspense Account.
3. Trust Account.
4. Revenue Account.

1. *General Account.*

The receipts, being lodgments by the Treasury for payments, amounted to—

	£	s.	d.	£	s.	d.
General Account ... ..	618,184	18	11			
Advance Account ... ..	591,056	12	7			
				1,209,241	11	6
Disbursements—

Memorandum

## Memorandum from Accountant to Under Secretary and Commissioner for Roads.

Public Works Department, N.S.W., Accounts Branch, 11 August, 1899.

SUBJECT—REVENUE ACCOUNT, 1898-9.

I SUBMIT herewith the Paymaster's Statement in connection with the Revenue Account of this Department for 1898-9.

The total amounted to £225,786 3s. 1d. From this there should be deducted £68,145 17s. 7d., for Refunds of Officers' Advances, &c., to credit of Votes, and £94,698 17s. 6d., Refunds of Stores' Issues. The net Receipts on account of Consolidated Revenue through this Department would thus be £62,941 8s., made up as follows:—

	£	s.	d.
Tolls and Rent ... ..	7,237	9	0
Sales of Property ... ..	6,109	6	2
Country Towns Water Supplies ... ..	16,373	13	1
Docking ... ..	5,637	11	0
Forfeited Deposits ... ..	1,075	0	0
Sundry Deposits ... ..	2,435	10	4
Dredging ... ..	755	0	0
Cement-testing Fees ... ..	505	12	6
Government of Victoria for Bridges ... ..	4,856	15	9
Hire, Repairs, Deductions, Royalties, &c. ... ..	17,925	10	2
	£62,941	8	0

To His Excellency the Right Honourable WILLIAM, EARL BEAUCHAMP,  
Knight Commander of the Most Distinguished Order of Saint Michael  
and Saint George, Governor and Commander-in-Chief of the Colony  
of New South Wales and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

The Parliamentary Standing Committee on Public Works, appointed during the first session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, have the honor to submit the following General Report, containing a statement of proceedings since the date of the last Report, 7th April, 1899:—

At the date of their last Report the Committee had before them four proposed works respecting which the inquiries were in progress, and two in relation to which the inquiries had not, up to that time, been commenced.

Works before  
the Com-  
mittee at date  
of their last  
Report.

The works respecting which the inquiries were in progress were:—

	Estimated cost.
Public Offices, Phillip, Bridge, and Young Streets, Sydney ... ..	£97,000
Railway from Dubbo to Coonamble ... ..	207,285
Railway from Cobar to Wilcannia ... ..	497,000
Locks and Weirs on the River Darling, between Bourke and Menindie ... ..	530,000

The inquiries relating to the following works had not then been opened:—

	Estimated cost.
Railway from Grenfell to Wyalong ... ..	£142,293
Penitentiary and Prison for Females, Randwick ...	118,000

Since then the inquiries referring to two of these works have been completed, and the Committee's reports concerning them will be laid before Parliament without delay. These works are:—

Inquiries  
completed.

	Estimated cost.
Public Offices, Phillip, Bridge, and Young Streets, Sydney ... ..	£97,000
Railway from Dubbo to Coonamble ... ..	207,285

The proposed public offices in Phillip, Bridge, and Young Streets, the Committee consider it inexpedient to erect until there has been a comprehensive investigation into the existing accommodation for the various public departments, and the possibility of improving it by fresh adjustments or slight structural alterations, and until the probable wants of the Government for ten years at least are approximately indicated. The Committee were led to this decision by its being apparent to them, from an inspection of the departments, that considerably more accommodation could be found in the present buildings if a better system than now exists in regard to the arrangement of offices, the style of office furniture used, and the area set apart for store-rooms, record-rooms, and also for the accommodation of messengers,

Public offices  
in Phillip,  
Bridge, and  
Young  
Streets,  
Sydney.

messengers, were introduced. They found generally that the structural fixtures of the buildings prevented a proper arrangement or a thoroughly systematic and effective control of the work. Under present conditions more single rooms are occupied than should be the case, containing a much greater superficial space than is necessary for individual officers, the consequence being that, while one officer may have a separate room of large size, a number of clerks may be crowded into a room of smaller dimensions, and the head of a room, who ought to be with the clerks or others he is expected to overlook, is either entirely apart from them in another room which he alone occupies, or he is shut off in a manner which the Committee consider renders personal supervision impossible. Much more space than appears to be requisite is used for store-rooms, and the same may be said in relation to record-rooms. The office furniture is so old-fashioned, unsuitable, and ill-arranged that it occupies a much larger proportion of space than it should do; and an imperfect system which prevails in regard to the keeping of books and papers further lessens the area required for the clerks. The investigation which the Committee recommend, should be made, they explain in their report upon the proposed offices, by a competent Board, consisting, say, of two representative public officers, two gentlemen connected with large business establishments in Sydney, and an architect; and they are of opinion that, should the results anticipated from this inquiry be realised, a new building such as that proposed in this instance may not be wanted, or the plans, if not set aside altogether, may require to be altered.

Railway from  
Dubbo to  
Coonamble.

The Railway from Dubbo to Coonamble, the Committee are of opinion, should be carried out as referred to them by the Legislative Assembly; and they have arrived at that conclusion after a careful investigation. Evidence has been collected in relation to the different routes put forward, and a close inspection made of the country which would be served by the proposed line, and of that along and in the vicinity of the route from Mudgee. The information thus obtained, together with that contained in the report by a previous Committee on the proposal to extend the railway from Warren to Coonamble, has enabled the Committee to arrive at a conclusion which they believe to be in the public interest as well as in that of the districts most concerned.

Early in the inquiry the Committee took steps to obtain from the Railway Commissioners reports upon the routes alternative to that from Dubbo. Regarding it as necessary that they should have before them expert evidence as to the probable traffic returns from the construction of lines of railway by those routes, and generally as to the nature of the country through which the lines would run, the Right Hon. the Premier and Minister for Railways was requested to have the Chief Railway Traffic Manager, or some other officer competent for the duty, instructed to visit the districts and obtain this information for the Committee, with the result that the Commissioners inspected and reported upon the Mudgee route, and the Chief Traffic Manager, who accompanied them on their tour of inspection, gave evidence on the subject. Further reports upon the Warren and Narramine routes were found to be unnecessary in view of the fact that the opinions of the Commissioners and of their expert officers concerning them were expressed in the inquiry made in 1898 with reference to the proposal for a railway from Warren to Coonamble. Reports from the Railway Commissioners upon alternative lines the Committee consider to be indispensable in all inquiries concerning proposed railways, and they trust that their action in this direction in the Dubbo-Coonamble Railway inquiry will form a precedent for the future.

Inquiries not  
yet complete.

Four works are still under consideration, but the inquiries relating to them are well advanced, and the Committee hope to be able to report upon two of them very shortly. These works are:—

	Estimated cost.
Railway from Cobar to Wilcannia ... ..	£497,000
Locks and Weirs on the River Darling, between Bourke and Menindie ... ..	530,000
Railway from Grenfell to Wyalong ... ..	142,293
Penitentiary and Prison for Females, Randwick ...	118,000

The

The evidence to be obtained in Sydney with regard to these proposals is almost complete. That relating to the Penitentiary and Prison for Females will shortly be brought to a close, and the report concerning it laid on the Table of the Legislative Assembly. The inquiry respecting the proposed Railway from Grenfell to Wyalong needs little more than an investigation by a Sectional Committee, and this will be made without delay. The inquiries with reference to the Railway from Cobar to Wilcannia, and the proposed Locks and Weirs on the River Darling between Bourke and Menindie, will necessitate a comparatively lengthy investigation in the Cobar and Darling districts, and this, up to the present, the Committee, in view of the work to be done in connection with the other works under consideration, have not yet been in the position to undertake.

Appended to this Report are the returns usually published with the Committee's General Reports, which contain a record of the inquiries by the several Committees appointed under the Public Works Act and the Amending Acts, and also a copy of the present Committee's Minutes of Proceedings. Appended returns and minutes.

JOHN PERRY,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 14th July, 1899.

---

**PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.**

**RECORD OF INQUIRIES.**

LIST of Proposed Public Works inquired into by the several Committees, with the results of their inquiries, from 27 August, 1888, the date of the first sitting of the first Committee appointed under the Act, to 14 July, 1899.

Date of inquiry.	Proposed Work.	Expenditure proposed by the Government	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
		£	£	£	£	
1888. 4 Sept. to 22 Oct.	Improvements to the Circular Quay.	120,000	125,000	5,000		The Committee recommended an alteration in the plan of these improvements, by which the total estimated cost would be increased to £125,000.
26 Sept. to 22 Oct.	Storage reservoir at Potts' Hill, and second line of pipes to Crown-street.	120,000	} 285,000	.....	.....	Recommended as proposed.
13 Sept. to 22 Oct.	New Central Police Court	165,000		48,000	48,000	
4 Oct. to 22 Oct.	Drainage works, Manly...	34,114	22,000	.....	12,114	The Committee recommended the adoption of a modified plan of these drainage works, by which the total estimated cost would not exceed £22,000.
10 Oct. to 22 Oct.	Drainage works, North Shore.	77,062	107,000	29,938	.....	The Committee recommended the adoption of the complete scheme proposed in relation to this work, and the estimated cost of which, as shown by the evidence, is £107,000.
31 Aug. to 22 Oct.	Harbour improvements at Newcastle.	112,000	112,000	.....	.....	Recommended as proposed.
19 Sept. to 22 Oct.	Wharfage accommodation, Woolloomooloo Bay.	42,000	.....	.....	42,000	The Committee were of opinion that the proposed expenditure was not justified either by the requirements in connection with the wharfage accommodation of the port, or by the nature of the proposal if regarded as a scheme for the improvement of a very valuable Government property.
16 Nov. to 1889. 11 Jan.	Bridge at the Spit, Middle Harbour.	62,000	.....	.....	62,000	The Committee decided that the proposed expenditure was not justified by the evidence, and that a steam-punt would meet the requirements of the district in the vicinity of the proposed work for some years to come.
1888. 7 Dec. to 1889. 27 Aug.	Drainage works for the Western Suburbs.	830,304	830,304	.....	.....	Recommended as proposed.
26 June to 30 Sept.	Improvements to the entrance of the Richmond River.	326,000	326,000	.....	.....	The Committee recommended that the proposed works be carried out in a certain order, so that the results from the works first constructed might be ascertained before others were proceeded with.
9 Oct. to 11 Dec.	Railway to connect North Shore Railway with Port Jackson, at Milson's Point.*	262,000	.....	.....	262,000	The Committee considered, for various reasons stated in their report on the subject, that the work as proposed should not be carried out.
29 Aug. to 12 Dec.	Railway from Culcairn to Corowa.	197,300 (or £4,184 per mile.)	164,500 (or £3,500 per mile.)	.....	32,800	The Committee were of opinion that this line should be constructed at a cost not exceeding £3,500 per mile.
22 Aug. to 19 Dec.	Railway from Goulburn to Crookwell.	193,300 (or £5,984 per mile.)	148,500 (or £4,500 per mile.)	.....	49,800	The Committee considered that the cost of this railway should not exceed £4,500 per mile, and that a saving should also be effected by utilizing a certain portion of the present main line instead of taking the proposed railway through a part of the city of Goulburn.
1890. 22 Jan. to 6 Feb. 1889.	Dredge and plant for Sydney Harbour.	30,000	.....	.....	30,000	The evidence showed that this class of dredge was not required
25 Sept. to 1890. 18 Feb.	Railway from Nyngan to Cobar.	207,360	207,360	.....	.....	The Committee recommended the construction of this railway as part of a line which should be extended to Wilcannia and Broken Hill.
14 Jan. to 11 Feb.	Offices for the Board of Water Supply and Sewerage.	50,000	50,000	.....	.....	Recommended as proposed.
14 Jan. to 6 Feb.	Reticulation of the Western Suburbs Drainage Scheme.	713,592	713,592	.....	.....	Recommended as proposed.
14 Jan. to 11 Feb.	Extension of Sydney Water Supply to Southern Suburbs—Hurstville and Rockdale.	66,000	.....	.....	66,000	This expenditure was rendered unnecessary by reason of a temporary water-supply scheme being sufficient to meet requirements for some years.
19 Nov. to 2 April.	Railway from Marrickville to the Burwood Road.	90,250	90,250	.....	.....	Recommended as proposed.
	Carried forward.....£	3,751,282	3,229,506	34,938	556,714	

List of Proposed Public Works inquired into by the Committee, &c.—*continued.*

Date of inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
		£	£	£	£	
	Brought forward ...£	3,751,282	3,229,506	34,938	556,714	
1890. 23 Oct. to 24 April.	Improvements to the entrance of the Clarence River.	580,900	211,900	.....	369,000	In this case the Committee recommended the construction of only a portion of the works proposed, as they were of opinion that when this portion had been constructed it might be found that the remainder would not be required.
31 Oct. to 15 April.	Breakwater at Byron Bay.	241,723	241,723	.....	.....	The original estimate for this work was £162,000; the increase was due to a difficulty in obtaining stone.
4 Dec. to 24 April.	Railway from Kiama to Nowra.	381,390	381,390	.....	.....	In this case there was an original estimate of £441,663. The reduction was due to an amended estimate made by the Acting Engineer-in-Chief for Railways since the railway was referred to the Committee.
12 Nov. to 24 April.	Railway from Grafton to the Tweed.*	1,728,100	800,000	.....	928,100	The Committee recommended that this railway should be constructed from Lismore to Murwillumbah, instead of from Grafton to Murwillumbah, the Committee's recommendation involving a length of about 60½ miles as compared with 140 miles 76 chains, the length of the line as referred to them by the Legislative Assembly.
15 Jan. to 24 April.	Railway from Cootamundra to Temora.	138,000 (or £3,656 per mile.)	125,400 (or £3,300 per mile.)	.....	12,600	The Committee considered that the cost of constructing this railway should not exceed £3,300 per mile.
23 Jan. to 24 April.	Railway from Moss Vale to Robertson.	84,900	.....	.....	84,900	The Committee negatived this proposal because they considered another route, described in their report, was preferable.
23 Jan. to 25 Mar.	Railway from Mudgee to Gulgong.	109,330	.....	.....	109,330	The Committee decided against this work, on the ground that any extension of the Mudgee Railway should form part of a more comprehensive proposal, the consideration of which should be deferred until after the suggestion for the connection of the Northern and Western systems, by a line between Dubbo and Werris Creek, has been dealt with.
12 Feb. to 24 April.	Bridge over Tarban Creek, Parramatta River.	26,000	.....	.....	26,000	The Committee considered this bridge to be unnecessary.
20 Feb. to 15 April.	Bridge over the Hunter River, at Jerry's Plains.	20,000	.....	.....	20,000	The Committee considered that a less expensive bridge would be sufficient to meet requirements.
25 Feb. to 24 April.	Bridge to connect Bullock Island with the mainland at Newcastle.	33,000	.....	.....	33,000	The Committee considered that this proposed expenditure was premature, pending certain reclamation works.
12 Feb. to 21 May.	Iron Bridge at Cowra ...	26,537	26,537	.....	.....	The original proposal represented an expenditure of £69,971, which amount was afterwards reduced to £26,537, as the result of a revision of the system of bridge-building in the Colony. Recommended as proposed.
22 Jan. to 21 May.	Railway from Molong to Parkes and Forbes.	433,000	433,000	.....	.....	
28 May to 8 July.	Hospital for the Insane upon the Kenmore Estate, near Goulburn.*	120,000	.....	.....	120,000	This proposed work, after being partly considered, was withdrawn from the Committee by resolution of the Assembly.
28 May to 21 Aug.	Railway to connect the North Shore Railway with the deep waters of Port Jackson, at Milson's Point.* (Second Reference.)	231,156	231,156	.....	.....	This proposal was before the Committee on a previous occasion (estimated cost, £262,000), when it was negatived; but having been referred to the Committee for further consideration, and circumstances appearing in the second inquiry which justified the construction of the railway, the Committee approved of the proposed work.
10 Dec. to 13 May, 1891.	Hospital Buildings, Macquarie-street.	140,000	56,000	.....	84,000	In this case, two sets of plans for the buildings were submitted to the Committee, one representing a design that was estimated to cost £140,000, and the other a design to cost £56,000, and the Committee approved of the latter.
1891. 11 Feb. to 25 Mar.	College for the Training of Teachers of Public Schools.	37,500	37,500	.....	.....	Recommended as proposed.
1 Feb. to 21 April.	Extension of the Kiama to Nowra Railway into the town of Nowra.	75,000	75,000	.....	.....	Recommended as proposed.
24 Feb. to 14 May.	Railway from Cobar to Cockburn.	1,168,000	1,018,000	.....	150,000	The Committee recommended the construction of this railway as far as Broken Hill only, which would reduce the proposed expenditure by £150,000.
22 Jan., 1890, to 19 May, 1891.	Cable Tramway from King-st., via William-street, to Ocean-street.	80,000	80,000	.....	.....	Recommended as proposed.
25 Nov., 1890, to 3 June, 1891.	Cable Tramway through George, Pitt, and Harris Streets, Sydney.	120,000	.....	.....	120,000	The Committee considered that it was not expedient at present, for reasons stated in their report, that this tramway should be constructed.
	Carried forward .....	£ 9,525,818	6,947,112	34,938	2,613,644	

List of Proposed Public Works inquired into by the Committee, &c.—*continued.*

Date of Inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
1892. 5 May to 2 June.	Brought forward .. £ Improvements at Darling Island.	£ 9,525,818 142,000	£ 6,947,112 .....	£ 34,938 .....	£ 2,613,644 142,000	The Committee considered that the proposed works might be postponed for the present without inconvenience, and that a more suitable design might be submitted.
7 June to 12 July.	Stormwater sewers discharging into Johnstone's Bay.	51,352	51,352	.....	.....	Recommended as proposed.
15 June to 4 Aug.	Reservoir at Centennial Park for Sydney Water Supply.	83,000	83,000	.....	.....	Recommended with an alteration of site.
14 July to 24 Aug.	Water Supply for Wollongong and the surrounding districts.	66,000	30,000	.....	36,000	The Committee found that the Water Supply proposed for the surrounding districts was not needed, and that the estimate of cost for supplying Wollongong might be reduced to £30,000.
28 July to 24 Aug.	Second pipe-line from Walka to Buttai, for Hunter River District Water Supply.	50,000	50,000	.....	.....	Recommended as proposed.
26 July to 9 Aug.	Sewerage works at Cottage Creek.	25,000	13,000	.....	12,000	The amount of £25,000 provided for a covered sewer; but the Committee found that a cover was not necessary at present, and that by constructing an open sewer the cost could be reduced by £12,000.
21 April, 1891, to 27 May, 1892.	Railway from Glen Innes to Inverell.*	427,400	.....	.....	427,400	The evidence in this case showed that the estimated cost of constructing the railway was excessive, and indicated the probability of a serious annual loss in the working of the line. In addition to this, the Committee were not as fully informed as desirable with regard to connecting Inverell not only with the Great Northern Railway but with the coast, a matter of considerable importance in the inquiry.
31 May to 18 Aug.	Railway from Jerilderie to Deniliquin.	148,000	.....	.....	148,000	The Committee were of opinion that the consideration of this proposed work should be postponed until it should be determined by Parliament as a matter of public policy to purchase the Deniliquin to Moama Railway.
12 July to 24 Aug.	Lunatic Asylum at Kenmore, near Goulburn.* (Second Reference.)	150,000	150,000	.....	.....	Recommended as proposed.
14 June to 28 Sept.	Railway from Grafton to Lismore.*	662,000 (or £8,000 per mile.)	108,000 (or £6,000 per mile.)	.....	554,000	The Committee decided that, for the present, only the Lismore to Casino section of the proposed railway should be constructed, that the cost should not exceed £6,000 per mile, and that the betterment principle be applied to the land to be served by the proposed line.
10 July to 26 Oct.	Railway from Eden to Bega.	564,000 (or £15,350 per mile.)	.....	.....	564,000	The Committee considered that the present resources of the district did not warrant the construction of such an expensive line, but they were of opinion that a cheaply constructed railway might be favorably considered.
22 June to 4 Oct.	Sewerage Works for Parramatta.*	75,926	.....	.....	75,926	The Committee were of opinion that the sewage farm included in the scheme was too small for the purpose, and that the sewage should be dealt with by precipitation and filtration or other effective modern process at a proposed pumping station at Clay Cliff Creek.
12 Oct. to 21 Dec.	Water Supply for Tamworth.	22,500	22,500	.....	.....	Recommended as proposed, with a provision as to the quantity of water obtainable, and the resumption of land surrounding the well in the drift forming the source of supply.
14 Sept. to 16 Nov.	Water Supply for Lithgow.	15,000	15,000	.....	.....	Recommended as proposed.
15 Sept. to 16 Nov.	Water Supply for Armidale.	43,500	43,500	.....	.....	Recommended as proposed.
17 Nov. to 10 Jan. 1893.	Railway from Glen Innes to Inverell.* (Second Reference.)	421,400 (or £7,975 per mile.)	369,862 (or £7,000 per mile.)	.....	51,538	The Committee considered it expedient this railway should be constructed, provided that the cost did not exceed £7,000 per mile, that special local rates were charged until the railway paid working expenses and interest on cost of construction, and that the betterment principle was applied to the land served by the railway.
14 Feb. to 8 Mar.	Waterworks for the town of Junee.	45,000	45,000	.....	.....	The Committee recommended that these works should be carried out, conditionally upon the Railway Commissioners undertaking to enter into an agreement for a period of not less than ten years to pay a minimum of £1,900 per annum for water supplied for railway purposes at Junee and Bethungra.
14 Nov., 1893, to 11 Jan., 1894.	Railway from Narrabri to Moree.	153,000	153,000	.....	.....	Recommended as proposed, with the condition that the work be not undertaken until a Betterment Act is passed.
	Carried forward.....£	12,670,896	8,081,326	34,938	4,624,508	

List of Proposed Public Works inquired into by the Committee, &c.—*continued.*

Date of inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
1894. 7 Feb. to 22 Mar.	Brought forward ...£ Sewerage Works for Parramatta.* (Second reference.)	£ 12,670,896 75,926	£ 8,081,326 .....	£ 34,938 .....	£ 4,624,508 75,926	The Committee decided that it was not expedient the proposed works should be carried out, for the reasons that the scheme had not been adequately considered, and that, according to the evidence, Parramatta was neither willing nor able to pay the rate necessary to provide the interest on the expenditure, and did not want the proposed works.
6 Mar. to 16 April.	Deviation to avoid the Lithgow Zigzag.	181,072	.....	... ..	181,072	The Committee were of opinion that as the professional evidence, as well as much of the evidence generally, indicated that the proposed deviation was not a matter of urgency it was not expedient the work should be carried out.
9 April, to 22 May.	Railway from Temora to Wyalong.*	104,430	.....	.....	104,430	The Committee were of opinion that the decision upon the proposal should be deferred for six months.
11 April, to 20 June.	Removal of Pyrmont and Glebe Island Bridges.*	296,500	.....	.....	296,500	The Committee recommended that when renewal becomes necessary the existing bridges at Darling Harbour and Glebe Island should be replaced by timber structures of a kind specified in their report, which report, however, in consequence of the sudden dissolution of Parliament was not presented to the Legislative Assembly.
3 Oct. to 14 Nov.	Removal of Pyrmont and Glebe Island Bridges.* (Second reference.)	296,500	82,500	... ..	214,000	The Committee recommended that the Pyrmont Bridge be replaced by a timber bridge with steel span, to cost £82,500, and decided that the Glebe Island Bridge did not at present require renewal.
19 Dec. to 27 Feb., 1895.	Railway from Jerilderie to Berrigan.	43,543	43,543	.....	.....	The construction of this railway was recommended, with the condition that the estimated cost, £2,000 per mile, should include goods and grain sheds, engineering charges, and all contingencies.
7 Mar. to 10 May.	Railway from Parkes to Condobolin.	127,000	127,000	.....	.....	In this inquiry the Committee, while considering it expedient the railway should be constructed, resolved that the cost should not exceed £2,100 per mile, including the cost of land resumptions.
17 May to 28 June.	Railway from Temora to Wyalong.* (Second reference.)	92,000	.....	.....	92,000	The Committee, in deciding against this proposed work, were of opinion that at the present time there is no justification for its construction, and the prospects of Wyalong's future are not such as to lead them to conclude that the line should be built in anticipation of what may be the condition of the gold-field and the district some years hence.
20 Mar. to 7 May.	Harbour Improvements at Newcastle.	141,000	141,000	.....	.....	In this inquiry the Committee recommended a modification of the works proposed by the Department and an additional work, the cost of the works as recommended by the Committee being about the same as that of the works proposed by the Department.
26 June, to July.	Tramway from Woolwich to the Field of Mars Common.	19,300	.....	.....	19,300	This proposed work was referred to the Fifth Committee who, at the termination of their existence, had inquired partly into it. A motion in the Legislative Assembly to refer the proposal to the Sixth Committee was, however, negatived on 11 December, 1895.
12 Dec. to 14 Dec.	Deviation at Locksley, Great Western Railway.	47,500	47,500	.....	.....	The Committee considered this work to be an urgent and necessary one, and recommended that it be carried out without delay.
17 Dec. to 24 Jan. 1896.	Water Supply for the Town of Tamworth.	32,824	32,824	.....	.....	The Committee recommended that this work be carried out, with the proviso that the capacity of the storage reservoir be increased from 35,000,000 to 50,000,000 gallons.
18 Mar. to 8 May.	Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-st. to the inter- section of John-street.	130,500	130,500	.....	.....	Recommended as proposed.
1 Jan. to 10 Mar.	Erection of Buildings at Rookwood for Infirm and Destitute Persons.	118,285	62,900	.....	55,385	The Committee decided that it was not expedient the proposed works should be carried out, deeming it inadvisable, for reasons stated in their Report, to concentrate the infirm and destitute at Rookwood. The Government estimate for the proposed buildings was £103,350 without, and £118,285 with, provision for sewage. The Committee recommended that the inmates of the Parramatta Asylums be removed, the healthy patients being housed at Rookwood and Liverpool, provision for the chronic and acute sick to be made on Crown lands near Campbelltown.
	Carried forward.....£	14,377,276	8,749,093	34,938	5,663,121	

LIST of Proposed Public Works inquired into by the Committee, &c.—*continued.*

Date of inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
		£	£	£	£	
1896.	Brought forward.....	14,377,276	8,749,093	34,938	5,663,121	
9 Jan. to 17 July.	Additions to the Treasury Buildings.	21,500	21,500	.....	.....	Recommended as proposed.
20 Feb. to 1 Oct.	Railway from Tamworth to Manilla.	72,150	71,875	.....	275	The Committee's recommendation provided for an amended route, the cost of the railway not to exceed £2,500 per mile.
21 April, to 20 May.	Railway from Nevertire to Warren.	32,730	32,730	.....	.....	Recommended as proposed.
12 May, to 31 July.	Construction of Locks and Weirs on the River Darling.	121,100	.....	.....	121,100	The Committee negated this proposed work.
5 June, to 19 Aug.	Railway from Berrigan to Finley.	27,250	27,250	.....	.....	The Committee recommended that this proposed railway should be constructed, the cost not to exceed £2,000 per mile.
16 June to 21 July.	Improvement of Cook's River.	36,400	15,000	.....	21,400	As recommended by the Committee the construction of the proposed works would involve an expenditure of £15,000—a reduction on the Departmental estimate of £21,400—which, in the opinion of the Committee, would meet the requirements of the case.
1 Sept. 1896, to April, 1897.	Railway from Moree to Inverell.	279,500	279,500	.....	.....	The Committee resolved that it was expedient this railway should be constructed as proposed.
28 Oct. 1896, to 10 Feb., 1897.	Construction of a Deep-water Harbour at Port Kembla.	440,000	200,000	.....	240,000	The Departmental estimate of cost provided for the construction of two breakwaters, known respectively as the northern and eastern, and the necessary equipment of the port for coal-shipping and general commercial purposes. The Committee were of opinion, however, that the proposed harbour would be rendered sufficiently secure to meet present requirements if the eastern breakwater only were carried out, and the estimated cost reduced by £240,000.
5 Aug. to 10 Dec., 1896.	Railway from Condobolin to Broken Hill.	955,063	.....	.....	955,063	The Committee, while having regard to the various aspects of this proposed work, and considering also that the annual loss on the working of the railway would amount to £60,000, were of opinion that it should not, at present, be proceeded with.
11 Feb., 1897, to 13 April.	*Sewerage Works for Parramatta. (Third Reference.)	60,000	60,000	.....	.....	This work was passed by the Committee with the provision that the cost should not exceed the Departmental estimate, and that the carrying out of the work should be subject to a guarantee (by the Municipal Council of Parramatta) of the annual payment required to cover maintenance and interest, and redemption of the principal outlay.
4 May to 8 June.	Duplicate Main from Prospect to Potts' Hill.	109,317	109,317	.....	.....	The Committee recommended the amended scheme submitted by the Engineer-in-Chief for Public Works, by which the sides of the canal between Prospect and the Pipe Head Basin would be raised, the canal strengthened, and the 6-foot pipe-line between the Basin and Potts' Hill Reservoir duplicated.
14 April to 6 Dec.	New Houses of Parliament.	533,484	15,000	.....	518,484	The Committee recommended the adoption of the scheme submitted by the Government Architect, providing for alterations to the present Parliamentary Buildings, at a cost not exceeding £15,000.
16 June to 15 Sept.	New Bridge at Glebe Island.	89,100	89,100	.....	.....	The Committee recommended that there be substituted for the existing structure a stone causeway, with a central, steel swing-span.
13 July to 25 Aug.	Railway from Redfern to St. James' Road.	650,000	650,000	.....	.....	Recommended as proposed.
31 Aug. to 7 Dec.	Railway from Condobolin to Euabalong.	108,225	.....	.....	108,225	The Committee negated this proposed work, but recommended, in connection with any proposal for a railway towards Hillston, that a survey be made for a line from Koorawatha, with a view to its consideration in conjunction with existing surveys.
16 Sept. to 25 Nov.	Railway from The Rock to Green's Gully.	67,000	67,000	.....	.....	Recommended as proposed.
5 Sept. to 18 Nov.	Railway from Coolamon to Ariah.	91,307	.....	.....	91,307	The Committee negated this proposal.
	Carried forward.....£	18,071,402	10,387,365	34,938	7,718,975	

Date of Inquiry.	Proposed Work.	Expenditure proposed by the Government.	Expenditure recommended by the Committee.	Amount in excess of that proposed.	Amount in reduction of that proposed.	Remarks.
	Brought forward.....	£ 18,071,402	£ 10,387,365	£ 34,938	£ 7,718,975	
1897. 20 Dec. to 1 April, 1898. 1898.	Railway from Koorawatha to Grenfell.	89,250	89,250	.....	.....	Recommended as proposed.
5 Jan. to 13 April, 1897.	Railway from the Terminus of the Rose Hill Railway to Dural.	57,000	.....	.....	57,000	The Committee negated this proposal.
14 Dec. to 29 April, 1898. 1898.	Railway from Warren to Coonamble.	150,000	.....	.....	150,000	The Committee negated this proposal, but recommended that a survey be made of a route from Dubbo to Coonamble.
15 Mar. to 26 April, 1897.	Harbour Works at Tweed River.	43,600	43,600	.....	.....	Recommended as proposed.
19 Oct. to 23 June, 1898. 1897.	Railway from Narrabri to Pilliga.	128,650	.....	.....	128,650	The Committee negated this proposal, but suggested a route from Narrabri to Eurie Eurie, which could, if necessary, be extended on to Walgett.
1 Oct. to 22 June, 1898.	Railway from Byrock to Brewarrina.	146,350	146,350	.....	.....	The Committee recommended that the railway should be carried out, provided that it be made legally binding upon the Crown lessees in the district served to pay, until the railway shall become self-supporting, one farthing per acre rent additional to their present or ordinary assessment, such additional rent to be credited to the Railway Commissioners.
9 Mar. to 24 June.	Railway from Woolabra to Collarenebri.	207,798	.....	.....	207,798	The Committee negated this proposal, but suggested a route by which a railway would go from Narrabri towards Eurie Eurie, and, at a point about 315 miles from Newcastle, proceed in a north-westerly direction to Collarenebri.
22 Feb. to 6 July.	Railway from Maitland to Taree.	982,233	.....	.....	982,233	The Committee negated this proposal.
30 Mar. to 6 July.	Harbour Works at Bellinger River.	36,000	36,000	.....	.....	Recommended as proposed.
8 Feb. to 1 July.	Harbour Works at Macleay River.	95,000	95,000	.....	.....	Recommended as proposed.
27 April to 29 June.	Harbour Works at Hastings River.	46,500	13,915	.....	32,585	The Committee recommended that for the present the southern training-wall only, estimated to cost £13,915, should be carried out.
22 Mar. to 1 July.	Harbour Works at Manning River.	100,000	100,000	.....	.....	The Committee recommended the construction of the proposed work, with some slight modifications.
14 April to 7 July, 1899.	Harbour Works at Nambucca River.	72,500	49,393	.....	23,107	Recommended with modifications.
25 Jan. to 2 Mar.	Water Supply Works for the Borough of Wollongong.	25,211	25,211	.....	.....	The Committee recommended the larger of the two schemes submitted, providing for an extension to Port Kembla on the south, and Bulli on the north.
18 Jan. to 28 Mar.	Public Offices, Phillip and Hunter Streets, Sydney.	44,810	16,000	.....	28,810	The Committee recommended a modification of the Government proposal, providing for a building containing a basement, ground-floor, and first-floor, at a cost not exceeding £16,000.
2 Feb. to 28 April.	Public Offices, Phillip, Bridge, and Young Sts., Sydney.	97,000	.....	.....	97,000	The Committee were of opinion that it was inexpedient to erect this building until there had been a comprehensive investigation into the existing accommodation for the various public Departments and the possibility of improving it by fresh adjustments or slight structural alterations, and until the probable wants of the Government for ten years, at least, were approximately indicated.
9 Mar. to 13 July.	Railway from Dubbo to Coonamble.	207,285	207,285	.....	.....	Recommended as proposed.
		£ 20,600,639	11,209,369	34,938	9,426,208	

\* Works marked with an asterisk have been referred to the Committee more than once, and allowing for these repeated references, and for the expenditure recommended in two instances in excess of that proposed, the actual saving effected amounts to £7,100,938.

#### WORKS RESPECTING WHICH THE INQUIRIES ARE PROCEEDING.

Railway from Cobar to Wilcannia .....	£497,000
Locks and Weirs on the River Darling, between Bourke and Menindie ...	530,000
Railway from Grenfell to Wyalong .....	142,293
Penitentiary and Prison for Females, Randwick .....	118,000

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RETURN SHOWING THE COURSE OF THE COMMITTEES' INQUIRIES FROM THE REFERENCE OF THE WORKS TO THE  
ULTIMATE ACTION RESPECTING THEM.

## FIRST COMMITTEE—FROM 12 JUNE, 1888, TO 22 OCTOBER, 1888.

### MEMBERS OF THE COMMITTEE.

#### LEGISLATIVE COUNCIL.

The Honorable JOHN LACKEY, Chairman.

The Honorable GEORGE CAMPBELL.

The Honorable WILLIAM HENRY SUTTON.

The Honorable JAMES WATSON.

The Honorable FREDERICK THOMAS HUMPHERY.

#### LEGISLATIVE ASSEMBLY.

JOSEPH PALMER ABBOTT, Esquire, Vice-Chairman.

JAMES NIXON BRUNKER, Esquire.\*

HENRY COPELAND, Esquire.

ALEXANDER KETHEL, Esquire.

JOHN RENDELL STREET, Esquire.

THOMAS MICHAEL SLATTERY, Esquire.

JACOB GARRARD, Esquire.

SYDNEY SMITH, Esquire.

\* James Nixon Brunker, Esquire, by reason of his accepting the office of Minister for Lands, did not take his seat as a member of the Committee.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Wharfage Accommodation, Woolloomooloo Bay.	1888. 23 July.....	1888. 19 September	.....	.....	1888. Inquiry completed by Second Committee.	See Second Committee.	See Second Committee.	See Second Committee.
Improvements to the Circular Quay.	23 ,, .....	4 ,, ...	.....	.....	22 October ...	The Committee recommended an alteration in the plan of these improvements, by which the estimated total cost would be increased from £120,000 to £125,000.	Passed.	Legislative Assembly—11 April, 1889—Bill read third time. Legislative Council—24 April, 1889—Bill read third time; 30 April, 1889—Assent reported.
Storage Reservoir at Potts' Hill	23 ,, .....	26 ,, ...	.....	.....	22 ,, ...	Recommended as proposed.	Passed.	Legislative Assembly—17 May, 1889—Bill read third time. Legislative Council—30 May, 1889—Bill read third time; 5 June, 1889—Assent reported.

FIRST COMMITTEE—continued.

Proposed Work	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Second Pipe between Potts' Hill and Crown-street.	1888. 23 July.....	1888. 26 September	.....	.....	1888. 22 October ...	Recommended as proposed.	Passed [Sydney Water Supply (Partial Reduplication) Bill].	Legislative Assembly—24 July, 1889—Bill read third time. Legislative Council—17 Sept., 1889—Bill read third time; 30 Sept., 1889—Assent reported.
Dredge and Plant for Sydney Harbour.	23 ,, .....	Dealt with by Third Committee.	.....	.....	.....	See Third Committee.	See Third Committee.	See Third Committee.

Bridge at the Spit, Middle Harbour.	23 ,, .....	Dealt with by Second Committee.	.....	.....	.....	See Second Committee.	See Second Committee.	See Second Committee.
New Central Police Court .....	23 ,, .....	13 September	.....	.....	22 October ...	Recommended as proposed.	Passed.	Legislative Assembly—15 May, 1889—Bill read third time. Legislative Council—23 May, 1889—Bill read third time; 30 May, 1889—Assent reported.
Improvements to the Entrance of the Clarence River.	23 ,, .....	Dealt with by Third Committee.	.....	.....	.....	See Third Committee.	See Third Committee.	See Third Committee.
Drainage Works, Manly .....	23 ,, .....	4 October ...	.....	.....	22 October ...	The Committee recommended the adoption of a modified plan of these drainage works, by which the estimated total cost would not exceed £22,000, or £12,114 less than the original estimate.	Passed.	Legislative Assembly—23 May, 1889—Bill read third time; 3 Sept., 1889—Bill finally passed. Legislative Council—20 June, 1889—Bill read third time; 12 Sept., 1889—Assent reported.
Drainage Works, North Shore	23 ,, .....	10 ,, ...	.....	.....	22 ,, ..	The Committee recommended the adoption of the complete scheme proposed in relation to this work, the estimated cost of which, as shown by the evidence, was £107,000.	Passed.	Legislative Assembly—17 April, 1889—Bill read third time; 15 May, 1889—Bill finally passed. Legislative Council—9 May, 1889—Bill read third time; 22 May, 1889—Assent reported.
Drainage Works for the Western Suburbs.	23 ,, .....	Dealt with by Second and Third Committees.	.....	.....	.....	See Third Committee.	See Third Committee.	See Third Committee.
Harbour Improvements at Newcastle.	23 ,, .....	31 August ...	.....	.....	22 October ...	Recommended as proposed.	Passed.	Legislative Assembly—11 April, 1889—Bill read third time. Legislative Council—24 April, 1889—Bill read third time 30 April, 1889—Assent reported.

SECOND COMMITTEE—FROM 24 OCTOBER, 1888, TO 19 JANUARY, 1889.

MEMBERS OF THE COMMITTEE.

LEGISLATIVE COUNCIL.

The Honorable JOHN LACKEY, Chairman.  
The Honorable GEORGE CAMPBELL.

The Honorable WILLIAM HENRY SUTTON.  
The Honorable JAMES WATSON.

The Honorable FREDERICK THOMAS HUMPHERY.

LEGISLATIVE ASSEMBLY.

JOSEPH PALMER ABBOTT, Esquire, Vice-Chairman.  
HENRY COPELAND, Esquire.  
JACOB GARRARD, Esquire.  
ALEXANDER KETHEL, Esquire.

SYDNEY SMITH, Esquire.  
THOMAS MICHAEL SLATTERY, Esquire.  
JOHN RENDELL STREET, Esquire.  
DANIEL O'CONNOR, Esquire.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Wharfage Accommodation, Woolloomooloo Bay.	1888. 23 July .....	1888. 19 September	.....	.....	1889. 10 January ...	The Committee were of opinion that the proposed expenditure was not justified either by the requirements in connection with the wharfage accommodation of the port, or by the nature of the proposal if regarded as a scheme for the improvement of a very valuable Government property. See Third Committee.	Not dealt with.	.....
Dredge and Plant for Sydney Harbour.	23 ,, .....	Dealt with by Third Committee.	.....	.....	.....	.....	See Third Committee.	See Third Committee.
Improvements to the Entrance of the Richmond River.	23 ,, .....	” ”	.....	.....	.....	” ”	” ”	” ”
Bridge at the Spit, Middle Harbour.	23 ,, .....	16 November	.....	.....	11 January ...	The Committee decided that the proposed expenditure was not justified by the evidence, and that a steam-punt would meet the requirements of the district in the vicinity of the proposed work for some years to come. See Third Committee.	Not dealt with.	.....
Improvements to the Entrance of the Clarence River.	23 ,, .....	Dealt with by Third Committee.	.....	.....	.....	.....	See Third Committee.	See Third Committee.
Drainage Works for the Western Suburbs.	23 ,, .....	7 December	.....	.....	Inquiry completed by Third Committee.	” ”	” ”	” ”

## THIRD COMMITTEE—FROM 7 JUNE, 1889, TO 6 JUNE, 1891.

### MEMBERS OF THE COMMITTEE.

#### LEGISLATIVE COUNCIL.

- |  |  |
|--|--|
| * The Honorable JOHN LACKEY, Chairman. | The Honorable FREDERICK THOMAS HUMPHREY. |
| The Honorable ANDREW GARBAN.           | The Honorable WILLIAM JOSEPH TRICKETT.   |
| * The Honorable JAMES WATSON.          | * The Honorable GEORGE HENRY COX.        |

#### LEGISLATIVE ASSEMBLY.

- |  |                                     |
|--|-------------------------------------|
| * JOSEPH PALMER ABBOTT, Esquire, Chairman. | * JOHN SUTHERLAND, Esquire.         |
| * JACOB GARRARD, Esquire, Vice-Chairman.   | EDWARD WILLIAM O'SULLIVAN, Esquire. |
| HENRY COPELAND, Esquire.                   | * JOHN HURLEY, Esquire.             |
| JAMES EBENEZER TONKIN, Esquire.            | * CHARLES ALFRED LEE, Esquire.      |
| WILLIAM SPRINGTHORPE DOWEL, Esquire.       | * WILLIAM MCCOURT, Esquire.         |
|  | * JAMES PATRICK GARVAN, Esquire.    |

\* Shortly after the first meeting of the third Committee, John Sutherland, Esquire, died, and his place was filled by the appointment of Charles Alfred Lee, Esquire. Subsequently the Honorable James Watson resigned his seat on the Committee, and the Honorable George Henry Cox was appointed in his place. On 22nd October, 1890, Mr. Joseph Palmer Abbott, having been appointed Speaker of the Legislative Assembly, resigned his position as Chairman and member of the Committee. The Honorable John Lackey, who at that time was Vice-Chairman of the Committee, was appointed Chairman in Mr. Abbott's place, and Mr. Jacob Garrard was chosen as Vice-Chairman. Mr. William McCourt was appointed a member of the Committee on 16th July, 1890, in the place of Mr. John Hurley, whose seat became vacant by reason of his resignation from the Legislative Assembly; and Mr. James Patrick Garvan was appointed a member on the 6th November, 1890, in the room of Mr. Joseph Palmer Abbott.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Dredge and Plant for Sydney Harbour.	23 July, 1888	22 Jan., 1890	... ..	.....	6 Feb., 1890	The evidence showed that this class of dredge was not required.	Not dealt with.	.....
Improvements to the Entrance of the Richmond River.	23 ,, ,,	26 June, 1889	.....	.....	30 Sept., 1889	The Committee recommended that the proposed works should be carried out in a certain order, so that the results from the works first constructed might be ascertained before others were proceeded with.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—28 Aug., 1890—Bill read third time; 3 Sept., 1890—Assent reported.
Improvements to the Entrance of the Clarence River.	23 ,, ,,	23 Oct., ,,	14 Nov., 1889	28 Jan., 1890	2 April, 1890	In this case the Committee recommended the construction of only a portion of the works proposed, as they were of opinion that when this portion had been constructed it might be found that the remainder would not be required.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—17 Sept., 1890—Bill read third time; 1 Oct., 1890—Assent reported.
Drainage Works for the Western Suburbs.	23 ,, ,,	7 Dec., 1888	.....	.....	27 Aug., 1889	Recommended as proposed.	Passed.	Legislative Assembly—26 Sept., 1889—Bill read third time. Legislative Council—26 Sept., 1889—Bill read third time; 30 Sept., 1889—Assent reported.

THIRD COMMITTEE—continued.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Railway from Goulburn to Crookwell.	31 July, 1889	22 Aug., 1889	29 Aug., 1889	17 Sept., 1889	19 Dec., 1889	The Committee considered that the cost of this railway should not exceed £4,500 per mile, and that a saving should also be effected by utilizing a certain portion of the present main line instead of taking the proposed railway through a part of the city of Goulburn.	Negated by the Legislative Council.	Legislative Assembly—25 Sept., 1895—Bill read third time. Legislative Council—12 Nov., 1895—Second reading resolved in the negative.
Railway from Nyngan to Cobar	1 Aug., "	25 Sept., "	24 Sept., "	31 Oct., "	18 Feb., 1890	The Committee recommended the construction of this railway as part of a line which should be extended to Wilcannia and Broken Hill.	Passed.	Legislative Assembly—10 July, 1890—Bill read third time. Legislative Council—17 July, 1890—Bill read third time; 23 July, 1890—Assent reported.
Railway from Kiama to Nowra	1 " "	4 Dec., "	14 Jan., 1890	30 Jan., 1890	22 April, "	In this case there was an original estimate of £441,663. The amount recommended by the Committee was £381,390. The reduction was due to an amended estimate made by the Acting Engineer-in-Chief for Railways after the railway was referred to the Committee.	Passed.	Legislative Assembly—10 July, 1890—Bill read third time. Legislative Council—7 Aug., 1890—Bill read third time; 13 Aug., 1890—Assent reported.
Railway from Marrickville to the Burwood Road.	1 " "	19 Nov., "	.....	.....	2 " "	Recommended as proposed.	Passed.	Legislative Assembly—11 Dec., 1890—Bill read third time. Legislative Council—18 Dec., 1890—Bill read third time; 19 May, 1891—Assent reported.
Railway from Culcairn to Corowa.	6 " "	29 Aug., "	29 Aug., 1889	11 Sept., 1889	12 Dec., 1889	The Committee were of opinion that this line should be constructed at a cost not exceeding £3,500 per mile.	Passed.	Legislative Assembly—10 July, 1890—Bill read third time. Legislative Council—31 July, 1890—Bill read third time; 6 Aug., 1890—Assent reported.
Breakwater at Byron Bay .....	6 " "	31 Oct., "	14 Nov., "	28 Jan., 1890	15 April, 1890	The original estimate for this work was £162,000. The estimate placed before the Committee, which they adopted in their recommendation, was £241,723. The increase was due to a difficulty in obtaining stone.	Negated by the Legislative Council.	Legislative Assembly—17 July, 1890—Bill read third time. Legislative Council—15 Oct., 1890—Bill negated in Council on motion, "That it be read the second time this day six months."
Railway to connect North Shore Railway with Port Jackson, at Milson's Point.	7 " "	9 " "	.....	.....	11 Dec., 1889	The Committee considered, for various reasons stated in their report on the subject, that the work as proposed should not be carried out.	See second reference.	See second reference.
Railway from Grafton to the Tweed.	27 Sept., "	12 Nov., "	14 Nov., "	28 Jan., "	15 April, 1890	The Committee recommended that this railway should be constructed from Lismore to Murwillumbah, instead of from Grafton to Murwillumbah, the Committee's recommendation involving a length of about 60½ miles as compared with 140 miles 76 chains, the length of the line as referred to them by the Legislative Assembly.	Passed.	Legislative Assembly—17 July, 1890—Bill (Lismore to the Tweed Railway Bill) read third time. Legislative Council—10 Sept., 1890—Bill read third time; 24 Sept., 1890—Assent reported.
Railway from Cootamundra to Temora.	27 " "	15 Jan., 1890	16 Jan., 1890	11 Feb., "	23 " "	The Committee considered that the cost of constructing this railway should not exceed £3,300 per mile.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—17 Sept., 1890—Bill read third time; 1 Oct., 1890—Assent reported.

THIRD COMMITTEE—continued.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
26—D Railway from Mudgee to Gulgong.	27 Sept., 1889	23 Jan., 1890	12 Mar., 1890	26 Mar., 1890	6 May, 1890	The Committee decided against this work on the ground that any extension of the Mudgee Railway should form part of a more comprehensive proposal, the consideration of which should be deferred until after the suggestion for the connection of the Northern and Western systems, by a line between Dubbo and Werris Creek, had been dealt with.	Not dealt with.	.....
Railway from Moss Vale to Robertson.	1 Oct., "	23 " "	30 Jan., "	12 Feb., "	29 April, "	The Committee negatived this proposal because they considered another route, described in their report, was preferable.	" "	.....
Railway from Molong to Parkes and Forbes.	1 " "	22 " "	12 Feb., "	19 Mar., "	21 May, "	Recommended as proposed.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—21 Aug., 1890—Bill read third time; 27 Aug., 1890—Assent reported.
Bridge over Tarban Creek, Parramatta River.	1 " "	12 Feb., "	.....	.....	15 April, "	The Committee considered this bridge to be unnecessary.	Not dealt with.	.....
Bridge over the Hunter River, at Jerry's Plains.	1 " "	20 " "	4 Mar., 1890	11 Mar., 1890	15 " "	The Committee considered that a less expensive bridge would be sufficient to meet requirements.	" "	.....
Bridge to connect Bullock Island with the Mainland at Newcastle.	1 " "	25 " "	4 " "	11 " "	29 " "	The Committee considered that this proposed expenditure was premature, pending the carrying out of certain reclamation works.	" "	.....
Iron Bridge at Cowra .....	1 " "	12 " "	18 Feb., "	19 " "	21 May, "	The original proposal represented an expenditure of £69,971, which amount was afterwards reduced to £26,537, as the result of a revision of the system of bridge-building in the Colony, and the construction of the bridge at the reduced cost was recommended by the Committee.	Passed.	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—21 Aug., 1890—Bill read third time; 27 Aug., 1890—Assent reported.
Hospital for the Insane upon the Kenmore Estate, near Goulburn.	1 " "	28 May, "	.....	.....	Inquiry not completed.	This proposed work, after being partly considered, was withdrawn from the Committee by resolution of the Assembly.	Rescinded.	Legislative Assembly—2 July, 1890—Resolution passed rescinding previous resolution referring proposed work to the Committee.
Offices for Board of Water Supply and Sewerage.	1 " "	14 Jan., "	.....	.....	11 Feb., 1890	Recommended as proposed.	Passed.	Legislative Assembly—7 Nov., 1890—Bill read third time. Legislative Council—20 Nov., 1890—Bill read third time; 27 Nov., 1890—Assent reported.
Reticulation of Western Suburbs Drainage Scheme.	1 " "	14 " "	.....	.....	6 " "	" "	"	Legislative Assembly—23 July, 1890—Bill read third time. Legislative Council—24 Sept., 1890—Bill read third time; 8 Oct., 1890—Assent reported.

THIRD COMMITTEE—*continued.*

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Extension of Sydney Water Supply to Southern Suburbs—Hurstville, Rockdale.	1 Oct., 1889	14 Jan., 1890	.....	.....	11 Feb., 1890	This expenditure was rendered unnecessary by reason of a temporary water-supply scheme being sufficient to meet requirements for some years.	Not dealt with.	.....
Cable Tramway from King-street, <i>via</i> William-street, to Ocean-street.	1 ,, ,,	22 ,, ,,	.....	.....	2 June, 1891	Recommended as proposed.	Passed.	Legislative Assembly—8 March, 1892—Bill read third time. Legislative Council—10 March, 1892—Bill read third time; 17 March, 1892—Assent reported.
Cable Tramway through George, Pitt, and Harris Streets, Sydney.	1 ,, ,,	25 Nov. ,,	.....	.....	4 ,, ,,	The Committee considered that it was not expedient, for reasons stated in their report, that this tramway should be constructed.	Not dealt with.	.....
Railway to connect North Shore Railway with the deep waters of Port Jackson, at Milson's Point (second reference).	8 May, 1890	28 May, ,,	.....	.....	21 Aug., 1890	This proposal was before the Committee on a previous occasion when it was negatived; but having been referred to the Committee for further consideration, and circumstances appearing in the second inquiry which justified the construction of the railway, the Committee approved of the proposed work.	Passed.	Legislative Assembly—12 Nov., 1890—Bill read third time. Legislative Council—20 Nov., 1890—Bill read third time; 27 Nov., 1890—Assent reported.
College for the Training of Teachers of Public Schools.	21 Nov., ,,	11 Feb., 1891	.....	.....	19 Mar., 1891	Recommended as proposed.	Not dealt with.	.....
Hospital Buildings, Macquarie-street.	3 Dec., ,,	10 Dec., 1890	.....	.....	12 May, ,,	In this case two sets of plans for the buildings were submitted to the Committee, one representing a design that was estimated to cost £140,000, and the other a design to cost £56,000, and the Committee approved of the latter.	Passed.	Legislative Assembly—9 March, 1892—Bill read third time. Legislative Council—17 March, 1892—Bill read third time; 29 March, 1892—Assent reported.
Railway from Cobar to Cockburn.	19 ,, ,,	24 Feb., 1891	.....	.....	14 ,, ,,	The Committee recommended the construction of this railway as far as Broken Hill only, thereby reducing the proposed expenditure (£1,168,000) by £150,000.	.....	Legislative Assembly—25 June, 1895—Motion to go into Committee to bring in a Bill; 27 June, 1895—Motion passed to withdraw item from Loan Estimates.
Railway from Glen Innes to Inverell.	19 ,, ,,	21 April, ,,	23 April, 1891	2 June, 1891	See Fourth Committee.	See Fourth Committee.	See Fourth Committee.	.....
Extension of the Kiama to Nowra Railway into the town of Nowra.	19 ,, ,,	19 Feb., ,,	.....	.....	21 April, 1891	Recommended as proposed.	Not dealt with.	.....

# FOURTH COMMITTEE—FROM 31 MARCH, 1892, TO 25 JUNE, 1894.

## MEMBERS OF THE COMMITTEE.

### LEGISLATIVE COUNCIL.

The Honorable WILLIAM HENRY SUTTOR, Vice-Chairman.  
 The Honorable JAMES HOSKINS.  
 The Honorable FREDERICK THOMAS HUMPHERY.

\* The Honorable ANDREW GARRAN, LL.D.  
 The Honorable JOHN DAVIES, C.M.G.  
 \* The Honorable WILLIAM JOSEPH TRICKETT.

### LEGISLATIVE ASSEMBLY.

JACOB GARRARD, Esquire, Chairman.  
 THOMAS THOMSON EWING, Esquire.  
 WILLIAM CHANDOS WALL, Esquire.  
 WILLIAM McCOURT, Esquire.

JOHN CASH NEILD, Esquire.  
 EDWARD WILLIAM O'SULLIVAN, Esquire.  
 CHARLES COLLINS, Esquire.  
 HENRY DAWSON, Esquire.

\* The Honorable Andrew Garran, LL.D., on 5th October, 1892, resigned his seat as a member of the Committee, and on 12th October, 1892, the Honorable William Joseph Trickett was appointed to fill the vacancy.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Improvements at Darling Island	29 Mar., 1892	5 May, 1892	.....	.....	2 June, 1892	The Committee considered that the proposed works might be postponed for the present without inconvenience, and that a more suitable design might be submitted.	Not dealt with.	.....
Water Supply for Tamworth...	29 ,, ,,	12 Oct., ,,	12 Oct., 1892	15 Nov., 1892	21 Dec., ,,	Recommended as proposed with a provision as to the quantity of water obtainable, and the resumption of land surrounding the well in the drift forming the source of supply.	Passed.	Legislative Assembly—29 May, 1894—Bill read third time. Legislative Council—31 May, 1894—Bill read third time; 5 June, 1894—Assent reported.
Storm-water Sewers discharging into Johnstone's Bay.	29 ,, ,,	7 June, ,,	.....	.....	12 July, ,,	Recommended as proposed.	„	Legislative Assembly—7 June, 1894—Bill read third time. Legislative Council—7 June, 1894—Bill read second time and passed through all stages; 7 Aug., 1894—Assent reported.
Reservoir at Centennial Park for Sydney Water Supply.	29 ,, ,,	15 ,, ,,	.....	.....	.....	Recommended with an alteration of site.	„	Legislative Assembly—20 Dec., 1894—Bill read third time. Legislative Council—21 Dec., 1894—Bill read third time; 26 Feb., 1895—Assent reported.
Water Supply for Wollongong and the Surrounding Districts.	29 ,, ,,	14 July, ,,	.....	.....	4 Aug., ,, 24 ,, ,,	The Committee found that the Water Supply proposed for the surrounding districts was not needed, and that the estimate of cost for supplying Wollongong might be reduced to £30,000.	Not dealt with.	.....
Second Pipe-line from Walka to Buttai, for Hunter River District Water Supply.	29 ,, ,,	28 ,, ,,	.....	.....	16 ,, ,,	Recommended as proposed.	.....	Legislative Assembly—2 Oct., 1895—Bill read third time. Legislative Council—12 Nov., 1895—Bill read third time; 9 Nov., 1895—Assent reported.
Sewerage Works at Cottage Creek.	29 ,, ,,	26 ,, ,,	.....	.....	9 ,, ,,	The estimated cost of this work was £25,000, which provided for a covered sewer; but the Committee found that a cover was not necessary, and that by constructing an open sewer the cost could be reduced by £12,000.	Passed.	Legislative Assembly—2 May, 1895—Bill read third time. Legislative Council—30 May, 1895—Bill read third time; 25 June, 1895—Assent reported.
Water Supply for Lithgow ...	29 ,, ,,	14 Sept., ,,	22 Oct., 1892	24 Oct., 1892	16 Nov., ,,	Recommended as proposed.	„	Legislative Assembly—5 April, 1894—Bill read third time. Legislative Council—13 April, 1894—Bill read third time; 1 May, 1894—Assent reported.
Sewerage Works for Parramatta	29 ,, ,,	22 June, ,,	.....	.....	4 Oct., ,,	The construction of this work the Committee did not recommend, as they were of opinion that the sewage farm included in the scheme was too small for the purpose, and that the sewage should be dealt with by precipitation and filtration, or other effective modern process, at a proposed pumping station at Clay Cliff Creek.	See second reference.	See second reference.

## FOURTH COMMITTEE—continued.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Water Supply for Armidale ...	29 Mar., 1892	15 Sept., 1892	12 Oct., 1892	20 Oct., 1892	16 Nov., 1892	Recommended as proposed.	Passed.	Legislative Assembly—22 May, 1894—Bill read third time. Legislative Council—31 May, 1894—Bill read third time; 5 June, 1894—Assent reported.
Railway from Eden to Bega ...	29 ,, ,,	10 July, ,,	11 Aug., ,,	7 Sept., ,,	26 Oct., ,,	The Committee considered that the resources of the district did not warrant the construction of such an expensive line, but they were of opinion that a cheaply constructed railway might be favourably considered.	Not dealt with.	.....
Railway from Grafton to Lismore.	29 ,, ,,	14 June, ,,	15 June, ,,	10 Aug., ,,	28 Sept., ,,	The Committee decided that, for the present, only the Lismore to Casino section of the proposed railway should be constructed, that the cost should not exceed £6,000 per mile, and that the betterment principle be applied to the land to be served by the proposed line.	„ „	.....
Railway from Glen Innes to Inverell.	29 ,, ,,	6 April, ,,	23 April, 1891 (See Third Committee.)	2 June, 1891 (See Third Committee.)	27 May, ,,	The evidence in this case, which was partly inquired into by the Third Committee and partly by the Fourth Committee, showed that the estimated cost of constructing the railway was excessive, and indicated the probability of a serious annual loss in the working of the line. In addition to this, the Committee were not as fully informed as desirable with regard to connecting Inverell not only with the Great Northern Railway but with the coast, a matter of considerable importance in the inquiry. The Committee therefore did not recommend that the railway should be constructed.	See second reference.	.....
Railway from Jerilderie to Deniliquin.	29 ,, ,,	31 May, ,,	2 June, 1892	23 June, 1892	18 Aug., ,,	The Committee were of opinion that the consideration of this proposed work should be postponed until it should be determined by Parliament as a matter of public policy to purchase the Deniliquin to Moama Railway.	Not dealt with.	.....
Lunatic Asylum at Kenmore, near Goulburn (second reference).	31 ,, ,,	12 July, ,,	.....	.....	24 ,, ,,	Recommended as proposed.	Passed.	Legislative Assembly—18 October, 1894—Bill read third time. Legislative Council—1 November, 1894—Bill read third time; 14 November, 1894—Assent reported.
Railway from Glen Innes to Inverell (second reference).	27 Oct., ,,	17 Nov., ,,	23 Nov., 1892	13 Dec., ,,	10 Jan., 1893	The Committee considered it expedient this railway should be constructed, provided that the cost did not exceed £7,000 per mile, that special local rates were charged until the railway paid working expenses and interest on cost of construction, and that the betterment principle was applied to the land served by the railway.	Negatived.	Legislative Assembly—18 April, 1894—Bill read third time. Legislative Council—7 June 1894—Bill negatived on motion for second reading.
Waterworks for the town of Junee.	2 Feb., 1893	14 Feb., 1893	15 Feb., 1893	28 Feb., 1893	14 Mar., ,,	The Committee recommended that the proposed works should be carried out, conditionally on the Railway Commissioners entering into an agreement for a period of not less than ten years to pay a minimum of £1,900 per annum for water supplied for railway purposes at Junee and Bethungra.	Passed.	Legislative Assembly—4 April, 1894—Bill read third time. Legislative Council—18 April, 1894—Bill read third time; 1 May, 1894—Assent reported.

FOURTH COMMITTEE—continued.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action
Railway from Narrabri to Moree.	1 Nov., 1893	14 Nov., 1893	15 Nov., 1893	5 Dec., 1893	12 Jan., 1894	Recommended as proposed, with the condition that the work be not undertaken until a Betterment Act is passed.	Passed.	Legislative Assembly—20 March, 1895—Bill read third time. Legislative Council—4 April, 1895—Bill read third time; 24 April, 1895—Assent reported.
Sewerage Works for Parramatta (second reference).	1 Feb., 1894	7 Feb., 1894	.....	.....	22 Mar., ,,	The Committee decided that it was not expedient the proposed works should be carried out, for the reasons that the scheme had not been adequately considered, and that, according to the evidence, Parramatta was neither willing nor able to pay the rate necessary to provide the interest on the expenditure, and did not want the proposed works.	See Sixth Committee.	.....
Deviation to avoid the Lithgow Zigzag.	25 Jan., ,,	6 Mar., ,,	.....	.....	16 April, ,,	The Committee were of opinion that as the professional evidence, as well as much of the evidence generally, indicated that the proposed deviation was not a matter of urgency, it was not expedient the work should be carried out.	Not dealt with.	.....
Railway from Temora to Wyalong.	29 Mar., ,,	9 April, ,,	9 April, 1894	24 April, 1894	28 May, ,,	The Committee were of opinion that owing to the uncertainty of the permanence of the Wyalong goldfield, the decision upon the proposed Railway should be deferred for six months.	See Fifth Committee.	.....
Removal of Pyrmont and Glebe Island Bridges.	25 Jan., ,,	11 ,, ,,	.....	.....	25 June, ,,	The Committee negatived the Departmental scheme, but recommended that when renewal becomes necessary the existing bridges at Darling Harbour and Glebe Island should be replaced by timber structures of a kind specified in their report, which report, however, in consequence of the sudden dissolution of Parliament was not presented to the Legislative Assembly.	,, ,,	.....

# FIFTH COMMITTEE—FROM 19 SEPTEMBER, 1894, TO 5 JULY, 1895, TO 17 JUNE, 1898.

## MEMBERS OF THE COMMITTEE.

### LEGISLATIVE COUNCIL.

The Honorable FREDERICK THOMAS HUMPHERY, Vice-Chairman.  
The Honorable WILLIAM JOSEPH TRICKETT.

The Honorable JAMES HOSKINS.  
The Honorable JOHN DAVIES, C.M.G.

The Honorable CHARLES JAMES ROBERTS, C.M.G.

### LEGISLATIVE ASSEMBLY.

\* VARNEY PARKES, Esquire, Chairman.  
\* THOMAS THOMSON EWING, Esquire, Chairman.  
JAMES HAYES, Esquire.  
ROBERT HENRY LEVIEN, Esquire.

JOHN MOORE CHANTER, Esquire.  
CHARLES ALFRED LEE, Esquire.  
JAMES GORMLY, Esquire.  
EDMUND WILLIAM MOLESWORTH, Esquire.

\* On 15th November, 1894, Varney Parkes, Esquire, resigned his seat on the Committee, and on 20th November, 1894, Thomas Thomson Ewing, Esquire, was elected Chairman.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Removal of Pymont and Glebe Island Bridges (second reference).	27 Sept., 1894	3 Oct., 1894	.....	.....	21 Nov., 1894	The Committee recommended that the Pymont Bridge be replaced by a timber bridge, with steel span, to cost £82,500; the Glebe Island Bridge, they decided, did not at present require renewal.	Passed.	Legislative Assembly—6 October, 1897—Bill read third time. Legislative Council—17 November, 1897—Bill read third time; 2 December, 1897—Assent reported.
Railway from Jerilderie to Berri-gan.	18 Dec., ,,	19 Dec., ,,	8 Jan., 1895	22 Jan., 1895	28 Feb., 1895	The construction of this railway was recommended, with the condition that the estimated cost, £2,000 per mile, should include goods and grain sheds, engineering charges, and all contingencies.	„	Legislative Assembly—7 May, 1895—Bill read third time. Legislative Council—12 June, 1895—Bill read third time; 25 June, 1895—Assent reported.
Railway from Parkes to Con-dobolin.	6 Mar., 1895	7 Mar., 1895	19 Mar., ,,	3 April, ,,	21 May, ,,	In this inquiry the Committee, while considering it expedient the railway should be constructed, resolved that the cost should not exceed £2,100 per mile, including the cost of land resumption.	„	Legislative Assembly—27 June, 1895—Bill read third time. Legislative Council—3 July, 1895—Bill read third time; 14 August, 1895—Assent reported.
Railway from Temora to Wyalong (second reference).	7 ,, ,,	17 May ,,	5 June, ,,	19 June, ,,	27 June, ,,	The Committee negatived this proposed work, being of opinion that at the present time there is no justification for the construction of this railway, and that the prospects of Wyalong's future are not such as to lead them to conclude that the line should be built in anticipation of what may be the condition of the gold-field and the district some years hence.	Not dealt with.	.....
Harbour Improvements at New-castle.	14 ,, ,,	20 Mar. ,,	28 Mar., ,,	9 April, ,,	16 May, ,,	In this inquiry the Committee recommended a modification of the works proposed by the Department and an additional work, the cost of the works as recommended by the Committee being about the same as that of the works proposed by the Department.	Passed.	Legislative Assembly—17 September, 1895—Bill read third time. Legislative Council—6 November, 1895—Bill read third time; 13 November, 1895—Assent reported.
Tramway from Woolwich to the Field of Mars Common.	20 June, ,,	25 June ,,	.....	.....	Inquiry not completed.	.....	Withdrawn.	Motion to refer work to Sixth Committee negatived—11 December, 1895.

# SIXTH COMMITTEE—FROM 11 DECEMBER, 1895, TO 8 JULY, 1898.

## MEMBERS OF THE COMMITTEE.

### LEGISLATIVE COUNCIL.

The Honorable FREDERICK THOMAS HUMPHERY, Vice-Chairman.  
 \*The Honorable JOHN DAVIES, C.M.G.  
 The Honorable WILLIAM JOSEPH TRICKETT.

The Honorable JAMES HOSKINS.  
 The Honorable CHARLES JAMES ROBERTS, C.M.G.  
 \*The Honorable DANIEL O'CONNOR.

### LEGISLATIVE ASSEMBLY.

THOMAS THOMSON EWING, Esquire, Chairman.  
 HENRY CLARKE, Esquire.  
 CHARLES ALFRED LEE, Esquire.  
 JOHN LIONEL FEGAN, Esquire.

\* ANGUS CAMERON, Esquire.  
 THOMAS HENRY HASSALL, Esquire.  
 GEORGE BLACK, Esquire.  
 FRANCIS AUGUSTUS WRIGHT, Esquire.

\*FRANK FARNELL, Esquire.

\* Since the appointment of the Committee, vacancies were caused by the decease of the Honorable John Davies, C.M.G., and Angus Cameron, Esquire. These were subsequently filled by the appointment of the Honorable Daniel O'Connor, and Frank Farnell, Esquire.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Deviation at Locksley, Great Western Railway.	11 Dec., 1895	12 Dec., 1895	13 Dec., 1895	14 Dec., 1895	17 Dec., 1895	Recommended as proposed .....	Passed.	Legislative Assembly—17 December, 1895—Bill passed through all its stages. Legislative Council—18 December, 1895—Bill passed through all its stages.
Water Supply for the Town of Tamworth.	11 Dec., 1895	17 Dec., 1895	8 Jan., 1896	16 Jan., 1896	30 Jan., 1896	The Committee recommended that the proposed work should be carried out, with the proviso that the capacity of the storage reservoir be increased from 35,000,000 to 50,000,000 gallons.	Passed.	Legislative Assembly—27 October, 1896—Bill read third time. Legislative Council—4 November, 1896—Bill read third time; 11 November, 1896—Assent reported.
Electric Tramway from Circular Quay, Sydney, to the Redfern Railway Station; and also along Harris-street to the intersection of John-street.	11 Dec., 1895	18 Mar., 1896	.....	.....	8 May, 1896	Recommended as proposed .....	Passed.	Legislative Assembly—2 September, 1896—Bill read third time. Legislative Council—10 September, 1896—Bill read third time; 16 September, 1896—Assent reported.

SIXTH COMMITTEE--*continued.*

Proposed Work	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Erection of Buildings at Rookwood for Infirm and Destitute Persons.	11 Dec., 1895	21 Jan., 1896	.....	.....	13 Mar., 1896	In this case the Committee deemed it inexpedient that the proposed buildings should be erected, but they recommended that the inmates of the Asylums in Macquarie, George, and Harris Streets, Parramatta, be removed as speedily as possible, and that the healthy destitute be housed at Rookwood and Liverpool; and further that suitable accommodation be provided near Campbelltown on available Crown lands for the chronic and acute sick.	Not dealt with.	.....
Additions to the Treasury Building.	18 ,, ,,	9 ,, ,,	.....	.....	17 July, ,,	Recommended as proposed ..	Passed.	Legislative Assembly—2 September, 1896—Bill read third time. Legislative Council—16 September, 1896—Bill read third time; 22 September, 1896—Assent reported.
Construction of Locks and Weirs on the River Darling.	19 ,, ,,	12 May, ,,	15 June, 1896	7 July, 1896	31 ,, ,,	Negatived ..	Not dealt with.	.....
Railway from Tamworth to Manilla.	11 ,, ,,	20 Feb., ,,	17 Mar., ,,	31 Mar., ,, *19 June, ,,	} 1 Oct., ,,	.....	Passed.	Legislative Assembly—4 November, 1896—Bill read third time. Legislative Council—11 November, 1896—Bill read third time; 13 November, 1896—Assent reported.
Railway from Nevertire to Warren.	11 ,, ,,	21 April, ,,	6 May, ,,	14 May, ,,	20 May, ,,	Recommended as proposed ..	,,	Legislative Assembly—13 August, 1896—Bill read third time. Legislative Council—27 August, 1896—Bill read third time; 9 September, 1896—Assent reported.
Railway from Berrigan to Finley.	28 May, 1896	5 June, ,,	14 July, ,,	28 July, ,,	19 Aug., ,,	The Committee recommended that this work should be carried out, with the proviso that the cost should not exceed £2,000 per mile.	,,	Legislative Assembly—27 October, 1896—Bill read third time. Legislative Council—4 November, 1896—Bill read third time; 11 November, 1896—Assent reported.
Improvement of Cook's River.	28 ,, ,,	16 ,, ,,	.....	.....	24 July, ,,	As recommended by the Committee the construction of the proposed works would involve an expenditure of £15,000, a reduction on the Departmental estimate of £25,000, and which, in their opinion, would meet the requirements of the case.	,,	Legislative Assembly—27 May, 1897—Committee agree to Council's amendments, resolution reported and agreed to. Legislative Council—25 May, 1897—Bill read third time; 9 June, 1897—Assent reported.

\* Supplementary Report.

SIXTH COMMITTEE—continued.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Railway from Moree to Inverell	26 Aug., 1896	1 Sept., 1896	29 Sept., 1896	15 Oct., 1896	21 April, 1897	The Committee resolved that it was expedient this railway should be carried out.	Passed.	Legislative Assembly—11 August, 1897—Bill read third time. Legislative Council—21 October, 1897—Bill read third time; 27 October, 1897—Assent reported.
Construction of a Deep-water Harbour at Port Kembla.	20 Oct., "	28 Oct., "	13 Jan., 1897	25 Jan., 1897	10 Feb., "	The Committee were of opinion that the proposed harbour would be rendered sufficiently secure to meet present requirements if the eastern breakwater only were carried out, and the estimated cost reduced by £240,000.	"	Legislative Assembly—2 December, 1897—Bill read third time. Legislative Council—20 December, 1898—Bill read third time; 21 February, 1899—Assent reported.
Railway from Condobolin to Broken Hill.	1 July, "	5 Aug., "	19 Aug., 1896	15 Oct., 1896	10 Dec., 1896	The Committee, while having regard to the various aspects of this proposed work, and considering also that the annual loss on the working of the railway would amount to £60,000, were of opinion that it should not, at present, be proceeded with.	Not dealt with	.....
Sewerage Works for Parramatta (third reference).	10 Nov., "	11 Feb., 1897	.....	.....	13 April, 1897	This work was passed by the Committee with the provision that the cost should not exceed the Departmental estimate, and that the carrying out of the work should be subject to a guarantee (by the Municipal Council of Parramatta) of the annual payment required to cover maintenance and interest and redemption of the principal outlay.	"	.....
New Houses of Parliament for the Colony.	"	14 April, "	.....	.....	6 Dec., "	The Committee recommended the adoption of the scheme submitted by the Government Architect, providing for alterations to the present Parliamentary Buildings, at a cost not exceeding £15,000.	"	.....
Duplicate Main from Prospect to Potts' Hill.	11 Nov., "	.....	.....	.....	8 June, "	The Committee recommended the amended scheme submitted by the Engineer-in-Chief for Public Works, by which the sides of the canal between Prospect and the Pipe Head Basin would be raised, the canal strengthened, and the 6-foot pipeline between the Basin and Potts' Hill Reservoir duplicated.	Passed.	Legislative Assembly—1 December, 1897—Bill read third time. Legislative Council—7 December, 1897—Bill read third time; 21 June, 1898—Assent reported.
New Bridge at Glebe Island ...	9 June, 1897	16 June, 1897	.....	.....	15 Sept., 1897	The Committee recommended that there be substituted for the existing structure a stone causeway with a central steel swing-span.	"	Legislative Assembly—2 December, 1897—Bill read third time. Legislative Council—9 December, 1897—Bill read third time; 21 June, 1898—Assent reported.
Railway from Redfern to St. James' Road.	30 ,, "	13 July, "	.....	.....	25 Aug., "	Recommended as proposed.	Not dealt with	.....
Railway from Condobolin to Euabalong.	5 Aug., "	31 Aug., "	17 Sept., 1897	26 Oct., 1897	7 Dec., "	The Committee negatived this proposed work.	"	.....
Railway from Narrabri to Pilliga.	5 ,, "	19 Oct., "	22 April, 1898	19 May, 1898	23 June, 1898	The Committee negatived this proposal, but suggested a route from Narrabri by way of Eurie Eurie, which could, if necessary, be extended on to Walgett.	"	.....

26—E

SIXTH COMMITTEE—continued.

Proposed Work.	Date of reference to Committee.	Date upon which inquiry was opened.	Date upon which Sectional Committee was appointed.	Date of Sectional Committee's Report.	Date of Committee's Report.	Statement of Committee's recommendation.	How dealt with by Parliament.	Date of Parliamentary action.
Railway from Byrock to Bre-warrina.	5 Aug., 1897	1 Oct., 1897	11 Feb., 1898	5 April, 1898	22 June, 1898	Recommended conditionally.	Passed.	Legislative Assembly—8 December, 1898—Bill read third time. Legislative Council—21 December, 1898—Bill read third time; 21 February, 1899—Assent reported.
Railway from The Rock to Green's Gonyah.	5 ,, ,,	16 Sept., ,,	7 Oct., ,,	26 Oct., 1897	25 Nov., 1897	Recommended as proposed.	,,	Legislative Assembly—7 December, 1898—Bill passed through its remaining stages. Legislative Council—22 December, 1898—Bill read third time; 21 February, 1899—Assent reported.
Railway from Coolamon to Ariaiah.	5 ,, ,,	23 ,, ,,	7 ,, ,,	26 ,, ,,	18 ,, ,,	The Committee negatived this proposed work.	Not dealt with	.....
Railway from Warren to Coonamble.	9 Dec., ,,	14 Dec., ,,	14 Mar., ,,	21 April, 1898	29 April, 1898	The Committee negatived the proposal for a railway from Warren to Coonamble, but recommended that a survey be made of a route from Dubbo to Coonamble.	,,	.....
Railway from Koorawatha to Grenfell.	9 ,, ,,	20 Dec., 1897	11 Feb., ,,	10 Mar., ,,	1 ,, ,,	Recommended as proposed.	Passed.	Legislative Assembly—8 December, 1898—Bill read third time. Legislative Council—21 December, 1898—Bill read third time; 21 February, 1899—Assent reported.
Railway from Woolabra to Col-larendabri.	9 ,, ,,	9 Mar., 1898	22 April, ,,	19 May, ,,	24 June, ,,	The Committee negatived this proposal, but suggested a route from Narrabri towards Eurie Eurie, which would proceed from a point 315 miles from Newcastle to Colla-rendabri.	Not dealt with	.....
Railway from Maitland to Taree.	9 ,, ,,	22 Feb., ,,	*14 June, ,,	.....	6 July, ,,	The Committee negatived this proposal.	,,	.....
Railway from the Terminus of the Rosehill Railway to Dural	9 ,, ,,	5 Jan., ,,	.....	.....	13 April, ,,	The Committee negatived this proposed work.	,,	.....
Harbour Works at Tweed River.	9 ,, ,,	15 Mar., ,,	22 Mar., 1898	2 April, 1898	26 ,, ,,	Recommended as proposed.	Negatived	Legislative Assembly—7 December, 1898—Bill read third time. Legislative Council—21 December, 1898—Second reading negatived.

---

*TUESDAY, 18 APRIL, 1899.*

The Committee met at 2 p.m.

MEMBERS PRESENT :—

John Perry, Esq., Chairman.

The Hon. Patrick Lindesay Crawford Shepherd,	William Thomas Dick, Esq.,
The Hon. Andrew Garran, LL.D.,	John Christian Watson, Esq.,
The Hon. William Joseph Trickett,	Robert Henry Levien, Esq.

The minutes of the previous meeting were read, and confirmed.

The Secretary read the following correspondence :—

Letter from the Secretary of the Railway League, Lake Cudgellico, with reference to the proposed Railway from Grenfell to Wyalong.

Letter from the Secretary of the Cobar-Wilcannia Railway League, Wilcannia, with reference to the proposed Railway from Cobar to Wilcannia.

Statement from Mr. J. Kirkpatrick, architect, with reference to his evidence in the inquiry respecting the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

The correspondence was received.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

The Committee deliberated upon certain portions of the evidence before them, and, in view of the want of agreement on the part of expert witnesses upon some important points in the inquiry, it was decided that further professional evidence should be obtained.

The Committee adjourned at 4 o'clock, until 2 o'clock p.m. on Wednesday, the following day.

---

*WEDNESDAY, 19 APRIL, 1899.*

The Committee met at 2 p.m.

MEMBERS PRESENT :—

---

*THURSDAY, 27 APRIL, 1899.*

The Committee met at 2 p.m.

MEMBERS PRESENT:—

John Perry, Esq., Chairman.

The Hon. Patrick Lindesay Crawford Shepherd,		William Thomas Dick, Esq.,
The Hon. Andrew Garran, LL.D.,		John Christian Watson, Esq.,
The Hon. William Joseph Trickett,		Robert Henry Levien, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, and Walter Liberty Vernon, Government Architect, were sworn, and further examined.

Mr.

Mr. Levien moved,—“That the Committee proceed to consider the evidence on the proposed erection of Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney, with a view to reporting on the subject to the Legislative Assembly.”

The motion was seconded by Mr. Shepherd, and passed.

Mr. Levien moved,—“That, in the opinion of the Committee, it is not expedient the proposed erection of Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Shepherd seconded the motion.

The debate was adjourned.

The Committee adjourned at 4 o'clock, until 2 o'clock p.m. on Friday, the following day.

*FRIDAY, 28 APRIL, 1899.*

The Committee met at 2 p.m.

MEMBERS PRESENT :—

John Perry, Esq., Chairman.

The Hon. Patrick Lindesay Crawford Shepherd,	William Thomas Dick, Esq.,
The Hon. Andrew Garran, LL.D.,	John Christian Watson, Esq.,
The Hon. William Joseph Trickett,	Robert Henry Levien, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

The adjourned debate upon Mr. Levien's motion,—“That, in the opinion of the Committee, it is not expedient the proposed erection of Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney, as referred to the Committee by the Legislative Assembly, be carried out”—was resumed.

Dr. Garran moved,—“That the motion be amended by the addition of the following words: ‘until there has been a comprehensive investigation into the existing accommodation for the various public Departments and the possibility of improving it by fresh adjustments or slight structural alterations, and until the probable wants of the Government for ten years, at least, are approximately indicated.’”

The amendment was seconded by Mr. Watson, and agreed to, and the motion, as amended, was then passed.

The Committee adjourned at 4 o'clock, until 2 o'clock p.m. on Tuesday, 2nd May.

*TUESDAY, 2 MAY, 1899.*

The Committee met at 2 p.m.

MEMBERS PRESENT :—

*FRIDAY, 26 MAY, 1899.*

The Committee met at 2 p.m.

MEMBERS PRESENT :—

John Perry, Esq., Chairman.

The Hon. Patrick Lindesay Crawford Shepherd,		William Thomas Dick, Esq.,
The Hon. Andrew Garran, LL.D.,		John Christian Watson, Esq.,
The Hon. William Joseph Trickett,		Robert Henry Levien, Esq.

The minutes of the previous meeting were read, and confirmed.

The Committee, accompanied by Mr. W. L. Vernon, Government Architect, then, in pursuance of their inquiry respecting the expediency of erecting a Penitentiary and Prison for Females, Randwick, proceeded to Randwick for the purpose of inspecting the site of the proposed buildings. The position decided upon was examined, and as it appeared that the buildings when erected would be in close proximity to the houses of some of the residents of Botany-street, the Committee endeavoured to ascertain whether they could not be erected on another part of the site, which would be away from all residences, and much less noticeable. An alteration of this kind in the plans appeared to be practicable, but as the Committee were informed by the Government Architect that it involved the question of expense in connection with the levelling of some of the ground, instructions were given for an estimate of the additional cost to be prepared.

*TUESDAY,*

*TUESDAY, 30 MAY, 1899.*

The Committee met at 2 p.m.

MEMBERS PRESENT:—

John Perry, Esq., Chairman.

The Hon. Patrick Lindesay Crawford Shepherd,		William Thomas Dick, Esq.,

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

**PUBLIC OFFICES, PHILLIP, BRIDGE, AND YOUNG STREETS, SYDNEY.**

### REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of erecting public offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney," have, after due inquiry, resolved that it is not expedient the erection of the offices should be carried out until there has been a comprehensive investigation into the existing accommodation for the various public departments, and the possibility of improving it by fresh adjustments or slight structural alterations, and until the probable wants of the Government, for ten years at least, are approximately indicated; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

#### GENERAL REMARKS.

1. In this inquiry, the Committee have had before them a proposal to erect at an approximate cost of £97,000, on Government land, which cost £33,500, with frontages to Phillip, Bridge, and Young Streets, Sydney, a stone building of six storeys and a basement, containing 70,727 superficial feet of floor space, for the accommodation of the Department of Mines and Agriculture and the Department of Public Instruction and Labour.

The initiation of this scheme, the Committee are officially informed, arose at the time the Department of Mines and Agriculture was occupying rented premises in Lincoln's Inn Chambers, Phillip-street, when the Government Architect was instructed to ascertain the possibility of finding accommodation for it in either the Public Works or the Lands Office buildings, and as a temporary measure a removal was made to the latter.

Steps were then taken to provide for the erection of a new building for the Department upon a portion of the site now before the Committee in connection with the present proposal, which faces Phillip and Bridge Streets, and £18,000 was voted on the Estimates of 1895 to meet the cost. Nothing further, however, appears to have been done until 1897, when a scheme being in course of preparation for accommodating the Inspector-General of Police and the Comptroller-General of Prisons upon a site at the corner of Phillip and Hunter Streets, a Board was appointed to consider whether it were practicable to erect on the Phillip, Bridge, and Young Streets site a building large enough to accommodate the Department of Mines and Agriculture, the Police and Prisons Departments, the Department of Public Instruction and Labour, and a number of smaller branches of the Public Service occupying rented premises or Government buildings regarded as unsuitable.

This,

This, it was found, could not be done conveniently, either as regards accommodating some of the Departments, or keeping the height of the building within reasonable limits; and, so far as the Department of Mines and Agriculture and the Department of Public Instruction and Labour were concerned, it was then decided by the Departmental Board to make the proposal subsequently referred to the Committee.

#### SCOPE OF THE INQUIRY.

2. In carrying out this inquiry, the Committee, besides examining Departmental officers, have had before them private architects and witnesses holding responsible positions in some of the large monetary and mercantile establishments of Sydney. Recognising the importance of comparing the accommodation provided in the proposed building with that which is used by the office staffs of business establishments in the city, evidence was invited from the General Manager of the Australian Mutual Provident Society, the General Manager of the Colonial Sugar Refining Company, and the Accountant of the Head Office of the Bank of New South Wales, and the information obtained from them is an important feature in the investigation. The Committee also visited and inspected most of the public offices, including those at present used by the two Departments for whose accommodation the new building is intended, and endeavoured to ascertain whether requirements might be met by some rearrangement, or by some comparatively inexpensive additions. Evidence on each of these points was obtained, part of it being reports from the Government Architect and two of the private architects examined, on the cost of adding another storey to the present Lands Office building, the Under Secretary for Mines and Agriculture having informed the Committee that, if the requirements of his Department could be fully met by the erection of an additional storey, he would be satisfied. Further, in connection with the proposal that the basement of the new offices should be set apart for the Museum of the Department of Mines and Agriculture, now in the Domain, and in order to determine whether, in view of other museums of a similar character in Sydney, that of the Department of Mines and Agriculture is required, the Committee visited and inspected the Museum in the Domain, the Australian Museum, and the Museum of the Technical College, Ultimo, and examined expert witnesses upon the subject.

#### DESCRIPTION OF THE BUILDING.

3. The external walls of the proposed building are to be of Sydney sandstone, in order to bring them into harmony with the architectural appearance of the offices of the Chief Secretary, Public Works, and Lands Departments; and as it is intended to continue the right-of-way on the southern side of the site to connect by a passage with Phillip-street, the building is designed with four façades. The spaces enclosed by the structural walls are to be subdivided by the Departments concerned. In the official statement placed before the Committee it is affirmed that the rooms will be well-lighted, either from the streets or from a spacious light-area carried upwards throughout the building. The corridors are also officially described as well-lighted and sufficiently wide, and are so arranged that a distinct system of horizontal air-shafting, connecting with upright ventilating shafts, is provided, into which communication from every room is proposed to be made, and a constant exhaustion of vitiated air set up by means of electric fans. The floors and ceilings, which will be fire-proof, it is proposed to construct on the Monier system, each floor being provided with adequate strong-rooms and lavatory accommodation. The basement is to be occupied entirely by the museum of the Department of Mines and Agriculture, the public approach to it being from the Bridge and Hunter Streets corner, and the light from windows facing the streets and from the light-area carried up through the building. The ground floor and first and second floors are divided between the two Departments; the fourth and fifth floors are to be used wholly by the Department of Mines and Agriculture. A separate entrance and lift are provided for each Department, and it is intended that the lifts shall be run, and the rooms in the building lighted and heated, by electricity.

## STATEMENTS OF ACCOMMODATION REQUIRED AND PROVIDED.

4. The minimum accommodation required and the amount provided for the two Departments are stated as follows :—

Department.	Minimum required.	Amount provided.
Mines and Agriculture ... ..	feet. 45,777	feet. 47,941
Public Instruction ... ..	19,776	22,786

The following statement shows the accommodation in superficial feet, exclusive of lavatories, corridors, staircases, lifts, ventilating shafts, &c., proposed to be given to each Department on the different floors, and the space provided for the museum in the basement :—

	Department of Public Instruction.	Department of Mines and Agriculture.
	feet.	feet.
Basement ... ..	.....	14,440
Ground floor ... ..	5,680	3,720
First floor ... ..	5,763	3,768
Second floor ... ..	5,763	3,768
Third floor ... ..	5,580	3,695
Fourth floor ... ..	.....	9,275
Fifth floor ... ..	.....	9,275
Total number of superficial feet ... ..	22,786	47,941

## THE PLANS.

5. The plans of the proposed building present to the view a façade harmonising fairly with the exterior appearance of the public buildings in Bridge-street, and the interior arrangements are generally similar to those of the existing offices; but it cannot be said that they are altogether satisfactory. The accommodation provided is in excess of present wants, and for some portions of the staff is over-liberal. The design, as regards Government buildings, is a novelty and an improvement, for partition walls as part of the structure are reduced to a minimum, the proposal being to use, for purposes of subdivision, a light fire-proof wall, which can be erected as required, in the first instance, and taken down, without difficulty or injury to the building, if any subsequent re-arrangement of the space is required. In the older offices it has been found difficult and expensive, and often impossible, to turn several small rooms into a large one, because the walls to be removed were wanted for the support of the building. At the same time, when, as in this case, the building is being constructed expressly for two Departments whose general requirements are known, the architect should have been in possession of the most detailed information as to those requirements, but it seems that little further was known or asked for than the amount of superficial space each Department desired. All the witnesses seemed to be agreed that a fair floor-space for each clerk ranges from 75 to 100 square feet, and in the large rooms it is easy to make this adjustment for any number of clerks. But in all the Departments a certain number of officers require rooms to themselves, and in these large buildings it is very difficult to provide small rooms; for as the distance from the outside walls to the corridor wall in this building, for instance, is 24 feet, and 20 feet for the interior rooms, it is only possible to make a small room by making it proportionately narrow, and each room must have at least one window. This makes the space-allowance per occupant for the single rooms proportionately larger, and makes the general average for the whole building come higher. The lighting of the rooms is satisfactory, but some of the architectural witnesses think that in the corridors the light is deficient, and it is very doubtful whether sufficient is provided for museum purposes in the basement.

That

That the accommodation shown by the plans is excessive may be seen from the following statement, which gives the average floor-space provided for the different officers of the departments in the new building :—

DEPARTMENT OF MINES AND AGRICULTURE.

Minister and Under Secretary ... ..	780 feet each.
Geological Branch (including library)...	188 „ „
Charting Branch... ..	133 „ „
Clerical Branch ... ..	129 „ „
Lease Clerks ... ..	124 „ „
Lease Officer and Legal Adviser ... ..	150 „ „
Inspectors of Diamond Drills ... ..	270 „ „
Accounts Branch ... ..	131 „ „
Stores ... ..	125 „ „
Plan-mounter, helio. printing, and helio. printer ... ..	495 „ „
Board-room ... ..	480 „ „
Museum ... ..	14,440 „ „
Clerical Branch (Museum) ... ..	270 „ each.
Public Watering-places... ..	164 „ „
Stock Branch (including two store-rooms) ... ..	161 „ „
Export Board (including board-room)...	200 „ „
Pathologist and Artists ... ..	285 „ „
Entomologist (including library) ... ..	430 „ „
Viticulture (including two laboratories) ... ..	665 „ „
<i>Agricultural Gazette</i> (including library) ... ..	357 „ „

DEPARTMENT OF PUBLIC INSTRUCTION AND LABOUR.

Minister ... ..	526 feet.
Minister's Ante-room ... ..	200 „
Under Secretary... ..	320 „
Under Secretary's Waiting-room ... ..	150 „
Chief Clerk ... ..	320 „
Correspondence Clerk ... ..	160 „
Teachers' Branch ... ..	110 feet each.
Correspondence ... ..	108 „
Records ... ..	161 „
Accounts... ..	138 „
Cashier ... ..	168 „
Clerks of Works and Draftsmen ... ..	232 „
Inspectors, and Messenger-in-Waiting ... ..	250 „
Cadets ... ..	106 „
Labour and Industry ... ..	140 „
Store-rooms ... ..	1,770 feet.
Cadets' Workshop ... ..	399 „
Library and Board-room ... ..	840 „

PRESENT POSITION OF THE DEPARTMENTS.

6. At the present time the Department of Mines and Agriculture has its head-quarters and the larger part of its staff in the Lands Office building. The Stock Branch is in a building owned by the Government in Young-street; the Agricultural Chemist, the Fruit Expert, the Dairy Expert, and the Entomologist are in the old Commissariat Stores, Circular Quay; the Pathologist in Agriculture is located in the Public Works building; and the Departmental Museum is in the Domain. The total space occupied, inclusive of the Museum, is 43,455 square feet, and exclusive of the Museum 36,000 square feet.

The rooms available in the Lands Office building, the Under Secretary states, are overcrowded; there is no strong-room accommodation for books and documents; and the necessity to accommodate branches of the Department in other buildings causes considerable inconvenience.

The

The Department of Public Instruction and Labour is accommodated mostly in the old building east of the Lands Office, which formerly was the office of the Colonial Secretary. The cashier, the clerks of works, and the inspectors, with the exception of the chief inspector and deputy chief inspector, are in rented buildings. The principal building is described by the Under Secretary as compact, but too small for requirements and badly ventilated. It is without a strong-room, and is deficient in store-room accommodation.

#### VISITS TO THE PUBLIC OFFICES.

7. Early in the course of the inquiry the Committee visited most of the Public Offices to acquaint themselves with the nature of the accommodation in the existing public buildings, and how it is used. They found generally that the structural features of the buildings prevented a proper arrangement of officers or a thoroughly systematic and effective control of their work. One officer may have to himself a separate room of large size, while a number of clerks may be crowded into a room of smaller dimensions. As an instance, a room in the Lands Department is occupied by twelve officers, while the Chief Surveyor of the Department has to himself a similar room, and, in addition, another room of 240 feet floor-space. The head of a room, who ought to be in the room occupied by the clerks or others he is expected to overlook, is either entirely apart from them in another room, which he alone occupies, or he is shut off from them in a manner which renders a personal supervision impossible. Wherever an officer has been able to secure a room to himself he has done so, and the buildings are so constructed that many of these rooms are much larger than they need be. The consequence is that more single rooms are occupied than should be, and they contain a much greater superficial area of space than should be allotted to individual officers.

Much space is also used as store-rooms. In all Departments it has been the practice to keep on hand large supplies of stores and stationery, and, except in the case of the Department of Public Works, which has lately altered its practice in this respect, these branch stores still exist. They occupy a considerable area which might be used to much more advantage. The same may be said of record rooms.

Then the space which should be available for the accommodation of clerks is encroached upon by unsuitable and unnecessary office furniture. In the Department of Mines and Agriculture this is particularly noticeable.

The evidence of the Under Secretary of this Department leads to the impression that the Department is insufficiently accommodated in the Lands Office building, but from what the Committee saw on their visit it does not appear to them that the most is made of the accommodation available. Unsuitable, old-fashioned, and ill-arranged office furniture occupies a large proportion of the space in most of the rooms, and what seems to be an imperfect system in regard to the keeping of books and papers further lessens the space required for the clerks. In the offices of an institution like the Bank of New South Wales, the Australian Mutual Provident Society, or the Colonial Sugar Refining Company, the clerical staff does its work at desks, either ranged around the walls or placed in the centre of the room, so that no more space than is absolutely necessary shall be taken up by office furniture, and every clerk shall be within the view of the officer over him; but in many of the rooms occupied by the Department of Mines and Agriculture the furniture consists, not of suitable desks, but of tables covering most of the floor-space, and having upon them large cupboards or sets of pigeon-holes, which lead to an undesirable accumulation and litter of papers, and effectually screen the clerks from observation. The Accountant of the Bank of New South Wales, who, at the request of the Committee, visited the Department, found a great waste of space and littering of the offices. There seemed to him to be in the rooms out-of-date and quite unnecessary furniture, superfluous books and papers, and a complete absence of method. In one large room, for instance, he saw from ten to twelve clerks, the bulk of whom had tables to themselves with plenty of space between them. The same clerks, he states, could have been accommodated at a desk, standing face to face, with perhaps a rack upon which to put their papers, in half the space. In his opinion accommodation could be found in the rooms he visited for 30 per cent. more clerks than are at present there. The unsuitable character of the office furniture in this Department is responsible for

for much of the want of space complained of. This witness noticed also, what is very apparent to the Committee, that through the manner in which the interior of the Lands Office building has been subdivided there is a much larger number of separate rooms than there ought to be, and a consequent defective system of supervision of the officers occupying them. If, instead of dividing-walls from floor to ceiling, apportioning the available space into a large number of rooms, there were partitions of wood and glass, as are to be found in the offices of most large business establishments, forming a few large rooms easily overlooked by the officers in charge, a much better system would prevail than appears to be the case at present. In the Bank of New South Wales the system is to economise space as much as possible by having in the rooms the most suitable furniture, and no obstruction to the proper supervision of the clerks, to group the officers so that their work shall be done without unnecessary running from room to room, and to provide plenty of air space by limiting the height of partitions to what is required to screen the clerks and their work from the public. A similar system prevails in the offices of those other institutions whose representatives appeared before the Committee.

The offices of the Department of Public Instruction and Labour are furnished more suitably than is the case in those of the Department of Mines and Agriculture, and there is an air of neatness and system observable about the rooms; but there appears to be unnecessarily large accommodation set apart for the storage of stationery.

#### EXCESSIVE ACCOMMODATION FOR STORES AND STATIONERY.

8. The excessive amount of space taken up in the two Departments for stores and stationery has led the Committee to the conclusion that in this respect some different system should be introduced. It would greatly lessen the necessity for store-room accommodation if the bulk of the printed forms used by the Departments were stored somewhere else, only sufficient being kept on hand for current requirements. The head office of the Bank of New South Wales manages to keep all the printed forms, and other papers required at any moment, in connection with its dealings with country branches, on the premises, in a press about 12 feet high and 10 feet wide. Anything that cannot be kept there is stored in a room at the disposal of the bank on the premises of John Sands & Co., who occupy towards the bank the same relation the Government Printing Office and the Government Stores Department do to the public Offices. The Chairman of the Public Service Tender Board, who was examined by the Committee on this subject, states that the matter has been investigated by the Board, who are very strongly of opinion that the Departmental branch stores should be practically done away with, and the annual contractors made the storekeepers for the bulk of the stores required. A very strong recommendation to this effect, the Committee are informed, has been sent to the Honorable the Colonial Treasurer. This is one direction in which it is clear to the Committee that considerable space in the Departments could be added to that used for the accommodation of clerks.

#### AN ADDITIONAL STOREY TO THE LANDS OFFICE BUILDING.

9. Being of opinion that better results might be obtained from the rooms at present occupied by the Department of Mines and Agriculture, the Committee set about ascertaining whether an additional storey to the Lands Office building were practicable at a reasonable cost. The operations of the Mines Department are so closely associated with those of the Department of Lands that it seems fitting these two Departments should occupy the same building, and, according to the evidence, an additional storey would be satisfactory to the permanent head of the first-mentioned Department, if sufficient accommodation could be thereby furnished. At the present time there are some rooms at the top of the building too much exposed to the heat of the sun to be of use, and the construction of another storey would improve these, and, with them, provide about 20,000 superficial feet of additional office space. The Government Architect states that to do this would cost £46,880. One of the private architects examined estimates the cost at from £30,000 to £35,000, and that of constructing not only an additional storey but also a mansard roof, which together would give 40,000 superficial feet of space, at £50,000. Another architect, who was called in to check the estimates of the other two, gives the cost of

of the additional storey as £45,346, though he thinks it might turn out to be something less, perhaps about £42,000. Compared with the estimated cost of the proposed new building, which would provide 70,721 superficial feet of space, accommodate two departments, and complete the line of public offices in Bridge-street, an expenditure of over £40,000 in adding to the Lands Office building does not seem to be justifiable.

#### QUESTION OF THE MUSEUM.

10. The proposal to set apart the basement of the new building, containing 14,440 superficial feet of space, for the purposes of a museum in connection with the Department of Mines and Agriculture, has been a subject of difficulty to the Committee. In 1895, when it was proposed to spend £18,000 on offices for this Department, accommodation for a museum was not contemplated. Then, as now, the Government Geologist had a collection of specimens for the purposes of reference; but in the proposal referred to the Committee, a public museum, representative of the whole of the mining and agricultural operations of the Department, is intended to be established on a wide and permanent basis. A very good collection of exhibits, representing both branches of the Department, is displayed at the present time in a galvanised iron building on the western side of the Domain; but this building is regarded as unattractive and unsuitable, and the space available is said to be much too limited. The inspection made by the Committee of this and other museums in Sydney led them to the conclusion that in timber exhibits the Technical College, Ultimo, possesses the best collection, as well as a useful display of exhibits illustrative of agriculture. Minerals also are well represented. According to the evidence of the Superintendent of the Technical College, all kinds of technological exhibits—animal, vegetable, and mineral—of an economic character are kept there for the benefit of the public and the teaching of students; they impart to the people who visit the museum an idea of the nature of the products of the country, and of how they can be employed to the best advantage, and they are used for the instruction of the college students. The total number of visitors to this museum last year, exclusive of students, was from 100,000 to 120,000; and inquiries relating to the products of the country have frequently been received from London and America, and from various other parts of the world. The Australian Museum does not contain specimens of timber or exhibits of general agricultural products, but it has a good mineral collection, though it has no connection with the mining centres and has to depend mainly upon gifts.

In view of the excellent museum at the Technical College, and the fact that it is in close proximity to the Redfern Railway station and will shortly be easily accessible by electric tram, it is questionable whether any museum is wanted in connection with the Department of Mines and Agriculture beyond what is required by the Government Geologist and his assistants, for which much less space than 14,440 feet should be sufficient, though some of the museum experts favour the proposal. Professor David is of opinion that space equal to at least three-fourths of that now occupied by the museum in the Domain is necessary for a reference museum, and that means accommodation to the extent of a little more than 5,000 feet.

#### THE COMMITTEE'S RECOMMENDATION.

11. As it is apparent to the Committee that considerably more accommodation could be found in the present public offices if a better system than now prevails in regard to the arrangement of officers, the style of office furniture, and the space used for store-rooms, record-rooms, and also for the accommodation of messengers, were introduced, they are of opinion that the proposed new offices should not be erected until there has been a comprehensive investigation into the present condition of the offices in these respects, by which it may be ascertained whether it is possible to bring about an improvement by some re-arrangement or slight structural alterations in the buildings, and until the probable wants of the Government in the direction of office accommodation, for at least the next ten years, have been approximately indicated. This investigation, which should be made by a competent Board, consisting, say, of two representative public officers, two gentlemen connected with large business establishments in Sydney, and an architect, would probably show that

that some of the buildings now used for public offices can be made to accommodate much more than they do at present. The Department of Public Instruction and Labour may not be provided for in this way; but, as a new Public Library building, and new offices for the Registrar-General, which are contemplated, will leave the buildings at present occupied for those purposes vacant, and as, in the event of the railway being brought into the City, the Railway Commissioners may find it convenient to remove from their present offices, which are of considerable area, there may before long be suitable quarters available for this Department, which will obviate any necessity for the erection of new premises for its accommodation. Federation, too, has some bearing upon the question of public offices—at least to the extent of making it desirable to postpone the construction of any costly new offices not urgently required until it is definitely known what buildings or portions of buildings the Federal Government will take over.

Should the results anticipated by the Committee from the inquiry they recommend be realized, a new building such as that which has been under their consideration may not be wanted, or the plans, if not set aside altogether, may require to be altered. In the preparation of new plans, information as to the probable future requirements of the Government with regard to office accommodation would be a valuable guide to a suitable design, and of much assistance in any inquiry as to the necessity for the new building. The Committee are of opinion, also, that before plans are prepared for any new public building the Government Architect should be in possession of complete details as to the manner in which the accommodation to be provided is to be used, and that the subdivision of the space to meet every requirement should be shown on the plans instead of being left to the subsequent action of the Departments.

#### THE RESOLUTION PASSED.

12. The Resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings, of Friday, 28th April, 1899:—

Mr. Levien moved,—“That, in the opinion of the Committee, it is not expedient the proposed erection of Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Shepherd seconded the motion.

Dr. Garran moved,—“That the motion be amended by the addition of the following words:— ‘until there has been a comprehensive investigation into the existing accommodation for the various public Departments, and the possibility of improving it by fresh adjustments or slight structural alterations, and until the probable wants of the Government, for ten years at least, are approximately indicated.’”

The amendment was seconded by Mr. Watson, and agreed to, and the motion as amended was then passed.

JOHN PERRY,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 3 May, 1899.

---

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### PUBLIC OFFICES, PHILLIP, BRIDGE, AND YOUNG STREETS, SYDNEY.

THURSDAY, 2 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee proceeded to consider the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] You have prepared a statement in regard to the proposed new buildings to be erected upon the site owned by the Government fronting Phillip, Bridge, and Young Streets? Yes; it is as follows:—

R. R. P.  
Hickson.

#### PROPOSED NEW PUBLIC BUILDINGS—PHILLIP, BRIDGE, AND YOUNG STREETS.

2 Feb., 1899.

*To accommodate the Department of Mines and Agriculture and the Department of Public Instruction.*

The initiation of this scheme arose from the Government Architect receiving instructions to ascertain if it were possible, or not, to accommodate the Department of Mines and Agriculture in either the Public Works or the Lands buildings. As a temporary result, that portion of the Department of Mines and Agriculture which was occupying rented premises in Lincoln's Inn Chambers was brought down to the Lands Office building, leaving a number of branches still scattered about the city.

Following this, steps were taken to provide for the erection of a new building for this Department upon the vacant land facing Phillip and Bridge Streets, being a portion of the site now under consideration, and the sum of £16,500 was voted on the Loan Estimates of 1895 to meet the cost.

The site for the scheme now placed before the Committee for investigation is that abutting upon Phillip, Bridge, and Young Streets, partially covered by Nos. 36 to 42 Young-street (four houses), and partly vacant, while it is approached on the southern side by an accommodation lane. The whole property was purchased, in November, 1883, for the sum of £33,500.

Early in 1897, a scheme was in course of preparation for accommodating the Departments of the Inspector-General of Police and the Comptroller-General of Prisons upon another site at the corner of Phillip and Hunter Streets, but as the larger site was available the Minister directed that inquiries should be made as to whether it was possible, or not, to accommodate on the latter all the Departments already referred to, together with a number of branches of other Departments, and relinquish the proposal to build distinctly for the Departments of the Inspector-General of Police and the Comptroller-General of Prisons.

A Board was, therefore, appointed, including representative officers from the Departments interested, with the Government Architect as Chairman. This Board reported that, in order to accommodate in one building all the Departments interested, it would be necessary to erect a building of an abnormal height, and considering the fact that the Inspector-General of Police and the Comptroller-General of Prisons objected to their respective Departments being housed with so many others, and in that particular locality, the Board recommended that the most advisable course would be to erect two buildings—one at the corner of Phillip and Hunter Streets for the two last-named Departments, and the other (the one now under consideration) for the Departments of Mines and Agriculture, and Public Instruction.

During the investigations made by the Board it was found necessary, in order to present a practicable scheme, to still further reduce the number of Departments to be accommodated, and therefore the following were omitted, to be provided for elsewhere, viz.:—

Auditor-General.	Public Service Board.
Charitable Institutions.	Fisheries Department.
Electoral Registrar.	Friendly Societies.
Medical and Pharmacy Boards.	Government Statistician, and
Railway Commissioners (portion).	

The Department of Mines and Agriculture is now partly housed in the building of the Lands Office, partly in the old Naval Depot, and the Public Works Offices, while its Museum is in the unsightly temporary building known as the Technological Museum, Outer Domain; while it is understood other small branches have to find accommodation elsewhere. The Education Department is somewhat similarly situated, its principal offices being in the old and inconvenient building directly to the eastward of the Lands Office. Both Departments require immediately more ample accommodation and proper arrangement of offices for their efficient administration.

There are practically few outside rentals paid by these two Departments, and the financial aspect of the scheme must be considered entirely from the point of view of the general requirements and expansion in the administration of the Colony.

R. R. P.  
Hickson.

The proposed building consists of six storeys, containing 70,727 superficial feet of floor-space available for office and museum accommodation. The minimum accommodation required by the two Departments, and the amount provided is, therefore, as follows:—

2 Feb., 1899.

Department.	Minimum required.	Amount provided.
Mines and Agriculture.....	feet. 45,777	feet. 47,941
Public Instruction.....	19,776	22,786

It is proposed to carry out the external walls in Sydney sandstone in order to bring the building into harmony with the architectural appearances of the Colonial Secretary's, Public Works, and Lands Office buildings; and, as it is intended to continue the right-of-way on the southern side to connect by a passage with Phillip-street, advantage has been taken to design the building with four facades, and complete in itself.

The basement is to be occupied entirely by the Museum of the Mines Department, and is approached by the public from the Bridge and Young Streets corner, the specimens and heavy goods entrance being from the lane on the southern side. The ground, first, second, and third floors are divided between these two Departments, and the fourth and fifth are appropriated wholly by the Mines Department.

There is a separate entrance and lift for each Department, and all the rooms are well lighted, either from the streets or from a spacious light area carried up throughout the buildings, which also forms an effective top light to the museum and basement.

The corridors are sufficiently wide and well lighted, while each floor has adequate strong-room and lavatory accommodation. The corridors referred to run a complete circuit through the building, and are so arranged that a distinct system of horizontal air shafting connecting with upright ventilating shafts is provided, into which communication from every room is proposed to be made, and a constant exhaustion of vitiated air set up by means of electrical fans. It is also proposed to construct fire-proof floors and ceilings on the Monier system, and to light and heat the rooms and run the lifts by electricity.

The estimated cost of the building, with floors of fire-proof construction as above referred to, inclusive of lifts, is, approximately, £97,000.

A schedule, showing the accommodation proposed on each floor, is appended:—

	Department of Public Instruction.	Department of Mines and Agriculture.
	feet.	feet.
Basement.....	.....	14,440
Ground floor .....	5,680	3,720
First floor .....	5,763	3,768
Second floor .....	5,763	3,768
Third floor .....	5,580	3,695
Fourth floor .....	.....	9,275
Fifth floor .....	.....	9,275
Total number of superficial feet.....	22,786	47,941

NOTE.—The lavatories, corridors, staircases, lifts, ventilating shafts, &c., are not included in the above superficial areas.

By resolution of the Legislative Assembly on 22nd December last, it was decided to refer this matter to the Parliamentary Standing Committee for investigation and report.

THURSDAY, 9 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq., CHAIRMAN.

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and further examined:—

R. R. P.  
Hickson.

2. *Chairman.*] In your statement before the Committee in reference to the proposed Public Offices now under consideration you said:

9 Feb., 1899.

The initiation of this scheme arose from the Government Architect receiving instructions to ascertain if it were possible, or not, to accommodate the Department of Mines and Agriculture in either the Public Works or the Lands buildings. As a temporary result, that portion of the Department of Mines and Agriculture which was occupying rented premises in Lincoln's Inn Chambers was brought down to the Lands Office building, leaving a number of branches still scattered about the city.

How many branches are scattered about the city? I could not tell you the number.

3. Do you know whether any of them are in rented premises? They were when that was written, and they are still, I think. Mr. Vernon can give you all these particulars; he was chairman of the Board which dealt with this matter.

4. Can you tell me whether any public inconvenience has been felt by the association of the Mines Department and the Lands Department in the same building? I believe so. I believe the Lands people there will tell you there has been a good deal of inconvenience. Personally, I do not know.

5. In this scheme it is proposed to apportion something over two-thirds of the building to the Department of Mines and Agriculture? Yes.

6. And there is also a museum in connection with that Department;—can you point out to the Committee where this is to be placed—in what part of the building? These are particulars which Mr. Vernon would be better able to place.

7. Can you tell the Committee the amount of accommodation which the Mines Department now have? I have not the information available at this moment.
8. Do you know the building occupied by the Education Department? Yes.
9. Has there been any great complaint with reference to the accommodation there? Yes, a great deal.
10. Could you state generally what is the nature of the complaint? The rooms are too small, and are inconveniently situated, besides which the building does not accommodate anything like the whole Department. A great many of the offices are in separate buildings.
11. Occupying rented premises? Yes.
12. Have you been supplied with a statement giving you that information? Yes.
13. Have you got it with you? No. Mr. Vernon will give you that information.
14. Do you know what it is proposed to do with the old building at present occupied by the Education Department? Nothing is definitely settled; but I am a very strong advocate for doing away with it altogether, and turning the space into a little park.
15. Is there a great necessity for more parks about Sydney? Well, this is a building you cannot do anything with, except at great expense. It cannot be made suitable for any Department, and it would be much better to take it down altogether, and make a little square park between the big Lands Office and this new building, if it goes up.
16. Then you are of opinion that the building at present occupied by the Education Department could not be utilised by any other Department? I would not say it could not be utilised; but it would be a very inconvenient building.
17. You know that before the Education Department started the whole business of the Lands Department was conducted there? I believe the whole business of the Colony was done there once—except the Post Office.
18. But was it not used by the Lands Department not so very many years ago? I do not know when it was done.
19. You do not know when the Lands Department vacated that building? No; not in my time.
20. I suppose the general tendency now is to house people in more magnificent places than used to be the custom in the old times? I do not know that I would put it that way. The Colony is growing, and the Service is growing with it, and you want more accommodation.
21. Would you prefer pulling down the present Education building, and turning the ground into a park, rather than place some small or sub-department in the present building? I would, because I think it is a most unsuitable building. I know it pretty well. I know nearly every room in it, and it is most unsuitable for public offices. There could not be a more unsuitable building.
22. *Dr. Garran.*] I see you have given part of the building to one Department, and part to the other? Yes.
23. Is it more convenient to adopt that plan than to give the two Departments separate floors? I might say that the details of the proposed building were decided upon by a Board consisting of officers from the various Departments, of which Board Mr. Vernon was Chairman, and I think that gentleman could give you all the detailed information much better than I could.
24. And as to the allotment of the rooms you could not say anything? No.
25. You have a frontage to this building nearly all round? We have frontages to three main streets, and a frontage to a lane.
26. The entire building, then, will be a frontage? Yes, with the exception of one small portion.
27. Will you abut actually on any private property? No.
28. Then you will have your own outer wall entirely? Yes.

R. R. P.  
Hickson.

9 Feb., 1899.

TUESDAY, 14 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Walter Liberty Vernon, Government Architect, sworn, and examined:—

29. *Chairman.*] Will you explain to the Committee the plans for the proposed building? I have the minutes of the Board which was specially appointed to prepare this scheme, and I think a considerable amount of light might, perhaps, be thrown on the original intentions if these minutes were placed as part of the evidence, as they embody the history of the transactions leading up to the preparation of the plans. I will read extracts from the minutes. The Board was appointed—

W. L. Vernon.  
14 Feb., 1899.

To inquire into the question of erecting new buildings on land resumed by the Government at the corner of Phillip and Young Streets, to accommodate the officers of the Mines and Agriculture and the Public Instruction Departments, and those employed under the Inspector-General of Police and the Comptroller-General of Prisons.

The members of the Board were:—

W. L. Vernon, Esq., Government Architect, Chairman; J. C. Maynard, Esq., Under Secretary for Public Instruction; E. Fosbery, Esq., Inspector-General of Police; F. Neitenstein, Esq., Comptroller-General of Prisons; E. F. Pitman, Esq., Government Geologist (Mines and Agriculture Department).

The first meeting of the Board was held on the 24th March.

Mr. Vernon stated that the members of the Board had been severally appointed by the heads of the respective Departments concerned, at the instigation of the Minister of Works, who had at the same time constituted the Government Architect as Chairman.

Discussion then arose as to the objects of the Board, when the Chairman fully set out the proposed scheme of accommodation. The matter, he explained, had first arisen by the Government Architect receiving instructions to see if it were possible to accommodate the Mines and Agriculture Department in either the Public Works or the Lands Office buildings,

W. L. Vernon. buildings, which resulted in the Mines and Agriculture Department being temporarily located in a portion of the Lands Office. Steps had at that time been taken to ascertain the exact amount of floor space required by each Department, the outcome being that the sum of £18,000 was placed on the Estimates and voted for the erection of permanent offices for the Mines and Agriculture Department on the vacant block of resumed land facing Phillip, Bridge, and Young Streets. At the same time a provision of £14,000 was also made for the erection of new offices for the Inspector-General of Police and the Comptroller-General of Prisons on the site of the present offices of the Inspector-General of Police. It was now considered that if possible, instead of the Mines and Agriculture Department only being placed on the vacant land in question some more land should be included in the proposed site, and accommodation should be found for the Inspector-General of Police, the Comptroller-General of Prisons, the Audit Office, the Public Service Board, and other Government offices at present occupying rented premises or Government property requiring rebuilding.

14 Feb., 1899.

I may say that the first site did not include those four houses in Young-street. This proposal does include them.

The two provisions of £18,000 and £14,000 to be lumped, making a total of £32,000 already provided, and the Minister for Works to give authority for the placing of a further sum of about £45,000 on the Estimates, as it was estimated that the necessary buildings complete would cost over £70,000; the value of the site of the present offices of the Inspector-General of Police to be placed to the credit of the scheme, as it would not then be required.

Mr. Fosbery said that, from the initiation of the scheme, he was opposed to it, and that his objections had already been verbally expressed to the Colonial Secretary and Mr. Hickson. He would like to state them fully to the members of the Board. They were:—

That the premises to be occupied as a head Police Station had to be of an exceptional description, and would require to be kept open day and night.

That space would have to be reserved for mustering men and horses in cases of emergency, which should not be done in a public or open space, where they would be under the observation of the public.

That the object of purchasing the site at present occupied was to get one which was central, which was not far from the public offices and from the Houses of Parliament, and which had the advantages of separate entrance from two streets.

There was also the fact that the persons who pervaded a police establishment were not such as it was desirable to have in a public office, nor would they go to it, and it was a decided disadvantage to have a central station, where telephones were going day and night, and which would always be lit up, in a general block of Government offices.

The only other Department he recommended the Government to combine with his was that of the Comptroller-General of Prisons, as it was working amongst the same class of the community, and was in accord with the Police Department.

The plans that had been prepared by the Government Architect for the new building on the present site were somewhat on the lines of the head Police Stations in London and other large centres.

Mr. Fosbery is there speaking of the Hunter-street site, the sketches for that building being then in existence.

And amongst other requirements provided were a photographic gallery and the necessary rooms, safes for officers to put valuable property taken from prisoners, and an assembly yard for mounted, foot, and special police.

Mr. Fosbery further stated that Mr. Neitenstein had also considered the matter, without in any way consulting him, and upon receiving his (Mr. Neitenstein's) opinions, which were forwarded by the Government, he found they traversed precisely the same ground as he had taken up, and that Mr. Neitenstein objected to be accommodated in the same building with numerous other Civil Departments.

He would like to mention that he originally recommended the purchase of the present site occupied by the Police Offices by the Government for the sum of £27,500; and that, notwithstanding the great depreciation in the value of properties, it was at present a fairly valuable site for the money.

On the grounds he had referred to he most strongly objected to become a nuisance to all the other public Departments his offices would be grouped with, and likewise to have them becoming a nuisance to him by his being hived in with them in a palatial building.

Mr. Neitenstein said his objections were very much the same as Mr. Fosbery's, although they had not spoken to each other, or had any communication whatever, on the subject.

He strongly objected to his Department being mixed up with any other of the Government Departments, except that of the Police, in the occupancy of a building. The joint occupation of the building with the Police Department would be a direct advantage, as the business both Departments had to conduct was on somewhat similar lines, and communication between the two offices on official matters was frequently necessary. He had a very objectionable lot of persons continually coming to see him, and they were of a class that it would be very undesirable to have about an ordinary public office for many reasons; and many of them might be prevented from coming if they thought too much publicity would be given to their visits, for in numerous cases they were the relatives and friends of prisoners. It was also essential that the head Prison Office should be centrally situated in comparatively close proximity to the Ministerial head and the other branches of the Justice Department.

A further objection, so far as his Department was concerned, lay in the fact that a special officer engaged during the night was continually getting messages by telegram from country gaols, and that telephones were constantly going transmitting messages.

The plans providing for central offices for the officers of the Inspector-General of Police and the Comptroller-General of Prisons, as prepared by the Government Architect, had been sent to him for approval, so far as the accommodation required by his Department was concerned; and he certainly thought the designs provided for all requirements, and, moreover, appeared to be on thoroughly economical lines.

Another argument he had against the proposed new building was the length of time that must elapse before it could be completed; for, in the meantime, the agreement with the lessor of the building his Department was at present occupying would terminate, it having only about eighteen months to run. That would make it absolutely necessary to enter into another agreement, which he especially desired to avoid, as the place was most unsuitable. Money had been specially voted on the Loan Estimates for the erection of the new building, and it would be quite practicable to proceed with it at once. Any other proposal would mean diverting the use of the £14,000 from the purpose for which it was voted.

Mr. Pittman thought that as Mr. Fosbery and Mr. Neitenstein had expressed such views the inquiry was practically ended.

The Chairman pointed out, however, that there were a number of other Departments holding rented premises, or Government premises, that must sooner or later come down, and that it was necessary the matter should be inquired into so far as they were concerned. He thought the better way would be to move some resolution relieving the two gentlemen mentioned from further attendance.

Those two gentlemen were then relieved from any further attendance on the Board, and at the next meeting—

The Chairman reported that he had forwarded a copy of the minutes of the previous meeting to the Minister for Works, recommending, as therein agreed, that the new offices proposed for the Inspector-General of Police and Comptroller-General of Prisons be not further considered in connection with this scheme, and stating that the certain other Departments for which accommodation was now to be included were not represented on the Board. The Minister had approved of the recommendation, and as regards additional representation, Mr. G. Brodie, Assistant Auditor-General, had been appointed as a member of the board by the Chief Secretary's Department, but was unable to be present at the meeting on account of absence from the city.

Then the minutes go on to refer to the rentals paid by the Departments.

The Chairman explained that, as accurately as could be ascertained, the rentals for private buildings occupied as public offices amounted to £1,731 per annum. This comprised 127 offices; and there were sixty-three offices in scattered buildings the property of the Government, including Richmond Terrace, Young Terrace, Public Instruction Offices, Young-street, and such like.

Mr.

Mr. Pittman pointed out that the removal of the Mines Department from the Lands Office building would leave a large amount of vacant space which would accommodate a large number of small departments. W. L. Vernon.

The Chairman thought it would be well, now that the offices of the Inspector-General of Police and Comptroller-General of Prisons had not to be provided for, if the Board went back to the first principles of the scheme, and took the respective Departments seriatim. 14 Feb., 1899.

The Board then resolved upon certain information being asked from the following Departments:—Department of Audit, Public Service Board, Department of Public Instruction (including Inspectors, Chief Clerk of Works, Cashier, &c.), Mines and Agricultural Department (including Stock and Brands Branch), Railway Commissioners (Tramway Manager, Medical Officer, and Electrical Engineer), Government Statistician, Registrar of Friendly Societies, Electoral Registrar, Charitable Institutions, Medical Board, Pharmacy Board, and Fisheries Commissioners. On the recommendation of the Board, those Departments were all written to, and asked to send in a return as to the accommodation they were occupying, and what they would require. Upon receipt of those returns, an interim minute was addressed to the Board by myself, showing the impossibility of accommodating such a large number of Departments and sub-departments in one building on this site, the total amount of floor-space required by these Departments being 104,000 superficial feet. Then the minutes go on to show that it was necessary to reduce the number of Departments to be considered in reference to this site, and one after another was omitted. Two of them—the Auditor-General's Department and the Public Service Board—were transferred to the scheme in connection with the Police and the Prisons Departments; and with regard to the remainder, occupying rented premises, or premises to be some day taken down, it was considered that they could be accommodated in the vacant offices at the Lands Office, after the Mines Department had been moved to the new building. The building, therefore, was reduced, until it came within practicable limits, so as to include only the Education Department and the Mines Department. It is upon these minutes, which were referred to the Minister from time to time, that the present scheme has been prepared. First of all, it was intended to bring the Police Department and the Prisons Department from the other side, and bring their money with them, and place it in this scheme. Then it was found that objections were raised by the Police Department and the Prisons Department against going into such a general building, and they were sent back to their original site. Then the attempt to include all the Departments requiring housing was found to be so unweildy, that the scheme had to be reduced again to the two Departments of Mines and Education, both of which are in need of a proper house. Then the Minister made a statement in the House, with a view to a reference to this Committee, and the Under Secretary for Public Works submitted a further statement to the Committee in his evidence the other day. I hand in a statement, which I have made to date, although it is not complete, for it is almost impossible to get it complete, of the area at present occupied by a number of Departments—those Departments interested in the scheme, either directly or indirectly. The statement gives the further space they require, the number of officers to be accommodated, and in some cases, the number of rooms asked for.

30. According to the minutes just read, you stated that the Government was now renting private buildings, for which it was paying £1,731 per annum? Yes; that is only in connection with the Departments affected by the scheme.

31. The whole of that amount, then, would be saved if this proposal were adopted? That is so.

32. Will you explain by reference to the plans where you propose to house the different Departments? The whole of the ground available is covered altogether by the buildings, except a 6-feet passage at the end of the premises now standing in Phillip-street. That has been reserved in order that there should be complete access all round the four sides of the building. The plans show two distinct colours. The portion coloured yellow is that proposed to be devoted to the Mines and Agriculture Department, and the portion coloured blue represents the part to be devoted to the Education Department. On the basement the whole of the building has been thrown as much as possible into one large room in order to provide accommodation for the Technological Museum, so that the exhibits now in the Domain may be taken out of that building, and the building removed altogether. The principal instruction from the Mines Department was that we should give the Museum as good light as it now has in the Domain, and I am quite prepared to show that in all cases we have an admirable and true light for every exhibit we can possibly have in the place. The net area is about 14,500 feet, which will give a Museum of a very considerable extent. The present Museum in the Domain covers something like 16,000 feet, but it is not arranged in the most economical way, and by better classification, and more compact arrangement, this site will really go further than the one in the Domain.

33. *Mr. Watson.*] Do you know whether the timber exhibits belonging to the Lands Department are now in the Technological Museum in the Domain? I think they are.

34. You think it possible to find room in the basement of the proposed building for all the exhibits now contained in the building in the Domain? We propose to find room for the whole of them.

35. But the timber exhibits belong to the Lands Department, which has taken over the Forestry Branch? I was not aware of that.

36. Still, the timber exhibits are now in the building in the Domain, and you say you can find room in the basement of this building for all that is at present contained in the Museum in the Domain? Yes. It will be seen from the plan that the slope of the ground which is fairly rapid in Phillip-street down to Bridge-street, enables the basement to be entered almost on the level from the central principal entrance, and the whole basement is practically a ground-floor; so that people visiting the museum can do so without any interference with the officials on the upper floors of the building.

37. *Chairman.*] You excavate up to Phillip-street? I excavate, but I have kept the building back 6 feet from the pavement line in order to keep the road as wide as possible, and to prevent rather an ugly jutting out beyond the adjoining buildings. By this means we get a large amount of light in the basement. There will be, therefore, an open light area along the western front of the building. It answers two or three good purposes. The southern portion of the Museum is lighted entirely from the roof.

38. *Mr. Watson.*] Covering practically what is a court-yard? It covers practically a court-yard.

39. *Dr. Garran.*] Have you counted the lifts and strong-rooms placed in that area? I have not taken in the lift spaces.

40. They would not be available? No.

41. *Chairman.*] They will be so constructed that they can be used? All these have spaces which can be covered, or they can even be used for open exhibits.

- W.L. Vernon. 42. Will the lifts come right down to the basement? Yes; in the case of the Mines and Agriculture Department, but not in the case of the Education Department. Although there is a sunk hole there is no occasion to take the lift down in the latter case. The basement also provides a special dock for backing drays and carts in the back lane when it is required to send in heavy exhibits, such as timber or heavy mineral exhibits. These will be lowered from the level of the road on the southern side into a dock, from which they can be distributed. If necessary, the cart itself could be lowered by a hydraulic platform, so as not to damage the exhibits more than possible. There is a small lavatory on the ground-floor for the use of the public in connection with the museum, and a light area, which is more a ventilation area than a light area, and there is also room for a ventilating plant—special provision for an electric plant. On the ground-floor the main entrance is at the upper corner of the ground, and that is the entrance to the Education Department. That also, having one or two steps, leads into a simple lobby, so that the two Departments are exactly alike in that respect; although on different floors, they have precisely similar entrances. The portion coloured blue is a portion of that floor for the Education Department, leaving the yellow portion for the other Department, for which the ground floor becomes a first floor. The rooms, for economy's sake, are placed on either side of the corridor. The corridor runs through the entire centre of the building, and it is connected across the back area shown on the plan by a flying corridor until it joins the eastern and western corridors. The lavatories are placed on this back flying corridor. They have the advantage of outside ventilation, and cross ventilation, and they are sufficiently convenient to the offices, and yet are well stowed away, so as not to be objectionable. Owing to the height of the floor, it is proposed to have intermediate closets to the extent that is necessary. The general rule in Government offices is to have one closet for every ten officers, and one or two over for special cases.
- 14 Feb., 1899. 43. Have you been supplied by the various Departments with the names of the officers whom they would locate in the large room shown on the plan;—were those large rooms designed for a special purpose? No. When first preparing rough sketches of these plans I grouped together special branches, which I placed in their right positions towards each other on their respective floors, and in spaces where the accommodation would be sufficient for them. This plan is really based on that sketch, although the rooms are not absolutely named.
44. *Mr. Watson.*] They are not subdivided? They are not subdivided. I have always urged the avoidance of subdivision as much as possible. I consider that I fully supply the requirements of the Education Department, if I give them the total area they require. In fact, they would rather be supplied in that way, than that I should dictate to them where they should put this man, and where they should put that man.
45. But apart from the placing of a man in a particular place, there is the question of their employment; for instance, a draftsman requires more than an ordinary amount of room;—does the Education Department employ many draftsmen? It employs some. We provide for them up on the third floor. That has all been worked out in the rough, but has not been produced on this plan.
46. The Departments make the subdivision themselves? Yes.
47. *Chairman.*] They can easily put up partitions in these rooms? Yes.
48. What is the size of the large room shown on the plan? It contains an area of 2,432 feet, or 105 ft. by 24 ft.
49. That is for the Education Department? Yes. That room on all the floors is really the largest of the whole lot.
50. How many draftsmen would it find space for? It would take twenty draftsmen.
51. Does the Education Department employ twenty draftsmen? No; not so many as that. I have placed the draftsmen on the third floor.
52. *Mr. Shepherd.*] These long rooms are all capable of subdivision, if necessary? Yes.
53. *Chairman.*] Will you point out which would be the Minister's room? On the first-floor plan. The Minister's room is placed overlooking Bridge-street. In the sketch plan it has been subdivided, giving room for the Minister, with an ante-room and also a room for the Under Secretary, and also at the back a waiting-room, and possibly room for a type-writer or clerk. It is the same in the case of the room for the Minister for Mines. There is a partition crossing the building, dividing the front between the two Ministerial rooms, and there is a door in the partition supposed to be kept locked; it is placed there to give access to the caretaker in case of fire or other necessity.
54. *Dr. Garran.*] The subdivision of the Minister's room must be guided by the windows? That is true in each case. When you get higher up the building each staircase is faced by the lift, so that passengers have a handy way of getting up and down the floors beside the staircase, and there is a messenger stationed close by. The space that cannot be lighted owing to the nature of the site, unless too large a space were taken away, is devoted to strong-rooms on every floor all the way up.
55. *Mr. Watson.*] You do not propose lighting the strong-rooms at all? I propose to light them by electricity; they do not want an outside light.
56. *Dr. Garran.*] The subdivision of the rooms you propose to make will be of the light character you described the other day? I propose to construct all necessary divisions in terra cotta lumber.
57. Have you any ties across the building? It is tied in steel framing right through on every floor. After reaching the third floor the Education Department is fully provided for, so that on the fourth floor and the fifth floor the whole of the area of the building is devoted to the Department of Mines and Agriculture. On the fifth floor are the laboratories and experimental rooms, geological rooms, and rooms of a character which require good light and absence of noise and dust. I have here draft plans showing the different uses to which it is proposed to put the rooms. The Committee will get some idea from one plan taken haphazard. You will see that the names are marked in pencil.
58. Could you divide that large room containing 1,508 square feet into one room of 600 feet to the Minister, a room 400 feet for the Under Secretary, an ante-room of 200 feet, and a waiting-room of 300 feet? I should put the waiting-room at the back of the corridor.
59. What is your idea of the subdivision of the large front room shown on the plan, which gives you a space of 1,508 square feet to dispose of? I could bring you a plan showing the subdivision.
60. I only wanted to know what you had in your mind's eye? The Minister's room would be about square.
61. About 600 feet? It would be hardly 600 feet, and there would be a room for the Under Secretary, and an ante-room for the Minister, including his lavatory.

62. And what would be the size of the waiting-room? Eighteen feet long, and probably about 10 feet wide. W. L. Vernon.
63. *Chairman.*] You propose to give the Public Instruction Department 22,786 feet? Yes.
64. And, according to their statement, they are now occupying a space of 9,356 feet? Yes. 14 Feb., 1899.
65. That is a very great expansion? Yes; it is to accommodate the whole of the Department.
66. They have said they require the whole of that space? Yes; that is their statement. They did really ask for more.
67. That is more than twice as much as they are now occupying? Yes. Their present premises are altogether inadequate.
68. They seem to get through their work all right there? Mr. Maynard can give you evidence on that point better than I can. The proposal is to develop the control and administration of the country work a great deal more than they have hitherto done; to provide proper libraries in which to store the books, rooms for interviewing country schoolmasters, rooms for examination, and for many other purposes. In regard to the accommodation at present occupied by the Public Instruction Department, there must be some mistake in the figures just given, for I find here, in a return, that the accommodation at present is 13,608 feet. Possibly in the previous figures I omitted the rented buildings.
69. Do you know the building occupied by the cashier's branch of the Education Department in Young-street? They have two outside offices.
70. Have you any idea whether those buildings would account for the difference? I think not sufficiently. A clerical error must have crept into the statement. The Education Department now occupies the old Colonial Secretary's Office. It also rents properties in Macquarie-street and Elizabeth-street; it occupies 42 Young-street, which is Government property, and it rents 46 Young-street and 54 Young-street. So that, no doubt, the accommodation at present occupied is fully 13,608 feet.
71. Would the floor-space in the old Colonial Secretary's Office amount to 9,356 feet? I have not now with me the details with regard to that Department.
72. In the statement handed in by Mr. Hickson, the minimum accommodation required by the Mines and Agriculture Department is given at 45,777 feet, and the amount provided at 47,941 feet. In the return furnished, showing the area now occupied, the figures are 39,135 feet, and the space required 51,227 feet. Therefore, they required over 3,000 feet more space than you have provided? That is so; but when that return was prepared the requirements sent in were of a more liberal character than those to which the space was afterwards obliged to be reduced. The minutes of the Board from which I quoted would show that it was constantly found necessary to reduce the space asked for. The space they required, according to their first statement, was ultimately brought down to 47,941 feet.
73. Have you had any means of ascertaining whether their demands are, or are not extravagant? In one or two cases, I thought the demand was extravagant, and I pointed those cases out, and we cut those down ruthlessly. In one case, in particular, the chemist, Mr. Guthrie, asked for 4,400 feet, besides 225 feet for himself. We cut that down very considerably. The fact is, Mr. Guthrie had been used to the old Naval stores, where he had plenty of room to carry on his work, although it was a dilapidated building, and I suppose this had enlarged his ideas as to what he would require in the new building. I am only giving this as one instance where we found the officers were asking in excess of what could possibly be provided.
74. What did you cut that down to? I cut that down at the most, including a laboratory for the viticulturist, to 2,665 feet.
75. *Mr. Watson.*] That is a different branch? Yes; but it was proposed to put them all on the principal floor.
76. So you included another branch with him? Yes.
77. And you gave him half of what he asked for? Yes. Even after the cutting down the total area came to 47,941 feet.
78. *Chairman.*] You were with us the other day when we inspected the various offices;—did it strike you that any of them were unduly crowded? Yes, several; but they were as much overcrowded with furniture as they were with officers.
79. Did it not strike you that it was more want of method or system in respect of the furniture about the place that caused them to be overcrowded? It certainly struck me so in two cases in particular. There were large rooms where a large amount of space was no doubt lost by the use of cumbersome furniture. There is no doubt that all that class of furniture is obsolete. Clerical officers who are doing similar work day after day should be placed at long desks, at which they can either sit or stand. Make them as comfortable as possible, but let the desks be continuous, and do away absolutely with all these pigeon-holes.
80. *Mr. Watson.*] Have room for their books underneath? Yes.
81. *Chairman.*] If you did away with the present furniture in those rooms occupied by the Lands Department and the Mines Department, and substituted furniture more up to date, you could save a lot of room, could you not? You could save some room no doubt.
82. Suppose you put two desks between two officers facing each other with racks to put the papers on? We have that in the Works Department. A scheme was proposed some time ago to do it thoroughly in the Works Department, but it was not fully carried out.
83. Suppose that aspect of the case were now considered, and suppose a thorough examination of the whole of the present offices were made, bearing this point in mind, that they should economise the space as much as possible by adopting a more up-to-date kind of desk—do you not think it would be possible to do without this new building altogether? No; I do not think so.
84. You still think it would have to be put up? I am sure you would have to do something, especially to provide for the future.
85. They complain of overcrowding—that is the principal complaint, is it not? Yes; they are overcrowded, and there is also a want of arrangement. The new scheme will give opportunities for more economical control and better administration. I consider that at present the Mines Department is worked at considerable disadvantage to itself. Its rooms are not placed where they should be, but placed where they could be got. It makes a great deal of difference in administration.
86. We generally found that where an officer was supposed to be in charge of a particular branch, he was stuck away by himself;—how could he have proper control of those under him, if he were out of the room altogether? I think there is, and always should be, a head in the room who has control of the room itself.

What

W. L. Vernon. What he very often does is to partition himself off from the rest, and he is practically shut out. Then the man under him partitions himself and he is shut out, and they carry it on until almost the office-boy has a place for himself. It is an absolute mistake to do that sort of thing.

14 Feb., 1899.

87. *Dr. Garran.*] You have divided this block of buildings perpendicularly between the two Departments? That is so.

88. For the practical working of a Department would you rather have several storeys, or put all your men, on, say, two flats? If I were considering one Department only I should put them on flats. But if I have to consider two Departments, and the requirements of both Departments being equal, I must provide them relatively with the same accommodation.

89. Suppose you have the whole thing before you to do as you like, would you give two entire floors to the Department of Mines and Agriculture, and two entire floors to the Department of Education, or divide them as you have done, according to this plan—that is, horizontally or perpendicularly? I do not think it is necessary to give them the full sweep of the whole range of offices, because the building is so extensive that half of it is really a fine floor in itself.

90. But if the different officers have to communicate with one another, can they not do so more easily on the same floor than if they have to go running up and down stairs? They can do it more easily up to a certain extent; but the floor may be so large that it is shorter to take the lift on to an adjoining floor than to walk along a long corridor to find a particular office.

91. You considered that point, I suppose? I think the plan from that point of view is as economical as it can possibly be, although it is true that in the principal floors we have provided for the officers of the Mines Department travelling the whole way round; but this was required by the necessities of the plan.

92. They want so much more room? Yes.

93. Could you tell me from the documents handed in how many rooms the Pharmacy Board require? Two offices and a board-room. The Pharmacy Board want an experimental lavatory for examination purposes.

94. And the Electoral Office wants two rooms for four officers? Yes.

95. If we have space in the other building we are considering, in which the Public Service Board, Auditor-General, Inspector-General of Police, and Comptroller-General of Prisons are to be accommodated, we could accommodate the Electoral Office? That is so, all things being suitable.

96. Is there any reason why the Electoral Office should be in any other public building? It is under the Colonial Secretary, and, of course, should be as near the Colonial Secretary's Office as possible. At present it is in the Colonial Secretary's Office.

97. It might be inconvenient to take it away? It might.

98. *Mr. Watson.*] Is it the Electoral Registrar who issues electoral rights or the Electoral Officer, the administrative head of the Department, who is being provided for? It is the branch which now occupies the large room at the Colonial Secretary's Office.

99. Is there no room in the building where this officer now is? Yes; but he is occupying too good a room. It is the room used for conferences.

100. *Dr. Garran.*] I see you have not imitated the Chief Secretary's Office in having deep balconies? No; the ground would not afford space for it.

101. I was going to ask you whether that was because you were pinched for room, or whether you thought it would take away the light too much? Well, it does both. Although there is a great deal to be said in favour of recessed colonnades for architectural effect, we can only indulge in those now and then.

102. You have endeavoured to gain that effect by the arrangement in the present plan? At the corner there is a recess to some little extent. It is just sufficient for a person to stand outside between the window and the balcony.

103. You have the architectural effect, but you have not the walking space? I have tried to get that effect.

104. And you do not interfere with the light there? Not at all.

105. You give a separate lift to each Department, a separate entrance entirely, and a separate set of strong-rooms? Yes, and a separate set of lavatories.

106. They are as detached as if they were in separate houses? Quite so.

107. Will the court-yard be large enough to throw a good light into the windows that look on to it? Yes; it is 56 feet one way and an average of 50 feet the other way. Then the outside wall on the southern side is pierced with openings the whole way up, so that practically it is, to some extent, an open side.

108. You have a strong wall there with no rooms going off it, but you cannot help that? No rooms, only a corridor. In the southern elevation that is kept down as much as possible so as not to obstruct the angle of light.

109. It is not so thick a wall as the wall round the building? It only has to carry itself, and is not stronger than is necessary for that purpose.

110. What is the depth of your front room facing Bridge-street from the front wall to the inside or corridor wall? Twenty-three feet 6 inches.

111. Then you could give the Minister a room 23 feet 6 inches square? Yes.

112. Then there would be ample space for his Under Secretary, and his ante-room;—in so sub-dividing that large room into three you are liberal? Yes; it may be noticed that the same room for the Mines Department is not so large. That is considered large enough for the purposes, and therefore there may be a small room to spare for other purposes in connection with the Education Department.

113. You could take off a small room? I could take off a small room there, and yet the room would be the same size as that for the Mines Department.

114. What is the square feet area of the waiting-room at the back? That could be divided into other rooms besides a waiting-room.

115. You gave it all up for a waiting-room? No; I said a waiting-room about 10 feet wide could be cut off, and the remainder used for clerical purposes in connection with the Minister's room.

116. It might do for a type-writer? Something of that sort.

117. You could subdivide that into two—have two windows? Three windows if necessary.

118. You could divide it into three narrow rooms? Yes, if necessary.

119. The details as to the allotment of the offices would come best from the Under-Secretary, I presume? Yes, I should think so.

120. He has considered, I suppose, what he is going to do with his staff? I presume so; I have a detailed W.L. Vernon.  
statement.
121. Has he gone over it with you? Not personally. The statement is from the Mines Department, 14 Feb., 1899.  
showing the accommodation they want in detail.
122. What are you going to make the wall of your strong-rooms of? Brick in cement.
123. How thick? They vary, according to the height from the ground.
124. Suppose the rest of the building were to fall, would that part stand as a tower? Yes; I think it would.
125. *Mr. Watson.*] Why should it do so? Because, owing to the peculiar shape of the site, an oval-shaped staircase is necessary, and this necessitates considerable buttressing in the walls themselves, so that the two angles of the building are extremely strong. They are more than usually strong.
126. Are they bound crosswise by girders, between the two sets of rooms? Yes; the girders cross in all directions.
127. *Dr. Garran.*] Is the strong-room tied? It is tied with fireproof floors.
128. Are there no girders? Yes; there are steel girders.
129. If there happened to be a fire, would the staircase fall, or would it affect the working of the lift—they are pretty close together? Well, it would; but the staircase contains no inflammable material. No smoke could arise from the staircase, except what might come from elsewhere.
130. And the same with the lift? Yes.
131. There is nothing inflammable? Nothing at all.
132. Except the wooden cage itself? Yes; and that need not be inflammable.
133. You say that you are going to have a locked door between the two Departments in case of fire? Yes.
134. Could it be unlocked in a hurry, suppose the lift and the staircase in the Mines Department were both unusable? I should put a safety lock on that could be opened by a strong push from the shoulder.
135. If both the lift and the staircase in the Mines Department were not available, there would be no way down unless you could get into the other Department? Yes; but this would also act as a fire check.
136. Quite so, but it would be a glass door? No; I think I should make it of sheet-iron.
137. That would shut out the light? I can do without that.
138. Will those corridors be sufficiently lighted? Yes.
139. Are you trusting to the fanlights over the doors for part of the light? No; I am trusting to these very large windows, which strike in at the angles and at the end of the corridors. There is a light area there to.
140. You have light at the end of each corridor, and light at the angle opposite the staircase? That is so.
141. And some light from the fanlights? Yes.
142. You think that will be more light than is given at the Lands Office, for instance? It will be more than is given in the southern corridor—much more; but not so much as in the two side corridors.
143. But it will be a fairly well-lighted corridor? Oh, yes.
144. You will be able to see to read the name on each door? Yes; very easily.
145. What is your object in that southern light area shown on the plan; did you want it particularly there? Yes; I wanted it for two purposes—one to help the corridor and the other to get a through ventilation across the lavatories.
146. *Mr. Trickett.*] I should like to take you back to the basement again. What would be the height of the museum? Twenty feet; but I can get a greater height, if it is wanted, in the centre portion under the area.
147. So that you will have ample height? Yes.
148. The open air-space will be covered over in the museum? That is so.
149. So that, in addition to the light from the surrounding windows—which you seem to be rather doubtful about—you will also have a skylight in the middle? That is so. The museum windows are as large as the design would possibly admit. They are lofty; they go on an iron grill in front right down to the pavement, and have an uninterrupted light, besides being on the light side of the building.
150. But the light on the eastern side would appear to be a little doubtful, would it not? There is no doubt it is blocked to some extent.
151. What is the floor space to be occupied by the museum? It will cover 14,442 superficial feet. The building itself has a frontage of 178 feet to Bridge-street. The thickness of the walls taken out of that would probably reduce the length of the museum to 170 feet, while the average width would be about 104 feet.
152. Is there any room with which you could compare it? It is a great width; I do not know of any other room of the same size. The Town Hall, I think is about 100 feet wide, but of course a great deal longer.
153. This will be a very large room? Yes; a very fine room indeed; it takes the whole area of the site.
154. You laid great stress on the point that, although called a basement, this is really hardly a basement? I contend that it is not a basement.
155. It is really a ground floor? Yes.
156. It will not suffer from want of light; and I suppose, by reason of its being below the ground on the Phillip-street side, there will be no dampness, or anything likely to injure the exhibits? We should have to take precautions with regard to the eastern wall. The area will help one portion of it, but in regard to the portions which will come against the excavation we must provide some protection by means of false walls or hollow spaces, and by using asphalt.
157. That part of a building is rather an unusual position for a museum, is it not? Not altogether. The Jermyn-street School of Mines is on the ground-floor. It has galleries certainly, but it covers the whole of the ground-floor.
158. You are quite satisfied that this room will be suitable in every way for the purpose? I feel confident about it.
159. Will you give us the dimensions of the strong-rooms you propose to erect for the Mines Department? There are six strong-rooms 120 feet each—averaging 12 by 10 feet.
160. Judging by what we gathered from Mr. McLachlan the other day, and also by personal observation in the Mines Department, it would seem that a strong-room somewhat similar to that at the Lands Office

W. L. Vernon.

14 Feb., 1899.

would be more suitable at the Mines Department—do you not think so? The Mines Department do not keep such valuable records as do the Lands Department. The records in the Lands Department relating to monetary transactions must be kept with perfect security, while the records of the Mines Department chiefly consist of papers dealing with subjects which perhaps are forgotten in six months. The mineral leases probably would require a strong-room, but the ordinary papers of the Mines and Agriculture Department would not require more security than would be given by a fire-proof building. There should be discrimination of course as to what should be put in the strong-room, and what should be put in a fire-proof office. Of course, I should get evidence on that point from the Under Secretary.

161. But it occurred to me that in a new building of this kind where one strong-room is to be above the other, the strong-room might be made something of the complete character of that in the Lands Office, although, perhaps not so capacious, communication being given by a winding stairs right up? It could only be done at such a sacrifice of space that we would not find room for the accommodation of the officials.

162. It would not be necessary to have a strong-room anything like as large as that at the Lands Office; The size in the plan is 12 x 10. Suppose it were a room 15 feet square with a spiral staircase, my idea is that it could be concentrated and approached from floor to floor by a series of little platforms, by means of which the officials on each floor could reach the strong-room and have access to the records? It is quite possible to do it, and it is only a question of shifting the enclosing walls further out in each case; and that really depends on the requirements of the Departments when one comes to work the details out. The principle of the thing is there; it can be increased or decreased.

163. If the Under Secretary were to say that that would be a desirable state of things, you could easily arrange it? Easily; there is nothing at all arbitrary in the position of these walls.

164. Would that be a very extensive item;—suppose you made a kind of circular vault? It would practically make no difference, because the provision is already made for strong-rooms and for strong-room doors and floors.

165. It would not be any more expensive? No.

166. In regard to the chemical branch of the Mines Department, are there not many places for the treatment and analysis of ores and minerals in various parts of the city, and also up the line? At Clyde they have an establishment. Those in the city are all supposed to be brought to this building.

167. What is the distinction between what is done in Sydney and what is done at these larger places? There is a geological branch, which consists of the Government Geologist, the curator, assistant curator, draftsmen, clerk, palæontologist, four geological surveyors, and a librarian.

168. Are they all to be accommodated in these new buildings? They are to be accommodated on the top floor. Then there is the helio printing; that will also be on the top floor. Then there are rooms in connection with the museum for a carpenter, lapidary cutter, curator, palæontologist and assistant, and a number of officials of that character. These would be accommodated on the top floor, and have their workshops there. Then there is a pathologist, who is at present in the Colonial Secretary's office, and his three artists. These are all to be accommodated on the top floor; also the entomologist and a chemist, Mr. Guthrie, with his clerk and his laboratory. Then there is the *Agricultural Gazette*, whose staff might very well be placed on the top floor. Then the charting staff will go up there, comprising twenty draftsmen and one chief draftsman.

169. That will be on the fourth floor? It might be on the fifth. It is really to be left to the Department to decide the matter itself.

170. Therefore, with the exception of the Clyde establishment, which is for the treatment of ore in bulk, all the scientific branches of the Mines and Agriculture Department will be located in this building? That is so.

171. When we were at the Lands Office the other day, we saw that, though the system of building large rooms had been adopted by the construction of one or two very fine rooms, yet these had been subdivided by cedar partitions—was that your idea? No. We certainly put the partitions up at the request of the Lands Department and the Mines Department.

172. In your opinion, has not this practice of partitioning the rooms interfered with the original intention of having a large air-space, to be of advantage to the clerks generally? Certainly. I am constantly drawing attention, when matters of that kind come in, to the desirability of leaving the rooms alone.

173. Must not anyone visiting these places be also struck with the quantity of wooden partitions and wooden furniture—pigeon-holes and so on—which must be a great peril in case of fire? Certainly. I think it is not only a case of peril from fire, but I think the multiplication of pigeon-holes increases the delays in carrying on the Government work. I think it is a great cause of delay in dealing with papers—pigeon-holes. People put their papers in the pigeon-holes, and think they are done with.

174. In the conferences which took place between the leading officials as to these new buildings, did the question arise as to whether a museum for the purposes of the Lands and the Mines and Agriculture Departments could not be included in one large room? No; that question never cropped up. I think at that time the Forests must have been with the Mines.

175. Do you know whether the Lands Department requires a museum as well as the Mines and Agriculture Department? I do not know, but it is very desirable that there should be some means of displaying the woods of the Colony in connection with the Forestry Department.

176. Would there be space enough in this building to have timber exhibits in the basement? Yes; because we propose to bring the timber exhibits down from the Technological Museum in the Domain.

177. Does it not occur to you, not merely as an architect, but as a member of the Board, that the exhibits of the Mines and Agriculture Department and of the Lands Department, being very much similar in character, it would be desirable that they should be put together? It would be a very good thing indeed.

178. And you think there would be ample space for the two in this building? Yes.

179. There would be a saving in administration, as only one caretaker or attendant would be required instead of two? That is so. The Government Geologist, who was a member of the Board, urged as a special plea for the bringing of the Museum into the main building, that he should be placed in close touch with the office generally, and so every effort was made to get it there.

180. A museum of this kind would not only be of local advantage, but people from other countries desiring information as to our woods and minerals and other products would not only be able to get the information

information from the Department, but would be able to go to the museum and see the very articles they W. L. Vernon contemplated buying? Yes, that is the idea.

181. In the inquiry that was held were the Board thoroughly satisfied that the best arrangement which could be suggested was the amalgamation of the two Departments in one building—the Mines and Agriculture Department and the Education Department—having regard to all the necessities of the case? We found, after exhausting the subject, that these two Departments would best fit into a building on this site, and as both of them were looking for a new home, it was thought better to throw the smaller Departments over, and deal with these two only.

182. There is a list of the Departments which it was contemplated originally to put into the building, but it was found that a building to accommodate all those Departments would be too cumbersome and too large? That is so.

183. I have looked through the administrative arrangements of the various departments, and there seem to be a great many Departments which are housed outside the Government buildings, or are separated one from the other; there is the Aborigines Protection Board;—is that on your list? No.

184. The Government Statistician? Yes.

185. Registrar of Friendly Societies? Yes.

186. Fisheries Commission? Yes.

187. Trustees of National Park? No.

188. State Children's Relief Department? No, unless it comes under Charitable Institutions.

189. Electoral Office? That is in the list.

190. The Navigation Acts? No; that is in the Customs.

191. Payment of Imperial pensions and allowances, and payment of Colonial pensions and allowances? That is in the Treasury.

192. Coroner's Office—that is a building by itself in Macquarie-street? Yes.

193. Gaols and Penal Establishments—that is under the control of the Attorney-General? Yes.

194. I have quoted these instances with a view to ask whether in the course of your inquiry you took this into consideration, that when you are going to clear out the officers from the Public Instruction Department, which is a building of considerable size, instead of pulling down a building which has had a great deal of money spent upon it, and which recently has been somewhat modernised—whether all these other smaller Departments which you found too numerous to be accommodated in one building, could not be put into the building now occupied by the Public Instruction Department? There is no doubt they could be placed there to some extent; but the scheme so far as it was discussed, had in view the placing of some of those officers in the Lands Office and the removal altogether of the old Education building.

195. That would be very well if the Lands Office could accommodate them all. But now that we are dealing with these questions largely from an economic point of view, it would seem a mistake to pull the Education building down, and go on renting premises, when that building is quite as convenient, and more convenient than the offices for which we are paying rent? I do not think it would be necessary to pay any rental except in the case of the Post Office, and possibly in the Justice Department for a short time. As regards the Departments interested in this scheme, I think every rental will cease.

196. I did not gather from the *precis* which was read that all the Departments not provided for in the new building, but which will be partly provided for in the Lands Office, would be sufficiently housed without keeping on the rented buildings? I think you may take it as a fact that they can be.

197. After building this new building you could pull down the Education building, and then house every Government Department without the necessity of paying any rent? That would be the result. The total rental paid by the Government, so far as I can ascertain from the different Departments in Sydney, amounts to £7,043 per annum. But a great deal of that is paid by the Post and Telegraph Department; they pay upwards of £4,754.

198. That is for suburban post offices, and premises of that kind? Yes.

199. That would be apart from this question? Yes.

200. That would reduce the rentals paid by the Government in Sydney proper to something under £2,000 a year? The Public Instruction now pay something like £400, and the Mines and Agriculture Department, £539 10s.

201. The Mines Department now occupy a considerable space in the old Commissariat Stores;—what will become of those buildings? I am afraid they will become so unsafe that they will have to be taken down. The white ant is eating the floors right out; they are not safe.

202. They are only makeshift buildings at the present time, and must gradually grow out of use by old age and decay? That is so.

203. In designing this building and its arrangements, have you had regard to the most economical system in building, in view of stability and convenience? I hope so. I have adopted, certainly, the most economical form of plans, and that is the key always to the question of economy or extravagance in building. The remainder is simply a matter of taste as to how far a building should be treated architecturally. The plan is the key to the building, and I am certain this is the most economical plan you could produce.

204. Is there any other public building in Sydney with which this could be compared, with regard to size and cost? There are two insurance offices in the City—the Equitable, and the Mutual Life—but neither of them compare with this in size. The nearest approach, I think, is the Lands Office, which is larger.

205. Do you know what the Lands Office cost? About £275,000.

206. Do you know what the Equitable Insurance Office cost? I have heard it cost about £80,000.

207. Is it two-thirds as large as this building? There is no comparison as to size.

208. That building is largely composed of trachyte, which is expensive? Yes.

209. You think the estimated cost of this building is a reasonable one? Yes; you cannot get away from the cost when you take the bulk.

210. I think the estimate is £97,000? Yes.

211. The light space shown on the plan appears to be rather extensive, as compared with that in many other of the City buildings;—what is the area of that space? It is about 56 by 50 feet.

212. Is not that a very large space to take up for air? Not with a building of that height. It must be recollected that it is not on the sunny side of the building; it is on the southern side, and no sun will get into it except from the top.

W.L. Vernon. 213. In going through the building occupied by the Works Department, one is struck with the smallness of the air space;—are you profiting by the experience of this building, in enlarging the air space as shown on the plan? Decidedly so. Besides, the more the air space is decreased, the less lighting space there is for rooms. It makes the site less useful. The smaller you make this area, the less will be the light for the rooms.

14 Feb., 1899.

214. In most large buildings the rooms are lit only on one side by windows, and by fanlights over doors, and in walking through the public buildings, one finds that the corridors generally are very dark;—is there no way of avoiding that? If a corridor be placed between sets of rooms you must get light wherever you possibly can, as long as you do not sacrifice too much space; but where the corridor is contiguous to a single room depth only, then it is a perfectly easy thing to light it. At the Treasury at the present moment, where we are erecting a new wing, with one room deep and a corridor, the corridor is as light as possible. I am having prepared, in connection with the other scheme before the Committee, a comparative plan of the corridor of the building, and of the main corridor of the Colonial Secretary's Office, and I am showing on that the amount of light each corridor has, compared with the extent of floor.

215. In designing this building, you have a site surrounded on all sides by light; you have no buildings up against your building in any way, but you have a clear space right round? We have made it—yes.

216. Would it not be possible to have some plan like that adopted in the Equitable building in Sydney, with a light space right in the middle, and a corridor running round? It would be quite possible to do that; but the Equitable building is only one room deep all round. In the case of this building, to make a central hall would mean a great sacrifice of floor-space. It would be quite possible to cover in such space the same way that the "Australia Hotel" is covered in.

217. But where you want to have a number of rooms divided by long corridors, it is impossible to get that central space? It is rather difficult, because the inner room has to be lighted entirely by the light you borrow from the skylight.

218. The light space you have given, as shown on the plan, would be of great assistance in lighting the corridors—more so than in the other buildings? Well, it helps it at either end.

219. How do you estimate the carrying power of the light in a room—is there any rule? Rules are laid down, but they are never followed. They vary according to circumstances and climate.

220. *Mr. Watson.*] This is an easy climate for lighting? Yes.

221. *Mr. Trickett.*] Could you point out on the first and second floors where you will get all your light from for the corridors—suppose you begin at the top? I obtain light at the south-east end by a light well-hole about 140 feet superficial, about 12 feet square, and by a side light from the area. Then I do not depend upon any more light at all, until I go to the staircase on the north-east corner, and then I get the direct rays from three large windows. The next lighting is on the north-west corner, with a similar light from three windows. The remainder of the corridor is lit from the south-west corner by direct light from the outside windows.

222. What is the length of the two long corridors? About 100 feet.

223. The longest corridor, which is about 100 feet, will also be assisted as regards light by the fan-lights over the doors? Yes; but we consider that we can do without any fictitious aid of that kind.

224. Do you think that there will be ample light? Yes.

225. How will it compare with the light in the corridors of the old part of the building in which we are now assembled;—will it be better than that? I can show you by the plan now produced. It shows the ground floor of the Colonial Secretary's Office running from the central staircase to the extreme one down by the Works Department. The other portion of the plan represents one of the corridors of the proposed building in Hunter-street. I have shown by a blue tint where the direct light is thrown in. In the Colonial Secretary's Office it comes in from the side windows through the central staircase. The comparison gives the following result:—The Colonial Secretary's Office has a light area of 282 feet, with a corridor floor space to light of 2,460 feet. It gives a proportion of 8 feet superficial floor space of corridor to 1 foot superficial window. I have also calculated that the furthest distance of any portion of the corridor from the nearest window is 62 feet. That may be considered a sufficiently lighted building for public purposes. In the proposed building in Hunter-street, the comparison of light, area and floor space gives only 5 feet floor space to 1 foot of window, a decided advantage in favour of the new building. Then the distance from the furthest portion of the corridor to the nearest window is only 50 feet instead of 62. I could carry out a similar comparison in the case of the building now under consideration. I could show that the longest distance from light does not exceed that just quoted—that the distance is, in fact, shorter.

226. So that you have no doubt that these corridors will be amply lighted? I am confident of it. There is another thing. In these new buildings it is not contemplated to complicate the corridors by a series of arches and swing doors, such as are now used in the Colonial Secretary's office. There being one floor for one Department there is no occasion to use these arteries and spring doors.

227. They will be done away with? Yes.

228. Is the system of ventilation proposed in this building similar to that in the Hunter-street building? Yes.

229. By special air-shafts? There is a special air-shaft at each angle of the building—a special mechanical appliance for sucking the air out of the rooms.

230. These air-shafts were commented upon the other day by a city architect as being unscientific in shape and size—that they generally have them circular and of smaller space, so as to get a more rapid outlet for the bad air? That is perfectly true. But this plan does not show the mechanism; the whole thing is done by tubes. The plan only shows a shaft.

231. Although the shaft is shown to be of irregular size, the tunnel or tube will be concentrated? Certainly; and there will be a series of hand-irons the whole height of the hall for the caretaker, so that the caretaker or the man in charge can constantly examine them.

232. What is the object of making the air-space that shape? The site being an irregular one it enables me to square up the rooms and the corridors.

WEDNESDAY, 15 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT,

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Walter Liberty Vernon, Government Architect, sworn, and further examined:—

233. *Mr. Watson.*] With regard to the southern side of this building, I see you have provided flying gangways from the eastern to the western side, leaving on the southern side, at one point at any rate, merely a connecting wall, without rooms? That is so. W.L. Vernon.  
15 Feb., 1899.

234. I should like to ascertain whether it would not be possible to utilise that southern wall in some way by a reduction of the area allowed as a light space or court-yard, and the construction of rooms along the southern wall; it seems rather waste of wall space under present conditions;—at present you have a wall running along the southern side, connecting the two wings or ends, which serves no purpose at all? In preparing this plan I did attempt to get a line of rooms across in connection with the corridor, or even to do away with the corridor, and make the entrance to the rooms at either end, but I found it made such a serious diminution of the air space and light space into the area shown, and was such a loss to the building, that I had to give up the idea.

235. You think it is necessary to retain the whole of that light area, 56 feet by 50 feet, inside? I feel confident it is necessary. It is a great height from the top of the building to the bottom, or rather to the ceiling of the basement, and there are a large number of rooms and windows to accommodate.

236. Is this building to be any higher, materially, than the Lands Office? Yes. The Lands Office is only three floors high besides the basement. This is six floors high besides the basement,

237. But the light and area space reserved in a similar way in the Lands Office is very much smaller than that proposed here? I have tried to avoid the errors that were made in the Lands Office, and also in the building in which we now are. If the Committee will recollect, the centre of the area in the Lands Office is taken up by a strong-room, and, unfortunately, by very lofty nests of lavatories and closets. The consequence is that, the inside rooms in the Lands Office, both on the north and south sides are perfectly useless for clerical purposes. I think some of the officers pointed that out to the Committee the other day.

238. *Mr. Levien.*] You had nothing to do with the building of this place? I built it on plans that were prepared. The area in the Works Office again is far too narrow. That could not be avoided owing to the size of the ground.

239. *Mr. Watson.*] It is very much smaller than the area you propose to allow in this new building? It is not smaller as regards length.

240. What is the size of it, approximately? I should think about 16 feet by about 60 feet.

241. In the case of the new building, you have an area 56 feet by 50 feet? Yes. Then I get the great advantage of having a square area instead of a long narrow one, and I get the additional advantage of keeping these openings in the screen wall.

242. What is the width of the outer series of rooms? About 20 feet 3 inches.

243. If you reduced the light area along the southern wall, by, say, 20 feet, that would still leave you 36 feet by 50? I would not like to try it.

244. You do not think that would be sufficient? No. The attempt in this plan is to make the lower rooms on the ground-floor equally as light and good as those on the top, so that they will be of equal value, and in fact of more value on account of their position.

245. You do not think that could be accomplished if you made any reduction in the light area? I am very much afraid not.

246. Have you any idea of the amount of floor-space occupied at present by the Railway Commissioners in the Works building? I could not tell you at the present moment.

247. It is a considerable area? Yes.

248. And I presume, in the event of the City railway being brought about—either to Hyde Park or to some other point—the Railway Commissioners would vacate the offices they at present occupy? That is the intention I believe. They would build offices of their own.

249. In order to have the administrative head near the executive offices? Yes.

250. And in that case, the accommodation now occupied by them would become available for other public Departments? Yes.

251. Are you prepared to give an opinion as to the probable increase of the branches already in the Works buildings, apart from the Railway Commissioners—as to whether they might require that space, or whether it would be available for other Departments or branches now located outside the Works buildings? I think the Colonial Secretary's Department is occasionally rather pressed for room, and would be glad of more room, but to what extent I cannot say. They have in that office a good deal of occasional work—accidental work that may occur from some special State reasons, and for which they require room; and I know they are always put to great trouble to find room on those occasions. Then again as regards the Works Department, there is constantly something required in the way of accommodation. It has been found a mistake to fit a Department too closely into its buildings. So long as you do not allow any extravagance, there should be a certain amount of elasticity.

252. Do you think there would be any large amount of space available, taking into consideration the possible requirements of the Works Department and the Colonial Secretary's Department, in the event of the Railway Commissioners leaving the building? At present the Railway Commissioners occupy rooms in the building about equal to one floor.

253. Then there would be a large floor-space available? Yes.

254. Reverting to the plan, it struck me that the space left in each corner for stairs seemed very large? It is only sufficient to admit of the staircase rising from floor to floor. The floors are 14 ft. 6 in. from floor

- W. L. Vernon. floor to floor, from which has to be deducted the thickness of the one floor. But it is necessary to provide sufficient spread in the staircase to comfortably get up that height. Therefore I cannot do with less.
- 15 Feb., 1899. 255. Is that area greater or less than the similar area in the large building in which we are at present? It is about the same. The staircase is 6 feet wide. The tread is about 6 feet long, and I am obliged to put at intervals landings, half-landings, and quarter-spaces, so that the stairs should not be too fatiguing, on account of the great height of the building. There is not an inch of room in the staircase more than I wanted.
256. A suggestion was made as to making the strong-rooms a little larger, and providing an iron staircase from top to bottom? I think that is a very good idea.
257. Do you think that, in the event of a fire breaking out in the lower series of strong-rooms, that might act as a flue to conduct the fire right up to the top? It might do so, unless you provided breaks. There should be floors, and there should be means of shutting off those floors one from the other.
258. Inside the staircase? Yes.
259. Is there any particular advantage to be gained by having a staircase inside? Only in cases where there would be a set of documents belonging to the next floor. We have an instance of that in the office of the Registrar of Births, Marriages, and Deaths. It is a rented building, certainly; but the strong-room has two distinct floors, one over the other, and they are connected by an internal staircase, altogether distinct from the building outside; so that by the closing of one door you close the whole of the strong-rooms, too. In the case of the present buildings, the height would be too great to enable that to be done in one undivided line. In the case of the Mines Department, if it can spare any room that space can very well be thrown into the strong-room; but that is a point for adjustment with the Department itself when we go into closer particulars as to how they will apportion the rooms.
260. It was mentioned in evidence, in connection with the other proposal for public buildings, that sandstone was more likely to fret if rubbed smooth; do you agree with that? I think sandstone that has been dressed with a fine face is more liable to fret than what we call rock-faced or pitch-faced—that is, with a sort of natural rough appearance left on the stone. I certainly think so for this very good reason, that all the Ashlar face has to be punched with a chisel, and it presses under the surface and disturbs the stone to some extent; while with the pitch or rock face the stone is left rough, and no tool is used on it to destroy the texture.
261. To some extent that is what has been done in the basement of the Treasury Buildings? Yes.
262. And the appearance of that is very good? I think it is very good indeed; but you cannot use it over the whole of the building—you would get no architectural detail.
263. You could not go in for columns and cornices, and things like that—not with any effect? No.
264. So that you would not advise the use of that facing for a complete building? I think it would look too heavy in the mass.
265. It could be relieved by a series of arches? Then they must be dressed.
266. You must dress your arches? You must dress some portions; but I am afraid a building of that sort in pitched face would be very heavy.
267. Do you think the liability to fretting in a building such as this will be very great? It will take its chance with the remainder of the sandstone in Sydney.
268. What does that chance amount to;—does it mean that within ten, fifteen, or twenty years it will require to have another dressing of the hard face? No; but I think that in 100 years it will begin, to some extent, to show signs of wear and tear, unless it is treated with a composition—a coating which is used now as a preservative for many of these stone buildings, and which, no doubt, checks all that action. It does not stop the action, but it checks it.
269. It has been suggested to me that the stone buildings in and around Sydney—the Government buildings—would be preserved much better if they were occasionally washed with a hose? There is a good deal of divided opinion as to whether it is advisable to do that or not. Some experts say that by washing stone you take away from it a sort of natural cement, which has formed on the face, and you let the air into it, and by that means disintegration sets in more quickly. Other experts say, on the other hand, that by the removal of this outside dirt, which contains a considerable amount of salt and soot, carbon, you take away all the destroying agents from the stone. It is quite a moot question.
270. On the Australian Museum building there is to be seen a great deal of moss as well as bird excreta;—do you think that would be liable to affect the stone at all? Moss should never be allowed to grow upon the stone; there must be some defect in the construction.
271. Do you know whether the pigeon droppings would have any effect? I do not think so—only so far as appearance goes.
272. I am informed that there are at least two qualities of sandstone in Sydney to be obtained, one from what is called the Purgatory Quarry at Pymont, and the other the ordinary sandstone? There are a good many kinds of sandstone in Sydney. The Purgatory stone is very hard, and then there is the Waverley stone, which is also exceedingly good stone. It has less colour than the Pymont and Randwick stones. Then there is the stone at Rockdale, and all down the coast, which is a whiter stone. There is the North Shore stone, which is very white and coarse. Then there are the stones around Annandale and the Glebe which contain a large amount of iron, which I do not think are very suitable.
273. Which of these do you prefer to use, in view of the cost of each? It is quite immaterial which you use; that is, if you take the better of the two kinds—the Pymont and the Waverley. In the case of the Lands Office one half is built in Pymont stone and one half in Waverley stone, and no one can detect the difference.
274. You do not think there is any difference as regards the lasting property of the stone? I do not think so.
275. But there is a considerable difference in the cost of the Pymont stone as regards working as compared with the other stone, is there not,—or some difference? Yes; there would be. But the Purgatory stone is not much used. We are using stone at the present moment from Pymont, because we bought it cheaper than we could buy stone any where else.
276. What stone are you using in the Post Office? Pymont stone. That is the result of competition—public tender.
277. Is the Pymont stone supposed to be a hard description of stone, or harder than the ordinary sandstone around Sydney? It is one of the best qualities of stone. Pymont has always a name for being the best stone, although the Waverley runs it very close.

W. L. Vernon.  
15 Feb., 1899.

278. You say it is being used at the Post Office, and you got it as the result of competition at a comparatively low price? The lowest price. There were some other circumstances in connection with it.
279. Does it cost any more to work? No.
280. I mean does it take a man longer to work a similar number of cubic feet? No.
281. Notwithstanding its being hard? I do not think it does. There is only a very slight difference in the degree of hardness. Contractors are perfectly indifferent as to which they use, unless the contractor happens to own a quarry himself, and then, of course, he wants his own stone. Otherwise, they are perfectly indifferent which they use.
282. During the visit of inspection paid by the Committee the other day to some of the public offices, I think you pointed out the undesirableness of having in the offices wooden racks and other clumsy furniture liable to take fire quickly? That is so.
283. I think you also mentioned, in reply to the Chairman, something about the manner in which the furniture was arranged—the sort of furniture that some of these Departments had? I did make some remark.
284. Is your Department likely to be consulted as to the arrangement and fitting of furniture in this new building? No. If it is to be dealt with as furniture it will go to the Public Service Tender Board.
285. It does not come under your purview at all? No.
286. Would it not be possible to arrange in some way that the opinions or ideas of those with a knowledge of the economical fitting of offices and safe fitting of offices should be taken into consideration? I think it is very desirable. I have men in my Department who, from long experience, have become experts in those matters, and I am quite certain there would be an advantage in making use of their experience. We do it in many cases now. In the Treasury, for instance, which has just been fitted with a strong-room, the arrangement of the desks was entirely a mutual arrangement between my expert and the officers of the Treasury. We find what they want, and we take care to place it in the most economical form.
287. That is as to desk space and the arrangement of documents and books, and so on? Everything of that kind.
288. Does that also apply to the arrangement of the spaces in the strong-rooms—the plan racks;—there are a great number of those used in all the offices where they have draftsmen at work? As a matter of fact we have had nothing to do with those. They are put up by their own branch in the Works Department. We fitted up the Lands Office with steel racks, and we have done the same at the Treasury.
289. And you would recommend those for use in other Departments? Decidedly.
290. But at present you are not necessarily consulted with regard to the arrangement of furniture and fittings in new offices? No, not necessarily.
291. It is only done when the ministerial head sees fit? That is the practice generally.
292. It has been suggested by the Departmental Board, whose minutes you read to the Committee yesterday, that the building now occupied by the Education Department should be pulled down;—has the building become so dilapidated that it should be pulled down, or are the Board under the impression that it will not be required? There are two reasons—one for the sake of the improvement of the surrounding buildings, and the other that the old building is so antiquated that it will not be worth putting another Department into it when vacated by the Public Instruction Department.
293. When you say antiquated, do you mean antiquated in the arrangement of the rooms, or that the walls and other parts of the building are unfit for occupation? I could not go so far as to say the latter, but I should say that the accommodation is not suitable to administer the Department well. It has been built at various times. A great deal of it is makeshift. It is just one of those buildings that a community like this should move out of sight altogether. There is no historic interest connected with it to require its maintenance.
294. There is no actual reason why it should be pulled down? No; it may only be a sentimental reason. There is no reason on account of its want of safety, or on account of its insanitary condition, for although it is not very good in that respect, still it is good enough. There are no reasons of that kind.
295. Is it not a fact that in recent years some additions have been made there? A great deal of money has been spent on it, and money always must be spent to keep it going.
296. Do you mean, to keep pace with the growing of the Department? No; to keep the place in repair, to keep its sanitary condition right. The sanitary fittings are all getting antiquated and out of date. These really want remodelling and rebuilding.
297. What would the maintenance of the building cost—I mean as regards sanitary matters and general repairs? I should say that the building would cost about £200 a year to keep in proper repair.
298. So that it would be just as profitable to pull it down, and pay £200 for another building if it were necessary to house a small Department? Yes; I think so. In speaking of the Education Department, perhaps I might be allowed to make a correction of a statement I made yesterday regarding the floor-space which that Department now occupies. It seems that by some mistake the rented and outside premises were not included. The consequence was, that I reported the Department now occupy some 9,000 feet, and they really occupy 13,608 feet.
299. *Chairman.*] That includes outside places? Yes. When the Department was asked to send in a return of what they required, they asked for 24,956 feet. The space ultimately fixed upon was—minimum 19,776, and maximum 22,786.
300. With regard to the internal walls shown on the plan—I do not mean the walls dividing the rooms as arranged, but the walls in the corridors—can you tell the Committee what the thickness is;—they seem very thin; they have a number of piers arranged along apparently, and very thin walls connecting the piers? The piers in the basement are 3 feet thick.
301. They run right up to the top? Yes; they are 6 ft. x 3 ft. solid brickwork in cement. They diminish in thickness, but they go from top to bottom. They are the constructive supports to the building, and we carry a series of steel girders over the work supporting the floors, so as to be as independent of partitions as possible.
302. And between these piers and the internal corridor walls,—what is there? I propose to put terracotta lumber in with steel frames, about 6 to 9 inches in thickness.
303. That would be nothing constructive, but merely dividing-work? That is all, and as light as possible.
304. You would have a considerable number of girders, then; there would be girders longitudinally and transversely? Yes; to some extent, but the girders will nearly all be transverse.

- W. L. Vernon. 305. You will have longitudinal girders also connecting? To some extent, but not to any great extent. The partitions will rest on the construction of the floors, particularly if the Monier system is used. The weight of the partition is on the floor only. It does not take the partition from top to bottom, increasing the weight as you go down, but each is treated independently, and the weight is thrown across on the main walls.
- 15 Feb., 1899. 306. And if you use the Monier system the floors will be sufficient to carry the partitions? Yes; the building is supposed to be so constructed that the whole of this internal work can be cleared out if necessary. The roof in all cases is carried on the main walls, and not upon the internal walls. These internal walls are provided simply for the floors.
307. Having so many girders is there any probability, in the event of fire, of the bursting of the building through the expansion of the iron or steel? I do not think so. Steel girders, when used in fire appliances now, are entirely protected from any contact with fire. It has been found by experiment, and also by experience, that so long as that is the case the girder can be depended upon. In the early days, when a fire-engine was playing upon girders, and particularly upon the old cast girders, which were first used, a stream of water would do damage at once. But now, so long as they are protected—and that has been found the best way to keep them—there need not be any fear.
308. Protected with cement? Cement or lumber—any non-conductor of heat.
309. Does the coating of lumber check the expansion and contraction, or merely keep the heat and water from the iron? It keeps the heat away. I do not think it can prevent expansion altogether.
310. It might minimise it? Yes; I have seen experiments made which have shown marvellous results in the way of protection. The lumber seems to defy all assaults by heat.
311. Is there less expansion in the steel girder than in the wrought or cast-iron girder, or would it be the same—leaving out any question of protection? I think it is about the same, except that, of course, in steel we use smaller sections, which would mean less expansion. But foot per foot, and inch per inch, not speaking as an engineer, I should say the expansion and contraction are the same.
312. So that what you rely upon, irrespective of the reduction in size, is the protection with lumber or cement? Yes.
313. In any case, I presume, if you have this building reasonably protected by the Monier system of flooring and ceiling, there is little probability of a fire sufficiently extensive to cause damage? In such rooms as those in which you saw large numbers of papers and records, I should recommend the use of a fire sprinkler as an additional caution. In that case no fire need be feared.
314. That would not mean a great deal of extra expense? No, nothing very serious; it would not affect the estimate.
315. And it would be better to arrange for that before you start building, I presume? Yes.
316. *Mr. Shepherd.*] With regard to the strong-room, would the papers contained in it not be liable to be damaged in case of fire—scorched or singed in any way—supposing there was a very heavy fire in the building? I do not think a fire could occur in the strong-room. If one did occur locally it would be very much minimised by the fact that the papers are all placed in steel receptacles.
317. Is there any vacuum outside the walls? No.
318. Do you not think that a vacuum or a second wall with a space between would still further protect the strong-room? Not necessarily so, while it would be a great harbour for vermin.
319. With regard to the subdivision of the long room on the plan, I noticed the other day, when we were going through the large public offices that, where the rooms were subdivided, the passages were inside;—there seemed to be no provision for entering from the corridors. In this plan is there any provision for that in the event of subdivision? You refer to the large room at the southern end of the Lands Office in which the staircase lands in the large room itself, which has necessitated the partitioning off of the room itself, to obtain access to the staircase from all parts of the building; but in this plan, the staircase goes up in the well-hole and not in the room.
320. Seeing that these long rooms are on each floor, is it not likely that smaller rooms would be desirable very often? To some extent.
321. Do you not think it would save space to provide for the entry from the corridor instead of having passages along inside? Certainly. A provision could be made for opening doorways direct from the corridor at frequent intervals.
322. I noticed the other day also, that there did not appear to be any provision against the sun on the west of the building, and the heat in some of the rooms was almost intolerable. Would it not be desirable to make some provision of the kind, even by means of a French shade, such as is fixed to the windows of this room? That is so. I could not afford the space to recess the rooms into a balcony. There is not sufficient ground to spare to do that on the western side, and the windows, no doubt, must depend upon any adventitious aid from outside shutters.
323. It is proposed to build the whole of this building in stone, I believe? Yes, except the internal walls.
324. It is proposed, I believe, to use the same kind of stone in the whole building, foundations and all? Yes.
325. Would it not be desirable to use some other stone for the basement, such, for instance, as Bowral trachyte, if not too expensive? It would be very suitable.
326. Would it not be likely to add to the appearance of the building? I think it would.
327. And it would be quite as durable? More so.
328. Would that add much to the cost? It would mean a difference of about 3s. 6d. or 4s. per cube foot on the lower floor.
329. That would mean something considerable in a building of this kind? It would mean a great deal. It is for that reason I hardly ventured to use it in this design. I might point out that the Sydney stone, curiously enough, frets at the pavement level. This is noticeable in the Lands Office, and also the Colonial Secretary's Office. Just above the pavement level there is a fretting of the stone, which would not occur in the case of trachyte.

THURSDAY, 16 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Walter Liberty Vernon, Government Architect, sworn, and further examined:—

330. *Mr. Levien.*] Did you build the new additions to the Treasury in Macquarie-street? Yes. W. L. Vernon.
331. The flooring there is laid in wooden blocks, is it not? Yes. 16 Feb., 1899.
332. Do you propose to wood-block any of the floors in this building? I have not gone so much into detail as that; but probably it would be a good plan to block the corridors.
333. Would you sooner block them than tile them? Blocking them would be better than tiling them. Tiling is noisy, and it wears, and very often the key underneath breaks, and the tiles come up,—except marble tiling.
334. The same as that at the Supreme Court? Yes, that might be used.
335. You think that is a good floor? Yes, a very good floor.
336. Have not the wooden blocks laid in the floor at the Treasury buildings contracted? They have shrunk to some extent.
337. It would be necessary to lift them and relay them? I am not certain. We are watching them to see. I might explain that we are endeavouring to use the Colonial hardwood for these floors, and the experience we gained in that building in regard to blocking showed that it was necessary to put the Colonial hardwoods through some other process besides simple seasoning by the weather. The consequence is that in subsequent works—the Art Gallery, for instance, and the Kenmore Asylum—we have had kilns built, and the wood has been steamed in these kilns for from four to six weeks before use. We find it absolutely necessary to do something of that kind with the Colonial hardwood. It is mahogany at the Treasury buildings.
338. Was that steamed? No.
339. Have the blocks that underwent steaming which were used in the Art Gallery contracted at all? Yes, slightly. I am afraid we must abandon the use of hardwood for floors. We have tried everything we could think of.
340. Both for boarding and blocking? Yes.
341. I suppose the use of the blocks at the Treasury building was a mere experiment? It was more than an experiment; it was specially provided in the specification.
342. Do you think it is a failure or a success? It is a success, so far as the construction of the floor is concerned. It has enabled us to use a fire-proof floor.
343. It would be more fire-proof than boarding? Yes; because there is no space for any draught or fire to get between the blocks and the concrete. But it has been a failure, so far as the wood we have used is concerned—a partial failure.
344. Do you know if there are any of the Colonial woods that would make more perfect blocking—Colonial beech for instance? That is very good wood. One of the floors in the Art Gallery is covered with beech, but it has gone the same there, and has left large spaces. It is very hard to keep such a floor clean.
345. All the sweepings drop in between the blocks? Of course there are degrees of shrinkage; in some floors the shrinkage would be less than in others.
346. No matter how small the shrinkage, would not the dust accumulate between the blocks? It would to some extent.
347. And do you think that is a desirable thing? Not if I could help it.
348. But even if you could not help it, do you think it is a desirable thing so far as health is concerned—say, where there are thirty or forty clerks in a limited space—do you think it a good thing that the dust should accumulate in these shrinkages? No. It is pretty universal though.
349. How do you mean universal? One can hardly find a wooden floor anywhere which is not open in the joints.
350. But the floor can be scrubbed? Yes; then the joints get filled up with dirt and dust.
351. Do you think you could wash a blocked floor with the same facility as you could a boarded floor? Yes.
352. In this building you do not propose to have any of this wooden blocking, do you? I have not written the specification for this building, but it would be quite an open question whether the corridors should be woodblocked or paved with marble.
353. What do you propose to build the basement of the museum with? Continuous asphalt. But even in that case I should consult the curator of the museum. I should recommend him to use continuous asphalt, because it is impervious to damp.
354. What do you propose to do with regard to flooring as regards the whole building? I have not written the specification. This is a matter of detail which does not affect the accommodation, or the construction of the building.
355. But it is an important element, is it not? The rooms themselves, or course, would be floored with boarding.
356. Going back to the Treasury building, that is a room and that is all blocked? It is a strong room, really.
357. Are both those rooms in the lower floor strong rooms? There is only one room, there is a gallery in it. It is one large strong room, a fire-proof room.
358. Have you ever had any report to the effect that heat is very intense there? We have had one or two suggestions that it is warm; but then we get those from all directions.
359. I mean from that particular building;—have you had any complaints from any of the officers there that the heat is very intense? No.

- W. L. Vernon. 360. Or that it is extremely hot? No; it is the most comfortable room in Sydney.
- 16 Feb., 1899. 361. Did you ask any of the officers? Yes; when we built it. Before the officers entered the building at all, in discussing it with the heads of the branches, we all thought it was desirable to adopt some mechanical appliance for sucking the air out of the room in addition to the windows.
362. You have a mechanical appliance there? Yes.
363. Is that sufficient for the purpose? Yes; considering that there are windows on all four sides of the room as well.
364. But in regard to those windows there is no opening for air at the bottom of the window? The window is hung on a pivot.
365. Worked by machinery? Yes.
366. Do you not think it necessary to have some air space below;—the air would come in, and it would ascend, would it not? But the air circulates throughout the whole of that floor. It has plenty of inlets besides windows—doors.
367. Are not those doors always closed? No.
368. Are they glass doors? There are two iron doors, I think; and there will be more when the new building is up. There will be two large archways.
369. What is there now? There is the front door, and, I think, two side doors.
370. Do you not think it advisable to allow the windows to be run up from the bottom, so that a current of air should come in? We took special pains with those windows.
371. They are set in iron, are they not? They are all iron themselves.
372. Is not the latest scientific and mechanical idea that the windows should be lifted from the bottom so as to allow the air to come in both at the top and bottom, and have a current of air in and out? Undoubtedly, the more the circulation of air the better; but there is ample in that room.
373. No complaint has been made to you? If you listened to all the fads of some of the Civil servants, you would never satisfy them at all. No complaints have reached my office that have not been attended to.
374. Do you not think there ought to be an inlet at the bottom of the window as well as at the top, to allow a free current of air? The window opens into places now—it works on a pivot, and it is opened on the top and the two sides to some extent.
375. In regard to all the windows facing the north, there is only an opening in the centre from the pivot? The window is formed of two sashes—upper and lower.
376. The lower sash does not open at all? No.
377. Would you think it advisable to have a current of air from the lower space? Not necessarily in a room of that construction. I might explain to the Committee that that window was specially designed to accord with a system of iron shutters which was to have been adopted for the purpose of extra security—the shutters to be worked by hydraulic power; but when the Treasury Department took possession of the rooms, they considered it was not necessary to go to that expense, and as they took the responsibility upon themselves—and it is so stated clearly in the papers—of any risk of incendiarism, or any damage from fire or from the approach of thieves, the shutters were all left out. The sash bars of the windows are all in metal, and it would be impossible to work a metal sash in the way you suggest.
378. So far as the books and papers are concerned, what good would they be to any thieves? I understand they have about £15,000,000 worth of accounts, there. They have the accounts for all the conditional leases and conditional purchases in the Colony there, and the debit and credit account of every leaseholder and freeholder in the Colony.
379. But are not those locked up during the night? No; the room itself is locked up.
380. The room itself would not be fire-proof? Yes, it is. All those officers are working in a strong-room.
381. But suppose a fire broke out in an adjoining building, would it burst those glass windows open? The Treasury have taken that risk upon themselves against my advice.
382. What did you advise? I advised a system of automatic, iron shutters. After the work was over of an afternoon, by moving one lever the whole of the shutters could be closed. It would cost £2,000. The money was provided, but the Treasury Department thought they could do without the expense, and I think there is a good deal to be said on that side. It is worth the risk almost. In suggesting the iron shutters I was afraid of incendiarism. I thought it possible that the window might be smashed by some evilly-disposed person who might throw a bottle of petroleum, or something of that kind, through the window, and do considerable damage. It is just one of those things which could be done. My first instructions were to build a fire-proof and thief-proof room; and without those iron shutters I do not consider I have done so.
383. It is not thief-proof now, as a man could cut through the glass, could he not? The windows all have iron frames and iron bars.
384. But they could cut through glass? Yes; it is not altogether secure.
385. It would not take a thief long to cut through the bars, would it? No. The mechanism of those windows was specially designed so that the frames or sashes should in no way interfere with the shutters.
386. As they come down they are sealed? Yes.
387. It would be a greater protection if the iron shutters were outside? As a matter of fact, the shutters would be inside.
388. That would have been a greater protection still? Yes; I think so.
389. *Chairman.*] It would have been absolutely proof then? Yes; the doors leading into the place are Chubb's strong-room doors. That shows that precautions were taken, wherever they could be taken, but the windows were left in their present state.
390. That would not be the case here;—you do not suggest any of these iron shutters for this building? No.
391. *Mr. Shepherd.*] Have the heads of the two Departments—Mines and Public Instruction—been consulted as to the arrangement and disposition of the rooms in this building? In the first place, the amount of accommodation required was obtained from them, and the detailed disposition of the rooms will be left very much to the heads of the Departments, in case the building is erected. So long as general lines are laid down, and suitable accommodation is provided, it is far better to let the heads of the Departments apportion the rooms. I may say that they have been supplied with copies of these plans, in order that they might know what is being proposed before the Committee.

392. I notice that the different floors are apportioned partly to the Department of Mines and Agriculture, and partly to the Public Instruction? That is so. W. L. Vernon.

393. Do you not think it would be a better arrangement that each portion should be apportioned to its particular Department, instead of having the Departments mixed up in this way;—what advantage is to be gained by dividing them in the manner proposed? There is the advantage to both Departments that certain of their officers who deal more closely with the public can, in both cases, be on the ground floor, and the Minister and others concerned in the administration of the Department can be placed on the first floor. The other floors do not so much matter—that is, for the accountant's work, and records work, and branches of that kind. But it seems to me essential that each Department should have a ground floor and a first floor, and consequently, it is better to divide the building perpendicularly than horizontally. 16 Feb., 1899.

394. It is proposed, I suppose, to keep them entirely distinct—that is on the ground-floor and the first floor;—each Department will have its offices divided in a regular way, one above the other, so as to keep them together as much as possible? Yes. So far as four of the floors are concerned, it is two separate buildings. It would be very difficult, if the main floors were dealt with horizontally, to satisfy the two Departments, because they would both want a ground-floor, and both want a first floor, and very naturally.

395. Is it expected that there will be much expansion in the case of either of these Departments;—they both seem to me to be growing Departments;—I see there is not a great deal of expansion provided for over and above what is immediately required? In regard to the Education Department, as the system now covers the whole of the Colony, its limits are almost ascertained in one sense. It was considered advisable, while reducing the accommodation they required to a minimum, to allow some elasticity to provide for an increase that must take place, though not to a very large extent. But the Mines Department is one which is constantly having new branches added to it for one purpose and another. One does not know what branch may be added to it, or even taken away from it. Therefore, there must be some elasticity in the accommodation provided.

396. In regard to ventilation, I suppose a thoroughly efficient system is provided for ventilating the whole of the building? It is done by means of openings in every room in the building, communicating by shafting with the upper upcast shaft in the building. Then, in order to make certain that a current is set up, we provide fans to draw the air out.

397. In the Works Department, the ventilation of the building does not seem to be as perfect as it might be? There is no attempt at ventilation in the rooms of that building. This is a new departure. In regard to the possible growth of these Departments I may say that the Mines Department in 1880 had sixty-nine officers, and in 1899 it has 164, showing that there must be a constant increase.

398. With regard to the division of the rooms, could not something better than wood be provided, because in case of fire that would be a great danger? I think it very desirable that no inflammable material at all should be used, and if that were insisted upon, the small divisions one sees constantly in these buildings would disappear altogether, and I think much to the advantage of the work in the offices. If terra-cotta partitions were insisted upon, the rooms would then be divided into reasonable sizes. But with wooden partitions they can be cut up into little boxes, 6, 7, or 8 feet square.

399. *Mr. Watson.*] You are not consulted with reference to the erection of these wooden partitions as a rule? Not as a rule. We sometimes put them up when we are instructed to do so.

400. *Dr. Garran.*] Who controls the quantity of furniture in a room? Now that a Public Service Tender Board has been appointed, I imagine that they will control it, so far as new work is concerned.

401. One of the rooms we visited the other day looked more like a second-hand furniture shop than an office? Yes. I counted one day in one of the old Lands Office rooms forty-five pieces of furniture. It was the greatest puzzle how the officers could find their way amongst the furniture to their seats.

402. Has each officer the right to order his own furniture? I think it has gone on from year to year, with constant additions, without any special plan or system.

403. It wants revising altogether? Altogether.

404. With regard to the rooms in this building, who will control the quantity of furniture to be bought;—will they cart in all the furniture from the existing rooms? I hope not; but that matter will be beyond my control, or even suggestion. I should say that the Under Secretaries of the Departments would themselves see that their furniture was rearranged and simplified.

405. Has there ever been a report as to the quantity of desk room and table room required by each officer in a room? An inquiry was made in connection with the building of the Treasury as to the desk room. Nothing definite could be obtained from other Departments, but we did fix the matter as regards the Treasury. We were able to do that by their books. It was a very simple matter, as they had so many ledgers for which we had to find so much room. That room was really built to fit the ledgers, and not the ledgers made to fit the room.

406. And you do not know what will happen to these nice new rooms you are going to build—whether they will be lumbered up as soon as they are opened? No; I do not know at all.

407. *Chairman.*] Regarding the size of the room required for different officers, in our inspection the other day we found Mr. McKinney located in a room 15 feet by 21 feet. He has a number of officers consulting him, I suppose, every day, and he says he has ample accommodation there. In the proposal we have before us, what is the size of the smallest room you have provided? Twenty-one feet is the length of the smallest room, and the width will be according to requirements. It is not set out in the plan, because it is rather difficult to ascertain what each officer will require.

408. Then you are virtually providing a skeleton building? Yes.

409. Does your estimate of £97,000 provide for a complete building, subdivided according to the requirements of the officers, or simply for the skeleton building shown on those plans? It includes a reasonable number of permanent partitions.

410. So that the estimate is not likely to be exceeded? No; it should not be.

411. We visited a room in which there were three draftsmen employed, its dimensions being 16 feet by 14 feet, which gives 75 feet of floor space each, and they were not overcrowded? That is too little for draftsmen. It is not the space that the draftsman himself takes, but the space his plans take.

412. But if the draftsman is a tidy man, and when he has dealt with one set of plans puts them away before dealing with another set, I suppose he would take less space than if he had his plans scattered all over the place? He must have plans out; it cannot be helped.

- W. L. Vernon. 413. But it all depends, I suppose, upon the habits of the chief of the room as to whether he can make 75 feet do or 200 feet? There is no doubt a great deal depends upon the head of the room, but there is a limit to the suitable area for a draftsman. I should not put it so low as that.
- 16 Feb., 1899. 414. There was another long room 46 feet by 19 feet, in which there were nine officers employed. That gives 97 feet of floor space for each officer. They appeared to have plenty of room there? I think for clerical officers who deal with papers and not so much with plans, 100 feet is a very fair allowance, and I think that is what you will find they now get in all the better-arranged Government offices. The average is brought up by the larger rooms for single officers.
415. In no case during our inspection did we find a room giving a greater floor space for each individual than 104 feet, so that I suppose we can accept that as being the maximum requirement, and 100 square feet for a draftsman. We found cases where the floor space per officer was 96 feet, 71 feet, 75 feet, and 97 feet; but in no case was it over 100 feet? I would fix the space for a clerical official at 100 feet, and for a draftsman, at from 130 to 140 feet.
416. We visited a room occupied by the Railway Department, the dimensions of which were 14 feet by 16 feet, and it was occupied by nine clerks, the floor space for each being 71 feet, and they did not appear overcrowded? That space is little enough—too little, especially where they have papers accumulating.
417. We found twelve men in another room with only 46 feet per man, and they did not appear so crowded as some of the others who had the 71 feet—so that it is all a matter of arrangement, is it not? To some extent it is.
418. And if a better type of furniture were used, we should be within the mark in saying that 75 feet would be sufficient for a man doing ordinary clerical work—taking into consideration the fact that in one room the space per man was 46 feet, in another 56 feet, in another 72 feet, and in another 62 feet? No; I think it is under the mark, even with the best-arranged room. In the case of a clerical room in an office, from the nature of things the officer sits there from 9 o'clock in the morning until half-past 4 o'clock at night. He has no business to take him outside, as many of the professional officers have, and if he is in that atmosphere the whole of a hot summer's day, 100 feet is only a fair thing to allow him, with his books and his papers. Generally speaking, the sides of the rooms are lined with pigeon holes for record purposes, in addition to his own papers on his table, and these are always accumulating.
419. *Mr. Watson.*] 100 feet is recognised as the standard for health purposes? It should be so.
420. *Chairman.*] Could you give the Committee any idea of the amount of space allotted to clerks in commercial houses? I could only do so after special investigation; but I am prepared to say that in the banking chambers in Sydney there is considerably more than that space for each officer; but then, of course, the public come in, and in some of these public offices the public come in.
421. But not to so great an extent as they do in the case of a bank? If an investigation were made of any one bank, I would undertake to say it would be found that all the officers in the separate rooms outside the banking chamber have considerably more than 100 feet each. That only allows 10 feet by 10 feet.
422. I suppose you were informed by the Department how many clerks would require to be housed in this building? Yes.
423. How many square feet per man did you allow? I think the Under Secretaries who supplied the information were guided very much by the special kind of work at which the groups of clerks were to be engaged, and on their own judgment they would give me to some extent the size of the rooms they required for them. In no case in the returns did they give the superficial floor-space per officer; but they give very often the size of the room in which they would put so many clerks. In the case of the Education Department, the figures given were these:—The Minister, 526 feet; Minister's ante-room, 200 feet; Under Secretary, 320 feet; and his waiting-room, 150 feet; Chief clerk, 320 feet; correspondence clerk, 160 feet; Teachers' Branch—4 officers, 440 feet—that is, one room; Correspondence, 17 officers, 1,840 feet; Records—11 officers, 1,778 feet. There is an instance where there is a difference in the space given per man, it being greater in the case of the Records Branch for the reason that the records take up room as well as the officers. Accounts—14 officers, 1,934 feet. In that case there is probably a space required for the public, and that upsets the calculation again. Cashier—6 officers, 1,008 feet; there is a requirement for the public again. Clerks of works and draftsmen—7 officers, 1,626 feet. Library and Board-room, 840 feet. Then comes a chief inspector, a deputy chief inspector, messenger-in-waiting, five metropolitan inspectors, and the country inspectors. The number of the officers is not given; they take a total of 2,000 feet. Store-rooms, 1,770 feet. These, I think, are for the school literature and educational appliances. The cadets have 320 feet for three officers; workshop, 399 feet. Six officers in the Labour and Industry Branch, 840 feet. That is a case in which the public want a considerable amount of room, as well as the officers. Then there is provision for expansion. That comprises the accommodation required for the Education Department.
424. Did the Mines Department requisition for the whole basement in the new building for a museum? That was one of the conditions under which they were prepared to come into the building.
425. That they should have a large museum? That their museum should be in connection with the Department, and under the same roof.
426. Have you been in the museum in the Domain? Yes.
427. You have noticed the exhibits there? I have not been there within the last two months; but I have been there in connection with this particular scheme.
428. Have you been in the Australian Museum? Yes.
429. Are not some of the exhibits there similar to those in the building in the Domain? Probably some of the exhibits are the same; but they are there for different purposes.
430. Have you been to the Technical College, at Ultimo? Yes.
431. Have you been in the museum there? Yes; but I forget the details. I have been in country museums. I have been in the museum at Newcastle and the one at Bathurst.
432. Did you notice whether there were any mineral exhibits? Yes; they all have a complete set of minerals, and within a small compass.
433. Do you think it is necessary in the interests of the public that there should be museums attached to every Department? I am afraid that is a question I should not like to answer. I can only speak as to the buildings.
434. You have a general knowledge as to what the public would require;—as one of the public, do you think

- think museums are required in about half a dozen different parts of the town? I really could not answer that. I am not prepared to say. I might have a private opinion, but not an official opinion.
435. You say that the Mines Department is now occupying part of the Works building; what do you propose to do with that portion of the building when the Mines Department leave it? I should prefer to keep it vacant—for purposes of safety. That is why I prefer that it should not be used for storage purposes. I refer to the dome.
436. We have it in evidence that there will be 10,000 feet of space vacant in the Lands Department when the Mines Department leave that building;—has there been any communication with you with reference to the question as to who would occupy that space? None as to who would occupy it.
437. In drawing out these plans, was that considered? It was considered that those rooms could be used, because the occupants of the four houses in Young-street, and the terrace that would be taken down, must be housed somewhere; and in regard to Richmond Terrace, in the Domain, which must sooner or latter be condemned to make room for public buildings there, those occupying that terrace of houses must also have room found for them. So that it was considered that the Lands Office would be able to provide pretty well all the accommodation required.
438. After this new building was put up? Yes.
439. Where would you propose to house these people in Young-street while the building was going up? Rooms would have to be hired for them.
440. They could not go into the Lands Office? No. You must rent some premises, I am afraid.
441. The Lands Office object, I think, to having their museum in the building you propose to erect? I could not say. I do not know what arrangement the Forestry Branch has made.
442. You had no communication with them at all? No; but I should think it would be very desirable to still keep the Forestry exhibition with the Mineral exhibition—I mean for the sake of the public.
443. Could you give the Committee the amount of floor space now occupied by the Mines Department in the Lands Office? As far as my recollection goes, the space occupied by the Mines Department, spread over the different buildings, is about 13,000 feet.
444. Will you give the Committee particulars as to the space the Mines Department ask for, and which you are providing for them in the new building? For the Minister, 2 rooms, and the Under Secretary, 2 rooms, we are giving 1,560 feet. In the Geological Branch there are 11 officers and a library; we are giving them 2,070 feet. The Charting Branch, 21 officers, 2,799 feet; the Clerical Branch, consisting of 30 officers, 3,890 feet; 8 lease clerks, 990 feet; lease officer and legal adviser, 2 officers, 300 feet. Inspectors of diamond drills, 4 officers, with occasional inspectors in addition, 1,080 feet. In the Accounts Branch, 12 officers, 1,578 feet; stores, 2 officers, 250 feet; plan-mounter, helio printing, and helio printer, 990 feet; board-room, 480 feet; museum, 1,440 feet; clerical Branch, 3 officers, 1,080 feet; this includes a director—I do not know what he is—which will make four officers. The Department asked for 1,200 feet, and we have given them 1,080. Public Watering-places, 6 officers, 990 feet; Stock Branch, 11 officers and 2 store-rooms, 1,780 feet; Export Board, 3 officers, 600 feet; that includes a board-room. Pathologist and artists, 4 officers, 1,140 feet; that is a case in which there must be plenty of room. Entomologist and library, 2 officers, 860 feet; Viticulture, 1 officer and a laboratory, and the chemist, 3 officers and a laboratory, 2,663 feet. Editor of the *Gazette* and a library, 2 officers, 714 feet. With the exception of the messengers, that is about the whole of the accommodation.
445. *Mr. Dick.*] I noticed that in the case of nearly all the large public buildings that have been erected for some time past additions have been prepared in the way of mansard roofs;—have you made provision for the possibility of such an addition here? They could be added; but I should hope they never will be.
446. It would interfere with the architectural harmony of the building? Very much.
447. With respect to the museum, you feel certain it would be adequately lighted? I am quite certain about it.
448. Could any further light be put in at the north-east corner? The front door takes up that position, and it would not be possible.
449. Or on either side of the window shown on the plan? It might be done; but I do not think it would be advisable to touch the structure of the building just there. I do not think there is any need for it.
450. I suppose throughout this building you have complied with the conditions of the City Building Act? Yes.
451. According to the schedule handed into the Committee there are a number of Departments still unprovided for? That is so.
452. Does the general scheme, of which this is a part, embrace a proposed building in which to house these small Departments? No, we have not gone beyond this scheme at present; but there is no doubt that would have to be considered.
453. Do you think this building is larger than necessary for the two Departments to be housed there? Not if a certain amount of allowance is made for natural increase. It is only just the size, and just suitable for the two Departments.
454. I think you stated there is not much prospect of any expansion of the Education Department? I would rather leave that point to be dealt with by Mr. Maynard, who would know better than I. But I judge by the returns as to the number of officers in one year and the number in another year, and also by the fact that the education system is pretty well established throughout the country.
455. Do you think a number of these smaller Departments could be housed in the Lands Office when the Mines Department vacate the floor they have there? I think there should be a rearrangement of the Lands Office to the extent of removing to the first floor some of the officers occupying the ground floor, and then using the ground floor and the basement for a number of these smaller Departments. For instance, the Charities—they should have a ground floor, and they should have a court-yard. Both those could be provided in the Lands Office with great advantage.
456. Do you think the greater number of these smaller offices could be housed there? I think it would take the greater number of them.
457. The Statistician, for instance? I assume the Statistician will go with the Public Service Board.
458. That is in Hunter-street? Yes.
459. And the Fisheries? That would be one; and the Friendly Societies, the Charities, the Electoral Office, the Medical Board and the Pharmacy Board. The requirements of these smaller Departments in regard to space would be represented by 11,000 feet.

W. L. Vernon.  
16 Feb., 1899.

- W. L. Vernon. 460. Very nearly that amount of space would be available in the Lands Office? I think there is very nearly 13,000 feet.
- 16 Feb., 1899. 461. Do you think you will have five rooms to spare for the Statistician's Department in the building in Hunter-street? I think, with a little management, the two Departments themselves could find room on that floor. I take it that so long as a member of the Public Service Board is Statistician he will not require two separate rooms.
462. Some evidence was given a few weeks ago to the effect that the underneath part of the cornices of these buildings, the throating, is more likely to fret than even the more exposed portions of the building;—has that been your experience? That is the experience with Sydney sandstone.
463. In this building, would the cornices be very heavily throated underneath? They must be throated, otherwise the rain would run down the cornices and down the walls. They are bound to be throated. We know as a fact that they do fret; it is a characteristic of the stone, that is all.
464. I noticed from the plans of public building sites in Sydney that a considerable extent of space was outlined for the Australian Museum;—in view of that fact, do you think it necessary to provide a large museum in this new building? I cannot answer that. It is a fact that plans are now being prepared for an enlargement of the Museum itself.
465. It is a question of administration you do not care to deal with? Yes; it is a matter I know nothing at all about.
466. With respect to the staircases, it struck me that a very large amount of space was devoted to the staircase; is that unavoidable in a building of this kind? The staircases are none too large. They are 6 feet wide, and the treads are only just sufficient to rise the height. But owing to the irregular angles of the site, it is an economical plan to take just as much of that site as is required, in order to square the rooms in the corners. It is necessary to take that area for the stairs. Whether I take it in one form or another is immaterial; but I take it in the way shown, because it enables me to square these rooms.
467. How much higher is the building at one end than at the other? Between 11 and 12 feet.
468. Judging from the plan, it must be necessary at the Young-street entrance to provide steps? There are four steps down from the doorway there into the museum, and at the other entrance, there are several steps up to the ground-floor.
469. By dividing the floor-space required by the number of officers to be provided for, a very wide variation is found in the amount of space per officer allotted in the different Departments;—leaving out the Mines Department, on account of the libraries and other special circumstances, I find these variations—280, 150, 187, 231, 220? In the Education Department there are some considerable libraries and stores in which there are no officers. In the Education Department there are 1770 feet without an officer.
470. The special circumstances of each Department will modify any rule as to space? It must necessarily do so.
471. *Dr. Garran.*] As you described the building to Mr. Watson yesterday, it is inside substantially a skeleton building? That is so.
472. And the partitions between the rooms are mere screens, having no structural value? The partitions have no structural value; the piers have.
473. Then you could alter or re-arrange the rooms at any time hereafter? Yes.
474. Without interfering with any walls which carry weight? It is designed purposely for that—for the shifting of partitions, irrespective of construction.
475. Would it cost much to take a wall down? Very little.
476. Would the kind of wall you speak of be as dear as lath and plaster? About the same.
477. It would cost no more to take down than a lath and plaster wall? It would cost no more and would be much cleaner.
478. You could shift these walls backwards and forwards? You could do that. We have gained experience from the Works Office. We have been constantly shifting structural walls in that building, which is a great mistake.
479. So that if these Departments should give up the building, and some other Department required quite a different arrangement of the rooms, you could adapt these screen walls to the new requirements? Quite so.
480. Could you move these walls bodily, without knocking them to pieces? No; a difficulty would occur with regard to the floor.
481. Could you use the same material over again? Yes.
482. It would be a comparatively economical thing to alter the size of the rooms? Yes. It would require no girders, and no cutting or making good.
483. It would not interfere with the safety of the building in any shape? In no shape whatever. And the floor is equally strong in any position to carry the weight that this partition would throw upon it.
484. *Mr. Watson.*] In reference to stone, is there any particular description that you intend asking for? No. We never specify the quarry from which the stone is to be obtained, because that is not an advisable thing. But we should take the best sample offered to us. I do not care whether it came from Pymont, Waverley, or elsewhere. As long as we are satisfied as to the quality of the stone, the quarry is of no matter.
485. Since questioning you yesterday on the subject, I have been informed that the cost of cutting or working the Purgatory stone is something like 5d. per cubic foot more than the cost in the case of the ordinary block stone from Pymont or Waverley? I should not be at all surprised. There is very little Purgatory stone used now.
486. There is some Purgatory stone being used at the Post Office at the present time, and the cost of the working I am informed runs into an additional 5d. extra? I should think that would very likely be the case.
487. So that in comparing the cost of the work under the day-labour system at the Post Office with the cost in the case of any other building, it would be proper, if that is so, to take that fact into consideration? If the whole were built of Purgatory stone it would.
488. To the extent that Purgatory stone is used it would be proper to take that into consideration? Yes, undoubtedly.
489. In this case, you do not think it will be necessary to ask for Purgatory stone? I do not think so. Purgatory stone should be used more for pavements where much wear and tear is expected, and for basements and walls and so-on. It is not at all necessary to use that particular kind of stone for the faces of buildings.
- 490.

490. If it were used for cornices and so on, do you think it would be less liable to fret than the softer stone? I do not think it would—they are both of the same composition.
491. The mere initial hardness of the stone would not render it less liable to the action of the weather? I should be inclined to say it would not. But there are really no means of accurately judging. Purgatory stone is only a modern stone. We cannot tell the effect of years upon it.
492. Being at a lower level, it has only been quarried recently? That is so.
493. Do you know the cost of the recent additions to the General Post Office per foot—that is, as far as the stone is concerned? I made a return a short time since to the Minister, and I think it was 3s. 6d.
494. And that was less than the cost of the work carried out at the Art Gallery? Yes, we calculated one against the other, and we found it was rather less.
495. Is the work at the Post Office done by day labour? Yes; but the return was not sent with the view of comparing the two systems as regards day labour. It is only fair to explain that the character of the work was somewhat different. At the Post Office, there is a considerable amount of plain Ashlar stonework; although against that there is the great height and rise of the building. The Art Gallery on the other hand is all finished work at a moderate height from the ground, and I think that, if anything, the advantage should be with the Post Office.
496. Notwithstanding that they are carrying out alterations instead of erecting a new building? I think so, because there is such a great bulk of plain stonework, and we had the advantage of good cranes.
497. Do you think that the advantage would be to the extent of a difference in cost of 7d. per foot? No; I do not think so much as that.
498. Not nearly that amount? No; I do not think all of it. I am only saying that in comparing the two you must not simply take the figures; you must take other things into consideration, if it is possible to get a comparison. We are quite satisfied with the result of the Post Office.
499. Do you think it would be impossible to get efficient supervision for the construction of this new building by day-labour, or sufficiently efficient? It is not impossible, of course, but there is a limit to the efficient supervision that can be given to any building. A contractor, no matter how large his firm is, will only take work up to a certain extent. Directly the work becomes unlimited or beyond his powers, then he is going to lose money at once. I take it that day-work by the Government should be treated in exactly the same way. When it has reached the limit of fair and close supervision it should remain at that.
500. But I should imagine that the limit would practically depend upon the possibility of getting subordinate officers whom you could entrust with the work. For instance, the Railway Commissioners manage a very big business, and they only manage it by getting subordinate officers upon whom they can absolutely depend. Would it be impossible to get a subordinate officer to superintend the erection of a building like this; I mean, would it be practicable? There is no comparison between railway work and building operations.
501. Are not railway deviations somewhat of the same character? No. In the case of deviation works you cannot have more than three or four items of labour. One item would be excavating in soil, another in rock, and the carting and the levelling. Probably those would be the whole of the items in connection with an expenditure of about £10,000. In the erection of a building you have hundreds of items, and hundreds of different kinds of material, and unless they are bought well, and worked well, and efficiently supervised in every respect, you are going to have a loss at once. That is the difference between the two—one is much more complicated than the other.
502. There is a difference in degree? Yes.
503. You are of opinion that you could not easily get the services of a man competent to superintend this work on whom you could rely? I will not say that for a moment, because I believe there are plenty of people fully competent to carry it out, and thoroughly conscientious, and who would work to the best advantage of the Government; but, after all, the responsibility rests upon those directly responsible to the Minister.
504. That applies to our vast Public Works Department generally? Yes; take my own instance. If I had day work all around me I should feel my position was not worth holding. I could not do it, there would be too much responsibility.
505. But I should imagine that increased responsibility would be recognised in the usual way? Yes, in the usual way.
506. However, you do not feel inclined to recommend the construction of this building by day labour? No. Where there are alterations in buildings, and where there is displacement of officers, which must be specially treated, I think that is a good opportunity. The Minister the other day approved of adding two storeys to the Custom-house by day labour, and that was a case in which the system could be tried to advantage.
507. I understand that the difference in cost in the first instance of which I spoke amounted to something like 7d. per cubic foot. Assuming that it only amounted to 3d. per cubic foot, in a large building such as this, if it were possible to effect the same saving by day labour, would it not be worth while to incur the extra expense if necessary to get another officer to take charge of the work? The fear is that I might drop the 3d. per foot on something else. That is the difficulty. There are so many items—hundreds of thousands of items.
508. Do you know whether any attempt has been made to test the quality of the stone at Cockatoo Island and Glebe Island, on properties owned by the Government. I understand some of the Glebe Island stone has been used on the Parramatta Road, and at various other places, and that the dock at Cockatoo Island was made with the stone there. Do you know whether either of these stones is equal to Waverley? Not for building purposes. At Cockatoo Island there is no doubt the stone is very suitable for dock purposes, where it could be used in large blocks, and where the appearance did not matter; and my experience of Glebe Island stone is that it contains too much iron, and the stone becomes of a very dark colour, and I think decay sets in very quickly. That is my impression of Glebe Island stone for building purposes; but for large sea-wall purposes, I should say it was suitable, where there is no great strain on it.
509. You would not care to recommend it for building? No, not without very great judgment.

John Charles Maynard, Under Secretary, Department of Public Instruction, sworn, and examined:—

J. C.  
Maynard.  
16 Feb., 1899.

510. *Chairman.*] You have been in communication with the Government Architect with reference to the proposed building? I was a member of the Board appointed to consider the propriety of putting up this building, but we did not initiate the scheme. Some years ago an application was made from our Department for more accommodation, but that lapsed in some way, and we heard nothing about it until lately. When it was proposed to erect this building, we were invited to confer with the other Departments concerned.
511. With the view of giving you better accommodation? Yes; of course, our former application was with them.
512. Your present accommodation is not sufficient? It is too small; there is no doubt about that.
513. *Mr. Levien.*] When did the Departmental Board, of which you were a member, sit? Just before Christmas—about four or five months ago.
514. Was that the first occasion on which you were consulted in reference to the matter? Yes.
515. How long have you been in the Service? Thirty years.
516. And as an Under Secretary? Nearly five years. The application for the enlargement of our accommodation was made, I think, some five or six years ago.
517. Did you make that application? No; I had nothing to do with that.
518. How many clerks are now employed in your Department? Clerks and inspectors, and all other officers? Eighty-five.
519. Where are those eighty-five employed? All in the main building, except the cashier's branch, and the clerks of works and inspectors.
520. How many are employed in the main building? Sixty-two.
521. How many rooms are there in the main building? Twenty-four, including stores.
522. Do you find the building much too small? Yes; it is much too small.
523. What is the largest number of clerks employed in one room? Fourteen in the Account Branch.
524. What is the size of the room? It is divided into three, with a total area of 1,200 feet.
525. Have you seen the plans of this new building? Only the plans now before the Committee.
526. Has the Minister seen them? I think not.
527. So that there has been no conference or consultation with the Minister so far as these plans are concerned? No.
528. Are your offices convenient or inconvenient? They are not very inconvenient, except that they are overcrowded. They are very compact, and that is a great advantage.
529. It is an advantage to have them under your direct supervision? Yes; all close together.
530. In regard to the Minister's room—is that sufficient? It is a pretty good room, it contains 408 feet.
531. Do you think that is sufficient for the purpose? I think so. It is not as large as Ministers generally have.
532. Do you think it is sufficient? No; if I were building I should build a bigger one than that.
533. The Minister has had to receive large deputations—has he found no inconvenience owing to the size of the room? It is a pretty good room; I should find no fault with it.
534. The Minister has never made any complaint as to the size of the room, or any want of accommodation, so far as he is concerned? Not that I know of.
535. Apart from the present Minister, have any of the other Ministers complained? Some two years ago, I think, an ante-room was added to the Minister's room. Before that there was complaint that the Minister had no place to wash his hands.
536. Is the ante-room sufficient? Yes.
537. So that there is plenty of accommodation so far as the Minister's room and his ante-room are concerned? Yes.
538. Are you reasonably well provided for? Fairly well.
539. What is the size of your room? 221 feet; that is about 18 by 12 feet.
540. Do you ever have to receive deputations? Only individuals—one or two.
541. And teachers? Yes, one or two at a time.
542. And you find the room quite sufficient for all purposes? I should like it to be a little larger; but I should never grumble about it.
543. Who is the next in command? Suppose we take the clerical staff—the chief clerk, Mr. Gibson.
544. What is the size of his room? 310 feet; that is about half as large again as mine.
545. Do you think that is quite sufficient? Yes.
546. Who is the next? The chief corresponding clerk—he has 189 feet.
547. Is that sufficient for him? I think so.
548. Referring to the room which the Account Branch occupies—what is the size of that? 1,218 feet.
549. Is that sufficient for all purposes? It is very insufficient. That is the worst room in the building, the most overcrowded.
550. What space do you think is wanted for that staff? About 2,000 feet.
551. Do the clerks suffer or complain as to want of air space? Yes; each clerk has a big desk, and when you have fourteen of these desks in a room, they take up a great deal of space.
552. Do you not think that in all these offices there is too much space taken up by furniture and desks? It is not the case in our Department. These desks are all round the walls; the clerks cannot do without them.
553. So that you think there is little enough office furniture for the requirement of the room? Yes.
554. And it is economically arranged? Yes; we have not a bit of spare furniture of any kind.
555. I suppose the great drawback is the want of air-space? Want of space generally. I suppose you might call it air-space.
556. It is a very old-fashioned building, is it not—both the building and the rooms? It is a very old building. I suppose it is the oldest Government building in the city.
557. There are no modern arrangements for ventilation or anything of that kind? No; the ceilings right through the building are very low.
558. Are there any rooms for the security of valuable documents? Only the iron safes. That is one great defect about the building—we have no strong-room.
559. What is the next largest room in the building? I think the Chief Inspector's.
560. How many use that room? Only one.

J. C.  
Maynard.

16 Feb., 1899.

561. What is the size of it? 435 feet.
562. That is a much larger room than yours? Yes.
563. And I suppose he is frequently away from his office? Not very frequently.
564. I suppose he wants a large room because he has a great deal of correspondence and interviewing? Yes.
565. Do you think that room is sufficient? Quite sufficient.
566. How about the ventilation of the room? The ventilation is very bad; there is no proper ventilation. There is none in any of the rooms.
567. So that you want more modern appliances, a more modern style of room as regards air-space, and more modern sanitary arrangements? Yes; and we want store-rooms and strong-rooms.
568. How many are there in the Record Room? Eleven clerks.
569. What is the size of that room? There are two rooms, with an aggregate space of 1,130 feet.
570. What do you say as regards the convenience of that room? It is not nearly sufficient. There is no room to store away the records.
571. And as to the air-space for health purposes? There is no proper ventilation at all.
572. In your opinion, are those two rooms overcrowded? Yes, both of them. There is no more room to store the records.
573. And not sufficient room for the necessary desks, tables, and other appliances necessary to carry on the work of the office? No. What we proposed was to double the size of the room.
574. Are there any more rooms which ought to be enlarged and the air-space increased? The air-space or the ventilation ought to be increased all over the place.
575. Is Mr. Sircom employed in the main building? No, in a rented building. The cashier, the clerks of works, and the inspectors, with the exception of the chief inspector and deputy chief inspector, are all in rented buildings.
576. Are the principal rooms to which you have referred—those occupied by the chief clerk, the correspondence clerks, the account branch, the chief inspectors, and the records—are these all in the main building? Yes. Then there are four rooms, one containing five clerks, and the other three containing four clerks each, and they are all too small.
577. You think they want more modern appliances for ventilation? Better shaped rooms altogether, and a different style of room.
578. I suppose you have a great many interviews with teachers and others who come down in holiday time;—what do you do with these—where do they have to stand? They have to stand about in the passages and in the messengers' rooms.
579. There is no other accommodation for them? None at all.
580. Do you not think it is necessary to have a room into which these persons could go when they come to the office? Yes; we propose that.
581. There is no such room available in the present building? No.
582. In fact, these visitors have to stand about the corridors and passages, and in the messengers' rooms, and wherever they can get? Yes; there is no other accommodation.
583. And I suppose the number asking for interviews during the holidays is very great? Yes; very great.
584. Is there anything further you would like to say with reference to the building, and the increased accommodation necessary? I do not think you could improve the rooms, because that would mean taking the building down, and taking the roof off.
585. What rent do you pay for the rooms occupied by your Department in Young-street? There are two places, for which we pay £200 a year each.
586. How many rooms? One is occupied by the inspectors and the cadet officers. Five inspectors and three cadet officers occupy three rooms. Three doors above that building, in the same street, we rent another place, occupied by the cashier and the clerks of works, for which we also pay £200 a year. In the cashier's office there are six clerks in one room, and in the other room there are nine including the Chief Clerk of Works. There are only two main rooms in that building.
587. There are fifteen persons in those two rooms? Yes.
588. And for those two rooms you pay £200 a year? Yes. The rooms were originally divided by wooden partitions.
589. Are these clerks of works under the Government Architect, or under the Architect for Public Instruction? Under the Architect for Public Instruction.
590. You have a separate architect for your Department? Yes.
591. Are the clerks of works always in these rooms? Yes; they are draftsmen and clerks.
592. They are permanently engaged in the place? Yes, the draftsmen and clerks.
593. What is done with regard to the clerks of works who come from the country;—do they have to go there too? Yes; there is no other place.
594. You have to find room for them when they come? They simply go into the same room—the big room.
595. Do you think there is sufficient accommodation for them? Certainly not; it is most insufficient.
596. What about the light for drafting work? It is very bad.
597. And what about ventilation? There is no ventilation, except by means of the window.
598. Have you had any complaint from the inspectors or clerks in either of these rooms complaining about the air space and ventilation? Not from the inspectors, but the cashier and the clerks of works are always grumbling about it; and not without good reason, for there is no doubt they are very much overcrowded in those two rooms.
599. And I suppose great inconvenience is caused by having to send records to and from the main building? There is not much in that.
600. Do you not think it would be much more convenient for all purposes to have the whole of the officers under one roof? Certainly. Still it does not make any great difference, they are so close to us. It is only just across the road. But it would be better to have them under the same roof.
601. I suppose no interviews take place in those rooms? The officers have to see contractors and people tendering.
602. Do you not think a room is required for the accommodation of contractors and other visitors requiring information? We suggest that in the new buildings.
603. There is no such accommodation at present? No.
604. The Department of Labour is under your control, is it not? Yes; that is in the main building.
605. How many clerks are there in that branch? Six, including the Chief Clerk, a lady inspector, two inspectors, and a clerk.

J. C.  
Maynard.  
16 Feb., 1899.

606. How many rooms have they? Four little rooms.  
607. Is that accommodation sufficient? No.  
608. They want a room also for employers and employees who come to the Department? Yes.  
609. And also for the general public, who have to interview the Chief Clerk with reference to prosecutions in connection with different trades? Yes; we propose such accommodation in the new scheme. We propose five rooms.  
610. Apart from the Labour Branch, of what number does the staff of your Department consist? Seventy-nine.  
611. How many of these are in the main building? Fifty-six, and twenty-three in the rented buildings.  
612. How many rooms did you propose in the new building for the general staff of the Education Department, apart from the Labour Branch? I have here a proposal that was laid before the Board, but it was thought that a building could not be constructed large enough to give the accommodation asked for, and so it was reduced, according to the following figures:—Minister's room, 26 by 20 feet, with an ante-room 15 by 20; Under Secretary, 20 by 20, with an ante-room 15 by 15; Chief Clerk, 20 by 20; Correspondence Clerk, 15 by 15; four clerks in the Correspondence Branch, one room, 30 by 20. That would be 600 feet instead of 627. Practically, we want less room there. Records, two large rooms, 56 by 20, making 1,120; Cashier, two rooms, 28 by 20, or one room 56 by 20; messengers' and waiting room; we want three rooms altogether for them; Clerk of Works, two rooms, 28 by 20 and 20 by 20, and a room for contractors 16 by 16. At present we have no strong-room, and nothing except iron safes standing about the passages. We propose to build two strong-rooms, 20 by 20, for the storage of all our records and valuable papers. At present we have no library or Board-room. It is proposed that we should have a room in the new building 30 by 20. The Chief Inspector is to have a room 20 by 20, which is somewhat smaller than the present room; Deputy-Chief Inspector the same, and a messengers' room and waiting-room 20 by 20. That waiting-room is intended for visitors to the Chief Inspector—the teachers who come to the office. The five inspectors and one country inspector now occupying the rented building we propose to put into two rooms 15 by 15 each. At present we have no store-rooms or dry cellars. We propose to build a large one 30 by 20. This is for stationery, records, and materials to be sent out to teachers. We propose one room 24 by 20 for the Cadet Office, with a military store and workshop. With regard to the Department of Labour and Industry, I have already given the figures. Then we allow three more rooms for further expansion. Our present accommodation is 12,608 feet.

FRIDAY, 17 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

John Charles Maynard, Under Secretary, Department of Public Instruction, sworn, and further examined:—

J. C.  
Maynard.  
17 Feb., 1899.

613. *Mr. Shepherd.*] I think you said yesterday that there were twenty-four rooms in the main building occupied by your Department, accommodating sixty-two officers? Yes.  
614. Are all the rooms occupied by officers? Yes.  
615. Do you think that by some rearrangement you could manage to prevent the overcrowding that seems to take place in some of the rooms;—for instance, the Chief Inspector has a room of 435 feet, and there is another room of 367 feet, in which there are four clerks;—in that case one officer has a great deal more than four officers? The Chief Inspector must have a room for himself. He cannot share a room with any other person, because so many people come to see him on confidential business; and there is no other room in which he could be put. He could not very well change his room with that occupied by the four clerks.  
616. Is there no method by which you could rearrange these offices? I do not think so; it has been tried over and over again.  
617. Is there sufficient space on which to put up an additional room or two? Yes; I think that could be done. But the space is pretty well covered. The space is chiefly in front where the fig-trees are. We have never contemplated building on that.  
618. What additional space do you think would be required on the site in order to accommodate the whole of your officers? The space at present covered by the rooms is about 14,000 feet, and in the proposed new building we ask for 21,000 feet, so that an additional space of 7,000 or 8,000 feet would be required.  
619. You say you have an architect in connection with your Department? We call him the Chief Clerk of Works; it is the same thing.  
620. Have you ever consulted him in reference to providing additional space? Yes.  
621. What is his opinion? He cannot do anything. Of course we could put up new buildings on the same ground; there would be no difficulty about that; but there is not very much space.  
622. And I think you spoke of the ventilation being very defective? It is very bad.  
623. Have you ever heard of any illness occurring from that cause? No.  
624. Have you ever consulted the architect with regard to providing improved ventilation? No.  
625. Considering that in any case it will be a considerable time before the new buildings are ready for occupation, do you not think it would be wise to do so? Yes; that might be done. Some ventilating-tubes might be put in, or something of that sort.  
626. Are you likely to have any addition to your staff in the near future? No great addition, I think.  
627. In the event of Federation being brought about, I do not suppose it would interfere with your Department? That I could not say.  
628. *Mr. Watson.*] I understand that yesterday you agreed with a suggestion that you might be able to point out to the Committee to-day the proposed arrangement of the rooms on the various floors you are to occupy in the new building, if erected? Yes. I went through the plans this morning with the Chief Draftsman, and we allotted rooms to the different members of the staff. It is understood that this is not final,

J. C.  
Maynard.  
17 Feb., 1899.

final, but it will show the way in which the rooms could be allotted. Beginning with the ground-floor plan, it is proposed to place near the entrance the officers who have most business transactions with the public, and who are in the habit of receiving visits from teachers and others. I may explain, that when we came to look at this plan, we found that the rooms have a width of 20 to 25 feet. In the arrangement of our space we had provided for rooms 15 by 15. The room near the entrance, fronting Bridge-street, on the ground-floor, we have given to the Chief Inspector. It is 23 by 16. Opposite the Chief Inspector, on the other side of the corridor, where the rooms have a width of 20 feet, we have put the Deputy Chief Inspector, the size of his room being 16 by 20. Next to the Deputy Chief Inspector there is a waiting-room for the accommodation of persons who come to see the Inspectors, the Accountant, and the Cashier. The other part of the ground-floor on the Bridge-street frontage we propose to give to the cashier, the size being 44 by 24. This would be occupied by six officers including the Cashier.

629. The Cashier would require a great deal of desk space;—I suppose that accounts for the large room allotted to him and his staff? Yes. Then, still on the same floor, we propose to give the northern end of the Phillip-street frontage to the Accountant. We propose to give the Accountant and his staff three rooms, his own room being 12 feet by 23 feet.

630. You think it advisable that he should be isolated from his subordinate officers? Yes; a great many people come to see the Accountant on official business, and they would not care to conduct their conversation in the presence of clerks. We propose also to give a large room, forming part of the inner section of the Phillip-street frontage, to the Accountant, its dimensions being 53 by 20. We give to the Accountant a space of 700 superficial feet on the Phillip-street frontage, and 1,060 feet in the inner section of rooms along the Phillip-street frontage. This makes a total of 1,760 feet for fourteen officers. The next room—65 by 23—in the Phillip-street frontage, we propose to give to the Labour and Industry Branch, representing 1,495 superficial feet of space. This will accommodate six officers.

631. That practically disposes of the ground-floor, so far as your Department is concerned? Yes.

632. Do you think it would be possible to arrange, so that a small waiting-room would be provided for the Labour and Industry Branch out of the space you have allotted to them? I think so.

633. On the first floor, what is the allotment of space? That is where we propose to put the Minister and the Correspondence Branch. On the western end of the Bridge-street frontage, we propose to give the Minister a room, 23 by 25, and further east an ante-room, 20 by 11, and the Under Secretary will occupy a room on the eastern extremity of the Bridge-street frontage with a superficial area of 550 feet. In the Phillip-street frontage, facing the light area, we have the Ministerial waiting-room, 20 by 18, or 360 superficial feet. To the east of that we have the Under Secretary's ante-room, the area of which is 20 by 11. In the Phillip-street frontage, we start at the northern end with an office, 21 x 18. The correspondence clerks, twenty-one in number, will occupy a room facing Phillip-street, 82 x 23, and a room, 42 by 20, facing the light area on the Phillip-street frontage, and then there is a small room for the First Clerk of 20 by 11, which also faces the light area on the Phillip-street frontage. That disposes of the first floor. On the second floor the whole of the Bridge-street frontage will be taken up by two record rooms, one facing the street, and the other facing the light area. These would be occupied by eleven clerks. The records themselves will take up a great quantity of the room. The room at the northern end of the Phillip-street frontage, on the second floor, we propose to give to the inspectors, of whom there are six. The room is 40 by 20, and we propose to subdivide it; and there is another room, 33 by 24, facing the light area on the Phillip-street frontage.

634. Do you think the whole of the space in these two rooms would be required for the use of the inspectors? I think so. The room facing Phillip-street, further south, is to be for the use of the Clerk of Works and draftsmen, the superficial area being 1,486 feet; and facing the light area on the Phillip-street frontage there is a small contractors' room, 20 by 12. I now come to the third floor. On the western end of the Bridge-street frontage, we propose to allot to the Cadet Office, with three officers, a room 22 by 15, with a superficial area of 330 feet. Facing the light area on the Bridge-street frontage there is a room 30 by 20, with an area of 600 superficial feet, which is proposed to be used as a store-room and workshop for the cadets. On the northern end of the Bridge-street frontage there is a library and Board-room with a superficial area of 1080 feet. That disposes of the Bridge-street frontage. On the Phillip-street frontage we come to a part of the building we really do not want. The room at the northern end of the Phillip-street frontage, with an area of 550 superficial feet, might be given up to type-writing and extra correspondence. That is only a small portion of the Phillip-street frontage on the third floor. The balance we have no special need for. On the Phillip-street frontage facing the light area there is a large room of 1,040 superficial feet, which we shall require for stores.

635. *Dr. Garran.*] What stores have you? All the material for the schools, such as forms, and all the stationery.

636. Does not the contractor keep these? No; we have a separate contractor for the books, &c.; but we keep our own forms and stationery.

637. *Mr. Watson.*] Could you give the Committee an idea of the amount of floor-space which you would not require on the third floor? About 1,400 feet.

638. Do you anticipate any great expansion of the Department within the next few years; I mean the administrative part? No.

639. You have skeleton machinery, administrative machinery, all over the Colony, pretty well? Yes.

640. And there might be a material increase in the number of schools without any corresponding increase in the administration of the Department? Yes. The only direction in which there might be a little increase would be in the Accounts Branch and the Architect's branch.

641. Has your Department considered the propriety of transferring the Architect's Branch to the control of the Government Architect? That has frequently been considered. It could not be done. It would be too expensive for us, and it would take too long a time.

642. Is it not a fact that you have practically decided on your various types of buildings, and, therefore, there is comparatively little architect's work involved in the erection of new buildings? Very little.

643. Practically you only require clerks of works? And draftsmen.

644. All your types are practically decided upon? Yes.

645. So that you do not require original plans? No; unless in the case of a peculiar site.

646. And then the plans have to be altered to fit it? Yes.

647. You are quite assured that it is not convenient or economical to remain in your present premises? I think it is economical, because the rent we pay is very small—£400 a year for branch offices.

648. Do you know what is laid out annually on your main building? I could not say; it has been patched up at different times.

649.

J. C.  
Maynard.  
17 Feb., 1899.

649. I mean the amount expended in repairs? I could not say.
650. Does it take much money to keep it going? Very little. It is very soundly built; the walls are very thick.
651. Did you concur in the recommendation or suggestion of the Departmental Board to the effect that that building be pulled down when vacated by your Department? I do not think we recommended anything about that building.
652. I understood there was a suggestion from the Departmental Board to that effect? I do not recollect it.
653. At any rate you have not, so far, concurred in that suggestion? I do not think we considered that at all.
654. If it is economical to continue in occupation of your present building, do you think the Department can be worked with sufficient expedition;—can you get through your work as expeditiously when you have some of your offices a little distance away? I do not think that makes any difference. The distance is so short, it is only across the road.
655. With your knowledge of the conditions under which you are working, do you think it is a proper thing for the State to expend a large amount of money in putting up new buildings? That is a matter of policy I could not express any opinion about.
656. Do you think it is necessary for the proper working of your Department that you should have larger offices than you occupy? It would be much more comfortable. But if you mean, could we go on as we are going for a considerable period, I should certainly say, yes.
657. Without serious inconvenience to the officers or to the State? Some inconvenience to the officers, but not more inconvenience than we have experienced in the past; and what we have done for several years we could continue to do for several years.
658. Do you think, as the result of your remaining, that there would be any serious inconvenience to the public in respect of getting the work done? No; certainly not.
659. And as far as the inconvenience to the officers is concerned, do you think that could be obviated by a better system of ventilation? To some extent, I daresay; but that would not enlarge the rooms.
660. It would make the conditions a little healthier? Yes.
661. I gather, then, from your evidence, that as far as your Department is concerned, there is no urgent necessity for the construction of a building of this character? I should not say there was any great necessity. In fact, we never moved in this matter at all. We have not raised any question about the building; but if you are going to build we should like to have things comfortable.
662. *Dr. Garran.*] You are to have rooms on four separate floors? Yes.
663. If you had your own choice, would you rather have two complete flats or have half of four separate floors? Half of four floors.
664. It would suit you better? Yes.
665. Your Department subdivides itself pretty conveniently. Yes.
666. How often are your country inspectors in town? Never, except on holidays.
667. Then you do not provide rooms for them? No.
668. Do they require desks on which to do any writing when they are in town? No; they never come to Sydney except on holidays.
669. They do all their writing in the country and forward it? Yes.
670. Do the metropolitan and suburban inspectors write up their reports in the office? Yes.
671. Are they out during school hours? Yes; nearly every day.
672. Then they are not much at the office in the middle of the day? You may say that they are at the office every Saturday, and generally one day in the week; and they come to the office every morning to get their correspondence.
673. Each inspector would require a separate desk or table? Yes.
674. But they would not require separate rooms? Well, I think they ought to have separate rooms. A great many teachers visit them on school business.
675. That would be after hours? No; on Saturdays.
676. That is the time when the teachers visit the inspectors? A great many teachers visit them on Saturday morning.
677. And you want to give every metropolitan inspector a separate room? I should not like to put more than two in a room. They work together in pairs. Two will take one part of the town.
678. And the conversation is partly confidential? Partly confidential between the teachers, the inspectors and the public.
679. You say that your plans for schools are all pretty well finished;—but is it nobody's business to keep you up to date, and to see that you are not missing any improvements introduced in England, America, or Germany? I think we all see those sort of things; we get every kind of report from all parts of the world.
680. But you have not all time to read up these architectural matters? I think we have; we do, as a matter of fact.
681. You keep your eye going as to the lighting of schools, desks and seats, and matters of that kind? Yes, every kind of seat that is invented; and we generally try them in practice.
682. You have settled down to what you think is best? Yes.
683. And your inspectors, in their visits to other colonies, see what progress is made in these matters? The officials in the Architect's Branch are very careful indeed to acquaint themselves with all these various matters.
684. You were talking of putting typewriters on the top floor if necessary;—but if a Minister or Under Secretary wanted to dictate to a typewriter, he would want that typewriter close to his elbow? Yes.
685. The typewriter ought to occupy a little room off the Under-Secretary's room, if it could be managed, instead of being in the top of the building? The typewriter, as a rule, is brought down. If a deputation waits upon the Minister, the typewriter comes into the Minister's room.
686. Does he work the machine while the deputation is going on? He does not work with a machine, but in shorthand.
687. But I am speaking of typewriting;—do you use a typewriter yourself? No.
688. I thought, perhaps, the Minister might want to dictate correspondence or other matter to a typewriter? No; we have no cases of that kind.
689. You dictate to a shorthand-writer always? Yes.
690. Do you use typewriters in the Department at all? Only two. But several of the clerks can type-write if we want anything extra.
- 691.

J. C.  
Maynard.  
17 Feb., 1890

691. You think it would not be inconvenient to put all that work at the top of the building? I do not think so.
692. If your Department grows, as it will grow with the population, the number of your inspectors will increase a little? Yes; but that would be chiefly in the country.
693. Only a little in the suburbs? That is all.
694. Could your metropolitan inspectors do an additional number of schools now? They could not do an additional number, but the population in the city could not increase very much.
695. But in the suburbs? The suburbs are all provided for. They come into the country inspectorships. The city we count up as far as Burwood.
696. But your staff is big enough now for an additional number of schools without any increase? Yes, in the country.
697. *Mr. Dick.*] Does the collection of fees and the registration of documents take up much time in your Department? Yes, a good deal.
698. How many officers in the Department are occupied solely with that work? No one is occupied solely. The work is spread over different branches. Some of it is done in the Accountant's Branch, and some in the Cashier's Branch.
699. It involves a great deal of work? A great deal of work.
700. In view of the fact that it is more than likely that education will be made not only compulsory but free, do you think the Department is likely to require nearly as much space as that allotted to it in this building? I do not think that would make any difference.
701. It would not necessitate any material reduction in the number of officers? No.
702. You spoke yesterday of the necessity for strong-rooms;—have you any valuable documents which require to be housed in strong-rooms? We have the whole of the teachers' insurance policies, and thousands of cheques, towards the end of the month, besides certificates. There is a great deal of valuable property in that way which we require to place in a strong room. There are also the records of the teachers—papers with the history of every teacher.
703. How are these documents secured now? In iron safes.
704. And it is absolutely necessary that you should have proper strong-room accommodation? It is very necessary.
705. What are the store-rooms for? The whole of the stationery is stored there. The whole of the correspondence, which is more than two years old, is stored there, and old records going back twenty or thirty years, which we dare not destroy, are stored there. There is a great quantity of matter of that kind we dare not destroy, and must have room for.
706. Then the accommodation is more for old records than for stores? Yes.
707. You allotted certain space for a library;—what sort of a library is it? We have not one at present, but it was always thought that we should have one. Sir John Robertson was very anxious that we should establish a library, and authorised the expenditure of £100 a year for the purpose. We never expended anything, because we had no place to put any books, and so we thought that in this new building it would be just as well to establish a library. It could be used also as a board-room.
708. Would the library consist mainly of works on the art of teaching and allied subjects? Everything connected with education.
709. You have no library in the Department now? No; except individually. There are a good number of books in my office, and a good number in the Minister's office. They are scattered about, and there is no proper provision for them.
710. We had some evidence yesterday from Mr. Vernon, concerning the necessity for a museum in the new building. As an expert in education, do you think it is wise to expend money in the multiplication of museums close to one another? No, I do not.
711. With regard to the arrangement of the furniture, in view of the probability of this building being erected, have you made any inquiries as to any improved method of arranging the furniture for the clerks? No, I have never thought of the furniture at all.
712. Do you propose to remove the antiquated furniture you have at present to the new building if it is erected? We should remove everything, I suppose—everything that is fit for use.
713. Do you not find the present furniture somewhat inconvenient? No; our rooms are so small that we are obliged to put up with very little furniture. We are not extravagant in that respect.
714. In going through the list of rooms, I did not hear you mention any accommodation for the technical branch of your Department? That is already provided for in the Technical College at Ultimo.
715. There is a somewhat growing manifestation in your Department in the way of athletic sports;—is there any provision in that respect? The teachers manage that themselves in connection with their schools.
716. There is no necessity to afford them any accommodation in this building? None at all.
717. In the country districts, is it not usual for the local inspectors to superintend the building of schools to a large extent? The small ones—the small wooden buildings.
718. And in the case of larger buildings, you send your clerks of works? Yes.
719. Do you think you could get accommodation in the Government Stores Branch for the stores you at present keep in your building? I do not know the Government Stores Branch; I do not know anything about the accommodation there.
720. Is there much space used in your present building for that purpose? There is a big cellar underneath the building, into which all the stores are crowded.
721. That cellar would not be suitable for clerical work? No.
722. What officers constitute the Cadet Branch? The Superintendent, Colonel Paul, and the drill sergeant.
723. What work is done in the workshop? The repairing of the weapons.
724. *Mr. Trickett.*] When you went through the plans with Mr. Watson just now, you seemed to have a little difficulty in filling up the space; there was ample space for all your requirements; looking at the minutes of the proceedings of the Board of which you were a member, I see that the resolution come to was:—"That the Public Instruction Department should be provided with 19,676 feet, which would appear to embrace all reasonably-expected increase consequent on further development," and the Board reported accordingly; now we find in the plans placed before us a space of 22,786 feet; that is 3,100 feet more than the Board said was necessary;—does not that seem rather a reckless way of building? According to my allotment of the rooms the space for my Department comes to about 19,000 feet, which is the quantity we wanted.
725. So that in the plan submitted to the Committee for consideration there is a space of 3,786 feet, which

J. C.  
Maynard.  
17 Feb., 1899.

which you will have to find means of filling up or else leave vacant? The space of 22,786 includes the strong-rooms.

726. It was quite evident when you were going through the plan that more room was provided than was absolutely required? Yes; because we allowed something like 2,000 feet for expansion.

727. There are four strong-rooms provided, one on each floor; will they be necessary? I think so.

728. During the discussions of the Board, you stated that a great many visitors attended your Department, and that you would not like to be placed higher than the second floor;—is that still your opinion? Yes.

729. That is for the officers of the Department who come in contact with the public? Yes.

730. But the floors above, I suppose, would be occupied by officers whose position there would not cause any inconvenience to the public? Yes; that was our idea.

731. Are you still of opinion that the accommodation now occupied by the Mines Department in the Lands Office would not be suitable for your Department? It would not be suitable for us. It is too rambling; it is all over the place.

732. So that if new buildings were erected and the Mines Department vacated their present offices in the Lands building, you could not conscientiously say that they would be suitable for the Education Department? I would rather retain our present buildings than take those offices in the Lands Department.

733. They are not desirable? Not desirable for us.

734. Is your Department interested in the museum that would be attached to the Mines Department? No, we have nothing to do with that.

735. Would it be of any advantage to the teachers or students connected with your Department to have a mining museum so close to you? No; it does not concern us in any way.

736. I notice that in the conference of Under Secretaries you said that your Department had the worst accommodation of any of the public offices;—is that still your opinion? There is no doubt about that.

737. You are not pressing for a change, you can get along as you are, but your offices are not suitable or sufficient? That is so.

738. I find this entry in the minutes of the Board:—

Mr. Maynard was of opinion that the outer branch, Labour and Industry branch of his Department, might very well be left out altogether.

Will you explain what that means? That does not refer to the Labour and Industry Branch proper, of which Mr. Clegg is chief clerk. It refers to Mr. Creer's relief branch at Redfern, where 200 or 300 men roll up every morning. I thought they might be left out.

739. You did not wish to make permanent provision for anything of that kind? No.

740. Then again I find this entry—

Mr. Maynard explained that if his Department were to get one complete floor, so far as the actual amount of accommodation was concerned, there would then be no difficulty, but he could not say that his Department would be prepared to accept it. He had thought it might be possible for the Mines Department to remain in its present position. That Department had included a museum in the accommodation asked for. It seemed to him to be open to argument whether it was desirable to have a museum in conjunction with public offices, for the offices were more for the accommodation of the administrative and clerical staffs rather than the working staff and students, whom he understood Mr. Pittman wished to be in touch with.

Are you still of that opinion? Yes.

741. Having that opinion, do you think it would be objectionable to have the Mines Museum on the basement of this new building? I do not think that was the objection. The objection was this:—The idea was that the Mines Department and the Education Department, and some other big Departments—I think the Statistician and the Auditor-General—should all be put in this one building. It was the opinion of the Committee, which opinion I shared, that we might do that, provided the Mines Department did not insist on the museum. But they did insist on the museum, and that drove us to the necessity of recommending this building for the two Departments, and some other building for the other Departments. At first we thought that we could put them all into the one building, until the Mines Department pressed for the museum—they said they could not do without the museum, and so we were obliged to take the course mentioned. That was the reason of the objection to the museum.

742. Further on I find this—

Mr. Maynard thought that the key to the whole position was the museum for the Mines Department. It was evident the Mines Department would have to come out of the Lands building if that provision were to be made.

As the Mines Department insisted upon a large space for the museum, that was the lever, so to speak, which necessitated this new building, in a great measure? The building in connection with the Police and Prisons, and including the Statistician and the Auditor-General.

743. Had it not been for the Mines Department insisting on this museum, then the Public Instruction Department, the Mines Department, the Auditor-General, Public Service Board, and the Statistician would all have been included in one building? We did not work it out, but we thought they might. But when the Mines Department stuck out for the museum we did not attempt it.

744. Although you do not appear to have been closely consulted by the Government Architect as to the details of the accommodation in the proposed building for your Department, do you think, now that you have gone through the plans with the chief draftsman, that the arrangement is all that could be desired for the accommodation of your Department, including the Labour branch? Yes; I think it is more than sufficient, really; but you could not make it less by taking off a storey, because then it would not be sufficient.

745. It is naturally difficult to fit a Department exactly into a given space, and it is better to leave a little room for expansion? Certainly.

746. Do you think you have been a little excessive in your demand for space? I do not think so.

747. You have not spread the Department out unnecessarily? No.

748. I suppose, as far as one can see, the Education Department, including the Labour branch, is not likely to increase very largely as regards its clerical work? I do not think so.

749. The Department of Public Instruction has not increased for many years? No.

750. Therefore, if you got fitted into a building of this kind, it would possibly be all that was necessary for a great many years to come? Yes.

751. If the early closing law came into operation, do you think that would involve a large clerical staff and a staff of inspectors? It might require a few more inspectors, but not a very large clerical staff.

It

It would be like establishing schools. The work would be done at Goulburn, Newcastle, and places like that, and not in Sydney.

752. Although there might be a few more clerks, the work of inspection would be done by the Police? I do not know that. I do not think the staff in Sydney would want to be increased very much. Extra branches might be established in the country.

753. *Chairman.*] In answer to Mr. Watson you gave the Committee particulars of the rooms in the proposed buildings to be allotted to your Department, with the area of the rooms, and the names of the officials who were to occupy them;—could you give the Committee particulars of the area occupied by the officials in the building they at present occupy, so that the information could be used for the purpose of comparison? Yes. They are as follows:—

## PRESENT accommodation in vested and rented buildings.

Designation.	No. of Officers.	No. of rooms.	Area in square ft.	Designation.	No. of Officers.	No. of rooms.	Area in square ft.
Minister .....	1	{ 1 room, 408 ft. 1 ante-room, 308 ft. }	716	Clerk of Works.....	9	1 (rented)	623
Under Secretary.....	1	{ 1 room, 221 ft. 1 ante-room, 170 ft. }	391	Chief Inspector.....	1	1	435
Chief Clerk .....	1	1	310	Deputy Chief Inspector	1	1	308
First Clerk .....	1	1	189	Inspectors and Cadets...	8	4 (rented)	1,230
Correspondence .....	21	5	2,062	Store-rooms (cellars) ...	.....	.....	1,791
Records .....	11	1	1,130	Cadet work-shop .....	.....	.....	176
Accountant .....	14	3	1,218	Labour and Industry ...	6	4	841
Cashier .....	6	1 (rented)	935	Messengers' rooms .....	3	3	407

754. In other public buildings, are waiting-rooms provided? I could not say; I know very little about the other public buildings.

755. Have you ever been in the Lands Office? I have not, except in the part occupied by the Mines Department.

756. Seeing that there are long corridors in the new buildings, do you not think that if seats were placed in those corridors that would answer all the purposes of waiting-rooms? It would not answer very well in our Department, because two-thirds of the visitors are lady teachers.

757. In the minutes of the initial meeting of the Departmental Board, of which you were a member, I find this statement:—

Steps had at that time been taken to ascertain the exact amount of floor space required by the Department, the outcome being that the sum of £18,000 was placed on the Estimates, and voted for the erection of permanent offices for the Mines and Agriculture Department on the vacant block of resumed land facing Phillip, Bridge, and Young Streets. At the same time a provision of £14,000 was also made for the erection of new offices for the Inspector-General of Police and the Comptroller-General of Prisons on the site of the present offices of the Inspector-General of Police.

The sums mentioned there for the two buildings are respectively £18,000 and £14,000;—could you give the Committee any information as to what led to the very great increase since proposed? I do not know anything about that. We were simply invited to attend this meeting to state what we thought would be the best thing to do to provide offices for the Education Department and some other Departments. Anything connected with the money side of the question I know nothing about.

758. Although one proposal grew from £18,000 to £97,000, and the other from £14,000 to £44,810, you do not know how this increase occurred? I know nothing about that.

759. In the minutes of the Board it is stated:—

In considering one like the Department of Public Instruction an increase of requirements must be looked forward to; the total floor-space at present occupied by that Department was about 13,000 feet.

That is the space you now occupy, including the main building and the rented building? Yes; the actual space is 13,608 feet.

760. *Mr. Watson.*] That does not include the cellar or store-room? Yes.

761. You utilise it, and in the new building you will have a corresponding amount of room at least? Yes.

762. *Chairman.*] At the same meeting of the Board the minutes say:—

It was agreed that all the Departments enumerated in the papers be asked to furnish a statement giving the following information:—(a) the number of officers to be accommodated, and their several occupations; (b) the number of rooms required; (c) the same information relative to their present accommodation.

Was that information supplied to the Board? It was supplied by our Department, and I suppose by the other Departments also. That is the information I am working on now.

763. *Mr. Pittman,* Government Geologist, seemed to be very strong on the question of the museum in connection with his Department;—have you any objection to give the arguments he used in favour of his proposal? I do not recollect exactly, but he seemed to think it was not worth while going on with any change at all, unless the Mines Department had the museum.

764. So that it was the want of a museum that led him to recommend the proposed buildings? I think so.

765. And it was thought that if he did not get the museum in connection with his particular offices there would be no necessity to remove the Department. Except as regards the museum, he did not at any time complain of want of space in his present offices? He did not.

766. Is the Technical College under your administration? Yes.

767. What exhibits are there in that museum in connection with mining? Scarcely any, I think.

768. Have you room for any there? No; the room is nearly full.

769. There are mineral exhibits there, are there not? Yes; specimens, but not many.

770. Would not this new museum be for specimens too? I do not know what they propose to put in that museum. I think it is to be largely in connection with agriculture.

771. It is proposed to remove to the basement in the new building the exhibits at present in the museum located in the Domain;—do you know whether it would be possible to find room for exhibits of that sort at the Technical College? I do not think so.

772. Is the ground there all built upon? No; but there would not be any accommodation for that purpose in the existing building.

- J. C. Maynard.  
17 Feb., 1899.
773. You think anything of that sort ought to be concentrated in one building in Sydney? I always thought that.
774. *Mr. Watson.*] It would be more convenient for students? Yes.
775. *Chairman.*] Did the question of students come up in this connection? Not in this connection, I think.
776. Do you recollect what Mr. Pittman said with reference to that? No.
777. Did he ever contemplate having students with him in connection with this museum? That I do not know.
778. It will be required, I suppose, for other exhibits besides minerals? I do not know what they propose to do.
779. The result of the deliberations of the Board was that it recommended that a building be erected at the corner of Hunter and Phillip Streets, and another at the corner of Phillip and Bridge Streets, the latter to accommodate only the Mines Department and the Public Instruction Department? That is so.
780. Having gone more fully into the matter, do you still adhere to that opinion? We did not recommend that those buildings should be put up. We simply said that if they were to be put up, if new offices were to be provided, that was the way we should recommend it to be done. But we did not recommend that those buildings should be erected. That was no part of our business.
781. I suppose the proposal came about in this shape: There were two valuable blocks of land lying idle, and it was proposed to utilise them, and your Department was asked what portion you would require? It was put to us in this way: "If new offices are provided for you, what accommodation will you require."
782. The only objection you have to your present premises, you say, is on account of the height of the rooms, which are too low? The rooms are very low. The ceilings in the main rooms are only 10 feet high, or less, and the ventilation is very bad. The accommodation is not sufficient—not large enough. There is no fire-proof accommodation.
783. Is there any space attached to your present buildings which you could utilise by building strong-rooms for valuable documents? Very little. To do anything of that kind we should have to raise the roof.
784. *Mr. Trickett.*] In reference to the construction of the strong-rooms to be used by your Department, would it be any advantage to you to have a continuous strong-room extending from floor to floor, with a spiral staircase from the top to the bottom, or would it be more convenient to have a separate strong-room for each floor? I think it would be more convenient to have separate strong-rooms.
785. In your Department you are not likely to have very bulky records, nor would communication with the strong-room be necessary from floor to floor? No.
786. Separate strong-rooms would suit you better? I think the arrangement proposed for the strong-rooms is a very good one.

TUESDAY, 21 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Thomas Bailey Clegg, Clerk-in-charge, Department of Labour and Industry, sworn, and examined:—

- T. B. Clegg.  
21 Feb., 1899.
787. *Chairman.*] It is proposed to locate you in the proposed new building? I understand that is so.
788. Have you seen the plans of the proposed building? Yes. Yesterday I saw the plan of the portion of the building which it is intended to allot to our Department.
789. Is it suitable for your requirements? That is rather a difficult question for me to answer. Our Department, of course, is not a fixed Department, such as the Public Instruction Department; but will, I trust, develop as time goes on, so that by the time the offices are erected the accommodation we shall require may be considerably greater than what we require at present.
790. Where are you housed at present? In the Public Instruction offices.
791. At the rear? No; the portion fronting on the space in front of the Metropole.
792. Have you sufficient room there for your present requirements? Barely. It is not sufficient to comfortably dispose of our records, and so on. I may mention that for years we have been collecting information, official and general, on labour and industrial subjects, and I have had to house that information in the Minister's bedroom. As a matter of fact, I had no room in my Department for it. Necessarily, little matters of that kind are a cause of discomfort to us.
793. Have you any idea of the amount of floor space which you now occupy? At present we occupy four rooms. They were originally two rooms, but by means of partitions they have been converted into four. The front office is 24 feet by 18 feet. My own room is 18 feet square. The room of the lady inspector of factories is 18 feet by 15 feet. Then there is a room occupied by two male inspectors of factories, 18 feet x 12 feet.
794. What amount of space is it proposed to allot you in the new building? Roughly speaking, about 70 ft. x 25 ft.
795. That is office room? Yes; that would cut up into five rooms of 25 feet by 14 feet. Of course 14 feet is a very narrow width, and is almost a disproportionate space to the 25 feet.
796. *Mr. Shepherd.*] Which floor are you to occupy? The ground-floor.
797. Do you think the space proposed to be allotted to you there will be ample? Yes, for present requirements. There is a great deal of industrial legislation which may come into force in the course of a few years.
798. Do you think your Department will increase to any extent shortly? Yes; even on its present basis it would have to increase.
799. At present you are cramped for room? Yes.

800.

800. What is the position you are expected to occupy in the proposed new building? It is on the ground-floor, fronting Phillip-street. We shall occupy from the southern end of the building to within about 40 feet of the northern end. T. B. Clegg.  
21 Feb., 1899.
801. Is that the whole of the space which you will occupy? Yes.
802. Do you expect to have that space subdivided? Yes.
803. Into how many compartments? Possibly into five, which would give 25 feet by 14 feet for each room.
804. How many officers will occupy the various offices? There are six officers at present.
805. Then they would almost have a room each? Yes; one room would be for the use of the public. At present we have a large room containing a counter at which we give out certificates, forms, and so forth to the public, who are constantly coming in and out of the place.
806. Do you receive deputations? They are usually received by the Minister, but occasionally a small deputation waits upon me in regard to some minor matter.
807. And the room you would take for yourself would be the same as the others? Yes.
808. In the event of your Department enlarging, do you think you will have room for any additional offices? I am afraid the space allotted to us, in view of the future, is rather limited.
809. Have you estimated the number of cubic feet you will have in each of the offices? No, I have not taken the cubic feet into account, but I have taken into account the superficial area of each room.
810. *Mr. Watson.*] Have you any waiting-room at present? No; the people at present wait in the passage.
811. Is there any probability of factory hands occasionally waiting upon some of your inspectors? That happens very frequently.
812. Would it not be advisable for them to be accommodated somewhere with a waiting-room? Yes; it is a very unpleasant thing to have a string of people leaning up against the wall of the office waiting to come in.
813. I presume a number of them do not care to be too particularly noticed by the public? No; many people send their children to the Department.
814. Then it would be a convenience to you to have a waiting-room? Undoubtedly; certainly for the women.
815. You do not think you will be able to provide that out of the space which has been tentatively allotted to you? No. The light is only to be obtained from the Phillip-street side, and if we attempted to cut up the space and go back from the Phillip-street frontage we should have no light. We might cut up the space into two sections, and make some smaller rooms, but there would be no light.
816. You are compelled, then, to have the rooms 24 feet one way? Yes. If we have five rooms we shall only have a breadth of 14 feet each, which is not much more than the breadth of a passage.
817. I understand that out of the space nominally set aside for the Department of Public Instruction there will be something to spare on the top floor;—would it be possible to re-arrange the disposition of the various branches to allow you to have more room on the floor you are supposed to occupy? I think it is desirable that a Department such as ours, where we have so many strangers coming in and out, should be as easy of access as possible. For people to climb staircases and lose themselves in corridors would be a disadvantage.
818. If, on the floor to be occupied by the Public Instruction Department, there is a large space to spare, would it not be possible to re-arrange the room on the floor you are to occupy with a view to giving you more accommodation? I should think so. I do not know what the Public Instruction Department may think about it. They might be inconvenienced by doing that, but personally I think it might be arranged.
819. In any case, you think it would be a great advantage to the public for them to have waiting-rooms provided? I think so. Our Department is peculiarly in touch with the public. Many people who are not accustomed to public offices come to us.
820. And they desire to be as private as possible? Yes. The accommodation should be as easy of access and as private as possible.
821. In the event of the Early Closing Bill being passed, do you think it will increase the number of officers in your branch? I do not know. I can say nothing about that. In some of the Colonies legislation of that kind is administered through the police, and in others partly through the police and partly through the factory inspectors. Possibly, in this Colony, it would be administered partly by the factory inspectors in regard to some matters, and partly by the police in regard to other matters.
822. If the police have the enforcement of the provisions of such an Act, would it not take a lot of work off your Department? Yes; but there are certain other matters to be considered. For instance, a shop may close its shutters and yet continue work, and a policeman would have no power to enter, but would, ordinarily, be a trespasser if he did so. Work may be going on behind closed shutters, and I think a factory inspector should be given power, not given to a policeman, to go behind those shutters. Under the circumstances, I think the factory inspectors would have to exercise some partial control. Of course they could not patrol the streets to see that every shop put its shutters up.
823. Do you anticipate that the enforcement of the provisions of the Act would mean an increase in the number of your officers? Undoubtedly.
824. Sufficient to necessitate your having more accommodation than is provided in the plan? Yes.
825. *Mr. Trickett.*] Will you tell us what functions your Department exercise? The Department have control of the Government Labour Bureau, the administration of the Factories and Shops Act, the carrying out of works at the West Bogan in connection with the unemployed—that has partially to do with the Lands Department—and the control of the Government Labour Farm at Pitt Town, the old co-operative settlement, which has been turned into a farm for the unemployed.
826. You have stated that you expect that the Department will considerably develop;—will you tell us in what particular line you think it will develop? There were two measures before Parliament last Session which, if passed into law, would, probably, have increased the duties of the Department. One of these was the Conciliation and Arbitration Bill. Although the Bill was introduced by the Premier, I think the carrying out of its provisions would have come under our Department. Then the administration of the Early Closing Act would, in some degree, come under our Department.
827. The administration of the Early Closing Act would not entail much extra clerical work, but would necessitate an inspectorial staff? Yes, an inspectorial staff. Of course, incidentally, it would add to the

- T. B. Clegg.  
21 Feb., 1899.
- the clerical work. Then there are other matters which are contemplated, and which have been mentioned from time to time. One is the registration of the registry offices of the city. That would also entail additional inspection. Then there is the Land Boilers Act, which has been contemplated for many years, and which would also increase the staff considerably.
828. I believe that in New Zealand there is a Trades Disputes and Conciliation Act? Yes.
829. Do you know whether that has involved the employment of a large staff? Yes; but not directly. The duties away from the central office are undertaken by officers who have other duties in connection with the Government. It increases the duties of certain officers in certain districts. It does not mean the creation of a new staff.
830. So that, in view of many of the measures which have been already considered, you think that extra space will be required? You will see from what I say that the matter is very much *in nubibus*. The Department may be a large one, or it may continue in its present proportions. Still there ought to be room left for expansion.
831. Looking at the space proposed to be allotted to you, do you think there is sufficient room to accommodate the Department likely to come under your control? Assuming the measures referred to were passed, I do not think there would be anything like sufficient space.
832. Supposing you got the block on the south-east corner, would that about accommodate you? Yes; that would add to our accommodation.
833. Does your Department come much in contact with the public? Yes; very much. A great number of boys and girls and men and women wait upon us. Men who appeal from the decisions of the Labour Bureau also come to us.
834. So that it is desirable that you should be on the ground, or first, floor—the ground floor for choice? Yes.
835. Are you in touch with the Labour Bureau by telephone? Yes.
836. Is it desirable that the Labour Bureau should be away from the central office? It is altogether desirable.
837. The Labour Bureau, I suppose, requires a considerable space of ground? Yes.
838. The inquiry office for the purposes of employment, and so on, is not in the head office? No; that is at the Bureau. Situated, as we are, we have a great number of inquiries of various kinds. People come into the offices to make inquiries, and, of course, we refer them to the various Departments.
839. I suppose all the people who come under the designation of unemployed are referred from your office to the Bureau? Yes.
840. And that will continue? Yes. If they happen to be in town they may come to the office, and we should telephone to the Bureau for any information they might require; but for the purpose of finding employment and for registration they are sent to the Bureau itself.
841. Do you contemplate that the inspectorial duty will be carried out by special inspectors or by the police—I am referring to early closing? Of course, it would take an army of inspectors to patrol the streets and see that the shops were closed. That part of the duty would, I think, have to be done by the police.
842. Otherwise the expense would be largely augmented? No doubt. On the other hand, I should think shopkeepers would resent policemen entering their premises simply because they saw a light in their windows after the shutters up, whereas an inspector in private clothes might very well enter under special authority.
843. What is the practice in New Zealand? They have a peculiar arrangement there. They frequently, I understand, appoint officers holding other appointments, such as sergeants of police, to be inspectors of factories in the country districts, and so work the two together.
844. In large towns and cities that could not very well be done? No. In Victoria, although the early-closing clauses are part and parcel of the Factories Act, they are administered by the police. The police report breaches of the Act to the Factories Department, and the Department then takes action and calls the police as witnesses.
845. Does that work satisfactorily? I think so.
846. Of course, if there were a large army of inspectors their housing in your Department would not be possible? It would not be possible.
847. You do not anticipate having a large army of inspectors to house? No. Of course we should have to increase the staff. I think that even now it ought to be increased. My own opinion is that to carry out factory legislation properly we want night as well as day inspectors.
848. *Mr. Dick.*] Is not your Department, in many respects, a Police Department? Yes; if you mean in the sense of inspection and control.
849. Do you think it would be advisable to house you in the same building as the Inspector-General of Police? It depends very much on what the Inspector-General of Police thinks. I daresay he imagines that the police are already burdened with too many duties.
850. Do you think it would be advisable to house your Department in the proposed building at the corner of Hunter and Phillip Streets? I do not think it would be advisable. In many respects we run into the Public Instruction Department. For instance, our inspectors, on visiting the various factories, find children at work who are under the Public Instruction age, and we thereupon report the cases to the Public Instruction Department, and they make inquiries. Each Department helps the other in that respect very considerably.
851. Then you do not think that with the extended operations which new legislation will force upon you, you could work your Department more economically in immediate conjunction with the police? I do not know. As far as present factory legislation is concerned, I should say no. Of course, under the Early Closing Bill, we should come more in touch with the police, but so far we have not come in touch with them.
852. Do you think, under the legislation you have indicated as being likely to be passed soon, any economy could be brought about in your Department by placing it close to the Police Department? Assuming that the Early Closing Bill were to be universal—to extend to the whole of the Colony—it might be economical to adopt the New Zealand principle of getting the sergeants of police to act as local officers. They, of course, would supervise the early closing clauses so far as seeing that the shops put up their shutters.
853. You said it would be necessary to cut up the open space allotted to you into five different rooms? If we are to have five rooms, they could only be 14 feet wide each.

854. Do you think it will be necessary to cut up the space proposed to be allotted into five rooms? Yes.
855. Would that enable you to exercise efficient control over the whole of your offices? I think so. We must have space for a general office. There must also be a room for the lady inspector to interview women. I require a separate office myself. Then there must be one office at least for the inspectors. That consumes four offices, and a fifth is required for the purposes of the storage of records and so on. That leaves no provision for a waiting-room.
856. Did you point out to the Under-Secretary the desirability of having a waiting-room for your Department? No.
857. Do you think accommodation can be obtained in your suite of offices for a waiting-room by a re-arrangement of space? I think so. I think if we had the whole of the space from north to south facing Phillip-street, it ought to provide us with sufficient accommodation. At present it is only proposed to give us two-thirds of it.
858. *Dr. Garran.*] Who will occupy the space you would like to get? The Accounts Branch, I think.
859. If that branch could be cleared out, you think you could usefully occupy the whole of the frontage? Yes.
860. What you want is a room for yourself, a room for the lady inspector, a room for the other inspectors, a general room for the public to come in and a waiting-room? Yes.
861. And the whole of those rooms are not at present provided for you? No.
862. I take it that if your Department grows, it will probably be in the number of inspectors? The increase of inspectors will necessarily involve an increase of the clerical staff.
863. You will want another clerk? Yes; for example, in connection with the Factories and Shops Act there is a good deal of clerical work. The work is carried on under a system which economises clerical work, and which enables us to keep a record of every visit paid to every factory, and the instructions given in connection with that particular visit. For boiler inspection we should require a record of that kind.
864. How many clerks proper have you now? One.
865. And he practically has a room to himself at present? We have also a typewriter, who combines the office of messenger as well.
866. Do you make use of the typewriter yourself? I usually scribble my letters on paper and send them to the typewriter. I do not dictate by word of mouth.
867. When you went to your present offices, did you turn out any of the Education staff? Yes.
868. What became of them? The room they had occupied was a large barn-like apartment which was cut up into smaller rooms, with a passage, for us. Then they migrated to offices near the Métropole.
869. If you have taken five rooms out of that Department, you must have squeezed some one out? Yes; the Clerk of Works, and, I think, the cashier.
870. Are they occupying rented buildings? They are occupying premises near the Métropole; I believe they are rented.
871. And your going into the office has been the means of causing rented premises to be occupied? I am not sure that they were newly rented. Still, we squeezed them out.
872. And not to their convenience, I suppose? Necessarily not. They are not housed under the same roof.
873. Have you to be in frequent communication with the Minister? Yes.
874. Would it be inconvenient for you to be away from him? Very.
875. Does your Department have any other analogy with the Education Department than the one you have already mentioned? I cannot say that it has.
876. There is nothing which specifically attaches it to Education beyond that? No. Our officers fulfil the duties of Truant inspectors to a certain extent. If they find boys in factories when they ought to be at school they report the matter.
877. Your evidence is to the effect that you are not overcomfortable where you are, and you could comfortably use the whole of the Phillip-street frontage on the ground-floor? Yes; that is assuming that contemplated legislation is passed into law.
878. *Mr. Shepherd.*] What duties are the inspectors called upon to perform? First of all every factory inspector has to register with us; then an inspector sets out methodically and goes from one to the other, and sees that the provisions of the Factories Act are complied with. If they are not complied with, he gives instructions that they shall be. If, on repeated occasions, he finds his instructions have not been carried out, he reports the matter, and it rests with the Department whether the owner of the factory shall be prosecuted for not adhering to the provisions of the Act. He takes district after district and street after street, until, in the course of the year, the whole of the factories are exhausted. If he gives instructions at any of the factories he has to call again to see that they are carried out. Then a quantity of industrial statistics are gathered from the employers. We have to send in certain returns, and at certain periods of the year the inspectors cease inspecting for a month or six weeks, and employ themselves wholly in dealing with these returns.
879. I suppose the inspectors visit the whole of our large manufacturing institutions? Yes; and the smaller ones too. Then there is the lady inspector who, to some extent, doubles on their work.
880. How many inspectors have you employed at present? Two male and one female inspectors.
881. Are they able to do the work efficiently? We do the work, I think, as efficiently as a staff of that number could do it; but I have no doubt that there are evasions of the Act which escape us.
882. How often are they supposed to visit these establishments? That depends on circumstances. If they go to an establishment, and find that the law has been complied with, and there is no reason to think there will be a violation, they may not call again for six months, but if they go to a place where they see systematic violation, they may drop in a week or a few days afterwards.
883. In fact, they like to take the establishments unawares. Yes. If we were to send notice beforehand, they would be prepared for it.

T. B. Clegg.  
21 Feb., 1899.

Duncan Clark McLachlan, Under Secretary, Department of Mines and Agriculture, sworn, and examined:—

D. C.  
McLachlan.  
21 Feb., 1899.

884. *Chairman.*] The part of the building which it is proposed to erect is, I believe, intended to accommodate the Department of which you are the Under Secretary? Quite so.

885. Before representing to the Government the necessity for this extra accommodation, were you very much inconvenienced in your Department? Very much indeed; in fact, it is so crowded and scattered that it is difficult to manage the business. We have a variety of branches, all representing very important interests, and we have a great deal to do with the general public. These branches, being scattered in different parts of the city, it is very difficult to manage the business expeditiously or satisfactorily. When the public come for information they have to be sent to Lower George-street, or some other part of the city instead of being able to get it in the building where, I think, they ought to get it.

886. You say your officers are scattered over various parts of the city;—do they occupy any rented premises? Yes. The Stock Branch occupies a house in Young-street, for which it pays £175 year.

887. How many clerks have you there? Twelve. Probably fifteen would have to be housed there, because very often stock inspectors come in from the country, and have to be found office accommodation.

888. Do you know what average space is occupied by the Stock Branch? About 1,300 square feet; that is including the store rooms.

889. What other private buildings do you occupy? We occupy the old Naval Stores in Lower George-street, for which we pay £150 to the Treasury. The Board of Exports have a room in Young-street. These houses it is proposed to demolish.

890. Are those stores the property of the Government? Yes.

891. And the Treasury charge you £150 a year for what you occupy there? Yes.

892. Do they charge anything for the offices you occupy in the Lands Buildings? No.

893. Do you know of any reason why they should charge for one lot of buildings, and not for another? I do not know, unless it is because of the commercial aspect of the case. The Government have a lot of houses which have been resumed at different times. They were placed in charge of an officer who is supposed to make them pay. He is supposed to get rent for all the Government buildings under his charge. He assessed the one we occupy at £150 a year.

894. Did the Government resume that? No; I think it was an Imperial building, which was transferred. For the house in Young-street we pay £32 a year. I suppose the Government wish to get the interest on the money they have spent on the building, therefore they charge rent to whoever occupies it. The only private outside office we have is the Stock Branch, for which we pay a private individual £175 a year.

895. You say you are so cramped for space in the present building that you have had to seek accommodation elsewhere? Yes.

896. Who are in the Commissariat Stores? The Agricultural Chemist, the Fruit Expert, the Dairy Expert, and the Entomologist.

897. Are they sub-Departments, in regard to which the Ministerial head has to be in anything like daily communication? No, but the public are in almost daily communication with one or other of these officers. Naturally they come to this building, as being the Agricultural Department, to make inquiries, and when they get there they find they have to go to Lower George-street, and, of course, some people complain.

898. But that would only occur once to that individual? It would only occur once to that individual. Of course, the dairying interest is a very large one, and a great number of people come to see the expert to obtain advice, and there is a great difficulty in finding him.

899. But there would be the same objection when the new buildings were erected;—they would have to inquire where you are? There would be an indicator, and a messenger to take them there at once. Again, some people come from the country and want to make half a dozen inquiries in the Agricultural Department. For instance, they may wish to make inquiries on the stock question, and they come to the Stock Branch; then they want to see the dairy expert, and they have to go somewhere else to find him. Very frequently the man has a mining commission to attend to as well, and he has to be sent all over the place, whereas there should be one building in which he could complete his inquiries.

900. So that this proposal is not altogether in the interests of the staff, but is a good deal in the interests of the public? Quite so. I may say that ours is an expanding Department, and will, I believe, grow at a much more rapid rate than any of the other Departments. We have extended a great deal during the last two or three years, and that extension will go on, and we shall want more of this outside accommodation.

901. Do you know the site of the proposed building? Yes.

902. The evidence we have is that the Government is in possession of certain lots of land which are very valuable. That is one of the reasons it set forth for erecting rather expensive buildings upon them. Having put up the buildings, you would have no difficulty in finding clerks to put into any of the rooms there are to spare? I do not say that because a man is a clerk he should be given a room. I believe in concentrating the work, and putting as many clerks as possible into a room. The Committee when they visited the Department no doubt observed that our rooms are crowded with clerks, and that there are very few instances where a man has a room to himself.

903. What is the average floor-space for your officials? As the building is designed, I understand there is allotted to our Department 51,932 square feet, but out of this there has to be deducted 23,980 square feet for rooms, which would be used for a museum, strong-rooms, a board-room, and so on. That leaves 27,952 square feet. That is equal to about 14 feet by 14 feet per man, that is with the present staff; but, as I say, I believe our Department is a rapidly-extending one, and the space per man will be correspondingly decreased. Thus, to allow 14 square feet per man at the present time, is not in any way extravagant.

904. I suppose you know that there is a proposal to give the whole of the basement to your Department for a museum? Yes.

905. What do you propose to put in it? We propose to make it principally a mining museum; also an agricultural museum. We have a Colony which boasts that one of our greatest productions is minerals; we invite people to come here to invest their money in minerals. A stranger coming here is staggered, because he cannot find any place where he can see them. There is no place in Sydney where you can see a display of the Colony's mining industry. I think that, even as an advertisement, it would be a very fine thing for the Colony to have a good museum. A stranger comes here, and wishes to invest in some  
of

D. C.  
McLachlan.  
21 Feb., 1899.

of our mining ventures—perhaps it is an outside metal, such as bismuth—and he wants to know where he can see some of it. The only place to which we can send him is the shed in the Domain. I think it is a disgrace to the Government, and to the Department to have that as a museum for the minerals of an important Colony like this. The effect on a man who wishes to see what we have in the mineral line is, I think, the opposite of satisfactory. Further than that, the minerals we have in the museum are very valuable. They are special minerals. They have taken years to collect. When the Garden Palace was burnt down, there was a fine collection of minerals—the best in the Colonies—but they were all destroyed, and the collection had to be started *de novo*. Some of the specimens can never be replaced. Therefore, we require a museum where they can be properly housed and protected.

906. What do you propose as regards agricultural exhibits? When the seasons are on, we propose to bring down typical specimens of what we can grow. We are just on the eve of being able to export wheat. We expect numbers of buyers from all parts of the world to see the wheats, and we would like to have typical samples from the different districts. We should also show wools, or anything else which we thought worthy of showing as the products of the Colony.

907. I think Mr. Pittman has stated that unless you got that museum you might as well be housed where you are? He was, I think, only speaking for himself.

908. I understood that he was representing your Department, not simply himself? If he said that, he must have had in his mind only his own particular branch, because he knows nothing of the inconvenience of having the scattered branches, because he has nothing to do with it.

909. *Mr. Watson.*] What number of officers have you? 143.

910. What space do you occupy inclusive of the rented buildings? The total space we now occupy, including the museum, is 43,455 feet.

911. What is the space, exclusive of the museum? About 36,000 square feet.

912. That leaves about 7,000 square feet at present occupied by the museum? Yes.

913. Then, it was proposed to increase the museum space by about double. Instead of occupying 7,000 feet in the Domain, you will get 14,000 feet in the basement of the new building? Yes. We should display much more in the Domain if the building were a suitable one. We shall have many more exhibits to display in the new building. At present we are not exhibiting anything at all in the agricultural line. We want to make a big display of timber and that sort of thing. Further than that, it is not safe to display the articles in the Domain building. We have had specimens of diamonds stolen out of the cases. We have valuable gold specimens, but we cannot show them; we have to lock them up in the Mint. The Domain building is a most insecure place. We have a watchman there, but it is a large rambling building, and he cannot watch every case that is there.

914. Is there in the Domain building an exhibit of timber now belonging to the Mines Department? Yes; but a very small one.

915. And you contemplate removing it to the new building and adding it to it? Yes.

916. The Lands Department seems to have the idea of putting up specimens of timber in a portion of the space now occupied by the Mines Department;—there seems to be a desire for an enormous number of these museums all over the place? I think it would be a mistake. I think there should be one museum where anyone can see all the products of the Colony, and as all the producing interests are centered in our Department, I think it is the most suitable place to show them.

917. Are there any other museums where exhibits of this character are to be seen;—are there any mineralogical specimens at the Australian Museum? I do not think so—of the kind suitable for the practical miner.

918. I suppose the main feature there are the curios, rather than a scientific explanation of the Colony's resources? Yes. In addition to that you want a curator in charge of the museum who will be able to explain the specimens.

919. I suppose each branch of the Australian Museum has an officer in charge who has a knowledge of that particular branch? I do not think so. Besides a man wants to be able to explain all the characteristics of the country surrounding the minerals which are displayed.

920. Practically, you want a mineralogist? Yes.

921. Are there any exhibits similar to yours in the Technical College? They have a museum there, but it is only for teaching purposes.

922. Has the Department considered the wisdom of concentrating all this museum so that the students might have a larger range in the one building? I have not considered that, but I do not think it would be a very practical idea, because a geologist requires his museum alongside him. To a geologist a museum is the same as a kit of tools to a carpenter, which must be alongside him. If a man comes to the Mines Department to make inquiries about minerals he must be at an advantage if there is a museum on the spot. If he has to go somewhere else, he perhaps does not bother. Anyhow, it is not so satisfactory to the Department or to the inquirer.

923. Have you seen the plan of the proposed new building, and of that portion to be allotted to your Department? Yes.

924. Do you think the space is sufficient? Yes.

925. Have you attempted to allot the positions to be occupied by the different branches? No. I may say that I am satisfied with the amount of accommodation proposed to be allotted. My main idea is to get all the Departments into one building.

926. You asked for 51,000 feet, and you have been allotted between 3,000 and 4,000 feet less than what you asked for? Yes.

927. In what way is the difference to be accounted for;—had some of the officers extravagant ideas? I presume so. The space at any rate was cut down.

928. Do you think that, with the reduced space, you will have satisfactory accommodation? I am certain of it.

929. In going through your Department, in common with other Departments, the Committee were struck by the immense quantity of furniture in some of the rooms, which took up a great deal of space;—would it be possible to rearrange the furniture,—that is, the desks and so on—on a more modern plan and so save room? The rooms seem to be crowded because there are pigeon-holes and that sort of thing, but if you take the pigeon-holes away, it will not give any more floor-space.

930. But in some of the rooms, it did not seem possible for the clerks to move about on account of the number of tables;—would it not be possible to provide long desks for some of the purely clerical staffs?

No;

- D. C. No; where the Committee saw they were crowded they were connected with records, and it is necessary  
 McLachlan. that they should have their papers beside them.
- 21 Feb., 1899. 931. Have you seen the new arrangement of desk room in the Treasury? No.
932. I understand there has been some re-arrangement there which has saved a good deal of room? I can understand that in the Treasury, because it is a bookkeeping department. If you have a miscellaneous department with thousands of papers, and several different branches, each man must have his papers about him, otherwise he loses time.
933. It seems that each Department has a plan of its own in respect to the accommodation of clerks;—do you think it would be possible to arrange for a Board to consult with the Government Architect with respect to the arrangement of the furniture of new buildings with a view to saving space? I think that in all later buildings that has been done. They have arranged a new system of furniture, but of course in the older Departments the furniture has grown with the Departments.
934. In your case it has been carted from one Department to another? It has been the cast-off from all the other Departments. Our Department has been growing very rapidly, and everything, whether suitable or not, has been sent to us—tables of all shapes and sizes. Of course it was economical to do that, because they were in the store. They were sent to us, and that is why the furniture seemed to be such a mixed lot.
935. There seems to be a danger from fire in respect of the wooden pigeon-holes—much greater than if the pigeon-holes were made of steel? That is so.
936. Do you think steel pigeon-holes would be preferable? I do. All public records ought to be in some strong room.
937. Have you noticed the strong-room accommodation in the proposed new building;—the area of it is 1,380 square feet;—do you think that would be sufficient for you? I think it would be ample for half a century ahead, and that ought to be provided for. We never destroy our records. In a strong room like that you can utilise all the space to the ceiling. You could have centre space also, which you could run up to the ceiling.
938. In that case, you could utilise the steel pigeon-holes? Yes.
939. A suggestion has been made as to the desirability of having a spiral staircase, instead of a strong room, with a view to giving access to each floor? I do not think it would be used. Any one wanting to go from a couple of floors below would get into the lift.
940. And you think that would be sufficient? Yes; and you would get up much quicker than you would if you went by a spiral staircase.
941. It is not proposed to light the strong rooms from the outside, but by means of electric lighting;—do you think there is any necessity for a window for lighting? I think an artificial light is sufficient.
942. You say that in your opinion the Department will probably increase in size? Yes.
943. Do you refer to an increase in the number of branches, or in the staff? In the staff.
944. Presuming the same number of branches were included in your Department, you anticipate there would be a large increase in the staff? Yes.
945. I take it that you think it is absolutely necessary that the alteration should be made so far as your Department is concerned? That is so.
946. The ventilation is bad? Yes. The space is too crowded for the officers who are there.
947. *Mr. Trickett.*] Mr. Pittman appears to have been the representative of your Department at the Board of Inquiry? Yes.
948. He made a great feature of the necessity for a museum? Yes.
949. Do I understand that is required, not merely as an ordinary museum for people to look at, but really for administration purposes? That is so.
950. To be an object lesson to assist applicants and others to see what they actually want? Quite so. In addition, it would help the officers to conduct their business in making reports. People send down specimens, and want to know what they are and how they are. Constantly geologists have to refer to specimens from different districts of the Colony, and they would be in the museum.
951. It would differ from an ordinary museum in that respect, and would be really part and parcel of the working of the Department? Quite so. It would be impossible to conduct the Mines Department without a museum and specimens.
952. Have you or Mr. Pittman been consulted as to whether this museum on the basement will be suitable? Mr. Pittman has. At first he had some doubt about it, but he has now been convinced that it will be suitable, and that there will be sufficient light in it.
953. And also that it will not have the disadvantage of an underground place in regard to damp? Yes. He has been satisfied on that point by Mr. Vernon.
954. It was also emphasised by the Board that the concentration of the whole of your Department was necessary for its economic working;—is that one of the main objects you have in asking for more accommodation? That is one of the main objects—that and the want of accommodation in the main building.
955. I believe the principal part of your Department was housed a little time ago in the Lincoln's Inn Chambers? Yes.
956. You have grown very much in your requirements for office accommodation? That is so; but that is a very much larger building inside than it appears to be outside. That particular building only housed the Mines Department. The Agricultural Department had a house in Macquarie-street. The Stock Branch was in Phillip-street, in another house. Then, you could scarcely say the Agricultural Department was in existence. It has grown since.
957. On the top of this building it is proposed to put your analytical and assaying staffs? Not the assaying staff—that is at Granville.
958. Seeing that you have works up the line, why do you want an extended assaying office in the main building? We want laboratories—an agricultural laboratory, for instance. There we test all the soil. If a farmer sends in any soil we test it. We also test the wheats for their value, the amount of gluten that is in them, bran, and so forth, in order to show which is the best bread-making wheat. Then we have to make experiments in connection with the diseases in fruit. We get all sorts of things of that kind sent in. Then we have a dairy expert, who has a laboratory and makes all kinds of experiments with milk. He tests the milk for tuberculosis. He also cultivates bacteria of all kinds. Those are the laboratories which we intend to put in the building. There is also the Stock Department. Of course, there

there are numbers of diseases which affect stock, and they would be sent to these laboratories to be examined.

959. Does your bacteriologist go in for incubating microbes, and that kind of thing? Yes. The dairy expert cultivates them.

D. C.  
McLachlan.  
21 Feb., 1899.

960. Will all that be done in the new building? Yes, on the top. He prepares now ferments for ripening cream. We give them to factories.

961. Is it usual to have manipulations of that kind in a main building such as this? No, excepting that that is his particular office, and people come to see him there. He can walk out of his office and demonstrate to the people what he has told them.

962. But I mean as regards locality;—do you think it would be suitable to have a large chemical establishment like that on the top of a fine building, such as this would be? I think so. There is nothing dangerous about it.

963. Will you have a mineral laboratory there as well? That will be at Granville, where the works are.

964. Will it be convenient to send all these small tests to Granville? Yes; that is where we send them now.

965. Do you and the Mint work together with regard to the analyses of minerals? No; they do nothing but mint the gold.

966. Do you see in the near future a probable extensive enlargement of the staff of your Department? I do, as the Colony gets populated, and the land is taken up. We ought to be a producing colony, and as all the producing interests are centred in our Department it must grow.

967. Have you had regard to that in considering the plans;—do you think that for the next ten years there would be sufficient accommodation for you? Yes; I think so. We have allowed a fair margin for growth.

968. What branches has your Department under it? There are the Mines Department proper, and the Agricultural Department. There are the Stock and Pastures Branch and the Country Towns Water Supplies and Artesian Boring.

969. Country Towns Water Supplies after construction? Before construction—the Water Conservation Branch. I refer to water supplies for mining townships, outside municipalities, and also to the water supplies on the stock routes of the Colony. Then there is artesian boring. We also have all the stock interests and the pastoral. Diseases in stock, of course, come under the Stock Branch. We have to deal with all fruit and vegetable diseases as well. We investigate all those. We make inquiries into cereal growths, and we make inquiries on all matters of that kind. We receive thousands of letters in a year, asking for advice of all kinds, and we have experts who supply it. There is also an Export Board.

970. Does that involve much work? In the busy season there is a fair amount of work, but not too much. We have also to deal with viticulture.

971. So that it is a very extensive branch of the Public Service? Yes, and a very varied one. It is full of expert business from top to bottom.

972. Is any branch of the Forestry Department left with you now? No; it has been entirely removed to the Lands Department.

973. Does not that appear to be an analogous branch which should be left with you? Yes; it seems to be more allied to our Department than to the Lands Department, excepting that most of the forest reserves are Crown Lands, and the Lands Department, having control of the lands, wanted to have control of the forests. Personally, I think a mistake was made in shifting it.

974. How long has that been done? About two years.

975. Was that done by statute? By the Public Service Board. They inquired into the matter, and recommended that the branch be placed under the Lands Department.

976. Did that relieve your Department to a considerable extent of clerks and work? Yes; to the extent of the Forest Branch. It relieved us of about five clerks.

977. Has that occurred since you have been in your present building? Yes. Immediately they moved out the Lands Department took charge of the room in which they were located, saying that they wanted it, and we had to give it up.

978. Do you and the Lands Department interchange much in your business? Yes, a great deal, particularly in connection with commons, also in connection with water conservation and water supplies, artesian boring, and mining reserves; in fact the business is interlaced a lot.

979. Does that involve papers having to go from one Department to the other, or correspondence only? Papers.

980. Will not that be somewhat inconvenient if you get moved to the new building? No. There would be one daily lot of papers to take to the Lands Department. There is no constant communication from one office to the other.

981. If anyone came to you and wanted to inquire about a particular matter, might you not want the papers at once from the Lands Office? Yes; that might happen, but it would not be a frequent occurrence. In nine cases out of ten it would not be necessary to go to the Lands Department for the papers, because there would be a record in our own Department, and from that record I should make out sufficient to make the matter understood. In occasional cases I might have to send to the Lands Department, but they would not be frequent.

982. Have you given consideration to the question whether you and the Lands Department could not get on conveniently in the building you now occupy? Yes; ever since we have been in the Department we have been trying to get more accommodation there. We assumed that the building was built for the Lands and Mines Departments, and that we should have as much of the building as they have, if we wanted it. One Minister after the other has consulted the Lands Minister. I have consulted the Under Secretary. We have gone round the building to see if we could squeeze anyone up to give us another room, and the reply has always been that it is impossible to give us a foot more space; in fact, instead of getting more room, we are constantly getting squeezed out. They contend that the building is theirs, and that we practically are there on sufferance, and that we must make way.

983. We noticed the other day, in going through your part of the building, that the corridors are impeded by large stacks of old-fashioned pigeon-holes, in which I understand there are valuable records;—is that a menace and danger to the Department? It is; a great public loss might occur by someone stealing the papers. They are covered with blinds and that sort of thing, but anyone who wanted to do so, could take papers away, and no one would be any wiser. It is the only place we have in which to put them. If they are taken away, nothing can replace them.

D. C.  
McLachlan.  
21 Feb., 1899.

984. I was struck with the splendid safe accommodation of the Lands Department—a series of floors extending in a circle from floor to ceiling. Do you not think, seeing that your records are very valuable, and apparently very bulky, that some arrangement of that kind would be well in the new building, instead of every floor having its separate strong-room, which has to be lit by gas or electricity. Do you not think that a modern strong-room, something like that at the Lands Department, only not so capacious, might be built with advantage? It would be better; but I have been thinking that it would take up a valuable lot of space in that building, whereas useless corners could be utilised for store space. I think that in that way the arrangement has been an economical one. Of course there would be extra rooms in the shape of strong-rooms, but there would be no clerks in them. If a man wanted to find a paper dated in 1870, of course he would know that the 1870 papers were at the top of the building. He would know the particular safe, and would run up and get it.

985. He would have to run about all over the building, perhaps, if he wanted something on the ground-floor? He would take the lift to go up. Of course, I take it that the older papers would be on the top. Papers three or four years old would be nearest the record room. As they got old they would, of course, be shifted higher up. Of course it would be better if you could have a continuous store-room. I think, however, that according to the plan there has been rather an economic use of space, and it will be just as safe for all practical purposes.

986. Have you considered the possibility of any fresh legislation which might occur, which would largely increase the necessities of your Department as regards office room? No; I do not think legislation would very much increase it. The development does not altogether depend on legislation, but on the seasons, the increase of population, and the discovery of minerals.

987. If this building is completed you will have every branch which comes under your jurisdiction, with the exception of the place at Granville, under one roof? Quite so, excepting the farms and colleges, and that sort of thing.

988. *Mr. Dick.*] I think you stated that the museum had to be used mainly in connection with the administration of your Department? With the practical working of the Department.

989. Can you illustrate your answer? We will presume that a man wants to know what is the character of the stone of the Berrima district. A member of the geological staff will go into the museum and find out and tell him. If we had not the museum connected with our office we could not afford the information.

990. How do you get on now? We have to send inquirers to the Domain.

991. Do you have many inquiries of that kind? Numbers of them.

992. You also desire to have a large exhibit of timber? Yes; we want to make a fair display of timber.

993. Will not the same argument hold with respect to that as with respect to the mineral exhibits? No; the timber is not required in connection with the administration or the men's work, whereas it is in connection with minerals.

994. What reason would you urge to having a timber exhibit there? Numbers of people come here wanting to purchase timber, and to see what kind of timber there is in the Colony.

995. Is it a common thing for men indulging in enterprises of that kind to call on your Department? Most of them come to the Department if they come from abroad. If a man comes from America the first place he calls at is the Agricultural Department to find out what sort of timbers we have, and whether we have any specimens.

996. And the number of inquiries of that kind has led you to the conclusion that you must have a museum to work those branches of your Department? Particularly the Mines Department. It would be a great advantage to the Colony to be able to show the people who come here good specimens.

997. Is it usual to attach schools of mines to the Department? No. Perhaps in other countries the Government is not run in the same way as here, but wherever you go for mining information you expect there to be able to see specimens of the minerals of the country.

998. Of course your experience in the office has led you to that conclusion? Yes. When a man comes from Germany, or somewhere else, I naturally would like to have something to show him of the Colony's mining products. But I am really ashamed to ask him to go to the place in the Domain to see what we have there. As I have said we are afraid to put good specimens in it.

999. Is it likely you will have any number of inquiries with respect to agricultural specimens;—would they not go to the ordinary produce market? I think they would in that case, but there are numbers of people who are interested in all kinds of growth, and if we get anything abnormal we let it be known to the press that at the Mines Department there can be seen a special exhibit, it might be sugar-beet; and there would be a man to explain what it meant, and where it was grown.

1000. What kind of work will be conducted in the laboratory at the top of the building? It will be principally in connection with agriculture—diseases of fruits and plants, analysing soils and analysing waters from the country water supplies, and from the bores. We analyse all the waters from the bores at different depths. They are full of all kinds of minerals and salts, and we have to keep a record of them. Again the dairying business is beginning to be a scientific one, and is full of experiments. The people who are going in for dairying expect us, as a Department, to give them information in regard to all these things. We have an expert who may go into a creamery. He discovers something in connection with the butter, brings the butter to Sydney, finds out in the laboratory what is the matter, and subsequently explains it to the person from whom he obtained it.

1001. I believe all these subjects are taught at the technical schools? I do not think dairying is.

1002. Are not the analyses, to which you have referred, conducted at the technical school? I think not in a practical way.

1003. *Dr. Garran.*] You will see by the plan that, including the basement and the space in the roof, your Department will be distributed over seven floors? Yes.

1004. Would you rather have all that up and down work, or three floors to yourself? I should prefer three floors to myself. But there are so many branches in my particular Department. I could put branches on special floors.

1005. Your Department lends itself to subdivision? Yes.

1006. Is it not desirable that Ministers should be on the first floor? It is, for the public convenience.

1007. Then both Ministers would want the first floor? I think so.

1008. That is one reason for making this perpendicular division? I think so.

1009.

D. C.  
McLachlan.  
21 Feb., 1899.

1009. You do not complain of it? No; but I think the other would be the better arrangement for many purposes.
1010. Is Mr. Pittman in charge of the museum? He is in charge of the geological staff, and the museum is under his Department. His speciality is geology.
1011. If a stranger goes to the much-despised shed in the Domain, who is there to answer questions? The curator, Mr. Card.
1012. Is he competent to explain? Yes; he is a Member of the London School of Mines—in fact, he was imported for that purpose. He is a mineralogist as well.
1013. Does he give information now? Yes; but the general public do not know where or how to get at him.
1014. Is it known that there is a competent man there? Most mining people in the Colony know it, but a stranger would not know it.
1015. If a man went there and said, "I want to see a specimen of Gympie gold," would he be the person to show it? Yes; and to tell him all about it.
1016. You will not have quite so much space in the basement of the proposed building as you have in the Domain? I think we shall have more.
1017. Is it your impression that the public would be more likely to come to the basement floor of the new building than to go to the Domain? Yes. If they came to the Department they would be attracted to the museum.
1018. Is Mr. Card on duty the whole of the day? Yes; from 9 a.m. to 4:30 p.m.
1019. So that anyone who comes to you and wants to know something is sent to him? Yes. Very often a man comes with a lump of stone in his pocket, and wants to know what minerals are in it.
1020. Does he or any other scientific man ever give simple short lectures on the articles in the museum? No. Some of the geologists do when they are out in the country.
1021. But there are no town lectures? No; excepting that Mr. Card teaches at the School of Arts at night.
1022. You do not utilise your museum as a teaching place? No; it is not adapted for it.
1023. Are not all the specimens of minerals you have got to be seen also in the general Museum? No.
1024. Their mineralogical show is different from yours? Yes.
1025. Yours is specially adapted for industrial purposes? Yes; we keep that altogether in mind.
1026. It is more practical than scientific? We only aim at the practical.
1027. You think, then, there is a special vocation to this museum different from that of a general museum and that of a technical school? Yes.
1028. You do not think we shall be multiplying museums unnecessarily in having this one? I do not.
1029. Your experience tells you this museum will be of special advantage to different people? Yes.
1030. You are quite with Mr. Pittman as to the expediency of having a museum in your Department? Yes.
1031. And you think there is no better place than the ground floor of the new building? No; I think it would be appreciated by the public, and would become a centre to which the mining people would be drawn. We should have samples showing, for instance, what the New England, Bathurst, and other districts could produce.
1032. So far as your staff is concerned, you are aware that you are inconveniencing the Lands staff to some extent, and yet you have not room for yourselves? That is so.
1033. You think the time has come when we must make better provision for each Department? I think so.
1034. Do you think the proposed building is an extravagant one? So far as the accommodation is concerned, I do not think it is.
1035. Having such a grand site in a main street, you think we ought to have a building which will be a credit to Sydney? I think so. It would be a mistake for the sake of a few thousand pounds to spoil the appearance of the building. It would be an ornament to the city.
1036. *Mr. Shepherd.*] I should imagine that a museum is intended to be educational? Largely educational and practical for the officers of the Department.
1037. Into how many departments do you propose to divide the museum? There will be a mineral section and an agricultural section.
1038. And you will have a competent person at the head of each department capable of giving instruction? Yes.
1039. I suppose you will include the fruit industry as well? Yes; in this way: a man may grow a particular apple, or other fruit, the name of which he does not know. We shall have models of all those fruits, and he can come into the museum and see what he is growing.
1040. Do you not think that it would be desirable to separate the agricultural from the horticultural or the fruit-growing department, because, an agriculturist, as a rule, is not supposed to know anything about fruit-growing? The agricultural section would, of course, be distinct from the horticultural. I think, however, we should have one man who would have sufficient knowledge of all these things to be able to give any information required.
1041. These officers would always be in attendance at the museum? Always.
1042. Do you not think it possible that, in the event of Federation being accomplished, there might be a sort of federation of these departments—that the head of the Department will be likely to be in the area in which the capital is placed? I do not think so. I think each Colony would run its own agricultural and mining Department; and apart from that they must be where the population is. The Federal centre would not have a large population, and the museum should be where the population is, and that is the principal city.
1043. Then, you think each colony will require to keep up quite as large a staff as it has at present? I think so, in these two particular Departments, and they would require their own museums.

WEDNESDAY, 22 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Edward Fisher Pittman, A.R.S.M., Government Geologist and Chief Mining Surveyor, Department of Mines, sworn, and examined:—

E. F.  
Pittman,  
A.R.S.M.  
22 Feb., 1899.

1044. *Chairman.*] I believe you were a member of the Board appointed to go into this matter when the proposition was first made? Yes.

1045. In considering the question of increased accommodation for the Service, you make a strong point of the necessity for a museum? Yes.

1046. Will you state your reasons for that? I may state that a museum is an absolutely necessary part of my equipment for the work I am called upon to perform. It is just as necessary for me to have a museum as it is to have a library, or instruments with which to carry out surveys; and it is extremely necessary that the museum should be in a place where I can refer to it without great loss of time, as is the case with the present accommodation in the Domain. In all countries in Europe and America where geological surveys are carried out, this is one of the points which is taken into consideration at the start. The first thing is to collect museum specimens for reference, and to have them stored in a place so that they can be referred to without trouble by the officers engaged in the work. I may mention that the present museum building is extremely hot; it is really not fit for anyone to work in, and yet we have a number of officers there who are obliged to work in it. In summer time it is quite unfit to work in by reason of the heat. It is an iron building, and is hot, dusty, and unsuitable for getting the best work out of a man. If the Committee would go and inspect it, I am sure it would be a great object lesson in connection with the inquiry; and if they could possibly come on a really hot day, they would get a better opinion of the disadvantages of the place. There is another reason—although it is not one in which I am directly concerned—why it would be an advantage to do away with the present structure, and that is, that it is a complete eyesore to the Domain. The Colonial Secretary and the Principal Under Secretary have moved in the matter several times, and we have had a direct request to take our collection away, utterly ignoring the fact that we have no place in which to put it.

1047. I think you have stated that unless you get a museum in the new building you would just as well stay where you are? In one sense. I should be no nearer my museum in the new building than where I am at present.

1048. You are not speaking then as representing the whole of the Department? No. The chief object of getting a new building, amongst other things, is to have a concentration of all the branches of the Department. If you leave out one of the important branches you do not carry the thing to finality. The object is not only to concentrate the branches, but also to provide better accommodation for them. We have a growing Department, and, as it is, we are exceedingly cramped. Frequently we have had to appoint new officers, and have had difficulty in finding where to put them. I believe the building was originally constructed for the Lands and Mines Department, but that fact has been ignored altogether by the Lands Department. They regard it as their establishment, and that we are there on sufferance, and we cannot get anything like an adequate share of the space.

1049. Who is in charge of the museum in the Domain? Mr. Card is the Curator.

1050. What are his duties? He has charge of the mineral collection there. He is really Mineralogist. He classifies the specimens, and arranges them so that anything new is exhibited to the public in an interesting form. Whenever I want anything in the museum I ask him for it.

1051. Do you find being so far away an inconvenience? Decidedly. If I want to look at a single specimen, by the time I get there and back it means a waste of nearly an hour.

1052. Will you explain the process under which a museum is used in connection with your Department? It is just as necessary a part of my equipment as a library. I have all my books around me where I sit, and I am continually referring to them, and I ought to be in a position to refer to my specimens just as easily. It is part of the work. In my work you cannot do without specimens any more than you can do without books.

1053. Do the public who deal with your Department also wish to have the real objects to look at in connection with applications they may make? Some of them undoubtedly do. For instance, the other day I had an interview with a man who wanted to know about platinum ores in New South Wales. He came out specially to go into platinum mines. He not only wanted to know all I could tell him about deposits, but he wanted to see the platinum.

1054. And I suppose you had to accompany him to the place in the Domain? Yes, or to send someone with him. If I had things properly arranged, as they have in London, I could step out of one room into another and show him the character of the specimen he wished to see, as well as the character of the rock in which it occurred, and so on, in a moment. In addition to that, our museum is largely used by students. We have special students' collections of fossils and minerals arranged so that University or Technical College students can come and see them, and within the limits of one or two cases get all the information they require.

1055. For that purpose, it would not matter much whether the building remained where it is or not? That is so, excepting that it is a very uncomfortable building.

1056. Do the exhibits suffer by reason of their being there? Undoubtedly the wall exhibits, such as photographs and geological maps, suffer—the heat affects them.

1057. Do you look upon this museum as useful only for administrative purposes and for students? It is eminently useful for historical purposes—for a record of the classes of ore found in certain districts and certain mines at certain times.

1058.

E. F.  
Pittman;  
A.R.S.M.

22 Feb., 1899.

1058. And it is a necessary adjunct to the Mines Department? Undoubtedly. The Geological Survey of England have their headquarters in Jermyn-street, in London. They have an extensive piece of ground there with valuable premises erected thereon. It is not a show museum, but it is regarded as a national necessity.

1059. What is your opinion of that portion of the building proposed to be allotted to the museum? The point I raised to Mr. Vernon in the first instance was that the museum would be absolutely useless unless it were well lighted. He assures me it will be well lighted.

1060. Are you willing to accept his assurance on that subject? I do not see how I could well object to it.

1061. Do you think the space the museum will occupy will be sufficient? I think so.

1062. It is proposed to give you 14,000 feet, which is a great deal more than you have at present? I think that includes the Agricultural museum. Of course I have nothing to do with the Agricultural museum.

1063. Do you think the space allotted will be sufficient? I do; it will allow for expansion for a considerable time.

1064. Would your own office require to be very close to the museum? Not necessarily.

1065. Will you be in charge of the laboratories in the building? No; they will come under the Agricultural Department.

1066. Who will have control of them? Mr. McLachlan is the Under Secretary, and Mr. Salwey is the Chief Clerk.

1067. Who is the scientist? Mr. Guthrie is the Chemist.

1068. Have you a testing-room in connection with your Department? Yes; a very large one.

1069. Will that be in the proposed new building? No; it will be at the Clyde Works.

1070. Then you will have nothing at all in the way of experimental works in your branch? To a slight extent, the Curator and Mineralogist answers inquiries as to minerals, and submits them to a simple test.

1071. Then there will be no smoke there from assaying furnaces? No.

1072. Do you find any inconvenience by reason of the works at Clyde being so far away? No; we have regular communication with them. A carrier takes specimens away in sealed boxes every morning, and the returns come back by post. All the assays go through under my supervision. When it was proposed to appoint a Government Metallurgist, the Assayer and his assistants were all on my staff, and Mr. Sydney Smith thought it would be more appropriate that they should be under the Government Metallurgist. He required a chemist to assist him, and I made a stipulation that if that were so, I should always have the right of supervising the assaying tests—that is to say, the correspondence from the country should all come to me. The information I gain in that way from different parts of the country, where new deposits are continually being found by prospectors, is of very great assistance to me in my work.

1073. When your offices were in Phillip-street, you rented a building in Macquarie-street with specimens and exhibits? Yes.

1074. So that, compared with your then position, you are now very much more inconveniently situated? Very much more. We had the museum close to my office door there.

1075. Did you find that an advantage? Yes.

1076. Although it was a building ill-suited for a museum, the advantage in other ways was great? Very.

1077. In your statements to the Board you urge concentration of all the branches of the mining and agricultural departments? Yes.

1078. Why? Supposing, for instance, the Minister requires certain information he tells the Under Secretary,—the Under Secretary finds it is necessary to refer, perhaps, to myself. Some time ago when I was in Macquarie-street, I had to come down to the head office. In the meantime, the Minister became engaged, and I lost three or four hours in that way waiting for him. Perhaps the Minister might want the Chemist from the Agricultural Branch, and his office is on the left hand side of Circular Quay. He told me not long ago that on one occasion the Minister rang him up on a Saturday morning, and he waited until a quarter past 12, after the office had closed, and even then never saw him. He simply wasted the whole of the morning.

1079. I suppose the premises at the old Queen's Wharf are utterly worn out and unsuitable? I think you will find that Mr. Guthrie will tell you he would sooner be there than anywhere.

1080. That is, of course, for his individual work? Yes. He has an immense area there. I should say that no chemist in the world has as big a room as he has in comparison with the size of his staff, and he is naturally loth to leave it. Of course the premises are isolated and inconveniently situated.

1081. Do you, or the Minister, or the Under Secretary, frequently want him? Very frequently the Under Secretary or the Minister requires to see him. He has told me that on many occasions he has been sent for, and has been inconvenienced in waiting.

1082. What is the number of your staff, and how many rooms have you? I have actually three rooms, at present—one occupied by myself, one by the field staff, and one by the Curator and his assistant.

1083. How many are there on the field staff? Three geological surveyors, two field assistants, a palæontologist, and a draftsman, all in one room.

1084. Is that room large enough? Yes.

1085. Would it be better to have some of these officers in separate rooms? I do not know that it would. The inconvenience is that there is absolutely no space available for the overflow of our library, which has assumed such large dimensions that we have not room for it.

1086. That is an increasing item? Yes; because we buy all the up-to-date books as they come out.

1087. Do you keep your own records? Yes.

1088. What provision have you for them? One clerk—he is also an assistant to the Librarian—and palæontologist.

1089. Do you require safe housing, or only ordinary housing? Anything which is extremely important I would send to the head office records.

1090. So that individually you have sufficient accommodation? Excepting in the matter of the library.

1091. Do you want a separate room for the library? No, I would sooner have it as it is at present; but I want better space for it.

1092. Is the Correspondence Branch conducted direct through yourself, or through the Under Secretary? Most of the correspondence is done by the head office staff.

1093. Is there a journal in connection with your Department? Yes; a number of publications are issued from the branch. We issue maps, and we have a series which we call, "Records of the Geological Survey," which

E. F.  
Pittman,  
A.R.S.M.  
22 Feb., 1899.

which come out about four times a year. We also have memoirs. Then we have another series called "The Mineral Resources." These are all done entirely by my staff, and are printed at the Government Printing Office. I may mention that there is a large amount of correspondence, which is under the immediate control of Mr. Card, in reference to all the assays about which I have been speaking. Those are prepared by one of Mr. Card's assistants, and are brought to me for signature. They show the particulars of the assays, the character of the minerals, &c.

1094. Does Mr. Card keep a proper catalogue of all his exhibits? He has not issued a catalogue yet; but that will be done.

1095. I suppose his work is dwarfed a good deal, by reason of the poor accommodation? There is no doubt it is.

1096. A man with a place like that in the Domain, and a lot of valuable exhibits, is, I suppose, really disheartened in his efforts to make the display of any value? I suppose so.

1097. And the building does not really perform its intended functions? It is a most unsuitable place altogether. We were given to understand when we got it that it was only a makeshift.

1098. *Mr. Dick.*] I understand that the museum will combine two functions;—it will be, in one sense, a museum for public instruction; and also a national museum? Yes.

1099. Shall you be able to reconcile those two functions with ease in the arrangement of specimens, and housing, and so on? There is no difficulty about that.

1100. I suppose it is intended that the museum should be of value to intending investors in the Colony? Yes.

1101. Has your experience led you to the conclusion that it is necessary for such a purpose? I do not know that I could absolutely say that it is necessary for investors; but it is a great convenience to them.

1102. Do you get many callers of that kind now? A good many.

1103. I suppose you know it is also intended to have a considerable number of timber and other exhibits in the museum;—will there be sufficient room for large exhibits of agriculture, as well as of timber, and so on, in addition to your special exhibits? I should think so; but if, in the long run, tons and tons of these things were brought in, there would have to be some limit.

1104. I suppose the allotting of space for your special interests has been considered? I think so. We have submitted a certain area which we think will be necessary for the museum.

1105. *Dr. Garran.*] Is the Geological Survey under the Minister for Mines? Yes.

1106. And is it a general or a special geological survey under your care? A general geological survey.

1107. You have your own Departmental museum in the Domain? Yes.

1108. There is another one of minerals in College-street? Yes.

1109. And another at the Technical College, and another at the University? Yes.

1110. Do you think they are all necessary? I do; at least, I think mine is necessary.

1111. Do you think we should be better off by concentrating the museums, or would it be a wise thing to subdivide them where the pupils are? I do not feel altogether in a position to advise as to other people's business. I can only give you my opinion as regards my own museum. I feel confident that the existence of our museum is a necessity if the geological survey is a necessity. That question was gone into to a large extent by the Public Service Board when they first came into existence, and I think I can go so far as to say that they started with exactly the same ideas as those you have expressed, but I fancy they have modified them. At any rate, they have not wiped out my museum, and, as far as I know, they have no intention of doing so.

1112. I suppose you do not think that at present there is any waste of power? I do not. Ours is not only a public museum, but it is part of my equipment, without which I could not carry out the work the State expects me to do.

1113. I suppose the great object is not to give you your scientific convenience, but to give a museum to the public at which someone should be in attendance to explain to all the inquirers where to look for certain minerals, and to show under what conditions they could be found? I doubt if that is possible in any of the other museums. Our museum is the only one, I think, where that can be carried out as completely as possible.

1114. You think it takes the palm as a practical museum for working miners? I do.

1115. If a miner comes down and says, "I want to see tellurides," you can show him them at once? As a matter of fact, we have a case now of tellurides, and we have had a notice inserted in the newspapers drawing attention to the fact that it can be seen. In addition to that we have made two collections of tellurides and sent them round the country in charge of a warden, so that the miners can become familiar with their appearance.

1116. I suppose it would not be possible in this museum to give occasional lectures? I have no doubt it would be possible.

1117. Would there be room for them? They would have to be standing-up lectures. That, I take it, would, to a large extent, be an encroachment on the work done by the Technical College.

1118. Do you ever interchange specimens with other people? Yes.

1119. If a Technical College lecturer wanted specimens, would you let him have them? Certainly, if we could do so without endangering our collection in any way.

1120. Supposing some travelling lecturer were lecturing in the mining districts, would you allow him to take your specimens up with him? No; of course, if we had plenty of duplicates we could let him have them if he were a Government lecturer, but we never touch our registered collection, which is kept in glass cases.

1121. If you want any specimens analysed, do you analyse them in your own office, or do you send them to your Chemist? We send them to our Chemist.

1122. Will he be located hereafter in the proposed new building? No; he will be at the Clyde Works. I still retain the right to have all my analyses made by the Chemist at the Clyde Works.

1123. And if a miner sends something which he has discovered, you can send it to the Clyde Works and get a report upon it? Yes; we have had as many as 6,000 reports made in one year.

1124. Do you find any real curiosity on the part of the people to obtain information about minerals? A considerable amount.

1125. There is a healthy public curiosity? A fair amount indeed.

1126. And the Department is carrying out a useful function in supplying information? Certainly.

1127. You think the museum an essential part of your business? There is no doubt about it.
1128. Are you responsible for the classification of the specimens? Yes.
1129. *Mr. Shepherd.*] Are you in charge of the whole of the museum? Not the agricultural side.
1130. Have you been consulted as to the arrangements for a museum? Yes; I was a member of the Board, of which Mr. Vernon was chairman. We have put forward an estimate of the amount of space we require.
1131. What staff have you employed in the museum? There is Mr. Card, the Curator, who spends part of his time there and part at the office. Then there is a rock-cutter, a polisher, a carpenter, a fossil-collector, and an assistant. In addition there is the caretaker of the building.
1132. Is their time fully employed? Yes; we make up a large number of collections. We receive applications from Schools of Arts in various parts of the Colony, and also from different parts of the world, asking for collections of New South Wales minerals, which have all to be made up, labelled, and despatched. We get exchanges in that way. Of course, for those which are asked for from the country we get nothing in exchange.
1133. Do you carry out a regular system of exchange all over the world? Yes.
1134. Do you find any difficulty in securing the specimens in your present building? We have been robbed two or three times.
1135. Have you everything under lock and key? Yes; but they manage to force the cases all the same.
1136. Do you think the specimens would be more secure in the proposed building? Much more. We have had a lot of gold specimens and diamonds taken.

E. F.  
Pittman,  
A.R.S.M.

22 Feb., 1899.

George William Card, A.R.S.M., Curator and Mineralogist, Department of Mines, sworn, and examined:—

1137. *Chairman.*] It is proposed in the new building to make provision for a museum, and we have it in evidence that you will, most likely, be in charge of it;—Will you state your opinion as to the necessity for the whole of the space proposed to be allotted being taken up by a museum? Up to now I have not seen the plan, or any statement as to the space proposed to be given.
1138. Do you know the area you now occupy? About 8,000 square feet.
1139. Is the museum much used by the public? Yes, I am gratified at the attendance.
1140. Have you any idea of the average daily attendance? We have no means of making an accurate record. There is a visitors' book, which we ask people to sign, but it is not compulsory. As a matter of fact, a great many people have objections to signing, and they refuse to do so. I think I should be safe in saying that on an ordinary day there are from seventy to eighty visitors, and on a public holiday two or three times as many.
1141. Are they led there by curiosity? I do not think so. It is a very unattractive building, and not at all the place to which people would go from curiosity. I think I am safe in saying that 90 per cent., or more of those who attend do so because they know of the existence of the museum, and wish to see something in which they are particularly interested. That has been my personal experience.
1142. Do any go there for instruction? I think the larger part do that. They usually come for some specific information, and to see some specific set of exhibits.
1143. Have you ever lost any of the exhibits? Yes; but that was at a time when our staff was rather inadequate, and at a time when we were not able to have some one constantly on the premises. Since, however, we have been able to do that, we have not lost anything.
1144. I suppose the visitors to the museum are allowed to wander about as they please? Absolutely so.
1145. Is there anyone there to give them information as they require it? There has been until lately. Our staff has been slightly reduced, owing to an assistant being taken out into the field, and owing to sickness. But so far as I can possibly arrange it, there is always someone there. As a rule I am there myself for nearly half the day.
1146. Supposing someone came to the museum and wished to make a close inspection of tellurides, would there be anyone there to allow them to do so? Usually so; and if it happened that there was no one there, and the case was a special one, and they telephoned to me, I would send round, or go myself. As a matter of fact that happens not infrequently.
1147. *Dr. Garran.*] Do people also ask you to give them a personal explanation? Very frequently they ask for me by name.
1148. Are they mostly practical miners? They are either practical miners, or persons who have a direct interest in mining matters, and students.
1149. They really want to know something? Decidedly so.
1150. And there is never a week passes but you have some real inquirer there? There is hardly a day passes without one or more inquirers.
1151. And you can see from their questions whether they are really in search of information? Yes.
1152. Do you think that the museum, situated as it is, is doing good service even now? It is doing excellent service.
1153. You say that you are away from the museum half the day;—where are you during that time? Portion of my time is spent in the museum itself. Frequently I am engaged in office work, but still I am in the museum building, and the remainder of the day I am in my office at the Mines Department.
1154. Are you frequently sent for to go to that Department? No.
1155. You are not required there by Mr. Pittman or the Minister? It is not often I am called for personally.
1156. During the greater part of the day you are available to any person who really wants to see you? Not at the museum itself. I make it a rule always to go there the first thing in the morning to arrange for the men's work, and I stay there as long as I feel my office work will permit me. But the rule I always follow is to place myself, in the first instance, at the disposal of the public either directly or indirectly. If there happens to be half an hour in the day available, it may be employed in arranging collections, and so on.
1157. Is your museum, as it exists to-day, fairly representative of the known mineral districts of the Colony? Yes. I do not mean that there is not a great deal that I would like to improve; but as it is now, it is fairly representative.
1158. Could you show a stranger a specimen from every working gold-field in the country? I could.

G. W. Card,  
A.R.S.M.

22 Feb., 1899.

- G. W. Cárđ,  
A.R.S.M.  
22 Feb., 1899.
1159. Could you point out to him all the particular kinds of geological formation in which the specimens are found? Yes.
1160. *Mr. Shepherd.*] Have you had any practical experience in mining matters? I cannot say that I have, although I spend my annual leave in visiting mining places.
1161. Where have you studied? At the London School of Mines. I was there for six years.
1162. Have you been long engaged in the study of mineralogy? For the last fifteen years.
1163. Do you find that other institutions are ready to exchange specimens with you? They are glad to do so, as a rule.
1164. Do you find that more applications are made to you than you make to other institutions? If you include all our local Schools of Art and Public Schools, of course there are; but in the case of any foreign museum we make it an almost absolute rule to send specimens only on condition that they exchange.
1165. I suppose that, as a rule, you do all you can for our New South Wales institutions? No application which is based on educational grounds is ever refused.
1166. What is the general nature of the information which visitors seek at the museum? The number of questions which one can put on mining and geological matters is so varied that I could not attempt to classify them.
1167. *Mr. Watson.*] You have stated that you are not quite able to offer an opinion as to the suitability of the proposed building for your purposes, but at the present time you occupy about 8,000 superficial feet? I believe so.
1168. It is proposed in the basement of the new building to allot about 14,000 superficial feet for the purposes of a museum, to include, in addition to the exhibition of your specimens, provision for agricultural exhibits and timber;—what proportion of that 14,000 feet do you think would be necessary to properly—I will not say extravagantly—display your exhibits, allowing for reasonable expansion which must occur? I think an expansion of 25 per cent. will fairly meet all necessary requirements.
1169. That would bring it up to about 10,000 feet? Yes; if I am correct in stating that the present space is 8,000 feet. The 7,000 to 8,000 feet to which I have referred is merely the space devoted to the public exhibition. Besides that we have store-rooms, a carpenter's room, and a variety of workrooms. I am not sure whether these have been allowed for in that space.
1170. Do you think you would require these rooms necessarily on the floor upon which the museum would be? Decidedly; it would be a serious inconvenience if most of these were not there.
1171. What space would they occupy? At present they are occupying about half the space occupied by the museum itself.
1172. That is in addition? Yes.
1173. *Chairman.*] Have you ever made any representation to Mr. McLachlan as to the space you would require? I was asked some time ago to state the facts, and I did so, but I did not keep a copy of them. I think my figures were used in drawing up the estimates.
1174. In any case you are satisfied you must have your carpenter's room and store-rooms on the floor adjoining the exhibition? It would be a very inconvenient arrangement if the store-rooms and sorting-tables were not so.
1175. Is that on account of making up the cases for the country for exchange? Yes. All our surplus stock of every sort is stored over there, excepting the books and bulk material. We have no space in the head office.
1176. I suppose the new building would be more convenient to you than your present quarters, owing to the proximity to the Ministerial head and other Departmental heads? That would all depend upon the exact nature of the arrangements made.
1177. But presuming you are to be elegantly housed, as far as your officers are concerned, it would be better to be in the same building with the Departmental head? It would be better for official purposes.
1178. Have you any qualification to that statement? My personal opinion is that if the museum is to be a really successful and live institution it ought to be in a separate building by itself, but if that is not possible the proposed arrangement would be the next best. As the curator of a museum, I think I could construct a more useful institution, from a public point of view, if it were in a separate building.
1179. Do you think the public would be as likely to find their way to a museum in the basement of the proposed new building as they would be to a separate building, say, on the site of the present museum? I do not think I have any data upon which I could base a reply to that question. We are very fortunately situated so far as public holidays go, because so many people from the country find their way into the Domain, and come right past our doors. We find, as a matter of fact, on public holidays, especially when there has been an excursion from the country districts, that we get a great many country people into the building.
1180. Mr. Pittman has stated that it is necessary, for geological survey purposes, to have a museum for reference close to his office, and I presume that, of course, will be a matter apart from the public aspect of the question? Yes.
1181. Do you agree with that idea, or do you think that could be subordinated to the public convenience, as far as having a separate building is concerned? I am not prepared to offer an opinion.
1182. Have you given any consideration to the question of providing a museum other than the one in the Domain? We have always been hoping that the time would come when we should have a separate museum. Ever since the fire which destroyed the Garden Palace in 1883 we have been hoping for it.
1183. Has your experience led you to the conclusion that it is more in the interests of the public, as well as of the Department, that this museum should be in close touch with the Department generally? Yes.
1184. Have you an office in the Domain? A makeshift one, where I write my labels and do work of that kind, but everything which can possibly be done in my office in the Mines Department is done there.
1185. Then it would economise space and time if your office were close to the museum? I would economise time, if not space.
1186. Are you aware whether it would be more convenient to the public to have the basement of the new building as a museum? It would probably be in our favour if we could be sure of there being no interference from other officers. The museum is open on Saturday afternoons and public holidays. If it were found necessary that we should conform to the usual hours of admission to the public, from 11 a.m. to 3 p.m. on certain days, it would certainly be a very serious matter. The main question in connection with the basement is the one of lighting. I think it would be rather an awkward thing to illuminate a building

building like that. Specimens and show-cases require careful lighting. I think it ought to be possible to adequately arrange for proper lighting.

G. W. Card,  
A.R.S.M.

1187. *Mr. Trickett.*] I suppose you would have to make a fresh start in the new building, and would, for instance, want fresh show-cases? I should like fresh show-cases, but I do not think I should get them. Those we have are old, and have come to us by chance. They were made cheaply by contract for exhibitions. I have all sorts, shapes, and sizes, and they are badly made.

22 Feb., 1899.

1188. Do you find a great disadvantage now in working the place? It is very hot in summer and cold in winter, but excepting on an occasional day it does not prevent us from working. Of course, it is open all round, and smoke, dust, and smuts have free entrance. We have to be always cleaning up our show-cases.

1189. When people come to see exhibits, have they to be taken out of the show-cases? If I and the assistants were there we should not hesitate about unlocking cases, so that the exhibits might be examined in our presence. I may say I gave information on about 8,000 specimens last year, and also superintended the despatch of 3,000 or 4,000 letters relating to inquiries.

1190. I suppose that people who deal with you do so very often as a preliminary to further investigation at the Clyde works? Very often it is so. If a man wants to know how much silver or copper is in his ore, it has to be sent to the Clyde works.

1191. Were you in the Department when the museum was in the Macquarie-street building? Yes, but only for a few months.

1192. Whilst you were there did you find it an advantage to be so close to the other officials rather than to be so far separated from them as you are at the present time? It is inconvenient to have to run to and fro.

1193. And the other experiences you had show the advantage of having a museum close to the general Department? If one could have a museum as a sort of centre, with the offices attached to it, I think it would be the best arrangement possible.

1194. Do you think a building with double the floor space of your present building will suffice for many years to come? It should do so. The experience of all museums is that the material they have available exceeds their space; but they have to control that by making careful selections.

THURSDAY, 23 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD,  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT,  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Newton Morris, LL.D., Superintendent of Technical Education, Department of Public Instruction, sworn, and examined:—

1195. *Chairman.*] Have you a museum in connection with the Technical College? Yes.

1196. What is the nature of the exhibits? All kinds of technological exhibits from the economic side. There are animal, vegetable, and mineral products both raw, and, as far as possible, articles manufactured from the raw material.

N. Morris,  
LL.D.

23 Feb., 1899.

1197. Have you a good selection of mineral exhibits? Yes, from an economic point of view. We have nothing there in the shape of mere curiosities, unless they are of some value from a commercial or economic point of view, and also, of course, for teaching purposes.

1198. Is there an attendant always present to give information to casual visitors? Yes.

1199. Do you have many visitors? The total number of visitors to the museum last year was from 100,000 to 120,000. Last month the visitors numbered 12,000.

1200. *Dr. Garran.*] Is your museum pretty full at present? Yes; but by pressing things closely, we could find more room.

1201. Do you make an effort to keep down your objects for the specific purposes of your institution? Yes.

1202. It is strictly a technical college museum? I will not say there is nothing in it which might not come under that definition.

1203. As a scientific man, you would not advocate the unnecessary multiplication of museums in the city? No.

1204. Do you think we could do without any of those we have at present? Of course, they have separate purposes. They must have a mineralogical collection in connection with the Mines for reference purposes, and there must be a systematic collection in the Australian Museum. The University also could not do without their collection for teaching purposes.

1205. Yours and the University, are distinctly for teaching purposes? For the purpose of general instruction—teaching the public and our students.

1206. And they must be where the classes are? Yes.

1207. There is no avoiding that? It would be a great drawback if they were not within reach for that purpose.

1208. How far does your museum duplicate the one in the Domain? I have never been there, but I should say that the purposes of the two would be distinct, and I do not see very well how the Mines could do without a reference collection.

1209. The Government Geologist maintains that it is absolutely necessary for him to have a museum where he works? I should think he must have a reference museum.

1210. The museum we are considering at present is not merely for the purpose of the Geological Superintendent, but for the public—to show them specimens of what we do in agriculture and mines;—you do that as well? Yes. Of course a technological museum is supposed to cover everything of economic value.

1211. The Department of Mines wants to show the economic value of certain products as well, and we might have a sufficiency for the purpose of the Geological Branch without unnecessarily duplicating what you have got? I should think that would be possible.

1212. Is your museum sufficient for all your purposes? At present we have sufficient space. 1213.

- N. Morris,  
LL.D.  
23 Feb., 1899.
1213. Are the specimens sufficient for your purposes? Yes; of course we are adding from time to time. Specimens are continually sent from various parts of the country.
1214. Do any of your teachers give lectures, illustrative of the specimens in the museum? The teacher in geology and mineralogy uses the collection in teaching the students.
1215. Does he lecture to the general public? No.
1216. Do you invite the outside public to attend? Of course that could be done, but we have not done it so far.
1217. Have you facilities for doing it? Not in the museum. Of course, we have a small lecture hall in connection with the college, which would be large enough for those who would care to come.
1218. How many would the lecture hall hold? About 150. It is built for students. We have a fine collection of timber there.
1219. *Mr. Shepherd.*] I suppose your collection is strictly for educational purposes? Yes; to give the people who come there an idea of the nature of the products of the country, and how they can be used to the best advantage, and of course to instruct our own students. Public school children are brought there by teachers, and they get lessons in the museum as well.
1220. Would it be convenient to instruct classes in a museum such as that we have in the Domain in preference to the one at Ultimo? For our students it would be so inconvenient that I am afraid we should never use it.
1221. What space do you occupy in the museum? There are four floors in the basement. Each floor contains about 10,000 square feet, and a wall space of about half that.
1222. I suppose visitors are able to gain information from some officer-in-charge? Yes; there is always an officer-in-charge.
1223. *Mr. Watson.*] In your estimate of 120,000 visitors, do you include the students? No; I refer to the visitors to the museum only.
1224. You say you have a fairly complete exhibit of timber? Yes; between 5,000 and 6,000 specimens.
1225. In various stages of growth and preparation? Yes; we are getting descriptive matter attached to each exhibit describing its nature, quality, and uses, and as far as possible, where it comes from; but that cannot be given definitely. The Forestry Branch would tell that better than we could.
1226. The Forestry Branch has exhibits in the Domain building;—do you think they impinge upon your exhibit? It is difficult for me to say for what purpose they require them. We have a collection for the purposes of comparison. People continually come there to make inquiries about timber, and the botanist who has made himself an expert in such matters, gives all the information he can. The only point upon which he does not undertake to definitely instruct is as to the best locality to go to.
1227. Have many people made inquiries as to where they can get supplies of timber? Yes; we often have inquiries from London, America, and various parts of the world. We have sent numerous collections to various places.
1228. Do you think it would be much inconvenience to people who wish to make inquiries of that description to go to your museum, instead of the one in the Domain? We are within 200 yards of the railway, and when the tramway is open it should be very convenient.
1229. *Mr. Trickett.*] Do you think your museum could be worked as an annex to the Mines Department? It would be a great detriment to us.
1230. Do you think it would be possible for Mr. Pittman to use your museum at Ultimo in administering his Department? I should think it would be inconvenient for him to go there. It appears to me to be indispensable to have a reference museum.
1231. You agree with him that he wants the collection at hand? I think so, I think the same museum should have its systematic collection for scientific purposes. There should be at the Mines Department a good reference collection, and we must have our museum for purely economic and teaching purposes.
1232. *Chairman.*] Do you think one floor in your museum would be large enough for a museum such as Mr. Pittman requires? I should think it would be ample.
1233. Would half of it do? I should be almost inclined to risk saying that half of it would be enough, but I do not care to give a definite judgment.
1234. You think that a floor space of 5,000 feet would be sufficient? That certainly is my impression.
1235. In the event of a museum being established as proposed there is no doubt a number of people would visit your museum all the same? Of course people would come there for the sake of the variety of exhibits, which, of course, cover the whole economic field.
1236. And any information they could get from the proposed museum they could also get from your museum, excepting as to the localities where timbers are obtained? Yes.
1237. Would it necessitate any great additional cost to post up your Department in that information? Of course the authorities in the museum know a great deal already in regard to botanical products, but they are not prepared to give an exhaustive account.
1238. Have you a library in connection with the Department, and any work on Australian timbers? Yes.
1239. Would they not give localities? Yes. Of course we have copies of all publications in the library.
1240. I noticed on some of the exhibits of logs the names of the localities from which they came;—have you any information as to whether they can be got in quantities in those places? I could not answer that question offhand; but I think the information could be obtained from our reference books.
1241. *Mr. Dick.*] I believe you also have in your museum exhibits of wool? Yes, the best in the hemisphere.
1242. And agricultural products, timbers, and minerals? Yes, and animal products.
1243. Are you continually being referred to by probable producers or investors, as to the best means of entering upon any enterprise in connection with minerals, timbers, or wool? Yes.
1244. You understand that in the Mines Department they contemplate having a large museum partly for the same purpose;—do you think any public purpose could be served by having two museums practically doing the same work? I do not think we ought to duplicate.
1245. There is another museum with almost the same class of exhibits, and intended for almost the same purpose;—do you think any public purpose would be served by having two museums of that character so close to each other? I do not think we should have two.
1246. Do you think you would serve the public purpose better by increasing the capacity of your museum or of one of the departments? Yes.

TUESDAY, 28 FEBRUARY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Richard Teece, General Manager, Australian Mutual Provident Society, sworn, and examined:—

1247. *Mr. Trickett.*] How many employees are there in the Australian Mutual Provident Society's buildings? About 115 altogether in the Sydney office.

R. Teece.

1248. Do they occupy the whole of the building? Yes; the whole of two floors, practically. The upper floor is devoted to other purposes—for the use of medical officers, and so on.

28 Feb., 1899.

1249. What is the size of your public office? Fifty-two feet by 41 with an annex 18 by 17 feet, and 22 feet high. That is the main hall. There are other rooms there. I occupy a room, and the Secretary occupies a room, which is additional to the space I have quoted.

1250. How many clerks are there in the main hall? Sixty.

1251. Is that room overcrowded? It is full. Of course, there is a public space, which I have not included in those dimensions.

1252. Is there any inconvenience in regard to sanitary arrangements, air space, and so on? Not the slightest.

1253. I suppose that, independently of the sixty clerks, there are frequently numbers of the public in the office at given times? Yes; as many as a dozen, and twenty at times.

1254. What about the working space of that room? I could not conveniently accommodate more.

1255. But still it is sufficient for all purposes? There is ample room.

1256. What is the system of arrangement;—have you one large room? Yes; overlooked by one officer.

1257. Is it divided here and there by head-high compartments? Not quite so high as that.

1258. Then the whole staff is under the supervision of one officer? Yes; the whole of them can be seen by one officer.

1259. Is that found to be a suitable arrangement in large establishments? Very.

1260. Is it better than having a number of small rooms? Yes; a number of small rooms is fatal to discipline.

1261. Have your clerks, generally speaking, a number of papers before them which occupy considerable space? Yes; they have large books before them.

1262. Is your system of arrangement of desks based upon any definite plan? Yes; so that the light shall fall along the length of the desks instead of on the backs or faces of the clerks.

1263. And I suppose they are arranged so as to economise space as much as possible? Yes.

1264. You have accounted for sixty of your clerks;—will you now deal with the other rooms on the ground floor? There is a small area 18 feet by 17 feet, by 22 feet high. An end has been cut off in the building which was originally in separate rooms, and which we have taken in. This is included in the information given above.

1265. Is that an open room? Yes; but it cannot be seen from the public entrance.

1266. By whom is that room occupied? By the clerks. There are sixty in all, but a few of them occupy that small space. I may add that the public space is 52 feet by 18 feet, and 22 feet high.

1267. Does the smaller area, to which you have referred, come into the room which you say is 52 feet by 41 feet? No; the portion absolutely occupied by officers runs out at about 900 cubic feet to each one. We cannot put them closer together if they are to work with comfort. The total superficial area for the clerks and the public is 3,374 superficial feet. Included in that is the public area, which is 936 superficial feet.

1268. With regard to the space occupied by the sixty clerks, and occasionally by the public—sometimes twenty of them at once—I understand that, although you have no room for any more clerks in that space, they are able to do their work well, and without inconvenience? Yes. Of course, we have provided for that by drafting clerks upstairs as soon as the room becomes overcrowded.

1269. But sixty clerks is the number you have continuously in that space? Yes.

1270. Are we to understand that the whole of the floor space of the A.M.P. Society's premises is occupied by sixty clerks, by the space for the public, by the Manager's room, by the Secretary's room, the lift space, and the strong-room? Yes; that is the whole of the ground floor.

1271. Will you describe the rooms on the next floor? There are two spaces there—one is 59 feet by 42 feet, and the other is 18 feet by 39 feet, including public space 17 by 13 feet.

1272. What is the smaller room for? There is only a wooden partition between the two. They are both clerks' rooms. It is practically one space divided by a wooden partition.

1273. What is the superficial space of those two rooms? 2,987 feet, used by clerks.

1274. How many clerks are there in that space? Only forty-five at present.

1275. How does that space accommodate the forty-five clerks? There is room for more.

1276. Have they ample desk accommodation there? Yes; without overcrowding.

1277. Have they any large books which require a fair amount of space to manipulate and move about? Yes; they have not only large books, but they have a space where tables have to be placed for the purposes of the particular work which has to be done.

1278. And there is room for more than the forty-five clerks already accommodated there? Yes.

1279. Do you occasionally go into the room occupied by the sixty clerks? Yes.

1280. What is your opinion in regard to the ventilation? It is quite satisfactory.

1281. Is there nothing offensive? Nothing at all. Both rooms are lighted on two sides. The one has a frontage to Pitt-street and the other to Hamilton-street.

1282. And I understand that the partitions only go up a little way? That is all. The object is merely to provide two departments of the office.

- R. Teece.  
28 Feb., 1899.
1283. And there is a current of air through the whole of the rooms? Yes.
1284. In connection with the building submitted to the Committee for consideration, there is provision for electric fans and special air-circulating appliances;—do you find the want of anything of that kind in the top or ground-floor rooms? No; we have not observed any want of it.
1285. Do the clerks suffer in health, as far as you know, by being in these rooms? No.
1286. And there is no special provision there, excepting ample window and ordinary ventilation? That is all.
1287. Where is your room? At the corner of Pitt and Bond Streets.
1288. On which floor? On the ground floor.
1289. Does that come out of the 3,374 superficial feet? No.
1290. I believe you are the head manager of the institution;—what is the size of your office? It is 18 feet square.
1291. Do you find it large enough for your requirements? Ample.
1292. Have you to frequently interview the public? All day long.
1293. To any great number at a time? As a rule only one at a time.
1294. And you find your room big enough for all purposes? Yes.
- 1295-6. You have accounted for sixty clerks, yourself, and Mr. Cameron on the ground floor, and for forty-five clerks on the first floor;—where are the remainder? They are messengers and casuals.
1297. You say the second floor is occupied by the medical staff? Yes; and a lumber-room, and a large hall where we hold examinations and do various jobs.
1298. What is the size of your strong-room? It is a large room. I will forward its dimensions to the Committee. [*Vide Appendix.*]
1299. Is it a room on the ground-floor? It goes up both floors. It begins in the basement, and is carried up by a spiral staircase. It is entered by a separate door on each floor.
1300. You go from the basement to the first floor by means of a spiral staircase, so that all your documents can be got at by one clerk, and from one entrance? Yes.
1301. Do you find that an advantage? I do not see any particular advantage in it.
1302. Is it more advantageous than having two or three safes entered by various doors and for various floors? It is not in our case, because we have a different set of documents in the two strong-rooms.
1303. Do you think that, in a great public Department, where documents and records are constantly being referred to, it would be an advantage to have one large room? I should think so.
1304. Is your strong-room fitted up on modern principles? Yes.
1305. With galleries? Yes.
1306. And steel fittings and pigeon holes? Yes.
1307. Have you a large number of records? Yes.
1308. Are they constantly being referred to? All day.
1309. What is the reason for separating the safe on the second floor from the other floor? It is not for the reception of ordinary office records. It is a room we keep for our ordinary valuations.
1310. In round numbers, you have a floor-space of 6,361 feet? Yes.
1311. Occupied by 105 clerks? Yes.
1312. And you find it sufficiently healthy and capacious for carrying on your business? Yes.
1313. The minimum space required for the Mines and Agriculture Department is 33,501 feet, and the officers of that Department number 147. Does not that, as compared with the space you have, appear to be an enormous amount? Yes; that gives about three and a half times as much superficial area as we have.
1314. In the Public Instruction Department there are, in round numbers, 100 officials, and it is proposed to give them 22,786 feet? That is about the same average as the other.
1315. And is it, in your experience, unnecessarily large? Altogether unnecessary.
1316. Was the A.M.P. Society's building erected as a life insurance building? Yes.
1317. Were you the manager at the time? No.
1318. What were the instructions to the architect as regards accommodation;—did you and the contractors consult with the architect as to the floor space required, and the number of clerks to be accommodated, and did you, generally speaking, consider the requirements of the Society before the building was erected? Yes; everything was gone into very carefully.
1319. You did not erect the building first, and then consult with the heads of the different departments as to how it was to be occupied? No.
1320. I presume you carefully considered the necessities of each department? That was with regard to the ground-floor. When we first went there, we only required to occupy the ground-floor, and consequently the whole of the first floor was made one large room, which we subsequently divided by ordinary lath and plaster partitions. When we required the whole room we simply removed the partitions.
1321. At the commencement of your occupancy of the building, had you sixty clerks on the ground-floor? We had not so many.
1322. *Dr. Garrahan.*] Do you open your windows for the purposes of ventilation? We do, but we find it very inconvenient on the Pitt-street frontage, owing to the neglect of the Corporation to give us a decent street there. There is too much noise, but we are hoping to remedy that.
1323. Do you find, in a large room with many clerks, great difference of opinion as to the opening of windows? Invariably.
1324. I suppose that some like them shut, and some like them open? Some people do not like fresh air, and others do.
1325. So that ventilation by means of the windows is inconvenient, in connection with a room occupied by sixty clerks? I do not know that. I do not think you could ventilate in any other way.
1326. Do you mean to say that if you keep the windows shut on a hot day, and there are sixty clerks in the room, there will be no foul air there by 4 o'clock? We do not keep them shut. We have a double street frontage. The Hamilton-street frontage is comparatively quiet, and we can keep the windows on that side open. It is one room right through from street to street.
1327. Do you always keep those windows open? Yes.
1328. Whether the clerks like it or not? Yes; they have to like it.
1329. There is no strong wind there to blow the papers about? No; that side faces the west.

1330. What do you consider is a fair and reasonably-sized room for an Under Secretary? That would entirely depend on what are the purposes to which the room would require to be put. If he is in the habit of interviewing considerable numbers of the public at one time he would require a large room, but if, like myself, he only interviewed one at a time, he would only require a small room. R. Teece.  
28 Feb., 1899.
1331. We will assume that he only required to see two or three people at a time? Under those circumstances, if he had a room 16 feet square, he would be amply accommodated.
1332. Then you think a distinguished officer of the Public Service who requires a single room will be amply accommodated with a room 16 feet square? Certainly.
1333. *Mr. Watson.*] In referring to the area occupied by your clerks, I do not think you mentioned the class of work in which they are engaged—whether they deal with ledgers and bundles of papers referring to particular cases? There are two classes of clerks; there are a number who deal with the public direct, and they require a considerable counter space. There is a much larger number who merely deal with books.
1334. Can they be concentrated? Yes. We put them as close as we can to find room. They could not be put closer, because there would not be room for the books.
1335. Is there any considerable portion of the clerks who have to deal with papers;—for instance, a man getting up a case may have a number of papers littered about;—would that necessitate much room being taken up? The man who would be doing that sort of work would probably be a responsible officer who would sit at a table.
1336. You do not think it necessary to provide tables for the ordinary clerical staff? No; they have desks.
1337. Even if they were dealing with papers as they do in the public departments? I do not think so.
1338. In the Lands and Mines Departments each set of papers is kept together, and when anything is done in reference to them the clerk has to consult them? Yes.
1339. You still think that in that case the work could be done more economically, as far as space is concerned, with desk accommodation than with tables? I think so.
1340. Have you a board-room? Yes.
1341. What is the size of it? It is about 28½ feet long by 18 feet.
1342. *Dr. Garran.*] For how many directors? Seven. It is quite a handsome room.
1343. *Chairman.*] Do you find it plenty large enough? Yes.
1344. With regard to the atmosphere of the room in which a number of clerks are engaged, I suppose you could hardly provide a room which on some days, in summer-time, would not be found inconveniently hot? You could not do that, no matter what building you have.
1345. And the clerks have to put up with it? Yes.
1346. Have you any special contrivance for ventilating the rooms? No. We started with the system known as Tobin's, but it turned out a perfect failure.
1347. As a matter of fact there are nights and days in which it is inconveniently hot in Sydney houses? Yes; I can give you the example of my own house, which is constructed with cavity walls, and with the most approved system of ventilation, and it is occasionally very hot.
1348. If your society were designing an entirely new building for the convenience of the clerks, would you depart materially from the arrangements of your present building? I do not think we should. I consider we have as fine and convenient a public office as any in the city.
1349. *Mr. Shepherd.*] Was the building constructed entirely under the direction of the Society? The arrangements were made under the direction of the Society.
1350. Did you calculate the number of cubic feet for each officer in constructing the building? No. We knew we were erecting a building which would be ample for many years to come—altogether too large for our then requirements.
1351. Have you any special arrangements for ventilation, or do you simply rely on the windows? Chiefly the windows. We endeavoured to improve the ventilation a little time ago by breaking through a thick wall in the basement. We have iron gratings over the pavements in the front, which communicate with some of the basement rooms, and we broke through an intermediate wall, which permits a current of air to go through the basement building now. That ascends, and I think it improves the ventilation a good deal.
1352. Is your strong-room absolutely fireproof? Yes.
1353. How is it constructed? It is constructed of concrete, and some kind of fire-resisting material. It has iron doors, and very thick walls.

WEDNESDAY, 1 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

John Williamson Manson, Architect, sworn, and examined:—

J. W.  
Manson.  
1 Mar., 1899.

1354. *Chairman.*] Are you the architect of the buildings in course of erection for Dalgety & Co., at the corner of Bent and O'Connell Streets? Yes.

1355. What are those buildings specially designed for? For offices for the company.

1356. In designing those buildings, were you informed as to the number of the clerks, and as to the accommodation which would be required for them? Yes.

1357. I suppose that is always done? Yes.

1358. Have you had an opportunity of examining the plans now before the Committee? No.

1359. Then, I suppose, you are not prepared to give an opinion as to their suitability? No; it requires an examination of them to enable one to do that.

1360. Can you give us any idea as to the amount of floor-space to be allotted to the clerks in Dalgety & Co.'s buildings? I may mention that there are a number of single rooms for heads of Departments which take up a good deal of room. The main office, however, is 1,564 square feet.

1361. How many clerks will that accommodate? There will be twelve clerks there, but in the room immediately above it—the wool office—which is of the same dimensions, there will be twenty-five clerks.

1362. Is there any space provided for the public in the main office? Yes; but I have referred to the actual space occupied by the clerks. I may mention that in the general office, there is a good deal of moving about, and books and papers are required. More room is wanted in a case of that kind than in cases where men sit down quietly at their desks.

1363. What is the space allowed for the manager's room? 19 ft. 6 in. by 15 ft. 6 in.

1364. *Dr. Garran.*] Are there any other officers there who have rooms to themselves? Yes, a great many.

1365. What sized rooms have you given them? About 18 feet by 14 feet is the average size.

1366. Were you obliged to make the space 18 feet by 14 feet? No; that is how the plan turned out.

1367. Have you an inside corridor? Yes.

1368. Is there any method of ventilation other than the opening of windows provided in the large rooms? There are ordinary outside ventilators. There is no artificial ventilation.

1369. I suppose you trust to the windows a good deal? Yes. I may add that there is a good deal of corridor space, and also an open staircase.

1370. Of course, in this climate you can have the windows open during the greater part of the year? Yes.

1371. Where a large number of persons are in one room it frequently happens that open windows do not suit the whole of them? That is so. You must provide some ventilation without causing a draught.

1372. Is it possible to do that without artificial means? Under certain conditions it is, but generally speaking it is not.

1373. I presume that there are very few offices in Sydney which have artificial means of ventilation? Very few.

1374. And where it does exist, is it a success or not? I do not know of any office in Sydney where I have had the opportunity of seeing it work. I have seen fans working, and they are very satisfactory, but I have not seen them working in offices.

1375. Do the fans exhaust the air, and bring in fresher? You can exhaust or force the air.

1376. I suppose that in muggy weather, if a room is at all likely to be stuffy, you could not get good ventilation without a draught? No.

1377. As you are aware, there are not only very hot days here, but occasionally very muggy days;—in days like that, should we not have extra ventilation? Yes.

1378. I believe that in the principal room at Dalgety's you have allotted about 60 square feet to each clerk? Yes; of course every office has its peculiar requirements. They wanted this space at Dalgety's. There is a good deal of moving about, and they do not want the men to be cramped for room. There are a number of books, and papers, and tables, and they have to be provided for.

1379. Would many of the officers who work in that room be out in the course of the day doing business elsewhere, and thus relieving the pressure on the room? I think they all remain in the office. I believe there are a couple of boys who are moving about most of the time, but the bulk of the clerks are in the office the whole of the day.

1380. Have you had anything to do with the arrangement of the furniture? Not yet; but I shall have. I have only a rough plan from the head of each Department, showing the desks required for those Departments. I may state that there is ample room in the main office for the clerks.

1381. We have had evidence to the effect that the proper allowance, in a climate such as this, is a floor-space of 100 square feet to each person;—do you think that an excessive amount? It all depends upon what the clerks are doing. If the clerks simply sit in their places, they do not require more. I should think that that amount would be quite enough.

1382. I presume you know that if air becomes vitiated, you cannot get the same quantity of work out of men as you would get out of them in a purer atmosphere? That is so. I do not see any difficulty, with modern ventilating appliances, in ventilating any place so long as you have an opening to exhaust the air, and reasonable window space.

1383. It is of course to the interests of an employer that his clerks shall work in fresh air, and not be suffocated? Yes.

1384. And you think 60 square feet is enough for each clerk? That is the amount which is provided at Dalgety & Co.'s. Of course the Government are setting a good example in giving ample accommodation, and in making the circumstances under which work is to be done as comfortable as possible.

J. W.  
Manson.

Mar., 1899.

1385. Do you think 100 square feet is too great for Government officers to work in? It is a very good space. I think 60 square feet would be enough, but in some cases I would rather give a little more.
1386. Do you think, wherever the architect can arrange it, that a room 16 feet by 16 feet is a fair size for an officer who is supposed to have a room to himself? Yes.
1387. Do you think that would be sufficient for an Under Secretary? Yes.
1388. Do you think the proposed building will harmonise with the buildings which will surround it? I think it will harmonise very well with the buildings about there.
1389. It is proposed to devote the basement of the building to the purposes of a museum;—do you think a basement like that, which is partly a ground floor, and partly a basement, would be a good site for a museum? Very good. Where there are heavy exhibits it is better there than anywhere else, and it is more convenient for the public.
1390. It is proposed to remove the exhibits from the building in the Domain to this structure;—do you think it would be a good position for a museum so far as the public are concerned? I think so, if there is sufficient light.
1391. The light on the Bridge-street side will be very good, inasmuch as there will be full-sized windows to the street. There will be a central light, and also a certain amount of area light on the other side, but not so good a light on the side where the basement is sunk? I had the same difficulty at Dalgety's, but I find the light ample for office purposes.
1392. Do you think there will be enough light for the purposes of a museum? Without seeing a plan of the proposed building, I could not very well say.
1393. The central lighting area will be 26 feet square? If that is all glassed, there will be a good light.
1394. Are you making any strong-rooms in Dalgety & Co.'s building? Yes, several; running from the basement right through.
1395. Do you enter on each separate floor? Yes.
1396. Do you provide that method of entrance in preference to an inside staircase? It is better for the purposes of the company.
1397. Do Dalgety & Co. propose to let off any portion of their buildings to other people? No.
1398. You prefer the plan of each floor having its strong-room? Yes; it works better, and it gives more room. A staircase inside will take up a good portion—about one-sixth—of the space.
1399. Are you building the strong-room of brick and cement? Yes.
1400. With any lining of iron? No.
1401. Of what are you making the floor? With terra cotta lumber, and steel joists.
1402. Are you constructing the racks for holding papers of steel? Of enamelled iron.
1403. If the building happened to catch fire and were burnt down, do you think the strong-room would stand of itself? I believe it would.
1404. You consider that the books and papers in the strong-room would be unharmed? Yes.
1405. Is the building itself a fireproof building? No.
1406. In constructing public buildings, in connection with which the documents used are not put into a strong-room, but are still of a valuable character, would you recommend a semi-fireproof construction? Yes.
1407. You do not think that a waste of money? Not in a public building, where the papers are very valuable indeed.
1408. It would embarrass the Government a good deal to lose ledgers and books? I presume it would.
1409. And you do not think a semi-fireproof construction of a public building would be a waste? No.
1410. If you were the Government Architect, would you make any new pile of buildings you erected fire-proof? Yes.
1411. Generally speaking, you think that a fireproof structure, with strong-rooms for special papers, would add security to Government buildings? Yes. I have never seen a really fireproof building in Sydney. I do not think such a thing exists, excepting in connection with the Safe Deposit Company. There are always such things as furniture about, which will burn. I have seen photographs of so-called fireproof buildings, where the intense heat has affected the constructions and brought the buildings down.
1412. As you are aware, in some of the Government offices there is a large amount of furniture, such as tables, book-cases, and so on;—do you think that if they caught fire they would try a fireproof room? In any ordinary-sized room they would not do any harm at all.
1413. The proposition put before us is that a fire in any one of these rooms might burn all the windows, but would not damage the rest of the building? That would be so in connection with good-sized rooms, not overcarried with furniture.
1414. It is proposed to make all the partitions of steel lathing;—do you approve of that? Yes; it is very good construction, and not expensive.
1415. Could you, judging from what you see of the plans, say whether the corridors would be sufficiently lighted? Yes; they would be fairly well lighted.
1416. If you had to make a fireproof staircase, what material would you use? Iron.
1417. Do you think iron will stand the effect of a fire? There would be nothing to burn if it were all iron.
1418. Would not the flames and water get into the iron and affect it? Certainly.
1419. Would such a structure be better than a brick and cement structure? If there were anything inflammable about the staircase, material which would burn fiercely and for some time, I would put in brick or cement; but an ordinary open iron staircase is quite good enough if there is nothing inflammable stored about it. It is very seldom that there is anything to burn under a staircase.
1420. In planning a building, would you put the staircases well away from the lift? Generally speaking, they are put together.
1421. Supposing a fire breaks out close to a lift, the staircases would, of course, under those circumstances, be choked with smoke? Yes.
1422. Would it be desirable, under those circumstances, to put them apart from each other? I do not think it is worth while considering that matter. The event is so unlikely that it would not be wise to separate the two. I would not spoil the arrangements of a building in order to avoid that contingency.
1423. Would a stone staircase be likely to split under fire? I do not think so.
1424. *Mr. Trickett.*] How many principals and clerks are to be accommodated in Dalgety & Co.'s building? About seventy.

- J. W. Manson.  
1 Mar., 1899.
1425. What is the floor space which will be occupied by them? The main floor is 6,365 square feet.
1426. *Mr. Watson.*] Is that exclusive of corridors? No; that is the total area. The corridors amount to about 1,200 square feet. The building is of four stories. Three of the floors have a space of about 18,000 square feet. The top floor is being made for future requirements and expansion.
1427. So that the seventy employees will occupy the three floors, comprising about 12,000 square feet? Yes.
1428. And in addition to that there is a top floor? Yes, at present used as a laboratory and for storing.
1429. Of the 18,000 square feet, how much must we allow for corridors, lavatories, safe accommodation, and lifts? I am afraid I cannot say at present, but I will supply the information. [*Vide Appendix.*]
1430. Is there a corridor running through the building so as to make the rooms front O'Connell and Bent Streets? No; the main corridor runs in a line with Bent-street.
1431. What is the width of the corridor? 9 ft. 6 in. or 10 feet.
1432. That, I presume, is an ample corridor? Yes; of course, there is a good deal of traffic.
1433. What will be the cost of the building? Approximately, about £18,000.
1434. Do you know the extent of the frontages to Bent-street and O'Connell-street? Yes; it is 104 feet to Bent-street, and about 90 feet to O'Connell-street.
1435. I presume the offices will be fitted up in modern style, with not too elaborate furniture? That is so.
1436. What would you think of a proposal under which the perspective drawings which you see around this room were prepared, showing the details of a building to cost £97,000, and then getting the heads of the various Departments, who are to occupy those buildings to go and look at them, and see how they are going to fit themselves into them. Is that the usual way of going to work? No. It would be better to get the requirements of the various Departments first, excepting in the case of a peculiar site. As far as one can see there has been, in the present instance, a very wise arrangement of the building so far as the site is concerned and the light. But the practice is to get all the detailed requirements before making your sketches.
1437. Of what are you constructing Dalgety & Co.'s building? Of brick, with stone dressings.
1438. Is that fairly expensive? It is much cheaper than stone.
1439. Dr. Garran has asked you something about special or shaft ventilation;—do you know of any place in Sydney where they have gone to the expense of providing electric fans? No; they may be put in a badly-situated building, where they could not possibly obtain ventilation otherwise.
1440. But are not ordinary air-shafts, with a patent revolving apparatus attached, very effective in the way of drawing out heated air? They are ineffective, and are always getting out of order.
1441. In a building which is occupied by a large number of employees, do you think it would be advisable to adopt that plan? Yes.
1442. It is proposed that the basement of the new buildings should be occupied by the museum in connection with the Mines Department;—you will see from the plans that it is lighted on the eastern side partly by area lighting; on the northern side it will be open; on the western side it will also be open, and over the air-space on the first floor will be a skylight;—do you think that will give ample light for the purposes of a museum? Very good light.
1443. So that in that respect you have nothing to fear? I do not think so. The worst place will be on the eastern side, but with the other light there ought to be sufficient.
1444. *Chairman.*] What is the amount of floor space occupied by the clerk in your own office? It is very small, but one cannot get what one would wish in the city in the way of an office. I have three small rooms, and the whole area is about 460 feet. One room is 14 feet by 12 feet, and two rooms are 12 feet by 12 feet.
1445. How many draftsmen do you usually employ? Two. When I have temporary assistance there are three.
1446. Is that all there would be employed? Yes; they are extremely cramped.
1447. In your profession you necessarily require much larger floor space than ordinary clerks? Yes; I may state that I am so cramped that I want double the space to do the work comfortably.
1448. Would a space of 10 feet by 10 feet per man give you plenty of room? No; in the first place we want a large drawing table, and another table is wanted on which to put plans. There must also be a rack for other plans, and a little desk which would fill up the whole space. For one draftsman to work comfortably you want an office 15 feet square at least.
1449. Supposing you had a dozen men together at that sort of work? It would take less—say 15 feet by 12 feet. Of course in a large office where there are from fifteen to twenty men you would want less space.
1450. *Mr. Watson.*] Mr. Trickett asked you a question as to whether, in connection with a building such as the one proposed to be erected, you would first get your rough plans out, and then invite the officers of the departments to tell you what were their requirements. I should like to ask you whether, in the event of your being informed by two departments that one required 23,000 superficial feet and the other 43,000 superficial feet, you would not feel justified in proceeding with the sketch plans? Yes; to the extent of rough sketches—that is, to show how the area could be put to the best accommodation. The plans before you are, I suppose, subject to alteration, if necessary. I think that Mr. Trickett's question referred to detailed plans.
1451. Of course, you would not called the plans before the Committee detail plans? No; sketches only.
1452. To give an idea of what it is proposed to do with the site? Yes.

Robert Etheridge, Curator, Australian Museum, sworn, and examined:—

- R. Etheridge.  
1 March, 1899.
1453. *Mr. Dick.*] I believe that the Museum of which you have charge is an educational institution? We try to make it so.
1454. Have you a great variety of exhibits of natural history and minerals? Yes, and fossil organic remains. Using the expression "natural history" in its broadest sense, we include the whole under one term.
1455. Have you any timber in the Museum? No. We do not take in botany in any shape or form.
1456. Are there any exhibits of wool or of agricultural specimens? No.
1457. I believe you have a large set of mineral exhibits? Yes, we have a fine mineral collection—chiefly foreign. 1458.

R. Etheridge.  
1 Mar., 1899.

1458. Is your Australian series of mineral exhibits complete? Not by any means.
1459. Is it as good as that of the Technological Museum? Yes; it is quite as good as that.
1460. I suppose you know that it is proposed, at a later period, to considerably extend the building which you now occupy? It is under gradual extension now.
1461. In what direction is your collection mainly extending? Chiefly in the zoological department and in ethnology—that is, in all matters relating to man.
1462. Then there is no great increase in your mineral department? No. We are not favourably suited for increasing it. We have no connection with mining centres. We have to depend simply upon gifts.
1463. Do you think you could accommodate the greater part of the Technological Museum exhibits in your present building? No. In fact, we have not room for our own possessions, much less anything else. I could fill a museum half again the size of the present Australian Museum from my stores without spending a single halfpenny in the purchase of specimens.
1464. What is the average attendance per day? Last year, on week days, our average attendance was 334, that is for five days in the week. On Sundays, when we are open for three hours, the average attendance was 561. The full attendance last year was 116,961. These figures are absolutely correct, because we have turnstiles at the institution.
1465. Do you think any public advantage would result from the institution of another mineral museum within a short distance of yours? That entirely depends on the point from which you look at the matter. If you look at the matter from a national point of view, the more these museums are agglomerated together, the better. If you look at the matter from a Departmental point of view, if a museum is to be of practical use to the Department to which it is attached, it should go with the Department. From a national point of view, the more you bring the museums together, there is the lessening of expense in every way, and better opportunities for displaying these specimens.
1466. Is there not a wide difference between a reference museum for Departmental purposes solely, and a general museum for national or educational purposes? Undoubtedly.
1467. Do you think it is wise to multiply within a very small area—to duplicate in fact—museums for the general education for the public? No.
1468. Your idea is, then, that a Departmental museum of the reference kind is essential to the Department; but nothing further so far as Departmental requirements are concerned? That is so. That is the view I have held for a long time.
1469. Can you give us a rough idea of the amount of space which would be required for a fairly well-equipped reference museum? I should not think they would require anything larger than the space at present occupied by the iron shed in the Domain. I should think that ought to be quite large enough.
1470. *Chairman.*] Would it be necessary to keep the exhibits in glass cases, in connection with the reference museum? Yes.
1471. *Mr. Dick.*] Do you find many inquirers amongst men who are seeking for information prior to entering into financial enterprises in connection with mines? We get a very fair number; I could not say that we get a large number.
1472. At any rate, you have inquiries? Certainly.
1473. I presume the Technical College at Ultimo requires a museum? They require class collections for the teaching of the students.
1474. With the reservation in regard to the requirements of technical schools, you think it would be a wise thing to combine all these museums in one large institution? Decidedly.
1475. *Dr. Garran.*] Do you know the museum at the Technical College at Ultimo as well as you know the museum in the Domain? I cannot say I know it intimately; still I occasionally go to it.
1476. Do you think the commercial specimens, which you do not keep in your own building, are duplicated in those two museums? I think so, to a slight extent. I would not like to answer the question in a positive manner without taking another look at both of them, but I think it is so.
1477. Is there any unnecessary duplication? I think there is inclined to be.
1478. The Technical College would really be the most suitable place for articles of that description because there the teaching is done? Decidedly. All specimens relating to process work should undoubtedly be exhibited in the Technical College at Ultimo.
1479. Whatever is suitable for that museum is not wanted in the other museum? Certainly not. I should like to point out that I have been most scrupulously careful in introducing into the Australian Museum—nothing which can be construed into process work of any kind whatever—so as not to trench on the Technological Museum.
1480. Yours is a scientific museum? Exactly.
1481. Do you agree with the Superintendent of the Geological Department that he should have his minerals close to his elbow? That is quite right.
1482. And so far as he is concerned his mineral specimens ought to be in the office adjoining the one in which he himself is situated? They ought to be contiguous to him.
1483. You agree that he should have a museum? Yes; so long as it is restricted within its proper limits.
1484. But the mere industrial part of it had better go to the Technological Museum? I should say so.
1485. Some duplication is inevitable? You cannot help that.
1486. Do you know the University museum? What do you mean by the University museum;—do you mean the Macleay museum or the class museum.
1487. The class museum? Yes, I know it.
1488. Is that as good as it should be? No.
1489. Is there any unnecessary duplication there? No.
1490. I presume that the professors at the University really require, not only all they have got, but more? Certainly they do. It is impossible to lecture without.
1491. You think they are deficient at present? Yes; it is impossible to teach students the various subjects which they are supposed to be taught without actually putting the specimens into their hands, so that they may become acquainted with them, not only by the eye, but by the touch and feeling.
1492. Then you think our educational equipment there is defective? Yes; in that respect.
- 1493-4. It is proposed to make the basement of the new building into a museum. You will see from the plan that the windows facing Bridge-street will give a very good light. On the western side of the building, facing Young-street, there will also be a good light, but on the other two sides it will not be so good. There will be a sunken area on each side, and also a central open space, which will be covered by

R. Etheridge. a glass roof,—do you think that, taken all round, there will be a sufficiently good light for the museum? I should think so. Of course, I am not in love with any light which is derived from a sunken area, but if it is of limited extent it will not make much difference.

1 Mar., 1899.

1495. But you have not such a good light as that in the Museum? Not in one part of it. One part of it was constructed many years ago. It was not constructed for a museum, and not much attention was paid to the lighting; but in all the portions recently added we have really more light than we want. That light is derived from what is known as Helliwell's patent. It is a roof within a roof, and is easily cleaned.

1496. Is that light only applied to the upper storey? No; to two galleries and a hall.

1497. Who was the architect who designed that? The Government Architect. I am not sure whether it was at the close of Mr. Barnett's reign, or when Mr. Vernon came in, but I think it was when Mr. Vernon first took office.

1498. We are supposed to have on the basement of the new building 12,000 square feet of space;—would that be abundant to house all the specimens in the new museum? I think so.

1499. If the museum in the Domain, which will be transferred to this museum, were purged of all that should go to the museum at Ultimo, the 12,000 square feet would, in your opinion, be superabundant? I should say that it is ample.

1500. Which is the best collection of minerals we have in the Colony at present? From an Australian point of view, that of the Department of Mines; but if we look at it as a general collection of minerals I could not say whether it was better than ours or *vice versa*.

1501. If anyone from abroad asked you to show him every kind of gold-ore raised in New South Wales, you could not show him them? I should send him to the Departmental museum.

1502. If he asked you to show him specimens of tellurides, could you do it? Yes; but not as good as theirs.

1503. Is your mineral department one of your best? It is one of the best.

1504. Is it equal to the rest? Certainly.

1505. It is not your weak department? No.

1506. Have you anything there which there is not in the Mines Department? I dare say we have; but I would not like to answer the question off-hand. I dare say they have things which we have not.

1507. Are you still increasing your mineral collection? When we get the opportunity.

1508. *Mr. Watson.*] What do you consider the opportunity—the obtaining of specimens, or the finding of room? The obtaining of specimens, if we can get people to give them.

1509. Then you have room for them? The minerals are the only things I have room for, at present. I have a little room for further minerals, and that is the only room I have.

1510. *Dr. Garran.*] When the building is finished, will you have room for your collection? Room for a certain quantity. If the entire south wing were put up I should have room.

1511. The general effect of your evidence is, that we must have four different museums in Sydney—one at the University, one at the Technical College, one at the Mines Department, and one where you are? Yes.

1512. But that we could and ought to avoid duplication? Yes, and that might be done by arrangement.

1513. And that we ought to aim at making yours the most complete scientific collection? Yes. I consider that the Australian Museum in New South Wales takes, and should be permitted to take, the place of the British Museum in Great Britain.

1514. There is no common authority to govern the whole of the four museums;—perhaps they are in conflict with, and to a small degree jealous of, each other? Possibly.

1515. The only authority would be Ministerial? Exactly.

1516. They are not all under the same Department? To a certain extent the Technological Museum is a direct branch of the Public Instruction Department, and we are an offshoot.

1517. If the University is under any body it is under the Education Department? Certainly; but the class museums there have been practically formed by the professors themselves—almost entirely by the sole exertions of each professor. I should not be inclined to speak of them as a city or national museum, because they really are the absolute property of the University.

1518. They are the result of personal efforts? Exactly.

1519. And the State has never given anything for them? I think not, beyond the mere State grants to the University.

1520. *Mr. Shepherd.*] Would it be possible to make some arrangement so as to avoid such a multiplication of museums? Only by increasing one or other of them so that it could encompass the whole.

1521. Do you think it could be accomplished? Yes, at a considerable expense. You would require to put up an entirely new building, or increase one or other of the remainder, so as to take in the lot. Then there is this difficulty: The Technological museum, of course, should be attached to the Technical College just as much as the Mining museum should be attached to the Mines Department. It is a difficult thing to say exactly how to go to work to accomplish it, but if it could be accomplished it would be a great saving. If you could bring the Technical College and the Technological Museum in juxtaposition with the Mines Department and museum, and then bring them into juxtaposition with our Museum, you would get them all in one.

1522. Do you not think that such a museum would be of greater value than a number of museums distributed about the city and suburbs? Certainly.

1523. You could have a larger and better collection controlled by one head? Yes, and it would be a more cheaply managed collection.

1524. Do you see any difficulty in the way of creating one establishment for the whole? Nothing more or less than vested interest.

1525. Would it not be possible to arrange some portion of a building of that kind so that classes could be taken to it and instructed? Yes. Of course, we lay out one day a week for the attendance of any classes or people who are in want of instruction.

1526. I suppose, there is no doubt that in all these museums there is a great duplication of specimens? I would not say a great duplication, but there is duplication to a certain extent. Of course, in what you might call the strictly zoological part of our museum, there is no duplication.

1527. I suppose the Mines Department would have duplications of what you have? To some extent.

1528. And the Technical College as well? To some extent, no doubt.

1529. So that there are really three or four specimens where one ought to do? Possibly.

THURSDAY,

THURSDAY, 2 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Edward William Knox, General Manager, Colonial Sugar Refining Company (Ltd.), sworn, and examined:—

1530. *Chairman.*] I believe you have had considerable experience in office work? I have been connected with a large business ever since I began business life. E. W. Knox.
1531. The Committee are anxious to know what would be a fair amount of space to allot to individuals doing office work;—can you give us any particulars as to the number of officers you employ, and the floor-space allotted to them? We have between sixty and seventy on our staff at present in the office, and the space inside the outer walls of the building consists of three floors of 2,800 feet each—8,400 in all—from which has to be deducted the staircase and corridors. When your Secretary spoke to me about the Committee wishing me to give what information I could on the subject, I calculated what I thought would be a fair allowance for each officer, and I came to the conclusion that 100 square feet was a fair thing, without taking into account the corridors and staircase. 2 Mar., 1899.
1532. Does your experience lead you to believe that 100 square feet is an ample average? Yes; I myself have a larger room of 200 square feet.
1533. I suppose that at times you receive a number of gentlemen in your office for the purpose of doing business with them? Yes.
1534. Do you find that you can transact business comfortably in that space? I think a room, the dimensions of which are about 250 square feet, is large enough for almost any one who has to transact business in an ordinary way.
1535. *Dr. Garran.*] Do you, as far as possible, put your staff of clerks in large rooms where they are subject to supervision, or do you put them in a number of rooms? We entered our present offices about fifteen years ago, and I had not given the matter as much consideration then as I have done since. We subdivided one floor into a number of small rooms with lath and plaster partitions. That, however, was, I think, a mistake. If I built a new office I would build a shell, and fill it up and subdivide it by means of glass partitions.
1536. Then your supervision on the floor to which you have referred is not so good as you would wish it to be? Nearly the whole of the floor is occupied by independent officers who do not require supervision.
1537. In a case of that kind, then, you would subdivide? I would subdivide with glass—not with lath and plaster.
1538. How much space do you consider a single officer in one room ought to have? Twelve feet or 15 feet by 10 feet—about 120 square feet.
1539. Do you consider that sufficient for an Under Secretary in the Government Service? Scarcely, because an Under Secretary sometimes has to see a large number of people at one time. I was referring rather to superior officers who have to do a good deal of work, and who require quietness in order to do it.
1540. What is the largest number of clerks you have in any one room? In the laboratory there are about fifteen.
1541. Have they 100 square feet of space each? Very nearly so, I think.
1542. I take it for granted that they would require fully that amount in a laboratory? I do not know that they require that space more in the laboratory than in any other room, because the men there work on their feet most of the time, and they keep the windows open more than it would be possible for them to do if the whole of them were engaged in clerical work.
1543. Are there no chemical vapours which vitiate the atmosphere of the laboratory? Not to any extent.
1544. What is the largest number of ordinary clerks occupying one of your rooms? There are twelve clerks in the main office down-stairs.
1545. Do you know the size of that room? It is about 50 feet by 20 feet. It is a very lofty room—a large open office.
1546. Do the public enter that room for the purpose of transacting business? Yes.
1547. Is a portion of the room railed off by means of a counter? Yes.
1548. Have you ever received any complaint from your clerks in regard to the condition of the atmosphere? No; the room is a very lofty one.
1549. Do you find that you can keep your windows open during office hours? We generally have the door open, and the windows are always open.
1550. We are advised that in many instances one clerk likes to keep the windows open, and another likes to keep them shut? Yes; that is often the case. The strongest man generally gets his own way.
1551. I suppose you can keep your windows open sufficiently to enable you to secure adequate ventilation and fresh air? Yes.
1552. Have you any special ventilating apparatus connected with the buildings? No.
1553. When you say that you allow about 100 square feet to each clerk, do you include in that space all the room occupied by single officers in various parts of the building? Yes.
1554. I take it that they would have a little more than 100 square feet of space? Yes; because if a man is shut up inside four walls the whole of the day, he must have a little more than would a number of officials who are spread over a large area.
1555. Do you carry your dividing partitions up to the roof? In places where you want quiet you must do so. For ordinary clerical work, I think the best arrangement is that which has been effected by the Australian Mutual Provident Society, where they have only low partitions.
1556. But where it is necessary for confidential conversation to go on you must necessarily make your offices more private? Yes.

- E. W. Knox. 1557. With regard to Government offices, where a large number of clerks are engaged, you would, I suppose, prefer a large open room for their accommodation? Yes.
- 2 Mar., 1899. 1558. You do not think, however, that the Government ought to allow its employees less than 100 square feet? I should not think it expedient to do so, because, after all, a man employed in an office passes the greater portion of his life there—that is, of his waking life.
1559. If you were planning a scheme like the one under the consideration of the Committee, and had to be in charge of from fifty to sixty clerks in one room, and you were asked what would be a fair space to allot to each of them, you would, I suppose, reply “100 square feet would be a reasonable amount”? It would be plenty.
1560. If you keep a man working from 9 a.m. until 5 p.m., you ought, of course, to give him as much fresh air as possible? That is so.
1561. I suppose you could not expect a man to do good work during the last three or four hours of the day if he were in a foul atmosphere? No.
1562. Do you think that 100 square feet would be about the standard to allow in new offices? About that.
1563. Were the offices which you occupy designed for you? No; the shell was put up, and we were left to fill it up with partitions in any way we pleased.
1564. The subdivisions are the work of the company? Yes. Since we first went into the building we have pulled down many of the subdivisions.
1565. You did that as the result of your experience? Yes.
1566. And your experience leads you to favour large rooms? Yes.
1567. Do you not find that confidential and leading officers like to shut themselves in? All the leading men have separate rooms.
1568. They do not like to be in a room with others? No; they should not be.
1569. Would you encourage that system in Government Departments for chief clerks? There you get beyond me, because I do not know to what extent the chief clerks have the direct supervision of those under them.
1570. There is a tendency in the Government Departments for officers to require rooms, so that they may shut themselves off? I think that is a mistake.
1571. You would only allow that where confidential conversation was really required? Yes.
1572. Do you find that your officers work fairly well, so far as space is concerned? Yes.
1573. If you had to build again would you make many changes? I would have nothing but glass for divisions.
1574. Do any of your men complain of want of ventilation? No, excepting in the very hot weather. The men on the top floor complain of the radiation of the heat from the roof. Unfortunately it is the practice in Sydney to make the lower rooms very lofty, and the top rooms very low, whereas the practice ought to be absolutely reversed.
1575. The top rooms are under slate or iron, and you cannot get away from the hot air? That is so.
1576. *Mr. Shepherd.*] I suppose the 100 square feet allotted to each clerk means 100 square feet of floor-space? Yes.
1577. Of course, the number of cubic feet would depend entirely upon the height of the rooms? Yes.
1578. What is the height of your different rooms? About 15 feet on the ground floor, 12 feet on the first floor, and 10 feet on the upper floor.
1579. Are 100 square feet allotted to each officer? No, that is how it works out roughly.
1580. How are the rooms ventilated? Only by windows, excepting on the top floor, which has ventilation through the roof as well. Of course, there are windows and openings into the corridors over the doors.
1581. Are the whole of the divisions of glass, or have you any divisions of other classes of material? On the ground floor they are all glass; on the first floor they are lath and plaster, and on the second floor they are match-boarding and glass.
1582. Is the building fully occupied by the sixty or seventy clerks, or have you room for more? There is, of course, the basement, but I would not put men there. Otherwise the place is rather too fully occupied.
1583. I suppose that on the ground floor a considerable space is occupied by an opening for visitors to come in? Yes.
1584. And there are a number of enclosed rooms on the ground floor? I gave you the area of the ground floor occupied by the twelve clerks as that which was not taken in by the enclosed rooms.
1585. Have you a regular length of desk, or has each clerk a table to himself? Downstairs we have nothing but desks; upstairs we have nothing but tables, excepting the desks of the book-keepers. Desks are the best for book-keepers.
1586. And the whole of the space on the three floors is occupied by clerks only? Yes.
1587. *Mr. Levien.*] You say that if you were building again you would have glass partitions between each room? Yes.
1588. Would you have none between the rooms of clerks who conduct confidential work? I do not think you can hear through a good glass partition.
1589. As a matter of fact, you would have each room with a partition of glass? Yes.
1590. Up to the ceiling? Yes.

FRIDAY, 3 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Frederick Bickell Guthrie, F.C.S., Chemist, Department of Mines and Agriculture, sworn, and examined:—

1591. *Chairman.*] Will you give the Committee the particulars of your present accommodation? I have premises in the old Naval Stores, Circular Quay, behind the North German Lloyd wharf. I have one half of the building. It occupies a little under 4,000 square feet of floor space. It is fairly suitable, as far as room goes. I could do, of course, with more room, because I have a great deal of bulky stuff. It is a ramshackle building, and it is of no use trying to put up anything good in the way of fittings. In chemical work it is essential that the buildings should be as good as possible, and the appliances up to date. We are rather handicapped in that respect: The floor is shaky and it is difficult to get the chemical balances to read accurately on that account. It is a very dusty place, and is inconvenient in being separated from the rest of the Department. Of course, I have a certain advantage in being left to myself when work is required to go on continuously. There is, however, a disadvantage in being separated from other scientific officers of the Department, because we cannot exchange ideas very well. F. B. Guthrie,  
F.C.S.  
3 March, 1899.
1592. Would the work be done more economically under one roof? Undoubtedly. I think it would increase the efficiency of the work if we were all together.
1593. Do you know where you are to be located in the proposed new building? I believe on the top floor, fronting Bridge-street. The accommodation is about one-third less than what I have now, and the accommodation I have now is none too large for my work. I should like to urge upon the Committee the desirability of giving me, at least, the amount of accommodation I now have. I understand that some of the top floor might possibly be available.
1594. You are of opinion that the amount of space allotted to you in the proposed building is not sufficient? It is rather cramped.
1595. Where were you accommodated before you entered your present building? I had a basement in the Forestry Department in Macquarie-street—about half the size of what I have now—perhaps about 2,000 square feet of floor space. My work since then has grown considerably.
1596. Do you think it will expand greatly in the future? Yes.
1597. If you have 4,000 square feet now, the probabilities are that you will require a great deal more in a short time? I should not like to say that, because I think 4,000 square feet is a very fair size for a laboratory, and four or five of us could work there comfortably. I do not think the work would require much more space. We have no museums or collections or anything like that which grow in size.
1598. The main things which would make it desirable for you to remove would be the inconvenience of the stores in not being close to the Department, and their age, which accounts for the floor being shaky, thus interfering with the proper working of the Department? That is so.
1599. *Dr. Garran.*] What are the bulky articles which you have in your premises? We have a small wheat mill, which takes up a good deal of room. It is a permanent arrangement, and requires to be separated from the rest of the chemical work. It does not do for the flour to become contaminated with acid vapours. In addition to that I have often to undertake some investigation or inquiry requiring the use of bulky apparatus. For instance, some time ago I was asked to make experiments with regard to fumigating fruit. That involves the fitting up of a small chamber.
1600. It is the apparatus that is bulky, and not the articles sent to you? The articles sent are sometimes bulky.
1601. Do you analyse soils? Yes; they are sent in large bags.
1602. Do you analyse wheat? Yes; a great deal.
1603. Is that done free for the farmers? Yes.
1604. Do you make any use of the museum in the Domain? Not much.
1605. Do you require a museum for your work? No, excepting a small collection of new chemicals, new foddors, foods, and manures. I have a little museum of that kind of my own, but it is not connected with the Department.
1606. Would the basement of the proposed building suit you as well as the top storey? One floor would suit me as well as another. There is, however, an advantage in having a chemical laboratory near the top of a building. If it is on the basement it may be found inconvenient, because of the acid vapours which are given off.
1607. Have you any assistants? Yes, two.
1608. If the work increases, will you have to increase their number? Yes; I am to have another shortly.
1609. *Mr. Watson.*] What space have you now? 3,700 square feet, according to a rough measurement.
1610. And it is proposed to give you 2,500 square feet; even allowing for the bulky articles you have mentioned, does not that seem a very large area for yourself and for your three officers? Of course, a great deal of space is occupied by benches, tables, and so on; and a great deal of the work has to be separated. For example, we keep the balances in a room which is shut off from the rest of the space, so that they will not be affected by the vapours and fumes.
1611. The balances will not take up a great deal of space? No; but we have to keep certain work separate. For instance, the examination of water has to be conducted in a separate room, where there is absolutely no danger from contamination by fumes.
1612. Are you a great deal inconvenienced by being sent for by the head of the Department for consultations? Very often I have to stop work for half an hour or an hour to see the Minister or Under Secretary. If we were in the same building the delay would not be more, perhaps, than ten minutes.
1613. How far are you from the Mines Department? About five minutes walk. 1614.

- F. B. Guthrie, 1614. Then, from your point of view, it is necessary that you should be placed in close proximity to the Department? It would be very advantageous. With regard to my remarks about space, I wish to state that I do not want more than I have now; but any less space will cramp me.
- 3 March, 1899. 1615. Do you think you could manage with 2,500 square feet? Yes; it would rather cramp and inconvenience me.
1616. Do you think the probable increase which you speak of in your work will necessitate a great increase in space? I do not think so. I think the increase hitherto has necessitated more space; but we shall not have much more variety of subjects to deal with.
1617. Then you could accommodate a greater number of officers even with the same space if there is not a great increase in the variety of the matter treated? Yes.
1618. *Mr. Shepherd.*] How is your present space of 4,000 square feet occupied? It was originally one large room, and I subdivided it into different rooms. There is one main laboratory in which the assistants and myself work. That takes up about 1,200 square feet. It is fitted up with six benches. Then there is a room partitioned off for books and records, and the assistants also use it. That is a small room, about 12 feet square. There is a balance room, about 14 feet by 9 or 10 feet. There is a small room, about 10 feet square, fitted up as a dark room for testing sugars and so on. There is a room about 20 feet by 20 feet in which I generally work. It is fitted with benches and tables, and a writing desk. I use it as an office and laboratory. There is another room which I use for any special work which requires to be kept free from contamination. The rest of the space is taken up with shelves and stores. There is a table for samples as they come in. Another corner of the building is devoted to grinding samples and getting them ready for analysis.
1619. Altogether you have seven rooms? Yes.
1620. Do you keep the samples permanently? Only for a certain time.
1621. Do you find the space always fully occupied? Yes.
1622. Do you think it is likely that you will require additional space? No; 3,700 square feet would be enough for me.
1623. Are any of the manures which you have to investigate obnoxious so far as smell is concerned? Yes; that is a reason why it would be an advantage to be in an upper building. Of course the ordinary acids we use are also objectionable.
1624. *Mr. Levien.*] Would it not be rather awkward to convey the bulky samples with which you deal to an upper storey? We are up-stairs now, and have to raise them. We have a chain, pulley, and lift.
1625. There would be no lift in the new building beyond the passenger lift? Of course our bags of wheat and other stuff could not very well be put into a passenger lift.
1626. It would be necessary to have a lift or some other means of conveying heavy goods and samples to the top of the building? Yes; it would require some arrangement of that sort.
1627. How many bags of wheat do you get at a time? The other day the Chamber of Commerce, in conjunction with ourselves, were taking the standard weights of wheat, and they sent about thirty bags, containing about 2 bushels each, to us.
1628. And these would have to be taken to the top of the new building? Yes.
1629. Do you often receive heavy bags? Yes; bags weighing 100 lb.
1630. Do you ever receive any machinery? Yes; for instance, we have a wheat mill.
1631. Then, in your opinion, it would be better to have a lift for the conveyance of the bulky samples? Yes, unless there is a court-yard from which to raise heavy goods by means of a rope and pulley.
1632. Otherwise, you think the situation of your Department in the new building on top floor would be convenient? Yes.
1633. *Mr. Shepherd.*] Are these very heavy parcels of wheat frequently received? No, not frequently.
1634. Could they be unpacked and sent up? No. A bushel of wheat, for instance, would have to go as it was received. Cases of chemicals and apparatus could be unpacked.
1635. *Mr. Trickett.*] Who fills the position of Metallurgist? Mr. Taylor.
1636. Is he in the building? No; he is at the Clyde.
1637. Who is the Bacteriologist? There is not one.
1638. Who is the Dairy Expert? Mr. O'Callaghan. He is at present next door to me at the Queen's Wharf.
1639. Where is the Assayer? At the Clyde.
1640. So that really the only scientist in your branch in Sydney is yourself? There is Mr. Froggatt, the Entomologist.
1641. Is it proposed that he should occupy part of the 2,500 feet? No, he will have a separate room.
1642. Your branch includes yourself and two assistants, who will be increased to three, and the space to be allotted to you is 2,513 feet? Yes.
1643. Mr. Knox, of the Colonial Sugar Company, has a laboratory in O'Connell-street, occupied by fifteen people, over a floor-space of 1,500 square feet; you and three assistants are to be allotted 2,513 square feet;—does not that seem ample? Not really. I can accommodate a great many more people, but I cannot accommodate more apparatus. Mr. Knox's work is all of the same nature—testing sugars. At his place they can work as students work at the University. We, however, have a considerable amount of different kinds of work which has to be kept separate, and some of which takes up a considerable deal of room.
1644. The other day Mr. Pittman said he thought that you might possibly object to want of space, because, as he stated, no chemist in the world has as big a room as yourself, and you will be naturally loth to leave it? That is rather unkind of Mr. Pittman. I am surprised he made the remark.
1645. Do you think you are not asking for rather too much space? I do not think so.
1646. With regard to your tests of agricultural produce—wheat, manures, and so on;—is it not always usual to limit the bulk submitted for analysis where the premises are limited in extent? I do not wish you to imagine I have an enormous bulk of separate samples. We have, however, occasionally to keep bulky things, such as, for example, cases of fruit for the purpose of examination. These have to be provided for. It would not do to neglect an experiment simply because we have no means of getting a few cases into the building. The bulky things I spoke of were things like the wheat-mill apparatus for weighing the bushel of wheat, small chambers for fumigating fruit, &c., which take up more space than chemical apparatus usually does. I do not wish to be greedy about space, but I should be loth to have less than I have now.

1647. Were you, as the chemist whom it is sought to locate at the top of the proposed building, consulted as to the location, size, and suitability of the place you are expected to occupy? I do not think I ever was officially.

F. B. Guthrie,  
F.C.S.

3 March, 1899.

1648. *Mr. Dick.*] Can you give us a general outline of the work you do in your Department? We are, speaking generally, chemical advisers to the farmers. We make all kinds of analyses of farm produce and soils in order to show the best treatment for manures. We make analyses of fertilisers, and tell the farmers whether they are getting value for what they receive. We make analyses of well waters, chiefly with a view to testing their suitability for irrigation or watering stock. We also make analyses of milk, butter, and cheese. Last year and previous years we had a good many beets to analyse, especially when Mr. Lee was cultivating beet at Tenterfield. We analyse fodder to ascertain its value and composition. We frequently analyse samples of plants which are supposed to be poisonous to stock. In addition to that, we have to give advice from the chemist's point of view, and undertake investigations into any questions of interest to the farming community.

1649. What does Mr. O'Callaghan do as a dairy expert? He, or his assistant, examines butter and milk as a bacteriologist. The work I have to do in regard to these things is to ascertain their chemical composition.

1650. Does Mr. Hamlet, the Government Analyst, also make analyses of water? His work is mostly in connection with the Board of Health. He deals with water for human consumption.

1651. His work in that connection, however, is in many respects similar to yours? It is a similar class of work, but the analysis requires a different application.

1652. If Mr. Hamlet makes a chemical analysis of water, he is doing similar work to yourself? Personally, I do not see why one Department should not examine all the waters, excepting, of course, that the farmers like to deal with the Department of Agriculture.

1653. There is also a chemical laboratory at the Mines Department? A laboratory for assaying and for the analysis of minerals, stones, and rocks.

1654. Do you think any economy, in the way of gas chambers and the various appurtenances to a laboratory, could be secured by combining the various laboratories under one roof? I do not think so. It would not decrease the quantity of work to be done.

1655. Do you not think that a large building could be fitted up in such a way as to result in a material decrease in the amount of apparatus required? I do not think you would find that there would be much saving. Each of us is working full time and overtime, and have more than we could do. In order to save in chemical apparatus we should have to do less. The more work there is the more chemicals have to be used.

1656. I am referring more to the mechanical appurtenances? The bulk of the Assayer's apparatus in the Department of Mines consists of such things as furnaces, which, of course, I do not use at all. There would be no saving there.

1657. Do you know the chemical laboratory at the University? Yes.

1658. The amount of space allotted to each student there is very small? Yes.

1659. You will find students there engaged not only in class, but in special work in the one building? Yes; but they have a fairly big laboratory. Their floor-space is considerably more than I have.

1660. What special apparatus have you besides the wheat-mill which takes up a lot of room? Practically very little, excepting benches and tables.

1661. Apart from the wheat-mill, have you any special apparatus of an extensive character? An occasional one has to be fitted up. For instance, I had to fit up a couple of big cases for the fumigation of fruit. I require a special room for that. I am fitting up an apparatus for taking up the weight of a bushel of wheat. That I have had to put into the basement in territory which does not belong to me—not so much on account of want of room, as on account of the floor being so shaky.

1662. Do you think if a decent floor were put down, the place would suit your purposes for many years to come? It is such an old and dilapidated building that, I think, the Government Architect would object to put a good floor into it. The walls, of course, are good.

1663. Do you keep samples of various kinds of soil? I used to try and keep them altogether, but I found the samples took up too much room. We keep them for about a year now. Of course we keep the results of the analyses. With regard to the accommodation at my disposal, I should like to say that I am occupying the rooms which used to be occupied by the analyst at the Clyde, and I have never heard him complain of their being too large. Mr. Hamlet, the Government Analyst, was next door to me, and occupied premises which are of exactly the same size. If Mr. Pittman says I have the largest laboratory of anyone in the world, I can only reply that I occupy exactly the premises his analyst occupied, and a space exactly similar to that which Mr. Hamlet occupied.

1664. What space does Mr. Hamlet occupy now? I do not know, but I do not think he has so much.

1665. Would it be wise to send your samples of soil when you have done with them to the Technological Museum? I should be glad to do so.

1666. *Chairman.*] How long have you held your present position? Since 1892.

1667. What were you doing before you entered the Government service? I was Demonstrator in Chemistry at the University of Sydney.

1668. Supposing you were in private practice doing work similar to that which you are doing at present, necessitating the employment of two assistants—do you think you would go to the expense of renting premises of 4,000 square feet? I should, if I could afford it.

1669. That is if money were no object? Yes. Of course, one would have to take into consideration the question of rent.

1670. The Government, being the providers in this instance of both space and money, you have not, I suppose, given much consideration to the question of economy? I feel, of course, justified in asking that I should not be cramped.

1671. You have not had occasion to think much of the question of economy? No.

1672. Are there many private laboratories in Sydney? Yes.

1673. What class of business does Mr. Vale do? He is an assayer. Dr. Helms has a fair-sized laboratory, and does general work. Mr. Dixon also has a fair-sized laboratory.

1674. Do they occupy anything like the space, which is provided for you in the new building? I should think they have nearly as much. Dr. Helms has a floor in Bridge-street, and Mr. Dixon has a floor in a street off Pitt-street.

1675.

- F. B. Guthrie, F.C.S.  
3 March, 1899.
1675. Is there not an overlapping of work, and could not some of that which you have to do, such as analysing soil, be done at the Clyde works? Not with the present staff. All their time is fully occupied.
1676. Would it be possible, by a better arrangement of work, for you to do with less space than you ask for? I could do with less space, certainly. If you only give me a certain space, I must manage with it.
1677. But you could do your work much better with plenty of elbow room? That is so.
1678. I understand that the Board of Inquiry, in regard to proposed buildings, stated that you asked for 4,500 square feet, and that they had to cut it down considerably;—did they cut it down without consulting you? Yes. I admit that I asked for more than was absolutely necessary. I did this in order to provide for expansion, and because I anticipated that whatever space I asked for would be reduced.
1679. *Mr. Levien.*] Are you frequently interviewed by farmers? Yes.
1680. Then it would be better for you to have your Department in Sydney than at Clyde? Certainly. Farmers generally go to the head office first, and then come to me.
1681. I suppose a personal interview with these men is far better than writing to them? Yes.

Alexander Bruce, Chief Inspector of Stock, Department of Mines and Agriculture, sworn, and examined:—

- A. Bruce.  
3 March, 1899.
1682. *Chairman.*] Where are your offices? In Young-street, in a house belonging to Mrs. Rosenthal.
1683. What rent do you pay? £175 per annum.
1684. *Mr. Dick.*] Give us a general idea of the work carried on by your Department? As Chief Inspector of Stock, I have to do with everything in regard to stock which comes within the scope of the Government,—principally in connection with the prevention of diseases to stock. Then I have charge of the registration of brands, pounds, and commons. I have to carry out the administration of the Stock Protection Act with respect to noxious animals.
1685. Do you employ officers who are skilled in stock diseases? Yes; there are about fifty inspectors, and a qualified veterinary surgeon.
1686. What qualifications do the inspectors possess? They pass an examination by the Stock Board of examiners.
1687. How many officers have you in the head office in Sydney? Fourteen including myself.
1688. What floor-space have you? 1,300 or 1,400 square feet. We are very much cramped for room.
1689. If you were provided with one large room, how many men could you put in it? I should like to get the whole of the staff in one room. It would be very convenient. My work is so much connected with the public, that I should like to have the ground floor of the proposed new building. We have to examine dogs and horses at the door. We have a continuous stream of people calling with respect to stock, which are going away by ships and trains.
1690. If you could not get a large room on the ground floor, do you think the basement would be suitable for you? Yes, if it were well lighted.
1691. *Mr. Trickett.*] Do I understand that horses and dogs are brought to you for inspection at your office door? Yes; generally on their way to be shipped. A person comes and makes a declaration, and subsequently brings his horse, which is inspected. The inspector signs a certificate, and hands it to the man in charge of the horse, generally when it is on its way to the ship.
1692. In a building in connection with which such a process as that is in operation, would it not be better that there should be a small court-yard where you could carry out your inspections? We have been accustomed to do it in the street. I do not know that there need be special provision for it. There is a lane in connection with the new building which would be very convenient.
1693. Were you ever consulted about the construction of the building? The heads of the different branches were invited by the Under Secretary to talk the matter over a few days ago.
1694. Was that before the plans were prepared? No. I think, however, there was some consultation some time ago, but I forget what took place.
1695. Are your clerks in different rooms? Yes, we are in seven different rooms.
1696. Would it be better to have them in one large room? Yes.
1697. Is your staff at present on different floors? Yes. We shall require about 2,000 square feet of space.
1698. Is your work in any way connected with the Chemist's department? Sometimes we have to send him plants to ascertain whether they are poisonous.
1699. It is proposed to locate the Chemist in the top storey of the building;—what is your opinion with regard to that arrangement? It would be very convenient for us.
1700. At present you have to send your work to Mr. Guthrie, at the Quay? Yes.
1701. Is that inconvenient? It would be very much better if we could be together. I find it very inconvenient, even now, to be sent for by the Minister as I frequently am.
1702. Is the quarantine of dogs, &c., under your Department? Yes; we have a quarantine at Randwick, one at Shark Island, and one at Bradley's Head.
1703. How do you work them? One of the inspectors takes charge along with a Government veterinary surgeon.
1704. Any dealings with animals in quarantine have to go through your office? Yes; in fact, we have to get notice that they are coming before they arrive.
1705. Are you connected with these stations by telephone? Yes.
1706. Do you think the accommodation you are asking for is ample for some years to come? I think it is, because I used to do work which some of the branches of the Agriculture Department have taken up.
1707. In erecting office accommodation for your branch of the Department, is any special consideration necessary, excepting that you should be as near to the ground-floor as possible? I do not think so.
1708. *Dr. Garran.*] Do any of your officers make use of the museum in the Domain? We have to refer to it at times, but not much.
1709. What about? About wool, plants, and animals.
1710. *Mr. Watson.*] Is your branch likely at any time to be brought under the Lands Department? I do not think it could possibly leave the Agriculture Department.
1711. Is it not a fact that your work and theirs comes very much in contact with regard to the administration of stock routes, annual leases, and reserves? Yes; but that is a comparatively small portion of my work. In every other part of the world, the Stock Branch is attached to the Agriculture Department.

1712. Then the small portion of your work which touches the Lands Department is not sufficient to justify your inclusion with them? No.

1713. *Mr. Shepherd.*] You say you require a space of 2,000 square feet? Yes.

1714. And your staff consists of fourteen? Yes.

1715. Are they supposed to occupy the whole of the 2,000 square feet? I need a pretty large room, because I frequently have meetings of the directors and other bodies. The Government Veterinary Surgeon would take up a large space. He has two rooms now, and I do not know that he could do with less. Besides there are frequently four or five people in the place at a time. We require a good deal of space for the public.

1716. In that case you would not require the whole of the 2,000 square feet in one room? There need only be a temporary partition between myself and the officers.

1717. You would have an office to yourself? Yes.

1718. And one for the Veterinary Surgeon? Yes.

1719. And the remainder could be placed in one room? Yes.

1720. Do you not think that 2,000 square feet is a very large space for the accommodation of a staff of fourteen? I speak from my experience of what I have at present. We have a large number of books and papers which require shelving.

1721. Do your inspectors often visit Sydney? Occasionally. Of course they would not require extra accommodation. They merely interview me, send in reports, and so on. We send out 11,000 or 12,000 letters during a year.

A. Bruce.  
8 March, 1899.

WEDNESDAY, 8 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD,  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Denison Samuel King Miller, Accountant, Bank of New South Wales, sworn, and examined:—

1722. *Chairman.*] Can you give the Committee information with reference to the number of officers employed in the head office of the Bank of New South Wales, and the floor space occupied by them? Yes; I have drawn a rough sketch showing each room, and I have also particulars of the number of clerks. The main banking hall is 45 feet by 90 feet by 18 feet high. The principal working space is behind a long counter to which the public go. That space is 24 feet by 44 feet, and in it there are forty clerks working. They are arranged along desks in such order as to take up as little space as possible, and to give every convenience in the shape of access. My office is located so that I can see the whole of these clerks at work. The room I occupy is 12 feet by 10 feet. That room is for myself and a clerk. At the side of where I sit there is further counter accommodation for the public. There is a working space there of 29 feet 6 inches by 10 feet, in which seven clerks are working. They attend to a great number of the public who stand on the opposite side of the counter. Nearer the front of the building the sub-manager is located. He occupies a room 7 feet 6 inches by 9 feet 6 inches, which is quite enough for him; and he, like myself, interviews people all day long. As a rule, I only require to see one person at a time, and if there is enough room for one's self, a table upon which to put necessary papers, and a chair for a visitor, it is quite sufficient. We go up a few steps at the rear of the main banking hall to the portion which we call the Government banking chamber. The whole of the space occupied by the Government banking chamber is 45 feet by 57 feet by 13 feet 6 inches high. The working space is 23 feet 6 inches by 23 feet by 13 feet 6 inches high. Nine clerks are working in that space at present, but when we did the whole of the Government banking business we had twelve or thirteen clerks there. At the back of that we have the chief cashier and three clerks in a space of 16 feet by 16 feet. He is given that amount of space because he has a large quantity of notes always on hand, which require to be sorted out during the day. We have an entrance to the inward exchange department from the side street for clerks from other banks. They only do routine banking business. There are from six to eight clerks there, and they occupy a space of 24 feet by 13 feet. Next to that is a room 8 feet by 11 feet 6 inches. In that room is the secretary to the exchanges for settlement with the banks in Sydney. In that room there is a desk and copying press. Adjoining it we have a makeshift for a library, which is 14 feet by 10 feet. Next to it is another room, 18 feet by 9 feet, which is occupied by a clerk and the auditors when they come round each half year. We keep that room practically for their use. That comprises the main banking hall from the front to the back. We also have a suite of rooms for the accommodation of clerks. The manager occupies a room 14 feet by 16 feet and 18 feet high. Outside his room is a waiting-room, which is used by people who come to see him. That room is 14 feet by 6 feet. Next to the manager's room is a room for securities and head office deeds only. That is so arranged that people who come to see the manager can go into the next room, and a clerk can attend to them. The room for securities and deeds is 20 feet by 13 feet. In it there are five clerks, and the necessary deeds for carrying on the head office work. Deeds and large tabular books have frequently to be spread out there. Then there is a room 23 feet by 17 feet for the purpose of dealing with bills, correspondence, and postage. In that room we have ten clerks. They also attend to the public who come to make inquiries. Next to that room is a room which we call our country office, which is 23 feet square, and in which are seventeen clerks at work. We have room for two or three more to attend to the public as they come in. At the back we have the Gold Department. In that we do all the smelting and assaying. That is divided into four rooms and a bath-room. There is a complete assaying plant, and it takes in about 23 feet by 25 or 26 feet.

1723. What is the total number of officials employed on the ground floor? 107 clerks on the working space, without taking into consideration the part allotted to the public. That gives each clerk 700 cubic feet.

D. S. K.  
Miller.  
8 Mar., 1899.

D. S. K.  
Miller.  
8 Mar., 1899.

feet. According to the Factories Act 400 cubic feet must be provided for each person, and under those conditions we could employ 325 people on the ground-floor.

1724. Has there ever been any sign of ill-health on the part of the clerks owing to overcrowding? None whatever. We are well situated with regard to ventilation. We have windows 5 feet 4 inches by 10 feet high, and they are open at the top and bottom all day.

1725. Do you find the ventilation from the window openings sufficient? Yes.

1726. Have you any mechanical appliances for ventilation? No; we have one or two ventilating shafts. Of course, the lift acts as a ventilating shaft, and in a room where we never get any ordinary ventilation, there are two shafts, or ordinary pipes, 12 or 14 inches in diameter, which go above the building outside. The ventilating cowl at the top sucks up the bad air. There are seventeen clerks in that room, and that arrangement gives ample ventilation.

1727. Will you describe your arrangement for the subdivision of that space, and the provision you make for supervision? Our system is to see the whole of the clerks at work at one glance. There are no obstructions in the shape of backs of tables or desks. I can sit at my desk and see fifty or sixty clerks at work. That is one thing upon which we insist. Another thing is the grouping of officers, so that the work they do shall run continuously. For instance, if a cheque comes in it goes to one clerk first, and then to the next in order, and then the next to him in order, instead of going to another part of the building and back again. A man presents a cheque, and the paying teller cashes it. It is then posted in the ledger, and the ledger is immediately behind the teller. It then goes to the cash book-keeper, who sits immediately opposite at a double desk. That deals with the cheque. If, after the teller cashed a cheque, it had to go to different points, 12 or 14 or more feet away, the result would be loss of time. As things are, the cheque passes directly from hand to hand, and the clerks deal with it in rotation. No time is lost in sending it backwards and forwards. The same thing occurs in correspondence. A letter comes in, and the clerks are so arranged to deal with it that they have not to take it from one room to another and back again, but they deal with it in one room only.

1728. Are the partitions carried right up? Only so far as the public are concerned, so as to prevent them from seeing to the back of the office. It is all open at the back of the office.

1729. Are the glass partitions between the public and the clerks frosted? Yes.

1730. And the partitions behind are of clear glass? Yes.

1731. *Dr. Garran.*] Is your own room surrounded by clear glass? Yes.

1732. How is the manager's room divided? It is closed right up to the ceiling.

1733. Is that the only one on that floor which is closed to the ceiling? Yes.

1734. Then the whole air-space is available for the clerks? Yes.

1735. *Chairman.*] Can you give us any idea as to whether the public attending the Bank suffer any inconvenience owing to the heat of the building? We have never heard of it.

1736. How many people do you suppose come to the Bank on a busy day? On a busy afternoon I have counted as many as 150 of the public in the Bank at the one time. We endeavour to arrange so that there may not be large gatherings of that character. We make arrangements so that a man who goes to the counter shall be attended to without being kept waiting, unless we really cannot help it.

1737. Are there frequently 150 of the public there, as well as the 107 clerks? From 100 to 150 of the public are occasionally there without any inconvenience. Of course, we are exceptionally well ventilated. I may mention, that on Saturday morning last, I got a messenger to stand at the front door to count the number of people who came in to be attended to between 10 and 12 o'clock, and there were just 1,100.

1738. What about the first-floor? Of course, the boundary walls are the same as down below. Going up in the lift we come to the principal room, which is the general manager's room. That is 22 feet by 17 feet by 14 feet high, which he finds ample. The next room is a board-room, which is also used for shareholders meetings. That room is 45 feet by 16 feet 6 inches. The Board can do with a room half that size, but we like to have our shareholders meetings in the Bank itself, and that room accommodates them as well. The height of the room on this floor is 14 feet. At the back of the general manager's room and the board-room are the usual bath-rooms, &c., for the directors. Going from the general manager's and the board-room we have the whole of the inspecting staff, branch securities staff, and branch accountant's staff. The general manager's secretary occupies a room 12 feet by 12 feet. Next to him are two clerks in touch with his department who keep the share-lists of the Bank. That room is 6 feet 3 inches by 12 feet 4 inches. Next to that are two rooms occupied by the inspector to the southern division. His room is 10 feet by 10 feet 6 inches. At his door are two clerks, and sometimes three, occupying a room 11 feet 6 inches by 9 feet 6 inches. We go along the passage and come to a room of the inspector for the northern division. When he is in town, he and two or three clerks occupy it. That room is 17 feet by 11 feet. Next to that is the room of the inspector of the central division. He occupies a room 12 feet by 12 feet, and his two or three clerks have another room 12 feet by 12 feet. Following round the building we come to the branch securities room. In that room, which is 22 feet by 18 feet, we have ten clerks always at work, and sometimes one or two more as the deeds come in from the country.

1739. Is there any accommodation included in that 22 ft. by 18 ft. for any person making inquiries? Yes; the end of the passage is fenced off by a counter 3 feet 6 inches wide, and the whole of the inquiries in that room are made at that counter. If the inquiry is such as to necessitate the inspection of a deed, the inquirer is taken inside to a table at which there are two clerks, who attend to him.

1740. Do you find that sufficient room? Plenty. Of course, they have no room to spread out there, but they are able to work quite comfortably. The next room is the branch accountant's room, 48 feet by 18 feet. In that eighteen officers are employed. They have a little more room than usual, simply because the room is there, and they have large returns, which must be spread out and put side by side. There is ample accommodation there for four or five more clerks. On the second or top floor, in a room of the same width as the general manager's room—17 feet by 16 feet, but with bathroom accommodation taken off, we have accommodation for two lady type-writers. Next to that we have a general ledger department, in a space 29 feet by 13 feet 6 inches by 12 feet high, in which there are five clerks. Extra room is required there, because other clerks have to come from other portions of the building to check their work. Next to that is the station inspector. He has charge of all stations in which the bank is interested. He has a room 11 feet by 9 feet 6 inches for himself and clerk. There is plenty of room there for any person who comes from the country to interview him, or see what plans they require to see. Next to that is the Wool and Produce department, which is 16 feet by 16 feet 6 inches, and three clerks

are

are employed there. A clerk working with ordinary ledgers, which are about 22 inches by 15 inches, and which open out to about 30 inches by 22 inches, can, with two such ledgers, work easily in a space of 5 feet 6 inches. Of course, he would always have one ledger open and the other shut. The clerks work back to back in the main hall, and there is a space between the desks of 5 feet. That is ample for them, and for any person passing up and down between them. For an ordinary single desk, for large books, such as we use, a space of 2 feet 6 inches is plenty.

D. S. K.  
Miller.  
8 Mar., 1899.

1741. On the top floor the arrangement is different from what it is below in this particular—that the walls go from floor to ceiling? Yes.

1742. Do you find any difficulty in regard to lighting? No; because we are bound by the street all round.

1743. On two frontages? Yes; I may mention that a lantern light is provided for the board-room and the general manager's room, and that, in each case, gives ventilation.

1744. How many clerks are there on the first floor? Forty-one, and twelve on the second floor.

1745. Have you any accommodation for a caretaker? Yes; three rooms and a kitchen are apportioned. Part of the Wynyard-street frontage on the top floor is occupied.

1746. Do air-shafts pass through each of the floors? No; when you pass the top floor there are open spaces. On the first floor there are louvres at the sides for ventilation.

1747. Do you find the cowls of the ventilating-shaft effective? They are, as far as we can judge.

1748. What about your lavatory accommodation? That is on the basement.

1749. Do you provide lavatory accommodation on each floor? The general manager and directors have general accommodation for themselves; but that is all. We have twelve water-closets and ten urinals in the basement for the use of the clerks.

1750. Have you a luncheon-room on the premises? Yes; those clerks who care to do so can lunch in the building. Most of them do that. They also have lockers, in which to put their clothing. Each senior officer has a locker to himself, and the juniors have to share one between them.

1751. Then in every way your bank has provided for the convenience of the clerks? Yes; they need not go out at all between morning and evening, unless they care to do so.

1752. Is there any special arrangement in reference to the luncheon-hour? Yes; the luncheon-hour is really the only time during which the clerks are allowed to be off the premises without consent. Matters are so arranged that if four clerks are working at one class of work not more than two of them can be away at one time. Thus the work is continuous.

1753. Will you describe your strong-room arrangements? The strong-rooms are, of course, on the basement. The cash strong-rooms are so arranged that the chief cashier has control of them, and you cannot get to them without going down some steps, and he or his assistant always has the steps in view. On the other side of the building are securities, and papers, and deeds. People cannot get down to them unless I or a clerk see them. Of course, no one can get into the strong-room without special keys which are carried by the officers who are authorised to carry them.

1754. I suppose that the securities-room, which you say is up above, is cleared of securities every day, and they are brought below? Yes; they are not allowed to accumulate. Work that comes in to-day must be done to-day. Each day's work stands on its own merits, and must be cleared off.

1755. Therefore, it is not possible for the securities to accumulate? No. No accumulation of work is allowed. We have book-rooms on the basement, and we follow out the same system there. We only keep on the premises at the head office the books which are likely to be required for daily use. Some of the books are not wanted after they are used, and can be stored away at the store-room of one of the branches where they can be got at when necessary. Books which are likely to be used day by day are kept on the premises, so that if a book for the year 1892 or 1893 is required it can be obtained without trouble.

1756. *Dr. Garran.*] Would it be more convenient to have the securities on a floor from which they would not have to be carried;—could you not have a strong-room on each floor? It would be advisable, if we had the space and accommodation.

1757. Supposing you were building afresh, would you prefer the plan of having a strong-room running up through every floor? If you were building a new building that might be an advantage.

1758. Are the securities carried loosely in the hand? No; they are locked up in tin boxes.

1759. Then they could not be snatched out of anyone's hand? No.

1760. Have they to be taken down two sets of stairs, and be brought up again the next morning? Yes, in the lift; but as many as four boxes are put on one truck.

1761. Are the tin boxes put away at night? Yes; everything is put away. The books are locked up in large safes 8 feet high. They are in such a position that the men who are working with the books have only to carry them a distance of 6 or 8 or 12 feet in order to put them in their proper places in the safe. You can put books in safes, but not moneys and securities. They, of course, go down below. Our objection to large safes anywhere but on the ground floor is that in case of fire they might fall through to the bottom. Those we have are bound to the wall and the floor.

1762. Have they any special support underneath? Railway sleepers are put right through under them, and the wall holds them up.

1763. I believe the old part of the building was erected many years ago? Yes.

1764. Then you have to adjust your space from time to time? Yes; to make the most of it.

1765. If you were to begin *de novo*, would you make more changes? Yes. We should be able to provide in the same space accommodation for more people than are there now.

1766. Is any part of the building fire-proof? No.

1767. Not even the new part of the building? That was built twenty or twenty-five years ago. The only fire-proof part we have is, of course, the strong-room.

1768. *Chairman.*] I suppose you are able to economise space by proper grouping of your officers? That is what we have done. All men engaged in a certain class of work are together and in touch with one another. By that means they keep their work going.

1769. *Mr. Trickett.*] I believe you had an opportunity this morning of going to the Lands Office and the Mines Department? Yes.

1770. Will you give us your opinion about the rooms, and the arrangement of the clerks there? Speaking generally, I may say that there is a great waste of space and littering of the offices. There seems to me to be quite unnecessary furniture, books, and papers there.

1771. Do you think there is an absence of method? Apparently, a complete absence of it.

1772.

D. S. K.  
Miller.  
8 Mar., 1899.

1772. If you go into a room, and stand at the main entrance, you probably see the head of a clerk or two, the rest are hidden behind some cupboards at the end of a big table? My experience of cupboards is that you have not time to open and shut them all day long, and that whatever you put in them generally stops there for a week. It is necessary that a clerk should have his work on the table, put it away at night, and start fresh with it next morning. In the principal rooms there, I saw great piles of papers, which no man can possibly attend to in one day. What he cannot attend to should be under the table or in the vaults.

1773. You will admit that the papers in the Government Departments are, in many instances, bulky? What I saw this morning looked bulky enough. Of course I would not like to say what the requirements were which necessitated all those papers being about a man when he was at work.

1774. Was there, in your opinion, an absence of method and arrangement? There certainly was. For instance, in one large room I saw from ten to twelve clerks. The bulk of them had separate tables to themselves, with plenty of room. The same clerks could have been accommodated at a desk, standing face to face, with, perhaps, a rack upon which to put their papers, in half the space.

1775. Did it not strike you that the furniture was cumbersome and old-fashioned, and took up a great deal of space? It was quite out of date. Of course, if you have any amount of furniture, which you do not know what to do with, you must put it somewhere. If, however, you run your office on business principles, that kind of furniture is quite out of place in it.

1776. Supposing you had the arrangement of the correspondence room in connection with the Mines Department, what would you do? I would rather not answer that question, without going into the matter properly; but, speaking generally, I should be very dissatisfied to control officers arranged as they are.

1777. Did you notice the arrangements for the books? Yes; the offices are littered up with books. I noticed a great number of large tables, with high pigeon-holes at the back of them. I made a note to the effect that there were large quantities of newly-printed matter and forms piled up in the different rooms, and large quantities of old, and probably out-of-date papers and books, lumbering the room.

1778. Did you notice a great deal of writing-paper, blotting-paper, and envelopes? There was a large quantity of printed and other papers all over the place.

1779. What are your own arrangements with regard to writing material and forms required for your business? We keep on the premises, in a press, which is about 12 feet high by 10 feet, all the urgent requirements of the country branches of New South Wales. They are all in methodical form. Anything which we cannot keep in that confined space is kept by Messrs. Sands in a room, which is at our disposal, on their premises. They look after it, and keep it in order. Each of our clerks keeps only enough writing material at his elbow or on his desk for his immediate requirements.

1780. That not only avoids waste, but it avoids the taking up of space? Yes; it avoids the taking up of unnecessary space.

1781. Messrs. Sands occupy the same relation to the Bank of New South Wales as the Government Printing Office and the Stores Department occupy to the Government? Practically.

1782. I suppose that in connection with the work of the Bank of New South Wales you do not find it necessary to have sheets of foolscap, blotting paper, and envelopes lying about? I would not allow it for a moment.

1783. I suppose your method of grouping your clerks economises a great deal of space? Yes; the clerks should be grouped in such a way that they are able to do their work expeditiously and easily. They should not be lumbered up with papers with which they have nothing to do.

1784. Are you in a position to say, judging from your observation of the two Departments you visited this morning, that, with an economical arrangement of space and modern desk appliances, considerably more clerks could be accommodated than are at present accommodated? Certainly, in a great many of the rooms. But I would not like to pick out any particular room and say it could accommodate so many more.

1785. But the general impression in your mind is that, arranged as they are, there is space for a great many more clerks in those rooms? From what I saw I should say that 30 per cent. more clerks could be accommodated in the rooms I visited this morning than are at present there. I should be very much surprised if that could not be done.

1786. I suppose you noticed in the Mines Department that what was originally a large room has been divided by partitions which run right up to the ceiling;—do you approve of that arrangement in dealing with a large number of clerks? No; we are quite opposed to it.

1787. Does it interfere with the ventilation, and with the supervision of the clerks? There is no question about it. You cannot see through a partition which is boarded up, but with clear glass you can see what the whole of the staff are doing.

1788. If you had the arrangement or supervision of a large Department, would that be one of the first things to which you would attend? Yes.

1789. So as to ensure complete supervision? Yes.

1790. *Dr. Garran.*] Is there not always a tendency on the part of leading officers to get themselves isolated? In the Bank of New South Wales we only have two men who are of sufficient importance to be isolated—the general manager and the manager.

1791. Are they the only people who are isolated? They are. The three inspectors are partially isolated, because they are fenced off with their clerks.

1792. If a partition is only carried up a little distance conversation can be overheard? Yes.

1793. And you have a good deal of confidential conversation in the Bank? Yes; but the manager and general manager principally deal with it, and also the three inspectors. The three inspectors can shut themselves off from their clerks; but they can see what they are doing.

1794. Beyond those officers, you would not allow anyone to be isolated? No; the rest are under observation.

1795. *Mr. Watson.*] You will notice from the sketch plans of the proposed new building that the strong-rooms run right up from the basement to the fifth floor? Yes.

1796. It is proposed that they should be entered from each of the floors upon which they are situated, and it has been suggested that it would be an improvement to have a spiral staircase in the strong-room running from the bottom to the top;—do you think it would be advisable? I should say that it would be

a convenience to have an entrance from each floor. I saw a strong-room at the Lands Department this morning, which, I daresay, is admirably adapted for the purpose for which it is used, namely, the piling-up of old records; but if you have an entrance to the strong-room from each floor, and if the separate Departments are responsible for the records which are deposited from each floor, there ought to be no means of access whatever by means of a spiral staircase.

D. S. K.  
Miller.  
8 Mar., 1899.

1797. You think, then, that it would be better to have access from each floor? I think so. It would be absurd, in order to get to the top floor, to go to the bottom and then come up a spiral staircase.

1798. *Mr. Shepherd.*] Can you give the Committee the gross measurement of the ground floor of the Bank of New South Wales? Seventy-three feet frontage by about 162 feet. A portion of space at the back is occupied as a yard.

1799. And on the ground floor you accommodate 107 clerks? Yes.

1800. Out of that space you provide accommodation for the public in the front of the counters? Yes.

1801. You have the manager's and other rooms there as well? Yes. On the ground floor, the whole of the work of what is called the head office is conducted. The work connected with the branches is located upstairs.

1802. What are the dimensions of the first floor? Exactly the same as those of the floor below. The first floor, however, is not so much occupied.

1803. How many clerks are accommodated there? Forty-one.

1804. And you have a large number of rooms on the first floor? Yes. Upstairs we only go back to about 93 feet. A large amount of space is occupied by the officer who lives on the premises with his family.

1805. I understand that you have three safes;—are they independent of the strong-room? Yes they are book safes only.

1806. Is the strong-room on the basement absolutely fireproof? Yes, and it is so constructed that if a safe fell upon it from the top storey, it would not go through the roof.

Walter Wilson Froggatt, Entomologist, Department of Mines and Agriculture, sworn, and examined:—

1807. *Chairman.*] Where are your offices? At 40, Young-street; but I am about to move to the old Naval Depot Stores as soon as the floors are covered.

W. W.  
Froggatt.  
8 Mar., 1899.

1808. *Dr. Garran.*] Are you moving because you are inconveniently situated? Yes; I have only one small room where I am at present, and there are two large rooms in the other building.

1809. Will you have plenty of room where you are going? Yes.

1810. Have you any assistant? No, but I have the promise of one shortly.

1811. And there will only be two persons to accommodate? Yes.

1812. Is the museum in the Domain of any value to you in the prosecution of your work? No, I have nothing to do with it.

1813. Do you keep any museum or specimens of your own? Yes, I keep a large collection in my room—it consists of economic collections.

1814. I suppose you are aware that it is intended to have a museum on the basement of the proposed new building. Yes.

1815. And no part of that will be wanted by you? No.

1816. Is it a matter of importance to you whether you are on the same building as the Minister for Mines and Agriculture? It would be advisable that all the experts should be there.

1817. Does he often send to you? Yes.

1818. How often? Once or twice a month.

1819. What is your special work? To report on any insect pests which turn up, and to reply to any letters dealing with them.

1820. Do you consider the best means of destroying them? Yes; that is my special study.

1821. Have you any practical work to do in connection with that branch of your business? Yes; I visit a good many places in the course of a year, and make reports on anything I find. I inspect orchards for scale insects and other pests.

1822. Part of your work consists in travelling about? Yes; and making experiments.

1823. How much time do you spend in travelling about? Last year, I spent ten days out of every month—perhaps more. That was an exceptional year.

1824. I suppose you are in no particular hurry to move from your present quarters? No; the only thing is that it will be convenient to be with the rest of the Department.

1825. Would it be any convenience to you to be with the other scientific gentlemen connected with the Department? Yes; some of our work interlaces. I refer to the work of Mr. Allen, the Fruit Expert, the Viticulturist, and the Chemist.

1826. You have no employment in common? I have a little with Mr. Allen in connection with spraying material.

1827. Have you any books in common? No; I keep my own entomological library.

1828. Now and again your work interlaces a little? Yes.

1829. But not often? No. Sometimes, however, I go out to inspect different places with Mr. Allen.

1830. I suppose you have no objection to being put into the top storey of the new building? No.

1831. It will be convenient for you, if you have room? Yes.

1832. What is the maximum room you require? I think I should have two rooms. At present you can hardly get into my room on account of specimens, books, and book-cases. The room I at present occupy is about 12 feet by 14 feet.

1833. Is it big enough? It is big enough for office work, but I want it a little larger for specimens.

1834. Would one room, 20 feet by 20 feet, and another, 14 feet by 14 feet, be sufficient? Yes.

1835. If you get an assistant you will not want more? No.

1836. Do you know anything about the specimens of insects at present in the museum in the Domain? There are only a few there which are used for sending to shows. They are of no special value to me for my work. They are merely curiosities, with no scientific value.

1837. Is there anything in the Technological Museum at Ultimo of any value to you? There is a little, because there are some of my old collections there which I made when I was there as an assistant.

1838. What you are making now is a fresh collection? Yes. Of course there was the nucleus to it before I went there, but I have identified it and worked it up since.

1839.

- W. W. Froggatt.  
8 Mar., 1899.
1839. Does it grow rapidly? Yes. Of course a good many scale insects and other pests are obtained, and I send specimens to different specialists in order to get others in return.
1840. There is always a special demand for a new case? Yes.
1841. And you would want room for new cases? Yes.
1842. Still the room you have referred to would be large enough for some years to come? Yes.
1843. Have you any special demand for light in your room? I want good light for the purpose of using the microscope. An ordinary window would do, so long as it is low enough. I want a side light.
1844. You prefer a side light to a light above? Yes, I want a direct light which I can shut off by means of a black curtain.
1845. *Mr. Shepherd.*] Have you no assistant at present? No.
1846. Do you inspect orchards? Yes, if I am requested to do so by the orchardist.
1847. Do you inspect any fruit that is sent away? No, but I have been doing that temporarily. I did it when the Act first came into force.
1848. How is the fruit inspected now? Our own fruit is not inspected at all; we have no Act; no one can compel any one to have the fruit inspected here. A great deal is fumigated, but that is at the option of the exporter.
1849. Is not that done under your supervision? No; special inspectors are appointed now.
1850. Sometimes fruit is condemned after having been operated upon here? We have no power to even fumigate here. We only do it at the request of the exporters.
1851. I believe some shipping companies refuse to take either fruit or plants without a certificate? Yes.
1852. How do they obtain that certificate? Through Mr. Campbell or some of the inspectors.
1853. Surely there ought to be some means of effectually treating these things before they leave here, or what is the use of the certificate? They are fumigated with hydrocyanic acid gas, which destroys insect life; but you cannot fumigate for the codling moth, the fruit fly, and internal insects.
1854. Do you find that there is a greater disposition to cope with insect pests than there was formerly? Yes; all the large orchardists are spraying now, and they were not doing that five years ago.
1855. I believe the Department issues a sheet, giving details of the diseases of fruits? A sheet was issued before I came into the office.
1856. Was it largely applied for? No. It was not very accurate. It was issued by Mr. Fuller, and I stopped it. We are, however, issuing a pamphlet now which is up to date.
1857. You say you only occupy one small room? Yes, at present. I have a verandah, upon which I keep a lot of boxes.
1858. *Mr. Watson.*] Did I understand you to say that you are only sent for by the Department about twice in a month? By the Minister: but more frequently than that by the Under Secretary.
1859. I believe the object of the question was to find out how frequently you are required at the head office? Several times a week, either by the Under Secretary or by the Minister.
1860. Suppose you were to remain away from the new building, would it not be possible to communicate with you by telephone without the necessity of personal attendance? Yes; but I am away a good deal. Of course, if I had an assistant, he would be able to speak through the telephone.
1861. In any case, if you were away, you could not attend the Minister; so that, from that point of view, there would be very little saving? Yes; I might be away for an hour or two, and the telephone would be ringing, with no one there.
1862. If your office were in the main building, and you were away for an hour or two, they would have to wait until you came back? Yes.
1863. I presume one large room would suit you, so long as you had the necessary space? I would sooner have two rooms, because I could then use one for the finer microscopic work, where there would be no dust.
1864. I suppose you would have visitors from amongst the public? I have a great number of visitors.
1865. And you would like to have them away from your work? Yes.
1866. In any case, there does not seem to be any urgent necessity to get your branch into the same building as that occupied by the general body of the Mines Department? I do not think there is at the present time. Of course it would be an advantage to be with the rest on account of the work interlacing a good deal.
1867. I suppose it is more important to you to be in close touch with the Fruit and Dairy Expert and the Chemist, than it is to be in close touch with the head of the Department? Yes.
1868. There is a nest of branches which overlap and interlace one with the other? That is so.

Duncan Clark McLachlan, Under Secretary, Department of Mines and Agriculture, sworn, and further examined:—

- D. C. McLachlan.  
8 Mar., 1899.
1869. *Chairman.*] Have you examined the plans since you gave evidence on a former occasion with a view to the more economical grouping of your officers? Yes; the more serviceable grouping of the officers.
1870. Will you give us the benefit of your examination? Yes. I was asked to consider further whether I thought it would be convenient to have the building divided right through from top to bottom. I think that would be a very inconvenient arrangement. I think there should be one floor devoted wholly to the Ministerial part of each Department. The Mines Department should have one floor to itself, and the Instruction Department another floor, so that the Minister could have about him all the officers he immediately requires. For that reason I think it should be so put up that one floor will be devoted to the Ministerial part of each Department.
1871. *Dr. Garran.*] But everyone seems to think that the first floor is the convenient Minister's floor? It is more convenient; but that is scarcely a matter about which I would argue, because I do not think it much matters, so long as we have a floor.
1872. You do not think the Ministers would mind the next floor? No.
1873. You, as Under Secretary, would not mind it? Not at all.
1874. So long as you had a lift? Quite so.
1875. *Chairman.*] That is the case now, is it not? Yes; he is surrounded by officers with whom he is in constant communication, so as to save going up another flight of stairs.
1876. The Minister for Mines is situated above the Minister for Lands? Yes.
1877. *Dr. Garran.*] And he has all his leading officers on the same floor? Yes.

1878.

1878. You would not like to alter that? I would not. It would be inconvenient to the public, and would cause vexatious delay.

1879. If that idea were carried out, it would mean an alteration in the disposition of the building, and there would be really two buildings under one roof? Yes. Theoretically it seems a good thing, but I do not think it would do in practice. I think too much has been made of the question of having separate stairs to each Department. It really does not matter. In the present building there are not separate stairs.

1880. *Mr. Watson.*] In any case the two separate corner entrances, which may be in themselves convenient as means of access, and which would save a little distance to the public, would still be consonant with the idea of having separate floors? Yes.

1881. There would be nothing out of place in having additional entrances? Not at all. Besides, you could not keep the business of that particular Department at one end of the building, and the business of the other Department at the other end. The public would come in where they liked, and would go out where they liked.

1882. It is proposed to have locks on the divisional doors? I am sure they would soon have to be unlocked. The whole building ought to be free to the public to get in as they wish. Of course it is a nice arrangement for the Department. They will keep every one with whom they are concerned to themselves, but I do not believe in the idea myself.

1883. *Dr. Garran.*] With regard to the other floor;—would you prefer to have the people working there also on the same floor? No; after getting one Ministerial floor, I can go in for a central division if I like.

1884. You have somewhat rearranged your rooms to meet the plan? I have.

1885. Otherwise you would subdivide much as you did before? Yes; all the accommodation we require is provided.

1886. You still find you have a little space on the top floor which you do not want? Not immediately. It will meet future requirements.

1887. *Mr. Watson.*] In the rearrangement which you have made, do you take into account the possibility of arranging your furniture and office accommodation in a manner different from what it is at present? Yes.

1888. The Committee, when visiting the place the other day, came to the conclusion that the space was not economised as it might be; that view has been borne out by outside evidence, not only with respect to your Department, but with respect to other Departments;—have you in view any better method of disposing of your furniture and officers? Yes.

1889. I understand that the method of furnishing would rest with yourself more than with the Government Architect? Yes; we should make a requisition to him.

1890. The manner in which you would arrange your officers, and the accommodation which you would give them individually rests with yourself? Yes.

1891. And you contemplate some alteration? Yes.

1892. Will you give us an idea of it? My idea is, as far as possible, to make all the clerks utilise flat desks, and instead of their having pigeon-holes and presses in front of them in which to keep their papers, the wall space around the room should be utilised for the presses. I would arrange the clerks around the room, and, if it is broad enough, along the centre as well.

1893. I presume you would arrange matters so that a clerk could obtain the papers which it is necessary for him to handle from within easy reach? Just behind him.

1894. In what would you carry the papers? In pigeon-holes right to the top. The clerk would be facing away from the wall. There would be a uniform width of pigeon-holes, and that would economise space. The furniture which is there now has been accumulating for years.

1895. It has been stated that the system of having tables with pigeon-hole backs, or pigeon-holes at one end, very often has the effect of obstructing a view of the clerk when engaged in his work? That is not a fact.

1896. Of course, it would not apply to the arrangement which you have spoken of, but it would apply to the existing arrangements? No; not where they work. The man who is in charge of a room can see every one in it. The pigeon-holes may be facing one way, but he can see all along the room, notwithstanding that they are there.

1897. Still, if there were anything in the objection it would not hold with regard to the suggested arrangement about which you have spoken? No. All the centre of the room would be clear of the papers against the wall.

1898. You think it is possible to arrange the clerical division in that way? Yes.

1899. And that should result in a great saving of space? Not a great saving, but it will result in a saving.

1900. What saving do you think you could effect by that method as compared with your present arrangements? I do not think it would save more than 1,000 feet.

1901. What percentage is that? Perhaps 10 per cent.

1902. I believe you have some plan to show the Committee with regard to the arrangement of the rooms? I have marked out the manner in which the Mines Office should be located. Of course, the basement will be as before—kept as a museum. I propose to leave the space on the ground floor exactly as it is allotted. I propose to put the Stock Branch in the two rooms on the ground floor fronting Bridge-street.

1903. *Dr. Garran.*] Mr. Bruce says he has all sorts of animals brought to his office for examination, and he thought it better for him to go to the back lane? It will not be far for him to go round. Mr. Bruce has a good deal to do with the public. A large number of people come in to see his inspectors, and they should be handy. For the reasons you have mentioned, it would be as well to put him on the ground floor as near the street as possible.

1904. *Mr. Watson.*] Is there any door from that lane to the ground floor? No.

1905. If there were, it might be possible to put him in some of the rooms adjoining the lane? I do not think he could be located in a more convenient place than the one I have mentioned. I propose to put the Stock Branch on the Bridge-street frontage on the ground floor. The room fronting Young-street I propose to devote to an inquiry office for the Registrar connected with the Mines Department. Mr. Slee, the Chief Inspector of Mines, and his clerks, I propose to put in a room on the inner section of the Young-street frontage.

1906.

D. C.  
McLachlan.

8 Mar., 1899.

D. C.  
McLachlan.  
8 Mar., 1899.

1906. What is the area of that space, and the number of officers who will be accommodated? I think there will be thirty officers in those four rooms.

1907. Supposing you occupy the ground-floor, which has 3,722 feet of space, exclusive of the corridors, it will be divided amongst the thirty officers? Yes. I propose to make the first floor a Ministerial floor, and if that is objected to, to put it on the floor above, where the accommodation is the same. I propose that the Minister's room should be on the Phillip-street frontage, with a waiting-room at the northern end of the Phillip-street frontage. My room would be next to the Minister's room, and there would be a waiting-room on the other side. On the southern end of the Phillip-street frontage, I would put the Lease Branch and the legal officers of the Department. The Lease Branch is one of our most important branches, and more people come there than to any other branch of the Department. They come to the Minister, and he requires immediate answers to their inquiries. He generally sends to me, and I have no trouble in getting at the Lease Branch at once. The room on the inner side of the Phillip-street frontage is a long room which I propose to cut into two, and to put the Registrar of Mines into one portion of it. I refer to Mr. Ray, who is a very important officer of the Department, and who requires to communicate with the Minister, and he will be right opposite his door. There will also be a board room and deputation room.

1908. You do not propose that the Minister should receive them as now, in his own room? His own room will very often not hold them now. We frequently have conferences on agricultural and stock subjects, and as many as 100 people come there. At present we have to borrow the Land Board room to accommodate them. We had a deputation last week from the Chamber of Mines, and there must have been more than 100 people there. They could not get into the room. Every office in connection with which deputations, conferences, and meetings are held, requires a board room. There is a long room fronting Bridge-street, which I have cut up into four sections—a small room in one part for the Chief Clerk, and the rest for the branches—Stock, Agriculture, and Public Watering Places. He is separated from the rest. On the opposite end I have put the Chief Clerk of Mines proper. Between them I have the records and correspondence. These two will be only separated by a glass partition with a swing door. They are always wanting papers, and they have them at their hand.

1909. Do you propose to have these two officials, although only having a glass partition between them, separated as far as sight is concerned, or could the partition be of clear glass? Clear glass would do.

1910. Would you have the room for the records and correspondence again divided? No. I would put the correspondence at one end, and the records at the other, with no partition. With regard to the inner section fronting Bridge-street, I propose to put the Public Watering Places Branch there. I propose to divide the room on the inner section fronting Young-street into two, and to put the clerks of the Agricultural Branch there, and the Inspectors of Agriculture alongside them. Their business is so interwoven that the papers can pass from one to the other without being carried upstairs or moved about.

1911. Do you propose to subdivide that by means of a partition all the way up? Yes; with a door between.

1912. Do you think it is a good idea to have so many partitions? Their work is quite distinct, and if you have too many in a room a lot of talking goes on, and it interferes with work.

1913. Some business firms have as many as sixty or seventy clerks in a room, and the man in charge sees that no talking goes on? I do not refer to general conversation, of course, but to conversation about business and explanations. A great number of people have to come and see the inspectors. When ships are arriving half-a-dozen frequently rush in to get the inspectors to go to the wharfs to inspect their fruit. They often have wordy battles about the fruit. Of course, if that goes on the clerks cannot work. At the end fronting Young-street, I propose to put the accountant's and the Examining Branch in one room. Therefore the Minister will have his Under-Secretary, his Chief Clerk, his records and correspondence, and his accounts and inspectors on the one floor, and if he wants any of them they can be sent for in a moment. If a man comes to him about his account, and wants to know why it has not been paid, or when it will be paid, he can obtain the information at once.

1914. What number of officers will be accommodated there? I could not tell you at once.

1915. There are 9,531 feet of space available on that floor;—I should like to know the number of officers proposed to be put there? I will send the information to the Secretary. With regard to the second floor, seeing that we have taken some space from the Instruction Department, of course, this floor will be given up to them. I have taken more than I give. To make up for taking more than I give, I let them have another floor entirely, so that they really get more than we do. The object, of course, is the concentration of offices.

1916. You are prepared to give up your share of two floors for their share of one floor? Yes; and I do not think they should object.

1917. Then, leaving the basement out of account, you would have three complete floors, and the already proposed division of another floor? Yes.

1918. That would be equal to three and a half floors? Yes.

1919. What about the fourth floor? That of course will remain as it is. I propose to put the Government Geologist and his staff in the rooms fronting Phillip-street, and on the side fronting Bridge-street I propose to put the Charting Branch. Fronting Young-street I intend to put the Library Department, and the editor of the *Agricultural Gazette*.

1920. Which branch is the library connected with? The Agricultural.

1921. What about the inner section fronting Young-street? I propose to put the Chief Inspector of Collieries—Mr. Atkinson—and his clerks there. On the inner section fronting Bridge-street, I propose to put the Board of Exports, who will occupy half a room. The other half will be taken up by the map-room, where they print all the mining plans and tracings, and that sort of thing.

1922. Does your Department print these for itself? Yes, it prints all the mining maps. The mining divisions are constantly being altered, and the maps are sent out every three months, showing all the ground taken up for mining purposes.

1923. You do not get that work done at the Government Printing Office? No.

1924. What about the inner section fronting Phillip-street? Immediately behind the Geological Branch, I propose to put the Curator of the Museum, and the place where all the sorting of minerals is done. I propose to put the Chief Inspector of Agriculture (Mr. Thomson) in a small room there, and in another small room, the Fruit Expert, Mr. Allen. The general agricultural work will also be done there.

For

For instance, the distribution of seed-wheat is going on. A couple of officers see to the distribution of that, and I want a room in which to put them. That exhausts the fourth floor. On the fifth floor I propose to put the Pathologist, and all the artists in the Agricultural Department in the large room fronting Phillip-street. D. C.  
McLachlan.  
8 Mar., 1899.

1925. Do you propose to subdivide that room? No; those people are at present working in the dome at the top of the Public Works building.

1926. Do you propose to put any more in that room than are at present working in the dome of this building? Yes; I propose to put Dr. Cobb and Mr. Farrar, the Wheat Expert, in a room on the inner section fronting Phillip-street. I give a room for plan-mounting, or anything of that kind required in connection with drafting. I cut off another portion for a store-room. There is also a long room fronting Bridge-street for Mr. Guthrie, (Chemist), and his assistants.

1927. *Dr. Garran.*] How do you propose to get his plant to the top of the building? It can be taken to pieces and conveyed up in sections; it can be easily dismantled.

1928. He states that at times he has 2 or 3 tons of wheat sent to him? That is on very rare occasions indeed.

1929. He sometimes receives heavy cases of chemicals? I do not think they would be too heavy to go in the lift. The back room on the inner section of the Bridge-street frontage I propose to use as a general work-room. The back room on the inner section of the Young-street frontage, I propose to cut into two, and to put the Dairy Expert in one part of it, and the Viticultural Expert in the other. The Entomologist will be put in a corner room fronting Young-street. He will have 300 feet of space there.

1930. *Mr. Watson.*] He states that he would like to have two rooms, as he has to receive the public, and he requires special lighting for his instruments? He can divide that room into two.

1931. There will be a certain amount of space to spare on the Young-street frontage? Yes; 824 feet.

1932. What about the Bridge-street frontage? That is for the laboratories and chemists.

1933. You have used up the whole of the room now? Yes; I admit that there is plenty of room in all these offices at present, and as we grow, we can put men in; but they will be all grouped, as I have stated.

1934. Leaving out the spare 824 feet, there is a saving of something like 1,700 feet as compared with the previous estimate? Yes.

1935. It was proposed to allot to you 47,941 feet;—the total you propose to utilise, not taking into account the saving of 824 feet, is only 46,240 feet? That is about it.

1936. If there are 824 feet to spare, that will leave about 45,200 feet; so that practically there is a saving of 2,500 feet? Yes. I pull in that much by means of this arrangement, and I make a much more convenient office to work in.

1937. That 45,000 feet would be better for you than the 48,000 feet as arranged in the first instance? Very much better. I am positive that if the previous arrangement of the office were adhered to it would be impossible to carry it out in practice, and the building would have to be re-arranged when we got into it.

THURSDAY, 16 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Walter Liberty Vernon, Government Architect, sworn, and further examined:—

1938. *Chairman.*] You were asked to prepare a statement of the cost of putting another floor on the present Lands Office building;—have you considered that question? I have looked at it, and can give you, approximately, the result. W. L. Vernon.  
16 Mar., 1899.

1939. Is it possible to do it? Physically, it is possible to do it. The office floor-space which would be gained would be 19,643 superficial feet. The approximate cost has to be taken into consideration with the removal of the dome. An extra storey would at once give the dome bad proportions, and it means reconstruction, so that I have had to calculate accordingly. I should also have to alter the construction of the side domes. Taking these matters into consideration, and also basing my estimate, to some extent, although not fully, upon the original cost of the building, I find that the cost of the floor and re-roofing will be £46,880. The original cost of the building, including the tower, was £232,000. If one takes the tower and domes and adds them to the average cost per floor, it gives £58,000 as the original cost per floor. I have brought that amount down in this instance to £46,880, believing I can do it by using the old roofs to a great extent, and probably simplifying the dome.

1940. *Mr. Watson.*] Is the 19,643 superficial feet exclusive of corridors? Yes, office space only. Then I use a certain amount of space in the dome floors, which I have not calculated. For the sake of comparison, the additional storey works out at a cost of 47s. per foot superficial, of office floor-space, as compared with the design before the Committee, in which the floor-space works out at 27s. 6d. per foot. It can thus be seen at once that this is a very costly addition to make. It is practically the building of one floor only, with a roof to it, at a cost of 47s. per foot superficial of floor-space, whilst the proposed building costs 27s. 6d. per foot superficial. In this instance we have one building with a number of storeys to construct, over which the roof could be proportionately spread.

1941. *Chairman.*] How much additional floor-space are you providing at the General Post Office? We are building two large halls—one for the telephone exchange, and the other for the telegraph operators. They measure about 120 feet by 54 feet each. There will also be a gallery at the end. Those two halls will cost about £22,000 or £23,000. I am not speaking now of the addition to the George-street frontage, which is another thing altogether.

1942. *Mr. Trickett.*] That is an exceptionally expensive job, owing to the height at which the work has to be done? That is so. 1943.

- W. L. Vernon. 1943. *Dr. Garran.*] In the course of our inquiries it has seemed possible that a large part of the museum will be found to duplicate with what is at the Technological Museum, and that we may not require the whole of the basement for museum purposes;—would it be possible to utilise it for offices? Yes; on the Young-street side particularly.
- 16 Mar., 1899. 1944. Would there be any damp? No.
1945. *Mr. Levien.*] Mr. Guthrie told us the other day that he would require heavy goods to be conveyed to the laboratory at the top of the building;—how is it proposed to take them up? There is provision in the plan for taking heavy goods down to the museum, and the same appliances can be used for taking them upwards. I did not know he wanted that accommodation. He can, however, easily find means for taking the goods up.
1946. Would that entail extra cost? It is probable we should put in a small lift which would be worked by an electric motor.
1947. Could they be taken up by means of a derrick? I do not see why they should not. The space in the corner of the lane is intended for a loading cart containing the material for the museum. If we can load downwards, there is no reason why we could not load upwards.
1948. *Dr. Garran.*] Would the passenger lift be strong enough to carry heavy cases of chemicals? I should not like to use it.
1949. The Chemist has a small flour-mill which he would require on the top storey;—would the vibration from the mill be inconvenient? We should place it in the best position possible. We propose to put a motor in the basement for ventilating purposes, and it would work the mill, and there would be no vibration at all.
1950. *Mr. Watson.*] Supposing the design for a museum in the basement were omitted, would it make much difference in the cost of the building? I could lower the building by one floor in height at once.
1951. What proportion would that bear to the total cost? If I took one of the smaller floors, it would probably mean one-seventh off. What I save on the roofed proportion I lose again on the partitions.
1952. The basement practically will cost about £1 to a superficial foot—about £14,000? Yes. I have reckoned the whole building at 27s. 6d. a foot; but, of course, there are no corridors in the basement.

Duncan Clark McLachlan, Under Secretary, Department of Mines and Agriculture, sworn, and further examined:—

- D. C. McLachlan. 1953. *Chairman.*] The question has arisen as to whether it is not possible to provide accommodation in the premises now occupied by you, by putting another floor on the top of those already existing;—how do you view a proposal of that sort? I should be quite favourable to it. Of course, our predominant idea is to concentrate all our forces. We have no wish or desire to have a special building of our own. We only want to get all our offices together, and if that can be done by putting an additional floor on the top of the existing building that is all we want.
- 16 Mar., 1899. 1954. I believe you have some rooms which are unoccupied on account of the heat? On the roof in the dome there are some rooms unoccupied. They are not serviceable. You would not utilise them in any way.
1955. Those rooms which are now lost, together with the additional floor-space which would be given by an extra floor, would, I suppose, accommodate you? It would accommodate us—not wholly, but it would be a great advantage over what we have at present.
1956. Would there be any great public inconvenience by retaining the old Commissariat Stores, and using them as they are now used? There would not be so much public convenience in leaving some of the other branches where they are. The Chemist's branch could more easily be dispensed with out of the main building than any other.
1957. Would it not be more advisable to keep a Department of that sort away from buildings where there are a number of offices? No. The work done there does not in any way interfere with the work of other offices.
1958. I noticed a couple of furnaces there the other day? They are only small gas furnaces, which affect nobody. Of course, nothing is done there on a commercial scale. Although I am the head of the Department, I have never been in some of the offices, simply because I have not the time to go and see them.
1959. Are there any rooms in the present building which you have not been in? Not belonging to the Mines Department.
1960. But there are some you are seldom in? There is no necessity to go into them, perhaps. I am in every room of the Department every week.
1961. Supposing something important were going on, would you not have to go to the building now occupied by Mr. Guthrie? No; I would have to send somebody else. My time is so much occupied where I am that I cannot leave the building. It is with difficulty, even, that I come here. Whilst I am here there may be twenty people waiting to see me. Apart from that, there would be better supervision if we were all in the same building.
1962. Suppose you went to that particular branch, you would not be able to tell whether the officials were doing their work properly or not? Nevertheless, the fact of their being overlooked has a good moral effect.
1963. Have you been to the Commissariat Stores? Only once.
1964. Are you aware that there are a number of unoccupied rooms there? I believe there are.
1965. There is also a covered yard there? I believe so.
1966. Mr. Bruce has stated that, as a rule, he inspects horses and dogs in the street;—if he could do that in the covered yard referred to, would it be a great convenience to your Department? Yes, no doubt; but Mr. Bruce is wanted every hour of the day at the head office.
1967. How long would it take him to go from where he is now located to the Commissariat Stores? Ten minutes each trip.
1968. Then there would be a difference of about 4 minutes in going to the yard from where he is now, and in going to it from where he would be located in the Commissariat Stores? Yes; but every 4 minutes are valuable, and we cannot afford to lose them. We have so many people to see in a day that we cannot afford to wait until an officer comes from a distance of a quarter of a mile away.
1969. How many times a day, on an average, do you think you have Mr. Bruce trotting backwards and forwards? I have known him come twenty times a day. If he makes a number of trips his day is practically gone.

D. C.  
McLachlan.  
16 Mar., 1899.

1970. Therefore, you consider it absolutely necessary that you should have as many officials as possible under one roof? Yes.
1971. *Mr. Dick.*] Do you set much store upon the idea of having the whole of the basement for a museum? Yes. I have an idea of making that a feature of the Department, and of the city. In a year or two the whole of it would be utilised with specimens which would be of use to the Department, and of benefit to the Colony generally.
1972. In arriving at that decision, have you taken into consideration the fact of the existence of other museums, one of which—the museum at the Technical College—will do the same work as yours? I do not think that museum supplies the objects we have in view at all. They have certain specimens which are only show specimens. We have what we call practical specimens—earth, and ordinary rock, and stones—which they discard.
1973. Take the various products of the Colony in order: do you propose, for instance, to have a timber department in the museum;—have you seen the timber exhibits at the Technical College? No.
1974. Are you aware that they have a complete set of exhibits there? I dare say they have, but I question whether the man who goes to the Technical College can obtain the economic information he requires from the officers there in the same way as he would from an expert belonging to the Department.
1975. Are you aware that they have an expert in timber at the Technical College? I was unaware that there was more than one man in the Government Service who was an expert pure and simple in timber, and he is in our Department. There are many people who know the different timbers, but that is all.
1976. Are you aware, too, that the botanist at the Technical College is in communication with other Departments with a view to informing intending investors where they can obtain supplies of timbers similar to those exhibited in the museum? No.
1977. Take the case of the various agricultural products of the colonies;—do you know that they have exhibits of that kind in that museum? They have small exhibits there.
1978. And a pretty extensive department showing economic values of many of our native trees? Quite so.
1979. Do you think that if the exhibits which you now have in the Domain were sent to the Technical College the object you have had in view would be practically served there? I do not think it would be nearly as well served.
1980. For what reason? Because the men who understand the specimens are in our Department and know the history of them, and could properly explain them. The man at the Technical College knows no more than enables him to show them. The information an investor or practical man would obtain there would be very poor as compared with what we could supply. Again, it is only natural to suppose that a man wishing to inquire about minerals would go to the Mines Department. He would not expect to be sent to the Technical College to be told by some theorist what certain stones were. He requires to be brought into contact with a practical man and a geologist, and that would be done at the Mines Department.
1981. Would not the difficulty be met by transferring not only the exhibits but also the gentleman who acts as Curator of the Department? No, because the Curator is only part and parcel of the geological survey work of the whole of the Colony, and he must be attached to where the geological work is going on.
1982. Supposing the Geological Surveyor himself were transferred to the Technical College? It would simply mean this: that so far as giving advice to the public, respecting the geological formation of the Colony is concerned, you had better shut the Mines Department up altogether, and allow the work to be done at the Technical College. I do not think I can make a better suggestion than this: that as the best authorities in the Colony are Professor David and Professor Liversidge, you should obtain their opinion. They have a knowledge of the value of museums, and what they are capable of doing.
1983. Have you any idea of the attendance at the museum in the Domain, compared with the attendance at the museum at the Technical College? No, because, as it is now, people do not know it is there, and it is so unattractive that they do not go near it. We desire to make the new museum so attractive that people will be drawn there.
1984. Do you not think it is easier of access than is the Technical College? It is; but I question whether one man in 1,000 knows where to find it.
1985. The man who is bent on discovering some avenue for the employment of his capital is as likely to find the museum where it is as at the Mines Department? Yes, and they do go there. But I should like to send many more there. For instance, Sir George Dibbs, a few months ago, brought a gentleman from Vancouver, and he wanted to see what minerals and timbers we had. He wished to invest in our own iron-ores. The display in the Domain is very poor, and I was really ashamed to ask him to go and see them as representing the minerals which the Colony possesses. He did not invest in our iron-ores; but if we had had something attractive to show him, it is possible he would have been impressed and might have done so.
1986. Do you know whether your timber exhibits are as good as those at the Technical College? They are not at present, because we do not consider it worth while spending money on them and exhibiting them in such a place as they are in now.
1987. With respect to the chemical and other laboratories which you have at the Naval Depôt;—do you think it is a good thing, as a matter of economy, to locate them in buildings occupying expensive city sites? I do not. I think that site might be turned to more profitable use.
1988. Do you think it is a good thing to place the Chemical Department in the proposed building? Yes; as a matter of economy.
1989. You do not think some suburban place would be more suitable, and would give more room at less cost? They do not want more room. The great object is to have them handy. It would be useless to send them into the suburbs.
1990. Do you think the Chemist will have plenty of room in the proposed building? Yes. Of course that is a branch of our Department, which we intend to make very much larger in the future. We intend to go in more for analysing soil, and also to deal with the bacteriology of soils more than we do now.
1991. Will the Entomologist be accommodated in the building? Yes.
1992. Will the Fruit and Dairy experts also be accommodated there? Yes. Practically every officer we have will be accommodated, and we shall have complete supervision over every one in the Department. It will be a great saving of time to the public to have them there.

D. C.  
McLachlan.  
16 Mar., 1899.

1993. *Mr. Watson.*] Supposing, later on, it was proposed to start a School of Mines in the city, you would require to have a mineralogical museum in connection with it for reference purposes? Yes; a slight one, but not to any extent. They would only require the main minerals to see what they are.

1994. I should imagine the practice of some of the other places would be followed in having a fairly good display? That is so now. The School of Mines is connected with the University, and they have specimens there.

1995. I believe that at the Technical College they have a fairly large number of exhibits of the mineral specimens of the Colony? Yes.

1996. Do you not think that, with mineral specimens at the Technical College, the University, and in the Domain, there might not arise some feeling of doubt in the minds of people as to where they should go to obtain the best information? No; I do not think any man is likely to have any doubt. I should imagine that he would naturally think that he ought to obtain the information from the Mines Department. I do not suppose that he would expect to obtain it at the Technical College.

1997. It is a certainty that if he expected to obtain information about timbers he would do a lot better at the Technical College than at the building in the Domain? He would at present. We do not pretend that that is a proper museum, simply because we do not know the moment that it will be burnt down. We have lost a life's collection of minerals by fire already. They included some of the most valuable specimens ever obtained in the Colonies.

1998. At any rate, a very large number of the minerals in the main are not of economic, but of scientific, value? A great number of them. We are in touch with all the mine-owners, and when our inspectors see any good specimens they can easily get them.

1999. Would it not be possible to apply their collecting capacity in that way to a central museum—I do not say to the exclusion of a reference museum for the Geological Surveyor, but a central museum which would not occupy so valuable a site as this? It would. At the same time I think a man is more likely to be interested in his own Department. If he feels he is doing something for his own Department he will pay more attention to it, and obtain better specimens than he would for an outside institution with which he is not connected.

WEDNESDAY, 22 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Tannatt William Edgeworth David, Professor of Geology and Mineralogy, University of Sydney, sworn, and examined:—

T. W. E.  
David.  
22 Mar., 1899.

2000. *Chairman.*] What position do you occupy? My present position is that of Professor of Geology at the University of Sydney. Before that I was for some years connected with the Geological Survey of New South Wales.

2001. *Dr. Garran.*] You had, I believe, some practice with museums before you came to this Colony? I had some experience of museums, such as the Museum of Practical Geology in London.

2002. Have you not had some connection with the museum which was in Macquarie-street, under the Department of Mines? I saw and used the museum in Macquarie-street, when it was connected with the geological survey, and also the older portion of the collection when it was housed at the back of the old Lands Office, subsequent to the burning of the Garden Palace. The geological collection and museum were kept for a few years, as far as I remember, at the back of the Lands Department, subsequent to the fire, and I used the collection then.

2003. You never were in any way in charge of it? Not directly.

2004. Did you collect specimens for it? I have done so.

2005. Have you had anything to do with the museum which is housed in the Domain? Nothing further than that I, from time to time, visit the spot and see the nature of the work which is going on there, and go over the collections.

2006. You have had no official connection with it? I have had no official connection with the museum in the Domain, as the date of the removal of the collection from Macquarie-street to the Domain was subsequent to my appointment to the University, and my commencement of my duties at the University.

2007. The proposal before the Committee is the construction of a new office in which the Mines Department is to be housed, and one part of the proposal is to take the whole of the basement for what I might call a Departmental museum. That covers not only the mineralogical specimens, but also a great variety of industrial specimens. It has appeared to the Committee, in the course of their investigations, that this industrial portion is duplicated to a very large extent at the Technical College at Ultimo. I want your opinion as an expert in museums as to whether there would be any advantage in that duplication? If it is proved beyond dispute that such duplication exists, I should say that it is very doubtful whether it is a public advantage that there should be anything like serious duplication. As far as I can see, although there may be a slight overlapping between a museum such as the Technological Museum and the Geological Survey, and again between the Australian Museum and the other two museums, still, knowing pretty intimately the collections of each of these museums, I do not think there is anything like a serious overlapping of the collections. It is true that, in the case of the Geological Survey museum, there are some specimens of such objects as building stone dressed up for exhibition purposes, and polished marbles, which were got up partly for exhibition purposes, and partly presented by the Works Department. There are a few specimens of that kind at the Geological Survey which I think are distinctly specimens of an industrial character, showing the manufacture of the raw product, which might, perhaps, with more advantage, be shown at the Technical College museum; but, in view of the fact that most of the visitors to the Geological Survey museum are visitors who come to the Mines Department, I think it would be in their interest if they could see, not only the collections made by the Geological Surveyors

T. W. E.  
David.  
22 Mar., 1899.

Surveyors at some locality convenient to the Department, but could also see a few of the economic uses to which some of the raw products are put. I must confess, however, that it would be undesirable to at all seriously duplicate collections illustrative of the working up of raw products into some kind of finished manufactured article. If it were proved that the overlapping or duplication was at all serious between the Geological Survey collections, and the Technological Museum collections, such a duplication would be prejudicial to the public interests, and steps ought to be taken to remove it. My opinion, however, is that there is no serious duplication at present.

2008. To some extent it seems that there must be a little duplication, because the director of the Geological Survey says it is as necessary for him to have his museum close, as it is for him to have his library close. Therefore, whilst he is quartered in the Department of Mines, he wants his museum there. That would apply to his part, so long as it is purely scientific; but would that cover the whole range of the mineralogical specimens, or only a part of them? Knowing the collection pretty intimately, I should say that it would cover something more than three-fourths; that is to say, more than three-fourths of the collection would be purely of scientific and practical value for the geological surveyors who have been chiefly instrumental in getting them together, and who need such a collection for reference, as well as for the mining public who, when they visit the Department of Mines, usually visit the museum also.

2009. Do practical miners go more to the Department than to the Technical College at Ultimo? I should fancy they do, although I am not prepared to give exact statistics on that point. I know that miners who come from a distance usually visit the Department of Mines on business, or to make inquiries of some kind, more or less official. I know that when I was at the Department of Mines, it was frequently their practice to go through the Geological Survey collection, with a view to instructing themselves.

2010. Do you think they would have done that if they had had to go to Ultimo? I should think it is very doubtful whether all of them would have gone to Ultimo. My opinion is that many of them would not have gone, as it would have necessitated a rather long journey.

2011. And you think you have more chance of getting them to make a study of the specimens, if you have them ready to hand, than you have if they are required to make a journey of a mile and a half? I distinctly think that would be so.

2012. So that, if we want to educate the people, we shall throw away a chance if we send them some distance to see the specimens? I think that would be the case.

2013. Admitting what you say with regard to the minerals, would your remarks equally apply to the large range of industrial products connected with the agricultural portion of the Department;—do you think there is any need to duplicate them? I have no knowledge of the exact character of that collection.

2014. The Department of Mines and Agriculture does not exactly touch the public at the same angle that a technical college would touch them, because the college is purely an educational institution, whilst the Department is an administrative one; therefore, the view of the college is scientific teaching,—that of the Department is to rouse public enthusiasm with regard to these industries;—do you think that consideration alone would justify two separate museums? It is hard to express a very decided opinion on that point. I know that the work the Department of Mines has done through the Geological Survey in arousing public interest, not only in Australia, but in other countries, by getting together collections of specimens, particularly in connection with either Australian or international exhibitions, has been an extremely valuable one, and I am sure has made very much in the interest of mining at large. The collections in the Geological Museum have been got together, partly by geological surveyors in their ordinary routine work, and partly through the agency of mining wardens, at times when exhibitions were about to be held. These two causes have operated to gather together these collections; and I think a very valuable work has been done in the way of interesting the mining community here in their own mineral resources, and in even educating the public, to a limited extent, in museums, by seeing the specimens and reading the labels. That may be of sufficient value, even in itself, to justify the existence of two separate museums.

2015. Your experience whilst you were in the Geological Branch was, that the money spent in that museum was well spent? I should express that opinion.

2016. You think the country got its money's worth? Yes.

2017. Still, as a museum expert, would you admit that it would be better to have one good museum than three inferior ones? I should certainly, if it be postulated in the first instance that there are three inferior museums. If, of course, you postulate that of the Australian Museum, the Technological Museum, and the Geological Survey Museum, I should certainly say, with regard to the Australian Museum, that that is a first-class museum.

2018. Still it is admitted that, in some mineralogical specimens, it is inferior to one or the other? The Australian Museum is, of course, capable of improvement in many directions. At the same time its general equipment all round is extremely creditable, and I should say it is the premier of the museums of Australia.

2019. We have three separate exhibitions of timbers under the Government, one distinctly better than either of the other two, or even of the other two put together;—is it worth while to keep up three separate exhibits of timber? As I have no knowledge whatever of what those timber collections are, my opinion, if expressed, would be valueless.

2020. With regard to the industrial part of the Mines Department exhibition—that is, their exhibitions of produce, you have no experience or opinion to offer? I have seen what may be termed products exhibited there, but they are extremely limited. I remember that, in one case, there is a little exhibit of metallic aluminium showing what varieties can be got out of the aluminous mineral of the country. That was put there with the view of showing miners that in spite of these minerals looking so earthy, as aluminous minerals do, there is still a precious metal contained in them.

2021. I am referring rather to the exhibits of vegetable products? I cannot express any opinion of any value, because I am not personally acquainted with agricultural exhibits.

2022. With regard to geological and mineralogical specimens, you are of opinion that the museum attached to the Mines Department is a good one? I think so.

2023. *Mr. Trickett.*] Would you care to express an opinion as to the structural properties of a room intended for a museum with regard to situation and light? It would be rather difficult for me to specify what my opinion would be of the most suitable position for the display of a geological collection, without knowing all the details beforehand.

2024.

T. W. E.  
David.  
22 Mar., 1899.

2024. Have you examined the plans of the proposed building? No.

2025. Do you know the new room in the Australian Museum, containing the mineral exhibits? Yes.

2026. Do you regard that as a well-designed room, as regards lighting, for mineral exhibits? Yes, I do—for its special purpose as a public museum.

2027. Do you not think that, in a museum, the light should be, as much as possible, of a uniform character all round? It is certainly very desirable in most cases to have the light as uniform as possible all through where specimens are exhibited.

2028. In the proposed building, the museum will be placed in the basement? The basement, on the eastern side, will be lighted by windows in areas adjoining the streets.

2029. On the Bridge-street side there will be windows as shown in the plan; on the western side the light will be fairly good by windows, and it is intended in one corner—so to speak—of the building to have a skylight which will reach up to the first floor, and above that there will be a lofty well right to the top of the building; that will be the character of the light to be conveyed to the museum;—do you think that would be a good kind of light for a museum? It would largely depend on the nature of the collections. If a very strong light is required all through the room, the light in places might, perhaps, be considered insufficient. If, for example, the specimens required minute microscopic examination, the light might be insufficient; but for general purposes it might, possibly, suffice.

2030. Do you not require a thoroughly good light for the casual visitor to inspect geological specimens containing gold indications, and so on? It should be a thoroughly good light, although not necessarily a very strong one. For example, a light such as we have in this room now is good enough for the examination of ordinary-mineralogical and geological specimens, although I should wish to see a somewhat better light in a museum.

2031. Is it not somewhat unusual to place a museum in a basement, part of which will not be on the level of the ground;—is not a museum generally constructed with regard to light requirements? It is certainly unusual to have a museum which is, in the least degree, inefficiently lighted. I know that, at the British Museum at South Kensington, parts of the collections are displayed in rooms which, for lighting purposes, would be somewhat similarly situated to the contemplated one in the new building; but that is the exception rather than the rule. As a rule, the lighting is extremely good. Nevertheless, advantage is taken of basements, even at such an establishment as the British Museum, for displaying collections of certain kinds.

2032. *Mr. Watson.*] I presume you have a pretty fair idea of the proportion of the exhibits in the Domain museum which would be necessary for reference purposes by Mr. Pittman, the Geological Surveyor;—it was stated by that gentleman that even if the industrial or economic aspect of the mineralogical museum were set on one side, and taken no notice of, he still would require a museum for reference purposes? That is so.

2033. Have you an idea what proportion of the exhibits now in the Domain would be required by Mr. Pittman for that purpose? I have.

2034. What floor area do you think would be necessary to accommodate that proportion of the Domain exhibits, without allowing for expansion? I have already stated that I think there is only a very small proportion—less than a quarter, perhaps only one-eighth of the collection—which might be considered from some points of view an industrial part of the collection. All the rest of the collection is purely of a scientific nature. I consider that the usefulness of the museum for Geological Survey purposes would be diminished if any part of the remainder of the collection were removed and taken elsewhere. I think three-fourths, if not more, of the present space occupied by the collection would be required in the future, and that is without allowing for any possible expansion in the future.

2035. You are now leaving out of account the exhibits which are there solely on account of their economic value? Yes; I am leaving out of account all specimens which could not be considered to be manufactured in any way—anything that is other than a raw product.

2036. Practically, then, you think that at least three-fourths of the exhibits, and consequently space now occupied there, will be required for Mr. Pittman's purposes as a reference museum? Yes.

2037. *Chairman.*] It is absolutely necessary that, for the purposes of Mr. Pittman, his specimens should be displayed in cases;—would it not be possible to arrange his specimens in drawers in order to obviate the necessity of taking up so much floor-space? I may state that I know that a considerable number of specimens are now kept in drawers for reference. Those which are displaced in the cases are chiefly specimens which are useful for more or less constant reference, and which are considered to be of public use in educating such members of the mining community as visit the museum.

2038. You mentioned a short time ago that a number of people visited the museum, and that you thought they would not go to the Technical College? That is so.

2039. I suppose there are two classes who visit the museum—those who visit it out of curiosity, and those who visit it for the purposes of business? I am speaking of personal experience of those who visited the museum at the time it was in Macquarie-street. At that time, those who visited the museum were, as a rule, miners who had business at the Department. There was, at the same time, a fair proportion of people who came in out of passing interest in the show.

2040. If there was a good collection of mineral exhibits at the Technical College, and the Curator there were supplied with information from the Mines Department, would that obviate the necessity of having the public museum in connection with the Mines Department;—would it not be possible to give him the information at the Technical College? Not, I think, as thoroughly and as efficiently as at the Geological Survey with a museum attached to it, for the reason that many of those men who use the Geological Survey collection bring down their specimens from various localities for assay to the Geological Survey; and it is to the Geological Survey that the assaying plant and the staff for assaying is attached. In view of there being so much work of that kind done for miners visiting Sydney, and who are up country, I think the Geological Survey can much better instruct visiting miners than could the Curator at the Technical College who would not have seen the specimens sent down from the mining districts to which the visiting miners belong, and who had not had an opportunity of a preliminary test of the minerals. I suppose the bulk of the time of the curator and mineralogist is taken up in testing specimens for miners who either bring the specimens personally, or who send them through the post to the Minister for Mines for testing at the Department. It would need almost the whole of a man's time to get through that kind of work, so numerous are the specimens received by the Department in a year. As I say, it would take up nearly the whole

whole of the time of one man. He thoroughly goes through the specimens received by the Department every day, and sees what they are, and what they are likely to contain. He discards some, and sends others on for assaying for the proper mineral they are likely to contain. That is the principal work Mr. Card does now. Any spare time he has, he devotes in arranging the Geological Survey collection.

T. W. E.  
David.  
22 Mar., 1899.

2041. If it is intended that the proposed museum shall be not only a reference museum for Mr. Pittman, but shall also have an educational value, do you think it is necessary that there should be two educational establishments—one at the Technical College and one in Sydney? If the two do not clash—as I do not think they do at present—and if the expense of maintenance is very small, I think it would be in the interests of the public to keep them both up.

2042. We are anxious that there should be no unnecessary duplication of the museums, either for educational or for show purposes. We have an excellent museum in the Australian Museum, and for people who simply want to pass away time, that would be ample? Yes.

2043. Now that we are in danger of having two educational establishments, the question is whether it is advisable to have them such a short distance from each other? I should be inclined to say that the more educational establishments you have, provided there is room for them both to work satisfactorily, the better for the mining public, always assuming that the two can be kept up without serious extra expense. I think the particular purpose which is served by the Geological Survey museum is somewhat different from the purpose served by the Technical College collection.

2044. But could not that particular part be served by a much smaller building? I am not prepared to give actual figures. I would state that I think the usefulness of the present collection to the Geological Survey would be impaired if it were reduced by any serious amount—that is by the withdrawal of any large proportion, such as one-fourth or one-third of the collection.

2045. *Dr. Garran.*] Would one caretaker be enough to look after 14,000 square feet of room? With the curator, and certain others in the building, such as the lapidary, who prepares rock sections for the geological surveyors, and with the clerk, I should think one caretaker would be sufficient. I should say that the same staff which at present has charge of the Geological Survey collection in the Museum, ought to be sufficient for a museum of the size contemplated in the new building.

2046. You must remember that in this building the Geological staff will be in a room four storeys high? By the staff I meant the staff who at present are actually at the museum in the Domain the whole of the day, or part of the day. That staff would be sufficient to look after a room of the size contemplated.

2047. What other persons are there besides the curator? There are two men engaged in lapidary work, and there is a man who is called a carpenter, who is engaged in packing and unpacking, preparing cases, and so on. They also have an assistant to the curator, who helps him in examining specimens for assay, and answering correspondence. That would make about five hands.

2048. Would there be any great inconvenience in having the museum at the bottom, and the scientific staff at the top of the building? I do not think there would be any serious inconvenience. I know that Mr. Pittman has complained a little of the distance, even as it is now, between the Domain museum and his office. He says that a good deal of his time is taken up, which should not be taken up, in travelling to and from one set of buildings to the other. If the museum were actually in the same building as the Survey, it would not be any material inconvenience to have the one on the basement, and the other on the top storey even.

2049. Especially if there were a lift? Just so.

WEDNESDAY, 29 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Archibald Liversidge, Professor of Chemistry, University of Sydney, sworn, and examined:—

2050. *Chairman.*] Have you had an opportunity of examining the plans and reading portion of the A. Liversidge. evidence? Yes.

2051. Has your attention been drawn to the proposed museum in connection with the Department? I have paid special attention to that. 29 Mar., 1899.

2052. What is your opinion with regard to the lighting of the museum? My first impression was that the lighting would be insufficient—where the light is derived from areas; but on looking through the evidence, I see that Mr. Vernon states that he has gone into the matter very carefully, and that the lighting is sufficient. As the room is 20 feet high, the lighting may be good provided that the area light wells are made sufficiently wide and deep.

2053. Can you give special evidence with regard to the lighting of museums? No; I do not pretend to be an architect.

2054. *Dr. Garran.*] Did you not write a report for the Government on museums? Yes; but that was mainly upon the contents and arrangement of museums for educational purposes. I did not go into the question of building construction. My impression at first was that the lighting in parts would be hardly sufficient; but I have since seen, from the evidence, that Mr. Vernon has gone into the matter very carefully, and there is nothing further for me to say.

2055. Did you notice that the two sides which are best lighted cover the narrower floor space? Yes.

2056. And that the two sides which are worst lighted cover the wider part of the building? Yes.

2057.

- A. Liversidge. 2057. The skylight would greatly affect the narrower part of the building; it would be more valuable for that part than the other? Yes.
- 29 Mar., 1899. 2058. It would greatly help the window-lighting? Yes; but the skylight is apparently at the bottom of a very deep well. The light from it would not spread so much as it would from an ordinary skylight.
2059. Do you know the Museum in College-street? Yes.
2060. Is not the new part of it side-lighted? Yes.
2061. There is no skylight there? No.
2062. Is there sufficient light there? I think not. It is not a well-lighted place in parts.
2063. The object in having the museum in the proposed building is because it is intended to connect it with the Department which is to occupy the building;—do you think it would be as well lighted in the basement as on an upper floor with side-lights only? I think not, because part of the museum will be, as it were, under ground, and will receive only an area light.
2064. Do you think it would be better for the purposes of a museum to take one of the floors instead of the basement? Yes; if the floors are of sufficient height.
2065. The first floor will be 18 feet high;—would you consider it preferable to put the clerks in the basement and to take one of the upper floors for the museum? Yes, as far as the lighting is concerned, and provided the height of the floor selected is sufficient for the exhibits.
2066. The basement is 20 feet high, and the height of the windows is 12 feet? I should prefer the windows to be larger.
2067. The Government Geologist has stated that it is as essential that he should have a museum close to him as it is that he should have a library close to him;—do you concur in that? Yes. The officers of the Geological Survey should not be separated from their collections.
2068. At present the Government Geologist has to walk some distance to get to the collection in the Technological Museum in the Domain, and he complains of delay and loss of time? It must be very inconvenient.
2069. And to do justice to him he ought to have his part of the museum somewhere in the proposed building? Yes; to do justice to him and to the public.
2070. It appears from the evidence of the officers of the Department that practical miners are continually coming to town to see officials about their business, and that they are interested in the museum;—is it very desirable, therefore, that in their interest the museum should be close to the Department? Yes.
2071. Do you think it would help forward the practical education of the people? Yes, very largely.
2072. For that reason, too, I suppose, you would have the Mineralogical Museum in the building? Yes. I think that in many instances you might recommend a person to go to the collection in the Domain, and he would intend to do so; he might not, however, go; whereas, if the collection were in the building he would go at once.
2073. Somewhat the same argument is used to apply to the industrial part of the museum;—people coming to see the Minister for Agriculture would be taken to the museum close by, but they would not go to the Domain;—does not that strike you as another reason why the museum should be in the same building? Yes.
2074. In going over the three museums we noticed some things, such as timber, of which there were three separate collections;—there is one at Ultimo, another at the Technological Museum, and another at the Lands Office;—is there any necessity for three exhibits of timbers? I think not; you want one central and principal collection, and perhaps secondary ones for other purposes.
2075. That is at the Technological Museum;—that is far and away the best? Yes, as far as timber is concerned you might find it necessary to have smaller and secondary collections for limited purposes; but whether the principal collection should be at the Technical College or at the Agricultural Department I am not quite sure. I do not quite know whether the inquirers with respect to the timber come, for the most part, from the country, or are visitors from abroad. I think that many of the inquirers would prefer to have the timbers and other vegetable products in the same building as the Agricultural Department. At the Royal Gardens, at Kew, they have collections of economic products as well as the strictly scientific series; not in all cases under the same roof, but they are close together. Visitors to Kew can see the living specimens in the garden; they can also see there the scientific collections, and the specimens illustrating the properties and uses of the timbers and other products. I think that is an ideal arrangement for vegetable products.
2076. Is there any distinct mineralogical museum at the University? No museum. There are collections, but they are for teaching purposes. Although the public can be admitted to see them, they are not expressly for the public. The collections are for the use of the students and the lecturers.
2077. They have been got together for the lecturers for their use in lecturing? Yes; in no sense do they form a public museum.
2078. And they must have their specimens at hand? Yes.
2079. The same remark applies to the mineralogical lecturers at the Technical Museum, at Ultimo? Yes.
2080. Wherever there is a teaching institution the specimens to illustrate the lectures must be there? Yes.
2081. So that there must be some duplication? Yes; but it is hardly fair to call it duplication in the ordinary sense.
2082. Do you think there is any amount of undesirable duplication in Sydney? Not to any great extent. I am afraid you cannot prevent a little.
2083. If we set aside 14,000 square feet for a museum, it is pretty sure to be filled up in course of time? I hope so.
2084. And we might run the risk of unduly duplicating what is at Ultimo? I think there ought not to be much risk. The Geological Survey Museum, or collection, as far as I can gather, is essentially one of New South Wales minerals, rocks, and fossils, to illustrate the geology of the country. In addition, the Survey will still, I suppose, continue to get representative specimens from other countries, so that they may be compared side by side. I think the Department gets them entirely by exchange, and not by purchase. I believe, too, it merely gets specimens which are really wanted for particular objects, and not merely for show or curiosity, or anything of that kind. At the Australian Museum we have a general collection of minerals, which have been obtained from all parts of the world. The idea was to have at the Technological Museum specimens illustrating various mineral and other products and their methods of manufacture and the manufactured articles. Thus the three things—the Geological Survey collection, the

the Australian Museum scientific collection, and the Technological Museum economic collection—were intended to be quite distinct. If the directors or curators or governing bodies of the three different museums conferred from time to time, they could easily prevent any useless overlapping.

A. Liversidge.  
29 Mar., 1899.

2085. The College-street Museum is purely scientific? Yes.

2086. The Ultimo Museum is purely utilitarian and educational? Yes; that was the original intention.

2087. I suppose the Geological Surveyor's Museum would be scientific? Yes, but mainly for the purpose of illustrating the geology and the mineral products of the Colony.

2088. And it would have a utilitarian side? Extremely utilitarian.

2089. And the other part of the Museum—agriculture—would be distinctly utilitarian? Yes.

2090. And the question is, how far would the utilitarian side be a mere duplication of what should be at Ultimo;—there is some risk there? There is a little risk, but I think that ought to be guarded against by the officers controlling the museums.

2091. On the whole, you rather favour the idea of a Departmental museum in the building, provided that care is taken that there is no unnecessary duplication? Yes. I should like to add that in England both the Geological Museum and the Royal School of Mines arose out of the Geological Survey. The Geological Museum is still in existence in Jermyn-street. The School of Mines has been moved to South Kensington, and I saw in a recent number of a scientific paper that the authorities had decided not to move the Geological Museum from Jermyn-street. I suppose it will eventually be moved to South Kensington, but in that case I think they ought to move the office of the Survey with it. I do not think there is any present intention of separating the two. At South Kensington they already have the general scientific collection of minerals.

2092. Our position is not exactly on all-fours with that of England, because we have Departments here more definitely than they have in England? The Geological Survey in England is very much the same, but it is very much larger than ours.

2093. But the Geological Surveyor is not in the Minister's office? No; there is no Minister for Mines. The Geological Survey is under a Minister, of course, but in separate offices.

2094. On the whole, you are rather inclined to maintain this Departmental museum? I think so. I do not think the collections could possibly be in better hands. The geologists have collected the specimens, and it is their business to know all about them, and any information they may be able to give the public will be given first hand, instead of second hand.

2095. Do you think the space allotted in the basement will be too large? No.

2096. It may be too large at first, but I suppose it would all be wanted before long? I think so.

2097. Your only doubt is about the light? Yes; but, perhaps, under the circumstances, I have no right to doubt that. As I said before, I have not gone into the matter from an architectural point of view. I do not think one should give a definite opinion without making calculations, and I have not the necessary data to do so.

2098. *Mr. Shepherd.*] Do you think that, for educational purposes, one general museum would be better than two or three? Do you mean for students, or for the public and students.

2099. It appears to me that when we have a large museum like the Sydney Museum, it is hardly desirable that a second institution should be kept up for the general public to visit;—what is your opinion about that? By the second institution you mean the Mines Department's Museum.

2100. We have had evidence to show that as many as 12,000 people visit the Technological Museum, at Ultimo, in the course of a month;—to some extent that must interfere with the educational aspect of the institution? Do you mean that the presence of the public would interfere with the teaching.

2101. Yes; I want your opinion about that? If things are properly arranged I do not think it should. The collections, of course, are open to the public. There are rooms for the public, and there are other rooms, which are used as lecture and class rooms. The specimens which are required for teaching are kept in the class-rooms, or else they are taken out from the general collection at the time they are wanted, and then put back again.

2102. *Mr. Levien.*] The same as in the University? Yes; but at the University we do not attempt to exhibit them for the public.

2103. But you take the specimens out for lecture purposes? Yes.

2104. *Mr. Shepherd.*] Does not the existence of so many museums largely increase the expense? I suppose it does increase the expense to a certain extent. There is no doubt that ideally it would be better to have only one museum, and to have that in the most central position. If it were possible to have simply one museum for geological and mineralogical specimens, I think that the collections should not be arranged solely from a scientific point of view, and they should also contain specimens to illustrate the economic uses of the products. The mineralogical and geological specimens, I think, should be under the control of the officers of the Department of Mines.

2105. Of course, the Sydney Museum would, no doubt, be the proper one to have open for the public generally? It is open to the public.

2106. What I want to know is whether it is necessary to have three museums open to the public;—would it not be better to confine the Sydney Museum alone to the public, so that the expense might be reduced; the other two would not then require to be so large if they were simply for educational purposes? Then, I think, you would have to move the Geological Survey to the Museum to make it a really good-working arrangement.

2107. The Curator of the Sydney Museum states that it would not be convenient for classes to attend there for the purposes of instruction? Yes; the collections there are not arranged for class instruction. The specimens at the Mines Department's Museum are not arranged expressly with that object, nor are they altogether at the Technological Museum. At the Technological Museum, however, they can utilise them in the class-rooms. They can take whatever specimens they want into the class-rooms. There are no class-rooms at the Museum, and I suppose there would be none at the Mines Department.

2108. Do you think, if the exhibits at the Technological Museum, and the Mines and Agriculture Museum were kept exclusively for educational purposes, it would be necessary to occupy so large a space as that now occupied, and to keep so many persons in attendance? I think they would be less expensive to maintain, and would require a smaller number of persons to look after them; but I do not think much less space would be required.

2109. Do you think it is feasible? Yes, if the site and money could be got for the necessary buildings,  
the

A. Liversidge. the best plan would be to have all the scientific and the economic collections under one roof. But, at places like the University and the Technical College, as distinct from the Technological Museum, you must also have teaching collections.

29 Mar., 1899.

2110. You really think our present system could be improved upon? Yes, but I do not think it is possible to get the building. It would be very expensive to make the change.

2111. *Mr. Levien.*] If all these museums were centred in one, would it not occasion great difficulty, as far as Technical instruction is concerned? My notion would be to have the class-rooms in connection with such a central museum; but I am only speaking about an ideal arrangement; we do not stand the slightest chance of getting it.

2112. You would require a building of about five times the space proposed to be allotted? Certainly.

2113. Then it would cost an enormous amount of money to erect the building, and at the same time you would have a very large number of instructors? Yes; I do not think it could be done, it would be too expensive.

2114. Do you not think it is very convenient to have mining specimens at the Department of Mines, so that inquirers can see them on the spot? Yes.

2115. Do you not think that after all it is better for museums to be allotted to each Department? I think that under the circumstances it is best to leave things as they are, and to see that there is no unnecessary overlapping. As the three museums are in existence, it is perhaps as well to allow them to continue.

2116. What do you think about the duplication of specimens in the different museums? I do not think the duplication amounts to very much, but if it does it ought to be stopped.

2117. Could not the heads of each museum confer on the subject of duplication? Yes; of course, the conference should apply to more than simple specimens.

2118. *Mr. Trickett.*] Have you been abroad lately? Yes; in 1896.

2119. Were you in America? I was there in 1887.

2120. Did you visit any institutions similar to this where schools of mines or mines offices exist? Yes; at San Francisco, for instance, there is a Geological Survey for the State of California, and they have their offices in San Francisco. They also have a geological museum in connection with the Department.

2121. Is it a large room? Yes; at the top of the building. That is not the case at Jermyn-street. The museum there occupies nearly all the building from the ground-floor upwards, and it is lighted from the top. It is also lighted from Jermyn-street and Piccadilly, but the main light is from the top.

2122. Do you know of one museum which is in a partly-buried Department, such as this will be? Yes, several. There is an art museum, for instance, in Dresden, part of which is under very disadvantageous circumstances. They put up with it, because they have no better accommodation.

2123. It is not desirable to have them in a basement? No.

2124. I suppose that in a museum good lighting is one of the main necessities? Certainly.

2125. Especially for the purpose of dealing with mineral and geological specimens? Yes; some of them; of course some are large, and do not require a very brilliant light.

2126. The overhead light of the proposed museum will be by means of a well going up to the top of the building; the well above the skylight of the proposed museum will really be a shaft or enclosed space 80 to 90 feet high; do you not think that that will very much detract from the irradiation of a light through the skylight in the museum? It certainly will not be equal to the light you would get if the skylight were in the open.

2127. If it were practicable, would it not be better to have the museum at the top rather than at the bottom of the building? Yes; it would be much preferable as far as light is concerned.

2128. Did you make yourself acquainted with the working of the Geological Department in San Francisco—I mean as to the museum portion of it; and as to its being used as an object lesson for applicants for mining leases, and so on? I did not make any particular inquiries; but I did learn that it was being made use of.

2129. I suppose there are no two opinions in regard to the advantages of having a museum of some kind in connection with the Department? No. At Washington also they have large collections in connection with the Geological Survey.

2130. Did you visit that building? Yes.

2131. Is the museum a large room? So far as I recollect there are several large rooms.\*

2132. Can you give us any opinion as to what space is required for a museum? I think the space proposed to be given is not too much to allow for expansion.

2133. Do you think that the 14,442 superficial feet will be required? I think so, especially if you are going to include vegetable products.

2134. How is the museum at the University lighted? In the case of the geological collections, the rooms are ordinary rooms, well lighted. I think there are two windows on one side, and two on the other in one room; the other rooms have two windows; but the rooms are not more than 25 feet by 18 feet.

2135. Is not the Ultimo museum lighted from above? I cannot charge my memory, but I know it is well lighted.

2136. I believe the room occupied by mineral exhibits at the Australian Museum is splendidly lighted? Yes; we had that newly lighted a few years ago.

2137. As all the exhibits in the proposed building will be in cases, you naturally require a good light for them? I think it is absolutely essential for a museum—no matter what kind it may be—that the light should be good.

2138. Have you ever seen any museum, with the exception of the one at Dresden, situated in a basement? A part only of that museum is in the basement. Many museums have a basement, which is generally used for storage or for large specimens not requiring much light; but I have certainly not seen any museum, with so extensive a floor-space as the one proposed, the whole of which is in the basement.

2139.

\* NOTE (on revision) :—I omitted to mention that the U. S. Geological Survey collections are transferred, when finally dealt with, to the National Museum at Washington, but are still for the most part under the charge of officers of the Geological Survey, e.g., the Director of the Geological Survey is Curator of the Palæontological Collections, and the Chief Chemist of the Survey is Curator of the Mineral Collections. At Washington all the National Collections, without exception, are concentrated in one group of buildings.

2139. *Mr. Dick.*] You have stated that if we have museums in different parts of the City it will result in expense;—do you think the gain to the public at large is commensurate with that expense? Yes. I think, as they have been started, you are justified in continuing them. But, as I have said before, unnecessary duplication of the contents should be prevented. A. Liversidge.  
29 Mar., 1899.

2140. Have you any experience of a museum on the top floor of a lofty building? There is a museum at San Francisco, already mentioned, which was at the top of a building, but I do not think it was as high as the proposed building.

2141. Do you think the placing of a museum at the top of a lofty building would militate against its success as a public institution? Not very much. Of course most people prefer to be able to walk straight into a building, and some might be deterred by having to wait for the lift; but only a very few. The slightest thing will often deter some people.

Duncan Clark McLachlan, Under Secretary, Department of Mines and Agriculture, sworn, and  
further examined:—

2142. *Chairman.*] I believe you have had an opportunity of seeing the evidence given by Mr. Miller? Yes. D. C.  
McLachlan.  
29 Mar., 1899.

2143. Do you wish to make any remarks with reference to it? I have perused the evidence given by Mr. Miller, and by Mr. Teece, and I do not see that it bears very much on the question of this building, because the circumstances under which they work their business are altogether different to the circumstances under which we conduct ours. For instance, they have only one business to control—a banking or insurance business, and they can amalgamate all their clerks and jamb them up into space. Perhaps, you will be surprised to find that even in the Bank of New South Wales they have double the number of clerks we have, or intend to put, in the proposed building. A clerk takes up much less room than the kind of officers we mostly employ. They have 146 clerks against our 75. The greater number of our officers consist of professional men, such as draftsmen, &c., and require a lot of space. Then there are five or six different Departments to conduct, and it is impossible to put them into one big room. The Mines business is quite distinct from the Agricultural, and the Stock business is quite distinct from that. Then we have the Water Supplies, which are again distinct. Therefore, we must have divisions of offices. The nature of the business of the Bank of New South Wales and the A.M.P. Society is such that it has to be done by the simplest class of book-keeping. A clerk who never has to move from the desk at which he is writing can do with much less space than a man who has constantly to be moving about.

2144. Is not a good deal of your work simple clerical work? A fair proportion, say one half of it, is. But it is very different clerical work to that which is done in a Bank. For instance, the greater part of a Bank's work is in reference to cheques. A cheque is received and is placed to a man's account, and is done with at once.

2145. Will not a ledger-keeper in a Bank require two large ledgers? Yes.

2146. Are there not a number of clerks in your Department who have simply to deal with papers of foolscap size? Yes; but the clerk who has to deal with papers of that character has some thousand bundles of them.

2147. But it is not necessary for a clerk to have thousands of bundles of papers on the table at one time? No; but he must have them alongside him.

2148. Would not a good deal of your work, as far as space is concerned, correspond with banking work? No; none of it that I know of.

2149. Would not the space which would be necessary for a bank clerk be sufficient for an ordinary clerk in your Department? Only so far as the Account Branch is concerned.

2150. What about the correspondence? And probably the correspondence as well; as a matter of fact the space at present occupied in the Records and Correspondence office is no greater than that which is occupied in the Bank of New South Wales or the A.M.P. Society. In that office we have 13,035 square feet and twenty men working there. That gives 66 square feet per man. I think some of the officers of the Bank of New South Wales and of the A.M.P. Society occupy exactly the same space.

2151. How many scientific experts have you? About twenty-five whom I consider experts.

2152. Have they separate rooms? Yes. I am speaking now of the Chief Inspector of Mines as an expert, and also the Government Geologist and the Mineralogist.

2153. Of course they would require more space than an ordinary clerk? Yes.

2154. And so would a draftsman? Yes.

2155. There are no draftsmen employed in banks? No.

2156. Under the proposed scheme you will have 33,500 feet exclusive of the museum;—how many officers do you propose to locate in that space? One hundred and forty.

2157. That will average over 200 feet per individual? Yes, I daresay it will. In the 140 I include the draftsmen and every one else.

2158. Do you consider that the difference between a space of 50 feet for an ordinary bank clerk, and a space of 200 feet for your officers is sufficiently accounted for by the fact that you require extra room for professional men? Yes. I would point out that the clerks in the Bank of New South Wales are doing exactly the same kind of work, and are probably dealing with the same papers. One man enters a cheque, and it is passed along from him to others. I could not, however, put all our clerks into one or two rooms in the same way as a bank can do it. For instance, the Chief Inspector of Mines must have his clerks near him. He could not very well have his clerks' two floors lower down in a general clerks' room. It would be impossible for him to conduct his business under such circumstances.

2159. Mr. Miller, in the course of his evidence, stated:—

Following round the building we come to the branch securities room. In that room, which is 22 feet by 18 feet, we have ten clerks always at work, and sometimes one or two more as the deeds come in from the country.

That is an average of 40 feet. Mr. Miller was also asked the question:

Is there any accommodation included in that 22 feet by 18 feet for any person making inquiries? Yes; the end of the passage is fenced off by a counter 3 feet 6 inches wide, and the whole of the inquiries in that room are made at that counter. If the inquiry is such as to necessitate the inspection of a deed, the inquirer is taken inside.

Do you think the business you do is so different to a Bank's business that your clerks require much more room? Much more room.

D. C.  
McLachlan.  
29 Mar., 1899.

2160. And you explain that by the fact that banking work applies to detail, and you have much? Yes. They can put their clerks together and we cannot. Again, we deal with a system of papers, and the nature of our inquiries is altogether different. We deal largely with questions of public policy; bundles of papers accumulate, and have to be kept about the place. For instance, a man may make an application to have a common established somewhere; the application comes in, and perhaps necessitates a dozen inquiries from other different Departments. A particular officer has to keep that paper until everything is complete. It may be that we should have to consult the mining interest to find whether it would be affected. We now also have to consult the Lands Department as to whether they want to sell the land. The people interested would have to be consulted, and perhaps numerous petitions would come in from all quarters. A bank clerk has nothing like that to look after.

2161. Do you mean to infer that your clerks would have all those things on hand at once? Yes; some of them would have 100 of them on hand at once.

2162. Could he not deal with one set of papers and put them away? He would require them behind him or in front of him, where he could easily get at them. Otherwise he would be going about the whole day long to obtain papers, and valuable time would be wasted, and the number of clerks would have to be increased.

2163. Is not the whole of the business transacted with pen and ink? Yes.

2164. And does not a parcel of papers of foolscap size take up less space than a couple of ledgers? But the clerk who is working at them has a ledger with him bigger than a bank clerk's ledger, probably he has fifty of them alongside him—I refer to a record clerk.

2165. Where do they keep them? Some of them under the table and in front of them. A paper over twenty years old may have to be searched back for, and connected with the new application. The record clerk has to have the registers for those years in front of him, or handed to him. We will suppose that it is a mining lease which may have been granted twenty years ago. It has gone through twenty people's hands in that time, and fifty complaints have been made against him. There have also been transfers of it and shares sold in connection with it. The record clerk has to trace all that back, and he requires to have his books handy to enable him to do so.

2166. Do you not keep the whole of the papers from the inception to the finish together in a bundle? Yes; when they are finished.

2167. But, as the matter is progressing, are not the papers tied up? Yes.

2168. So that a man would not have to refer to fifty or sixty books to check what was in the papers? Not in any particular paper, but he gets in fifty new papers every day for which he has to set up a fresh search.

2169. Supposing there were fifty new cases coming in each day, he has not the whole of the papers connected with those cases littered about him at one time? He has them somewhere handy.

2170. Perhaps that accounts for a good deal of the delay about which we hear so much at different times? He has the whole of the papers by him.

2171. Is there any other matter in connection with Mr. Miller's evidence upon which you would like to give an opinion? No.

2172. What was the first proposition with reference to the accommodation you required;—do you know anything of a scheme which was to cost £18,000? That was prior to my joining the Mines Department, but I understand that it is a scheme somewhat similar to the one before the Committee now, excepting that there has been attached to it the accommodation for the Public Instruction Department.

2173. You have also stated that you have no desire to have a special building of your own, and that if you could get accommodation on the top of your present quarters, you thought you would be able to manage with it? I confirm what I said then. We only want to concentrate our offices, and if a storey can be added to the building which will accommodate us, it will suit just as well as a separate building. I may say that I was rather staggered at the estimate of cost by Mr. Vernon for an additional storey. It may be that he has some very elaborate scheme in regard to it. The building in which we are now situated has had a storey put on the top—a Mansard roof. I think the Mansard system of roofing is much cheaper than the one Mr. Vernon proposes to put up.

2174. Is there any great Departmental or public inconvenience occasioned by reason of the laboratory being at the Government stores? Only on account of the loss of time. When people come to the Department, a messenger is required to take them down. People from the country cannot find the place.

2175. Are you supposed to take country visitors about town? If a man is interested in this business we try to oblige him in every way we can.

2176. *Dr. Garran.*] During the examination of Mr. Liversidge it was suggested that instead of having the museum in the basement it should be on the top storey;—would it matter to you whether your officers were located in the top of the building or in the basement? I think not.

2177. Do you see any disadvantage in having a museum at the top? None at all.

2178. Do you think the people who want to go to it will willingly go in a lift? I think so. As a rule, interested people are willing to be put to a little inconvenience to obtain information.

2179. Would you keep the museum in the new building open on public holidays? Yes; that is the intention.

2180. Would there be any inconvenience in having the museum at the top of the building under those circumstances? No.

2181. Would you not have to keep the whole of the establishment open? Yes; but only a doorkeeper and those in charge of the museum would be occupied.

2182. Do you think it is very important for your Department to have an industrial portion of the museum? It is not so much for the benefit of the Department as for the public.

2183. Do you think the public would make more use of it in the proposed building than they would if it were at Ultimo? I think so.

2184. Do you know minutely the museum at Ultimo? No.

2185. You cannot say then whether there is any overlapping? No.

2186. Do you think the people who come to see you with regard to the agricultural portion of your business will visit the museum? I am sure they will, and it will save the Department a great deal of correspondence too. For instance, a farmer may want to know what is the best kind of wheat to plant. He may hear of a certain wheat, say Allora Spring, and he knows he can see it in the museum. He will, therefore, come there instead of writing.

2187. Then you think it would be a mistake to take away the industrial part of your museum? Yes.  
 2188. You think it would be worth all it would cost? It would cost very little indeed.  
 2189. Otherwise you admit there would be some disadvantage in having the same thing shown in the proposed new building at Ultimo with separate people to look after it? A great disadvantage to the public, I think.  
 2190. You do not favour overlapping unnecessarily? Certainly not.  
 2191. But if you are to have a museum of this kind it will be necessary for you and the Curator at Ultimo to come to an understanding not to multiply specimens uselessly? I think that would be a good thing to do.  
 2192. Have you any such understanding at present? No.  
 2193. Do you not think that there should be one? Yes.

D. C.  
 McLachlan.  
 29 Mar., 1899.

THURSDAY, 30 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Joseph Henry Maiden, Director of the Botanic Gardens, sworn, and examined:—

2194. *Chairman.*] What position did you occupy before taking up your present one? I was in charge of J. H. Maiden the Technical Education Branch of the Department of Public Instruction.  
 2195. Did that include any supervision over the museum in connection with that institution? Yes; I was the curator of the museum—a post I held since 1881.  
 2196. What does that museum embrace? The specimens are divided into three kingdoms—the animal, the vegetable, and the mineral products. Besides those there are exhibits which cannot very well fall under any section—such as educational and ethnological appliances.  
 2197. During your curatorship had you any opportunity of noticing whether the museum was visited by a great number of people other than students? Certainly it was.  
 2198. Is there any difficulty by reason of distance in reaching that institution? It has always been an objection. I always regretted the placing of the museum at Ultimo, but it had to be done. There was no vacant ground sufficiently extensive in Sydney. Before it was erected I held the opinion that it was out of the way for the general body of the public, and I think so still.  
 2199. Will the construction of the electric tramway past that museum remove that objection? Of course, new means of transit will be an improvement, but they will not entirely remove the objection.  
 2200. In the proposed museum in the new building it is intended to group all mineral and entomological specimens;—that being so, and the position being central, would there be much necessity for a museum in connection with the Technical College? It all depends on whether the two museums are conducted on the same lines. If one were a precise duplication of the other in aim and individual specimens, it would be wrong. I take it, however, that the museums have different objects and different classifications.  
 2201. Do you think the basement of the proposed building will be a suitable place for a museum? Any judgment I form is made, to some extent, on the spur of the moment; but I should say that there is not enough light for a museum building in that situation.  
 2202. Suppose we grant that there is sufficient light—do you think the museum would be better situated in any other part of the building? The handier to the street the better. There are, however, other things to be considered. You want light and ready communication with the professional officers who have to use the museum for the purpose of giving technical information to the public.  
 2203. If the geological surveyor is on the middle floor, it would not matter much whether he went up or down to the museum? No.  
 2204. I presume a better light could be given on a higher floor? Yes. I am very suspicious about the light. You cannot have too much light. Of course the position is advantageous, on account of it being easily accessible from the street.  
 2205. You will have noticed that the museum is to be lighted by an area on the eastern and southern sides? Yes; but those windows are connected by stone-work. There will be a lot of light absorbed and obstructed there. The light on the eastern side will not be sufficient; the windows will be below the footpath.  
 2206. *Mr. Trickett.*] What do you think of a skylight with a kind of shaft about 80 feet high above it;—would the light from that, for the skylight, be very effective under such circumstances? I do not think so. It would be like the light you would get in a mine; you would get some light from the top of the shaft, but on a dull day you would be very much in the dark.  
 2207. *Chairman.*] A scientist in pursuit of his studies would require all the light he could obtain? Exactly.  
 2208. This being a reference museum for a scientist accentuates the objection you have to it being on the basement? Yes; the question of lighting is paramount with me.  
 2209. *Mr. Trickett.*] Have you had much experience in regard to museums? Yes; when I left the old country I had been in most of the important museums in England, besides which I had had other experience.  
 2210. Do you know the Jermyn-street Museum? It is nearly twenty years ago since I was there; it was not well lighted then. Of course the developments of museums have taken place during the last quarter of a century. The new museum of natural history at South Kensington is a type of a modern museum. We have in Sydney, as far as I can make out, the nuclei of some of the best museums to be found anywhere.  
 2211. Do you not think that the proposed museum would be better situated if it were closer to the geological surveyor than it is proposed to be? Yes, from his point of view; but I take it that it will be used by the general public as well.

2212.

J. H. Maiden. 2212. Seeing that there will be a large lift in connection with the establishment, do you think it would be objectionable if the museum were higher up, where you could get good light? I do not see any objection if you have a lift. Some exhibits at the Australian Museum are several floors up, and so they are at the Technological Museum.

80 Mar., 1899.

2213. Anyone requiring information for his own purposes, or in connection with his business, would not object to go up by means of a lift, so long as the museum is in a good central position? That is so. It is no use tantalising a man by showing him specimens in the dark. Light is paramount with me, and I have had nearly twenty years of practical experience.

2214. How is the museum at the Technical College lighted? By side windows. If you take notice of them you will find that the building is practically all windows. That building was designed by myself. The place is well illuminated.

2215. On what floor is the museum there? On all three floors. The ground is a little sloping. There is half a floor on which I placed the carpenters, and even they have good light. On the next (ground) floor you have the mineral kingdom, and on the first floor the timbers and botanical products. I placed them in the middle for two reasons—one because the products were intermediate in weight between the minerals on the ground floor and the animal products on the upper floor; and, because as Curator, I wished to have my office in the centre of the building, and, being a botanist, to have everything around me. On the upper floor are the animal products and miscellaneous specimens not otherwise characterised, such as musical instruments, educational appliances, sanitary fittings, &c.

2216. In designing that museum your main object was regularity of light? Yes; and if you want to keep out the light there is a good system of blinds.

2217. Do you think it would be advisable to try and locate the proposed museum in a part of the building where there would be no risk whatever in regard to light? I have no hesitation in expressing that opinion.

2218. If you were advising, would you not say, "I would sooner put the museum in some other part of the building higher up, where the light would be unmistakable"? Yes; I should be sorry to take charge of the museum in the site proposed.

2219. *Mr. Shepherd.*] Have you thoroughly examined the whole of the museums in Sydney? Yes.

2220. Has it struck you that a great many specimens are duplicated? There is some duplication, no doubt, and it should be the endeavour of those in charge to minimise it, but I question whether it could be done away with altogether. Of course, a man may run his museum regardless of any one else, and may duplicate without consideration; but the mere existence of two specimens of the same mineral or timber in two public institutions in Sydney would not necessarily denote duplication. In the Mines museum the collections are referential for the various officers. To some extent the museum at Ultimo is away from the heart of the city, and you must make allowance for the convenience of the public. Every day of my life it is my duty to refer people to the museum at Ultimo, and when it is explained that it is a mile and a half away they do not care to go. I think a small general collection in the city would be a great advantage to the public.

2221. I suppose the Ultimo Museum was intended more as an educational establishment for students than for the general public? No; I think the reverse was the case. When I was appointed to form that museum there was no such thing as a Technical College. Afterwards, when the system of Technical education was founded in New South Wales, it was brought forward as an argument for having the buildings together. That museum was inaugurated in 1880 as a branch of the Australian Museum. The Australian Museum buildings were not adequate to hold timber and specimens illustrating processes. Arrangements were made by the Government to take over a large number of exhibits from the Sydney Exhibition of 1879, and house them in a separate building. The idea was to have a general museum in Sydney for exhibits of that class.

2222. Would it not have been more desirable to add to the Australian Museum than to have had a separate building so far away? I think, with the development of trade, and an increased knowledge of products, the Technological Museum will, in process of time, become as large as the Australian Museum, and inasmuch as the Australian Museum will want to increase too, there would be constant conflicts in regard to the allotment of space, so I think it would be better for them to work out their own destinies independently.

2223. It appears to me that the multiplication of museums means the multiplication of expense? Of course it depends to some extent on the loyalty of the heads of the various staffs to reduce what is unavoidable to a minimum.

2224. You say you have always objected to the Technical College Museum on account of it not being sufficiently accessible to the public? Yes.

2225. It has been stated that 12,000 people have visited the place in a month;—is not that a large number? There is no limit to my ideas on the subject. Personally, I would put the Technological Museum where "Deeble's Hotel" is, and get 100,000 a month to come in. I do not think any site is too good for it.

2226. On the whole, then, you do not think the position of the proposed museum is suitable? No. I think it should be at the top of the building, if another floor cannot be given to it. If the choice be between lighting by area and roof, I would prefer the roof.

2227. Do you think a space of 14,440 feet is ample for a museum? I should think so, because there must be limitations to a Departmental museum. It would certainly last for twenty years or more.

2228. *Dr. Garran.*] As between the basement and the roof, the consideration is which is more important—to have easy access for the public, or to have good light? Light.

2229. If you had charge of the proposed museum, would you say, "Let it be on the top of the building, where I can have any quantity of light, and I will guarantee that the public will come to it by means of the lift"? Yes; I would choose that alternative. Of course the position of the basement is a great advantage in favour of that site.

2230. But balancing one advantage against the other, you look upon the light as the most important? Yes; I look upon light as the first consideration in a museum.

2231. And yet you say we have to shut out light very often, because it is too great? You should always have power to modify your light. You may have a collection of resins, for instance, which in hot summer weather might melt in the bottles.

2232. Have you any roof-light at Ultimo? No, excepting in a room I got the architect to put in a roof.

2233.

2233. You have some transverse walls in the middle of the building;—do they detract from the light? No; <sup>J. H. Maiden.</sup> their advantages outweigh their disadvantages. You must have some supports for the floors, and you get <sup>30 Mar., 1899.</sup> your supports in that way. These walls divide your exhibits, and also give you the opportunity of hanging objects against them.
2234. Is it found, in this climate, that light from the south is better than from any other quarter? It is the general opinion, for many purposes. There is no glare from it.
2235. In many factories we have the eschelon-shaped roofs with the windows to the south? Yes; but I do not express any opinion as to whether that is extensively carried out.
2236. If you had to light the top floor from the roof would you so arrange it that all your windows should face the south, so as to get no sun on them at all? I do not know. I should prefer an opportunity of getting light all the way round, but with facilities for excluding it, if possible.
2237. You prefer a side light? Yes.
2238. Is the Technical College at Ultimo in the right place? Yes. It is not in a perfect situation, because I think no site is too good for it, but taking all things into consideration, I think the advantages are very much in its favour.
2239. It will be more accessible when the electric trams run? Yes.
2240. It would be more out of the way at the University? Yes.
2241. The Technical College, then, is there to stay? Yes.
2242. And being there, there must be a museum attached to it? Yes.
2243. I believe your exhibit of timber at the Technical College is the best in the Colony? Yes.
2244. Is there anything in the other two museums which you have not got? I could not say.
2245. The Ultimo exhibit being so good, would it not be desirable to make it as nearly perfect as possible, by taking from the other exhibits whatever it may be deficient in? I do not think there is anything in the Domain which the curator there would covet.
2246. Are those who want most to study our timbers persons who are engaged in the timber trade or visitors from abroad? Primarily the timber merchants. Many furniture-makers are also deeply interested in our timbers. A large number of people also come to our shores wanting to know about our timbers. Only a few days ago I had one of the principals of the world-wide firm of Wolff & Sons, the pencil-makers, to see me. He was in Australia for the purpose of seeing what timbers were suitable for pencils in New South Wales. A short time ago I had another person to see me. He was interested in using up our waste timber for the purpose of distillation—making various products from it. These people are perfectly sincere in their desire to utilise our timbers if they can get them.
2247. People having a special object would go to the museum wherever it was? Yes.
2248. But so far as the general public are concerned, a journey of a mile and a half, or to the top of the building, might make some difference? Yes.
2249. But still they are the least valuable visitors? Of course we sow our seed on all sorts of ground, and we never know whom we benefit. Some of our best men are those who say the least about it. They come in, obtain information, and jot it down in their books; in fact, they scarcely like to obtrude, but they think all the same. I have very strong feelings in regard to having a representative collection of our products in Sydney. Only yesterday I saw a gentleman whom I sent to Ultimo, but he very much demurred to going there.
2250. Identified as you have been with the Ultimo Museum, you are still in favour of a Departmental museum in the city? Without a doubt.
2251. And you think the idea of attaching a museum to the Department of Mines and Agriculture is a good one in the public interest? Yes.
2252. And that we shall get our money's worth? I am quite of that opinion. In the first place, as regards the staff, you can no more dissociate a staff from its specimens than you can a carpenter from his tools. Then I would have a small general collection of products for the public—I would limit it. There is one set of specimens you never can get at Ultimo, and that is a fresh collection of agricultural products—wheats, and the various kinds of vegetables and fruits in seasons. You must have these specimens in touch with the Department of Agriculture. If the Department of Agriculture only took up that one museum, I think it would justify its museum existence. Those are absolutely unprovided for in Sydney, with the exception of a few poor specimens in the Domain.
2253. Do you mean the natural products themselves or the models? I would have the models when I could not get the natural products.
2254. How long could you keep a squash or other vegetable in Sydney? A few days, or even years; it depends upon how you preserve it. At present there is no institution in Sydney to which you can take a country cousin to see a good collection of wheats and perishable articles generally, and that is what a large number of our citizens are interested in.
2255. I suppose the best we have is in the Domain? Yes.
2256. And you would have something like it, or something better in the city itself? Yes; I would keep it going all the year round.
2257. It has been stated that a great many people interested in mining and agriculture come into the office on business, and that it would be handy for them to go to the museum at the same time? That is a perfectly sincere statement.
2258. Do you think that in itself is a justification for a Departmental museum? It would be a justification for a small museum certainly.
2259. Have you anything like a herbarium at the Botanic Gardens? I have 15,000 species.
2260. Are you forming a little botanical museum? I am countenancing no duplication; I have carefully sent anything in the industrial line to the Technological Museum.
2261. And botanical students get access to your museum? Yes, and I send fresh specimens to the Technical classes for the students.
2262. Could University students get access to them? Yes; I am sending specimens to the University also.
2263. I take it that you work with the authorities at Ultimo and the University? Yes. Of course, unless there is a good feeling there will very readily be duplication.
2264. I understand that you think that provision for a museum in connection with the Department is not only proper in itself, but that the area devoted to it is not too large? Yes.

- J. H. Maiden. 2265. *Mr. Watson.*] You have stated that you consider it probable that the basement lighting will not be sufficient? Yes.
- 30 Mar., 1899. 2266. On the southern frontage of the building there is a wall which is ultimately used for carrying a flying corridor; that will naturally have the effect of obstructing the central lighting;—do you think, if it were removed, it would materially advantage the lighting in the basement? I do not think it would make much difference. It would not remove my objection to the position for a museum.
2267. I suppose you recognise that the amount of light derivable from the northern and western frontages would be considerable? Exactly.
2268. On those two frontages no area for lighting purposes is necessary? The only frontage that is good is the Bridge-street frontage, and there is not too much of it there.
2269. Notwithstanding that there is a fairly good light on the northern and western sides, the lack of light on the eastern and southern aspects would be fatal to the proper use of the museum? I think so. If it were to be handed over to me I would not take it without a severe struggle. I should say I would be handicapped in making a good museum.
2270. *Mr. Shepherd.*] Could not artificial light be supplied by means of gas or electricity? I doubt it. If you get artificial light you affect the appearance of the specimens. I would not light artificially if I could help it.
2271. Would it not be preferable to an imperfect natural light? That is rather a suggestion to do the best you can with a bad job. If I could avoid it I would not have artificial light. Of course, if you cannot get natural light, you must have artificial light.

TUESDAY, 11 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

John Kirkpatrick, Architect, sworn, and examined:—

- J. Kirkpatrick. 2272. *Chairman.*] You are an architect practising in Sydney? Yes.
- 11 April, 1899. 2273. You are the architect who had charge of the work in connection with the additions to the Infirmary? Yes.
2274. Have you examined the plans of the proposal before the Committee? Yes; I have examined them partially.
2275. What the Committee particularly want to know is this;—whether it is possible to put another floor on to the present Lands Office building, and the cost? That I understood, and I have spent a little time in examining the building. I have been over the building twice. I spent Saturday afternoon on the roof, and I have made what I consider an approximate estimate of the cost of putting one or two storeys on, that is one first with a stone front by carrying up the building with stone, say 14 feet high, and placing over that storey another storey with a Mansard roof. That would give two storeys. Above the second floor, I propose to place a storey carrying it up 14 feet, and utilising the present roofs that are now on the building. They are all very good roofs. The greater part of the slating could be re-used in a similar manner to what has been already done on the front of the Government Printing Office. They have used the old slates there. That is one estimate that I have made. I also went on further, and I thought that I would suggest an idea of my own, namely, to take a good Mansard roof right round, by the removal of all the domes. The large dome in front is used as a plan-mounting and drafting room. Another one is used for photographing, and the one on the opposite side is not used at all. Whilst I was being shown over that roof by the caretaker, I was told that those domes were a perpetual nuisance, that they are always leaking, and that they are of no use whatever. Recently £100 has been expended on them, but they are just as bad as ever after rain. I think that, sooner or later, the domes will have to be taken away, and we might as well make an improvement by going right round and removing the domes; then we should lose that much roofing area. You might as well go in for an entirely new roof in the shape of a Mansard roof. There is a Mansard roof on a portion of this building. I thought we might as well gain the floor-space. There are some 20,563 superficial feet, including the corridors on one floor, as well as the large space that is occupied in the centre of the building. There is a block 80 feet long by 50 feet, and that includes a strong-room, store, corridors, &c. I thought we might as well take the whole of this up with the one floor in stone. I do not propose to go away from the architecture of the present building, but to carry it up in stone; then if, as I say, we remove the domes, it may be advisable to take the Mansard roof right round. However, we could carry up the stone building one storey, 14 feet high, and utilise the old roofs there, and the domes, without removing them. Of course, then comes in the expediency of doing that, whether it would not be better to go to the larger expense and remove the domes, which ultimately will have to be taken away. Whilst the scaffolding is all up, it may be better, and no doubt it would be cheaper to carry out this work at the first cost, whereas if we carry up the one storey in stone 14 feet high, and place the old roof on that, it would be done at a moderate cost at present, but within a few years time, I doubt whether those domes will be found too safe. From what I can see of the state of preservation they are in at present, they will have to be removed before very long, and to remove them you would have to put up fresh scaffolding, and go to work again, thus upsetting the officers at their work. It would be a serious matter to have the work of the draftsmen and compilers in the building, as well as of other classes of labour, destroyed or disturbed by workmen. Instead of getting a good day's labour you would have the men disturbed by the hammer, and the work going on. Therefore, it is a question whether we should not make a clean sweep of it at once, and do the whole thing properly.

2276.

2276. What would the cost be to do it at first? I have estimated in this way: I have run out the superficial area first and then the cubic area. I have estimated 14 feet and 6 feet—that is 20 feet. I have taken it up 20 feet high the entire area, and the area would be 20,563 superficial feet. I make the cost 1s. 6d. per cubic foot, or 30s. per superficial foot, and that runs out at £30,749.

2277. *Mr. Watson.*] That is for one floor? It is for one floor.

2278. Have you excluded from that the space which would be occupied by the domes? No; I have taken into consideration the labour that I should put on the dome. The 20,000 superficial feet is including the area of the dome.

2279. They are there already? Yes; but we have a considerable amount of cutting and fixing. I have omitted those little spaces; I have not taken in the latrines.

2280. That large dome has a fair superficial area, has it not? Yes.

2281. *Dr. Garran.*] You do not get 20,000 feet of new additional area? I do. The main dome is used for clerks. The room opposite the "Exchange Hotel" I am told is used for nothing at all. I have included the superficial area of the large domes.

2282. *Mr. Watson.*] That is hardly giving us the exact superficial area? A great many alterations could be made in connection with it; for instance, the front portion of the dome will come away.

2283. Do you know the area of the dome? It is 54 feet square. I run out the actual office space at 15,827 feet.

2284. Exclusive of the dome? No.

2285. There is nearly 3,000 feet in the dome;—that will leave a little over 12,000 feet actual additional space? Yes.

2286. *Chairman.*] Your design would be in harmony with the existing building? Yes.

2287. And it would cost £30,749? Yes.

2288. *Mr. Watson.*] Does that estimate include the removal of the dome, or only building around it, including the space already occupied by the dome? I cut the roof, and I make certain provision, and the corridors run through it in the same way.

2289. Otherwise you leave the domes as they are? Yes.

2290. *Chairman.*] You said you also prepared an estimate giving another floor under a Mansard roof? Yes; removing the domes, putting on a Mansard roof, and giving another 14-foot storey. For drafting purposes they could not have a better storey than that. I should construct a roof, not with a lot of wood-work with a danger of fire, but one of iron—iron principals, and place concrete on it in a similar manner to the roof of the Equitable Life Company's building. That roof is, perhaps, a heavier one than I should have. I have a copy of the specification. At the big building in George-street they have a fire-proof roof. They went to an expenditure of £167,000 on that building. They have a very fine roof, but it is a very extravagant one. We could have it quite as good for all purposes, and fairly cool, if we put up a Mansard roof. It would not be as hot as some of the Mansard roofs are. They are in vogue in Germany, and they are being copied largely in America. I would carry the roof round, remove all the domes, and I think that the whole of that work can be done for £30,000 for the first storey, and while we are at work there, I think we could do the whole of the work for £50,000. The space would be 40,000 superficial feet.

2291. *Mr. Watson.*] Inclusive of corridors? Yes.

2292. *Chairman.*] 40,000 feet for £50,000? Yes. There is no doubt that you would not use any of these iron principals again, but they are all of value. They could be sold to the Railway Commissioners, who are putting up new sheds. Instead of the Commissioners getting fresh iron-works, those iron pillars would fit some of their sheds.

2293. Then whatever we sold, it would be to the credit of the account? Yes.

2294. With regard to that floor with the Mansard roof, would that, in your opinion, be a suitable place for a reference museum in connection with the Geological Survey Branch? I think so. It would be out of the way, and you would have good lifts and the benefit of a good light. In a museum one of the most vital things is light. Every part of the museum should be well lighted, so that when you want to look at a specimen you can see it clearly. In this room we have to go to the light. But if that building is lit from the roof you will not have to go near a window, because you will get the light from above. One of the greatest examples in the world of this way of lighting is the "Pantheon." It has a diameter of 100 feet, and it is lit from the top by means of a 16-foot opening, and that one 16-foot opening beautifully distributes the light over the whole place. If you take the Eveleigh sheds, they put a small area of glass in the roof, and they get a perfect light. If you have a museum at all, and you want a perfect light, you could not do better than light it through the roof.

2295. Could those additions be put up without greatly inconveniencing the clerks at present working in that Department? I think so. There are some alterations being made in George-street, and the electrician was saying how troublesome it was for him and his men to be employed there, whilst men were working at the building. He said they dropped cold chisels through the building, and that it was a great discomfort trying to carry on business with all that work going on. They have a concrete ceiling at the Lands Office, and for a little expense the rain-water could be taken away if it should rain whilst the work is going on.

2296. Could you put up the necessary scaffolding to carry on the work without injuring the walls? Yes; I took my practical scaffolding builder there on Saturday afternoon, and he pointed out that we could erect gantlings and take them right down to the basement, so as not to have the machinery vibrating through the building.

2297. You considered that when you calculated the cost? Yes.

2298. It has been done in connection with public buildings in the city? Yes, in putting a storey on a portion of the Post Office. There is one portion in Pitt-street in a fair way for completion, and the George-street end is progressing.

2299. Does that injure the main building at all? I heard the other day that cranes were put at the top of the wall instead of bringing the bearers down to the ground, and a 10 or 12-ton crane, with the vibration of lifting, I believe, shook the Post Office walls pretty considerably. It was not discovered what was the cause for some considerable time.

2300. Have you anything to add to the proposal to put a new floor on to the present Lands Office? I think not, except that in my opinion if one floor is added I would not make it a simple Mansard roof. If you put a one-storey Mansard roof without the additional storey, you will destroy the whole proportion of the building, because, in my opinion, it is not sufficiently high for a Mansard roof.

2301.

J.  
Kirkpatrick.  
11 April, 1899.

J.  
Kirkpatrick.  
11 April, 1899.

2301. *Mr. Watson.*] If only one storey is to be added, you think it should be in stone? I should keep it in stone. I think it is a wise suggestion to put a storey on the top of the Lands Office. I think it would greatly improve the building. It is a noble building; the architecture of it is good, except for those wretched domes.

2302. *Chairman.*] It would not improve the appearance of the building? Another storey would improve the building materially, and do away with the wretched appearance of those domes. That large dome is a very unsightly thing. If you were to go and look at the inside of the dome, you would say, "Remove it at once." It is in danger from fire; it is all wood; they use fire there; there are always scraps of paper about, and it might easily be set fire to. One little match in that dome would set the whole building ablaze.

2303. Your opinion is that the dome is dangerous as it stands? I think so. If you took a look at the wooden partitions and the wooden staircases, you would say, "We must clear the dome out for the safety of the building."

2304. *Dr. Garran.*] Was it put up for utilitarian purposes or for architectural reasons? I think they thought at one time of having instruments there for astronomical purposes. The plans show a revolving dome, which could be opened to let an instrument be put through.

2305. Do you know whether it has ever been appropriated to survey uses? I think not. There is a section which shows that it was intended to be similar to the Observatory dome. The part above the windows is entirely lost; it is of no use whatever. There are only about 12 or 13 feet of the dome available, and the other domes are of no use. The one intended for photographic purposes is not built correctly for modern photography.

2306. Is it used for photography now? It is used for storage and the taking of sun-prints.

2307. *Chairman.*] How much of that tower would be affected? We should have a little below the first cornice.

2308. *Dr. Garran.*] Do you consider the proportions of the tower are good as it relates to the building? I do not.

2309. In what respect? I think the tower is too high.

2310. You think it would rather improve it to take off the lower portion? It would not interfere with it.

2311. Suppose you put on your Mansard storey, how much would you take off the tower then? I should still save the cornice line.

2312. Then you raise the building by two storeys, and take off entirely the lowest storey of the tower? Yes; I think it will bring the tower into better focus.

2313. You have explained that you would make a new Mansard roof of iron;—how would you keep the heat down? I should make the frame of iron, and I should fill the spaces in with concrete. I should use the principle of the Monier arch, because I think it would be the strongest.

2314. The outside lining would be concrete, and the inside concrete? No. I would cover the outside with concrete and copper.

2315. Then it would be practically a fire-proof roof? Yes.

2316. And it would be cool? Yes.

2317. You admit that the usual Mansard roof is lined with wood? Yes.

2318. And it is very inflammable? Some that I put up years ago, I lined with wood, then covered the outside with felt, to try and keep the place cool, but I cannot say that it is a success.

2319. What is the Mansard roof at the top of this office lined with? I think it is very similar to the Post Office; I think it is lined with wood. A portion of it may be plaster. I have not examined it.

2320. The foundations of that building are all rock, are they not? I think so.

2321. So that they will carry any additional weight? Yes.

2322. And you are of opinion that the appearance of the building would be improved if it were raised one storey? I am sure it would.

2323. Should we have to alter the lifts very much? Yes; we should have to remove the lifts altogether.

2324. There are three or four lifts? There are two. They have a very cumbersome arrangement at present; I think they have their own pumping-gear.

2325. You were talking about the museum;—you entirely concur with the idea of putting the museum on the roof of the building in preference to having it on the basement? Yes.

2326. Are you aware whether there is any advantage in having the roof lights? Yes; you would have a clear light without any reflection.

2327. Is it not in many workshops a serrated roof which will light only from the south? Yes; our exhibition building which was burnt down was made in that way.

2328. Would that be a good light for a museum? Yes.

2329. We should be practically independent of side-lights? Yes; but I do not know that it would be absolutely necessary for a museum, because sometimes we want an extra bright light, even more than the south light; but the south light is the best.

2330. It is necessary to keep out a strong sun from a side window, but we should get no strong sun from a southerly light? Those things on exhibition that would be destroyed by a direct ray of the sun could be removed to a corner where they would not receive the direct rays.

2331. You recommend that the museum should be shifted to the top of the building? Yes. Were I erecting a new building I would make it sufficiently strong to carry the weight of a museum. I would certainly have the museum at the top of the building.

2332. Suppose we had it on the top of the building, would the southern lights on the corridor be sufficient to light the whole of that inner area? I have not studied this very well. You would have the whole of that light from the centre. Do I understand that the museum is only to cover a portion of the building.

2333. *Mr. Watson.*] In the basement it covers the whole area? In the roof the area would be reduced. You would have ample light from the top, and if you wanted the southern lights over the corridors you could place them there.

2334. *Dr. Garran.*] There would be plenty of side-lights on the top floor from the corridors in addition? No; I do not think there would be in this case.

2335. Looking at the design, do you think the Lands Office would make a suitable companion building to this office? I do not see much fault to find with the architecture of the exterior of the Lands Office.

2336. *Mr. Watson.*] The idea has been to try to lessen the apparent height of the Lands Office, in view of the small area? That cannot be according to the plan.

2337. You are of opinion that any building that is erected on this particular area of land should be a building fit to compare with the other two public buildings in the immediate vicinity? Yes.

2338. You would not throw away that site by erecting a plain brick building? No; I would have a good building.

2339. Do you think that the building designed would be fairly suitable? No; I do not think so. I think that between the two big buildings—the Lands Office on the one side and the Works Office on the other—that building will look an absolute pigmy as it is.

2340. *Dr. Garran.*] Squat? Yes.

2341. *Mr. Dick.*] Do you know that that building would be higher than this building or the Lands Office? No; that is not shown on the drawing. In perspective, some architects often do little forgeries. Some move a thing up or down for effect; some do not make them absolutely correct. That picture is not drawn correctly.

2342. *Dr. Garran.*] You propose to put on two new floors to get 40,000 square feet, at a cost of £50,000? Yes.

2343. Well, this building will give 70,000 superficial feet available for office accommodation, all useful space, at a cost of a little less than £97,000;—do you think it would be worth while to meddle with the old building if we have to spend £30,000 or £40,000, when, by spending £97,000 on a new place, we can get 70,000 superficial feet;—which do you consider the better mode of utilising the money? That requires consideration. I have not looked at it in that light. I was written to and asked by the Secretary to come and say what I knew about the estimate.

2344. You have not considered that point? No.

2345. *Mr. Watson.*] In that first estimate of £30,749 for raising the Lands Office one storey, in stone 14 feet;—what do you think it would mean additional on that estimate if you were to take the removal of the dome? I do not know that we could utilise the dome roofing.

2346. I want to know roughly what you think the additional cost would be to remove the dome, and put one storey right round? I do not like to hazard a guess; I should say £3,000 or £4,000.

2347. Would the removal of the dome itself entail much labour and expense? No; it is all iron bolted together.

2348. So if you put that down at £4,000, it brings up your estimate to about £35,000 for the erection of a single floor right round the building and the removal of the dome? Yes.

2349. *Mr. Dick.*] I think you stated that the Mansard roof, as you propose it, would be a cool one? I think it would.

2350. Would not the copper covering absorb the heat? It would; but I would have two linings. I have got means of overcoming any trouble from heat.

2351. *Mr. Watson.*] Do you think that the concrete would counterbalance it? We should put two layers of concrete, and have other arrangements.

2352. *Dr. Garran.*] Would not the air-space exactly underneath the copper be very hot? It would be more or less hot.

2353. Do you provide any exit for the heated air? Yes; there would be a draught from the bottom to the top. There would be a space of about 1½ inch at the top.

2354. There would be no hot air imprisoned there? None whatever.

2355. *Mr. Dick.*] In what way would that building be out of keeping with the architecture of this building and the Lands Office? The storeys of this building and of the Lands Department are 20 feet high. If you take a building with 20-foot storeys, and divide it up into the ordinary office style with ordinary windows, such as they have in ordinary warehouses, it makes a great difference.

2356. In the new building these are the measurements—basement, 20 feet, then they run 16 feet, 18 feet, 14 feet, and 12 feet. In this Department the ground-floor is 16 feet, this one 20 feet, and the others are all 14 feet? You must bear in mind that both here and in the Lands Office the ceilings have 20 feet from cornice to cornice. There is a space left between the floor of this storey and the ceiling of the other that you can crawl along. I was told that it was left for taking all kinds of pipes through, but the same thing applies in some of the rooms. I do not think the new building would fall in with the other offices, but it would be better than having a brick building.

2357. Would you like to offer an opinion as to the advisableness of placing the museum on the top storey as far as the attendance of the public is concerned;—would people like to go to the top of a high building to a museum? As an ordinary citizen, I might say that I think it is a waste of money to have a museum in the building at all. I would simply have one museum. Where do the public go; do they ever go to the Mines Museum. I have never seen any one else there when I have been there. If they must have a museum I would put it on the top floor. There is another reason why the museum should not be on the ground-floor—it is desirable to keep public offices on the ground-floor as much as possible. People who attend public offices are generally in haste to get their business done, and would lose time in having to go to the top of a building, but people who visit a museum generally have time at their disposal.

2358. You think the basement would have light enough in it for offices? Yes.

2359. You do not think the proportions of the tower of the main building will be altered for the worse by the addition of two storeys? I do not. If I did think so I would not propose a Mansard roof.

2360. Is the tower out of proportion now? I think it is too high. It looks too much like a candlestick, very much like the Post Office tower. All our towers are too narrow from the start. The only decent tower that we have in Sydney is the University tower.

2361. *Mr. Shepherd.*] You think that the museum would be better at the top of the building than at the basement? Yes.

2362. Do you think that it would not be possible to get sufficient light into the basement? Not as at present designed; that is an impossibility.

2363. You say that you propose to leave a lighting space of 16 feet square in the roof, if the museum is on the top of the building? No; I mentioned that in another building there is a lighting space in the roof 16 feet square, but in this case we should want a smaller opening.

2364. Of course, there would be ample means of thoroughly lighting the upper storeys? Yes.

2365. Could you properly light it from the roof? Yes.

2366. It would be something similar to the lighting of the Australian Museum? Yes.

2367. The light there seems to be perfect? Yes.

J.  
Kirkpatrick.  
11 April, 1899.

- J. Kirkpatrick.  
11 April, 1899.
2368. Did you say that you could add one storey to this building for £30,749? Yes.
2369. And two storeys for £50,000? Yes; for 40,000 superficial feet.
2370. In that plan would you do away with the dome? If I put on the two storeys I should take away the dome.
2371. Will the addition of one or two storeys interfere with the present design of the building? No.
2372. You can make it all in keeping? My idea is that something like what I propose will absolutely improve the appearance of the building.
2373. As it is it does seem rather squat? Very squat, and these domes make it a great deal more so.
2374. I suppose you would not interfere with the tower? I would not.
2375. *Chairman.*] This position is presented to the Committee: The evidence of the Under Secretary, Department of Mines, is that, by adding a storey to the present Lands Department, he would get all the accommodation that he required, and that is borne out by the fact that at the present, in the Lands Department, he occupies 36,000 feet, and Mr. Vernon would add on, in round numbers, 20,000 feet more, that makes 56,000 feet. The plan that is submitted to us of entirely new buildings will give the Mines Department a total of 48,000 feet, therefore the new building, at a cost of £97,000, will provide only 48,000 feet for the Mines Department. They at present occupy in the Lands Office 36,000 feet, plus that 20,000 feet, making 56,000 feet; therefore, by this one-room addition they will get 8,000 feet more than they would get in the entirely new building. That being so, and seeing that the new building was to cost £97,000, and that a top storey can be put on of a symmetrical appearance for £30,000, which do you think would be the best plan to adopt? The most economical plan appears to be to put one storey on the top of the Lands Department, and it will improve the building. I should think that that course ought to commend itself to the officers of the Department. The two Departments are so interwoven together that it will be most convenient to have them both under one roof.
2376. What do you think is a fair space for a draftsman to occupy;—suppose you had a dozen in a room, what space ought they to have? I had, I think, nine men working in a room in Pitt-street,—a room 40 feet by an average of 27 feet.
2377. Was not that rather crowded? They did not feel crowded.
2378. Would you not give draftsmen a little more room than that? I think they could work in that space.
2379. Do you think the draftsmen's rooms in the Mines Office and Lands Office are fully occupied? I went through them, and there appeared to be a good many desks, but I made the remark that I would not mind having an office like it. I am referring to two very long rooms fronting Bridge-street—one was occupied by draftsmen entirely, but the lower room partly by draftsmen and partly by clerks.
2380. You did not see the room whilst the men were there? No.
2381. Did you go through all the other rooms there? No; I only went through the two rooms. You can give a draftsman too much space to work in. When my business got slack I found that I only wanted three or four men, and they occupied a very large drafting-room, and they always had a great litter of things. They work in a more compact space and keep things in better order when they have not too much room.
2382. What is a fair space to allow for a draftsman? It depends upon what he is working on. Some drawings take up a large space.
2383. And it is difficult to lay down a rule? I do not think that a rule could be laid down, unless you were to classify the size of the maps and drawings.
2384. I did not get your figures quite correctly as to the cost for the additional storey? I gave 30s. per foot superficial, that is equal to 1s. 6d. per foot cubic. I was told by two men who were in the habit of taking out quantities for buildings that I had over-estimated it, but I think I have given a fair estimate.
2385. Have you gone pretty carefully into the matter and made a fairly liberal estimate? If I were a contractor, I should like to take the building at my figures.
2386. How much do you add for the removal of the dome? £3,000 or £4,000.
2387. That would be about 4s. per superficial foot extra? No, I included the amount per foot in my original estimate.
2388. Allowing for the removal of the dome, 34s. or 35s. would be a fair amount per superficial foot? I allow for the cost of stonewalling 7s. per cubic foot. I put up the Sydney Hospital and the Mutual Life of New York, and the contractors had only 5s. 6d. per cubic foot, and yet they made money. I believe they had something under that for the Markets.
2389. Would this addition that you suggest alter the character of the building so as to make it look as if it were an addition? I have not added anything of a new character to the work. In the top of the Post Office they have introduced work of a new character.
2390. You have avoided that? I have.
2391. If you look at the photograph on the wall, there is the coping shown in a dark line;—how would you treat that coping? That cornice I would leave where it is. The top balustrade would be altered to suit the design.
2392. Suppose that the Committee were to favour your idea of adding on one or two storeys to this building, would it be a work which you or any other architect might be ashamed of? I should not be ashamed of it.
2393. It would not make an ugly, unsuitable building? No; it would not turn out like the Post Office.
2394. As regards the tower, you think the additional storey would be an improvement? I think so. I do not think it would interfere with the tower in the slightest degree.
2395. When we visited the public buildings recently, we found that in those high-up rooms, especially where there were Mansard roofs, the heat was very great indeed;—could that be obviated? That could be entirely obviated. The upper rooms would be as cool as any of the other rooms if properly treated.

WEDNESDAY, 12 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIFN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Walter Liberty Vernon, Government Architect, sworn, and further examined:—

2396. *Chairman.*] In your evidence given here on the 16th March, you estimate the cost of giving 19,643 superficial feet at £46,880; we had Mr. Kirkpatrick here yesterday, and in his evidence, which I think you heard, he said that he could give slightly less than that for £30,740? Yes. W.L.V. mon.  
12 April, 1899.

2397. He bases his estimate on 1s. 6d. per cubic foot;—can you tell the Committee what you base your estimate on? I heard the evidence given yesterday by Mr. Kirkpatrick. I think he is perfectly right in his opinion that if an additional storey is to be put on to the Lands Office, it should be one in stone, and not a Mansard. As regards its dimensions, he states that the additional floor-space amounts to 20,563 superficial feet on one floor, as against the estimate which I gave to this Committee previously, of 19,643 feet. I have been through these figures very carefully this morning, and I cannot quite fit in the 20,563 feet to any exact portion, or the whole of that floor. But I find that he has included the floor space covered by the domes, which, it may be recollected by the Committee, he afterwards suggested he had omitted from the 20,563.

2398. *Mr. Watson.*] He included corridors? Yes, but he took no account of the strong-room, which is in the centre; so, practically speaking, the 20,563 feet is against my 19,643 feet, and I think the Committee may take them as fairly representing what the case is. But it must be shown that it includes the area which is now covered by those domes. When the evidence goes on as regards the cost, I also agree with Mr. Kirkpatrick that the cubic cost of that one storey is fairly put down at 1s. 6d.; in fact in my evidence I previously stated 1s. 6d. myself, so that we actually agree upon that. But in calculating, a difference has arisen between Mr. Kirkpatrick's estimate of £30,749 and my estimate of £46,880, and I can account for it in two ways. In the first place, taking the heights, I calculated for an additional height of 23 feet for the room, and for a portion of the roof, as we generally do in matters of cubing. The storeys in this building average 18 feet in height; the present top storey is 18 feet in height. I therefore calculated 17 feet in height for the new one, and the remainder for the thickness of the construction of the floors, and the average height of the roof, making 23 feet as against the calculation by Mr. Kirkpatrick of 20 feet in height. Mr. Kirkpatrick told the Committee that he calculated 14 feet as the height of the floor, and 6 feet additional for roof and floors, making 20 feet only. But if the Mansard roof were omitted from this sketch, it would give at least the 23 feet which I have taken, and therefore I think the 20 feet of Mr. Kirkpatrick is cutting it too fine for purposes of valuation. The second reason that presents itself to my mind is this, and I feel quite certain it is the case that Mr. Kirkpatrick has given you the superficial contents of the floors for office purposes, and has multiplied that by his height, but has forgotten to take the area of the outside walls as well. He has taken the one dimension of 20,563 feet, and has multiplied that by 20, which comes to 411,260 feet, and if that is calculated out at 1s. 6d. per foot, I get the result of £30,800, as against his estimate of £30,749—a difference of only £51. So that it is perfectly evident that instead of taking the whole area of the building, he has taken only the whole area of the floors inside the building, and measured that by the height, instead of the outside walls by the height. To my mind that explains the difference between us. Those two mathematically do explain it.

2399. You said that calculating by a height of 20 feet only, instead of 23, brings it, at 1s. 6d. per cubic yard, practically to Mr. Kirkpatrick's price? Yes; that is superficial floor-space. But the superficial floor-space is not the superficial contents of the building.

2400. *Chairman.*] In your evidence you say there are 19,643 superficial feet, Mr. Kirkpatrick says 20,563—would that account for the difference? No. I account for mine by not including the staircases.

2401. *Mr. Watson.*] And you do not include the corridors? Nor the corridors.

2402. Mr. Kirkpatrick did include the corridors? Yes.

2403. Including the corridor space, 20,000 odd feet, that would make up the difference? Not exactly. But I can get out the exact total cost of the building, taking his superficial floor-space multiplied by his height, and showing that there has been an omission of the thickness of the walls.

2404. *Dr. Garran.*] Still with your slightly larger area you do not differ very much from him in the estimate? Well, it increases the estimate from £30,749 to £46,880, which was my original estimate—that is, the heights and the widths taken as the two items.

2405. *Chairman.*] Taking your measurements, you add 50 per cent. to the measurement? Yes, quite. I understand Mr. Kirkpatrick afterwards added from £3,000 to £5,000—say £4,000—for taking away the domes—additional on his first estimate.

2406. *Mr. Watson.*] But he said he had included the space already in the domes and so calculated that as all additional, and he said it would give 20,000 feet of additional space, though that meant doing away with the space now in the domes? That is so; but, when I take out his figures I find this 20,000 multiplied by 1s. 6d. a foot cube makes up his estimate, without the £4,000. Therefore, he has not really made the two calculations on the same basis. The evidence went on to state that the present domes are inflammable. I do not think he could have seen exactly the construction of those domes, because, as a matter of fact, they are of steel and concrete. The whole of the three domes—that is, the one in Pitt-street, and the two side ones—are constructed entirely of steel ribs and concrete filling-in, but, like all buildings that are covered with metal, they necessarily have a wood sheathing on the outside in order to carry the metal. I may state to the Committee that unless very extreme cost is gone to,—as in the case quoted by Mr. Kirkpatrick yesterday—the Equitable Life Building, where the roof is covered with a flat tile, and the whole is one solid mass—unless that is done, and if copper is used, as suggested, it is absolutely necessary to have a wood sheathing under it in order to take the dressing and to get the cavity which

W.L. Vernon. which was referred to as a space for ventilating and cool-air purposes; so a concrete Mansard roof still has some woodwork under it, that is, it has the wood sheeting on wooden bearers—and it is impossible to get away from that.

12 April, 1899.

2407. *Chairman.*] How is the dome finished inside? It is plastered inside. The evidence then went on to give the cost of an additional Mansard over the storey, and the cost was estimated at another £20,000, making altogether £50,749. I think that is too low, because of the mistake evidently made in the first item of the £30,000. The average cost per floor of the original building was £58,000. I am, of course, including the cost of the tower and the domes, and am scattering it over the present storeys, which makes an average of £58,000 per floor. Of course, the upper storeys would not cost as much as that, but still there is too great a difference between £25,000 per floor and £58,000. £25,000 each is the average of Mr. Kirkpatrick's estimate for two floors—the half of £50,000—and it is a great deal too small in comparison with the £58,000 the original cost. It might be said that wages and cost of material in those days were higher than they are now, but in looking up matters I find that was not so, except as regards the cost of material, which is certainly cheaper. Wages have gone up, and are still going up very much compared with what they were at the time when this building was put up. Nine years ago the tower was finished, and the wages then and now are not very dissimilar; at any rate it would not make all that difference. As regards the architectural appearance of the two floors, I produce a view of the Lands Office taken from the corner of Pitt-street and Bridge-street showing how little is seen of those domes and the tower. The addition at the heights shown on this sketch of Mr. Kirkpatrick's would produce this effect, and I should like to venture the opinion that a building monotonously made that height, with four square sides, and a squat tower in the centre, and with no relief by way of domes or pavilions, would be a very sad mistake, and a failure from an architectural point of view. I strongly advise you not to put up a four-sided building with absolutely no features on the top.

2408. *Dr. Garran.*] Whenever you have a building like this, and you add to it afterwards, does it not always show that it is an addition? It must necessarily do so.

2409. If you have a heavy cornice and you build over that, then that cornice is afterwards out of place? Necessarily so, because the first building is designed complete in itself, and then another person comes along and makes an addition. It is exactly the same as writing a book. The last chapter is written by somebody else, and you detect the change in the literary style at once; you cannot help it. Of course one of the charms of the large buildings of the world is the change of style introduced in constructing them.

2410. A great many of the large buildings of the world have been erected in different centuries, and so there must be some change? Yes.

2411. But here, in buildings like the General Post Office or banks, when you have a heavy cornice three-quarters of the way up, it is clear what may be done in making additions above it? They could not carry up an additional storey on a building like the General Post Office with the same detail as that of the original building itself. If a building is designed with a large heavy cornice, you cannot put any addition on the top of it without upsetting the appearance of the building and its details.

2412. *Chairman.*] Are you not putting additions up to the Custom House? Yes. Fortunately that building lends itself better to change than any other building in Sydney would do. There is nothing there to interfere with the sky line.

2413. *Dr. Garran.*] You are taking away the cornice? Yes, I am raising it from one level to another.

2414. *Mr. Trickett.*] The old portion of the Custom House is a good age, is it not? Some portion of it is.

2415. It has been built at least thirty years I suppose? Yes, it has.

2416. Did you put up the new front? No, it was erected before my time.

2417. Has not the front of the Custom House had a storey put on to it? Additions were made just before I came into the Government service. I believe that an additional storey was put on by the Dibbs Government.

2418. Another storey was put on that, and you are going to put two more storeys on? Yes.

2419. Are you going to improve the superstructure? We are raising the same cornice and the same parapets.

2420. You will not have to solidify the superstructure? No; but I think we shall carry all we can.

2421. *Dr. Garran.*] Have you a rock foundation there? No.

2422. *Mr. Trickett.*] If you remember when we were considering the Inspector-General's Office, a very great point was made by you that, to meet future requirements, you would have to spend a lot of money to strengthen the superstructure; that does not seem to be necessary in this Custom House? Well, this building was built strong enough at the first.

2423. Was it built with the idea of adding to it? No; I do not think so. The Lands Office would carry four or five more storeys, although it was not specially designed to carry them. It is a mere matter of accident. But as regards the scheme to which you refer, in the first instance I was endeavouring to keep the cost of the building down to the lowest possible limits, to meet the requirements of the Government, and when the question of additional storeys came under consideration, I knew at once that I must strengthen the walls. It is an entirely different matter.

2424. It seems very strange that, in the case of those buildings which have been added to, like the Government Printing Office and the Custom House, which apparently were erected with no ultimate intention of their being added to, you were able to add to them without requiring to strengthen the superstructure? Those buildings were put up regardless of cost originally, and as it happens, they have answered for the additions. But in erecting more modern buildings, the cost is kept down to the very lowest—it is cut very fine. I think the Lands Office would carry half a dozen more storeys.

2425. *Chairman.*] Would another storey built on to the Lands Office detract from the appearance of that building,—that is, without a Mansard roof? It would still require some construction of either a pavilion or dome to break its sky-line.

2426. Do you, as an architect, think that a pigeon-box like that photographic place adds to the beauty of the building? Well, in this particular photograph it looks particularly well; but it does not look well from every point.

2427. *Mr. Watson.*] You were going to add another reason? My other reason is that the internal courtyard rooms of the Lands Office would become almost useless.

2428. That is because of the darkness? Yes; the strong-room was constructed in the centre of what should

should have been an open court yard. Those rooms are now almost useless. With two more storeys they would be quite useless, and therefore the Lands Office would be asking for more rooms higher up the building if those two storeys were erected. W. L. Vernon.  
12 April, 1899.

2429. *Chairman.*] You say the Lands Department would be asking for more room? They certainly would, because they could not use those lower rooms.

2430. Is it not a fact that some of the rooms are so dark that those employed in them have to use artificial light? That is so. On a day like this, they probably would not, but nearly all the year round they have to.

2431. Have you not lately fitted up this building—the Public Works Office—with electric light? Yes—for working at nights.

2432. So you can get artificial light into any building? That is true.

2433. They have to use artificial light now in the strong-room of the Lands Office? No.

2434. Perhaps you are not aware, but I saw naked gas-light in the strong-room there in the daytime? On the lower floor they do sometimes use it, I know, but that is really owing to the small areas.

2435. *Mr. Watson.*] Comparing the light-area you allow in the proposed new building with the light-areas existing in the Lands Office—how do they stand in comparison? There is no comparison.

2436. So that really for lighting a much greater number of rooms you have a smaller light-area in the Lands Office than you propose to allow in the new building? Very much smaller.

2437. *Chairman.*] Have you prepared an estimate of the cost of a Mansard roof, as well as of an additional storey? No, I have not.

2438. *Mr. Watson.*] Is there much difference per cubic foot between the cost of a Mansard roof and the cost of a stone storey? Taken separately it would be less, unless it were of costly fireproof construction in the Mansard; and then it would mount up.

2439. Can we fairly estimate the cost of the additional storey as being as much as you propose to allow for this first storey of stone? I think you may take Mr. Kirkpatrick's proportions—he puts it at thirty to twenty. I should like also to point out that assuming that accommodation must be found for the Mines Department in these two proposed upper storeys, the question of the museum would present a very great difficulty, because it would be necessary for the museum to have a certain height, which practically means leaving one floor out, and if the museum is to contain the same superficial area as is shown in the scheme before the Committee, it would practically mean taking the whole of the floor, and leaving the Mansard floor out, but with a Mansard construction over it; so nothing would be gained at all. It would never do to fit in the museum in a storey not more than 14 feet in height. At any rate, it would not be considered a success as a museum. Therefore, it would mean the destruction of the intermediate floor to get the height. Beyond that the Lands Department uses these domes for printing, for storage, for extra surveyors, and extra draftsmen, and for a great number of matters of that kind, so if they were deprived of their present accommodation in the dome they would want some of the accommodation provided in the Mansard, and, therefore, the Mines Department would run short. I have also prepared a statement of the accommodation. The Mines Department at present occupy 13,600 feet in the building. The space which Mr. Kirkpatrick stated would be available on the first upper floor would be 15,827 feet. If those two only were added together they would make a total of 29,427 feet, as against the requirements in the Mines Department amounting to 47,941 feet, leaving a deficiency of 18,514 feet, and the 18,514 feet could not be found in the Mansard roof.

2440. *Mr. Trickett.*] Have you looked at the figures given by Mr. D. C. McLachlan in answer to question 910. He was asked:

What space do you occupy inclusive of the rented buildings?

He answered,—

The total space we now occupy, including the museum, is 43,455 feet.

? Yes; but, as he said, that is “inclusive of the rented buildings.” The space occupied by the Mines Department in the Lands Office is about 13,600 feet; so that the three floors together would not afford sufficient space for the Mines Department; it would absolutely dispossess the Lands Department of the upper portion, which they are now using, and the museum would have to be abandoned.

2441. *Mr. Watson.*] According to your estimate, it would cost somewhere about £78,000 to put the two floors on—in the proportion of three to two; suppose £47,000 is the price of the first stone storey; then the Mansard would cost, in the proportion of two as against three, £31,000, and that would make a total of £78,000? Yes; I think the allowance for the Mansard is a liberal one. But it would be absolutely necessary to have some pavilion designed to break the monotony of the roof. Neither Mr. Kirkpatrick nor I have included the addition of the strong-room, and unless that were added also, the Mines Department would have no accommodation there at all. I saw Mr. Houston, of the Lands Department, to-day, and he told me that he could not possibly spare any of the present strong-room for the Mines Department—that it only just holds the Lands Department documents.

2442. *Chairman.*] I suppose that if you were to give him twice the space for a strong-room he would find something to put into it? I did not ask him anything about that.

2443. *Mr. Trickett.*] At question 1952 you stated that you had reckoned the whole building at 27s. 6d. per superficial foot; that is the all-through charge, is it not? Yes; that is so.

2444. Does it not seem a very big margin to jump from that to 47s. per superficial foot for this addition? Yes; it does seem so, but there is no more expensive form of building than adding to a public building whilst the officers are working in it. It means two roofs—taking the present roof off, and putting a temporary one on. I am afraid the General Post Office addition will cost more.

2445. But you told us the other day that that is an exceptionally expensive job? Yes; it is.

2446. *Chairman.*] How much do you estimate the new Custom House building will cost? £19,700, I think.

2447. I meant per foot? It is costing £1 2s. 4d. per foot, superficial, but that is a particularly easy work to do. Of course that is only an estimate. I hope the cost will not exceed it; in fact, it must not.

2448. Can you say how many feet you are adding to the Custom House? 17,413 superficial feet.

2449. *Mr. Shepherd.*] What is your opinion as to the general effect of adding two storeys to the Lands Office? I consider it detrimental to the appearance of the building.

2450. You may have heard Mr. Kirkpatrick say yesterday that he thought it would improve the appearance of the building? I thought I heard him say it would be improved by one storey, but not that two storeys would improve it.

2451. I think he spoke of two? Then I cannot agree with him.

2452.

- W.L. Vernon. 2452. You think one storey would improve it, then? I do not think it is wanted, but it would not ruin the appearance of the building.
- 12 April, 1899. 2453. And you think two would? I think two would.
2454. *Mr. Watson.*] Unless, of course, you had sufficient treatment of the roof or skyline to redeem the extra height? Yes; but then the tower would be a difficulty.
2455. *Mr. Dick.*] Will those pavilions have the effect of giving the building too lengthy an appearance? No. Mr. Kirkpatrick was perfectly right as to horizontal lines in a classic building, but that building contains all the horizontal lines necessary for a classic composition. The effect of having those columns engaging two storeys really detracts from the height, because it apparently reduces the number of storeys. I carried those pavilions up to the top purposely to break the sky-line.
2456. That building would be higher than either the Lands Office or the Works Office? It is slightly higher.
2457. It will not have a squat appearance, then? No. I should like to put the Committee right as to the correctness of the perspective. I am ready to guarantee the absolute correctness of the relative position of this building. I went through the perspective lines with the draftsman who laid down the lines for this building, and that is exactly as it would appear.
2458. Will the Works building dwarf that, or will that dwarf the Works building, or will they have no effect of that kind on each other? I think they will work together, because the Works building farther off is rather higher. There is another storey on the Works building, a little further up Phillip-street than the Colonial Secretary's corner, and I think those two buildings will balance each other; but they are both much higher than the Lands Office, and they are higher up the hill.
2459. Is the actual height of this building greater than the height of the Works Department building? Making all allowances for the lower portion of the site, there is very little to choose between the top attic on the new building and the Mansard roof on the Colonial Secretary's.
2460. They are about the same? Yes.
2461. *Mr. Watson.*] Regarding the estimate of £46,000 odd for putting one storey on the Lands Office, have you gone into that question at all with a view to see whether any reduction could be made? I have not.
2462. Do you still think it would require that expenditure to deal with the matter in a fair way? I am sure it would, because the pavilions have to be dealt with. The domes must be dealt with at the same time.
2463. How, in that estimate, would you propose to deal with those domes? I have a drawing here, showing what the effect on the dome would be if a storey were raised without altering the dome; and it can be seen at once that it would take all the shapeliness—all the due proportions—out of it.
2464. In the £46,000 you include the cost of taking away the domes? Yes, I do. The 1s. 6d. I think would cover what it is necessary to do to them.
2465. Mr. Kirkpatrick yesterday estimated that to take away the domes would require an additional £1,000 on his previous estimate of £30,000, odd, and that therefore would bring it up to nearly £35,000? Yes, that is so.
2466. *Dr. Garran.*] You would agree that, roughly speaking, Mr. Kirkpatrick's two plans can be carried out for about £50,000? No.
2467. At how much do you estimate it? I think he is £20,000 under the estimate.
2468. He said £30,000 and £20,000? Yes.
2469. You think that the £20,000 is too low? I do.
2470. It is £70,000 altogether? Yes.
2471. Well, as £70,000 would give you 40,000 square feet, do you agree with his estimate of the available area? Practically, I do.
2472. Well, if he would have to spend £70,000 to get 40,000 square feet, that would contrast unfavourably, would it not, with your proposal to spend £97,000 to get 70,000 square feet? Undoubtedly.
2473. He would have to spend more for less accommodation? By carrying up the Lands Office; and then the scheme is not complete.
- 2474-5. Therefore, you think that his two projects compare unfavourably with your own project? I am of that opinion.
2476. *Chairman.*] I think you estimated for your additions a higher building than Mr. Kirkpatrick has done for his? Yes, I have.
2477. The floor-space is practically the same? Yes.
2478. *Dr. Garran.*] At what do you estimate your floor-space? I took 19,643 feet with the staircases. Mr. Kirkpatrick takes 20,563 for his floor generally.
2479. *Mr. Watson.*] Inclusive of corridors and the space now occupied by the domes? Yes.
2480. Which brings his net down to under 16,000 feet? 15,827.
2481. That is for the first floor in stone? Yes.
2482. And somewhat in proportion, but slightly less again, on the Mansard? Yes.
2483. *Dr. Garran.*] To do that, he says he would have to spend £50,000, and you say £70,000? Yes.
2484. And yours would be a more convenient building altogether, you think, than his? I do not say that.
2485. Would it be as convenient to occupy the two top storeys of that building, as for the Agriculture and Mines Department to occupy half of your new building? That is a question which requires a very long answer, because it is so mixed up with the Lands Office and with the disposition of the Museum—assuming there is one—and the provision for the laboratories, that it is a most difficult question to answer.
2486. You are aware that some of the witnesses—the Museum experts—have said that if your new building is carried out, it will be better to give the upper storey for the Museum instead of the basement? I heard that yesterday.
2487. Do you see any architectural objections to that? There is no architectural objection, but there is the objection that I could not provide for the laboratories, which must have a top light, if the upper storey is to be occupied entirely by the Museum.
2488. You want to put your laboratories on the top floor, in order to keep the smell of gas away? Yes; and also to have the light.
2489. There is no other difficulty in the way of putting the Museum on the top? There is the disadvantage of having the public travelling up and down the official staircases and lifts.
2490. The light could be perfect at the top, I suppose? Yes; but the light at the bottom is just as good.
2491. You could have a roof-light on the top? I have a roof-light in the basement, too, of very great service—of larger service than I could get on the roof in one particular position. 2492.

2492. But that roof-light you get in the basement does not light the whole of the basement, but lights a large area of it? The horizontal windows which are on three sides of the building are also lighted. I should like to point out that the sun travels all round the whole of those three sides. It was rather inferred yesterday that one would be in deep shadow, but that is not the case. After 6 o'clock in the morning, the whole of the Phillip-street front is in the sun, and the sun travels round the whole of those three sides. W. L. Vernon.  
12 April, 1899.
2493. On the east in the morning, and on the west in the afternoon, and on the north a great part of the day? Yes. It has an uninterrupted light from three sides, and a top light at the rear.
2494. And you are not favorable for putting the Museum just under the roof? If it were not for the difficulties I have mentioned; otherwise there is no objection.
2495. But you want to raise the height of it? I should take the two top floors, and the floor-space which I lost there I should gain in the basement.
2496. Then you would lose the area of one floor? Yes.
2497. Then you would not have room enough for the two Departments? No; I should want to put another floor in.
2498. Could you raise the top of the roof above your design without any great harm? Yes; but it is quite high enough—120 feet to the parapet. One might gain a little height in the roof behind the parapet.
2499. If you had skylights, for instance, in the centre portion of the roof, that would give an appearance of height to it? Yes; but in putting in skylights in this climate it is absolutely necessary to put in a second light, because the intense heat of the sun would ruin the specimens. Therefore, although the inner light could be a skylight, the outside light must be a horizontal light.
2500. *Chairman.*] You say that if you put an addition on to the present Lands Office, it would always have the appearance of an addition? I am afraid it would.
2501. You see the plan there; do you think that would look more like an addition than the two different styles of treatment of the buildings as proposed? The treatment of the existing floor works in with the addition, because, as Mr. Kirkpatrick said yesterday, it is a copy of it. I do not like the idea of a rank copy of one floor for another, for it shows poverty of design; but it could not be out of character with the building, though it might alter the proportions.
2502. But in the first and second floors, you have exactly the same treatment? Very much the same.
2503. Therefore, if you put two other floors on, with exactly the same treatment, it will not show too much sameness of design, will it? Many people think that one of the weak points of this design is that of these two floors one is a copy of the other.
2504. *Mr. Levien.*] What is the highest building in America? The highest was in Chicago, but now the highest is in New York; it runs up about 240 feet, I think.
2505. The highest buildings in America are very good buildings architecturally, are they not? No; I do not think so.
2506. Too high to look at? Yes.
2507. Are any of them Government buildings? No; they are chiefly hotels and insurance offices.
2508. What is the height of the Government buildings there? It all depends upon the character of the building itself. The State House at Washington is not a lofty building for its size, because it covers a large amount of ground, and is only proportionately high for the class of building. I do not know any lofty Government buildings in America. I know a great many Court-houses and other State buildings in the United States.
2509. Are they of any great height? No. I do not know the Government offices in Washington.
2510. *Chairman.*] Have you examined the Public Instruction Department building? Yes; I went over it the other day.
2511. What was the result of your examination? An addition could not be made to that building which, however, could not be considered as an alternative to the scheme before the Committee, but only as a last resource, if you were driven to alter that building. I do not think that any additions to that building could rank as an alternative to the scheme before you.
2512. *Mr. Levien.*] Could it stand it in any way? One would not know where to begin. If we were driven to make any enlargement there, of course it could be done—unsatisfactorily—but it could be done.
2513. *Chairman.*] Then, providing that the Mines Department were found accommodation elsewhere, it is practicable to make the additions necessary for the proper working of the Education Department? I do not say "for the proper working of the Education Department"; but it is possible to cover in more space there in order to accommodate the officers. However, it would never be satisfactory.
2514. What was the latest addition to that building? I think it is a wooden structure at the back for store-rooms, and for the use of the cadets.
2515. Is there not a caretaker's cottage there? Yes.
2516. What was the cost of that? I could not tell you; it was erected a long time ago. Unfortunately the lower portion of the Education Department building is below the level of the ground, and no amount of alterations will do away with that unless the floor is abandoned altogether, and one built over it. The conclusion I came to was that additions to the Public Instruction Department should not be regarded as an alternative; but might be used as a last resource.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

2517. *Chairman.*] Have you a plan of the offices occupied by your Department? Yes; I have a plan here showing the disposition of the accommodation of the existing building. C. E. Rennie.  
12 April, 1899.
2518. Will you describe to the Committee the various rooms, giving the area of the rooms, and how they are occupied? I have not all the details of the area of the rooms. I can give you a statement of that in schedule form. I can now tell you how the rooms are occupied.
2519. Can you tell us the number of officers to each room? I can tell most of them. I have not got all of them in detail. I can describe in succession the different floors, and how they are occupied. Beginning at the basement, the Accountant occupies four rooms; Forestry Branch, one room; Mines Department, two rooms; Lithographic Branch of the Survey Department, seven rooms—mostly for storing lithographic stones, and also for the printing machinery; then there is one room occupied by the boiler-heating apparatus for heating the rooms of the building, and the messenger occupies for his dwelling five rooms; the corridor-cleaners.

C. E. Rennie. cleaners have one room, and the Inquiry Branch (Information Bureau) occupies six rooms; then there are two inner rooms occupied by the gas-engine and the accumulator in connection with the lifts. Then, on 12 April, 1899. the ground-floor, we have the Miscellaneous Branch, occupying one large room; the Chief Clerk, one room; the Minister, two rooms; the Under Secretary, two rooms; the Conditional Sales Branch, one large room; Ministerial Branch, one large room; a small room used for post; another large room for the Conditional Purchase Branch; another room for the Alienation Branch; another room for the Conditional Lease Branch; a room for messengers; a room for the Inspector of District Offices; a room for the Rabbit Branch; another room for Conditional Sales Branch; then there is a Board-room for the Metropolitan Land Board; a room occupied by Mr. Saunders, the Chief Inspector; another room occupied by the head of the Lease Branch, Mr. De Low; another room occupied by the Occupation Branch; another by Mr. Curry, the Chief Inspector; and another by the head of the Conditional Sales Division; room occupied by contract writers, waiting-room for the public, ministerial store-room, and alienation store-room; then the centre is occupied by a large room used as a strong-room. Then the first floor is almost entirely occupied by the Mines Department. On the first floor we have seven rooms, the Chief Surveyor occupying two rooms—a large and a small room; a room for the Survey Correspondence clerks; two rooms for the Deeds Branch; a room for the Trigonometrical Branch; and half of a strong-room. Then, on the second floor, with the exception of two rooms which are occupied by the Geological Branch and the Government Geologist, we have the whole of the accommodation occupied by draftsmen. Then above that we have the dome rooms, occupied as follows:—By contract draftsmen, one room; the Government Surveyor, metropolitan district, has another room; the plan-mounting Branch, another; the heliographic apparatus and store, another; and above that, again, there is a room occupied by the Trigonometrical Branch, Surveyor-in-charge. He is there only occasionally. Then, going back to the first floor, there are rooms occupied by the Mines Department, as follows:—Charting Branch, one large room; Public Watering Places and Artesian Bores Branch occupies two rooms; Chief Inspector of Mines and Agriculture and the Forestry Branch occupy one large room between them; Curator and Mineralogist and Lease Branch occupy another large room, with a partition between them; the Under Secretary, two rooms; the Minister, two rooms; the Chief Clerk, one room; Records and Correspondence, another large room; Chief Clerk of Branches, one room; Coal-fields Branch and Stores, another room; Records and Messengers, another room, with partitions; and there are two rooms for the Accountant, two rooms for Agriculture, and one room occupied by the Chief Inspector of Mines and Diamond Drill Branch; and then half the strong-room.\*

2520. Has the Mines Department part of that strong-room now? I am not quite sure; but I think they have lately left it. It was set apart for them originally. Then, on the higher floor, eastern galleries, the Mines Department has one large room divided between the Plan-mounting Branch and the Department of Agriculture Library. That is how the rooms are occupied. I could exactly work up a schedule giving the size of each room if the Committee would like it.

2521. Will you send into the Committee a statement giving details of the superficial area of the rooms, and also the number of officials working in them, together with the class of work they do? Yes. [*Vide Appendix.*]

2522. I suppose you are pretty well acquainted with the whole of the office work in connection with the Lands Department? Fairly. I do not know so much about the clerical part of it.

2523. Your duties carry you into pretty well the whole of the rooms? The greater part of them. There are some I do not know much about.

2524. Does there appear to you to be any undue cramping? Yes; there is in several of the rooms. The Occupation Branch, for instance, is very much crowded, and so is the Miscellaneous Branch. Both of those are overcrowded, and the Deeds Branch is quite as full as it should be—in fact, it is rather crowded. Some of the other rooms I have not been in at all, and therefore cannot speak in regard to them.

2525. How many of the rooms at present in occupation of the Mines Department does your Department require? Eight we shall want.

2526. How many will that leave in the building for disposal to some other Department? On that floor it will leave eleven, without the strong room.

2527. Will you require that strong-room? I think not.

2528. So that there would be eleven rooms and the strong-room at the disposal of some other Department? Yes; that is what we determined upon before.

2529. And the whole floor above that? Those are the whole of the rooms we can afford to spare; that is what we decided before. It was gone through very carefully, and we came to the conclusion that those were the rooms we could spare for anybody else coming in.

2530. Would it be possible, by a better arrangement of the office accommodation, for you to do without some of those extra rooms which you say are required; take, for instance, the Roads Branch;—would it be possible to put Mr. Stopps into the room with the clerks of whom he is the head? That could be done, but it would not suit; because Mr. Stopps has a great deal of interviewing with the public on questions which could not be dealt with in an open room. There are reasons why he should have a room to himself.

2531. Could that not be done by putting up a glass partition? That could be done; but the room is a lofty one, and it would require a very large partition to secure it.

2532. Have you been in the chart-room of the Department lately? No; but we have had big partitions put up in some of the other rooms.

2533. Glass partitions? No; cedar.

2534. Is it not advisable for the head of the Department to supervise those under him? Yes; it is far better, speaking generally, for the head of a Branch to be in the same room as those under him; but in this Branch the officer really in charge of the men is with them—Mr. Winder, who really has charge of the discipline of the room. Mr. Stopps is mainly occupied in the Administrative Branch, and has a great deal of interviewing, and for that reason it is advisable that he should have a room to himself.

2535. Leaving that aspect of the case out, do you not think it would be possible to accommodate him in a portion of that large room? There would be room for him there at present.

2536. Are there any other Departments that you could, by economising space in that way, do the same with? I do not think so.

2537.

\* NOTE (on revision):—It is found on further inquiry that this half of the strong-room is required by the Lands Department.

2537. Are not a number of other rooms occupied each by a single officer having a very large floor space? I can only speak for my own floor in that respect. On the Lease floor there are several officers occupying individual rooms. There is no room for them in their particular Branches, I believe; but I am not so familiar with that floor that I can speak positively. For instance, in the Miscellaneous branch, the head of the branch could not stay there, because it is packed full of clerks, and there is no room for anybody else; and the Occupation Branch the same. Each of those branches has a man in charge—a man next to the head of the division. He is a special head, and has charge of the branch, and is responsible for the discipline.
2538. Do you know whether it was absolutely necessary to turn the Mines Department out of the strong-room? I had nothing to do with it, and do not know anything about it.
2539. Do you know the nature of the papers that have lately been put in? No.
2540. *Dr. Garran.*] Am I to understand that if the Mines Department were to vacate the building altogether, and you then took possession of the rooms you really want, there would only be eleven rooms left? That is so.
2541. Have you any of your Departments renting offices outside? Not that I know of. You say those would be the only rooms left; but there are one or two rooms on the roof. There is a photographic gallery, for instance, on the western roof; that is vacant, but it is too hot for anybody to work in. The same may be said of those rooms now occupied under the dome. They are certainly occupied, but they are very hot and very awkward. It would be a great advantage to us to have the men there brought down on to the lower floor.
2542. Where do you do your photographing now? At the Government Printing Office.
2543. Then there was never any need for this photographic gallery? It was the intention, when that building was put up, to do the work there, but it never was done there.
2544. Has the dome ever been used for surveying purposes? No; not for surveying operations.
2545. What is it used for? It is used by the contract draftsmen, Surveyor of the Metropolitan District, and plan-mounting draftsmen.
2546. We understand that that was a very expensive structure, and yet neither the dome nor the photographic gallery has been used for the special purpose for which it was built? So far as I know, they have not.
2547. In the tower, are there any empty rooms? There are two or three small rooms in the tower.
2548. Are they occupied by anybody? One of the lower rooms is used to store documents in, but at present there is not sufficient light.
2549. They are good for store-rooms? Yes; they are good to store things in.
2550. You could use the dome, I suppose, for a store-room? Yes. Of course, there is always a risk of fire, when you have things stored in a place like that.
2551. But we are told that the dome is fire-proof? Outside it is.
2552. Has not the Lands Office been in sole possession of that building once—before the Mines Department came in? I was away in the country at the time the building was finished, and I cannot say. Part of the building was finished some time before the other part, and at that time the Lands Department was in entire occupation. But that was only about half the present size. I think that immediately the building was finished, or very soon afterwards, the Mines Department came in; but I cannot say for certain, because I was away in the country when the building was finished.
2553. What I want to get at is, whether the Lands Department ever had the run of the whole building? I cannot answer that question.
2554. According to your account, there is more room than the Lands Department really wants? Yes; there is no doubt about that.
2555. Those thirteen rooms you spoke of would all be on the top floor, I suppose? They are on the first floor.
2556. You fill up the top floor, then, with your draftsmen? Yes, it is occupied entirely by the draftsmen, excepting the two rooms occupied by the Government Geologist and the Geological Branch, and we want them moved out, so that we may have the whole floor for draftsmen, and have them all under supervision on the one floor.
2557. *Chairman.*] Is your Department—I mean the Department in Sydney as a whole—likely to expand in the future or to contract;—are you likely to require more clerks and more room in Sydney in future? I believe they are anticipating that they will want a dozen or more clerks in connection with the Rabbit Branch if the new Rabbit Bill be passed. Speaking generally, the tendency has been to increase rather than otherwise.
2558. *Dr. Garran.*] That Rabbit Branch would want two rooms out of those thirteen? They are provided for outside that; it has been allowed for.
2559. *Chairman.*] And then there is the new banking department, is there not—the Advances to Settlers Act will necessitate some room being required? Probably. You can never, of course, tell what fresh developments may take place. Speaking about our own particular branch—the Drafting Branch—there is a probability of its being enlarged in connection with the land-tax work.
2560. But they are putting some additions to the Customs House building? Yes; but independently of that there will be a larger demand for maps probably, and more elaborate maps than we have published hitherto, in which case we may require to enlarge our operations in providing more maps. A large part of our work in Sydney is the preparation, compilation, and publication of maps.
2561. *Mr. Shepherd.*] I may ask you what average space you allow for each of the clerks in your Department? A draftsman, we reckon, should have about 88 square feet.
2562. As a rule, a draftsman, I suppose, requires more space than an ordinary clerk? Yes, he does.
2563. Do you ever employ more than one draftsman on one plan when it is a very large one? It is the exception. As a rule, there is not more than one draftsman employed at the same time on the same map.
2564. You say that you have not the measurement of your rooms? Not of the whole of them. I have the measurement of a few of them, but have not got all the measurement complete. However, I can easily make out a schedule for the Committee, giving particulars of every one.

FRIDAY, 14 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. |  
 The Hon. ANDREW GARRAN, LL.D. |  
 The Hon. WILLIAM JOSEPH TRICKETT. |

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

John Kirkpatrick, Architect, sworn, and further examined:—

J.  
 Kirkpatrick.  
 14 April, 1899.

2565. *Chairman.*] In going through your evidence, and also the evidence given by Mr. Vernon, I see you both agree on a price—1s. 6d. per cubic foot—for the additions that have been suggested for the Lands Office, but when we come to the total cost, there is a great discrepancy between you; you make it £30,000 and odd pounds, and Mr. Vernon makes it £46,000 and odd pounds;—can you explain how that difference occurs? The only explanation I have to give is that Mr. Vernon must have made a mistake in his figures.

2566. But Mr. Vernon thinks you have made a mistake? I have just had a look at the evidence which Mr. Vernon gave some time ago—not this week. He makes the measurement 19,642 superficial feet, and in his evidence given some time ago, he puts that 19,642 superficial feet at 47s. per superficial foot, whereas I put mine at 30s. a superficial foot; yet he agrees with me on 1s. 6d. a cubic foot. 1s. 6d. a cubic foot amounts to 30s. a superficial foot 20 feet high; but Mr. Vernon now says that he has taken 23 feet high. However, 47s. a superficial foot is simply absurd. If Mr. Vernon agrees with me as regards 1s. 6d. a cubic foot, he cannot make it amount to 47s. a superficial foot, even at 23 feet high. A quantity surveyor could take out all these measurements for you in a very short space of time, and then, independently of Mr. Vernon and myself, you would have an estimate you could work on. When I put down 1s. 6d. a cubic foot, I was told by one of our best estimators that I had allowed too much per cubic foot, and that I ought to have allowed about 1s. 3d. only, which would have covered it, because we have the roof and foundations. We have no foundations to put in, and we have only to cut the roof away a little. If the contract were given to me for £30,000 I should like to sign it, and put up a cheque for £1,000 to carry the contract out. I am sure that I could get contractors to guarantee to carry out the work for that amount.

2567. *Mr. Trickett.*] Mr. Vernon also said that you had calculated your superficial area inside, and had excluded the construction of the walls;—would that account for the great difference between you? It is absolutely correct that I have not included the walls. How Mr. Vernon discovered that he will know himself.

2568. *Mr. Watson.*] He said he discovered it in looking round to see what possible measurements would have made up the 20,000 feet? It was not discovered in that way, and that is the reason why I just now made that little incidental remark. The 20,000 feet does not include the walls; but the 1s. 6d. does include the walls.

2569. Mr. Vernon gave that as one reason why his estimate of cost so far exceeded yours, although having the same basis per cubic foot? That would not be the way. The reason is, that there is a mistake in the superficial area; but 47s. is wrong, even at 23 feet high. If I take the inside measurements at 20,000 superficial feet, and if for outside purposes I add one-fifth to 20,000 feet, although I do not require to do so really, because the 1s. 6d. per cubic foot is too much to start with, or if Mr. Vernon adds one-fifth to 19,000 feet, it will only make 4,000 feet more. Well, 4,000 feet would mean £6,000; it will not make £17,000. According to the general rule of calculations, you add one-fifth for the walls. But the walls in this case will not be one-fifth more; they will only be a little over one-third more, because of the enormous size of the rooms. But taking it at the maximum of one-eighth more, Mr. Vernon cannot even then make up the £17,000.

2570. *Chairman.*] You say the usual practice is to take the sizes of the different rooms, add them together, and then to allow one-fifth more for walls and waste? Yes.

2571. That is for an ordinary dwelling? Yes; for an ordinary first-class dwelling.

2572. How much would it be fair to add for a building of this sort? In this particular case I would add only one-third for the walls.

2573. If you add one-third for the walls, that will make it more still? I meant to add one-third to one-fifth, thus making one-eighth. The main outside wall, and also the inside wall, are intended to go up; but all the large divisional walls are in there now. The large room on the top floor will be repeated. I did not intend to take the walls any more than Mr. Vernon intended to do so.

2574. You proposed to do what Mr. Vernon proposes to do on the work that is before the Committee—that is, to put up structural walls, and leave the partitions to be put in afterwards? Yes—carrying up, of course, the main chimneys.

2575. Mr. Vernon says it is practically the building of one floor only with a roof to it, at a cost of 47s.;—would the cost of a new roof entirely make that difference? No, it would not. Even if there were a new roof entirely, the cost would not come to 47s.

2576. If Mr. Vernon in his estimate provides for one floor only, and a new roof entirely, would that account for the difference between 47s. and your estimate of 30s., you saying you could use the greater part of the present roof? Of course, if Mr. Vernon has included in the 47s. a new roof, that would increase the cost per foot superficial beyond 30s.; but in my estimate there is no need for a new roof, any more than there was for a new roof for the Government Printing Office. They did not put up a new roof there, and they even used the old slates, with the exception of a few which were broken, and which had to be replaced. I think 30s. is over and above what would do the work, and the only question is whether 20,000 superficial feet or 19,000 superficial feet is correct. Last evening I went carefully over these figures of mine, and I will vouch for their being absolutely correct; and my figures have been overlooked by a quantity surveyor as well, and Mr. Vernon agrees generally that my figures are correct.

2577.

2577. *Mr. Trickett.*] Mr. Vernon in reply to Mr. Watson said :—

But in calculating, a difference has arisen between Mr. Kirkpatrick's estimate of £30,749 and my estimate of £46,880, and I can account for it in two ways :—In the first place, taking the heights, I calculated for an additional height of 23 feet for the room, and for a portion of the roof, as we generally do in matters of cubing. The second reason that presents itself to my mind is this, and I feel quite certain it is the case, that Mr. Kirkpatrick has given you the superficial contents of the floors for office purposes, and has multiplied that by his height, but has forgotten to take the area of the outside walls as well. He has taken the one dimension of 20,000 feet, and has multiplied that by twenty which comes to 411,260 feet, and if that is calculated out at 1s. 6d. per foot I get a result of £30,800 as against his estimate of £30,749, a difference of only £51. So it is perfectly evident that instead of taking the whole area of the building, he has taken only the whole area of the floors inside the building, and measured that by the height, instead of the outside walls by the height. To my mind that explains the difference between us. Those two mathematically do explain it.

J.  
Kirkpatrick.  
14 April, 1899.

Do you think that the omission of the outside walls, which you admit, would account for the difference of about £15,000? No; I do not.

2578. Nor anything like it? Nor anything like it.

2579. *Mr. Watson.*] You made your estimate at 20 feet high, did you not? Yes.

2580. Twenty feet in stone? No.

2581. The height of the office space was to be 14 feet? Yes, and allowing 6 feet additional for roof.

2582. Although your wall was 20 feet? No.

2583. You raised the height of the building 20 feet, allowing for everything? Yes; when we take a cube, we go half-way into the roof—the shape of the roof gives you an apex. We measure from the foundation half-way into the roof, and I have taken 14 feet for the rooms and 6 feet for the roof.

2584. You say you take 20 feet as your basis with a 14-foot floor? Yes.

2585. If Mr. Vernon took 3 feet more as his basis, and in addition to that counted the walls in, that would give a much greater cubic area? It would give a larger cubic area, but not such a large one as to affect the estimate to such an extent.

2586. If you multiply your superficial floor space by 23 feet, and in the superficial area add the width of the walls, are you certain that that will not come very nearly to the estimate put forward by Mr. Vernon? I cannot make it do so. I have tried to see if I had made any error.

2587. His floor space is 16 feet instead of 14 feet, and this total additional height is 23 feet instead of 20 feet, and I was wondering whether those two items would account for the difference in the cost—the additional height of 3 feet, and the addition of walls in the superficial area? No. If the first examination of Mr. Vernon is carefully looked at, you will see his basis. He said 19,000 superficial feet.

2588. But the question of superficial feet is not affected by the height of his storey, is it? No.

2589. It is a fixed quantity, whether you have a storey 15 or 20 feet high? Yes.

2590. And it is a fixed quantity practically if you allow for the wall space? Yes.

2591. So it is possible to have 19,000 feet, and still have 23 feet additional height put on to the building? But I am taking 20,000 to his 19,000, and 3 feet would not make the difference in the cubical contents.

2592. *Chairman.*] But would it make a difference in the price;—supposing you had walls going up 18 feet instead of 14 feet, would you keep to your basis? Yes.

2593. Supposing you were to make the wall 18 feet, would you not reduce your 1s. 6d.? In this case it would be a fractional part reduced. Mr. Vernon does not say where he got the 19,642 feet from. I can explain exactly how I got my 20,000 feet;—you can get at that in a few minutes; but I do not know where he gets his 19,642 feet from.

2594. *Dr. Garran.*] The cost of the extra height would be simply the cost of the walls with the plaster? Yes.

2595. The roof the same, the floors the same, and the ceiling the same? Yes; everything the same. There is only that little bit of extra height in the walls, and that could not make up the difference. All these rooms have certain dimensions according to this scale, and if anyone will take the inside dimensions and work them out, you will find that you will get exactly what I have put down—namely, 20,563 feet—and even those dimensions include some of the internal walls; they include all the chimneys.

2596. *Mr. Trickett.*] Do I understand that for £30,749 you can put a storey on, inclusive of outside walls? Yes.

2597. That will be the whole cost? Yes.

2598. *Chairman.*] Although your measurements are taken for the inside of the walls, and Mr. Vernon's include the outside walls, you come to about the same figures, and you explain it in this way: that although you have taken the inside as your basis, you have made the allowance that is laid down by the best authorities—that is, in calculating the cost at £30,000 and odd pounds you allowed one-fifth extra, according to the recognised formula? Yes; according to Professor Kerr of London University; and one-fifth is ample to allow for walls and waste, as it is called.

2599. Then, what you have done is the practice? Yes, it is exactly the practice; there is no other way.

2600. *Mr. Trickett.*] Is your addition to cost £30,000 with one-fifth added—that is, £36,000? No. I am prepared to stand by my estimate of £30,000. The other day I was asked about cutting out the domes, and while I was here I thought that I would add £3,000 more for that: but really I do not want £3,000 to be added. I should like to undertake the work to-morrow morning for my estimate of £30,000.

2601. Is this formula which you quote all at 1s. 6d. a cubic foot? No. Some of the houses that are mentioned there are mansions, whilst others are more ordinary houses, and they are put down at 89s. a square, and that means 100 superficial feet. But we are estimating on the foot now. One of the main points where the discrepancy comes in is in Mr. Vernon putting down 47s. a superficial feet, although he agrees with me on 1s. 6d. a cubic foot. He cannot possibly work it out at 47s. per superficial foot, even at 23 feet high. At 20 feet high mine works out at 1s. 6d.

2602. You are both agreed as to 1s. 6d. per cubic foot? Yes.

2603. And as to the internal measurement coming in round numbers to 20,000 superficial feet? Yes; I understand we are both agreed there.

2604. *Chairman.*] Had you taken Mr. Vernon's method, and included the external walls, your basis would have been 1s. 3d. instead of 1s. 6d.? Yes, and then I add for the walls one-fifth on to the 20,000 feet. That is the proper way to do it. It is the orthodox way of taking out the areas. The 19,624 feet of actual office space which Mr. Vernon says he gets is absolutely incorrect. He says he does not include the corridors, and he says he gets a portion of the domes. I say that is absolutely wrong. I have had my figures checked by two different men, the plans have been very carefully scaled right throughout, and

- J. Kirkpatrick.  
14 April, 1899.
- I include everything—the whole of the areas internally, and some of the walls at 20,000 superficial feet, the whole of the floor space, including the domes—and that 20,000 feet includes 4,300 feet of corridors. Now, take 4,300 feet of corridors away from 20,000 feet, and you do not get 19,000 feet of office space. My 20,000 feet also takes in the whole of that area of the strong-room—the staircases, and the latrines.
2605. *Mr. Watson.*] But Mr. Vernon proposes to take that out? But how can he get 19,000 feet actual office space when I take all these.
2606. *Mr. Dick.*] Does Mr. Vernon base his estimate only on the office space, or on the whole space? I want to show you that he says he gets 19,642 superficial feet.
2607. But that is not the basis on which he calculates his estimate? Well, he does not give any details of space.
2608. But he tells us how he gets it by saying he includes the whole areas of outside walls? Well, he might have given the areas. But it does not matter how he does it, for he is absolutely wrong. If Mr. Vernon says that he has 19,643 superficial feet of actual office space, I say that he is wrong by 4,000 feet.
2609. *Mr. Watson.*] A few moments ago I asked you whether it would not probably account for the difference between your estimate and that of Mr. Vernon, if you added in the additional cost of the extra 3 feet in height, multiplied by the superficial area of the walls; your original estimate was £30,700 and odd pounds; then one-fifth extra for walls at 4,000 feet at 1s. 6d. would be £6,800? Yes.
2610. Then the 3 feet of additional height by 20,000 superficial would make an additional £4,500, bringing up the total to slightly over £42,000; then you said there was additional cost for altering the dome—£3,000 or £4,000—and, assuming it to be £4,000, that would make £46,000; and so, if those figures are correct, they nearly account for the whole difference between yourself and Mr. Vernon, the small fraction not accounted for being accounted for by the fact that he proposes to put in strong-room accommodation instead of ordinary office space, which might mean a little extra expense;—is not that so? No; you are basing your estimate on 20,000 feet.
2611. I am taking your own figures? Yes; but you should take Mr. Vernon's figures.
2612. In this instance I want to take your own figures, and see how far they bear out the contention that the work could be done for £30,000;—is it not a fact that the 20,000 feet is exclusive of the wall-space, and it is multiplied by 20 feet in height? Yes.
2613. Well, that makes £30,700, exclusive of wall-space, and for only 20 feet in height? It does not exclude the cost of the walls.
2614. It excludes the space occupied by the walls? Yes.
2615. If you allow one-fifth extra for that, it, at 1s. 6d. per cubic foot, makes £6,800 and odd pounds? Yes.
2616. You have to add that to the £30,000, and then it is only fair to multiply the 20,000 feet by the additional 3 feet in height—supposing we were to decide it would be better to take it up that height; therefore, at 1s. 6d., £4,500 has to be added, and that makes a total of £42,099; and then adding between £3,000 and £4,000 for altering the domes, practically brings the cost up to £46,000? Of course we can all make up a good account, but it does not follow that we are making up a correct estimate.
2617. Will those things not account for the difference? No; we have no evidence to show what height Mr. Vernon was going to build his place.
2618. Well, assuming he said it would be 23 feet? Well, I should like to know how he came to 47s. per foot superficial.
2619. Is that not dependent on the height he is going to make the building? Yes.
2620. If you went 100 feet high, and 100 feet superficial, it would probably cost more than if you went only 10 feet high and 100 feet superficial? Yes.
2621. So the superficial cost is dependent on the height? Yes.
2622. And assuming you took 23 feet instead of 20 feet, it would, with the wall space, largely account for the difference between the two estimates;—is that not so? Yes, if you can assume all that; but we have to assume it all.
2623. *Mr. Dick.*] What is the amount of floor space you took for your estimate? I took 20,000 feet.
2624. How much per foot? 30s.
2625. *Dr. Garrahan.*] To go to another subject than the one we have been discussing, you will remember that in your evidence you said that, if there was to be a museum in connection with the Lands Office, you would rather have it at the top of building than lower down? Yes.
2626. Well, Mr. Vernon, in his evidence, says that if this idea were carried out of having another storey and a Mansard, the Mansard would not be high enough for the museum—that you cannot have a stumpy, squat room for a museum;—how would you get over that difficulty? I do not know that there is any exact regulation for the height of the museum. It is to be a fair museum, but not such an one as a large general museum. It is not to be treated as a matter of great architectural eminence. You merely want a useful place. If it is to be 14 feet, there is a good slope to the roof, and I think we could add 3 or 4 feet to the slope, and that would be sufficient.
2627. Mr. Vernon seemed to be of the opinion that he would want the space of the two floors for the museum, and that would be simply putting a double top on for the one purpose, and that would be a great waste of room? Quite so.
2628. Could you raise the Mansard high enough? The Mansard, I think, would act very well at that height for the kind of museum proposed.
2629. You would not fear for the temperature of a Mansard roof? No; not in the way I purpose it being constructed. I should have a space like a hollow wall; I should have cavity sides; I would have two thicknesses of concrete, and leave a space to ventilate the place.
2630. And make a sidelight? You could have all side-lights.
2631. You see no difficulty in putting in a Mansard roof? I see none whatever—that is, for a museum such as I understand you want—for mineralogical, timber, and agricultural specimens.
2632. In your designing of a Mansard roof, you did not contemplate a museum at first? No; what I did with the design was merely to suggest the carrying up of a storey and a Mansard.
2633. You were looking simply at the elevations? More at the elevation. If that will suit we can make a very good museum.
2634. You see no architectural difficulty in adapting the Mansard roof to a museum? No.
2635. You said the lifts would have to be altered? Yes.
2636. Would they have to be entirely reconstructed, or could you add to the length of them? We could add to the length; but I would reconstruct the lifts.
- 2637.

2637. What kinds of lifts are they at present? Hydraulic lifts. They are worked by their own pumping, and their own accumulators—not direct acting. It is a very expensive gear which is in use there, and that could be sold, and the lifts could be connected with the Sydney Hydraulic Power Co.
2638. Would you recommend entirely new lifts? Yes. It would be an improvement to the building, too.
2639. What would be the expense of adding entirely new lifts? It ought to be done for £1,000.
2640. That would add to the cost? No; I included all that.
2641. *Mr. Levien.*] Would the top floor you intended to add give the same space as the second floor? Yes.
2642. *Mr. Watson.*] Supposing the domes were taken away and walls put round, there would be 19,000 feet of office space available? No; that is not correct.
2643. That has been calculated by the Chief Draftsman of the Lands Office, not by Mr. Vernon? I do not care who has done it.
2644. *Chairman.*] On the basement we find all the office space, including messenger's dwelling, &c., is given as 13,637 feet; on the ground floor, 16,070 feet; and on the first floor, including the domes, 19,500 feet? Yes.
2645. *Mr. Trickett.*] You had to do with the alterations of the Sydney Hospital, had you not? Yes.
2646. You gave an estimate, I think, of what the proposed alterations would cost? Yes.
2647. How did that come out in actual practice? We came out, when we finished the whole thing, £1,100 over my estimate.
2648. I think your estimate was £56,000? Yes; and then the contractor went on, and we finished the whole of the building for exactly £1,100 over my estimate. I may say that I also gave the Mutual Life of New York an estimate for their building. I gave an estimate of £75,000, and I finished and completed the building for £78,000, and that included a good many little additions.

J.  
Kirkpatrick.  
14 April, 1899.

TUESDAY, 25 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.		The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. ANDREW GARRAN, LL.D.		WILLIAM THOMAS DICK, Esq.
ROBERT HENRY LEVIEN, Esq.		

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Harry Chambers Kent, Architect, sworn, and examined:—

2649. *Chairman.*] You are an architect, practising in Sydney? Yes.
2650. You have been asked to prepare a statement as to the estimated cost of adding one floor to the present Lands Office building? Yes.
2651. Have you that statement ready? Yes; and also a statement as to accommodation. I estimate that the gross cubic contents of a storey to be added to the Lands Office would be 604,620 cubic feet, which, taken at 1s. 6d. per cubic foot, would work out £45,346.
2652. *Dr. Garran.*] For one storey in stone? Yes. I have taken that storey at a height in the clear of 16 feet, and then I have measured half-way up the roof.
2653. *Chairman.*] That makes, what? I get a height of 22 feet 6 inches, the roof measurements being taken from the Lands Office drawings, and that gives a cube of 604,620 cubic feet over walls and all. The superficial area, taking the present second floor of the Lands Office, would give 19,920 feet superficial in office accommodation, 3,816 in corridors and staircases, and 3,136 in walls, making a total of 26,872 superficial feet.
2654. *Dr. Garran.*] That 19,920 feet superficial is useful space? Yes.
2655. *Mr. Shepherd.*] That is available space for offices? Yes.
2656. *Dr. Garran.*] Corridor space includes lavatories? Lavatories are included with staircases and corridors.
2657. *Chairman.*] And the cost? The cost, worked out at 1s. 6d. a cubic foot, is £45,346—that is, if taken at 1s. 6d. a cubic foot. My own impression is that it would not cost quite so much as that. I think something might be saved on that.
2658. You think, then, that 1s. 6d. is an over-estimate rather than an under-estimate? Yes; for this reason: The areas are very large and unbroken. But, of course, against that, again, you have the difficulty of building on top of a high structure; but still even then my own impression is that £42,000 would be about the price.
2659. What height to the ceiling would that give? Sixteen feet clear in the room itself.
2660. Mr. Kirkpatrick allows 14 feet? Yes; but I do not think 14 feet is high enough for those rooms. I have compared partly with the Lands Office building as it exists, the plans of which I have had the advantage of seeing. In the last storey the present rooms are, I think, 18 feet.
2661. Would that cost be by utilising the old roof at all? The roof, including the principals, would be used again. That is partly where, I think, some of the saving would come in.
2662. Does that amount include the cost of a new roof? No; utilising the present roof. I do not know anything about the Mines Office portion of the roof, but I do know something about the Lands portion of it, for I had to do with the building of that, and in that the principals are iron, and could be taken to pieces and put together again.
2663. In estimating at 1s. 6d. a cubic foot, you go half-way up the roof to get the mean? Yes.
2664. Counting the cost in that way, would not the price include the cost of a new roof? It would, as a rule; but, in cutting down the price, I am allowing something for that.
2665. *Dr. Garran.*] You do not disturb the dome or tower? You would have to build round and readjust the dome; but I would not disturb the tower at all.
2666. *Chairman.*] What about the pavilions? As regards those two pavilions, I may say I have cut those right out, so as to get the full benefit of that space.

H. C. Kent.  
25 April, 1899.

2667.

- H. C. Kent. 2667. You would not recommend putting those on? I would not recommend repeating those pavilions.
- 25 April, 1899. 2668. Had you anything to do with the building of the present Lands Office? I was with Mr. John Young, the contractor, when he built that.
2669. *Mr. Trickett.*] Can you tell us the cubic area at 14 feet high for the rooms? Mr. Kirkpatrick allowed 14 feet for a room, and 6 feet for half the roof, making altogether 20 feet. At those figures it should work out at £40,308. If I may be allowed to criticise to this extent, in an explanatory way, I think that Mr. Kirkpatrick made this mistake: he calculated his net floor areas at about 20,500 feet, or something like that. If you take that at 20 feet high, and then at 1s. 6d., you get almost exactly the £30,750 he calculated upon. That looks as though he had taken his net office accommodation area in cubing, and not calculated his walls, corridors, stairs, &c. The presumption is that he had taken the net area and cubed it, and then thought he had allowed sufficient at 1s. 6d. But if you take the gross area of 26,872 feet superficial—and there can be no mistake about the calculation of that, because it is an easy calculation—and work that out at £30,000, I do not think it would be more than 1s. 2d., if that. The gross area over the whole building is 26,872 feet, and from that I have deducted the tower which is already built, and I have not included raising the strong-room which is already up the storey. So he must be mistaken in his gross area.
2670. Mr. Kirkpatrick, in a letter to the Committee, says:  
I have estimated for one additional storey with stone walls treated in a similar design, &c., as the present top or second floor, and calculated the superficial area, 20,000 feet, without the wall areas.  
? And without the corridors and stairs, too.
2671. Mr. Kirkpatrick goes on to say:  
I allowed one-fifth additional for walls and waste on my price, namely, 1s. 3d. per cubic foot, which makes the cubic foot price, including walls, 1s. 6d.  
? It would have been far easier to run the scale over the whole building and work it out.
2672. *Chairman.*] You have made your measurements by taking the whole of the floor space now on the second floor; but you do not include the tower, neither do you include in your estimate anything for the central strong-room? That is so. That makes 26,872 feet superficial.
2673. Mr. Vernon has worked out his calculations at 23 feet? Yes; and he brings the cost out at £46,880.
2674. You worked it out at 22 feet 6 inches? Yes; and I worked out the cost to £45,346, or at 23 feet, £46,353, which is, approximately, Mr. Vernon's estimate. That is at 1s. 6d. per cubic foot; but I think that the price of 1s. 6d. per cubic foot need not be quite reached.
2675. It could be done at 1s. 3d.? I think it could be done at £42,000.
2676. Mr. Kirkpatrick took as his basis 20 feet high? Yes; and the 2 ft. 6 in. difference would about make £5,000. Mr. Kirkpatrick says he has taken the superficial area of 20,563 feet, which at 20 feet high, and at 1s. 6d. a cube, would give almost exactly the price that he puts down for it—namely, £30,790 and odd pounds. Where I think he has made a slip is in taking the net area of available office space instead of the gross area, including walls, corridors, staircases, &c.
2677. *Mr. Levien.*] You think he has made a mistake? Yes, to that extent.
2678. It is a polite way of saying that he has made a professional mistake? I did not put it quite in that way. If you look at the figures, and take 20,563 feet and work it out in the way I have expressed, you will see my meaning, I think.
2679. *Chairman.*] Having measured and found that that office space comes to a little over 20,000 feet, Mr. Kirkpatrick must have omitted to calculate the corridors and the staircases? Yes; I am deducing it from his own evidence.
2680. Mr. Kirkpatrick explained that he had taken a different way of calculating from Mr. Vernon's; he said that he calculated the net area at 1s. 6d. per cubic foot, and that he allowed one-fifth for walls and waste, and that if he had taken the gross area—including walls and waste, corridors, and that kind of thing—he would have put it down at 1s. 3d.? It is quite right to say we generally allow one-fifth for walls and waste, but that does not appear in the £30,790 estimate.
2681. Can you include it in that calculation? Not unless you are going to add one-fifth to his estimate.
2682. Would the addition of this floor detract from the appearance of the present building? I do not think it would at all.
2683. Do you think it would improve it? Yes, I do.
2684. Have you made any calculations in reference to adding a Mansard roof? Yes; and I work out the cost at £58,000 for one storey and a Mansard roof, but I do not like the idea of having a Mansard roof on the top of that storey. That is only a rough estimate, and I should like to qualify it to this extent. That the cost of the Mansard roof would very much depend on the amount of packing and double walling that was done for cooling purposes.
2685. *Dr. Garran.*] I understand you to say that Mr. Vernon, estimating at 23 feet high, puts the cost at £46,880? That is so.
2686. You, estimating at 22 feet 6 inches, put the cost at £45,346? Yes.
2687. Mr. Kirkpatrick, estimating at 20 feet, puts the cost at £30,749? Yes; but is he supposed to add one-fifth for his walls on the top of that?
2688. He said he did? Well, I should like to point out that that one-fifth is not included in the calculation.
2689. It would make it more? Yes; it would make £6,000 more, at any rate.
2690. With the Mansard roof you estimate a cost of £58,000? Yes; that is a rough estimate. Mr. Vernon estimates it at £78,000, and Mr. Kirkpatrick at £50,000. I agree with Mr. Kirkpatrick—that is to say, fairly well—as to the price of the Mansard roof only.
2691. Have you counted on removing the domes? Yes, if you put a Mansard roof on.
2692. *Chairman.*] You were present at the construction of the present Lands Office? The first part of the Lands Office only.
2693. In your opinion, would the walls be strong enough to carry another floor? Yes.
2694. More than one? Easily another storey and a Mansard. I should say they would carry two whole storeys, at any rate, without any risk.
2695. *Dr. Garran.*] The foundation is on rock, I suppose? Yes, all on rock,—splendid rock too.
2696. The walls at the bottom are thick enough to carry anything in reason? Yes, anything in reason. The bottom of that building I can answer for absolutely. The foundation is a splendid one. 2697.

2697. *Chairman.*] Your estimate in reference to the Mansard roof is, I suppose, based on some experience? *H. C. Kent.*  
 Yes, on cubics, and an allowance for taking off the present roof, which of course, would have to be reconstructed. 25 April, 1899.
2698. *Dr. Garran.*] But Mr. Kirkpatrick, in estimating for the Mansard, provided for a copper outside and a concrete inside? If I built it I should build it with terra cotta lumber, which I think is the best thing for Mansard construction. The latest practice in England is to build Mansard roofs with iron ribs, and with terra cotta put in, and to batten on the outside for slates, and plaster on the inside. Sometimes the terra cotta may be used thicker to get an increased cavity, for in a terra cotta lumber wall you can have two or three cavities. The terra cotta forms air spaces. Terra cotta lumber is the most modern thing used at Home for Mansard roofing.
2699. And there is nothing that could catch fire? No; excepting the battens under the slates.
2700. Would it be more expensive than concrete and copper? It would certainly be cheaper than concrete and copper.
2701. And quite as cool, if not cooler? In my opinion it would be cooler.
2702. You assisted Mr. John Young to construct this dome, which is said to be so very hot, and yet we are told that it is concrete? The dome itself is not concrete. It is constructed with iron ribs, and, I think, wooden sheetings and muntz-metal.
2703. What is the reason the room is so hot? It is really a big muntz-metal oven.
2704. *Chairman.*] It is iron rafters and wooden sheetings? Yes. When that dome was built, it was built with this object: they wanted to have the possibility of putting a transit instrument into the small dome at the top. It is a revolving dome, and has an astronomical shutter, and the dome was raised sufficiently to get a horizon line over the top of the building in which we are now assembled. I know that was the intention in lifting and stilting that small astronomical dome to that height.
2705. *Dr. Garran.*] But if there is a dome at the Observatory, what is the need of a second one? I had nothing to do with the departmental part of the matter; I am only stating history.
2706. *Mr. Shepherd.*] What is your opinion as to the general effect that an addition of two storeys would have on that building? I think that one storey and a Mansard would dwarf the tower. It would stand one storey well without a Mansard.
2707. *Chairman.*] Then you are of opinion that one storey would improve the appearance of the building, but that a storey and a Mansard would not be desirable? Not architecturally.
2708. *Mr. Shepherd.*] You really, then, recommend only the one storey? Yes.
2709. *Chairman.*] Have you given your attention to the plans of the proposed new building? Very slightly indeed. I spent my time yesterday and to-day principally on the calculations, and have not spent much time in looking at the original proposal.
2710. Take the basement: it is proposed to put a museum there; have you had time to consider whether the light for that museum would be sufficient? I think that, with slight modifications, you would get sufficient light there.
2711. What would you suggest? The first thing is, that I should like to get rid of this high blank wall, which must stop a great deal of direct light. I think that might be dispensed with, and a slight contraction of the lavatory accommodation would help the light there; and that instead of going down to the basement, the basement might be kept to the Young-street level, and so raise the windows a little more above the street on the Phillip-street side. By doing away with the four steps at the corner of Young and Bridge Streets, and by keeping the floor to the Young-street level, you would gain in the height of these windows above Phillip-street, and I think more window space might be given there.
2712. *Dr. Garran.*] You would have to raise the walls 3 or 4 feet? No; 2 feet to 2 feet 6 inches would do that.
2713. *Chairman.*] Now there is a light area near the south-east corner? Yes, there is.
2714. Between the light area and the wall there is a vent shaft? Yes; I should like to take that vent-shaft away from that position, so as to give that light area the full benefit of the light.
2715. So that you would get a direct light on each floor? Yes, instead of a well light. By taking away that vent-shaft and putting it elsewhere you would get the whole of that area clear, and would get a direct light to each floor instead of a light coming down the shaft.
2716. *Mr. Levien.*] What would be the depth from the top of the shaft towards the bottom, so far as the light would go? From 105 to 110 feet, I should think.
2717. Then the shaft light might have to start from a height of 110 feet? Well, over 100 feet at any rate.
2718. *Mr. Dick.*] These are the measurements in the new building: 20 ft., 16 ft., 18 ft., 14 ft., 12 ft.? That is only for five floors instead of for seven; and if you put on another 16 and another 12, that will make 108 feet.
2719. *Chairman.*] If you get a direct light on each floor, that would give more light than the proposed shaft, would it not? Yes.
2720. More especially on the lower floors? Yes. If Mr. Vernon wants that vent shaft, there are other positions in which I think it could be placed without disadvantage.
2721. *Mr. Trickett.*] If that blank wall and balcony on the southern side were removed, the corridor leading to it could be transferred to the northern end of the room, and so diminish the quantity of balcony for access to the lavatories? Yes.
2722. *Dr. Garran.*] Could you not shift the western lavatory to where you are going to shift your corridor? You might be able to do so.
2723. *Chairman.*] Now, with reference to the width of the rooms? The main front rooms are, I think, 24 ft. and the back rooms 20 ft.—those are about the measurements.
2724. Will those dimensions lend themselves readily to subdivision? I do not know that they lend themselves badly to subdivision, provided you consider how you are going to occupy them. For heads of departments or Ministers, a 24-ft. room is not too wide—say 24 by 20, or by 18, would make a good Ministerial room; and if you are going to work a number of clerks in one room, 24 ft. is a good width for such a chamber; but it is entirely a matter of how you are going to arrange your office space. It is difficult to criticise in reference to widths of that kind, unless you know the purposes for which the building is actually designed.
2725. There will be two rooms for Ministers; all the other rooms will be occupied by clerks and heads of departments? But will they be occupied in large areas or in subdivided areas; that is really what it comes to.

- H. C. Kent. 2726. They will be obliged to use large areas if the width is 24 feet? Well, are not large areas better for supervision.
- 25 April, 1899. 2727. In your profession, in laying out offices, what is the general office width? It entirely depends on the purpose; a banking chamber might be any size.
2728. Well, for clerical work—not for banking purposes? Not for banking purposes—generally about 20 feet.
2729. *Dr. Garran.*] It is only for rooms, each for a single person, that 20 feet is excessive? Yes.
2730. The moment you come to put numbers in them, it is a good size? Yes, if properly lighted, of course.
2731. *Chairman.*] Can you give us an idea from these plans if these floors are properly lighted? I think the rooms seem fairly lighted everywhere, and the corridor would have light if you were to carry out the suggestion for the removal of the vent-shaft at the end. It seemed to me there would be a little deficiency of light in that corridor unless the vent-shaft were removed. But the rooms all seem fairly light, and I think the museum would be sufficiently light with the modifications I have suggested, and with further window space being made use of.
2732. *Dr. Garran.*] If the museum floor were raised the 3 feet you suggest, would that cost very much? The cost would not be very much. Of course, it is in the foundation work where the cost would come in.
2733. Would it be £2,000 more? I think about £3,000.
2734. Would 2 feet carry three steps? Yes. I should like all I have said to be taken as suggestive only, and not as dogmatic.
2735. *Mr. Dick.*] Taking the general design of the proposed building, would you favour the Committee with your opinion of it—I mean the exterior design, does it meet with your approval? I do not know that I should not like to suggest some things, but it is a good building.
2736. Do you think it will harmonise with the Public Works Office and the Lands Office, both of which will be adjacent to it? I think it is a little heavy at the top, but that might easily be modified. The pavilion finishings are heavy.
2737. *Mr. Levien.*] You have seen the plans of the proposed new offices;—considering the number of clerks that are to be employed in the building itself, would you erect a building like that? That depends on the instructions given to you; for any man would erect a building very largely according to instructions in reference to occupancy.
2738. *Chairman.*] Supposing you were left to yourself, and there were no instructions at all given, except to put the building up? If I were left to myself to design a building for any occupancy, I should consult the people who were going to occupy it in regard to every detail I could possibly get from them. When I am building a wool store, I go to see the men who are going to work the wool, and if I am building a solicitor's office, I try to find out all the requirements of the principals and subordinates.
2739. Then you would not recommend the practice of first putting up a building, and afterwards thinking of how to put the people in it? No, I would not. As a matter of practice, I think the architect cannot possess too many details in reference to the occupancy and the intentions of those who are to occupy the building.
2740. *Mr. Levien.*] Supposing you knew the purposes for which the building was being erected, after making all the necessary inquiries, would you, as an architect having a knowledge of offices, design a building like that? Do you mean as regards its facade or its arrangements.
2741. Both as to the facade and the arrangements? No one can tell you that unless he knows the purpose for which the building is going to be occupied, and how those are going to be placed who are going to occupy it. I know nothing as to who is going to occupy that building, or what it is for, except that I believe the Mines and some other Department are to share it.
2742. Well, taking that as a starting-point, you would first of all inquire what each floor was intended for? I would.
2743. Whether it was for a museum, how many clerks were to be occupied on each floor, what their line of occupation would be, and all the details that were necessary—you would make the fullest inquiry before you entered into the matter? That is my usual practice.
2744. Not alone your usual practice, but do you think it is the proper practice? I do think it is the proper practice.
2745. So you do not know whether that building is suitable for the purpose? I would not express an opinion upon it one way or the other.
2746. With all those new offices, if you had the details given to you, you might be able to make arrangements for them by making an addition to the present Lands Office? Yes, if I knew all the details.

John Kirkpatrick, Architect, sworn, and further examined:—

J. Kirkpatrick. 2747. *Chairman.*] You sent a letter to the Committee? Yes. I brought a copy of the letter, but my clerk had made some mistakes in it, which were subsequently corrected. I now produce a correct copy of the letter, which is as follows:—

25 April, 1899.

To the Chairman and Members of the Parliamentary Standing Committee on Public Works,—

Gentlemen, Sydney, 18th April, 1899.  
I beg herewith to submit to you my estimate for the proposed addition of one storey to the present Lands Office.

I have estimated for one additional storey with stone walls treated in a similar design, &c., as the present top or second floor, and calculated the superficial area, 20,000 feet, without the wall areas. I allowed one-fifth additional for walls and waste on my price, viz., 1s. 3d. a cubic foot, which makes the cubic foot price, including walls, 1s. 6d. The height of the storey, say 14 feet in the clear—of course I allow 6 feet—being a full allowance for one-half the height of the roof, calculated in my full cubic measurements to cost £30,749. This amount will cover all incidentals, &c.; and I am convinced that there would not be any extra works required to cause this sum to be added to.

Space could be arranged for a museum on the top floor facing Spring-street, which room I would extend the whole frontage of the building to that street, and the roof-light could be arranged facing south.

The

The domes I am sure should be taken down, and the space now occupied by them could be utilised to much greater advantage, and in my 20,000 feet super. calculation I have taken them into consideration. At present they are little better than useless, although in partial use. The roofs leak and are in continual disrepair, and the heat in summer is so great as to interfere with the work of those who appear to me to be temporarily engaged there; and their disappearance will cause no loss, but a practical gain in good and useful superficial area.

As I stated in my evidence, I thought of adding about three or four thousand pounds to do this additional work, which, in round numbers, would make my estimate about total £34,000.

If it is thought more space would be required, a Mansard roof could be added to the entire area of building, as shown in the sketch submitted by me, to the elevation in Spring-street, which would give about another 20,000 superficial feet, and I estimate the total cost at £54,000.

This area could be divided up into offices to suit the Mines Department or Lands, and a portion could be utilised as a museum, with the same arrangement for light as I have already stated, viz., a southern light.

The Mansard roof will in no way interfere with the proportions of the tower, as can be shown hereafter by a correct perspective drawing.

I have, &c.,

JNO. KIRKPATRICK.

J.  
Kirkpatrick.  
25 April, 1899.

When I say 20,000 feet, I do it in the rough. The measurement is really 20,500 feet; but for the purpose of simplifying matters, I brought it down to 20,000 feet, because I know that I not only have fully estimated, but have over-estimated—that is, I have in this letter allowed ample for everything.

2748. It has been suggested to the Committee that you probably had omitted in your estimate the cost of building under the dome in the centre;—it has been suggested that you probably omitted all that construction, which you will see in the centre of that block if you look at the plan of the Lands Office? No; I have not done so. I have included the domes; I have included the entire area in the 20,000 feet.

2749. Mr. Kent points out that we can get 20,000 feet of office space? I do not think you can get 20,000 feet of absolute office space.

2750. In your estimate, do you duplicate the second floor of the present Lands Office? I duplicate the second floor in the other floor we intend to put on. I give you a clear floor of absolute usefulness right round the entire area. I can account for the discrepancy between Mr. Vernon and myself.

2751. That is exactly what we want to get at? The other day, when I was giving my evidence here, I intimated it, but I did not practically describe it to you. Mr. Vernon, in his first evidence, describes the area of the proposed additional storey to be 19,624 feet. He puts down 47s. 6d. Now, if you take 47s. 6d. per superficial foot—that is to say, multiply 19,624 feet by 47s. 6d.—you will find it runs out to the exact figures I am going to quote from a letter written to me by Mr. Houghton, a civil engineer, and one of our best computers:

3rd.—Dealing with superficial feet area, say, for instance, 19,624 superficial feet at 47s. 6d. per foot, the total amounts to £46,607.

That shows you how Mr. Vernon got at his £47,000. He multiplied 19,624 feet by 47s. 6d., and that gives £46,607. In the evidence that he gave he did not state how high he was calculating the ceilings, and I pointed out when I gave my evidence that I could not arrive at how he got at 47s. 6d. per superficial foot. He stated that he was allowing for a building 23 feet high, and in his evidence he also pointed out that he quite agreed with me that 1s. 6d. per cubic foot was ample to cover the cost. Well, if he agrees to 1s. 6d. a cubic foot—which is what I have agreed to as well—that is inclusive of the walls, you have then to find out what it is per superficial foot at 23 feet high. These are Mr. Houghton's figures, which again bear out mine:

You have submitted to me for my correction the following figures, and I find that the totals given by you are correct. They are—1st, say, a building 23 feet high, taking into consideration the roof area —

That means half the roof —

as a portion of the 23 feet at 1s. 6d. per cubic foot, is equivalent to 34s. 6d. per superficial foot,

instead of what Mr. Vernon has put down—47s. 6d. per cubic foot.

2752. *Dr. Garran.*] Those are Mr. Houghton's figures? Yes, and mine too; and they ought to be Mr. Vernon's. If an architect states he has estimated at 1s. 6d. per cubic foot and 23 feet high, he should state what it is per superficial foot. Well, a superficial foot at 23 feet high and 1s. 6d. per cubic foot is 34s. 6d. per superficial foot. For instance, in my estimate I said 1s. 6d. per cubic foot for a storey 20 feet high equals 30s. a superficial foot. Let us see what Mr. Houghton has to say about that:

2nd.—While a similar building 20 feet high at the same value per cubic foot, viz., 1s. 6d., is equivalent to 30s. per superficial foot.

Then he goes on to say:

4th.—19,624 superficial feet, say at a height of 23 feet, at 1s. 6d. per cubic foot, equal to 34s. 6d. per superficial foot, amounts to £33,851.

and £33,851 ought to be Mr. Vernon's estimate for his own building according to his own figures. I tried to explain that, by the way, the other day when giving my estimate. After knowing my evidence, Mr. Vernon distinctly states in his second evidence that he has estimated a building at 23 feet, including the roof. Of course, that meant at 1s. 6d. a cubic foot. Well, he cannot possibly make out more than 34s. 6d. per superficial foot; therefore his estimate must be and should be 34s. 6d.

2753. *Chairman.*] In your estimate of 1s. 6d. per cubic foot, you have allowed for the use of the present roof? Yes.

2754. Now, Mr. Vernon in his evidence, at Question 1940, says that he practically puts on another roof:

It is practically the building of one floor only, with a roof to it, at a cost of 47s. per foot superficial of floor space, whilst the original building cost 27s. 6d. per foot superficial. In that instance we had one building with a number of storeys to construct, over which the roof would be proportionately spread.

Would that account for the difference? No; it could not account for the difference.

2755. In your estimate, you allow for the use of the materials in the present roof; in Mr. Vernon's estimate he provides for a completely new roof? In the first place it could not account for the difference, even if he provided for an entirely new roof, with new slates and new iron; but would it not be ridiculous to provide a new roof when you are carrying up the walls the same width—would it not be ridiculous to provide for a new roof when what you have will fit? All the principals will fit, and all the spaces between the principals; and I am confident, of course, that, even if he did provide for that, and it was carried out, either by day labour or by contract, he would use the same roof and the same iron principals. We are not going to alter the shape of the roof; but in regard to this one storey, we are both going to keep the same roof—we are simply going to lift the roof right up. There is a fine opportunity to do this, as you have a foot concrete of wall and a foot concrete of ceiling. But what I want

J.  
Kirkpatrick.  
25 April, 1899.

to particularly call your attention to is that I had to assume that this was so-and-so, and that the other was so-and-so, in trying to bring out the estimate at £46,000. If 19,624 feet, superficial feet, is correct—or, as I say, 20,000 superficial feet—and at 23 feet high, and if Mr. Vernon agrees to 1s. 6d. a cubic foot, he should not charge more than 34s. 6d. for every superficial foot, and you have to take the difference between that and 47s. 6d., and that accounts for the difference between Mr. Vernon's estimate and mine, for you have only to multiply 19,624 by Mr. Vernon's figures, and you get his estimate. 2756. But he says that the office floor space that would be gained would be 19,643 feet, and that is exclusive of corridors? But we know that is not so. We know that from a return of the offices. When you have a return of the offices in the Lands Department, you have a return for the first floor, inclusive of the domes.

2757. The actual offices in that top floor occupy a space of 19,884 feet? But in that they included the dome spaces. They do not say "dome spaces," but they include the dome spaces. They mark some "vacant" in the plan.

2758. No, they do not include those? Well, you cannot get 19,884 feet on the one floor without those spaces. It is absolutely impossible.

2759. Mr. Kent says you can get 20,563 feet? Well, if you can get that it will be of so much more advantage in putting another storey on the Lands Office. But if you want to put a storey on the Lands Office, and want to get 20,000 feet, you can do it for £30,000, as surely as I am standing here.

2760. *Mr. Trickett.*] For the purpose of arriving at the superficial area of this proposed new storey, Mr. Kent told us that he measured the extreme outside boundary of the whole building;—did you do that? I measured the extreme boundary of the internal walls of the whole building.

2761. Not the outside? Not the outside.

2762. Mr. Kent said he allowed for indentations on the whole outside area, and then he deducted from that the inner walls, lavatories, and spaces which will not be occupied by building—he absolutely taking the measurements of them;—did you do that? I did not measure the extreme outside.

2763. And you did not measure all the inside building? I measured every inside dimension.

2764. I want to find out if you went to work in the same way, and you do not seem to have done so, for you admit that you did not measure the whole of the exterior? Practically in the same way.

2765. I do not mean practically, but actually;—did you measure the whole of the exterior measurements of the top storey of the Lands Office? No, I did not. I measured the absolute interior from wall to wall.

2766. Therefore, if you measured on the inside you cannot have the exact details of what it would cost to do the outside? I added one-fifth for the walls—I should have said one-eighth.

2767. Surely there cannot be a hard and fast rule like that; the wall might be a plain wall like Goldsbrough Mort's, or it might be an ornate work full of bas-reliefs? Yes, there is a hard and fast rule in cubing a building.

2768. You add one-eighth, not in cost, but in space? It comes in in both ways. I allowed 1s. 3d. for ordinary space, and one-fifth extra for the walls.

2769. *Mr. Levien.*] With all that architectural display on the Treasury building opposite, and there being so many superficial feet inside, how much would you allow for all on the outside—the filigree work, and that kind of thing? In making a cube estimate at any time we base our cube price on the architectural display of the exterior, and what we intend to do. There are some buildings for which you might put down 2s. 6d. a cube foot, or even 3s. 6d.

2770. *Dr. Garran.*] You do not mean to say that a plain stone wall is going to cost as much as a highly ornate one? No.

2771. *Chairman.*] The way I understand the matter is this: You take the cubical contents of a building, and then you add from one-eighth to one-fifth in order to give you the cubical contents of the walls in estimating your cost? Yes.

2772. Then it is quite possible that a building—it might be a plain building—you would put down in your estimate at 1s. a foot? Yes, or 9d. or 6d.

2773. If there were a large amount of embellishment outside, you would raise the price accordingly? Yes.

2774. *Mr. Dick.*] Can you point out in the evidence where Mr. Vernon estimated at 1s. 6d. a cubic foot? Yes. In reply to Question 2398, he said:

When the evidence goes on as regards the cost, I also agree with Mr. Kirkpatrick that the cubic cost of that one storey is fairly put down at 1s. 6d.; in fact, in my evidence I previously stated 1s. 6d. myself, so that we actually agree upon that.

2775. *Mr. Levien.*] What do you think is a fair, reasonable estimate? To take the storey up, I am sure I could get a tender for £30,000.

2776. But how much per cubic foot? 1s. 3d., or, inclusive of the walls and everything else, 1s. 6d.

WEDNESDAY, 26 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESEY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Charles James Saunders, Inspector, Department of Lands, sworn, and examined:—

2777. *Chairman.*] What other position have you held in the Lands Department? I was the Chief Draftsman for about nine years. I have been associated with the Department about twenty-five years.

C. J.  
Saunders.

2778. You have opportunities of observing the work that is going on in the various rooms, have you not? Yes, ample opportunity. 26 April, 1899.

2779. The inquiry which we have now in regard to these public buildings has been brought about in this way: It is found that there is not sufficient room in the present Lands Office building to accommodate both the Mines and the Lands Departments;—what the Committee would like to know is whether you could not economise space a little by somewhat differently grouping the offices; have you gone into that question? I cannot say that I have thought very much of that. You might save a little space here and there, but I do not think you would save enough to be of material assistance.

2780. We will start on the basement;—you have been through the building lately? Yes, since the Under Secretary spoke to me. He said that you had mentioned the matter to him, and he asked me to have a look at the particular rooms you spoke of.

2781. On the basement there are quarters which are allotted to a messenger? Yes.

2782. Would they be fit for offices? I do not think so. I think they are too dark.

2783. The whole of them? Yes, except possibly No. 21, which was designed originally for a kitchen. There was an idea at one time—when the building was first constructed—that dinner for the officers would be cooked there, but it was never carried out.

2784. What about room No. 22—corridor-cleaners' room? That is a room that might be available for a couple of clerks. But the corridor-cleaners have to change their dress when they come in and before they go out of the Lands Office building, and they must have a retiring-room of some sort.

2785. Would you mind explaining to the Committee the necessity for a messenger to live there with his family, occupying all those five large rooms? A good deal of night work goes on in the Lands Department and also in the Mines Department, and there ought to be somebody there to turn out the gas, put out fires, or to see that water does not do any damage in the case of a sudden storm. Our roof is a very defective one—always has been—the drafting-rooms have been flooded on two or three occasions, and if the messenger had not been there at one time we should have lost very valuable plans, which could not have been replaced; the whole place was flooded.

2786. I suppose, if you had a properly-constructed roof, that would do away with the necessity of having somebody there always to watch for you? Yes, from that point of view; but when Parliament is sitting the Minister and the Under Secretary very often want to have access to the offices, and men are constantly working in the office at night.

2787. Do you not keep a constable there on watch all night? He is there; but I fancy he would not shut windows and doors and look after the different things the messenger has to look after.

2788. Do you think it is necessary to have a messenger living there, and occupying all those rooms, for that purpose;—would it not be possible for the messenger also to come back if the Minister or any officer found it necessary to come back in the evening? I suppose it would be possible. But hardly a night passes when the building is not occupied by somebody, and besides that the Messenger's rooms are quite unfit for occupation by clerks.

2789. Not all of them? No. 21 is about the only one I think you could use for that purpose. I went down there on a bright day, and the rooms were much too dark even then for clerks to occupy.

2790. But are there not clerks occupying rooms equally dark? I do not think so.

2791. Take room No. 51—occupied by the Conditional Purchase Branch; are not those rooms as light as that? I do not think they are as light as that, and that is a very poor room.

2792. What about room No. 53, which is marked "Vacant"? No. 53 is equally bad.

2793. I thought that Nos. 51 and 53 were not so well lighted as the rooms in the basement? I think the rooms in the basement are not so well lighted as those rooms to which you refer. I do not, however, say there is much difference between them.

2794. Would it not be possible to utilise those rooms; for instance, take room No. 24—lithographic map stock room—that is a well-lit room? That room is fit for occupation by clerks.

2795. That is a well-lit room? Yes.

2796. It is occupied solely as a stock room for maps? Yes.

2797. Would it not be possible to transfer those maps into one of those rooms which are occupied by the messenger? Yes; I think that would be possible. It would take the maps farther away from the Sales Branch, but not very much farther.

2798. Then room No. 23, also, you use as a lithographic map stock room? Yes, in part.

2799. Would it not be possible to utilise one of those other rooms instead of that one for that purpose? We could put two or three clerks in there; but we should have to move the maps a little further away, and the men who get them out would, consequently, have to walk a little farther for them when they were required.

2800. How much farther? The length of two of those rooms.

2801. They would have to go out from No. 26? Yes—26 and 25.

2802. In going from 26 to 22, how much farther is it than in going from 26 to 24? It is not a great deal farther.

2803. It is a little shorter in distance, is it not? No; I do not think it is shorter. You would have to go to the opening marked on the plan. 2804.

C. J.  
Saunders.  
26 April, 1899.

2804. Take No. 2 room—stores; there is a large room there used for stores. Can you explain to the Committee why you require so much space as 2,791 feet for a store-room there? They do not find that is too large to carry all the stores for the Department.

2805. What do the stores consist of? Poolsap, drawing-paper, and drawing material; all clerical material required, and books of all descriptions.

2806. But in the different rooms occupied by the clerks, do they not keep a stock? Only a small stock for current requirements. They have to make a requisition on the officer in charge of the stores, and he supplies what they want, and enters it in a book, and sends it up to the Branch.

2807. Would it not be possible to keep your bulk stores in the Government Stores Department? I think it will come to that ultimately if the new Stores Department is organised on those lines.

2808. So it would be possible to keep the bulk stock in the new Stores Department? Yes; but that room would not be a good room for clerks. It might possibly be used for something else, and another room be devoted to clerks.

2809. *Mr. Watson.*] Do you know if there is room in the Government Stores Department for the storage of a greater quantity of stuff than they have there now? I understand that ultimately the Government Stores Department, when it gets into proper working order, will do away with the necessity for having separate stores in each Department.

2810. *Chairman.*] There has been latterly a reorganisation of the Government Stores Department? There has been, but they have not taken our stores away. We have had no official intimation that they intend to take them away.

2811. But would it cause any great inconvenience to your Department, if, instead of keeping bulk stock on your premises, you had to send to the Government Stores Department? I think there would be a little more inconvenience.

2812. In what way; you have just said that in the different rooms the clerks keep a stock of stores for current requirements? Yes; a small stock.

2813. It would not make much difference? It would not make much difference, practically. We should have to wait sometimes, I suppose, whilst a messenger brought what we required from the Government Stores Department.

2814. What about the Lithographic Branch; I find that in the basement, rooms Nos. 13, 14, 15, and 16 are used as store-rooms for the Lithographic Branch? Yes.

2815. Have you been through those lately? Yes.

2816. Is there any possibility of saving any space there? I do not think there is. Of course, those rooms were never designed for that purpose. You can store only a limited number of lithographic stones there. You cannot store them more than a certain height, because some of them are very heavy.

2817. Your Department has had some inquiry in reference to the question of removing the Lithographic Branch from the Lands Office to the Government Printing Office? Yes.

2818. Will you tell the Committee the result of that inquiry? It was decided to allow the Lithographic Branch to remain in the Lands Department.

2819. There was a full inquiry into the matter, and it was found that it was more convenient to allow that branch to remain in the Lands Department? Yes.

2820. When was that inquiry made—before the additions to the Lands Office? No; quite recently, after the Branch was established in the Lands Office. Previous to their being in this building, we had a branch building for them in Bridge-street, in a place known as Wolfen's Buildings.

2821. Who were the members of the Committee or Commission who held that inquiry? It was done under the Public Service Board, I think. I believe that Mr. McLeod of the *Bulletin* had something to do with it. I know he made some inquiries.

2822. They went carefully into the matter, and also extended their inquiries into the other colonies? Yes; that was a departmental inquiry into the matter of regrading the lithographic staff, but I do not think it touches on what you are asking about.

2823. Now, on the same floor, take the rooms occupied by the accountants? Yes.

2824. I find four rooms with a space of 1,872 square feet occupied by seventeen clerks, that gives 91 feet per officer;—what do you consider to be a fair space for men doing clerical work of that sort? I think about 75 superficial feet is a fair average space to allow, which would provide space for any necessary furniture, and also for alley-ways between the tables, and all the conveniences required. I mean 75 feet all round. A draftsman wants about 100 superficial feet.

2825. You think that would be ample? I think that is a liberal allowance. I do not think it is a good thing to crowd a staff of men too much, for when they move about they disturb one another in their work, and when they are jammed closely together there is a tendency to talk and lose time.

2826. Have you taken any notice of the furniture that is used in the offices? I know pretty well the kind of furniture that is used.

2827-8. Have you had occasion to go into the Public Instruction Department? Yes.

2829. Have you noticed the desks used there? They have a desk there, with men working on either side of it.

2830. Do you think the introduction of desks of that description would enable the clerks to be less cramped in your Department? I do not know whether it would. There are some branches, such as the Accountants' Branches, where work is entered from one book into another, and men call over from one to another, and in such cases the sort of desk referred to is of great convenience; but in the Lands Department, excepting the Account Branch, the work is different. Each man is on practically an independent basis.

2831. Well, take your Correspondence Branch, or the Branch that is under Mr. O'Dwyer;—do you not think the work could be better done, and with less crowding, if you had desks of that description, instead of those tables? Well, they are not very suitable desks for spreading out maps and such things upon; and in many of the land cases—not in all—there are a good many lithographs that have to be looked at. I think those desks are more convenient for an Account Branch.

2832. Do you not think by adopting more up-to-date furniture than appears to be used in that case, you could economise the room a little? I think you could.

2833. I do not mean you could put more men in that space, but would they not appear to be less crowded? Certainly.

2834. You think they would? I think so.

2835.

C. J.  
Saunders.  
26 April, 1899.

2835. How long have you been in the Lands Office altogether? I have been in the present building ever since it was put up. I was Chief Draftsman before the Mines Department came there. They came after we had the addition at the back.

2836. You cannot speak, I suppose, of the way the officers are accommodated in the Mines Department? I have only a general knowledge of the Mines Department. I would not like to speak about their requirements, although I have been in all their rooms.

2837. No. 32 is occupied by the Metropolitan Land Board. What work is done there. Is it a room that is used for a great variety of purposes. There is nearly always a board of one sort or other using that room. It is the general board-room of the Department. For instance, stock conferences and a Board sitting under the Public Service Act hold meetings there. The Metropolitan Land Board sit there occasionally. That is why the room is called the Metropolitan Land Board room; but they use it only for a small part of the time.

2838. No. 35—Occupation Branch;—there are twelve clerks there, and 592 feet of space, which is an average of under 50 feet per officer? I have always regarded that room as being overcrowded.

2839. Have you compared it with the other rooms? Comparing it with No. 39, for instance—the big room you spoke of just now—they are both good rooms.

2840. In No. 39 room the average is 62.5 feet of space per man; the Committee visited that room, and it appeared to us that in No. 39 the men seemed to be overcrowded, whereas in No. 35 they appeared to have plenty of room? You have difficulty in walking about in No. 35, and getting to some of the tables, they are so close together. You have to disturb a man to get past him, and it must destroy his efficiency to some extent if you do that.

2841. There did not appear to be so many racks and pigeon-holes in No. 35, and I suppose that is the reason why we got the idea that it was not so crowded; in room No. 47—Conditional Sales Records Branch—there are fourteen officers and 1,534 feet of space;—that makes 109 feet per man? I did not think there were so many men as that in it. There is a trouble you cannot get over here. Branches are of certain sizes, and you cannot put the men of two Branches in one room; so one Branch may not actually fill up a room, as in that case, whilst in another room, No. 35, you have to put more men than you would like to have there, simply because you cannot extend or alter the rooms.

2842. That is on account of the width of the room, I suppose? I dare say that has partly to do with it.

2843. There is room No. 51—Conditional Purchase Branch—with no one in it, and with 351 feet of space;—would it not be possible to remove the contents of room No. 51 into room No. 47? You might possibly do that.

2844. You would not thereby increase the number of officers in the room? No.

2845. Then there is No. 50—Registration and Transfer room—1,541 feet, and thirteen men, giving 119 feet per man? Yes.

2846. Then there is room No. 52—Alienation Branch? That is an overcrowded room.

2847. 648 feet, and the same number of men, which gives 50 feet per man;—what is the difference between the work in the two rooms? In No. 50 there is a very large number of registers. All the conditional purchase registers are in that room, and there has to be a large desk down the middle of the room, with the registers stored underneath on rollers. The registers are taken out and put on the top of the desk. There must be a large space, in order to open them out for reference purposes. The clerks are constantly referring to them, and they do not know where they will have to pull out next from.

2848. You require extra space in order to exhibit maps and that sort of thing? No, to use the registers. But No. 52 is distinctly overcrowded. They have hardly room to turn round in it.

2849. In room No. 54—Conditional Lease Branch—there is an average of 162 feet per man? In regard to room No. 52, I think that they have some of their records in the room opposite marked "Vacant." Looking at the plan of 54 and 52 again, I see that there is only a temporary partition between them. That is a rather convenient arrangement, for the Conditional Lease Branch is becoming smaller, not so many new leases are being taken up, whereas the other Branch is increasing, and if there is only a temporary partition it could be moved back and thus accommodate the two Branches better.

2850. Have you been through with a view of seeing whether it is not possible to save space by grouping officers in different rooms? I do not think you would save very much. Of course, in grouping the officers, in the first instance we were careful to get the Branches dealing with the same kind of work—the Branches associated with each other—as nearly as possible together. We tried to get all the Drafting Branches on the same floor, and they nearly all are. We did so, because these Branches are constantly using the same maps and plans.

2851. Take the Chief Surveyor—he occupies rooms Nos. 67 and 68 on the first floor? Yes.

2852. There are 773 feet altogether in those rooms? I know that the small room, No. 68, which is marked "Chief Surveyor's private room," is always used by any district surveyor who happens to be in town. He makes that room his head-quarters. It is rather convenient to have that room available, because a District Surveyor or Chairman of a Local Land Board visiting Sydney has no other place in which to write his letters, or do any business which he may have to do in Sydney. But I do not know that Mr. Twynam could not do with a smaller room than No. 67. He would probably be able to tell you more definitely about that.

2853. Would not No. 68 be large enough for the chief surveyor? I do not think it would be large enough. It might be with No. 69. No. 69 is a room we once used to occupy, but which we gave up to the Mines Department.

2854. The same thing has struck me and other Members of the Committee, I think, namely, that a lot of space might be made available if the planning of the building were different. Can you give the Committee any idea as to the wisdom of making the rooms so wide? You mean the general space between the corridor and the outer wall. If that is too wide, when you come to design rooms for one man each, they are far too long, and you have a lot of waste space. It answers very well in the upper floors where you may have two rows of draftsmen, one down each side of the room, and a gangway down the middle of it.

2855. Do you think that that would account for the apparently large space occupied by certain officers? To some extent it does.

2856. Take Mr. Stopp's room, for instance, No. 101, on the second floor? Yes.

2857. He has his officers occupying No. 100? Yes.

2858. There are ten men in that office with 220 feet per man? Yes.

2859.

C. J.  
Saunders.  
26 April, 1899.

2859. Would it not be possible for Mr. Stopps to move into No. 100? Yes; they might fence off a little piece for him.
2860. Would there be any advantage in shifting Mr. Stopps in there? He is the head of the branch—the head of the administrative work. He interviews the public, and deals with the public generally. He has a man under him, Mr. Winder, who looks after the discipline of the room. You would not gain anything much in the way of supervision by bringing Mr. Stopps into that room—you would simply gain a room.
2861. A large partition run part of the way up would give all the privacy necessary, I suppose? Yes.
2862. Do you think that 220 feet per man in that room is more than is actually necessary? Yes. It is partly explained by the fact that the road plans are much bigger than ordinary plans, and there must be larger presses to put them in.
2863. I suppose that is the only room available for that purpose? It is the only space available—but they have more than the average by a great deal.
2864. The proposal is to remove the Mines Department from the present Lands Office building;—have you had any experience in reference to the necessity of separating these Departments? When I was Chief Draftsman, and the Mines Department was in Phillip-street, it was a constant source of inconvenience to us through our plans going out of the building. The Mines Department uses our original plans and maps to a very large extent. They are constantly borrowing and using them, and if we wanted a map a man might have to go to the Mines Department for it, and lose much of his time; or perhaps an inquiry might be made of the Information Bureau, and they might send for a map, and find it away in the Mines Department. So it was a great relief to us when the Mines Department were removed into the same building as we occupy.
2865. You think that in working the office it is better to have them there? Yes.
2866. And also from a public standpoint? Yes.
2867. To have both Departments under one roof? Yes. I think those two Departments are more closely associated than any of the others.
2868. Then, from either the public or the official aspect of the question, you think it would not be better to put the Mines Department in a separate building? I think not.
2869. I think you said something in reference to the roof leaking? Yes.
2870. Does that often occur? It does in heavy rainy weather, after a long spell of fine weather. Some of the down-pipes become choked in some way or other. We clear them out periodically, and endeavour to guard against it, but the roof has always given us a certain amount of trouble.
2871. How would you regard the proposal to put another floor on the top of the present Lands Office building;—that would necessitate something being done to the roof? Would it necessarily alter the roof plan.
2872. It would necessitate taking down the present roof and rebuilding it? And I suppose you would leave off those galleries on the top, for they would not be wanted.
2873. Yes? At one time we thought we should do all our photographing in the Lands Department building. We draw our maps and print them, and we thought we should do the photographing as well there, but it was found more economical to have it done at the Government Printing Office.
2874. So you do not use those galleries? No, and I do not think we have any intention of using them.
2875. Do you use the dome? The lower part is occupied by draftsmen, and in the top part we have a lot of old records and maps, which are not wanted very often. They could go downstairs into some of the basement rooms.
2876. If another floor were put on the present Lands Office building and the Mines Department could be accommodated there, do you think that it would be of public convenience? I think so, because very often the same people go to the Mines Department as to the Lands Department.
2877. *Mr. Trickett.*] According to figures submitted to us the other day by the Chairman, in the basement of this building there is a total floor-space of 13,637 feet, the total floor-space on the ground-floor is 17,070 feet, the total floor-space on the first-floor is 16,534 feet, and on the second-floor 19,884 feet, and under the dome 2,989 feet; I make the total of those measurements 69,114 superficial feet—that is, the space in the whole building? Yes.
- 2878–9. Well, according to the figures which we get from the plan which you have been quoting from, out of that 69,114 feet of floor-space, 4,272 feet are devoted to store-rooms; does not that seem a very large space for that purpose? Yes; but that includes the lithographic stones room.
2880. Is No. 2 room on the basement—807 feet—for clerical stores? Clerical and drafting stores for the whole of the Lands Department.
2881. This room, I suppose, is not much larger than that? I think this is a wider room. I think that room is about 40 feet long.
2882. It must be 40 feet by 20 feet? Yes, about 40 feet by 20 feet.
2883. Does not that seem rather a large room for a store-room, assuming that you have store-rooms on the other floor? We have no other store-rooms for that particular material. That store-room is a general store-room for drafting and clerical stores.
2884. Well, granted that that room is for clerical stores, is there another similar room for similar material on the ground-floor? Not that I know of.
2885. There is a room 503 superficial feet, and another room 471 superficial feet on the ground-floor? No. 40 is vacant at present.
2886. It is marked on that plan as a store-room;—you say it is a vacant room? There are some Votes and Proceedings and that sort of thing round the walls, but I do not know of any other stores that are kept there.
2887. Then No. 53 is marked as a store-room, too? I think that in No. 53 there are mostly records belonging to the branch in room No. 52.
2888. But you have a large record-room on that floor? Yes. Our records are very numerous.
2889. *Chairman.*] But you are removing a number of them into the strong-room? A great number of them. They have to be frequently referred to.
2890. *Mr. Trickett.*] With regard to those two rooms on the ground-floor, you say that one is empty with the exception of containing a few Votes and Proceedings;—what fills up the other one? No. 53, I think, holds papers and records belonging to No. 52.
2891. Is it full? I would not like to say it is full. I have not been in it within the last month or so.

so. It is a very dark room. We had two men working there at one time, but they really could not do so properly, and we had a device constructed outside in order to try and reflect some light into the room, but it did not have the desired effect—the men had always to have gas burning.

2892. And on the first floor there is a store-room—No. 70—containing 570 superficial feet? That is in the Mines Department, and I do not know anything about it. I think it is their stores, corresponding with our No. 2, down below.

2893. Well, apparently, the store-rooms you have mentioned are not over-taxed at any rate? Those other rooms, I suppose, will be the lithographic rooms. Those are in the basement. I know that in No. 13 we keep our stocks of lithographic printing paper.

2894. In the basement, independently of the large room—807 superficial feet—there are four other store-rooms;—are those fully occupied? Those containing the lithographic paper, lithographic stones, and the printed lithographs are all full.

2895. They are taxed to their full extent? I think so, but I do not say that the contents of those rooms could not go into a much smaller space in a more convenient room.

2896. They could? I think so. I daresay there could be some contrivance for the lithographic stones, so that they could go into a smaller space. We use those rooms for that purpose, as they are not fit for anything else.

2897. Then do I understand from you that if this Lands Office building had been better designed, there would have been much more accommodation there? I think so; that is the general experience.

2898. There are some other figures to which I should like to draw your attention;—on the various floors of this building, I have added up the spaces that are occupied for stores, machinery, messengers' rooms, map stocks, and records, and I find they total 19,828 feet, so that out of a building whose total office accommodation is 69,114 feet, no less than 19,828 feet, or about two-sevenths of the whole space, is occupied for stores, machines, messenger's rooms, map, stock, and records;—does that not seem a very large proportion indeed? Yes; I think it is too large a proportion.

2899. Is there not some way by which that space could be more economically used? I am afraid not, without reconstructing the building.

2900. As the Chairman has pointed out, over 2,200 feet are occupied for the messenger's accommodation;—does not that seem a very large space for that purpose? The rooms are far too large for the messenger. He could do with smaller rooms, but the rooms are there. He has to have separate bed-rooms for himself and his daughters, of whom he has two. He, however, could do with smaller rooms, and he would be satisfied with smaller rooms, for his present rooms are too big for him, but I do not think they could be used for anything else. The Under Secretary asked me to mention that he is very strongly in favour of having a resident messenger—a man who will always be on the premises. Perhaps, I ought to have said this before.

2901. Do you think that the available space in this building is utilised to the best advantage by the two Departments that now occupy it? I think it is, in the main.

2902. Have you been through the Mines Department? Yes.

2903. Have you seen the correspondence-room there? Yes.

2904. What do you think of that as a modern style of carrying on an office with those old-fashioned tables and cupboards? They have to put up with the furniture they already possess, to a large extent.

2905. Do you not think there is a great deal of space there taken up by that which could be better arranged if the furniture were of a uniform and modern character? I dare say there is.

2906. Information has come from the Chairman of the Public Service Tender Board to the effect that the Government Stores Department is to be reorganised with the view of removing the bulk of the stores, stationery, &c., from the Departments, and issuing them only when they are wanted for immediate requirements, leaving the rest in the stores of the contractors to be obtained as required;—if that is carried out, will not that relieve the Lands Department considerably of the stores now piled up in the Lands Office building? I think it would relieve them only of the stores in No. 2 room in the basement. The lithographic stones, of course, we could not let go away.

2907. I do not mean the lithographic stones, but would not the ordinary store-rooms be available for other purposes? The lithographic stores would have to remain with us—that is, very large stocks of printing and drawing paper—it would not do for them to be taken away from us.

2908. But those are in four rooms, independent of the 807-feet room? Yes, quite distinct from it. No. 2 room is the only one we could spare under those conditions. The Mines Department might, perhaps, spare the store-room upstairs.

2909. I suppose if the Mines Department were moved away from the Lands Office building, you would manage to fill the whole building with your present staff? I do not think we could.

2910. Would you have considerable vacant space if they did go? Necessarily so.

2911. Therefore, if new buildings were provided for the Mines Department, there would be a very considerable amount of space unoccupied in the Lands Office building? Yes.

2912. *Dr. Garran.*] Did the Lands Department ever have to themselves the whole of the Lands Office building, old and new? No; they did not.

2913. You had the original building all to yourself? Yes.

2914. The Mines Department came in just after the new building was finished? Yes.

2915. Did they turn you out of rooms you had previously occupied? No; but some of the rooms upstairs were occupied temporarily by the land-tax staff when the land-tax was first brought into operation.

2916. Well, the Mines Department coming in did not crowd you up any more than you were crowded before? Not to any appreciable extent.

2917. We have been led to understand that the Mines Department have crowded you,—is that so? I was in charge of the drafting branches. I had not the clerical branches under me, and, speaking from my point of view, I do not think that the Mines Department coming in made much difference. The Mines Department may have occupied some of the strong-rooms that the Lands Department would have liked to have had.

2918. I understood there had been a complaint by both Departments—first on the part of the Mines Department, that they had not room enough; and secondly, on the part of the Lands Department, that the Mines Department coming in had squeezed them? Of course you can look for that sort of thing when you have two Departments occupying the same building.

C. J.  
Saunders.  
26 April, 1899.

C. J. Saunders.  
26 April, 1899.

2919. That is one of the disadvantages? Yes; unless one Department can be given a whole floor, so that there can be no possibility of misunderstanding as to which is their territory.
2920. Is there in the Lands Office part of the building no single room that accommodates more clerks than before the Mines Department came in? I am not sure whether that is the case or not; but it certainly is not to any extent.
2921. I think Mr. Rennie said that if the Mines Department went out the Lands Department could occupy the whole of the building, except thirteen rooms; if that is the case you would have to spread out a good deal to occupy all the building except thirteen rooms;—that would seem to imply you are not squeezed? In those individual cases, I have already pointed out the men are cramped; but their getting rooms on another floor would not be of use to them. You could not have part of the branch upstairs and part of it downstairs.
2922. Then, so far as you are concerned and know, the Lands Department do not want to expand their present accommodation at all? I do not think they want to expand it very much.
2923. So that the departure of the Mines Department would not be any relief to the Lands, so far as space is concerned? It might in some small ways, but I do not think it would make much difference.
2924. Not material? No.
2925. You have given one instance in which it is convenient to have the two Departments under the same roof;—how often does it happen that you want to refer to one another's plans? Constantly.
2926. Once a week? Every day. The Mines Department men use our maps as much as we do ourselves, except that there are fewer of them.
2927. Do they take a tracing of them, and then return the maps to you? No; they borrow the original maps, and our original plans as well.
2928. Could not you, with your lithographic apparatus, give them a copy instead of sending the original plan? They always get lithographic copies. But the maps referred to are those we keep charted up to date, and when examining new surveys nothing but the original plans are of any use.
2929. Then, in regard to all new leases taken out, do you chart them first? No, they do the charting; but they chart them to a large extent on our maps.
2930. Then two sets of charting men work on the same plan? Practically, the Mines charting draftsmen and the Lands charting draftsmen.
2931. Would it not be rather difficult to say who made a mistake, supposing one were made? We could easily tell by the plan itself which branch charted it. The Mines measurements are charted in a distinctive way on our maps.
2932. If this projected building were carried out, you would have the Mines Department close to you—only just across the street; it would not be like having to go up Phillip-street? It would not be so bad, but it would be inconvenient. It would mean a man having to go down a lift and walk up the street, and then, perhaps, wait for another lift to take him up to the top of the other building, because usually the draftsmen are on the top floors, so as to get the best light.
2933. So far as your observation goes, has there been any inconvenience from putting the two Departments in the one building? I do not know of any particular inconvenience; but a little feeling occasionally arose when we were occupying parts of the same strong-room.
2934. Do you have altogether separate floors from the Mines Department? Not altogether. The Mines Department offices are mostly on the first floor.
2935. Then how do you arrange about the strong-room, where you are on the same floor;—do both Departments have access to the same level of the strong-room? Yes.
2936. And do they divide the space between them according to agreement? That has been the arrangement. I do not know whether it stands good now.
2937. Has there not been some chafing between the two Departments about that distribution? I do not know if there has been any actual chafing about it. Mr. Wilson said that he should like to have all the strong-room for himself, if he could get it—he had plenty of papers to fill it.
2938. Which Department has the greater demand on that strong-room—the Lands or the Mines? The Lands has, by far.
2939. The Mines Department has not anything like the same space that you have? No, they have not asked for it.
2940. What sort of documents does the Mines Department principally keep there? I do not know.
2941. Does the Mines Department keep its maps of lease areas for mining purposes? I do not think so.
2942. Supposing they were burnt, would the Mines Department be inconvenienced? Yes.
2943. Do you keep your maps in the strong-rooms? All the original surveyors' plans. We have a separate map-room, No. 96, in which we keep all our working maps.
2944. Supposing one of the Mines Department maps which they were keeping charted up to date were burnt, could you replace it for them? It could be replaced, for in our local offices we have another set of maps which are used in dealing with all new applications for land.
2945. District offices? Yes.
2946. Do they chart all the mining leases? Yes, they chart everything, because they deal with fresh applications for land, and have to settle the details.
2947. They have to do that in order to prevent people from settling on mining leases? Yes. I think a map could be replaced if lost at either end. We have had cases where maps have gone astray, and we have been able to replace them. If the Mines Department were to keep a separate set of maps it would mean that they would have a separate staff of draftsmen who would chart up information from our maps.
2948. And, perhaps, within an hour after they had borrowed your maps you might want them yourself? That is what happened when the Mines Department was in Phillip-street. A man would come to the Information Bureau and ask to see a certain map, and he would be told that it was in the Mines Department office, and he might have to wait until it was brought back.
2949. Would it not be a simpler plan for each Department to have the maps charted up each week? It would be too expensive. There are about 5,000 parish maps which we have to keep charted up. Of course, the Mines Department would not use a number of those, as mining is confined to certain localities; but, still, they never know which one they may want.
2950. Is the whole of the second storey occupied by the Lands Department? Yes, excepting one corner where

where the Geological Branch is. That was our grouping of the branches. We brought all the drawing branches on to that one floor, with the Plan Record Branch in the middle.

2951. Except for the Geological Branch, the Mines Department do not touch that floor? In addition to the Geological Branch, Mr. Pittman, the Government Geologist, has one room, but all the rest belongs to the Survey branches.

2952. What do the Mines Department occupy on the first floor? I think they have about four-fifths of that.

2953. They have the greater part of the first floor and one corner of the second? Yes.

2954. And that is all they have? I think that is all they have. The plan-mounter has a piece of one of the galleries on the top.

2955. And if they were turned out into some other building you would have available for yourself the greater part of the first floor, and the Geological corner of the second floor? Yes.

2956. And you could not usefully fill all those spaces too? No.

2957. But when that addition to the Lands Office was made, was it made with the view of putting in a new Department or for an extension of the Lands Office accommodation? I fancy the original idea was to put another Department in.

2958. Then it was not an after-thought to bring the Mines Department in on the top of the other—it was intended originally? I fancy that was the original design.

2959. They were turned out of the old Phillip-street office rather in a hurry, were they not? Yes. I do not know what the reason for it was.

2960. Then, so far as you know, the Lands Department are fairly quartered at present, and have not any great requirements? I do not think they have any great requirements.

2961. The only fault that you can find with the office accommodation is that the rooms are not as well designed as they ought to have been? They are not. Some of them are too large, and some are too small, and some are so dark that they cannot be used.

2962. And those are defects which you cannot now very well remedy? I do not think we can remedy them very well under present arrangements.

2963. The darkness of the inner rooms arises, I suppose, from the strong-room being built up there? I understand that is partly the reason for it. The building was originally designed with an open courtyard.

2964. Still, that strong-room is very convenient there? Yes.

2965. You could not have it more conveniently placed? No.

2966. And there is not such inconvenience to any part of the Lands Office as to call for reconsideration of the distribution to see if you could not make a better adjustment of spaces? There are some of these branches which we should like to readjust if we could, but we do not think we could do that without altering the building.

2967. At any rate you cannot afford to give up any more room to the Mines Department? I do not think so.

2968. They speak as though they would like a little more; you have nothing to spare for them? Nothing that they would care to accept.

2969. You could not possibly find them room for their museum in the building as it stands? I do not know what space they require, but I do not think we should be able to. I suppose they would not go into the messengers' quarters.

2970. They do not want the museum to be broken up into a number of little rooms, but to have a large room, and you have not that to give them? No.

2971. Then while you are contented, there is some room for discontent on the part of the Mines Department? I dare say there is.

2972. The discontent with the present building does not spring up with your Department, but with theirs? I think so mainly.

2973. *Mr. Levien.*] I suppose you do not know whether, before the additions to the Lands Office building were made, the plans were submitted to you for your consideration, and whether you thought they properly provided for the officers? At that time I was not in a sufficiently responsible position to be asked about that sort of thing.

2974. Now that you are in a sufficiently responsible position, what do you think ought to have been done in the matter of the arrangement of rooms and everything else? These basement rooms, as far as I can see, ought never to have been finished off in the style they are in. They are all finished off as if they were going to be occupied by clerks.

2975. *Chairman.*] Does the general design lend itself to an economical distribution of space? No; we do not get the full advantage of the space at our disposal; we cannot make the best use of it.

2976. *Mr. Levien.*] You consider that the Mines Department and the Lands Department should be under the same roof? I think they always ought to have been under the same roof.

2977. And now the question is being considered, do you not think that the Lands Department and the Department of Mines and Agriculture ought to remain under the same roof? I think they ought to do so.

2978. And they could? If it were all well-lit floor-space, the floor-space already at our disposal, we could accommodate both Departments in the Lands Office, except in regard to the museum, about which I do not know sufficient to express an opinion. They seem to want a large space for the museum.

2979. But supposing a new storey could be put on top of the present Lands Office building, and it was a well-lit storey, you think you could meet all the requirements of the two Departments in that one building? I think so.

2980. If they had a lofty style of building, well lit on the roof, do you not think that would meet all requirements? I should think it ought to.

2981. And be an improvement on the present broken up spaces that are there, including the dome? We cannot utilise the space in the dome or the galleries. They are of no practical use now, and I think they help to make the roof leak.

2982. And they are very hot, are they not? Yes. Men could not work in the galleries. You could not turn them into offices; they are not intended for men to work in.

2983. Have the Public Service Board ever considered the question of utilising space at all in regard to the number of clerks to be put in certain rooms, or have they considered only other matters? I have not heard of their considering that question at all. I think they leave those matters to the permanent head of the Department, and regard it as part of his responsibility.

C. J.  
Saunders.  
26 April, 1899.

2984. They do not consult the Department in any way on that question? I have never heard of their consulting the Department on that sort of question.

2985. They do not seem to have rendered the Public Service Board any assistance in the way of utilising space in the Government buildings; do you know of any? I would rather not put it in that way. I would rather say that I think they leave those matters to the permanent head of the department.

2986. You say that with judicious care and management both the Lands and the Mines Departments can be accommodated under the same roof without any great difficulty? I think that would be the most convenient arrangement.

2987. That is to say, taking away the dome, and having proper lighting arrangements and whatever else is necessary for the preservation of health, you think that that could be done? I do not see why it should not be done.

2988. *Mr. Shepherd.*] With regard to the stores, for what period do you generally take in stores for the use of the office? I suppose they get in a half-year's supply.

2989. Not more than a half-year's supply? I should think not, except certain kinds of drawing materials. Some material may have to be purchased from England, but of the ordinary stores I should think they would not have more than six months' supply in.

2990. Would it be much inconvenience to the Department if a large portion of those stores were located elsewhere, that is to say, if you were to get a month's supply at a time into the building—that would considerably reduce the space required for the stores, I should think? Yes; you could do with a smaller space then.

2991. And it would not cause much inconvenience I should think? No. It only means sending up to the Stores Department wherever it might be, and I suppose it would be ready to supply us at any time we might want stores.

2992. Has there been much expansion in your Department of late years? No.

2993. Is there likely to be in the future? The only think I know of, at present, is in connection with the Advances to Settlers Board. I think they are looking for offices outside at the present moment. There is no accommodation for them in the Lands Department building, and I have heard unofficially that they are looking outside for rooms. It is impossible to say at this stage whether that would ever be a large branch or not. They may do with a few clerks for the present.

2994. Do you think the fact of Federation being brought about would have any effect on the staff of the Lands Department? I do not think it would.

2995. The same sort of work would still have to go on? Yes; we should have our separate land laws, and should go on under the same conditions as regards the land, I suppose, as before.

2996. With regard to the dome—that is not fully utilised, I suppose; you say it is almost uninhabitable; at all events we have had evidence to that effect? There are men working in the lower part of it. There is Mr. Perdriau in one corner, and four or five draftsmen in the other corner, and a plan-mounter takes one piece and the heliographic printer's room another.

2997. Are those rooms constantly occupied? Yes.

2998. Is the whole of the dome space utilised? Yes. The flats above are used for storing records and old things in—things of no particular value. They are not occupied by men. I do not know the exact number of men on the lower floor.

2999. I think you have already said you think the dome could be done away with? So far as a place for working in is concerned. It is of no convenience as a place to work in. I think it would be rather a dangerous place in the event of fire.

3000. *Mr. Watson.*] I think you said it was a matter of mutual convenience for your Department and the Mines Department to be in the same building? Yes.

3001. I presume you are aware that the Mines Department has a desire to have all its branches under one roof, which is not the case now? Yes, I can quite understand that.

3002. Which do you think would be more in the public interest—the gathering together of all the branches of the Mines Department under one roof, or the keeping of the Mines Department in close touch with the Lands Department; supposing we were reduced to the two alternatives—I do not say it is so—which do you think would be the better in the public interest? So far as the Mines Department is concerned, I think the outlying branches now are the Museum and some of the Agricultural branches.

3003. The Chemist's Branch, the Stock Branch, the Export Board, the Wine Experts, the Dairy Expert, and the Pathologist, and quite a number like that—I cannot enumerate them all at the moment—occupy rented buildings; which would be more in the public interest, the gathering of all the branches of the Mines Department under the same roof, and thus helping the economy of their administration there, or, on the other hand, the keeping of the Mines and the Lands Departments in close connection, so far as the building will allow;—which would result in the most economical administration of that portion of the Civil Service embraced in those two Departments;—supposing you were the officer charged with the general direction, would you sooner have the Mines and the Lands Departments in conjunction to the extent they are at the present time, and your present building will allow, or would you rather take the Mines Department away a little distance from the Lands, and gather the whole of the Mines branches under one roof? Looking at the matter from a public point of view, I think it would be more advantageous to have the whole of the Mines branches together.

3004. Do you think greater economy of administration would result, or that the advantage would be greater, from having the Mines Department branches altogether under the one roof, that is, as far as they could be put together under one roof—leaving the crushing plant out of the question—than it would be to have the certain amount of convenience which results from the Mines Department being close to the Lands Department? Yes.

3005. At present the conjunction of the two Departments relates mainly to papers? To papers and maps, the use of maps more particularly.

3006. Well, would the divorce, so to speak, of the Mines and the Lands Departments result in any very great inconvenience or expenditure in regard to the preparation of maps? I think it would result in great inconvenience.

3007. That is, the work of one Department might be delayed a little? That was our experience while the two Departments were separated.

3008. But if the matter resolved itself into an alternative between, on the one hand, keeping the Mines Department

Department where they are, and doing without the gathering together of the various branches, or, on the other hand, the possibility of removing the Mines Department away a little distance, and keeping the branches together, you would prefer the latter? Yes, looking at it from a public point of view.

3009. In the space spoken of a little while ago as being set apart for stores, I thought there was included in that category the space which is really occupied by lithographic machinery, stones, and so on? Yes.

3010. You do not think it is practicable to make any saving in regard to that? No; but we might put the lithographic stones in a smaller space than they occupy now.

3011. Do you speak from knowledge, or merely as a matter of opinion, for I understand it is not a wise thing to stow lithographic stone in the same way as ordinary lumber? You could not do it. They must stand up in racks.

3012. Therefore they take up a greater amount of room than might appear to the outside eye to be necessary? They do; but they occupy more space now than is necessary. If you were designing rooms merely to suit lithographic stones and machinery, you could do it in a more compact way than is done there. But we had the rooms already, and had to make the best use we could of them. They were never designed for the purpose. When the building was constructed, it was supposed that these rooms would be suitable for clerks—at least I should say so, judging from the fittings, because those rooms have the same cedar fittings as the other rooms.

3013. So you do not think that a great saving could be effected in regard to that storage accommodation? No; you would have to give us other accommodation for the lithographic stones.

3014. And I think it is practically agreed by those concerned that you could not economically have that particular branch of your Department under the control of the Government Printing Office? It has been decided to be more convenient on the whole to allow it to remain where it is.

3015. So we may put aside the other suggestion? Yes.

3016. You said, I think, that the space which you thought would be a fair amount to allow for a clerk was 75 square feet superficial? Yes.

3017. It has been given in evidence before us by Mr. Kent, Mr. Kirkpatrick, Mr. Vernon, Mr. Manson, all of whom are architects, that a proper allowance—evidently arrived at by a consensus of opinion of architects everywhere—would be 100 square feet superficial for a clerk? Yes.

3018. You are of opinion that is rather much? Yes, in a building like ours. The rooms are very lofty, and, as far as I can judge, we can get on in most of the branches with 75 feet—I think 75 feet is a liberal allowance.

3019. When you say that, do you have regard only to the possibility of moving about without loss of time, or without friction, or have you regarded the health aspect of the matter? I have looked at it from all points of view. With those lofty rooms, I think 75 square feet superficial is ample.

3020. Assuming that is a proper allowance for a clerk, still, if you allow a separate wide room for the Minister, and separate rooms each for the Under Secretary and a number of heads of branches, then necessarily the extra room which they have must go very largely towards making up the general average allotted to each officer, and you must increase the general average in order to allow the clerks 75 feet each, after deducting what is given to heads of branches? I did not include in my estimate heads of branches and people who occupy separate rooms; I merely meant the persons doing ordinary clerical work and sitting together in branches.

3021. If you allow 75 square feet superficial for each clerk, then naturally the average for every individual in the building should be very much higher when you make allowance for heads of Departments, waiting-room, strong-room, and so on? Yes.

3022. *Chairman.*] On the second floor, in regard to room 94—feature survey and standard map room—508 feet, would it not be possible to utilise one of those other rooms, which you say are rather dark, to put those maps in, instead of room 94? Those are the standard maps belonging to the compiling branches in rooms 91, 92, and 93. They must have their standard maps very close at hand, for when compiling they have to refer to adjoining maps; those are the original compilations from which they publish additional maps from time to time; the room is not light enough for a drawing-room—you could not put draftsmen there.

3023. Do they do any drawing in there? No; it is not suitable for draftsmen.

3024. There is only one man there? Yes, the custodian of plans and maps.

3025. So far as light is concerned, it is good enough for clerical work? Yes; it is quite light enough for clerical work.

3026. As regards room 96, map-room, 860 feet? Yes; that is the general map-room for the charting branches; that is where we keep the original maps used by the charting branches of the Lands and the Mines Departments.

3027. Could they not be removed to some other room? I do not think there is any other convenient place we could put them in.

3028. Would it not be possible in the compiling branch rooms 93 and 95 to put the maps round the walls? I do not think so; those rooms are pretty full of draftsmen. In 93 there are thirty or thirty-one men, and they have a little less than the average amount of space—about 90 feet—and in 95 there are 24 men with 100 feet per man.

3029. There is a urinal on each side of the central building;—would it not be possible to convert one of those urinals into another lavatory? I think we might. If large bodies of men work together, as on this floor, we ought to have lavatories at both ends of the building. It would lead to a waste of time if you had only one lavatory, and all the men had to go there to wash.

3030. But they are in the centre of the building, both of them? Well, one is on one side, and another on the other.

3031. With a sort of flying corridor or gallery? Yes; they can get access easily from one to the other. The draftsmen have to use the lavatories a good deal.

3032. *Mr. Dick.*] We have it stated in evidence that if the Mines Department leaves the Lands Office building there would then be available thirteen rooms for any other Department, which the Lands Department itself would not require;—does that statement take into consideration the fact that the Department is desirous of having a timber museum in its main building? I do not know anything about that. I know it has been mooted. Mr. Wilson got particulars about that; but I know nothing of it.

3033. *Chairman.*] You said you thought it would be in the public interest, rather than have the Mines Department

C. J.  
Saunders.  
26 April, 1899.

C. J.  
Saunders.  
26 April, 1899.

Department Branches scattered, to have that Department in a separate building; supposing the Mines Department could gather in its scattered Branches under one roof by our putting another storey on the present Lands Office Building;—how would you view that? That would be the very best arrangement that could be made, so far as the convenience of the two Departments is concerned.

3034. And the public? And the public, undoubtedly; but I understood Mr. Watson to say, if one or the other had to be sacrificed, which would be of the greater public importance to preserve.

3035. *Dr. Garran.*] There is no upstairs room that you are using for stores which you could clear out and make useful for clerks, you sending your stores down to the basement? I do not think so.

3036. *Mr. Shepherd.*] I see that your estimate of space is supported by your Chief Draftsman, Mr. Rennie. In answer to a question he said:

A draftsman, we reckon, should have 88 square feet.

And the next question was:

As a rule, a draftsman, I suppose, requires more space than an ordinary clerk? Yes, he does.

So that would bring it to about your estimate of 75 feet for an ordinary clerk, and 100 feet for a draftsman? Yes; I think a draftsman should have about 100 feet.

3037. He says 88 feet? There are some large rooms which cut up to greater advantage than others, and where 88 feet might be sufficient.

3038. *Chairman.*] You were formerly Chief Draftsman, and therefore you can speak with authority? Yes; I was Chief Draftsman for nine years before Mr. Rennie took charge.

Robert R. P. Hickson, Chairman of the Public Service Tender Board, sworn, and examined:—

R. R. P.  
Hickson.  
26 April, 1899.

3039. *Chairman.*] A point came before the Committee with reference to the large space occupied in the present Lands Office building by stores;—what is being done towards reorganising the Government Stores Department;—can you inform the Committee? I have had the matter very fully investigated with regard to all the branch stores, and my Board are very strongly of opinion that those branch stores should be practically done away with.

3040. That is the branch stores in each Department? Yes. I may say that the Department of Public Works had a branch store in which there were three clerks, and I have done away with that altogether, and sent down all the forms, &c., we kept there to the Government Stores Department where they are kept and issued without any additional assistance, and the Public Works Department has got a room to the good. The same thing, I believe, should be done in all the Departments, and a very strong recommendation to that effect has gone to the Treasurer.

3041. So that, instead of each Department having rooms occupied with paper and envelopes, and other stores, they will just be supplied with sufficient for current requirements? Yes.

3042. And then requisition the new Stores Department for further supplies? Yes, as required. And as far as the Government Stores Department itself is concerned, our policy is to reduce as much as possible the quantity of stores kept there in bulk, making the annual contractors the storekeepers. So by bringing in these branch stores we shall not require any additional room at our present Government Stores Department, nor yet any additional staff.

3043. Do you know whether there is any proposition to erect a new Public Library? It is just mooted; nothing has come of it yet.

3044. You have not decided anything? Nothing decided yet.

3045. You could not say whether it is likely to be proceeded with? I could not say at all; it entirely rests with the Minister for Education.

3046. Has it been stated that there is not sufficient room for the Library in the present building? In connection with the donation of books by Mr. Mitchell it has been stated that extra accommodation will be required somewhere.

3047. Is there a proposition to erect new buildings for the Registrar-General's Department? That also is mooted, but there is nothing definitely settled about that either. I could let you know exactly, if you like, how both those matters stand, at least so far as the Public Works Department is concerned.

3048. Has there been a strong requisition from the Registrar-General's Department for extra space? There has been a requisition for extra space. I do not know whether it is very strongly worded or not.

3049. Are there any other buildings that are in contemplation? I do not think so.

3050. *Mr. Watson.*] Do you say that the concentration of stores of the character used by the several Departments in the present Government Stores Department proper would not necessitate extra space there? I do not think so.

3051. You think their present accommodation would be sufficient? Yes; for the reason that we are reducing the bulk stores there.

3052. Do you think that it is an economical plan to reduce the bulk stores? I think the proper thing is to make the annual contractors our storekeepers as much as possible, we keeping only a small quantity for the general work of the Departments.

3053. Is it not possible that they would charge a little extra for storing on your behalf? I find in the annual contracts, it does not make the least difference in the cost whether we take them into the Government Stores Department, or get them directly from the contractors as required, and in the long run it costs us more to store them, because we have to pay our own clerks and storemen, whereas the storing could be done without extra cost to us by making the contractors do the storing.

THURSDAY, 27 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of erecting Public Offices on land with frontages to Phillip, Bridge, and Young Streets, Sydney.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and further examined:—

3054. *Chairman.*] Has your Department at any time had under consideration the question of closing up, as it were, the different officers in the Public Works Department—that is, instead of having the officers spread all over the building, have them brought together more? Yes.

3055. With what result? The result is that we have economised space, and also economised in the working of the Department very considerably. For instance, each branch used to have its own complete set of officials—record clerks, chief clerks, accountants—in separate rooms, scattered all over the building, taking up a great deal of room, and making it not easy to get proper supervision over them. They have all been brought together now.

3056. Then, I understand that each sub-Department had its separate room for records? Yes.

3057. And now that they are brought into one room you economise both space and labour? Yes.

3058. Do you think that would be a wise thing to do in connection with other Departments? I certainly think it would.

3059. From your experience, do you find that you gain by doing that? Most unquestionably—a very considerable gain.

3060. I think you said yesterday that there was a proposition, not yet finally dealt with, to construct a new Public Library? Yes.

3061. Has anything been decided as to what would be done with the present Public Library if that proposition were carried out? Not that I am aware of.

3062. Then, there is a proposition with reference to the Registrar-General's Department;—they require better offices, do they not, and have made application for them? So I understand.

3063. Then, again, as regards the Railway Commissioners, if a city railway be constructed, I presume that the administration will find room somewhere near the head station, will they not? It depends on what scheme is carried out. If the proposal which is now under consideration be carried out, there will not be accommodation for them.

3064. How would you view a proposal that, before any fresh public buildings were entered upon a committee of the heads of Departments should be formed to go through the whole question of the accommodation now provided, and to be provided? I think it would be a very good thing to do.

3065. Looking, say, ten years ahead? I think it would be a very good thing to do.

3066. I mean to consider the requirements of the different Departments, and also whether, by reorganisation in the different Departments, and the introduction of other furniture, and matters of that sort, it is possible to meet those requirements;—do you think it would be advisable to do that, previous to entering upon the erection of new public buildings? I think it would.

3067. *Dr. Garran.*] Have you heard any suggestions for a new office for the Registrar-General? No; the proposal is not formulated yet.

3068. Have you not heard that the present office is very much crowded? Yes, we have heard that; but no new design has been formed yet.

3069. It would be very difficult to add to the present building? From my superficial knowledge of that building, I should think it would be.

3070. That is another case, then, where a new building will be wanted before long? Probably.

3071. Is there any idea of building a new Supreme Court? I do not think there is.

3072. It has been talked about for twenty years? There is no talk of it at present; but I think it ought to be done.

3073. If a railway station be erected in Hyde Park, according to Mr. Eddy's notion, will not the additional noise be so great that it will be almost impossible to hear witnesses in the Supreme Court building? I do not think so. I think that that was fully gone into when the Hyde Park scheme was under consideration.

3074. The noise of the trams is very bad? The noise of the trains will not be so bad, as they will be under cover and some distance away.

3075. They will be heavy trains though? Yes; but the noise will not be so much as the noise of the trams.

3076. You do not think that having a railway station there will at all add to the inconvenience of the Supreme Court? I do not think so.

3077. Have you heard complaints as to the heat of the Equity Court? A good deal of complaint.

3078. There is no definite proposal for putting up a new Equity Court? No; but the putting up of proper courts in Sydney is a thing that will have to be faced sooner or later; the present accommodation is exceedingly bad.

3079. Do you think that our Supreme Courts are up to date? No; I think they are very far behind it. We have a very much more suitable building in the town of Goulburn than there is in the city of Sydney.

3080. Do you know whether any of the other great colonies have Supreme Courts as old-fashioned as ours? In Melbourne they have a comparatively new one. In Adelaide it is pretty old, but the accommodation is fair. The one in Brisbane I do not know. I do not think that any colony has such old buildings, and such bad accommodation, for the Supreme Court as we have.

3081. Then it is quite possible that there may come a demand on your Department for a new Supreme Court before long? Quite possible.

3082.

R. R. P.  
Hickson.  
27 April, 1899.

- R. R. P. Hickson.  
27 April, 1899.
3082. But you do not think the advent of the railway in the city will make any difference? I do not think it will. If the line were made at Hyde Park I do not think it would inconvenience the Supreme Court business; and, of course, if the present idea be carried out it will not affect it at all.
3083. Not the new plan? No.
3084. There will be a railway station on the other side of Elizabeth-street, where the High School is, and there will be the additional noise from that? I do not think you will find there will be any noise from that.
3085. Screaming and whistling? Whistling, of course, you will hear, but I think no noise of the trains. The experience I have of railway stations is that there is very little noise of the trains heard outside the stations, because the railway stations are always closed in. The tramway, of course, is not; it is open on the street, and the trams are very noisy.
3086. And you get the vibration, too, from the trams? I do not know whether they would in the Supreme Court. They might, but I cannot say.
3087. You would not if it were on the other side of the road? No. I do not think there is any vibration from the trams.
3088. Is there any other public department which is badly housed and is calling out for fresh accommodation? No; I think not.
3089. But you think it would be a good idea, before we spend another shilling, to get a comprehensive survey of the whole question of lodging the Government officials? I think it ought to be fully gone into to see if there could be any closing-up carried out in the other departments.
3090. If we did that, we could go on system? Yes.
3091. Even if it took ten years to complete, we should be going on a definite plan? It ought not to take long to complete.
3092. Not to complete the plan; but it might take some years to carry out all the schemes? I thought you meant to complete the investigation.
3093. No, I meant to carry out the works;—how long do you think the investigation would take? Very few weeks, if it were commenced at once.
3094. Six weeks would be ample? I think so.
3095. Would such an inquiry take into account any possible readaptation of the existing offices? It could be made to do so.
3096. *Chairman.*] What was the cost to the Government of the site upon which it is proposed to erect these buildings? £33,500.

Walter Liberty Vernon, Government Architect, sworn, and further examined:—

- W. L. Vernon.  
27 April, 1899.
3097. *Dr. Garran.*] You have had time for reconsidering the estimate of expense of putting one or two floors on the Lands Office;—do you still abide by your estimate? I have not been asked to reconsider my estimate.
3098. I mean for the two ideas separately—first for the one floor, and secondly for the two? I have only made calculations for the one floor.
3099. You abide by the estimate you have given us for that? Yes, certainly.
3100. In round numbers, £47,000? Yes.
3101. *Mr. Trickett.*] That is at 23 feet high? Yes; and as I explained also for the necessary treatment of the roof to prevent the dead level of uniformity which would be induced by taking away the present dome.
3102. *Dr. Garran.*] £47,000 for one storey? Yes; and the finishing of the roof.
3103. And that will give only 20,000 square feet of useful space? That is so.
3104. Now with regard to the Mansard roof in addition: there is one question, No. 2441, that Mr. Watson put to you, which almost implies an estimate of yours for the two; but I see that is not really your estimate—it is on the assumption of a proportion of 3 to 2, and Mr. Watson said that the total cost of the two storeys would be £78,000; but have you made any estimate of your own as to that? I have not. It is quite true that I did hazard the opinion before this Committee that Mr. Kirkpatrick's proportion was a correct one, but without getting plans and sections I could not bind myself to figures on such an important question as that.
3105. Not even approximately? Well, I should not like to. It is quite true that the proportionate cost worked out to seventy and odd thousand pounds, but I think I made the remark that it seemed exceedingly high.
3106. Yes. Mr. Kent gave us an estimate of £58,000 for the double construction, and, of course, that is considerably lower than £78,000? £58,000 is exactly the average cost of the one floor of the present building.
3107. That is what it did cost originally? Yes, of one floor only. This is two floors.
3108. But building was dearer then than it is now? Not very much.
3109. Well, I notice that the Lands Office must have been a more expensive structure then than it would be if put up now, because your figures bring out the fact that the Lands Office has cost 64s. per square foot of *bona fide* office space? No, I have not done that. I told you, simply as a matter of general opinion, that the cost per foot square of the new floor would be about 47s. 6d. I have not ventured on the cost per foot of the present building.
3110. In this new plan that you have put before us, and which we are considering, the cost per square foot would only be £1 7s. 6d.? That is so.
3111. Does that not intimate that building must be very much cheaper now? Certainly; but then it is of a less monumental character. The Lands Office is probably the most substantial building in the whole of these colonies. It was built with every regard to substantial character, and the drawings themselves show it cannot be surpassed in the matter of construction. My instructions do not go so far as to build the same class of building now as was built in those days.
3112. The Lands Office was built for all time? Yes. For the reason I have given, amongst others, I fixed the estimated cost of the additions at 1s. 6d.
3113. But the building you are putting before us is to be a very durable building, is it not? Certainly. One distinctive difference between the two is that the Lands Office, on its principal fronts, is only one room deep, whereas the new building is two rooms deep; hence the maximum of accommodation in the latter building as against the minimum in the other.

3114. But that was all to give what would have been a yard space to this fire-proof building? It may be <sup>W. L. Vernon.</sup> for that reason.

3115. So the cost of that fire-proof building is really very great—not only its actual cost, but it has taken <sup>27 April, 1899.</sup> away all the inner rooms? It has been very costly to the building itself.

3116. Then, you are not able at present, at a moment's notice, to give us any definite idea of what the total cost of two storeys added to the Lands Office would be? I should not like, on such an important matter, to give an offhand opinion.

3117. It would not be less than £58,000? No; it would not be less. It would necessitate making a design showing how the cornice or the centres of each facade of the main building should be treated, for it would be the ridicule and contempt of all the community to see a four-sided building with just the top end of the tower peeping out from behind it, and no relief whatever. It would be a great architectural mistake, and therefore it would involve some consideration in designing the top so as to break that.

3118. To give all the accommodation asked for, we want the two storeys? At least.

3119. And we have not an official estimate before us of what the cost of those two storeys would be? My instructions from this Committee have never gone beyond one storey.

3120. *Mr. Trickett.*] Will you give us your estimate for the one storey at 20 feet high;—your estimate is £47,000 for 23 feet high, while Mr. Kirkpatrick's calculation is for 20 feet high, and so also is Mr. Kent's;—Mr. Kent's estimate is £40,308 for 20 feet high;—I forget whether you gave us a price for that? No; I have not. It comes to £2,000 per foot in height. That would take off £3,000. That is a mathematical calculation, at 1s. 6d.; that is not a guess. That reduces my estimate to about the same as Mr. Kent's would be for the same height—20 feet. But Mr. Kent's height is 22 ft. 6 in.

3121. *Mr. Watson.*] Did you read the evidence given by Mr. Kirkpatrick on 25th April? I have had an opportunity of glancing at it since I have been in this room to-day. I have seen his previous evidence.

3122. You see he adheres to his previous estimate of thirty and odd thousand pounds for one storey 20 feet high? Yes; I have seen that.

3123. Did you notice that he has taken as his basis 19,624 superficial feet? Yes.

3124. Inclusive of what he would afterwards have to take out in the way of corridors and staircases? Yes; I noticed that, and that is where he is wrong.

3125. Whereas, on the other hand, you and Mr. Kent, I understand, each take as your basis 19,000 feet of office space, exclusive of corridors, staircases, &c.; practically, it seems that Mr. Kirkpatrick takes for his basis for calculation of cost a much less superficial area than you and Mr. Kent take? That is quite true. The exact figures upon which we have all cubed up are as follows,—this is the gross superficial area taken in order to multiply by height: Mr. Kent, 26,872 feet; myself, 27,177 feet; Mr. Kirkpatrick, 20,563 feet.

3126. That accounts for the difference? It all lies in the mistake of Mr. Kirkpatrick.

3127. Mr. Kirkpatrick evidently got a wrong set of figures for his base line? He has evidently lost sight of the fact that he should have taken his whole heights by the area of the building, and not by the area of the floors available. That is where the whole mistake has arisen. The whole thing centres upon that.

3128. So actually Mr. Kirkpatrick, in ascertaining his cubic space, calculates upon a superficial area of between 6,000 and 7,000 feet less than you do? Quite so. It would not cover the whole building. It would be 7,000 feet short of covering the superficial area of the building.

3129. But between yourself and Mr. Kent there is practically an agreement in that respect? Only a difference of 200 or 300 feet, which will always arise in a building that is not rectangular.

3130. This building occupies a peculiar set of angles? That is so.

3131. So that you want very correct measurement to get at the actual superficial area? That is so.

3132. *Chairman.*] Mr. Kirkpatrick adds one-fifth to his estimate? He adds first one-fifth, and afterwards one-eighth. But that was a most dangerous thing to do in estimating the cost. It is never done under any consideration whatever.

3133. It seems to the Committee, I think, that you cannot make a hard-and-fast rule of that sort, because buildings would vary—there would be no two buildings alike? They must vary. A difference would occur, for instance, between a building L-shaped and a building perfectly square, and also with a courtyard.

3134. *Mr. Dick.*] What is the usual method of making these calculations? The general method is to take the superficial area of the whole of the building (inclusive of walls) by its height; and the height is reckoned sometimes from the bottom of the footings, and sometimes not, according to the nature of the footings, up generally to about the middle of the roof, and then every excrescence is added on by cube contents afterwards. In the case of this treble roof, I should take my cube measurements to the top of the roof, otherwise I should be short. But when the roof goes simply to an apex—an ordinarily-constructed roof—the measurement is taken half-way up.

3135. There can be no hard-and-fast rule? There is no rule to add one-fifth for the walls. I am absolutely certain that Mr. Kirkpatrick has never done that for a client yet.

3136. *Mr. Watson.*] And, of course, in providing for the difference in cost between an ornamental exterior and a plain one, you simply do it on the allowance for cubic feet? Yes, and according to one's judgment in constant professional work. I might also say that possibly a discrepancy has arisen between Mr. Kent and myself, to a small degree, by the measurements of the outside of the wall. In this building the cornices of the ornamental work have a large amount of projection beyond the true face of the wall itself. The London practice is to add to the outside measurement of the wall an average of the projections, otherwise you do not really get the true cube contents of the building, and it is just possible that Mr. Kent and myself, in our small discrepancy, may have done that.

3137. *Chairman.*] He said we must make some little allowance for scaling off? Some little discrepancies will necessarily arise in a case of that kind. I notice that Mr. Kirkpatrick quoted Professor Kerr's book. Well Professor Kerr gives, as a matter of general information, what proportions the walls of dwelling houses bear to the internal area of the walls. But he also gives an average of the general area of corridors and staircases compared to the rooms; but he never, on any occasion whatever, would value the rooms, and then add on a percentage for the walls or for his corridors. It would be an impossibility.

3138. *Mr. Dick.*] Will you look at Question 2,751 in Mr. Kirkpatrick's evidence? Yes; I am afraid I have been misunderstood here.

3139. You say that the practice is to make the calculations per cubic foot? Yes.

3140. That is upon the total cubic contents of the building? That is one way of estimating the cost of a building.

W. L. Vernon. 3141. Then the 47s. 6d. per superficial foot is got in this way—having made your estimate in that way per cubic foot, and also having ascertained what available superficial floor-space you will have, dividing one by the other gives you this 47s. 6d? That is so exactly.

27 April, 1899.

3142. Then Mr. Kirkpatrick has made the mistake of taking the total available floor-space and dividing that into your total estimate to bring out what he thought was the basis on which you made your calculation? He is utterly wrong.

3143. He was reversing the process? Yes; besides that, there is no height given of the superficial floor, so there is one unknown quantity, and it is therefore an impossibility.

3144. The price per superficial floor-space must vary with the height? Certainly. I brought that 47s. 6d. before this Committee only in order that they might compare the cost of floors in other buildings—that is, not the cost of the building, but the cost of accommodation for offices—but I never calculated the cost of the building at so much per superficial foot floor-space.

3145. In other words, the 47s. 6d. is simply a result of your estimate, and not one of the factors of it? It is the 19,600 and odd superficial feet of floor-space divided into the estimated cost.

3146. It is a result of your estimate, and not a factor of it? Yes, it is a result and not a factor of it.

3147. *Mr. Watson.*] If you will look at question 1940, you will see that in reply to a question put by me, you, in referring to the putting of an additional floor on the Lands Office, said:

It is practically the building of one floor only, with a roof to it, at a cost of 47s. per foot superficial of floor-space.

The impression seems to have obtained with some Members of the Committee that in using those words, "the building of one floor only, with a roof to it," you meant to put on a roof composed absolutely of new material;—did you intend that, or did you intend that it should be only so much new material as might be necessary, because of the alteration? That is what I would have said if I had been more specific. But, practically speaking, a great portion of it must be new roof.

3148. But you did not intend, by that remark, to imply that it should be an absolutely new roof—or did you intend so? No. It did not cross my mind at the time I mentioned, what the specific amount of new work and of old work would be; but I had in my mind this, and I have had it all through, that although there is a certain portion of roof which could be used again, yet the gaps to be filled and the loss and breakage in taking down and re-erecting the roof, and then the necessary work in raising the features in some respects, meant really a new roof. Besides that, the Committee must not lose sight of the fact that to build a new floor in that building means putting up two roofs; it means putting up a temporary roof, while the other is being taken off, otherwise the building must be vacated by the Lands Department and the Mines Department until a new roof has been put on; and all that cost is included.

3149. *Chairman.*] It has been stated that there is virtually a concrete floor above the present offices, and that any ordinary precautions would prevent any wet from coming in? It is true that is so. But at the same time it would never be safe to trust entirely to a concrete floor which has openings through it in several directions, and which must have a get-away for the water, without having a temporary roof of some kind. It has never been intended to protect the building from water; it is only coke concrete, and is porous.

3150. It is used for cooling purposes? Yes, for cooling and fire-protection purposes.

3151. Is not coke concrete, if properly made, impervious to water? Not altogether; it is too light in texture.

3152. But if it were properly made, no matter how light it is, it would be impervious would it not? Coke concrete would not be impervious to water. The more the cement can find its way into the interstices of the coke, the better it is; but it cannot all go through it. It can only take the surface of the coke, and there are always spaces which will be affected by the weather.

3153. In reply to Question 1939, you said:

The office floor-space which would be gained would be 19,643 superficial feet. The approximate cost has to be taken into consideration with the removal of the dome. An extra story would at once put the dome into bad proportions, and it means combination, so that I have had to calculate in that way. I should also have to alter the construction of the side domes. Taking these matters into consideration, and also basing my estimate, to some extent, although not fully, upon the original cost of the building, I find that the cost of the floor and re-roofing will be £46,880.

That is how I and others came to the conclusion that you were going to put a new roof altogether there;—I think you had that in your mind when you spoke? No. I always intended to use the old roof as far as it would go, because I know the principals could be used again, and also some of the slates, although some part of the slating is in bad order. This is owing to officers getting on to the roof during lunch hour and breaking the slates. The leakage reported to this Committee is nearly all due to that, and we have had complaints about it from time to time. There are two or three doors leading from the dome on to the roof, and those young fellows have their lunch out there.

3154. *Dr. Garran.*] Mr. Kent made a criticism that I should like to ask you about;—you know the light you have at the corridor on the south side? Yes.

3155. You block that light if a ventilator is put on? It can easily be removed, although I should like to connect the building at the top again, so as to get a good architectural effect. But it must not be forgotten that we have a side light on the corridor from the shaft in the centre.

3156. But at the end of the corridor next to the wall and not an outside window? It can be open if necessary. It should not be open at the extreme top of the building. The main cornice should go round.

3157. *Mr. Watson.*] If it were open, would it be necessary to have that area which you leave blank there? Yes; it would be necessary to have it to light the urinals. That is really a ventilating shaft.

3158. *Chairman.*] But are not the urinals lit from outside? Yes. I have cross ventilation there. It is not really wanted, because there is light on the southern side, but there is a good draught through that area, and I thought I would make use of it. There is one little matter to which I should like to refer. Mr. Kirkpatrick gave the following evidence in regard to the lifts at the Lands Office:—

2637. What kinds of lifts are they at present? Hydraulic lifts. They are worked by their own pumping and their own accumulators—not direct-acting. It is a very expensive gear which is in use there, and that could be sold, and the lifts could be connected with the Sydney Hydraulic Power Company.

2638. Would you recommend entirely new lifts? Yes. It would be an improvement to the building, too.

2639. What would be the expense of adding entirely new lifts? It ought to be done for £1,200.

2640. That would add to the cost? No; I included all that.

I should be glad if the Committee would note that Mr. Kirkpatrick was absolutely in error about those lifts. I do not think he could have seen them. They are direct-acting lifts, and they are supplied with water-power

water-power by the Hydraulic Power Company, and they were put in in 1893 with the very latest improvements that money could buy. I wrote to the Hydraulic Power Company myself this morning, because I thought I must have been dreaming when I read that, and they have confirmed my statement as to the use of their water. But a visit to the place would show anybody what we are doing. There is certainly an engine—a small gas engine—which runs some lithographic printing plant, and which pumps out the sump-hole in connection with the lifts; but that is really all it does. The lifts are the most modern lifts; they are direct-acting—they are rams, and they are supplied with water by the Hydraulic Power Company.

W.L. Vernon.  
27 April. 1899.

3159. With reference to the first proposal, I want to ask you a question;—on page 4 of your original statement there is the following:—

The outcome being that the sum of £18,000 was placed on the Estimates and voted for the erection of permanent offices for the Mines and Agricultural Department on the vacant block of resumed land facing Phillip, Bridge, and Young Streets.

Did you ever go into details in connection with that proposal? A rough sketch was made at the time in order to get sufficient data upon which to get money placed on the Loan Estimates that year for that building. It was intended to take a portion of the site on the Bridge-street frontage only down to the back-yard of those four existing houses—about half-way down, and with a lane behind it—and then on the Phillip-street frontage a large proportion was left for the question of the museum to be settled. The idea then was to build on the Phillip and Bridge Streets corner only a set of offices for the Mines Department, leaving the question of the museum open for further consideration. It is just possible I might find a sketch in the office, but that is really what the proposal was.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Public Offices, Phillip, Bridge, and Young Streets, Sydney.

APPENDIX.

A.

[To Evidence of Richard Teece.]

AUSTRALIAN MUTUAL PROVIDENT SOCIETY—HEAD OFFICE.—PARTICULARS OF ACCOMMODATION PROVIDED.

Superficial Areas.

Main office .....	52 feet by 41 feet = 2,132 feet	} 2,438 feet, exclusive of public space. Sixty clerks.
Annex .....	18 " by 17 " = 306 "	
Public space .....	52 " by 18 " = 936 "	
Manager's-room .....	18 " by 18 " = 324 "	
Secretary's-room .....	18 " by 18 " = 324 "	
Strong-room .....	19 " by 18 " = 342 "	
First floor .....	42 " by 59 " (less 17 feet by 13 feet) = 2,257 feet	} 2,987 feet total area used by clerks, forty-five in number.
Annex .....	39 " 6 inches by 18 feet 6 inches = 730 "	
Public space .....	17 " by 13 feet = 221 "	
Board-room .....	28 " 6 inches by 18 feet = 513 "	
Strong-room .....	14 " by 12 feet = 168 "	
Basement strong-room... {	19 " 0 inches by 18 feet = 342 feet 0 inches.	
	{ 11 " 3 " by 8 " = 90 " 0 "	
	{ 8 " 9 " by 6 " = 52 " 6 "	

484 feet 6 inches.

The cost of the building, exclusive of land, was about £56,000, and it was completed in 1880.

B.

[To Evidence of John Williamson Manson.]

NEW OFFICES FOR MESSRS. DALGETY & Co. (LIMITED), BENT AND O'CONNELL STREETS.—PARTICULARS OF ACCOMMODATION PROVIDED.

Ground plan.

	Square feet.	No. of persons.
Shipping department.....	927	6
Head of department .....	140	1
Captains'-room .....	88	2
