<b>P</b>			
<b>POINTS OF ORDER (continued) :—</b>			
<b>RULINGS OF SPEAKER (continued) :—</b>			
That motion in respect to expenditure from Revenue and Loan Account was irregular in form as submitted, as some of the Resolutions were inconsistent with each other, 143.			
That Motion of Adjournment in reference to payment of legal expenses of Sergeant McKee without the consent of Parliament, should not be discussed, as the item could be discussed in Supply, 193.			
That Hon. Member was in Order in Committee of the Whole in discussing <i>Hansard</i> reports of Speeches made in past Sessions, provided they were relevant to subject under discussion, 250.			
That the matter of referring the Central Railway Station, Devonshire-street, to the Public Works Committee, instead of submitting to Parliament the Hyde Park scheme recommended, was in Order; also, that the explanation of the Minister as to the probable revenue to be derived from the work was clearly that no revenue would result, 265.			
That motion for adjournment in reference to prosecution of Kate Burns, at Bourke, was not in Order, as matter could be discussed in Committee of Supply. (Mr. Speaker also referred to previous rulings), 282.			
That Member was not in Order in discussing any particular item in Committee on the Appropriation Bill which had been passed by Committee of Supply, 307.			
That Member was not in Order in moving in Committee the omission of an item in the Appropriation Bill, 307.			
That the proposed amendment on the Motion to refer the matter of the Extension of the Railway into the City was in accordance with the terms of the Public Works Act, 315.			
<b>POLICE :—</b>			
<b>BUILDINGS AT HILL END :—</b>			
Notification of resumption of land, under Public Works Act, laid on Table, 31.			
<b>BUILDINGS AT FREDERICKTON :—</b>			
Notification of resumption of land, under Public Works Act, laid on Table, 31.			
<b>INTERFERENCE OF POLICE IN REGARD TO BOXING EXHIBITION :—</b>			
Adjournment moved ( <i>Mr. Meagher</i> ) to call attention to, and negatived, 67.			
<b>ERECTION OF BUILDINGS AT COWRA :—</b>			
Notification of resumption of land under the Lands for Public Purposes Acquisition Act, laid on Table, 211.			
<b>NEW SOUTH WALES FORCE :—</b>			
Motion made ( <i>Mr. Norton</i> ) for appointment of Royal Commission, and Debate interrupted by Government Business taking precedence at 8 o'clock, 213.			
<b>PROSECUTION OF KATE BURNS, AT BOURKE, UNDER VAGRANCY ACT AND WITHDRAWAL OF SUMMONS :—</b>			
Adjournment moved ( <i>Mr. Norton</i> ) in reference to; <i>Point of Order</i> .—That this motion anticipated discussion in Committee of Supply,—upheld by Mr. Speaker, 282.			
<b>POLICE REGULATION BILL :—</b>			
Received from the Legislative Council, and on motion ( <i>Mr. Reid</i> ), read 1 <sup>o</sup> , 40; read 2 <sup>o</sup> ( <i>Mr. Wise</i> ), committed, reported without amendment, Report adopted, 172; read 3 <sup>o</sup> , passed, and returned to Council, 186; Assent reported, 207.

<b>SPEAKER</b> :— Appoints Temporary Chairmen of Committees, 2, 133. Lays on Table his Warrants appointing Elections and Qualifications Committee, 2, 120; reports maturity, 14, 145. Lays papers on Table, 5, 18 <sup>(8)</sup> , 69, 259. Commission of Deputy, to Administer Oath of Allegiance, 14. Announces return of Writs, 119 (1 <sup>o</sup> ). Reports resignation of Member, 119. Intimates his intention to consider Points of Order, 106. Clerk informs House of unavoidable absence of, and Deputy-Speaker takes Chair, 151, 215, 253. Clerk adjourns House in the absence of the Speaker and Deputy-Speaker at time appointed for meeting, 251; Standing Order amended in reference to absence of Speaker and Chairman of Committees, 265; Assent reported, 271. Submits Nomination to fill vacancy on Public Works Committee separately, 328. Reports letter from Governor enclosing Despatch in reference to Address on Federal Constitution Bill, 201.		
<b>RULINGS OF</b> :— That a motion for adjournment of the House could not be moved before the Address in Reply to the Governor's Opening Speech had been dealt with, 4. That motion for adjournment in reference to Australian Jockey Club Trust was out of order as it was not definite, and introduced another subject for discussion, 84. That amendment on motion to declare the Member for Paddington, Mr. Neild's, seat vacant, to refer matter to the Elections and Qualifications Committee was in order, 88. That an amendment on a proposed amendment on the Motion of Censure against the Government was relevant to the proposed amendment, 107. That an amendment on a proposed amendment on the Motion of Censure was relevant to the original motion, 107-108. That after the mover of a motion, on which an amendment has been proposed, had replied, an Hon. Member could only address the House on the amendment, 136. That amendment, on motion for removal of Green Rocks, in connection with Hunter River Flood Mitigation Scheme, to refer matter to the Public Works Committee, was in order, 142.		

REFERENCES TO THE VOTES AND PROCEEDINGS, VOL. I—18TH PARLIAMENT—THIRD SESSION, 1899.	PAPERS ORDERED TO BE PRINTED.	
	VOL.	PAGE.
<b>S</b>		
<b>SPEAKER (continued) :—</b>		
<b>RULINGS OF (continued) :—</b>		
That motion in respect to expenditure from Revenue and Loan Account was irregular in form as submitted, as some of the Resolutions were inconsistent with each other, 143.		
That motion of adjournment in reference to payment of legal expenses of Sergeant McKee without the consent of Parliament, should not be discussed, as the item could be discussed in Supply, 193.		
That Hon. Member was in Order in Committee of the Whole in discussing <i>Hansard</i> reports of Speeches made in past Sessions, provided they were relevant to subject under discussion, 250.		
That the matter of referring the Central Railway Station, Devonshire-street, to the Public Works Committee, instead of submitting to Parliament the Hyde Park scheme recommended, was in Order; also, that the explanation of the Minister as to the probable revenue to be derived from the work was clearly that no revenue would result, 265.		
That motion for adjournment in reference to prosecution of Kate Burns, at Bourke, was not in Order, as matter could be discussed in Committee of Supply (Mr. Speaker also referred to previous rulings), 282.		
That Member was not in Order in discussing any particular item in Committee on the Appropriation Bill which had been passed by Committee of Supply, 307.		
That Member was not in Order in moving in Committee the omission of an item in the Appropriation Bill, 307.		
That the proposed amendment on the motion to refer the matter of the Extension of the Railway into the City was in accordance with the terms of the Public Works Act, 315.		
That an amendment to alter the route on the motion to carry out the Extension of the Railway into the City, as recommended by the Public Works Committee, was an evasion of the Public Works Act, 315.		
<b>SPECIAL ADJOURNMENT (See "ADJOURNMENT").</b>		
<b>STAGE CARRIAGES BILL :—</b>		
Received from the Legislative Council, and on motion ( <i>Mr. Reid</i> ) read 1 <sup>o</sup> , 39; read 2 <sup>o</sup> ( <i>Mr. Wise</i> ), committed, reported without amendment, report adopted, 171; read 3 <sup>o</sup> , passed, and returned to Council, 193; Assent reported, 232.		
<b>STAMP DUTIES (AMENDMENT) BILL :—</b>

1899.  
(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND  
TRAMWAYS.

(ANNUAL REPORT OF THE RAILWAY COMMISSIONERS FOR THE YEAR ENDED 30TH JUNE, 1899.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35.

Printed under No. 3 Report from Printing Committee, 22 August, 1899.

Office of the Railway Commissioners of New South Wales  
Sydney, 15th August, 1899.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—  
SIR,

In accordance with the provisions of the 45th clause of the Government Railways Act of 1888, 51 Vic. No. 35, we have the honor to present, for the information of Parliament, our Annual Report upon the working of the Railways and Tramways for the year ended June 30th, 1899.

GENERAL REMARKS.

The result of the year's working may be briefly summarised as under :—

	Railways.	Tramways.	Total.
Total Earnings ...	£3,145,273	£348,556	£3,493,829
Total Expenditure ...	1,690,442	288,022	1,978,464
Balance after paying } working expenses }	£1,454,831	£60,534	£1,515,365

RAILWAYS.

The total miles open for traffic on the 30th of June last, was 2,706½.

The following extension was opened for traffic during the year :—

	Mileage.	Date opened.
	m. c.	
Berrigan to Finley ...	13 73	16th September, 1898.

The line between Tamworth and Manilla, and the first section of the extension from Inverell to Moree, referred to in our last Report, will shortly be opened.

Further extensions of the Pioneer class are now under construction, viz. :—

			Miles.	Chains.
Byrock to Brewarrina	...	...	58	11
Moree to Inverell (2nd section)	...	...	60	59

and lines of a similar character have been approved by Parliament, between Koora-watha and Grenfell (a distance of 31 miles 51 chains), and The Rock to Green's Gunyah (a distance of 24 miles 20 chains).

The pioneer lines already constructed continue to prove satisfactory.

The capital cost of the lines open for traffic on the 30th June amounted to £37,992,276. The interest on this sum, at 3·640 per cent., the average interest paid on the debt of the Colony is £1,382,919. After providing for this charge and having paid all Working Expenses there is a credit balance of £71,912.

The earnings show an increase of £118,525, viz. :—Coaching contributed £29,714, and Goods, £88,811; Second-class passengers contributed £26,973; Parcels and Miscellaneous, £5,693; General Merchandise, £20,662; Live Stock, £47,787; Coal and Coke, £11,771; and other Minerals, £11,765. First-class passengers show a decrease of £2,952, and Wool, £3,174.

In connection with the increased earnings, 1,492,861 additional passenger journeys were made, and 393,338 additional tons of traffic conveyed.

The train miles run total 8,806,647, being an increase on last year of 466,309 miles.

The gross Earnings per train mile are 7s. 1 $\frac{3}{4}$ d., and the net, 3s. 3 $\frac{3}{4}$ d., as compared with 3s. 4 $\frac{1}{2}$ d. last year.

The percentage the Working Expenses bear to the gross revenue has increased from 53·34 to 53·75. This increase is more than accounted for by the large amount of unremunerative work done in the removal of starving stock to districts where pasture was available, and in many instances their subsequent return, and the carriage of fodder for stock in drought-stricken localities from which removal was not practicable. Freight reductions in these connections were made to the extent of £37,500. In addition, the higher price of coal represented an increased expenditure of £11,273.

In view of the severity of the season which generally prevailed throughout the Colony, the result of the year's working is most satisfactory, having proved "a record" both in gross and net earnings.

The successful operation of the lines during the current year depends largely upon the grain season, and at present the prospect in that direction is most encouraging.

In the wool traffic a considerable shortage appears inevitable.

## ANNUAL REPORT OF RAILWAY COMMISSIONERS.

## EXTENSION OF THE RAILWAY INTO THE CITY.

This most urgent matter is practically in the same position that it was a year ago, and has been for many years.

The subject was referred to in our last report in the following terms :—

“The proposed extension of the railway into the city is a matter which demands some mention in this report, not with the object of advocating any particular route—our views on that subject having been placed most fully before the Public Works Committee—but because of the absolute necessity for a decision in the matter. The time has arrived when it must be emphatically stated that the passenger business cannot longer be conducted at Redfern with reasonable convenience to the public, or without unnecessary risk.

“The accommodation is inadequate, and consequently there is, notwithstanding the exercise of the utmost care and the use of all modern appliances for safe working, an element of danger which would not attach to a terminal station arranged to meet traffic requirements.

“For the daily business the accommodation is below what is required, and for holiday or exceptional traffic it is very deficient.

“We trust that the question of the extension of the railway into the city will be finally dealt with on an early date.

“The experience of the past twelve months has more fully impressed the Commissioners with the absolute necessity for a prompt settlement of this long-pending question.

“Now that the Public Works Committee has reported in favour of the Hyde Park Scheme, which has been from the first recommended by the Railway Commissioners, we hope that there will be no delay in giving effect to the Report of the Public Works Committee.”

We must adhere to our opinion that the Hyde Park scheme will best meet the requirements of the City extension; and whatever may be the outcome of the inquiries that are now being made on the subject, we fervently hope that this will be the last Report in which it is necessary to state that the question is still unsettled.

#### INTERCOLONIAL RAILWAY CONFERENCES.

These conferences have, after many attempts, been successfully inaugurated. The first was held in Sydney in September of 1898, and the second in Brisbane in May last. Much good work has been done in bringing about uniformity of practice, and the competitive rates which prevailed between New South Wales and Queensland were satisfactorily adjusted. The more important question of this character as affecting New South Wales, Victoria and South Australia still remains to be dealt with; but it is hoped some advance in the direction of settlement will be made at the next conference, which is to be held in Adelaide.

#### UNIFORM GAUGE.

Nothing further in the direction of a final settlement of this matter can be announced; but it is satisfactory to note that Victoria and South Australia reported at the last intercolonial conference that all new structures and appliances were being designed, where practicable, with due regard to the future adoption of the 4 ft. 8½ in. gauge, being that of New South Wales.

The only question now remaining to be determined is as to how the cost of the change is to be apportioned, which is one for the respective Governments to deal with.

#### SAFETY APPLIANCES.

This important subject has had consistent attention, and rather more than the usual progress has been made. Recently it was decided to introduce Sykes' system of lock and block on the busy suburban sections, and it is hoped that the first installation will within the next few months be in operation on the fast road between Petersham and Ashfield.

The fitting of the goods stock with the Westinghouse quick-acting brake has been practically completed.

It is satisfactory to mention that during the year we have had an immunity from accidents of any serious character.

#### RATES.

Some alterations have been made in the fares, which should tend to facilitate and cheapen travel; and an arrangement for refunds on account of unused halves of ordinary return tickets introduced.

The reduced stock rates have been before referred to in connection with the recent drought; but it may be added that they were more largely availed of than hitherto, and the concessions must have proved of great assistance in facilitating the removal of stock from drought-stricken districts.

Through, instead of local, rates have been introduced on the Camden, Narrabri to Moree and Jerilderie to Finley lines.

The general truck rates have been rearranged and reductions made in other directions to the advantage of the user of the railways.

With few exceptions the lines generally show an improvement, and the aggregate loss been reduced by £19,895.

## ACCOMMODATION FOR THE TRAFFIC, AND CONDITION OF LINES AND ROLLING-STOCK.

The passenger and goods stock have been maintained in good order and condition.

Pullman sleeping cars have been placed on the Sydney-Brisbane Mail, and cars of a similar type are about to be added to the Southern and Western Mail trains.

Second-class corridor lavatory carriages have been placed on to the Sydney-Melbourne Express, which is now a corridor train throughout. In addition to the improvement thus made in this train, the second-class lavatory compartment carriages which were attached to it have been transferred to other long-distance trains, and are much appreciated.

In the near future it is proposed to add to the 1st and 2nd class corridor carriage accommodation, and also to the standard type of suburban cars.

The goods stock has been increased by 330 vehicles, and will be shortly further augmented by about 70 now under construction.

The replacement of worn-out goods vehicles has been kept well in hand.

Provision has been made for 8 new powerful engines to replace 12 smaller ones, and a number of engines are under order to meet future requirements.

Four passenger tender locomotives have been converted into tank engines for suburban working, and 6 passenger and 2 goods tank engines have been rebuilt.

In addition, 12 new boilers have been constructed in the Eveleigh Shops for renewal purposes.

Generally the expenditure on renewals and repairs of engines, carriages and wagons has exceeded that of last year by £3,576, and is in excess of the preceding year by £40,405.

To facilitate the renewal and repairs of engines, a new erecting-shop has been built at Eveleigh, and it is being equipped with modern machinery, electric overhead Cranes and other appliances.

The permanent way and station buildings have been maintained in good condition, and the expenditure in complete relaying, also rerailling, resleepering, and lifting and ballasting was greater than that of the preceding year.

The large work of renewing the Wagga Wagga viaduct in steel has been continued, and will probably be completed during the current financial year.

## GRADES AND CURVES.

Extensive improvements on the Northern, North-western, and Southern Lines have been made, and a large work between Harden and Cootamundra is in hand.

The expenditure is remunerative and productive of better train working, and where these results can be secured it will be continued.

Surveys have been completed and plans prepared for the duplication of the North Shore Line from St. Leonards to Lindfield, and the work will be expeditiously carried out.

## RESULTS OF THE WORKING.

## RAILWAYS.

## TRAMWAYS.

On the 30th of June, 1898, 66 $\frac{1}{4}$  miles were open for traffic.

The electric line, Ocean-street, Woollahra, to Rose Bay, a distance of 1 mile 24 chains, was opened on the 4th of October, 1898.

The total tramway earnings for the year show an increase of £34,685, the working expenses £28,881, giving an improved net result of £5,804.

The cost of the lines open for traffic is £1,516,343, and the return upon the capital invested, £4 0s. 1d.

### CONDITION OF EXISTING LINES.

The lines have been maintained in good order. Relaying has been carried out where necessary, and a large amount of work done in anticipation of the introduction of electrical traction.

### ACCOMMODATION FOR TRAFFIC.

The rolling-stock has been well maintained, but no additions have been made to the steam tramcars. Latterly, in the evenings, consequent largely on the increased traffic in certain directions, the inconvenience of overloading has arisen; but this was unavoidable, as to have increased the number of the old type of cars would have involved building additional rolling-stock, to be superseded almost immediately by electrical cars. The difficulty has, however, been minimised as far as practicable by running a number of the cars built for the electrical lines attached to the steam trams.

One of the advantages claimed for the George-street electric tram, shortly to be opened, was that it would largely divert traffic from the existing overcrowded main City line; and there is no doubt that this will be so, and the temporary difficulties now experienced will largely disappear.

Considerable improvements have been made at Redfern Railway terminus to meet the requirements of electrical tram working to and from the station, and it is anticipated that the change will be much appreciated.

A short time will be allowed to elapse after the opening of the George-street tram before it is taken into the Railway premises. This is deemed prudent in order to gain some slight experience of the volume of business in George-street.

The completion of the power-house at Ultimo, and the necessary cable connection with North Shore, will permit of the existing mixed system of electric and cable now running in the populous northern suburb being made wholly electric, and the full complement of cars required to accommodate the traffic then put upon the road. This cannot be done at present for want of sufficient haulage power.

The Ocean-street cable line has to the present proved financially and otherwise satisfactory; but in view of the limited capacity of cable as compared with electric traction to rapidly move an increasing volume of traffic, we must consider whether the Ocean-street tramway should not be made electric when the general conversion takes place.

This alteration will be imperatively necessary before any substantial reduction in the fares, as has been asked for, can be granted. To justify such concessions it is essential that there should be a good prospect of a proportionate increase in traffic. Assuming that this would be realised, the present cable system would be quite

inadequate to cope with it during the busy hours of the day, and therefore it must be superseded by one capable of giving a more frequent and quicker service, and this can best be done by introducing electricity.

The tramways generally are in a good financial position, but the greatest care is necessary to keep them so, and compliance with applications for reductions in fares must be deferred until the results which will follow on the general introduction of electrical traction can be better gauged.

Further information regarding the working of the various sections will be found as an Appendix, page 38.

## TEN YEARS' RETROSPECT.

The close of the first decade following the passing of the Government Railways Act of 1888 seems to us a fitting opportunity for reviewing the progress made during that time. The period referred to ended a few months after the close of the year covered by our last Annual Report, and is reviewed in the form of an Appendix hereto.

In dealing with the subject, which is a large one full of information, nothing is aimed at but a record of facts, yet to bring them out it has been necessary to make comparisons. These, however, are only made in order that the progress of the Railways and Tramways may be thoroughly understood. The review will also, we believe, be taken as an emphatic endorsement of the value of the Government Railways Act.

We beg to most fully acknowledge the great service rendered to the country by the late Mr. E. M. G. Eddy, the first Chief Railway Commissioner under the Act, who so ably laid the groundwork of the success of the present system of management, and by whose bright intellect and herculean labours it was firmly established.

We desire also to bear testimony to the efficiency and diligence of the executive officers, and the co-operation of the staff generally.

In this connection we are pleased to be able to state that at the close of the last financial year we were in a position to award increased rates of pay to the extent of about £35,000 per annum, chiefly to the lower paid staff. During the two previous years, the advances respectively amounted to about £27,000 and £24,000 per annum, and we hope, should the working results prove satisfactory during the current half-year, to enlarge the scope of advancements in pay at the termination of the period.

We have the honor to be,

Sir,

Your most obedient Servants,

CHARLES OLIVER,  
Chief Commissioner.

W. M. FEHON,  
Commissioner.

DAVID KIRKCALDIE,  
Commissioner.

## APPENDIX I.

Chief Mechanical Engineer's Office,  
Eveleigh, 21st July, 1899.

Sir,

I have the honor to report, for the information of the Commissioners, that the rolling stock, the machinery, pumping plant, and water supplies of the Railways have been maintained in efficient working condition.

*Locomotives.*

Twelve new boilers have been constructed in the Eveleigh shops during the year on stores account.

Four passenger tender engines, Nos. 81, 87, 91, and 172, were rebuilt, converted into tank engines for suburban line; and 6 passenger tank engines and 2 goods tender engines were rebuilt. All were fitted with new boilers and charged to working expenses.

Three hundred and fifty-three engines have been repaired during the year, 224 of them at Eveleigh, 56 at Newcastle, and the remaining 73 at smaller depôts; 239 of them received heavy repairs, and the remaining 114 had general repairs of a lighter character.

Three hundred and twenty-five boilers were overhauled during the year, 234 of them at Eveleigh, 53 at Newcastle, and the remaining 38 at smaller depôts; 106 of them, as they fell due, were internally examined, heavily repaired, refilled with tubes and returned to locomotives. Forty-eight stationary boilers were overhauled; 10 of them received heavy repairs. Eight new stationary boilers and 5 old locomotive boilers replaced worn-out plant for stationary purposes.

*Carriages and Wagons.*

Fifty-two vehicles were rebuilt as replacements during the year, of which 7 wagons of the open bogie type (class G) were strengthened and converted into bogie bolster wagons (class F). 1,315 passenger vehicles were repaired—1,010 of them at Eveleigh and the remaining 305 at Newcastle. 322 of these vehicles received heavy repairs, and the remaining 993 had general repairs of a lighter character. 5,803 wagons and vans passed through the Eveleigh and Newcastle shops during the year, 2,088 of which were heavily repaired. 2,868 axle boxes of defective designs were removed, replaced by standard boxes, and charged to working expenses.

*New Stock charged to Capital Account.*

Three second-class corridor carriages, built in the Eveleigh shops, were added to the coaching stock, and 330 merchandise vehicles (130 built in the Eveleigh shops and 200 by contractors) were added to the goods stock during the year. The cost of these vehicles charged to capital account is £49,324.

*New Stock charged to Working Expenses.*

Eight powerful goods engines have been charged to working expenses during the year, replacing 12 smaller engines.

Nine four-wheeled horse-boxes and 1 bogie horse-box have been built in the Eveleigh shops as replacements of 13 old four-wheeled horse boxes.

As replacements, 156 merchandise vehicles were built in the Eveleigh shops, and provision made for 50 sheep-vans, ordered from contractors, of which 12 have been delivered.

£56,734 was charged against the working expenses of the year on account of the above engines and vehicles.

The following statement shows the relative mileage executed and the working costs of the Locomotive Branch for 1898 and 1899 :—

	1899.	1898.	Increase.	Decrease.
Train miles ... ..	8,806,647	8,340,338	466,309	.....
Engine miles ... ..	12,557,316	11,908,461	648,855	.....
Percentage unproductive to train miles ... ..	42.59	42.78	.....	0.19
Revenue ... ..	£3,145,273	£3,026,748	£118,525	.....
Expenditure ... ..	£777,087	£736,616	£40,471	.....
Do per cent. to revenue... ..	24.71	24.34	0.37	.....
Cost in pence per train mile ... ..	21.177	21.197	.....	0.020
Do engine mile... ..	14.852	14.846	0.006	.....

The attached statements show the relative position of the locomotive, carriage, and wagon stock on the 30th June, 1898 and 1899.

W. THOW,  
Chief Mechanical Engineer.

To the Secretary to the Railway Commissioners.

#### APPENDIX II.

#### RAILWAYS.—RETURN OF WORKING ROLLING STOCK, 30TH JUNE, 1899.

A.—6 powerful goods engines, with a tractive power of 172,662 lb., replace 9 small type engines with an aggregate tractive power of 163,296 lb. Two goods tender and 6 passenger tank engines have been rebuilt, and 4 passenger tender engines have been converted into suburban tank and rebuilt.

B.—3 new second-class corridor cars have been added to stock; 1 bogie horse-box has replaced 4 4-wheel horse-boxes; 9 new 4-wheel horse-boxes have replaced 9 4-wheel horse-boxes; 19 carriages of various classes have been rebuilt, and 8 converted into other classes.

C.—330 open 4-wheel wagons have been added to stock; 201 goods vehicles have been rebuilt or replaced during the year—33 were rebuilt, and 168 replaced an equal number of other vehicles.

## APPENDIX III.

REPORT on the Condition of Permanent-way and Works for the year ended  
30th June, 1899.

Office of Engineer-in-Chief for Existing Lines,  
25 July, 1899.

Sir,

I have the honor to report, for the information of the Commissioners, that the permanent-way, works, and buildings have been thoroughly maintained during the past year.

*Relaying, Reballasting, &c.*

During the period, 81 miles 23 chains have been completely relaid, rerailed, or resleepered; 241 miles 22 chains have been lifted and ballasted; 82 miles 61 chains of fencing have been renewed; and 24 miles 66 chains of new fencing have been erected in connection with deviation works.

35,654 new sleepers, and 36,417 good sleepers recovered on relaying, have been used for partial resleepering and repairs, adding a total of 33 miles to the length of road put into perfect condition during the year.

Special attention has been given to station and other buildings, which, wherever needed, have been thoroughly repaired and painted. Many additional works, rendered necessary by expanding traffic, have been completed. In these are included a large number of works fairly chargeable to Capital, but which have been carried out and debited to Working Expenses.

All bridges have been systematically inspected, and, where necessary, repairs have been carried out. Work in connection with the renewal of the Wagga Wagga viaduct in steel has been steadily carried forward.

Among large buildings erected during the year may be mentioned the new locomotive erecting shop at Eveleigh, 400 feet by 120 feet, built of brick and floored with concrete.

*Improvement of Grades and Curves.*

Operations under this heading have been carried out almost entirely on the Northern and North-Western Lines, where the grades have been improved in the vicinity of Thornleigh and Point Clare, and between Wyong and Morisset, Waratah and East Maitland, Glennie's Creek and Liddell, Braefield and Quirindi, Quipolly and Werris Creek, Werris Creek and Gunnedah, and Boggabri and Baan Baa, while others are rapidly approaching completion in the vicinity of Carlingford, Berowra, and Woy Woy, and between Muswellbrook and Scone.

On the Southern Line similar works have been completed near Marrar, and others are in progress between Harden and Cootamundra.

All the above works have been smartly and economically carried out by gangs acting under the direction of Departmental officers.

Surveys have been completed and plans prepared for the duplication of the North Shore Line between St. Leonards and Lindfield, and the work will be started on an early date.

*Extension opened.*

The only extension added to the mileage during the year was that between Berrigan and Finley, 13 miles 73 chains, pioneer type, which was opened for traffic on the 16th September, 1898.

Sidings laid in and extended ... .. 13 miles 16 chains.  
 Sidings relaid ... .. 22 chains.

	New.	Second-hand.	Total, year ended 30 June, 1899.	Total, year ended 30 June, 1898.

Coal and Coke for 1898 and previous years did not include the Coal hauled by private engines; the weight so hauled in that year was 224,418 tons. To compare with the present year the total coal tonnage should, therefore, be 3,042,801 tons. The traction charges of £2,607 on the 224,418 tons having been included in Miscellaneous Earnings instead of Coal also increases the total coal earnings to that extent.

## Percentage of Expenditure in each Division.

Divisions of Expenditure.	Year ended 30 June, 1899.	Year ended 30 June, 1898.
	%	%
Maintenance of Way, Works, and Station .....	21·90	21·92
Locomotive working .....	24·57	23·44
Engine repairs and renewals .....	13·00	13·56
Carriage and Waggon repairs and renewals .....	8·40	8·62
Traffic Expenses .....	27·90	28·21
Compensation (Passengers) .....	0·14	0·08
Do (Goods) .....	0·18	0·13
Gratuities to Widows and Children of Employes, and payment on account of Pension Allowance .....	0·16	0·28
Fire Insurance Fund .....	0·07	0·08
General Expenses .....	3·68	3·68
	100·00	100·00

## APPENDIX VII.

RETURN showing the Number of Passengers, Tonnage of Goods, Train Mileage, Earnings, Working Expenses, Percentage of Working Expenses to Gross Earnings, Net Earnings, Capital spent on Lines open, and Interest on Capital Invested each year, from 1855 to 1899, inclusive.

Year.	Length of Line.	Number of Passengers.	Tonnage of Goods and Live Stock	Train Mileage.	Earnings from Coaching Traffic.	Earnings from Goods Traffic.	Total Earnings.	Working Expenses.	Earnings per Train Mile.	Working Expenses per Train Mile.	Percentage of Working expenses to Gross Earnings.	Net Earnings.	Total Capital expended on Lines open.	Interest on Capital Invested.

## APPENDIX XVIII.

## REPORT of the Tramway Locomotive Superintendent.

Randwick, 13 July, 1899.

To the Secretary to the Railway Commissioners,—

Sir,

I have the honor to submit, for the information of the Railway Commissioners, the following report on the working of the Locomotive Department of the Tramways for the year ended 30th June, 1899:—

## SYDNEY CITY AND SUBURBAN LINES.

The rolling-stock, machinery, and plant have been maintained in efficient working order, and although the expenditure shows an increase over that of the previous year, this is due to necessary provision having been made for the renewal of rolling-stock. Apart from this, the cost of working the steam lines shows a decrease of 0.44d. per tram mile run. The tram mileage shows an increase of 153,935 (131,400 steam lines and 22,535 cable).

In September last, an important improvement was effected in connection with the working of the King-street to Ocean-street cable tramway, new cable-drums being provided at a cost of over £800, and the speed increased from 8 miles to 9 miles per hour.

Following are particulars of the work performed in maintaining the rolling-stock in good order:—

Motors: 67 received general overhaul; 70, heavy repairs; 756, more or less extensive repairs, occupying from one to eight days each; and 441, light repairs.

Cars: 138 thoroughly overhauled and repainted (103 for steam lines, 28 cable, and 7 electric trail-cars; 39 repaired and partially repainted; and 1,379 received minor repairs, occupying about one day each. In addition, 55 trucks and 35 cars for other lines were repaired.

## NORTH SHORE CABLE TRAMWAY.

The rolling-stock, cable, &c., have been maintained in good working order. Eight cars received general overhaul.

## NEWCASTLE, KOGARAH TO SANS SOUCI, AND MORPETH TO EAST MAITLAND LINES.

The whole of the rolling-stock, machinery, and plant of these tramways has been maintained in efficient order, while the requirements of the traffic have been fully met.

GEO. DOWNE,  
Locomotive Superintendent.

## APPENDIX XIX.

## Report of Engineer for Tramways.

Office of Engineer for Tramways, 21 July, 1899.

To the Secretary to the Railway Commissioners,—

Sir,

I have the honor to submit, for the information of the Railway Commissioners, the Annual Report on the condition of the Permanent-way, Buildings, and Works under my charge on the City and Suburban Tramways, for the year ending 30th June, 1899.

The whole of the lines have been maintained in good working order, although the constant rain during the latter portion of the year necessitated a large amount of macadam being used for ordinary maintenance—12,325 tons, as against 11,800 last year. The only addition to the mileage during the year was the extension from Ocean-street to Rose Bay, a distance of 1 mile 24 chains, and which is operated electrically; also the duplication of the Waverley Cemetery line for a distance of 48 chains. The partial duplication of the Crown-street line is also in progress.

The following relaying was carried out:—Marrickville--Eumore terminus to Edinburgh loop, 31 chains, single road; Botany—Cleveland-street junction to Boundary-street, 44 chains, double track; Elizabeth-street, from Market-street to Bathurst-street, 22 chains, double track; George-street West, 17 chains, single track; Crown-street, from Collins-street loop towards Cleveland-street, 17 chains, single track. Total length, 2 miles 37 chains, single track. The relaying in Elizabeth-street included an extension of the use of 80 lb. T rail, with specially-prepared non-expansion joints, and repaving, while in Crown-street 83 lb. girder rails were substituted for the light 42 lb. rails formerly in use, and the track repaved.

Four waiting-sheds were erected during the year, and twelve painted and renovated. The power-houses and bridges have also received attention.

The Ocean-street cable line has been well maintained, although the swelling of the paving-blocks has caused trouble through closing the slot rails in King and William Streets.

The North Shore cable line is being bonded, and the longitudinal sleepers, where necessary, renewed, with a view to conversion to electric traction on the completion of the George-street line.

I have, &amp;c.,

G. R. COWDERY,

Engineer for Tramways.

THE GOVERNMENT RAILWAYS ACT, 1888.

---

RAILWAYS AND TRAMWAYS OF NEW SOUTH WALES.

---

TEN YEARS' RETROSPECT.

PERIOD—22nd OCTOBER, 1888, to 20th OCTOBER, 1898.

---

Appendix to the Report of the Railway Commissioners.

August, 1899.

*Each branch of Service is dealt with separately. For convenience, the financial results are based upon a comparison of the years ended 30th June, 1888 and 1898, and are given in tabulated form. Special reference is made to the Organisation, the Ambulance Movement, the Railway Institute, and the Intercolonial Railway Conference.*

---

THE management of the Government Railways and Tramways was, on the 22nd October, 1888, vested in the Railway Commissioners, as provided by the Government Railways Act of 1888, and the progress made during the decade ended with October last is reviewed in the following pages.

The organisation of the Staff is first dealt with, then the changes and improvements made throughout the different Branches of the Service.

It will be found in the Permanent Way Department that the economies effected permitted of considerable additional work being done, while the total working expenses for the financial year of 1898 was £75,032 less than it was in the year 1888, although the mileage increased by 577 $\frac{1}{4}$  miles.

The improvement of grades and curves, the introduction of more powerful engines, the fitting of the Westinghouse Automatic Quick-acting Brake to the rolling-stock, and the quadruplication of the suburban lines, effected considerable economy and accelerated the train service.

Increased safety appliances, additional and accelerated train services, improved carriages, and cheaper rates resulted in very satisfactory development of the passenger and goods traffic.

The Ambulance Movement, the establishment of an Institute for the instruction and social improvement of the Staff, and, latterly, with the co-operation of the other Colonies, the inauguration of Intercolonial conferences for the interchange of ideas on railway matters, are of great value in the working of a large system.

It will be found that economies have been effected in various directions, yet every attention has been given to the upkeep of the lines and rolling-stock, both of which have been much improved, and the value of the property as a whole increased. At the same time the returns to the Treasury have been augmented to the extent of £2,451,895.

### ORGANISATION.

The first matter which received the attention of the Commissioners was the organisation of the Staff and the method of conducting the business.

Many changes were made, and a complete system for the future was introduced. As affecting the general routine of business, it may be briefly described as follows :—

Once a month the whole of the principal officers under the Traffic, Locomotive and Existing Lines Branches have independent meetings, presided over by the Head of each.

The Traffic Officers' meetings, presided over by the Chief Traffic Manager, are attended by the principal Traffic Officers and the Outdoor Locomotive Superintendents. At these meetings the train running, mileage run, the accidents and failures for the previous month, and all matters of importance concerning the working of the traffic are thoroughly reviewed. The Locomotive meetings, which are presided over by the Chief Mechanical Engineer, are attended by the principal metropolitan and district Locomotive Officers, and matters affecting the Locomotive Branch, such as the condition and examination of the rolling stock, the stores consumed, the train mileage, &c., are dealt with. At the meetings of the Permanent-Way Officers, presided over by the Engineer-in-Chief, questions affecting the existing lines are considered, such as the condition of the roads, the necessity for renewal of particular parts, the condition of station buildings, the works of improvement in hand, &c.

The minutes of these meetings are subsequently considered by the Commissioners, and meetings with the chief officers, each presided over by one of the Commissioners, is held. The whole of the minutes then come before Commissioners sitting as a Board for final decision or direction as to the matters that may arise at the various meetings and conferences.

There are other Committees, over which one of the Commissioners presides, dealing with finance and accounts, stores, law, tickets, fares, medical and tramways, the minutes of such meetings being dealt with at the Board meeting already referred to.

It is to be understood that these meetings do not deal with the every-day business of the Department, which is dealt with as it arises; but they enable a regular and comprehensive review of the month's working, and incidents in connection therewith, to be made.

The principal officers are required to make themselves acquainted with the requirements of the lines, and for this purpose periodically go over the whole of the railways to see that proper attention is being paid to all matters, and if additional facilities are required for working the traffic more conveniently or expeditiously, to report the same.

At intervals the Commissioners also make a personal inspection of the lines; and have made it a rule since taking office that every portion of the railways shall be visited at least once a year, more frequent visitations of course being paid where important works are in progress or large expenditures involved.

### THE PERMANENT-WAY DEPARTMENT.

When the Commissioners took office in 1888 the condition of the permanent-way was a cause for much anxiety. After careful investigation it was considered absolutely necessary, in the interest of safety and economy, to renew a considerable portion of the Main lines—consisting of iron rails, weighing 70 and 75 lb. per yard in 18, 21 and 24 feet lengths, which had been in the road for many years—with steel rails weighing 80 lb. per yard and 30 and 40 feet in length, and ballasting with bluestone or other hard rock material; also to reballast the lines, strengthen the bridges and improve the character of the lines generally; and this policy has been continued.

On the 30th of June, 1888, 2,114 miles of line were open for traffic; during the past ten years the mileage was increased by  $577\frac{1}{4}$  miles; making the total, on the 30th of June, 1898,  $2,691\frac{1}{4}$  miles.

During the period under review 30 per cent. of the lines open in 1888, viz., 643 miles, were relayed, at a cost of £614,614, as compared with 161 miles, costing £181,485, during the previous ten years; and practically the whole of the Southern and Western Lines have now a high-class permanent-way of steel rails. About 60 per cent. of the iron rails on the Northern Line were replaced with steel rails, and it is expected that in the near future the whole of the iron rails on this line will be similarly dealt with.

With the view of strengthening the lines, and to reduce the cost of maintenance, sleepers spaced from 2 ft.  $8\frac{1}{2}$  in. to a maximum of 3 ft. 1 in. were respaced 2 ft. 6 in. from centre to centre.

In connection with the renewing and improving of the permanent-way 1,283,954 of the highest class of ironbark sleepers were used, of which 914,251 9 ft. by 10 in. by 5 in. replaced sleepers of 8 ft. by 9 in. by  $4\frac{1}{2}$  in.

The original sandstone and gravel ballast used having, to a large extent, perished, it was found necessary to extensively reballast the permanent-way; for this purpose 1,440,955 tons, principally blue-metal, were used, and the ballast under the sleepers has been increased in depth 60 per cent.

In connection with the reballasting, the use of Rogers' Patent Hopper Wagons and Ballast Ploughs, the patent rights of which were purchased, very considerably cheapened the work. These appliances effect a great saving in the handling of ballast; 200 tons can be unloaded and spread by one man in twenty

minutes, while under the old system the same work would occupy at least twenty men about one and a quarter to one and a half hours. The system is of great importance in working, as anything done to minimise the time the ballast trains are in the sections saves the time of large gangs of men and facilitates the working.

The acquisition of quarries at various places cheapened the cost of ballast by about 70 per cent., and this great economy extends to future maintenance.

Many facilities have been introduced; each ganger has been provided with a tricycle to enable him to move speedily over his section, inspect his length daily, and spend more time with his men. Special geared trollies have also been provided to enable the fettlers to move more rapidly from point to point with appliances for effecting repairs. Improved weeding tools and ratchet-lifting jacks have also been brought into use.

By the aid of these improved facilities, equally efficient service in the maintenance has been effected with a largely reduced staff. The total number of men employed in 1898, was 2,823 as compared with 3,140 in 1888, notwithstanding that the mileage increased by  $577\frac{1}{4}$  miles. The number of way and works inspectors of all descriptions was also reduced, from 58 to 35. The consequent economies permitted additional expenditure in other directions and a larger portion of the permanent-way and other works were renewed than previously, while, at the same time, the total permanent-way working expenses fell from £429,001 in 1888 to £353,969 in 1898.

Many timber bridges were renewed and replaced by steel, iron and brick structures. The timber bridge over the Ironbark Creek, near Hexham, 110 feet span, and another, of 67 feet span, over Styx Creek, near Hamilton, were renewed in steel on concrete foundation.

The old timber bridge at Wagga Wagga consisting of six viaducts, with a total of 317 spans, each span measuring 29 ft. 6 in. in length, and averaging 15 feet in height, is at present being reconstructed. The abutments and foundations for the piers are built in cement concrete, with steel trestles bolted to the foundation, carrying steel plate girders with open top, the sleepers being bolted to the top plates. About one-half of the viaduct has been renewed, and the work is being proceeded with, without causing any delay to the traffic. When complete about 5,000 cubic yards of concrete and 1,650 tons of steel will have been used.

The standardising and classification of station and other buildings, also permanent-way materials, has been attended with very satisfactory results.

#### IMPROVEMENT OF GRADES AND CURVES.

These subjects are most important in connection with the economical working of the New South Wales Railways, and have engaged attention from the first; the lines being most exceptional in their character, having been constructed with an enormous proportion of steep gradients (631 miles of grades, varying from 1 in 30 to 1 in 75), the worst being on the trunk lines, and so situated that the whole volume of traffic had to pass over them. It was therefore decided to reduce some of the steep gradients which interfered with the loading of trains over long sections.

The first improvement was made when the Main Southern Line between Granville and Picton was duplicated, the ruling grade having been then reduced from 1 in 66 to 1 in 100, by which the loading of trains was increased 50 per cent. for a distance of 40 miles.

On the Main Western Line at Wentworth Falls an isolated grade of 1 in 33 which ruled the loading of all trains from Mount Victoria to Penrith, a distance of 43 miles, was cut out, and the loading of up goods trains increased 100 per cent.

The cutting out of Lapstone Hill Zig Zag, a work of some magnitude, admitted of the increased loading of trains and accelerated the running generally over the mountains.

On the Northern Line, between Ravensworth and Singleton, a series of grades varying from 1 in 33 were reduced to 1 in 60, resulting in the loading of trains being increased by 100 per cent. for a distance of 70 miles.

The grades of 1 in 55 between Dubbo and Nyngan were reduced to a maximum of 1 in 70, which permitted of through trains of 45 vehicles being hauled by one engine unassisted from Bourke to Dubbo, a distance of 225 miles.

Other important improvements in grades have been made at various places, particulars of which are as follows:—

Section.	Length of Line affected by alteration.	Original ruling Gradient.	Against Up or Down Traffic.	Improved Grade.	Percentage Increase of Engine Loads.
	mls. chs.				
Nundah to Wingen ... ..	51 30	1 in 46 ...	Down...	1 in 60...	30 per cent.

Diagrams showing the improvements in some of the more important alterations in grades are attached.

All the 8-chain curves on the Blue Mountains were reduced to a curvature of not less than 12 chains radius; in some instances the curves were cut out, and in several cases the grades improved.

“ PIONEER ” RAILWAYS.

In the Annual Report for the year ended the 30th of June, 1891, it was suggested that in extending the railways into level country, where the traffic would at first be exceedingly light, lines, designated “ Pioneer ” Railways, should be constructed. It was considered that suitable lines of the standard gauge, on which trains might be worked at a speed of 15 miles per hour, could be laid down at a cost of £1,750 per mile (exclusive of bridges and station accommodation), and, when the traffic developed sufficiently to justify it, these lines should be gradually improved, so as, eventually, to make them equal in all respects to the other parts of the railway. Subsequently, in connection with a proposal to construct narrow-gauge railways, it was strongly urged that in preference to introducing a break of gauge, which “ could only be looked upon as a national calamity,” the “ Pioneer ” lines, as already suggested, should be constructed.

The proposal at first met with a considerable amount of opposition, chiefly on the alleged ground that the lines could not be constructed for the estimated cost per mile which was less than half that of any of the lines constructed up to that time; but the Construction Department has been able to lay down lines of this class, the cost per mile for the permanent-way not exceeding the estimate, and the total first cost being from £1,800 to £2,000 per mile.

The following lines of the “ Pioneer ” class have been completed within the last three years, and are now being worked :—

Line.	Length.	Total cost.	Cost per mile.
	m. ch.	£	£
Jerilderie to Berrigan ...	21 65	39,563 ...	1,814
Parkes to Condobolin ...	62 60½	117,224 ...	1,868
Narrabri to Moree ...	63 10	138,886 ...	2,200
Berrigan to Finley ...	13 73	32,702 ...	2,350
	-----	-----	-----
	161 48½	£328,375	Average per mile £2,032

The original cost of the Narrabri-Moree line was about £2,000 per mile; but, owing to the increase of business, improvements became necessary, and it is now classed as an ordinary branch line.

The “ Pioneer ” lines have been laid down in widely-separated districts of the Colony.

The lowest cost per mile for any line previously constructed had been that of the light railway from Nyngan to Cobar, a distance of 81 miles 27¼ chains, the total cost of which was £302,211, being equal to £3,715 per mile.

The cost of the lines generally has been greatly cheapened by the reduction of the rates for materials. It was the custom to charge against the cost of new lines ordinary rates, and thus swell the revenue at the expense of capital, but the rates for the bulk of the material have since been reduced to one-fourth.

## LOCOMOTIVE DEPARTMENT.

## ENGINES.

In 1888 the Locomotive, Carriage and Waggon Stock generally was in a very unsatisfactory condition. Of the 428 engines in stock, 5 had been on the line over thirty years, and 29 for periods ranging from twenty-two to twenty-six years, and the mean age of more than one third of the entire stock was fifteen and a half years; many of the locomotives had done good work, but had become unsuitable and practically worn out, while others were in urgent need of repairs. It was therefore absolutely necessary to order new engines to take the place of the worn-out inferior types, and obtain others to meet the increase in traffic and the requirements of new lines.

New engines to the number of 186 were supplied, and 74 rebuilt. Of the former 90 replaced, 122 of the least useful of the old type, and the remaining 96 were additions, and, being more powerful, were equal to 140 of the old stock.

On the 30th of June, 1898, the number of engines had been increased to 492, and the aggregate tractive power from 6,509,725 lb. to 8,865,833 lb. The average tractive power of the engines in 1888 was 15,210 lb., while those supplied since that date give an average of 21,327 lb.

The introduction of more powerful engines resulted in the haulage of much longer trains, and, following on this, the postponement of the duplication of the busy sections of single lines, that would otherwise have become necessary at great expense. Further, these engines have contributed materially to the saving previously referred to under the head of improvement to grades and curves.

The increased haulage power in connection with the introduction of more powerful engines will be readily understood from the following:—

## THREE Classes of the new powerful Engines.

Grade.	10-wheeled Engine. Illustration "A." "P" Class.				Consolidated Goods Engine. Illustration "B." "J" Class.		Australian Consolidated Goods Engine. Illustration "C." "T" Class.	
	Working Passenger Trains.		Working Goods Trains.		Working Goods Trains.		Working Goods Trains.	
	Tons hauled.	Speed per hour.	Tons hauled.	Speed per hour.	Tons hauled.	Speed per hour.	Tons hauled.	Speed per hour.
		Miles.		Miles.		Miles.		Miles.
1 in 40 ... ..	225	20	275	10	350	10	350	10
1 in 75 ... ..	260	30	505	12	580	12	615	12
1 in 100 ... ..	255	35	600	15	620	15	700	15
1 in 150 ... ..	330	35	700	18	650	18	750	18

## THREE Classes of the Old Engines.

Grade.	4-wheels coupled. "C" Class.		6-wheels coupled. Goods tender. "A" Class.		6-wheels coupled. "B" Class.	
	Working Passenger Trains.		Working Goods Trains.		Working Goods Trains.	
	Tons hauled.	Speed per hour.	Tons hauled.	Speed per hour.	Tons hauled.	Speed per hour.
		Miles.		Miles.		Miles.
1 in 40 ... ..	90	20	200	10	230	10
1 in 75 ... ..	120	30	345	12	395	12
1 in 100 ... ..	110	35	375	15	430	15
1 in 150 ... ..	165	35	450	18	460	18

A comparison of the working in 1888 and 1898 shows how largely the powerful engines, improvement of grades and curves and other modern appliances, have contributed to the better financial results.

	1888.	1898.
Gross earnings per mile of line open ... ..	£ 1,123	£ 1,138
Working expenses per mile of line open ... ..	749	607
Net earnings per mile of line open ... ..	374	531

## CARRIAGES.

The carriage stock was considerably strengthened and improved by 324 carriages of superior modern types on bogies, the total capacity having been increased from 28,823 seats in 1888 to 35,470 in 1898, and by the rebuilding of 68 carriages, and the conversion of a number of the least up-to-date first-class carriages into second-class carriages. In addition, 24 lavatory composite bogie brake-vans, 9 lavatory composite bogie mail-vans, and other coaching vehicles, were placed in traffic.

## WAGONS.

The Goods Stock, which numbered 8,833 vehicles, was augmented by 2,043 new wagons of improved design and increased carrying capacity. 1,570 worn-out vehicles of inferior types were replaced by 1,164 new wagons of greater capacity, and 654 have been rebuilt.

The total carrying capacity of the stock on the 30th of June, 1898, was 78,836 tons, as compared with 59,011 tons in June, 1888.

With regard to the new stock, a considerable number of bogie trucks have been introduced, viz., 136 tube-framed open wagons and vans, 82 composite framed open wagons, 37 refrigerator cars, 96 sheep and cattle vans, and 50 composite brake vans.

Great advantage has been gained in the carriage of large consignments of goods and economising the space at stations by the introduction of a limited number of the large bogie-class of wagons; but it would not be advantageous to have too

many of this class, as, for general purposes, the ordinary four-wheeled goods wagons, of a carrying capacity of from 8 to 10 tons, a large number of which have been built, are the most useful.

A sum of £3,613,782 was expended on the repairs and renewals of locomotives, carriages and wagons as compared with £1,522,589 during the previous ten years.

A new foundry has been constructed in connection with the Eveleigh Workshops, the building previously used for the purpose having been converted into an addition to the Boiler Shop; and with the view of dealing expeditiously with the repairs in connection with the more powerful engines a larger erecting-shop has been built, which will be fully equipped with modern machinery, electric overhead cranes and other appliances.

Engine-sheds have been provided at Hamilton (Newcastle), Clyde, Hurstville, Homebush, Campbelltown, Harden, Werris Creek, Orange, Queanbeyan, Temora, Waterfall, Richmond, Mount Victoria, Coolabah, Gundagai, Hornsby Junction, Gunnedah, Milson's Point and Murrurundi.

With regard to the improvements made in connection with carriages and wagons, it may be stated that the stock was considerably strengthened by replacing 2,000 weak axles with strong ones, fitting 5,500 vehicles with standard draw-gear, and substituting 11,600 standard axle-boxes for others which were of defective design.

The expenditure in oil, tallow and waste was considerably reduced by the adoption of a standard axle-box, the erection of plant for washing waste and sponge-cloths, and the substitution of mineral for castor oil. The importance of these economies will be seen from the following comparison of the cost of working in 1898 as compared with 1888 before these improvements were made :—

	1888.	1898.
Expenditure in oil, tallow and waste ...	£31,730	£15,111

Illustrations of the engines, carriages, and wagons are attached.

#### TRAFFIC DEPARTMENT.

The traffic returns show very satisfactory increases.

The Coaching and Goods Earnings for the year ended the 30th of June, 1898, compared with the year ended the 30th of June, 1888, are as follows :—

	COACHING.	GOODS.	TOTAL.
	£	£	£
Year ended 30th of June, 1898... ..	1,126,257	1,900,491	3,026,748
"          "      1888 ... ..	918,975	1,376,149	2,295,124
Increase ... ..	207,282	524,342	731,624

In the Coaching Department the most striking feature is the falling off in first-class passenger earnings, the whole of the increase having been made out of second-class passengers, parcels and miscellaneous earnings.

The growth of the second-class traffic calls for some notice. It developed largely when the financial depression occurred in 1893, and in consequence of the improved second-class accommodation has greatly increased.

A comparison with 1888 is not available, as the first and second-class passenger traffic was not kept separate until 1890. The following comparison, however, shows how largely the public are availing themselves of the cheaper means of conveyance.

Year ending June.	1st Class.		2nd Class.		2nd Class Workmen's Cheap Tickets.		Total.	
	Journeys.	Revenue.	Journeys.	Revenue.	Journeys.	Revenue.	Journeys.	Revenue.
	No.	£	No.	£	No.	£	No.	£
1888 ...	.....	.....	Not available.		.....	.....	15,174,115	783,336
1890 ...	5,440,327	431,760	9,641,250	442,594	1,990,368	15,510	17,071,945	889,864
1898 ...	<b>3,898,396</b>	<b>308,893</b>	<b>15,041,642</b>	<b>594,054</b>	<b>4,293,168</b>	<b>27,783</b>	<b>23,233,206</b>	<b>930,730</b>

#### AVERAGE Earnings per journey.

	1st Class.		2nd Class.		2nd Class Workmen's.		Total.	
1888 ...	.....	.....	Not available.		.....	.....	1s. 0·58d.	
1890 ...	1s. 7·05d.	.....	11·02d.		1·87d.	.....	1s. 0·59d.	
1898 ...	1s. 7·02d.	.....	9·43d.		1·55d.	.....	9·61d.	

The Parcels and Miscellaneous Coaching Earnings show an increase of £59,888.

In the Goods Department all classes of traffic contributed to the increase, viz. :—

#### EARNINGS.

Year.	General Merchandise.	Wool.	Live Stock.	Coal and Coke.	Total Increase.
	£	£	£	£	£
Year ended 30th June, 1888 ...	848,175	217,671	164,847	145,456	.....

<b>Increase over 1888 ...</b>	<b>255,771</b>	<b>65,500</b>	<b>155,685</b>	<b>47,386</b>	<b>524,342</b>
<b>TONNAGE.</b>					
	Tons.	Tons.	Tons.	Tons.	Tons.
Year ended 30th June, 1888 ...	1,152,377	74,148	68,101	2,105,146	.....
Do do 1893 ...	1,287,660	107,491	150,115	2,228,577	.....
Do do 1898 ...	<b>1,546,737</b>	<b>98,608</b>	<b>166,836</b>	<b>2,818,383</b>	.....
<b>Increase over 1888 ...</b>	<b>394,360</b>	<b>24,460</b>	<b>98,735</b>	<b>713,237</b>	<b>1,230,792</b>

Owing to a succession of droughts in various parts of the country the number of sheep depastured has fallen from 61,831,416 in 1891 to 40,147,603 in 1898.

The wool traffic has in consequence declined from the highest point reached in 1895, namely, 747,480 bales weighing 125,095 tons and earning £397,012, to 609,910 bales weighing 98,608 tons earning £283,171 in 1898.

The carriage of Live Stock, however, increased from this cause, many thousand truck loads having been moved to districts where pasture was available and the supplies for sale in the metropolitan markets much augmented. There has also been a large increase in the Frozen Meat trade, the exports having increased from 5,251 tons in 1891 to 26,978 tons in 1898.

The Grain traffic shows very satisfactory development, the tonnage having increased from 198,491 tons in 1891 to 340,040 in 1898, and the ton mileage from 22,130,334 to 57,313,853. The total area under crops in 1898 was 1,820,209 acres, as compared with 855,627 acres in 1888.

The mention of increased agricultural pursuits while writing of a succession of droughts as seriously affecting our flocks may appear contradictory, but is explained by the fortunate escape of portions of the districts devoted to agriculture from the serious effects of the bad seasons, although the crops in some districts were a complete, and in others a partial, failure, the larger area under cultivation produced the increased tonnage.

Coal and Coke and other minerals also show satisfactory increases.

#### ACCOMMODATION AND FACILITIES FOR CONDUCTING THE TRAFFIC.

The quadruplication of the Suburban Line between Redfern and Flemington, and the reconstruction of the station arrangements, together with the duplication of the line, from Granville to Picton, Hurstville to Waterfall, Strathfield to Hornsby, and Adamstown to Teralba, largely contributed to the suburban traffic being conducted with economy and great regularity.

The Passenger train services generally have been considerably accelerated, and additional trains given where there was reasonable prospect of the traffic being developed.

The Passenger train mileage of 1898, compared with 1888, shows an increase of 1,005,292 train miles; about 420,000 of this increase was in connection with new lines, and the balance represents additional train services.

The working of the Passenger Trains on the lines generally may be mentioned with satisfaction. For the three months ended 30th September last the following was the record of the running of the trains:—

TRAIN PUNCTUALITY RETURN.—PERCENTAGE.

Description.	To time, and not exceeding two minutes late.	Two to five minutes late.	Above five minutes late.
	Per cent.	Per cent.	Per cent.
1. Main Suburban (business trains), 5 to 10 a.m. ...	100	.....	.....
2. Local, 5 to 10 a.m. ... ..	97·84	1·23	·94
3. Through Mail and Express ... ..	90·81	2·02	7·17

1. Main Suburban, covering distances up to 13 miles.  
 2. Local, covering distances up to 77 miles.  
 3. Through long-distance Trains and Express and Mail Trains, covering runs of varying distances up to 503 miles, of which, in one instance, 465 miles are single line. The total single lines worked consist of 2,523 miles, of which there are 1,033 on the Southern Division, 817 on the Western, and 678 on the Northern.

The Passenger Rolling-stock, already referred to, has been greatly improved. All the four and six-wheeled vehicles (316) of inferior designs have been replaced by the American type of car of improved design for the Suburban traffic. Pullman sleeping cars are now run daily on the Sydney-Melbourne Express and Sydney-Brisbane Mail Trains, and corridor carriages for first and second class passengers, similar in exterior design to the Pullman car, and replete with the best accommodation, have recently been brought into service for the Sydney-Melbourne Express, forming a vestibule corridor train throughout. Sleeping carriages for through traffic on branch lines have also been introduced.

Lavatories were not provided, except in sleeping cars, prior to 1888. Now all main line through trains have first-class lavatory carriages, and second-class lavatory compartment cars are attached to the mail trains.

Brake-vans of an improved design have been brought into use on all Mail, Express and through trains, and bogie mail-vans, at one end of which a special compartment has been set apart for bicycles, have superseded the old four-wheeled vehicles.

The carriages, which suffer so much by exposure in a climate such as ours have been protected by the erection of carriage-sheds. This accommodation has been provided at Sydney, McDonaldtown, Homebush, Hurstville, Moss Vale, Goulburn, Harden, Junee, Albury, Bathurst, Wallerawang, Mount Victoria, Condobolin, Cowra, Bourke, Cobar, Dubbo, Blayney, Orange, Forbes, Hornsby, Werris Creek, Moree and Jennings.

New Passenger Stations have been built at Bowral, Moss Vale, Wentworth Falls, Katoomba, Lithgow, Orange, Blayney, Helensburgh, Carlton, Erskineville, Exeter, Riverstone, Cockle Creek, Greta and Hartley Vale, and at Newcastle the passenger station has been greatly enlarged and improved, and includes a large Refreshment Room. A new Parcels' Depôt and Cloak Room have been provided at Redfern, and considerable additions and improvements to sidings, platforms and stations have been made at a large number of other places throughout the lines.

The working at the present terminus at Redfern has been much improved by the widening of the Redfern Tunnel, the rearrangement of the lines, and providing an additional up and down road between Redfern and the locomotive and carriage-sheds at Eveleigh. Additional roofed platforms have also been provided.

But the terminal accommodation is altogether inadequate to satisfactorily deal with the constantly increasing traffic, and so long as the extension of the railway into the City remains unsettled the business cannot be conducted with reasonable convenience to the public, or without unnecessary risk.

Extensive and convenient marshalling sidings, illuminated at night by the electric light, have been provided at Clyde, by which the goods traffic in and out of Sydney is expedited, expense saved, and the deliveries at the central terminal goods depôts at Darling Harbour and Redfern, and other stations, accelerated.

The new junction constructed from the Northern to the Main Line enables the heavy stock traffic from the north to be transferred with facility to the stock yards at Flemington, avoids delay and shunting on the Main Suburban Line, and effects a saving of 4 miles 37 chains on each engine bringing stock to Flemington.

A large covered shed for agricultural produce at Redfern, capable of holding 87 wagons, an outward goods-shed fitted with hydraulic cranes at Darling Harbour, capable of accommodating 97 wagons, and a wool-shed for dealing with the wool traffic at the same place, capable of holding 118 wagons, have been erected.

Considerable additional siding accommodation has also been provided at Newcastle in connection with the coal traffic, and goods sheds, loading banks, sidings, weigh-bridges, engine turntables and numerous other minor works have been provided at various places to meet the development of the traffic.

In 1888 separate generating plants supplied Eveleigh and Redfern with the electric light. They have since been centralised, and the current supplied for those places as well as Darling Harbour from a generating station at Eveleigh, giving considerably increased light, while the cost has been reduced by about £2,000 a year, and a further saving will be effected when the current can be supplied direct from the new power-house at Ultimo.

The electric light has also been provided at Flemington, Bullock Island and Newcastle by which the work can be performed with greater expedition and safety.

The improvement to grades and curves, the introduction of more powerful engines, the quadruplication and duplication of the lines where considered necessary, and other important additional facilities, have resulted in improved working and general economy.

The loading of the goods trains has increased 42·75 per cent. as compared with 1891 before the improvements took place.

#### SAFETY APPLIANCES.

Considerable improvements and additional safety appliances have been introduced. In 1888 only 28 miles of line were worked under the "Absolute Block," whereas, in December last,  $8\frac{1}{2}$  miles of quadruple,  $154\frac{3}{4}$  double, and  $992\frac{3}{4}$  miles of single line, making a total of 1,156 miles, were worked under this system. The number of places where points and signals have been interlocked having increased from 104 to 417.

The following table shows the progress that has been made :—

Year.	Miles of line open for traffic.			Miles of line on which the Traffic is worked under the Absolute Block System.			Number and Percentage of Places which have or have not Points and Signals interlocked.					No. of Signals.	No. of Levers.	Inter-Locked Level-crossing Gates.
	Quad-ruple and Double.	Single.	Total.	Quad-ruple and Double.	Single.	Total.	Number of Places.			Percentage.				
							Inter-locked.	Not inter-locked.	Total.	Inter-locked.	Not inter-locked.			
June, 1888 ...	71½	2,042½	2,114	28	...	28	104	318	422	24·63	75·36	2,103	1,492	17
June, 1893 ...	167	2,525½	2,692½	163¼	992¾	1,156	417	221	638	65·35	34·65	3,365	4,284	30

The system of block for the single lines is a combination of the advantages of the "Staff" and the "Absolute Block," known as "Tyer's Tablet," and "Webb and Thompson's Electric Staff Systems." Both afford satisfactory results; the work and responsibility of the Staff have been reduced, and the traffic facilitated and rendered much more secure.

For Express trains a system of automatic exchanger has been adopted, which permits drivers, travelling at a regulated speed, to exchange the tablet when running through stations.

In connection with sections where the traffic is light and tablet instruments are in use, a system has been devised by which special instruments are substituted for the usual instruments at the more remote ends of two sections, for the purpose of cutting out the intermediate tablet stations during certain hours of the day or night. By this, reductions are made in the number of officers which would otherwise be required.

For outlying country lines a modification of the Electric Train Staff System has been arranged, so that if the traffic at any crossing station is insufficient to justify a person being placed in charge, the guard of the train can exchange the staff without in any way interfering with the security of working.

These improved appliances have made it possible to effect savings in various directions. For instance, owing to telephones being used in connection with the "Absolute Block" instead of Morse instruments under the old system, a saving has been effected in the number of telegraph operators, the expenditure in 1898 compared with 1888, having been reduced by one-half, equal to about £7,000 per annum, although the number of messages transmitted has been doubled.

Seventy-one over-bridges and subways have also been provided for the greater security of life in connection with the crossing of the railways.

The fitting of the goods and live stock vehicles with the Westinghouse automatic quick acting brake has now been completed, and practically the whole of the rolling-stock, including engines, passenger carriages, and goods and live stock vehicles have now been fitted with this valuable appliance by which the trains have been expedited and various economies effected.

The following figures show the relative number of fatal accidents to passengers and employees on the New South Wales Railways for the year ended the 30th of June, 1898, as compared with the United States and Great Britain, with the latest date for which the statistics are available, viz. :—

				<i>Fatal Accidents to—</i>	
				Passengers.	Employees.
New South Wales, June, 1898	...	...	1 in	7,744,402	1 in 1,175
United States,	„	1897	...	1 in 2,204,708	1 in 486
Great Britain,	Dec.,	1897	...	1 in 7,747,520	1 in 945

#### FARES AND RATES.

Recognising the great importance of cheap railway transit and providing improved facilities for working the traffic economically, fares and rates have been considerably reduced, and additional train services given where possible to do so without interfering to any serious extent with the necessary improvement in the financial condition of the property.

In the passenger department, workmen's weekly tickets have been extended to a radius of 30 miles of Sydney and Newcastle, and the hours during which the tickets were formerly available also extended.

A lower scale of fares has been adopted for the Newcastle Suburban area, and the Sydney Suburban area was enlarged.

Fares have been reduced to pleasure parties, and various concessions have been made in connection with the holiday excursion arrangements.

Cheap trains are periodically run to and from the country at greatly reduced fares, which are generally less than the single fare for the double journey.

The rates for packages prepaid, not exceeding 112 lb., sent by passenger trains, were revised, with a view to encouraging small parcels traffic, and reductions made, as shown hereunder, on parcels not exceeding 70 lb. :—

Weight.	22 Miles.		50 Miles.		150 Miles.		300 Miles.		500 Miles.

In the Goods Department important concessions have been made to the Agricultural, Mining, and Pastoral industries, the rates having been very considerably reduced.

TABLE showing the reduced rates of Agricultural produce, Minerals, Live Stock, and Agricultural Implements and Mining Machinery for the year 1898 compared with 1888.

\* Grain, Flour, Meal, Bran, Pollard, Millet Seed, Beet-root, Green Chicory-root, Potatoes, Pumpkins, Melons, Turnips, and other Agricultural Produce, not otherwise classified. † Forwarded at the convenience of the Department. General Goods.—A general truck rate was introduced in May, 1894, for distances over 90 miles, embodying considerable reductions upon the ordinary tonnage rates, and further concessions have since been made.

These are the principal directions in which low rates may be expected to develop traffic, and to this end efforts have been specially directed. The higher rates for goods of a general character have also been materially lowered. Large numbers of articles have been reduced to a lower class, and the 4th class rate, which was as high as 9d. per ton per mile has been abolished altogether, so that the 3rd class is now the maximum rate.

The rates for agricultural produce have been made specially low in consequence of the settlement that the cultivation of the land induces. A rough estimate of the value to the Railways of 10,000 acres of land under cultivation, as compared with 10,000 acres employed for running sheep, strongly illustrates this point. A distance of 300 miles from Sydney has been adopted in each case, the estimated freight from the agricultural industry being £2,660 as compared with £87 from the pastoral product.

With the view of encouraging small producers, single packages of such commodities as dairy produce, butter, cheese, eggs, fruit, jams, vegetables, garden produce, honey and wine have been reduced by about one-half the rates formerly charged.

To assist pastoralists in time of drought, which have been severe of late years, the rates for starving stock moved from one district to another have been reduced, on the forward journey by 50 per cent., and on the return journey by 75 per cent. Fodder for starving stock and store stock carried by rail owing to the stock routes being impracticable, as well as sheep sent to boiling-down works in consequence of grass and water failing, are also carried 25 per cent. less than the ordinary rates.

To encourage development, Agricultural and Mining machinery are carried at low rates, and the introduction of a reduced truck rate for general merchandise has been a considerable advantage to traders and others.

The rates on Wool have also been reduced.

The reduced rates on coal in the Newcastle, Western and Illawarra Districts amount to over £25,000 a year for the past four years.

As previously stated, the great importance of cheap railway transit has been recognised, and every economy in working has been studied to bring about the desirable result. In addition, however, to economy of working, volume of traffic is required; and this indispensable factor can only be derived from increased population and greater development of the land.

On a large portion of the lines trains only run once a day, and in some instances three times a week. When the traffic is sufficient to warrant these services being materially increased, a proportionate reduction of rates may be looked for; and if the volume of traffic approaches in a comparable degree to that of other countries where cheaper rates prevail, any inequalities which may exist will disappear.

In addition to the absence of volume of traffic, there is the disadvantage of a large proportion of unbalanced running, empty trucks having to be hauled in one direction, and thus practically reducing the earning power of the trains by one-half. There is also the prevalence of severe grades to be reckoned with—a formidable barrier in the way of economic working; nevertheless, much has been done in the direction of cheapening the conveyance of both passenger and goods traffic.

RETURN of Ton Mileage for the year ended 31st December, 1898, as compared with 1891.

The ton mileage was not worked out for 1888, 1889, and 1890. The comparison cannot therefore be made with those years.

It is computed that if the 1891 rates had been in operation during the seven years, 1891 to 1898, the revenue would have been increased to the extent of £725,885. This sum represents considerable additional haulage without any additional revenue, as will be seen from the figures given below:—

	Tons carried for no additional Revenue.	Tons carried 1 mile for no additional Revenue.
	tons.	tons.

1898	...	...	...	...	...	...	53·34	13·35 „	404,071
							Total	...	£2,451,895

It was not formerly the practice to include in the Railway Accounts the stores obtained from the Government General Stores, the value of postage stamps, the cost of printing and stationery obtained from the Government Printing Office, gratuities paid to employees, Bank commission, &c., but the Accounts are now debited with all expenditure, and the Working Expenses have, very properly, been augmented by such items to the extent of about £250,000 during the past ten years.

The expansion of capital, gross, and net savings and miles opened during the period under review were as follows :—

	Year ended—	
	30 June, 1888.	30 June, 1898.
Railway Capital ... ..	£27,722,748	£37,719,402
Gross traffic ... ..	£2,295,124	£3,026,748
Net profit, after paying working expenses ...	£764,573	£1,412,143
<i>(Return on Capital, after paying working expenses)...</i>	2·85%	3·75%
Miles open—Railways ... ..	2,114	2,691½

The total number of Staff employed on the Railways, the average number of Staff per mile of line open, the amount of salaries and wages paid, and the gross earnings for the year ended the 30th of June, 1888, compared with 1898, are as follows :—

	June, 1888.	June, 1898.	
Total Staff ... ..	9,605	10,574	
Average Staff per average mile of line open ... ..	4·70	3·98	
	Salaries.	Wages.	Total.
Year ended 30th June, 1888...	£220,869	£978,522	£1,199,391
Do 1898...	221,031	993,558	1,214,589
Increase	162	15,036	15,198

The actual and average rates of pay of the principal groups of employees, and privileges of the service are given in the list attached.

The following table shows the comparative value and importance of the Railway property of this Colony, as compared with the other Australasian Colonies:—

	LINES OPEN.		CAPITAL.	
	1888. miles.	1898. miles.	1888. £	1898. £

Total Net Earnings ... ..	£2,828,931	£4,075,950

For years ending 30th June, 1888 and 1898, except in the case of Tasmania (December, 1888 and 1897), New Zealand (March), Queensland (December, 1888, and June, 1898), and West Australia (December, 1890, and June, 1898).

## TRAMWAYS.

THE Tramways also show very satisfactory results. In October, 1888, 38½ miles of line were open; various lines and extensions have since been constructed, and on the 30th of June last a total of 65 miles of line had been opened for traffic, viz. :— 54 miles steam, 4 miles cable, and 7 miles electric.

The following shows the comparative financial results of the working for the ten years ending the 30th June, 1898, compared with the previous ten years, viz. :—

	Ten years ending 30th June, 1888.	Ten years ending 30th June, 1898.
	£	£
Capital expended on lines open ... ..	877,244	1,478,251
Gross earnings ... ..	1,534,456	2,876,090
Net earnings ... ..	127,474	503,523
Return on the capital ... ..	2·63 per cent.	4·16 per cent.

The capital has increased by 68·51 per cent., the gross earnings by 87·43 per cent., and the net earnings by 295·00 per cent., the return on the outlay having improved from 2·63 to 4·16 per cent.

This improved financial condition has permitted of considerable reductions in fares and additional service being provided in numerous directions, the reduction in fares since 1888 amounting to 30 per cent. and the additional service 58 per cent.

The rolling-stock, permanent-way, and works generally have been efficiently maintained. Eighty per cent. of the cars in use in 1888 have been renewed. Twenty miles of line of 42-lb. rails have been relayed with 60-lb. and 80-lb. rails, 5 miles duplicated, and 8¼ miles wood-paved.

Although every effort has been made to make the present system of steam and cable tramways as efficient and useful as possible, the necessity of effecting important improvements in the direction of replacing the present systems by electric traction has been recognised. Considerable experience has been gained on the North Shore line, and owing to the rapid advances which have been made in perfecting the overhead electric trolley system in various parts of the world that system has been adopted for the George and Harris Streets line, now being constructed, and will be introduced in connection with the conversion of the existing suburban steam lines and portion of the cable lines.

The expansion of capital, gross and net earnings, and miles open, during the period under review were as follows :—

	Year ended—	
	30 June, 1888.	30 June, 1898.
Tramway Capital ... ..	£877,244	£1,478,251
Gross Traffic ... ..	£236,519	£313,871
Net profit, after paying working expenses...	£17,323	£54,730
(Return on Capital, after paying working expenses) ... ..	1·98%	3·75%
Miles open ... ..	38½	65

The total number of staff employed on the Tramways, the average staff per mile of line open, the amount of salaries and wages paid, and the gross earnings for the year ended the 30th June, 1888, compared with 1898, are as follows :—

	June, 1888.	June, 1898.

Average Staff per mile open ... ..	26·31	23·00
	Salaries.	Wages.
Year ended 30th June, 1888...	£11,725	£153,455
Do do 1898 ...	15,424	175,251
Increases ...	3,699	21,796
	Total.	
		£165,180
		190,675
		25,495

### THE AMBULANCE MOVEMENT.

The Ambulance movement continues to make very satisfactory progress. In October, 1888, the Corps consisted of 191 members only; in 1894 the membership had increased to 850. The Corps now numbers 1,500 enrolled members, but at least double that number have received instruction, though, owing to the nature of their duties, many are unable to attend a complete course, and, therefore, do not present themselves for examination.

The membership is widely distributed, and may be found in every branch of the service, in the workshops, and at every station of importance throughout the system.

With a view of encouraging the staff, each member who passes the first examination is presented with an "Ambulance certificate," and, if successful in passing the second examination, is presented with a silver medal. As a special acknowledgment of the exceptional service and ability of six members, each was presented with a gold medal.

Although New South Wales Railways compare favourably in regard to freedom from accident with any other railway system, all passenger trains running outside the Suburban Section and mixed trains on Branch Lines are fitted with a Medical Chest and Ambulance appliances available in case of need.

Ambulance equipment is also in reserve at a number of Railway Stations, and each break-down van is also fitted with a Medical Chest and equipment.

The Ambulance instruction is conducted by the Railway Medical Officer in the various centres throughout the Colony. He is ably assisted by several of the old members of the Corps, who ungrudgingly devote a great deal of their spare time to the work. Great assistance is also rendered by Medical men in some of the largely-populated country cities. Much useful service is performed by members of the Corps. Upwards of 300 cases are reported annually to the Corps Secretary in which "first aid" is rendered in cases of injuries of all kinds to employees and many of the general public.

### ESTABLISHMENT OF A RAILWAY INSTITUTE.

Soon after taking office, the Commissioners became convinced that great good would result if a building were provided where the railway staff could meet for the purpose of mutual intercourse and improvement; where a central library could be established, and accommodation provided for classes for the instruction of the staff, particularly on subjects that would render them more efficient in the railway service. In this movement the late Chief Commissioner, Mr. Eddy, took great interest.

The Commissioners having formulated a scheme and submitted it to the Government, funds were provided by Parliament for the erection of the building. A suitable site adjacent to the Redfern terminus was selected, and the Railway Institute was built at a cost of £6,000, and formally opened by Mr. McMillan, then Minister for Railways, on the 14th March, 1891. The Institute contains a splendid library of 7,512 volumes, which are circulated amongst the employees all over the Colony. This provision is much appreciated by the Staff, as a large number of the employees are located at considerable distances from public libraries, and would practically be unable, if it were not for the Institute library, to obtain the use of books. Numerous classes are also attached to the Institute, embracing such subjects as safe railway working, shorthand, typewriting, telegraphy, mechanical drawing, and railway accounts. Lectures and social entertainments are also held frequently in the large hall of the Institute, which seats 600 persons. A monthly newspaper, called the *Railway Budget*, is also published in connection with the Institute. This paper, in addition to reporting the various matters in hand in connection with the Institute, also publishes information affecting railway matters generally, and endeavours to disseminate knowledge amongst its members in regard to railway improvements, &c., which are taking place in other lands.

The management is left entirely to the staff, and the Committee, elected by the members, have shown an enthusiastic desire to make it of the best possible service to the employees. So much have its advantages been appreciated, and so popular has the building become as a meeting-place, that the original accommodation proved insufficient, and extensive additions were recently completed at a cost of £2,000.

#### INTERCOLONIAL RAILWAY CONFERENCES.

The desirable arrangement of holding annual Intercolonial Railway Conferences for the interchange of ideas on railway matters, was brought into active operation by a meeting of the Railway Commissioners of New South Wales, Victoria, South Australia, and Queensland, at Sydney, on the 14th September, 1898. For a considerable period prior to that date the advantage of such meetings was generally recognised, and although occasionally conferences for the discussion of subjects of special interest took place, no arrangement existed for holding periodical meetings. The result of the first meeting has demonstrated their value, and the advantage of holding them regularly will, it is anticipated, be appreciable, the united interests representing over 10,000 miles of railway and a capital value of about £110,000,000.

These conferences have already done much to bring about uniformity of practice, and vexed questions, many of which it has been found impracticable to settle by correspondence, have been readily disposed of; and as the railway interests of the Colonies become more united, the great advantage to be derived from this intercourse will be fully realised.

The Conferences are preceded by meetings of the principal officers, at which the details of approved subjects for discussion are thoroughly investigated, and subsequently dealt with at the Commissioners' conference.

The Colony of Western Australia recently joined the Conference, and now all the Colonies of the Continent of Australia are represented.

## STATEMENT of the New South Wales Railway Capital Account to 30th June, 1898.

	£
CAPITAL SPENT TO 30TH JUNE, 1888 ... ..	27,722,748
Capital moneys subsequently paid on account of lines authorised prior to the Railway Act coming into force, principally for the following lines:—

Every servant, except salaried officers, is granted a day's leave on full pay for each proclaimed public holiday (averaging about twelve days each year).

In addition to the above, engine-drivers, firemen, guards, assistant guards, signalmen, gangers, tramway drivers, firemen, gripmen, conductors and assistants, gangers and railway shunters are allowed six, and shunters in the tramways three good-conduct holidays.

Expenses, averaging 3s. per day, are also allowed to drivers, firemen, guards, and all others, when away from their home station.

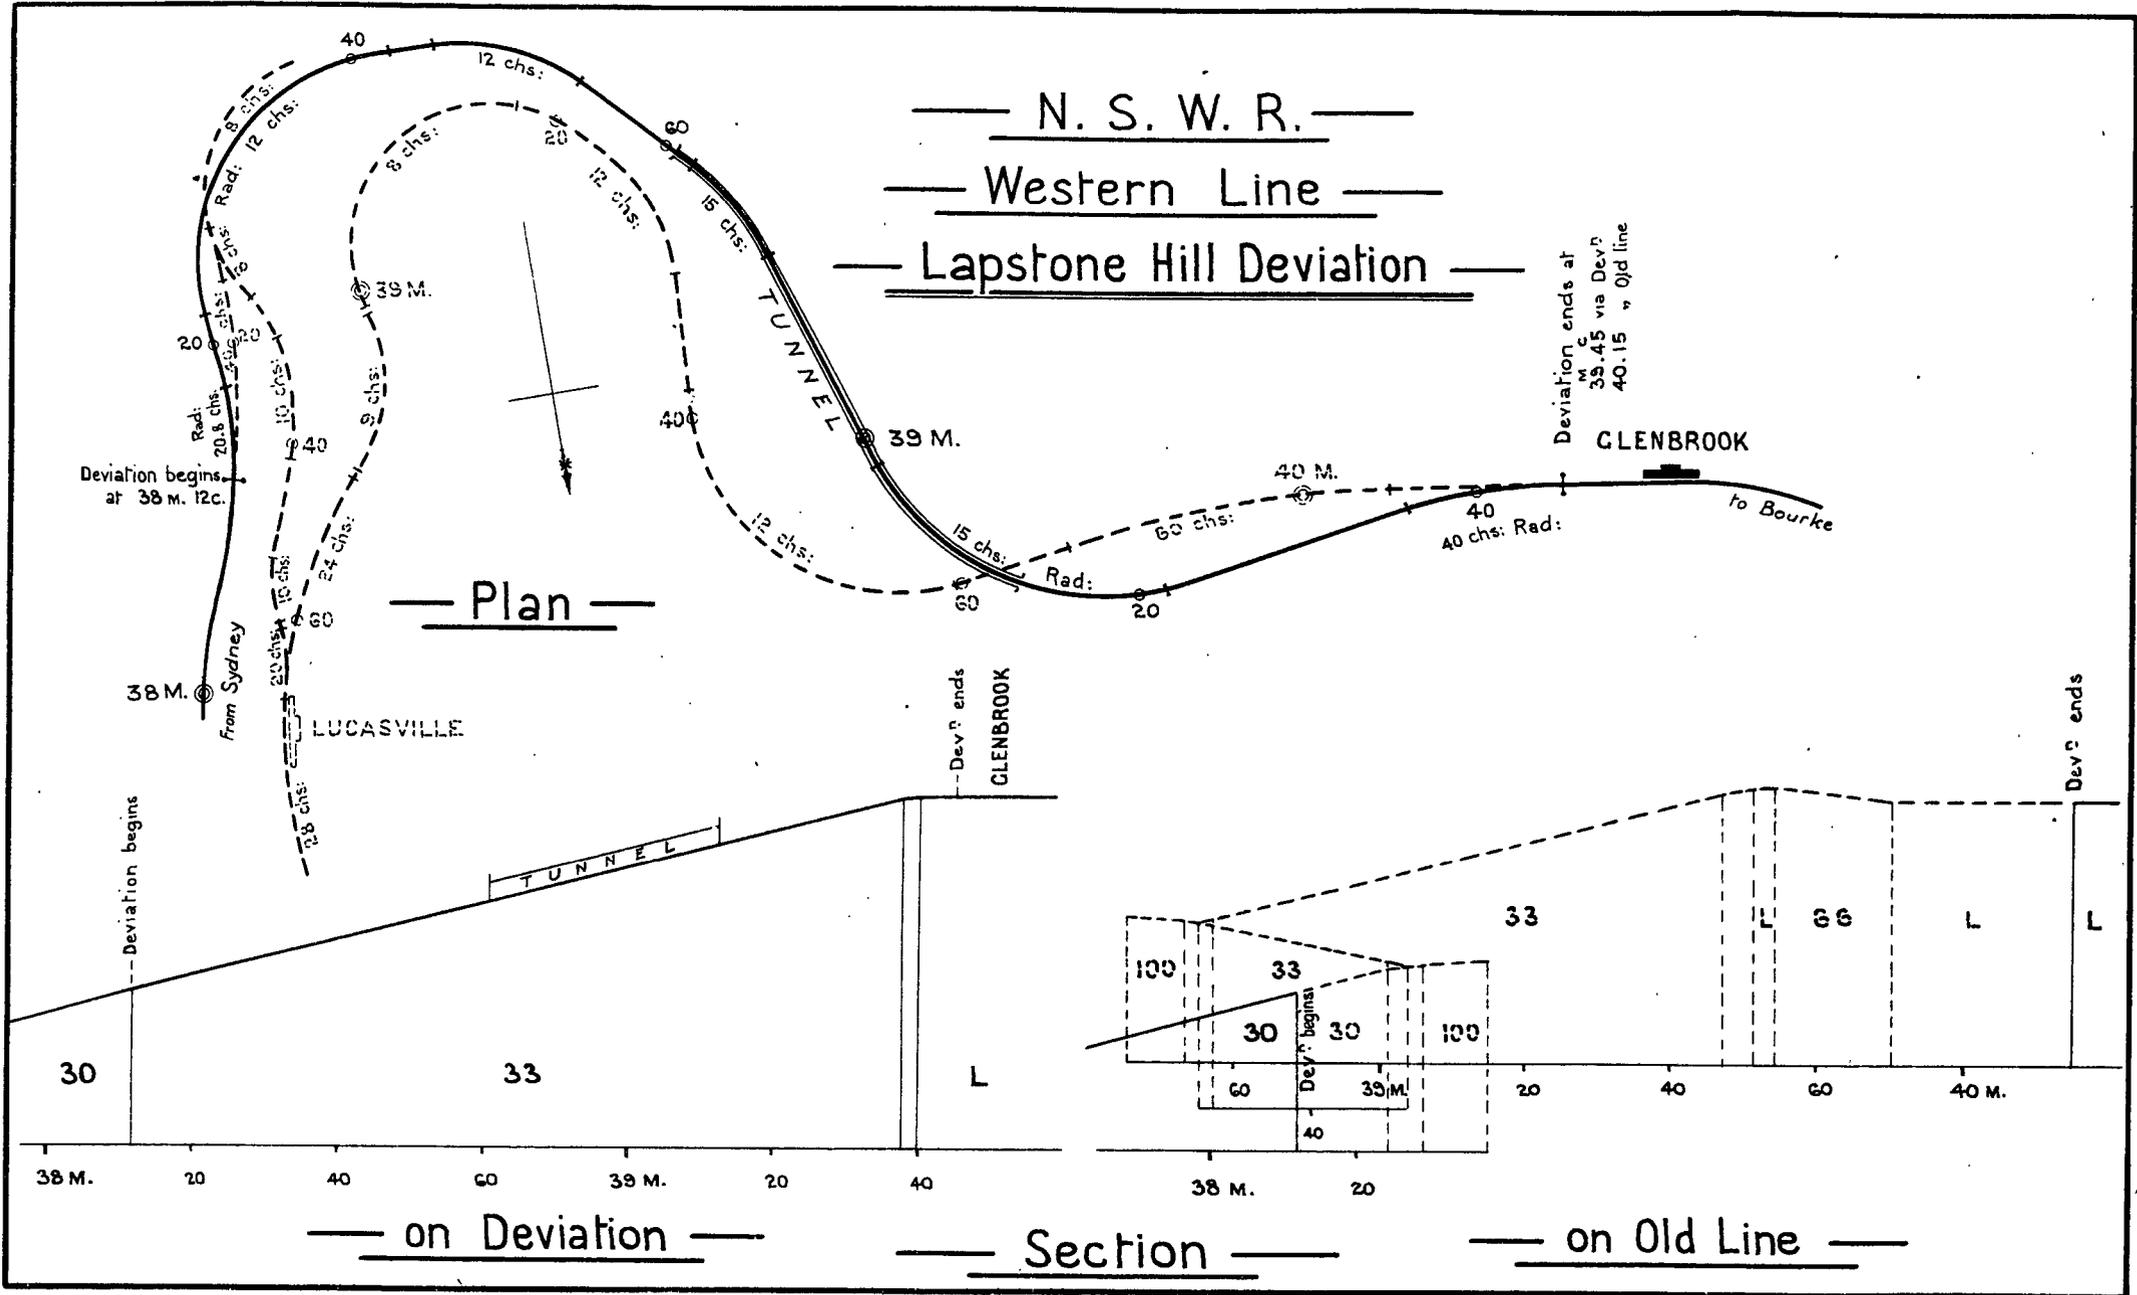

Lodging-houses, with attendants, are also provided at all the principal depôts for drivers, firemen, and guards, free of charge.

Station-masters and officers-in-charge are allowed free houses.

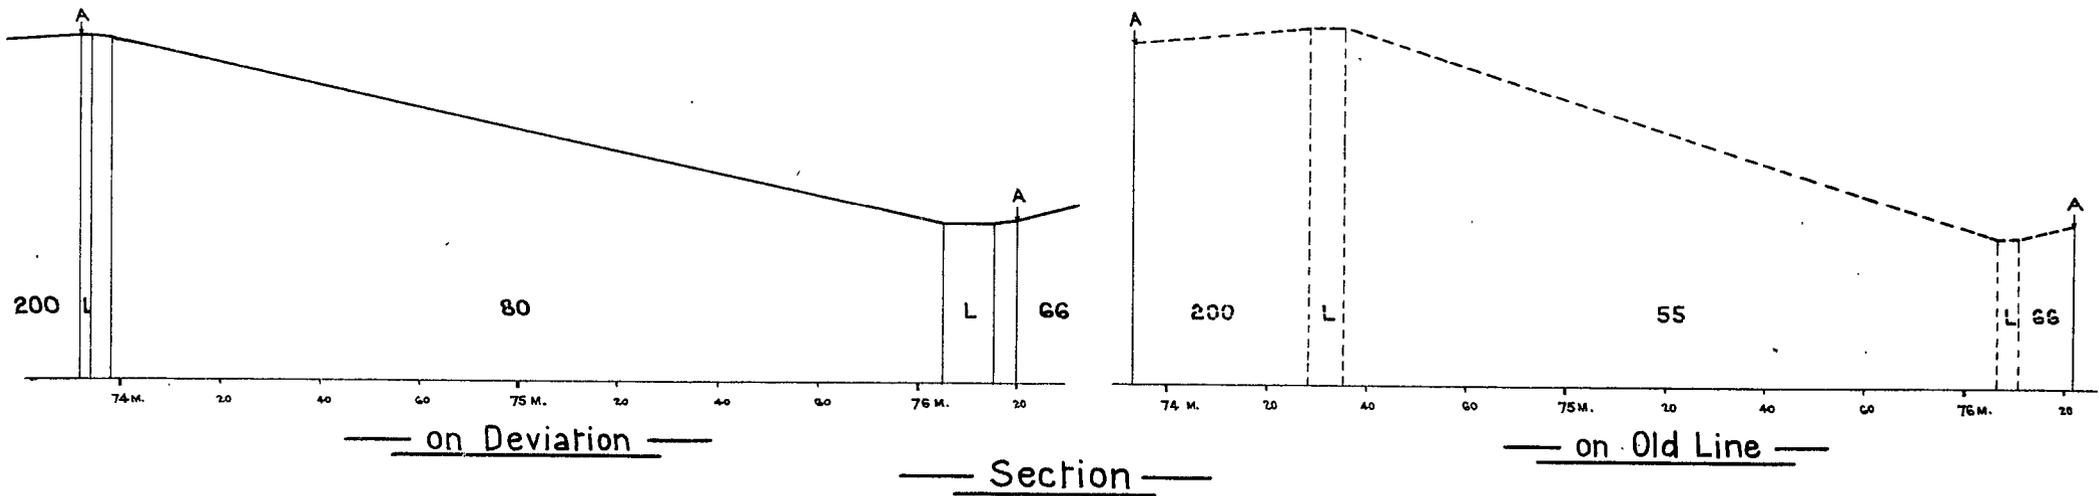

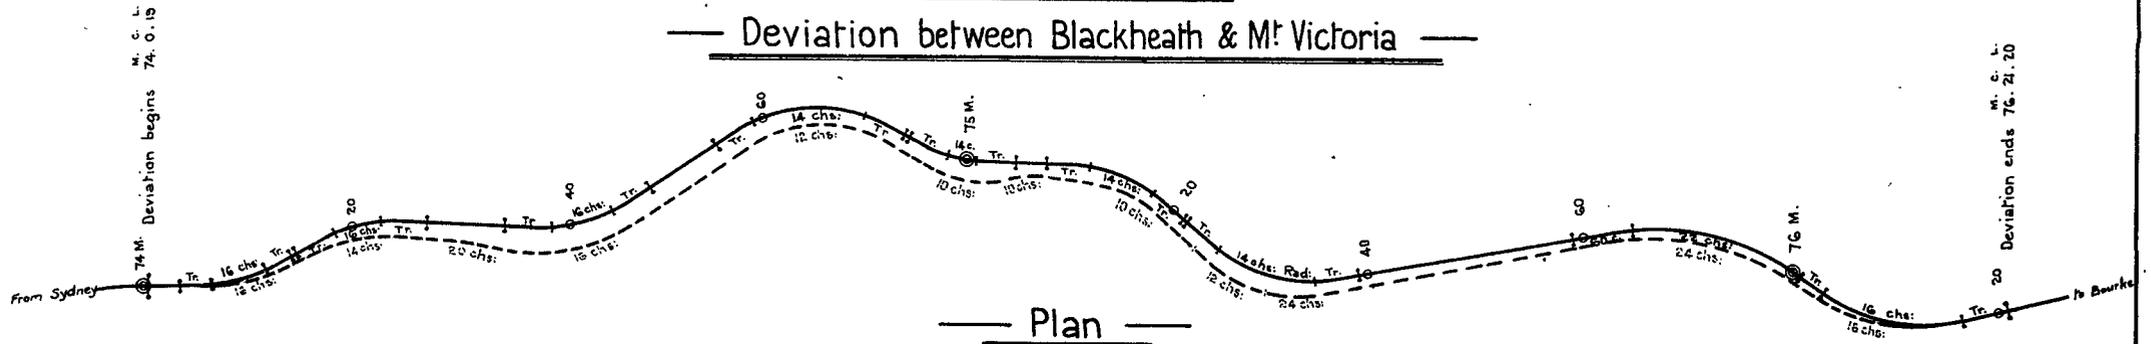

Salaried staff are allowed three weeks' holiday per annum on full pay.

Free passes, "Station to Station," are also allowed, when on leave, to each member of the staff, including wife and family, not exceeding three persons.

PULLMAN VESTIBULE SLEEPING CAR.

	ft. in.
Length of body over panels .....	61 0
Length over platforms .....	67 11
Width over panels .....	9 4½
Height from floor to ceiling in centre of lantern roof .....	9 0¾
Tare .....	35 tons 10 cwt.

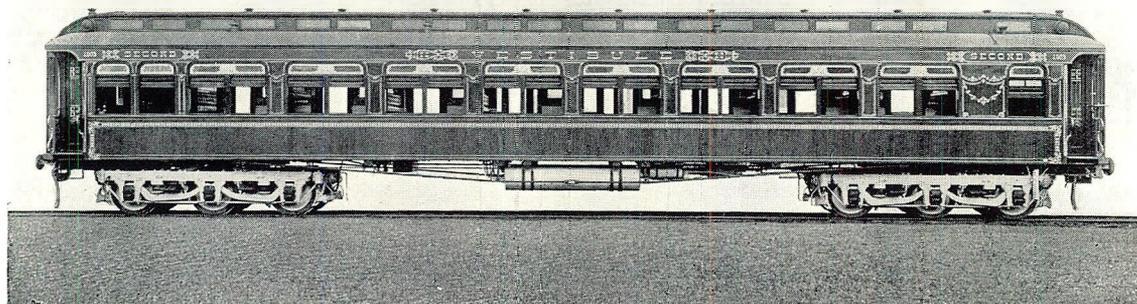

The interior is divided into a smoking-room, with lavatories, &c., a main sleeping compartment (in which there are twenty-four berths), and a ladies' saloon containing four berths. It accommodates during the night twenty-eight persons in all, and during the day has seating capacity for fifty-eight persons. Requisite lavatory accommodation and vestibules are provided at the ends. Through communication is made from one car to another.

FIRST-CLASS VESTIBULE CORRIDOR CAR.

	ft. in.
Length of body over panels .....	61 0
Length over buffers .....	67 11
Width over panels .....	9 4½
Height of body inside, from floor to ceiling, at centre .....	9 0¾
Capacity .....	45 persons.
Tare .....	36 tons 10 cwt.

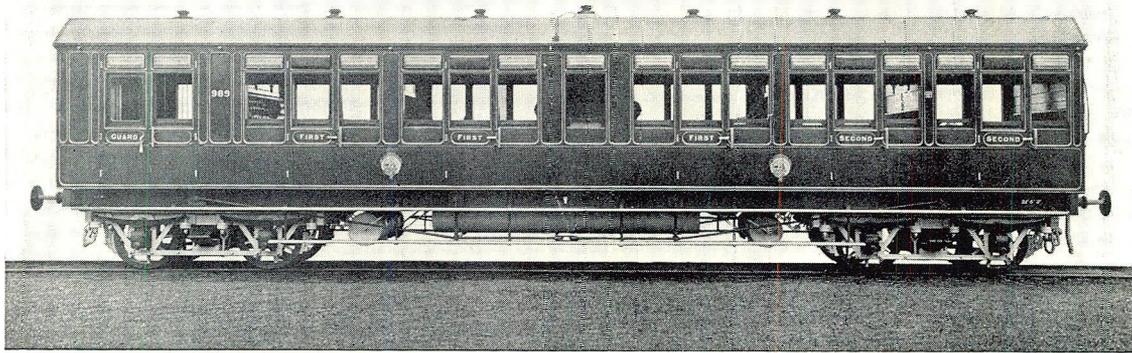

The interior is divided into seven passenger compartments, including a lady's saloon at one end and a smoker's compartment at the other. Seating accommodation is provided for nine in lady's saloon, twelve in smoker's, and six in each of the intermediate compartments. Requisite lavatory accommodation and vestibules are provided at the ends. Through communication is made from one car to another.

SECOND CLASS VESTIBULE CORRIDOR CAR.

	ft. in.
Length of body over panels .....	61 0
Length over buffers .....	67 11
Width over panels .....	9 4½
Height of body inside, from floor to ceiling, at centre .....	9 0¾
Capacity .....	64 persons.
Tare .....	35 tons 12 cwt.

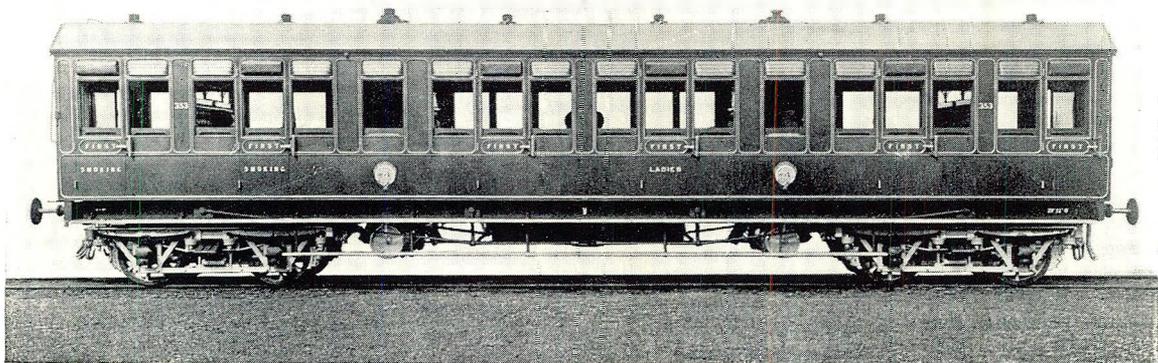

The interior is divided into eight passenger compartments, including lady's at one end and smoker's at the other, each of which will accommodate eight persons. Requisite lavatory accommodation and vestibules are provided at the ends. Through communication is made from one car to another.

COMPOSITE LAVATORY SLEEPING CARRIAGE.

	ft. m.
Length of body over panels ... ..	46 0
Length over buffers ... ..	49 3
Width over panels ... ..	8 6
Height of body inside, floor to ceiling, at centre ... ..	7 8½
Tare ... ..	21 tons 5 cwt.

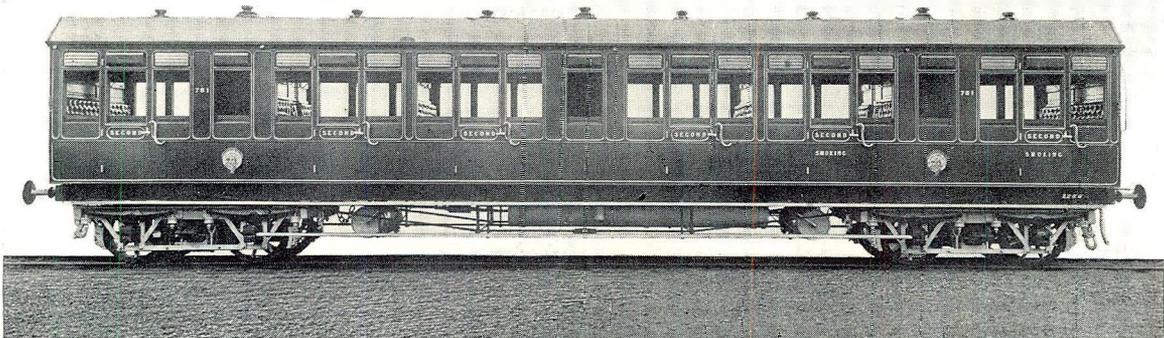

The interior is divided into three first-class compartments, two of which give sleeping and lavatory accommodation to six passengers; two second-class compartments, with seating accommodation for twenty passengers; and a baggage compartment.

FIRST-CLASS LAVATORY CARRIAGE.

	ft. in.
Length of body over panels ... ..	46 0
Length over buffers ... ..	49 3
Width over panels ... ..	8 6
Height of body inside, floor to ceiling, at centre ... ..	7 8½
Tare ... ..	21 tons 11 cwt.

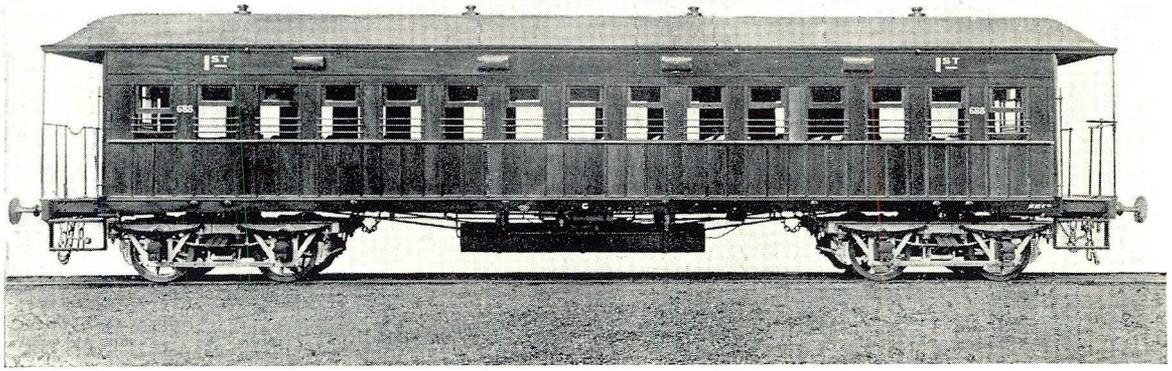

The interior is divided into four compartments, each with seating accommodation for eight passengers, and two end coupes, each with seating accommodation for four passengers, giving a total seating capacity of forty passengers. Lavatory accommodation is provided in the four centre compartments.

SECOND-CLASS LAVATORY CARRIAGE.

	ft. m.
Length of body over panels ... ..	49 3
Length over buffers ... ..	52 6
Width over panels ... ..	8 6
Height of body inside, floor to ceiling at centre ... ..	7 8½
Tare ... ..	22 tons 10 cwt.

The interior is divided into six compartments, giving seating accommodation for sixty passengers. Lavatory accommodation is provided in each compartment.

SUBURBAN CAR 1ST AND 2ND CLASS (DESIGNED 1889)—N.S.W. GOVT. RAILWAYS.

	ft. in.
Length of body ... ..	44 1
Length over platforms ... ..	49 7
"    "    " buffers ... ..	51 1
Width (outside) ... ..	8 11
Height, floor to centre of ceiling ... ..	8 5½
Capacity ... ..	60 passengers.
Tare ... ..	19 tons 12 cwt.

MAIL VAN.

	ft. in.
Length of body over panels ... ..	46 0
Length over buffers ... ..	49 3
Width over panels ... ..	8 6
Height of body inside, floor to ceiling, at centre ... ..	7 8½
Tare ... ..	19 tons 19 cwt.

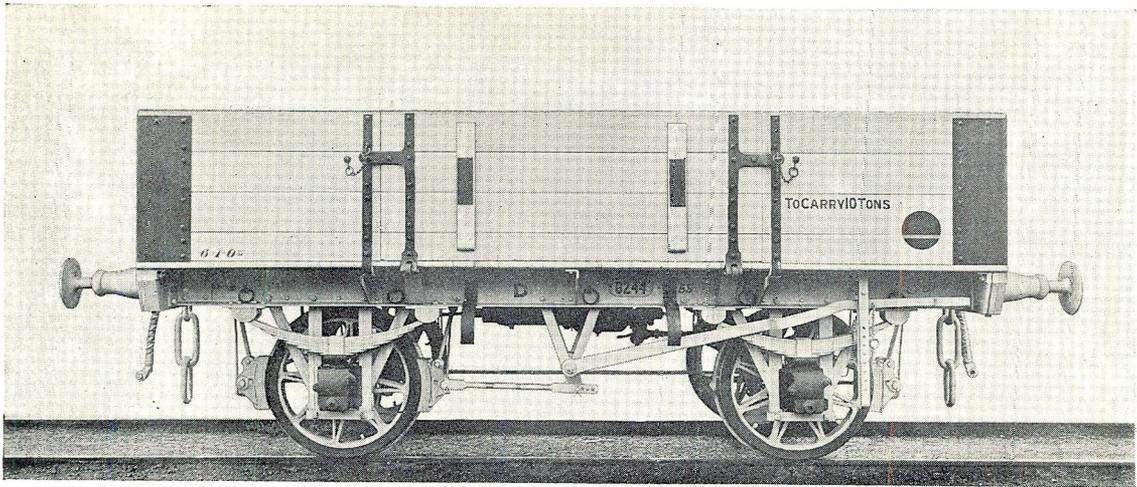

The interior is divided into three compartments—the centre compartment for carrying 7 tons of mails or baggage, a passenger compartment with seating accommodation for ten second-class at one end, and one for carrying bicycles at the other end.

EXPRESS BRAKE-VAN.

	ft. in.
Length of body over panels ... ..	46 0
Length over buffers ... ..	49 3
Width over panels ... ..	8 6
Height of body inside, floor to ceiling, at centre ... ..	7 8½
Tare ... ..	18 tons 12 cwt.

The van is divided into two compartments—the one for 8 tons of baggage or mails, the other to carry 1½ ton.

ORDINARY GOODS WAGON.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDED 31ST MARCH, 1899.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Printed under No. 1 Report from Printing Committee, 3 August, 1899.

Offices of the Railway Commissioners of New South Wales,  
Sydney, 27th April, 1899.

To THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ended 31st March, 1899, upon the subjects specified, viz. :—

### I.—STATE OF THE TRAFFIC.

RAILWAYS.								Quarter ended 31st March, 1898.	Quarter ended 31st March, 1899.

## II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

## III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found attached, page 4.

## IV.—STAFF.

These returns are given as an Appendix, pages 5 to 7.

## RAILWAYS.

### GENERAL REMARKS.

The Working for the quarter has resulted in an increase in the earnings of £36,028, and an increase in the Working Expenses of £19,057, the result being an improvement over the corresponding quarter of last year of £16,971.

Nearly all classes of traffic contributed to the increase, viz., First-class passengers, £3,108; second-class, £15,296; parcels, &c., £1,630; live stock, £12,749; coal and coke, £6,770; hay, straw, and chaff, £6,693; minerals (other than coal and coke), £2,465; general merchandise, £912; and wool, £190. Grain, flour, &c., shows a decrease of £14,085.

The passenger traffic shows an increase of 534,358 passenger journeys, and the goods traffic 131,226 tons.

### CONDITION OF LINES AND ACCOMMODATION FOR THE TRAFFIC.

The grade improvements between Werris Creek and Gunnedah, Boggabri and Baan Baa, Waratah and East Maitland, and Glennie's Creek and Liddell have been completed, satisfactory progress is being made with the improvement of the grades between Ravensworth and Liddell, Muswellbrook and Scone, Braefield and Quirindi, and Quirindi and Quipolly, and the work in connection with the grades near Carlingford, Berowra, Woy Woy, and Point Clare, is being proceeded with.

A large amount of relaying, reballasting, and resleepering has been done. The renewing of the Wagga Wagga viaduct has made satisfactory progress, and the Permanent-way and Works generally have been efficiently maintained.

## TRAMWAYS.

## TRAMWAYS.

## GENERAL REMARKS.

The Earnings show an increase of £10,136, and the Working Expenses £7,171, the net increase over the corresponding period of last year being £2,965.

We have the honor to be,

Sir,

Your most obedient servants,

CHARLES OLIVER,  
Chief Commissioner.

W. M. FEHON,  
Commissioner.

DAVID KIRKCALDIE,  
Commissioner.

## APPENDIX I.

## NEW SOUTH WALES GOVERNMENT RAILWAYS.

## REPORT on Condition of Way and Works for the quarter ending 31st March, 1899.

Sir, Office of Engineer-in-Chief for Existing Lines, 6 April, 1899.

I have to report, for the information of the Commissioners, that the permanent way and works have been efficiently maintained during the past quarter.

Relaying, reballasting, and resleepering operations have been vigorously carried on in all divisions, and special attention has been given to the renovation of buildings and the renewal of fencing.

The grade improvements on the North-western Line, between Werris Creek and Gunnedah, and Boggabri and Baan Baa, also those on the Northern Line between Waratah and East Maitland, and Glennie's Creek and Liddell, have been completed, and satisfactory progress is being made with others between Ravensworth and Liddell, Muswellbrook and Scone, Braefield and Quirindi, and Quirindi and Quipolly, while others in the vicinity of Carlingford, Berowra, Woy Woy, and Point Clare have just been started.

The work of renewing the Wagga viaduct in steel has been steadily continued.

I have, &c.,

THOMAS R. FIRTH,  
Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

## APPENDIX II.

## NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 41 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, Quarter ending 31st March, 1899.

Article.	Particulars of Rate.	Reason for Rate.
Live hares .....	Half parcels rates to be charged when sent by passenger train .....	New rate.
Artesian boring plant .....	Consignments of not less than 5 tons, Darling Harbour to Finley, loaded in one 4-wheeled wagon, to be charged £2).	To secure traffic.
Broom handles .....	When forwarded to a manufactory, "B" class rates and conditions .....	To encourage traffic.
Slag .....	E. and A. Copper Co.'s Works, New Lambton Colliery branch, to Sulphide Corporation Works, Cockle Creek, 11d. per ton.	do
Small coal .....	From Waratah Colliery to Sulphide Works at Cockle Creek, 1d. per ton per mile.	To secure traffic.
Malt and sugar .....	To Bourke, in 6-ton truck loads, £28 per truck .....	do
Meal, bran, and pollard .....	Jerilderie to Hay, to be charged an equal distance on the down journey at the special up journey rates to that which it is carried on the up journey, the remainder of the distance to be charged at "A" rates.	do
Salt .....	Sydney to Armidale, 29s. 11d. per ton; Newcastle to Armidale, 22s. 3d. per ton—conditionally upon 50 tons being sent from either place each month.	do
Preserved meat .....	Morisset to Newcastle, "A" rates and conditions .....	do
Shale and oil .....	Joadja to Darling Harbour, 5s. 11d. per ton .....	To equalise rates.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDED 30 JUNE, 1899.)

*Printed under No. 2 Report from Printing Committee, 10 August, 1899.*

Offices of the Railway Commissioners of New South Wales,  
Sydney, 28th July, 1899.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ended 30th June, 1899, upon the subjects specified, viz. :—

## I.—STATE OF THE TRAFFIC.

## II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

## III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found attached, page 4.

## IV.—STAFF.

These returns are given as an Appendix, pages 5 to 7.

## RAILWAYS.

### GENERAL REMARKS.

The Earnings for the quarter show a decrease of £24,753, as compared with the corresponding quarter last year. With few exceptions, all classes of traffic, including that of passenger, have contributed to the decrease. However, the number of passenger journeys made and tonnage of goods and live-stock hauled have increased by 397,851 journeys and 87,279 tons respectively. This is in consequence of an increase in the short and a decrease in the long distance passenger traffic, an increase in the tonnage of goods traffic at the lower rates, and the reductions made in rates for Starving Stock carried during the drought. Although more stock has been dealt with the earnings show a decrease of £15,428.

The train miles run have increased 39,028.

The expenditure per train mile compares favourably with the corresponding quarter of last year, but not so the percentage of expenses to earnings which unavoidably follows on the incidents of traffic mentioned. The return on the years' working as a whole is satisfactory.

### CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The Permanent Way and Works have been efficiently maintained. Relaying, reballasting, and resleepering have been continued on all divisions.

Many of the Grade Improvements on the Northern Line have been completed, and satisfactory progress has been made with others. The work in connection with the improvements between Harden and Cootamundra on the Southern Line has been commenced.

Steady progress has been made with the work of renewing the Wagga Wagga viaduct in steel.

## TRAMWAYS.

## TRAMWAYS.

The Earnings show an increase of £8,532, but owing to special provision having to be made for relaying and car renewals the Expenditure is in excess of that for the corresponding period of last year.

We have the honor to be,

Sir,

Your most obedient servants,

CHARLES OLIVER,  
Chief Commissioner.

W. M. FEHON,  
Commissioner.

DAVID KIRKCALDIE,  
Commissioner.

## APPENDIX I.

## NEW SOUTH WALES GOVERNMENT RAILWAYS.

Report on the Condition of Permanent Way and Works for the Quarter ending  
30th June, 1899.

Sir,

Office of Engineer-in-Chief for Existing Lines, 4 July, 1899.

I have to report, for the information of the Commissioners, that the Permanent Way and Works have been efficiently maintained during the past quarter.

Relaying, reballasting, and resleepering operations have been steadily continued on all divisions.

The grade improvements on the Northern Line, between Willow Tree and Werris Creek, and between Ravensworth and Liddell, and also those in the vicinity of Point Clare and Thornleigh, have been completed, and satisfactory progress has been made with those between Muswellbrook and Scone, and near Carlingford, Berowra, and Woy Woy. Those between Harden and Cootamundra have just been started.

Steady progress has been made with the work of renewing the Wagga Wagga viaducts in steel.

I have, &amp;c.,

THOMAS R. FIRTH,

Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

## APPENDIX II.

## NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the Special Rates which have been made, and the reasons for making such rates, quarter ended 30th June, 1899.

Article.	Rate.	Reason for rate.
Returned drapery and 3rd class goods.	Three tons Goulburn to Sydney or Bathurst 20 per cent. rebate to be allowed.	To secure traffic.
Rabbit poisoning machines, with shafts.	To be carried at the same rate as cultivators, harvesters, reapers and binders, &c.; referred to under agricultural implements, as shown on page 6 of the rate-book.	To encourage traffic.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDED 30TH SEPTEMBER, 1899.)

*Printed under No. 8 Report from Printing Committee, 2 November, 1899.*

Offices of the Railway Commissioners of New South Wales,  
23rd October, 1899.

To THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report, for the quarter ended 30th September, 1899, upon the subjects specified, viz. :—

### I.—STATE OF THE TRAFFIC.

## RAILWAYS.

## II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

## III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found attached. [Appendix, page 4.]

## IV.—STAFF.

These returns are given as an Appendix, pages 5 to 8.

## GENERAL REMARKS.

The Earnings for the quarter, as compared with the corresponding period last year, show a falling off of £41,722; the Expenditure shows a reduction of £6,073; the net result being a decrease of £35,649.

Wool, Live Stock, and General Merchandise show an aggregate decrease of £66,010, but increases in other traffic reduced this amount by £24,288, viz:— Passenger and other Coaching Earnings, £14,315; Grain and Flour, £5,116; Coal and Coke, £2,064; and other minerals, £2,793.

The Passenger traffic shows an increase of 536,000 journeys.

The Pioneer line from Tamworth to Manilla, a distance of 29 miles 42 chains, was opened for traffic on the 15th of September.

CONDITION OF LINES AND ACCOMMODATION FOR THE TRAFFIC.

The Permanent-way and works generally have been efficiently maintained. The grade improvements near Berowra and Woy Woy have been completed; those near Carlingford are nearing completion. The deviations between Harden and Cootamundra have made good progress, and others between Blayney and Gresham have been started.

A large portion of the earthwork in connection with the duplication of the North Shore Line, St. Leonards and Lindfield, has been completed, and satisfactory progress has been made with the renewal of the Wagga Wagga Viaduct and other works.

TRAMWAYS.

The Earnings show an increase of £9,860, and the Expenditure £5,734, the net improvement being £4,126.

The number of fares collected increased by 2,329,280.

We have the honor to be,

Sir,

Your most obedient servants,

CHARLES OLIVER,  
Chief Commissioner.

W. M. FEHON,  
Commissioner.

DAVID KIRKCALDIE,  
Commissioner.

## APPENDIX I.

## NEW SOUTH WALES GOVERNMENT RAILWAYS.

## REPORT on Condition of Way and Works for the quarter ended 30th September, 1899.

Sir, Office of Engineer-in-Chief for Existing Lines, 7th October, 1899.

I have to report, for the information of the Commissioners, that the permanent-way and works have been efficiently maintained during the past quarter.

Steady progress has been made with reballasting, resleepering, and rerailing.

The grade improvements in the vicinity of Berowra and Woy Woy have been completed. Heavy rains have delayed the works near Carlingford, which are nearing completion. Good progress has been made with the deviations between Harden and Cootamundra, and others between Blayney and Gresham have been started.

The work of duplicating the North Shore line, between St. Leonards and Lindfield, was started in August, and a large portion of the earthwork has been completed.

The extension from Tamworth to Manilla, 29 miles 42 chains, pioneer type, was opened for traffic on the 15th ultimo.

Satisfactory progress has been made with the renewal of the Wagga Wagga viaduct.

I have, &c.,

THOMAS R. FIRTH,  
Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

## APPENDIX II.

## NEW SOUTH WALES GOVERNMENT RAILWAYS.

## LIST of Special Rates for quarter ended 30th September, 1899.

Article.	Rate or Particulars.	Reason for alteration.
Sewing machine stands.....	Sewing machine stands by passenger train double parcels rates .....	New rate.
Jadoo fibre and liquid .....	The rate for jadoo fibre and liquid same as artificial manures instead of "B" class.	To encourage traffic.
Malt .....	Mittagong to Sydney, "A" rates in 4-wheeled truck loads of not less than 6 tons.	do

1899.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## RAILWAY BETWEEN SYDNEY AND BELMORE.

(RETURN RESPECTING.)

*Printed under No. 13 Report from Printing Committee, 12 December, 1899.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 21st November, 1899, That there be laid upon the Table of this House, a Return showing,—

“ (1.) The revenue obtained from the Sydney-Belmore Railway for the last two years, inclusive of all fares and freight between Sydney and Belmore, and all intermediate stations.

“ (2.) The total cost of working the line during that period.”

(Mr. Parkes.)

(1.) £8,559.

(2.) £9,829.

The cost of working the line does not include the interest on the capital outlay, which amounts to £11,658 for the two years.

1899.  
(THIRD SESSION.)

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## RAILWAY FROM COBAR TO WILCANNIA.

### REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of Railway from Cobar to Wilcannia," have, after due inquiry, resolved that it is expedient the proposed railway be constructed to a point on the east side of the Darling River, 619½ miles from Sydney, and suggest that the railway revenue should be subsidised to some substantial and suitable extent from the land revenue derived from the district benefited by the line; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

#### DEPARTMENTAL STATEMENT.

1. The first action with regard to this proposal, according to the Departmental statement placed before the Committee by the Under Secretary for Public Works, was taken in 1884, when, in response to a petition to the Legislative Assembly from residents of Cobar and the surrounding district, asking for the construction of a railway from Nyngan to Wilcannia, *via* Cobar, the Minister for Works approved of a survey being made. This was completed in 1885. In 1889 it was suggested that Wilcannia should be connected with the railway system of the Colony from Forbes, but this was disposed of by a report from the Engineer-in-Chief for Railways who had no hesitation in stating that if it were considered desirable to construct a railway to connect with Wilcannia, and which might eventually be extended to Silverton, the best route would be from Nyngan to Cobar, and thence to Wilcannia and Silverton. The following year it was proposed that a railway should be constructed from Nyngan to Cobar, and this having been inquired into by the Public Works Committee, was recommended by them as part of a line eventually to extend to Wilcannia and Broken Hill; the circumstances at the time being such as, in their opinion, justified this recommendation. In 1892 an amended survey was made between Cobar and Wilcannia, and on that survey was based the proposal now before the Committee. Another route which bears on the question is that from Condobolin to Broken Hill, *via* Menindie, which originated in 1895, and during that year was before the Public Works Committee. It was regarded by the Railway Commissioners as preferable to the route from Cobar, but on several grounds was not approved by the Committee.

#### DESCRIPTION

## DESCRIPTION OF THE RAILWAY.

2. The railway, as now proposed,  $165\frac{1}{2}$  miles in length, would leave the present terminus of the Nyngan to Cobar line at about 459 miles 36 chains from Sydney, and, proceeding in a westerly direction, follow the main road to Wilcannia through the counties of Robinson and part of Booroondena to 501 miles 50 chains. Thence it would run in a slightly south-westerly direction past Brokmetta Lake up to 533 miles, and after bearing north-westerly as far as 538 miles go due west through the county of Rankine to Lake Poopelloe, crossing and recrossing the main road at 569 and 572 miles. From that point it would bear south-westerly through the county of Werunda to 587 miles, and thence north-westerly to Wilcannia, where it would cross the Darling River at about 619 miles 60 chains; and, passing through the town of Wilcannia, running between, and parallel to, Murray and Brougham Streets, it would terminate at about 621 miles 36 chains. The ruling grade on the line would be 1 in 100, and the curves 14 chains radius. As originally surveyed, the length of the line was 162 miles. Three and a half miles have been added to obtain a favourable grade. Only a very small portion of alienated land would be passed through.

## ESTIMATED COST.

3. The estimated total cost is £497,000, or £3,003 per mile, of which amount £401,808 is the estimate in relation to the length from Cobar to the east side of the Darling River, 156 miles, and £95,192 that for the remaining  $9\frac{1}{2}$  miles. The last portion of the line is very expensive owing to its liability to flood and the number of creeks to be crossed. Two and a half miles of this section are quite dry, but the remaining 7 are more or less subject to flood, and in that distance there will be  $5\frac{1}{2}$  miles of embankments and viaducts.

## RAILWAY COMMISSIONERS' REPORT.

4. The Railway Commissioners' report upon the line shows, in a comparison between expenses and receipts, an annual loss of £20,510, and they do not recommend that the railway be constructed. The estimated annual cost amounts to £27,310, which is made up of £14,910 interest at 3 per cent. on the capital expenditure, and £12,400 cost of maintaining permanent-way and for traffic and locomotive expenses; the traffic estimate is £6,800, comprising merchandise, wool, and live stock, £2,800, and passenger traffic, mails, parcels, &c., £4,000. When the project of a railway to Broken Hill was under consideration some years ago, the prospects in relation to Broken Hill, the Commissioners point out, were exceptionally good, and quite different from what they are to-day. Then, a very large trade in coke, fuel, and ores was anticipated, but this cannot now be hoped for, as the ores are not now locally treated. In their opinion there is little prospect of the proposed line to Wilcannia proving other than a large burden on the railway system of the Colony.

## THE COMMITTEE'S INQUIRY.

5. In making their inquiry the Committee have taken evidence in Sydney, Wilcannia, and Cobar, and at some of the pastoral stations in the Wilcannia and Cobar districts, and travelling from Wilcannia to Cobar they, as far as possible, inspected the railway route and the country in its vicinity. A journey down the Darling from Bourke to Menindie, in relation to the proposed locking of the river, also afforded them a valuable opportunity for informing themselves as to the manner in which the railway might serve the district, and the extent to which it was likely to secure traffic.

## NATURE OF THE COUNTRY.

6. The country traversed by the Committee when travelling between Wilcannia and Cobar consisted throughout of large pastoral holdings, and, for the most part, in consequence of the severe drought from which the district is suffering, was exceedingly dry and destitute of grass. There was, however, even in the driest parts

parts some little herbage and more or less edible scrub. Previous to the Committee leaving Wilcannia for Cobar, two of its members proceeded from Wilcannia along the Ivanhoe-road, in the vicinity of the surveyed railway route, to Talyawalka Creek, in order to inspect the land between the Talyawalka and Wilcannia subject to flood. They found that the first high land on the eastern side of the river Darling, which the railway route touches, is a sand ridge within a quarter of a mile of the river bank, and some distance higher up stream than the present road bridge. It is large in area and exceptionally high, and if the terminus of the railway should be located on the eastern bank of the river offers an excellent site for the railway station. Further on for some miles the land was found to be generally low-lying, with occasional sandy rises which seemed to have been taken advantage of to the fullest extent in connection with the railway survey, in order to save expense in the construction of viaducts or high embankments. Approaching the main channel of the Talyawalka Creek the land became more depressed, and evidently would require rather expensive works to overcome its exposure to flood. Where the creek beds are, and over the low-lying country generally, the soil is so soft and friable that the piles of the road bridges constructed are continually sinking, thus necessitating frequent readjustment. A good deal of the country seen during this inspection was covered with old-man salt-bush and some blue-bush. From Wilcannia towards Cobar the railway makes a lengthy detour to the southward in order to avoid as far as possible the flooded country, which for a considerable distance extends to the north-east of Wilcannia. Owing to there being no track by the railway route the Committee, in journeying from Wilcannia to Cobar, followed the coach road, which for the first 50 miles of the distance—as far as Petyuna, an out-station on Murtee holding—passes mainly through country subject to flood and gradually bears away from the influence of the Darling River. This tract of land consists mainly of dark grey soil, with sandy ridges and stony rises, and on it the effects of the drought were only too apparent, as there was no grass to be seen and little herbage. The Committee, however, were informed that in good seasons the low-lying land is excellent fattening country. Between Petyuna and Bulla Tank higher country was reached, of an undulating nature with occasional hills, and for the most part of good quality. Feed was scarce except mulga, leopard wood, and other edible scrub, and occasionally a little wild spinach. Bulla Tank, 92 miles east of Wilcannia, is the first Government water supply met with. From Bulla Tank towards Cobar the country along the route was found to be largely a red loamy soil of excellent quality, carrying at present a considerable quantity of edible and other scrub. The resumed areas now open are very extensive, and, with the construction of the railway, should be largely availed of for closer pastoral settlement; but the evidence tendered to the Committee was to the effect that the present maximum area of 10,000 acres for homestead leases is rather small, and that if, say, double that area were allowed much of the country for some distance on each side of the proposed line would be taken up by pastoralists to the advantage of the public revenue.

Between Wilcannia and Cobar no minerals of importance have been discovered, and there are no indications on the surface of their existence; but the Government Geologist expresses the opinion that valuable mineral deposits may yet be found there. West and north-west of Wilcannia the country is of a pastoral nature with extensive tracts of mineral-bearing land within it. At White Cliffs, and for 40 miles north, and about half that distance to the north-west, beyond White Cliffs, an opal-bearing country exists, having upon it a considerable population, who, up to the present, have been doing very well. To the north-west of White Cliffs, at Nuntherungie, there are what are believed to be valuable deposits of copper and silver ore, and on the way from White Cliffs to Mount Browne the country is, in several places, auriferous. At Mount Browne, Milparinka, Tibooburra, and some intervening places there are alluvial and quartz gold-fields, which would be extensively worked if cheaper means existed for obtaining machinery and supplies, and if water were more plentiful.

At the present time Wilcannia is suffering from depression, occasioned chiefly by drought. The population has decreased considerably, and business is dull. Many of the people, however, have gone temporarily to White Cliffs, and when the prolonged drought from which the district has been suffering is at an end it is believed the former prosperity of the town will return.

## LAND OCCUPATION AND REVENUE.

7. From information supplied by the Department of Lands, it appears that the land, within 20 miles of the railway route on either side, consists of 51,000 acres of alienated land, 381,000 acres of settlement and homestead leases, 476,000 acres of reserves, and 3,453,000 acres of Crown land. Of the last-mentioned, 1,995,000 acres are held under leases which expire in the year 1918, 1,433,000 are held under occupation license, and 25,000 acres are practically untenanted. The rents received from the pastoral holdings, going westward from Cobar, are one penny an acre; 77-100ths of a penny; 75-100ths of a penny; 89-100ths of a penny; one penny and 5-100ths of a penny; 80-100ths of a penny; 70-100ths of a penny; 36-100ths of a penny; and, immediately north of Wilcannia, 88-100ths of a penny.

In relation to this subject of rents, the Committee thought it well to obtain the annual revenue received by the Crown from land within an area described as starting from Cobar, and going in a north-westerly direction to Wanaaring; thence in a south-westerly direction towards White Cliffs, and about 50 miles to the west of that township; thence coming down in a southerly and easterly direction to the Darling River, about 40 miles south of Wilcannia; and thence in a north-easterly direction back to Cobar. From this area, most if not all of which would be more or less within the railway's sphere of influence, the annual revenue received, exclusive of that from mining occupation and land tax, is £35,260, made up of £739 from conditional purchases, £172 from converted pre-leases, £4,520 from homestead, improvement, artesian well, and settlement leases, £23,854 from leasehold areas, and £5,975 from land held under occupation license.

## POPULATION.

8. The population of the districts likely to be served by the railway is variously stated by some of the witnesses examined, but the figures supplied to the Committee from the office of the Government Statistician, representing the population within an area of 25 miles on each side of the railway line, and at and in the immediate vicinity of the townships to the north-west of Wilcannia as far as Yalpunga, are as follows:—

Cobar	...	...	...	...	...	...	...	...	2,450
Wilcannia	...	...	...	...	...	...	...	...	1,050
Around and between Cobar and Wilcannia	...	...	...	...	...	...	...	...	2,060
White Cliffs	...	...	...	...	...	...	...	...	1,700
Mount Browne	...	...	...	...	...	...	...	...	330
Milparinka	...	...	...	...	...	...	...	...	360
Tibooburra	}	...	...	...	...	...	...	...	710
Yalpunga									
									8,660

If the mining population between White Cliffs and the South Australian border, and White Cliffs and Mount Browne, and those engaged in pastoral pursuits along the banks of the Darling and within the influence of the proposed railway, were added, the figures would be larger. There are 2,716 names on the electoral roll for the Wilcannia electorate, and that number should represent a population for the electorate of about 11,000.

The lot of the people in these districts is not one to be envied, for with the absence of railway communication, the frequently unnavigable state of the river Darling, and the impossibility, except at an unjustifiable expense, of providing the district with good roads, they are practically cut off from the rest of the Colony, and subjected to conditions of existence which at times are most trying.

Those who have taken up land for pastoral purposes are, in periods of drought like the present, when their holdings are little better than sandy deserts, forced to see their stock dying by thousands, removal to country where feed and water could be obtained being impossible. At least 2,000,000 sheep are said to have died in the sheep district of Wilcannia, through the drought, during the last five years, and so great have been the losses to pastoralists, and so little prospect does there seem to be of an improvement in their circumstances, that, in the continued absence of improved communication, the abandonment of many of the runs is seriously talked of. The mining populations in the far north-west frequently suffer much hardship through the difficulty and expense of obtaining supplies, and this, together with a scarcity

scarcity of water, interferes seriously with the development of the mining industry in that part of the Colony. At Wilcannia the people are never actually in want of water, but the river is frequently very low, and during the last seventeen years has been closed to navigation for half that period. Communication with other places is consequently often interrupted, with the result that, though whenever the opportunity offers, abnormally large stocks are imported, commodities often become scarce and prices rise. Just before the last improvement in the river flour was selling at Wilcannia at £20 a ton. Supplies are obtained chiefly by river from Adelaide and Melbourne, but goods placed on board river steamers have been known to occupy twelve months in reaching Wilcannia. The difficulties connected with travelling are also very great. Rather than undertake the coach journey between Wilcannia and Cobar, some travellers to Sydney go by way of Adelaide.

#### CULTIVATION.

9. The statistics of cultivation in the area likely to be served by the railway show that in 1898 there were 1,678 acres under cultivation, and in 1899, 1,834, at Cobar, Wilcannia, White Cliffs, Mount Browne, Milparinka, Tibooburra, and Yalpunga. These figures indicate, of course, that the district is not an agricultural one.

#### MINERAL PRODUCTION.

10. The mineral production from the different mining centres for the last two years—1897 and 1898—is shown in the following return from the Statistician's Office:—

District.	Year.	Gold.		Silver.		Copper.		Opals.
		Quantity.	Value.	Quantity.	Value.	Quantity.	Value.	Value.
		oz.	£	oz.	£	tons	£	£
Cobar .....	1897	26,211	105,067	120,860	9,765	2,461½	108,306	.....
	1898	22,254	78,808	170,704	14,556	3,514	178,900	.....
Wilcannia .....	1897	.....	.....	.....	.....	.....	.....	.....
	1898	.....	.....	.....	.....	.....	.....	.....
White Cliffs .....	1897	.....	.....	.....	.....	.....	.....	75,000
	1898	.....	.....	.....	.....	.....	.....	95,000
Mount Browne .....	1897	540	2,163	.....	.....	.....	.....	.....
Milparinka .....	1898	389	1,556	.....	.....	.....	.....	.....
Tibooburra .....	1897	815	3,314	.....	.....	.....	.....	.....
Yalpunga .....	1898	831	3,323	.....	.....	.....	.....	.....

Just now opal mining is somewhat depressed, owing, it is said, to the opal market in Europe being flat. Similar depressions have been experienced before. They lessen the output, it is explained, for the time being, but this strengthens the European market, with the result that the mines are all the more prosperous afterwards. The Police Magistrate and Mining Warden, giving evidence at Wilcannia, expressed the opinion that for the first nine months of the present year the value of the opal output would prove to be very nearly £150,000.

#### TRAFFIC PROSPECTS—RAILWAY COMMISSIONERS' ESTIMATE.

11. The traffic prospects of the railway, as put before the Committee by the Chief Traffic Manager of the Department of Railways, differ very much from those that appear from the evidence of witnesses examined in the country. The former show that the traffic would be very limited, and such as to subject the line to considerable loss; the latter, that it would be much greater than the estimate of the railway officer indicates, and such as to fully justify the construction of the line. The Chief Traffic Manager's figures, summarised, are:—

Goods, 1,390 tons	...	...	...	...	...	£1,000 16 8
Wool, 1,756 tons	...	...	...	...	...	810 0 0
Stock, 800 trucks	...	...	...	...	...	1,000 0 0
Passengers	...	...	...	...	...	2,000 0 0
Miscellaneous coaching	...	...	...	...	...	130 0 0
Mails	...	...	...	...	...	1,872 0 0
						£6,812 16 8

TRAFFIC

## TRAFFIC PROSPECTS—LOCAL ESTIMATE.

12. According to the evidence representing the local traffic estimate, the annual imports of two business firms at Wilcannia, now amalgamated, amount to 4,000 tons, and their exports in wool, skins, tallow, &c., to 6,500. All this might not be carried by the railway, but the line, it is considered, would have a very good chance of competing successfully with the river, and would be certain to secure a large portion of the trade of the district. Produce, it is pointed out, should be obtainable from Orange or Dubbo at a rate much below that at which it is carried by the river steamers, and to deprive the steamers of this produce trade would be to take away their uploading, and so render them unable to carry wool at present rates. It is admitted that it would take time to alter the present drift of the wool traffic; but with such rates upon the railway as would make the cost of sending wool to Sydney about the same as that of forwarding it elsewhere, there is no reason, it is considered, why the line should not obtain most of the wool. Fully one-half of the outwards goods trade of the district, it is believed, could be secured, even with a full river, and with a closed river, it would be possible to obtain the whole, for then despatch by railway would mean an important saving in interest and insurance, two very large items which have to be considered in connection with river traffic. One great advantage to Wilcannia from the railway, would be that tradespeople would find it unnecessary to keep large stocks on hand. Half the capital now employed, it is said, would be sufficient to carry on trade, with the result that small tradesmen would be able to make a living where, under existing circumstances, it requires something like a limited company to enter into business of any kind.

An important feature in connection with the traffic question, pressed locally but not taken into account by the railway authorities, is the additional new trade which the line would bring to the main Western Railway. It is admitted that the main line would benefit by any new traffic finding its way upon it, but the Committee were unable to ascertain to what extent. The Chief Traffic Manager's estimate is confined to the sectional earnings of the proposed railway. If due allowance were made for the additional earnings on the main line, the estimated annual loss of £20,510, shown by the Railway Commissioners' report, would be appreciably reduced.

## EFFORTS TO CHEAPEN THE CONSTRUCTION OF THE RAILWAY.

13. With a view to seeing whether the cost of the railway as estimated could be reduced in any way the Committee endeavoured to ascertain—

- (1) Whether the line could, with advantage, be constructed in the nature of a tramway.
- (2) Whether the district could be served and traffic attracted to the railway, if the line terminate for the present where the expensive section of it commences,  $9\frac{1}{2}$  miles from Wilcannia.
- (3) Whether the railway, if it should terminate on the east side, and close to the Darling River, would meet requirements.

To construct the line in something of the form of a tramway should mean the adoption of lighter rails, cheaper sleepers, perhaps fewer or cheaper culverts, and less timber viaduct work over country liable to flood, a saving of distance and of earthworks by increasing the grade, and the running of light engines with moderate loads at a low rate of speed. In considering this aspect of the matter it seemed to the Committee that if a cheaply constructed tramway could be worked satisfactorily in connection with the Nyngan-Cobar railway, traffic requirements would be met, the district adequately served, and the principal objection to the proposed line—a heavy initial expenditure—removed; and to ascertain what could be done in this direction the Railway Commissioners were waited upon immediately after the return of the Committee from their inspection of the railway route, and two of their officers and the Engineer-in-Chief for Railway Construction examined on the subject.

The Commissioners were not favourable to any alteration of the original proposal, and the Engineer-in-Chief could not see any advantage from making the line a tramway instead of a railway. It was pointed out by the Commissioners that some  
years

years ago they advocated the construction of light railways at a cost, in easy country, of £1,750 per mile, and they appeared to think that something approaching that estimate should be the cost of all such railways now; but, whatever the cost, the line constructed, they contended, must be a railway, as a tramway could not be worked satisfactorily. Their estimate of cost, which is £1,253 below that in connection with the proposed line, could not be examined closely, as the details of it were not obtainable, and any importance which might attach to it was further discounted by the explanation that it was made when the price of rails was much below what it is at the present time. The Engineer-in-Chief, when questioned, could not see how any saving was possible in rails or sleepers, and everything else, he urged, had been kept down to the lowest limit. By steepening the grades the earthworks could be lessened, but even the hope of a little saving in that direction was dispelled, for it was found on further inquiry that the advantages from the alteration would be inappreciable, and the saving hardly worth considering.

Stopping  $9\frac{1}{2}$  miles short of Wilcannia, and so saving for the present £95,192, the cost of the more expensive portion of the railway, was also found to be unadvisable, for on carefully inquiring into the matter it was evident that, so constructed, the railway would be practically useless in attracting wool from the pastoral holdings on and beyond the Darling River, and would fail in meeting traffic requirements in other respects.

The third method by which it seemed possible to reduce the cost of the line was to make the terminus on the east side of the Darling River, which would represent a reduction of £30,200, the details being:—

Saving through stoppage on east side of river—						
Bridging main channel ...	...	...	...	...	...	£18,000
3,000-foot viaduct, at £3	...	...	...	...	...	9,000
$1\frac{1}{2}$ mile formation, at £2,400	...	...	...	...	...	3,200
						£30,200

It would then be possible, though perhaps not advisable, to save £11,700 by not ballasting any part of the line, and this additional amount, together with £8,750, the saving through altering the grade, added to the £30,200, would make a total reduction of £50,650. Further inquiry, however, elicited the fact that since the estimate of the cost of the railway was prepared the price of rails has gone up from £5 5s. to £7 10s., or at the rate of £270 per mile. So that the estimated total cost of the line should be £541,685, or £3,273 per mile instead of £497,000 or £3,003 a mile, and while it is possible to reduce the original estimate of total cost by £50,650, the addition of the sum representing the increased rail price, £44,685, makes the actual saving or difference, based upon the original figures, only £5,965. In the event of the price of rails falling the cost per mile would be proportionately less.

#### RESULT OF THE INQUIRY.

14. The Committee have decided to recommend the construction of the railway as far as the Darling River, and they do this because they are of opinion that the condition of Wilcannia and the surrounding districts is such as to call for the establishment of some means of communication between that part of New South Wales and Sydney in the nature of a railway or tramway. Under ordinary circumstances the anticipated loss from the construction of the line would cause the Committee to negative the proposal, but, in the present case, the circumstances are peculiar and pressing, and lead to the conclusion that the railway should be constructed in some form, even if the difference between cost and earnings should for a time be considerable.

The districts to be served by the line form an important part of New South Wales, where pastoral pursuits have for many years been carried on extensively, and gold and opal mining have developed into what seem to be permanent and profitable industries. The possibility of copper mining also is indicated by the existence in the locality of rich copper deposits which are now being prospected. The population is considerable, and Wilcannia, the chief town, is the headquarters of large trading operations connected with the Darling River and the country to the west and north-west. This town, by way of the Great Western Railway and the Nyngan to Cobar line,

line, is 621 miles from Sydney, 165 miles of which distance is through country almost waterless in dry seasons, and, in wet, much of it subject to flood, rendering the construction of good roads impossible, except at enormous expense. It is, therefore, practically cut off from communication with the metropolis of the Colony of which it forms a part, and, whether it desire to do so or not, is compelled to carry on trade relations with South Australia or Victoria. White Cliffs, the opal-mining centre, being 65 miles to the north-west of Wilcannia, and Tibbooburra, Milparinka, and Mount Browne gold-fields still further away, are in a worse position. The Darling River is a means of communication with other places, and for obtaining supplies, but it is not always navigable, and the Committee have already reported that it is not advisable to make the river permanently navigable at the cost solely of New South Wales.

While, however, it seems but simple justice to give these districts railway communication with Sydney, it is clear to the Committee from the weight of evidence, and from what they saw during their visit of inspection, that if the line should be constructed it cannot for a considerable period be expected to pay interest and working expenses. Between Cobar and Wilcannia there is very little prospect of traffic other than wool from a few stations, some of which at the present time finds its way to the railway at Cobar. Closer settlement than at present exists in that part of the country would probably follow the construction of a railway by land in the resumed areas being taken up in smaller blocks than those now held by pastoralists, and if it did wool production in the district would increase proportionately, and there would be an increase in rental. Farming is very unlikely. The land, in places, is in itself suitable for cultivation, but the rainfall is too scanty and uncertain to attract farmers, and it must not be overlooked that in other parts of the Colony, much more suitable for agriculture, there are large tracts of land not yet under the plough. From Wilcannia and places beyond there would be a goods and passenger traffic which, doubtless, in the course of time, would increase; but for many years it would probably be far below what, on purely commercial grounds, would justify the railway.

It was thought the principal difficulty in the way of recommending the line—the heavy initial cost—might be removed by carrying out a cheaper scheme, but that, as far as the evidence goes, does not seem practicable. If the railway be constructed it must be done at the originally estimated cost with the addition of the sum representing the increased price of rails, the only saving being that effected by not taking the line across the river into Wilcannia. But against this it is only fair to place the impetus the railway will impart to the development of the district, which is not only in good seasons splendid pastoral country, but is undoubtedly rich in minerals, and, with easy means of communication, should support a much larger population than it now contains. Further, it must not be forgotten, that, so bad is the state of the country in this part of the Colony, unless relief in some form be afforded much of the land now taken up will probably go out of occupation.

The people of the district are of opinion that they are entitled to the line not only on traffic grounds, but also because of the large revenue obtained from that part of the country by the State in general taxation as well as land rentals, the insignificant sum spent on the roads, which are merely bush-tracks, and the climatic and other trying conditions under which the population live.

By clause 12 of the Public Works Act the Committee, in considering and reporting on any work referred to them, are enjoined to “have regard to the amount of revenue which such work may reasonably be expected to produce, and to the present and prospective value of such work,” and while sensible of the loss which will follow the construction of this railway for some time, they believe that in addition to the reasons already stated the prospective or ultimate value of the work may reasonably be expected to compensate for the expenditure. In the meantime they think that the deficiency in the railway earnings should be met in some degree from the land revenue obtained from the district benefited by the line, and to effect this they suggest that the railway revenue should be subsidised to some substantial and suitable extent from this source.

RESOLUTION

## RESOLUTION PASSED.

15. The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings :—

Mr. Watson moved :—“ That, in the opinion of the Committee, it is expedient the proposed Railway from Cobar to Wilcannia, as referred to the Committee by the Legislative Assembly, be carried out to a point on the east side of the Darling River, 619½ miles from Sydney.”

Mr. Dick seconded the motion.

Mr. Trickett moved :—“ That the motion be amended by the addition of the following words— ‘ The Committee, however, having “ regard to the amount of revenue which such work may reasonably be expected to produce,” recognise that, at present, the direct revenue will fall far short of the amount required to pay interest and working expenses ; but looking at “ the present and prospective value of such work ” they regard the proposed railway as a means of much needed relief to the settlers in the north-western part of the Colony, and an aid to the greater development of the country, and they therefore suggest that the railway revenue should be subsidised to some substantial and suitable extent from the land revenue derived from the district benefited by the line.’ ”

The amendment was passed, and the motion, as amended, was then agreed to.

W. J. TRICKETT,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 12 December, 1899.

---

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### RAILWAY FROM COBAR TO WILCANNIA.

WEDNESDAY, 15 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Cobar to Wilcannia.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you prepared a statement with reference to the proposal under the consideration of the Committee? Yes; it is as follows:—

R. R. P.  
Hickson.

THE first action with regard to this proposal was taken during the year 1884, when a petition from residents of Cobar and district was presented to the Legislative Assembly, asking for the construction of a railway from Nyngan-Wilcannia *via* Cobar. Mr. Secretary Wright approved of the survey being made, and it was completed in 1885. Length 156 miles 45 chains.

15 Mar., 1899.

Another route, namely, that from Forbes, has been suggested for railway communication with Wilcannia, but in February, 1889, when the late Engineer-in-Chief (Mr. Whitton) was asked to report on the matter, he had no hesitation in stating that if it were considered desirable to construct a railway to connect with Wilcannia, and which might eventually be extended to Silverton, the best route to adopt would be from Nyngan to Cobar, thence to Wilcannia and Silverton.

When the Public Works Committee were inquiring into the proposed railway from Nyngan to Cobar, they did not confine themselves to the question of the expediency, or otherwise, of constructing a railway as far as Cobar, but directed their attention also to the larger question of opening up communication by railway with the extreme north-western portion of the Colony, and they recommended the construction of the railway to Cobar as part of the line eventually to extend to Wilcannia and Broken Hill.

The Engineer-in-Chief for Railway Construction in July, 1889, submitted to the Minister an estimate furnished from very rough data, viz., £497,000, for the length from Cobar-Wilcannia.

An amended survey was made in 1892, the length to the east end of the Darling River flood area being 152½ miles, and to which 9½ miles must be added to cover the flooded area and the crossing of the Darling into Wilcannia. Total length 162 miles, for which the estimate of £497,000 stands good.

This surveyed line leaves the end of the present terminus, Nyngan to Cobar Railway, at about 459 miles 36 chains, and proceeding in a westerly direction, follows the main road to Wilcannia through the counties of Robinson and part of Booroondena to 501 miles 50 chains; thence in a slightly south-westerly direction past Brokmetta Lake up to 533 miles; thence it bears north-westerly to 538 miles; thence due west through the county of Rankine to Lake Poopelloe crossing, and recrossing the main road at 569 and 572 miles; thence bearing south-westerly through the county of Werunda to 537 miles; thence north-westerly to Wilcannia, crossing the Darling River at about 619 miles 60 chains; thence through the town of Wilcannia, running between and parallel to Murray and Brougham Streets, and terminating at about 621 miles 36 chains.

This line is laid out with 1 in 75 grades, to get rid of which, by contouring, an extra length of line of 3½ miles is considered necessary, making 165½ miles. The estimated cost, £497,000, covers this additional distance, and includes the cost of altering the grades to 1 in 100. Sharpest curve 14 chains radius.

Wilcannia, which is to be served by this line, is the centre of a very large district, and from evidence given before the Public Works Committee, it was ascertained that the annual freight earned inwards and outwards at this town was at least £80,000.

Another route which bears on this proposal is that from Condobolin to Broken Hill, via Menindie, which originated in May, 1895, the Works Committee having at that time presented a report to Parliament recommending the construction of the extension from Parkes to Condobolin, and in clause 10 of this report the question of extending the line on to Menindie is referred to.

R. R. P. Hickson.  
15 Mar., 1899.

The Railway Commissioners also, when reporting on the line from Parkes-Condobolin, under date 19th February, 1895, stated that this line should be looked upon to a great extent as part of a national line ultimately being extended to serve the Lachlan district as far as Hillston, and later on by a further extension to Menindie on the Darling.

Further, the Railway Commissioners, when reporting on the Condobolin to Broken Hill, via Menindie line (8th May, 1896), assumed that the Government would proceed with the extension of the Cobar line to Broken Hill, via Wilcannia, and in their opinion it would be a long time before two new routes to the Darling would be necessary, but as the construction of the Parkes line to Condobolin had been authorised, they were of opinion that if the Government decided to construct a line to Broken Hill the Lachlan River and Menindie route should be adopted, as it not only afforded the through connection intended to be given to Broken Hill, but also gives it by means of the shortest route, and would enable the New South Wales Railway system to conserve to itself a great deal of the traffic from the centre of New South Wales, which is now obtained by adjoining colonies.

The Public Works Committee could not see their way clear to recommend the construction of the line from Condobolin to Broken Hill.

The latest report of the Railway Commissioners on this proposal was received on 13th December last, in response to a request from the Minister, and is as follows :—

Proposed line of Railway from Cobar to Wilcannia—162 miles.

In accordance with the provisions of the Public Works Act of 1888, section 13, we beg to report as under :—

Cost of Construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a single line of light railway, exclusive of land and compensation at about..... £497,000

Annual Cost—

Capital expenditure, at 3 per cent, .....	£14,910
Estimated cost of maintaining permanent-way, and for traffic and locomotive expenses .....	12,400
<b>Total annual cost .....</b>	<b>£27,310</b>

Traffic Estimate—

Merchandise, wool, and live stock .. .. .	}	£1,000
Passenger traffic, mails, parcels, &c. ....		800
		1,000
		4,000
<b>Total annual traffic.....</b>		<b>£6,800</b>

In connection with the above railway proposal, we desire to say that, having on previous occasions traversed the districts through which the proposed railway line would pass, and being acquainted with their resources, we have not deemed it necessary to make another visit of inspection.

It is not our usual practice, when dealing with extensions referred to us by the Government, to enter into the merits of alternate routes, but the circumstances surrounding the proposal under review are exceptional, and necessitate some reference being made to other proposals for dealing with the traffic of the Darling River district.

We have already reported on proposals for railway extension from Cobar to Wilcannia and Silverton, and from Condobolin to Menindie and Broken Hill.

The one recommendation in favour of the line Cobar to Wilcannia, as against one from Condobolin to Menindie or Wilcannia, is the fact that it will require the construction of considerably less new line, and consequently, in the first instance, involve less capital outlay. It will, however, be the longest in length from the Metropolis.

From a traffic point of view it is, however, not so desirable as the route via Condobolin. The latter route would better bisect the country lying between the Western and South-western lines. It would open up for development a better class of country, and would enable New South Wales to conserve a great deal of traffic from the centre of the Colony which is now drawn to the adjoining Colonies.

It is presumed that if the extension to Wilcannia is made, the line would eventually be taken on to Broken Hill. When this project was under consideration some years ago, the prospects of Broken Hill were exceptionally good, and quite different to what they are to-day. Then a very large trade in coke, fuel, and ores was anticipated, which cannot now be hoped for, as the ores are not now locally treated.

In view of the very small prospect of the line to Wilcannia proving other than a large burden on the railway system, the Commissioners cannot recommend its construction.

CHARLES OLIVER,  
Chief Commissioner.

W. M. FEHON,  
Commissioner.

DAVID KIRCALDIE,  
Commissioner.

The Lands Department has supplied me with the following information with regard to the tenure of land within 20 miles of each side of the proposed line.

Alienated land.....	51,000 acres
Settlement and homestead leases .....	387,000 "
Reserves .....	476,000 "
Crown lands.....	3,453,000 }
	3,929,000 acres.

The final action was taken on the 22nd December last, in the Legislative Assembly, when Mr. Secretary Young's motion to refer the proposal to the Public Works Committee was passed.

2. *Mr. Watson.*] Do you know whether the estimate of the cost of construction per mile has been brought up to date? Yes.

3. Does not the estimate of £3,000 per mile appear to be rather heavy compared with some of the lines we have been making? Yes; but it must be remembered that there are 9 or 10 miles of the line near to Wilcannia which will be very costly indeed, owing to the crossing of the river and the necessity for passing a considerable length of flooded country. This was not contemplated in the original proposal.

4. Is the country between Cobar and the river easy for the purposes of railway construction? Fairly easy.

5. Is there not a large area of Crown lands in the vicinity of the proposed line? Yes.

6. Do you know whether any, or a large portion of it, is good land? I can only say that all the land I went through was bad.

7. And not likely to assist to make the railway pay? I think not.

8. Do you think, if the railway were constructed, we should be able to compete with the river in the carriage of goods towards the seaboard? That is an extremely difficult question to answer, because there is no certainty as to when the river is trafficable. If we erect locks, as is proposed, it will alter the circumstances of the case entirely. That scheme has yet to come before the Committee.

9. But that scheme does not contemplate the erection of locks all the way down? As far as Menindie.
10. So that that would not assist the carrying of produce towards the sea in the lower reaches? I do not think so.
11. Do you think the river would be sufficiently improved by the construction of locks to increase the probability of any great amount of traffic from Wilcannia, or towards Wilcannia, going by river? I think the effect of locking the river, as proposed, would undoubtedly be to increase the traffic on the river.
12. Consequently, detracting from the probabilities of traffic on the railway? I think so.
13. Do you think it necessary to provide for the fencing of the line as proposed in the estimate? I think some of it ought to be fenced, but a good deal of it might be left unfenced.
14. According to the estimate, in the previous inquiry—Cobar to Cockburn—£36,000 will be added to the cost of construction if the line is fenced;—if the trains travel at a low rate of speed, would it not be possible to do without fencing? I think it would.
15. On the Moree line there is no fencing, nevertheless, the trains travel at night with a good head-light. If it is possible to do that on the Moree line, would it not be possible to do it on the proposed line? I think it would.
16. *Dr. Garran.*] Have you been over the route of the proposed line? Yes.
17. It is not an absolutely straight line? No; it deviates a little.
18. What is the nature of the obstructions—swamps or hills? They are little rises, which it is advisable to get round.
19. Nothing more than that? No.
20. And it is to keep the gradients down that you go round them? Yes; near the river you get into swampy country for the last 10 miles.
21. The Commissioners speak of another route—from the Lachlan direct to Menindie? Yes.
22. Have you been along that route? No.
23. Have you been to Menindie? No.
24. Do you know whether the approach to the river there would be as difficult and expensive as the approach to Wilcannia? I think not; but I should not like to say for certain.
25. The lakes at Menindie are on the western side of the river? Yes; below the railway.
26. Then we should escape that expensive part, if we chose Menindie as the point of construction? To whatever extent the difference exists; but I would not like to say myself what it is.
27. Is Menindie as good a trade centre as Wilcannia? I think not.
28. I suppose more stock cross at Wilcannia than at Menindie? I think so.
29. There is a project before the country to get to Hillston, and in that case, if a line to Menindie were constructed, it would start from Hillston? Yes; a proposal will come before the Committee to extend the Koorawatha-Grenfell line to Wyalong, and, if that is done, it will eventually go on to Hillston.
30. Then the starting-point to the Lachlan would be Hillston? Yes.
31. But the route to Menindie would be very much the same? Yes.
32. The difference would be simply on the south side of the Lachlan? Yes.
33. *Chairman.*] Have you been over both routes? No; only between Cobar and Broken Hill, via Wilcannia.
34. Is there any good pastoral country there? The part I went through was very poor country for any purpose.
35. What would be the principal traffic if the railway were constructed? The principal traffic would be from the river. There would be very little local traffic. There would also be the traffic which centres in Wilcannia.
36. Do you not think that, instead of people using the line east towards Sydney, the tendency would be to take the traffic down the river, having got it so far? Of course, if they had a river, it could, I believe, compete with the railway, but the difficulty there is that they cannot depend on having a river.
37. Do you know anything of the country between Condobolin and Broken Hill, via Menindie, or from Wyalong to the same point? No. I have been as far as Condobolin, but not further west.
38. *Mr. Trickett.*] The statement you have handed in shows that the estimated annual cost of the line is £27,310, and the estimated revenue is £6,800, showing a loss of £20,510? That is so. The Commissioners follow that up by saying:

In view of the very small prospect of the line to Wilcannia proving other than a large burden on the railway system, the Committee cannot recommend its construction.

39. Do you endorse that opinion? I think that is hardly for me to say.
40. The Commissioners also state:

It would open up for development a better class of country, and would enable New South Wales to conserve a great deal of traffic from the centre of the Colony which is now drawn to the adjoining colonies.

How is it drawn there? By river traffic—by the Darling and the Murray.

41. Is not this proposal in one way closely connected with the question we have to consider of treating the river Darling by means of locks and weirs? Very closely, I think.

42. It would seem, too, that if we were to improve the navigable properties of these rivers, and also to construct a railway, the rivers would still maintain the trade? I think so; I do not think a railway could compete with the river.

43. I believe that river transit, where fairly regular, generally beats railway transit? Certainly.

44. *Chairman.*] Do you mean that the traffic likely to be obtained from a district like this is more likely to take the cheaper method of transit? Naturally.

45. The experience in America is that the railways can beat the rivers? I do not think you can lay down any hard-and-fast rule. There are certain circumstances to be taken into account. Markets have to be taken into account. The class of merchandise to be carried has also to be taken into account. If you have a traffic which has to be brought expeditiously and quickly to a market, of course it must come by railway; it cannot stand the time on the river.

46. Do you think that, with the class of traffic which is likely to come down, the rivers will compete with the railway? I do.

47. *Mr. Levis.*] If you were to construct a railway on your own account, would you go from Cobar to Wilcannia, or from Condobolin to Wilcannia? I think I would go from Cobar, because there would be so much less length of line to make.

R. R. P.  
Hickson.

15 Mar., 1899.

R. R. P.  
Hickson.  
15 Mar., 1899.

48. What is the distance from Condobolin to Wilcannia? 270 miles. The following is a table of distances by different routes from Sydney and Brisbane to Broken Hill and Adelaide:—

## COBAR TO WILCANNIA.

TABLE of distances by different routes from Sydney and Brisbane to Broken Hill and Adelaide.

	Miles.		Miles.
Sydney to Cobar .....	459	Sydney to Broken Hill, via Condobolin and Wilcannia .....	718
Cobar to Wilcannia .....	165½	Broken Hill to Adelaide .....	334
Wilcannia to Broken Hill .....	118½		
Sydney to Broken Hill.....	743	Sydney to Adelaide .....	1,052
Sydney to Condobolin .....	329½	Sydney to Broken Hill, via Menindie .....	696
Condobolin to Wilcannia.....	270	Broken Hill to Adelaide .....	334
Wilcannia to Broken Hill .....	118½		1,030

Sydney to Broken Hill, via Cobar.....	743		
Broken Hill to Adelaide .....	334		
	1,077		

49. Is not the whole of that western country of the same character? I do not think so.

50. What kind of country would there be from Orange to Condobolin? Good agricultural country, and I believe it extends from there well on to Hillston along the river. What it is like from there onwards I cannot tell you.

51. Have you been from Cobar to Wilcannia? Yes.

52. What class of country have we along there? Poor.

53. *Mr. Shepherd.*] Is the line, as surveyed, supposed to follow the best route which can be obtained from Condobolin to Wilcannia; it seems to follow a round-about course? I think the idea of that was to follow, as much as possible, the valley of the Lachlan, where the best land is to be found. It would also get fairly close to Hillston. A straight line across from Condobolin to Menindie would go a long way from Hillston, and would not accommodate it.

54. Would it not be better in these cases to take the most direct line possible if the advantages are equal? Of course, if the advantages are equal.

55. Is the country much poorer more to the north? Yes; you will find there is a great difference between the country in the valley of the Lachlan and 50 or 60 miles north.

56. Is the country between Cobar and Wilcannia well watered? No.

57. Is it proposed that the line should intercept much of the traffic carried by the river Darling? I think that is what the Commissioners thought when they made their report.

58. Is there anything in the shape of cultivation being carried on between Cobar and Wilcannia? Not as far as I saw.

59. I suppose that the country chiefly carries sheep? Chiefly rabbits, when I was there.

60. *Mr. Trickett.*] Is not railway construction cheaper now than it was ten years ago? Yes.

61. I asked the question, because I see that the estimate in 1889 was £497,000, and that is the estimate now? I think that Mr. Deane will tell you that that estimate includes crossing the Darling, which it did not include before.

62. *Mr. Levien.*] Which is the better timbered country—from Cobar to Wilcannia, or from Condobolin to Wilcannia? I think there is very little difference. It is all very poor. As a matter of fact, between Cobar and Wilcannia there is very little timber.

63. *Chairman.*] Is it intended ultimately to continue the line to Silverton? I presume so.

64. It was anticipated at one time that there would be a large traffic in coke? Yes.

65. Has anything occurred to alter that anticipation? Yes; the smelters have been taken from Broken Hill to Port Pirie.

66. Then no traffic of that kind is anticipated now? I think not.

67. *Mr. Watson.*] Although the smelters have been taken to Port Pirie, is it not a fact that all the refined ore has to come to Sydney in the mail-boats? A great deal of it.

68. The steamers which take the ore to Port Pirie for the use of the smelters there bring back the refined material? I think so.

69. Do they not practically bring it all here? I could not say to what extent.

70.

70. Is it not worthy of consideration whether it would not pay to bring the ore to Lithgow, and take the refined metal to Sydney for shipment? That is a traffic matter, upon which I could not give an opinion. It is just a question whether the rates on a railway would be low enough to compete with the rates of carriage by water.

R. R. P.  
Hickson.  
15 Mar., 1899.

71. If we could get the rates down sufficiently to make it pay the companies to send their ore to Lithgow at practically the same cost as they send it to Port Pirie, it would probably be a saving to them in sending the refined metal into Sydney? We may be sure that the companies will send their goods by the cheapest route.

THURSDAY, 30 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

72. *Chairman.*] I believe you were examined on a former occasion in connection with the proposal to construct a railway from Cobar to Cockburn? Yes, in 1891.

73. Is the present proposal a portion of that scheme? Yes.

74. Were the Railway Commissioners in favour of the line from Cobar to Cockburn? Yes; their report was favourable.

75. Are they still of that opinion? They have altered their opinion.

76. Can you give us the reasons why they have altered their opinion? Yes, to a large extent. When the Commissioners made their report in 1889 the circumstances were very different from what they are now. They were asked to report on a line from Cobar to Cockburn, and they went to a great deal of trouble to obtain information as to the merits of the scheme. They went over the route, and to Broken Hill, and obtained the best evidence they could as to the probable traffic. At that time Broken Hill was commencing to boom. The population was commencing to grow very fast, and they were working a rich class of ore. The Commissioners were assured on the best authority that Broken Hill was going to be a permanent field, and that, if a line were constructed, there was a big prospect of obtaining a large traffic in ore one way, and coal, coke, and timber the other. In view of that, the Commissioners thought the line was one they could recommend. There was another consideration upon which they dwelt to some extent, and that was that it would be a line which it might be wise to construct as a matter of State policy. At that time they did not say that the line would pay. They said it would be very difficult to get an estimate of traffic, but that they thought the traffic circumstances were rather favourable. Since that time Broken Hill, instead of increasing, has gone down, and the circumstances in connection with the ore have altogether altered. At that time no smelting-works were established in this Colony outside Broken Hill. The understanding was that if a line were made we should see smelting-works at Lithgow, the ore carried there, and a back loading. Since then the richer class of ores has been to a large extent worked out, and, according to present circumstances, the traffic would be in ores from the mines to the seaboard. If a line were made to Broken Hill the present position seems to indicate that there would be very little prospect of getting mineral traffic over it. Of course, if we had that traffic it would give us the advantage of being able to compete very much more favourably for intermediate business. We should have trucks working backwards and forwards, and that would place us in the position of picking up intermediate business. As the Commissioners pointed out, there were national considerations to be thought of, such as the giving of outlying districts the benefits of railway communication, the carriage of stock to market, and their removal in times of drought. One thing which has caused them to somewhat alter their opinion has reference to Cobar as a starting-point. They reported on the merits of the line directly before them. At that time we had no line stretching towards the Menindie country from any other point. At the present time, however, we have a railway from Molong to Parkes and Condobolin on the one side. A railway to Grenfell is also about to be constructed, and there is a proposal before the Committee for an extension to Wyalong. Thus, circumstances are altering considerably in regard to the different routes. The Commissioners, looking over the different routes, say that, as the best means of reaching that country, they are in favour of a line which would go to Menindie, as it would better bisect the country, and, as a matter of strategy, it would be a far better line for us to intercept that traffic which now drifts to the other colonies. We want a line going south instead of north. The traffic comes to the southward, and if a line were made from Cobar to Wilcannia the traffic lying between Condobolin, Euabalong, and Menindie would still follow the course it has been following to the other colonies; but we should be in a better position to compete for that business if the country were intersected, as it would be, by a line running from Hillston to Menindie. I think those are some of the considerations which have influenced the Commissioners in altering their opinion.

77. Wilcannia depends greatly, at present, on water-carriage? Yes.

78. And that is very unsatisfactory? It is uncertain.

79. Supposing the water-way is made permanent, would the traffic be likely to come on the railway? I hardly think so. It would, I think, make it more difficult to compete for the business.

80. Wilcannia has been reported as being the centre of a very large district;—would the Committee be justified in considering it the centre of a large area of land, or the centre of a large producing district? The centre of a very large area, which is productive to a limited extent, compared with an equal area in the eastern part of the country. If you look at the Commissioners' report you will find that they estimate the traffic as being a comparatively small one. It is estimated that the traffic from merchandise, wool, live stock, mails, parcels, and passengers will be £6,800 per annum.

81.

H.  
McLachlan.  
30 Mar., 1899.

- H.  
McLachlan.  
30 Mar., 1899.
81. Is the traffic likely to increase? I do not think so immediately. It is a country where population does not grow very quickly.
82. Federation being nearer than the completion of any line out there, is it not more than likely that pretty well the whole of the district will be served by a line to another colony? Yes. I think the position is also altered by Federation. In 1889 we had not the same competition to face with the other colonies, and we would have been more at liberty to quote differential rates; but if you had Federation the outside towns on the borders of the other colony would most likely obtain more of the geographical advantages of their position—that is to say, that a town 200 or 300 miles from Adelaide is more likely to do business with Adelaide than with Sydney, which is 750 miles away.
83. I suppose we may consider that the Commissioners are against the proposal being carried out on account of its saddling them with a loss? Yes; they do not recommend it.
84. *Mr. Watson.*] What do you think the distance is between lines which would be profitable—not competing against each other, but working practically in unison—in pastoral country? Pastoral country differs very much, but I should say not less than 100 miles.
85. What will be the distance between Menindie and Hillston? I should say it would be about 100 miles.
86. Primarily, if it were not on account of the altered circumstances on account of the river traffic, there would be a sufficient distance between those two lines to justify the construction of both? I should say the distance should not be less than 100 miles in pastoral country.
87. You say that the Commissioners think that a line to Wilcannia will not pay;—is that alteration of their opinion due only to the fact that the conditions of Broken Hill are different, or to the possible increase of the facilities for water-carriage? No; originally they did not say that the line from Cobar to Broken Hill would pay; but they thought there were so many considerations in favour of it that the Government might undertake it. Their opinions have been altered by the different set of circumstances which now prevail at Broken Hill, and also to some extent by the appearance of a better route made possible by the extension of the railway westward from Orange. Then there is another factor which must be considered, and that is the extension of the line from Grenfell to Wyalong. Another advantage in reaching Sydney is that you have much the shorter route of the two.
88. What is the difference in distance by the Condobolin route compared with the other? About 50 miles in favour of the Condobolin-Menindie-Broken Hill route.
89. Would 50 miles be of great importance in a run of some hundreds of miles? It must be. It is 7 or 8 per cent., which is a fairly big percentage of the whole.
90. Has the output of ore at Broken Hill been lessened, or has the grade of the ore only been reduced? A different grade of ore has been produced, and smelting at Broken Hill has been done away with.
91. I understand that the ore is now conveyed to Port Pirie? Yes; or sent to Newcastle for Cockle Creek and Dapto.
92. What is the cost of carriage between Broken Hill and Port Pirie? About 12s. 6d. per ton.
93. Including the rate over the private line from Silverton to Broken Hill? Yes.
94. What is the distance from Broken Hill to Port Pirie? 253 miles.
95. What is the steamer freight from Port Pirie to our ports? About 5s. a ton.
96. I understand that the lowest price at which the Commissioners, in 1891, estimated they could carry ore from Broken Hill to Lithgow was £1 6s. 4d.? Yes; one halfpenny per ton per mile. Of course when the Commissioners made their report in 1889, the big smelting-works on the seaports were not established.
97. Do you think one halfpenny per ton per mile is the lowest rate at which the Commissioners could profitably carry ore that distance? It depends upon return loading. If you have to take full loads one way and return empty, it discounts your rate very much, and in view of the uncertainty, one halfpenny per ton per mile would be as low as they could quote with any probability of profit. It is very low, and there is no other rate in the Colony like it.
98. I understand that ore is carried on the railways at that price now;—if it can be carried for that over 200 or 300 miles, surely it can be carried for a little less over 700 miles? Yes; if the circumstances are the same in both cases. One of the present conditions with regard to the low rate is that the traffic has to wait to be carried at our convenience.
99. Would there be back loading if ore were taken to Lithgow? Not now; they are not smelting at Broken Hill.
100. I should imagine that there is a fair demand for coal at Broken Hill for mining and household purposes, independent of smelting? There would be nothing to balance the traffic.
101. You think, then, that there is no probability of the proposed line, if carried to Broken Hill, competing with the steamer and railway carriage to Newcastle? No; the Commissioners think there is no prospect of competing for the business.
102. Do you think the construction of locks, if carried right through to Wentworth, would have the effect of dragging the traffic away from any railway which would tap the Darling? That is a new question, and the Commissioners have not considered it.
103. Do you think the construction of locks between Bourke and Menindie, ceasing at Menindie, would help to drag traffic towards a railway which would tap the river there? I am a little bit doubtful as far south as Menindie. You are not a great distance from navigable waters all the year round. In ordinary seasons it would not affect business, because, to a large extent, it would still go up the river, locked or unlocked. Generally speaking, you can get a good river to Menindie, for at least half the year.
104. Do you think that would be sufficient to carry the trade? I think so.
105. I understand that the character of the country between Cobar and Wilcannia and beyond is pastoral? Yes.
106. Do you think, if irrigation were entered upon largely, it would have an appreciable effect on the traffic? I hardly think so. It would be very difficult to irrigate that country, because there are no waterways, and the rainfall is uncertain. If you irrigated it to some extent, and cultivated a comparatively small portion, it would rather prejudice the chances of the line in this way—that the local requirements would be met instead of being carried by railway.
107. You do not think there would be a sufficiently large development of local traffic to render export to Sydney or along the river necessary? I do not think it would be wise to count on business of that kind in connection with this extension.
- 108.

108. You are aware that the line would pass through nearly all Crown lands? Yes; that is one of the national advantages which the Commissioners referred to originally.
109. It was mentioned in connection with the former investigation that the Commissioners anticipated a fair amount of traffic from the removal of stock during times of drought;—do you think that traffic would be of importance, so far as volume is concerned? It would be in times of drought, and it would be an economic advantage to the State. Our experience, however, shows that, compared with the stock in the country, not a very large number are moved in times of drought. People hold on too long. Then there is the difficulty of getting suitable country to which to send them. Generally speaking, we find the movement of starving stock is hardly so great as many people would imagine.
110. Is it not a fact that in some places they have run a very light line, in the nature of a tramway, with the view of dealing with the light traffic? Yes.
111. Do you think it would be possible to construct anything of that character for dealing with this country? I do not think the light tramways have been run over a long area of country, such as this. Of course, you would not run the trains every day. The estimate of working expenses is based on three days' running per week. There would be fair loads occasionally, when stock and wool were coming down. The proposed line is what we call a cheap line, and will cost about £3,000 per mile.
112. That seems high for that class of country? There is a good deal of expense in getting into Wilcannia. There are a good many waterways, and 10 miles of flooded country.
113. Is there any idea in the minds of the Commissioners to utilise the motors which are going to be discarded in Sydney? No; not for a long length like this. They would not carry sufficient water.
114. *Dr. Garran.*] Judging from what you have said, it appears that the Commissioners are looking towards pushing a railway to Hillston? Yes; if a railway is necessary they favour that direction rather than to the north.
115. They think they would sweep a certain area of traffic from Hillston, and they want to get to where the traffic concentrates? Yes.
116. If Hillston were made a terminus, the traffic they now miss would probably go there? Yes.
117. Therefore, altogether apart from the question of reaching the Darling, the Commissioners have a desire to get to Hillston? Yes; they have already expressed that opinion with reference to a railway to Euabalong. The Commissioners generally, other things being fairly equal, recommend the construction of the line which necessitates the least expenditure.
118. When the line to Condobolin was sanctioned, this idea of a more southern line was not then to the front? No.
119. That line would not have been made if the line from Koorawatha to Grenfell had been developed? That alters the position a good deal.
120. Now that the line has gone as far as Condobolin, would the Commissioners favour going from there to Hillston, or from Grenfell to Hillston? They have never been directly asked to report, but originally their opinion seemed rather in favour of going from Condobolin to Euabalong, and then to Hillston.
121. One advantage of going to Grenfell is that you strike the cross-country line between Blayney and Murwillumbah, which would give you the opportunity of bringing the traffic to Sydney by the Southern or Western line? Yes; that is an advantage, and it bisects the two lines better.
122. Is Koorawatha as near to Sydney by the Southern as by the Western line? No.
123. Are the gradients on the Southern line better? Generally. Of course we have the same heavy grades on both lines.
124. You propose to improve a good many of the heavy grades on the Southern line? Yes.
125. Especially between Sydney and Mittagong? You will always have a big trade there; but so far as traffic there is concerned, it would be with the grade.
126. Is the traffic heavier on the Western than on the Southern line, at certain times of the year? Yes.
127. Is it generally more heavy? Yes.
128. It would be a relief for the Western line if some of the Hillston traffic could be thrown on to the Southern line? It would be an advantage to be able to work it either way. Of course we are not overcrowded.
129. But it would give you the choice? Yes.
130. And the extra mileage would be compensated for by somewhat better gradients? Yes; and the convenience of working.
131. And it would also tend to bring that cross-country line more into use? Yes.
132. That is at present one of our unprofitable lines? Yes.
133. Is any quantity of cattle from the north brought along that line to go to Melbourne? We get some from Bourke from the west.
134. Do you take it straight away from Bourke to Albury? Yes.
135. You supply the Melbourne market to some extent from the western country? Yes.
136. If we made a line from Cobar to Wilcannia, would there be any risk of our taking some of the traffic we already get to the river, instead of bringing it down? I do not think so.
137. When you get within 50 miles of Wilcannia, and you have made a railway to the wharf there, would there not be some risk of the wool going to the river? We do not get that traffic now.
138. How long has the Cobar line been opened? Since 1891.
139. Is it paying expenses and interest? Close to it. Although it does not directly pay, the assistance it must give to the parent line makes it financial.
140. How long has that been the case? For the last three or four years. In 1896-7 the loss, after providing for working expenses and interest, was only £1,390. In the previous year it was £2,800.
141. Is the improvement due to pastoral or mining traffic? To a large extent to mining traffic.
142. If mining had not looked up the line would not have paid? I think not.
143. Then a purely pastoral line is not a very paying speculation? No.
144. If any other mineral districts were opened up in the neighbourhood of Cobar, it might pay you to extend the line to them? Yes.
145. Mineral districts are paying districts? Yes; they generally have a big population. Ore and coke may not pay so well, but the general goods and passenger business helps to pay.

H.  
McLachlan.  
30 Mar., 1899.

- H. McLachlan.  
30 Mar., 1899.
146. If we could see that a mining district would be opened up within easy distance of Cobar, it would be wise to extend the line to suit the population there? It would be worth while considering.
147. Is there any such district at present? Not to my knowledge.
148. It would be safer for a railway to wait until the mining district develops itself first? Yes; to get some reasonable idea that it is going to be permanent.
149. Have you any hope of a mining development on the Southern line from Koorawatha westward? It is a grain-growing district. We expect to get the traffic of a big agricultural district. We know that west of Grenfell there is a mining district already established.
150. Is there any object in going to Hillston, excepting the Willandra Billabong? The line would run alongside the Willandra Billabong. In running to Hillston you would follow the valley of the Lachlan, where you are more likely to touch population and traffic, and it is a reasonable thing, if you can do so, to go to an established traffic.
151. Is the line to Condobolin paying? We have not had sufficient experience of it yet.
152. Do you consider the line from Molong to Parkes and Forbes is paying? There is a slight loss upon it, but looking upon it in the same way as we look upon the Cobar branch, we consider it as practically paying.
153. You do not wish you were without it? No; it is a good line, and there is always business upon it.
154. And it will not deteriorate? We think not.
155. Is the Cootamundra to Temora line likely to improve? I believe there is a revival there, but there is no striking growth.
156. A cockspur line will not pay as a rule? Not unless it has a good district behind it.
157. Under the circumstances, then, you think that unless there are national reasons for it, it would be a mistake to construct the line from Cobar to Wilcannia? That is what the Commissioners feel at the present time.
158. Only national reasons would justify its construction just now? Yes.
159. Is the line from Nevertire to Warren a promising one? Yes; but it is comparatively new.
160. You think, then, that the question of pushing to the west is, as yet, an unsettled problem, and that there is no need to be in a great hurry about it? Yes; the Commissioners' idea is to go rather to the southward than from Cobar.
161. The more southerly you make your line to the west, the more you command your traffic northward? That is an important consideration.
162. If you make a line to the west, you are pretty sure of the traffic on the north side? Yes. The point is to go as far south as you can reasonably go to the Border.
163. And yet, on the line to Hay you do not get it? We get a good deal of the Hay traffic.
164. Is not the river freight from Hay to Echuca cheaper than you can carry it? Yes; but a great deal of business comes in.
165. You have to cut low to get it? Yes; but still at rates we consider remunerative.
166. Looking at the matter from a traffic point of view, you would rather reach the Darling by the more southerly route? Yes.
167. Although it will take longer to do it? Yes; at the same time if the objective point is Broken Hill, you bring Broken Hill 50 miles nearer to Sydney.
168. If the Government buys the line from Broken Hill to Tarrawingie, we shall have a railway of our own? The Government has purchased that already. Still it bears very little on this question, because it does not run in the proper direction.
169. As between the Western line and the Southern line competing for our western traffic, do you think the cost of haulage is greater on the Western than on the Southern line? We do not reckon it is. You have heavy ruling grades on the Southern as well as on the Western line, although, perhaps, not so many.
170. You could run as big a train on the Western as on the Southern line? Yes.
171. The same engine would take the same number of trucks on either line? Yes; you have the same maximum ruling grade.

TUESDAY, 4 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

H. Deane.  
4 April, 1899.

172. *Chairman.*] Will you explain to the Committee the details of the proposed line? Yes; the Under Secretary has read a statement describing the route, and I will furnish the estimate in detail. I have divided the estimate into two parts.

COBAR TO WILCANNIA.—Part 1.

Cobar, 459 m. 36 chs. to east end of Darling River flood area, at 611 m. 76 chs.

Amended mileage .....	m. chs.
152 40	
Add for easing grades = .....	3 40
Total .....	156 00

*Estimate.*

## Estimate.

H. Deane.

4 April, 1899.

Description.	Per mile.	Cost.
Earthworks.....	£ s. d. 400 0 0	£ s. d. 62,400 0 0
Culverts.....	200 0 0	31,200 0 0
Road—Rails, &c., including freight by rail to Cobar, or by river to Wilcannia.....	£812 18 0	
Sleepers—2,464 at 4s.....	492 16 0	
Ballast—300 at 5s.....	75 0 0	
*Laying—1,760 at 1s. 6d.....	132 0 0	
Miscellaneous.....	1,512 14 0	235,981 0 0
Stations and sidings.....	30 0 0	4,680 0 0
Water supply.....	40 0 0	6,240 0 0
Telegraph gradient and mileage posts.....	70 0 0	10,920 0 0
	30 0 0	4,680 0 0
Contingencies, 7½ per cent. (nearly).....	£ 2,282 14 0	356,101 0 0
	171 0 0	26,676 0 0
Engineering, 5 per cent. (nearly).....	£ 2,453 14 0	382,777 0 0
	122 0 0	19,031 0 0
156 miles at £2,575 14s.—cost, £401,808.	£ 2,575 14 0	401,808 0 0

\* Includes cost of running over line under construction.

## COBAR TO WILCANNIA—Part 2—Crossing of the Darling River.

From #611 m. 76 chs. to west end of Wilcannia Station ground at #621 m. 36 chs., amended mileage = 9½ miles. 2½ miles clear of floods. 7 miles below flood-level; say 3 miles bank and 4 miles opening.

2½ miles, at £2,400.....	£6,000
Station, Wilcannia.....	6,000
3 miles embankment.....	9,000
Bridging main channel, 600 ft., at £30.....	18,000
Viaduct—20,500 ft., at 50s.....	51,250

Add increased cost of permanent-way materials, 9½ miles, at £13.....	£90,250
„ telegraph, gradient and mileage posts, 9½ miles, at £30.....	124
	285

Engineering and supervision, 5 per cent.....	£90,659
	4,533
	£95,192

\* These do not include the extra ¾ miles allowed in estimate for casing grades.

## COBAR TO WILCANNIA—Summary.

Cobar to east side of Darling River, 156 miles.....	£ s. d. 401,808 0 0
East side of Darling River to Wilcannia, 9½ miles.....	95,192 0 0

Total, 165½ miles..... 497,000 0 0

Not including fencing. Grades, 1 in 100. Curves, 14 chains radius.

173. Have you any other statement to make? Yes; I have another statement showing that the length of Crown lands traversed is 160¾ miles, and the alienated land 1¼ mile only. There is only a small portion of alienated land traversed by the line, and it consists of three blocks in the immediate vicinity of North Cobar. I put in the plans. I hand in a compilation of county maps, the plan of the line in two parts, 10 chains to 1 inch, the longitudinal section to a horizontal scale 10 chains to 1 inch, and vertical 100 feet, and the Book of Reference.

174. There was a line submitted to a former Public Works Committee from Cobar to Broken Hill? Yes, from Cobar to Cockburn.

175. Is this identical with the same portion submitted before? It is practically the same route.

176. Have you been over that country yourself? No; I have been at Cobar and I have been at Broken Hill, but I have not been over the intermediate line.

177. Has there been any fresh survey since this line was submitted, I think in 1891? The original survey has been amended, but I think that that was before the previous submission. Messrs. Wickham and Hixson did the original survey. That was a line with pretty bad grades, because the country is by no means flat throughout. After leaving Cobar a series of ridges has to be crossed. Then Mr. Marshall was instructed to improve the line, and alter the grades to 1 in 75 to agree with the Nyngan to Cobar line, which was laid out with grades of 1 in 75. During the construction of the Nyngan to Cobar line, the Railway Commissioners requested that the ruling grade should be altered from 1 in 75 to 1 in 100, and that was done. I have, therefore, in the present proposal, assumed that the grades on this line will be altered to 1 in 100. But no survey has been made for that purpose. I have satisfied myself, from an inspection of the plans and reports, that it can be done without any difficulty with a probable additional length of 3½ miles.

178. By lengthening the route by 3½ miles, you could get a ruling grade of 1 in 100? Yes.

179. What is the ruling grade coming towards Sydney (say) from Nyngan to Cobar? 1 in 100 both ways.

180. And further on in this way coming east—if the line were constructed from Wilcannia, how far would that ruling grade carry you? I believe it would carry you to Narromine. I would not say exactly how far east. Between Narromine and Dubbo the grades begin to steepen, but many alterations have been made including those near Dubbo, with the object of altering the ruling grade in the direction of Sydney to 1 in 70.

181. Right into Sydney? No. Eventually, no doubt, they would be 1 in 70 right into Sydney, but it is not so at present. At Eskbank there is a rise of 1 in 42, and there is a rise of 1 in 40 higher up. But

- H. Deane: with the exception of that, eventually the grades will all be altered to 1 in 70. I believe there are a good many left still that are steeper, but the intention is to get rid of them all in time—for instance, the Locksley Deviation where there was a grade of 1 in 40 against Sydney, and 1 in 33 in the other direction has been cut out, giving a better grade.
- 4 April, 1899.
182. It is not intended to ballast this line right through? No. I have put down a small portion only to be ballasted.
183. At £75 per mile? Yes. That, of course, is the average amount. If this line comes to be constructed, a great many miles of it will have no ballast on it at all. The average would not be exceeded.
184. Is there not a good length of that line going through country which is absolutely rotten, hardly any bottom to be found? I do not think so. I do not think you can look upon any as impassable without ballast. On the Parkes and Condobolin line there were one or two tracts that were very soft in wet weather, but the moment you drain the country by putting in side cutting and throwing up banks, you get rid of the bogginess.
185. I notice that there is no provision made for fencing? No.
186. I presume that the intention is to run day trains there? I suppose so.
187. *Mr. Trickett.*] I notice in your present estimate of the cost of this proposed line, £2,575 14s. per mile, you are somewhat below the former estimate? You are referring to the Cobar to Cockburn line.
188. Yes? The Cobar to Cockburn line included a much heavier length at the further end between Broken Hill and Cobar which is very rough.
189. The length of the line from Cobar to Wilcannia is 158 miles, and the cost £3,050 per mile (page 2 of the Cobar to Cockburn report);—now we seem to have got down to £2,575 per mile, a difference of over £400 per mile? I have knocked out the ballasting, and altered the construction to the extent of making the formation lower. The present experience shows that it is better to do so to make the line cheaper, and it is easy to maintain. Then again I have reckoned that the prices are less now than they were then. That estimate made in 1891 was a very rough estimate.
190. Yes, I do not think that even Mr. Firth had been over the line then? No.
191. I see that you put down in your memorandum £100 per mile for earthworks;—does not that seem rather a low estimate? No, it is not a low estimate. The more recent lines have cost a good deal less than that—lines over easy country.
192. How much would the formation of this line be above the surface? From 6 inches to 1 foot as a rule. But, as I mentioned before, there is a good deal of low ridgy country to pass through, which will involve cuttings and embankments—small ones in nearly all cases, but still sufficiently large to make me put the earthwork at £400 per mile.
193. Why I asked the question is that this question of surface railways seems to me a very indefinite kind of thing. In your own report, when you came back from America (page 3), you state that the height of the formation above the surface on the plains is 18 inches at least. These are looked upon as pretty important lines, and cost £450 per mile for earthworks, and your memorandum seems to indicate that as soon as they can, they go on and make the permanent-way better, the inference being that the laying of these surface lines is merely a kind of initiatory stage? It is so as a rule, but it is not always the case. I traversed several lines where probably that condition is a permanent one. It depends very much upon the circumstances of the case. If it is a dry country, such as you get in California, and the west generally, it is quite safe to leave out the ballast; but if, on the other hand, there is a lot of heavy traffic, it is better to put on the ballast afterwards.
194. Does not that strike you as likely to be the case in a country of this kind, where you have a large tract of flat country that sooner or later will have very large quantities of water flowing over it;—do you not think that, in all probability, this primitive kind of road would have to be improved? No; I do not think it would have to be improved on that account. If the traffic should largely increase, of course the line can be ballasted, and it can be ballasted then at quite as little cost, if not less, than in the first instance. Then as regards the danger of floods, the lower the embankment the less the damage that is done. So it is a measure of precaution. If the country is unknown, and with that large extent of flat land it is very difficult to tell where the water will come, it is really safer to put the embankments lower down; they can be raised afterwards, if necessary. These floods come at very long intervals.
195. The experience, so far, has been that there is no chance at all on these light lines of the rolling-stock taking a dive into the earth? Not the slightest.
196. Although you have had a pretty good experience of the Narrabri to Moree line, there has been nothing of that kind? Nothing of the kind. As I mentioned, in some parts of the Parkes to Condobolin line, reputed to be very soft, we had to cope with that difficulty. I remember that Mr. Edols, of Burra-wang Station, was certain that it was useless to make the line in the way that we were making it, and that the engines and tenders would disappear; but he was quite satisfied when he saw how effectual the drainage was, due to the side cuttings and the throwing up of embankments.
197. *Mr. Watson.*] We have had dry seasons since then? We have had enough wet to make the ground boggy.
198. *Mr. Trickett.*] Although you are not in charge of the permanent-way after it is once established, you have been made aware of it if anything of that kind occurs? Yes; I know the Commissioners would inform me at once if there were anything of the sort; and, besides that, I make inquiries.
199. I notice too in your account of your American trip that there the cost of earthworks on surface railways comes up to £450 per mile, but here you only put down the cost at £400; I should have thought that the cost would be quite as much here as in America? I have found it possible to reduce the cost of earthworks generally in flat country to about £200 a mile. It is to be noticed that there is this difference between this country and America, that they are subject to very hard winters, with snow and ice, and the great trouble they have to contend with is the breaking up of the winter frost. During the winter they can do nothing. The formation gets frozen perfectly hard. At the approaching spring, the formation gets soft and rotten, and they have to send out large gangs to put it in order. Of course higher embankments are an advantage in that case. In our case, I am sure that they are quite unnecessary. The lower the embankment, the easier it is to maintain, so long as you have a sufficient height to throw the water off.
200. In your description handed in to-day you put down sleepers at 1s. each;—is not that very high? They have to be carried a long way.
201. Are they not procurable locally? I think there will be some red gum on the Darling; but for half the line, they will have to be carried from some point east of Parkes.

202. The price is high, compared with the price on the Narrabri to Moree, and on the Dubbo to Coonamble lines, which is 2s. on the former and 2s. 6d. on the latter? Yes; but that is ironbark country with forests in the neighbourhood. On this line, there is no timber which could be used, until you come to the Darling, and even on the Darling it may be necessary to carry the sleepers a considerable distance by water. H. Deane.  
4 April, 1899.
203. Will you tell us what you have allowed for waterways? For culverts, £200 per mile.
204. That is a heavy item;—apparently that includes box drains as well? Yes; that includes everything.
205. Is that an unusual amount? No; that is a very fair amount.
206. Based upon experience? Each of these lines is considered on its merits. I have here the estimate of the Narrabri to Pilliga line, which was considered last year, and in that estimate the timber bridges and small timber openings are put down at £209 per mile. That line would give a good deal more trouble, probably, in regard to water than this would, but here the carriage would be costly.
207. I do not see any item in this estimate of yours for land? No; I never put down land; but the land will be a trifle, as there is only  $1\frac{1}{4}$  mile of alienated land traversed by the line.
208. It is mostly leasehold? Yes.
209. The route has been increased apparently, by diversions, by  $3\frac{1}{2}$  miles;—where are those diversions? In various parts.
210. Is there any particular part? No, there are several places. The land after leaving Cobar is undulating; then you get an easy bit.
211. What is it after you leave Cobar—1 in 70? We have 1 in 75 at present.
212. It chiefly occurs shortly after leaving Cobar? For some considerable distance there are various low ranges.
213. How would the cost of going through that cutting compare with the cost of going round? Very likely it would be four times the amount.
214. Four times the cost of going round that slight distance of  $3\frac{1}{2}$  miles? Yes.
215. Does crossing the Talyawalka Creek cause a heavy item? I have included Talyawalka Creek in the flooded country of the Darling.
216. How far is Talyawalka Creek from Wilcannia? About 8 miles.
217. Is that included in the item for viaducts? Yes.
218. The cost for viaducts is £20,500;—does that include that last 8 or 9 miles on this side of Wilcannia? Yes; the amount is £51,250.
219. So that you may say that the last 9 miles of the line from this side to Wilcannia is a very expensive portion, owing to the low character of the country and the number of creeks to be crossed? Yes.
220. Would the whole of that country be traversed by embankments and viaducts? The whole length is  $9\frac{1}{2}$  miles. There are  $5\frac{1}{2}$  miles of embankments. Two-and-a-half miles of the route is absolutely dry, and 7 miles more or less flooded. For about 3 miles of the distance there is so little current in the water that I have proposed to carry an embankment. That would leave various openings aggregating 4 miles.
221. How would the part on which you do not make embankments be constructed? On timber piles, girders, and driven piles.
222. Piles with decks? With girders and transoms and open work.
223. The water would run underneath the rails? Yes.
224. How high would that be? It will vary.
225. Would it be 5 or 6 feet? I daresay that, on the average, it would be something like that.
226. The flood there is of a character that spreads itself very largely over the country, and does not rise to any very great height? No; except in certain well-marked flood-channels.
227. Such as this creek? Yes.
228. *Mr. Levien.*] What would be the length of the longest viaduct? About 2 miles.
229. *Mr. Trickett.*] I suppose that in that country the rush of water is not very great, except in the waterways? No.
230. Owing to the height of these piles, the works would be of a costly character? No; they are not costly; I only put them down as a general average at 50s., but that amounts up to £51,000.
231. Have you any lines in existence to compare with this with regard to raised viaducts on piles? I have plenty of low bridges of that kind, but nothing extensive. The more extensive one, crossing the Murrumbidgee River, is very much higher.
232. Have you not one or two places on the Parkes to Condobolin line of a similar character? Yes, the Yarrabundi. There is a creek just a little beyond Burrawang. I think those are 14-foot openings. That is about the cheapest effectual waterway that you can have.
233. That is not so high as this would be? No; but that would be the class of viaduct.
234. Has that stood well? It has not had any particular testing by floods.
235. I suppose that these piles would all have to be driven down? Yes.
236. What is the estimated cost of a bridge across the river at Wilcannia? The main bridge, £18,000; 600 feet at £30.
237. Then the approaches are by far the most expensive part? Yes, they are; but, of course, they are a long way cheaper per foot run. The main channel will necessitate a steel bridge and an opening span.
238. Would that be a bridge merely for railway purposes? Yes.
239. For a single line of railway? Yes.
240. Has it never occurred to the Department that, in constructing a railway bridge over a crossing of this kind, the bridge might be made available for both railway purposes and ordinary traffic? Yes; in several instances. But the conclusion arrived at is that, as a rule, it is not a desirable arrangement. The kind of bridge that we want for road traffic is so very different from that which you want for railway traffic. A railway bridge is very narrow, and it is open work—there is no continuous decking across.
241. Lately they have tried at Parramatta River actually to have a punt to carry the ordinary traffic across the river, although there is an enormous bridge on huge stone pillars which is used by only a few trains a day? There is a good lot of railway traffic over that bridge.
242. In the case of this bridge at Wilcannia, where only one train a day would pass, it would seem a desirable thing to combine the two objects? No doubt that is the case where the two objects may be combined.
243. Do you not think it is worth considering? Yes.
244. It is suggested to me by Dr. Garrahan that we might have the rails laid and let the ordinary traffic go over

H. Deane. over the rails? I think there would be very little objection to it in a case like this, because the traffic would be so small, and as soon as the traffic becomes large the building of an extra bridge ought to be considered.

4 April, 1899.

245. *Dr. Garran.*] At Wilcannia, how often would a locomotive be going over that bridge in a day? Very seldom; about twice a day.

246. *Chairman.*] Would there not be a straight run to the bridge, so that the approach of a train could be seen a mile or two off? Yes.

247. *Mr. Trickett.*] The cost of the bridge and viaduct seems to have been considerably reduced since we had the matter under consideration before? No; it is about the same. The former estimate was £92,000; this is £95,000.

248. In your examination, on a former occasion (page 7, question 98), you said that you added to that £92,000 for bridges and viaducts, and to that we should have to add £45,000;—what was that for, I wonder? I added 50 per cent. for a double line; it is a very rough estimate.

249. The consideration of the double line here would not be reasonable? It is not likely to be wanted.

250. If the traffic increased, you could easily arrange to have a double line? Yes, double lines outside the bridge, and single lines across the bridge.

251. I suppose you have had nothing to do with bringing this matter before the Committee, and that you are only giving evidence as to the engineering part of it? That is all.

252. You think that circumstances have changed since this project was considered before, so as to make it less desirable now to construct the railway than it was then? I understand that circumstances have changed. There is not the same activity at Broken Hill.

253. When it was first proposed to make a line to Broken Hill, the idea was to intercept the traffic, and to get the great coal and coke trade? Yes.

254. The prospects now, I understand, are not so good in that direction? No; I believe that the ore is sent away very largely for treatment.

255. At that time the idea was to create a traffic and to divert it from Adelaide, but the traffic has gone an increasing to Adelaide, owing to the shortness of the distance and the increased railway facilities given in South Australia? Yes.

256. The Nyngan to Cobar line may be looked upon as the first instalment of this line;—has that line been a success financially? I believe it has; the returns are constantly increasing. The Cobar district has gone ahead so much; there is much more mining there now than formerly.

257. The copper trade especially has increased largely? Yes.

258. With regard to this route under consideration, its chief object, if a line were constructed to Broken Hill, is that this would be the smallest number of miles of railway to be constructed, as compared with the other routes? Yes.

259. But having that advantage, it has the disadvantage of being the furthest to travel from Sydney? Yes.

260. Looking at it in the way of convenience for intermediate traffic, would you like to say which you think would be the best route to be chosen? No.

261. Would you like to say, on engineering grounds, which you think would be the best line to construct to connect Sydney with Broken Hill—this, or the one to Condobolin, or the one *via* Hillston? This is the shortest.

262. It is very desirable to connect the Lachlan valley by railway;—would that be a very expensive route as compared with this? No.

263. Have you got a comparison? The cost of a line from Condobolin to Broken Hill line was given in August, 1896, as £955,000.

264. How much per mile? The average cost per mile, £2,606.

265. There is very little difference then? Very little.

266. Was there ever a survey made from Hillston to Condobolin? Yes; I think the estimated cost of that was given during the Condobolin to Euabalong Railway inquiry. On page 16 of the evidence the estimated cost of the line from Condobolin to Hillston *via* Cargellico is put down as £259,900. As regards expense, it seems to resolve itself into a question of mileage, because the difference of cost in going over one part of the country and another is so very small.

267. So that in approaching Broken Hill, whichever way you go, the cost of construction is much the same, and the only thing that would save expense would be to go by the nearest route? Yes.

268. Does it not seem rather strange, seeing that this project is put before the Committee in 1899, that no fresh survey has been made of this line since 1891? The survey was quite a satisfactory one.

269. You do not think that there is any necessity, owing to the character of the country, to make a fresh one? No; none whatever.

270. Who was the gentleman who made that survey? Messrs. Wickham and Hixson were on the original survey, and Surveyor Marshall amended some portions to get a better grade.

271. Are they in the service still? Messrs. Wickham and Marshall are.

272. If they are required by the Committee they can be got? I believe so.

273. Do you think of anything special to mention to the Committee in addition to what you have stated at former inquiries? No; I have nothing further to add.

274. You think that the line is a thoroughly practicable one at the cost you have estimated? Yes.

275. *Mr. Dick.*] Could you inform the Committee what was the average cost per mile of the Nyngan to Cobar section? I think it was about £3,000.

276. Somewhat more than the cost of the proposed section from Cobar to Wilcannia? Yes. The Nyngan to Cobar line was estimated to cost about £2,560 per mile. In consequence of the alteration of the grade chiefly the extra expenditure was incurred. Of course it is a very expensive thing to alter grades after a line has been commenced. Possibly the estimate was a little low.

277. What was the grade reduced from? From 1 in 75 to 1 in 100.

278. It is not proposed to have in this section any grades higher than 1 in 100? No.

279. Are the engineering difficulties on the Nyngan to Cobar section any greater than you find on the section of the proposed line? No, I do not think so. The Nyngan to Cobar line would have been more cheaply constructed if it had been laid out for the grades that were finally adopted.

280. All the other constructive details of the Nyngan to Cobar line were the same practically as those of the proposed line from Cobar to Wilcannia? With the exception of the ballasting. The line from Nyngan to Cobar is ballasted. That would be saved.

281. The amount of ballasting will not be so great on this section? No. It will do without ballast almost entirely.

282. Is that fact due to the experience gained in the construction of the Nyngan to Cobar line? No; it is due to the principle that I recommended to be adopted after my trip to America, and which has been carried out since.

283. I think you said, in answer to Mr. Trickett, that you considered the survey a pretty good one? Yes, quite sufficient for the purpose. If the construction of the line is authorised, of course a fresh survey will have to be made for a permanent line, and when that is undertaken there will be modifications made along the route, so as to get the best line.

284. Would you favour the Committee with some idea of the cost of a new survey along that distance? I suppose it would cost about £15 a mile.

285. I have it on fairly reliable authority that in some of the older surveys—for example, in the case of the line from Newcastle to Sydney—the practice was to keep as close to the road as possible, in spite of any engineering difficulties which might be in the way; and that recently very large departures have been made from the original line, adding greatly to the improvement of the line, reducing grades and taking out curves? Yes, the latter is correct.

286. You are quite prepared to rely upon this survey as one sufficiently accurate for your purposes? Yes.

287. How high will the proposed bridge across the river be above summer level? I could tell you more exactly from the details in the level-book. I should think it would give a headway of about 40 feet.

288. That would make the main part of the bridge well clear of any danger from floods? Yes.

289. How long do the approaches on each side of that bridge require to be? On the Wilcannia side they are very short—not much more than a quarter of a mile. On the other side, of course, there is a good deal of viaducting; but the bridge over the main channel is an isolated structure. The banks are high enough to be out of floods, so that it would be more correct to say that there would be a quarter of a mile on each side.

290. Does not the approach on the Sydney side of the bridge include the 2 miles of viaduct which you mentioned? No; not that particular viaduct. It would be detached.

291. Where should we find this 2 miles of viaduct? Some distance back from the river. I said 2 miles; but the stretch of viaduct, including Talyawalka Creek, will be considerably longer, I think. Talyawalka Creek is about  $6\frac{1}{2}$  miles back from the river.

292. Does that viaduct cross an old watercourse? There is a series of depressions, along which flood-waters flow.

293. What is the general height of the viaduct over those depressions? I think the height is from 6 feet to 8 feet. It would be higher in the middle of the depressions, but we may take that as the general average.

294. Is it likely that in flood-times large masses of snags and other *debris* will be piled up against those viaducts? No.

295. They would not act like those rocky bars on the river? No. I take it that any floating timber would come down the main channel chiefly.

296. Have you had any experience of the velocity of the current along those depressions in flood-time? No; I have no information on that. You want to be there to observe them.

297. Would it not constitute a serious danger to the viaducts if large masses of timber were brought down? It depends upon the size of the timber. If it was small it would go underneath. Whenever there is a flood in any place the Railway Commissioners have men on the watch to clear the bridge openings. That is a necessary part of the maintenance of the line.

298. How distant would the timber supports be from one another in the viaducts? The average distance apart that I should put the piles would be 14 feet. If I found it necessary to put wider spans in the middle of the channels I should do so, but not unless on careful observation it was found necessary.

299. Is it a fact that they are replacing the wooden spans of the Wagga Wagga viaduct with steel spans? Yes.

300. What would the life of timber in that district be? Thirty years, I suppose. The timber used in the Wagga Wagga viaduct was not very satisfactory. Another thing—the spans were just a little too long; there was too much sag in them. I am not building viaducts on that design now. That was given up almost as soon as it was adopted. There are only two or three viaducts in existence that were built on that design.

301. What class of timber was it that was used at Wagga Wagga? Ironbark girders; but I could not, without inquiry, give you any definite information, because I was not in charge at the time, and did not see the bridge during its construction.

302. It was not the girders which proved unsatisfactory? No; it was the piles and the decking.

303. Do you propose to get the timber for the viaduct on this line? It will have to come a good way east—from east of Parkes.

304. What is the reason that the line takes such a sudden bend to the north-west, just before it crosses the river? There is water at flood-time to be kept clear of. There is a kind of lake in flood-time—Lake Poopelloe.

305. This is really an amended estimate, as far as the grades are concerned, is it not;—I see an addition for easing grades in the first part? Yes; I have added  $3\frac{1}{2}$  miles to give better grades.

306. What improvements do you propose in the grades? To change them from 1 in 75 to 1 in 100.

307. Is there much country in which it will be 1 in 75? No, not very much; but wherever that broken ground occurs the grade is at present 1 in 75.

308. When the surveyors went out to survey this line, had they any instructions as to seeking a route that would not involve a grade of more than 1 in 100, or 1 in 75? When the first surveyors went out, they were allowed, I believe, to use steeper grades. I afterwards arranged for Mr. Marshall to go and improve the line to get 1 in 75, the same as the grade of the Nyngan to Cobar line.

309. Then two separate surveys have been made? Mr. Marshall's was only a partial survey. He only did certain portions where the heavier grades occurred.

310. *Mr. Shepherd.*] I should like a little information about these curves;—what is the difference in distance between a straight line from Cobar to Wilcannia and following the curves of the line? It scales 146 miles in a direct line.

311. And  $165\frac{1}{2}$  by the curves? Yes.

H. Deane.

4 April, 1899.

- H. Deane. 312. That will make a difference of  $19\frac{1}{2}$  miles? Yes.
313. What are the obstructions that necessitate these curves? Ridgy country and flooded ground.
- 4 April, 1899. 314. Are the ridges high? They are hard ridges, but not high.
315. But, seeing that the line is to be laid out for all time, do you not think it would pay to overcome some of these obstacles instead of going round about? No, I do not think so. It would be very costly to make a line straight through with a good grade.
316. You said it would cost about four times as much, I think? Yes.
317. Four times as much for about  $19\frac{1}{2}$  miles would not be such an enormous amount after all? That is for the difference between 1 in 75 and 1 in 100. If you were to go straight across from Cobar to Wilcannia, I should not like to say what the expense would be.
318. What do you consider a fair working grade on a railway? In country of this kind, I think that 1 in 100 is a proper grade.
319. That is a very easy grade, is it not? Yes, it is an easy enough grade.
320. I see that the water supply is put down at £70 a mile;—where do you derive your water supply from? It will be mostly from tanks or dams.
321. There is no natural supply on the line? No, nothing that you could depend upon.
322. I see that on the line between Dubbo and Coonamble you dispense with ballast? Yes.
323. Here you provide for ballast? Only to a small extent. You will find a small amount of ballast on the Dubbo to Coonamble line too.
324. Do you think the lines are as safe without ballast as with it? In the dry western country—yes; and where the traffic is small.
325. Unballasted lines are not so well calculated to withstand a flood as ballasted lines? I do not know that that makes much difference. It is where the traffic is heavier that it is much easier to keep a line in order with ballast, and also where a good deal of rain falls, rendering the formation for days or weeks together soft. Then it is desirable to have ballast; but in country where there is only a few days' rain in the year, it can be very well dispensed with.
326. Is timber plentiful on the line? No; there is no timber until you get to the Darling.
327. I suppose that is one reason why fencing is dispensed with? That is one reason; but the principle recently adopted has been to make lines without fencing; it was looked upon as an unnecessary expense.
328. On those lines, I suppose, the traffic is small, and the trains run only in the day-time? Yes; there is no danger.
329. *Dr. Garran.*] What do you consider to be the life of these box culverts? It depends upon the material; if they are made of ironbark, twenty years.
330. Are there a good many in use in the Department? Yes.
331. Where an embankment is very small there is no trouble in putting in new ones? No; we do not put in box culverts where the embankment is high.
332. Of what area do you propose to make these culverts? It all depends upon circumstances. They are all classed as culverts, but they may be small timber openings with piles, or they may be open waterways, such as I have lately been putting in, with cross timbers, and planking on the bottom, to support them.
333. I gather from a previous answer that you look forward to the possibility of very heavy floods flowing over this line? Yes.
334. Do you think it better to risk that than to have embankments? Yes, decidedly.
335. Time will prove where your weak points are? Yes; you cannot know till time shows; it is impossible to tell where flood-water is likely to accumulate.
336. If you have an embankment only 1 foot high it will offer very little resistance, and it will stand where a high one would give way? Yes; and if damage is done it is very easily repaired.
337. Where you have to make a cutting through these little ridges you speak of, would you not get some material there for embankments? Yes; that is put into the embankment at each end.
338. So that you will have more than side cuttings in some places? There will be side ditches.
339. You throw that material on the permanent-way? It is thrown out to make the road.
340. Where you have little ridges, you will have more earth than where the ground is level? Yes.
341. You will have a better road there? If the ground is hard; but I look on an embankment well consolidated as quite as good as a cutting. It is less costly to maintain than a cutting.
342. Is the water-supply that you speak of likely to be sufficient to stand a four years' drought? Yes.
343. Will the tanks be very deep? About 15 feet.
344. Excavated? Yes. Of course, if there were any channels that one could dam up, with a prospect of collecting water, that method would be adopted.
345. Will 15 feet of water, reckoning for what you would use of it and for evaporation, last you four years? I think it ought to. The water supply is put down at £70 a mile. If we can run for 30 miles that means an expenditure of £2,100 over 30 miles. That ought to be quite sufficient, and we ought to be able to excavate a very large tank, and to put up overhead engine-tanks for that.
346. I am supposing such a drought as we have already had, and this line had been made for four years; would you have been obliged to bring water from somewhere else to work the line? No; I do not think so, if we had caught the water. We might excavate a tank, and have to wait for it to fill as on the Condobolin line.
347. The Cobar line is not fenced, is it? No.
348. Has any difficulty been found to arise in consequence? No; I believe not. The Railway Commissioners are quite satisfied with the institution of unfenced lines.
349. They do not run a lot of trains on those lines? No.
350. Most of this line is pretty straight? Yes.
351. You can see stray cattle ahead in the day-time? Yes. There are one or two curves in the cuttings.
352. There have been no accidents of any importance? No.
353. A few cattle killed I suppose? I have heard of a small number of stock being killed, but the loss has been very trifling.
354. What pattern of bridge is it that you propose to build over the river? I propose to build a steel bridge. I have not gone into the design very much, but I have provided sufficient money to make a bridge that will meet all requirements.
355. Will it swing on a central pier? I prefer the bascule system.

356. That will be cheaper? For the same amount of opening, you get so much more space. With a swing-bridge you get two openings, which you do not want. H. Deane.
357. The two halves of the opening become perpendicular? Yes; nearly so. 4 April, 1899.
358. Have you a rocky bottom for your foundations? There is a very good foundation.
359. Has there been any boring done? I think I have the particulars of that, but if not I reckon it will be perfectly safe to stop at a certain depth. There is no fear of the foundations scouring out on the Darling.
360. Where there are so many rocks and reefs crossing the river, could you not pick a site where you could have a rocky bottom? Possibly. The site has been selected to suit the general location of the line, so there is not much choice in the matter.
361. How many piers are you going to have in the river itself? I should put in spans of about 120 or 150 feet. That would mean either three or four piers.
362. Will they be cylinders filled with concrete? I think so.
363. How deep do you estimate that they will go down? Thirty or 40 feet, if we do not find rock.
364. From the plan, it appears that the line has a bend to the southward to avoid a range of hills? Yes.
365. Then you have to make a sharp run to the north-west to get to Wilcannia? Yes.
366. Then after you cross the river the trend of the line to Broken Hill is south-west? Yes; about west south-west.
367. Then if from the point where it goes south of those hills, instead of turning up to Wilcannia, we made a straight track to the Darling, then to Broken Hill, we should save a considerable detour? Yes.
368. Is not Broken Hill a municipality? Yes.
369. Have you any idea of the valuation of property there? No, I have not.
370. It appears that we have to spend nearly £100,000 to make an extremely difficult crossing to get to that one place? Yes; but any other crossing would be quite as expensive.
371. Is there not many a place within 10 miles of Broken Hill where there is no such difficult crossing? I do not think so. I think it is a good crossing, as crossings go.
372. Do I understand that wherever we cross the Darling we have to face this expenditure of £100,000? Yes. You have to allow for miles of flood-waters on that line. On the line from Condobolin to Menindie there was a fairly favourable crossing found, but the estimate for that crossing was over £90,000.
373. Is the object of this line to serve the township of Wilcannia, or to serve the river trade of the district? My instructions were to go to Wilcannia.
374. You look at it simply as an engineer? Yes.
375. But if we had simply to serve the river trade of the district, the line need not cross the river at all? No, I suppose not.
376. Have not many railways stopped on one side of a river, with the township on the other side? It has been done.
377. Is there a road traffic bridge at Wilcannia? I think not.\*
378. In any case, if we did stop at this side of the river, we should have to make some kind of a road down to the wharf to get to the steamboat? Yes; and you have some miles of flooded country if you stop on this side of the channel.
379. The flooded country begins 9 miles from the channel? Yes.
380. The Darling does not go 9 miles from all parts of its course? No; the greater flooding would be on one side or on the other.
381. Supposing the line be made, it is to be considered whether we should stop on this side, or make the bridge across the river? Yes.
382. You could avoid that expense? Yes.
383. And that would cheapen your line? Yes.

WEDNESDAY, 5 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

384. *Mr. Deane*: I have ascertained that there is a road-bridge at Wilcannia. I was told by one of the surveyors that when they were there there was no road-bridge; but there is one now. I also find that it was at Wilcannia that we took some borings. We let a contract for borings down to the rock, on the line of survey. Mr. Cummings, Road Superintendent at Wilcannia, looked after them, and measured them for me. H. Deane.  
5 April, 1899.
385. *Chairman*.] With what result? Rock was found about 35 feet below the summer-level, in the middle of the river; but on the eastern side we have to go down over 90 feet to get to rock; but it will be quite unnecessary to go the whole of that depth with the cylinder. I think that 35 feet in the bed of the river will be perfectly safe. There is no scour likely to take place that would lay bare the cylinders.
386. The stream is sluggish? Yes; the fall of the river is only 2 or three inches per mile.
387. Do you know what depth they drove the piles for the road-bridge? They went down to rock. The rock there is only about 25 feet below summer-level. That is shown on the bridge drawings.
388. You would drive to a test in any case? Yes; the cylinders would, of course, be weighted with a certain load. 389.

\* NOTE (on revision):—I have ascertained that a traffic bridge has been erected within the last few years.

- H. Deane. 389. With regard to sleepers;—in the report you provide for 2,464 sleepers; on the line from Nyngan to Cobar, I think, they used 2,000? Yes, about 2,080.
- 5 April, 1899. 390. What is the necessity for that difference? On the earth-ballast lines I put in fourteen sleepers to the 10-yard rail.
391. You make a saving by not ballasting? I make a saving by not ballasting; but even if I were making a ballast road, I should much prefer to put in a greater number of sleepers. It makes a very much better road, and one much easier to maintain.
392. You allow 5s. a yard for ballast;—but in connection with the Nyngan to Cobar line, I think the successful tender was about 6s. per yard? Yes; for all the ballast that we shall want on this line, there would be plenty to be obtained in those ridges skirted by the line.
393. At the inquiry into the proposed line from Cobar to Cockburn, you said that the contractor's price per yard between Nyngan and Cobar was 6s.? Yes.
394. And you have allowed 5s. here? Yes; that will be quite enough.
395. In your evidence, in reference to the proposed line from Cobar to Cockburn, you say:—"I have taken 6s. throughout as a fair average"? Yes; you see prices generally have gone down since then.
396. I will suppose that your officers have reported to you that ballast can be obtained readily at 5s., and that it need not cost more? I know from my own knowledge of the way the work can be done, that we can excavate for much less than that. The contractor, if he arranged his work properly, would have made a very large profit indeed out of that 6s.
397. I suppose that a considerable quantity of the ballast will be gravel? I should think it would be nearly all stone. This is what is stated in one of the reports by Mr. Stuart to the Minister in 1892:
- The sandstone suitable for ballast can be obtained from the Bulla Range, and from the lower ranges in the neighbourhood of the line.
398. In Part 1 you say that stations and sidings can be provided at a cost of £6,240;—in Part 2, there is the statement that the Wilcannia station will cost £6,000? Yes; the intermediate stations are mere sidings, very small ones. There is no population along the line. There are a few small sidings with now and then a loading bank or a waiting-station. It is very different at Wilcannia. Wilcannia will be the terminus, and you will want a rather expensive station.
399. Is not that a rather large amount for a place like Wilcannia? No; I do not think so. You would have to put down a turn-table, and to have a passenger station, an engine-shed, carriage-shed, goods-shed, wool bank, residences, and all the loops and sidings requisite for a terminal station.
400. Then you have not provided simply for the station; but this being the terminus, it will require other buildings? Yes; it is not merely the passenger accommodation, it is the terminal accommodation requisite for trains, the housing of engines, carriages, &c.
401. You were examined yesterday in reference to the nature of the country. This is in the evidence taken by a former Committee:
- When the Committee were travelling over the country on the other side of the Darling, they found that miles of it was so soft that it could not bear them walking over it. We very often sank to the knees, so soon as the surface was broken. Do you think the country will bear a railway, unless there is some sort of foundation obtained for it?
- You were asked that question, and your reply was:
- It only requires to be well drained by ditches on each side of the line.
- That was in 1891. Have you had any experience as to whether that class of country can be drained? Yes; I mentioned yesterday that on the Parkes to Condobolin line there is a similar tract of country, and the drainage of the line is secured by side cutting and the raising of embankments. There is no doubt whatever about its being perfectly safe. The reason why a country like that gets boggy is that the water soaks in and does not get away. There is nothing to drain it off. Then when you are travelling through, walking or driving, your weight, the weight of the horse, and the weight of the vehicle is not distributed,—it is applied over a very small surface. But it is quite different when you have an embankment with sleepers and rails, and the load is distributed over a considerable surface; so that even where the ground is pretty soft, it will be perfectly safe.
402. If, as is reported, it is difficult to drain the land, or that you cannot drain it, then will it be safe to run a train over a line constructed through that land? There is no fear about the drainage.
403. Are you aware that there is a proposal to lock the Darling, and that it is stated that that will cause a lot of depressions throughout nearly the whole of that country to be filled with water, and if that is so have you taken any precautions as to what might occur? These depressions, if we had to cross any of them, would not present any particular difficulty, because they are clay pans, and the bottom is sufficiently tenacious to carry a railway after the embankment is formed.
404. Was it not found necessary to raise the embankment on the Nyngan-Cobar line on account of heavy rain? There was a short length, I think, of about 2 miles which was raised.
405. And you think it is perfectly safe to rely on the distribution of the weight of the train? Yes.
406. Have you had any borings made in that country, to see the depth of that soft stuff? No; I do not think it is necessary. The only class of country that would be difficult to cross on an embankment would be an actual bog, which is composed of vegetable matter, and in such a case it would be necessary to arrange some way of making a foundation for an embankment with fascines.
407. It is described as so rotten that if a coach goes off the beaten track it will go down? Yes. I should not have the slightest hesitation in laying a line across it, but the surface wants draining. You want to put a side cutting in, and make embankments. You must provide means for the water on the surface to get away. Then the ground begins to consolidate. If you made the railway by laying the sleepers on the surface without draining, or raising an embankment, it would be an unsafe proceeding. But considering that this line would be well drained it is perfectly safe.
408. There being similar country on the Nyngan to Cobar line, and you having had experience of it, you consider it perfectly safe? Perfectly safe.
409. Did you not make provision for fencing when this scheme was before a former Committee? There was a sum added afterwards. It was proposed at first to do without fencing; then a sum of £36,000 for fencing was added.
410. At that time, I suppose, it was anticipated that with the line going right through to Cockburn, you would have trains running at night? I expect so.
411. Then it would be necessary to have a fence? Yes.

412. And if traffic were carried over this line at night, would it not be absolutely necessary to have it fenced? I do not know that I should like to say that, because I think that, with good head lights on the engine, you could run pretty safely. You see the stock is very much scattered in the western country. With regard to fencing, I should like to call attention to this: You will find on the top of page 2 of the report of 1891 details given of the cost of the Cobar to Wilcannia line—Cobar to Wilcannia, £440,000; bridge over Darling and viaducts, £57,000; making a total of £497,000. That is the amount I have given now, but it does not include fencing.

H. Deane.  
5 April, 1899.

413. You say in the same report, page 2:

As these lines will have to be run over at night, I think it most undesirable to leave them unfenced, and I would recommend that the cost of fencing, namely, £36,000, should also be added.

That is why I asked if it was intended to run trains on this line only during the day-time. I know that cattle will get on to the embankments? They will, especially where there is ballast.

414. Is it intended to run trains on this line at night? I cannot tell you that. My estimate does not include fencing. Of course if fencing is necessary that will have to be added.

415. What is the cost per mile for fencing in that country? I should think about £100 per mile—fencing on both sides. Materials would have to be brought forward from one end of the line.

416. Do you think it would be false economy to omit the £100 a mile, and run the risk of a serious accident? That would be a matter for the Railway Commissioners to consider.

417. Is not the line from Narrabri to Moree unfenced? Yes.

418. Have there been any accidents there at all? No; I have not heard of any.

419. *Mr. Watson.* In your estimate of 1891, I think that portion of the line then under consideration between Cobar and Wilcannia was estimated to cost £3,050 per mile. The report says (Question 33):

With regard to this written estimate, which has been given out to us this afternoon, is not that your final recommendation or estimate?

And your answer is:

Yes. Cobar to Wilcannia, 158 miles, £3,050 per mile.

That does not include ballast? No.

420. How do you account for the difference;—I should imagine that the cost would be smaller now than it was in 1891, because some things have gone down in price? I have gone into the matter very carefully, and I do not think the estimate ought to be reduced, below this amount of £497,000, although the ballast is left out.

421. But, in addition to the ballast you have left out, one would imagine that there would be some reduction in the cost of construction which would be taken into account;—I understand that wages are not so high, and that railway construction is not so costly as it was eight or nine years ago? It is not. I will explain where some of that difference comes in. Although I have left out the ballast, the grades are improved. You will see, on page 2 of that report, it provides for a sum of £60,000 to be added for the improvement of the grades. That would make a difference.

422. But you increase the length of the line by  $3\frac{1}{2}$  miles? Yes; but I have not altered the total. The total for the original line, with a ruling grade of 1 in 75, was £497,000. Then for the grade of 1 in 100 the proportional part was about £36,000. £497,000 and £36,000 would come to £533,000. That was the estimate at that time for the grade of 1 in 100. I have put it down now at the original amount of £497,000, and I have still got the 1 in 100 grade, so that there is a reduction in cost allowed for, considering that the original estimate, with a grade of 1 in 100, was £533,000. I estimated rather roughly for the improvement in the grade, £60,000, and I have now taken three-fifths of the whole line, £36,000, but, as a matter of fact, I ought to take more, because the first part of the line from Wilcannia to Broken Hill would not want altering at all. The ruling grade there would be something like 1 in 200, because there is no elevation at all until you get to Stephen's Creek.

423. Would not the ballasting mean a large difference;—what would the cost of 6 inches of ballast be per mile? I do not think I took 6 inches.

424. In reply to question 93 in the report of 1891, you say 6 inches;—do you remember at what you estimated the cost at the time of the last inquiry? No.

425. The difference, I should imagine, would be very considerable in that country, where ballast has to be carried so far; in answer to Question 124, you say that the price calculated beyond Cobar was 6s. per yard? Yes.

426. Six inches, I suppose, is a fair quantity to lay; at 6s. it would be about £500 a mile; the ballasting here, allowing 5s., is down to £75 per mile; there is a difference of about £450? I shall have to look into the matter. I do not think that full ballast was allowed on that line. I think it was about 1,200 yards to the mile; that would be about £350 per mile.

427. What is the width of it? It is per cubic yard; it would run about 4s. per cubic yard. It is about £350.

428. That is a difference of about £275 apparently;—there ought, apparently, to be a reduction of £275 per mile, because of having so much less ballasting? Yes. I think you will find it comes out to about the same thing. There is the earth ballast to consider.

429. There must be something which runs up the cost in other respects if these reductions are made—for instance, there is a reduction of your estimate of the bridge and viaducts as compared with the estimate of 1891;—then, in the original scheme, the cost was estimated at £57,000, to which you added £35,000? Yes. I am glad you reminded me of that—that in itself accounts for a considerable reduction.

430. It says, bridging main channel, £18,000; viaduct, £51,000? The bridge and the viaducts now come to £95,000.

431. What do you count in with the viaducts? It is the bridge and viaducts.

432. That only comes to £69,000? The original estimate as it appears to me is this, as shown on page 2—the first item is £440,000, to which is to be added for improvement of grades, say, £40,000; probably it would be a little more. That would mean £480,000 for the section of the line up to the river. The bridge over the Darling, and viaducts, the second item on page 2, is £57,000, plus the additional cost of bridge and flood openings, £35,000. £92,572 you say was the estimate submitted for a similar line to what we have now, but including ballast, as submitted in 1891. There is a difference there, you observe,

- H. Deane. between £572,000 and £497,000, a difference of £75,000. Practically there is a reduction now in the estimate of £75,000, as compared with the estimate of 1891, and that is, to some extent, due to the ballasting.
- 5 April, 1899. 433. Doing without the ballasting? Yes. You may say that the ballasting cost £300 per mile extra. That would mean for the 150 miles, £45,000. That would leave a difference of £30,000 that might be put down for the difference in wages and general cheapening of construction.
434. But I believe there are cheaper methods in vogue now for carrying out these works? Yes; ploughs and scoops are used where there is no timber.
435. *Chairman.*] The extra number of sleepers (464) would come to £100 per mile? Yes, it would. If the details were all worked out and compared, you would find that it just about tallies.
436. *Mr. Watson.*] With regard to the cost of sleepers, you put them down at 4s., which is 1s. 6d. more than was put down for them in the estimate for the Coonamble line;—would the cost of carriage from Dubbo to Cobar (181 miles) amount to a difference of 1s. 6d.? The carriage of sleepers costs 1d. for every 13 miles. Carriage for 130 miles only would be 10d.
437. The estimate for the Coonamble line is 2s. 6d. per sleeper; on this line it is 4s.? Yes. Divide thirteen into 181; that is 14d. If you allow the extra pence for carrying over the line itself it comes about right.
438. Is it not possible to get some red gum when you get to the other end of the line, and thus save carriage? Yes; but the red gum on the Darling, near Wilcannia, is not of much account. If we get red gum it will have to be brought by the river.
439. If the river were up, you could get the gum carried very cheaply, I presume? Yes; but red-gum sleepers are expensive as compared with ironbark. You cannot split them; they all have to be sawn. The lowest price we have paid for red-gum sleepers has been about 3s. 1d.
440. Was that on the river? I think it was. I can get the particulars of tendering for the supply of red-gum sleepers on the Finley line.\* Then to that has to be added carriage and cartage.
441. There is an item for laying (1s. 6d.), that comes to £132 per mile. A foot-note says, "laying includes the cost of running for 78 miles, £98 per mile, 1s. 1½d."? Yes; that is for laying the road and fixing the sleepers, and plate-laying.
442. What is the cost of running? Running over the line itself, because the running of trains means something in the shape of wages and material.
443. There is another item, which is rather large, and that is the amount of £200 per mile for culverts;—between Cobar and the flood area, I am given to understand that the country is almost destitute of watercourses of any importance? Yes; but still one must provide wherever there is a depression ample water-ways for ordinary rainfalls, because water is sure to collect. We found on the Nyngan to Cobar line that the rain collected in the depressions to a far greater extent than we anticipated.
444. Does it cost as much as that on the Dubbo to Coonamble line? No; but £200 per mile is not a large amount. The Dubbo to Coonamble estimate would give figures for comparison.
445. I hardly think it is similar country;—the box drains and timber bridges—that would be an item of £182 on the first section, and on the second only £67 per mile? That is because we run on the bank of the river, and there are scarcely any watercourses to provide for.
446. The country between Dubbo and Gilgandra is ridgy? I think that as a matter of catchment area, this line will have to deal with much more water than the Dubbo to Coonamble line.
447. The rainfall is much heavier on the Coonamble line? I do not think you can judge by that. It is a question as to the rainfall which occurs in a short time. When it does come, you get several inches in twenty-four hours. Then there must be a vast accumulation of water.
448. Of course it is not so dangerous as it would be if the water accumulated in country where it runs much faster? It would not have so far to run on the Dubbo to Coonamble line.
449. You do not think you could safely reduce the estimate of expenditure for culverts between those two points? No; you must remember that all the timber has to be carried, you may say, from one end of the line, because unless we start the permanent-way from the Darling end, all the timber will have to come from the eastern end; therefore the cost will be increased by the carriage.
450. You are contemplating the use of box drains and timber bridges? Yes. It will be more convenient in low embankments to put open timber waterways.
451. It has been suggested to me that the approach to Wilcannia might be improved if the road were taken some distance further to the south-west;—you see there is a southern turn on the suggested line to the north-west, and it has been suggested that if the line were taken south-west, crossing the river some distance below the suggested crossing, where the Municipal Council have a dam, not only would there be a better crossing, but a higher ground would be available for approach to the river? I am very doubtful about that, because an inspection of the plan shows that the approaches to the river on each side are very good on the surveyed line. On the eastern side of the river, the approach to the bridge starts from a sandy bank, and on the western side you only go a short distance before you come on land clear of flood. At about 619½ miles, where the approach to the river crossing begins, that is high ground clear of floods. Then, again, after crossing the flooded area, at about 620½ miles, you get on to dry ground again. I do not think you can have a better crossing. The river was very carefully examined by the surveyors who went down there. I cannot speak from personal experience, because I have not been there; but I believe the best crossing has been found, and it is the experience of most of these rivers that after having found a pretty good spot it is difficult to improve it. If you go higher up, you may shorten one particular part of the bridge, you may get a narrow part of one particular channel, but you find that the river spreads out to a greater distance somewhere else.
452. *Mr. Trickett.*] I do not think you have given us the usual information about the weight of the rails, the rolling-stock, and so on;—what is the weight of the rails between Nyngan and Cobar, and what will be the weight of the engines? The weight of the rails will be 60 lb. per yard.
453. That is lighter than the rails on the main line? Yes; the weight of the rails on the main line is 71½ lb. per yard. The axle load is from 12 to 13 tons. I am not aware whether any heavier engines will go over the line. Thirteen tons is about the proper limit for the axle load on 60-lb. rails.
454. Seeing that this is a line which, if constructed, will bring a lot of heavy freight, do you think 60-lb. rails would be heavy enough? Yes, I think so; the grades are very good.
455. That would be of sufficient strength to carry all the minerals and ores? Yes; it is really the load on the axles of the engines that determines the carrying power of the permanent-way. 456.

\* NOTE (on revision).—The price paid to Tuck & Co., of Cobar, was 3s. 3d. per sleeper.

456. With a gradient of 1 in 100, that will be sufficient? Yes.

457. I think you told us yesterday that these dams for the water supply would cost something over £2,000 each? Yes.

458. What did that comprise—dam, overhead tank, pumping engine, and shed? Yes.

459. What would be about the cost of those last items, independent of the dam? The tank to hold about 20,000 gallons would cost £400 or £450; I suppose that the engine and pump would cost about £200.

460. That comes to about £700 or £800? Yes; for pump, tank, piping, &c. An excavated tank to provide 3,000,000 or 4,000,000 gallons of water will cost £1,500 or £1,600.

461. Has it ever been considered by the Department in these long lengths of railway, where the trains run so infrequently, whether you could not have some inexpensive pumping apparatus fixed on the engines? No, that would never do. It would take too long to fill up. The advantage is that you get the tank of water, you have a large pipe and a large outlet, and you fill up your tender rapidly. If you had to pump it would take, perhaps, half or three-quarters of an hour.

462. Then that would be out of the question? Yes; unless you had a very expensive pump. It would not be worth while to pay for that, and at any rate there would be no saving.

H. Deane.

5 April, 1899.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

463. *Chairman.*] Have you examined into this proposal from the traffic point of view? Yes; I will read the report which I made to the Commissioners, and on which they based their estimate.

J. Harper.

5 April, 1899.

New South Wales Government Railways, Chief Traffic Manager's Office, Sydney, 13 December, 1898.

PROPOSED RAILWAY, COBAR TO WILCANNIA, 156 MILES.

As directed by the Commissioners, I have made careful inquiries as to the probable traffic were a railway constructed from Cobar to Wilcannia, a distance of 156 miles.

The character of the country through which the line passes is practically the same as that between Nyngan and Cobar, from a pastoral point of view, with a diminishing rainfall, the average at Wilcannia being 11½ inches per annum. There is very little prospect of any intermediate traffic between Cobar and Wilcannia, and at the present time the traffic for Wilcannia and outlying districts is carried either by river, or by road from Broken Hill. When the river is navigable, the river route is, of course, adopted as being cheaper; and by this means Wilcannia commands a traffic extending 270 miles north-west to the Queensland border, and 60 miles west-north-west as far as White Cliffs. It is the practice at Wilcannia, in order to meet the uncertainties of the river, for the local storekeepers to hold large stocks, so that it is most exceptional to use the railway to Broken Hill. Produce is landed at Wilcannia from Moama, Morgan, or other Murray ports, at the rate of £1 7s. 6d. per ton, and general goods from Adelaide or Melbourne at £2 15s. per ton; and as our lowest rates for flour for the same distance would be £2 6s. 1d. per ton, woolpacks £4 4s. 4d. per ton, sugar £7 8s. per ton, and general goods £10 13s. 6d. per ton, it is evident that under the circumstances we could not hope to compete with the river in the carriage of general goods. It is possible, however, that the exigencies of the case might permit of obtaining occasional consignments of produce, the margin of difference not being so great.

*Wool traffic.*

The total number of bales of wool shipped at Wilcannia from stations adjoining the river during the last three years was 13,785 bales, equal to 2,515 tons per annum. This wool is shorn at sheds on the river banks, and transferred direct to the steamers, and carried to and delivered in Melbourne or Adelaide at £3 5s. per ton. We could not under any circumstances expect to obtain this wool for railway transit, as our very lowest competitive rate would be £3 18s. per ton, and this would, of course, involve the additional cost of delivering in the trucks. 13,700 bales, weighing 2,496 tons, reached Wilcannia from the north-west by road, and this was carried at a similar rate. In view of competition this rate could be lowered by the steamboat proprietors to £2 or £2 10s. per ton; and as nearly all the stations have their head-quarters in, and conduct nearly all their trade with, Melbourne or Adelaide, it would be hopeless to expect to obtain its carriage. To prove the possibility of this taking place, it might be mentioned that "Kallara" clip of 1,500 bales, 80 miles above Wilcannia, is carried at the rate of 50s. per ton, in order to divert it from the railway at Bourke; and, even assuming that there were no river, a great deal of this wool would be diverted to the Broken Hill line, where the circumstances of shorter carriage would permit of lower rates being charged than would be possible for us to adopt. In framing my estimate of the wool traffic I have allowed the contingency of there being no river, and some owners electing to forward by railway, and for this purpose have taken 1,000 tons, or nearly 40 per cent. of the total weight (2,515 tons), ex Wilcannia, from the neighbourhood of Wilcannia, and the river banks.

*Stock traffic.*

This district is not in any sense a fattening one; but presuming that some pastoralists may elect to fatten stock for market, I have adopted 800 trucks per annum as the maximum estimate for this class of traffic; and in connection with this, it may be mentioned that with the most favourable season we have had since the Cobar line has been opened, only 400 trucks of stock have been despatched.

*Goods traffic.*

Under the circumstances detailed above, it will be observed that it is an exceptionally difficult matter to frame any estimate of the probable traffic, as on the surface it does not appear that we could successfully compete in any line; but the most liberal figures have been adopted; and I have estimated for the district beyond White Cliffs 200 tons of produce, &c., out of a total consumption of 500 tons, and 800 tons for Wilcannia and White Cliffs, which is the approximate total weight of that class of traffic disposed of in the district yearly. It is idle to expect that under the circumstances already referred to we could hope to carry any general goods whatever, and I have therefore discarded it in my estimate.

*Passenger traffic.*

I have allowed 2,000 passengers per annum, which is also an exceptionally liberal estimate, being between 13 and 14 passengers per day with a tri-weekly service.

My estimate of the probable traffic is as follows:—

*Intermediate traffic.*

There will be a limited quantity of intermediate traffic to points between Cobar and the river, which I have estimated as follows:—

Goods, 390 tons.....	£305	
Wool, 756 tons.....	158	
Stock, 200 trucks .....	110	
		£573 0 0

And from Wilcannia and district I estimate:—

Goods, 1,000 tons, at 13s. 11d.....	£695 16 8	
Wool, 1,000 tons, at 13s.....	650 0 0	
Stock, 600 trucks, at 29s. 8d.....	890 4 0	
Passengers, 2,000, at 20s.....	2,000 0 0	
Miscellaneous coaching.....	130 0 0	
Mails (150 miles, at £12).....	1,872 0 0	
		£6,238 0 8

Summarised,

J. Harper.

5 April, 1899.

Summarised, the estimate is as follows :—

Goods, 1,390 tons.....	£1,000 16 8	
Wool, 1,756 tons.....	810 0 0	
Stock, 800 trucks.....	1,000 0 0	
Passengers.....	2,000 0 0	
Miscellaneous coaching.....	130 0 0	
Mails.....	1,872 0 0	
		£6,812 16 8

464. According to the Commissioners' report, they estimate the loss at £20,510 per annum? Yes.

465. They put down the annual capital expenditure at 3 per cent., but when this proposal was before a former Committee, it was 3½ per cent.? Yes; I suppose that represents the rate at which the money can be borrowed now. I assume that the Commissioners have been well advised in framing their estimate in that direction.

466. If capital is borrowed at 3 per cent. per annum, do you not think the cost of borrowing and remitting interest and that sort of thing ought to be added? I really could not say. I assume that the Commissioners would obtain information from a reliable source on that point.

467. Have you been over the alternative line? No; I have been over the Condobolin to Menindie line, but not over this line, with a view of a railway being built over it; but I have been to Wilcannia.

468. Mr. Hickson says in his report:—

From a traffic point of view, it is, however, not so desirable as the route *via* Condobolin. The latter route would better bisect the country lying between the western and south-western lines. It would open up for development a better class of country.

? Yes; that is my impression.

469. You have been over both lines? Yes.

470. *Dr. Garran.*] The Nyngan to Cobar line is now in operation;—do you charge on that line through, or local rates? We charge some local rates, but the bulk of the rates are through rates. As a matter of fact nearly all the local rates disappeared on the first of this month. The Commissioners introduced through rates generally.

471. The wool rate has always been a through rate? Yes; a competitive rate, really.

472. Looking at the plan, you will see that between the Nyngan and Cobar line and Nyngan and Bourke there is a triangular space? Yes.

473. Where does the wool from there go to? To Byrock or Girilambone.

474. Supposing we make this railway from Nyngan to Wilcannia, it will be the base of a triangle, of which the Great Western line will form one side and the river Darling the other? Yes.

475. Where will the bulk of the traffic from within that triangle go to when the river is up? It will go by the river.

476. Will three-fourths of it go by the river? No; I should not say three-fourths.

477. More than half of it? About half of the wool, but not the minerals.

478. And the return stores would be carried by the river? Yes.

479. Fully half of the traffic would go by the river? Yes.

480. Even if this railway were made? Yes.

481. Taking the line as it is, from how far beyond Cobar towards the Darling do you get wool at present, that being a distance of 160 miles;—do you get the wool for a distance of 70 miles? I should think about 70 miles.

482. About half way? Yes; 70 or 80 miles.

483. What I want to get at is this:—Suppose we make the railway, will you get any more wool out of that triangle than you get now? We shall get some that we get to-day delivered on the new line, instead of its being delivered at Cobar. We shall get that additional mileage, and we shall get one or two additional clips.

484. As the matter is now, would not a squatter who is equi-distant from Cobar and the river have a temptation to go to the river, even if the carriage were heavy, because of the cheap carriage down the river? Yes; unless local circumstances influence him, such as a desire to sell in Sydney.

485. Supposing he were ledger-logged in Sydney? Yes.

486. But supposing him a free agent, there is a tendency to go to the river instead of going to Cobar? Yes.

487. The estimates you have made in the paper which you have read to us is, I suppose, largely based on the experience that you have had of river traffic? Yes.

488. You have had to come down in your prices to compete with the river? Yes; we had to reduce the carriage on sugar to £2 a ton to maintain our trade at Bourke.

489. Supposing the Darling were only a chain of waterholes, and unnavigable, what would be your charge to bring wool down from Bourke? We should not vary our rates.

490. If the river did not exist as a navigable channel, and you had it all your own way, what would be the cost of carrying wool from Sydney to Bourke by railway? It would cost about £5 a ton.

491. What are you really charging? £4 from Bourke; but there are lower rates still between certain parallels of latitude, and certain points on the river.

492. Take the lowest you charge? We charge £3 5s. That is for undumped greasy wool. Then off that there is a further allowance of 12s. 6d.

493. You would not make that allowance if you had a monopoly? Certainly not.

494. Then you are reducing it to less than half? Yes.

495. The river competition has forced you, in some cases, to take off 70 per cent.? Yes.

496. Is not the river sometimes open to Wilcannia when it is not open to Bourke? Yes, frequently.

497. Then river competition will last longer in the year there? Yes.

498. Then the competition at Wilcannia will be more severe than the competition at Bourke? Yes.

499. Have you ever known steamers to go to Wilcannia when they cannot go to Bourke? Yes.

500. Your competition will be a little sharper at Wilcannia than at Bourke? Yes.

501. And the line from Wilcannia to Sydney will be longer than the line from Bourke to Sydney? Yes; 114 miles longer.

502. You will not be able to charge more for wool from Wilcannia than you charge now from Bourke? To get any wool at all, we could not charge as much.

503. To get the trade, you would have to go lower still? Yes.

504. Would it pay you to go as low as £2 10s.? I do not think so.

505.

J. Harper.  
5 April, 1899.

505. You would have to go as low? We should. They are carrying Kallara wool for £2 10s.
506. *Mr. Watson.*] Where does that go to? To Echuca. £2 10s. is a through charge.
507. *Dr. Garran.*] Does the wool generally go to Morgan? Yes; a great part of it goes to Morgan.
508. The point I am working out is this: That you have less chance of getting payable carriage to Sydney from Wilcannia than you have of getting it from Bourke? Yes.
509. And a longer distance to carry the traffic? Yes.
510. And so the prospect, if you could make a fair fight for the trade, would not be very great? No; I do not think so.
511. It would barely pay you at 50s.? It would if we had enough of it; but we should not have enough.
512. I suppose the same experience will apply to taking stores up there? Yes.
513. When you cannot take the wool, you cannot take the stores in competition? No.
514. There might be natural reasons for making a line to Wilcannia, but they are not remunerative reasons for the railway? No.
515. The Commissioners see no profit in it? No.
516. If we cannot get the wool that comes down the river, we cannot get the wool from the north-west? No.
517. As far as you know of that country, is there any prospect of closer settlement taking place there? I do not think so. The rainfall will not permit of it.
518. Is there any indication of great mines being discovered? Not to my unpractised eye, at all events.
519. Is it not a fact that the minerals generally run in the lines of longitude, rather than in the lines of latitude? I believe that is the lay of the country.
520. So that they would run north and south of Cobar, rather than west of it? Yes.
521. At any rate, there is no known mine being worked between Cobar and Wilcannia? No.
522. Is the number of stations large? There are some large holdings on the river frontages; six or seven altogether.
523. The line would not run through more than six or seven? I think that is about the number, speaking from memory.
524. I suppose you would not get, at the most, more than half of the traffic from them? No; you will see my estimate. As regards intermediate traffic, I have estimated that we shall get 756 tons of wool.
525. When the Tarawingie line was running, did that affect the trade of Wilcannia? That I could not say. It would have some effect, probably, on the north-western and northern traffic.
526. It goes further north than Menindie, and that country would be affected by it? The probabilities are that the traffic coming down from the north-west, if the river were not navigable, might be placed upon it.
527. Tarawingie is much nearer to the sea-coast than Wilcannia? Yes; no doubt stock travelling through from Queensland would strike that line for the Adelaide market.
528. And might not the wool go by it? Yes.
529. If a line is made to Wilcannia, do you think it will come into competition with the Tarawingie line? Yes.
530. You say you have been across the Lachlan valley to Hillston? Yes.
531. It is a very dry country? Yes; so is the country we are speaking of.
532. Is there water in the Willandra Billabong? I think there is.
533. Do you know how many miles it carries the water back? I could not say.
534. It goes about one-third of the distance between the Lachlan and the Darling? Yes.
535. And the land there is very level? Yes.
536. Looking at it from a practical point of view, I think you said, some years ago, that in making your lines from east to west you would rather do it as far south as possible? Yes.
537. So as to catch the trade to the north? Yes.
538. We have not done that? We have by the extension as far as Condobolin.
539. Yes, but in no case have we gone to the Darling? No.
540. Is it still your impression that, if we go to the Darling, we should take a more southerly instead of a westerly route? That is my impression.
541. If we should go from Hay to Wentworth, do you think that that line would catch all the trade to the north of it? No; I do not think so. We know that that Hay traffic passes over our line to the river.
542. Then the only line we could make in this western district would be one from Hillston and Condobolin, or somewhere on the Lachlan to Menindie? Yes.
543. You would not advocate the line further south than that? No.
544. If we make a line to the Darling at all? Then I should say, go by the Condobolin route.
545. Do you think there can be any possibility of agricultural settlement on such a route? I do not think there could be much; there might be immediately west of Condobolin, and in the neighbourhood of Hillston, but I do not think there would be any further west than that.
546. Is there not some cultivation on the rivers? I do not regard that as cultivation from a railway point of view. There would be no traffic from it.
547. Might there not be places suitable for irrigation? I do not think we should ever make any appreciable volume of traffic for railway purposes from irrigation along the river. People might grow produce locally to keep their herds alive, which at present, under drought conditions, are carried by railway.
548. As a matter of fact, do they attempt to grow it;—do they not prefer to get it from the east? They do.
549. Have you not this year carried very large quantities of lucerne hay for the purpose of feeding cattle? I had it made up before the holidays. We have carried 27,000 tons of fodder for starving stock this year.
550. You say you think they will grow it? I say I think they may.
551. But they do not; they prefer to pay you a very high tariff to growing it themselves? They do not pay us a very high tariff; as a matter of fact, the freight on produce does not pay us.
552. In that case, by your low rates, you are discouraging local cultivation? I do not think so. You could not find a local market, and if we kept our rates higher I am afraid we should not have much production.

- J. Harper.** 553. What I mean is that if the squatter can get his hay brought by you so cheaply it suits him better than growing it himself? Yes; but we are not the only ones that he pays. He has to pay the grower a stiff price.
- 5 April, 1899. 554. If he could grow lucerne, would it not pay better to grow it than to import it? I should think so.
555. Yet they have not found it out to be to their interests? No.
556. Is it because they cannot grow it? I do not know.
557. I want to know whether they would be likely to grow it? I can only give the opinion of experts. Colonel Home expressed the opinion that irrigation would not succeed by reason of its costliness.
558. You think that without irrigation produce could not be grown? No; you might get an occasional crop in a very favourable year.
559. Your advice, then, is that the country should make the line from Condobolin to Menindie? No; my impression was that it was the preferable route to adopt, though it was not a good commercial undertaking; that if a national object was sought to be served, that was the best means of serving it.
560. You would not make the line? No.
561. It would not pay? No.
562. But if there is any national object in getting to the far west, that is the route you would take? Yes.
563. *Mr. Shepherd.*] What is the average cost per mile of running a load? It depends upon the country that you are running over.
564. Where the grade is about 1 in 100, what is the cost? You must tell me what the load is. You would have to know the kind of load, and to calculate the interest on the capital cost. It is very difficult to tell the cost per mile over any particular section of road.
565. Do you think it is likely that we should intercept much trade by continuing this line to Broken Hill from Wilcannia? I do not.
566. Port Pirie would be the attraction? The distance from Broken Hill to Port Pirie is 253 miles, and by Wilcannia to Broken Hill it is 734 miles. The grades on the South Australian lines are more favourable than ours, and there is nothing to prevent them carrying as cheaply as we do. I think they are now carrying ore at  $\frac{1}{2}$ d. per ton per mile.
567. And even the Darling would be likely to attract a good deal of trade from Wilcannia, and wool and other articles would go by the river? Yes.
568. So that really a line from Cobar to Wilcannia is not likely to be profitable? It certainly would not be.
569. *Chairman.*] Your traffic estimate is £2,800 per annum as to goods;—what would the wool rate be? Over that increased mileage we should charge a competitive rate. The reduced rate which we have to-day is £3 5s. per ton; it should be £4. £3 5s. is the reduced competitive rate for certain distances. We add to that a penny a mile on this line, which brings it up to £3 18s.
570. Would that induce the squatters to send their wool along the line? No. There are about 13,000 bales of that wool sent from the sheds on the river, which would involve longer cartage to the railway at Wilcannia than to the steamer.
571. I have seen it stated that some wool had been two years in transit from the station to Sydney;—do you think the more rapid communication a railway would afford would cause them to send it to the railway? It is an exception to have the river in such a state as that; it has only happened once since the railway has been opened. I have particulars as to how often the river has been navigable during fourteen years, commencing in 1882 and ending in 1895, and the river has been navigable on an average for 171 days in the year.
572. *Mr. Hickson*, in his statement, says:
- Wilcannia, which is to be served by this line, is the centre of a very large district, and, from evidence given before the Works Committee, it was ascertained that the annual freight earned inwards and outwards at this town was at least £80,000.
- Can you say whether or not that is a fair estimate? I do not know where he got it from, I am sure.
573. You do not think it is a fair estimate? I should not like to contradict anything that *Mr. Hickson* has said.
574. What is your opinion about it? It is absolutely incorrect that it amounts to £80,000. The total tonnage, as dealt with at Wilcannia, was 9,000, over an average of three years, inwards and outwards. If £8 10s. a ton were charged on that, it would yield £80,000. But I have already indicated what are the prevailing rates on the river.
575. They are not anything like that? No.
576. Presuming it were correct, how much of this £80,000 do you think would come to the line? I do not know what would come to the line. The maximum is what I have stated in my report. But of that £80,000 I know nothing.
577. The traffic would consist chiefly of wool, live stock, and provisions? In my report I have tried to show that our chance of getting any wool at all is very remote, except from intermediate stations. I have given 1,000 tons, which is 40 per cent. of the quantity of wool dealt with at Wilcannia. With the opening of the railway, in the event of there being a low river and low freights, they would pay on the extension of our line from Cobar 1d. per ton per mile, and that would give £810.
578. *Mr. Hickson's* estimate was taken from evidence given before a former Committee; you discredit some of that evidence? Absolutely. That amount is more than the revenue you get for the haulage over the whole section from Nyngan to Cobar and Bourke inclusive, almost as far as Dubbo; indeed, it would represent the earnings from Dubbo west to Cobar and Bourke.
579. Do you think there would be any traffic in coal on this line? I cannot think how there could be.
580. There is a decent fleet of steamers on the river? Yes; they burn wood at present.
581. Do you think they would be likely to use coal? If they did they would bring it from Adelaide. They are chiefly South Australian boats on the Darling.
582. Would this line serve as much country as the line to Bourke? Certainly not.
583. Do you get much wool over from Queensland on to the Bourke line? We did until the export duty was imposed.
584. Would not the wool from the Paroo country come to Wilcannia? No; the traffic from the Upper Paroo comes to Bourke.

585. You do not think it probable that the revenue from Wilcannia would be equal to that from Bourke? No; I am sure it would not be. There is another feature about Bourke, and that is the enormous number of stock coming from Southern Queensland. J. Harper.  
5 April, 1899.
586. You know that there is a proposal to erect locks and weirs on the Darling? Yes.
587. Do you think that that will bring more traffic? Whatever you do to improve the navigation will take the traffic from the railways. If the navigation is improved above Bourke, it will have the effect of bringing traffic down to Bourke, which finds its way to Walgett. But if the navigation is improved between Bourke and Wilcannia, the probabilities are that you will afford means for the carriage of produce outside the Colony. I may explain that I am not selfish enough to say that that ought not to be the case; but, speaking from a railway point of view, it seems to me that it is my duty to try to help to retain the trade.
588. You think that the Darling River will serve the people out there better than the railway? I am sure it will.
589. You are not likely in any case to get the whole of the traffic from Wilcannia, even if the river is not improved? No; I do not think we shall even get a small proportion of it.
590. Do you know how the station properties out that way are held, whether by New South Wales people or by Victorians? I think they are all held by financial institutions.
591. And where do they hold their headquarters? Some in Sydney, some in Melbourne, some in Adelaide.
592. If the bulk are held in Sydney, and their business transactions are in Sydney, are they not likely to send their wool clip to Sydney? If the wool is to be shipped for sale at home, they will take the cheapest route. If it is intended for sale in Sydney, it is brought round by sea from Adelaide.
593. Suppose the Darling River is improved, and tonnage rates are charged, would any reasonable rate drive the traffic on to the railway? It would certainly be more equitable. If the river is improved, the users of it should be required to contribute towards the cost of its improvement. The users of the railways have to pay for their construction.
594. What charge would make that necessary difference? I could not tell; it would be rather an involved calculation.
595. You have not gone into it? No.
596. You simply say that there should be a charge? Yes.
597. And if a charge is made, it might affect the railway traffic? Yes; it seems to me that it is a legitimate charge to make.
598. Mr. Darley, in giving evidence, has said that it would hardly be fair to charge tolls, inasmuch as we do not put tolls on the ordinary roads? I have always regarded that as a grave inconsistency, because if people use the railway, they have to pay not only the working expenses, but also the interest on the capital cost.
599. If you come to a river crossing, you have to pay to go over in the punt? Yes; and I have had to pay for watering my horse at the Government tanks.
600. That being so, it would be a legitimate thing to charge for the use of the river? Yes.
601. *Mr. Watson.*] What proportion does your interest on capital bear to your ordinary working expenses? The interest on capital cost is £1,380,000, and the earnings for 1898 were £3,026,000.
602. I meant the working expenses as compared with the interest on capital? £1,614,000. The working expenses are £300,000 more than the interest.
603. So that practically amounts to this, that, if the users of the railway were not saddled with the interest on the cost of construction, the rates could be reduced by nearly half, say by about 45 per cent.? Yes; I have here the particulars in an interesting form of how the money comes. The earnings from the goods, wool, and live stock are £1,570,000. It takes within about £200,000 of the total earnings of all the merchandise and stock traffic to pay interest on the capital cost.
604. That is without passengers? The passengers have to pay the working expenses, really. It would make a wonderful margin if relief were given in the direction of interest on the capital cost.
605. There is no difference in principle between a road and a railway, as far as capital cost is concerned? Absolutely none. It always struck me as an anomaly.
606. *Chairman.*] On an ordinary road the carriage is very heavy; on the railway it is lighter? Yes.
607. So that they can afford to give the State something for the difference? We have had this anomaly, that we have had teams competing with the railway in what we call the more profitable lines of traffic—traffic on which we get the higher rates. These teams have been burning the country's candle at both ends, so to speak—cutting up the roads and withdrawing the traffic from the State railways, leaving the users of the railways to pay more for their accommodation.
608. What is the distance from Sydney to Wilcannia, and from Wilcannia to the nearest South Australian port? The distance from Sydney to Wilcannia is 615 miles. It is 987 miles from Port Pirie to Sydney, and 253 miles from Port Pirie to Broken Hill.
609. Taking it for granted that Federation is accomplished in the near future, the probabilities are all in favour of the traffic going to Adelaide? Undoubtedly. The business connections are with Adelaide, and under Federation the business relations would be continued under more favourable circumstances.
610. Then we gather from you that the Railway Commissioners do not view this proposal with any very great favour? No.

THURSDAY, 6 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane.

6 April, 1899.

611. *Mr. Dick.*] I find in the first document submitted to us, in reference to this proposal, the following statement:—

Another route, namely, that from Forbes, has been suggested for railway communication with Wilcannia, but in January, 1889, when the late Engineer-in-Chief (Mr. Whitton) was asked to report on the matter, he had no hesitation in saying that if it were considered desirable to construct a railway to connect with Wilcannia, and which might eventually be extended to Silverton, the best route to adopt would be from Nyngan to Cobar, thence Wilcannia and Silverton.

Do you agree in the main with that? Yes; I do. If Wilcannia is to be connected, I believe that Cobar is the proper starting point.

612. Do you know enough of that report to know whether Mr. Whitton confined himself merely to the engineering aspect of the question, or viewed it as a matter of policy? I think he confined himself to the engineering aspect of the matter.

613. You would not care to venture an opinion upon any other aspect of it except the engineering? I have been in the habit of avoiding anything else.

614. What are the advantages connected with this scheme over any other scheme, say from Condobolin to Silverton, or Condobolin to Wilcannia? It is very much the shortest to construct, and I believe the country along this route is better too. I think that some information was given on that subject at the inquiry into the proposed railway from Condobolin to Broken Hill. There are some questions upon it on page 11 of the Minutes of Evidence. If you refer to question 250, Mr. Roberts asked—

If a line were taken to Condobolin, through Wilcannia to Broken Hill, what would it cost per mile?

I said—

Not much more than the proposed line.

Then question 253—

Would the country to be traversed differ very much apart from the flooded portions?

The answer I gave was—

No. On the Wilcannia route there would be one or two ridges to cross, but you could get over them without great difficulty. Still the country along that route is not so good; it is less suitable for settlement.

615. Does not that operate against the statement of the late Engineer-in-Chief that this line is the better one to construct? This is comparing the Condobolin line. The land on the Condobolin line to Wilcannia is not so good as on the Condobolin to Menindie route. There does not appear to be any comparison made between the Condobolin to Wilcannia and the Cobar to Wilcannia route. I remember the survey being made from Condobolin to Wilcannia. There were no difficulties in it; there were one or two ridges which, no doubt, would be surmounted with easy grades, the same as on this particular line.

616. Then the advantage of this particular line is its shorter distance? Yes. I do not think there would be any appreciable difference in the cost per mile.

617. I find it is stated that the surveyed line follows the main road 50 miles; later on it crosses and re-crosses a main road;—has not recent experience in regrading and deviations led to any change of opinion as to this practice of hugging the road? It depends very much upon circumstances. In some cases I have no doubt it is the best practice to adopt; in other cases it is absolutely necessary to depart from the road, because the levels of the road are not at all suitable. Generally speaking, it is a good thing to be near a road, because roads give access to the stations. A road is a main line of traffic on which side roads converge, and so it would naturally help the stations on the route, and the adoption of such a location would, of course, obviate the necessity for opening up new roads.

618. Have you had anything to do with these deviations and regrades of lines? With a good many of them.

619. Have you noticed in your experience, that, although the original line keeps very close to the old roads, the deviations are nearly always away from the roads? Yes; that is frequently the case.

620. Do you think that, in the survey of the route from Cobar to Wilcannia, full consideration has been given to the necessity of getting the easiest road, even at the expense of some deviations? Yes; I am sure the most direct line was sought, independently of what the road furnishes. Of course a road in that remote district is not really of any value, it is more a mark on paper than anything else.

621. You will notice on the plan that there is a surveyed road going through a railway reserve marked green;—do you know whether the amended plan departs very much from that? In several places it does. The land in that district is not alienated.

622. I suppose there will be little, if any, resumptions there? Very little. The only private property is near Cobar.

623. What do you include in the item £400 per mile for earthworks in your estimate? All the earthworks on the running road—cuttings and embankments.

624. Any ditching? Yes; any drainage, cuttings, or banks.

625. Would you consider that a heavy or a light charge for a light line? It is not much, considering the remoteness of the district, and the fact that there are ridges to cross.

626. How would the remoteness of the country affect it? There would be the carting of water, and, probably, the extra pay that you would have to give the men.

627. *Mr. Watson.*] There are some artesian bores out there, are the not? There are no artesian bores, but there are some tanks. Still you would have to cart water a long distance.

628.

628. *Mr. Dick.*] That item, I suppose, includes the placing of the soil from the cuttings on the line? Yes; it includes the filling. H. Deane.
629. What height will you make the embankments? Where the country is flat it would run from 6 inches to 1 foot. 6 April, 1899.
630. That is with the ballast? Yes; 6 inches would be a minimum. In the ridgy parts the cuttings and banks would be equalised, so that if you had to take out a cutting of 4 or 5 feet, you would probably have a bank to follow it about the same height.
631. Does the cost of earthworks vary directly with the height of the embankments formed? No. The cost of side cuttings and embankments is very much less than the cost of embankments that are made from cuttings, because the earth is obtained alongside, and put in. You can make it with ploughs and scoops.
632. Supposing the ordinary side-cuttings would have to be double the height of the embankment,—does that double the cost of the work? No, not necessarily. If a bank were not more than about 3 feet, it would not be necessary to add anything to the earthworks.
633. I find that in your report, after your visit to America, you say that the height of the embankments there is at least 18 inches, and that they cost £450 per mile; and as these embankments are going to be about 6 inches, the cost would be a good deal less? When I say that the cost would not be any greater, I mean the cost per cubic yard. Of course, the more earth you put in the embankment, the more the aggregate cost will be.
634. In that case, the difference between an 18-inch embankment and a 6-inch embankment would be considerable, would it not? Yes; but you cannot always get a 6-inch embankment, on account of the undulations of the ground. You would not be able to get a minimum of 6 inches, and keep it as an average. That description of line in America that I mentioned would be more costly than I would put on an absolutely level country. But then we have not only level country to deal with; we have a good many ridges, cuttings, and banks.
635. You would not agree, then, with the statement made by Mr. Barling in his evidence on the proposed line from Cobar to Cockburn that the country from Nyngan to Wilcannia is remarkably easy for railway construction? That is quite correct. Any country which admits of earthworks being done for £400 a mile is remarkably easy by comparison with what has gone before.
636. But the cost per mile on this route is a good deal higher than it was on the Jerilderie to Berrigan and the Narrabri to Moree lines? Yes; but when Mr. Barling gave that evidence those lines had not been made.
637. Which of these two, as a matter of economy and construction—the Cobar to Wilcannia, or the Condobolin to Wilcannia—do you think would be the better? I think I should prefer the one from Cobar to Wilcannia.
638. In spite of the rough nature of the country? Yes.
639. Will you refer to page 12 of the evidence on the Condobolin to Broken Hill line, Questions 278 to 282? Is not that a comparison of the Condobolin to Menindie with the Cobar to Wilcannia line.
640. Coming back to the question of economy in construction, the point is whether the construction of a line from Cobar to Wilcannia or from Condobolin to Wilcannia is the cheaper;—does it not bear on the question whether the Cobar to Wilcannia line is a line that is remarkably easy of construction? It was the Condobolin to Menindie line which I apparently pointed out, in answer to those questions, as being the easiest. Mr. Barling's statement must be taken as a comparative statement. He said that the route from Nyngan to Wilcannia was through remarkably easy country. So it is by comparison, even supposing it costs £400 a mile. I maintain that it is through easy country; but part of that £400 per mile is necessitated through difficulties arising in the ridgy country.
641. Then what you wished to be understood was that the Condobolin to Menindie line, as compared with the Cobar to Wilcannia, would be easier to construct? Yes; that appears to be so. I think the estimate shows that that is the case. For instance, on page 4 of the Condobolin to Broken Hill evidence, I give the first item—
- Condobolin—329½ miles to 587½ miles—256 miles at £2,200.
- But the average cost of this line works out to £2,575 per mile.
642. With respect to that bridge which Mr. Watson asked you a question about yesterday, you hardly cleared up a little perplexity in my mind;—the old estimate for a viaduct and bridge across the Darling was £92,000; the present estimate is £69,250? I think you will find that what I said was that in the original estimate (it was stated to be from rough data), the bridge was put down at £57,000, and then £35,000 was added; that makes £92,000. That is for that particular section of the line, I think; and if you compare this one with that, you will find that the cost of that particular section in this case is £95,000.
643. Does the viaduct then, in the case of the Cobar to Cockburn proposal, include more than it does in this detailed estimate of yours? I believe it means the whole cost of that section covering the Darling from the eastern side of the flood-waters into Wilcannia.
644. In fact, there is a good deal of difference between the estimate of the section, Cobar to Wilcannia, in the larger scheme, Cobar to Cockburn, and the estimate for the section Cobar to Wilcannia, as now proposed? Yes; it is now reduced, on the whole, very much.
645. Is that the result of more careful investigation? Yes, and the cheapening of construction generally.
646. Does that account for the very large decrease of something like £126,000, as I take it; the section under the old scheme was to cost £623,000; under this scheme, £497,000, being a difference of £126,000;—I suppose that a cheapening of material and increased information account for that? Yes.
647. I think you provided for ballasting in the old scheme? Yes.
648. What is the grade from Cobar to Nyngan? 1 in 100.
649. And from Nyngan to Dubbo? They are all good grades till you get near to Dubbo, and those have been improved recently.
650. There are some ranges, I believe, just to the east of Wilcannia, which partly necessitate that detour;—has a survey been made to the north of those ranges in order to give a straight run right across to Wilcannia? The country has been examined, but you will see that the Poopelloe Lake runs very far north. I do not think you would gain anything by going round there. If you went to the north of the lake you would have to turn round to the south to get the shortest river crossing. If you start the crossing on the

- H. Deane. direct line you will have about twice as much flood-water to cross as you would by getting down to the point at present proposed and then going square across.
- 6 April, 1899. 651. You could not cross the river higher up, then go along the right bank to Wilcannia? Possibly, we could, but I do not think anything would be gained by it.\* The map shows that the Talywarka Creek comes in closer to the Darling, and crosses then further to the east.
652. Reading through the evidence taken and the reports of Committees which have gone through that country, I find there is a general impression that the country there is of a very soft and boggy nature, and the opinion has been freely expressed that a watercourse alongside the line would render the embankments extremely soft, and the pressure of the trains going across would, most likely, seriously injure it;— I suppose that that aspect of the question has been considered? You may depend upon it that the witnesses do not know anything about it. An engineer knows that by putting drains alongside the line you do not bring the water to it; you take it away. The water may stand a little, but still the surface is drained and hardened. There is not the slightest fear of the softening of the embankments in that way. The drainage of the line and the throwing up of an embankment will be effectually completed, and it would be perfectly safe to cross. The rails and sleepers help to distribute the load. It is just the same as when you are walking over a boggy place. If you walk without assistance you are very likely to go in, but if you walk on a plank your weight is distributed, and you can get across with perfect safety. Rails and sleepers have the same effect in the case of a railway. There are many parts of the country of the nature of that referred to. I mentioned yesterday some part of the route from Condobolin to Parkes where it was soft in rainy weather; it has become quite hard where the railway passes.
653. How will the bridge that you propose to put across the Darling near Wilcannia be carried? On cylinders—steel or cast-iron cylinders filled with concrete.
654. Have bores been put down to test the country? Yes.
655. What sort of a bottom is there? You get rock in most of the sections; otherwise gravel and sand. It is a very good foundation.
656. *Dr. Garran.*] Have you ever had any flying survey of a road north of that Poopelloe Lake, or are you speaking from your general knowledge of the country? There was no flying survey made, but I think the country has been generally examined.
657. Sufficiently so to make it clear in your mind, as an engineer, that it will be better to go south, about? Yes.
658. Will it be a shorter or a longer way? It would not be any shorter.
659. If you can go round to the north of the lake, you will be much nearer to the Darling than you are at Wilcannia? Yes.
660. So that if you cross the Darling there, you accommodate the country to the north of Wilcannia better than by going to Wilcannia itself? Yes.
661. And if you want to get to Wilcannia, you can still run down the bank of the river? Yes, but it is all flooded country.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper. 662. *Mr. Watson.*] Can you indicate on the map what you have estimated as the traffic area which would be served by the railway if taken to Wilcannia? The area would extend to the Queensland border in one direction practically, almost to the South Australian border in another, and in a westerly direction, 60 miles towards White Cliffs.
- 6 April, 1899. 663. And the Lower Paroo? The trade of that district would come into Wilcannia.
664. I understand that there are no tracks with water anywhere south of Brewarrina towards Bourke? No.
665. So that the Lower Paroo traffic must all come into Wilcannia? Yes.
666. Did the estimates that you mentioned as to the quantity of tonnage to Wilcannia include any of the up river traffic that comes through Wilcannia? Yes; of course as far as wool is concerned, I said in my report that it was extremely problematical whether we should get any. But assuming that some growers would elect to send by train, especially in the event of there being no river, I allowed for 1,000 tons. The other 1,300 bales, or 2,000 tons, comes from the north-west, and would find its way to Broken Hill, where the freights would be more favourable than from Wilcannia.
667. You put down the total trade of Wilcannia as 10,000 tons? 9,100 tons.
668. Did that amount include all that passes through Wilcannia, or only what is sent there? All that passes through Wilcannia; all that is distributed from Wilcannia as a centre.
669. Including the traffic coming down the river? Yes.
670. What data have you to go upon? Three years were taken—three years when it was a good river. There is a population of about 3,000 people.
671. That is in the town? No; there are not 3,000 people at Wilcannia; there are 3,000 people in the district.
672. By whom were the figures compiled, and what do they represent? They represent the increase on the various boats which arrive at Wilcannia. They were taken from the boats' manifests.
673. Are they supposed to supply some returns? They supply us. We have relations with them of such a character that we can always get information from them of that sort.
674. Those figures are for good seasons? They represent the average of the last three years.
675. I notice that in an earlier inquiry some stress was laid by the Commissioners in their report on the possibility of a line such as this being used for the conveyance of stock in time of drought;—do you think that would amount to any large feature? No; I do not think so.
676. Have you had any large traffic this season on the Cobar line on that account? No; we have carried stock to the Cobar line. We have had two transactions, representing about 25,000 sheep, on that line.
677. So we could hardly take that as a criterion? No; we have not removed very many sheep from the western district. It has been principally horses. Sheep have been removed chiefly from the Riverina district.
678. You do not anticipate that there may be occasion to remove large bodies of sheep? I do not think it would pay, even with the concession to remove sheep from Wilcannia. They do not carry a class of sheep worth preserving, in the same sense as the Riverina sheep are, which have been bred up for a series of years to a very high standard. It pays the owners in the Riverina district to go to some expense rather than lose their strain of sheep.

679.

\* NOTE (on revision):—If the line crossed in this way, the flood-waters of the Paroo would have to be encountered.

679. Do you anticipate on this line the conveyance of fodder, say, from districts like Dubbo which probably would have fodder for sale, though there may be a drought in the west? No doubt we should. But we could scarcely frame an estimate on a drought season. As a matter of fact, I do not credit the district with a large amount of produce which would include fodder. J. Harper.  
6 April, 1899.
680. It struck me that the rate, as at present laid down for chaff and that sort of thing would be only 10s. 6d. a ton from Dubbo to Wilcannia, in 6-ton loads? That is assuming that you did not charge a local rate. But if you only charged 10s. 6d. a ton, you can understand what the proportion would be over the distance between Cobar and Wilcannia—150 miles: It would be a very small amount, and it would take a very large volume to represent any earnings. Our charges for produce are designed to encourage settlement in the interior, without regard to whether we derive any profit from the carriage. We expect to derive a profit from the carriage of other material.
681. I should imagine that in a question of policy like that, the people of Wilcannia would be entitled to some consideration, the same as people in other parts? Most decidedly.
682. If it is justifiable in the interests of production and settlement to carry things like that at a loss in other parts of the country, it is just as proper to do it for the Wilcannia people? Yes; but if we carry produce at a loss in other districts, our profit is derived from the conveyance of general traffic, which we should not obtain at Wilcannia, because it is carried on the river.
683. It is no justification for refusing it to the people of Wilcannia to show that produce is carried at extremely low rates in other parts resulting in no profit? No; it would be no more justification for withholding it from Wilcannia than it would be for adding another non-paying line.
684. If the line were constructed, the people of Wilcannia would be able to get the low rates which you now charge;—suppose they are charged through rates, they would be able to get a truck-load of fodder carried at 10s. 6d. a ton, or £3 8s. for the 6 tons? It would be about 12s. 6d. That line would be credited with about 5s. a ton out of that.
685. Still, if it added some additional traffic to the main line, I assume that it is only fair in reckoning the thing up to credit the branch line with that? Then what is going to pay the interest on capital, and the working expenses of the main line.
686. Would there not be a profit on the produce that goes over the main line? Decidedly not; there would be a loss.
687. That applies to the present? No. Assuming that they did get the produce at 6s. 6d. a ton, they would have to get an enormous volume of it to represent any money, and the reasons which justify the Commissioners in other directions in charging low rates for produce to encourage production would not apply in this case, because they will not be recouped by the carriage of other goods which will bear higher rates. As far as Wilcannia is concerned, we should not get the carriage of any traffic at higher rates.
688. Are there not instances where you carry fodder at rates set down in the regulations, and your general traffic results in a big loss per annum? Yes; but we get the whole traffic of the district, but in this case we should not.
689. You have sent for a map to show the area from which traffic is derived? Yes; the lowest clip of wool we get on the river is from Dunlop. That goes at present to Bourke. The wool from all the stations below goes down the river.
690. What distance is Dunlop from Bourke? It is 130 miles below Bourke.
691. Why does that go to Bourke? Owing to special concessions. The Salisbury Downs is the last station west of the Paroo, from which the wool comes into Bourke. The others come into Wilcannia or Broken Hill. The wool from Tickalara goes into Wilcannia, and a duty of £2 10s. a ton has to be paid on the Queensland border.
692. Referring to the question of the conveyance of fodder and chaff, is there at present any considerable amount of fodder carried from Dubbo to Wellington towards Cobar? Yes; this year.
693. Ordinarily speaking, they do not produce enough about Cobar to supply themselves? Yes; but fodder for working stock generally comes from the main line. It is quite exceptional to feed sheep and cattle there in the way that they have been doing lately.
694. Which is the main fodder-producing country, the produce from which would go in that direction? In fair seasons the Bogan and Girilambone supply fodder; but this season, Dubbo, Narromine, Trangie, and Wellington have been the chief sources of supply.
695. They do not come so far east for it as Orange? They do sometimes. They come there for flour as a rule, not for fodder.
696. You say that you put down 1,000 tons of wool at 13s.;—would not that be new freight, so far as the Cobar to Sydney line is concerned? Yes.
697. And if it were reasonable to expect that, would it not be fair to credit the Wilcannia line with that amount on the main line? If you do, how are you going to make the main line pay.
- 698-9. A certain amount ought to be credited to the branch line. It will be profit over that number of miles, and might be credited to the branch;—but how would you treat the losses on the main line on the carriage of their produce;—you should credit the main line with that loss out of the earnings of the Cobar line? If it was fair to do one thing, it would be fair to do the other.
700. If you have a branch constructed which brings new traffic feeding the main line, it is only proper to allow something, if not in definite figures, at any rate in your attitude towards the line? You may recognise it as an abstract principle.
701. I do not think it would be possible to figure it out, but it ought to be thought out? Considering that the great bulk of the traffic that would come in at Wilcannia would be produce, it would be a loss on the main line, because the greater tonnage is represented by produce outwards.
702. But anything you would get inwards would be new traffic? Yes.
703. And to that extent, it would help the main line? Yes; and the losses sustained on the new line would be heavier than any profits, and should be debited against the branch line.
704. Do you think there is a material loss on the carriage of produce? I am sure of it.
705. When you say material loss, do you mean in the cost of running, or loss, including the original cost of construction? As a matter of fact, there is a loss on the working expenses.
706. You have a train running ordinarily, and you are asked to attach to it a certain number of trucks of fodder, and the additional cost of carrying the fodder entails a loss? Yes; because in nine cases out of ten we have to return the trucks empty.

- J. Harper.  
6 April, 1899.
707. Of course, that loss is submitted to by the whole country for the sake of encouraging settlement. It would not be proper to deny any other district the right to participate in the benefits accruing? No; I may mention that wherever new lines have been opened, although local rates may be applied to the ordinary goods traffic, they have never applied to produce. The produce traffic has been charged the through rate temporarily. For about twelve months we had a local rate on the Jerilderie-Berrigan line, but that was abandoned and a through rate quoted. Hay, straw, and chaff produce, on the average, '39d. per ton, practically one-third of a penny. A charge of  $\frac{1}{2}$ d. a ton per mile does not pay us. Our average earning is 1'38d. per ton per mile.
708. I understood from the evidence given by one of the officers of the Department that when the line from Cobar to Cockburn was under consideration that  $\frac{1}{2}$ d. per ton per mile would pay? I think Mr. McLachlan gave evidence about that. You may have gathered from him that it would pay if there was a sufficient volume of traffic, such as we at that time anticipated from Broken Hill, and a return traffic. Then it probably would pay. If you had fully-loaded trains in both directions then  $\frac{1}{2}$ d. per ton per mile would pay, because there is very little difference between the cost of hauling a train that is loaded and a train of "empties." I daresay that the gentleman who gave evidence in that instance expected that we should get ore from Broken Hill.
709. It was Mr. McLachlan who made the statement; he said that if it was found that the traffic to Broken Hill, Nyngan, or Lithgow would not bear a  $\frac{1}{2}$ d. rate per ton, the rate would have to be reduced; then he goes on to say that the regulations then in force provided for a minimum of 2 $\frac{1}{2}$ d. for 6-ton trucks, if not less than thirty trucks per week. I was about to ask whether you could say whether that cut-rate for dumped wool from Bourke does pay now? It is over 1d a ton per mile—it does pay.
710. Wool is not to be compared with minerals? We can get as much wool in a truck as it can carry. We can get in 8 tons of wool, and we could not get more minerals.
711. Would it pay to carry wool as cheaply as anything else? That is rather a peculiar question. I can unhesitatingly say "no," on the principle on which rates are adopted.
712. That hardly gives much information? It is a standard rule in fixing railway rates that the value of the article shall be considered. We have to consider what charge it is capable of bearing. It is considered that wool will bear a certain charge. You would not carry a ton of silk at the same rate as you would carry a ton of coal.
713. What I want to get at is, what would be the lowest rate at which it would pay over a distance of 624 miles to bring a train load of wool;—I want to know what is the lowest rate at which you could possibly carry it over the distance we are contemplating, and yet leave a margin of profit? The lowest rate we could possibly charge would be £3 18s.
714. You said the other day that you found it necessary, in order to get freight to the river, to reduce the cost of the carriage of sugar to Bourke to £2 a ton; if it did not pay to carry it at that, I presume that the Commissioners would do without the traffic? The fact of our getting the carriage of that sugar to Bourke means our getting the wool back. That is a countervailing rate to counterbalance the reimposition by Queensland of the £6 a ton duty on sugar. Any sugar reintroduced into Queensland has to pay a duty as though it were imported. No drawback is allowed.
715. How does the carrying of sugar up or down ensure the carrying of wool either way? Teams go up with the loading, and bring the wool back.
716. In any case you have a cut-rate to get the Dunlop wool? Yes.
717. But seeing that you have made a cut-rate there, and I presume in other places also, it does not seem necessary to stand up for consistency? Yes; we have to be consistent within certain limits. As a matter of fact, our Act compels us to treat all people alike under like circumstances. As far as Bourke is concerned, the rate, with the exception of certain districts, applies to every one in that district. The rate to Bourke is no less than it is from any other point on the Western line. But if a lower rate were made than exists to day from Bourke or Wilcannia, we should have the anomaly of charging lower rates from Wilcannia than we charge from Cobar and intermediate stations.
718. It seems that cut-rates are being used on the Southern line;—I understand that some time ago people struck the happy idea of sending goods to one station, then bringing them back to another station to make a saving? Yes, that was at Cocotamundra.
719. It seems to me that if the differential rates are allowable in order to get the trade, it simply resolves itself into a question of what would be the lowest rate at which it would pay? It would not pay us to have a rate of less than £3 18s. a ton. Since 1890 we have been adjusting our rates so that more distant stations shall not have lower rates than those that are nearer, and for the sake of consistency a great deal of revenue has been given away. The rates which apply in Riverina now are maximum rates, and the rates to Bourke are maximum rates.
720. You say £3 18s.;—I understand that undumped wool could be carried from Bourke for £3 5s.? Yes. There is 13s. added for the distance on this local line.
721. Do you say seriously that you could not afford to carry it for the less? I say seriously that we could not afford to carry it for less than that.
722. It is a strange thing, if you can afford to carry minerals at less than  $\frac{1}{2}$ d. per ton per mile, that you cannot carry wool for 1d. and under? Supposing a man had £50, and he badly wanted household necessities, he could not afford to buy a piano. We give away on what we consider necessities, but luxuries we expect to be paid for. They are goods which will bear a heavy rate.
723. I hardly make myself clear;—what I want to get at is, not what one would desire to get on the traffic under normal conditions, but what it would be justifiable to get? That is all we could afford to carry it at.
724. It seems to me that the question of affording resolves itself into a question of how much it costs to run the train after making the line;—leaving out of account what the value of the wool is, I want to know what the lowest charge would be on which a profit could be made. A gentleman stated in 1891 that the charge for a 6-ton truck of coal from Eskbank to Sydney was very low? We are getting more than  $\frac{1}{2}$ d. a ton per mile for that. We are getting nearly  $\frac{1}{2}$ d. per mile.
725. How much is a full truck of 6 tons from Eskbank? Six shillings per ton—95 miles.
726. In that case you have to take the trucks back empty? We do in some cases.
727. Of course, I suppose, a short journey is not worth as much to you at  $\frac{1}{2}$ d. a ton as a long journey? That depends upon circumstances. It is better to have a full load for a short journey than half a load for a long journey at the same rate.
- 728.

728. It would cost more proportionately to bring a load from Lithgow here, in view of the grade, than the whole journey from Wilcannia? Yes, certainly; assuming that you had a full load. I may mention, as far as that line is concerned, that with the class of engines which they could work on that line, the load would not be much greater than the load we should haul with the engines in use between Sydney and Eskbank. J. Harper. 6 April, 1899.
729. Because the light line would not carry the same class of engines? On one line we could have forty-five trucks, and on the other thirty-seven trucks.
730. You use the heavy class of engines on the main line? Yes.
731. Would not a lower speed on the line admit of a larger load being carried? No; it would not make much difference.
732. What I want to arrive at is the lowest possible rate at which it would pay to take the traffic with a view of getting hold of the traffic which now goes in another direction;—it appears to me that as you carry it for  $\frac{1}{2}$ d. a mile, and bring back the trucks empty, it might be possible to charge less than a 1d. a mile, with a view of getting new trade? I do not think the Commissioners would view it in that light. As far as wool is concerned, we do not care to make any reductions for the purpose of chasing the traffic on the steamboats. We have realised that, when we have reduced our freights, the boats have reduced theirs too, and the boats can reduce more than we can, and when we make a reduction, the intermediate districts complain of their unfair treatment, and very properly so too.
733. You referred yesterday to the fact that at Hay you found the wool passing the railway and going on to the river? Yes, that is so.
734. Is it not a fact that at Hay the Murrumbidgee is suitable for navigation when the Darling is absolutely dry? That is so; it is backed by the Murray waters, and it is fed by snow waters.
735. So that you can get a regular uninterrupted trade to Hay when you could not on the Darling? Yes; they usually have a good river in the wool season.
736. So, from Hay, they can depend upon getting down to Melbourne with some reasonable celerity? Yes. I yesterday stated that the Darling has been open for traffic on an average 171 days in the year during the last fourteen years.
737. Mr. Darley's return extended over some ten years, and it shows that, as nearly as possible, on the average, the river is open for half the year, and is half the year closed? These are the figures: in 1882, it was open for 84 days; in 1883, 44 days; in 1884, 21 days; in 1885, 31 days. That was practically about the time the line was built; they had a bad time then. In 1886, it was 222 days; in 1887, 269 days; in 1888, 82 days; in 1889, 199 days; in 1890, 354 days; in 1891, 282 days; in 1892, 247 days; in 1893, 337 days; in 1894, 282 days; in 1895, 54 days. Of course, I do not know what ten years Mr. Darley took—the average is 171 days.
738. That is less than half the year? Yes; but it is open generally during the wool season, unfortunately.
739. There is one matter which seems to be worth considering, whether it would not be worth while for the people round Wilcannia to make a show of getting quick despatch for their wool, in order to realise? It does not weigh with them. As a matter of fact, under ordinary circumstances, they can have their wool in Melbourne or Adelaide within fourteen days of the time that it is put on the steamer.
740. Is there not a heavy insurance involved? No, the wool is generally insured from the sheep's back to London.
741. Is there not an increasing tendency every year to sell the wool in Sydney or Melbourne? Yes; but even assuming that they did, the steamer is still cheaper than the railway. They can have the wool brought from Adelaide to Sydney for from 12s. 6d. to 15s. a ton; and from Melbourne at about 10s. a ton. As a matter of fact, some of the Darling wool does come in that way.
742. If the rates were nearly equal for the two routes, the people would choose the one to Sydney, because of the quicker despatch, there being no necessity for insurance, and buyers being here from all parts of the world? There is a disposition to come to the Sydney market; but as a matter of fact, the wool can be taken to Port Victor, loaded there, and brought round to Sydney cheaper than we can bring it by railway. The Kallara wool is delivered in Adelaide for £2 10s. a ton.
743. I thought it was admitted that the Murrumbidgee hardly offered a parallel to the case of the Darling? I did not admit that. I say that whenever you have water carriage, you have a very formidable competitor. The matter of waiting a few days with regard to the transit of wool makes no difference.
744. Do you know anything of the mining possibilities of the district between Cobar and Wilcannia? No.
745. I should imagine that if there were any mining to any great extent, it would be a factor in the case? It should be if in existence, but not prospectively.
746. I am informed that there are mines now being worked close to Wilcannia, apart from the opal fields about 30 miles on the Cobar side;—you know nothing of them? No.
747. Have you been over this route? It is seven or eight years since I was at Wilcannia. I went from Cobar to Wilcannia.
748. So there is a possibility of mineral developments having taken place which you would not notice then? Yes.
749. Do you think that there is a large possibility of that kind, or a probability that it would be worth considering? I think that every consideration should be given to every circumstance connected with it. I have only dealt with the apparent traffic.
750. Do the mines at Cobar entail a good deal of traffic? Yes.
751. Can you tell us whether the line is paying? It is not paying yet, but it is getting very near it. The returns are not made up yet, but I had a sight of the figures in the rough, and I saw that it was getting very close to it.
752. The line now projected will be slightly lower in cost of construction than the Cobar line? Yes; all the pioneer lines now are less.
753. Therefore, it would require less traffic to pay interest on it? Yes.
754. There is another aspect of the matter: You have heard of the project for locking the Darling between Bourke and Menindie? Yes.
755. Do you think if the river were locked to Menindie and no further, thus giving revenue and sure communication between the points I have mentioned, that that would have any effect as regards feeding the line which will tap the river at Wilcannia or Menindie? Personally, I think it is rather an unfair project. I think that if the river is locked, although it may be against my interests as a railway man, it should be used to the best advantage of all concerned.

- J. Harper. 756. That is, that it should be locked all the way to Wentworth? That is a reasonable thing.  
 6 April, 1899. 757. Assuming that it be locked only a portion of the way, of course they would begin up the river and gradually go down? I think that would be reasonable.  
 758. In that event do you think the locking would help to feed the railway within a reasonable distance? No; I think it would tend to improve the river communication and enable a more powerful class of boats to be put on the river, and to reduce freights.  
 759. They could not do that until the river was locked the whole way, I suppose? No.  
 760. You do not think it would have any material effect upon the project if the river were locked as far as Menindie? No; I should not anticipate any improvement even at Bourke if the river were locked. I should not expect to get a single bale of wool lower down stream than we get it to-day. I am sure that it would not pay the Kallara people who pay £2 10s. for the carriage of their wool to incur shipping rates to Bourke, and then pay £3 5s. a ton from there.  
 761. *Dr. Garran.*] You said yesterday that that it would be perfectly fair if the Government spent £500,000 to lock the Darling, that we should raise revenue to pay interest on that debt? That is my impression.  
 762. We might raise that revenue in three ways: by putting a tax on the tonnage of steamers; secondly, by putting a tax on the tonnage they actually carry; and, thirdly, by an *ad valorem* tax on the goods;—which do you think it should be? I think the fairest tax would be a tonnage rate on the steamers.  
 763. But would not that have to be a very heavy tonnage rate to pay the interest on £500,000? That would be a matter of adjustment. As far as the principle is concerned, I should imagine that a tonnage rate would be a fair rate. It would be inequitable to charge on the cargo.  
 764. But if the river were locked, it would rather be against the railway than for it? Yes.  
 765. Because you do get some traffic when the river is dry? Yes.  
 766. *Chairman.*] Have you ever been down the Darling? I have been between Wilcannia and Bourke; not on the river.  
 767. You have not been down the river at all? I have been from Bourke to Brewarrina.  
 768. You know nothing of the river between Menindie and Wentworth? No.  
 769. I do not know that I was quite clear as to the reason why you make a half-penny rate for minerals;—is the reason that in getting minerals to carry, you also get goods that carry a much higher rate? Yes.  
 770. Therefore, although a half-penny a ton does not pay, the fact that you get traffic on which a higher charge is realised answers your purpose? Yes; that, and that we desire to develop the agricultural resources of the country.  
 771. But if you had only the minerals to carry one way, you could not possibly carry them at that rate? No.  
 772. If the goods that would bear a higher rate were carried on the river from Wilcannia, you could not carry the minerals from that district at anything like that rate? We should carry them at a greater loss. It is not a question of profit under any circumstances.  
 773. As a matter of fact, you would not? If the position were forced upon us of having to administer the railway under consideration, I do not suppose that we should alter our rates—we should have to grin and bear the loss.

FRIDAY, 7 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

J. Harper.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- 7 April, 1899. 774. *Mr. Trickett.*] Since this matter was before us on the last occasion, there seems to have been a considerable change of front on the part of the Railway Commissioners in regard to the line; at the time of the inquiry into the proposed line from Cobar to Cockburn, Mr. McLachlan and Mr. Kirkcaldie seemed very much in favour of the line? Not Mr. Kirkcaldie.  
 775. Well, Mr. McLachlan? Yes.  
 776. Are you now giving your own individual opinion, or are you speaking on behalf of the Railway Commissioners? I am giving my individual opinion, and I am also repeating the opinion of the Railway Commissioners in the matter to-day.  
 777. Could you tell the Committee how it is that the Commissioners have apparently changed their view in regard to the line? Circumstances have absolutely altered at Broken Hill. When they made their report in 1889, there seemed a prospect of coal being carried to Broken Hill for the treatment of ores; now it suits them better to carry the ore to Port Pirie.  
 778. At the time of that inquiry, Mr. McLachlan was very strongly in favour of a line to Wilcannia, as being a line that he thought the public would largely avail themselves of as a direct means of communication, and a reliable one as distinguished from the uncertain communication by river; that view would still exist, would it not? Not as far as I am concerned. You will find my evidence at the first inquiry consistent with the evidence which I am giving to-day. The circumstances have absolutely altered, as far as the Barrier trade is concerned.  
 779. It was a large factor in favour of the proposal when we had it before us on the last occasion—that if you gave them certainty of transit, they would use the railway instead of the river? That was eight or nine years ago. Since then we have had a lot of experience—rather bitter experience—in reference to the river traffic.  
 780. Does not this proposal appear to be very much in the same position as the one from Dubbo to Coonamble;—does there not seem to be a number of possible outlets in this western country? We seem

to be rather in a fog as to which would be the best to adopt. I think there are only two practicable schemes for reaching the river—one is a line from Condobolin to Menindie, which has been already fully investigated, and ably reported upon by a Public Works Committee—the other one has been under consideration twice, and is now under consideration again for the third time—the proposed line from Cobar to Wilcannia.

J. Harper:  
7 April, 1899.

781. Seeing that the Broken Hill aspect of the case does not find favour with the Commissioners at present, does not that leave it a very open question whether we should not do something for the people in the direction of Wilcannia—for that great western country there? I do not think there is any justification for doing it. It will involve a very heavy annual loss without conferring any material benefit on the people in the district. As far as the carriage of the bulk of their goods and produce are concerned, they will always avail themselves of the river.

782. Have you been over that district lately? Not for seven or eight years.

783. On what do you base your present facts and figures? Upon information gathered by officers of my Department.

784. Do you think the trade has decreased from there since you were in that district? I could not say. When I was there I made no inquiries in connection with the Wilcannia trade. My inquiries were in reference to the river traffic to see to what extent we could divert that traffic to the line at first. But outside the circumstances, incidental to the seasons, it has not varied to any extent.

785. Could you tell the Committee what outlying places trade with Wilcannia? White Cliffs in a north-westerly direction is the extreme limit. That is an opal field, about 60 miles from Wilcannia, a place of doubtful permanence, carrying a population of about 1,000; also to the Queensland border in the other direction. The Tickalara wool on the Queensland border comes to Wilcannia.

786. Does that country include Milparinka? Yes.

787. Is not that a large district? Yes. I suppose that, in all, the population of the district outside of White Cliffs is something like 1,200 or 1,300.

788. Including Mount Browne, Milparinka, Tibooburra, and the Paroo? Yes.

789. Could you tell how far to the eastward the stations send their wool to Wilcannia? All the frontage stations send their wool by river, or through Wilcannia, I should say 60 miles.

790. Is there not a place out there called Monaro? That is so. They would go to the river.

791. I suppose that Wilcannia occupies a somewhat peculiar position;—does it not geographically belong to South Australia? Geographically it belongs to New South Wales. Its trade relations are chiefly with South Australia.

792. And Victoria? No, chiefly with South Australia. The greater part of the Darling trade is with South Australia. Victoria holds the Murrumbidgee trade.

793. It really has very little tie to Sydney except politically? It certainly has no tie with us. We have a very much reduced rate to Wilcannia, which has been in operation some ten years, for traffic landed at Bourke and delivered at Wilcannia, on production of certain declarations that it has been so landed; and for the ten years that it has been in operation—(all these matters have to obtain my signature before any refund is made)—I have not dealt with £50 worth of railway freight.

794. But very often when we have had the Commissioners' evidence before us on a question of this kind, we do not look to the actual state of things, but to a developing business? I have in my report given evidence which indicates the prospects of development.

795. In the summary to the statement which you handed in in regard to the prospective traffic, you put down the goods at 1,390 tons, and wool 1,756 tons, as likely to be the trade done with Wilcannia, if we extend the railway to that place; and you also give us an average statement to the effect that the total number of bales of wool shipped to Wilcannia from stations adjoining the river during the last three years was 13,785 bales, equal to 2,515 tons per annum; those three years have been rather bad years, have they not? No.

796. Has it not been rather droughty during the last two years? Yes; but the year before was a good year. The Colony generally has been going down in the matter of wool production for some years.

797. You would hardly take those as three fair average years? Yes; as sheep are now held in the country, they would be fair years. In 1897, we dealt with 634,000 bales of wool; in 1898, with 609,000; that is all over the Colony. It shows a reduction of 5 per cent. in a bad as against a good year.

798. The figures you give us with regard to the trade at Wilcannia seem very small compared with the local evidence which was obtained during the inquiry into the proposed line from Nyngan to Cobar? I am responsible for the one; I am not for the other.

799. There was a gentleman named Doake who gave evidence in that inquiry; he was asked this question:

Can you give us a general idea of the amount of goods forwarded at Wilcannia during the present and previous years?

He says:

The inward tonnage to Wilcannia has been 9,600 tons on the river alone. The outward tonnage from Wilcannia has been 8,900 tons—that is, since June of the present year up to the present date.

That was in October—four months' trade—making about 18,000 tons;—that seems a tremendous difference compared with your estimate? You will probably find, when those figures are investigated, that they will not be borne out. That was ten years ago, and we have been able to secure some further evidence as to the trade since then. Wool that used to pass down stream beyond Bourke, and other goods, we get on to the railways. We have been fighting for that traffic for the last ten years.

800. A lot of that trade, which went to Wilcannia, now goes to Bourke? Yes. I should not like to doubt Mr. Doake's word; but it seems to me that the estimate was an excessive one then, because it appears from that that over 50,000 bales passed Wilcannia. I am quite sure that 50,000 bales did not pass Wilcannia.

801. Then you are inclined to think that that is rather an exaggerated statement? I am. I know it is a far higher volume of traffic than the South Australians and Victorians ever admit having got there; and I may tell the Committee that in negotiations with the other colonies we have had opportunities of seeing the actual figures of the traffic that comes off these rivers.

802. You estimate this wool traffic at 1,756 tons;—will you tell us how you arrive at that? That has been taken from the actual trips of the boats on the river.

803. That is peculiarly a wool-growing district, is it not? Yes.

804.

J. Harper. 804. Did that district suffer more than the others during the late drought;—you say that the figures indicate a falling off? I put the figures for the Colony generally; they show a difference between a bad and a good year of 5 per cent. This year our falling off in wool has not been equal to more than about 4 per cent. in the Colony generally. That part of the Colony suffered very severely, there is no doubt.

7 April, 1899.

805. One cannot doubt actual figures from stock returns, but it does seem a very small quantity of wool from such a very extensive district? Yes; but this has been confirmed by information which we have had from the Victorian and South Australian authorities in conference with them on questions as to rates.

806. You put down an amount for trucking stock;—what would that be for? Fat stock for sale; in view of the fact that the Cobar district is nearer the market, and may be regarded as more of a fattening district; but during the best seasons we ever had, we only had 400 trucks of stock. I have allowed 800 trucks for this line.

807. I should like also to draw your attention to the freight which you quote in your statement;—you say:

The produce is landed at Wilcannia from Moama, Morgan, or other Murray ports, at the rate of £1 7s. 6d. per ton, and general goods from Adelaide or Melbourne at £2 15s. per ton, and as our lowest rate for flour for the same distance would be £2 6s. 1d. per ton; woolpacks, £4 4s. 4d. per ton; sugar, £7 8s. per ton; and general goods, £10 13s. 6d. per ton; it is evident that, under the circumstances, we could not hope to compete with the river in the carriage of goods. It is possible, however, that the exigencies of the case might permit of obtaining occasional consignments of produce, the margin of difference not being so great.

This same gentleman (Mr. Doake), from whose evidence I have quoted, was asked:

What is the general through rate of freight?

He says:

It varies from £4 10s. to £7 10s. per ton. In the case of measurement goods, it has cost me as high as £10 a ton. That is from Melbourne, Adelaide, and Sydney.

That is what he says? That was in 1889. You may accept my figures as being absolutely accurate, because they were taken from contracts made with people to whom the goods were consigned. There is no doubt about the figures which I have quoted to you.

808. These are not charges produced for the occasion when they hear that the railway is likely to come? No.

809. We have had some little experience of that sort of thing;—when the river carriers expect a railway competition, they become liberal? The best evidence of that is contained in a statement which I made yesterday, that we had to reduce our charge for sugar, wire, &c., to £2 a ton, in order to compete with the river at Bourke.

810. Coming to the passenger traffic, you estimate that there will be thirteen or fourteen passengers per trip, trains running three days a week? Yes.

811. On what do you base that? From our most favourable experience of country similarly situated. It practically represents the traffic between Cobar and the junction, discarding the commercial travellers.

812. Do you base it on the coach traffic? No; we never take the coach traffic into consideration. We have many lines on which the circumstances are similar to those of the Cobar line.

813. Do you estimate those who go on horseback, and by teams and buggies? No; that is valueless for our purpose. We take the population of similar towns served by the railways, and we know what the traffic is from those towns, and we apply that to the line to be built. If we took the traffic by coach and on horseback, the number would be much lower, because that number of people do not travel between Cobar and Wilcannia.

814. Experience has taught you that these estimates of yours are reliable? Yes.

815. When this inquiry and similar ones took place on former occasions, the point was emphasised that this was to be regarded as a kind of national line;—has it lost that character now? No; it never had it with me.

816. I think you were asked what your opinion was? I was, in connection with the Condobolin and Menindie line.

817. You said that a national line is paid for by the taxpayers, and not by the users? Yes, and I still maintain the same opinion. In my opinion a line from Condobolin to Menindie would be a better one as a national line than this.

818. Would not the rates that you would charge on a line of this kind, if it were established, be cutting rates? They would be cutting rates under any circumstances.

819. How much a mile would you charge to bring traffic right through to Sydney? Wool about 1d. a ton per mile.

820. Is not that very low? Very low indeed.

821. Could you not charge more than that? We should not get the wool at that rate.

822. When Mr. McLachlan was examined before on this point, he was asked:

What is the lowest charge now for a long distance, per mile per ton? I could not say from memory;—a little over 2d., I think.

That would be a little above the ordinary freight by river to Port Pirie and Adelaide? Yes.

Do you think it is possible, if this line were constructed, for the Commissioners to be able to reduce the freight, so as to bring the produce this way, instead of its going to Adelaide? Yes; we think we should get a large amount of it.

You do not agree with that? I should prefer you to examine me on my evidence there, and see whether I am inconsistent.

823. Mr. McLachlan is Secretary for Railways now, as he was then? Circumstances have altered.

824. You do not agree with that? No.

825. He was also asked:

There is an immense traffic at Wilcannia? Yes; it is shown to be of rather large value. The tonnage, I think, is not mentioned. That would be a good guide to us.

He seems to have a very good opinion of the district, but you cannot back him up? No.

826. I suppose you will recognise that Wilcannia is a very large centre of trade for that district? Yes.

827. Do you know whether there is a large amount of unalienated land there that would be available if there was better communication? That I could not say. But I should imagine that at present it is carrying all that it is capable of carrying.

828. In the statement which was handed in by the Department, it says :

J. Harper.

The Lands Department has supplied me with the following information with regard to the tenure of land within 20 miles of each side of the proposed line.

7 April, 1899.

Alienated land .....	51,060 acres	
Settlement and homestead leases .....	387,000 "	
Reserves .....	476,000 "	
Crown lands .....	3,453,000	3,929,000 acres.

Are these all occupied lands? They are all occupied by pastoralists.

829. Is it used for grazing? Yes; I do not know for what other purpose it could be used.

830. Is it stocked to its fullest extent? I fancy so, from my experience of the western area.

831. What do you put down as the carrying capacity of that country? I could not give an opinion worth much. Some parts of the country would not carry a sheep to 20 acres. It varies very much. A great deal of the scrub in the district has been destroyed by rabbits.

832. Having regard to all the advantages of a railway to a great centre like this, direct and speedy communication, the storekeepers, instead of having to get in supplies for two years, being able to get supplies as they want them, and able to trade with their own people, do you still think that the line would not answer? I do not think that which you speak of exists. It does not exist at Bourke. We have had to reduce our charges to £2 a ton.

833. Allowing what they say to be correct—that they do have to get in supplies for long periods to stand the droughts, and considering the possibility of more land being taken up, do you still think it is not desirable to make this line? I do not grant any of these things in the first place, and I do not think it is a desirable line.

834. The position with regard to this part of the country seems to be that we keep on having inquiries, and we do not seem to get any nearer. A Committee goes and inquires into the line, and then recommends one to be made. Then we come back to the old plan;—could you, as a practical man knowing the requirements of the country, help us to solve the difficulty? I am afraid that I could not. It all depends upon the way the subject is looked at. If it is considered desirable to establish a connection with that district for national purposes, then I should say undoubtedly the line which will best intersect that territory is the better line.

835. A line more to the south? Especially if it is a shorter one, and at the same time intersects the territory better; but I am not prepared to express an opinion that the time is ripe for dealing with the line from a national standpoint. I certainly think that, with means of communication such as are available in that district, it would not be a fair thing to burden the users of existing lines in other parts of the country, where they have no alternative means of reaching a market, with the loss which would result from the construction of this line.

836. *Chairman.*] There are other lines upon which there is a loss;—have not the people of Wilcannia to bear a share of that? Yes; but this fact must be borne in mind, that the people living on those lines have to bear other burdens in meeting them. In order to meet the deficiencies on those lines rates have to be maintained at a higher level than they otherwise would be, and the people are compelled to use those lines—they have not such an alternative as a river route. They are compelled to pay a higher rate rendered necessary by non-paying lines.

837. If we add to our non-paying lines it means that you would have to raise the rates on existing lines? Yes, to users generally; there is no way out of it, because the interest on the capital cost has to be provided for year after year, and the working expenses have to be paid. My contention is that where people are absolutely compelled to use the railway for the carriage of their produce and supplies, it is scarcely a fair thing that they should be burdened with another non-paying line where there is an alternative route and cheaper means of communication.

838. *Mr. Trickett.*] Would you venture an opinion as to how far west from, say, Koorawatha or Young railway communication might be made in the direction of Wilcannia so as to be profitable? I do not think that would be a desirable line to construct.

839. Say in the direction of Menindie? My impression is that the best line to construct to reach Broken Hill would be one from Condobolin through Menindie to Broken Hill.

840. As passing through the best country? Not necessarily. There is very little difference between a lot of that country.

841. You cannot say much for the present proposal? I cannot.

842. *Mr. Levien.*] I suppose you are absolutely opposed to this line? Yes; on the grounds I have stated to the Committee.

843. Have you any idea of the number of sheep around Wilcannia and Cobar? No; I might calculate the number from the number of bales of wool produced.

844. I suppose you got the number of bales of wool from each station? Yes.

845. Did you inquire the number of sheep running on each of those stations? No; it was not material to our point, because it is the wool that we carry, not the sheep.

846. Supposing the people around Wilcannia want to get their live stock to market, how long would it take them to go from Cobar to Silverton or Broken Hill by road? I could not say.

847. There would be no live stock taken from Cobar to Port Pirie? No.

848. So you have not given any opinion as to the transit of live stock? I have allowed 800 trucks—that is 80,000 sheep; twice as many as we carry from Cobar within a year.

849. But you have had exceptionally bad seasons? No; we have had good seasons since the Cobar line was opened.

850. Have they good marketable mutton up there? It is not a fattening country. It is used to carry a maximum number of sheep, or wool.

851. But I suppose they have fat sheep for the markets;—what do they do with their sheep? Use them for producing wool.

852. Wool only? Chiefly.

853. Surely they do something more than that with their sheep? Not to my knowledge. The sheep do not reach the Sydney market.

854. Then after they have got their wool off the sheep's back, the animals die? Yes; and are boiled down. There are extensive works on the river.

- J. Harper. 855. I suppose the produce is taken away by boat? Yes.  
 7 April, 1899. 856. Would it not come to Sydney if they had a railway? No; we could not carry at anything like the rates of the river boats.
857. The Commissioners once favoured this route? That was in the early days of Broken Hill.  
 858. That was in the expectation that there would be millions in population? No. At the time when they reported on the matter, the population of Broken Hill was 40,000 or 50,000, and I think they had in view the probability of large quantities of coal being carried to the mines to reduce the ore; but the ore is now carried to the coast, and reduced there.  
 859. There are mines at Wilcannia? Not that I am aware of.  
 860. Are there not copper mines at Cobar? Yes, but they have railway communication.  
 861. Do they convey coal to Cobar now? Coke is conveyed to Cobar.  
 862. What is the population of Broken Hill now? It was about 20,000 when the matter was investigated in 1897.  
 863. What was the opinion of the Commissioners then in regard to this line from Cobar to Wilcannia? In 1889 their opinion was that it should be built. They thought at that time that great coal developments would take place in the neighbourhood of Dubbo. That was one element. Then it was considered that coal and coke would have to be carried to Broken Hill for the treatment of ores.
864. *Chairman.*] Mr. McKinney says in a report on the utilisation of the River Darling, that no record has been kept with reference to the traffic on the Darling. Then he goes on to say:
- What we do know is that able railway management is steadily lessening the percentage of New South Wales wool shipped from ports in other colonies. In the year 1878 only 48·7 per cent. of the wool grown in this Colony was shipped from our own ports, leaving 51·3 to the ports of other colonies. In 1891 the percentages were respectively 71·5, and 23·5. The returns of the Bourke railway show that Darling wool has been considerably affected by this change. In the season of 1885-86, the number of bales of wool carried on the Bourke line totalled 28,717. In the season of 1891-92, the figures totalled 87,000.
- What do you say to that? In 1878 our railway was opened as far as Blayney. There is no doubt that the extension of the lines has brought in a certain amount of traffic from the rivers; but it has not brought it all, and it is not likely to bring it all. Then Mr. McKinney says:
- So effectively has this line been administered that hardly any of the produce of the Upper Darling country gets past Bourke.
- ? The effective administration he speaks of means the cutting rate.
865. Then a large proportion of the produce of the Bourke-Wilcannia country has been secured? That is as far south as Dunlop.
866. You cannot get it from any farther south? No: as a matter of fact we can only get that far as a hard bargain.
867. What then do you reckon to be the limit at which you could carry wheat and other agricultural produce to Sydney? Our rates do not vary much between 600 and 800 miles. It would pay to carry it from any point in New South Wales where it can be grown.
868. You think that at any rate within 3 miles of the banks of the Darling, the land is generally fit for cultivation, and if there were some system of irrigation, you could irrigate hundreds of acres within a few miles of the frontage? It would not be railway freight that would prevent us from succeeding; it is more likely to be the cost of irrigation.
869. Suppose that were overcome, as it has been in other countries; do you think it would pay the farmers to settle there? Will you pardon me for asking where it has been overcome.
870. They carry wheat immense distances in America, do they not? Yes; but 75 per cent. of their railways are in the hands of receivers. We are not in the hands of a receiver yet.
871. If it had been a private company, would you not have been by now? We have never paid less than 2½ per cent. Some of those companies in America lose their capital, as well as failing to pay their interest. You cannot compare American rates with the rates here.
872. The American system is to push the railways to develop the country? Yes.
873. They do not stop to consider whether it will pay immediately? As long as they can get people to subscribe the capital, the promoters do not care about anything else.
874. If we can borrow the money, does your knowledge of the country enable you to say that the country could be developed sufficient to pay the cost of the railway? I certainly do not think so, from my experience.
875. *Mr. Dick.*] You do not place any reliance on the estimates of gentlemen outside the Department, as to the trade to Wilcannia? No.
876. I suppose you have more reliable sources of information than they have? Yes.
877. Is there any great difficulty in arriving at an estimate? It means a lot of work. It means getting the details of every load of goods that is delivered.
878. It is not likely that private individuals would have that information? Probably firms would not be willing to give every one the information. My experience is that, in country towns, whilst they would give the information to any one representing the Railway Commissioners, or such a body as the Works Committee, there would be a jealousy in regard to furnishing such information to a local man.
879. The map shows that there are over 4,000,000 acres of Crown lands within 20 miles of the proposed railway? Yes.
880. Twenty miles is a somewhat narrow limit, is it not, within which to obtain pastoral products for the railway? Twenty miles in that case fairly represents the area from which the traffic would be obtained, because the frontage stations have their sheds on the river, and would use it.
881. You say that 20 miles would bring you to the frontage stations? Yes; approximately. There are only about four or five runs there, and these frontages run back a long way from the river.
882. In any case, that would not affect the general question that 20 miles is a very narrow limit to put down as the area from which the railway would draw agricultural products? It all depends upon what its boundaries are. If its boundary is the river, it is quite far enough; if it is a railway, it is quite enough.
883. In this case, neither of those conditions exist? I think it would, as far as the river is concerned. I do not think that outside the 20 miles, any traffic would go back in that direction. It would be more likely to come down and join the other line at Condobolin, or go down to Hay. There is no disposition
- on

on the part of anyone to go back to a railway to incur greater mileage. The disposition is to get the shortest route. J. Harper.

884. Even with the 20-mile limit, there is a very large area of Crown lands there;—that does not affect the consideration of the question of setting aside certain areas of Crown land, the revenue of which should be devoted to making up the deficiency in the earnings of a non-paying railway? I have often regretted that it was not done thirty years ago. 7 April, 1899.

885. Do you think that if you found that there was a great disparity between the earnings and expenses of the railway, it would be a good case in which to apply such a principle? I do not know whether the whole of that country would represent the loss. I do not know what the rent is at present, but I should imagine that it is exceedingly low.

886. I think you said in answer to Mr. Trickett that you preferred to see a line to open up that country from Condobolin to Menindie? If it is decided that a national line is to be made to connect with Broken Hill, I say that that is the better one. I do not say that it would be a paying line.

887. I think you also said that the river is open longer at Wilcannia than at Bourke? Yes.

888. And that it is more than likely that a larger percentage of traffic would go past Wilcannia? Yes.

889. Would not that apply with still greater force to Menindie? Yes; I am not an advocate of the Menindie line any more than of the other one.

890. At 1d. an acre even the area within the 20-mile limit would give a large sum? I do not think anyone is paying 1d. an acre for that country. They are more likely paying a 120th part of a penny.

891. *Mr. Watson.*] You are mistaken; the rental is not quite 1d.; it averages about 80-100ths? Well they are paying a good price.

892. *Mr. Dick.*] In any case a railway going through that country would lead to the reappraisal of the rents? I think it has generally been done in such cases.

893. You think it would be a desirable thing to have something like railway land endowment? Yes; I think it is a great pity that it was not done years ago.

894. In any case, when these leases fall in, do you not think that if there is some sort of railway land endowment policy, the Railway Commissioners can get more out of it without harassing the users of the line? I do not think so. I cannot conceive any conditions that would improve that country very much; it is not fit for agriculture.

895. Still it would be a great advantage to them to have a railway? No doubt it would; but it is not a great advantage to the people who have no other transit than by railway, and who, in consequence of these non-paying lines, have to pay greatly increased rates.

896. I was asking whether you were in favour of a land endowment? Decidedly; it ought to have been adopted years ago, because as long as we follow our present method, the users of the railways will be burdened with the interest on the capital cost of railways of this character, and it will prevent the reduction of the rates.

897. I find that Mr. McLachlan, in reference to the Cobar to Cockburn railway, said:—

As the Commissioners pointed out in their report, the traffic is very difficult to arrive at.

Is that the case now? I do not think the Commissioners at that time went into the details of the traffic, but they have been gone into since.

898. Mr. McLachlan says further on they could not form any definite estimate as to what it would be? At that time the Commissioners did not obtain details of the traffic.

899. At present you have better information? Yes.

900. Do you know how many steamers are trading up and down the river? It is a variable quantity. Sometimes Murrumbidgee steamers go up and down there and *vice versa*; it all depends upon the freight and other circumstances.

901. There must be a considerable amount of trade up and down the river to employ such a number of vessels? Yes; there is a good deal of trading done by the steamers, as well as carrying. A great deal of hawking is done by the river boats.

902. *Mr. Watson.*] Did you include in your estimate of 9,100 tons what the steamers carried? My estimate would not include the whole of the Darling trade by any means.

903. *Mr. Dick.*] Mr. McLachlan was asked:

In view of your experience of Bourke over two or three seasons, do you think you will be able to compete for the Wilcannia traffic as against the tendency to send it down to Port Pirie and Adelaide?

His answer is very explicit. He says:

Yes; we think we shall get a large portion of that trade by this railway.

? What did he say when before the Committee the other day. He told you that he had altered his opinion. When Mr. McLachlan made that statement, we did not know as much about the river as we know now. We have been in constant negotiation with the other colonies, and every year has given us special information with regard to the traffic on the river.

904. Are we justified in presuming that there is not likely to be another change of opinion in two or three years? If you examine me on the evidence which I gave in that report, you will see that I have not changed my opinion.

905. Mr. McLachlan had the benefit of your experience before he gave that reply? I do not think he had.

906. What is the recent experience with reference to the rivalry between the railway and river trade? We have had to reduce our rates on the heavy traffic. So much so, that a month ago we carried certain lines, such as galvanised iron, sugar, and woolpacks, in large quantities, at £2 a ton on condition of our using stock waggons, which would otherwise run empty. I was approached by a firm which was getting 300 tons of mixed goods consigned to Bourke, but we were not sending to that district, because there was no fat stock coming down. I told them that they would have to wait three weeks or a month, so that the conditions would apply. Their reply was, "We shall have no alternative but to get the goods up from Adelaide." As a matter of fact, we had to carry the goods in ordinary trucks.

907. What part of the trade of that district north and west of the Darling would be catered for by the Tarrawingie tramway; would there be much of it? No; they would join the tramway, probably, instead of joining the line at Broken Hill. I think there is a certain portion of wool carried over it already.

908. Do you think anything east of Mount Browne would go there? It would depend on the seasons.

- J. Harper. 909. Do you think the Mount Browne traffic would go by Tarrawingie? I think it would if there was no river.  
 7 April, 1899. 910. Have you anything to justify your opinion? No; it is simply a conjecture as to the possible direction of the traffic.  
 911. Have you any idea of the number of sheep in the district round Wilcannia? No; I do not think anyone knows that.  
 912. Do you know that during one drought nearly a million sheep perished in that district? Yes; but the Wilcannia district is a very big one. It includes Dunlop and Toorale, and it extends nearly as far as Bourke. Those sheep would not all be within the trafficable area of that railway.  
 913. Mr. Kirkcaldie was asked this question in a previous inquiry:  
 On the basis of that amount of wool leaving the place, do you think £90,000 a year an over-estimate of the traffic inwards and outwards? I do.  
 You think it is very largely over-estimated? I should not say very largely, but, in my opinion, it is over-estimated.  
 Do you think, in the light of fresh facts, it is so? Mr. Kirkcaldie did not know anything at all about it at that time. But you will see how singularly my estimate is corroborated. There is another question:  
 Do you think that it is the fact that in 1889, 27,000 bales of wool left Wilcannia.  
 My details make almost that total.  
 914. You do not think that this line would get the whole of that 27,000 bales? No.  
 915. Not more than half? It is extremely doubtful whether we should get any.  
 916. Are you aware that the country from Cobar to Wilcannia has been described by the Government Geologist as a highly-mineralised district? It may be so.  
 917. Do you think that the construction of the line is likely to lead to the discovery of new mines? I should not think so. If we had waited till the railways were built we should have been in a very queer way in regard to the discovery of mines. When the Cobar mine was discovered there was no railway within 300 miles.

Richard Sleath, Esq., M.P., sworn, and examined:—

- R. Sleath, Esq., M.P.  
 7 April, 1899. 918. *Chairman.*] You are Member for Wilcannia? Yes.  
 919. Have you any evidence to give to this Committee in reference to this proposal? I have a very fair knowledge of that country.  
 920. Are you aware that there is another proposal before the Committee to give those people a better means of communication by means of locks and weirs? Yes; but I think the proposal for locking the river is only from Bourke to Menindie, and that, in itself, would not be of much benefit to the people unless they also have railway communication.  
 921. Would not the locking of the river from Menindie serve the people up there? No.  
 922. Have you been down the river from Menindie? Yes; I have been right down to the junction with the Murray River. There is a long distance from Menindie to Wentworth, so that when the river is down between those two points, the fact of the river being locked from Menindie to Bourke would be of no advantage to the people who want to get down below. It would be of very little advantage in the way of getting supplies. If the supplies came by rail, then the boats on the river would charge much the same price per ton from Bourke down as they would from Morgan. The people would be paying two freights—the river freight and the railway freight.  
 923. In order to make the Darling navigable, it would be necessary to lock it below Menindie? Yes; at least to Wentworth.  
 924. Unless it is locked to Wentworth, in your opinion, the river traffic would not take anything away from the railway? No; not in the least. As a matter of fact there is a good deal of misunderstanding as to when and where the river is navigable. It is navigable at Bourke just as long as it is, say, at Menindie, not quite at the same time, because when a fresh comes down it will take about seven days to travel. It depends on the volume of water that is coming. The river has very little fall, and it takes a fresh a long time to travel, so that the river may be navigable at Bourke for a week when it is not at Wilcannia, and it may be navigable for a week at Wilcannia when it is not at Bourke.  
 925. In reference to the anticipated traffic on the railway, what would it consist of from there? It would consist of wool and minerals.  
 926. What minerals? Gold, gold-bearing stone in small quantities, and concentrated copper. The whole country between Cobar and Wilcannia and to the east of Wilcannia is a rich mineral country.  
 927. Is there much gold-mining in that direction? Yes; there is a good deal of gold-mining. The whole of the supplies for the gold-mining district lying to the north come through Wilcannia. Wilcannia has always been the main distributing centre of that western country.  
 928. Supposing this line is constructed, would there be other traffic created? The chances are that the large holdings would be taken up in small areas. It would settle a great many more people; there would be more homestead leases taken up.  
 929. You think that if the railway were constructed, instead of there being three or four holdings between Cobar and Wilcannia, there would be a great many more? Yes; a great many small ones.  
 930. And that would conduce to the land carrying more stock? Certainly, because the better improved the land is, the more stock it will carry. If you fence in small paddocks well supplied with water, you can carry more stock than you can carry on a large run not fenced, and not properly supplied with water.  
 931. Where do they send their stock to from that district? It is a first-class fattening district; of course, not in a time of drought, but in ordinary seasons. The difficulty they have to contend with now is, that they have to travel the sheep such a long way through to Bourke or Hay, or in some cases to South Australia. A great quantity of stock travels from the north of Wilcannia through to Hay, or they go to Wilcannia and up the river to Bourke. Of course, you can understand that having to travel such long distances prevents the stock from arriving at the market in the condition in which they would arrive if they had railway carriage.  
 932. Their market for stock and wool is to the east? Yes.  
 933. Which way do they get their supplies? They get them by river. But during the last four years the river has been down most of the time, and they have had to get them from Broken Hill. That was the nearest road for teams. But then the cost of carriage from there is excessive—the freights amounting to £10, £12, and £15 per ton.  
 934.

934. Suppose this railway were constructed, do you think the carriers would reduce their charges, and the people would get their supplies from Adelaide? No; very few supplies come from Adelaide. They generally come from Morgan. The carriers would not be able to reduce the freight, because, in a great many instances their teams have perished within even 10 or 20 miles of Wilcannia. They have not been able to get through. One shilling per ton per mile is the regular charge in a fair season; in a bad season, when there is neither feed nor water, they double the charge on account of the risk they have to run with their teams.

R. Sleath,  
Esq., M.P.  
7 April, 1899.

935. You mentioned that the stock and wool come in from some distance north of Wilcannia—how far north? Right across from some distance into Queensland. The traffic from Berawinnia comes into Wilcannia, also from Tickalara and all those stations in that direction.

936. Bourke is nearer? Yes; but you cannot get a direct road across, in consequence of flood-water.

937. It has not troubled them much lately? No, but you cannot travel a team without a properly-watered road; there is no track to get across that way, and when the flood-waters come down from Queensland, it is impossible to cross at all.

938. They travel down from the Paroo? To the west of the Paroo.

939. The traffic from all that country to the north-west would come into Wilcannia? Yes.

940. Wilcannia is the depôt for that country? Yes.

941. You were examined before a Committee on a proposal to construct a railway from Condobolin to Broken Hill? Yes.

942. You were asked this question:

You recognise the fact that the pastoralists would still use the river for wool carriage?

You answered:

Undoubtedly. I feel confident that no matter which way the line may go, the only freight which would really come from the river would be the ordinary produce. The necessary goods for consumption would undoubtedly come by rail from Sydney if it was constructed, whether the river was up or down.

Are you still of that opinion? Yes; I am still of that opinion. During a good river the wool would go by the river, and all the heavy cargo. Of course, that is only my opinion. Some of the pastoralists say that they would prefer to send their wool by rail. They say that in sending it by river they have not only to pay the freight, but they have also to pay a very heavy insurance. I think about two years ago the river was up for only some six weeks, and there were twelve barges of wool sunk between Wilcannia and Wentworth. That means great depreciation in the values. The wool gets wet, and they refuse to ship it, because it is liable to become heated.

943. Is there not a general rate of insurance from the sheep's back to the market in London? No; they pay special insurance for river cargo.

944. A special rate for railway and for river carriage? Yes. I forget what the rate is, but I know it is very high, and they contend that it would be as cheap for them to send their wool by rail, that it would arrive at the port of shipment much quicker, and that the additional freight by rail would not be much more than they have to pay by boat and for insurance.

945. You think that the wool will come to Sydney if the line is constructed? For the last four years, and even now, it has been impossible to get the wool away. There are great quantities of wool—last year's wool and some of the previous year's wool—lying at Wilcannia now, because they have not been able to get it despatched.

946. Do you think that the last three years has been a fair test? No; the last four years has not been a fair test.

947. It may occur again? It did occur before. Previous to the 1890 floods it was the same for about three years, I think.

948. You said that that district is good fattening country? Yes.

949. Do you know the country between Cobar and Wilcannia pretty well? Yes; I have been over it many times.

950. About Paddington Station? Yes; that is really good country. It is a good wheat-growing country. Sometimes they miss a season. If they do not get rain at the proper time the crop is a failure. If they do get rain it is an excellent crop.

951. Have they experimented in reference to wheat there? Yes. Within 2 or 3 miles of Wilcannia a homestead lessee has been growing wheat for chaff purposes. He has not attempted to grow it for anything else.

952. Do you think that if this railway were constructed there would be any settlement in that part which would raise produce to come east, or would the production be simply for local requirements? It would probably be a different class of produce from that which is grown in the eastern portion of the Colony. I think that for a considerable time anyhow all that would be attempted to be grown there would be only for local requirements. As regards fruit, and that sort of thing, no doubt if they had railway communication an attempt would be made—and I believe a successful one—to go in largely for fruit production on the principle adopted at Mildura and Renmark.

953. Anywhere they have attempted to irrigate, or conserve water in that district, has agriculture been a success? They have not attempted to do very much.

954. In any other similar district that you are aware of has irrigation been a success? The land down at Mildura and Renmark is not equal to the land there. It is very rich red loam, and there is a great depth of soil. It is land which all experts admit is very suitable for irrigation. At Renmark they have not the same depth of soil, and it is said that in some cases it is proving a failure, the subsoil being too near the surface and causing disease to affect the trees.

955. *Mr. Trickett.*] Wherever they have tried it on a small scale it has been successful? Most successful. There are in Wilcannia a number of gardens. They have tried it in small patches of 2 or 3 acres. On some of the stations they produce chaff, wheat, and lucerne.

956. *Chairman.*] So that if irrigation can be carried out, there would be a traffic produced for the railway? Yes; I believe it would mean the settlement, within a very few years, of many thousands of people out there, in a comfortable way on Crown lands. Practically it is all Crown land there.

957. *Mr. Harper,* in his statement, summarises the traffic as follows:—Goods, 1,390 tons; wool, 1,756 tons; stock, 800 trucks; passengers, 2,000;—do you think that is a fair estimate? I think it is a most ridiculous estimate. As a matter of fact, some three years ago, we arranged with some of the people at Milparinka,

- R. Sleath, Esq., M.P.  
7 April, 1899.
- Milparinka, 200 miles further north than Wilcannia, to keep a record of all the trade from Mount Browne, Tibooburra, and all those little townships right out to Queensland. They were to keep a record of the number of teams, and the tonnage they carried. It was found that there were between 8,000 and 10,000 tons going through Milparinka. Since evidence was taken on the subject before, a great many more people have settled in the district. At White Cliffs there are something like 3,500 settled. In 1890 that place was entirely unthought of.
- 957½. What are the principal products there? It is an opal-mining district. The goods for consumption required by those people would undoubtedly come by rail. Round about Wilcannia there is copper, and west of Wilcannia, about 20 miles, there is a very large copper lode; but they have not been able to open it up properly on account of the drought, and the difficulty of transit.
958. *Mr. Watson.*] There is no fuel there? They have neither water nor fuel, and the river being down, they have not been able to send shipments away, except at a great cost.
959. You gave an estimate of the population at White Cliffs? Yes.
960. What do you reckon the population of Wilcannia to be? There is a good deal of settlement around Wilcannia.
961. What is the population of the district? Less than that at White Cliffs; I think, probably, about 3,000 all told.
962. What would be the population of Tibooburra, Mount Browne, and Paroo? There are a great many people out there; but it would be difficult to estimate the scattered population of that district.
963. *Mr. Harper* told us that the total population of the district within the influence of Wilcannia was about 3,000? I should say that it will be about three times that, about 10,000.

THURSDAY, 13 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LUNDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Edmund Resch, sworn, and examined:—

- E. Resch.  
13 April, 1899.
964. *Chairman.*] What are you? A brewer at Wilcannia and Sydney.
965. Have you an intimate knowledge of the trade of Wilcannia or a general knowledge of it? I have never gone into anything as regards what the storekeepers import, and so on, and I cannot say anything about that—I can only speak for myself.
966. How long were you in Wilcannia? Nineteen or twenty years.
967. You were doubtless able to form an opinion as to whether there was much business doing there—as to whether it was a good depôt? Oh, yes.
968. And whether there was much traffic passing through it? Yes; and a good deal of it would be diverted to the proposed railway, if it were made; at least, that is my impression. In my own little way I would do more. I think, for instance, it is about two years since I imported any malt there. I have to buy it from Adelaide merchants, or send it round from Sydney *via* Adelaide, and living here now, I should send pretty well all of it that way, except when a big flood was on.
969. At the present time you get it from Adelaide, do you? Most of it. I have sent some from here—round by Adelaide, too.
970. At the present time you mainly draw your supplies from Adelaide for your own business at Wilcannia? I have done. I have not imported any there for a good while. I used always to take advantage of the river when it was high. Owing to the uncertainty of the river I have had to keep a big stock always on hand at Wilcannia. It would be disastrous to import malt to Wilcannia in a dry season, such as the present—we should have to carry it by teams such long distances.
971. You are compelled to lay in a big stock simply because the river is not always navigable? Owing to the uncertainty of the river.
972. But supposing the river is made navigable by means of locks from Menindie up, how should you get your supplies? I should get my supplies still from Sydney, because I import such a lot of malt here—myself that it would pay me to send it on by Cobar, rather than to buy from merchants in Adelaide. I import a lot of malt direct from England.
973. If the proposed railway is constructed and Wilcannia is its terminus, you are quite sure that the whole of your supplies for Wilcannia will go from Sydney? The greater portion of them I should send from Sydney.
974. Now supposing that Wilcannia is not the terminus, and the line is constructed on to Broken Hill from Wilcannia, how would your supplies go then? I would still get my supplies from here.
975. Notwithstanding that at Wilcannia you would be nearer to Adelaide? Yes. I would still get the greater portion of my supplies from here.
976. Malt, sugar, and other things, I suppose? Yes. Of course, malt is an awkward thing to carry in dry seasons, and if there is no railway we have to take advantage of the river when it is navigable.
977. *Mr. Levien*] How do you carry the malt? In 400-gallon tanks.
978. *Chairman.*] You consume only English malt, I presume? All English malt.
979. Then, if English malt is landed at Adelaide at the same price as it can be landed at Sydney, you still think you would draw your supplies from Sydney? Yes; I get all my supplies from England here. I get my malt out by means of sailing boats, and they would not call at Adelaide.
980. You having a business established here? Yes; I would get most of my requirements for Wilcannia and district here. It would not necessitate my keeping up any big stock, as I could get it as I required it from here.
981. Have you any knowledge of the country surrounding Wilcannia? A fair one. I have been up as far as Tibooburra and Milparinka.

982. What sort of a place is Tibooburra? It is a pastoral township, kept going by the stations round about it. E. Resch.
983. Do you know much about the population of that country, for which Wilcannia may be said to be the depôt? I cannot say anything about the population, but the district itself is a large one. 13 April, 1899.
984. Would the population be much more than 3,000? Yes, I should think so. I suppose that White Cliffs must have a population of 1,000 at least, and Wilcannia fully 1,000. We used to boast at one time of having 2,500 or 3,000 at Wilcannia.
985. Then, if evidence has been adduced here that the number of people to be served by this railway will be about 3,000, that is an under-estimate? Yes; I think it would be more.
986. Do you think if wool reaches Wilcannia that wool will be carried by the railway in preference to going by the river? I think so, in many instances. I have heard people grumble about the high rate of insurance they have to pay on the river-borne wool, and I have often had a chat with the storekeepers there, and I have often heard them say that they would prefer in many instances to use the railway, on account of the heavy insurances they have to pay on several things river-borne. I think that Rich & Co., and Stone and Corney, would be able to give explicit answers to the question.
987. *Mr. Shepherd.*] What is the nature of the country about Wilcannia? A good deal of it is salt-bush country.
988. Is it fit for agriculture, or merely for pastoral purposes? I have seen some splendid crops there. I am interested in one selection; at least, I have advanced a lot of money on it, which I am not sure I shall ever get back. They could not get seed wheat last year, and I do not think it would have been any good, as there was a great drought this year.
989. You have experienced a great drought there, I suppose, during the last three or four years? Yes. I have had goods stuck in the river, I suppose, for fully twelve months.
990. Is there any good timber in the neighbourhood? I do not think so.
991. It is chiefly plain country? Yes.
992. As salt-bush country generally is? Yes.
993. Of course, you always have an ample supply of water in the river for domestic purposes? Yes.
994. And for watering stock? The Council have had to bank the river up now and again in order to force the water back for water supply purposes.
995. What kind of traffic have you there generally—all kinds of stores, I suppose? All kinds of stores necessary to carry on the stations, and for the inhabitants of the district.
996. I suppose it is chiefly wool which is grown there? Yes.
997. There are very few cattle? Yes; very few cattle—mostly wool.
998. So a steamer takes up supplies and returns mostly with wool? Yes.
999. Do you mean to say that you would prefer getting goods from Sydney by rail if there were a railway open to Wilcannia? Yes; so far as I am concerned the greater portion would go from here.
1000. Do you think you could land it there at anything like the same price? I think so. For instance, in regard to the carriage of malt, I send it round from here to Adelaide by steamer, and then it goes by rail to Murray Bridge, where it is handled into a steamer again, and I can do that cheaper than buying from the Adelaide merchants, because I import it here myself. Instead of laying in fifty, sixty, or seventy tanks of malt at Wilcannia at a time, I should prefer to send 8 or 10 tons from here at a time.
1001. But there are steamers running right to Adelaide, are there not? No.
1002. They always stop at Murray Bridge? Yes; Murray Bridge or Morgan. Morgan is the nearest to Wilcannia, and the rail is cheaper to Murray Bridge, which makes a little difference. Sometimes the Murray River is not navigable much past Murray Bridge, and when goods are sent to Murray Bridge, the people are, perhaps, short of time, owing to the river falling fast; and they, therefore, want to save the time it takes from Murray Bridge to Morgan.
1003. On an average, how many months in the year is the Darling navigable? You cannot say anything. I have seen it not navigable for fifteen months. As I have said, I have had goods stuck twelve months in the river without reaching their destination.
1004. Do you know anything about the country between Wilcannia and Cobar? Yes; I have travelled over that country, and have often thought that there ought to be more mines discovered there. It looks like a mining country.
1005. The mining there now is chiefly near Cobar—none about Wilcannia? Yes.
1006. Is the country of the same character all the way to Cobar? Pretty well.
1007. Salt-bush country? Yes.
1008. Have you been as far as Condobolin? Yes.
1009. Is there any material difference between the nature of the country between Wilcannia and Condobolin and that between Cobar and Wilcannia? I think it is about the same kind of country—most of it.
1010. It is badly watered, I suppose? Yes; very badly watered. There are some mines, I believe, about 30 miles from Wilcannia towards Broken Hill, but they are not working now for want of water. They have been working a good while trying to do something, but on account of want of water the men cannot go on with it.
1011. In the event of a railway being taken to Wilcannia, do you think it would be largely used for the carriage of wool and supplies, or would the wool and supplies continue to be taken by the river? I have explained to you that in my conversation with storekeepers they have often told me that if they had a railway they would prefer it on account of the heavy insurance they have to pay on the steamer-borne goods, but I cannot enlighten you on that subject very much, because it never came in my line. However, as I have said, Rich & Co. and Stone and Corney, the principal storekeepers there, would be able to throw more light on the matter than I can.
1012. Of course, if it would be an advantage to you it would be an advantage to them;—what would be good in one case would be good in another? Yes.
1013. Supposing that a line via Condobolin to Wilcannia would be 23 miles shorter than a line via Cobar, which do you think would be the better line to adopt? I think the Cobar line, by far.
1014. From Wilcannia to Sydney via Condobolin is about 23 miles shorter than from Wilcannia to Sydney via Cobar? But I suppose that that would not make much difference in such a long distance.
1015. Of course, if the country is all the same, it does not matter very much, but it is the opinion of some people that the country on the Condobolin line is far superior;—you have been all over there? Yes; I have several times. I often gone from Cobar to Forbes.
- 1016.

- E. Resch.  
13 April, 1899.
1016. Do you think the nature of the country would permit of the line being carried through straight, or would there be any great obstacles? There are some rises, but I do not think that it would be very difficult to get over them. They are not big mountains—only little rises.
1017. You think they could be overcome without much difficulty—without having a difficult grade? Yes, there would be no difficulty about that.
1018. Are there any obstacles on the line from Condobolin to Wilcannia? No; I do not think any more than there would be from Cobar to Wilcannia.
1019. *Mr. Trickett.*] How long altogether were you a resident of the Wilcannia district before you started business in Sydney? About seventeen or eighteen years.
1020. So you have started in Sydney only within a short period? I have been in Sydney only about three and a half years now.
1021. Was that change by reason of a falling off of business in Wilcannia? No. I left Wilcannia some seven years ago. I retired. I thought I had enough to live on, and I went to Melbourne, and lived there; but something happened. The bank which had been assisting me very much in my earlier career wanted me for something, and I complied with their request, and came to Sydney, and took charge of the business of Allt & Co., which later on I purchased myself.
1022. But you still carry on business in Wilcannia? Yes.
1023. What has been your experience of the place of late years;—has it increased in population? No; not the town itself. I suppose the district you may say has increased, through the opal fields mostly. The population of the district has not decreased much, at any rate, if it has decreased at all. The first blow to Wilcannia was, I think, the discovery of the silver-field at Broken Hill.
1024. It unsettled the people? Yes.
1025. How is the town in regard to prosperity now as compared with what it was formerly? It is nothing at all compared with its prosperity in former years. The town itself has gone down very much. But look at the three or four years' drought they have had—it could not be otherwise.
1026. Are there many empty houses? There are a few empty houses.
1027. What do you pay for freight on your goods from Sydney to Wilcannia;—what do you pay for malt, for instance? That all depends on the river freight. I have had it as low as £4 10s. a ton.
1028. Give it us with a good river? With a fair river, I suppose it would be about £2 a ton from Murray Bridge.
1029. And what does it cost you before it gets to Murray Bridge? I suppose it costs fully £2 or £2 10s before it gets to Murray Bridge—£2 anyhow.
1030. In addition to that you would pay insurance? Yes.
1031. What rate per cent. do you pay for insurance? That I cannot exactly tell you.
1032. It is pretty high, is it not? I cannot say from memory exactly what it is.
1033. Is it not between 1 and 2 per cent.? I cannot remember; but I think it is over 1 per cent. However, I would not be quite sure on that point.
1034. Well, putting it at  $1\frac{1}{2}$  per cent., that is £1 10s., which with £2 10s. and 30s., make £5 10s., which it costs you to get your malt from Sydney to Wilcannia by river when the river is good? I think you can average it at £5 a ton with a fair river. It may be when there is a little competition going on a little less, but not much, I think.
1035. Now will you tell us what would be the highest that you have paid for getting malt to Wilcannia? I cannot remember that. I suppose I have paid £15 a ton. I have paid as much as £6 a ton from Morgan to Wilcannia.
1036. That is with a bad river? Yes.
1037. Would that come by river or by team? That would come by river all the way—at least it is supposed to do so? I remember at one time that I had a lot of goods which did not get any further than Wentworth, and I had to send teams to Wentworth; and I think I paid £25 a ton from Wentworth to Wilcannia, if I remember rightly—some enormous sum, £20 or £25 a ton.
1038. Seeing that your malt freight ranges from about £5 a ton, with a good river, up to as high as £20 or £25 under very adverse circumstances, can you tell us the charges under the same circumstances with regard to store goods? The same rate applies. I remember at one time I had to get malt by mail coach from Hay. You labour under many great difficulties in that district.
1039. *Mr. Harper*, in a statement which he laid before us the other day, said that the rate of tonnage for sugar would be £7 8s. per ton, and the rate for general goods would be £10 13s. 6d. per ton, and that those would be the very lowest rates from Sydney to Wilcannia by rail; and he went on to say: "It is evident that under the circumstances we could not hope to compete with the river in the carriage of general goods";—will you give us your views on that statement? Would that be taking a truck load at a time.
1040. I suppose so; *Mr. Harper* quotes those as the lowest rates—sugar £7 8s. a ton, and general goods £10 13s. 6d. a ton;—as a man of the world and as a trader in Wilcannia, do you think that for the benefit of constant and ready communication, the people would pay those high rates when they could get the goods carried more cheaply by river; that is rather an important feature of the question before us? If the river were a favourable one for a long time, and there were competition between the boats, of course the people would get the things carried a great deal more cheaply than that.
1041. Supposing I were to put that question directly to yourself—supposing that you could get your goods up there for £5 or £6 a ton, would you care to pay up to £10 13s. 6d. a ton? Of course, none of us like to pay more than we can help. I suppose we are all alike in that respect.
1042. You naturally would take the cheapest? Yes; that is, under more favourable circumstances as regards the river.
1043. Seeing that there would be these two means of communication with Wilcannia, and that, at the start at any rate, apparently the railway rates would be heavier than the river rates under favourable circumstances, is there anything in this district itself that you think is a prominent feature towards connecting it with Sydney by railway? I think so. In the first place, I think the population out there deserves a little consideration from the Sydney people. It is very hard to be out there with no means of communication, and sometimes on the verge of starvation for the want of food, and having to depend on camel teams and such things. I think they have not been fairly dealt with by the Government. I think there would be more mining carried on there if easier means of communication were provided.

E. Resch.  
13 April, 1899.

1044. At the present time the district is sparsely populated; is the country of such a character that you think that, with better means of communication, it would be likely to attract a larger population for sheep-breeding or for agricultural purposes? If there is a drought the stock simply have to perish; they cannot get away from there. There are no means of communication to take them away. If stock-owners had an easy way of getting them away from there in time of drought, I daresay they would stock more than they do at present. At the present time it is terrible to be there. I was there six or eight weeks ago, and really there was not a blade of grass to be seen.

1045. And the sheep had died in great numbers? Yes; there were the bodies of sheep lying about everywhere.

1046. Then you apply to that district the reason we have heard given in favour of the construction of many such railways, namely, that with an impending drought, such as the one we have just realised, the stock-breeders would have been able to get their stock away either to another district or to a ready market if they had had railway communication? Yes; but under present circumstances they cannot get them away, and they simply have to perish. The present state of affairs is simply disastrous.

1047. Do you regard this as a breeding district, or chiefly as a wool-growing district? Both.

1048. But would it be a meat-supplying district if it had railway communication? I should think so.

1049. Does the town of Wilcannia extend right up to the river banks? Yes.

1050. Is there any portion of the town on the Cobar side? No.

1051. The town starts immediately you get on the other side? Yes.

1052. I suppose you have some little knowledge of the public travelling to and from Wilcannia;—you must have noticed whether a good many people come to and fro? The coaches are sometimes pretty well loaded.

1053. Mr. Harper, in his estimate of the probable revenue from this line of railway, puts down the probable travelling people at 2,000 a year to and fro; that would be about six travelling both ways each day all the year round;—do you think that is a fair estimate of the traffic? There are a good many people who do not go to Wilcannia because of the coach travelling. I myself would go to Wilcannia four or five times a year if there were no coaching to do.

1054. It seems to me a low estimate? I think it is a very low estimate.

1055. What does it cost you to get by coach from Cobar to Wilcannia? £7 7s. return, I think, and £4 4s. single fare. Then there is the inconvenience of being two nights and one day in the coach. Now I do not go oftener than I require.

1056. And when there has been a slight fall of rain the road is almost impassable, is it not? Yes; I very seldom go that way. I generally go via Adelaide and Broken Hill. Going that way there is only twenty-four hours in the coach, and there is a better track than going the other way, where you have two nights and a day in the coach.

1057. If you want to go from Wilcannia to Sydney and back, what does it cost you for fares by the most convenient route? I think that the charge for a return ticket to Broken Hill from Sydney is £13 odd, and then the charge is £5 return from Broken Hill to Wilcannia.

1058. In round figures the fares come to £20? Between £18 and £19.

1059. And what the other way—from Wilcannia via Cobar to Sydney? In round figures, between £13 and £14.

1060. So that you are carried from Sydney to Cobar, a distance of 459 miles, and back for £6 8s., and from Cobar to Wilcannia and back to Cobar, a distance of only 156 miles, you have to pay £7 7s.? Yes. Although it would be cheaper that way, I still prefer to go the other way. The mail coaches are so fully loaded that you run a great risk in going inside a coach at all, when you go from here via Cobar.

1061. Do you ever suffer any inconvenience at Wilcannia by reason of delay in the mail deliveries? Yes. very often the Cobar mail is very late.

1062. Has this last drought during the last two or three years been a very severe one? Yes; very severe.

1063. Would any estimate of the traffic, the freight, or the general prosperity of the country, based on the last three or four years, be a fair average? Not at all. Everybody cuts down everything during a time of drought. It is a wonderful country in that district. It soon picks up. I have seen it in a time of drought when there was not a blade of grass anywhere to be seen, and yet with a couple of inches of rain it would, in a fortnight or three weeks, be like a meadow all over the place. You would not think it was the same country.

1064. That has not been the case for two or three years? No; unfortunately.

1065. Do you find it is to your interests to remain in Wilcannia still as a business man? It is all right yet. The district is a splendid one.

1066. Have you noticed very much, or any, diminution in the trade of Wilcannia since the Bourke railway was opened? Yes; it has taken away a good bit, because we used at one time to send goods from Wilcannia to Wanaaring and Thargomindah, and places in that direction, and all that trade now goes from Bourke.

1067. But a large quantity of wool still comes into Wilcannia from country lying towards the Queensland border? Yes.

1068. And for the country in the north-west, I suppose the requirements of a railway are just as great now as before the railway to Bourke was constructed? Yes. It is wonderful how the people keep alive there when no goods can sometimes be got up to them.

1069. One prominent view you take of the question is that, as a matter of fact, that north-west corner of the Colony is one in the direction of which railway communication is absolutely necessary for present requirements, and also with the view of further development? That is my opinion.

1070. *Mr. Watson.*] You said you thought the people of Wilcannia deserved some consideration at the hands of the Government, or of the people of the Colony generally, with a view of having proper communication;—can you offer an opinion as to which the people there would prefer—a railway or the locking of the river, so as to secure permanent navigation right down to the Murray? That I could not say.

1071. Which would you prefer? The railway, by far.

1072. You think the railway would do more towards opening up the country and securing regular communication? Sometimes the Murray is not navigable, and how can you have permanent navigation if the Murray is not navigable sometimes. I have had a lot of goods stuck in the Murray. You could not ensure permanent navigation by simply locking the Darling.

- E. Resch.  
13 April, 1899.
1073. In evidence given before us the other day, the opinion was offered that the Murray was nearly always navigable? I have seen it not navigable for a long time. Besides, that would not ensure the people or stock being able to get away from the drought-stricken districts.
1074. That would provide only for goods, pure and simple—not for stock and passengers? Yes; not for passengers at all.
1075. So, from the point of view of the convenience of the people there generally, you think the railway is much preferable? By far preferable I should think.
1076. I suppose you know what the general run of traffic would be on a railway at other places; there was an estimate given here as follows of the goods which it was likely this railway would carry, namely:— Ordinary goods, 1,390 tons for the year; wool, 1,750 tons; stock, 800 trucks; do you think that that would fairly represent a year's carriage on the railway under ordinary conditions;—do you think that would be an under-estimate, an over-estimate, or a fair estimate? I think that would be an under-estimate.
1077. The total revenue which is expected to be derived from the line, including any traffic that might accrue between Wilcannia and Cobar, amounts to only £6,800? Of course, I am not able to judge, because I think that is a long way below the correct estimate. If we had permanent communication to Wilcannia we should supply the whole of that portion of the country which lies to the north-west of Wilcannia. Whatever goes there now comes from Port Pirie way. A lot of fodder would go from New South Wales, whereas now it is obtained from South Australian farmers.
1078. At present the people there draw their supplies only from South Australia? Yes.
1079. You think that with the construction of this line they would draw a much greater quantity from New South Wales? Certainly; especially if Nevertire and Dubbo and that district is a producing country.
1080. There is a great quantity of fodder produced there now? Yes; and that would go up this way instead of the people getting their supplies from South Australia.
1081. The evidence is that taking chaff and other fodder from Dubbo would only mean a freight of about 10s. 6d. a ton from Dubbo to Wilcannia, if based on the present freights for similar distance on other lines;—do you think that would compete with the river? The river could not compete with that.
1082. Even in good seasons? No, it could not.
1083. Do you think there would be a fair demand for fodder of that description? Yes. Look at the lot we now get from South Australia.
1084. There are a large number of teams, I suppose, which carry supplies to stations and other places in the Wilcannia district? Yes.
1085. And they would be customers for fodder? Yes. I have seen chaff as much as £30 and even £40 a ton in Wilcannia.
1086. I suppose that has been when there has been no river for a long time? Yes, with a drought on. The station owners had to feed their stock, and also the horses they used to work the station with.
1087. It would cost a great deal to get the fodder there, even from Cobar, at the time you speak of? You could not get it from Cobar. There was no water on the road then for teams. We had to get it all the way up from Wentworth at that time.
1088. Can you tell me whether the Tibooburra and Mount Browne trade goes through Wilcannia? A good deal of it does, but, of course, at a time like this, most of it goes *via* Broken Hill and Tarrawingie, whereas, if we had a permanent depôt in Wilcannia, we should again supply the whole of that country in the north-west. The supplies of produce would be brought to New South Wales.
1089. You say "at a time like this";—I presume there is not the convenience on the track to Wilcannia there might be, and owing to the long drought Wilcannia cannot supply goods as cheaply as it could otherwise? We can scarcely get supplies to Wilcannia at all now. There has been a little river lately.
1090. Only a slight fresh, lasting a short time? That is all.
1091. So, practically, Wilcannia, through not having communication with the coast either at Sydney or Adelaide by the river, is losing a portion of the trade that otherwise would go to it from Mount Browne and Tibooburra? Yes; and it has lost a good deal of the White Cliffs trade from the same cause. When I was in Broken Hill six or eight weeks ago, I saw lots of teams carrying South Australian goods over to White Cliffs from Broken Hill that should have gone from Wilcannia, in the natural course of things.
1092. You see Berewinga, on the Paroo, marked on that map; can you tell me how far south of Berewinga trade would begin to be drawn towards Wilcannia if the railway were constructed;—do you think half-way up, or three parts? More than half-way up. I think the railway would draw all the trade from the Wilcannia side of Wanaaring. If you had the river locked, and this railway were not constructed, no one would send goods to Bourke and then down to Wilcannia by the river. They would be sent up the Murray and the Darling. The supplies would not be drawn from New South Wales; they would all come either from Victoria or South Australia.
1093. So you much prefer the construction of a railway? Yes; for the good of New South Wales.
1094. Do you think that the locking of the river as far down as Menindie would in any way help the railway if it were constructed;—if it were locked from Bourke to Menindie, would it help to feed this railway or the Bourke line? I think it would considerably help to feed this railway at Wilcannia.
1095. So, to that extent, you think that, from a New South Wales point of view, the locking of the river would be justified? Yes; it would feed the railway.
1096. You were saying that you saw teams a little while ago loading at Broken Hill for White Cliffs? Yes.
1097. Do you think a railway from Cobar to Wilcannia, if constructed, would have anything to fear from the Broken Hill-Adelaide line in the way of competition? I do not think so.
1098. The South Australians would not compete for the trade of the district? I do not think they would.
1099. The competition with them would be only round Broken Hill? Yes.
1100. I understand that, on the whole, you think the Government would be justified in making a railway to Wilcannia? That is my opinion.
1101. You do not think a great loss would result? In my opinion there could not be much loss.
1102. And even if there were a small loss, you think the people of that district are deserving of some consideration at the hands of the Government? That is my candid opinion. They do deserve something to be done for them.

1103. *Dr. Garran.*] What is the lowest freight at which you have ever sent malt from Sydney to Port Adelaide? About 10s. or 12s. 6d. per ton, I think. E. Resch.
1104. Will the owners of the steamers on the Darling quote you a price from the ship's side at Port Adelaide to Wilcannia? Yes. 13 April, 1899.
1105. How much? I think about £3 10s. or £4 a ton.
1106. And they do all the handling? Yes.
1107. That would make £4 12s. 6d. from Sydney to Wilcannia? Yes, with a favourable river.
1108. Exclusive of insurance? Yes.
1109. Which would be how much extra? It all depends on the nature of the goods. I suppose that on malt it would be 5s. or 6s. a ton.
1110. If you were to send goods from Sydney to Wilcannia by railway, would you insure them? No; it is not necessary.
1111. From the time the Government take the goods until the time they deliver them, they are responsible? Yes.
1112. So you have no insurance to put on there? No.
1113. Then, if the Government would not charge you more than £5, it would be cheaper for you always to use the railway? If they were to charge me £6 all the year round they could have all the hauling I have to do. I would not send one ounce by river.
1114. But supposing that the river and the rail were in full competition, and had cut rates down to the lowest, and the river rate was still 5s. less than the rail, which route would you take? I should give the railway £1 a ton always the preference.
1115. For what reason? For the simple reason that I need not have any great quantities in stock at a time. The river steamers will not carry 4 or 5 tons at a time at such low rates. It is only when you make up large quantities that they will carry at those low rates; but by rail you could always send a truck-load at a time, and for that simple reason I would not require such a large amount of money sunk in stock when it was not required.
1116. How many of your malt tanks could you put in a truck? I think the other day I sent five to Bourke; that is about 6 tons.
1117. These very low rates on a railway would be for a truck load? I suppose so.
1118. If you wanted to send a single tank, you would have to pay more? Yes.
1119. For your particular trade, the railway has such advantages that you would give the railway a higher price than the river? Certainly.
1120. Up to what point—£1 higher? Yes; always.
1121. Do you think that other storekeepers would do that for general goods? I fancy they would, though, perhaps, not quite to that extent—for now, in order to get any low rate, they must get up large quantities at a time, whereas by their being able to get smaller quantities by rail at a time, they need not have as much money invested in goods.
1122. All your experience has been with the river in its natural state? Yes.
1123. That is a very uncertain means of communication? It is simply a matter of gambling; it is not business there at all.
1124. But supposing the Government, or the future Federal Government, were to lock the whole river, and make the navigation open all the year round, do you think the people then would get their goods by rail if the river were cheaper? I do not know about that.
1125. It is a state of things that has never arisen in your experience, and, therefore, you cannot tell what would happen? No.
1126. So far as passenger traffic between Sydney and Wilcannia is concerned, I suppose that the railway would carry nearly the whole of it? Yes.
1127. Nobody would go round by way of Adelaide? I do not think a single one would.
1128. Not to save 10s.? No one will go by coach if they can go by rail.
1129. I meant that they would not go round and work their way up the river? No; that would be impossible. It takes such a long time to get there.
1130. The time would be against that? Yes; it would take you at least a week to get there from Adelaide.
1131. Would people going from Melbourne to Wilcannia prefer to go by rail to Morgan, and thence by the river, or go to Sydney and thence go to Wilcannia by rail? The latter way.
1132. So you think the railway would get all the Melbourne and Sydney traffic? Yes.
1133. And of course all the Queensland trade? Yes.
1134. South Australians would prefer the river perhaps? No; they would go by Broken Hill.
1135. And then by coach? Yes.
1136. You think that the Adelaide men would prefer to do that rather than go to Sydney, and then go to Wilcannia by rail? I presume so. I go right round to Adelaide and Broken Hill in order to go to Wilcannia now.
1137. You told the Committee you had some slight interest in a free selection on which wheat had been sown? Yes.
1138. Do you think that, apart from irrigation, there is any prospect of agriculture in that district—taking your chances of the seasons? I think there would be if there were always communication to Wilcannia. I think there is a great chance of wheat being grown there.
1139. How many seasons in ten years do you think a man would get his crop? If you were to go back ten years from now, when there have been four bad years, the average would be a bad one.
1140. You have been there seventeen years; supposing you had been farming every year, how many crops do you think you would have had? Eight crops out of ten, I think, on the average.
1141. And it would pay a man, you think, to lose two crops out of ten? Yes; the crops are abundant ones; I have seen beautiful crops there.
1142. The soil is rich? Yes.
1143. And manured, I suppose? Yes. I have a garden round my house at Wilcannia, in which everything grows prolifically. I never saw anything richer anywhere.
1144. How many years did you cultivate it? About seven or eight years—until I left there.
1145. It kept good to the last? It is good now.

- E. Resch. 1146. Do they grow any hay in that district? They only use the wheat for hay. They have no mill there. Some of them asked me to erect a mill a little while before I left, and I did say that I might consider it if there were plenty of wheat grown there; but I left the district—you may say—almost, and I did not take quite so much interest in the place afterwards as I did previously.
1147. What class of people grow the hay? Selectors.
1148. All selectors? Yes.
1149. Do any of the squatters grow hay for themselves? Yes.
1150. But no sufficient amount of hay to keep stock alive during a drought? No.
1151. It is principally used by the teamsters, I suppose? Yes.
1152. The teamsters buy from the free selectors? From the storekeepers.
1153. The storekeepers buy from the free selectors? Yes.
1154. How much does the free selector get from the hay? Different prices.
1155. According to the season? According to the river and the season.
1156. Is hay ever sent up and down the river in the steamers? Sometimes from South Australia. New South Wales now derives no benefit from that part of the country as regards supplying fodder or anything of that sort; but it would if the railway were made from Cobar, because the Nevertire and Dubbo districts would supply the people in that district.
1157. Is this wheat hay brought all the way from Morgan up to Wilcannia? Yes; wheat and oaten hay.
1158. Mixed? No, not mixed, separate.
1159. What does that cost generally in Wilcannia? It all depends on how the river is.
1160. On the cost of the navigation? Yes. I have paid as low, I think, as £5 8s. a ton there; but, as I have already said, I have had to pay £40 a ton for chaff there.
1161. If the river were open permanently between Morgan and Wilcannia, would the sale of hay from South Australia be a steady business? Yes.
1162. A regular business? I think it would be a fair business.
1163. Do you not think the people around Wilcannia could grow hay cheaply enough to cut out the imports from South Australia? Not in droughty seasons.
1164. Could they in ordinary seasons? I dare say they could; but it will be years before they grow enough there for the requirements of the place. I do not suppose it will be done in our time, at all events.
1165. It is an industry that is not even in its infancy, I suppose? No; there are simply a few selectors there.
1166. What quantity of hay in a year would you think is brought up from Morgan? I cannot say. I think that Mr. Shainwald, of Rich & Co., would be able to give you a very good idea as to that.
1167. I suppose all the flour for Wilcannia comes up the river? Yes; it is all river-borne.
1168. You get very little down from Bourke to Wilcannia? None at all, excepting, perhaps, when the river is just sufficiently navigable to enable the boats to go from Bourke to Wilcannia.
1169. When there is a fresh in the river, a boat may carry it all the way from Bourke to Wilcannia coming down the river? Yes.
1170. But it would not be able to go up from Wilcannia to Bourke? No.
1171. Because the fresh would have ceased before it could get up? Yes.
1172. Therefore, a boat can sometimes get to Wilcannia when it cannot go beyond? Yes.
1173. The business of the whole district is at present pastoral, I suppose? Yes.
1174. And the prospect for the future is pastoral or mineral if mines should be discovered? Yes.
1175. But the opal district is the only mineral district that at present affects Wilcannia? Yes; White Cliffs. All the way up to Tibooburra and Milparinka there are mineral districts.
1176. But the traffic of that part goes largely to Tarrawingie now? Yes.
1177. Do you know whether there is a coach running from Tarrawingie to Mount Browne or Tibooburra? It goes from Broken Hill, I think.
1178. Then the prospects of a railway would depend, to some extent, on the possible development of mineral country? The pastoral and mineral.
1179. But the pastoral trade is pretty well a fixture;—you know what the maximum of that would be, do you not—it would not go beyond a certain amount? In good seasons they would be able to stock plentifully, and when droughts came on they would be able to get the stock away.
1180. Still the number of sheep per acre does not increase very much year by year, does it? I do not think so.
1181. *Mr. Dick.*] I think you said you would prefer to pay £1 a ton extra for the railway as against sending round to Port Pirie? Yes.
1182. Of course you would not do that as a matter of patriotism, but simply because it would pay you? Convenience; and because it would pay me.
1183. There would not be the delay? There would be no delay, and no need to keep big stocks on hand. While the stock is lying idle a couple of years, the insurance and the interest on the money would be sufficient, if saved, almost to enable me to pay £1 a ton more to send the stuff direct. It must be insured whilst lying there, and also whilst in transit now.
1184. There is a loss of interest occasioned by the holding of large stocks? Yes.
1185. It is rather difficult, I suppose, to arrive at what it costs you per cent. on the value of your goods in that way? I never went into that.
1186. It is an amount worth considering, I suppose? It is a considerable amount. It must be when I offer £1 a ton more for the carriage of the goods by rail rather than by water.
1187. What is the carriage per ton from Sydney to Port Pirie or Adelaide for goods? I think I paid about 12s. 6d. to Adelaide.
1188. Supposing you only send small quantities by the river, do the rates go up? They are higher then.
1189. They are higher for small quantities than for large ones? Yes. I think it is only for 10, 20, and 50-ton lots that the rates are cut.
1190. Do you know if any part of the district around Wilcannia is suitable for fattening stock? They send a lot of fat stock to the market from there when the season is all right. It is a good fattening country when there is a good season.

1191. Do you think that if there were a railway from Cobar to Wilcannia, killing works would pay at Wilcannia? Well, I do not know what the freight would be from there to Sydney. E. Resch.
1192. Works similar to those at Bourke, for instance? I think it would pay there as well as it does in Bourke. 13 April, 1899.
1193. And, of course, that would feed the railway with a certain amount of traffic? Yes.

Richard Sleath, Esq., M.P., sworn, and further examined:—

1194. *Mr. Watson.*] Have you had an opportunity of hearing Mr. Harper, the Chief Traffic Manager, give evidence? Yes. R. Sleath,  
Esq., M.P.
1195. You have heard his estimate of traffic which he anticipated would be got if this line were constructed to Wilcannia? Yes. 13 April, 1899.
1196. Can you offer any opinion as to whether that estimate would be likely to be exceeded in ordinary seasons? That estimate is, in my opinion, ridiculous, because a record has been kept of the traffic that has gone from Wilcannia, through Milparinka, on towards Tibooburra, to supply Tibooburra and Mount Browne, and across the Queensland border, and we find that the traffic that has gone from Wilcannia in that direction much exceeds the estimate made by Mr. Harper. Leaving out the whole of the country lying to the west and north-west and north-east, and taking in the Paroo, White Cliffs, and Wilcannia itself, and all the settlements down the river between Wilcannia and Menindie, and out towards the north-west corner, the number of teams and the tonnage carried by the teams have been kept, and that traffic exceeds the whole of the traffic that Mr. Harper includes in his estimate.
1197. How far does the Wilcannia influence extend on the eastern bank of the river and up the river—a radius of how many miles around Wilcannia would you estimate as being within this estimate on that side? In a north-westerly direction the Wilcannia influence, going along the river, would not go quite half-way to Bourke. The Wilcannia influence also extends towards Cobar, Ivanhoe, and Menindie; but during the seasons we have had recently a good part of the northern trade has come from Tarrawingie. The reason why that occurred was because it could not go from Wilcannia, as there was no river to land goods in Wilcannia, and in a great many instances the goods for Wilcannia itself had to come through South Australia to Broken Hill, and be carted by teams through Broken Hill to Wilcannia; so that, as regards the greater portion of the whole of the trade in that northern part in times of drought, and there being no railway to Wilcannia, many people have had to depend on getting goods through Broken Hill.
1198. So that any shifting of trade from Wilcannia to Tarrawingie is merely a passing and not a permanent event? Yes. Had there been railway communication to Wilcannia it would never have taken place; but owing to the river being down, and unable to land goods at Wilcannia, that was the only route that was open to the people.
1199. Mr. Harper also spoke about the charges on wool—as to the amounts that were paid by the people for the carriage of wool by the river as compared with the railway? Yes.
1200. I think the lowest price he mentioned from Bourke was £3 5s., off which 12s. 6d. was taken, leaving it at £2 12s. 6d.;—can you offer any opinion as to what rates are charged per ton on the river, say from Wilcannia or above Wilcannia, so far as the through charge is concerned: we were told that some stations are getting it carried from 50 miles above Wilcannia right to Adelaide or Melbourne for £2 10s. per ton;—have you heard of such a low price as that being charged—that is, a through charge? I am perfectly satisfied that that is altogether an incorrect statement, unless, perhaps, there were some special circumstances in connection with that particular station of which we know nothing. That is certainly not the ordinary rate chargeable. Of course the charges on the river vary at times. For the greater portion of the time, I suppose, the people will have to pay, even on goods sent in quantities, from perhaps £4 10s. to £10 per ton. The reason for that is that a boat may be laid up for six or eight months; they have to keep the crew, and when the river goes down they consider that, in order to keep the boat on the river at all, they must charge additional freight to make up for the time the boat has been laid up. The boats belong to a number of people on the river, and in order to retain the trade of a particular station and prevent another boat from getting it, a boat-owner may have in one case charged exceptionally low freights. I do not know anything about that, but, of course, that cannot be considered the fair average freight chargeable by the boats on the river.
1201. Have you any idea how many boats there are on the river permanently? I think Rich & Co., of Bourke and Wilcannia, have fourteen; Mr. Connell has a number; Stone and Corney have some; Donaldson & Co. have some; and there are also some Menindie and Wentworth boats plying, and likewise some boats owned by people in the neighbourhood of Murray Bridge and Morgan, and some also come up from Moama and Echuca. I suppose that altogether the boats trading right up the river must number twenty-five or thirty anyhow.
1202. That is, regularly trading on the Darling? Yes.
1203. When they have anything to do? Yes.
1204. We had an estimate in Mr. Harper's evidence that the total trade in and out of Wilcannia amounted annually to about 9,100 tons;—can you offer any opinion as to that total, in view of the fact that so many steamers are plying on the river, and have to be kept up; would that be sufficient to keep them going? I do not wish to mislead. I should say that those steamers supply the trade right from Morgan up to Bourke. Those steamers are not plying directly with Wilcannia, and nowhere else. Of course we have a number of regular steamers—six or eight that ply regularly; they are steamers of light draught, and they get cargo from barges brought up by other steamers. We have four or five steamers that trade between Wilcannia and Bourke—Rich & Co. have two, and Connell has others. They take up goods brought up by the barges of other steamers.
1205. Do you think that that estimate of 9,100 tons represents the whole trade of Wilcannia? It is simply a ridiculous estimate, and one which no one would dream of making who had any idea at all of the trade.
1206. I think you gave some evidence previously about the Condobolin-Broken Hill proposal? Yes.
1207. You were then asked which of the two routes—Cobar to Broken Hill, or Condobolin to Broken Hill—you thought would be the better? Yes.
1208. And you said you preferred the Cobar-Wilcannia-Broken Hill route? Yes.
1209. Can you give any reason for that, as far as the character of the country or anything else is concerned?

R. Sleath,  
Esq., M.P.  
18 April, 1899.

concerned? My reason is this: If you were to adopt this lower route from Condobolin, you would probably run the railway to within 100 and odd miles of the Cootamundra-Hay line, and you would be simply robbing the Hay line of the trade which it is getting at the present time, without gaining much, if any, additional trade. If the Cobar to Broken Hill or Cockburn line is carried out, you are running it through the centre of that great western country, and giving an opportunity for an immense quantity of trade taking in a great area of land; in fact, supplying the wants of the settlers on 40,000,000 acres of Crown lands. But at the same distance from Wilcannia in this direction the land is equal in quality to the land in that direction.

1210. When you get near the river the land is very much the same as you approach Wilcannia, from whatever point of departure? Yes. The rainfall is much the same right down. You can draw a straight line down, and you will find the rainfall is much the same, and that the soil is much the same in character. But the land in the Wilcannia to Cobar direction is, in my opinion, superior to the land at an equal distance from the river in going from Menindie towards Condobolin.

1211. So that, although the Condobolin route commences in better country, you would have just the same proportion of poorer country, so far as production is concerned, to go through? Yes.

1212. Can you offer any opinion as to the comparative dryness of the routes;—we have been informed that there is some swamp between Menindie and Ivanhoe, for instance? Yes, there is.

1213. And that it is more expensive to make a line through it than through ordinary country? I do not know if there would be a great deal of difference in that respect, although there are a number of billabongs and that sort of thing lying back, which, especially when the river was up, would make it rather dangerous country. But in constructing a railway from Condobolin to Menindie you would have more than 100 miles more construction.

1214. And the most you could save, taking the total distance to Broken Hill, would be about 40 miles? Forty-three.

1215. Do you know the country towards the river on the Cobar side? Yes; I have travelled over it many times, and camped on it.

1216. Have you noticed on this parish map that the line, when it gets to a point 600 miles from Sydney, takes a sudden turn to get into Wilcannia; it has been suggested that, instead of going in that way, it should branch off at about 575 miles, and go more northerly, passing round the other side of some small hills;—can you offer any opinion as to the desirability of going more northerly from 575 miles with the view of avoiding the Talyawalka Creek or Anabranche, and crossing the river higher up? I am not prepared to give a very definite answer in reply to that question, because I have not considered that phase of the matter—because I have not made an examination of the ground, and without doing that one could hardly be in a position to express an opinion.

1217. You are aware that the immediate approach to Wilcannia seems to offer a fairly large obstacle to railway construction? Yes.

1218. According to the estimate put before us, it involves the expenditure of some £10,000 a mile for 9 miles? I believe that by taking a swing further to the north you get on to higher ground. On the western side of the river you certainly have higher ground, and I think that on approaching the river from the eastern side you would also have higher ground.

1219. As against the suggestion I have just mentioned, it has also been suggested that possibly, if you went higher up, you would get lower-lying land on the western side of the river? No. On the western side we have higher land. Of course you do not mean going up 70 or 80 miles.

1220. No, a short distance? Yes; you have higher land on the western side, and I think also on the eastern side, of the river. You get on higher land much more quickly in going back from the river.

1221. You mean there would be a shorter width of low-lying land? Yes; probably when the river was in flood a mile would be covered by it, but you would get on high land probably 1 mile back instead of 9 miles.

1222. If that is so, it would be a consideration, I imagine? Yes.

1223. At any rate, you think from your local knowledge it is advisable to make some effort to discover a route along there? Yes. I am not in a position to give the Committee a very definite opinion about it, because I have not paid particular attention to the lay of the country with the view of expressing an opinion in regard to it now.

1224. Of course a deviation through that country would be just as acceptable to the people of Wilcannia, because it would practically make no difference in the total number of miles? Quite so.

1225. And if it had the effect of reducing the expenditure in crossing the river that would be an advantage? Certainly.

1226. I understand that there is a long stretch of mineral country from near Wilcannia towards the border? Yes; it is all mineral country from Cobar, and indeed the whole of it lying right out. It has not been thoroughly prospected yet, but within 20 miles of Wilcannia I think they are opening out a large copper lode.

1227. In what direction from Wilcannia? It lies to the south-west, I think.

1228. It is somewhere on the extension of the proposed line towards Broken Hill? Yes; I think it is, almost. They are just opening it up. I have not had an opportunity of personally examining it; but from reports I have to hand, I know there have been a great many leases taken up recently, and there are a number of men working, opening up that copper lode. I have had some of the samples sent to me, and have had them assayed. They have gone very high in copper—that is, if they were a fair sample.

1229. Do you think that there are any possibilities of development between Wilcannia, Tibooburra, and Mount Browne? Yes; there are fresh developments taking place there every day. In 1890, when the Public Works Committee took evidence, White Cliffs was unknown—unthought of. Now there is a population there of at least 3,500 souls, all getting a fair living at White Cliffs from the opal-mining. Some distance from, although not in a direct line between, White Cliffs and Wilcannia—more towards the Paroo—on a back station of Momba, known as Purnanga, there has been opal quite recently discovered, and a number of men have settled down there, and are getting some first-quality opal, although I do not suppose they are getting it in large quantities.

1230. Still it shows there are possibilities there? When I went through White Cliffs, in 1891, I found, only about a dozen men camped there, living on rabbits or whatever else they could get; and it was two or three years after that before there was any population settled there, although they were then getting opal. About 14 miles further on than White Cliffs, in a north-easterly direction, some development has taken

taken place quite recently in regard to opal-mining, and a number of men have gone out there, and they believe that that is going to be just as important a field as White Cliffs. The demand for this gem, instead of decreasing, is increasing every day. The prices paid are much better now, because there is more competition amongst the buyers.

R. Sleath,  
Esq., M.P.  
13 April, 1899.

1231. The superstition must be fading away? Yes; at one time there were a few men who had the whole of the trade in their hands. Now, I suppose, there are twenty or thirty buyers who go up from Sydney and Melbourne every month and compete for the opal that has been got during the month. Some distance further out, still going north—about 40 miles—there is gold-bearing country. Some years ago there was a great rush there; but it was just about the time when rushes were not very successful as a rule, and there have been only a few men left working there. They are still working there, and I believe that a number of the station-owners and others have put some money into the venture, and are now developing the reefs in that particular locality. It is known as Kandie Peak. One claim is known as the London, another as the Mystery, and there are a number of others. The gold is held in ironstone, and when that gold-bearing country was first discovered there was a belief prevalent amongst mining men that you could not get gold in ironstone, and as far as my recollection serves me, I think Peak Hill was the first mining field that gave the lie to that assertion. The reefs resemble very much the reefs at Peak Hill. They are simply ironstone lying very flat with a great dip.

1232. You have between Wilcannia and Mount Browne some artesian bores, have you not? Yes.

1233. Are they in working order? The Government has got none until you come to Cobham.

1234. How far is that out? 160 miles from Wilcannia, I suppose.

1235. Are there any near Wilcannia? On private property, but not Government bores.

1236. Are they successful? Yes; on Momba station.

1237. How far from Wilcannia? Fifty or 60 miles. There are a number of artesian bores on Yancannia station—private bores, but all having a flow.

1238. Do you think that the existence or possible increase of the number of those bores would have the effect of increasing the capacity of the country either for stock-carrying or for mining purposes? I am afraid not to any great extent, because the cretaceous formation lies only back from the river a certain distance, and then the slate comes in. Almost due west from Wilcannia the cretaceous country runs right on for close on 100 miles. But north from that, the slate comes in, 14 miles west from White Cliffs, and then, of course, it comes in with a dip, so that you would not be likely to get a flow. The fact of the matter is that the Government Geologist, Mr. Pittman, although he suggested as an experiment to put down a bore at White Cliffs, was afraid that that was almost on the fringe of the cretaceous country, and it was very doubtful whether a flow could be got at all. Mr. Pittman has been over that country.

FRIDAY, 14 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

1239. *Chairman.*] You were asked to supply the Committee with some further evidence in reference to the overflow of the Darling? Yes.

H. Deane.

1240. Can you give us that evidence now? Yes. I have marked on the county map the position of some of the flood-waters. When I was here before I quite overlooked the fact of the Paroo coming in near Wilcannia.

14 April, 1899.

1241. Where does the Paroo enter the Darling? It comes down from the north and enters the Darling just above Wilcannia. The overflow of the Paroo is marked on the map.

1242. What distance above Wilcannia does the Paroo come in? A few miles above Wilcannia.

1243. Has that bend in the river a few miles above Wilcannia any local name? I do not know of its having any local name. It is 30 miles, I think, above Wilcannia, and the river takes a sharp turn to the south, and the flood-waters from the Darling spread out there. Consequently, the location of a railway there would be a very unsuitable one. I also understand that from the Poopelloe Lake, opposite to that bend, right across to the Darling, the country is subject to flood. Therefore, if any attempt were made to run a line across there to Wilcannia, you would have over 20 miles of flood area. The line is curved to the south in order to secure the best place for crossing the river. The flood-waters are narrower there than they are for a long distance either above or below Wilcannia.

1244. Then the flood-waters from the Paroo, and the fact of the country being subject to inundation between Poopelloe Lake and the Darling, drove you to that more southerly course? Yes.

1245. *Dr. Garran.*] Have you equally precise information about the country on the south side of Wilcannia? On the south side of Wilcannia, it will be seen that Talyawalka Creek begins to branch out again.

1246. You mean it spreads out over the country? Yes; and on the other side of the Darling too—that is on the Wilcannia side—there is more flood country. I am assured by one of the surveyors who was engaged on the survey, Mr. Wickham, that the crossing that has been selected is the narrowest crossing that could be found.

1247. *Mr. Watson.*] Do you know whether Mr. Wickham went up the river with a view of exploring that country, particularly above Wilcannia? I believe that the officers obtained all the information that was necessary, but I do not think that any attempt was made to get a crossing which would avoid Wilcannia.

1248. I did not mean to avoid Wilcannia, but to get a more northerly crossing? The extent of the inundation area proved the undesirability of any survey being made there.

1249.

- H. Deane. 1249. What I meant was, do you know whether Mr. Wickham personally went over the tracks to the north? I do not know that he did. I think he depended very largely on information that was given to him. The distances to be travelled over are very considerable.
- 14 April, 1899. 1250. We were told yesterday by Mr. Sleath that he would not be positive, but that he was under the impression that there was a better crossing-place to the north where the inundated country was narrow, and it occurred to the Committee that if there was any possibility of that being true, it would be well for an officer to make a cursory inspection of that locality? Yes.
1251. *Chairman.*] Is the course at present proposed identical with the original scheme? Yes.
1252. *Mr. Watson.*] You have very largely followed the coach road, have you not? To a considerable extent. But if you look at the map you will see that it is a long way off the coach road, in different places.
1253. Is that stock route the coach road? Yes. I understand that the reason why the road goes north there, and skirts that lake, is on account of getting water for horses and stock; but for a railway we keep south of that, so as to keep out of the way of floods.
1254. *Chairman.*] You avoid a lot of that boggy country, I suppose? Yes. Of course, the coaches and the stock want to go as near the tanks as they can; but with a railway, so long as we get water supplies at convenient places, the more we keep out of the way of water the better.
1255. *Mr. Watson.*] But usually a coach road, I imagine, would keep away from low-lying ground, or otherwise the coach travelling would be slow? Yes. Possibly in flood-times the coaches may not use that road, but it is very rarely that a bad flood comes along there. When it does they may have to choose some other road. I think the Committee may rest assured that it is not possible to get a better crossing north of Wilcannia. I believe that the information which the surveyors have obtained is perfectly reliable; it is also apparent that the Paroo waters, which, of course, occasionally, though very rarely, cause any difficulty, ought at all events to be avoided, and you cannot cross the Darling higher up and avoid that overflow on the right bank and the flood-waters of the Paroo. You must encounter them if you cross the Darling higher up. I think that on the latest plan of the Colony in the Survey Office you will find that the country from that bend down towards Wilcannia is shown to be intersected by numerous channels.
1256. Does that condition of things obtain right down to Wilcannia? Further down towards Wilcannia the Paroo floods are encountered.
1257. *Chairman.*] You said just now that the line proposed is less subject to flood than if it were taken further north? Yes.
1258. *Dr. Garran.*] Both sides? Yes.

Francis Edmund Wickham, Resident Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- F. E. Wickham. 1259. *Dr. Garran.*] You have been in this Darling country with a view of examining the route for the crossing at Wilcannia? Yes.
- 14 April, 1899. 1260. When were you there? In 1887.
1261. Was that a dry year or a wet year? There was a very good season that year.
1262. Was the Paroo River running? No.
1263. Had it been running shortly before you got there? Yes. It runs very seldom though.
1264. Had it either reached the Darling or made marshy country north of Wilcannia? No. It leaves the channel quite dry. You would not know the river was there unless you saw the flood-waters.
1265. Does it spread out in the neighbourhood of Wilcannia when it does come down? Yes; very considerably.
1266. Of course, then it would be very troublesome for a railway? Very troublesome.
1267. Will you tell the Committee how far you personally went in your travels then, and how much of your information you got from the residents—how far over this country did you travel—either along the proposed line, or up and down the river? I staked a line from Cobar to Wilcannia along the black-mark line. I made a detailed exploration of all the country from Wilcannia up the river, until I came to the junction of the Talyawalka Creek.
1268. In a straight line, how far is that from Wilcannia? Something like 50 miles, as nearly as I can recollect. It was impossible to get to Wilcannia by that route on account of swamps and other obstacles.
1269. Did you go across from the proposed line in order to strike the Darling at the northern end of the Talyawalka Creek? Yes; I went across there.
1270. What sort of country did you cross over there? Sound country as far as the Darling.
1271. Was it floodable? To some extent, but not more than usual—all the banks of the Darling are floodable.
1272. Is Lake Poopelloe flooded by the Darling flood-waters? Yes; it is a great storage place for the Darling flood-waters.
1273. Is it what you would call a back-water lake? Yes.
1274. That is what makes it a lake? Yes; it has none of its own water. The whole of it comes from the Darling.
1275. It is not a rain catch-water lake? Not at all.
1276. Then the ground there is soft? Yes, when it is wet; but it is very hard indeed when it is dry.
1277. It bakes? Yes, bakes very hard.
1278. Then you would not recommend that route for crossing the Darling? Not at all.
1279. Between that north end of Talyawalka Creek and Wilcannia there is no other way of crossing? No.
1280. We are shut out so far as that 50 miles is concerned? Yes.
1281. You notice the bend the line makes to the north-west to get in to Wilcannia? Yes.
1282. Could you avoid that by going a little more south of the Darling? I think so; but I did not examine the country further south than Wilcannia, because Wilcannia was my objective point.
1283. If there should be an extension of the railway hereafter to Broken Hill, its course would lie to the south-west? Exactly.
1284. Would there be any reason for going north-west of Wilcannia if you would have to go south-west the moment you crossed the river? I think you could go south-west of Wilcannia some miles, without meeting with more obstacles than at present. I think you could get across before you come to the great anabranch.
1285. That leaves the river a little above Menindie? Yes.
- 1286.

1286. Between Wilcannia and Menindie are the sides of the Darling bad? No; I think they are very good. I think you could get across anywhere there.

F. E.  
Wickham.

1287. How far south of Wilcannia does that anabranh start—on the western side? I could not say accurately; but I think about 80 miles.

14 April, 1899.

1288. It would not do to cross there, because you would have both the Darling and the anabranh to cross? Yes; the same as the Talyawalka Creek and the Darling further up.

1289. Then the choice lies between Wilcannia and where that anabranh strikes out? Yes.

1290. That is a distance of about 80 miles? Yes.

1291. And you have not minutely examined that 80 miles? No, not as regards a railway; but I have been across the country.

1292. From what you saw while you were there did Wilcannia seem to be the natural centre of the district? Yes; I think so.

1293. Is it a good site for a township? A very good site for a township.

1294. Is it ever flooded? No; it is out of flood reach.

1295. There is no likelihood of such an accident as happened at Bourke happening at Wilcannia? I should not think so. I do not think flood-waters have ever been actually in the main street of Wilcannia.

1296. They have to go behind it? Yes.

1297. And so make it an island? They would make it almost an island.

1298. You would have high and dry ground for the railway station? Yes.

1299. Do you locate your station north of the township? Yes.

1300. On good sound land? On very sound land.

1301. Did you go at all into the question of the foundations for the bridge? No; I simply chose a site with a view of erecting a bridge.

1302. You have been over the whole of the line from Cobar to Wilcannia? Yes.

1303. At one place on the parish map there is a considerable bend marked at 530 miles; perhaps you can tell me the reason? There is a range of mountains called the Racking Range, which increases as you go more southerly, and that would necessitate rather heavy grades. I have not the slightest doubt that a straight line taken where I went first could be developed into a better line than I have got.

1304. You do not think there is any obstacle in the way of making a straighter line? I do not think so.

1305. Does the stock route go over that range? In several places it does.

1306. Were the grades 1 in 70 when you went to examine the route? The grades went up to 1 in 50.

1307. Did you reduce them all to 1 in 100? No; I took them out to 1 in 50 on the first route across there.

1308. What did you make the ruling grade there? 1 in 50.

1309. Has it not been altered since then? Yes; it has been cut down on the section. It is possible to cut it down on the section without making a further survey.

1310. Continuing the same line, you could easily bring it down to 1 in 100? Yes, easily.

1311. Without any material cutting? Yes.

1312. It is contemplated, I presume, to make it 1 in 100? I could not tell you that, but I think it is very likely.

1313. According to your evidence, the margin for choosing the site of the bridge is not very large? No; it is not at all large.

1314. It must either be at Wilcannia or within 80 miles of Wilcannia to the south? Yes.

1315. And as to that 80 miles, you have no direct evidence? I cannot say anything with certainty about that 80 miles.

1316. Did you go up and down the river very much? Yes.

1317. How far? Up the river to the mouth of the Talyawalka Creek, and I have been down [the river as far as Wentworth.

1318. With a view of fixing a railway crossing? No; only travelling.

1319. But this time you went there with a view to fixing the railway crossing? Yes; I was inspecting the country, so as to get through there.

1320. There would be no particular object in striking the Darling north of the Talyawalka Creek unless we were going to strike out towards Mount Browne? No; you would be out of the direct line to Broken Hill if you went up there.

1321. We should have to give up the idea of going to Broken Hill, and make the railway a line more to the north-west of the Colony? Yes.

1322. Of course you understand that going to Broken Hill is a mere contingency, and that the project before the Committee is for a line merely to Wilcannia? Yes.

1323. Do you know anything of the country between Hillston and Menindie? I have driven over it.

1324. Is it much of the same character as the country between Cobar and Wilcannia? Yes; a little flatter if anything.

1325. How far does the Willandra Billabong go back from the Lachlan? I cannot say. I did not go anywhere in the neighbourhood of that.

1326. In going from Hillston to Menindie, are there any ranges you have to cross? Nothing to speak of.

1327. It is pretty level country? Yes, all the way.

1328. Not level enough for a water-course to be made from one river to the other, I suppose? No; the country is bound to rise too much for that.

1329. But there is nothing that you could call a range? No.

1330. You could make a railway there with an easy gradient, from one place to the other, even if you could not cut a canal? Yes; you could make a railway there easily.

1331. And the quality of the soil is about the same? Yes; I think it is almost precisely the same.

1332. This side of the Darling, going from Menindie, is there not an anabranh called the Teryawynia Creek? Yes, there is an anabranh on this side breaking out almost where the Talyawalka comes in again, and running south; but although of good capacity, it is not of the same capacity as the Talyawalka.

1333. It does not flood the country to the same extent? No.

1334. There would not be the same difficulty in crossing it? No; the work would be rather lighter than in the case of the Talyawalka.

1335. Did you look into the question of water supply along the proposed line of route? Yes.

F. E.  
Wickham.  
14 April, 1899.

1336. Do you think there would be any difficulty in getting water stations sufficient to hold out during four years of drought? You would have to conserve the water.
1337. Could you conserve it so as to make it last for four years? I think so.
1338. In open tanks? Yes; that is the only possible way. The ground is very good holding ground.
1339. You would have to get natural hollows? Yes.
1340. Is the ground sufficiently clayey underneath the surface to hold the water? Yes, if you select your spots.
1341. You would have to sink shafts here and there to see how the subsoil is? We should have to sink trial shafts to see what the subsoil is like, and if it was not good enough in one place, we should have to try somewhere else.
1342. After rain you see the hollows where the water settles naturally? Yes.
1343. And you can ascertain the retentiveness of the subsoil very easily? Yes.
1344. And if you chance to get rain just before you fix your sites you will have that to guide you? Yes.
1345. At what intervals would you have the tanks along the line? I think you could have them as often as would be necessary. There would be no difficulty in finding suitable sites at almost any point to hold water. The station tanks are very large, and we should be guided very much by their position. Some of them are 10,000-yard tanks, and they hold water very well.
1346. You do not know how those station tanks have held out this season? No; I have not been there for twelve years.
1347. And you have not heard? No.
1348. Of course such experience would be valuable to you? Yes.
1349. Do the station-owners make larger tanks than you would make? No; but I think we should make larger tanks than those.
1350. Do they make them deep? They make them 16 or 18 feet deep.
1351. That is about what you would do? Yes; it would not do to break too far into the bottom ground.
1352. You would have to pump and lift the water? Yes; we should have to lift it for the locomotives.
1353. You see no difficulty about conserving water? Not the slightest. We should have to wait for rain and then fill the tanks—that is all we should have to wait for.
1354. What should you want for that—2 inches? Two inches would give an enormous quantity of water.
1355. Would 2 inches fill most of your tanks 15 or 17 feet deep? I do not think it would.
1356. You would want 4 inches? Yes, 4 or 5 inches to fill a tank.
1357. When once you got that, the rain would make good all you took out of it? I think so.
1358. You do not at all anticipate getting into difficulties for want of water on that line? I do not think so at all.
1359. Have we had any trouble at all on the line from Nyngan to Bourke for water? Not that I am aware of.
1360. Do they depend on tanks there? I do not think they do. They may have one tank, but I cannot say for certain.
1361. The 6 miles just before entering into Wilcannia is rather swampy country, is it not? Between the Talyawalka Creek and Wilcannia it is rather swampy country.
1362. There must be 6 miles in which you would have to support the railway on piles? Oh, no; I do not think so.
1363. Would you make an embankment all across? No, not all across; but I should have a great portion of embankment.
1364. Would not that stop the flood-water? Not materially. It would force it under the necessary openings which we should leave.
1365. Where would the wooden viaduct be? At the Talyawalka—most of it—and about a mile before you reach the Darling, on the eastern side.
1366. Then between the Talyawalka and the Darling there is fairly high ground, from which you could make an embankment? Yes; sand-ridges.
1367. The cost of those last few miles is reckoned at £10,000 a mile on account of the difficulty of getting over the flooded country? Yes.
1368. Do you think it would cost that? I could not say.
1369. You think that an embankment would do over part of that distance? I think so.
1370. How much—half? I could not tell you without a section.
1371. Did you make any special investigation? No.
1372. You are satisfied it could be done? Yes.
1373. And you could not get a better access to Wilcannia? No.
1374. So far as you could see, there was no better way of getting into the township? None that I could find.
1375. And after you cross there, there is a fairly good get-away on the other side? Yes.
1376. There is no other river coming in there? No; there is no other river west of that.
1377. It is a riverless country right away to Mount Browne then? I have not been to Mount Browne. It is riverless until you get near Broken Hill.
1378. *Mr. Levien.*] What is the distance from Hay to Melbourne? It scales 224 miles in a straight line.
1379. *Mr. Dick.*] In making railway surveys, has it been the practice to keep as close as possible to a road? No, I do not think so. We take a good route in preference to closeness to a road.
1380. How far did you make explorations in carrying out your survey—did you explore the country on each side, or merely straight ahead? We usually get a general route, and go in advance of the survey party, and take the most suitable crossings of rivers and mountain ranges, and then take the line from point to point. A low cutting of the range and a good crossing of the river we unite, so long as they are on the main route. If we cannot get our line that way, we might go several miles another way to get it.
1381. How do you decide on the general route in the first instance? A straight line first.
1382. You work ahead of that, do you? We explore ahead of it.
1383. On both sides of the straight line? Yes; miles on both sides of it.
1384. I suppose you have noticed that in many of the deviations now being carried out in connection with the existing railways, although the old line kept close to the road, the new deviation, which is a much better route, goes widely from it in many instances? Yes.
1385. I was wondering whether you carried out the same practice in this instance? As a matter of fact, there was no coach road when I went over this route.

1386. You feel satisfied that this is about the best route you could get between Cobar and Wilcannia, if Wilcannia is to be your objective point? I am quite satisfied it is the best route.

1387. *Mr. Watson.*] You were asked about the length of the proposed viaduct going towards Wilcannia; included in the evidence given by Mr. Deane was a statement that the viaduct would be about  $3\frac{1}{2}$  miles long, but not in one piece;—that would coincide with your opinion? That is what I said, though I would not give an opinion as to the exact length.

1388. You mean the  $3\frac{1}{2}$  miles viaduct would not be in one section, but spread over the last 9 miles in approaching Wilcannia? Yes; bridge all the low portions, and bank the higher ones.

1389. You said that, as originally surveyed, the scheme provided for a ruling grade of 1 in 50? Yes.

1390. Can you explain how, with a resurvey, you get a reduction to 1 in 100;—is it a mere alteration of the section, or do you have to make deviations in order to avoid hills? We make slight deviations. Supposing I had half a mile of 1 in 50, I should cross-level the line for some chains in the right direction, and then it could be struck out on the plan, showing how it could be obtained.

1391. You keep a record of the different rises, and so on, which you obtain in the survey? Yes; and use that again when estimating afterwards.

1392. The alteration of grades has been allowed for in the estimate? I think it has.

1393. *Chairman.*] You are satisfied from the explorations made by yourself that the line submitted to this Committee is the best line that could be obtained? I do not think you could find a better.

1394. And that the crossing or site for the bridge is the best to approach Wilcannia by? Yes.

1395. Supposing there was a better crossing for a bridge some miles to the south of Wilcannia, would you recommend its adoption? So much depends on whether you want to go to Wilcannia or not. If you can afford to miss Wilcannia I should certainly go for the better crossing.

1396. What is the nature of the country on the western side of the Darling below Wilcannia;—is it much the same? Yes; you see no difference in driving over it. It is slightly rolling country.

1397. So you would save nothing, even if you did go to the south and crossed on to the other side? I think you would save nothing, unless you found an eminently suitable site for a bridge. That is all you could save in.

1398. *Mr. Watson.*] You have not been far below Wilcannia with a view of looking for a site? Not in railway exploring; but I have driven over that country many times in a buggy.

1399. Was there any spot that struck you as being "an eminently suitable site for a bridge"? No; there was not.

1400. With, of course, correspondingly high approaches that would make a sufficient saving in going south and then going back to Wilcannia? I saw nothing like that.

1401. *Chairman.*] I suppose you have explored south of Wilcannia to see if you could get a better site for a crossing? Yes; 3 or 4 miles below the town.

WEDNESDAY, 19 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Edward Fisher Pittman, Government Geologist and Chief Mining Surveyor, Department of Mines, sworn, and examined:—

1402. *Chairman.*] Have you made a geological survey of the country to be traversed by this line? No, I have not. I know the character of the country, but there has not been anything like a detailed geological survey of it made. E. F. Pittman.  
19 April, 1899.

1403. Generally, you know the character of the country? Yes.

1404. Do you know what the possibilities are, from a mining standpoint, of the country about Cobar and west of Cobar? Yes; about Cobar there are very valuable deposits of copper ores containing gold and silver, but so far as we know there is no extension of these westward towards Wilcannia. But at the same time, seeing that those western plains are all covered by a superficial deposit of Pleistocene soils, there is a possibility of there being valuable mineral deposits there which would not show on the surface. However, we are not aware at present of any deposits west of Cobar.

1405. There are a few low hills are there not in the country between Cobar and Wilcannia? Yes.

1406. Are there any mineral indications there? Not so far as I am aware.

1407. What about the country west of Wilcannia? It is all mineral-bearing country west of Wilcannia. I have been over that country, but on the direct route I do not know of anything, although off that route there are deposits of silver and of copper also.

1408. I mean the country that is likely to be served by a railway? Undoubtedly a railway would offer facilities for mining which would induce people to open up the deposits of copper and silver in the ranges north of that line.

1409. That is, known deposits? Yes. At least I should be of that opinion.

1410. And, provided with proper railway facilities, do you think those deposits would maintain a large population? I can hardly go so far as to give an idea of what population they would maintain, because they are practically untried at present.

1411. You say there are deposits there? Yes.

1412. But, they not having been proved, you do not know what they are, but I suppose it is possible that another Broken Hill might be found about there? Quite possible.

1413. Is it the same class of country as the Broken Hill? Very much the same class of country. There is some copper about Nuntherungie, opened up about twenty-five years ago, and quite recently, on account

E. F. Pittman. account of a considerable increase in the price of copper, it has been taken up again, and the last report I saw on the deposit was from the warden, and he spoke very highly of it. At the same time, it is in such a position that without a railway I hardly think it would be possible to do much with that copper ore, because its value would be largely discounted by the cost of carriage. With a railway such a deposit ought to be opened up.

19 April, 1899.

1414. Then, in your opinion, there is a fair amount of mineral country there which would be developed if there were railway communication? Yes; I think that until we do get a railway out west there, it is almost hopeless to expect that anything definite will really be known of the mineral deposits of the western country, and there is really no reason why very valuable mineral deposits should not be opened up there.

1415. Then the possibility of a railway being extended out in that direction, you think, would stimulate prospecting? Undoubtedly, because with the knowledge of a railway coming there, there would be a hope of the deposits being worked at a profit. At the present time it is hardly worth anyone's while prospecting there, unless, perhaps, for gold, because the cost of carriage would be a fatal handicap.

1416. And the reason why that mineral country has not been prospected is, in your opinion, because, owing to the absence of cheap carriage, it is impossible to work those deposits at a profit? Yes.

1417. *Mr. Trickett.*] I suppose then we can take it that between Cobar and Wilcannia, the whole of the country may be regarded as metalliferous? I cannot go quite so far as that. As I said, the surface of the country is obscured by superficial deposits of soil over a very great extent of that route, and it is impossible to say what really is below; but the probabilities are that there is a considerable extension of these Palæozoic rocks—the rocks in which mineral deposits occur in this country—hidden by the soil.

1418. Have you any report in the Department on that line of country? I do not think there is any report on the country between Cobar and Wilcannia, with the exception of a report made in connection with the artesian water supply.

1419. Do you think it is likely that copper and silver would be developed in that direction? I think it is very likely indeed. They have copper at intervals between Girilambone and the Barrier Ranges—at intervals all the way.

1420. Therefore you, not from having visited the country, but from information in the office, think it is a country in which it is likely there would be a development of copper, silver and, I suppose, iron? Yes. I have visited the country myself, but I have never made a detailed geological survey of it.

1421. You have been on the western side of the river down to Wilcannia? Yes, over a considerable portion of it.

1422. Are there goldfields there? There is no gold-field anywhere in the neighbourhood of the proposed line or on a line between Wilcannia and Broken Hill. The nearest gold-field is a considerable distance north of it—at Milparinka.

1423. Well, taking the direction out north-west, what is the character of that country,—say from Wilcannia to White Cliffs? That is not a mineral-bearing country, so far as I am aware. It is a part of the artesian water basin.

1424. But when you get to White Cliffs you have mining? You have only an opal-field.

1425. Is not that opal-field very extensive? Yes; that is, the class of rock in which the opal occurs is spread over a very large area. The occurrence of opal is so capricious that it is impossible to say what extent of the rock will contain opal.

1426. But that is a recognised opal-field at the present time? Yes, an important one.

1427. Do you get reports on that place? Yes. I have also visited it myself.

1428. Is the occurrence of opal spasmodic? Its occurrence is very spasmodic.

1429. It may run right out? Yes, at any moment. You get it in small patches. A man may sink a shaft where nothing appears on the surface, and perhaps in 10 or 12 feet he may come on to a heap of opal as large as this table.

1430. Is it indicated by an outcrop? No; there is no indication on the surface, as a rule. In the first instance, opal was found there through a small piece being found on the surface, and a man sank on that. But that is very rare; as a rule, it does not come up to the surface at all.

1431. That is the only mineral at White Cliffs? Yes.

1432. Going in the direction of Mount Browne, what is the character of the country? It is all a cretaceous basin until you get to Mount Browne, and there you have a limited gold-field.

1433. Alluvial? Both alluvial and quartz.

1434. Is that attracting anything of a population at the present time? It did some years ago. The place is suffering from a drought now, and it is an exception when it does not. There is very great scarcity of water there. It is one of those fields that would be very extensively worked, I think, if it were in a favorable climate; but under the present climatic conditions, it is very difficult, indeed, for men to get a living by mining there.

1435. Would it be what you would call a good poor man's field? Oh, no; not under present climatic conditions.

1436. I mean under favourable circumstances of approach and better water;—do you think it would then attract a large population? I hardly think it would be possible for Mount Browne ever to develop into a poor man's diggings, because of its climatic conditions.

1437. Only organisation could make it habitable? Yes.

1438. Is there any water out there at all? There is enough water for domestic purposes, and you can always get water by sinking or boring in the neighbourhood.

1439. Have they had a bore out there? Not in the immediate vicinity of Mount Browne. They have had one within 10 or 12 miles. That country is being systematically prospected for artesian water by the Department of Mines.

1440. But suffering from those disadvantages as regards water, would not that bar its becoming a field where the mineral could be locally treated? I think so.

1441. The ore would mostly have to be taken away to be treated? Except that they might do it with artesian water. They could certainly sink artesian wells and get sufficient water for mining purposes.

1442. But gold is found there in payable quantities, is it not? Oh, yes; it has been found in rich deposits.

1443. Is there any coal at all in this locality? None whatever; at least, there is coal at a depth of between 2,000 feet and 3,000 feet beneath the surface. It might be of use for local purposes if it could

be

- be obtained; but in the first place it would be impossible to mine it on account of the artesian water. *E. F. Pittman.*  
The miners would really have to work in water under pressure, which would be impossible.
1444. Do you think that Mount Browne is a mining district that would be improved by improved facilities of approach? I cannot say that I do. Mount Browne is essentially a gold-mining field, and gold-mining fields, as a rule, are not very much affected by railway communication. It is different with other ores, such as copper and silver ores. The trouble with the Mount Browne field, as I said before, is the climatic conditions that prevail. *19 April, 1899.*
1445. It has a very bad climate? Yes, a very hot and dry climate.
1446. Has there been any great mortality there amongst the mining population? I do not know that there has. I think there was a fair amount of typhoid when it first broke out; but I do not think that the climate is an unhealthy one in the ordinary sense of the word, although it is a very dry one.
1447. It has extreme heat? Yes, and dryness.
1448. Can you tell us how far, in all directions, the mineral belt round about Wilcannia would extend? The mineral belt commences to the west of Wilcannia, and runs north and south approximately—that is, so far as we know it.
1449. How far west? Right away out to Broken Hill.
1450. And goes pretty well up to the north-western border of the Colony? As far as I remember, it would take in the words "White Cliffs," and also the words "Mount Browne" on the map. It runs in that direction.
1451. Right away up to Paroo? No, it does not go so far east as the Paroo. It just takes in the words "White Cliffs" on the map.
1452. Has that country been thoroughly prospected? I should hardly like to say it has been thoroughly prospected.
1453. It has been prospected? Yes.
1454. Mostly for alluvial deposits? Yes.
1455. Generally, would you be disposed to say that it is a district that would develop in a mineral way if it had better means of communication? Yes, I think that a railway would probably result in the fields about this district being more thoroughly prospected, with a reasonable hope of success in some instances at any rate.
1456. *Chairman.*] You have maps in the office showing the geological features of the country about there? Yes, you can have a copy of them at any time.
1457. *Dr. Garran.*] Can you give us a sketch map showing the size of the lodes already known? No; but I can give you a map showing the trend of the rocks already known. That is shown on the geological map.
1458. *Mr. Trickett.*] You know the area to be served by the proposed railway, from Cobar westward; will you kindly have blocked off a map, to be attached to your evidence, showing the whole of that north-western corner with those lodes marked? Yes.
1459. West, and on both sides of the railway? Yes.
1460. *Mr. Watson.*] You said that gold and silver deposits occur north of the proposed line of railway? I may have mis-stated what I meant. What I mean is, north of an imaginary line from Wilcannia to Broken Hill.
1461. Not north of the line between Cobar and Wilcannia? No.
1462. Do those instances that you had in your mind, when speaking, occur close to Wilcannia in any case? No. I should think that the nearest of them would probably be 60 or 70 miles from Wilcannia.
1463. Still that would be within the influence of the Wilcannia railway? Yes.
1464. So there are some west towards Broken Hill which are within that distance of Wilcannia? Yes.
1465. Outcrops which would justify prospecting? Yes.
1466. I think you said you did not know of any mineral deposits between White Cliffs and Mount Browne? Yes, that is so.
1467. It would seem, then, that your Department has not kept up-to-date in regard to discoveries? Pardon me, I think I am wrong there.
1468. There is a place called Kandie Peak, about 50 miles north by west from White Cliffs, a rather notable peak, which juts out very abruptly; that is being worked at the present time, I understand;—have you heard of that? If I did say that I did not know of any mineral deposits between White Cliffs and Mount Browne, I was wrong, and I should like to correct that answer.
1469. There is the London claim, and the Mystery claim, which are not very far out on the White Cliffs side of Wilcannia, I understand? Yes.
1470. Then, again, the Kooningberry ranges, further on towards Mount Browne from Kandie Peak, are being tunnelled into very extensively with a view of gold-mining; I do not know whether you have had this reported to your Department? I have been all over that country, and if I stated just now that there were no mineral deposits between White Cliffs and Mount Browne, I did not intend to say so.
1471. You said it was a cretaceous basin, and I think that the inference which the Committee drew from that was that, it being a cretaceous basin, there was no mineral deposit? I distinctly remember stating that there was a belt of country running north from a line between Broken Hill and Wilcannia, taking in the words "White Cliffs" and "Mount Browne" on the map, and that is essentially a mineral belt, in which all these deposits, which I hope will be served by the railway, occur.
1472. So you might say that it is a continuous line of mineral country starting from a line drawn between Broken Hill and Wilcannia, and going north for a considerable distance towards Mount Browne? Yes; except that it is obscured in a great number of places by surface deposits.
1473. Still it is, broadly speaking, a fairly continuous line of mineral country? Yes.
1474. You know, I presume, that at a place called the Bunka, some distance from White Cliffs, there are opal deposits being worked fairly extensively at the present time? Yes. There was a place reported the other day as a new find—I do not know the exact locality—and subsequently the warden reported that it was a place where prospecting was carried on some years ago, and it has been reopened.
1475. I understand that there are about 100 men there at present getting opals? Yes.
1476. There is another matter, which I think of importance in this connection;—can you give the Committee an idea of the general run of the cretaceous formation in the district of Wilcannia? Yes.
1477. Where you think it is probable that artesian water would be got in the district generally around Wilcannia?

E. F. Pittman. Wilcannia? Yes. Wilcannia, so far as I am aware, is just about on the southern boundary of the artesian water-bearing basin.

19 April, 1899.

1478. Say, starting from Cobar, are there any indications of cretaceous formation between Cobar and Wilcannia anywhere near the route of the proposed line? I do not think there is any chance of getting it there.

1479. Take now north-west and north-east of Wilcannia;—do you think there are any reasonable chances of getting it there? We know it occurs north-east, along the northern bank of the Darling; but I do not think it crosses the river southwards.

1480. Now, going out on the Mount Browne road—that is, past White Cliffs, and right out north? At Tarella Station they have the older rocks—that is, the rocks in which artesian water does not occur—close to the surface, so that there is very little chance of getting artesian water south of White Cliffs. There is just a possibility of getting it in places.

1481. It is not probable that you will get it between Wilcannia and White Cliffs? Well, it is open to question. You might get it in places, but you would not get it continuously.

1482. Well, north of that again? North of that again, you ought to get it all the way.

1483. All the way between White Cliffs and the Queensland border? Yes; but not going north-west, for then you get on to the mineral-bearing country.

1484. How far would the cretaceous formation extend west of a line north of White Cliffs? It goes a long way into South Australia.

1485. I thought you said it was limited in a westerly and north-westerly direction? Yes; by the out-cropping of rocks that come to the surface. But on the other side of those you again get the cretaceous formation.

1486. Does this extend over a large area of country? Yes; a good width. It is shown exactly on the Geological map, as near as we know it.

1487. How far west of White Cliffs can you go and make sure practically of getting water—with a few experiments, of course? I should not like to make a statement to that effect without having the Geological map in front of me; and even that is not absolutely accurate. We are continually testing this country—that is to say, the Public Watering Places Branch is—by means of bores.

1488. Have there been any successful bores out in that direction so far, between White Cliffs and Mount Browne;—out in that country, are there any bores down from which water is flowing in anything like a volume? Oh, yes. As far as I remember, there are a number of bores put down by squatters.

1489. And a number of them are giving a good flow? Yes.

1490. Are there any put down by the Government which have proved successful—I understand they have put some down? Yes. On the road from the Paroo to Mount Browne there are several splendid bores—that is, between Wanaaring and Mount Browne; that is the Lower Paroo.

1491. That would be a good few miles north of White Cliffs? Yes, it would. I cannot remember all the bores and their positions.

1492. You say there are splendid bores—that is, there is a big flow? Yes.

1493. Can you give us any idea of the worth of an artesian well, so far as the country round is concerned, irrespective of the mere watering of stock;—do you think it would be of any value for irrigation? Yes; it has been proved to be valuable for irrigation wherever it has been tried by the Government.

1494. For a small extent of country? Yes. I should hardly be inclined to think, although I am not an authority on the subject, that it would be suitable for irrigating large areas of country for grass.

1495. Still, it would be a valuable addition to the resources of the district? No doubt.

1496. From the map which you are going to supply, shall we be able also to get the limits of the cretaceous formation, so far as they are known? Yes.

1497. *Mr. Shepherd.*] I think you might say that you have been a good deal about the country to the west of Wilcannia? Yes.

1498. Are you sufficiently informed of that part of the country to say distinctly that there are large mineral deposits there of any particular kind? To the north of the line, between Broken Hill and Wilcannia, there are.

1499. Chiefly copper? Copper and silver. There have been rushes over that country both for copper and silver. They have not paid so far. I think that some of them would stand a very good chance of paying if they had better communication.

1500. Are there any men at work there now? I believe those deposits I was speaking of are being worked now—at Nuntherungie, I think they are.

1501. Have they been developed to any extent? Not to any very great extent.

1502. So that you would hardly be justified in recommending any large expenditure on the supposition that this country was sufficiently rich in these minerals? No, I should hardly feel justified in doing that. I should simply say that I believe that that country, if assisted by a railway, would probably possess mineral deposits, some of which would be payable. I could not go so far as to say that it would be worth while building a railway to prove those deposits, so far as we know of them.

1503. I suppose you have been to the White Cliffs opal-mines? Yes.

1504. Are they very extensive? Opal-mining is something like alluvial mining, in some respects—that is to say, the mines themselves are not extensive. Perhaps two or three men work together, and they simply sink a straight shaft, perhaps 20 or 30 feet, and if they do not find opal there they sink another elsewhere—in fact, when I was there, they had a theory amongst themselves that you could not get opal below 12 feet, and therefore they would not bother looking.

1505. There is no organised company there now? No; it is all in the hands of miners. There may possibly be one company owning large blocks, but from the appearance of the mines you would think they are all in the hands of miners.

1506. They just hold these blocks, but are not working? Oh, yes, the miners are working. It is just like an alluvial rush; that is the idea the workings convey to anyone.

1507. At what do you estimate the population at White Cliffs? I really do not know how many people there are there now; it is about four or five years since I was there.

1508. Have they been regularly at work since then? Yes; I think they have been continuously at work. They had some trouble about water during the late dry seasons, but I do not think they have ever stopped working.

1509. Is there any other population to speak of, either to the north or to the west of Wilcannia? E.F. Pittman. Excepting the Mount Browne and the Tibooburra goldfields, there is no township.
1510. What railway station does Mount Browne now communicate with—Bourke, I suppose? Broken Hill, I think. It is considerably nearer to Broken Hill than to Bourke. There is a regular coach line from Mount Browne to Broken Hill. Broken Hill, 19 April, 1899.
1511. Mount Browne would be just about as near to Bourke as to Wilcannia, or there would be a very little difference, I should think? It is nearer to Wilcannia than it is to Bourke.
1512. I think you said you had not been very much in the country between Wilcannia and Cobar? No, I have not.
1513. You have been more on the other side? Yes.
1514. You are not aware, then, if there is mineral country between Cobar and Wilcannia? I know all the country between Cobar and Wilcannia, and I know that there is no known deposit of mineral—at least if there is, I am not aware of it, and I should be, I think, if there were any.
1515. Does the mineral country extend far to the west from Cobar? Not very far.
1516. So that really, as far as the mineral country is concerned, there is nothing sufficiently advanced or sufficiently known to justify the expenditure of money in that direction? I should think not, from Cobar to Wilcannia. It is not as though the Cobar people would take their material down the Darling. I do not think that is at all likely, because they have made arrangements to take it to Lithgow, and smelt and refine there. They get, I understand, very cheap railway rates between Cobar and Lithgow. They get their matte carried for 14s. 8d. a ton from Cobar to Lithgow.
1517. Did you notice any fairly good agricultural country to the west or north of Wilcannia? To the north there is country that would grow anything, provided that it had a sufficient rainfall; but you cannot call it agricultural country, with the present climatic conditions. I have seen experiments tried on the stations there for growing green food for horses and cattle, and about one crop in every three or four crops comes to maturity. Some of the big stations, where they had to spend large sums of money on fodder, have tried the experiment of growing oats, and they got on an average one crop in every three or four crops.
1518. *Mr. Levien.*] How often have you visited White Cliffs? Only once.
1519. Have you sent your officers there, though? Yes.
1520. What is the report as to the chances of success of those mines? The point is this: The occurrence of opal is so capricious, and it gives no sign whatever of its occurrence at the surface, and it is impossible to say what population could be kept by opal-mining in that district, or how much opal is likely to be got; in other words, it is impossible to say what are the dimensions of the opal deposits there.
1521. That will apply to all mining—for opal or anything else; it is impossible to do more than guess? No, that is not so, because in the case of lodes you have considerable surface evidences.
1522. You have been deceived many a time, have you not? You may be deceived; but here you have no evidence at all. In the case of a lode, you are able to see that there is a lode running from such a point to such a point, and by testing it at certain places between those two points you get certain results.
1523. We are told that there are 3,500 people at White Cliffs; most of those are miners—men who would have a good knowledge—and their opinion would be worth having? From my examination of the opal-fields at White Cliffs, I do not think that anybody's opinion as to how much opal there is there would be worth anything.
1524. Do you know of any instance, either from reading or otherwise, where an opinion is worth having as to opal-fields? No; I cannot say I do.
1525. Do you know of any instance where they have reported with certainty as regards opal fields—I mean as to their success or otherwise? I have met men who were prepared to report as to the success of any mining undertaking.
1526. That is to say there is no certainty about any of it; but considering that there are 3,500 people at White Cliffs, as we are told, including, no doubt, many miners with vast experience, working there for a living, do you not think that they have a fair idea as to whether they can make a living there or not? Certainly; if they have made a living there for some time, they could have a fair idea of the continuance of the living.
1527. Their opinion would be worth having, would it not? Yes, I think so. I misunderstood you. I understood you to mean, did I think anybody could say with certainty that there is so much opal there.
1528. I do not suppose any living being could do that; but with their long experience in opal-fields they would have a good idea, would they not;—I suppose men go there who have had a fair experience of opal-fields elsewhere, to see if they can make a living in that part? I do not think anybody went there who had had any experience of opals previously, except, perhaps, some who came from similar deposits in Queensland.
1529. Well, they would have experience? Yes.
1530. What is the price of opal? It sells for as much as £5 per carat.
1531. Has any opal from White Cliffs fetched £5 per carat? I think so. I do not mean that the people there get that price, but that is what the jewellers ultimately get for it.
1532. Do you think it is worth that? It is worth exactly what you can get people to pay for it.
1533. But in your opinion, what is the fair marketable value of it? There is no such value as regards opal. Gold has an absolute value, but opal has not. Its value is merely what people will pay for it.
1534. Of course, I know that gold has a recognised value; but has not opal? Opal has merely a fancy value.
1535. Have you seen opal from White Cliffs as good as opal from any other fields? I have seen opal from White Cliffs which I liked as well as any other opal; but another man might say it is not so good; it is a pure matter of fancy. A certain kind of opal becomes fashionable, and people will pay large sums of money for it, and outbid others for it; but it has no intrinsic value.
1536. Have you been to Mount Browne? Yes.
1537. What kind of field is that? Mount Browne is a goldfield.
1538. What is your opinion about it? As I have said, it is a field which, if it had better climatic conditions, would be very considerably worked.
1539. So it is merely the climatic conditions of Mount Browne which prevent it, in your opinion, from being worked? Prevent it from being more extensively worked.

- E.F. Pittman. 1540. But what is your real opinion of Mount Browne as a mining centre itself? I do not quite understand your question.
- 19 April, 1899. 1541. Supposing I were to give you £20,000 to go and develop Mount Browne, or some equally good place, to which would you go? The climatic conditions must influence me under those circumstances, for £20,000 is only a limited sum.
1542. What would you call climatic conditions? Absence of sufficient water supply, extremely hot weather, and scarcity of wood.
1543. Would you call water supply climatic conditions? I should call water supply one of the effects of climatic conditions, most undoubtedly.
1544. What is your opinion of Mount Browne, apart from all those considerations? I do not know what other opinion I can express beyond what I have said.
1545. Supposing there were a water supply there—supposing the climatic conditions were favourable, and there were a pleasant atmosphere and plenty of water there—what would you say of Mount Browne then as a mining-field itself? I think it is probable that there would be a very considerable amount of mining development there.
1546. But, in your opinion, is it a gold-bearing country? Yes, undoubtedly.
1547. Therefore you look upon the field itself, apart from the climatic conditions or water supply, as a gold-bearing country? Undoubtedly.
1548. Would you say it is a payable one? With those conditions altered, I think it would be highly payable.
1549. Leave those out? I cannot leave those out. If you ask me my opinion, I must be allowed to give it unconditionally. I cannot say what would happen if certain things were not there. I must be allowed to give my opinion on the matter as it appears to me.
1550. But the water or the climate would not bring the gold there? No; but they would bring facilities for working the gold.
1551. I am not considering the facilities for working; people have in many instances to bring water many miles to work mines? Yes.
1552. They have to bring machinery thousands of miles? Yes.
1553. They cannot bring the climate, no matter what they do? No.
1554. Then, in your opinion, is it a gold-bearing country that would pay? If you insist on my leaving out those conditions, I must say it is not a gold-bearing country that would pay.
1555. Why? Because they have not the facilities for working it. You cannot work gold without water.
1556. But supposing the water can be brought there? If you brought the water there, I say it is all right.
1557. But is the gold there? I have already said the gold, in my opinion, is there.
1558. And you think it would pay if the water could be brought there? No; I do not say that exactly. I say that if the water were there it would pay. It would not pay to bring the water there to work the gold; for there is not, so far as I am aware, any place to bring it from.
1559. Supposing it were opened as a mining-field, would it be a sufficiently extensive field for a large population? It is not a very extensive field.
1560. But have you gone over the field in such a way that you can give a direct opinion about that? Yes.
1561. How long were you there? I could not tell you without referring to my notes. I was about two months in the district on the one trip, and I visited wherever there was anything to be seen in the shape of mining. I could not do more than that. I am speaking only from the experience gained from that and from reports that are continually coming in from the district.
1562. Have you ever been further than Mount Browne? I have been right up to the Olive Downs Station—in fact, right up to Warri Warri, right on the Queensland border.
1563. What sort of country is that? It is all pastoral country north of Tibooburra.
1564. Is it rich or poor? Some of it is very good—Mitchell grass, and that class of country. It all depends on the season.
1565. Good sheep-growing country? Yes; all for sheep. It is a splendid country—when it has a fair rainfall—that is, in fair seasons.
1566. Taking generally the country from Wilcannia right up to the place you mentioned on the border of Queensland, what is your opinion of it;—I suppose you have a fair idea? There are so many ways of expressing one's opinion.
1567. Well, as to pastoral purposes; put that first? It is pastoral country, undoubtedly.
1568. Undoubtedly good? Yes, when it has a sufficient rainfall.
1569. With fair seasons? Yes.
1570. Now as to mineral? I know of nothing in the shape of mineral north of Tibooburra.
1571. What is the country about Tibooburra? It is a granite goldfield.
1572. What do you think of that as a goldfield? Well, it supports a number of miners in sluicing—working alluvial claims.
1573. Do they get a fair living there? I cannot give an idea of what they make.
1574. I suppose you were not there long enough? No, I was not. It is all shallow alluvial working.
1575. But in having a general conversation with those miners in going through there, what is their general expression of opinion about that? They are always asking for rain, and not getting it.
1576. I mean as to the chances of success in getting gold? It is not a very rich goldfield.
1577. But is it such a one that the men would make a fair wage at it? Spasmodically, I think.
1578. If you had a man out of work, would you keep him here, or would you send him there for the chance of making a fair living? If I wanted to be sure of his never coming back, I would send him there.
1579. I mean as to the chance of his making a living? He would have a better chance of making a living there than here, in good seasons.
1580. He would have a chance of making enough to keep himself and family? Yes, in fair seasons.
1581. They could get a fair living there? Yes, in fair seasons.
1582. Where do the people there now get their water from? They have it in tanks.
1583. Are there no creeks or rivers? They are conspicuous by their absence.
1584. It is a great barren space, according to that map? It is very little better. 1585.

1585. Are there no creeks in which they can conserve water? In the vicinity of Mount Browne they can. They have a dam in a creek close by Milparinka, I think. E.F. Pittman.
1586. Are there any big creeks running through there? Not a big creek, but there is a fair-sized creek, which contains water in holes during fair seasons. 19 April, 1899.
1587. Is the country at all hilly about Mount Browne? Yes, it is.
1588. So there would be a fair waterfall off these places? Yes.
1589. How is the ground for holding water? I should say it is fair to medium.
1590. That is to say, that in your opinion the ground would hold water? Yes. I do not think it is first-class holding ground; but I think it would hold water fairly well.
1591. How about Tibooburra? That is all granite.
1592. How is that for holding water? That would be good for holding water.
1593. Is it hilly country about there? Yes, fairly hilly.
1594. There would be a good place for holding water there? Yes.
1595. Do you know the distance from Tibooburra to Wilcannia? I cannot say right off. I have travelled it.
1596. Well, roughly speaking? Two hundred and odd miles.
1597. And the traffic of that Tibooburra, Mount Browne, and White Cliffs country all centres in Wilcannia? Not all of it. A large amount of the traffic goes to Broken Hill, where there is a railway.
1598. You, having travelled that way, and been there a month or two, do you think that the trade would centre in Wilcannia, and come from Wilcannia into this Colony? If a railway were built to Wilcannia, it stands to reason that a great deal of the traffic that at present goes to Broken Hill would go to Wilcannia.
1599. To Wilcannia, and then from Wilcannia into this Colony? Yes.
1600. Did you see many people travelling along there? Yes, a good many.
1601. And it is a fairly populous district, say, from Wilcannia to White Cliffs and Mount Browne, and up to Tibooburra—it is a fairly trafficable place? For that sort of country, it is.
1602. So they seem to make to Wilcannia? Yes; I found that most people there regarded Wilcannia as a centre.
1603. So, naturally, the trade would centre in Wilcannia, and then come on to this metropolitan area? Yes. If the colonies were federated, I think it would be different, though.
1604. *Dr. Garran.*] I understand you to say that all this western country is a large cretaceous plain, with peaks and ridges rising up occasionally? Yes.
1605. Do those peaks and ridges represent spurs of the main dividing range? Well, hardly that; it is more a dividing range of itself.
1606. A parallel range? Yes.
1607. Is Cobar part of such old country? Yes; it is the same rock. But Cobar is on a sort of submerged range, which runs at right angles from the main dividing range—a sort of T-piece.
1608. Cobar is on a spur from the main range? Yes.
1609. And it is in these spurs that there are likely places to look for minerals? Yes.
1610. What is the characteristic rock of Cobar? Silurian slate.
1611. Has it been penetrated by dykes? Yes.
1612. Of what character? Diorite, chiefly.
1613. And it is in those places you look mostly for mineral? Yes.
1614. Do these mineral belts run mostly north and south, or east and west? As a general rule, they run north and south; but Cobar, as I have said, is an exception to that, in being situated on a range that runs west from the dividing range.
1615. Is there any high land between Cobar and Nyngan? The old rocks come to the surface, but there is not any very high land.
1616. Has any mineral been detected in any part of the country between Nyngan and Cobar? I do not know that it has.
1617. Then it is only in particular parts the spurs are mineral-bearing? So far as I know. They may be mineral-bearing in numbers of other places where they have not been prospected.
1618. Now, seeing that there is mineral at Nymagee and Mount Hope, would that be in the same strike as Cobar, or quite independent of it? Quite independent of it.
1619. Would that be on another spur of the main range? That is a very difficult question to answer. It may be a very wide range, or it may be a spur; I cannot say. There is not sufficient evidence on the surface to show.
1620. You cannot at present say? No.
1621. Is there any evidence that the spur between Cobar and Wilcannia continues beyond Wilcannia? I have no evidence of it.
1622. That is the end of it, so far as you know? Yes, because the surface is all covered with soil.
1623. Does it show a dip to the west rapidly? No. The range gradually becomes lower, and then meets the surface soil, which obscures it to the west.
1624. But, of course, under this overlying cretaceous soil, there may be, of course, mineral deposits? Yes.
1625. Only they will have to be groped for? Yes.
1626. Do the railway surveyors, when they are out on their expeditions, report to you if they see anything in making their surveys? Occasionally some of them do, but very seldom.
1627. This line between Cobar and Wilcannia, we have been told, has been travelled over several times by surveyors? Yes.
1628. Have they ever reported to you any mineral indications? No.
1629. Have you been over that route yourself? Only a portion of it—not a very large portion of it.
1630. On the portion over which you have been, have you detected any of this old country cropping out? No. The older rocks outcrop in places for 80 miles westward of Cobar.
1631. Supposing the spur does continue from Cobar, it is overlaid with a cretaceous formation? No, with Pleistocene soil.
1632. With a non-mineral soil? Yes.
1633. Is there any hope of mineral being found between Cobar and Wilcannia? Yes, there is a chance of its being found.
1634. We have to cross the Darling to get to mineral country? There is mineral country across the Darling.

- E.F. Pittman. 1635. Would not a line merely between Cobar and Wilcannia open up a mineral country? It would open up country in which mineral deposits may occur.
- 19 April, 1899. 1636. It would only be useful for the country beyond? Yes.
1637. Is this mineral strike at Mount Browne a continuation of the Broken Hill, or rather a continuation of the White Cliffs? I cannot say whether it is a continuation of either, for between both places the country is quite obscured by those superficial deposits. In appearance the Mount Browne stone is not at all like the Broken Hill stone.
1638. What is the main rock at Broken Hill? It consists of gneisses and banded quartzites, whereas at Mount Browne it is a slate.
1639. Now, with regard to the great mines in Australia, have not many of them been developed altogether apart from railway facilities? That is so.
1640. Was not the Burra Burra a great mine before there was a railway to it? Yes.
1641. And Broken Hill? Yes.
1642. And Cobar? Yes.
1643. And Mount Browne? Yes.
1644. And Peak Downs? I believe so.
1645. Then, admitting that we have a mineral district beyond the railway line, would you, as a geologist, say that it is best to make your lines on speculation, or to wait until the great mines develop, and then bring your railways to the localities where the mineral deposit is? I do not think I have intentionally conveyed the idea that I would say that a railway should be made for the purpose of developing mines in this district.
1646. You would not make a prospecting railway? No.
1647. Admitting the mineral character of the north-west corner of this Colony, would it be wise, for instance, to make a railway from Wilcannia to Mount Browne on the chance, or to wait until something was definitely developed, and then make a railway to the mines? I certainly do not think it would be worth while to make it for the sake of the minerals alone.
1648. You think that the uncertain mineral character of the country at present would not justify the construction of a railway? I should think not.
1649. You see that in making a line to Cobar we were making it to a mine as well as to a mineralised country? Quite so.
1650. I am speaking especially of the policy of making railways to what you, as a geologist, call mineralised country? Quite so.
1651. There might be a great deal of mineralised country, but no mine in the paying sense of the term? Quite so.
1652. With regard to Mount Browne, is that an alluvial or a reefing field? Both alluvial and reefing.
1653. Then, when the alluvial is worked out, there is a good prospect for the reefs? Yes; the alluvial, I think, has been pretty well worked out.
1654. You are not able to say whether the opal field is a permanent field or not? I think it is a permanent field, as far as one can tell. I merely state that the occurrence of opal is so capricious that I think that anyone who tried to make a statement as to the amount of opal there would be simply saying what he was not justified in saying.
1655. Is it permanent enough to justify the construction of a railway to it? As far as its permanency is concerned; but I should hardly have thought that the trade of the place would have justified the construction of a railway.
1656. *Mr. Watson.*] I understood you to say a little while ago, when referring to the bearing of the construction of a railway upon mineral development, that it would have a good effect in helping to develop the mineral wealth? Undoubtedly that is my opinion.
1657. I did not understand you to imply that it would be worth while constructing a railway simply for the purpose of developing minerals, but that the effect of railway construction would be to help forward things from the mineral point of view? That is what I wanted to convey.

Richard Sleath, Esq., M.P., sworn, and further examined:—

- R. Sleath, Esq., M.P.  
19 April, 1899.] 1658. *Mr. Dick.*] Do you think, if a railway were constructed from Cobar to Wilcannia, that the people in the whole of that north-western corner of the Colony, or a majority of them, having certainty of transit, would send their goods along that line instead of down the river practically at all times? Yes, I think so. I think the great bulk of the traffic of the north-western corner will go to Wilcannia, and thence by rail.
1659. What is their outlet at present? The only possible outlet at present is to Broken Hill.
1660. It is a matter of necessity, then, for them to go to Broken Hill at present? Yes; because if the river is down, and they bring anything to Wilcannia, they cannot get it away from there.
1661. Is there any difference between the character of the country for traffic purposes between Mount Browne and Tarrawingie, and between Mount Browne and Wilcannia? Yes. Going from Mount Browne to Tarrawingie, you have to cross over what is known as the Euriowie Ranges. It is very difficult for teams to get over those ranges, because they are a succession of ranges extending about 12 miles, and it is impossible for teams heavily laden to travel over them at all. It is all plain, open country from Mount Browne to Wilcannia.
1662. So that, given facilities for getting away from Wilcannia, it seems that Wilcannia is the natural outlet of that district? Yes. Wilcannia has been always the great distributing centre for the whole of the western portion of that country.
1663. How far east would the distributing area of Wilcannia extend—does it go east to the Paroo? Yes, until you get farther north to Wanaaring. Wanaaring is, I think, served as a rule from Bourke, though sometimes from Wilcannia. All the lower Paroo is, of course, served from Wilcannia. Wanaaring is almost in a straight line between Bourke and Milparinka.
1664. You have a pretty good idea of the character of the mineral operations that are being carried on in that district. I have.
1665. Will you take the larger centres, and give the Committee a general idea of the scope of the work being carried on there (say) all north and west of Wilcannia? The work that is actually going on at the present time is about 20 miles west of Wilcannia, where there is a large copper lode being opened up.

As

As to whether it is going to be of a permanent or payable character, I am not in a position to form an opinion, because I have not seen it since it has been opened up. A number of men are employed on it.

1666. *Mr. Watson.*] That is on the road to Broken Hill? Yes. Then about 10 miles further west there is a claim which I believe is being worked. If it is not, they have got suspension of labour conditions, for it is held by a number of Wilcannia people, and was at work the last time I was up there. That is at Caulker's Well. It is gold.

1667. *Chairman.*] Is there any tin there? I do not know of any tin. I am talking of the claims now actually being worked. There has been very little development on the Caulker's Well field, although it is some years since it was first started. They sent away one or two shipments of stone, which went, I think, something like  $1\frac{1}{2}$  oz. of gold to the ton, but apparently the men and the manager knew little or nothing about mining, and considerably mixed it up. Those are the only two claims I know of close to Wilcannia on the western side which are at present being worked. Then, of course, there is the White Cliffs opal-field. I heard Mr. Pittman give his evidence, but you should understand that it is three or four years since he was there, and a very different style of working has been adopted of late years compared with that in operation when he was there. A London company bought, I think, some six or eight 40-acre blocks, they buying out Turner, Richardson & Co., and others who held a number of 40-acre blocks. They have been working those blocks partly by wages, and partly on what is known as the tribute system—that is, the miner gets a certain percentage of what he finds.

1668. *Mr. Watson.*] What does the percentage generally amount to? They have increased the percentage lately. The company give 75 per cent., and take 25. They have a manager of course, and deputy managers, because they are working over a large extent of country. They are able to sell better. They keep a classer—a man who judges the quality of the opal, puts each class by itself, and values it, and then they are able to deal much better in that way with buyers, and get a better price than would be the case if each miner were selling the opal independently. The result is, that in many cases the 75 per cent. is almost as good to the miners as if they were working the mine entirely "on their own." Now, I think they have shafts down over 100 feet. You may get opal anywhere—you may get it 1 foot from the surface, or 2 feet, or any distance down; and you will come on it, especially near the surface, in patches—that is, until you really get on to it you will have no indication that it is there. You may get a patch a foot down, and may turn over the whole of that country and not get any more for many feet or yards at that depth. But when they have got down into settled country, it is proved that there the opal runs in a sort of layer or stratum—flat, on the same principle as a coal seam,—and they are able to follow it by means of tunnels; and although they may be on the seam of opal, that opal may be valueless, because there is any quantity of it that has no colour—what they call locally "potch" opal. Then, of course, there are all different qualities from that up to the very highest value.

1669. *Mr. Trickett.*] What stone is it found in? It is like a soft, limy, sedimentary deposit. That denotes opal-bearing country. You get it in all forms. It is a most peculiar thing. Sometimes, perhaps, you will get a round water-worn boulder, and if you break that boulder, you will find inside it a very valuable piece of opal. You get it in all sorts of ways; but, generally speaking, in the soft country, it is lying flat. Sometimes it is got in harder country, and then generally it is in larger pieces, and of very good quality, too. The extent of that opal-field runs from White Cliffs right away up to the back station of Momba, Purnanga,—which is close to the Paroo. It extends about 40 miles from White Cliffs. Then, in a north-westerly direction, it goes about 17 miles, I think, from White Cliffs to a place known as The Bunker. They have been finding opal there for a considerable time, and there have been a number of men there for the last three or four years, and I have had information since I gave evidence last before this Committee, that there are over 100 men employed there now, and that they have got some excellent opal. It is all opal-bearing country all round that area. Of course, as to the quantity of opal which that country may hold, no one can form any idea.

1670. *Chairman.*] The same country extends right to Cooper's Creek, does it not? Practically, the same country, and in a portion of that country, which has been thoroughly prospected, they have got a better quality of opal at a depth than they have got on the surface, and the small portion that has been developed has proved exceedingly rich in opal.

1671. *Mr. Dick.*] How deep do you go, as a rule, for opal? I think that in Hungary they have worked it to a depth of 5,000 feet.

1672. And how deep at White Cliffs? The last time I was there I think they had tested it only to a depth of 100 feet. To start with, they used to take it in what they called paddocks. They dug a little shaft, and if they did not get anything after going down 10 or 12 feet, they dug another shaft alongside, and kept on going along like that on the surface. But they found that that was the worst possible method they could adopt, and so they have adopted a system of regular mining. I may say that just at the back of the township of White Cliffs there is a high hill—in fact a mountain—of this sort of limy deposit, and they are really turning the whole mountain over.

1673. *Mr. Watson.*] After opal? Yes; it is all opal-bearing, and they are digging into the face of the mountain as you would in making a railway cutting, and are filling it into waggons and tipping it over an embankment. Then, to the north-west of White Cliffs—more west than north I should think—there is the Nuntherungie copper and silver field. Some twenty years and odd ago, it was worked rather extensively. Mr. Quinn, who was a Member of Parliament here, I think, was very successful in his dealings with that. He was one of the first to open it up, and I believe he made a lot of money out of it. Then, the cost of carriage stood in the way, and they could work out only the rich veins of copper. They could not deal with an ordinary copper-lode, such as there is at Cobar or Girilambone, and other copper-fields. They simply dug it out from rich patches, and carted it down to Wilcannia, and sent it away. A company was formed, but for some reason or other they gave it up.

1674. Would it not require to be rich ore to be carted down from the mine to Wilcannia, and sent thence by steamer to another place for treatment? It would require to be particularly rich. About six years ago, I think, there was a rush there for silver. Those of you who remember it will recollect that all the metropolitan papers declared that it was a second Broken Hill—in fact that it was going to be greater than Broken Hill,—and at one time I suppose there were 2,000 men on that field; but the cost of carriage then killed them. They were working then, not so much for copper as for silver. Most of the claims then were held and worked for silver, and a great number of parcels were sent away—that is, a great many parcels of 5, 10, or 20 tons were sent away to Adelaide, Sydney, and elsewhere for treatment—and they returned a very high percentage of silver, and in some cases a fair percentage of lead.

1675.

R. Sleath,  
Esq., M.P.

19 April, 1899.

R. Sleath, Esq., M.P.  
19 April, 1899.

1675. *Mr. Shepherd.*] Is that the Corona country? No. Corona is on the western boundary, about 16 miles from Tarrawingie. Nuntherungie lies almost in a direct line between White Cliffs and Mount Browne—I suppose, about 40 miles from White Cliffs. A great many of those parcels averaged 60 or 70 oz. of silver. It was not a silver ore that went very rich in lead. Most of those who had those claims were poor men. It is a very difficult country for mining experts or capitalists to reach when you have no railway, because you have to travel from Cobar to Wilcannia by coach, and also from Wilcannia up to there; and owing to the heavy carriage the field had practically to be deserted. A few months ago a number of men there again took up those claims, and started to work. I think that, the week before last, there were applications lodged in the local warden's office at Wilcannia for six 40-acre blocks to be worked for copper, and there are a number of men actually working there now, and have been. Going further north, but more east—much in the same direction—there is Kandie Peak. I think I have already given evidence in reference to that. There have always been a few men prospecting there, but not very many.

1676. *Mr. Watson.*] You said it was something similar to Peak Hill? Yes; the reef or lode is exactly the same as that at Peak Hill. The gold is held in an ironstone formation. It is all good country round there. I have myself many a time drolled a piece of the stone, and got a very fair prospect indeed; and even if you take the surface soil and wash it off, you can always get a prospect all round that country. As to the Kooningberry Range—a range that rises very abruptly nearer to White Cliffs than Mount Browne—a great deal of fuss was made about the place some years ago, and several people visited it and reported favourably, and floated a company; and, if I recollect rightly, after a little work had been done the local manager was missing.

1677. Also some money? Yes, I think so. However, they had not done any considerable amount of work. They had simply been tunnelling into this high mountain that rises very abruptly. When I was up there recently I found that some of the station-holders round there had gone in halves with a number of working miners, and were forcing this tunnel through with the expectation of cutting a very rich gold reef. Whether those expectations will be realised or not, I cannot, of course, say, but we can see a reef, that may be gold-bearing, outcropping right through the range.

1678. *Dr. Garran.*] Is it gold-bearing where you see it? Certainly it is not payable where it is outcropping; but we know by experience that you may get almost a barren reef in the outcrop, and a very short distance down it may be very rich.

1679. And sometimes the other way? Quite so; but the fact that the reef is there, and that it is gold-bearing, although not in payable quantities, is a very good indication that it is worth trying.

1680. *Mr. Watson.*] It is the usual thing that if they see indications they have a prospect? Yes. Of course when we get the gold on the surface it is much handier.

1681. *Mr. Shepherd.*] Sometimes you get a good show on the surface and none down below? Quite so. I myself do not care very much about these very sensational things on the surface. Then, going north, of course, we come on to the Mount Browne field. Mr. Slee, the Chief Inspector of Mines, was the first warden when that field was opened. He was there at the first rush, and remained there for a considerable time, and I think he ought to have as good an idea about it as any man in the Colony.

1682. *Mr. Dick.*] Can you give us any opinion about Cobham Lake? It is a very large lake. It was never known to be dry until, I think, 1892 or 1893. It has been pretty low, and the water has not been very good. The water gets a little salty when it is very low. The reason for its getting dry on that occasion was that the main creek which runs into it—Evelyn Creek—gathers the whole of the water from the north-western corner, practically, and after rain it comes down with terrific force. They had been cutting some big gums that grew on the banks of the creek, and had left portions of them lying about, and a small quantity of water coming down caused the place to silt up, and then a heavy fall of rain coming, the loose soil on the banks of the creek gave way, and the water spread itself over a big plain lying to the east and did not go into the lake.

1683. *Mr. Levien.*] How far is that lake from the town? About 30 miles from Mount Browne in a direct line.

1684. *Mr. Watson.*] That was an accidental diversion of the whole source of supply? Yes.

1685. *Mr. Levien.*] What is the area of that lake? I cannot tell you, but it is very large; it is a sort of double lake.

1686. Is it deep? The last time I was there, about twelve months ago, there was 15 feet of water in it, and that was after February, when we had had 2 or 3 inches. They reckon the evaporation there at 5 feet a year. From Mount Browne to Tibooburra, or a distance of 35 miles, is one mineral belt. It is alluvial as well as reefs. One peculiarity about it is that a good many men are making a very good living indeed, simply by washing the surface soil. They have wash-dirt right on the surface, and when they can get a supply of water they do very well in puddling it. The deepest lead proved at Mount Browne is, I think, at a depth of 240 feet. It was worked by a Melbourne company for a few years, and when they had any surplus cash in hand they paid dividends, and when they did not have sufficient to pay wages the men had to go without. They got very sick of that, and the company got in debt, the miners sued the company for wages owing, and the whole of the plant was sold, and the shaft of that deep lead is used now for a public watering place. That is at Mount Browne proper. Then there is what they call the "One Mile,"—that is a mile nearer to Milparinka. They are working there at a depth of from about 100 feet to 120 feet, and at the "Four Mile"—that is 4 miles further towards Milparinka—I think at a depth of from 60 feet to 80 feet; but as they go out to the south-west, which is the trend of the lead, the sinking gets deeper. Then, about 5 miles from Milparinka towards Tibooburra is where the reefing field begins—what they have called Little Bendigo. They treated a quantity of the stone at a local battery, and I think the first 150 tons that were treated from one claim gave a return of something over 6 oz. to the ton. They sent me down some of the tailings, and when I was there some time ago I carefully selected samples from the different tailing heaps, and the tailings averaged from 1 oz. to 3½ oz. The battery is an old 10-head battery that was really done for when it was placed there some fifteen or sixteen years ago. W. R. Wilson was the man who placed it there, and it was so useless that, I think, he sold it for £40 or £50 as it stood. From there right on to Tibooburra there is Waratta East and West, Evan's Gully, and what are called the Waratta main reefs, and right away from Little Bendigo into Tibooburra, a distance of about 20 miles or more, there are reefs exposed, which have been opened up to some extent. But the great difficulty that miners there have had to contend with has been the difficulty about getting machinery for

for treating the ore. However, some of it has proved exceedingly rich. Some of the leaders have in places been almost solid gold.

1687. *Mr. Watson.*] Narrow leaders? Very narrow, perhaps only half an inch thick. But I have seen pieces weighing half a pound or 1 lb. almost all pure gold—with scarcely any quartz at all. The reefs have never been properly prospected there. It is only about two years since they first discovered those reefs, and owing to the dry seasons and other things the reefs have never been properly prospected. Now a company from Bourke is working there, and I believe they are going about things in a more business-like manner than was done before. The alluvial around Tibooburra is much the same as the alluvial around Mount Browne.

R. Sleath,  
Esq., M.P.

19 April, 1899.

1688. *Mr. Dick.*] Taking a general view of that district, would you describe it as rising, stationary, or falling in the matter of prosperity? The population has gradually increased. Sometimes it becomes a shifting population on account of drought. Two or three months ago it was supposed that the whole of the population would have to leave White Cliffs on account of want of water. Sometimes people have to leave Mount Browne for that reason. I have seen 300 or 400 men on Mount Browne—not that they had any richer patches to work than they have now, but because they had had a good rainfall for a year or two, and there was plenty of water available. Now, I do not suppose that there are more than fifty or sixty miners on Mount Browne—that is, Mount Browne proper. I do not refer to the country east or north-east of Milparinka.

1689. Do you think many of these fields are likely to prove permanent? Well, Mount Browne broke out fifteen, sixteen, or seventeen years ago, and it has been a permanent field ever since, and there has been a great deal of development since then—that is, the reefs were not discovered just then. The leads round about Tibooburra were not discovered then; so I think there is every prospect of its being a permanent field. Of course, they labour under many disadvantages, but it is a field that will always carry a fair population for a great many years.

1690. What will be the general effect of a railway to Wilcannia upon the mineral operations in that district? It is not very long ago when the people at White Cliffs, and right up the line, had no flour for a week—they could not get it. A team was going through from Broken Hill, or somewhere else, the horses died, and the people had to eat what they could get. They had no vegetables or flour, and they had to subsist as best they could on meat, Nestle's food, and anything else they had. People, once they have had such an experience as that, do not care for it again. But if a railway to Wilcannia were constructed, they would be able to get flour and that sort of thing at very short notice.

1691. That would induce a considerable increase in the population? Yes.

1692. And a corresponding increase in material wealth? Undoubtedly.

1693. *Mr. Levien.*] How many people do you think there are, roughly speaking, at Mount Browne? I think there are only about fifty or sixty miners there now. Of course, there are their wives and families.

1694. *Mr. Dick.*] Then, in a bad season, you could have got food from Wilcannia to the northern places when you could not get it from other towns, such as Broken Hill? Yes. The road from Broken Hill is a bad one, from a teamster's point of view, in many ways. First of all, you have the Euriovie Range to contend with, and that is a serious matter for a teamster with anything like a decent load, and then that road from Broken Hill is hardly watered. The bores put down there have not been a success. But from the first stage from Wilcannia out towards Mount Browne it is a fair road.

1695. With a railway to Wilcannia, food could always be sent to them? Yes.

1696. *Mr. Levien.*] What are the stations right out to Mount Browne? The largest station is really where White Cliffs is—Momba. It consists of about 3,000,000 and some hundreds of thousands of acres.

1697. How many sheep? That country does carry about one sheep to 8 acres. Of course, in a good season it would carry many sheep to one acre; but they have to stock the country rather lightly, so that if there are two or three bad seasons there will be some grass left, and the stock will not all perish.

1698. All the people at Mount Browne must be making a living there? Yes; they send a lot of gold down to Sydney.

1699. They must be making a fair living, or otherwise they would not stop there? Yes; when they have plenty of water they make a good living, and when they have not they do not do very much.

1700. *Mr. Dick.*] In reply to a question, Mr. Harper makes this statement, referring to White Cliffs:

That is an opal field, about 60 miles from Wilcannia—a place of doubtful permanence, carrying a population of about 1,000.

Do you agree with that? Mr. Harper makes many ridiculous statements, and that is one amongst the many. The Rev. Father Curran, admittedly a geologist of some standing, and Mr. Pittmann, and also the South Australian Government Geologist, and many visiting geologists from America, Germany, and other countries, have visited that field, and have declared that it is one of the largest and best opal-bearing deposits they have ever seen. As a matter of fact, it stands to-day the largest opal-mining centre in the world.

1701. *Chairman.*] Have you heard of tin being found in that district? Not outside of Euriovie. There are some of the largest tin deposits in the country there, but that is some distance from Wilcannia.

1702. *Dr. Garran.*] Does that range run east and west, or north and south? It is not a continuous range; it is volcanic.

1703. Due north of Tarrawingie? No; I think it is a little to the north of east.

1704. The teamsters have to cross it? Yes.

1705. Can they not go round it? No; it is all broken country right down on to the Purnamoota Creek.

THURSDAY,

THURSDAY, 20 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. ANDREW GARRAN, LL.D.	WILLIAM THOMAS DICK, Esq.
JOHN CHRISTIAN WATSON, Esq.	

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Richard Sleath, Esq., M.P., sworn, and further examined:—

R. Sleath,  
Esq., M.P.  
20 April, 1899.

1706. *Dr. Garran.*] Your electorate of Wilcannia is a very wide-spreading one? Yes, it is.
1707. How near does it go to Broken Hill? I suppose 30 miles.
1708. And its western boundary is nearer to Broken Hill than to Wilcannia? Yes, it is.
1709. How far up the river towards Bourke does it go? Just the other side of Tilpa; about 100 miles.
1710. The people in a small portion of the south-western part of your electorate would naturally trade with Broken Hill? Yes.
1711. And those living in a small portion of the north-eastern part would trade with Bourke? I think they would rather trade with Cobar. The people in that portion would not trade with Wilcannia. It is nearer, right across from the river, to Cobar than it is to Wilcannia. It is 79 miles from Cobar to Louth, and it is about the same distance from Bourke to Louth.
1712. Does any of the trade of your district cross the river at Louth and go to Cobar? No; I do not think so.
1713. If it gets to the river it goes down the river? Yes.
1714. With the exception of those outlying portions, then, the bulk of the trade of the electorate concentrates in Wilcannia? Yes.
1715. That is the natural commercial centre of the district? Yes; it has always been.
1716. Is Wilcannia nearer to Broken Hill than it is to Cobar? Yes.
1717. How many miles? Wilcannia is about 40 miles nearer to Broken Hill than it is to Cobar. I think it is 120 miles from Wilcannia to Broken Hill, and 160 miles from Wilcannia to Cobar.
1718. I presume you are pretty well acquainted with the views and opinions of your electors? Yes.
1719. Supposing the Government were to offer them their choice of a connection with Broken Hill, or with Cobar, by railway, which do you think they would prefer, seeing that they are 40 miles nearer to Broken Hill? They would prefer a connection with Cobar.
1720. They are nearer to the sea-coast at Port Pirie than they are to the sea-coast at Sydney? Yes; but then there are so many obstacles in the way. There is, for instance, a private company's tramway which somewhat interferes.
1721. That would raise the cost of carriage a little over that length of line? Considerably. They charge nearly as much over the 40 miles of private tramway as is charged for the whole distance of 200 miles on the South Australian Government Railways.
1722. You are pretty clear that they would prefer connection with Cobar to connection with Broken Hill? Yes; the general opinion out there is that, as they are part of New South Wales, they would like to be connected with the capital of New South Wales.
1723. That is more than a sentimental idea, you think? It is. They seem very strongly in favour of that.
1724. To put the question in another way: Supposing that a railway from Cobar through Wilcannia to Broken Hill had been made, and it was nearer to Port Pirie from Wilcannia than it is to Sydney, do you think that such trade as went by railway would go mostly to Port Pirie or mostly to Sydney? Of course, that is a very difficult question to answer, but one reason why a good deal of the trade would go to Sydney is this: Sydney is a very large distributing centre—a large commercial centre. Port Pirie is not. To get or to send goods via Port Pirie you would require, practically, to get them from Sydney to Port Pirie, or to send them from Port Pirie to Sydney. I admit that the sea-carriage would not be very heavy, but it would mean a great delay in time; and, as regards ordinary goods, I think the feeling amongst the business people and the general community up there is as to being able to deal quickly. They seem to attach great importance to that.
1725. Do you know enough of the details of the trade to say whether Wilcannia storekeepers can buy more cheaply in Sydney than in Adelaide? From personal experience I cannot say, but they all profess that they can buy much better and more cheaply in Sydney.
1726. Does that arise from the fact that Sydney is the larger market, or that we have so much freetrade in Sydney? It may be a little from both. Sydney, of course, is the great terminus for many of the big sea-going vessels, and I suppose that it is as large a distributing centre as any other town in Australasia, if not larger; and probably on account of the fiscal policy of this Colony, also, the people there are able to buy more cheaply in Sydney. The firm opinion amongst the merchants up there is that they can buy more cheaply in Sydney.
1727. Then, if there were a railway right through to Broken Hill, which would really make a continuous railway from Sydney to Port Adelaide, you think that the Wilcannia buyers would take the longer way of journey for their goods and get them from Sydney rather than from Port Adelaide? That seems to be the impression amongst them—that is, in accordance with their own statements.
1728. That is the impression you gathered? Yes. They prefer to deal with Sydney if they can possibly manage to do it at all.
1729. Supposing that the river were regularly locked right away from Wentworth to Bourke, so that steamers could go up and down with full cargoes during the whole year, then the water-carriage either down the river or up it would be cheaper to Wilcannia than any land-carriage by either railway? No doubt it would be.
1730. Do you think if it were put to the people: "We will spend about £500,000 in making a railway to Wilcannia, or we will spend the same amount of money in locking the Darling," which would they prefer? They would prefer the railway.
- 1731.

1731. You think they would? Yes. The reason for that is that even if they had continuous water-carriage by the river being locked, it would take a long time for them to get goods shipped from Sydney, because they would have to bring them to Adelaide and take them by rail from Adelaide to Morgan, and then by the river. And even if the river were locked it would take a considerable time to get them from Morgan to Wilcannia. R. Sleafth,  
Esq., M.P.  
20 April, 1892.
1732. But the rates for insurance would be much lighter, would they not, if the river were fully locked? They would be much lighter than they are now, I presume; but still there would be no insurance on the railway travelling, whereas, on the river, they would still have insurance and loss of time, and also an outlay of capital on which they would be receiving no return while the goods were in transit; and I suppose in all classes of business you sometimes find it necessary to get goods quickly.
1733. Still, the people of Wilcannia, and along the Darling generally, do, I suppose, look forward to the locking of the Darling? They think that that is a thing which will ultimately take place, but I think the general opinion just now is, and they are afraid, that the expense would be considered too great.
1734. They hope that it will come under Federation? Yes; they hope it will be done some day.
1735. It is an idea that is in their minds? Yes.
1736. They will always press for it? Yes. A good many years ago a syndicate was formed for the purpose of carrying it out as a private work. I think they had some difficulty in getting legislative sanction, and they allowed the idea to drop. That was in the days when money was more plentiful out west than it is to-day.
1737. Did they ever have the idea that the thing would pay on its own footing? They thought it would pay. A private company was prepared to carry it out, if they could get legislative sanction.
1738. Supposing we had had this line from Cobar to Wilcannia during the last four years' drought, I suppose there is no manner of doubt that we should have got the bulk of the business at Wilcannia? Yes; you would have had the trade of all that country lying west and north of Cobar.
1739. Nothing would have come overland in drays from Broken Hill to Wilcannia as against the railway from Sydney? No; the freight from Broken Hill to Wilcannia, a distance of 120 miles, at the lowest charge, is 1s. a ton per mile, and during the drought, when it was very difficult to get either feed or water for their stock, the teamsters had to raise the charge for carriage to double and treble that.
1740. Then the cost of land-carriage would be practically prohibitory? Practically it has been.
1741. It could not compete against the railway? No; not at £15 or £20 per ton from Broken Hill.
1742. Not even if the Commissioners, feeling they had a monopoly, put on the usual full charge? That would be a mere moiety of what the team charge would be from Broken Hill to Wilcannia.
1743. Supposing we have the river open half the year, and closed half the year, then, by parity of reasoning, we may assume that during the half-year when the river is closed, whatever traffic goes to Wilcannia must go by the railway? If the river is closed, the whole of the traffic must go by rail, of course.
1744. When the river is open, will the traffic go by water or by land? There is no doubt that some of the traffic would go by water—at least, that is my opinion.
1745. You say "some";—do you think half would? It is very doubtful. If the river were very high—an excellent river—and if plenty of steamers were available, they would probably get half of the trade.
1746. But the river being in its present state, the Railway Commissioners would always have an advantage over their competitors, because, in the case of the last-named, the insurance would be heavy? Yes.
1747. It appears from your evidence, as well as from that of others—Mr. Resch, for instance, I think—that it is the custom of the storekeepers to load up wherever the river is good? That is so.
1748. Because they know that for six months of the year it will not be good? The future is always a glorious uncertainty. Sometimes the river may be down twelve or fifteen months.
1749. There have been times, I suppose, when the river was navigable all the year round? Yes. After the big flood of 1890 the river was navigable, I suppose, for eighteen months or two years.
1750. They are accustomed to load up in six months to meet the demand for the twelve months? Yes.
1751. Would they not continue that custom, even if the proposed railway were made? No.
1752. You think not? I do. I am taking the matter on their own showing. They say they have to pay insurance on the goods when they store them. The value of those goods is simply so much money lying dead to them, and they run a great risk of depreciation—that is to say, for the goods that may be fashionable and in demand for this year there may be very little demand a year or two hence, and the storekeepers may be left with them as dead stock on their hands.
1753. That would not apply to the regular stock class of goods? No; it would not apply to many lines, of course.
1754. You think, then, that during the six months when the river was available, fully half of the trade would go up and down the river? I think that probably about half the trade would.
1755. Therefore, the Railway Commissioners could not calculate on getting more than half the year's trade? No. Going back a number of years, I think that, on an average, the river has been up for three or four months in the year. During that time I do not think the Railway Commissioners could safely calculate on getting more than half the trade—that is, at least to start with. During the other portion of the year, of course, there would be no competition, and they would be bound to get the full volume of trade.
1756. Do you think that they would be able to shift their rates about—altering them to six months high and then to six months low? I do not think so.
1757. That is not a usual thing for Governments to do? It is not.
1758. They would have to face the full force of the competition during the river season? Yes.
1759. And they would have to adjust their rates to that competition? Yes; but they would have an advantage, of course, in the quick means of transit.
1760. I quite understand all that; but still we have the railway to Bourke, on the Darling, and therefore we are not in ignorance of what is happening or what is likely to happen? Just so.
1761. And, as you will admit, Wilcannia being lower down the river, and navigation being open there sometimes when it is not open to Bourke, the competition at Wilcannia would be rather more, than less, severe than the competition at Bourke? I do not think there would be much difference, because no water of any importance comes into the river between Bourke and Wilcannia; and although the river may be open at Wilcannia when it is not open at Bourke, still the river is open about the same number of days at Bourke as it is at Wilcannia.

R. Sleath,  
Esq., M.P.  
20 April, 1899.

1762. But a fresh coming down often leaves the river very dry at Bourke while it is a good river at Wilcannia? Still, even if it is a strong fresh, it will, perhaps, take four or five days to travel from Bourke to Wilcannia.

1763. We have it in evidence that a boat may get to Wilcannia, and not be able to get to Bourke? That is so.

1764. All I mean is that the competition at Wilcannia with the steamers would be rather more severe than it is at Bourke? I do not think that there would be much difference.

1765. Then the length of line to Wilcannia from Sydney is longer than the length to Bourke? Slightly longer.

1766. That from Nyngan to Wilcannia is longer than from Nyngan to Bourke? Yes.

1767. It would be 70 or 80 miles more? Yes; I suppose so.

1768. Then, if they were to go by mileage—at either a low or a high rate—the Railway Commissioners' rate to Wilcannia would be greater than their rate to Bourke? Yes.

1769. That, again, would make the competition of less advantage to them? Yes.

1770. We have it in evidence from Mr. Harper that the Commissioners have been obliged to reduce their ordinary rates one-half in order to get the trade at Bourke;—therefore they would not be able to get the Wilcannia trade with a smaller reduction than that, would they? Of course I am not in a position to express an opinion from my own personal knowledge in regard to the management of the Sydney to Bourke line; but I know that there seems to be grave dissatisfaction amongst the people there because of the difference in freight from Sydney to Bourke. A small quantity—less than a truckload—is charged for about twice as much as a larger parcel is charged for, in proportion.

1771. Is not that the difference between a wholesale and a retail customer? Yes, it may be; but then the people there contend that fifty retail customers, sending 5 or 6 tons each, are just as good as one wholesale customer sending the lot.

1772. But is not this truckload business thrown out as a bait to catch the large wool-shippers and the stock trade;—do not the Commissioners give this rebate for that purpose? That may be the idea; but in regard to sugar, I know that the cheapest method of sending sugar would be by rail, even if they charged practically the full rate.

1773. If you were managing the railway yourself, would you not give special facilities to large customers in order to get their trade? I do not know that I should make much difference between 6 tons and 60 tons. If one wholesale merchant in Bourke gets up 60 tons of sugar at £2 a ton, and then he, in distributing that out to the smaller firms, charges the price of the sugar, and also freight at the rate of £4 a ton, the wholesale buyer in Bourke is getting the advantage instead of the Railway Commissioners.

1774. Could not three or four storekeepers combine and get a truckload if they did not each want a whole truckload at a time? Yes; no doubt they could if they so desired.

1775. At any rate the carriage to Bourke now by the railway is a trifle compared to what the carriage by dray would be? Yes.

1776. The people who grumble most forget that, surely? No; they do not grumble at paying the higher rate, but at one or two firms getting a lower rate, because these firms are thus enabled to trade without any competition in supplying the outlying country.

1777. Do they grumble because the freight to Nyngan is as low as the freight to Bourke? I do not think it is.

1778. Not quite? I think it is much higher to Nyngan and Cobar than it is to Bourke.

1779. Then the Railway Commissioners have to contend also with the fact that goods going from Bourke to Queensland have to bear all the border duties? Quite so.

1780. So they have competition all round the compass, and they are forced to meet the circumstances; finding that we have that severe competition at Bourke, I want to get your opinion as to whether we shall not have at least as severe a competition in trying to get the trade at Wilcannia? Judging from the experience at Bourke, it would appear that there is every likelihood of having practically the same competition at Wilcannia, although the country which Wilcannia would supply is somewhat differently situated from that which would be supplied from Bourke. The Railway Commissioners have got, I think, in one direction perhaps, a greater handicap at Bourke than they might have at Wilcannia. Take it that Wilcannia is the distributing centre for the whole of that north-western corner; then, when the river is up, the Commissioners would have an equal, if not greater, competition there than they would have at Bourke.

1781. Although they have a longer journey to go to Wilcannia than to Bourke, they will not be able to get more freight at Wilcannia than at Bourke? I think so. But I suppose that when the matter becomes one of competition every merchant will look after his own interest. That is only natural.

1782. That is precisely what we have to face? It is in his power at the present time, I think. The Railway Commissioners, in charging fair rates, would be able to get the great bulk of the trade, or at any rate a very large portion of the trade, even when the river was up—quite half of it, I should think.

1783. When the river was up, they would have to fix the lowest rate at which they could afford to take goods, in order to get the trade? Yes.

1784. Then they could hardly put on any other rates for the rest of the year? No; I do not think they could.

1785. Then it comes to this: That their busy season will only be when the river is down? That would be their busy season.

1786. And even when the river was down they would only get the same rates for their carriage as they would be able to get when the river was up? Yes. I do not think it would be advisable for them to shift the freight charges.

1787. We must assume that they would not shift them? Yes.

1788. They will have a good trade only for six months in the year, and even when they are not exposed to competition they will have to do that which monopolists are very slow to learn to do, namely, to act as if they were subjected to competition? Yes. If there were railway communication from Wilcannia the competition with the river would not be so severe as many people imagine, because, under present conditions, the whole of the trade being dependent on the river when it is up, there are a great many boats which are kept there, the owners of which are really not making much profit out of keeping them here, because they are laid up so often, and if they had to compete with the railway, a number of them

R. Sleath,  
Esq., M.P.  
20 April, 1899.

them would give up the river trade altogether, because the contention that the boats would reduce their present freights in order to compete with the railway is a contention that cannot hold good at all, for the reason that the present competition between the boats is as severe as it could be, and the construction of the railway would not make the competition any greater.

1789. That might any day be ended by their all forming one company? Well, that is hardly likely.

1790. Do you not think such a thing would happen? I do not think so.

1791. Cut-throat competition has often led to combination? It has; but, viewing the peculiarities of this trade, I do not think that is possible here.

1792. Have you seen a copy of the petition that was sent to the Committee the other day by some people living in your electorate? I have not.

1793. The good people of Wilcannia, who are very enthusiastic, make out that the traffic on this railway will return  $7\frac{1}{4}$  per cent. on the capital invested in it, after deducting the working expenses and interest on the cost of constructing the line; that would make it the most profitable line in the whole of New South Wales; do you think there is any likelihood of its being the most profitable line in New South Wales? I do not think so. I understood from what I saw in the papers that they calculated it would pay 11 per cent.

1794. Yes, without deducting the working expenses, £12,400; but after deducting that amount they say it would pay  $7\frac{1}{4}$  per cent.; Mr. Harper and the Commissioners estimate a loss of about £20,000 a year on this line; now, there is a great difference between a loss of £20,000 and a profit of  $7\frac{1}{4}$  per cent.? Personally, I do not quite agree with either. I think that Mr. Harper is even farther out of it in his way than the good people of Wilcannia are in theirs.

1795. Do you think that if from the start it paid interest on the cost of construction, and working expenses, it would then be a legitimate enterprise? I should think it would, if it paid anything like that from the start.

1796. You would be content to let the  $7\frac{1}{4}$  per cent. remain? I would, because I am perfectly satisfied, even if the traffic produced a considerable loss to start with, that in the very near future the volume of trade would be bound to increase, and in a few years it would probably pay all working expenses and interest on capital invested.

1797. Then you think your worthy constituents of Wilcannia have taken rather too rosy a view of their prospects? I think so; but of course they, no doubt, think they have placed the matter fairly.

1798. Judging from their petition, it seems to me that they assume that nearly the whole trade of Wilcannia will come by the railway? Probably they may be right. I would not like to offer an opinion in contradiction of that.

1799. You have said, in your other answers, that you think half of the trade would be a fair estimate? Yes, when the river is up. That is my opinion; but some of these gentlemen have carried on business there many years, and, as business men who will really pay these freights, I think their opinion is of much more value than mine in a matter of that sort.

1800. You gave the Committee yesterday a very interesting statement of the mining ventures between Wilcannia and Mount Browne—the best statement I have heard as yet; but do you think that any one of those mines, or the whole of them together, would justify the construction of a railway from Wilcannia to Mount Browne? If the railway was to serve no other purpose than that of mining, I do not think that it would be justifiable at all to construct it; taking into consideration the development that has taken place, I do not think it would be justifiable purely for mining.

1801. You have visited most of those mining centres personally? I have been over them many times.

1802. Do you think that any of them are likely to turn out really great mines? Of course that becomes practically a matter of opinion; but from all indications at Nuntherungie, I believe that when that field is thoroughly tested, sufficient claims will turn out payable to employ a great number of men, both in silver and in copper.

1803. I understand you to say that the road is fairly watered by wells, and so the teamsters can get along? Yes; that road from Wilcannia to Mount Browne, with the exception of the first stage from Wilcannia, is fairly well supplied with water.

1804. So that, even in these droughty seasons, the teams can get along, carrying the people's food to them? The difficulty, of course, is in regard to grass. Most of the teams are bullock teams, which cannot travel more than about 8 miles a day, and so the journey from Wilcannia to Mount Browne occupies a considerable time.

1805. You cannot carry food by bullock team as well as you can by horse team? No.

1806. But suppose we had a railway to Wilcannia, and that stores could always be in full supply there, and suppose we had a well-watered road right up to this string of mining townships, do you think they would be fairly accommodated then so far as supplies are concerned? So far as present conditions are concerned, they would be; but if a great development took place at Nuntherungie, as I believe it will, it might necessitate, if circumstances warranted it, the running of a railway up to that place, which railway would act as a feeder to the main line—I mean if there were, say, 3,000 or 4,000 men there, and circumstances warranted it.

1807. Of course, if another Broken Hill turned up, it would be worth while to make a railway to it, wherever it was? Quite so.

1808. But, so far as I can gather from your account, White Cliffs is the only mineral locality that has gathered anything like a population; and that has 3,000 or 4,000 people? Yes; of course, that population has been gathered there since 1891. For many and various reasons, as I explained yesterday, Nuntherungie has never been properly prospected. They have sent away small shipments of 10 or 20 tons, and the return has been very satisfactory; but they did it at great expense. They had to take the stuff to Wilcannia, where it had to lie for some months before they could send it away to be treated, and being poor men working the claims, they could not afford to wait for the return, and had to desert the claims.

1809. But still there are always capitalists looking for good investments, especially in mining country like that of Broken Hill, and the men could get help? But the capitalists did not "rush" Broken Hill until it was pretty well proved.

1810. The opal mine at White Cliffs has a natural limit to its attraction of population; you cannot produce more than a certain quantity of opals, I suppose, or you would smother the market? The demand

R. Sleath,  
Esq., M.P.  
20 April, 1899.

demand to-day for opal is greater than it was some years ago. The gem has become more fashionable, and some of the best markets for it are, comparatively speaking, untouched yet. I am led to understand that the Siamese have a great fancy for that gem above all others, and that is a market which has not yet been exploited.

1811. Do you look forward to a rapid doubling of the population of White Cliffs? I do not know about a "rapid doubling"; but I look forward to a gradual increase. The population there has been gradually increasing during the last five years.

1812. Slowly, but steadily? Yes. Five years ago the population numbered about 500 male adults; from that it has gradually gone on increasing until to-day there are something like 1,000, or perhaps more than 1,000 male adults there. A great many have brought their families and wives to White Cliffs. I think the school attendance four or five years ago averaged only twenty-two; to-day it is something like 142.

1813. Is the White Cliffs locality fairly well supplied with goods now from Wilcannia? They have had very great difficulties to contend with; for instance potatoes have been 2s. 6d. per lb.

1814. Can they grow potatoes in an irrigated garden on the Darling? I do not think they have ever tried it. They have certainly not grown them to any extent.

1815. Have no Chinamen ever tried it? No; they devote their attention to pumpkins, water-melons, and fruit. There are not many Chinamen out there; only three or four, I think.

1816. Are there any white men who have irrigated gardens? Yes; but I do not think that they have taken the trouble to grow potatoes.

1817. Do you know what the population of Wilcannia is now? I could not really form anything like a fair estimate.

1818. In the latest *Statistical Register* I notice that it is guessed at 1,000? I think it is much more than that; not, perhaps, the town of Wilcannia. I think, in looking over the Electoral Roll, you will find there are 500 or 600 names on the Roll for the Wilcannia division—that is, Wilcannia, and within a few miles radius.

1819. What is supposed to be the population of the whole of your electorate? It is very difficult to get anything like a fair estimate, because if you take the Electoral Roll in a place like White Cliffs it does not give you anything like a fair estimate of the male population, for at White Cliffs you will always find 200, 300, or 400 men who have not their names on the roll at all.

1820. Are they new comers? Well, they have been away, perhaps, out on a station, and they have come into White Cliffs, and have never troubled about getting enrolled. From a great many of the outlying stations men have to travel 50, 60, or 100 miles to get electors' rights, and they will not do it. There are scores of men whose names never appear on the Roll at all, and it is most difficult to form anything like a fair estimate of what the population is, but I should say that the full population would be quite 10,000.

1821. Do you think that the expenditure of £500,000, which is what this railway would cost, would be justifiable for a population ranging between 5,000 and 10,000? Well, if the population were to remain stationary at that number, I should say, "No"; but believing, as I do, that the construction of the railway would mean, within a short time, doubling the population, and going on with a gradual but steady increase, I think it would.

1822. Do you know what the ratable value of the property in Wilcannia is? No; I cannot tell you. I saw it mentioned the other day, I think.

1823. The most recent figures that we can find are £100,800—that is, the whole ratable property—improved land and everything else put together;—do you think that is a fair valuation? I suppose it is.

1824. I suppose it is taken from the books of the town Council? I suppose so.

1825. During these bad seasons, I suppose the value of property has gone down rather than up? Yes.

1826. So this would be an outside estimate? I should say it would be a low estimate.

1827. Do you think it would? Yes. We have had bad seasons the last four years.

1828. But this is probably an estimate made before the drop in the values? I could not really say.

1829. Is Wilcannia a municipality that has been keeping its head above water, or has it been getting into difficulties like others? It has had some difficulties in the past, but I think it stands at the present time in the position of having met all its obligations, and that it owes nobody any money—a very satisfactory state of things for any of the municipalities as they exist now-a-days.

1830. *Mr. Watson.*] Not even the Government? No; they have paid the Government all their dues.

1831. *Dr. Garran.*] I gather from you that there is a number of mining properties between Wilcannia and Mount Browne that are suffering from want of water? Yes.

1832. The making of a railway to Wilcannia would not get rid of that difficulty? No, it would not.

1833. They want a constant water supply, as well as a railway, to make that mineral district fully developed? Yes; to get the full advantage of course that is required, but a railway would do much. They have water in the river, and if they get their stuff to the river, they can reduce it there if they choose.

1834. If they had a sufficient quantity of water, they could go ahead as a mining population, even if a railway were not made to Wilcannia? Well, it would be a very difficult matter, because the cost of carriage by team is so great. For instance, the cost from Nuntherungie, probably a distance of 60 miles, would be, on an average, £2 10s. or £3 a ton. But if you had to cart it on to Cobar—three times that distance—it would be from £8 to £10 a ton additional.

1835. But in a year when the river is good, they would not cart beyond Wilcannia? No; but you cannot carry on mining in a spasmodic fashion like that—you cannot employ men for three months in a place like that, and expect to get them again three months later when the river comes up. Your mine would be standing still, and there would be a loss on the machinery. The fact of its standing still, and not being worked, would depreciate it much more in value than if it were being worked.

1836. But if we were to get local water sufficient to work all those mines, they would all be able to get their product to Wilcannia when the river was up and send it down to Adelaide? Yes; but take, for instance, the last four years. Supposing there had been a company in a fairly flourishing condition, they would not have had a possible chance of getting their product away, and they would not have been able to get advances on it to any extent in Wilcannia, and unless the mine had been paying tremendous profits previously, they would not have been able to continue working.

1837. That implies rather that you want a railway from Wilcannia to those mines? Of course, if the mines would justify it, that would certainly be the best thing. The next best thing would be a railway only to Wilcannia.

R. Sleath,  
Esq., M.P.  
20 April, 1899.

1838. Supposing you had a fairly promising claim of your own at Nuntherungie, would you not rather have an abundant supply of water in preference to a railway to Wilcannia, if you could only have one of the two; you could go to work at once with water? You could, to a certain extent; but you require coke coal, and fluxes, and many other things for the treatment of ore, in addition to water. You might be able to reduce it (say) from 5 tons to 2 tons; you might reduce ore going only 20 oz. or 30 oz. of silver so that it would go 70 oz.; but beyond that I do not think you could treat it with water only.

1839. We have it already in evidence that when the river is up there is no complaint of the dearness of carriage to Wilcannia as compared with what will be the case when the railway is there—the railway will not cheapen the carriage to Wilcannia? The complaint is not as to the dearness of carriage, but as to the difficulty of getting any carriage at all.

1840. During part of the year? During many years, at times.

1841. But the present is a most exceptional instance;—you have not known a similar one before? No; there have been four bad years this time; but previously they had a like experience of three years' duration.

1842. But is not the immediate want of all that mineral district water rather than a railway? I think the two would be absolutely necessary.

1843. Supposing the State could give only one;—is not water more essential to that district than railway carriage, seeing that it already has water carriage? Of course, if you had plenty of water it would make the railway more necessary than now.

1844. No doubt it would make it more profitable, but could not all the claimholders keep on working if they had plenty of water? No, I do not think so. If they had a continuously open river, it certainly would be of great assistance to them—if they had any guarantee that when they got their ore to Wilcannia, they could get it away to somewhere else. But they might start working, and spend all the capital they have in raising their ore to grass, and paying the carriage to Wilcannia, and when it got there the river might be down, and it might lie there twelve months, and then they would be beaten; they would simply have to give up working. The men would scatter all over the country, and when the river came up again, it would be a long time before they could get back, and in the meantime, perhaps, someone would have jumped the claim.

1845. If they could always get to Wilcannia, and the river was open for six months, could they work all the year round? They could work all the year round if the river was never down; but if the ore is to lie at Wilcannia for six months in the year, they can get no return from that when they want it, and are kept out of the money they require to pay for the working of the mine.

1846. I suppose we may look forward to the time, some day or other, when the Darling will be locked? That seems to be the general impression.

1847. And if this railway be made, do you think that when the river is locked it will be a less profitable line than before the river was locked? No, I do not think so, because I am satisfied that before the Darling is locked from Bourke to Wentworth, many years will elapse. Even if the work were about to be started, it would take considerable time, and, with the construction of this railway, I am sure settlement would increase sufficiently to more than compensate for the loss of any carriage that might afterwards go by water.

1848. You do not think the profit of the line would be decreased? No; I think the altered conditions would be such that when the railway was constructed, the trade on it would gradually increase, even if the river were locked. Of course, if you were to do the two simultaneously, perhaps it would.

1849. You think that the permanent locking of the river would so stimulate settlement and production that the railway would get as much traffic then as previously? I think it would get much more than previously.

1850. *Mr. Trickett.*] There is one feature of the inquiry which entered largely into former inquiries: how about the rabbits? We might find a good deal of traffic for the railway in sending them away.

1851. But are they as bad as they were? No. It is very hard to say what is the reason, but I am rather of the opinion that it is owing to the dry season; they have not been able to stand it any better than any other animals have. There is one thing you may, perhaps, permit me to say, namely, that I believe that there would be a large traffic in fat stock from Wilcannia if the railway were constructed. I heard Mr. Harper give his evidence, and he stated that it was not a fattening country at all. I regret I cannot accept Mr. Harper as an authority on that, because it is the best fattening country, I suppose, in Australasia in an ordinary season. Under present conditions, they have to travel the sheep either to South Australia—they travel them very often to Cockburn—or to somewhere down there and then truck them to Adelaide, and they also travel them to Hay and to Bourke; but, as you know, it takes sheep a long time to travel, and naturally they cannot possibly arrive at their destination in the same condition as they would be in if, say, cooling chambers were erected at Wilcannia, and the meat were killed there fresh—in excellent condition—and sent in cool cars to Sydney. I think that the country which would be practically served by the railway carries something like 5,000,000 sheep—that is, under ordinary conditions. I do not say that there is that number there now, because the bad season has reduced the increase, and a very great many of the stock have died.

1852. *Mr. Watson.*] Dr. Garran asked you a question in regard to the probable effect of locking the Darling to Wentworth—do you think if the Darling were locked from Bourke to Wentworth you could then secure permanent navigation all the year round down the Murray? No, you could not; but, taking it as a general thing—unless the season is a very dry one—the Murray, as a rule, is navigable. However, on many occasions in my experience I have seen it dry. At Murray Bridge I have often seen river steamers lying high and dry.

1853. So that anything that the Government of this Colony could do in regard to locking the River Darling would not guarantee an absolutely permanent water-way? Certainly not.

1854. They could ensure it in moderate seasons? Yes.

1855. If the river were locked as far as our western boundary—that is, the junction with the Murray—they would only absolutely secure navigation in moderately good seasons? Yes.

1856. Not in really bad seasons? No. I think the locking of the river below the junction with the Murray is almost impracticable.

1857. Very difficult, because of the conformation of the country? Yes; the Murray below that is sometimes miles wide.

1858. What constitutes the difference between the Darling and the Murray with regard to the desirability of locking? The banks of the Darling are very nearly perpendicular, and they are firm and solid; the Murray

R. Sleath,  
Esq., M.P.  
20 April, 1899.

Murray is very different. Below Wentworth, the river spreads out all over the country in a sort of morass, with a main channel somewhere near the centre, but it is hard to find it.

1858. Therefore it would be difficult locking there, except at vast expense? Yes.

1860. The channel would have to be arranged first, I suppose? Yes, I think so.

1861. You were asked whether the people at Wilcannia would be served if the river were locked, and the navigation thus secured; but that would not provide either for stock or for passengers, would it? No; it would be no good either for passengers or for stock.

1862. Practically, they cannot carry stock on the river sometimes, because of the time it takes, and the impossibility of feeding them? Just so.

1863. And passengers would not go that way, but would prefer to go by ordinary coach roads? They would not go that way.

1864. So, as a matter of convenience to the people of Wilcannia, the river, even if locked right through to the ocean, would not afford facilities other than for the carriage of ordinary goods? Just so.

1865. It would not meet their requirements in the way of stock and passenger traffic? No. That is the opinion of the people out there too, I may say.

1866. You were asked a question with regard to the possibility of having at Wilcannia to meet with the same competitive conditions as at present exist at Bourke, so far as railway traffic is concerned; is it not a fact that the Queensland railways compete for a portion of the traffic which geographically should go to Bourke—that is by means of the line which ends at Cunnamulla? Yes.

1867. I understand that an export duty on wool was put on by the Queensland Government with the object of forcing the wool and cognate traffic towards Brisbane via Cunnamulla? Yes.

1868. If that is so, the competitive conditions would be intensified at Bourke, so far as a great portion of the country immediately north of Bourke is concerned? Yes; I think I said that in answer to Dr. Garran. The railway to Wilcannia would not have the same competition to contend with as the railway to Bourke. The Queensland people have been pushing their railway system over to catch that trade. Competition with Queensland would not affect the north-western portion of our territory in the same way as it would affect that in the direction of Cunnamulla.

1869. You said also that you thought that there would be an inducement for extra population if the railway were constructed to Wilcannia;—in what way do you think that extra population would be induced—by a reduction in the cost of carrying the means of existence, and by the greater certainty of communication, or in what way? Well, it would give an outlet to the products of a great many industries that might be established there, where there is no possible outlet at the present time. It would induce a great many men to take up smaller areas,—homestead leases. Instead of having pastoral holdings of over 3,000,000 acres, we should have a great many smaller holdings of, perhaps, 10,000 acres each. The land would be more highly improved in regard to both fencing and provision for the conservation of water, and that would mean the carrying of a great deal of additional stock.

1870. And any reduction in the cost of living consequent on the better means of communication, I take it, would facilitate settlement there? Undoubtedly it would be of great advantage.

1871. And giving a greater certainty to the people of being able to get something to eat,—which is not always the case now, I understand—would work in the same direction? Quite so.

1872. If settlement were encouraged in that way, would it not induce greater competition for the small blocks the Crown now has open for occupation in the way of lease? Yes.

1873. And that would mean an increased amount of rental for Government lands? Undoubtedly the construction of this railway, giving the people a certain means of getting their products to market, would also mean the fixing of an increased rental at the first reappraisal.

1874. Is there land in the district now which is open for homestead lease in any quantity? Yes; of course the reserved area has been added in some cases.

1875. But in many cases the land is still open for homestead lease? Quite so.

1876. How do the rents payable by the homestead lessees for their 10,000-acre blocks compare with the rents paid by the pastoral lessees for much larger areas, which, if any, are the higher? I think the homestead lessees have been treated rather badly, for in some instances they pay double the rent of the pastoral lessee.

1877. In an inquiry held in 1891, Mr. Wilkinson, who was then the Government Geologist, gave evidence before the Committee? Yes.

1878. He was asked by Mr. Copeland:—

From the official records in the Department, do you know of any mineral country between Cobar and Wilcannia that would warrant the extension of the railway beyond Cobar? From specimens which I have received from various correspondents, I conclude that nearly the whole of the country between Cobar and Wilcannia is of metalliferous formation, with patches of sandy areas between which, no doubt, cover up metalliferous ground.

You heard Mr. Pittman give his evidence yesterday? Yes.

1879. I was asking you whether you had read that portion of Mr. Wilkinson's evidence—given in 1891—where he expresses his opinion that the country between Cobar and Wilcannia will probably be found to be metalliferous right through? Yes.

1880. Do you agree with that idea, from your knowledge of the country? Yes.

1881. You have had considerable experience in mining in connection with different kinds of minerals? Yes.

1882. And do you think from your knowledge that it is likely that there will be mineral deposits found there? Yes; from every indication which one can see in travelling over the country, one must come to that opinion; for in the small ranges there are some little upheavals all highly mineralised, and you can get both copper and silver-bearing stone. I do not say you can get it in great payable quantities without any prospecting, but you can get sufficient to prove it is there—of course in what quantities, only development can prove.

1883. That is distinctly between Cobar and Wilcannia? Yes.

1884. Do you know of any instance of that close to the line, or north or south of it? Yes; in nearly every range, where there has been an upheaval—a blow—you will find indications of either silver or copper.

1885. Of course those deposits of soil on the top would be confined to the gulleys, would they not, and to the lower ground; what you say would apply to outcrops or hills which occur here and there along that line? Most of it is flat country. For instance, take the Wyalong gold-field. You have no outcrop there. In connection with the best of the claims there, there was no indication on the surface that there was anything beneath, simply because the soil had been washed over the original surface.

1886.

1886. But I believe that between Cobar and Wilcannia there are small hills jutting out? Yes; little upheavals.

1887. And these, in the nature of things, would not be covered by that deposit of sedimentary stuff? No.

1888. In any case, you think that there are mining possibilities along that line? Yes; it is all mineral country. Whether there will be payable minerals there or not is a question I cannot answer.

1889. There is another question bearing on the mining matter generally; I believe that at Lithgow, within the last few years there has been a considerable increase in the erection of works, or in the works used for the treatment of ores? Yes.

1890. And at present some of the ores from Cobar go there for treatment? Yes; a great deal.

1891. For refining? Yes, and for smelting. The Cobar people have works there of their own.

1892. If a railway were constructed between Cobar and Wilcannia and those deposits were found to exist in anything like large quantities, the connection with Cobar would be of distinct advantage, because they could get from there to Lithgow, where arrangements are already made? Just so. They would gain greatly in two ways: first, they would not require really to send their ores on to Sydney; and, secondly they would get coal at the cheapest possible price at the pit mouth.

1893. The price of coal at Lithgow is lower than it is anywhere else in the Colony? Yes; one-third lower.

1894. Than it is at Newcastle? Yes; more than one-third probably, but at least one-third lower.

1895. So that Lithgow would be a very desirable place to reach from the point of view of ore reduction? Yes; there is any amount of water and fire available—the two necessities to treat any kind of ore with.

1896. *Mr. Shepherd.*] I think you have had a great deal of experience in mining? I have had a good deal of experience.

1897. How do you arrive at the value of opals? Opal, of course, is a gem that is judged according to its quality. The quality is in the quantity of fire it contains, and the various forms of fire. Take two pieces of opal of equal size and of equal weight; one might be worth £500, and the other not 500 pence. You have to judge as to the value of it from what it will bring in the market. There is a sort of standard value in regard to quality. Experts will value opal much the same; that is to say, if one piece of opal is submitted to one expert, he will tell you what it is worth. He may say that he will give you £100 for it, and if you submit it to another expert, he may, perhaps, offer you £99 or £101, or something like that; but there is really no standard by which you can arrive at the value. You would really have to be an expert to be able to judge either in the selling or in the buying of opals.

1898. The reason I asked you that question was because you heard Mr. Pittman give evidence yesterday, and he said that there was no marketable value for opals—that the value was merely a fancy one? I think that what Mr. Pittman meant was that there was no standard value.

1899. *Mr. Watson.*] He said that there was no intrinsic value, that opal in itself was not worth anything, and that its value depended on the fancy of people? Yes; that is how I understood Mr. Pittman.

1900. *Mr. Shepherd.*] I wished to ascertain how the value was arrived at, for you said yesterday that the opals were of greater value at a depth than at the surface? Yes; because they are of better quality—with more fire and more variations in the fire and the colour.

1901. Have you any idea what the value of the output has been the last four or five years? It has been a very difficult matter to arrive at anything like a fair return. I think the warden in his report gave the value last year at £125,000.

1902. For the one year? Yes; but there has been a great deal of opal got by individual miners. They have a system of mining there much the same as mining in alluvial, where one man can hold 4 acres under a mineral license really, and perhaps two, three, or four men each take up 4 acres, and they work it by themselves, and send their opal away to London, or Germany, or Sydney, or Melbourne, and there is no record kept of the transaction, and consequently the returns that came to hand last year were principally the returns from the one large company.

1903. You also said that at a depth the country seemed more settled? Yes.

1904. And the opals were found in greater quantity? You can trace them better.

1905. Are you aware if the miners have touched what is generally termed the bedrock? No; they have not.

1906. Have they touched anything like a lode? No; it seems peculiar country. It appears to be a sort of limy, sedimentary deposit, like all made country. There is a sort of diorite walls running through it, but beyond that it seems a formation peculiar to itself.

1907. Are you aware if these opals have ever been found in conglomerate, or are they always separate? I have never heard of their being found in conglomerate, and I do not think they ever would be, because of the nature of them. They run in one continuous layer or seam, and close to the surface you are not able to trace that seam; they are patchy. When you get a certain depth you are able to trace the seam for, perhaps, hundreds of feet, though, perhaps, only a portion of it is good opal, and the rest is colourless.

1908. I thought, perhaps, that the nature of the opal in this deposit would be something similar to that of the emerald? No.

1909. Emerald you find in an exceedingly hard conglomerate? Yes; in Queensland you have to break through a very hard matrix to get the opal; but our opal is altogether different.

1910. I understood you to say that this opal-field extended something like 50 miles? Yes.

1911. Has it been prospected to that extent, or is it judged only from surface appearances? It has not been prospected all over; but at Purnanga, about 40 miles to the east or south-east of White Cliffs, they have prospected, and a number of men are working there, and getting very good opal. The country right out to there is all the same sort. Then to the north-west of White Cliffs, some 17 miles, at the Bunker, it has practically been prospected; opals have been got all the way from White Cliffs to the Bunker, and at the Bunker there are over 100 men employed, and they are getting very good opals. So, I think, it is fair to assume that all the country lying in between is opal-bearing country.

1912. We have been told that there is some very good agricultural country out in that neighbourhood; is that so? Of course, if we get a fair average rainfall it certainly is excellent country, but the rainfall is not quite sufficient, with the result that I am afraid you could not say it was first-class agricultural country.

1913. I was doubting that;—you say that potatoes sometimes fetch 2s. 6d. a lb. out there, and that is £280 a ton; that does not speak much for the country? The quality of the soil is certainly excellent, but the climatic conditions are too severe.

R. Sleath,  
Esq., M.P.

20 April, 1899.

R. Sleath,  
Esq., M.P.  
20 April, 1899.

1914. From your knowledge of the country, do you think it would be possible to run a line of railway in a more direct line from Cobar to Wilcannia than that shown on the plan? So far as my memory serves me I do not recollect any obstacle being in the way at all. There may be one or two of those small hills, but the great bulk of the country is almost a dead level. There are no waterways to contend with; there is not even a creek that would be flooded in case of a heavy rainfall.

1915. It appears to me that it is always of immense advantage to run a line as straight as possible, and on as even a grade as possible? Yes; where you have no engineering difficulties to contend with, in my opinion, it is of great advantage to run the line straight.

1916. There would be a saving of about 10 miles in that line? I cannot believe that there is any engineering difficulty in the way.

1917. And I understand that an ordinary train costs something like 4s. a mile to run it, and that would mean £2 a day for every train they would run on that line? Yes.

1918. That would come to an immense amount in the course of a year, and, seeing that a railway is laid for all time, it seems to me that unless there is some very great obstacle indeed it would be of advantage to run the line perfectly straight? Yes. I do not know of any engineering difficulty in the way, because the country is not rough or difficult at all.

1919. There would be a saving of some 23 miles if the line were run from Condobolin to Wilcannia? Yes.

1920. Is there any reason why the line from Cobar to Wilcannia should be adopted in preference to the line from Condobolin to Wilcannia, seeing that there would be a saving of 23 miles in the case of the last-mentioned line? The distance of construction would be something over 100 miles, I think.

1921. No doubt there would be a considerable amount to construct;—but do you know of any reason why, so far as the character of the country is concerned, the Cobar line should be adopted in preference to the Condobolin line? No. Going back from the river towards Condobolin, the country is much of the same character as that towards Cobar. I believe that there would be some engineering difficulties to contend with in coming into Wilcannia from the direction of Condobolin.

1922. There is a considerable curve there, you will, perhaps, have noticed? Yes. I think that they would have some engineering difficulties in regard to water channels there, but, so far as the nature of the country is concerned, I think there is not much difference. The rainfall is much the same, and also the nature of the country.

1923. You seem quite convinced that the railway would be adopted in preference to the river? Yes, by the people. They look upon the railway, when they once have it, as a certain means of transit. As to the river, they say that no matter what may be done, the river will always be doubtful.

1924. We have had evidence here to show that goods have sometimes been delayed on the river for twelve months? Yes, I have known that myself.

1925. That would be of immense disadvantage to river-carriage? Yes.

1926. Mr. Resch said he had had goods delayed twelve months on the river? Yes.

1927. If such cases were likely to occur frequently, there is no doubt that the people would adopt the railway in preference to the river under any circumstances? Yes; of course, even the locking of the river to Menindie would do nothing to make the river navigable right through to Morgan. The locking of the river to Menindie would be of great service, no doubt, to the people about Menindie, and those along the banks of the river and back a considerable distance; but even the locking of the river to Menindie would do nothing to give an outlet any more than there is at the present time.

Edward Fisher Pittman, Government Geologist and Chief Mining Surveyor, Department of Mines, sworn, and further examined:—

E. F. Pittman.  
20 April, 1899.

1928. *Chairman.*] You were asked yesterday to put in a map showing the geological features of the country out west; do you produce it? Yes. The dark areas are the metalliferous areas I spoke of yesterday. They run more or less in a north and south direction through this country north of a line between Wilcannia and Broken Hill. This map also shows approximately the limit of the artesian water basin, which is coloured green on the map, and I have also shown on this map a considerable number of bores with the flows marked in figures.

1929. So it is quite possible to get artesian water out where those mines are? You will notice that some of these bores are failures.

1930. *Mr. Watson.*] You have indicated on the map which are failures? Yes. Where they are marked simply as a circle, and the word failure is not written, the bores must be understood to be successful. But there are two failures—the first is 5 or 6 miles south-west of White Cliffs, and the other is 23 miles east by south of Cobham Lake.

1931. Have there been any other failures there? No.

1932. In giving your evidence yesterday, I understood you to say, in reference to the possibility of mineral development between Cobar and Wilcannia, that it was quite possible there were mineral deposits there, but that sedimentary alluvial had been placed on it which had the effect of hiding it for the time being? Yes.

1933. Do you know of any evidence in your Department that goes to show that there are any mineral deposits between Cobar and Wilcannia? No; I do not.

1934. Or anywhere near the vicinity? No.

1935. Have you noticed the evidence given by Mr. Wilkinson in that connection some years ago? Yes.

1936. It would appear from what he said that he had received something indicating that discoveries had been made by way of outcrop along there? Yes; possibly he may have had something that looked promising, but if he had, it has never been proved to be a workable deposit since, and I am not aware of it.

1937. At any rate, there is nothing in the Department since that you are aware of? No.

1938. *Dr. Garran.*] Then there is no known indication of mineral deposit? There is no known occurrence there.

1939. What may be underground you cannot tell? No.

1940. *Mr. Watson.*] Mr. Wilkinson said:—

From specimens which I have received from various correspondents, I conclude that nearly the whole of the country between Cobar and Wilcannia is of metalliferous formation, with patches of sandy areas between, which, no doubt, cover up metalliferous ground.

He

He would not have given that answer unless at the time he had received in correspondence indications and specimens, and so on? I think that Mr. Wilkinson's statement was probably based on the fact that the Silurian rocks extend to about 80 miles west of Cobar in the direction of Wilcannia, and that he really meant that the occurrence of those rocks was in itself an indication that metalliferous deposits might be expected to occur there.

E. F. Pittman.  
20 April, 1899.

1941. Then for that 80 miles it appears the Silurian is not covered up to any extent—that is, it crops out sufficiently to let you ascertain where it is? Exactly; but over a considerable portion of it there are superficial deposits.

1942. Still that does not get away from the evidence given by Mr. Wilkinson in a direct fashion; he said "From specimens which I have received"? Those might have been specimens of rock—I cannot say; but that is my impression. I know of no specimens of deposits that have come from there.

1943. And you think the records would not have disappeared? No. If they had been of any importance within the last seven years, I should certainly have known of them.

1944. So you think it is probable that what Mr. Wilkinson received were specimens of rock which went to fix the character of the rock found? Quite so.

George Charles Yeo, Draftsman, Stock Branch, Department of Mines and Agriculture, sworn, and examined:—

1945. *Chairman.*] Do you produce a map showing the stock routes in the district affected by the proposed railway? I produce a map showing the area which I think would be affected by the construction of the proposed railway; also showing the stock routes. I have also a statement of the number of stock in that area, and other information.

G. C. Yeo.  
20 April, 1899.

1946. Will you read that statement? Yes, it is as follows:—

No of stock in area tinted pink on map A containing about 26,700,000 acres.

Year.	Cattle.	Sheep.
1894.....	23,881	3,600,129
1895.....	20,809	2,893,322
1896.....	22,902	2,439,235
1897.....	20,135	2,192,620
1898.....	23,586	2,097,524

WEIGHT of clip in area tinted pink.

Year.	Weight in lbs.	or	Tons.
1894.....	18,532,500		8,273
1895.....	15,482,000		6,912
1896.....	13,232,000		5,907
1897.....	11,582,504		5,171
1898.....	11,166,388		4,985

Average weight of fleece in northern part of area for 1897 and 1898, 3 lb. 13 oz.  
Average weight of fleece in middle part of area for 1897 and 1898, 5 lb. 13½ oz.  
Average weight of fleece in southern part of area for 1897 and 1898, 6 lb. 3½ oz.

*Stock Traffic.*

	Cattle.	Sheep.
1895—Wompah to Wilcannia.....	5,850	187,700
Wompah to Broken Hill.....	11,000	120,000
Wilcannia to Broken Hill.....	.....	70,000
Broken Hill to Wilcannia.....	.....	14,900
1896—Wompah to Wilcannia.....	2,894	100,420
Wompah to Broken Hill.....	8,800	105,000
Wilcannia to Broken Hill.....	.....	60,000
Broken Hill to Wilcannia.....	.....	27,380
1897—Wompah to Wilcannia.....	1,609	26,000
Wompah to Broken Hill.....	17,000	85,000
Wilcannia to Broken Hill.....	1,000	20,000
Broken Hill to Wilcannia.....	.....	18,984
1898—Wompah to Wilcannia.....	2,100	6,500
Wompah to Broken Hill.....	16,000	130,000
Wilcannia to Broken Hill.....	1,305	67,272
Broken Hill to Wilcannia.....	.....	10,000

Stock passing from New South Wales into South Australia at Cockburn.

Year.	Cattle.	Sheep.
1894.....	8,987	154,000
1895.....	4,638	196,634
1896.....	8,621	38,609
1897.....	9,296	81,930
1898.....	7,306	195,909

Stock passing from Queensland into New South Wales at Wompah.

Year.	Cattle.	Sheep.
1896.....	20,000	50,000
1897.....	14,884	46,630
1898.....	24,351	44,960

I may say that a lot of the clip in that part of the Colony is scoured.

1947. Can you give the Committee any information in reference to the effect of railway construction on the movements of stock;—supposing a railway be constructed to Wilcannia, will the movements of stock be greater than they are at present, and in the direction of bringing traffic to the railway? I do not think so. I think the traffic would still go to South Australia.

1948. Most of the stock goes to South Australia? Yes.

1949. Supposing that the season was very dry in the western part, and there was good grass from Cobar out towards the eastern part, do you think there would be any movement of stock from that direction which would bring a payable traffic on to the railway if it were constructed? There might be in a case like that; but, as a rule, travelling stock, such as store and breeding, are taken by road in preference to the railway, on account of the railway freights being so high.

1950. So it would be an exceptional case that would bring stock to the railway? In my opinion it would.

1951.

- G. C. Yeo. 1951. The country out there is, in fair seasons, good fattening country, I suppose? Personally I do not know much about the country.
- 20 April, 1899. 1952. Have you no records in your office to show it? I did not look up anything to answer definitely in regard to that.
1953. Does not fat stock find its way from that district into Sydney now? I do not think so.
1954. If the proposed railway were constructed, do you think it would? I daresay there would be a few coming in if a railway were constructed there; but I do not know that there would be a great many. The owners prefer to travel their stock along the roads if there is anything like a good season.
1955. With plenty of grass along the stock routes they would be taken along them in preference to the railway? Yes.
1956. *Mr. Watson.*] You notice the area tinted red on the map you have put before the Committee? Yes.
1957. In a north-easterly direction from Wilcannia towards the Paroo, how far have you reckoned to be within the influence of Wilcannia? Sixty-four miles from Wilcannia—to the edge of the area tinted red, in the direction of the Paroo.
1958. It has been given in evidence here that the trade for Wilcannia in the direction of the Paroo begins a little south of Wanaaring on the Paroo? Yes.
1959. How much further is it from the edge of your red tinting—that is the area which you consider to be within the influence of Wilcannia—to Wanaaring? Sixty-four miles. The edge would be about half-way from Wilcannia to Wanaaring.
1960. So if the evidence which we have before us is that the trade coming to Wilcannia starts a little south of Wanaaring, we may extend your red tinting another 50 miles in that direction? Exactly.
1961. And that would proportionately, of course, increase the number of stock, and also the general trade to be considered? It would.
1962. Can you tell me how far from the north-western portion of the Colony towards the east you have taken your sphere of influence to extend? About 100 miles.
1963. How far would that bring us? To a place called Adelaide Gate.
1964. How far is it from Hungerford or Berawinnia to where your tinting leaves off towards the east? 115 miles approximately.
1965. Wilcannia's sphere of influence comes much closer to Berawinnia than is shown by your red tinting—to the extent of, perhaps, another 50 miles? Yes.
1966. So, taking those two last questions together, there would be, according to the evidence we have on that aspect of the matter, a considerably increased area to be accorded to Wilcannia as being within its sphere of influence? Yes, so far as sheep depasturing is concerned, there would be; but not so far as the stock movements are concerned, for the routes I have mentioned would not affect that at all.
1967. Only the amount of stock there and the supplies required for the population? Yes.
1968. With the increased area I have spoken of, it was estimated there were in good seasons about 5,000,000 sheep; do you think that that would be an exaggerated estimate; I think your estimate is 3,600,000 sheep during a good season there? Yes, it is.
1969. Well, allowing for the increased area to which I have referred, do you think that 5,000,000 sheep in a good season would be an exaggerated estimate? Yes, I think it would. It would be too much altogether for the area.
1970. What do you think would be a reasonable number to add for the additional area which has been suggested? About 300,000 more sheep.
1971. *Mr. Trickett.*] That would increase the area to about 30,000,000 acres? Yes.
1972. *Mr. Watson.*] In a good season it would bring it up to about 4,000,000 sheep? In a season like 1894 it would bring it up to something like 4,000,000 sheep.
1973. *Chairman.*] What guided you in marking that area? The information as to the trend and drift of stock coming into Wilcannia.
1974. And if you extended that boundary as suggested do you think you would be justified in extending it? No, I should not.
1975. As to the trend and drift outside of that portion treated by you, where does the stock go to? Bourke.
1976. Would the construction of this railway divert to Wilcannia that which is now going to Bourke? No; I do not think it would. The rail freight from Wilcannia to Sydney would be more than from Bourke, and they would have to consider that extra freight.
1977. The railway from Bourke to Sydney being very much shorter than from Wilcannia to Sydney, you think you would not be justified in extending that traffic area as shown in pink? No, I should not.
1978. *Mr. Watson.*] Evidence has been given that once you get south of Wanaaring, on the Paroo, the facilities for stock travelling, or any other sort of travelling, towards Bourke, are extremely limited owing to the lack of water? Yes; but bores are sunk along the Bourke to Wanaaring route, and they are extending the bores from Wanaaring to Tibooburra, on the Milparinka way.
1979. I said, once you got a fair distance south of Wanaaring, then the traffic ceases to go via Bourke, owing to the lack of facilities for water? Yes. You could go up the Paroo.
1980. You would have to get to Wanaaring first? Yes.
1981. You would have to add an angle on and go first to Wanaaring? Yes; but that would be on the road, and there would be nothing much in the way of expense in travelling along the road.
1982. But the longer you travel fat stock, the worse its condition gets? Yes.
1983. It is not a usual thing to travel fat stock any considerable distance? No; they truck them as much as they can.
1984. So a saving, perhaps, of 50 miles of railway carriage would be nothing as compared with the saving of 40 miles by the stock route—I mean in the case of fat stock only? No; it would not.
1985. Would it pay a man better, who had fat stock to dispose of, to take a rail journey a little longer distance rather than a road journey a little longer distance? Yes; it would pay him better; but there is not a great deal of fat stock drawn from that part of the country.
1986. Do I understand that, so far as the area adjoining the river is concerned, it is a good fattening country in a decent season? Yes.
1987. *Dr. Garran.*] I gather from the general trend of your evidence that you do not think this line will carry much live-stock travelling traffic? No; I do not.
1988. We could not look to that as a source of revenue? Not in my opinion.

1989. The natural market for all the fat stock in that district is South Australia or Broken Hill? Yes. G. C. Yeo.
1990. *Mr. Trickett.*] Excepting in bad seasons, when the owners would want to get their stock away quickly? Well, according to the returns last year, which was a very bad year, the stock traffic towards South Australia seems to have increased. A great deal of it comes through from Queensland. It enters this Colony at Wompah, and goes out again at Cockburn. 20 April, 1899.
1991. *Dr. Garran.*] I see by your figures that the stock in this district has never fallen below 2,000,000 sheep? 2,097,000 was the number last year—that was the estimate made in December, 1898.
1992. Have they got that number now? Yes.
1993. So that, after four years' drought, that country still carries 2,000,000 sheep? Yes.
1994. We are told that the country is as bare as a board? So I believe.
1995. Still, the sheep manage to live there? They have been reduced in numbers since 1894 by 1,600,000.
1996. Have they been mostly sent away, or have they died? I think they have mostly died. The facilities were not great enough to send them away. They have to travel along the road, or avail themselves of the stock routes.
1997. Some people are of opinion that this line would assist the sending of starving stock to the eastern portion of the Colony? Yes; but it has been proved that the carriage of starving stock does not pay the Railway Commissioners; therefore that would not be a source of revenue to them.
1998. Has it paid the squatters? It would benefit them by getting their stock to good grass.
1999. Has it paid them? I do not know whether it has paid them. Of course it has been money out of pocket all the time.
2000. Is the quality of the sheep up there very inferior to that of the sheep we have between the Murrumbidgee and the Murray? I could not say. I have not been in that part, nor seen any sheep from there.
2001. One witness said that the stock south of the Murrumbidgee was so superior that it would pay to truck it away in times of drought; but that the stock in the north-west was of inferior quality;—is that so? South of the Murrumbidgee, stock-owners go in for breeding pure bred stock for stud purposes, which they supply to people in the northern part of the Colony.

FRIDAY, 21 APRIL, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD,  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

2002. *Chairman.*] You produce a map? Yes.
2003. Will you explain it to the Committee? The map has been prepared to show the tenure of land within 20 miles of each side of the proposed line from Cobar to Wilcannia. The blue tint shows alienated land. That amounts to 51,000 acres. Settlement and homestead leases are shown by the blue hatching, and they amount to 381,000 acres. Then there are reserves, tinted green—all those green patches represent reserves of different classes, and they amount to 476,000 acres. The Crown lands are shown by the brown tint, and they amount to 3,453,000 acres. Those Crown lands are held under the following tenures: Leasehold areas, the leases of which expire in the year 1918, 1,995,000 acres; held under occupation license, 1,433,000 acres; not held under any recognised tenure, 25,000 acres—practically untenanted. Those are the different classes of tenure of the areas along the line within 20 miles of each side of it. C. E. Rennie.
2004. *Dr. Garran.*] Has the alienated land been mostly purchased at auction, or pre-emptive, or how? A portion of it would be by improvement purchase, and some, particularly land adjacent to the towns, would be most likely auction. 21 April, 1899.
2005. Have the improvement purchases been recent purchases or made many years ago? There have been no recent improvement purchases in that district; they would be under an old, repealed Act.
2006. Under Sir John Robertson's Act? Yes; or the immediately Amending Acts.
2007. I suppose that constitutes some of the best land about? These improvement purchases are generally the picked spots on the runs; but of course when they were taken up there was very little settlement there, otherwise probably more land would have gone—that is to say, under corresponding circumstances in the Central and Eastern Divisions much more land would be taken up under other tenures.
2008. Were they taken up to protect water, or for special goodness of the soil? I could not say without looking into every case; but, as a general rule, those spots are taken up for water supply purposes.
2009. I see there are 381,000 acres under settlement and homestead lease;—are the lessees prospering on that land? I cannot say.
2010. Would the forfeitures come under your notice? Yes.
2011. Have you had many pass through your hands? I could not answer that question without looking the matter up.
2012. You cannot say whether, in spite of the bad seasons, the lessees have been able to hold on to their holdings? Well, to the extent that is shown there. All those stand good that are quoted there. Those show the leases that now stand good within those limits.
2013. And are these leases mostly along the line of water frontage? They are about equally divided, I think, because there is no water frontage near Cobar. A large portion of those near Wilcannia are on the water frontage.
2014. Is any rapid extension of the settlement or homestead leases going on? Not at present in the Western Division, I think; at least not within that area.
2015. There is plenty of land open for settlement lessees to choose from, is there not? Yes; there is plenty. But the areas for settlement lease are set apart specially by the Department. It is not like the old conditional purchases, where men could settle down where they liked.

- C. E. Rennie. 2016. What I mean is, there is still plenty of land open for settlement lease if they want it? All that resumed area quoted there is now open for new settlement.
- 21 April, 1899. 2017. Which do you call the resumed area? The occupation licenses, I mean.
2018. Then, out of the 1,433,000 acres, the Minister can, from time to time, declare any portion he likes open for settlement lease? That is so.
2019. The lessees are not debarred at present for want of land to choose from? No.
2020. The Minister always keeps a certain quantity of vacant land ready for them? Yes.
2021. Do you know what the lessees mostly do;—do they graze or cultivate? It is mostly grazing tenure, nominally so at any rate.
2022. Have you any idea of the fair minimum quantity of land a man could keep himself and family on in that country? The homestead leases are limited to 10,240 acres.
2023. And the settlement leases? They go up to the same extent—10,240 acres.
2024. Do you know whether these leased lands are fenced in? I cannot say.
2025. The reserves, I presume, are mostly for the preservation of water supply? Travelling stock largely. Those long strips are travelling stock routes, and there are camping and water reserves at intervals along the routes.
2026. The reserve on each side of the line is a railway reserve, I suppose? Well, that was reserved in anticipation of a railway being made.
2027. It is really a reserve at the present moment? Yes.
2028. Not open to selection? No, it is not.
2029. How much in width? About 2 miles.
2030. A mile on each side? Yes.
2031. Those untenanted 25,000 acres, I suppose, are comparatively worthless land? Probably the most inferior.
2032. In a good season I daresay somebody's sheep run over it? It is probably made up of little remnants scattered here and there through the whole extent.
2033. What rental are we getting for this block you have got tinted there? The rents running from Cobar westerly are as follows:—One penny an acre; 77-100ths of a penny; 75-100ths of a penny; 89-100ths of a penny; one penny and 5-100ths of a penny; 80-100ths of a penny; 70-100ths of a penny; and, immediately north of Wilcannia, 88-100ths of a penny. Those are the rents of the pastoral holdings in succession running westerly from Cobar.
2034. Now, the lowest rental of that lot is 70-100ths of a penny? Yes.\*
2035. Those rents have all been settled by the Land Board? Yes, all appraised.
2036. How long ago? They were reappraised not very long ago.
2037. *Mr. Watson.*] Under the 1895 Act? I believe so.
2038. *Dr. Garran.*] Do you think that the construction of the proposed railway would make any considerable difference in the tenure and occupation of land 20 miles on either side of that line? It would be hard to say. Of course, increased communication always helps settlement.
2039. You see that the settlement and homestead lessees are clustered at the two ends of the line—one where you have the railway terminus, and the other where you have a navigable river;—do you think that the making of a railway right through there would multiply them within easy reach of the railway? It is, perhaps, doubtful, because the character of the country there is dry, and it is not a high-class country, as a rule. Therefore, I think that settlement would never be likely to be as thick there as farther east.
2040. What do you consider the average number of acres per sheep in that locality. I cannot say. It varies very much, and I am not familiar with the data.
2041. Supposing it is 10 acres to a sheep, then a man with 10,000 acres could only keep 1,000 sheep? Precisely.
2042. Is that considered about the minimum a man can live upon? I cannot answer that question. Of course it varies in different localities.
2043. Can you tell whether the pastoral lessees are at all behind hand, any of them, with their rents? I cannot answer that question.
2044. Has the drought covered the whole of that district? Practically, the whole of it.
2045. It has not been particularly bad, nor particularly good, as regards the drought? Speaking off-hand, I believe it has been severe all over that tract.
2046. You have no information of the population within that belt of country, I suppose? None at all. But it must be very sparse.
2047. Do you know how many different pastoral properties the line runs through? I could not be sure of it from this map, but I can find out, and give you that information.
2048. Are they large pastoral properties, or are they mostly moderate-sized ones? They are mostly large properties.
2049. And there are no townships along that line of route? I think there are none at all.
2050. Have you been over that country yourself? No; I have never been further west than Bourke.
2051. *Mr. Watson.*] Do you know whether the resumed areas are open for homestead lease; of course I know they have to be declared as homestead lease areas before they can be taken up in that way; but do you know whether the fact of their being merely under occupation license would leave them open for homestead lease? The resumed areas are open for homestead lease.
2052. There does not seem to be any great rush all this way back from the river frontage? No.
2053. *Mr. Trickett.*] With regard to the homestead leases, have many of them been abandoned? I could not answer that question without looking the matter up; but all those quoted are standing good at the present time. That area represents those that now stand good within the limits of the map. I could get that information for the Committee if you wish it.
2054. Can you furnish us with the number of homestead leases that have been taken up within the last five years, and how they stand—whether they have been abandoned or not? Yes, I can do that.†

2055.

\* NOTE (on revision) :—It is found on inquiry that there are rents as low as 36-100ths of a penny on the southern side of the line.

† NOTE (on revision) :—Nineteen homestead leases comprising 133,117 acres have been applied for since 1885 within the limit of 20 miles on each side of the proposed railway line, and are not now in force, some having been forfeited and the others either withdrawn or not accepted.

2055. Are there any improvements going on upon this land? I cannot answer that question. Of course there must be a certain amount of improvement, otherwise they could not hold their tenures. C. E. Rennie.
2056. Have many applications for permission to ringbark been received? I have no knowledge about that. It could be found out; but those are dealt with mostly at the local offices, and would not pass through my hands. 21 April, 1899.
2057. Is it timbered country to any great extent? I do not know the country sufficiently well to answer that question.
2058. Do you know anything about the common around Wilcannia—there is a very large common there, is there not? I only know there is a common; I cannot give you any particulars about it offhand. This green patch shown here round Wilcannia is common land.
2059. Does it state the acreage on the map? No, but I could easily find that out for you.
2060. This large common area round Wilcannia, do you know whether it is country of good character which would be taken up if it were thrown open in small areas? I cannot say. I do not know that country at all. I have not been there, and I have not seen any reports on the subject. You could get that information from the district surveyor.

William Henry Hall, Sub-editor, "Statistical Year Book," Government Statistician's Office, Chief Secretary's Department, sworn, and examined:—

2061. *Mr. Trickett.*] Do you produce some figures in regard to population for our information concerning the district between Cobar and Wilcannia? I do. W. H. Hall.
2062. Will you kindly read them to the Committee? Yes; they are as follows:— 21 April, 1899.

*Estimate of Population.*

Cobar .....	2,450
Wilcannia .....	1,050
Around and between Cobar and Wilcannia.....	2,060
White Cliffs .....	1,700
Mount Browne .....	330
Milparinka .....	360
Tibooburra } .....	710
Yalpunga } .....	
	8,660

2063. When was that got together? Within the last couple of months.
2064. You say White Cliffs; how many? 1,700.
2065. *Chairman.*] What is the area included in the Cobar return? Just the municipality; that is, both in the case of Cobar and Wilcannia.
2066. *Mr. Trickett.*] You say there are about 2,000 people between Cobar and Wilcannia? Yes; and round about those places.
2067. How far does that extend? I have taken an area of 25 miles on each side of the railway-line. As regards the estimate for White Cliffs, I may say there is a check upon that, inasmuch as the police collect these returns, and they furnish just about 1,700 as the estimate of the population of White Cliffs.
2068. *Chairman.*] You say the police check it; how is it first arrived at? By estimating in connection with the census returns, and the natural increase of population.
2069. How do you allow for the moving population—on a mining field, for instance? Then we have to rely, to a great extent, on the police estimate.
2070. And the actual return from the police comes out very near to what you estimate? Yes; for the whole district.
2071. *Mr. Watson.*] In that estimate of 8,000 and odd, you include Yalpunga, Tibooburra, and right down to White Cliffs;—do you allow anything for population outside those townships? Only in the immediate vicinity. For instance, I have not taken it to the junction of the Queensland and South Australian borders.
2072. *Dr. Garran.*] Do you take in the pastoral population? It is supposed to be included.
2073. You do include that? Yes.
2074. You estimate the men on the stations? Yes.
2075. *Mr. Watson.*] I understand you take the population of each of those townships and the immediate vicinity, right down to Mount Browne? Yes.
2076. But there is an area of country between White Cliffs and the South Australian border and between White Cliffs and Mount Browne;—have you made any allowance for the mining population at present there? No, I have not, because it was not asked for.
2077. You have taken the townships? Yes; the townships and the immediate vicinity.
2078. So it is possible there may be a fair amount of population in addition to that at those mining townships? Unquestionably there would be.
2079. *Dr. Garran.*] Have you any estimate of the ratable value of property in Wilcannia? I could obtain that, but I did not anticipate being asked for the information, and so I did not bring it. These returns are furnished every year to the office, and are prepared and published.
2080. *Mr. Watson.*] Do you know the boundary of the Wilcannia Electoral District? No, I do not.
2081. If the electoral roll, within the boundaries indicated on the map, contains 3,000 names, what would you estimate as the probable population, allowing something for the mining country? About 13,000, I should say.
2082. Would that be your estimate, including the mining country? Yes.
2083. Because there is always a fair proportion in a mining district which is not on the electoral roll? Yes.
2084. Men come and go, and do not bother about registering? Taking an average, the census discloses that the average would be a little over four to one.
2085. That is the general average for the Colony? Yes; and it would apply just as well to that district.
2086. You think that the shifting population would make good the deficiency in the number of children in some of the families? Yes.

W. H. Hall. 2087. So if there were 3,000 names on the roll there would be about 13,000 people in the district? Yes.  
 21 April, 1899. 2088. *Dr. Garran.*] Do you generally estimate the male adults one-fourth or one-fifth? Between one-fourth and one-fifth.  
 2089. You said, in reply to Mr. Watson, that you had included only the population around the mining townships, but I understood you to say to me that you had allowed for all the pastoral population? Only in the immediate vicinity. That was the requisition I received—the names of the places were given and the immediate vicinity.  
 2090. Then the pastoral population that fills in those blank spaces on the map you have not reckoned in? I have not taken that into consideration.  
 2091. And that estimate you made of the pastoral population between Cobar and Wilcannia was limited to 25 miles on each side of the projected line? Yes.  
 2092. What do you say the population of Wilcannia is now? 1,050—that is the Municipality.  
 2093. Have you any estimate of the population along the banks of the Darling from Bourke down to Menindie? It would have to be a very rough estimate.  
 2094. A good many of the homesteads cluster on the banks, do they not? That I cannot say.  
 2095. *Mr. Trickett.*] Have you any other information? Yes; I have a statement of the area under cultivation; but on account of the conditions of the twelve months ending in March last, I thought it only fair to the Committee that I should give them an estimate also covering the previous twelve months; therefore I have taken it out for the two years. It is as follows:—

Area under Cultivation.

District.	Date of Return.	Total area under cultivation.	Grain, Hay, and Green Crops.						Root Crops, Fruit, &c.											
			Wheat.		Lucerne.		Maize.		Potatoes.		Onions.		Vineyards.		Fruit Orchards.		Market Gardens.		Minor Crops (pumpkins and melons).	
			Acres.	Return.	Acres.	Return.	Acres.	Return.	Acres.	Return.	Acres.	Return.	Acres.	Return.	Acres.	Value of crop.	Acres.	Value of crop.	Acres.	Return.
Cobar .....	Mar., 1898	469½	397	352½	52	22	..	..	..	..	..	1½	4 tons	2	5	10	440	7	12	
	.. 1899	396	342	24	41½	Failure	..	..	7.	..	..	..	..	..	..	11½	820	1	6	
Wilcannia .....	.. 1898	719½	708	280	½	2	..	..	2½	11½	2½	5	3	1 ton & 400 gals. wine.	1½	20	2	40	..	..
	.. 1899	990	952	60	7	Failure	..	..	..	..	..	2	360 gals. wine.	..	..	29	653	..	..

	.. 1899	207	207	58	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	
Mount Browne....	.. 1898	206	172	35	30	8	..	..	..	1	2	..	..	3	30	..	..	..	..	
Milparinka .....	.. 1899	241	230	35	6	Failure	..	..	..	..	..	..	..	..	..	5	165	..	..	
Tibooburra .....	.. 1898	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	
Yalpunga .....	.. 1899	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	..	

2096. Those figures would indicate pretty clearly that it is not an agricultural district? Exactly.  
 2097. With regard to the falling off in 1899, it is only fair to state that that is occasioned by the prolonged drought? Exactly.  
 2098. *Mr. Shepherd.*] The drought has been really for four years;—that is all against agriculture? But after all said and done, it is not an agricultural district, excepting in specially fitting places, where, perhaps, they might apply a little irrigation.  
 2099. Of course, it is hardly fair to gauge the agricultural capabilities of a district in such a year as the last year has been? Certainly not.  
 2100. *Chairman.*] Do you know if agricultural pursuits have ever been attempted there? There is nothing to show that there is any larger attempt than that indicated in this table, and, at the utmost, within that area there are only 3,000 acres under cultivation.  
 2101. *Mr. Shepherd.*] Have you any means of finding out the production prior to the droughty years—five years ago, for instance? The position we are in, in regard to this information, is this: It is obtained in a confidential way from the settlers on the distinct understanding that these returns will be destroyed as soon as the tabulations for the Department are complete. Consequently, the original returns have been destroyed. That guarantee has to be given to them, or we should be precluded from getting the information, and because the returns might otherwise be used for other purposes in connection with the public service.  
 2102. *Chairman.*] Is there an Act of Parliament to compel the settlers out there to give this information? Unfortunately not. It is a pure act of grace on their part.  
 2103. *Mr. Levien.*] Is there not an Act of Parliament under which they have to furnish some returns? Only stock returns.  
 2104. *Mr. Trickett.*] To put another test, as there seems to be some doubt about this country; comparing a similar tract in New South Wales, have you any other part that would return such a small area of land under cultivation? I should say not.  
 2105. So it is admittedly not agricultural country? Not under present climatic conditions.  
 2106. How does it compare with the Nyngan to Bourke country? I have not the details with me, so I cannot answer the question. I know nothing about the character of the two countries. I have been over the country from Nyngan to Cobar, but I know nothing of the country under discussion at the present time.  
 2107. *Mr. Watson.*] There is plenty of wheat grown at Nyngan? There is a little.  
 2108. *Mr. Shepherd.*] You have not been over this district personally? No.  
 2109. So you cannot speak from any personal knowledge of it? No.

2110. *Mr. Trickett.*] Have you another return which was asked for? Yes. It is as follows:—

W. H. Hall.

*Mineral Production.*

21 April, 1899.

District.	Year.	Gold.		Silver.		Copper.		Opals.
		Quantity.	Value.	Quantity.	Value.	Quantity.	Value.	Value.
		oz.	£	oz.	£	tons.	£	£
Cobar .....	1897	26,211	105,067	120,860	9,765	2,461½	108,306	.....
	1898	22,254	78,808	170,704	14,556	3,514	178,900	.....
Wilcannia .....	1897	.....	.....	.....	.....	.....	.....	.....
	1898	.....	.....	.....	.....	.....	.....	.....
White Cliffs .....	1897	.....	.....	.....	.....	.....	.....	75,000
	1898	.....	.....	.....	.....	.....	.....	95,000
Mount Browne .....	1897	540	2,163	.....	.....	.....	.....	.....
Milparinka .....	1898	389	1,556	.....	.....	.....	.....	.....
Tibooburra .....	1897	815	3,314	.....	.....	.....	.....	.....
Yalpunga .....	1898	831	3,323	.....	.....	.....	.....	.....

2111. That return shows that there is an increase in the gold production of that country? Not altogether, because in 1897, at Cobar, there was £105,000 as against £78,000 in 1898.

2112. *Mr. Watson.* But, leaving Cobar out, there is a slight increase? No, there is a slight decrease. The production of gold is very small. The production at Tibooburra is much the same; but at Mount Browne and Milparinka, it was £540 in 1897, as against £389 in 1898.

2113. *Mr. Leven.*] Do you know how that information is obtained? It is gathered through the Mines Department.

2114. You know nothing of how it is gathered? No.

2115. What are the chief minerals in the district? Gold, silver, and copper, and opals at White Cliffs.

2116. You know of no other? No other has been reported.

2117. *Mr. Dick.*] Is the population in that district stationary or increasing, according to your return? It is slightly increasing.

2118. Is the increase fairly uniform over a long period? That I could not say without investigating the matter.

2119. *Mr. Shepherd.*] Have you any information as to the effect the drought has had on the production of minerals in that country? No.

2120. *Mr. Watson.*] I suppose you are aware that the drought does adversely affect the production of minerals in alluvial gold-mining? Yes.

2121. And in some cases stops reefing and other forms of mining? Yes; the Mines Department could give information better on that. We confine ourselves to the statistics, and not the reason why, unless there is some phenomenal reason.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

2122. *Chairman.*] Will you make a statement as to the average rainfall in the district to be served by this railway? Yes; starting from Cobar, and going north to Bourke, and from Bourke westward half the distance to Wilcannia, passing through Louth, and then going down to the middle line between Cobar and Wilcannia, the average rainfall is 15·41 inches. Taking the other half of the country out here from Louth to White Cliffs, and back again to Wilcannia, the average rainfall is 11·78 inches. Then, taking a section of the country south-west from Cobar to Mount Browne, and westward of the same line, and down from Louth again, so as to divide it into eastern and western halves of the country affected, the average rainfall of this piece—say, from Ivanhoe to Cobar and Mount Hope—is 15·38 inches; and taking the other section—that is, from Ivanhoe to the Cobar line, and up to Silverton and back—the average rainfall is 11·46 inches. The information I have given relates to an area that comes down to within 20 miles of Menindie.

H. C. Russell,  
C.M.G.

21 April, 1899.

2123. That would embrace the whole of the country to be served by the proposed railway? Yes; so far as I understand.

2124. Have you a station at Yalpunga? I have a station at Tibooburra. The average rainfall there is 8·73 inches. At Mount Poole, which is in the same district, and close to Tibooburra, it is 9·00; and at Milparinka it is 9·30. Then, going eastward, the nearest station I have is that of Elsinora, on the Paroo practically, and the average rainfall there is 14·29. At Wilcannia it is 11·13, and at Cultowa it is 12·36. Menindie is the driest place in the Colony, so far as the records go. The average rainfall at Menindie is 9·86, and at Wentworth it is 12·09.

2125. *Dr. Garran.*] Have you any stations north or south of Menindie? Tintinology is about 30 miles north-east, and the average rainfall is 10·29. At Billila, 10 miles or so further north, on the river, it is 10·49, and at Culpaulin it is 10·74.

2126. What is the average at Broken Hill? 10·11; that is a nine years' record, which would be rather below the average. The record is for the last nine years.

2127. Have you White Cliffs? No; that is a station that has been going only about twelve months. There are a number of stations just to the west of Wilcannia. There is a station called Grassmere immediately west, about one-third of the way between Wilcannia and Broken Hill.

2128. That would be on the coach road, I suppose? Yes; the average rainfall there is 6·84, but that is a four years' record, of which three were drought.

2129. Then I understand that the extreme north-west of our Colony is not drier than Menindie? No; the rainfall in the neighbourhood of Milparinka is fair in amount, considering the district it is in; but it falls in violent storms. Often they go practically months without rain, and if they do not get rain in the first three months of the year it is highly probable they will not get any.

2130. They had 2 inches a few weeks ago? Yes, they had—rather more in some places. For instance, in the Hungerford district some of the stations had from 3 to 4 inches in that storm.

2131. Have you a record for Wanaaring on the Paroo near the border? Yes; Wanaaring is 13·28—an eighteen years' record, so that may be taken as a fair average. Urisino is 12·28.

2132.

- H. C. Russell, 2132. Do you know how many years Wilcannia has been established as an observatory? Twelve years. That would be about a fair average.  
C.M.G.
2133. Preceding this drought, when was the last bad drought? The corresponding drought to this was in the middle of the eighties—about from 1883 to 1886.
2134. That was a three years' drought? Yes; and speaking generally the rainfall was much less in those years than in the present drought.
2135. There is no part of the Colony, I suppose, where there is not some rainfall in each of these four years? No; but the rainfall is so small—half an inch in the month, and that sort of thing—that in that country it is perfectly useless.
2136. In those places where you speak of 8 inches, would that come in light showers, or 2 inches at a time? If it is in the west, the rain they get is nearly always in heavy showers.
2137. Is that the case at Menindie? Yes.
2138. Then the contribution to the Darling water from the Darling basin itself is really very slight? Yes; except in heavy storms.
2139. Then we are really indebted to the Queensland rain for the navigation of the Darling? Yes—perhaps more than half of it; but the tributaries to the Darling in this Colony, running from the main range, feed the Darling very well. The floods come down from the Macintyre River, which is partly Queensland and partly New South Wales rain. Nearly all the valuable floods come in from there, but the Namoi and Macquarie, and several other rivers, also feed the Darling very satisfactorily.
2140. In good rainy seasons there is a good discharge from the Bogan and the Macquarie, I suppose? Yes. Sometimes the rains are so heavy in the west that they cause considerable floods. I remember one rain-storm occurring in January, 1886, when 11·36 inches fell at Wilcannia in thirty-six hours. The consequence was that the river rose at Wilcannia 27 feet, whilst the rain was light about Bourke, where the rise was only 4 feet.
2141. That is very occasional? That is the only instance I know of, but it shows that they may get a flood in the river from a purely local downpour.
2142. As regards occupying that country for agricultural purposes, this very sudden and heavy rainfall is rather against agriculture? Yes; and there is another still more serious objection, which I pointed out some years ago, namely, that nearly all of their rain comes in the summer and autumn.
2143. When they do not want it? It is of no use then for agriculture. In the north-western districts the rainfall is extremely uncertain.
2144. That is all to the good for grass-growing I suppose? Yes; the grass grows so very fast after heavy rain that in the course of two or three weeks after heavy rain they have a fine crop of grass.
2145. Unless very hot winds nip it off? Yes.
2146. Still, there is this great distinction between these two industries (pastoral and agricultural), namely, that the rainfall is not wanted so far as the pastoral is concerned, but very often it is wanted so far as agriculture is concerned? Yes. I think the best illustration of the character of that rainfall I gathered from an old squatter some years ago. I expressed my doubt as to how he could exist there with a rainfall of 6 inches a year, and he said, "I am perfectly satisfied with 6 inches a year if you let me have it when I want it." I asked, "How do you want it?" He replied, "I want 3 inches in the early spring, and 3 inches in the early autumn; then the grass will grow up—I will have heavy fields of grass. There is very little wind here, and, with a lightly stocked country, the grass is preserved, a sort of dry hay."
2147. Then, for orchard purposes and vineyards and so forth, if anything is done with tillage in that district, it must be done by irrigation? I think so, but I do not pretend to know anything about it.
2148. Of course, with irrigation you can put the water on when you like? Yes.
2149. And in any volume you like? Yes.
2150. In the other case you are dependent absolutely on what Nature gives you? Yes.
2151. And sometimes Nature gives too much and sometimes too little? Yes; and it is very uncertain as to when she does give it to you.
2152. We have just had an account given to us of the agriculture and orchard growing in this district, and a beggarly account it is;—I suppose that is due to the climate—the uncertain rainfall? Yes. If a line be drawn from Wentworth (say) to Walgett, all to the west of that is not much good for wheat-growing. To the east of it there is a chance.
2153. You will get an occasional crop, I suppose? Yes.
2154. And, when you do get it, a very good crop? Yes; I know one squatter living near Cobar who told me that for six years running, each of them drought years, he got a good crop of wheat, and I was very doubtful. At last he came down and finished his joke with me. He said that he had chosen his wheat-field in a gully, and every shower of rain that ran at all on the surface came down and watered his field. That shows it is possible to grow wheat under irrigation, and very satisfactorily; but if it would pay, I do not know.
2155. Then, Cobar is quite as far west as cultivation could go? Yes.
2156. In fact, it is a little outside the range? Yes.
2157. The line going to Dubbo from Bourke, between Nyngan and Bourke at any rate is practically the eastern limit of the wheat-growing country? Yes. Of course, in their best years they could grow wheat, but it could not be made a commercial transaction further than that. In the north-western half of the Colony, speaking generally, the rainfall is in the early part of the year, and, therefore, is unfavourable for the growth of cereals.
2158. And that part you spoke of as lying west of your line would, in area, take in quite one-third of the Colony? Yes.
2159. And it is not a wheat-growing country? No.
2160. Not from any want of richness in the soil? No; I think, from what I learn, that some of the richest soil in the Colony is to be found on the Darling.
2161. *Mr. Shepherd.*] How many years back do you calculate your average rainfall? For each individual station we take an average for the number of years it has been at work.
2162. So there is a great variety of averages? Yes; but out west there are very few stations with long records.
2163. How does the general average compare with the rainfall for the last four years? I could not tell you off-hand exactly what it is, but I should think that the average for the last four years would be from 20 to 30 per cent. below the general average.
- 2164.

2164. And last year, I presume, was the lowest of all? Yes.
2165. In what months do they usually get the rain in these districts? January and February—sometimes in March. This year they missed the rain in January and February, and got it in March.
2166. Not in the spring months? Not as a rule.
2167. All that is really against agriculture? Yes; I think, as far as I know anything about it, it is altogether inimical to agriculture.
2168. If they cannot get their crops in before June or July, at the latest, they are not likely to get any crops at all? No.
2169. *Chairman.*] Anything that we could do artificially, you think, would not alter the climatic conditions of that part of the country? I have never been able to learn of anything that is likely to increase the fall of rain. But, of course, it is possible by artificial means to conserve water, and use it to greater advantage than Nature seems to do, over small areas by irrigation.
2170. But that would not alter the climatic conditions? It would not increase the rainfall.
2171. With the rainfall in that particular district, do you think agricultural pursuits are possible there? I think not.
2172. Have you a detailed statement of the rainfall at Wilcannia (say) for ten or twelve years back? Yes; the first year's record is in 1873. It was 11.14; 1874, 11.22; 1875, 11.47; 1876, 5.65; 1877, 12.20; 1878, 12.22; 1879—one of the finest years they ever had—14.30; 1880, 10.89; 1881, 10.82; 1882, 8.35; 1883, 6.84; 1884, 7.65; 1885, 18.37; 1886, 12.00; 1887, 21.99; 1888, 3.23; 1889, 14.08; 1890, 15.17; 1891, 13.89; 1892, 9.87; 1893, 10.80; 1894, 16.62; 1895, 10.77; 1896, 7.30; 1897, 7.25; 1898, 11.13.

H. C. Russell,  
C.M.G.  
21 April, 1899.

TUESDAY, 13 JUNE, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (VICE-CHAIRMAN).

The Hon. PATRICK LINDSAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined:—

2173. *Vice-Chairman.*] The length of the proposed Railway from Cobar to Wilcannia is 156½ miles, so that at the ordinary rate of £12 per mile it would cost your Department £1,878 a year for the carriage of mail-matter on that line? Yes.

J. Clarke.

13 June, 1899.

2174. What is the cost of the mail service to Wilcannia? I have prepared a return.

2175. Will you be good enough to read the return? It is as follows:—

COBAR-WILCANNIA LINE.

Number of mails, including parcels, exchanged on the line, with the approximate weight, per week:—72 bags, &c. = 52½ cwt.

STATEMENT showing the number of Letters posted at the post offices on the line, and the Revenue derived from the Post and Receiving Offices during the year 1898.

Name of Office.	Number of Letters posted.	Revenue.			
		Postal.	Telegraphic.	Money Order and Postal Notes.	Total.
Cobar .....	206,600	£ 2,134	£ 909	£ 195	£ 3,238
("Meadow's Hotel") .....	.....	5	.....	.....	5
Wilcannia .....	132,070	1,622	740	67	2,429

STATEMENT showing the number of Letters posted at, and the amount of Revenue derived from, the Post Office at Wilcannia each year from 1891 to 1898.

Year.	Number of Letters posted.	Revenue.			
		Postal.	Telegraphic.	Money Order and Postal Notes.	Total.
1891 .....	130,599	£ 1,879	£ 1,168	£ 75	£ 3,122
1892 .....	131,277	1,887	1,030	69	2,986
1893 .....	143,150	1,847	942	74	2,863
1894 .....	137,450	1,541	1,087	68	2,696
1895 .....	134,230	1,730	848	66	2,644
1896 .....	133,480	1,607	934	70	2,611
1897 .....	134,640	1,539	811	63	2,413
1898 .....	132,070	1,622	740	67	2,429

2176. How do they reach Wilcannia? The mails for Wilcannia leave Sydney on Monday, Wednesday, and Friday, *via* Cobar, and they get to Wilcannia on Thursday, Saturday, and Monday, at 6.30 a.m. A mail leaves Sydney on Tuesday *via* Bourke, and arrives at Wilcannia on Friday evening.

2177.

J. Clarke. 2177. *Mr. Dick.*] Will you now give the particulars of the mail contracts? The return I have brought is as follows:—

13 June, 1899.

## PARTICULARS OF MAIL CONTRACTS.

Contractors'		Postal Lines.	Dis- tance in Miles.	Frequency of Communi- cation.	Mode of Conveyance.	Annual Amount pay- able to Contractors.	Date of Termination of Contracts.
Names.	Addresses.						
241 Wm. H. Morrison.	Balranald .....	Cobar, "Meadow's Hotel," and Wilcannia.	160	No of times per week. Three .....	4-horse coach.	£ s. d. 1,490 0 0	31 Dec., 1900.
239 Alfred Francisco	Cobar .....	Cobar, <i>Fulham Park</i> , and <i>Baden Park Station</i> , via Belaraboon (mail-box) and Nekarbo.	167	One .....	4-wheeled vehicle, 2 horses.	169 17 6	31 Dec., 1900.
242 James Jarrett...	Cobar .....	Booroondarra Tank, Wuttagoona, Pulpulla, Gidgee, Abbotsford, Tiltagoona, and Innesowen.	60	One .....	4-wheeled, 2-horse vehicle.	83 0 0	31 Dec., 1900.

The latter two lines I mentioned, because if a railway is constructed from Cobar to Wilcannia the probability is that these mails will be started from some point or points on the line.

2178. Can you give the time-table? It is as follows:—

## TIME-TABLE.—COBAR-WILCANNIA LINE.

Leave Cobar .....	Tue	Thur	Sat	8:30 p.m.	Leave Wilcannia .....	Thur	Sat	Tue	5	p.m.
Arrive ("Meadow's Hotel") ...	Wed	Fri	Sun	5 a.m.	," ("Meadow's Hotel") ...	Fri	Sun	Wed	11	do
," Wilcannia .....	Thur	Sat	Mon	6:30 do	Arrive Cobar .....	Sat	Mon	Thur	5:45	a.m.

There are other places from which we receive considerable revenue;—for instance, from White Cliffs, Tibooburra, and Milparinka.

2179. *Mr. Watson.*] Has there been an increasing revenue from White Cliffs? It is a comparatively new place.

2180. That might have the effect of taking away some from Wilcannia? In the way of postages, I have no doubt it does.

2181. *Vice-Chairman.*] How much is paid for the service between Bourke and Wilcannia? The line is between Bourke, Louth, Tilpa, Tankerooka, and Wilcannia, 250 miles, twice a week by a three-horse coach, for £1,450 a year. The present contract ends on the 31st December, 1900. It is a very old-established line.

2182. With a railway from Cobar to Wilcannia would that service still be necessary? It might require a rearrangement at different places.

2183. There are several townships between the two terminal points? I do not know that the towns are very large. There are settlers about 70 miles from Bourke; but as you get further on I do not think there are many settlers.

2184. There is not likely to be any saving to the Government by reason of the new railway doing away with that service? I think not. What we find is that the railway payments increase considerably, and that the mail-coach business remains at about the same per mile.

2185. How do you arrive at that uniform payment of £12 per mile per annum on new lines? It was understood to be a fair one, I believe.

2186. Is it more than the coaching rate? A good deal more.

2187. Is it made up by a saving on the mail-lines which strike the new railway? I do not think so. They put down the amount of work which has to be done, and the weight which has to be carried, and so on, and after a great deal of consideration, in 1886 they thought that was about a fair thing to do.

2188. If a railway were constructed from Cobar to Wilcannia several mails which are conveyed by coach could possibly be sent right in to Cobar;—you say that these routes will be shortened by their making for some point on the line of railway? Yes, a couple of them.

2189. Will it not result in a saving to the Department by making a shorter route? The services get split up, and we do not save much; the interests become divided, and you have to serve them from certain points. Instead of having one line, you have three, four, or five short ones, amounting to about the same, perhaps a little less sometimes.

2190. *Mr. Shepherd.*] Does the nature of the country not vary the price per mile? Yes; in dry country it costs more than it does on the coast, where you can get plenty of feed. Perhaps in dry country, where it is a short line, and there are plenty of people willing to carry, we get the work done for a small amount.

2191. Is there very much competition, as a rule, when tenders are called for these services? You will have tenders for one up to, we will say, twenty-seven. It all depends on the line. I think the largest number of tenders sent in are generally for the North Coast lines.

2192. Are the tenderers generally local people? Not generally. A man may come from the west right away to the north. Contractor Keogh, who has the Hexham to Gloucester line, is a western man. They do not confine themselves to any particular district. There is a man named Potter, who has been all over the Colony—south, west, north, and South Coast. I have known him as a contractor for twenty or twenty-five years. He will have a contract somewhere.

2193. *Vice-Chairman.*] When railways are constructed to outlying places, do you find that there is much diminution in the telegraphic business? I am not aware; I should think it would rather increase that business.

2194. *Dr. Garran.*] Do you have much competition for the mail service between Bourke and Wilcannia? You would not have much competition for that, because, you see, only men of means could do that very heavy service; you, perhaps, would have three or four competitors.

2195. The competition is practically in the hands of two or three men? It is in the hands of about four men. It is so keen between them that I think we get a fair service.

2196.

2196. The competition is sufficiently keen to do justice to the Department? Yes; in fact, locally they consider the price paid now is very small. J. Clarke.
2197. That is because of the hardship of the season? Yes; the difficulty of the country to be worked. Just before this rain came down, according to statements we had, they were carrying out water for their horses for a considerable distance on the Cobar-Wilcannia line, and it is during the driest times that our heaviest loads of parcels go out that way. 13 June, 1899.
2198. Why? The rivers get shut up, and the people must have their pieces of drapery somehow, and they get them sent through the parcels post.
2199. The dry season brings a little grist to your mill? Yes.
2200. You have a larger parcel business? Yes, at dry times. When the rivers are opened the business goes that way because it is cheaper.
2201. *Mr. Watson.*] You do not give anything extra to the contractor if you send heavy parcels in a dry season? No; he makes many applications, but he is told that if he wants more he ought to have asked for more in his contract.
2202. Have you got a mail route from Broken Hill to Wilcannia? Yes.
2203. What does it cost? It is another contract held by Morrison. The line is Broken Hill, Round Hill, Mount Gipps, and Wilcannia, by the new route—about 120 miles twice a week by a four-horse coach, for £100 a year. It is a good coaching road, and the contract terminates in 1901. If this railway were built it would make a quick route—even from Melbourne, *via* Harden, Blayney, and Cobar, to Wilcannia. Say, they left Sydney on Monday, they would get to Wilcannia on Wednesday morning, at about 4 or 5 o'clock if they went through. And if they started from Melbourne on Monday at 6:15, they would arrive at Cobar on Tuesday evening, and at Wilcannia on Wednesday morning; whereas if they left on the same night *via* Adelaide and Broken Hill they would get to Wilcannia on Thursday morning.
2204. Have you got any mail route approaching Wilcannia, from Mossgiel, Ivanhoe, or the Hillston district? We have a line from Hay to Booligal three times a week, and from Booligal to Ivanhoe twice a week, and from Ivanhoe to Wilcannia once a week.
2205. But these lines would not carry Sydney matter? Not to Wilcannia. We discarded that line for Sydney mails when the Cobar railway was opened; and it was reduced from three times a week to twice a week between Booligal and Ivanhoe, and once a week from Ivanhoe to Wilcannia.
2206. You have a line going from Wilcannia out towards Tibooburra, *via* White Cliffs;—what does it cost? Yes; twice a week. From Wilcannia, "Victoria Hotel," Tarella, Double Tanks, to White Cliffs three times a week.
2207. What does that line cost? It is included in a further contract of twice a week.
2208. Give us the cost of the line right through? £1,126 17s. 4d. to Tibooburra—that is, for a service three times a week to White Cliffs, and a service twice a week to Tibooburra.
2209. You do not go any further in that direction? We go out to Queensland as far as Wompah once a week.
2210. What is the cost of the line? Tibooburra, Yalpunga, and Wompah (Queensland), *via* Warri Warri, 52 miles, once a week by vehicle with two or four horses, for £75 a year. Starting from Sydney on a Monday, the mail would be able to get to Broken Hill, if this railway is built, on Wednesday afternoon, whereas now it does not arrive till Thursday morning at 9 o'clock.
2211. How much time should you save to the people of that north-western district if the mails were conveyed by rail from Cobar to Wilcannia? Twenty-four hours or so. We should get there at about 4 or 5 a.m. on Wednesday. We get there now at 6:30 a.m. on Thursday.

---

FRIDAY, 4 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

William Bethell Sharp, shipping and colliery agent, Newcastle, sworn, and examined:—

2212. *Chairman.*] I believe you have been over the proposed line from Cobar to Wilcannia? Yes; I went over the whole route in April and May last, from Cobar to Wilcannia. W. B. Sharp.

2213. With a view of giving evidence at this inquiry? Yes.

2214. Are you prepared to make a statement of your views with reference to this proposal? I have prepared the following statement, which I will read:— 4 Aug., 1899.

Hon. Alexander Brown, M.L.A., Newcastle,—  
Dear Sir,

Newcastle, 2 June, 1899.

In conformity with your letters of April 10th and 25th, I proceeded to Broken Hill, *via* Lithgow, Cobar, Wilcannia, and returned to Newcastle *via* Port Pirie, Adelaide, Melbourne, and Sydney; and I have much pleasure now in handing you report upon my observations as to the advisableness, or otherwise, of constructing a railway line between Cobar and Broken Hill, *via* Wilcannia.

Seeing, from the evidence taken before the Public Works Committee in 1891, considerable stress was laid upon the fact that coal and coke were carried from Lithgow to Broken Hill, and crude ore returned there for smelting, a considerable revenue was likely to accrue to the Government therefrom, I made it my business to visit Lithgow, and have to report that the output of the collieries there—*viz.*, Lithgow Valley, Hermitage, Eskbank, Iron-works Tunnel, Zigzag, Vale of Clwydd, Oakley Creek, and New Vale—totals at the present time about 200,000 tons yearly, of which the Railway Commissioners purchase about half, and the western and southern towns the balance. Of course, if a greater demand took place for the coal, the output could be considerably increased. The present price of Lithgow coal, on the trucks, ranges from 4s. to 4s. 6d. per ton. The total output of coke is about 4,000 tons per year, which is principally used by the Tramway Department for fuel. The quality of coke at the present time is not of a very first-class order, as exemplified by the fact that the Cobar Smelting Works do not use it, although much nearer to Cobar than Newcastle and Rix's Creek; they prefer to pay the extra carriage on the better article from the Northern districts. It is quite possible that when the new

W. B. Sharp. copper mines at Blayney; Cow Flat, Wiseman's Creek, Chesney, and others, get into full working order, they may use a considerable quantity of coal and coke from the Lithgow district, the output of Newcastle coke being nearly all contracted for at present. Timber is cheap, and can be bought for about 10s. per hundred, and bricks for about 30s. a thousand. In the face of this, however, very little timber is despatched to Cobar, the bulk of the timbering of the mines there being rough timber, procured within 15 or 20 miles of Cobar.

4. Aug., 1899.

On my arrival at Cobar I was joined by Mr. Kilgour, who had arranged to drive from there to Wilcannia. During my stay, however, I visited the Great Cobar Copper Company's property, and found that very little timber for mining purposes was used there, except what was procurable within a short distance of the mine. The ore raised is burnt in open dykes, to throw out the sulphur contained therein. It is then worked through water-jackets, and converted into matte, containing about 35 to 40 per cent. of copper. This matte is forwarded under ore rate to Lithgow at 15s. 1d. per ton, and refined there, and sent in ingots from Lithgow to Sydney. I found that no coal is used at the mine, timber fuel being plentiful. The coke used in the water-jackets is nearly all imported from Rix's Creek, and the company have a special arrangement, made with the Commissioners some years ago, to carry this coke at a through rate of £1 5s. 10d. per ton. The balance of coke used is from Newcastle, the rate being £1 4s. 5d. per ton.

We started from Cobar by buggy, and passed through the following stations:—Amphitheatre, Springfields, The Meadows, Tambua, Barnato, Nelyambo, Bulla Bulla, Cultowa, and Murtee. The bulk of the distance was adjoining the proposed railway route. I saw no particular difficulties, from an engineering point of view, regarding the construction of the line, but the whole of the country was in a deplorable condition owing to the drought. Feed was almost impossible to obtain, nearly all the tanks were dry, and the mortality amongst the sheep has been enormous.

On arrival at Wilcannia, I ascertained that the quantity of wool handled last year was 29,700 bales, of which quantity 10,550 bales were forwarded through Broken Hill to Port Pirie and Adelaide, but that, in the year 1894, which they considered a good period, they handled 36,947 bales. The carriage on wool from Wilcannia to Adelaide and Melbourne *via* Echuca or Morgan, was as follows:—

Adelaide .....	Greasy, 45s. to 50s. ....	Scoured, 60s.
Melbourne .....	„ 50s. ....	„ 55s.

Insurance on river carriage to be calculated at 20s. per cent. The carriage on up goods averages about 85s. per ton at the last rise in the river, and at ordinary times when the river is up, 55s. per ton. Freights on general goods from Adelaide to Wilcannia, *via* Murray Bridge, are £3 10s. per ton; Melbourne to Wilcannia, *via* Echuca, £3 10s. per ton; Sydney to Wilcannia, *via* Echuca, £4 per ton when the river is up. There is no doubt a strong feeling in Wilcannia to have the extension of the railway from Cobar, as, in times of drought, under the rates charged by the railway for corn, chaff, and other feed, goods could be carried from Orange to Wilcannia at very cheap rates; on the other hand, equally influential people are in doubt as to whether Wilcannia would be best served by a railway or by the locking of the Darling. The cost of the railway is estimated at £497,000, whereas the cost of locking the Darling as far as Wilcannia is £532,000. I was told frequently that if they had a railway to Wilcannia they would be satisfied, as they did not think for one moment the New South Wales Government would be insane enough to continue it on to Broken Hill. In the event of the Government doing so, there would be no doubt that a considerable quantity of wool would find its way to the seaboard *via* Broken Hill. The population of Wilcannia is 1,200; White Cliffs, 1,600; Milparinka, 750; Tibooburra, 600. The population of White Cliffs is increasing rapidly, owing to the liberal mining laws, and, lately, discoveries of copper in large quantities have been found at Nuntherungie. Of course, if the copper deposits are of a permanent nature, a large amount of trade could be done through Wilcannia, not only as regards the carriage of coke, but also the conveyance of minerals. It is a very difficult matter to decide whether in the event of a railway going to Wilcannia, it would be used to any great extent when the river was up. I feel certain that shippers and owners would use the cheapest route when available, and consequently the annual returns of the railway would in my mind fluctuate very considerably. There is a strong railway league formed in Wilcannia, and they have several concentrated facts to put before the Public Works Committee on their arrival there, showing that the revenue derivable from the extension to Wilcannia would total £67,750. These estimates, as far as the sheep and cattle traffic, are purely imaginary. The revenue estimated by them from goods at £48,500, would, I hardly think, be realised, although, no doubt, at the present time while the drought is on, a railway would be a very great blessing to the people there, who are paying something like £7 a ton for goods by camels from Broken Hill.

I then proceeded by coach, *via* Netalie, Grassmere, Langawirra, and Mount Gipps stations to Broken Hill. The country on the western side of the Darling appears to me to be very much superior to that on the east. The salt-bush is still flourishing, and there appears a fair amount of feed, the great difficulty in keeping the stock alive being the scarcity of water. At Broken Hill I ascertained that the whole of the smelters had been removed from the Hill to Port Pirie, as it was found much cheaper to send the ore to the smelters at the seaboard, than to bring the coal, coke, and other materials from the coast. The smelting seems to have settled down on a sound basis, and my own opinion is that if the railway were opened to Broken Hill the whole of the smelting operations would be continued at Port Pirie. The average rate for ore from the Hill, to and from Port Pirie, is 12s. 3d. per ton; flux, 15s. 1d.; coke, 28s. 6d.; bullion, 30s. 11d.; coal, 16s. 9d.; timber, 25s. 2d.; and wool—greasy, 36s. 9d.; scoured, 48s. 6d. per ton. You will see from these rates that it would be hardly possible for any rate to be struck on the New South Wales railway that could come near them. Coal is selling at Port Pirie for 15s. 6d. per ton, and at Broken Hill for 32s. 6d. Even estimating the lowest possible rate for coal from Eskbank to Broken Hill at ½d. per ton, the freight alone would come to £1 7s. 1d., and the cost 4s. 6d., totals £1 11s. 7d., and as the back loading of bullion or crude ores would be unobtainable, it would be impossible to carry coal that enormous distance at the low rate named. The basis of carriage on coal at ½d. per ton, I consider absolutely inadequate. It is a well-known fact that the Railway Commissioners have stated time after time, in their reports, that the coal traffic of Newcastle does not pay them. We find that they haul over 2,300,000 tons yearly, and charge a rate equivalent to about 1d. per ton per mile, making the various collieries provide sidings and rolling stock for the conveyance of the coal. If, with all this thrown in, the coal trade here does not pay, according to their statements, how could they possibly expect it to be payable when the carriage proposed on the Western line is ½d., and the wear and tear of the Government trucks on long-distance runs would be very great? The comparison admits of no argument. I find that, owing to the new system of working the mines, the use of timber is rapidly decreasing, and that only a small quantity of colonial timber is used at the Hill at all, amounting to about 30 tons monthly. Therefore, there would be no inducement for sending timber from Dubbo to the Hill as previously advocated. As showing the enormous difference in the amount of bullion carried by the railway, I find that in 1893 as much as 59,725 tons was carried from Broken Hill to Port Pirie; but since the smelting operations have been carried on at the latter place, in 1898 only 3,179 tons of bullion was carried. On the contrary, in 1893, the amount of ore sent from Broken Hill was 158,058 tons; in 1898 it amounted to 426,820 tons, the bulk of this being for treatment at Port Pirie, and the balance for shipment from there to Europe. Likewise, the falling off in the carriage of coke in 1893, when it was 72,441 tons, to last year when it only reached 4,631 tons. Coal, however, has been steadily increasing, and last year 92,297 tons were consumed at the Hill at an average cost of 32s. 6d. per ton. Considering the geographical position of Port Pirie, which is only 256 miles from Broken Hill, the whole of the trade, in my opinion, must divert to that port, and as every facility is being given for the expansion of trade there, I do not think it at all possible that any Broken Hill trade can be brought to Sydney. The bullion is carried from Port Pirie by steamers to eastern ports, and transhipped from there to London, and it would be impossible for any railway to compete with this regular and cheap water carriage.

I have, therefore, come to the conclusion that the extension of the line to Wilcannia would benefit that town very considerably, by having easy access and fairly cheap freights; but no reliance could be placed on a regular traffic, on account of the cheap conveyance by river when navigable; but that a continuation to Broken Hill would be mostly suicidal. None of the trade, in my opinion, would come to Sydney, but a large amount of trade would be diverted from Wilcannia to South Australia, owing to the smaller mileage carriage. I doubt not, that a large number of people at Broken Hill could be found advocating the extension of the line from Cobar to that city, for the obvious reason that if they had a Government railway there, they would be in a position to use it as a lever to reduce the rates on the South Australian railways. These, however, if competition ensued, would, in my opinion, always hold the business at Broken Hill.

I have all data at my disposal, and shall be pleased, if required, to give my evidence before the Public Works Committee when called upon.

I have, &c.,

W. B. SHARP.

2215.

2215. Have you any other statement? I have the figures showing the increase and decrease of trade at W. B. Sharp. Broken Hill, from the year 1888 to the year 1898:—

The last of the smelters was closed down in Broken Hill during 1898. They were removed owing to the great cost of smelting, it being cheaper to smelt at the seaboard than to pay cost of coke and flux to Broken Hill, and cost of ballion to ports. 4 Aug., 1899.

Present price of coal at Broken Hill:—

Hetton, Wickham, and Newcastle, 15s. 6d. per ton at Pirie; 3d. agency; 16s. 9d. railway freight. Total, 32s. 6d. per ton on trucks at Broken Hill.

Freights between Pirie and Broken Hill:—

Coal, 16s. 9d. per ton.  
Coke, 28s. 6d. per ton.  
Mine timber, 26s. 2d. per ton.  
Ore, 12s. 3d. per ton.  
Wool rates, see page 36, S. A. Railways Goods Rates-book.

Mileage:—

Broken Hill to Pirie, 256.  
" Port Augusta, 287.  
" Port Adelaide, 334.

Colonial timber:—

A few tons only used. About 30 tons monthly, the rest being Oregon. Mines are not using as much timber as formerly. No special concessions in freight now.

Population of Broken Hill:—27,000.

Mines working:—

South, Sulphide Corporation, Block 10, Broken Hill Proprietary (three blocks of 40 acres), Block 14, British Junction, Junction North, North, Consols, Pinnacles.

Number of men employed:—

6,700, including miners, surface hands, mechanics, &c., at the mines.

Customs value of ore exported during 1898 was £1,452,443, this being the value of ore at Broken Hill. It is, of course, only approximate.

<i>Ore despatched during 1898.</i>	Tons.

2216. Do you think that the smelting is permanently fixed at Port Pirie for Broken Hill? It is permanently fixed at Port Pirie, Cockle Creek (Newcastle) and Dapto. There is no smelting at the Hill.

2217.

W. B. Sharp. 2217. You think, even if a railway is constructed, that there will be no possibility of doing any smelting at Lithgow? I do not see how it is possible, the companies having made their arrangements now, and gone to a very large expense in erecting enormous works at Port Pirie. There are thirteen smelters at work there. They have also arranged for smelting at Cockle Creek and Dapto. I do not think it is likely that smelting will come out of that channel again. It is quite likely that large quantities of ore from Cobar will be smelted at Lithgow.

4 Aug., 1899.

2218. Then you do not think that there is any possibility of Lithgow cutting in and getting any of that smelting? I do not think it is at all possible. I have some notes here that bear on the subject:—

DURING the year 1898, 426,820 tons of crude ore and concentrates were sent from Broken Hill, of which 38,070 tons went to Cockle Creek and Illawarra; 277,325 tons to the various smelting works in South Australia, viz., at Port Adelaide, Port Pirie, Dry Creek, and Wallaroo; and 111,425 tons were shipped direct from Port Pirie to London. Now, the question is, if Sydney was connected with Broken Hill by rail, what proportion of the above traffic could such a line hope to get? (1.) The ores and concentrates sent to Cockle Creek and Illawarra (38,070 tons) are at present delivered at these places at the following rates, viz., Broken Hill to Port Pirie, 12s. 3d. per ton; Port Pirie to Newcastle, 5s. per ton; and Newcastle to Cockle Creek, 10d. per ton; or a total of 18s. 1d. per ton. The cost from Broken Hill *via* Cobar and Wilcannia would be, supposing the ore was carried at  $\frac{1}{2}$ d. per ton per mile (835 miles), 34s. 10d. per ton.

The cost of ores delivered at Illawarra (Dapto) by the present route is as follows:—Broken Hill to Port Pirie, 12s. 3d.; Port Pirie to Sydney, 5s.; Sydney to Dapto, 2s. 6d.; or a total of 19s. 9d. per ton; *via* Cobar and Wilcannia the cost would be, at  $\frac{1}{2}$ d. per ton per mile, 33s. 4d. per ton (800 miles). The question is, could ore be carried at  $\frac{1}{2}$ d. per ton per mile without back-loading? Mr. Harper would decidedly say "No." It might be said that these ores could be treated at Lithgow, and the products sent to Sydney; but that is out of the question, as the ore for Cockle Creek is from the Central Mine, the property of the Sulphide Corporation, who have their own works at Cockle Creek, and the ore for Dapto is purchased by the Australian Smelting Company, who buy it to treat at their own works at Dapto. The ores and concentrates sent to South Australia are as follows:—Port Adelaide, 59,492 tons; this is from Block 14 Mine, and is all consigned to their own smelting works there. Port Pirie, 200,527 tons, is from the Proprietary Mine, and goes to their own reduction works at Port Pirie. The small quantity sent to Dry Creek and Wallaroo, 17,306 tons, is purchased by the smelting companies at these places for treatment at their own works.

All the ores from the Central mine go to Cockle Creek, and the Australian Smelting Company buy the other ores and send them to Dapto.

2219. There is no possibility of the railway getting that traffic? I do not think so. They have smelters established at Port Adelaide. About 17,306 tons were sent to Dry Creek and Wallaroo.

2220. Apart from the Broken Hill trade, suppose the terminus of the line is at Wilcannia;—while you were out there had you any means of arriving at an opinion as to whether it would pay to have the terminus there? I got a considerable amount of information with reference to the wool. The Wilcannia people estimate that the wool from the various stations ought to come through Wilcannia. In 1898 they got 29,700 bales; but a large proportion of that—10,550 bales—went to Broken Hill, the rest went down the river.

2221. I think you said it was your opinion that in any case the traffic would vary considerably according to the seasons, that if there were water enough in the Darling they would use the river? Yes.

2222. And not use the railway at all? They would only use the railway for certain goods. When the river was up, all the wool would go down the river.

2223. Wool, and I suppose salt and other things coming back—things not of any great value—would come by the river? Yes, of course. To carry expensive goods, which they might want quickly, they would use the railway. But there is not a large amount of that traffic in that district.

2224. Do you not think people doing business with Sydney—the squatters—would, if there was a railway to Wilcannia, use the railway for their wool? I do not think so. There are only about six stations between Cobar and Wilcannia, and the largest of those have river frontages. The head station is on the river. The back stations only would be touched by the railway. When the river was dry the probability is that they would shear the sheep at the back stations, and send the wool by train. If the river was navigable they would shear at the front stations, and send the wool down by water-carriage.

2225. I gather from the statement made by the Commissioners that there would be a loss of something like £30,000 a year on the line? I do not take such a pessimistic view as that.

2226. They estimate the traffic at £6,800—on the other hand, the Progress Committee estimated it at £67,000? I think it a fair thing to say that the revenue would be about twice as much as Mr. Harper states. It is an unknown quantity; you must take the average of a number of years, and after all it is only a matter of opinion.

2227. *Dr. Garran.*] The interesting report you have read to us is addressed to Mr. Brown? Yes.

2228. I presume from that that you went out there at his request? I did.

2229. Was it a personal matter of his own, or was he representing a number of people in Newcastle? As far as I know, it was a personal matter of his own. He asked me to go and report, and I went.

2230. You know the opinion of the people at Newcastle pretty well, I presume? Yes.

2231. Is it generally adverse to the construction of the line? I do not think it would affect them.

2232. Whether it would affect them or not, is the opinion of the people of Newcastle against the making of the line? I do not think that many people there have thought of it.

2233. So far as you can see, Newcastle has nothing to hope for or to fear from the making of the line? That is my idea.

2234. There is no local interest involved in the matter? None whatever.

2235. They have nothing to fear in the way of losing the coal trade? No. The railway could not compete with water-carriage.

2236. So that the whole question of smelting at Port Pirie or Broken Hill does not touch Newcastle at all? No.

2237. From the figures you gave us it appears to be a little more than 1s. a ton cheaper to land the ore at Cockle Creek than to land it at Dapto? Yes; the charges are—Cockle Creek, 18s. 1d.; Dapto, 19s. 9d.

2238. Yet the whole of it does not go to Cockle Creek? Only the ore from their own mines.

2239. Do you know any reason that determines to which place the ore shall go? The Sulphide Corporation of Cockle Creek bought the Central mine.

2240. It is their own ore? Yes.

2241. Do they compete in the general market for the purchase of ore for smelting? No.

2242. Has any other company any interest of the same kind? No; the Australian Smelting Company buy ore from the other mines.

2243. The Sulphide Company do not go into the general market to buy ore? Not at Broken Hill; but they are going into the general market to buy ore throughout New South Wales.

2244.

2244. For blending? No; they are going in for copper-smelting and refining gold. They are getting a W. B. Sharp. quantity of ore from Western Australia.
2245. A different kind of business? No; they blend the gold ore with silver, and make the product more valuable. 4 Aug., 1899.
2246. Is not the blending in the process of fluxing? Yes.
2247. All skilled treatment of ore is largely skill in blending? Yes.
2248. So they have to look out for different kinds of ore for that purpose? Yes.
2249. What I want to know is whether, for the purpose of blending, the two companies compete with each other in the general market? I do not think so.
2250. They are not competitive companies? They are, in the strict sense of the word.
2251. But not to any appreciable extent? No.
2252. They do not undercut each other? No.
2253. Can you tell me, as between the northern and southern coal, whether the coal and coke used at Cockle Creek is better for general smelting purposes than the coal and coke used at Dapto? In smelting they do not use coal, only coke. That used at Cockle Creek is brought from the Co-operative mine at Newcastle. I also have a contract with them bringing it up from Bulli. They blend it altogether, and they find that the southern coke is an improvement when mixed with northern coke.
2254. They not only mix the northern sorts together, but they also mix the southern coke with it? Yes.
2255. Does that make the best coke they can use? No; it makes the cheapest. Nearly all the coke used at Port Pirie is German coke—90 per cent. of it is German.
2256. From what part of Germany? It comes from Hamburg.
2257. Is that because it has greater heating power or greater cleanness? They find it has better resisting power in the furnaces, and does not contain so much dirt as Australian coke.
2258. Do the coke factories at Newcastle wash the coal well before they coke it? At the Purified Coke works they wash it.
2259. Is the Rix's Creek coal good for coke? It is better than the Newcastle coal. The Newcastle coal contains a certain quantity of dirt which depreciates the value of the coke.
2260. Do the southern coke men clean their coal? No, they do not.
2261. Is there not a very much larger amount of earthy matter in the Illawarra coal than in the Newcastle coal? The Purified Company's coke contains from 7 to 9 per cent. of ash. That is washed. The Co-operative Company's coke, which is not washed, contains from 12 to 14 per cent. of ash. The coke from Bulli contains from 16 to 18 per cent. of ash.
2262. If they find it advantageous to mix the three coke in the north, do they do so in the south? No; I think that it is a matter of cheapness in the south.
2263. They put up with any inferiority? Yes.
2264. But as far as you know, the Illawarra coke is not equal to the blend that you use in the north? No. They use a large quantity of that coke at Mount Lyell.
2265. Is the coal cheaper? The coal is cheaper, and the coke is much cheaper. It is landed at their jetties, and costs about 13s. 6d. per ton.
2266. As regards this line to Wilcannia, we have had witnesses who expressed the opinion that if a railway were made right through from Wilcannia, the bulk of the Wilcannia commerce would come to Sydney in preference to going to Port Pirie or Adelaide—you entertain a different opinion? I am quite sure it would all go the other way.
2267. You have had considerable experience as a commercial agent? Yes.
2268. Is it a general rule that commerce takes the cheapest route to market? It is.
2269. And there is nothing in the shipping facilities of Sydney that would make it more advantageous to put stuff on board at Port Jackson, instead of at Port Adelaide? No; nothing whatever.
2270. That is, whether you take line steamers or sailing ships? Yes.
2271. All the charges are the same? Yes. The only reason why ships prefer to come to Sydney is that it is a cheaper port.
2272. But as far as making up a parcel of goods or stores, would there not be some advantage in buying in Sydney rather than in Adelaide? From Wilcannia to Adelaide is about 500 miles, as against a much longer distance to Sydney.
2273. Would that be counterbalanced by the further advantage of buying in Sydney? You can buy in Adelaide as cheap as you can buy here.
2274. You said that, supposing the railway were made through from Wilcannia to Silverton, and the river were not navigable, the wool from Wilcannia would show a tendency to go to Silverton and Port Pirie? In my opinion it would all go that way.
2275. Do you think that that influence would extend to the eastern side of the Darling at all;—do you think that any of those sheep stations, supposing the railway to be made right through, would send their wool to Port Pirie? Half of them would. There is one station, 70 miles from Cobar, that sends its wool to Cobar.
2276. That influence would not extend as far as Cobar;—I suppose Cobar would always prefer to send to Sydney? Yes.
2277. But when you get half way between Cobar and Wilcannia it would be doubtful? Yes.
2278. The effect of making a railway from Cobar to Wilcannia and right through would be, probably, to send the east Darling wool to southern ports? Yes.
2279. But suppose the squatters were ledger-logged in Sydney, would that make any difference? I think most of them are ledger-logged in Melbourne and Adelaide.
2280. You seem to think that if the river were up, and navigable, it would beat the railway to any port? I think it would.
2281. It is a longer passage down, and there is a risk of coming to grief over snags, but in spite of all that you think that the river will always be availed of? Yes.
2282. Whether the river is locked or not? Yes. As long as it is navigable the bulk of the trade will go by the river.
2283. Then the only chance of this line making profits is when there is a big drought? I do not see how it can make any profit then. I have just been there, in a time of bad drought, and the stock are all dead; even the rabbits are dead.

- W. B. Sharp. 2284. There is only half the usual quantity of wool to carry this year? I do not think there can be as much.
- 4 Aug., 1899. 2285. There has been a traffic in fodder wherever the railway reached? Yes, there is sure to be.
2286. The railway would have a hard fight when the river is up to get any business? Yes.
2287. They would get the passenger traffic to Sydney and a little light goods traffic? Yes.
2288. One train a week would do all that? It would be inconvenient for passengers—the coach runs three times a week.
2289. You do not think that the Commissioners' estimate is quite favourable enough, but you agree with them that there is very little prospect of the line being a paying one? I do not think it will be a paying one.
2290. We have had a statement before us from Wilcannia, showing that the line would pay from the jump;—were you converted by those figures? No.
2291. They make out that it is going to be a most remunerative line? I said in my report that I threw out altogether their estimate of the cattle and sheep traffic. I do not think there would be any traffic at all in these.
2292. They must have looked at the figures through magnifying glasses? They took a rosy view of the matter. It would be an advantage to them to get a railway.
2293. We must also not lose sight of the fact that it would be an advantage to the Government to have communication with all its western territory? My own opinion is that the trade ought to go to the natural ports.
2294. The river belongs to us, and, as long as it belongs to us, South Australia cannot lock it? When we have Federation that difficulty will be removed.
2295. According to your feeling, then, we need not bother with the railway very far to the west? I do not think so.
2296. That trade belongs to South Australia? Yes.
2297. And you draw the boundary line a little to the west of Cobar? Yes; because the railway goes there now.
2298. According to the figures you gave us, White Cliffs is a more populous place than Wilcannia? Yes; nearly all of the men are leaving Wilcannia to go and work at White Cliffs.
2299. Wilcannia is only important from its being the centre for the traffic of that district? Yes; it has been the centre for many years.
2300. It began by being a convenient crossing-place for stock? Yes. I saw thirteen houses empty there in one block.
2301. Then the town itself is not to be considered in regard to the question as to whether there should be a railway? There is a very large distributing trade done there.
2302. That would be at any point where the proposed extension would touch? Yes.
2303. If the line went straight to White Cliffs it would be as convenient to the river people as if it went to Wilcannia? Yes; to the river people, but not to the town.
2304. I say that the district would be served just as well by crossing the river anywhere else? Of course you could cross the river higher up.
2305. Is there anything at Wilcannia to make it imperative, if we cross the Darling, to do it at that point? No; except that vested interests have grown up. I think it would be unfair to pass the town.
2306. Looking at it from an engineering point of view, you would not be bound by that? You could cross the river anywhere, of course.
2307. It would be a straighter line to cross the river at the back of Wilcannia, so we are not to consider ourselves in bondage to one particular crossing-place? No; not unless your terminus is to be at Broken Hill.
2308. You say it would be madness to go to Broken Hill? Yes.
2309. If we leave that out, we are free to consider the advantages of any other crossing? Yes.
2310. The smelting works used to get their lime trucked from Tarawingie? Yes.
2311. Where do they get it from now? There are large deposits of lime within about 30 miles of Port Pirie, and the lime is brought down by rail. There is also a number of small vessels that bring it from the other side of the Gulf.
2312. They are quite as well off for flux as they were? Yes, much better off; it does not cost them so much.
2313. Coal and coke are much cheaper than formerly? Yes.
2314. According to the figures you gave us, the quantity of coal taken up to Broken Hill has nearly doubled since they moved the smelting works down to Port Pirie? Yes. There are large industries at Broken Hill, and they have a steadily increasing population. Concentrating plants are established all round—they have them at every one of the mines—consequently the consumption of coal is increasing. One company is opening up works there for the extraction of zinc.
2315. These various works then, have more than made good the falling off in the demand for coal for smelting works proper? They have increased the consumption of coal; there is no coke sent up there at all.
2316. From what you saw of Broken Hill, do you think that the durability of that mining district is assured? I think it is one of the finest mining districts in New South Wales.
2317. And the mines will last? They will last for ever, I believe.
2318. At any rate, the end of them is not in sight? No.
2319. Is the country between Cobar and Wilcannia a country that could be used for any other than pastoral purposes? I do not think it would be of any use for any other purpose. In time of drought it is very bad. I notice that Mr. Sleath was asked a question about its being a good fattening country, and he said it was. He was asked:—

Do you know the country between Cobar and Wilcannia pretty well.

He said:

Yes; I have been over it many times.

About Paddington station? Yes; that is really good country. It is a good wheat-growing country. Sometimes they miss a season. If they do not get rain at the proper time the crop is a failure. If they do get rain it is an excellent crop.

I showed that to a friend of mine, who once owned Paddington station, and his reply is :

W. B. Sharp.

The grass and herbage which ought to be necessary to that district are only noticeable by their absence. Specimens of sheep-food are occasionally found by man, also occasionally by sheep. But the extreme efforts of the sheep in fossicking from one atom of feed to another sometimes militate against the acquirement of adipose tissue, and the result is only the development of sinew and gristle, which have no commercial value.

Aug., 1899.

2320. Is there no edible bush? The edible bush is all dead; the rabbits have ringbarked it.
2321. Apart from the minerals, there is no prospect of any settlement on that country? I did not see any minerals in the whole distance which I travelled.
2322. As far as stimulating settlement is concerned, you do not think the line holds out any prospects? It would be impossible to live there by agriculture. A man to settle there would have to be a pastoralist, and he would require a great deal of land. I should think it would take 20 acres to feed a sheep.
2323. The country round Cobar has been pretty fairly prospected, has it not? I think Cobar is going to be a second Broken Hill.
2324. Do you think the mineral deposits go towards the west at Cobar? No; they go north and south. I do not think there are any minerals to the west of Cobar to the Darling.
2325. Are you acquainted with the quality of the Lithgow coal? Yes; I know a good deal about it.
2326. Has it a pretty close resemblance to the Illawarra coal? I think it is harder than the Illawarra coal.
2327. Is it as good for smelting purposes? If it is harder, it must be better for smelting, because it will resist the crushing down of the ore in the smelter.
2328. Have you seen any coke that was made from Lithgow coal? Yes.
2329. Was it good? No; it was very bad indeed. They are now erecting new coke-ovens at Lithgow, and improving the method of manufacture. There is no reason why they should not make coke of that coal as well as of Southern coal.
2330. Intrinsically you think it may turn out as good coke as the Illawarra coke? Yes; I do not see why it should not.
2331. And as good as the Northern coke? Yes; when it is washed.
2332. You said the Railway Commissioners had repeatedly asserted that they gained nothing by their coal-carrying business at Newcastle? Yes.
2333. Have they said that in their annual report? They have said it in their quarterly report.
2334. Not that they are losing money? No; but whenever they are asked for a reduction in the charges for the carrying of coal, they always say that it does not pay.
2335. That means that it does not give more than a fair profit? I suppose that is what they really mean. During the strike they hinted that the reduction in the revenue was caused by the strike.
2336. From which you inferred that they really make a profit? They make a good amount of profit.
2337. Is it the general opinion of the colliery proprietors that they pay a high rate to make that profit? Yes.
2338. Are there any coal companies that carry coal to their own ports? There are the Waratah Company and the A. A. Company.
2339. Is there not a line from Minmi to the river? Yes; from Hexham, J. and A. Brown's.
2340. Are there any proprietors who know what it costs to carry coal from the shipping place? Yes.
2341. Can they test what it costs? Yes; they do, and they find it much cheaper to run the trains themselves.
2342. If they found they were losing would they not get the Commissioners to run the trains for them? I do not think the Commissioners would run on their private lines and ship at private wharfs.
2343. Then there is a difference of opinion between the Commissioners and the colliery proprietors on the subject? The colliery proprietors think that the Commissioners charge too much.
2344. Do all the colliery companies find their own waggons? Yes.
2345. Do the Lithgow people find their own waggons? It is a different trade there. The coal is deposited in Government waggons at Lithgow—there are no private waggons there.
2346. Are they Government waggons that come from the Metropolitan Colliery? Yes.
2347. Has there been any attempt in the north to get the Government to use their own waggons? The Government will when they have the waggons to spare. We have to pay 3d. a ton extra for the carriage of coal in the Commissioners' waggons for the journey.
2348. That is now saved? It is sometimes an advantage in case of a rush of trade.
2349. Do you consider it would pay to carry all the coal under those conditions? It would pay better to have your own waggons than to pay 3d. per ton for the journey.
2350. Do you think that what they carry from Lithgow pays a price equal to 3d. a ton? I do not think so. I think they have a greater advantage at Lithgow, to the detriment of Newcastle.
2351. Then 3d. is rather an excessive charge? Yes.
2352. The presumption is that the coal is to be carried out westward by this scheme at  $\frac{1}{2}$ d. per ton per mile; but according to your evidence the Commissioners could not carry it at  $\frac{1}{2}$ d. a ton per mile? Not unless they had back-loading. Even then it would not pay.
2353. If it costs a penny a ton from Rix's Creek it must cost more than a half-penny a ton from Lithgow? They have certain rates within certain areas. They have a charge of 6d., then one of 10d., and one of 1s.
2354. As the distance gets greater, they charge so much less; there is a discount for distance? Yes.
2355. If the charge for these short distances does not give more than a fair profit, how can they carry coal for a half-penny per ton out to the west? It is impossible to carry it at a profit.
2356. Either they cannot carry it at a half-penny a ton across that country, or they can carry it for less than 1d. per ton close to Newcastle? That is my argument.
2357. *Mr. Dick.*] I take it that you object to the construction of this line, not because it will interfere with any existing avenues of trade, but because it will result in an annual loss to the country? I think it would result in a loss to the country. It would not interfere with the Newcastle trade if the railway went right on, because we could land coal cheaper at Port Pirie, and then at the Hill, than coal could be carried from Lithgow.
2358. Considering it entirely on its own merits without reference to the extension to Broken Hill, you do not think that the district near Wilcannia and any intermediate country is of sufficient importance to warrant the construction of such a line? I do not think that the trade which would be brought to the railway would warrant the expenditure.

- W. B. Sharp. 2359. Do you think the river at all times would be a dangerous competitor? When the river was navigable it would always take the trade from the railway. If there were no river it would be a fair point to argue whether the trade would warrant the extension of the railway. If you could get all the trade it would warrant it.
- 4 Aug., 1899. 2360. Do you think the delay and inconvenience which would arise from the intermittent character of the navigation of the Darling more than outweigh any extra cost which may be involved in the carriage of goods along this railway to the metropolis? They have got into a regular way of business there, and as soon as the wool is in the boats they can always get an advance against it from financial institutions. This year there were about 2,000 bales of wool locked up there. It was a God-send to the owner, on account of the rise in price that took place; it made a difference of £4 a bale.
2361. It is a very exceptional year, is it not? Exactly the same state of things happened about nine years ago.
2362. Have you read Mr. Resch's evidence? Yes.
2363. Do you agree with the general tenor of his reply to Questions 1000, 1181, and 1182, namely, that as a matter of convenience and saving in the way of interest and insurance, it would be better for the traders to send their goods to Sydney by railway from Wilcannia than to send them by Adelaide and Broken Hill, or by the river? I do not think that in a case like that referred to, where a man is ordering a lot of malt, it would make such a difference as he says. He says that he would be willing to pay £1 a ton more for the carriage. Malt is a bulky thing, and the chances are that if carried on a railway from Sydney to Wilcannia the charge would be so high that the difference would be much more than £1 a ton. I should think that the carriage of malt from Sydney to Wilcannia by railway would cost twice as much as the carriage of malt by steamer from Adelaide.
2364. You have also considered the question of the handling of the goods sent by any other route from Sydney to Wilcannia;—is not that a serious matter? It is all included in the freight. If they charged 50s. a ton they would do all the handling.
2365. Then your opinion is that except in the case of a non-navigable river the railway is never likely to have very much trade? The bulk of the trade will always go by the river when it is navigable.
2366. In your estimate of the probable traffic, have you considered the carriage of starving stock to more favoured districts? I do not think that that would be possible, because, in time of drought there, where could they take the starving stock to? It is very different from the case of the New England district, where they can take the cattle from the plains on to the high country, and get good feed. If you have to take the stock to Orange or Dubbo, they will be dead. If there was good feeding country about Cobar or Nyngan, the stock might go there.
2367. *Mr. Watson.*] How long do you think it would take them to go from Wilcannia to Dubbo by train? About twenty-two hours.
2368. Do you think the cattle would die in that time? Yes, if they were starving. But I do not think there would be much revenue from that source.
2369. *Mr. Dick.*] From your observation of the country between Cobar and Wilcannia, do you think there is a likelihood of any large mineral development taking place within that area? I do not think there is any possible chance of it; there is no indication of minerals there. There are no hills of any magnitude, except one about half-way, where the surveyed line takes a turn. I made inquiries, and nobody had seen any minerals.
2370. *Mr. Trickett.*] I suppose that the prospect of early federation, when there will be uniform duties imposed, there will be no inducement for the people of Broken Hill to get goods from the capital of their own Colony, as they will get them just as cheaply from Adelaide and other places as from Sydney? The chances are that they will get them cheaper from those places.
2371. So there will be no inducement for them at all, either through sympathy with their own Colony, or by reason of getting cheaper goods, through not having to pay duties, to do their business with Sydney? No. At present the sympathies of all the people down there are with South Australia. They do all their business with South Australia.
2372. So there is every prospect, in case of Federation, that the traffic will go to the nearest port? Yes. The idea of Federation is that trade should go to its natural port.
2373. Looking at the position of Wilcannia as regards Port Pirie and Adelaide and the distance from Sydney, is it at all likely, all other things being equal, that we can drag the trade of Wilcannia to Sydney? I do not think you could, unless you carried it for next to nothing.
2374. You read something about Paddington station; I suppose you do not put that in seriously, as it is rather far-fetched? If you saw the country as I saw it when I left there, it would not seem far-fetched.
2375. *Mr. Shepherd.*] You think that that part of the country is already served by the river Darling? Yes.
2376. And that this railway is not required? I do not think it is required.
2377. You seem to have a very poor opinion of the character of the country there? Yes, a very poor opinion. No doubt I saw it under unfavourable circumstances.
2378. Were you for any length of time in that district? About a fortnight, in the beginning of May.
2379. Then you would see the country under every disadvantage? Yes. We had to carry our water and food.
2380. We have had evidence that some splendid crops have been grown near Wilcannia;—would you think so? I should not, unless the land was irrigated. There is an orchard there, in which a Chinaman grows very good vegetables by irrigation.
2381. Of course, the river is only navigable sometimes for a very short period; at other times it is navigable for the greater part of the year; when the river has ceased running for a long period, the people in that neighbourhood [are put] to great straits to get supplies;—in that case, do you think a railway would be justifiable? It would be a very great convenience to the people living there; but I do not think anybody would invest money in a railway to that place, thinking they were going to get any return from it.
2382. People living in those outlying districts expect the Government to give them some means of communicating with the capital, and under these circumstances do you think it would be justifiable to construct this railway? I think the better plan would be to lock the Darling, and make it navigable all the year round.
2383. That would entail an enormous expense? Not much more than the railway. 2384.

2384. Do not you think that would be more in the interests of South Australia than of New South Wales? *W. B. Sharp.*  
Of course it would; but it would be a great advantage to the people living along the river. I presume that the South Australian Government would bear part of the expense.
2385. When Federation is brought about no doubt they would, and possibly this is one of those things which it is only fair to leave to the Federation? I think so.
2386. *Mr. Watson.*] You said you thought the construction of this railway was not justified, because it is not likely to pay? Yes.
2387. Have the Government always considered the possibility of works paying, as far as the coast district is concerned, when projecting them? I think the Government try and get all the information they can about railways before they make them.
2388. Do you know whether the public works carried out at Newcastle are paying—the harbour works? I should think they are paying very fair interest.
2389. In what shape has any return been made? In tonnage dues.
2390. They do not pay any wharfage dues, do they? No; but they pay tonnage rates, which are an equivalent. A ship pays  $\frac{1}{2}$ d. per ton per day for lying at the wharf.
2391. Do you think that all the revenue from Newcastle is sufficient to cover the cost of the harbour works and the expenditure on wharfs which has been incurred? I should think they have an asset there amounting to far more than the Government have spent altogether at Newcastle.
2392. Judging by the returns? Not merely by the returns. They have hundreds of acres of reclaimed land, which has been handed over to the Railway Commissioners, and which is worth thousands of pounds, certainly more than the Government has spent in Newcastle on harbour improvements.
2393. Going further north, the Government has spent large sums of money on various rivers without getting any return;—was that justified? I think some of it is justified and some of it is not. It spent £70,000 at Lake Macquarie; that was not justified.
2394. Take the expenditure on the Clarence and the Richmond Rivers;—do you think that is justifiable? I think it is justifiable. It opens up a large area of country, and gives the people communication with the metropolis.
2395. Do you not think we should be justified in doing something for the convenience of the people in the extreme west, even though there may not be a direct return? If you are not going to make a permanent line to Broken Hill.
2396. For the time being we are not concerned with Broken Hill? I do not think the people in that district would use the convenience to the extent you think they would. The interest of the people of Wilcannia is in South Australia and Victoria.
2397. We have had it in evidence, too frequently to be pleasant, that the people in that district have been in a condition approaching starvation, because of the river being down and the roads being impassable through want of water? If the worst came to the worst they could get camels from Broken Hill in seven days.
2398. A statement appeared in the Press since we last took evidence on this proposal to the effect that flour at White Cliffs was £19 a ton? I have paid as high a price for it in the North.
2399. Not in recent years? No. But that is not a very high price for people inland to pay for flour.
2400. Very often the people are in straits in that district, because of the want of communication? I think the people will look after themselves well enough not to get into such a tight corner as you indicate. There seems to be plenty of money about there.
2401. You do not think that the construction of the railway is justified from the point of view of the convenience of the people? It would be a great convenience. But the question is whether the country is justified in spending such a large amount of money for the convenience of a few.
2402. You will recollect that the whole of the land within the influence of the line is Government land? Yes. You would not get population on to that land; they could not live there.
2403. Do you think it possible that any land near the basin of the Darling might be used for agriculture? No; I do not think so—not unless it is irrigated, and irrigation is too costly.
2404. Of course, you know that the Federal Constitution does not propose to take over the railways, unless some arrangement is arrived at? Yes.
2405. Consequently the Federal Government, for a considerable number of years, would hardly be likely to have power to construct a line to Wilcannia, so there is no hope in Federation for the Wilcannia people as regards railway construction? No.
2406. You said that the Great Cobar Company were getting coke from Newcastle? Yes, and from Rix's Creek, 60 miles north of Newcastle.
2407. Which means 200 odd miles extra carriage from Lithgow? Yes; but they have a special concession. At the time they opened the mine at Cobar they made special arrangements with the Railway Commissioners that they should carry the coke from Newcastle and Rix's Creek at a special rate. The rate from Rix's Creek is £1 5s. 10d. a ton to Cobar.
2408. What would the rate be from Lithgow? A rate on the mileage. It is a special rate to the Cobar Copper Company. They have to load up trucks of 10 tons. They get a special concession. It is £1 5s. 10d. a ton from Rix's Creek to Cobar, a distance of 600 miles.
2409. That would be somewhere about  $\frac{1}{2}$ d. a ton per mile? Yes.
2410. They are able to carry coal a long distance for  $\frac{1}{2}$ d. a ton per mile in this instance? Yes; but then they bring the ore back. They get back-loading from Cobar to Lithgow at 15s. 1d. per ton.
2411. And your opinion is that even with back-loading it would not pay? No; it would not pay.
2412. Do you think the Commissioners are not getting any profit out of their arrangements? I do not think so. It is a special concession to develop the trade with Cobar. They have got a large population there.
2413. Of course, in America they have larger traffic on the railways; but I understand that there they carry at less than  $\frac{1}{2}$ d. per ton per mile on long runs? Probably they do; but the loading is quite different there from what it is here. They have trucks that hold from 25 to 30 tons, and they pour the wheat into them; it is shipped in bulk; there is no handling; the wheat is sucked out of the truck when it reaches its destination.
2414. There would not be much handling in the case of coke, coal, or ore? Yes; there is a good deal of handling. Coal and ore have to be shovelled; coke has to be bagged.
2415. Referring to the Lithgow coke question, what is the reason that they prefer to take coke from so far away as Rix's Creek to Cobar? The same people who own the Cobar mine own the Rix's Creek mine.

W. B. Sharp. They make all their coal into coke for the mines; but they cannot make sufficient, so they buy 100 tons a week from Newcastle in addition.

4 Aug., 1899. 2416. Is that extra supply which they get from Newcastle better than they can get at Lithgow? It is better than they make at Lithgow at present. I think that they will improve the Lithgow coke.  
2417. You think that the coal there is good enough for coke? I think so; it only wants care in making the coke. I should like to mention that there is one statement which was made by Mr. Sleath (page 38, Question 956), to the effect that the population of White Cliffs was 3,500, and that the population of the whole district was something like 10,000. I have got the returns of the population from the police, and they are as follows:—White Cliffs, 1,600; Wilcannia, 1,200; Milparinka, 750; Tibbooburra, 600. There is a great difference between the two statements, and I think Mr. Sleath is wrong.

Charles Kilgour, Inspector of Station Properties, sworn, and examined:—

C. Kilgour. 2418. *Mr. Trickett.*] Are you a station manager? I am inspector for the A.M.P. and other societies in Sydney.

4 Aug., 1899. 2419. You have a knowledge of station properties in this Colony? I have.

2420. Are you acquainted with this proposal to construct a line of railway from Cobar to Wilcannia? Yes.

2421. Are you pretty well acquainted with the country through which the line is proposed to run? Yes.

2422. Have you any statement to make on the subject? Yes; I will read it.

Dear Sir,

12, O'Connell-street, Sydney, May, 1899.

In accordance with the instructions received, I proceeded to inspect the pastoral capabilities of the country through which the proposed railway line, Cobar to Wilcannia, has been surveyed, and also the commercial prospects coupled with this phase of its construction.

I left Sydney on the 27th April, and arrived at Cobar the following evening. In any ordinary season there would not be any difficulty in travelling from Cobar to Wilcannia; but as you are doubtless aware those parts are now suffering from drought—the worst for years. There was not a blade of grass between Cobar and Wilcannia, and there was a great scarcity of water.

A mail coach runs three times a week between the two towns; but that would be useless to travel by when inspecting country, &c.

After a little delay I managed to hire a trap and horses, and in spite of the severe season Mr. Sharp and self got through to Wilcannia. We could not go along the exact surveyed railway line; but the road we travelled by was close to and crossed it in several places. From Wilcannia Mr. Sharp went on to Broken Hill, and I returned to Cobar, then Sydney. During my stay in Cobar and Wilcannia I made full inquiries re the pastoral and agricultural prospects in those districts.

I may mention that I was managing Tindarey Station, 28 miles from Cobar, towards Bourke, during 1881, 1882, and 1883, and have since inspected other properties in that district; so consider I am well able to judge whether the country is better suited for pastoral purposes or for agricultural, and also whether the land is improving or deteriorating.

The following is the result of my inspection:—

*Description of the country.*—Soil principally red, interspersed with ironstone and sand ridges; level and undulating. There would be no engineering difficulties in constructing railway line. Lightly timbered, principally with mulga, also box, gum, yarran, &c. None of the timber is fit for buildings, railway, or mining purposes. Owing to the small and irregular rainfall, I do not consider the land suitable for agriculture. Best suited for sheep; but the carrying capacity inferior, owing to the land being thinly grassed. I noticed a great change for the worse in the country. In former days there were many edible bushes, such as emu, hop-bush, &c., which were a grand stand-by for the sheep, especially during dry times; but they are now all destroyed. Cause—the rabbits. They arrived in great numbers during 1891, 1892, and 1893, and after eating the pasturage turned their attention to the bark of the bushes, and soon destroyed them all—a great loss. There are certainly very few rabbits now; but am afraid they will soon increase when the grass returns, and to keep them in check cannot but entail a heavy expenditure on the pastoral lessees in wire-netting and poisoning. I estimate that double or more acreage is now necessary in an average season to carry a sheep. I believe the carrying capacity is less than half what it formerly was. Country that when first stocked was equal to 5 acres for one sheep, will now require 10, and even more.

On all the runs I passed through the sheep were being kept alive by cutting mulga and other edible trees. If that were not done there would hardly be any sheep alive; but, of course, that is not peculiar to Cobar and Wilcannia. In other districts, where land is very good, losses are now being experienced.

*Water.*—With exception of the Darling River, there is no natural water supply. It is principally conserved in tanks (excavations of say, 9,000 yards), which are a source of considerable trouble and expense, owing to their silting up.

I think you will have gathered from the foregoing remarks that my opinion of the country through which the proposed railway line passes is not a high one. I spoke to several who knew the country when first stocked. They agreed with me that it is deteriorating, and the number of sheep in the district steadily decreasing.

It is a sure sign of the soundness of country when the original holders keep their properties. Now, in the district I inspected it is just the reverse. Nearly all the previous holders have lost their holdings, and they are being carried on by financial institutions.

*Re Closer Settlement.*—I do not see any prospect of it. How is it possible, on inferior lands, overrun with rabbits, a small rainfall (average—Wilcannia, 11½ inches per annum), and visited periodically by droughts? Even should the proposed railway line be constructed, I am confident that when the Darling River is navigable much of the traffic now carried on the railway between Sydney and Cobar would go instead by river to and from Wilcannia. Railway-carriage cannot compete against water-carriage.

I trust the foregoing remarks give the required information. Should they not do so, will be pleased to write you further.  
I am, &c.,

The Hon. Alexander Brown, M.L.C., Newcastle.

2423. The map which you see on the wall is exhibited by Mr. Rennie, Chief Draftsman, Department of Lands, and the part coloured black shows a tract of country within 20 miles on each side of the proposed line; the part coloured brown represents Crown lands held under lease;—is not that itself a pretty strong indication that the country is not very good? That country is not good.

2424. The alienated land is indicated on that map by blue colouring, and the blue etching indicates settlement and homestead leases; looking at that large tract of country, and seeing so little alienated land, and as little held under settlement and homestead leases, do you consider that also is an indication that the country is not very valuable? Yes; a very strong indication. If the land were good, it would be taken up.

2425. It was also pointed out by Mr. Rennie that the following were the rents charged;—From Cobar to the westward, 1d. an acre, 77–100ths. of a penny, 75–100ths. of a penny, 5–100ths. of a penny—that is, as far as Wilcannia; immediately north of Wilcannia the rent is 88–100ths. of a penny;—what would you say about those rents? I think they are high for that land.

2426. How do they compare with rents charged in other parts of the country? They appear very low, showing that it is poor country.

2427. You stated that it required about 10 acres to keep a sheep in that country? I believe it would really take more. I said not less than 10 acres. There is no natural water there at all.

2428.

2428. While you were in the district, did you ascertain if many of the homestead leases have been taken up? They have not in that direction. I believe some have been taken up near Cobar—more towards Nyngan. C. Kilgour.  
4 Aug., 1899.
2429. Do you think the country between Cobar and Wilcannia is of a character that is likely to be availed of largely by homestead selectors? I do not.
2430. Why? Because it would not pay them.
2431. I suppose a man would want 10,000 acres to carry 1,000 sheep? Well, then, it would not pay. Suppose a man has 1,000 sheep, his working expenses will be just as much as if he had 4,000 sheep.
2432. Then, do you think that that tract of country is only likely to be taken up by large holders? That is all, and they are not doing well. The properties there are mostly in the hands of financial institutions.
2433. Did you visit any of these stations? Yes.
2434. Did you see whether any improvements were going on? There were none at all.
2435. Was the feeling among those in charge of the holdings despondent or hopeful? Very despondent.
2436. You went there in about as bad a time as you could? Yes. It would not be fair to say that that country alone is so terribly bad. The Riverina country has suffered terribly, too; but that is a different class of country.
2437. Did you take occasion to inquire as to what that country is worth in a fairly good season? Suppose they had a good season, where are they going to get stock from to put on the land? The country is lightly stocked owing to heavy losses, and it will take time to breed up. You cannot buy good ewes except at high prices. Supposing the drought broke up through the Riverina and Darling country you could not get good ewes under 15s. to 20s.
2438. From your experience of that country, having lived out there, do you think that the holdings will have to be abandoned? I think they will have a very rough time of it, and are having a rough time of it. I went out to one property near Cobar where they were feeding 9,000 ewes on chaff.
2439. Taking one season with another, do you think it is a country which a squatter could get a living on? I do not. If you go to the stock inspectors, and ask them to show their books, I think you will find that the sheep during the last ten years have steadily decreased in number throughout the district. That tells a tale.
2440. Are there no creeks in that district? No; there may be odd ones, but it does not pay to dam them up; the water would escape through the porous soil. The best plan is to make a tank in good ground, and run the water into it. We could always tell when we were coming to a tank when travelling in that country, because the mulga was all cut down. Of course other districts have the same trouble; but I think they suffer more in the Wilcannia district than in other places.
2441. Did you make any inquiries about this railway project whilst you were there? I heard people talking about it.
2442. It has been stated by some witnesses that it is fine agricultural country? It is not agricultural country.
2443. It is good soil? Yes; but they have not the rainfall.
2444. Did you see any evidence of cultivation there? Only a little garden in Wilcannia.
2445. Mr. Hall, statistician, informed us that out of this vast area, extending from Cobar to Wilcannia, embracing millions of acres, there are only 3,000 acres under cultivation;—is not that a good indication that the land is not much good for agriculture? Yes.
2446. Does it produce a good class of wool? It is good when they have a good season; but I should not call it first-class wool. The weather is too hot in the summer, and it and the dust affect the wool.
2447. You said that most of the runs there were in the hands of financial institutions? Yes.
2448. Did you come across one that was not? I think I knew of one that was not.
2449. Did you visit any of those homestead lessees? No; there were no homestead lessees where I was.
2450. The rabbit pest is very bad there;—when the grass begins to grow the rabbits eat it? Yes; and they breed very quickly.
2451. Is not that district regarded as one of the worst rabbit-infested districts in the country? Yes.
2452. Is not that a serious handicap to the squatter? It is. The rabbits have eaten all of those edible bushes, which were a great stand-by to the stock-owner.
2453. Are the squatters just holding on to those stations which are in the hands of the mortgagees without improving them at all? They are just keeping things going.
2454. There is no life in the district? No life at all. But, of course, that is not peculiar to this district during a drought. The Riverina has had terrible times.
2455. *Chairman.*] Do you know the country at Bourke? Yes.
2456. We have tapped the Darling at Bourke;—if that was justifiable, do you not think it would be justifiable to tap it down at Wilcannia? You get a lot of Queensland trade at Bourke which would not come down to Wilcannia, and it is a better class of country.
2257. North-west from Wilcannia there is a vast amount of country, the trade of which would come into Wilcannia, would it not? Yes.
2458. Supposing there was a detour towards Wilcannia, is there not a large part of the Paroo the trade of which would come in there? If the river was up it would all go down the river.
2459. So locking the Darling would be of more use to the people out there than constructing a railway? Yes.
2460. *Dr. Garran.*] Did you see any signs of cultivation about Cobar? Only a Chinaman's garden.
2461. There is very little of that country cultivated? Very little.
2462. The difficulties of cultivation would grow worse as you went westward, of course? Yes.
2463. Is there a large township now at Cobar? Yes.
2464. And, therefore, a good inducement to grow fodder and vegetable stuff? Yes.
2465. Is there a good local market? Yes, very good.
2466. Yet they do not supply that local market? No; it is cheaper to grow the stuff near the sea-board and at Narramine, and bring it out there.
2467. It is cheaper to get the stuff from Narramine than to grow it at Cobar? Yes.
2468. That is a fair test of the unsuitableness of the district for cultivation? Yes.
2469. *Mr. Watson.*] Do you think Cobar is held to be as good as the land further on? I think the land is bad enough at Cobar. 2470.

- C. Kilgour. 2470. Is it as good as it is further on? About the same.  
 4 Aug., 1899. 2471. You do not think it is better? No; if anything, it is worse. The land is very inferior around Cobar.
2472. What you have said with regard to the river attracting trade away from the railway terminus in relation to the proposal to go to Wilcannia,—could it not have been said with equal justice about the proposal to take the railway to Bourke? That is a different matter.
2473. Could it not have been said by those who might have been opposed to a railway to Bourke, that the river would take all the trade to Adelaide? Yes; they could have said that.
2474. Yet the Bourke line is paying? Yes; but they have a bigger trade—the Queensland trade.
2475. But the presumption is that where they have a bigger trade there would be a bigger chance for the river to take it away? Yes; if the river is up.
2476. If the river is the competitor that it is alleged to be with the railway, then the greater the amount of trade coming there the greater will be the amount for the river to carry? Certainly.
2477. Whatever argument would apply against the construction of a line to Wilcannia would have applied to the construction of the railway to Bourke? No; there is far more trade at Bourke than you can ever have at Wilcannia.
2478. Would not the competition with the river be nearly as great at Bourke? Yes.
2479. A few miles of river-carriage would not make a great difference in the amount of the freight? No.
2480. They charge nearly as much from Wilcannia southward as they do from Bourke? Yes.
2481. *Mr. Dick.*] Would you call the year 1894 a fair season? I could not tell you, unless I knew the rainfall.
2482. We have the stock returns for 1894 for the district within the influence of this proposed railway;—the area of that district is 26,700,000 acres, and in 1894 it carried 23,881 cattle, 3,600,129 sheep, or practically about one sheep to 7 acres over the whole area;—would you call a district carrying that number of stock and sheep a poor district? I should.
2483. You would consider it a district not likely to afford much traffic for a railway? No.
2484. Do you not think 3,600,000 sheep is a good number? It depends on the extent of the country which they occupy.
2485. The area tinted red on the map carried 3,600,000 sheep in 1894;—would you consider that, both from a sheep-owners point of view and a railway point of view, that particular district should be served by a railway? If they only had an outlet to get to Sydney, it would be a good thing; but as they have another outlet down the river, I do not think it would pay.
2486. There is one point about the possibility of cultivation there: Mr. Resch has been living at Wilcannia for seventeen years, and he stated in evidence here that he thought that eight years out of that seventeen—very nearly half the period—good crops of wheat could have been grown, and that it would pay to grow wheat around there, especially with railway communication;—do you agree with that opinion? No; I do not.
2487. That is leaving out altogether any idea of irrigation? It would not pay.
2488. So that, although the soil is good, the rainfall is not sufficiently plentiful, or sufficiently uniform, to produce payable crops? That is it.

MONDAY, 9 OCTOBER, 1899.

[The Committee met at the Court-house, Wilcannia, at 11 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Edmond O'Donnell, Mayor of Wilcannia, sworn, and examined:—

- E. O'Donnell. 2489. *Vice-Chairman.*] What are you by occupation? A general agent.  
 9 Oct., 1899. 2490. How many years have you resided in Wilcannia? About twenty-two.  
 2491. You are prepared, I understand, to furnish the Committee with certain statistics? Yes.  
 2492. Will you kindly read the statistics which you have had prepared concerning the municipality of Wilcannia? Yes; they are as follows:—

MUNICIPALITY OF WILCANNIA.

*Estimated Returns.*

Population .....	1,183
Dwellings, shops, &c. ....	231
Capital value of the freehold of improved property .....	£100,500
Capital value of the freehold of unimproved property .....	£10,960
Fair average gross rate of interest on freehold value which buildings and dwellings are yielding.....	10 per cent. on capital value.
Estimated value of water-works, including mains.....	£10,000
Wharfs (two).....	£1,700
Metalled roads—1 mile 4 chains .....	£1,680
Formed „ 1 mile 47 chains .....	£508
Cleared and drained—3 miles.....	£300
Cleared only .....	£60
Footpaths asphalted—15 chains .....	£495
„ formed—2 miles 70 chains .....	£232
Kerbing and guttering, stone—1 mile 12 chains .....	£1,720
Culverts (two), wood .....	£120
Kerbing and guttering, wood—70 chains.....	£280

ESTIMATE

## ESTIMATE OF RECEIPTS AND EXPENDITURE.

E. O'Donnell.

9 Oct., 1899.

		<i>Receipts.</i>		
		£	s.	d.

Water rates and assessments .....		1,230	0	0
Night fees .....		280	0	0
		£1,942 2 3		
		<i>Expenditure.</i>		
Average water-works, including interest to Government .....		£980	0	0
Night work.....		160	0	0
General .....		400	0	0
		£1,540 0 0		

2493. Can you state what is the area of the municipality? It is about 4 miles square.

2494. Is there outside that area, and in close proximity to the town, any large population? No. The population is not large, but there are a good few places. The municipality extends 2 miles from the centre of the town; but outside that there are several homestead leases and old conditional purchases. The population is not very much on either. So within a radius of 10 miles the population is not very great, but there are a good few places.

2495. The population has decreased lately, has it not? Yes, greatly during the last couple of years.

2496. Is that mainly due to the development of the opal-fields at White Cliffs? That has certainly had a great effect upon it; but, apart from that, I think that owing to the want of employment here and the unfortunate bad seasons that we have had, people would have had to go somewhere else in any case; but that has taken them from other places the same as it has from Wilcannia.

2497. Do you think, then, that the continuously bad seasons of the last few years have had the effect of diminishing the population? Most decidedly, because the bad seasons have stopped work. People could not give employment, and the men not being able to earn wages had to go somewhere else in order to try to get employment there.

2498. Wilcannia is the centre for a certain district;—can you state generally the names of the various places around Wilcannia for which this town acts as a business centre? I cannot give them all at once; but taking the district right through, I suppose that you may say that at the very least Wilcannia is the business centre for places within a radius of 75 miles—I daresay even more, because on our western side, with anything like a tolerably good season and means to get out, we can send goods to Milparinka and Mount Browne, and other places in that district; also, to the south-western portion of Queensland, and the north-western portion of New South Wales, a distance of 200 or 300 miles. Of course, places north and south of Wilcannia would depend purely on the river itself. On the eastern side we go as far as Ivanhoe, which is nearly 100 miles from here. Therefore, the radius would be far more than I said in the first instance.

2499. Has the trade of Milparinka, Mount Browne, and Tibooburra been temporarily diverted from Wilcannia to Broken Hill, on account of the uncertainty of the river and the difficulty of river navigation? It has been diverted simply because the seasons have been so bad that the river did not rise, and we had no means of getting goods to Wilcannia except at exorbitant rates, and people at those places could get their goods from Broken Hill more easily than from Wilcannia. But it was only through the river not being up. If we had the means of getting goods to Wilcannia even as cheaply as they can be got to Broken Hill, we would supply that district, especially the southern portion of the Paroo, and up that way.

2500. If a railway were constructed from Cobar to Wilcannia, do you think that the trade of the districts to which you have been referring would be permanently secured to Wilcannia? Yes, I do.

2501. In any case, if that railway were built, the heavy cost of carriage from Broken Hill to Tibooburra, and the other places just mentioned, would, as far as the railway is concerned, naturally divert the traffic of those places from Broken Hill to Wilcannia, would it not? Most decidedly; if we had anything like reasonable freight across to Cobar, there would be no business done on the South Australian side—that is, not until you got within about 50 miles of it.

2502. Can you state where the bulk of the labour employed at shearing time in this district is engaged from—in New South Wales or in South Australia? No; I cannot say exactly, because I know that it is very mixed, and it would be almost impossible to locate it. The men come from all parts of the colonies. Men once on a place come again year after year, until something happens which prevents them.

2503. Presuming that a railway were built from Cobar to Wilcannia, and that the river were not locked, what would be the effect upon the trade of Wilcannia and the surrounding district in cases where the river were easily navigable—would it come from Sydney, or from Adelaide, or from Melbourne, when you could get up and down the river with ease? It is purely a matter of freight. I believe that a man would take advantage of the cheapest means of getting anything he wanted, no matter how he would get it.

2504. You do not think, then, that the certainty of carriage by railway, the absence of serious danger, and consequent reduction in insurance, would determine the trade along the railway in preference to the river? I cannot answer that question. But, given the possibility of getting goods, the average man will take advantage of what is the cheapest for the time being.

2505. Do you know whether it is a fact that storekeepers and other distributing agencies are, owing to the uncertainty of river traffic, compelled to carry very large stocks? Yes, I know that—far larger than they would ordinarily. There are some stocks in Wilcannia which would perhaps astonish some Sydney merchants, if they were to see them.

2506. Of course, that means that the price to the consumer must be correspondingly increased? Yes; more particularly when the river goes down, and the storekeepers have to bear extra expense in the way of cartage, storage, and interest, in addition to waste.

2507. Can you quote to the Committee any extremely high prices which have been brought about by the difficulty of obtaining supplies at Wilcannia within the last few years—for instance, what was the price of flour before you had this late rise in the river? I know it was about £20 per ton just before the rise in the river three months ago.

2508. Can you quote any other instances as showing the difficulty of transit to Wilcannia? I know that butter and some other commodities have had to be brought from Broken Hill, and even from Cobar. The lowest freight has been 3d. per lb, and as much as 4d. has been paid—I daresay more in some cases—  
and

E. O'Donnell. and that would be £25 per ton from Broken Hill. Chaff has also gone up to pretty high prices here lately. I have had to pay £15 and £16 per ton for it; oats, 12s. 6d. per bushel. Bran cau, with a river, be ordinarily sold here at about 1s., or, at the outside, 1s. 3d. per lb. I myself paid 3s. 6d. per bushel for it just before the river rose recently. Pollard was also very dear.

9 Oct., 1898.

2509. Would you say, then, that these periods of expensive transit are of rare or of frequent occurrence? Unfortunately, too frequent.

2510. With a railway from Cobar to Wilcannia, considerable improvement would take place in matters of that kind? There is no doubt about that, because people would not have to lay in such big supplies.

2511. In ordinarily good seasons, when stock can travel, where is the general drift to from this district? Melbourne and Adelaide.

2512. Do you think that, with a railway from Cobar to Wilcannia, much of the stock of this district would find its way to the markets of New South Wales by means of that railway? Like everything else, that is a matter that would depend entirely on freights. Given an ordinarily fair season, when men could get their stocks from here to Melbourne or to Adelaide at 15s. or £1 per head, if they could not get them from here to Sydney at less than 30s. a head, I think that they would send them to Melbourne or to Adelaide.

2513. We have it in evidence that in fair seasons there is a considerable area of good fattening country around Wilcannia? Yes; there is as good as there is anywhere else in New South Wales.

2514. Do you think that a railway from Cobar to Wilcannia would act like the Bourke railway as a means by which the fat stock of the district could be sent speedily to market? Yes, I do.

2515. And that the Cobar-Wilcannia railway would derive some revenue from that source? Yes. Not only would the railway derive benefit in that way, but so also would this part of the Colony, and through it the Colony generally.

2516. *Mr. Shepherd.*] You say that the population here now is much less than it was some time ago? Yes.

2517. I did not catch exactly to what you attributed the falling off of the population;—can you give us a clear opinion as to that? What I think is this: To commence with, our seasons have been particularly bad. The rents of the properties have been very heavy, and the lessees and others have not had returns from their stock, and consequently they have not employed labour. No money could be earned by the wage-earning classes generally, and they have had to go somewhere else. It is not that the country is worse. All those men will be required again directly we get anything like a tolerably good season and the country will carry stock. There are in the district stations where the number of sheep has dwindled down (say) from 100,000 to 30,000, or from 50,000 to 10,000. Culpaulin station used to have 50,000 sheep, and has only 4,000 now. There is nothing going on in Wilcannia in the way of work to keep any men. At one time there were four or five blacksmiths' and wheelwrights' shops in Wilcannia, and the waggons coming in kept the men there fully employed; but through the last season being so bad, and our having nothing to send out, and no wool coming in, the work has gone to Broken Hill and other places, and this place has been thrown idle.

2518. This depression, then, is chiefly attributable to the drought? I think so. This is the fifth year of it, and it is very bad indeed.

2519. What prospect do you think there is of any return to good times within a reasonable period;—supposing that the drought were to thoroughly break up, how long would it take to bring about a state of prosperity again? That is a very hard question to answer; but I do not think that it would be very long, because the country here is very good. All it wants is just a little "spell" and rain. As soon as we get rain we get herbage, and with that come sheep, and with them employment. If we have stock we must have men to look after them.

2520. Of course, the number of sheep has been so terribly reduced that it will take a considerable time to bring the number up to what it was formerly? Not so much as you might think. This is a wonderful country with ordinarily good seasons. The sheep that we have left now have the best constitutions of the lot. They are the ones that have gone through the drought. In our paddocks we have, by lambings, over 100 per cent. in many cases—all good sheep.

2521. The district, I suppose, is almost entirely dependent on wool? Yes; it is comparatively.

2522. How do the White Cliffs opal mines affect Wilcannia;—do you do the whole of the business for White Cliffs? We would, if we had the goods here. But we have not done so for the last six or eight months. We had not the goods here, and, therefore, the White Cliffs people had to go to Broken Hill for goods, and had to pay £12 per ton for carriage from Broken Hill, besides having to pay high prices for the goods in Broken Hill.

2523. Supposing that you had the goods, what would be the charge for carriage from here to White Cliffs? In ordinary seasons, from £2 to £3 per ton. I have sent goods to White Cliffs at £2, and also at £2 10s., and some at £3; but very little at the last rate.

2524. In the event of the Cobar-Wilcannia railway being constructed, do you think that it would draw a large portion of the traffic that now goes to Adelaide and to Melbourne? I am sure it would. It would be one of the greatest blessings we could get.

2525. You are aware that the freight by rail would be considerably more than that by water? Yes, I am.

2526. Do you think that the Cobar route would be taken in preference to the Bourke route? Yes; from anywhere within 50 or 60 miles of Wilcannia—up the river, at any rate.

2527. A considerable number of the people on the river trade with Melbourne and Adelaide? Nearly all.

2528. Principally with Adelaide? Yes; I daresay it is principally with Adelaide.

2529. Do you think that the Cobar-Wilcannia railway would divert any of that traffic? Yes, I think it would, to a very great extent.

2530. People would be prepared to pay an extra amount for the purpose of using the railways and having certainty of traffic? Yes, I think so.

2531. How do you get goods to Wilcannia when the river is not navigable? Chiefly by teams from Broken Hill, and sometimes from Bourke. Previous to the last little rise in the river, I suppose that over 100 tons of goods were carried by team from Bourke to Wilcannia. On one occasion it cost me £20 a ton to bring one lot to Wilcannia from Louth, where it had been left in a steamer. We have to get goods in any way which is at all possible.

2532. Goods coming from Broken Hill, I suppose, would be almost exclusively purchased in Adelaide? Not necessarily. A good deal is sent round from Sydney in bond, but I think that the goods are purchased chiefly

chiefly in Adelaide. There are occasionally odd things sent through in bond from Sydney—particular things that people may specially require—but there is no doubt that the largest proportion of the goods is purchased in Adelaide. E. O'Donnell.  
9 Oct., 1899.

2533. *Vice-Chairman.*] Do you think that in times of drought the railway from Cobar to Wilcannia would offer cheaper means for the conveyance of fodder for large stock on the stations and for the stud rams and the more valuable of the breeding ewes? Yes; I should think so. I should imagine that the freight from (say) Orange to Wilcannia would not be half of the freight from Broken Hill to Wilcannia. It should not be more than £2 10s. or £3 from Orange to Wilcannia.

2534. *Mr. Watson.*] Seeing that the railway officials anticipate a very large annual loss on the proposed railway from Cobar to Wilcannia, and considering that the omission of the more costly 9½ miles at the Wilcannia end of that railway would materially reduce the capital cost, do you think it would sufficiently serve the people of Wilcannia if the railway were brought to the 156 miles point—that is, 9½ miles from here? Wilcannia would not be sufficiently served, but it would be greatly benefited by the railway, even if it were to stop there.

2535. When the flood-waters were up, you would not be able to reach the railway station in that case? At present we have roads by which, unless the floods are very far out, we can get to that point.

2536. Do I rightly understand you to say that, excepting in the very worst floods, you would be able to reach the bank on the eastern side of the Talyawalka Creek if the railway did terminate there? Yes. We have at present embankments and bridges over the flood-ground, which would help us to reach the point on the eastern side of the Talyawalka Creek. When the floods were too far out for that means of communication the communication could be kept up by means of boats.

2537. Would that occasion any serious inconvenience in the transshipping of cargo from a steamer to the railway;—supposing that the railway were attracting traffic to itself from up and down the river, with a view of taking it towards Sydney, would it be very inconvenient to have the intervening 9½ miles of road carriage between the river steamer and the railway? There is no doubt that it would be a nuisance. But to have the railway even within 50 miles of us would, of course, be of very great benefit to us.

2538. Do you think that the intervening distance of 9½ miles would be sufficiently serious to handicap the prospects of the railway in regard to attracting trade as against the river? No, I do not think so; but it would be a great nuisance.

2539. Do you think that, when the river was navigable, the railway, through ceasing 9½ miles from here, would be seriously handicapped in its chance of attracting trade? The distance to that stony rise is really only 8 miles, and we have a splendid road.

2540. The road is a little higher than the railway route? Yes.

2541. What do you think would be the cost of road-carriage over that distance between the river bank and the Talyawalka Creek? It would cost nearly as much to bring goods from a steamer into our stores as it would cost to cart goods to our stores from the high ground on the opposite bank of the river.

2542. Do you know how much is charged for the cartage of goods from the wharf into the town now? Yes; 1s. 6d. and 2s. per ton for any small parcels. It is nearly as much trouble to handle goods in that way as to handle them and carry them farther. If the road to the 8-mile point were a good one, then goods in large lots could be carried by road very cheaply—I think about 7s. 6d. per ton.

2543. The railway survey, as at present projected, comes across the river, and right into the town of Wilcannia? Yes.

2544. Supposing that the line were to cease at the nearest high land on the eastern bank of the Darling, which, according to the engineers, is about half a mile distant from the town, would that be sufficiently close to serve the people of Wilcannia generally? Yes; I think so.

2545. The saving in that case, according to the Departmental officers, would amount to about £33,000 in capital cost, and an annual saving of £2,300, including what would be saved on the estimate for the maintenance of viaducts and bridge, and interest on capital;—do you think that that would be a point worth considering, in view of the fact that the line has to face a very heavy deficiency? As far as the district is concerned, a railway terminating just on the other side of the river would be equally as good as if it were to terminate on this side of the river; but so far as Wilcannia itself is actually concerned, there is no doubt that Wilcannia would far sooner have it on this side of the river. It would be better for Wilcannia, because we have our buildings and everything else required here for the carrying on of business; whereas, if the railway terminus were on the other side of the river, I think it would, to a certain extent, detrimentally affect Wilcannia.

2546. Would there be much difference between the cost of bringing goods from a railway terminus distant half a mile from the eastern bank of the river, and the cost of carting goods from the projected terminus in the town of Wilcannia to the stores? I do not think there would be much difference; but there would be some extra cost in the former case.

Edmund Francis Murphy, sworn, and examined:—

2547. *Mr. Shepherd.*] What are you by occupation? I am an ex-mine-manager, and am now an opal-buyer at White Cliffs. E. F. Murphy.  
9 Oct., 1899.

2548. You are thoroughly acquainted with White Cliffs and its surroundings? Yes.

2549. Would you kindly state for the information of the Committee how the population of White Cliffs has varied since you first went there? I went there about nine years ago. The population for the first two years was about eighteen. About that time the field got a start. We obtained a better market for the opal, and the populations began to increase. It has kept on increasing up to the present time, and it is now something over 2,000. The increase in the last twelve months has been greater than in any other year during the last nine years.

2550. The population at the present time is larger than it has been at any previous period? Yes.

2551. Can you form any idea of what the output has been? It has been variously estimated, but about £100,000 per annum is taken to be about the output.

2552. For how long a period? Last year the output was estimated at £100,000, and the year before at £75,000. It has been very difficult to arrive at a correct estimate of the output, because the way in which the output was arrived at was through the buyers. The warden got information from most of the buyers as to what their purchases were for twelve months, and he allowed a certain percentage for what went away without going through the buyers, but which was sent by men to their relations in different parts of the world to sell for them. 2553.

- E. F. Murphy. 2553. I suppose that this estimate includes the quantity supposed to be sent away in that manner, as well as what is actually sold on the field? Yes.
- 9 Oct., 1893. 2554. Therefore, about £100,000 is the largest supposed output for any one year? Yes; but the output may exceed that.
2555. What are the present prospects of the mines? I think they are very good. There is a little depression at the present time, owing to the opal market in Europe being flat, this being caused chiefly, I think, by the Transvaal trouble, and the late trouble in France. We have had depressions before, and there is generally a good effect after them. They lessen the output for the time being, and this strengthens the market at Home, and the mines are more prosperous afterwards.
2556. There is no regular fixed value for opal? There is no standard value, such as there is for gold, but opal has a value; people in the trade can estimate the value, and go very close to it. They become good judges, and they know pretty well what they can get for certain classes of stone at Home, and, therefore, what they can afford to pay for it.
2557. So there is no difficulty in their making purchases of opal, with a sure prospect of profit? No, there is not. A good judge can generally buy in such a way that it pays his company, or whomever he buys for. It is not all chance work—it is judgment.
2558. What are the prospects of the permanency of the mines? There is a very large tract of opal-bearing country. At White Cliffs itself I should say there is opal-bearing country about 6 miles long and 3 miles wide, but there is a lot of country adjoining which is gradually being opened up for opal. It has no appearance whatever of opal on the surface, but it is all opal-bearing country underneath. If they sink down about 30 feet it is the same as where the opal is got shallow; and that is being extended every day.
2559. There are no indications on the surface? Not at that particular part, but where the opal was first found there was shallow opal and deep opal too. The part to which I referred first of all was table-land country capable of extension.
2560. But the reason why you come to the conclusion that the mines are likely to be permanent is because of the large area over which opals have been discovered, and because of the formation of the seams or levels in which they have been discovered? Yes.
2561. And you can judge, I suppose, with something like accuracy that these seams will extend over a considerable distance? Yes, over a large tract of country.
2562. What is the greatest depth at which opals have been discovered? Fifty-one feet is the deepest I myself have experienced; but I know of claims further out where the opal has been got at 60 feet.
2563. Not deeper than 60 feet? No. There has been very little work done below that. All the levels being worked now are from the surface down to about 60 feet.
2564. What is the description of country that the opals are in? There are patches of hard ground in it, where, on the surface, you have to use powder; but 20 or 30 feet down you can work it with a pick. The country softens as you go down.
2565. And that continues to the greatest depth it has been tried? Yes; it is easily worked.
2566. Have any men gone deeper than that without success? There may be some odd shafts that have gone a little deeper, but very few.
2567. But they have not found opals below the 60-foot level? They have not tried it. You cannot say that they have proved that opal is not to be found lower down, because they have gone down only to levels they knew of—(say) 26, 30, or 40 feet. They work those levels, and in odd places put down what is called a monkey shaft at the end of the drive. They have got opal in many of the little places where they have gone down deep—opal of various qualities—but no work has been done at any deeper level.
2568. Is there any difficulty in keeping on a seam when once you get on it? No.
2569. No fear of losing it? No; you become expert at the work in a very short time.
2570. It is not defined, I suppose, as in gold-mining, between rocky walls? No; there is no bottom, nor any walls, nor anything to guide you. All the opals are in the seams. They lie principally horizontally. The formation of the ground is flat, with different layers of country, one on the top of another. The opal occurs in the seams between the different layers.
2571. What is generally the width of these seams? They are of all widths. The seams run regularly; but they do not carry opal everywhere. There may be 10 or 15 feet here carrying opal, and you may go 20 feet without opal, and further on there may be another patch of opal. I may state that there are adjoining fields. There is one field 10 miles away called the Bunker, which, at the present time, is not being worked, as the men were driven out for want of water. A very short time ago there were 200 people there, and they made a living. Some of them did well. They have had to abandon the field on account of the water drying up.
2572. There is no water at all there now? No. The nearest water was in the Government tank, which is now dry.
2573. You think that those mines will be worked again when they get a supply of water? Yes.
2574. With regard to your supplies—you draw your supplies chiefly from Wilcannia, I suppose? Yes, when there is a river, and we can get them that way.
2575. What is the cost per ton of getting goods out from here to White Cliffs? At the present time it is £3 per ton.
2576. When the river is not navigable you get supplies from Broken Hill, I suppose? Yes.
2577. What is the cost per ton from Broken Hill? We have paid as much as £14 a ton. I think that at the present time it is from £9 to £10 per ton. There is a difference between the charges by horse-teams and those by bullock-teams. Very often you may run short of supplies, and have to get them up by express waggons at a cost of £16 per ton.
2578. What is the distance from Broken Hill to White Cliffs? About 140 miles.
2579. What is the distance from Wilcannia to White Cliffs? Sixty miles.
2580. So that Broken Hill is more than double the distance from White Cliffs than Wilcannia is, but the freight is more than four times as much—can you account for that? There is no feed or water on the track, or very little water. The teams have to depend on some of the stations for water as they go through, and the track is a very bad one—rocky, through gorges and mountains.
2581. A bad route and scarcity of water? Yes.
2582. How are you off for water now at White Cliffs? We have about 10 feet in the population tank.
2583. What is the size of that tank? About 12,000 yards.

2584. How long do you suppose the supply you have now will last, supposing there is no further rainfall? E. F. Murphy. It will not last until Christmas next.
2585. Is any attempt being made to increase the conservation of water? There is a contract let by the Government for a 25,000-yard tank. The contractor is unable to proceed properly with the work, because he cannot get water for his stock. He is doing a little with it, but he cannot get sufficient water for his stock to enable him to put on a big plant.
2586. At present have you an ample supply of water to carry on mining successfully? We have water from the tank for domestic use, we paying the carters 4s. for 100 gallons; but there is, practically, no water for stock. The water in the tank is reserved for domestic use.
2587. So that, really, you are labouring under difficulties now for want of water? Yes.
2588. And a largely-increased supply of water would, I suppose, make the mining there much more successful? Very much more.
2589. *Mr. Watson.*] Are there any other indications of opal near White Cliffs, in addition to the Bunker, which you spoke of? There is another opal-field, opened some time ago, near Purnanga station, between 30 and 40 miles from White Cliffs.
2590. In which direction? North-east.
2591. What are the prospects at Purnanga? The field there was not worked very much. Some good opal was got there, which fetched a good price; but there were only a few people there, and owing to the scarcity of water the field had to be abandoned for some time. But there is opal-bearing country right through from Purnanga to White Cliffs—the same line of ranges.
2592. Are there any indications of opal in any other direction? Yes; there is good opal to be got, and some people are working between the Bunker opal-field and White Cliffs itself—6 miles from White Cliffs.
2593. So there seems to be a large area of opal-bearing country in that vicinity? Very large.
2594. Do you think there would be any important developments in the way of opal-mining if greater provision were made by the authorities for water? Yes. It would make the conditions of living so much better that the place would support a larger population, and it is generally believed that the opal would be got very much deeper than at present.
2595. It is a fact that opal is got in some other parts of the world very much deeper than 60 or 70 feet? Yes. The Hungarian mines run as deep as 400 feet.
2596. They have been working a long while? Yes, for years and years. I do not know how long.
2597. So there is no reason to suppose, then, judging from the experience of other countries, that the opal deposits at White Cliffs will peter out at a very shallow depth? No.
2598. And, from what you know, there is every prospect of the opal-bearing country at and around White Cliffs supporting a fair number of people for a good while? Yes.
2599. Are there any other mineral developments in the direction of, or near, White Cliffs—for instance, in the way of copper? Yes, at a place called Nuntherungie. I was out there the week before last. There are 6 or 8 miles square of country there which is intersected with lodes of almost every mineral, including silver-lead and copper.
2600. Are the lodes of any width? There is one lode, the Wertigo, which has an outcrop of over 100 feet in width, from edge to edge, of copper-stained ore, green and blue. It is showing for a mile and a half in length along the side of a range, and there is a very large surface outcrop.
2601. Are you a judge of copper ore? I am not an expert, but I know good ore.
2602. Would you say that this Wertigo lode is to all appearances a rich one? I have been told by people whom I met at the mine—experts—that if they had machinery and smelters there it would pay from the start.
2603. Did you see other lodes as well as the Wertigo? Yes, there is one other copper-lode, the Well claim, about a mile west of the Wertigo, running transversely. It is a cross-lode; it runs north and south (the Wertigo runs east and west), and has been proved to a depth of 110 feet, down to the water-level.
2604. What is the width of that? The lode on the surface is something like 3 or 4 feet in width. At 110 feet it is between 7 and 8 feet wide, and very much improved. It is improving with depth.
2605. Improving not only in size but also in quality? Yes. It has been proven for about 100 feet along the line of lode.
2606. With satisfactory results? Yes; that is the Well claim.
2607. Do the silver and lead-bearing ores show by outcrop? Yes; but not so much. The outcrop of silver and lead is not so much. I am referring to the Nil Desperandum and the Central, which are silver-lead with copper. There is a lot of different sorts of ore there—silver-lead, copper, and gold. The surface outcrop does not show very much.
2608. Not so pronounced? No; but they are both proven for about 100 feet in depth.
2609. And are they also improving with depth? Yes. They have been worked, and the stuff sent away at a profit.
2610. Where was it sent to for treatment? It was sent through Broken Hill, principally to Dry Creek.
2611. It would need to be fairly rich to bear the expense of all that carrying—several hundred miles? Yes.
2612. Are the conditions such as, in your opinion, would necessitate the employment of a large amount of capital at Nuntherungie? Yes.
2613. For what reason? The distance that Nuntherungie is away from a railway. For smelting at Nuntherungie, they would require a lot of coke and coal, which they would have to get from Lithgow. The wood supply out there would soon be used up in the copper furnaces.
2614. That country is only sparsely timbered, in common with most of the western country? Yes. Most of the timber is on the creeks.
2615. And not very extensive? No, it is not.
2616. Under present conditions, where would be the cheapest place from which to get coal or coke, if they wanted to smelt locally? If there were a river they would get it up to Wilcannia, and cart it out from there.
2617. And without a river, *via* Broken Hill, I suppose? Yes; and teams would carry it from Broken Hill.
2618. In the event of a railway being constructed from Cobar to Wilcannia, would coal, for the purposes of smelting at Nuntherungie, be got more cheaply from Lithgow? Yes.
2619. Supposing that they were to start smelting at Nuntherungie, and were to take coke to that place

E. F. Murphy. for the first reduction of ore, I suppose there would be, as at Cobar, a certain return traffic, in the shape of matte for further refinement? In all probability; but it would depend on what sort of furnaces they would have.

9 Oct., 1899.

2620. At Cobar they find that the cheapest method is to take coke to the field sufficient for the first reduction of ore, and to send that reduced ore, or matte, as back loading to Lithgow for further treatment;—I should imagine that something similar would require to be done in the case of Nuntherungie? Very probably it would.

2621. If the deposits are as large as you say, it would seem reasonable to expect that a fair amount of traffic would accrue to the Cobar-Wilcannia railway, if it were constructed, from the development of a field like that? Yes. With railway communication, that country, being very rich in ore, ought to support a big population. Without some assistance of that sort it cannot be worked well.

2622. How far distant is Nuntherungie from Wilcannia? I think it is about 70 miles.

2623. And if a railway were built from Cobar to Wilcannia, do you think that Nuntherungie would be within practicable distance of the railway, so far as convenience is concerned? Yes. One firm who had an idea of purchasing the mine, and may do so still, estimated the cost of a line from Wilcannia to Nuntherungie, which they intended to build if they purchased the property.

2624. Would that be contingent on a railway being built from Cobar to Wilcannia? Yes.

2625. They were thinking of running a tramway for their own purposes from Wilcannia to Nuntherungie? Yes.

2626. They did not appear to think that there was any other method of developing the field than by having railway carriage for their necessities? No, they did not.

2627. I suppose we shall be pretty safe in saying that no low-grade proposition is capable of development unless fuel can be brought to it cheaply? I do not think it is.

2628. At present the supplies for White Cliffs and places in its vicinity are drawn, according to the condition of the country, either from Wilcannia or from Broken Hill? Yes. For a long time past we have been depending principally on Broken Hill for everything. Wilcannia's supplies were becoming exhausted, because there was no river.

2629. And you have had to depend on Broken Hill at greater cost to yourselves? Yes.

2630. Do you think that a railway from Cobar to Wilcannia would be of any assistance to the people of White Cliffs, speaking generally? Yes; great assistance.

2631. That implies, of course, that, in your opinion, the greater portion of their supplies would be brought from Sydney by the railway? Oh, yes.

2632. Of course, regular and rapid transit would be a factor in determining in which direction trade would flow—that is, the fact of the people of White Cliffs having the chance of getting regular supplies at a stated cost would probably have the effect of their sending the orders to Sydney? Yes; that is almost a certainty, because they would get into the way of doing business with the Sydney merchants, and would not leave them.

2633. You appear to think, then, that the people of White Cliffs, having once established relations with Sydney houses, would continue to trade with them, no matter what the condition of the river happened to be—even if it were up? Yes, I feel sure they would, except, perhaps, for very heavy lines—such as flour and wire. They might take advantage of the river for those.

2634. That would be only when the river was high? Yes.

2635. But, under ordinary circumstances, you think that the greater portion of the traffic would come from Sydney? Yes.

2636. In regard to the carriage of coal or coke, and the consequent return of ore that might be expected from the development of the copper-fields, do you think that the river could compete against the railway? No; I do not think so. The river is too irregular. The railway would certainly be the best and the cheapest means of transit for the people on the copper-fields, because they could get their ore away regularly, and obtain their supplies regularly, and could carry on their work properly.

2637. Between Wilcannia and Broken Hill are there any indications of mineral? Yes; there is mineral country nearly all the way through, where blocks have been taken up and partly worked, and copper-lodes exposed. There are copper and other minerals right until you get to the tin-mines at Euriovie. There is also the Grassmere copper-mine about 20 miles west from Wilcannia, towards Broken Hill, and there is Caulker's Well, 32 miles from Wilcannia.

2638. Is that in the same direction, or more northerly? It is on the Broken Hill road; it is called the Bonley gold-field.

2639. Is that alluvial or reefing? Reefing.

2640. Has much work been done there? A couple of shafts have been sunk, and there has been a lot of costeeing. Five tons of ore have been sent to Bendigo, and it turned out something over 1 oz. to the ton. That was taken off the surface a few years ago.

2641. Do you think there is any probability of that being properly developed? I think so. There is a shaft 113 feet deep on the lode, showing the ore right down.

2642. What was the cause of that not being developed earlier? I think the wrong people had hold of it—people who did not understand mining—and they had very little capital to work it, and they expended their capital in a wrong way—in sinking a shaft off the lode. I do not know exactly the width of the lode, but it was the width of the shaft that I was down. That would be 8 feet; but I do not know how much wider the lode may be. It did not show the wall.

2643. Going more in a north-westerly direction from Wilcannia towards Mount Browne and Tiboorra, is there anything in the way of mineral country before you reach Mount Browne? About 25 miles from White Cliffs, on the Mount Browne road, there is Kandie Peak. There is alluvial gold there. There are also some reefs there. They have been taken up, some work done, and then abandoned.

2644. Do you know to what cause they attributed the abandonment of the reefs there—because they were too poor? I think it was the difficulty under which they had to work.

2645. In what respect—lack of water, or of communication? Yes; it is a long way out, and they are mostly taken up by poor people, and unless they get something very rich which they can work without machinery, it is no good to them, and they have to leave it; and being so far out from the railways they cannot get people with capital to come in and help them.

2646. Do you think that the construction of the Cobar-Wilcannia railway would assist in the introduction of people with capital to develop those propositions? Very much so. 2647.

2647. Are there any other reefs in that direction? There is a reefing show at Kooningberry—north—E. F. Murphy, west of Nuntherungie.
2648. From what you say of the country generally, it seems to be one vast series of mineral deposits? <sup>9 Oct., 1899.</sup> Yes—ranges containing minerals of almost every sort.
2649. And extending over a very large area? Yes.
2650. So, with rapid and regular transit, there seem to be great probabilities of development? Yes.
2651. *Mr. Shepherd.*] Does the quality of the opal vary according to the depth? No.
2652. It seems to be the same quality all the way down? You get it all qualities; but you get it just as good at 50 or 60 feet as on the surface, and just as good on the surface as at 50 or 60 feet. You get it good and bad at every level.

George Donaldson, merchant, Wilcannia, sworn, and examined:—

2653. *Mr. Watson.*] How long have you been here? I have resided here sixteen years, and have been in <sup>G. Donaldson.</sup> business nine years. <sup>9 Oct., 1899.</sup>
2654. I understand that you are prepared with some figures concerning the trade that would probably accrue to the Cobar-Wilcannia railway in the event of its being constructed? Yes. These figures are taken from the books of E. Rich and Company (Limited), Wilcannia branch, and of Stone and Corney, and relate to actual transactions in ordinary seasons, the river being open and not a closed river. The books show the inward tonnage—that is, the imports—to be 4,000 tons, and the outwards—that is wool, skins, tallow, &c.—6,500 tons. That has no reference at all to live stock nor to passenger traffic. Those books are available for you if you wish to inspect them. It is estimated that something like 1,500 tons of produce—that is, chaff, flour, wheat, bran, oats, &c.—come into Wilcannia every year, and the bulk of that would be carried by the proposed railway, in the event of its being constructed, because the supplies would be drawn from about Orange and down that way. It is estimated that the rates for carriage from Orange to Wilcannia, *via* Cobar, would be on the same basis as the rates for carriage at present from Orange to Bourke, and, therefore, that we should be able to land produce here for about 12s. a ton from Orange, or 10s. 6d. from Dubbo. The cost of produce to us, at Dubbo, would be about the same as the cost of produce at Echuca and Moama at the present time, which are the places where we buy now principally; and from Echuca and Moama the rates per steamer are 40s. per ton, ordinary rates, and 30s. per ton, special rates for 500-ton parcels. Within the last two months the inward tonnage that our firm has put through has been 1,400 tons. At the present time we are stocked up for four months. Of course, if the proposed railway from Cobar to Wilcannia were constructed, we should not need to lay in such large stocks.
2655. The inward tonnage and the outward tonnage that you gave as being applicable to ordinary seasons totals between 10,000 and 11,000 tons? Yes—4,000 inward and 6,500 outward.
2656. For two firms only? Yes.
2657. Would there be other consignments besides those which came to the two firms you mention? Yes.
2658. And which would have to be added to the trade? Yes; but those two firms did seven-eighths of the trade.
2659. But would not some of the stations beyond Wilcannia contract directly with steamship owners for the carriage of their wool outwards—wool that would go past the Wilcannia wharf from farther up the river? They make the contracts with us, and we send the boats up.
2660. So they are accounted for? Yes, up as far as Warloo, near Tilpa. Bourke takes the stations higher up, and does their business.
2661. Would they get their station supplies from your firm too? Yes, up to Warloo.
2662. Would that apply to stations which are north and west some distance from Wilcannia;—would they get their supplies through you, or would some of them order their supplies directly, and arrange directly with the steamers? There are such difficulties about the shipping that they always arrange through the agents. If they miss a rise they are without their supplies, and so they always arrange through the agents; and we have our agents in Adelaide who are in touch with their principals, and the things pass on from one to the other.
2663. Would 4,000 tons inward represent supplies for Wilcannia and its immediate vicinity only, or would it include also supplies for White Cliffs. It would include supplies for White Cliffs.
2664. And as far as Milparinka and Mount Browne? If the season is good we do their trade; but if the season is not good we lose it. It all depends on the state of the roads, and whether we have supplies for them.
2665. Would the 4,000 tons inward represent the total of what would be required for supplying not only Wilcannia and its vicinity, but also White Cliffs, Milparinka, and Mount Browne? No; it would not.
2666. To supply those places from this centre, you would require more than that tonnage in a year? Yes; we should require close on 6,000 tons.
2667. It would be an increase of 50 per cent. to supply them? Yes.
2668. At the present time White Cliffs is getting some of its supplies from Broken Hill, is it not? Not just at the present time. It is all working in here now, now that we have supplies for them. There is an immense difference in the road carriage in our favour.
2669. Through the river having risen recently, the White Cliffs trade has returned to Wilcannia? Yes.
2670. Having previously been diverted to Broken Hill while the river was low? Yes.
2671. Supposing you were to have an easy method of obtaining supplies, whether by river or by rail, would you be always able to command the White Cliffs trade against the Broken Hill competition? I have no doubt about it.
2672. And can you say the same in regard to the north-western portion of the Colony—Milparinka and Mount Browne, and out that way? No—about even.
2673. A portion of their trade would go to Broken Hill? Yes. There is only 10 miles road-carriage in our favour; that is the only pull we have on Broken Hill.
2674. Is the condition of the track any better between here and Milparinka than it is between Broken Hill and Milparinka? It generally is better; the carriers prefer the track to Wilcannia, rather than the one to Broken Hill.
2675. So you have a little pull as against Broken Hill? Yes.
2676. With your experience for so many years as a merchant here, what chance do you think the Cobar-Wilcannia railway would have of competing against the river, year in and year out? I think it would have a very good chance.
- 2677.

- G. Donaldson. 2677. For what reason? Because if you take the produce away from the steamers—if you take from them (say) 2,000 tons of up-loading, chaff and other stuff—and you carry that at 12s. or 10s. 6d. per ton, the boats will not have employment. You take away their employment straightaway—you take away their up-loading, and they cannot carry the wool at the same rates as they can at the present time. I had an interest in a steamer syndicate here for three years, and they got very fair rates, but still they were going back and back every year, and the boats were not paying, and had not been paying for some years. They were getting the same freights as we are paying now—40s. or 30s. for big loads—and even at those rates they did not pay unless they got full loads both ways. Therefore, the steamers cannot go under those rates and live. If you take the bulk of their loading away from them, it puts their business in a different position altogether.
2678. Which is the place from which you generally get things? We get them from Echuca, Morgan, and Murray Bridge.
2679. What would be the average freight paid on ordinary classes of goods, for fairly large quantities, from those places? Thirty shillings per ton. To that you have to add insurance and railway freight from Adelaide to Murray Bridge or to Morgan, or from Melbourne to Echuca, which, in either case, is about £1 2s. 6d. a ton on general goods, 11s. 7d. a ton on sugar, 19s. 7d. a ton on wire, and 11s. 7d. a ton on salt.
2680. That would bring the total cost of landing a ton of goods here up to about £2 12s. 6d.? Yes; and to that you have to add insurance, which is about 3s. a ton, and also shipping charges at Morgan, Murray Bridge, or Echuca, 2s. 6d. per ton, which bring it up to nearly £3 a ton on ordinary goods.
2681. Sometimes your goods are delayed in transit very considerably? Yes.
2682. What would better transit, as compared with delay, be worth to a merchant here? On sundries—small goods—it would be worth fully £1 a ton.
2683. You said earlier in your evidence that you had to lay in a big stock of goods? Yes.
2684. And, of course, pay insurance on that while it is in? Yes; and that is a very big item.
2685. There is also the interest on your outstanding capital? Quite so.
2686. Putting those items together, do you think that the saving of those items, or a large proportion of them, would be worth anything to the merchants here? A very considerable saving. I should say 10s. a ton, besides the risk of your flour going bad. We have a great deal of trouble here with flour in the summer-time. It gets full of weevil. We have lost flour and also pollard through weevil. You have to hold a large stock, and cannot keep the weevil out of it.
2687. So while there is any uncertainty about the river, it would pay you to give something like £4 per ton to have things brought from Sydney by rail? It would pay us well.
2688. But, with a high river, what proportion of the goods would then come from Sydney? The railway would be safe for the produce. I do not think there is any question about that; and, say you split the other into two, I think it would be an equitable thing.
2689. Do you think that the railway, even with a high river, would get the whole of the produce and half of the remaining traffic? Yes, I think so, because we would not stock-up and pay interest and insurance. I mean large produce, such as chaff, pollard, bran, maize, and oats.
2690. Coming to outward traffic, of course the river offers no facilities for the getting away of station stock? None.
2691. Which the railway would? Just so.
2692. And as far as any possible stock traffic is concerned, that would probably go by the railway? Yes.
2693. Then, as to the carriage of wool outwards, what chance do you think the railway would have of gathering traffic in that connection; assuming that the lowest rate now charged on wool taken from Bourke to Sydney were applied to Wilcannia, the rate, I think, amounting to £2 12s. 6d., do you think that then the railway could compete against the river? I am sure it would.
2694. For what reason? The present rate *via* Echuca to Melbourne on greasy wool is 50s. per ton. To this you have to add insurance at 16s. per £100, which would amount to (say) about 14s. per ton.
2695. Bringing the charge by river and rail to Melbourne up to £3 4s.? Yes.
2696. Then occasionally delays occur in the transit by river? Yes; and that means a big loss in interest on a clip of wool, and probably the losing of a good market; and people weigh all these things.
2697. So, if the wool-grower were offered the two avenues of carriage at about the same price, he would prefer the railway, because of its greater expedition? Ordinarily so; but sometimes it is modified by the fact that finance companies in Melbourne having interests in this district order the wool to be sent to themselves. However, when there was a low river the wool would be certain to go by the railway, because those finance companies have also offices in Sydney, and their offices there treat the wool. Of course, it would take time to alter the drift of traffic and get it from Melbourne.
2698. Do you think that the rates at which the boats are working with a high river are the lowest at which they could work? I am sure they are.
2699. You do not think that in order to meet railway competition they could materially reduce their present rates? They could not, and also make their plants pay.
2700. The rates for scoured wool are higher with the boats as well as with the railway, are they not? Yes. The boats get 5s. a ton more for scoured wool, and the railway also charges 5s. a ton more for scoured wool; and the insurance on scoured wool is considerably higher.
2701. The insurance of 16s. per £100 net, of which you spoke, in reference to river-borne wool, was that covering only to Melbourne, or beyond? To Melbourne only.
2702. It is not sufficient to cover to London, should the wool be shipped thither? Through insurance rates can be got from here to London, and they would be about 27s. 6d. per £100. The big risk is on the river, and that necessitates the greater portion of the premium.
2703. By rail, they do not insure? No.
2704. They take it that the transit is safe enough there? Yes.
2705. As to the passenger traffic, I suppose there need be no doubt as to the railway being able to compete against the river? There is no question about that.
2706. The river would not serve the passengers? No. A passenger at the present time going from here to Echuca in the cabin has to pay £7, or from here to Morgan £7, and the journey occupies ten days. There is no question about the passenger traffic.
2707. I suppose that most of the passenger traffic both to and from Wilcannia, at the present time, is by coach?

- coach? Yes. I may add that, with a low river, we have paid up to £3 per ton on goods brought up from South Australia, or from Echuca, and that the rates I have quoted—30s. and 40s.—are with a full open river.
2708. That is, under the best of conditions? Yes.
2709. Of course, in this connection we have to keep before us the possibility of either the New South Wales or the Federal Government locking the river from one end to the other, and the consequent chance of an open and high river always competing against the Cobar-Wilcannia railway? Yes.
2710. How do you think that possibility affects the question;—do you still think that there is a fair chance of trade for the railway, even against that contingency? I do not think that anything could take the produce trade away from the railway, because if the river were locked I take it that there would be tolls to pay, and that would increase the cost of river carriage a little.
2711. Whatever Government were to carry out the work of locking the river would probably expect to get something in the way of recouping itself? Yes; from the boats.
2712. The projected terminus of the surveyed line to Wilcannia is at about the junction of Murray and Desailly Streets, Wilcannia? Yes.
2713. And that is about half a mile from the north-western or right bank of the Darling River? Yes.
2714. Do you think that the town could be considered to be fairly served if the line were to terminate on the other side of the river, namely, at the sand-hill half a mile from the south-eastern bank of the river? In view of the extra cost, I do think that the town would be well served.
2715. The Departmental officers' estimate is that if the line were to terminate at the spot I have mentioned, on the high ground, that would allow of the saving of the cost of viaduct and bridge to the extent of £33,000, and a probable saving in annual expenditure of £2,300? Yes; I think that the town would be well served without that.
2716. Do you think that the carting of goods from a railway station half a mile from the south-eastern bank of the river would involve a much greater expenditure of time and money than would the carting of goods from the projected station at the junction of Murray and Desailly Streets? Nothing worth considering.
2717. Do you know anything of the intervening country between Wilcannia and Cobar? I do.
2718. Do you think that we have a right to expect anything to speak of in the way of traffic from there? Yes; I think so.
2719. Of what nature? You will get traffic from the stations *en route*. For instance, you will get traffic from Barnato and Nelyambo. The Barnato and Nelyambo wool at present comes into the river at Nelyambo, where they have their wool-shed. I think that they would shear all their sheep at Barnato, and that the wool would go straight on to the railway. It would pay them to do that.
2720. The two places you have just mentioned are really in the same holding? Yes; they belong to the Australian Mortgage, Land, and Finance Company.
2721. There are other stations along there which you also think would give their traffic to the railway? Yes; I think you would get traffic from Cultowa.
2722. With regard to the wool from stations some distance east of Wilcannia, which now goes to Cobar, the railways would get a greater amount of freight from them than is now the case, because of the extra distance the wool would be carried by rail? Yes. The Cobar-Wilcannia line would also get the wool from Bulla, Kew, Fulham, Innesowen, Goonalg, Marfield, Mount Manara, and Baden Park, besides several homestead leases. All that wool at the present time is being conveyed by river. Those stations would be fairly adjacent to the railway line, and are all off the river.
2723. You think there is a great probability of the Cobar-Wilcannia railway getting the wool from those stations? There is more than a probability.
2724. Do you think there is any probability of the Cobar-Wilcannia railway attracting trade from the south-western part of Queensland;—at the present time some of the Queensland trade goes to Bourke? Only a very little of it does.
2725. And I understand that a portion of the trade from the south-western part of Queensland goes to Broken Hill? Yes.
2726. Do you think that any of that traffic would go to the Cobar-Wilcannia railway? It is all a matter of team carriage. The teams prefer the route to Wilcannia, as compared with that to Broken Hill, and with a regular supply we could command the trade.
2727. I believe there are a number of stations with which you trade which might reasonably be expected to send their wool by the Cobar-Wilcannia railway? Yes. The following stations in the Wilcannia district could be relied upon for wool to be carried by rail to Sydney, if the proposed railway from Cobar to Wilcannia were constructed, and if the rates were about £3 from Wilcannia to Sydney:—Netallie, Menamurtee, Tarella, Kayrunnera, Monolon, Yantara, Tongo, Purnanga, Mount Murchison (if river closed), Murtee, Momba (if river closed), Turkey Creek, Yancannia. In regard to the undermentioned stations in the Wilcannia district, it is an open question whether they would use the Cobar-Wilcannia railway as a means of transit for their wool, with a full river, but with a closed river they are certainly likely to use that railway:—Weinteriga, Culpaulin, Grassmere, Nuntherungie, Fort Otway, Connulpie, Cobham, Olive Downs, Caryapundy, Marra, Terryawinnia, Cuthawarra, Goorimpa, Gnalta, Glenlyon, Morden, Whittabranah, Billilla, Mount Stewart, Tintinallogy; also, the following Queensland stations:—Yanco, Woodbourne, Naryilco, Tickalara. In 1887, when the river was closed about eighteen months, the Momba wool was carted to Bourke at a cost for road carriage of £4 per ton, and was railed from Bourke to Sydney.
2728. Have you anything to add as to the feeling of the people generally in reference to the proposed railway from Cobar to Wilcannia? The feeling of the people generally is that, as the Government draw a large revenue from the Customs and from the tenants of their own properties—that is, the pastoralists—they think they are entitled to this railway, as it will benefit the State property, and because those people who come out here and endure all the hardships which they have to undergo are entitled to some consideration. No money worth speaking of has been spent on roads in this district, and nothing has been done with the place except just to drain it. We do not trade with South Australia and Victoria because we have any friendly feeling towards them, but because we are compelled to do so, and if we had any inducement to trade with Orange and Dubbo we would much rather do that and get our produce from there, instead of from Moama, Echuca, and South Australia. Any increment of value accruing to the lands of the district through additional means of transit being provided will be of direct benefit to the State, as it owns nearly all the lands.

G. Donaldson.  
9 Oct., 1899.

G. Donaldson. 2729. *Vice-Chairman.*] I should like to direct your attention to Question 906 in Mr. Harper's evidence referring to the Bourke railway:—

9 Oct., 1899.

What is the recent experience with reference to the rivalry between the railway and river trade? We have had to reduce our rates on the heavy traffic; so much so that a month ago we carried certain lines—such as galvanised iron, sugar, and woolpacks—in large quantities, at £2 a ton, on condition of our using stock waggons which would otherwise run empty. I was approached by a firm who were getting 300 tons of mixed goods consigned to Bourke, but we were not sending to that district, because there was no fat stock coming down. I told them that they would have to wait three weeks or a month, so that the conditions would apply. Their reply was, "We shall have no alternative but to get the goods up from Adelaide." As a matter of fact, we had to carry the goods in ordinary trucks.

I should also like to direct your attention to Questions 914 and 915 in the same gentleman's evidence:—

You do not think that this line would get the whole of that 27,000 bales? No.

Not more than half? It is extremely doubtful whether we should get any.

In view of your intimate knowledge of the conditions of trade in this district, are you inclined to agree with the replies given by Mr. Harper with respect to the probable competition between the river and the proposed railway from Cobar to Wilcannia? I do not agree with Mr. Harper.

2730. I think that the general tenor of your evidence has been that, so far as inwards produce is concerned, the Cobar-Wilcannia railway would certainly be able to claim the lion's share? Yes, there is no question about that.

2731. While, with respect to the outwards goods, the railway could at least obtain one-half? Fully one-half.

2732. Even with a full river? Yes; and it must get the whole with a closed river, as there would be a saving in interest and insurance, which are very large items, that have to be considered in connection with river traffic.

2733. You stated that the figures furnished by you to the Committee with respect to the business carried on by your firm—which incorporates the businesses formerly carried on by E. Rich & Co. (Limited) and by Stone and Corney—could be verified by inspection of the books? Yes.

John Banks, Customs Officer, Wilcannia, sworn, and examined:—

J. Banks. 2734. *Vice-Chairman.*] You hand in a statement showing inward and outward tonnage of shipping from and to Wentworth, with the approximate amount of cargo carried during the years 1893 to 1899, inclusive? Yes; as follows:—

9 Oct., 1899.

COMPARATIVE Statement showing the Outward and Inward Traffic on the river Darling, from and to Wentworth, for the years 1893 to 1899, inclusive:—

Year.	From Wentworth.			To Wentworth.		
	Total Number of Steamers and Barges.	Total Registered Tonnage.	Approximated Tons of Cargo.	Total Number of Steamers and Barges.	Total Registered Tonnage.	Approximated Tons of Cargo.
1893 .....	223	19,281	8,531	233	20,169	9,108
1894 .....	266	23,423	9,162	269	23,833	11,637
1895 .....	197	14,658	5,053	182	12,882	3,949
1896 .....	232	19,842	8,292	248	21,841	9,655
1897 .....	166	14,128	7,757	158	13,244	6,159
1898 .....	138	9,834	3,488	133	9,713	2,286
1899 (to 30th September)	98	8,382	4,327	96	7,702	3,273
Totals.....	1,320	109,548	46,610	1,319	109,384	46,067

2735. You also hand in a yearly statement showing the amount of goods entered at Wilcannia, under bond, during the years 1895 to 1899, together with the amount of duties paid at Wilcannia in each year from 1889 to 1895? Yes, as follows:—

STATEMENT showing Value of Goods passed through, and Duty collected at, Customs House, Wilcannia.

Year.	Value.	Duty.	Year.	Value.	Duty.
	£	£ s. d.		£	£ s. d.
1889 .....		13,244 3 3	1895 .....	23,864	10,426 4 1
1890 .....		15,938 15 5	1896 .....	64,750	11,791 6 9
1891 .....		21,061 3 4	1897 .....	44,680	9,957 10 5
1892 .....		17,264 13 4	1898 .....	32,580	8,812 4 0
1893 .....		16,559 9 11	9 months ended		
1894 .....		14,130 7 6	30 September, 1899	25,944	4,742 2 1

I may mention that these returns do not give the total amount of inward, river-borne traffic, because many classes of goods do not come under the jurisdiction of the Customs Department at Wilcannia.

2736. Can you supply the Committee with a statement showing the number of vessels engaged in hawking on the river, which have reported at Wilcannia? Yes; as follows:—1896, 25; 1897, 14; 1898, 6; 1899, to the 30th September, 4.

2737. Can you state what the average tonnage of these hawking vessels is? No; the papers do not show that.

2738. These vessels are engaged in bringing supplies to residents along the river, and in removing their produce? Yes.

2739. You have also some statistics referring to the cargo vessels on the river, which have reported at Wilcannia? Yes; for 1896, 67; 1897, 37; 1898, 20; 1899, to the 30th September, 30.

2740. These returns show, since 1896, a diminishing amount of shipping per annum; to what do you attribute this falling off? To the fact that the river has not been navigable during the greater portion of each year.

2741. Your returns do not include vessels trading directly from Wentworth to Bourke? No, they do not; nor do they include any vessels trading from Bourke to Wilcannia.

Robert

Robert Knox, merchant, Wilcannia, sworn, and examined:—

2742. *Mr. Shepherd.*] You are a member of the firm of Donaldson, Coburn, and Knox? Yes.
2743. You have been engaged in business at White Cliffs for some time? Yes; up to the end of last September.
2744. For how long? Two and a half years.
2745. In a general store? Yes.
2746. How did you generally get your goods when you were at White Cliffs? From Wilcannia.
2747. Did you never get them from Broken Hill? Yes; during the last six months we got a great quantity of goods from Broken Hill. When they were not to be had in Wilcannia, we had to go to Broken Hill for them. The respective distances are 66 miles to Wilcannia, and about 140 to Broken Hill. Therefore the difference in land-carriage to White Cliffs is considerable.
2748. What is the difference in land-carriage? The freight is £3 from Wilcannia and £8 from Broken Hill; but it has been as high as £12 from Broken Hill, and with water along the road, you can get goods carried at £2 10s. from Wilcannia to White Cliffs.
2749. The charge depends, to a great extent, on the state of the roads? Yes; according to the state of the roads the rate for carriage varies a good deal.
2750. Are horse teams usually employed? Horse teams and bullock teams.
2751. Have you any idea of the relative quantities of goods taken to White Cliffs during the years which you were there? Yes. During the last twelve months my firm have paid £5,400 for road-carriage alone.
2752. That would be up to the end of September? Yes.
2753. Do you know what it was the year before? The year before my firm paid £3,200 and odd; but up to that time the firm was a smaller one. During the last twelve months we have bought out Stone and Corney, at White Cliffs. The combination of the two businesses increased our turnover considerably.
2754. That accounts for the great excess of last year over the year before? Yes. There were two firms previously, competing against one another.
2755. And the two firms combined? Yes.
2756. How do you find the state of affairs there;—do they seem prosperous? Yes, they are very prosperous.
2757. Do the miners seem satisfied with the result of their work? Yes. They have been going to White Cliffs for months from all parts—Cobar, Broken Hill, Bourke, and Wentworth. There are over 2,300 people there now. In my estimation it is slightly over-populated now.
2758. That is the largest number of people, I suppose, that has ever been there? Yes. Still people are going to White Cliffs now from the out-stations. A few are going away, but I think the population is still increasing.
2759. Is the production of opals up to the ordinary average? Yes. The last twelve months it has been above the average. There have been more miners on the field, and that would account for it.
2760. Have you been a purchaser of the opals to any extent? Not to any extent.
2761. Not in the way of business? No. I had a good knowledge of the opal that left the field, because I insured it.
2762. Have you any idea of the actual number of miners engaged in the industry? I should say from 1,200 to 1,500.
2763. And the balance of the population is made up, I suppose, of their wives and families, and store-keepers and others? Yes. There are about 1,500 *bona fide* miners on the field.
2764. Have you any idea as to whether the proposed railway from Cobar to Wilcannia, if constructed, would have any effect on mining operations at White Cliffs? Only, I think, as regards giving them some guarantee of being able to get their goods to White Cliffs at a cheap freight. Getting goods from Broken Hill and paying £12 or £14 for road carriage, is a big drag on the community. If the people at White Cliffs had a certainty of getting their goods from Wilcannia, that would make them more prosperous.
2765. If they are paying from £8 to £12 per ton now, and if a railway were open from Cobar to Wilcannia, I should imagine that the freight would be very much less? The freight would be from about £2 to £2 10s. from Wilcannia, and there would be a guarantee of constant supply. There is also a good deal of passenger traffic.
2766. You think that that would give an impetus to mining at White Cliffs? Yes, I do. There is a big area of country that has not been properly prospected yet, but which has been proved to be opal-bearing.
2767. Have any other minerals been discovered at White Cliffs or in the neighbourhood? Wertigo copper-mine is about 40 miles from White Cliffs.
2768. Is that in full work? No; it is not being worked.
2769. Do you know the reason? It has only recently been discovered, and it is on the market now for sale.
2770. They have not regularly commenced operations there yet? No.
2771. Does the discovery there promise to be of any importance? Yes; it promises very well.
2772. I believe that the supply of water there is not very satisfactory? No; it is very bad.
2773. And that, I suppose, to some extent retards progress? It does, a good deal. Two hundred or 300 people clear out every summer on that account alone. The lack of water is one of the main reasons why I myself left.
2774. Is the country suitable for storing water? Only by excavation. It is very suitable in that respect. It is eminently suitable for the formation of tanks.
2775. Do you usually get a sufficient rainfall there to replenish the tanks? The rainfall has been very small the last two years, but a small tank that the Government have there now has managed to keep the field going. They are talking about putting down a 30,000-yard tank, and the Government have started on the silt-tank, and if the big tank were to get filled the town would never be without water.
2776. Has the tank already there always had some water in it, or has it ever been quite dry? Last year it was quite dry.
2777. What did the people do for water then? They had to have it carted 6 or 8 miles, and had to pay 15s., and even £1, per 100 gallons.
2778. Is there a permanent supply at that distance? Only excavated tanks—station tanks.
2779. When was the last rainfall there? I think that within the last four months there have been two falls of 30 points each. Previous to that there was no fall at all for a considerable time.

R. Knox.  
9 Oct., 1899.

- R. Knox.  
9 Oct., 1899.
2780. How long do you suppose the water that is there now will last? Until the end of the present year.
2781. I suppose there is a very large catchment area there? Yes. A half-inch rainfall will fill the tank. The last 30 points that fell put about 4 feet in the tank. Had it not been for that fall the people there would have been clean out of water now.
2782. Has any expert been on the ground with the view of saying whether the country is suitable for artesian boring? Not that I know of; except Father Curran. He was there, but not officially.
2783. Did he give any opinion about it? He gave the opinion that the country was suitable for artesian boring.
2784. Have the Government been approached in any way on the matter? Yes; and they have promised an artesian bore. I understood that it was to come from the Warri to White Cliffs.
2785. What is the total value of the goods taken to White Cliffs annually? I should say between £50,000 and £60,000. I consider that I did half the business of the place.
2786. Do you know the estimated value of the opals that have been produced there annually? I should think that £100,000 is a low estimate. I think that Mr. Fletcher, the Police Magistrate and Warden, is collecting some figures now, and will be able to get very close to the right estimate, for the opal buyers will tell a man in his position when they will not tell an outside person.
2787. But a good many of the opals, I suppose, leave the field privately? Yes, and a good many of the opals are sold in Melbourne and in Sydney. The miners send them down to personal friends themselves, and there is no account of those.
2788. Can you give any other information in connection with the opal-fields which will be of use to the Committee? Only regarding the passenger traffic. The passenger traffic both to and from White Cliffs is fairly large. It has been very large during the last twelve months.
2789. Do many visitors go there just to view the field? Yes; a good many visitors go there.
2790. Independently of those interested in the mines? Yes; and there have been at least twenty people up about the Wertago copper-mine, from one place and another.
2791. Can you say what proportion of the inward goods at White Cliffs has been drawn from Broken Hill during the last three years? Up to the previous six months it has been very small; but during the last six months it has averaged about £1,500 worth a month.
2792. Do you think that, with a railway from Cobar to Wilcannia, the whole of the White Cliffs trade, inward and outward, would be secured to Wilcannia? Undoubtedly, yes.

Charles Nolan, sergeant of police, White Cliffs, sworn, and examined:—

- C. Nolan.  
9 Oct., 1899.
2793. *Vice-Chairman.*] How long have you been stationed at Whitecliffs? Since February, 1898.
2794. Have you any statistics as to the population? Yes. According to the census collected by the police the population in January, 1898, was 793 males, 163 females, 230 children, and 12 Chinese; total, 1,198. That included the town of White Cliffs and the police patrol district.
2795. How large is that? We go 70 miles north, and about 150 miles east. South we go to within 30 miles of Wilcannia, and west we go about 70 miles. It is a very sparsely populated patrol district. There are only just a few stations. In January, 1899, the return of population for the town of White Cliffs—which was kept separately this year—was 870 men, 207 women, 145 boys, 132 girls, 9 Chinese, and 5 aliens; total, 1,369; and for the district, the return was—163 men, 42 women, 54 boys, 51 girls, 9 Chinese, and 8 aliens; total, 327; grand total, 1,696; as against 1,198, for the previous year. From January last the population increased up to July, when it reached, as far as my observation went, about 2,300. Since then it has decreased owing to the men going away shearing, and owing also to the continued drought, and I should say that at the present time it is a little over 2,000. The estimates for the period since January are for the town only.
2796. *Mr. Shepherd.*] I suppose you are pretty well acquainted with the way in which the miners were getting on there? Yes.
2797. Did they seem to be satisfied with the results of their work? Yes. The general opinion amongst the men at White Cliffs is that it is the best poor man's field in Australasia. Opal-mining does not require any capital, and you stand a chance at any time of making a competence in a single day, as several of the men have done.
2798. They commence getting the opal right from the surface, I believe? Yes.
2799. Is there any great difficulty in discovering the seams of opal? The work is all haphazard. Experience is of no use to a man at all. There is nothing to indicate the locality of opal. You simply put down a hole, and if you chance on opal, well and good. All the country is opal-bearing.
2800. So, all the men have an equal chance? Yes. A man who never saw opal before has an equal chance with a skilled miner.
2801. Can they always readily dispose of the opals on the field? Yes. Of course, at periods, just as at the present time, there is a depressed market for inferior quality of opal. The value of best quality opal fluctuates very little. It is always saleable at a handsome price; but the commoner quality of opal is sometimes not in demand. Especially is that the case at the present time.
2802. These periods of depression have occurred, I think, on several occasions, have they not? Yes.
2803. And they seem to turn round again and go ahead again as brightly as ever? Yes. The buyers do not seem to be opening up any fresh markets. The demand for opal does not seem to increase. The general opinion on the field is that the sale of opal is not being pushed in foreign countries—India, China, Japan, and Russia, and various other countries; otherwise there would be a greater demand, as it would sell itself anywhere.
2804. And that is the reason, I suppose, why occasionally there is a depressed market, and not a great demand for the opals? Yes.
2805. But that applies only to the poorer quality of opal? Yes.
2806. The better qualities of opal can always be readily disposed of? Yes; up to £35 and £40 an ounce.
2807. *Mr. Watson.*] Are most of the mines held by miners individually, or are they worked for companies? The land is principally held by companies. Opal was a new mineral in this country until about ten years ago, and the Government had made no provision under the Mining Act for dealing specially with opal, consequently they leased as much as 40 acres of land to one individual, for the purpose of mining for opal, at a rental of 5s. an acre—that is, £10 for the 40 acres. Of course it was quickly discovered that it was ridiculous to do anything of the sort. For a man to work 40 acres of opal-bearing country

country he would require at least 1,000 tributors. The Government then reduced the area that one person could take up to 4 acres. After further experience it was found that that was also ridiculous—that one man could not possibly work 4 acres, and the Government have now reduced the area that one can hold to 100 feet by 100 feet. That is the greatest area that one man can hold under the present Act and regulations. Those individuals who got 40 acres, or 20, 15, or 17 acres, or various other areas, are now working those areas by means of tributors; and the White Cliffs Opal-mining Company at the present time have, I think, for five blocks, 450 men tributing, the tributors giving the company 25 per cent. of the value of all opal won, and the tributors retaining 75 per cent. of the value. When a tributor is put on to work, he has to sign an agreement to bring all opal discovered to the company's office the same day, and hand it over under seal. It is then classed by the finder and the company's officers together, and a valuation is put on it by the company's officers. The opal is then allowed to be taken away by the tributor to any buyer he pleases. The buyers are all round town, and he takes the opal and sells it to the highest bidder; but it cannot be sold below the valuation put upon it by the company's valuer. In any case, the company get at least one-fourth of the value that they themselves have placed on the opal, and also their percentage of whatever additional price the tributor obtains.

C. Nolan.  
9 Oct., 1899.

2808. I suppose that a large area of country is taken up in these large leases? The area being worked at the present time is probably a block of country 4 miles square. There is one other place, 12 miles from White Cliffs, called the Bunker. There have been as many as 100 men working there, but they have been driven out through having no water, and they have had to go back to White Cliffs. At Purnanga opal-field, 50 miles in a north-north-easterly direction from White Cliffs, opal, and also good indications of opal, have been found, but there also the miners were driven out through want of water. At the present time there are about fifteen or twenty men on the Bunker, but the Purnanga field is abandoned altogether. I have been all over the country. The formation of the country is all of the same nature, and as far as a casual observer could see, it is all opal-bearing for 60 miles—that is, from White Cliffs to Purnanga, which is 50 miles north-north-east, and to the Bunker, which is 10 or 12 miles south-west of White Cliffs—a continuous run of country, all opal-bearing.

2809. And what belt of country do you think? I should think a belt of country 8 or 10 miles wide.

2810. Sixty miles, by 8 or 10? Yes. The demand for opal does not seem to increase, and at the present time the buyers are very lukewarm about buying, unless they get it at a very low price, and also, unless it is of the best quality.

2811. They have been paying a very high price, have they not? Yes, they have; but now the market appears to be glutted, and they do not seem able to dispose of opal as rapidly as they were calculating on, and the price is lower.

2812. Would the conditions for opal-getting, if there were a proper supply of water, permit of opal being sold at a lower price than was previously obtained? Yes, certainly.

2813. And still give a number of men a living? Yes. Of course, there would always be a small percentage of men who would be unsuccessful.

2814. That applies to gold-mining, or any other similar industry? Yes. I knew a man personally who worked continuously on the White Cliffs field and who left the field the other day after completing his third year there, and he told me that he had found only £15 worth of opal in the three years. He said he had given the field a fair trial and, rolling up his swag, he was going to walk to Melbourne.

2815. But other men have made a fortune there? Other men who came on the field have in a few months made a competence for themselves. Two men that I know of have found opal estimated to be worth £1,800, within four months.

2816. *Mr. Shepherd.*] Is it not strange that the men who are working as tributors do not go on their own account if there is such an enormous field open for them? The reason for that is this: the area where the leases have been taken up has been proved in every direction; it has been proved beyond doubt that all the leases carry opal and are rich opal-bearing country, but outside that area the country has not been proved. It requires a lot of men to prove a country, and the number of men that have been working on the unproved country has been very small. There have been very few men prospecting or searching for opal. The want of water has been a terrible drawback to the field. For instance, from the commencement of this year up to the present time the total rainfall has been less than  $3\frac{1}{4}$  inches.

TUESDAY, 10 OCTOBER, 1899.

[The Committee met at the Court-house, Wilcannia, at 9:30 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Alexander Munro, manager, Mount Murchison portion of Momba holding, sworn, and examined:—

2817. *Vice-Chairman.*] You are the manager of the Mount Murchison portion of the Momba holding? A. Munro.  
Yes.

2818. What prospect do you think there would be of a railway from Cobar to Wilcannia attracting any of the traffic that now goes down the river? Quicker despatch, for one thing. It takes on an average about twelve days to deliver wool at Morgan from Wilcannia, and then it has to be put on railway trucks and sent on to Adelaide. 10 Oct., 1899.

2819. That is, with a full river? Yes. There would be ten days' difference, I suppose, in getting the wool to market.

2820. With a late shearing it might be of importance to a wool-grower to catch a certain boat for certain sales? Yes; the wool would have to go to Sydney then.

2821. So even with a full river you think that there is a fair chance of the Cobar-Wilcannia railway getting a proportion of the wool traffic that goes down the river at the present time? Yes; I think a large proportion.

- A. Munro.  
10 Oct., 1899.
2822. During a period of low river, how would the railway stand? I think that nearly all the wool would have to go to Sydney *via* Cobar then.
2823. Assuming that similar freights were charged from Wilcannia to Sydney as are now charged from Bourke to Sydney, namely, a minimum of £2 12s. 6d. per ton on greasy wool, how would that compare with the river freights? Very favourably. The cost of landing wool at Morgan would be from about 35s. to £2 2s. 6d. per ton from Mount Murchison station.
2824. And on to that you would have to put how much for insurance? I cannot say what the rate of insurance is now.
2825. How much in addition to that amount would be paid for railway carriage from Morgan to Adelaide? Eighteen shillings or £1 a ton.
2826. Is that during a full river? Yes. It has been done more cheaply, but I think that that is about the average rate with a fair river.
2827. To that has to be added something for insurance by river? Yes. How much that is I cannot say.
2828. It would appear, from what you say, that, even with a fair river, if no greater railway freight were charged from Wilcannia than is now charged from Bourke, the wool traffic could be secured by this railway? Yes, I think so.
2829. Greater expedition in transit would, of course, be secured by the use of the railway? Yes; and there would be less handling of the wool. The more handling, the more cost.
2830. Do the pastoralists have to pay for the loading at Morgan? I do not know. I think that the steamers land the wool on the railway trucks.
2831. During a period of low river, if wool is shipped towards the coast by that means, there is often considerable delay, is there not? Yes.
2832. Even if you are able to get the wool on to the barges, you have sometimes to wait a considerable time before it is delivered? Yes.
2833. And, consequently, sometimes a favourable market may be lost? Yes. Through a delay of four days in the delivery of wool at Morgan, the Momba Pastoral Company lost £1,500 through not getting their wool to hit a certain market. Space was engaged on the mail steamer for a certain quantity of wool, but the wool got stuck up on the river and did not hit the market.
2834. Of course, in wool-selling, as in every other business, a man wants to take advantage of the market if it happens to be rising? Yes; and he can take advantage of the market only with a railway.
2835. From what you have just said about the charges on the river, it would seem that, even if the river were locked, the railway would have a fair chance of competing against it, because of the fact that locks would necessarily involve something in the way of charges, in addition to the present freight charges? Yes.
2836. Any authority that might carry out the locking of the Darling River would have, I imagine, to impose something in the way of a charge to recoup itself? I should think so.
2837. That would be an additional reason why the railway would be able to compete against the river? Yes. I think it would be a mistake to lock the river as proposed—at least, as far as the carriage of wool and produce is concerned.
2838. You do not think that the game is worth the candle? I do not think it is. In my opinion the money spent on the locking of the river would be wasted, unless the river were locked in such a way as to make it permanently navigable right through; and that of course would send the trade to Victoria and South Australia.
2839. And I suppose that, if the trade is to go to Victoria and South Australia, it is a fair proposition that they should be expected to contribute something towards the cost of the works? I should think so.
2840. And that could be secured only by leaving the locking of the river to be taken charge of by the Federal Government? I think that the locking of the river is a question for the Federal Government,—the locking to begin at the lower end of the river, and to end at the top of it.
2841. As to the country off the river (say) to the north and north-west of Wilcannia, do you think that the Cobar-Wilcannia railway would have any reasonable chance of attracting wool traffic from that direction? I think so. I think that the Cobar-Wilcannia railway would attract nearly all the wool that now goes to Adelaide *via* Broken Hill.
2842. For a considerable distance towards Broken Hill? Yes; and it would also attract Queensland wool that now goes to Bourke.
2843. A portion of that which now goes to Bourke would be attracted to the Cobar-Wilcannia railway? Yes.
2844. That is, I suppose, wool from south-western Queensland? Yes.
2845. From how far in the Paroo direction do you think that Wilcannia might act as an attracting centre, if the proposed railway from Cobar to Wilcannia were constructed? I think from about Wanaaring.
2846. That would be about 160 miles north of Wilcannia? Yes.
2847. Which way does that traffic go at the present time? It goes to Bourke; but I think it would find its way to Wilcannia if there were a railway here. There is a better track to Wilcannia.
2848. Then down the river towards Menindie—would you care to venture an opinion as to how far it would be likely that pastoralists would send their wool to a railway at Wilcannia,—first, in an ordinary season, and secondly, in a dry one? It would depend on the rate from any station below Wilcannia, towards Menindie, to the railway at Broken Hill.
2849. Do you think that we may reasonably expect that pastoralists half way between Wilcannia and Menindie would, in ordinary seasons, send their wool to Wilcannia for conveyance by the Cobar-Wilcannia railway? I think that in an ordinary season they would send it down the river.
2850. But with a low river they would send it up to Wilcannia? A large proportion (say), as far as 50 miles from here by road.
2851. Between Wilcannia and Bourke I understand that from as far up the river as Kallara station they send their wool to Adelaide? From Kallara down they send it to Adelaide and Victoria.
2852. Do you think that if the railway rates were on the basis we have previously spoken of, the Cobar-Wilcannia railway would intercept the wool from Kallara downwards? It would go by rail.
2853. Do you think that your own people would send their wool by rail? I cannot say. Their interests are all in South Australia, but I think that they would send the bulk of their wool by the Cobar-Wilcannia railway, and they must send all of their wool by this railway in a bad season.

2854. I suppose that if the Cobar-Wilcannia railway freight panned out the cheaper, after allowing for all charges, your people would be influenced by business considerations, as other people generally are, and would probably take advantage of the railway? I think they would send their wool by rail. It is a matter of pounds, shillings, and pence. A. Munro.  
10 Oct., 1899.
2855. Is any portion of this district suitable for fattening stock in good seasons? Yes; the whole of this district is suitable for fattening stock if we can only get the rains.
2856. Assuming you have good seasons, you would have a fair chance of fattening stock? Yes.
2857. Is the area of country that is suitable for fattening stock large? Yes; nearly the whole of the district.
2858. And I suppose that in good seasons you have a large quantity of surplus fat stock? Yes.
2859. If the people at Bourke are able to send fat stock to Sydney in a good season, do you think that you would take advantage of the Cobar-Wilcannia railway for the same purpose? I think so, if the charges were somewhat equal.
2860. Assuming the charges to be nearly the same as they are now at Bourke, do you think that you would take advantage of the Cobar-Wilcannia railway in order to get rid of your surplus fat stock in decent seasons? Certainly. That would be the only means of getting rid of them.
2861. Assuming that you have no railway, and that you have a fair season, what then are you able to do with your fat stock, if anything? Either send them to Adelaide, or sell them on the station. Buyers come round and buy.
2862. Where do the buyers usually take them to? South Australia.
2863. But I should imagine that by the time they had travelled so great a distance by the stock route they would not be in as good a condition as they were in when they left the station? No; and the stock tax on stock going into South Australia is against them.
2864. But, of course, we have to assume for the time-being that that stock tax is non-existent, for the sure approach of Federation will do away with it? Yes.
2865. Do you think that pastoralists in a fair season would send their fat stock by the Cobar-Wilcannia railway, or would they do as they have done in the past—send them by road to Victoria or South Australia? A good deal would depend on the markets—on the prices in Sydney and Adelaide.
2866. But assuming the markets to be similar, as they would be to some extent under Federation? Then I think they would send them by rail.
2867. The evidence that we have had in other inquiries has been that road travelling cannot possibly compete against railway carriage for fat stock? Certainly it could not compete against the railway.
2868. So that this railway, if constructed, would, it would seem, give an opportunity to pastoralists to get rid of fat stock, which opportunity at present they do not possess? Yes.
2869. And you say that the quantity of fat stock available in a fair season would be very considerable? Yes.
2870. During our trip through the district we have been informed that sometimes fat stock have been sold here as low as 1s. or 1s. 6d. per head? Yes; they have, off the shears.
2871. Simply to get rid of them? Yes.
2872. The Cobar-Wilcannia railway ought to have a little influence on the prices in that connection? Yes. Aged ewes in fairly good condition, and in the wool, have been sold as low as 2s. 9d. per head.
2873. There is another aspect of this question;—do you think that the advantage of railway communication to pastoralists of the district generally, in relation to an outlet for wool and fat-stock, would be such as to justify their paying any increase in rent, allowing other conditions to be equal? I think the rents are quite high enough at present—during the last four or five years.
2874. But, under your leasehold tenure, you have periodical reappraisements by the landlord? Yes.
2875. What I wished to get at was this: whether we could fairly expect a small increase in rental of the Crown lands, to recoup the State for the very large apparent loss which is estimated to result from the construction of this railway; I say “apparent” loss, of course;—do you think there might be any prospect of that? I do not think there would be any loss on the railway.
2876. Do you reckon it is worth one-sixteenth of a ld. per acre per annum to have a railway? I do not think so.
2877. But if you, in one season out of three, were to get double the price for your surplus fat sheep, that would be worth something to you? Yes.
2878. Well, a man should be prepared, I imagine, to pay a little extra for that privilege? But, if there is an increased rental, it is put on for a term of seven years, or for a longer period, and that would cover both the good and the bad seasons. We could afford to pay an increased rental in a good season, but not in a bad one.
2879. What is the area of Mount Murchison, portion of Momba? At present about 400,000 acres—that is, leasehold and resumed.
2880. You do not pay a great deal on the resumed area, because you have not a secure tenure of that, have you? No; £1 6s. 8d. for 640 acres, I think.
2881. Have you an idea of what the leasehold area on Mount Murchison amounts to? I cannot say that exactly, but the leasehold area of Momba holding is between 900,000 and 1,000,000 acres.
2882. Leaving it at 400,000 acres as pertaining to Mount Murchison, what number of surplus fat sheep might you expect from that in a fair season? From 12,000 to 15,000.
2883. What price would you get for those in a fair season, under present conditions—that is, without a railway or other means of getting them to market—what price would you expect for them, off the shears? You could not sell them. You could hardly give them away. Buyers could not get them away. You could hardly do anything with them.
2884. Assuming that you could follow the example of the Bourke people, and send those 12,000 or 15,000 fat sheep to Sydney on the railway trucks, that would leave you considerably ahead, as compared with your present position? Yes.
2885. One-sixteenth of a penny per acre per annum in rental would amount, for your 400,000 acres, to £108? Yes.
2886. Do you think that would be too much to pay for the benefit of getting rid of your surplus fat stock, and also the benefit of getting your wool away when the river was down? No; I do not think it would be too much.
2887. *Mr. Shepherd.*] The estimated cost of this railway is, in round numbers, £500,000, and about one-fifth of that would be spent on the last 10 miles of the line;—do you think that it would cause very great

- A. Munro. great inconvenience if the railway were to stop short at that point, in order to save that one-fifth? Yes; I think it would cause very great inconvenience.
- 10 Oct., 1899. 2888. Do you think that the people, who would be influenced by the railway, would be glad to accept the railway stopping at that point, rather than have no railway at all? Yes; but the stopping short of the railway (say) 9 miles from Wilcannia would add considerably to the cost of sending goods and stock to Sydney.
2889. Can you form any idea what the cost would be of carrying goods those 9 or 10 miles by road? From 8s. to 10s. per ton; certainly not less than 8s.
2890. It is possible that Parliament might be induced to construct the railway to that point only, instead of the whole way to Wilcannia, with the view of saving nearly £100,000;—do you think that it would be desirable to give up the project altogether, in preference to constructing the railway to that point only? No; I do not think so. It would be better to have the railway to that particular point, than to have no railway at all.
2891. Perhaps the most expensive item in the lot is the cost of the bridge over the river;—do you think that any great inconvenience would be caused by the railway stopping short on the other side of the river, instead of coming right across? It would not cause great inconvenience.
2892. That, of course, would be far preferable to the railway stopping short 9 or 10 miles away? Yes.
2893. Because goods could be easily taken over the present road-bridge to or from the railway? Yes, at about one-fourth of what it would cost to bring goods from, or take them to, the 9-mile point.
2894. Stopping the railway short on the other side of the river, just a little over half a mile away, would effect a saving of £33,000 on the capital cost, or £3,465 on the annual cost; so, in presenting the Committee's report to Parliament, in the event of its being favourable, these alternative propositions could be pointed out, and, of course, if the people here were favourable to the railway stopping short of Wilcannia, as suggested, that, of course, would be an incentive to Parliament to adopt the recommendation;—do you think that, whilst it might be more advantageous to the people of Wilcannia if the railway were to come right into the town as proposed, according to the plans, it would still be of very great advantage to the district, even if the railway were to stop short at the half-mile distance, or even at the 9 or 10 miles distance? Yes; especially if it were to come to the nearer point.
2895. Assuming the terminus of the railway—with a railway station—to be on the sand-bank, half a mile from the south-eastern bank of the river, would it not be practicable to catch the river traffic by running a light tram-line the other half mile, just sufficient to carry a light engine and trucks? Yes, certainly, that would suit all right.
2896. The running of a light tramway down to the river-bank from the railway-station to catch the river traffic could be done very cheaply, and even if the tram-line were covered in times of flood it would not be injured much? Yes; there would be very little difference between landing goods on a railway of that description and landing them on an expensive wharf.
2897. The trucks might be run on that light tram-line right down to the water's edge, and loaded there directly from the steamers' hold? Yes.
2898. *Vice-Chairman.*] Do you think that, with the advantages for the disposal of surplus fat stock by sale in Sydney, or by freezing, the building of the proposed railway would practically mean an addition to the carrying capacity of the runs within the influence of the railway? Yes.
2899. Do you think that the construction of this railway would render small holdings a more profitable investment than they are now? I think so.

Mark James Curry Tully, Inspector of Stock, Wilcannia, sworn, and examined:—

- M. J. C. Tully. 2900. *Mr. Shepherd.*] You are aware of the proposal to construct a railway from Cobar to Wilcannia at a cost of £497,000? Yes.
- 10 Oct., 1899. 2901. What effect do you think that would have on the district, so far as the advantages to be derived from it by squatters and others are concerned? I think that the railway would be of immense advantage on account of the certainty of having communication with Sydney. That alone would be a very great item in the advantage: the certainty of daily communication, whereas now even by coach we are not sure when we will get there.
2902. What is the longest period, of which you are aware, that goods have been delayed in being brought to Wilcannia from distant parts, to furnish the business people in the town, and the squatters and others, with supplies? I have known goods to be started from Adelaide or Melbourne and placed on board the steamers, and the steamers to be delayed twelve months, and the goods, therefore, also delayed for that period.
2903. Of course, all that inconvenience would be obviated by the construction of the proposed railway? Yes, entirely.
2904. Do you think that the railway would be of great advantage to stock-owners in removing their stock in the event of a bad season? I think it would be of incalculable benefit to them, because I may safely say that at least 2,000,000 sheep have died through the drought in this district during the last five years, that is to say, the greater portion of them might have been saved if they could have been sent away by railway, and that would have meant the addition of the value of nearly 2,000,000 sheep to the Colony's assets.
2905. Do you think that great inconvenience would be caused by the railway stopping short (say) 9 or 10 miles from Wilcannia, in order to save a very large expenditure; the cost of the last 9 or 10 miles being about one-fifth of the whole expenditure on the construction of the railway from Cobar to Wilcannia? I understand that, and I think that, inasmuch as so much of the expense of despatching goods is on account of the handling, the stopping short of the railway 9 or 10 miles from Wilcannia would mean the addition of so much a ton on every ton of goods carried by the railway, and, unless the completion of the line to the river would involve an expenditure that would be considered really too high, I think that the line should be completed to the river.
2906. So you do not think it desirable for the line to stop short as suggested? I do not think so. My own opinion is that the line should be brought to the river.
2907. Of that very large expenditure, the cost of a bridge across the river is a very large item;—do you think that it would cause inconvenience if the railway were to stop short half a mile on the other side of the river? No. In my opinion it would be much more advisable for the railway to stop short there than

than to spend the money that would be required for the construction of a bridge, because £30,000 or £40,000 would probably be required for the erection of a bridge.

2908. The present road-bridge would be available for taking goods across, and you think that that would be quite sufficient? Yes. One other advantage in bringing the railway to the river is that, in the event of the railway being begun at both ends simultaneously, those who were constructing the line, by beginning at this end near the river, could get sleepers and rails delivered by water, and there would be some compensation in that for the expense of the Talyawalka work.

2909. Are there any other advantages you can think of in connection with the construction of this railway? The river would be of no use to us in the conveyance of mails or passengers. The river would supply us only with what would be termed "heavy goods." Light goods, such as drapery, would, excepting in a few cases, come directly from Sydney by coach, because they could be got so much more quickly that way. A great advantage of the railway, as against the river as it is now, would be that no large stocks would have to be kept by the trades-people here. Half the capital would be sufficient to carry on trade, and, consequently, a number of smaller tradesmen would be able to make a living, whereas now it requires something like a limited company to begin business here at all.

2910. I suppose that having to hold large stocks is a matter of very great consideration? It is a matter of very great consideration. It is, in fact, the great consideration, so far as the river is concerned, because of the immense storage room that business people have to provide themselves with, and the thousands of tons they have to store at once. I am satisfied that there are more than six months' supplies for Wilcannia and district stored in Wilcannia now. That has all to be provided just as if we were being besieged by an enemy.

2911. I gather from your evidence that you are of opinion that the construction of a railway from Cobar to Wilcannia would be of much greater advantage than the locking of the river Darling? I am strongly of that opinion.

2912. *Vice-Chairman.*] Have you a return showing the number of fat sheep sent away from the sheep district of Wilcannia during a period of years? I have. It is as follows:—Five years, 1886–90, 660,000—average, 132,000. Five years, 1891–95, 550,000—average, 110,000. Three years, 1896–98, 146,000—average, 48,600. Grand totals: for thirteen years, 1,356,000—average, 104,000 per annum.

2913. Can you give an approximate estimate of the area of country that would be served by the Cobar–Wilcannia railway? In thinking over the matter, I have made a distinction. I have considered so many acres that would be absolutely served by the railway, and so many more that would be presumably influenced by the railway. I reckon that from 30,000,000 to 35,000,000 acres would be served by the railway, and that 10,000,000 acres further out would be influenced by it—that, from those 10,000,000 acres also, the people would bring their goods to the railway.

2914. Is there any other information that you can give for the guidance of the Committee. There is the question of the railway being made use of by stock-owners for the purpose of getting away starving stock. I know that is not taken into consideration generally as a reason for the construction of a railway; but I think it ought to be, because it would result in such a saving in stock to the district, that it would mean something worth having, even if they had to be carried on the railway at a loss. Besides that, the district now, for instance, if a good season should come, would need to purchase at least 200,000 sheep. If those 200,000 sheep could have been saved, it would have been worth 7s. a head to save them—it would have paid the owners to give 7s. per sheep in order to have them now, because they are not procurable. Another point is that I think the railway would be largely taken advantage of for the purpose of getting rid of fat stock, inasmuch as by no other way can the pastoralists get rid of them. Frequently they can get 1,000 sheep fat, and only that 1,000; but they say, "It will not pay me to send them to Adelaide; it will cost as much to travel that 1,000 as it would cost if I were to send 4,000." That 1,000 sheep could be sent by rail to Sydney, and turned into money. It would pay to send them that way, but not to travel them over-land. In numberless instances, there would be small lots of sheep sent away by rail which are now allowed to get into poor condition, and perhaps to die.

Edward Quin, owner of Tarella station, sworn, and examined:—

2915. *Mr. Watson.*] How far is Tarella from Wilcannia? Forty-six miles north-west.

2916. At one time you were a Member of the Legislative Assembly? Yes; in three Parliaments.

2917. Have you had a long experience in this district? Yes. I have had over forty years' experience north of the Murray—over thirty years in this immediate district. I have lived on my present property for twenty-eight years.

2918. You know the proposal to construct a railway from Cobar to Wilcannia? Yes.

2919. Will you tell the Committee what, in your opinion, would be the effect of the construction of that line upon the prospects of the district? Yes. I think that the effect of the railway upon the prospects of the district would be very favourable. I do not go so far as to say that the line would pay very well; but I think that the presence of the railway would be very favourable to the district. I think it would enable a great deal of this country to remain in occupation, which perhaps would go out of occupation, and, which, I think, is very likely to go out of occupation, under present conditions, by enabling pastoralists to send stock down to more favourable districts, if the railway rates were favourable, and perhaps bring them back again, instead of their dying as they do now. If we had had a railway here large numbers of stock could have been removed to more favourable districts, and I think that in that respect this district would benefit very considerably by having the proposed railway.

2920. To where do you send your wool at the present time? Chiefly to one of the South Australian ports, by road and steamer.

2921. Assuming that the charge for conveying wool by rail from Wilcannia to Sydney were to approximate to the rate now charged from Bourke to Sydney on greasy wool, namely a minimum of £2 12s. 6d., do you think it would pay you, taking into account all charges, to send your wool by this railway at that rate, rather than by steamer? Yes, I think it would pay me, if the rate were as low as that. I have worked it out very closely as between my station and Adelaide by road and rail *via* Broken Hill, and by road and river, and I find that it is about 16s. 6d. or 17s. in favour of the road and rail in insurance alone—that is, we save that in insurance in sending the wool by road and rail. The great cost is the river insurance.

M. J. C.  
Tully.

10 Oct., 1899.

E. Quin.

10 Oct., 1899.

- E. Quin. 2922. The insurance to London itself would be 16s. cheaper if you did not touch the river than if you went that way? In my case it cost 30s. by road and river to London, and 14s. by road and rail to London, so it is 16s. in favour of road and rail to London, which is a great saving.
- 10 Oct., 1899. 2923. So the proposed railway would have that advantage in competition against the river, to make up for any advantage which the river might have in cheaper freights, *per se*? Yes. Then, to go into a close calculation, it would have this advantage: I will quote an instance that occurred the other day. Some of my wool, shipped only three or four days ago, had been lying at Wilcannia about twenty-three days. If we had had a railway here that wool could have been put on trucks and taken to Sydney at once. Sometimes the period of detention is longer than that, and the saving of interest would be very much in favour of the railway. I have had two clips lying at Wilcannia together—every bale that I had shorn at Tarella at those shearings—and the saving of interest and insurance, spread over a number of years, would be considerable.
2924. It is occasionally important, I suppose, that you should get your wool to the shipping port at a certain time, in order to catch certain sales? Yes; though my experience has cut two ways—I have sometimes found it of advantage to be late, and at other times of advantage to be early. I do not think there is really any great advantage in that matter.
2925. But would you not have a better opportunity of catching a market if you could get expeditious carriage? Of course. If you so wish you can hold your produce, but, in this case, you have to hold it. When it may be advantageous for you to have it in the market you cannot get it there. In the other case you exercise your judgment.
2926. At present it is a matter of luck whether you get a good or a bad market, whereas with rapid transit you would have a greater certainty of being able to catch a good market if you should wish to do so? Yes.
2927. Do you think that this railway would be availed of in good seasons for the carriage of fat stock? I think so. It is very rarely that the large gap of country between here and the present railway is in a fit condition to send fat stock over it; but with a railway at Wilcannia you could send as few or as many as you might like, so long as you sent full trucks; and then you would save money which is now being lost to yourself and the district.
2928. But in any case travelling fat stock a long distance by road deteriorates their quality from a butcher's point of view, does it not? It does; but if there is plenty of grass, and they are carefully driven, not very much. Of course, a railway journey also deteriorates stock.
2929. But does it often occur that, whilst having fat stock fit for market on your station, you would have a continuous stretch of good feed along the stock routes towards the railway or market? No; that has not been our experience here. It is very rare, as I have said, that the routes are in such a condition.
2930. So, practically, at the present time if you have a good season you have no outlet for fat stock? No. If you were to sell them to-morrow, no one could take them away.
2931. Speaking broadly, is this district a good fattening one in fair seasons? Very good in good seasons. The grass that does grow is very nutritious.
2932. Of course, the proposed railway need fear no competition from the river in regard to the transit of fat stock? No, none.
2933. Do you think that there are any prospects of the proposed railway securing fat cattle for transit to the market? Yes, a few. At present the policy of station-owners is not to grow many cattle. They are uncertain as to their income from them. But I think that this railway, in enabling them to get rid of a few fat cattle, would cause them to go in a little more for them than they are doing now.
2934. And, consequently, the railway receipts would be swelled to some extent by that? Yes; not largely. What produces large railway revenue is chiefly sheep, wool, stores, and the necessary wire to enclose the paddocks and make them smaller.
2935. In regard to station supplies, such as wire, stores, and so on, do you think that this railway would have a fair chance of securing that traffic, or a large proportion of it? I think that in some cases it would; but the men engaged in the pastoral business here are very keen, far-seeing men, and if they could effect a saving by using the river, they would. This country can be made to pay only by very careful and closest management, and if they could save £1, they would do it; but, against that, if the needs of the people were small, they would not wait for large parcels. If a man wanted 2, 3, 4, or 5 tons of wire, he would not like to risk waiting for the river for the sake of saving £1. Therefore, I think that men wanting small quantities would not bother about waiting for the river. Goods that deteriorate, such as flour, currants, raisins, and things of that kind, I think, would all come by rail, and all those things are consumed very largely in this district.
2936. Assuming that through rates were charged upon the Cobar-Wilcannia railway, the freight on produce, which would include flour, would be 10s. 6d. per ton from Dubbo to Wilcannia;—do you think that the river steamers would have any chance of competing against the railway, if the railway freights were at that rate? Not the slightest.
2937. Consequently your supplies of fodder and produce, if brought from outside at all, would probably come by rail? Yes; I think so.
2938. Do you think it would be of any advantage to the pastoralists here, in bad seasons, to get fodder more cheaply than they can get it at the present time? Of the greatest advantage.
2939. Do you think there is any chance of this railway competing against the river in respect to the heavier lines of goods? I think so, under the same conditions as are observed in Bourke.
2940. That is, you think so, if arrangements were made by the local merchants to get quantities up at a time? Yes. Large quantities of heavy goods could be brought at the convenience of the Railway Commissioners, probably at a reduced rate. In that way they would be able to utilise their full working powers without wasting any.
2941. We have been informed that there are important mineral deposits to the north and west of Wilcannia, which might be expected later on to carry a fairly large population in addition to what is, at the present time, engaged in connection with them? I would not go so far as to say "important mineral deposits"; but there are all over the district large surface shows of mineral. I do not think deposits have ever been discovered in any large quantity. They could not be, unless the men were to sink under the surface; but there are very considerable shows.
2942. Sufficient to justify prospecting? Yes; prospecting largely. I was interested in one. We sent 10 tons of copper ore to London some years ago, and netted £30 a ton, but at that time the price was very high—I think £90—much higher than it is now.
- 2943.

2943. Did you not continue that? No; we did not find a sufficiently large lot to justify us in going on, with our limited means. We spent a few thousand pounds, but did not feel justified in going on. I refer to these only as "shows," because I do not know what they might lead to. There are indications of the presence of minerals, more or less, all over the district. There are indications at Caulker's Well—20 miles from here—and many other places.

E. Quin.  
10 Oct., 1899.

2944. If, later on, present expectations of mineral development prove to be justifiable, do you think that this railway would be benefited by the opening up of those lodes? The trend of that country is towards South Australia, and possibly the steamers might benefit more than the railway, unless coal were found nearer this way; and then, as it would take 1 ton of ore to 5 tons of coal, it might pay to take the 1 ton of ore to the coal by means of this railway.

2945. But, seeing that copper ore requires coal or coke treatment, is there any place to which the ore could be taken which is nearer than Lithgow would be if connected by rail with Wilcannia? No, not by land. They might take the ore more cheaply *via* Adelaide, and then round to the coastal coal towns.

2946. In the latter case, the land carriage, without taking into account the sea carriage and consequent handling, would be quite as much as would be involved in taking the ore to Lithgow? It is a moot point as to which way the ore would go, but if the coal that has been discovered at Dubbo were available in large quantities that would alter the case considerably in favour of this railway.

2947. The supplies that have been received and distributed at Wilcannia during the last year or so, in regard to which we have been given statistics, would, I should imagine, be considerably under the normal quantity usually consumed? I should say they would be under the normal quantity.

2948. There have been great losses in the pastoral industry in this district lately? Yes.

2949. What do you think are the prospects of the pastoral industry in this district? At present, bad; they could not be worse so far as I can see; but I think that, if confidence could be restored by legislation giving a greater security of tenure with something like certainty in the amount of rental to be paid, it would lead to the investment of capital which would maintain present improvements and still further improve the country. Unless something of this character be done, I think large areas must be thrown up, but, with the alteration of conditions I have mentioned, I have no doubt about the pastoralists of this district being able to pull through and retain their holdings. With a lengthened tenure over the whole of the holding, greater employment would be given in the making and maintenance of improvements, and consequently a large quantity of stock could be carried, ensuring the employment of more labour, and consequently more stores to be brought by the railway, and more wool to be sent away by it.

2950. *Vice-Chairman.*] Does it pay pastoralists in this district at present to send small lots of fat sheep to Adelaide? No.

2951. If the proposed railway were constructed, do you think that there would frequently be small consignments of sheep—I mean small as compared to what you send to Adelaide now—trucked at the railway station at Wilcannia? I think so. Runs would be eased off as the drought was approaching.

2952. Do you think that such a condition prevailing—in case the proposed railway were constructed—would lead to greater opportunities for the consignment of heavy goods to Wilcannia by train, which otherwise might be carried on the river? Yes; I certainly think so. There is always the element of the great saving of insurance, which is a serious amount.

2953. In that way this railway would prove a successful rival of the river? Yes.

2954. With present conditions—no railway, insecurity of tenure, and inconsistent appraisements—it is difficult for pastoralists to pay the present rents on their holdings and work them at a profit? Yes.

2955. But with a railway, and with improved conditions as suggested, would an addition of one-sixteenth of a penny per acre per annum be a fair one to impose in return for the advantages of the railway? I think so.\*

2956. Mr. Harper, in his evidence, states that of all the wool now sent from Wilcannia by the river hardly any would be sent by rail if the proposed railway from Cobar to Wilcannia were constructed;—do you agree with his opinion? It would depend on the relative cost. As I have said, if this railway could carry wool at the rates Mr. Watson stated just now, I think that, with the lessened cost of insurance, the railway would be a severe competitor against the river, and as you could send one, two, three, or four trucks by the rail, I think they would be sent. Mind you, if conditions were favourable to the river—such as a full river, with boats here—I think the river would be a severe competitor against the railway.

Bertram George Millard, Road Superintendent, Wilcannia, sworn, and examined:—

2957. *Vice-Chairman.*] Is road construction in this district costly? Yes; above the average, for what it could be done in other districts.

2958. Is it possible to spend money here on road construction to advantage? In some places it is possible to spend it to a very great advantage, but in other places it is not.

2959. Do you think it is practicable to construct an ordinary road from Cobar to Wilcannia? It would be very costly, judging from what I have seen of the country. Of course, my district does not go out very far on that side.

2960. But you know the country? Very slightly.

2961. Well, from your knowledge of the country, taking into consideration the cost of constructing a road and also the yearly cost of maintenance, together with the fact that it gives no return of revenue, do you think it would be better, in the interests of the country, to lay down a railway from this town to Cobar? Decidedly I do, because the cost of constructing the road would amount, I should think, to at least £1,300 per mile, because of the difficulty of getting metal.

2962. How much does your road expenditure on the Cobar side of the district amount to per mile? I have a distance of 50 miles towards Cobar, and I am allowed £30 per annum for that.

2963. When the river is down, goods are frequently brought from Broken Hill to White Cliffs? Yes; in very great quantity.

2964. Is that road a good one for such traffic? It is a fair road; in some places it is bad.

2965. Is it a formed road? No; nothing of that sort—only a bush track.

Thomas

B. G.  
Millard.  
10 Oct., 1899.

\* NOTE (on revision):—I think I said that if the rental were fixed for the full period of a lease on the whole of a holding, or if an appraisal took place, it should be on the same lines as in South Australia, and not in the haphazard way as is now the case; and that rents would have to be considerably reduced. If this were done I do not think a small additional sum would be objected to. As the holdings are now held they could not pay any more.

Thomas Henry Bell, journalist and licensed and mining surveyor, Wilcannia, sworn, and examined :—

T. H. Bell. 2966. *Mr. Shepherd.*] You are the editor and proprietor of the *Western Grazier*, Wilcannia, and a licensed and a mining surveyor? Yes.

10 Oct., 1899. 2967. How long have you been here? Fourteen years.

2968. Have you thoroughly studied this railway question? Yes.

2969. Will you make a statement as to your opinion of the benefits likely to accrue to this district from the construction of this railway, and give us your opinion generally as to the advisableness of constructing it? I was a member of the Cobar-Wilcannia railway league, which prepared the following statement.

[*Vide Appendix.*] With reference to the estimate therein given of the freight on wool, I now find that the freight from Bourke to Sydney is as low as £2 12s. 6d. per ton, as against our estimate of £4 13s. 4d., which we understood was likely to be the freight from Wilcannia. On the estimate of £2 12s. 6d. from Bourke, wool could be conveyed by rail from Wilcannia at a cheaper rate than it could be conveyed by river. As a consequence, all the wool coming into Wilcannia will be taken by rail. This estimate will reduce the estimated revenue, but will increase the probable traffic.

2970. The storekeepers and the squatters in this district now are very much inconvenienced very often on account of the river not being navigable? Yes.

2971. And the storekeepers in consequence of this have to lay in very heavy stocks quite beyond immediate necessities? Yes; and it has ruined several of them.

2972. This railway, I presume, if it were constructed, would obviate that necessity? Exactly. They would keep lighter stocks, and turn over their stock as the purchases came in.

2973. Do you think that this railway, if it were constructed, would draw any of the traffic that now goes to South Australia or to Victoria? Yes, I am sure it would.

2974. Even though an additional charge were made? I think so, for this reason: Originally, before Broken Hill existed, the traffic used to come down the Paroo and along the Mount Browne road, which is a fairly well-watered track, and people would go along that still if they had a chance.

2975. Are you aware of the estimated cost of this railway? Yes; £497,000.

2976. Do you think it is likely that the traffic on this railway would recoup the Government for the expenditure on this line? I am certain it would at least pay expenses; but, in any case, if it did not pay directly, it would pay indirectly, by the greater development of the district and the increasing of the value of the Crown lands. Nearly all the lands in this district are Crown lands, and, if there were greater facilities for the sending away of produce and for the obtaining of supplies—which would be cheapened in consequence—people would have more opportunities for settling in the district and developing it. At present we are altogether cut off.

2977. Do you think that the construction of this railway would induce additional settlement in the way of smaller people taking up areas of 10,000 acres, or something of that kind? I am afraid not. I am afraid the climate is against that; but the construction of this railway would result in a very much larger settlement in mining communities. This district is very rich indeed in minerals from here to Mount Browne; in fact, it is also mineral-bearing country from here to Cobar, but that has not been prospected; but, taking the country from here to Mount Browne, there are several areas that are highly mineralised and give very good returns—returns that in any other district would afford a living to a large mining population, but, owing to the want of facilities for getting machinery and goods, people cannot work these properties, and they have been abandoned. They are not there to be discovered, but their existence has really been proved.

2978. And you think that the construction of this railway would induce a much larger population to drift towards the mining districts here? Yes, I feel confident of it. If the railway had been here some years ago there would have been a much larger population about Mount Browne at the present time, and the copper-fields that are now being reopened would probably have been worked long ago. Extending north-westerly, from Wilcannia to Tibooburra, there is a belt of mineralised country which is capable of very great development, and able to carry a large population, owing to its mining resources. If railway facilities were afforded, there is little doubt that this country would be opened up. The opal-fields, 60 miles from Wilcannia, are within this belt, and there is a settlement there of about 1,600 people, I think. The Wertigo copper-field is situated about 70 miles north-west from Wilcannia. Assays from the mines there have been obtained, and have given very good returns. I have personally inspected those mines; I took specimens from the lodes, and sent them down to the School of Mines, Sydney, for assay, and they gave the following returns:—Copper, 9 to 44 per cent.; lead, 16 to 54 per cent.; silver, 1 oz. to 139 oz. per ton; gold, a trace—under 2 dwt. in each case.

2979. Have you any idea of the width of this belt of country? It is, I daresay, from 20 to 25 miles wide. The Wertigo lode, to which I have referred, is now under offer to a New Zealand mining company, and if they purchase they intend to proceed with operations at once, and, in the event of a railway being made from Cobar to Wilcannia, it is not unlikely that they will put in a tramline to the river themselves. Should they proceed with these mining operations a very large settlement will take place. In the event of their doing so it is probable that they will obtain their coal or coke from Lithgow. In addition to the copper-fields, in the belt of country to which I first referred gold has been got in very large quantities. The Mount Browne gold-field is included in the area referred to, and also the Tibooburra. The Mount Browne and the Tibooburra gold-fields would probably be worked to a far greater extent if railway facilities were afforded. Gold has been got within 30 miles of Wilcannia at a place called Caulker's Well, which has gone up to over 1 oz. per ton. I may add that I am confident that in the future there will be a very large population on that area. It is very rich; according to those assays it will be a second Broken Hill.

2980. This area includes the opal-fields? Yes. It is a mineralised belt. It is not all copper, and it is not all gold—it varies as it proceeds. Even the copper will turn to silver as you go along the field.

2981. Has the opal-field proved itself sufficient to justify you in saying that it is likely to be a permanent field? Yes, I think so, for this reason: Although the surface may gradually get worked out, they have not ascertained up to the present how deep the opal can be found. It is found at all depths. They have never put down a really deep shaft to try it; but the depths they have gone they have found opal—that is, 60 to 80 feet down. That opal country extends a very great distance, but the opal found on the surface is not so valuable as that which they can get at White Cliffs, and, therefore, it has not been followed up; but there is no doubt that with prospecting it is quite within the bounds of possibility that another opal-field may be discovered. Opal is a thing that varies in quality as it proceeds. For instance, you might get

T. H. Bell.  
10 Oct., 1899.

get a good seam of opal and follow it along, and it might turn into indifferent opal, and, perhaps, a little further along you would come to good opal again. The deposit appears to be of the same character throughout the district.

2982. The demand for opal fluctuates to some extent, does it not;—there is no regular steady demand for it such as there is for gold, for instance? No, there is not; there is no standard value. In a manner, of course, the value is fixed by the buyers, and when the buyers are limited they, more or less, fix their own value, but, at the same time, they give very good and payable prices.

2983. Have you been to the opal-fields recently? Within the last six months.

2984. Do the men at work there seem to be fairly sanguine as to their prospects? Yes, so far as I know. I have not spoken to many of them, but that is the general impression.

2985. And the population seems fixed—not a fluctuating population? No; the only fluctuation that has occurred has been for want of water. There has not been a sufficient water supply there, and last summer a great many people left, and others will have to do the same unless the big tank that is being put down now is filled. It is not for want of getting opal that they have ever left.

2986. I believe that a drawback of the opal country is the difficulty of procuring goods there—stores and that kind of thing? Yes.

2987. When the river is not navigable they are obliged to get goods from Broken Hill at a largely increased freight? That is so.

2988. Are you aware of the extent of the opal-field, as proved at present? I think I can give an estimate of it. I should say that immediately at White Cliffs—not including the Bunker—it is about 5 miles long and 2 miles wide; but there is a separate field known as the Bunker, and some time ago there were seventy men employed there. I do not know how many are there now.

2989. The actually proved field is about 5 miles by 2? It is, according to my memory of it; but I think it is really more than that.

2990. And, if the proposed railway from Cobar to Wilcannia were constructed, the whole of the supplies for this mineral belt of which you have spoken would be got from Wilcannia, I suppose, in preference to Broken Hill? Yes, I think so.

2991. And, of course, if these fields are likely to be worked to any great extent the population will be very largely increased? Yes. There might be a second Broken Hill there.

2992. And, therefore, the traffic by this railway would be much increased? Yes; and the chances are that this railway would be eventually extended there. That is nearly a certainty.

2993. Can you think of anything else in connection with this project which you think the Committee ought to know? Yes; in connection with the goods returned in our estimate, the estimate has been formed on what has actually passed through Wilcannia; but, in addition to that, a great deal has come from Broken Hill to White Cliffs, of which we have no record. I should also like to point out that the land revenue derivable from the area affected by this railway would, in five years time, pay the actual cost—that is, taking it at 40,000,000 acres, at 3 farthings per acre. That makes £125,000 a year; and, therefore, in five years that revenue would clear the capital cost of this railway, and give £100,000 over that.

2994. Are you aware what is the value of the opals that have been obtained? I know that an estimate has been given by the wardens who have been at White Cliffs, and the highest estimate they have given is £100,000 per annum. Last year it was given as £80,000, but there are very many reasons why the actual output of opal should not be stated by the buyers, and it is very difficult to get a true return. From what I have heard, I think that fully £130,000 worth of opal is purchased there every year.

2995. For how many years do you suppose that that has been going on? The heavy purchases I do not think have been going on for more than four years. Before that the purchases amounted to, perhaps, £10,000, £20,000, and £50,000 per annum, but regular buyers have been there for over four years.

2996. I suppose that the difficulty in arriving at a correct estimate is because a great many opals leave the field by private hands, and no record is kept of them? That is one reason; another is, that there are only a few buyers there, and they naturally do not care to let the outside world know what a good business they are doing.

2997. *Mr. Watson.*] It has been suggested that, in view of the estimated loss in connection with the construction of this railway, the actual cost might be reduced by terminating the line on the high ground half a mile from the south-eastern bank of the river, thus saving the cost of viaducts and bridge necessary to get to the river and across it;—if that proposal were carried out would it seriously inconvenience the townspeople, as compared with the carrying out of the project as it is now planned? Of course, we would be very glad to get the railway even that far, and I do not know that its stopping short there would seriously inconvenience the townspeople. I daresay it would be wise to stop the line there, because by the time that would be done this district must either have gone ahead, or these mining fields must have been proved to be not so valuable or permanent as they are supposed to be, and if the district should go ahead the additional expenditure for crossing the river would then be justifiable.

2998. The matter of cartage from the terminal station to the stores, as laid down on the plans, would be about the same as from the high bank on the other side of the river, would it not? Yes. By using the existing road-bridge there would be practically no difference.

2999. *Vice-Chairman.*] It is a fact that some Queensland wool now comes for shipment at Wilcannia? Yes.

3000. Do you think that the construction of this railway will offer an additional inducement for that wool and other wool from Queensland to come to Wilcannia for transmission to Sydney? Yes, I am certain of it, because in that case there will be a certainty of getting the wool away. I may mention that one station, Woodburn, during the past season sent their wool to Wilcannia, and it remained here for some months. If they will send their wool to Wilcannia, when it may have to wait here that length of time, they are more likely to send it to Wilcannia when they can get it taken straight away, and save the river insurance, interest on the capital value of the wool, and interest on the wages paid for bringing the wool in.

3001. *Mr. Harper*, in his evidence, says he doubts whether a railway from Cobar to Wilcannia would catch any of the wool now sent from Wilcannia down the river, except when navigation were absolutely impossible;—what would you say in reply to *Mr. Harper* on that point? I should say that, if the wool were carried at the same rate from Wilcannia as it is carried from Bourke, not a single bale would go

T. H. Bell. down the river at any time, because at that rate the carriage by rail would actually be cheaper than by river, certain in transit, and better, from a business point of view, in every way. I am speaking of the wool particularly, but, with the ordinary carriage rate, other merchandise would also go by train, especially perishable goods, such as butter, eggs, potatoes, onions, or anything of that nature. Fodder is bound to come by rail on account of the cheap carriage. Even at £1 a ton from Dubbo it would come by the railway. As it is, with regard to fodder, when it is brought up the river people have to take what they can get, even at a high price—a robbing price really—and they have to take it whether it is good or not.

James Rowand Holding, post and telegraph master, Wilcannia, sworn, and examined :—

J. R. Holding. 3002. *Vice-Chairman.*] You have a statistical statement to make to the Committee? Yes; this is a comparison of the business done at the Wilcannia office in 1894, 1898, and the present year. It is principally taken from the Postmaster-General's Annual Report. In 1894 there were 137,450 letters posted, 12,750 telegrams sent, 292 postal-notes sold, 1,394 money-orders issued and 425 paid; 521 Savings Bank deposits made, and 205 Savings Bank withdrawals. The revenue was £2,696, and the expenditure in salaries, &c., £1,225 12s. 6d., leaving a profit of £1,470 7s. 6d. The parcels received, despatched, and delivered in the year, numbered 11,423, the approximate weight being 35 tons 12 cwt. In 1898 the postings of everything totalled 167,501—that is, letters, papers, and packets, but not including parcels. Parcels:—1,399; weight, 4,580 lb.; with a postage of £91 4s. 4d. The declared value of intercolonial and international parcels was £14,766 2s. We received from Victoria and South Australia ordinary letters, papers, and packets, and ditto registered, 47,184; parcels, 224; weight, 911 lb., with a postage of £26 11s. and of a declared value of £492 7s. 5d. The total number of parcels received, delivered, or sent on, including those posted locally, was 15,225, which, taken at an average weight of 7 lb., makes 106,575 lb., or about 47½ tons, with an approximate postage of £1,567. This large "parcel"-post business is the result of the difficulty and inconvenience in getting supplies by other channels. Our year dates from the 1st December to the last day of November. There are, therefore, yet two months of this year to run; but the number of letters and papers is compiled twice in each year—once in May and again in November—and then it is multiplied by ten to give the total number for the twelve months. The annual returns for 1899 are, of course, not yet due. There were posted at the local office during May, 1899, ordinary letters, papers, and packets, and registered ditto., 21,022; and we received from South Australia and Victoria 6,383 letters, papers, and packets. The number of parcels received, despatched, and delivered at Wilcannia from December, 1898, to 30th September, 1899, was 15,199; weight, 102,284 lb., or about 46 tons, with an approximate postage of £1,518. The value of parcels going outside the Colony posted at and despatched from Wilcannia, from 22nd December, 1898, to 14th December, 1899—that is, intercolonial and foreign parcels—was £54,386 18s. declared value. With regard to the mails in the district, the line that would be most affected by the proposed railway from Cobar to Wilcannia is our present Cobar mail contract, which originally ran once a week. Owing to the increase in the traffic, it had to be increased to twice a week, and with a further increase in the traffic it had to be increased to thrice a week. The contract price paid at present is £1,490 per annum, which is lowest price that we have paid yet for it. The mail business at the local office is twenty-eight mails, in and out, per week, with 169 exchanges with Sydney, Melbourne, Adelaide, Broken Hill, Cobar, Bourke, Louth, Tilpa, Wanaaring, Milparinka, Tibooburra, White Cliffs, Menindie, and Ivanhoe. Seven mail routes, extending to the east, south-east, north-east, north-north-east, north, west, and south-west, the aggregate mileage per week being 4,580 miles. The total number of bags handled per week is 354; that includes private bags.

John Walter Fletcher, Police Magistrate and Mining Warden, Wilcannia, sworn, and examined :—

J. W. Fletcher. 3003. *Mr. Watson.*] Your district embraces White Cliffs? Yes; my mining district goes a long way south of Menindie, but there are practically no mining operations there, and they are wholly centred in the White Cliffs District.

10 Oct., 1899. 3004. You have, I believe, some statistics relative to the transactions in regard to mining matters at White Cliffs? I have. The mining revenue at White Cliffs for 1897 was £234 11s. 5d.; for 1898, £352 18s.; for the first nine months of 1899, £557 7s. 2d. I may state that the population has increased in the eighteen months I have been here from about 800 to something between 2,000 and 2,500. The total revenue of the White Cliffs office—including mining revenue and Petty Sessions revenue—for 1897 was £407 6s. 7d.; for 1898, £537 9s. 4d.; for the first nine months of this year, £738 7s. 11d. There are seventeen leases, of 625 acres altogether, in force at White Cliffs. The number of miners' rights issued from 1st January to 30th September this year is 674, as against 283 for the whole of the year 1898. At Nuntherungie, there are twenty-four mineral leases in force, including 932 acres 3 roods and 11 perches.

3005. At White Cliffs the issuing of leases has been abolished lately by the Government? Yes; the tenure of land at White Cliffs is solely in 100 feet by 100 feet blocks.

3006. Because it was found that a smaller area was sufficient for an ordinary miner? Yes; it was done in the interests of the working miner.

3007. Do you care to offer an opinion as to whether there are prospects of permanent occupation, or anything approaching permanent occupation at White Cliffs? It would be too much to speak positively on that matter; but that there is enough opal to last a great number of years I feel positive.

3008. The leases to which you referred as being in force at Nuntherungie—are they of recent issue? They are of recent issue, but they are old abandoned leases almost entirely. They were held years ago, either for silver or for copper, but on account of the price of copper, and the difficulty of carriage, and other causes, they were abandoned, but subsequently they were taken up through the enterprise of Mr. Thierman, who now controls the copper-mining interest at Nuntherungie. There are a number of leases taken up at Fort Oway, which lies west of Nuntherungie.

3009. Do you consider the appearance of the mineral deposits at Nuntherungie encouraging? Yes, most encouraging surface indications; and as far as the sinking goes, about 100 feet. In two places, I am aware, from personal knowledge, that the indications are very good indeed.

3010. Would you care to express an opinion as to what bearing the construction of a railway from Cobar to Wilcannia would have on the development of that mining district generally? I feel sure that the only thing

thing which has retarded the introduction of capital into the Nuntherungie field, and similar work, which is absolutely necessary to carry it on, and without which it is practically valueless, is due to the want of easy communication.

3011. In regard to the opal-mining industry, the getting of cheaper and more certain supplies would be an advantage to White Cliffs and similar localities, I should imagine? Without doubt. They have been terribly handicapped during the last six months, through want of carriage and no river.

3012. They have had to get their goods from Broken Hill or Bourke, at very great expense? Yes; by camel-teams from Broken Hill or Bourke.

3013. Your opinion, then, speaking as a Government official outside of the ordinary influences of private interests, is that the construction of a railway from Cobar to Wilcannia would be of immense benefit to the district north and north-west from here? I feel quite certain that it would be a great boon to the district. I should like to add something about the output of opal. I may give a fair estimate of that, but, as you know, it is only an estimate. Last year I estimated the output of opal for White Cliffs at from £80,000 to £120,000. I did not wish to give an excessive estimate in so doing, and was very careful to keep it under the mark. I feel that this year, for the first nine months, the output will go very nearly to £150,000. I suppose you have heard that there is a temporary depression in the opal market, but that applies only to the inferior class of opal. However, as a large percentage of the miners on the field are dependent on that third-class opal, the depression will seriously affect the population of White Cliffs—only temporarily, I hope.

3014. We have been told that these periods of depression in the market are recurrent, and seem to disappear? No doubt. I have seen signs of depression before, and the field has recovered from it. I do not think that the opal-field, as it is now, should carry such a large population as flocked in there during the last winter, bringing the population up to about 2,500. I do not think the field will carry that population permanently, but it will carry 1,500 for a long time.

3015. *Mr. Shepherd.*] What do you base your estimate of 1,500 on—is that for want of water? A great deal of it has to do with the want of water—that is one factor in the matter; and the other is the uncertain character of the opal market. Third-class opal is now practically unsaleable, and I suppose that 50 per cent., at a very low estimate, is third-class opal; and what are the poorer people going to live upon. Then, it must be remembered, that all the money spent in White Cliffs is not opal money. In the present time of drought in this district people have been deprived of their ordinary occupations, shearing and pastoral, and have flocked into White Cliffs as being the only place where money was to be got. There was plenty of money there. Wilcannia, for instance, during the winter lost about one-third of its population; but I do not regard that as being permanent. The opal-field will, I think, carry comfortably and easily 1,500 people for a number of years.

3016. What you mean by that is that 1,500 people could raise all the opals that would find a market, and that anything beyond that would glut the market? Yes. There is no doubt that the market has been glutted with this poorer stuff.

WEDNESDAY, 11 OCTOBER, 1899.

[The Committee met at Petyuna out-station, Murtee holding, at 9 p.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. |

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

John Williamson, overseer, Petyuna out-station, Murtee holding, sworn, and examined:—

3017. *Vice-Chairman.*] How far is Petyuna from Wilcannia? Thirty-six miles. Petyuna is an out-station of Murtee holding.

3018. How long have you been in the district? About four years.

3019. Can you say whether this district suffers any considerable inconvenience from lack of railway communication? I think it does.

3020. In what way? There is a certain amount of uncertainty as regards the river traffic. At times there is considerable difficulty in getting fat-stock and wool to market.

3021. Which is your market for fat stock? Adelaide, chiefly.

3022. Do you think that railway communication would, in addition to offering certain and easy carriage for your wool, open up a market for fat-stock in Sydney? Yes, I think so.

3023. If the railway rates for the carriage of wool from Wilcannia to Sydney were similar to those from Bourke to Sydney, and also considering the uncertainty and frequent delay in river carriage, and the higher rate of insurance, do you think that the wool from this district would, as a general rule, be conveyed by railway to Sydney in preference to being sent by the river? I think it would be.

3024. Do you think it would be of advantage to pastoralists in this district were they to have a railway for the purpose of removing at frequent intervals small consignments of fat stock, which would not pay to send by road to the present market at Adelaide? Yes, I think so.

3025. Would that be of considerable advantage to the sheep-owners of this district? Yes.

3026. Do you think that the proposed railway would offer facilities for the carriage of starving stock to more favoured districts in times of drought, and thus afford the pastoralists of this district a means of insurance against the heavy losses which occur during times of drought? Yes.

3027. Presuming that the rates for the carriage of fodder from Dubbo would be at the present standard of about 10s. 6d. per ton, do you think that fodder would be conveyed to the pastoralists of this district by rail in preference to their obtaining it by means of river carriage from other colonies? Yes, I think so.

3028. Do you think that that would afford a large amount of revenue to the proposed railway if it were built? Yes, I think it would, for the whole district.

3029.

J. W.  
Fletcher.

10 Oct., 1899.

J.  
Williamson.

11 Oct., 1899.

- J. Williamson.  
11 Oct., 1899.
3029. Do you think that it would afford a means of saving stock which otherwise would inevitably perish? I think so.
3030. Would that in its turn lead to an increase in the general annual amount of wool raised in this district? Yes.
3031. That, of course, would bring additional revenue to the railway? Yes.
3032. Is flour a large item in station stores? Yes.
3033. At 10s. 6d. a ton, the rate before mentioned from Dubbo, do you think that river-carriage would have any chance of competing against the railway-carriage? I think not.
3034. What class of goods do you think might come on a full river in competition against the railway? Wire or netting that might be required, and a small amount of machinery, which is not an important item in pastoral pursuits.
3035. Do you think that, even with respect to that class of goods, the establishment of business relations with New South Wales firms during periods when the river was low would lead to a permanent use of the railway rather than the river? I think so.
3036. *Mr. Shepherd.*] Are you aware of the estimated cost of the proposed railway? No.
3037. Well, it is, practically, about £500,000, and the working expenses would exceed £3,000 a year;—do you think that the country would be likely to benefit by the expenditure of so large a sum? No, I do not think it would.
3038. What do you consider the present prospects of the district;—are they likely to improve largely? At the present rate of going, I do not think they will.
3039. What do you consider the principal causes of the present depression? It is due principally, I think, to drought.
3040. Do not the rabbits come in as a considerable drawback? Yes, they are a great drawback.
3041. And I suppose that, with a return of good seasons, the rabbits would very largely increase? Yes; but in a good season, I think, the rabbits do very little harm. It is when things begin to go off that we feel them.
3042. A very large proportion of the wool at present finds its way to Adelaide and Melbourne, I believe? Yes.
3043. The rate by the railway, of course, would be considerably higher than that by the river;—do you think that when the river was navigable the railway would be used in preference to the river? I think not.
3044. You think that the pastoralists would still use the river? I think so.
3045. So that it would really only be in the event of the river not being available that they would use the railway? Yes.
3046. What do you think would be the chief advantages to the district from the construction of this railway? Getting stock away in a bad time, such as we are going through, to more favoured parts would be one advantage—a great advantage too, I think.
3047. We understand that the storekeepers, in consequence of the river Darling often not being available for navigation, have to lay in very large supplies, beyond their immediate necessities, and also have to pay very high freights;—for instance, when they have to get their supplies *via* Broken Hill, that militates also, does it not, against the squatters? Yes, to a certain extent.
3048. They have to pay a higher price for their stores and that kind of thing, I suppose? Yes.
3049. So, in that particular, the railway would be of advantage also? Yes, it would.
3050. Do you think that the proposed railway, if constructed, would induce small holders to take up country? Yes, I think so.
3051. And thereby considerably increase the population? Yes.
3052. *Vice-Chairman.*] In answer to Mr. Shepherd, you stated that you thought the construction of this railway would not benefit the country;—does your reply refer only to the immediate returns of the railway, or to the general indirect benefit conferred on the district, and thereby on the whole Colony? My reply referred only to the direct return.
3053. You think, then, that considerable indirect benefit would accrue to the Colony and the district from the construction of this railway? Yes.
3054. Supposing you were in the position of a holder of a large run, do you think that, year in and year out, good seasons and bad seasons, a railway running through this district would be of such value to you that you could pay one-sixteenth of a penny additional on the present rents in this district? I think not.
3055. Do you think that you could pay a slightly increased rental for the general advantages of the railway? I hardly think so.
3056. Is it a fact that pastoralists occasionally miss a favourable wool-market through the delay in river-carriage? Yes, very often.
3057. With the carriage of wool at £2 12s. 6d. from Wilcannia to Sydney by rail, do you think that the wool from this district would be sent by rail? I think it would.
3058. What do you think is the minimum area which a man should hold in this district in order to make a decent living, year in and year out? It depends on the class of country, to a certain extent, and it varies a good deal in the district.
3059. Do you think that an area of 10,000 acres is sufficient? No, I think not.
3060. Would 20,000 acres be sufficient? Yes, I think so.
3061. *Mr. Shepherd.*] One of the most expensive items in connection with this railway is the cost of crossing the river;—do you think that it would be equally convenient, for the people who would use the railway, if it were to stop short about half a mile on this side of the river? I think so.

THURSDAY, 12 OCTOBER, 1899.

[The Committee met at Bulla Tank, at 10 p.m.]

Present:—

WILLIAM THOMAS DICK, Esq., (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Edward Pearce Kevan, lessee, Bulla Tank, sworn, and examined:—

3062. *Mr. Watson.*] Bulla tank is on the Cobar-Wilcannia road? Yes; 71 miles from Cobar.
3063. Are you the lessee of the tank? Yes.
3064. This is a changing station for the coaches running between Cobar and Wilcannia? Yes.
3065. Under what conditions do you hold the tank? I have a five years' lease, with a right of renewal for five years more. I receive a bonus from the Government, and pay rent for the tank. I pay £3 a year rent, and receive a bonus of £45 a year, and so I get a net bonus of £42. I have the right of selling water to travelling stock on a regulation scale of charges, and the use of paddocks containing 640 acres, attached to the tank.
3066. How long have you been here? Nine years; first as caretaker, and latterly as lessee.
3067. Have you any portion of the area under cultivation? Yes, 10 acres this year. I have about 22 acres altogether fit for crop. I have had all those 22 acres under cultivation; but the seasons have been bad, and I have not had much return.
3068. How long is it since you first put in a crop? The Government put in a crop about four years ago as an experiment.
3069. How did that turn out? It was an absolute failure.
3070. Since then have you had some in each year? Yes, every year; but I have had only one crop, that was last year.
3071. What did you get last year? Four tons of hay off the 10 acres. That was not a very big crop; but it was the largest I have had.
3072. To what do you attribute the failure—to the lack of something in the soil, or merely to want of rain? Want of rain is the cause of it. The soil is good, and I have put about 200 loads of manure on the 10 acres.
3073. Is it not possible that the manure has made it too hot? No, I do not think so, because I have cross-ploughed it.
3074. Stable manure, I suppose? Yes. It has lain there about six years. I tried 5 acres with manure and 5 without, and what I had manured gave the better return.
3075. But these last four years, during which the experiment has been tried, have been exceptionally dry, have they not? Yes. When we did have the rain, it came at a wrong time for the crop.
3076. During these four years, when you have had either absolute or partial failures, the same conditions have applied in the regular wheat-growing districts, have they not? Mostly, in this district.
3077. In the Central districts of the Colony also people have had either absolute or partial failures during the last four years? Yes, in some of them.
3078. So the experiments made here, so far, have not demonstrated that the land is any worse for wheat-growing than land nearer the coast? No, I do not think they have.
3079. I should imagine that it can hardly be said that anything that has been tried here during the last four years has demonstrated whether the country is, or is not, fit for wheat-growing under ordinary conditions? If we were to have anything like favourable weather we could grow very good crops here. The grass has been 3 or 4 feet high here in good seasons.
3080. Do you know whether any attempt has ever been made to cut the natural grasses for hay, when they were so plentiful? Yes. The grass was cut at Jacob's Well, 4 miles from here.
3081. With what result? It kept well; it was nice sweet hay, and it kept about twelve months.
3082. What kind of grass was it that was treated? Spear grass.
3083. Any other description? Mitchell grass, too.
3084. Was that cut in with the spear grass in the hay? Yes, it was all cut together; also crow's-foot and herbage. It goes black in the stack.
3085. Similar in colour to ensilage? Yes.
3086. It was good hay? Yes. Mr. Tully, the then owner of Nelyambo station, on which Bulla tank is situated, cut between 70 and 80 tons of natural grasses for hay, in 1890.
3087. That was a wet season? Yes.
3088. On which description of soil did you try the cultivation you have in now? A sandy loam—mulga flats.
3089. Grey or red? Reddish.
3090. Do you think that is the best soil for wheat-culture around here? Yes, when we have rain. It holds the moisture better.
3091. You have apparently a great deal of herbage and edible scrub round about here even at the present time? Yes. Though the herbage is rather stunted there is plenty of mulga and other edible scrub.
3092. And yet the country round about here seems to be comparatively unstocked? Yes, it is not stocked to the extent it generally is.
3093. What is the great deficiency in this part of the country, from a pastoral standpoint, at the present time—is it the lack of water? No, they have plenty of water on nearly all the runs. They are short of water at Barnato, an outstation belonging to Nelyambo. Last year was very dry, and a lot of the stock there died.
3094. Was any effort then made for the purpose of keeping the stock up? Yes; they had forty or fifty men on for four or five months cutting scrub to keep the sheep alive; but since the last rain there has been no necessity to cut scrub any further.
3095. You know of the proposal to run a railway from Cobar to Wilcannia? Yes; I have heard of it.

E. P. Kevan.

12 Oct., 1899.

3096.

- E. P. Kevan. 3096. Do you care to express an opinion as to whether that would or would not help to advance the interests of this portion of the district? I think it would; I think it would cause settlement along the line, and open up a lot of good country. There is a lot of good country here, and it wants population on it.
- 12 Oct., 1899. 3097. When you say "good country," do you mean for pastoral purposes only, or do you think it is possible for people to go in for agriculture combined with pastoral pursuits? Most of the land between Cobar and Wilcannia, along the proposed route for the railway, is fit for agricultural and pastoral pursuits combined.
3098. But, assuming the land to be good enough, do you think that the rainfall in most seasons would be sufficient to give some return in the way of crops? Yes.
3099. From your point of view, then, a man would be justified in taking up land in this district with the view of combining agriculture with pastoral pursuits, if he had railway communication with the seaboard? Yes, I think so. On most of the stations there is a little agriculture. At Bulla station, 11 miles from here, they have two 10-mile blocks, and they have had 60 or 80 acres under cultivation, though there is none this year. Last year they had a little.
3100. This being a changing station for the coaches, I presume that you have some idea of the passenger traffic? Yes.
3101. Is it considerable? Sometimes there are a few passengers. Nearly every coach that goes through is pretty well loaded up with something or other.
3102. A good few passengers go through altogether? Yes.
3103. So far as passengers are concerned, this coach route has to compete against the Broken Hill route, has it not? Yes.
3104. The greater number of the people going to Wilcannia at present take the railway and go overland from Broken Hill? Yes, they come that way, too.
3105. So that, whatever number may travel through from Cobar to Wilcannia at the present time, does not represent by any means the whole of those that now travel to and from Wilcannia? No.
3106. At present the coach fare between Cobar and Wilcannia is £4 4s., single, is it not? Yes.
3107. Assuming a railway to be built from Cobar to Wilcannia, and the fare reduced to 20s., which the Railway Commissioners estimate would be the fare, it is probable that, then, a greater number of people would travel between those places, is it not? Yes; I should think so.
3108. In addition to the saving of money there would also be a saving of time in travelling by rail? Yes.
3109. And the journey would not be such a trying one as it is at the present time? No. It would be a great deal better going by train than by coach.
3110. At present a coach journey from Wilcannia to Cobar involves about thirty-six hours' continuous travelling, does it not? Yes; two nights and a day.
3111. Do you have much demand for water for travelling stock? There have been no stock travelling through here lately. There is no other tank between here and Wilcannia, and when the drovers cannot get permission from the station-owners to take water for their stock (because the station-owners have no surplus water for themselves) the stock have to go up the river to Bourke, or down the river, towards Adelaide and Melbourne.
3112. Prior to the bad seasons commencing, was there much of a drift of stock this way towards Cobar? Not much. I think that only about 20,000 sheep have passed this tank whilst I have been there.
3113. There seems to be a long distance unprovided for by means of Government tanks between Wilcannia and Bulla tank? Yes. The original intention was to put a chain of tanks right through between Cobar and Wilcannia; but only four were completed, between Cobar and here, excluding Bulla tank. The tanks projected, between here and Wilcannia, were never made.
3114. The failure to put down tanks between here and Wilcannia renders those that have been put down comparatively useless? Yes. If stock were going from Cobar towards Wilcannia they could go only as far as Bulla, so far as public watering places are concerned.
3115. If stock-owners should wish to take their stock from Wilcannia to Cobar, along this road, the first 89 miles would be waterless, except on the chance of getting a little water from the stations? Yes. If the stations could not supply them they could not get through at all.
3116. Do you know the country between here and Wilcannia? Yes.
3117. Do you think there will be any difficulty in getting sufficient watersheds and holding ground to obtain water supplies for railway purposes, similar to the tank you have here? The Inspector of Public Watering-places, Mr. Donaldson, of Hay, has been here, and he told me that there were some good places; and Mr. Tully, the Inspector of Stock at Wilcannia, said the same thing.
3118. But you yourself have been along the route between here and Wilcannia? Yes, and I do not think there would be any difficulty in obtaining good catchment areas and good holding ground for a water supply for the railway.
3119. Is there a plentiful supply of pine timber in this district? Yes; there is a good belt of pine round about here.
3120. Do you think there would be any outlet in Cobar for pine if the proposed railway were constructed? I think so. The teams when they are going back always take pine logs as back loading into Cobar.
3121. So there would be some traffic for the railway, from carrying timber into places like Cobar, where there is not a natural growth of pine? Yes.
3122. Do you know if there is stone near at hand suitable for ballast? Yes, there is good ballast stone round about here. There is also good building stone.
3123. I take it, from what you have said, that you think that the proposed railway would be of advantage to the district generally, and would eventually repay the country for the expenditure? Yes, I think it would. It would cause settlement and plenty of traffic for the line.
3124. You think it would create traffic itself because of the new settlement? Yes. The line from Cobar to Nyngan is, I think, paying now very well.
3125. *Mr. Shepherd.*] Where do you get your stores from? From Cobar generally.
3126. How do you get them delivered here? When the horses are being fed here, we get our stores brought by the teams; but when there is plenty of grass, and the horses are not being fed here, we have to go in for our own rations.
3127. How far are you from the river Darling? About 42 miles.

3128. What does it cost you to get goods from Cobar? £3 10s. a ton now.
3129. Of course, it would cost you very much less than that if the proposed railway were constructed? Yes.
3130. Then, you would rely entirely on the railway for bringing your stores, and so on? Yes.
3131. Is wheat the only crop you have cultivated here? No; I have tried lucerne and barley. Lucerne grows very well here in a good season.
3132. You have had to depend entirely on the rain? Yes; we have no irrigation.
3133. In what year was it that you got the 4 tons off the 10 acres? In 1897.
3134. Have you any idea what the rainfall was in that year? No; I have not. I kept the register, but have delivered it over to Mr. Cotton, Inspector of Stock.
3135. Was that 4 tons of wheat? Yes.
3136. You did not grow any for grain; you cut it all for hay? Yes; I cut it all for hay.
3137. And I think you said you manured about half the area? Yes; I put 200 loads of manure in altogether.
3138. Five acres with manure, and 5 acres without manure? Yes.
3139. Did you grow any lucerne in the same year? No.
3140. When did you grow the lucerne and the barley? In 1893.
3141. Had you about the same area sown that year? No; I put in only about half an acre of lucerne, to try it as an experiment. I got about 1 cwt. of lucerne.
3142. Did you estimate what the average would have been per acre for the lucerne crop? I put in about half an acre altogether, and got only about 1 cwt. of lucerne.
3143. And that was in a fairly good season, I suppose? Yes; the season was not a bad one. The ground was very hard. I do not think it had ever been ploughed before.
3144. That could hardly be called a success? No.
3145. What quantity of barley did you have in that year? About the same area.
3146. Did you have about the same return for the barley? No; the barley grew very well.
3147. Do you know what weight you got off the half acre? I cannot say the weight exactly; but I got about three loads—I should think about 12 or 14 cwt. altogether. It grew pretty high, as there was plenty of water near it.
3148. Do you think there is a large area of land round about here that would be equally good for cultivation? There is plenty of good agricultural land.
3149. In which months do you generally get a rainfall here? In January and February we have most of our rains.
3150. Do you not get any rain in the winter, as a rule? We have a little, but not much.
3151. Do you not get enough to enable you to put your crops in? We have to chance that. We put them in generally in May. We have not had much rain this year since May.

E. P. Keenan.  
12 Oct., 1899.

FRIDAY, 13 OCTOBER, 1899.

[The Committee met at Barnato out-station, Nelyambo holding, at 4.45 p.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

William Rodier, grazier, Tambua station, sworn, and examined:—

3152. *Vice-Chairman.*] How many miles is Tambua from Cobar? The homestead is 40 miles westerly from Cobar. W. Rodier.
3153. What is the area of your holding? 128,100 acres. 13 Oct., 1899.
3154. Can you give the Committee an idea of the carrying capacity of your run? It was fixed by the appraisers, at the last assessment, at one sheep to 7 acres. My holding consists of two sections—Tambua and Mulga Downs. That assessment refers only to Tambua.
3155. Would Mulga Downs carry more or fewer sheep per acre? Fewer, I think. I think that was assessed at one sheep to 10 acres.
3156. Where do you generally send your wool to? Cobar.
3157. Do you suffer any inconvenience owing to the distance you are from a railway-station—40 miles? Yes. I have to do all the carriage from there, and it is not always convenient to get teams.
3158. What is the rate of carriage by teams from your run to Cobar? From 30s. to £2 a ton. It varies according to the times.
3159. For stores outwards does the same rate prevail? About the same.
3160. Can you indicate to the Committee in what way pastoralists in your neighbourhood would be benefited by the construction of the proposed railway from Cobar to Wilcannia? They ought to get cheaper carriage, for one thing, and certain carriage, for another. The railway would also be of great assistance to them in sending fat sheep to market and in getting buyers to come up to look at store sheep.
3161. At present, on account of the distance from a railway, you have a difficulty in inducing buyers to come to inspect, with a view of buying store sheep? Yes.
3162. If the proposed railway were built, do you think you would be able to send large drafts of your stock away, during times of drought, to parts of the country where there was more feed? It would be a great help to us. We should either have to do that, or chance their dying. Now we have to cut mulga; and, if they live, they live, and if they die, they die.
3163. But this cutting of mulga is a process which, of course, must soon end, if you have many droughts? Yes; once it is cut out. It is very difficult to cut mulga in such a way that it will grow again.
3164. Does the distance of 40 miles to a railway offer any great obstacle to the transit of fat stock to the Sydney market? They lose in condition and in value.
3165. If the proposed railway were constructed, do you think you would be enabled from time to time to truck consignments of fat stock to the Sydney market? Yes; I do. 3166.

- W. Rodier. 3166. Would being able to do that be of considerable benefit to you and other pastoralists in a similar position? Yes, I think so.
- 13 Oct., 1899. 3167. Do you think, then, that one practical effect of the construction of the proposed railway would be to cause a substantial addition to the carrying capacity of your holding, owing to the fact of your being able to get your fat stock away when you would like? Well, I should be able to get rid of them when they were in good condition, and not have to cut scrub for them, and even then perhaps let them die.
3168. Taking year-in and year-out, would that effect a considerable saving to the pastoralists of this district, do you think? Yes, I do.
3169. *Mr. Watson.*] Have you tried any cultivation? Yes, a little.
3170. With what result? This year, I think it is hardly a criterion; but I have taken 3 tons off 3 acres this year.
3171. Have you been cultivating for a long period? For about five years.
3172. On the average, how has your cultivation turned out? Fairly; I have been cultivating only during the worst years of my experience. I have seen a crop of 3 tons to the acre in the district.
3173. On what class of soil have you tried cultivation? The red soil. We have nothing else.
3174. Is there much more of it in the district that you think is similarly suitable for cultivation? Yes; in good seasons. It depends entirely on the seasons.
3175. How long have you been in the district? Fifteen years.
3176. Taking an average over that time, supposing you had a railway to your door, do you think it would pay you to go in for cultivation to any material extent? I have had a fair amount of success with a small area, in growing wheat for hay, but I have not had sufficient experience of farming to be able to express an opinion as to whether it would pay to grow wheat for grain; but Mr. McPherson, of Paddington station, grew wheat for grain, which turned out a success.
3177. Can you say what year that was in? I think it was in 1894, but I cannot say definitely.
3178. Do you think there are any means that could be adopted to cause closer settlement, or a greater carrying capacity in this portion of the country, speaking generally? Yes, I do. The first step in that direction would be the extermination of the rabbits. For my own part, I think that the easiest method of dealing with the rabbits is to catch them, kill all the females, and allow the males to go free.
3179. Has that method been successful in your own experience? Yes, it has. In 1891, the stations round about here were bare of grass, and the rabbits had practically died out. Subsequently, with the better seasons and a greater amount of grass, rabbits increased, but to a much smaller degree on my station than on the surrounding stations, with the result that in 1895 I was sending away more wool than I had previously sent, whilst other stations had a reduced quantity as compared with their previous output. I have no doubt that if my method of getting rid of the rabbits were persevered in generally, it would settle the question of the rabbit-pest.
3180. Is it usual round about here to wire-net the holdings? Yes; I think the majority of them are wire-netted.
3181. Do the pastoralists adopt any other means to destroy the rabbits—for instance, in the way of poisoning and trapping? Yes; they have tried those methods, but with comparative failures, because the rabbits in good seasons apparently increase faster than they can be destroyed in that way.
3182. Which of these methods do you think is the least expensive? I say my own; because I have proved it to be.
3183. How do you secure them—by trapping? I have invented a trap which is set in the burrows, and catches them alive.
3184. Does that method of trapping involve any great expenditure in the way of labour, in proportion to the number of rabbits caught? My method is the more economical in the long run, because, although I may not kill or trap as many as other pastoralists may, still mine is a surer way of preventing an increase, and of gradually exterminating the rabbits.
3185. What are the other means by which this country could be made more profitable, by having a greater carrying capacity? Ringbarking and cutting, and cutting up the paddocks into smaller areas, and making more water.
3186. The catchments for water are pretty numerous and good round about here, are they not? Yes, very good.
3187. And, as a general rule, you can get good holding ground? Yes.
3188. So it is only a matter of expending money to secure water against the times of drought? Yes.
3189. Do you think it is likely that pastoralists under present conditions will go in for ringbarking and the other means you have just mentioned? Yes, I think so. It is already being done in the district, and in an increasing measure.
3190. Do you think that this country is in any way suitable for smaller pastoral settlement at some future time? If the rabbit difficulty were met, I think that this country would be suitable for pastoral settlement in smaller areas than obtain at the present time.
3191. What do you think would be the minimum area of the country round about here necessary to give a man a fair chance of making a living, assuming he had sufficient capital to turn it all to account? I do not think he could do with less than from 10,000 to 20,000 acres.
3192. In favourable seasons would such settlers be able to combine a little agriculture with pastoral pursuits, if they were near a railway? Yes, they could.
3193. So, in your opinion, there would be some development of population consequent on the construction of the proposed railway? Yes.
3194. There are now, are there not, resumed areas which are open for smaller settlement in 10,000-acre blocks? Yes.
3195. Do you think that the distance from market has had any deterrent effect in regard to the taking up of those blocks? Yes, I do.
3196. In some cases, though, I suppose the resumed area would contain land too poor to enable a man to make a living on 10,000 acres? In some cases, no doubt.
3197. In such cases an increased area would be necessary, even with a railway? Yes.
3198. *Mr. Shepherd.*] Would you kindly explain the comparative state of the country at the time when you first came here and at the present time? When I first came here I made a lot of money, and I continued to make money until the rabbits came, but since the rabbits came I have not done so.

3199. Do you attribute the great falling off in the production of wool chiefly to the increase of the rabbits? Yes, I do. W. Rodier.

3200. In cutting the mulga scrub, I think you said you cut it in such a way that you did not kill it? Some you can cut and it will grow again; but some will not. Speaking in the main, half or more than half dies. You want careful men to cut it. 13 Oct., 1899.

3201. Will you explain how it is cut to prevent it from being killed? Yes, by leaving one limb with branches on it.

3202. Have you ever tried a system of lopping the limbs at some distance from the ground—for instance, putting a heavy bill-hook on the end of a stick of some length, so that you can reach up some distance? No.

3203. Do you not think that that would be a good plan? Whenever lopping is done, men have to climb the tree, and I do not think a man with a bill-hook would do as much as a man with an axe—a man with an axe, I think, would feed more sheep than a man with a bill-hook.

3204. But is not the difference compensated for if you can preserve the life of the mulga trees? We in this district do not suffer from scarcity of mulga, and perhaps we get reckless in regard to it, because we have plenty. We never cut down currajongs; we always lop them, and they grow again beautifully. In some places, where I have cut the mulga completely out, the grass has improved considerably.

Edmund Francis Hayes, station inspector, Australian Mortgage, Land, and Finance Company, Ltd.,  
sworn, and examined:—

3205. *Mr. Shepherd.*] Have you been in your present position a long time? Five years. E. F. Hayes.

3206. Did you occupy any position under the company prior to that? No; that is the period of my association with the company. 13 Oct., 1899.

3207. Have you been in the habit of visiting this district frequently? Yes, pretty frequently during the last five years.

3208. And during the whole term of your office under the company you have experienced bad seasons here? Yes. When I came here first, namely, in 1896, the season was a bad one, compared with some seasons, but a very much better season than there has been here since then.

3209. Has the number of sheep in the possession of the company in this district decreased much during the last five years? Yes.

3210. Can you state what the percentage of decrease has been? We shorn 130,000 sheep here in 1895—that is, for both Nelyambo and Barnato—and this year we have shorn not quite 40,000.

3211. To what cause do you attribute that great falling off? A great deal to the destruction of the country by rabbits and drought combined. The country has been eaten out by rabbits since 1889.

3212. I suppose that you, like nearly all other squatters in the neighbourhood, have had to resort to scrub-cutting in order to keep the sheep alive? I reduced the number of sheep a good deal by selling some of them, but we did cut scrub. In the first year that I came here a great quantity of scrub was cut.

3213. What effect, do you think, the construction of a railway from Cobar to Wilcannia would have on the whole of the country that would be served by that railway? I do not think it would have a great deal of effect, except that it might cheapen carriage a little, and would facilitate people's journeys. They would not have so rough a time as they have now with coaches and buggies. But, so far as squatting interests go, I do not think it would mean much.

3214. Are you not greatly inconvenienced sometimes by reason of the high rate of carriage from Cobar to this place? The cost of carriage from Cobar to here is not unreasonable.

3215. Taking the whole length of the proposed line, do you not think that people at Wilcannia and other places at a greater distance than this place is from Cobar are greatly handicapped by the present high rate of carriage? I think that the railway would greatly convenience Wilcannia, so far as passenger traffic goes, but I do not think that wool would go by rail from Wilcannia to Cobar, if the river were open.

3216. Of course the time they suffer most now is when the river is not navigable, but, during the time the river is navigable, they use the river by sending their wool and other produce either up the river to Bourke, or down the river to Victoria and South Australia? No doubt a railway to Wilcannia would make things more certain for people living out there, and so it would to a great extent for everybody along the line. They would always have a get-away, if they liked to go to the expense of trucking stock, or they could bring feed to the stock by means of the railway.

3217. Do you think that the construction of the proposed railway would induce more settlement in the district—on the part of small holders, for instance? I think that in a really good season, homestead leases would be taken up, but I doubt if people would be able to make a living in that way in this district, year-in and year-out. I may, however, say that my experience is that if people once settle on the land near a railway, they do not readily leave it; whether they are doing well or not, they stop there.

3218. In construction, the most expensive portion of this railway would be about the last 10 miles this side of Wilcannia, which it is estimated would cost nearly one-fifth of the whole of the expenditure on the proposed line;—do you think it would be equally convenient to the people who are interested in the railway, if it were to stop short within 10 miles of Wilcannia, with the view of saving £100,000? For the Wilcannia people it would be infinitely better to have the railway within 10 miles than not to have a railway at all.

3219. There is another suggestion—the cost of a bridge across the river Darling would be the largest item in that expenditure, and there is a convenient place for a station about half a mile on this side of the river;—it would, of course, be more convenient if the people of Wilcannia had to go only about half a mile to reach the railway at that station, instead of having to go 10 miles in order to reach the railway? Yes, it would.

3220. I suppose that you have no traffic whatever with Wilcannia? No.

3221. Therefore, you would not be interested in the railway beyond this point? No; I do not think it would make any difference to us. It all depends on the freights. For instance, if the railway were to run past within a reasonable distance of Thackambie, where we have one of our wool-sheds, it might pay us better to truck wool on the railway to the river, if the river freights were low—in fact, the same consideration applies to the Barnato shed. The insurance rates are very high when the river

- E. F. Hayes. river is low ; but when the river is high the insurance rates are not so high, consequently it might pay us to truck wool from here by rail to the river.
- 13 Oct., 1899. 3222. There is, of course, a project for locking the river which would render it permanently navigable ;—do you think, in a case of that kind, it is likely that any quantity of wool would be sent to the river ? It would entirely depend on the differential rates on the railway and the rates of insurance on the river.
3223. You think that the squatters generally would adopt the cheapest route ? Undoubtedly.
3224. I suppose you have thought over the matter of the proposed railway ? I cannot say that I have given it much consideration.
3225. Can you think of anything in connection with the proposal which would be likely to assist the Committee in coming to a conclusion ? I think you have asked me all the questions I could have suggested. With regard to settlement, of course one man has one opinion, and perhaps another man has the reverse opinion. I think it is possible that, upon the mulga country, men might take up homestead leases ; but I do not think that is agricultural country. I do not think that wheat would grow in this district in enough seasons to make it pay. I doubt whether it would pay one year with another to grow even enough to feed the horses used in the station work. It is so often a failure. When you get a good crop and stack it, you have to run the risk of mice and other vermin eating it. I suppose, however, that all stations would put in sufficient wheat to try it for horse feed ; but I do not think it would be very successful over a number of years.
3226. Has any attempt been made here at cultivation ? We always put in what we think will give us enough horse-feed—anything from 30 to 60 acres ; but we do not often get anything off it.
3227. But, in a fairly good season, you might get a fairly good crop ? Yes ; I think we might get 30 cwt. of hay per acre.
3228. *Mr. Watson.*] I think you said that the question whether wool would be sent along the proposed railway would depend on the freights ? Yes.
3229. Can you tell the Committee what you pay at the present time for the carriage of wool by steamer from Nelyambo to Adelaide ? I think that the cost, including insurance, comes to £4 2s. 6d. this year.
3230. I suppose that, the river being comparatively low this season, the cost is higher than the cost would be with a full river ? I am speaking from memory ; but I think that three years ago the insurance was about £1 10s. per £100, but two or three barges have been sunk since then, and the companies will not insure as low as they used to insure.
3231. Do you remember what was charged, including insurance, from Nelyambo to Adelaide on a full river ? I think we got our wool down for £3 10s. at the end of 1895.
3232. That is as low a charge as you know of ? Yes.
3233. *Mr. Harper, the Chief Traffic Manager,* informed us in his evidence on the locking of the river Darling that greasy undumped wool is taken from Bourke to Sydney in some cases at as low a charge as £2 12s. 6d. per ton ; allowing for the extra distance from Wilcannia we might assume that wool could be conveyed by rail from Wilcannia to Sydney for £3 per ton ; do you think that, with a railway at Wilcannia taking wool at £3 per ton through to Sydney, this railway would then have a chance of competing against the river ? If the railway would carry wool from Wilcannia through to Sydney at £3 per ton I think that we should truck wool from Barnato, and also the Nelyambo wool at Thackambie, to Sydney.
3234. Assuming that the railway freight were even a little higher than the river freight, do you think that the rapid transit would be a sufficiently large advantage to the wool-growers to cause them to pay that slightly higher freight ? Yes, a slightly higher freight. It would be a matter of calculation, including the interest on the capital value of the wool.
3235. Speaking generally, I suppose it is always an advantage to be in a position to catch certain sales ? Yes, as a rule ; unless there is some marked thing foretelling a higher market later on.
3236. But it is an advantage to be able to take advantage of an early market, if you wish to do so ? Yes, undoubtedly.
3237. And I suppose there are some years during which, under present conditions, the river is of no advantage as a carrying medium ? Yes, there are.
3238. And in those years there is no doubt that the railway would get the wool traffic ? Yes, no doubt ; in fact, people would draw their wool to the railway by road rather than have to keep it waiting perhaps for twelve months.
3239. I think you said, in reply to *Mr. Shepherd*, that the railway would be of some assistance to pastoralists on or near the line, in allowing them also to get their stock away in times of drought if they should wish to do so ? It might be so.
3240. Does it sometimes happen in favourable seasons that you have any considerable number of fat stock that would be fit for market if you had the means of getting them to a market ? I think that in those seasons the sheep would most likely be travelled in to the railway at Nyngan. It would not be likely in a good season, if the roads were open and the sheep were fat, that we should truck them at Thackambie or Barnato. We should walk them as far as we could.
3241. We have been informed by witnesses who gave evidence during our journey down the river that sometimes pastoralists there have some thousands of fat sheep, for which there is not outlet—that is, that although a number of the sheep may be fat, on the plain country the roads are not sufficiently good for the owners of the sheep to be able to get them away, and they have been compelled to sacrifice them by selling them at a nominal price in order to clear the stations a little ? That is quite true ; and it might occur here.
3242. In such a case it would be of great advantage to have an opportunity of getting them away by rail ? Yes ; a great deal would depend, too, on the differential rates.
3243. You think that if the freight on this railway for the carriage of fat stock were on a similar scale to the freight on the Bourke railway, there would be a fair amount of traffic on this line in carrying fat stock in good seasons ? I daresay there would be in good seasons. I think that fat stock would then go to Sydney ; but it is impossible to judge what the traffic would be.
3244. Do you know what the rainfall here is ? For three years past it has been very light—8 inches, 5½ inches, and this year, up to now, 4 inches.
3245. Do you know whether the rainfall this year and a few years previously has been greater or less than it was about Nyngan ? It has been less here.

3246. Considerably? This year, at any rate. At Nyngan the rainfall was  $2\frac{1}{2}$  inches when it was only 50 points here; and I think that the rainfall in the last two or three years has been less here than it was at Nyngan. E. F. Hayes,  
13 Oct., 1899.

3247. With regard to wheat-growing, people have found that even during these comparatively dry years they have been able to grow wheat successfully not far from Nyngan, have they not, lately? They have at Narramine; but I do not think that anybody has done much good with wheat-growing about Nyngan, or in fact as far as Nevertire; but, there is not much wheat country near Nevertire.

3248. And there is not much wheat country near Nyngan? No; but, there is more there than there is about Nevertire.

3249. Is there much land available at the present time in this district for homestead leases on the resumed areas of the various runs? Yes; there is. All Barnato, which is an out-station of Nelyambo, is a resumed area, and is all available for homestead settlement.

3250. So it is quite possible that, if the proposed railway were constructed, a portion of Barnato might be taken up by homestead lessees? I know that quite as arid country has been taken up by homestead lessees down the river; but it has a water frontage. I do not know of any back blocks that have been taken up by homestead lessees, which are in so arid a country as this.

3251. Do you think that the river-frontage country is of any more advantage to a man with small capital than the back country? I do not think it is, except that he has water. As a rule it is teamsters that take that country up as selections, and the traffic on the road and river causes them, I think, to take up those selections.

3252. Is it not a fact that in dry seasons the river-frontage country is less fit for carrying stock on a small area than is the back country? I should not like to say that. I think that on the river-frontage country you would require fewer acres to carry a sheep than at Barnato.

3253. To what do you attribute that? The creeping salt-bush principally.

3254. Does that grow only on the river-frontage country? It does not grow on the mulga country out back, or, if it ever did grow there, it has all been eaten out.

3255. You have not had much grass on the river-frontage country for some time, have you? No; but, it is good herbage country.

3256. Do you think that an area of 10,000 acres of the class of country about Barnato is sufficient for a homestead lessee to make a living upon? I think that he could do as well on 10,000 acres as he could do on 20,000 acres—I mean, in proportion.

3257. How many sheep do you think a homestead lease would require to carry in order to keep a man and his family? At the present price of wool, I think that 500 would be sufficient—that is, I think that the homestead lessee could get a better living from the 500 sheep than he could get by working for £1 per week.

3258. But, assuming that the present price of wool were not maintained, what, then, do you think would be a fair number of acres for a homestead lessee to have? Proportionately, as wool fell in price. If it fell 50 per cent., he would want 50 per cent. more in acreage.

3259. Do you think, taking the average price of sheep for some years past, that 1,000 sheep would be sufficient to maintain a man and his family? Yes; I think that a man with 1,000 sheep would make a good living.

3260. And, with this class of country, if a man had capital enough to improve his holding, do you think he could carry 1,000 sheep on 10,000 acres? It would take him all his time. The land would have to be a picked piece, and he would have to take an average, year in and year out.

3261. So it would seem that a 10,000-acre block is, on the average, rather small for this class of country? Yes, perhaps it is.

Sydney Hamilton, manager, Nelyambo station, sworn, and examined:—

3262. *Mr. Watson.*] What is your position? I am manager of Nelyambo holding, which includes S. Hamilton. Barnato. 13 Oct., 1899.

3263. What is the area of the holding? About 900,000 acres.

3264. In ordinary seasons, how many sheep does it carry? From 70,000 to 80,000.

3265. How many is it carrying at the present time? About 40,000.

3266. How long have you been on the holding? Since February, 1896.

3267. So all your experience here has been with bad seasons? Yes.

3268. Have you considered the question of railway communication, and its possible effect on the pastoral industry of the district? I have not studied it very much, but to a certain extent.

3269. How do you think it would affect the pastoral industry of the district? I do not think it would affect it very much.

3270. Do you think it would be of any benefit to the pastoralists in the way of carriage? Slightly.

3271. At present you get your supplies, I suppose, in the main, by river? Yes, when there is an open river.

3272. And the wool from Nelyambo goes down the river usually? Yes.

3273. To where do you send the wool from Barnato? I generally send it from here to Cobar by team.

3274. Assuming that the rates on the Wilcannia-Cobar line were to approximate to the rates existing on the Bourke line, do you think you would be likely to use the Wilcannia-Cobar railway for the carriage of the wool from Barnato towards Sydney? Yes, I think so, certainly.

3275. Would you use the Wilcannia-Cobar line for the carriage of the Nelyambo wool, if you could send it from Thackambie to Sydney for £3 7s. 6d. per ton? Yes.

3276. Whether there was an open river or not? It would depend on what the freight on the river was.

3277. You know what that freight has been when the river was open? Yes. I do not know about the insurance, which is attended to at the head office, and is rather a heavy item; but the freight, with which I have to do, is less than £3 7s. 6d.

3278. We have received information from several sources that the insurance on wool between Wilcannia and Adelaide or Melbourne is never less on the river than from 14s. to 16s. per ton? In that case, I should send wool for less than £3 7s. 6d., from Nelyambo, by river.

3279. What is the rate you are paying at the present time for carriage by river? £2 1s. 6d., exclusive of insurance.

3280. Is that under a special contract? Yes.

3281.

- S. Hamilton. 3281. Does it include rail to Adelaide? Yes, it includes delivery at Adelaide.
- 13 Oct., 1899. 3282. Is the wool from your station sold in Adelaide, or does it go right through to the London market for sale there? It generally goes through to London.
3283. What would your clip amount to in an ordinary season? For 70,000 or 80,000 sheep, 1,100 or 1,200 bales.
3284. The steamers, in consideration of having a large quantity, make a special cut-rate for you? Yes.
3285. I suppose that the steamers at present get a fair amount of trade in carrying agricultural produce from South Australia or Victoria up the river? Yes.
3286. Assuming that, on this railway, through rates were charged from (say) Dubbo to Wilcannia, it would then cost about 10s. 6d. per ton to deliver agricultural produce at Wilcannia;—do you think that the steamers could carry that class of produce to Wilcannia as low as that? I really do not know what the rates are from Adelaide to Wilcannia.
3287. We have been informed by some of the steamer people that the lowest at which the steamers could afford to carry produce from Echuca or Morgan to Wilcannia would be £1 per ton for big lots, and if that is the case it would appear that the railway could carry more cheaply than the steamers could carry that line of goods? Yes.
3288. If the steamers were to have no up-river loading of flour and similar produce, do you think that that would have the effect of causing them to raise their freights on general river loading? Possibly it might have that effect.
3289. Do you think that the lightest possible kind of railway, or something in the nature of a tramline, would be sufficient for the necessities of the district, allowing for a low rate of speed and comparatively light loads? I should fancy it would, so far as the amount of produce that the line would carry or the passenger traffic is concerned.
3290. You do not seem to think there would be much probability of an expensive line paying? I should fancy not.
3291. It has been suggested that this railway might afford the pastoralists a means of getting fat stock to market;—do you think that would be the case? Yes; if we had any fat stock, I suppose it would.
3292. You have not had any during your three years' experience here? No.
3293. I understand that you had experience on the Bogan and Lachlan Rivers before you came to this district? Yes.
3294. You sometimes had large quantities of fat stock for market? Yes.
3295. And the railway communication you found of great benefit to you? Yes.
3296. With a railway it would be possible for a man to send to market fat stock in smaller lots than would be payable without railway transit? Yes.
3297. Have you made any attempt at cultivation during the three years you have been here? Yes; but with very little success. However, the three seasons I have been here have all been bad ones.
3298. The bad seasons you have had have been in common with those experienced nearer the coast? Yes.
3299. So that the failures you have had during these last three years would not necessarily imply that it would be impossible to grow crops here? No, not impossible.
3300. Have you attempted any irrigation on Nelyambo? None at all.
3301. In going along the river we noticed that a number of small irrigation plots were in operation; can you give any reason why irrigation has not been tried at Nelyambo;—have you no suitable land there? We have not an irrigation plant; and there is only one plot where we could go in for irrigation, and the seasons have not been suitable for starting it, and it has not been the policy of the station to tackle irrigation.
3302. Do you think that any of the land on the Nelyambo river frontage is suitable for irrigation? Yes, possibly, on a small scale.
3303. With permanent water-holes in the river adjoining? Yes; there are such water-holes, but we have not attempted to utilise them.

MONDAY, 16 OCTOBER, 1899.

[The Committee met at the Court-house, Cobar, at 10.30 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Peter Snelson, Mayor of Cobar, sworn, and examined:—

- P. Snelson. 3304. *Vice-Chairman.*] How long have you resided in this town? Eleven years.
- 16 Oct., 1899. 3305. You were acquainted with the town of Cobar previous to the extension of the railway from Nyngan to Cobar? Yes.
3306. Can you indicate to the Committee in what way the construction of that railway materially affected the condition of things in Cobar? Yes. In the first place, by carrying improved machinery to Cobar, the railway assisted in the development of the mines. They got machinery at a cheaper rate. The copper-mine had been closed down for about four years. The cost of carriage of copper from here to the railway at Nyngan was too much to be paid out of the results from the low-grade ore; but, through having the railway from Nyngan, the proprietors of the copper-mine were able to get improved machinery, in the shape of smelters. These had to be worked with coal and coke, and now, of course, by means of the railway from Nyngan, the carriage of coke and coal is cheap. To-day, as you see, the town is in a flourishing condition, through having the railway from Nyngan. The population of the place must, I think, have increased nearly fourfold since the opening of the railway from Nyngan to Cobar.
3307. Do you think that if the railway from Nyngan to Cobar had not been constructed this rich mineral district would have remained practically in the same condition as it was previous to the construction of that line? I do. 3308.

3308. Do you know whether any mines or mining districts adjacent to Cobar have been developed owing to the extension of the railway from Nyngan to Cobar? Yes. P. Snelson.
3309. Will you name them? Mount Drysdale, 25 miles from Cobar; Mount Hope, about 110 miles from Cobar; and Nymagee, between 65 and 70 miles from Cobar. 16 Oct., 1899.
3310. What was the condition of those places previous to the construction of that railway? Very similar to that of Cobar; they were almost deserted.
3311. Presuming that there were, within an equal distance from Wilcannia, mining fields similar to those you have mentioned as being close to Cobar, do you think that the extension of the railway to Wilcannia would lead to a similar development of mining? Certainly.
3312. For what reason do you hold that opinion? The necessary machinery could be taken to them by rail to develop the mining property, the same as mining property has been developed in Cobar.
3313. And all other necessities could be more easily conveyed thither? Yes; coke and coal, and other material that was required for use there.
3314. During the inquiry on the proposed extension of the railway from Nyngan to Cobar it was stated that land would be more readily taken up, and that a certain amount of cultivation would probably be indulged in along the line, if that railway were constructed;—can you state whether those predictions have been verified by experience? Yes. At the Nyngan end of that railway I notice that there are several farms now under cultivation, and with very good crops.
3315. Have the resumed areas along that track been taken up? I cannot answer that question positively. I know that a good deal of work has been done by the Government in ringbarking and scrubbing the country, and I believe that a good many of those blocks have been taken up since.
3316. Do you know whether an increase in cultivation of the character carried out at Hall's holding has been brought about by the construction of the Nyngan-Cobar line? The increased cultivation might have occurred whether the Nyngan-Cobar line had, or had not, been constructed, because it is within 12 miles of Nyngan.
3317. I find, too, that it was stated in the same inquiry that the country west of Cobar towards Wilcannia is of a somewhat better character than the country between Cobar and Nyngan;—do you agree with that opinion? I am not acquainted with the road between Cobar and Wilcannia for more than about 30 miles out, and with respect to that portion, I think the country is similar to the country between Nyngan and Cobar.
3318. Do you know whether the tract of country between Cobar and Wilcannia is mineral-bearing? Only from what I have heard. I have seen specimens of copper that were got somewhere in that direction.
3319. Do you think it is likely that coal will be found along that track? Some years ago, before the railway was constructed from Nyngan to Cobar, a man—I think a shearer or a boundary-rider—who was working on one of the stations north of the route proposed for the railway from Cobar to Wilcannia, brought me in a piece of coal, 6 or 7 lb. in weight. I burnt some of it, and it burnt beautifully. In fact, I could not tell it from Newcastle coal. I made inquiries in order to find out whether he had brought it from Louth, or whether he obtained it from one of the steamers that run up and down the river there; but I found out that they used only wood. It is not likely that he could have fetched it from there, and the railway was then no nearer than Nyngan, and he came from the direction of Louth, he having been at work either at Wittagoona or Gidgee. His name was Doyle, and he described the country as being a broken sandstone country.
3320. Are there any indications of limestone deposits between here and Wilcannia? Yes; about 7 miles out of Cobar towards Wilcannia.
3321. Would that lime be of use in smelting operations at Cobar? I do not know that the mine-owners at Cobar are using lime now; but under the old system of smelting they did use lime. There is also fire-clay at the same place. Fire-clay at present is used at Cobar for making furnace fire-bricks.
3322. Do you know whether close to the route proposed for the Cobar-Wilcannia railway there is stone of a proper quality for ballasting? Yes, I think there is.
3323. Would you say that the slag from the furnaces here would make good ballast for the railway? I think it would.
3324. Can you give the Committee any example of the difficulty of transit between here and Wilcannia? Yes. The distance is a long one, and the roads are not very good. The roads are not macadamised, and people travelling are on the road a very long time, and during the last drought most of the fodder and station supplies required at places in the direction of Wilcannia went from Cobar, the river traffic being stopped through the Darling being low. There was great difficulty then in getting teams to take out the supplies, on account of want of water; the country being dry, and the Government tanks being a good distance apart, the teams often found it very difficult to make the stages for the water.
3325. Do you think that the wants of the district between Cobar and Wilcannia, and around Wilcannia, would be fully met by a light line, almost of the nature of a tramline, with a service not exceeding 10 miles per hour? Yes, I think they would, for the present, at any rate—unless some fresh developments were to take place.
3326. Would it be infinitely better than the present connection? Yes.
3327. Can you inform the Committee whether any small holdings have been taken up near Cobar since the construction of the railway from Nyngan to Cobar? Yes; nearly all the 10-acre lots available within the population area have been taken up.
3328. Where were they situated? From about 2 miles to, I think, 6 miles out of Cobar.
3329. For what purpose are they being used? They have not been taken up a very long time.
3330. Do you know what the people intend to do with them? From private conversations which I have had with some of the people, I know that they have taken them up with the idea of growing lucerne and having dairy farms and poultry farms.
3331. Leaving out of consideration the recent almost unprecedented period of drought, in how many seasons (say) out of ten do you think an agriculturist in this district could expect to have a fair crop? Previous to the last drought there were about five seasons out of seven in which a fair crop was obtained. I may add that one lessee, Mr. Scanlan, has successfully grown crops on his homestead lease, about 8 miles out of Cobar, in the direction of Louth, and about 3 miles north of the route proposed for the railway from Cobar to Wilcannia.

- P. Snelson. 3332. Can you say whether the area he cultivated is a picked area, or whether it is a fair average of the land in the district? It is a fair average of the land in the district.
- 16 Oct., 1899. 3333. *Mr. Watson.*] I take it from the evidence you have given that you are in favour of the construction of the proposed railway from Cobar to Wilcannia? Certainly I am.
3334. Do you anticipate that any benefit would result to Cobar from the extension of the railway from Cobar to Wilcannia, or would it not make any difference to Cobar? I do not think it would make very much difference to Cobar. Perhaps it would be the means of people coming from Broken Hill and White Cliffs to Cobar, and money might be brought here for the further development of the mines. At present I look upon Cobar as self-supporting, now that we have the railway here from Nyngan. So far as Cobar is concerned I do not think that it would benefit very much from this new line.
3335. You are not advocating an extension of the railway from Cobar to Wilcannia on any local grounds? Certainly not. I look at the project from a national point of view.
3336. From what you think would be in the public interest? Yes. I consider that the increased traffic would not benefit Cobar, because the line from Nyngan would then be a through one—Cobar would no longer be the terminus. People wanting to go (say) to Broken Hill from any part of the country above Bathurst, or out towards New England would come this way, but only just pass through Cobar—they would not stop here.
3337. I presume that there would be an opportunity for produce grown on the western line between Orange and Nyngan to find its way westward through Cobar to Wilcannia? Yes. Within the last eight or nine years pretty well the whole of the country from Dubbo to Nyngan has been taken up for agricultural purposes. There are some very large farms, and I consider that in times of drought, such as we have passed through during the last few years, and are experiencing now, there would be an outlet for the Nyngan produce to go westward to Broken Hill, Wilcannia, and White Cliffs, and other places in the west.
3338. During the last few years there has been a steady and continuous extension of agriculture westward, has there not? Yes.
3339. People now are cultivating areas which a little while ago were thought to be too far west, and to have too small a rainfall to be fit to grow wheat? Yes.
3340. They have proved that it is possible to grow wheat in those parts of the country with a comparatively small rainfall? Yes; and to grow it very successfully.
3341. *Vice-Chairman.*] In a letter to the *Sydney Morning Herald* of 6th October, with reference to the proposed railway from Cobar to Wilcannia, this statement is made as to its effect on the pastoral industry: "With sure communication there will be more profits in ordinary seasons, and less loss in drought";—do you think that that would be the general result of the construction of a railway from Cobar to Wilcannia? Yes.
3342. And if that were the general result, do you think that that would encourage the taking up of homestead leases, and bring about, therefore, closer settlement in the district? Yes. I think that if the railway be extended from Cobar to Wilcannia, the people between Cobar and Wilcannia will receive benefits similar to those that have been received by the people here through the extension of the line from Nyngan to Cobar.

Walterus Le Brun Brown, Police Magistrate and Mining Warden, Cobar, sworn, and examined:—

- W. Le B. Brown.  
16 Oct., 1899.
3343. *Mr. Shepherd.*] How long have you been located at Cobar? I have been located at Cobar about eighteen months, but I have known the district between Cobar and Wilcannia for the last twenty-five years.
3344. Where were you residing before you came to reside at Cobar? I resided permanently at Wilcannia from 1874 to 1886, and I have been there once or twice since. I was stationed as Police Magistrate at Wilcannia before I came here, and I have also been stationed at Milparinka as Police Magistrate and Mining Warden.
3345. Do you think that the projected railway would largely benefit Wilcannia and the country between Wilcannia and Cobar? Yes; I think it would benefit it considerably.
3346. Will you kindly explain to the Committee in what way? It would benefit it in this way: In drought time, by affording people an opportunity of getting their stock away. During the time I was at Wilcannia fat stock were selling at Sydney, Bathurst, Orange, and Dubbo at big prices, whilst similar stock were perishing in the Wilcannia district in hundreds of thousands, because the people could not get them away. I am speaking of fat sheep particularly. If there had been a railway to Wilcannia those stock could have been removed. I also think that probably there would be closer settlement on some of the land adjoining the proposed railway if it were constructed. Some of that land is very good wheat country.
3347. Are those the chief benefits that you think would be derived from the construction of this railway? Yes; I think those are the chief benefits that would be derived from it, and also in giving the people an opportunity to get goods backwards and forwards, which would be a very considerable benefit, especially when the river is not navigable. Very often the river is not navigable for a lengthened period—for two years at a stretch sometimes.
3348. Do you think that the country would benefit very much, also, by this railway enabling the squatters to send to market smaller lots of sheep than they can send at present? Yes; in drought-time it is almost impossible for them to send stock away (because they cannot travel) which they could send away by train.
3349. Of course, in sending stock away in the ordinary way, at present it does not pay them unless they have a large number to send at the one time? No; and, as a matter of fact, they cannot send them, because they cannot travel over the country. I have known an instance of a squatter in the Wilcannia district who sent 10,000 sheep away, and at the end of the trip was £600 out of pocket, with the loss of his sheep as well. Those 10,000 sheep would have been sent by train if there had been a railway from Wilcannia, and probably a lot of those sheep were really fat and fit for the butcher.
3350. Do you think it would pay to send sheep from Wilcannia to Sydney at £10 4s. 3d. per truck, or about 2s. 0½d. per head? Yes, sometimes; not always, of course. In times of drought it certainly would.
3351. One great advantage of the railway, I presume, would be that sheepowners would be enabled to take advantage of a high market through getting their stock down in a few days? Exactly; and in selling

selling fat sheep, of course, which otherwise would perish. If they had a railway they could often send fat sheep to the Sydney markets which they could not possibly send without the railway. For instance, I daresay that during this late drought there have been a good many fat sheep in the district which could have been sent away if there had been a railway running through the district, but their owners had to keep them on the station and let them perish. In the old days, I know from experience that hundreds of thousands of sheep were lost. I know the district pretty well. I was appraising for some years in it, and was carrying on the business of a stock and station agent there, as well as that of a journalist.

W. Le B.  
Brown.  
16 Oct., 1899.

3352. Being well acquainted with Wilcannia and its requirements, do you think that it would suit the Wilcannia people just as well if the railway were to stop short (say) half a mile on this side of the river, instead of crossing the river—which would effect a very great saving in the expense of constructing the line, by avoiding the bridging of the river? I think that if the railway were to go to Wilcannia at all it ought to go farther even than Wilcannia; still, so far as Wilcannia itself is concerned, I think it would suit the people there just as well if the railway were to stop on this side of the river. I think that the railway would have more probability of paying if it went farther than Wilcannia, more especially if there were a light line from Wilcannia to White Cliffs.

3353. The estimated cost of this proposed line from Cobar to Wilcannia is £497,000, and the estimated income is £6,800 per annum; that leaves a loss of £20,510 a year;—do you think that the country would be justified in constructing this line in the face of that heavy loss? No, I do not.

3354. Do you see any prospect of a large increase in the income in the immediate future? Not to any very great extent. I should have thought that the income would be more than is estimated by the Railway authorities.

3355. Of course, if anything could be pointed out, such as an immediate prospect of a large increase in traffic, it might justify the construction of the line; but you say that you do not see any immediate prospect of the revenue being increased? Not to any very great extent.

3356. Are you acquainted with White Cliffs? Yes.

3357. Do you think that the construction of this railway would have a great effect on the mines there? I do not think it would have a very great effect on the mines there, but I think there would be a good deal of traffic. There is a good deal carried on that road. I do not doubt that a light line between Wilcannia and White Cliffs would pay, so far as that particular line is concerned, for a good quantity of goods go backwards and forwards to White Cliffs, and the stations round about also would have a good deal of carriage.

3358. Now, when the river is not navigable, I believe that the people at White Cliffs get their supplies chiefly from Broken Hill? I think they do get a good deal from Broken Hill.

3359. At a very high rate of carriage? Yes. Of course, it is very hard to say what the rate of carriage in that district is in drought times.

3360. Is there any other information you can give the Committee which would assist them in coming to a conclusion in reference to this railway? No, I do not think there is, except that I think that probably some land would be occupied for farming purposes which is now lying idle. There is a good deal of good wheat country in the district.

3361. Is the rainfall sufficient to justify the cultivation of that land? I think it would be. They get good prices, and they reckon that if they get a crop once in three years it will pay them. Of course, in such seasons as we have had of late, farming would not pay at all.

3362. I suppose that the last four years we may put aside as being almost unprecedented? Yes, I think so. There has been nothing like them in my experience during the last twenty-five or thirty years.

3363. Do you think that Cobar would largely benefit from the construction of the railway from Cobar to Wilcannia? I do not know that it would benefit largely from it.

3364. Do you think that it would induce small settlers to take up leases of 10,000 or 20,000 acres;—do you think that the railway would facilitate matters for them? Yes, I do.

3365. *Mr. Watson.*] You said, in reply to Mr. Shepherd, that you thought that in fair seasons a number of fat sheep would be trucked between Wilcannia and Cobar for the Sydney market. I think there would be.

3366. In the estimate of traffic which was made up by the Railway Commissioners' officers, they allowed for 600 trucks of sheep from Wilcannia in the course of a year;—would that, so far as the main line is concerned, be absolutely new traffic? Yes, it would.

3367. Therefore, when the Railway Department credit the projected line with only the amount of freight chargeable over its own length, they are not giving the full amount of traffic which that would mean to the railways of the Colony? I do not think they are.

3368. For instance, the through rate from Wilcannia to Sydney is £10 4s. 3d. per truck; Mr. Harper, in his estimate, credits the Wilcannia-Cobar line with only 29s. 8d. per truck of that amount; therefore, the amount credited to the projected line from 600 trucks, as estimated, is £890, whereas the total new revenue accruing from these 600 trucks to the railways of the Colony would be over £6,000, at a through rate; do you think that the fact that this new revenue would be brought to the main line absolutely in addition to what is now carried over it should be considered in relation to the question of constructing this line? I think it should be.

3369. Practically speaking, any traffic that came from the Wilcannia end of the projected line would be absolutely new traffic over the railways of the Colony right down to Sydney? Yes.

3370. And consequently we have a right to consider that, to some extent, in dealing with this question? Yes, I think so.

3371. Do you know that there is a lot of land included in the resumed areas of the various runs between Wilcannia and Cobar, which is now open for settlement by means of homestead leases? Yes.

3372. Do you think there would be any probability of that being taken up more quickly if this line were constructed? I think so. I think the homestead leases might be made to pay in that district if this railway were constructed. I am quite sure they do not pay at present, and I do not think that they ever have paid, but I am sure that they would have a better opportunity with the railway.

3373. Would it afford the homestead lessees an opportunity of getting rid of any fat stock which they might have occasionally? Yes, it would.

3374. And cheaper supplies, I should imagine, would also be an important item to a homestead lessee with small capital? Yes, I certainly think so. If a homestead lessee had a few hundred fat sheep, or even

W. Le B.  
Brown.  
16 Oct., 1899.

even a smaller number, he could truck them away. If the roads were bad he could truck them away, if he could not travel them, and, of course, it would not pay a homestead lessee to travel a small lot of sheep.

3375. During our visit of inspection we were informed that on some of the resumed areas the present occupants are paying as low as 14s., 15s., or 16s. by way of rent for a section of 640 acres? Yes.

3376. Do you think it would pay a homestead lessee to give a higher rental than that, if he had railway communication? I think I am safe in saying that the land would be worth more with railway communication, so far as rental is concerned, than it is at the present time. But I am of opinion that the pastoral runs in the Western Division, under present conditions, are rated altogether too high.

3377. But, whether they are rated high or low, the Crown would be entitled to a greater return if there were railway communication, than without it? Yes. I think that if the pastoral tenants can afford to pay now 14s. or 15s. per section, they could afford to pay more if they had railway communication.

3378. By reason of getting cheaper supplies and a greater outlet for their stock or crops? Yes; it would make a material difference.

3379. So that, whatever benefit would accrue through the construction of the railway, in the way of facilitating communication, would result partly to the Crown as the landlord of this part of the Colony? Yes, I think so.

3380. I understand that there is a little or no alienated land between here and Wilcannia? No.

3381. In your capacity as Mining Warden, formerly at Wilcannia and now at Cobar, what is your opinion of the country between Cobar and Wilcannia, from a mining point of view? I think that some of it is auriferous, and that it might at some future time be developed for gold-mining.

3382. Any indications of copper? I have not seen or heard of any.

3383. Do you think it is likely country for copper? No; I should not say so—not this side of Wilcannia.

3384. Beyond Wilcannia you had some experience of the country also? Yes.

3385. What is your opinion of the possibilities out in that direction? I think the possibilities are that it will be a very large mining district.

3386. For any particular description of mineral or for a number of minerals? I think it will be a large copper district; I dare say gold, too. I do not think there is much doubt about it as a copper district.

3387. If copper-mining were developed there, this railway would be of considerable importance in assisting such development? Yes.

3388. Speaking as one who has had a lot of connection with mining matters, in your official capacity, do you think it is likely that mining would have reached its present development here supposing there had been no railway communication to Cobar? I daresay not. But that is a matter upon which it is very hard to form an opinion.

3389. But, I suppose, we may take it for granted that with the lower-grade ores which you usually get at a depth, cheap or easy communication, either in taking away ore or in bringing coal to the mine, is a matter of the first importance? Yes; most decidedly. I think there would have been a great deal more mining in the Wilcannia district if there had been railway communication there, especially in the Grassmere and Nuntherungie country. I know that there are good copper indications there, and that syndicates have refused to touch it on account of want of communication.

3390. *Vice-Chairman.*] Sometime ago you held the position of appraiser in the Wilcannia district, did you not? I held it under the old Act as lessees' appraiser. I never appraised for the Crown.

3391. In that position you naturally gained a pretty intimate knowledge of the country? Yes. I have been over most of it in the olden days.

3392. How does the country between Cobar and Wilcannia compare with the country between Nyngan and Cobar from a pastoral point of view;—is it practically the same? I should say that practically it is much about the same; I do not think there is a great difference.

3393. Do you think that after the construction of this line there would be a tendency towards closer settlement in the way of homestead leases along the railway line? Yes; I think there would be.

3394. Do you know whether there are any engineering difficulties between Cobar and Wilcannia which would offer any serious obstacle to the construction of an extremely light line—practically a tramline? I do not think there are—until of course you come to the river.

3395. As indicated by a question put by Mr. Shepherd, a considerable reduction in the annual cost of this railway, namely, a reduction of £3,465 per annum—would be brought about by making the terminal point at a short distance on the south-eastern side of the river Darling; if that saving were effected, and if there were a further saving by laying down a line of a lighter construction than that proposed, and taking into consideration the fact that in estimating the annual revenue no credit is given to this line for the new traffic that would be brought by it on to the main line, would you still hold the opinion expressed in your answer to Mr. Shepherd that it would not be in the best interests of the country to construct this line? No. I should think that if the revenue could be increased beyond those figures, and the expenses decreased, the construction of this line would be in the interests of the country.

3396. When you say "if the revenue could be increased beyond those figures," do you mean that the revenue of this line should be credited with some of the new traffic that would be brought on to the main line by it? Yes; I do think so. I may say, in regard to the advantages to Cobar, that I think one great advantage that the Cobar people would derive from the construction of this line would be that the freight would be considerably less. Now they pay a local freight on the short line from Nyngan to Cobar, but with a greater length of line I think that through rates might be allowed on the Cobar section, and, if so, that would be of great advantage to the Cobar people.

Edwin James, storekeeper, Cobar, sworn, and examined:—

E. James.  
16 Oct., 1899.

3397. *Vice-Chairman.*] How long have you resided at Cobar? Sixteen years.

3398. Do your business operations include the supplying of people some distance west of Cobar with stores? Yes.

3399. How far do those operations extend? We have gone out to most of the stations between here and Wilcannia.

3400. Do you find your operations at present much handicapped by the absence of a railway out that way? I do not think so.

3401. Is the road-carriage either difficult or expensive? Certainly not expensive. I take it that the margin between the railway freight, based on the present rates, and the team freight is a very narrow margin at the present time. E. James.  
16 Oct., 1899.
3402. Then you do not think that the proposed extension of the railway—regarded, at any rate, from the point of view of supplying stores—would be of much benefit to the stations which you now supply? Not on a financial basis.
3403. Do you think that it would lead to the direct carriage of stores from Sydney to stations along the line? No; I think it would shut Sydney right straight off.
3404. From which places would they get their goods then? Melbourne and Adelaide.
3405. By that you mean that the construction of a railway from Cobar to Wilcannia would bring the river Darling into active and successful competition with the railway from Sydney? Yes; down as far as Trangie.
3406. I suppose you make this statement being fairly well acquainted with the general railway rates, and also with the rates on the river? Yes; it is based upon actual experience. For instance, I have landed goods at Louth from Adelaide at 25s. a ton. I can get them from Louth to Cobar for 45s. That makes £3 10s. from Adelaide. The cost of carriage from Adelaide to Wilcannia would, of course, be less than that.
3407. What is the cost of carriage from Sydney to Cobar for the same class of goods? Getting it by the truck, at the present time, £7 12s. 6d. per ton; but if people, such as small storekeepers, are not able to make up a full truckload, they have to pay £11 9s. 7d. per ton.
3408. Is the general course of your business, then, with Adelaide firms? No, Sydney.
3409. Will you indicate to the Committee why, with such a great difference between the rates, you still patriotically trade with Sydney? Yes; we cannot control the rainfall, or the amount of water that is in the rivers.
3410. The uncertainty of the rivers? Yes.
3411. I presume that the rate of £3 10s. per ton from Adelaide to Cobar prevails only with a full river? Yes; when steamers can travel.
3412. Can you state how often during the last ten years you would have been able to obtain your goods in that way? I think about one year in two years. I am speaking of about twelve years previous to the last three years, and of the river as far as Louth.
3413. Does the obtaining of the goods by river impose upon you the necessity of holding very large stocks? No.
3414. You simply take advantage of the river when it is up, and otherwise you use the railway and obtain your goods from Sydney? Yes; we have done that. I have not done any business with the Adelaide or the Melbourne market for several years.
3415. Since the railway has been open from Nyngan to Cobar, have you obtained any consignments of goods by river from Adelaide? No. Those remarks of mine as to a saving of £1 per ton apply only to third-class goods—the higher classification.
3416. You say you think that from Wilcannia to Trangie, in respect to the class of goods you have indicated, the Sydney market would be entirely shut out when the river Darling was navigable? Yes; if rates were according to the present rate-sheet.
3417. With respect to the carriage of wool, can you offer any opinion as to which direction wool grown between Cobar and Wilcannia would be sent, if the proposed railway were constructed? I can only offer an opinion; but I would reasonably expect that the wool would go to Wilcannia for conveyance down the river.
3418. Do you know the rates for the carriage of wool from Wilcannia to Adelaide, or to Melbourne? No; I do not.
3419. If the rates from Wilcannia to Adelaide, or Melbourne, by river, with insurance and other expenses, were practically equal to the rates from Wilcannia to Sydney by rail, do you think that pastoralists and other wool-growers would prefer the river instead of the railway as a means of communication? That would be governed altogether by the domicile of the owners of the stations, which, in regard to that district, is very largely Victorian; also by the factor as to stations being under cover to financial institutions in New South Wales or Victoria.
3420. It would not be merely a question, then, of pounds, shillings, and pence? Not altogether. I suppose that if there were a large margin in favour of the New South Wales market, then even the Victorian market would be overlooked in favour of the New South Wales market.
3421. Certainty and rapidity of carriage are both desirable, are they not? Yes.
3422. And they are both to be obtained by railway, but seldom by river? Yes, that is so, at present; but under the Federal Constitution, I take it, one of the first steps would be to make the Darling permanently navigable.
3423. That fact, of course, would weigh considerably with pastoralists, would it not? Yes.
3424. *Mr. Shepherd.*] I gather from what you say that you are of the opinion that, if this railway were constructed, it would act in favour of South Australia rather than of New South Wales? Undoubtedly.
3425. Do you think that it would really drain the country between Cobar and Wilcannia? There can be no question about that.
3426. And you think, then, that New South Wales generally would not be benefited by the construction of this line? Certainly not.
3427. *Mr. Watson.*] You gave it as your opinion that the construction of this railway from Cobar to Wilcannia would probably result in the trade between Wilcannia and Cobar and on to Nevertire being carried to Melbourne or to Adelaide? Yes.
3428. You base that opinion on the existing rates? Yes.
3429. If through rates were applied to the traffic between Wilcannia and Sydney, do you think then that trade would probably go in the direction you have indicated? Perhaps in that case not quite so far as Nevertire, but as far as Nyngan. I base that opinion upon taking the average mileage on the through-rates system from Wilcannia to Nyngan as against the general through rate by rail.
3430. Which class of goods would that be for? Third-class. I am speaking only of the higher-class goods.
3431. But it would hardly pay steamers to carry higher-class goods only? No. They form the bulk of the traffic, though.
3432. You said that you could get third-class goods to Louth for £1 5s.? Yes, £1 5s. I have paid £1 7s. 6d. for case-goods.
3433. Have you had a contract of that description? Yes—that is, before I purchased the business I now have, I was managing at Cobar for Barton Brothers, and we did business with Adelaide, and I am giving you actual figures. 3434.

- E. James. 3434. Were there any special circumstances surrounding the freight quotation? None whatever.
3435. Was it, for instance, during the wool season only? No; all through the year.
- 16 Oct., 1899. 3436. During our recent visit to the river, we were informed by steamboat proprietors and others interested in the trade, that the lowest at which they could carry goods up or down was 30s. a ton? Thirty shillings is the maximum that I have paid to Louth.
3437. It was stated to us that that was the lowest they could charge, even with a full river? Thirty shillings, to the best of my knowledge, was, I think, the highest we ever paid to Louth from Adelaide by the river.
3438. Do they charge a greater amount on the river for wool than for the class of goods you have mentioned? I cannot say that—I know very little about the wool freights on the river—but I think so.
3439. We were informed that the freight for wool about Louth amounted to about 50s.? Wool is very much more bulky.
3440. But still they get a bigger load of it? Yes; I cannot say anything positive about that, and therefore will not hazard an opinion.
3441. How long ago is it since you got your last lot through that way? Between eight and nine years.
3442. If the Railway Commissioners are anxious to draw traffic from Wilcannia, would it not be possible for them to impose rates similar to those which are now in force at Bourke, for the purpose of competing against the river for traffic? It is quite possible for them to do so, but I do not think that on broad lines the railway could ever possibly compete against the river for traffic, excepting at a ruinous loss of income.
3443. For a considerable distance down the river from Bourke, the Railway Commissioners are now drawing wool, and sending supplies by the railway; according to your theory, they must be doing that at a loss, because they are successfully competing against the river for a considerable distance down? Of course it lands one in the alternative of two positions—either those who are not similarly circumstanced are being fleeced inordinately, or the Railway Commissioners are losing money.
3444. In regard to the lower-class goods, do you think there would be any probability of the traffic going the same way as you said the higher class goods would go? No. Classes two and three, I think, would go by the river, but the lowest classification goods would come from Sydney. Practically class 2 is wiped out on the railway by the truck arrangement. The margin between is so small that practically there is no difference. I think, however, that even the lower-class goods would be landed more cheaply from Melbourne or Adelaide, as far as Cobar.
3445. Class 1, which is the lowest, includes all the heavier lines, does it not? Class 1, I think, would also go that way, because there is not much margin between £6 5s. 8d. for class 1, and £7 10s.
3446. Truck-loads of chaff, sugar, kerosene, galvanised iron, and fencing wire are brought to Cobar for £4 10s. per ton, which includes a local rate between the main line and Cobar? Yes; that is inclusive of the local rate.
3447. Therefore, if the proposed line from Cobar to Wilcannia were constructed, there would be no probability of retaining the local rates with any success? Then that class of goods would certainly come from Sydney, even if the proposed line were constructed, because, unless there was some really good margin, no one would dream of ordering goods from Melbourne, and taking the risks of the river, when they could get them up so quickly from Sydney. I am speaking only of classes 1, 2, and 3—certainly classes 2 and 3.
3448. We were informed at Wilcannia that, judging from the amount paid now in freight and insurance—leaving out of account delays and loss of interest on capital while wool was in transit—a very large proportion of the wool would go Sydneywards at a through rate approximating to what is now being charged at Bourke; bearing that in mind, if the river steamers were to have taken from them that heavy traffic of wool, and the class of goods you have just mentioned as being likely to come from Sydney, would the steamers be so likely to carry the other and smaller portion of the general traffic at the rate you have spoken of;—if you were to take away a large proportion of their traffic, is it likely that the steamers could carry the remainder so cheaply on the river? Perhaps not; but I do not think that the construction of the proposed railway from Cobar to Wilcannia would affect in any material degree the present destination of wool, because the margin between the low rate that is paid at the present time for carriage by teams, and the railway rate of carriage, as based upon its present freight, is so small that there is no inducement for consignees to alter the destination of their wool. I may add that I know that goods have been carried from here to Marfield at £2 5s. per ton by team, and I question very much if the railway would carry from Wilcannia to Cobar for £2 5s. a ton.
3449. But the railway, while probably charging a high freight between Wilcannia and Cobar, would probably also carry to Sydney at a very slight increase on £2 5s., because, in a long haul, the railways carry very cheaply; they have delivered sugar at Bourke at £3 a ton freight? But that is practically a monopoly. I do not think that can be fairly used as an argument, because it is absolutely a monopoly which very few men could operate upon, because they must get up 200 tons at one time to be able to take advantage of that rate, and 200 tons of sugar at the minimum price for whites, say £17, equals £3,400 on a thirty days' purchase, a deal confined to one firm in the west, only, and can have no general application, and is absurd as an argument.
3450. It is beyond the scope of most men's business? Yes.
3451. But it is always true that with railway freights you can do a long haul at much less, proportionately, than a short one? Not now, practically, for at Cobar we pay more proportionately at the end of the line.
3452. But, supposing through rates be applied, you can do a long haul more cheaply than a short one? Yes. We have competed here against the existing branch line from Nyngan to Cobar, by bringing goods from Girilambone and Coolabah, on the main line, across by teams, and by that means have landed goods here from the main line at less cost than we should have had to pay for carriage from Nyngan to Cobar.
3453. That would go to show that the local rate from Nyngan to Cobar is a disadvantage to the Railway Commissioners rather than an advantage to them? They have reduced their figures considerably since then.

Neil Morrison, auctioneer and commission agent, Cobar, sworn, and examined:—

- N. Morrison. 3454. *Mr. Shepherd.*] How long have you resided at Cobar? Over nineteen years.
- 16 Oct., 1899. 3455. Are you thoroughly acquainted with the country between Cobar and Wilcannia? Fairly well acquainted with it.
3456. Will you favour the Committee with your opinion as to the benefits that would be likely to accrue to the country between Cobar and Wilcannia from the construction of the proposed railway? The benefits that would accrue, so far as the country between Cobar and Wilcannia is concerned, would be the

the providing of means for receiving and despatching that which they require more cheaply, conveniently, and regularly than at the present time. The railway might also cause settlement in some places along the track between here and Wilcannia, and, therefore, an increase of population to a small extent.

N. Morrison.  
16 Oct., 1899.

3457. Do you think that the railway would be likely to induce settlement, in the shape of homestead leases, between here and Wilcannia? Yes, in some parts. The whole of the country is not fit for small settlement, but there are parts likely to be occupied.

3458. What do you think would be a sufficient area to support a family? That would depend greatly on what means they took in hand for their support—grazing or agriculture. I do not think there is very great benefit to be derived from the country. They might make a living such as people do in other parts, or, perhaps, a little more, with areas of not less than 10,000 acres.

3459. Has cultivation been carried on to any extent between Cobar and Wilcannia? Not to any great extent; but there are several places where there are small farms just for growing fodder. People have not gone into the matter of cultivation beyond ploughing and chancing a crop.

3460. Have you any idea what the results have been? They have been fairly good in some seasons; in others they have had none at all. Sometimes they have had a very heavy crop. It entirely depends on the season.

3461. Prior to 1896, what do you consider the seasons have averaged;—how many seasons during the past ten years, for instance, have been considered fairly good? About six out of ten.

3462. Prior to 1896, did any large losses of stock occur? No, not particularly.

3463. Had there been a general increase up to that time? Yes, I think so.

3464. At what do you estimate the losses since 1896? I consider that the losses have been, generally, 50 per cent—making allowance for the increase that there ought to have been, but has not been, and the fatality amongst the living stock.

3465. In the event of the proposed railway being constructed, do you think that it would facilitate the removal of stock, in bad seasons, to better pasture? Yes; it would be taken advantage of in that respect, in my opinion. There are places from which, if the season become very bad, there is no possibility at present of getting the stock away. The only chance of keeping them alive is by means of tree fodder. Water is scarce and grass is beyond reach altogether, so far as droving sheep or any other stock is concerned. But the lives of a great number might be saved if there were a railway by which they could be trucked to other parts at once. In many instances that is now being done about here.

3466. Do you think that the stock-owners would be largely benefited also by being able to send away by means of the railway smaller quantities of sheep than they can send away under existing conditions? I do think so. As things are now, unless stock-owners have a large mob which they can take away by road, it does not pay them to take any away. Two hundred or three hundred sheep might be sent away by truck and pay, when it would not pay to take them away by any other means. You may have ten head of good cattle which you cannot take away, and which you try to keep alive, and the result now is that you have only their bones left; whereas, if a truck on a railway were available, 60 or 80 miles west of Cobar, they might be put into a truck and taken to a better part and disposed of.

3467. If the proposed railway were constructed, do you think that it would be largely availed of in the face of the river being rendered permanently navigable? Yes, I do; so far as the requirements are concerned. Of course, there is not a very large population, nor a very great demand, between here and Wilcannia; but I think that rather than depend on an uncertain river, people would take advantage of the railway in preference to the river, in order to have quick transit of their produce, and a direct return from its sale; in fact, many people have actually told me that rather than risk their wool being left twelve months on the river, they would pay a higher freight to get it to market and get their money back.

3468. They would rather pay extra freight by rail? Yes. It is a very common thing for men to have to wait six months for returns on their wool when they send it by the river.

3469. Have you any idea of the average period the river is navigable, leaving out the last four years? Yes; I think you might get it navigable three months in the year pretty regularly. There are seasons in which you might not get a navigable river for more than twelve months; but, on the average, I think that you may depend upon it about three months in a year.

3470. Have you any idea of the quantity of goods of various descriptions which are delivered from Cobar on the road to Wilcannia? No, I have not. There is not a very large quantity. They are taken all ways.

3471. Chiefly by coach, I suppose? To Wilcannia itself, I suppose, the greater portion of the light wares are carried by coach. They are taken in large parcel-post baskets, and the coaches are generally loaded three times a week with this class of goods. In many instances, cheese, butter, ham, and fruit are carried in tons by coach, at a high rate of freight. This also applies to the river coach line.

3472. Does any appreciable quantity of that find its way to Wilcannia? Nearly all of it; very little is delivered on the road. There are very few habitations on the road. You sight only one station in the whole of the distance from Cobar to Wilcannia. There are branch roads running to the stations; but on the main road there are hardly any residents, and the goods are generally carried directly to Wilcannia. Light wares, such as clothing, drapery, and hats, go in great quantities right through to Wilcannia, and even to Broken Hill.

3473. I suppose that this railway would absorb all that goods trade, except, perhaps, the post parcels? Yes. We often have to send forage by team, the rivers being very low for long periods.

3474. It is estimated that the cost of this railway would be £497,000, and the estimated traffic on the line comes to only £6,800 per annum, and the annual cost would be £27,300, leaving an annual loss to the country of £20,510;—can you see any prospect of the traffic on the line increasing to such an extent as would justify the expenditure of this money? No, I cannot, just now. I do not think that the line would anything like pay for the next ten years.

3475. Can you see any prospect of the improvement of the country? Yes.

3476. Supposing that the proposed railway were constructed, do you think there would be a large increase of population or trade sufficient to justify the country in going to this large expenditure? No; I do not think there would be a large increase of population on this particular branch. I believe that as a national concern it might be looked upon as a paying one in the future, but not in the near future.

3477. What is your opinion about the pastoral capabilities of the holdings;—do you think they are likely to be thoroughly resuscitated, or do you think they have been permanently injured by rabbits and droughts? They

N. Morrison. They have been permanently injured, there is no doubt about that, and their recovery is very doubtful. During the heavy droughts and the destruction by rabbits of all smaller fodder, edible bushes and such like, a terrible raid has been made on all the larger scrub, and it has become scarce—such as mulga—and unless the country should recover natural fodder by grasses and so on, so as not to interfere with the scrubs for a few years, it will not have any chance of recovering; but if we get three or four good seasons the scrub will recover. The rabbits have ringbarked the smaller scrubs which were so plentiful in this district, and have finally killed them.

16 Oct., 1899.

3478. Has not a great deal of the edible scrub also been killed by cutting down? Yes, the larger scrub has; but the smaller scrubs, which the rabbits have destroyed, were only cropped by the stock, and that did them no harm. The rabbits, however, have killed those as well as the large scrub.

3479. And the scrub that is useful for feeding stock cannot well be resuscitated by seeding, because the rabbits eat the young plants? I do not think it can be. The matter is one to be judged by experience, but so far the scrub has been dead a couple of years. The seasons have of course not been very good, and it might grow again, but I doubt it. If the proposed railway were constructed, it might be the means of increasing traffic. I believe it would be, from Wilcannia and places beyond, such as White Cliffs, Broken Hill, and other places, from which people would travel this way, instead of going through the other colonies. The journey from Wilcannia alone, either way, at present, by the only means of travelling available, occupies two nights and a day, without resting on the road in any way. It is a bad road for water and everything else. The journey is a very disagreeable one. At such times as we had here last week we have many people in town from that direction—people and race-horses come even from White Cliffs and Broken Hill at present, although the journey is a very heavy undertaking. People have to travel to that part of the country, and, I think, that on the railway from Sydney the traffic would be materially increased by the extension of the railway to the Wilcannia district. I think also that the proposed railway would certainly be of benefit to Cobar. It would establish a connection with a place in regard to which we have no chance now, the river being the opposing factor. Some people may think it is a good thing to have Cobar a railway terminus; but I have always thought that if we were connected with Broken Hill by rail it would be a good thing for the Colony generally; but, of course, you have to look at the expense of taking a railway all the way to Broken Hill.

3480. Are you aware of any mineral deposits that have been discovered between here and Wilcannia, the development of which is likely to be assisted by this railway? Minerals have been discovered in small quantities, 60, 70, and 80 miles from Cobar, slightly north of the projected line; but there being no water, and people being at a great disadvantage in searching, the discovery has never come to anything. I believe that all the country about here is mineralised, so far as the ranges are concerned.

3481. What class of minerals has been discovered? Gold and copper. I have heard of other kinds of minerals said to have been discovered in the district; but I have seen only those two in quantities.

3482. *Mr. Watson.*] Do you think, then, that there would be any greater probability of prospecting being gone on with if the proposed railway were constructed? Yes, I think there would be every probability.

3483. It would give the prospectors a greater chance of getting cheap supplies and so on? Yes. The construction of the line would mean a lot of men going into the district who associate themselves with that calling, and in their leisure hours they might see something that would induce them to go further, and there is no doubt that the country would at any rate be prospected.

3484. That is not the case at the present time? No; it is quite impossible.

3485. From your own knowledge, do you think that as regards minerals the district is likely looking country in places? Yes, a large tract of it is very likely looking country.

3486. I believe that you, with others, have sent out prospecting parties occasionally? Yes.

3487. Was that to the country between here and Wilcannia, or further on? I have had something to do with prospecting between here and Wilcannia, and also beyond Wilcannia. I have sent out a man or two now and then to have a look at matters in the direction of Wilcannia, and on one occasion I made arrangements to send a party beyond Wilcannia; but after searching a week or two they could not get any water. They came back with a good report, but the undertaking was too great to go any further with, and we abandoned it. In many other directions—east, north, and south—I have been associated with parties, on several occasions, in sending men a distance of 70 or 80 miles to search for minerals, and in some cases we have been very successful, and in others we have had to give it up.

3488. Generally speaking, you consider there is a large area of mineral-bearing country between here and Wilcannia? Yes; there is a large area of it.

3489. Is any mining now going on at Gundabooka? Yes; some of those mining there are parties from Cobar.

3490. Their work, so far, is largely in the nature of prospecting? Yes.

3491. Are the prospects encouraging? Yes; they are in one particular instance I know. Of course, we do not know much about each other's business. It is generally kept quiet.

Thomas Byrne, hotelkeeper, Cobar, sworn, and examined:—

T. Byrne.  
16 Oct., 1899.

3492. *Mr. Watson.*] You were formerly a resident of Wilcannia? Yes.

3493. Do you know the district well between Wilcannia and Cobar? Yes; I know better the district west of the Darling—in the direction of Broken Hill and Mount Browne—but I have a fair knowledge of the district between here and Wilcannia.

3494. Do you know the proposal before the Committee—to construct a line of railway from Cobar to Wilcannia;—do you care to express a general opinion as to the advisableness of doing that, from a national point of view? I do not think that at present the line would pay. The country between here and Wilcannia is very sparsely populated, and I think that the population there is not likely to be increased very much, even with a railway, for some time to come. That country seems to me to be much poorer than the country west of the Darling. I think that west of the Darling population would be increased by the construction of a railway from Wilcannia to Mount Browne and Nuntherungie.

3495. The population there would be mainly a mining population? The pastoral country there as well is better than the pastoral country on this side of Wilcannia.

3496. But I presume that you would look to mining for your main development west of the Darling? Yes.

3497. In respect to what particular class of mining would you expect the development to occur? All classes. There are opal-mining, copper-mining, and, at Mount Browne, gold-mining. T. Byrne.  
 3498. Would the proposed railway be of advantage to them? Certainly. They have to draw their supplies now from wherever they can. When the river is open Wilcannia is a depôt for the supply of places west and north-west of that town. They have occasionally to pay exceedingly high prices when the river is down. 16 Oct., 1899.
3499. Have you been out Nuntherungie way? Yes.
3500. You have seen the copper "shows" at Nuntherungie? Yes.
3501. What is your opinion of them? I have a very high opinion of them. The ore is good, and seems to be payable.
3502. And railway communication would be a good help to that? Yes. I do not see how it is possible to develop it without railway communication.
3503. Do you think that the proposed railway would have any reasonable chance of competing against the river when it was fit for navigation? I am certain that so far as traders are concerned they would make use of the railway in preference of the river, because of the delay and uncertainty of the river. It would be only people like Rich & Co.—in a very large way—who would avail themselves of the river. I lived in Wilcannia for eighteen years, and I should prefer to pay a great deal more freight in order to get goods regularly. I have had goods stuck on the river for two years at a time, and eventually they had to be sold where they were.
3504. You say that you would not expect the proposed railway to pay for some time to come? No. The prospect between here and Wilcannia is so poor that I do not think the railway would pay for some time to come. I do not think that the population between here and Wilcannia would be very greatly increased.
3505. Would not this railway lead to a larger number of people taking up small pastoral holdings between here and Wilcannia? From my general knowledge of the country between here and Wilcannia, I do not think that a great deal of it would be taken up. No doubt a little would be taken up.
3506. You do not anticipate, then, that the traffic between Wilcannia and Cobar would be of a heavy character? No, I do not. Still, I think there would be a fair amount of traffic in wool, and also in stock. The railway would afford great facilities to squatters, especially in times of drought, to get wool away, and also to get stock away in smaller quantities than it would pay them to send in any other way.
3507. It has been suggested that, instead of building a railway of expensive construction, something in the nature of a light tramway, suitable for only a low rate of speed, would be sufficient to meet the requirements? I think it would. I believe it would answer the purpose.
3508. You do not think there would be any necessity for a very high rate of speed? No, I do not, so long as the people had regular communication. That is all they want.
3509. A big saving in capital cost is a consideration that might influence Parliament in adopting a scheme? Yes. I think a light line would answer the purpose just as well.
3510. The country is fairly level, is it not? Yes. It is fairly level, you may say, from here to Tarrawingie, which is a long way past Wilcannia.
3511. You think that the people of Wilcannia and the people living north and west of that town are deserving of consideration in the way of better means of communication than they have now? Yes, most certainly they are.

John Leah, Council-clerk, Cobar, sworn, and examined:—

3512. *Vice-Chairman.*] You are Council-clerk of Cobar and also legal manager for some mining companies at Cobar? Yes. J. Leah.  
 3513. How long have you resided in Cobar? Twenty years. 16 Oct., 1899.
3514. From your long residence here, you have an intimate knowledge of the country to be served by the proposed railway? Yes, I have.
3515. Would you indicate to the Committee in what way the construction of the railway from Nyngan to Cobar has affected the general prosperity of this district? Yes. Had the railway not been constructed to Cobar, the Great Cobar Copper-mine would have been shut down—it could not have been worked in such a way as to pay. None of the gold-mines could have been worked. The mines could not have got their machinery, and the development of the field could not possibly have gone on, the ore then being raised being of so low a grade. The railway coming to Cobar enabled the Great Cobar Copper-mine to get coke to smelt their ore, and to get new machinery, which they could not have got with land carriage and without a railway. As a matter of fact, it would have been impossible for the Great Cobar Copper-mine to work without a railway, as no teams could have carried the coke they required. The railway has also induced a cheaper method of treatment by enabling that company to send their metal in the shape of mattes to be refined at Lithgow. It has also enabled the Cobar-Chesney mine to open up their copper deposits, and treat their ore, which otherwise would have had to lie idle. As regards the development of the town since the railway was opened, I may say that the annual value of the property here in 1892, when the railway was opened, was £10,824. For 1899 it is £21,647. That is to say, it has increased twofold. I estimate that the population has increased two and a half times in that period.
3516. Has the effect of the Nyngan to Cobar railway upon the mining industry been confined solely to mines in Cobar and its immediate vicinity, or within 50 miles of it? No, it has not. That railway has enabled the Nymagee Copper-mine to be worked to advantage—to be re-opened after being closed down, and to employ about 300 men at the present time. The distance of Nymagee from the Nyngan-Cobar railway is 46 miles by the road.
3517. Seeing there is every indication that the district around Wilcannia is highly charged with minerals, do you think it is reasonable to expect that a general development in population and in prosperity would follow an extension of the railway from Cobar to Wilcannia, in the same way as it has followed the opening of the railway from Nyngan to Cobar? Yes, provided that there is the same quantity of minerals, or something approaching it; with this exception—that the new railway would have the river to contend against at Wilcannia.
3518. In other words, the proposed railway would give equal facilities for the development of mineral country, if it exists, near Wilcannia, as have been given here by the extension of the railway from Nyngan to Cobar? Yes; it would not only do that, it would also assist the main line by bringing into use coal and coke from Lithgow, and would thus assist in developing another industry. 3519.

- J. Leah. 3519. That is to say, besides providing local facilities for local traffic, you are of opinion that the railway from Cobar to Wilcannia would also act as a feeder to the main trunk line of this part of the Colony?  
 16 Oct., 1899. Yes.
3520. Would you indicate to the Committee in what way the railway from Nyngan to Cobar has affected pastoral properties along that line, and within a short distance of Cobar? I am not able to say in what way it has done that, except that it has given them cheaper railway carriage; but it has opened up the country between Nyngan and, at any rate, Hermidale, 29 miles from Nyngan. A lot of small holdings have been taken up, and agriculture has been gone in for at a good many places along there.
3521. Do you think that the progress of settlement in the way of small holdings has been retarded during the last four or five years by the persistent drought? I am certain it has.
3522. Is it reasonable to anticipate that along the Cobar-Wilcannia extension there would be an increase of settlement in the way of small holdings? I think that undoubtedly there would be—given fair seasons; but if we get four years more like the last four years, no one is likely to go in for increased settlement, for, as a matter of fact, those there now cannot make a living.
3523. What agricultural operations have been carried on between Cobar and Nyngan? I think there are about eight or nine different holdings, the owners of which, in a fair season, have made a living by growing wheat and cutting it for hay and chaff.
3524. Can you offer an opinion as to the relative character of the land between Nyngan and Cobar on the one hand and of the land between Cobar and Wilcannia on the other hand? I think that one is practically the same as the other, but the rainfall is a little better at Cobar than it is further west. The average rainfall at Cobar for the seventeen years terminated at the end of 1898 was 16·27. The lowest rainfall during those years was in 1888, when it was 5·29; the rainfall ranging from that 5 inches up to 31 inches, the highest. Taking the twelve months just passed—part of 1898 to September, 1899—the rainfall has been about the same as it was in 1888, with this difference: on either side of 1888 there was a fairly good year. On one side the rainfall was above the average, and on the other it was up to it.
3525. Would you care to offer an opinion as to whether the land between Wilcannia and Cobar is of such a character that with fair seasons a holder of (say) 10,000 acres would be able to carry on a little agriculture together with a certain amount of sheep-raising? I think he could in fair seasons.
3526. Do you think that that area is sufficient along that route to afford a man and his family a decent living? I do not think he could do with less than 10,000 acres.
3527. Do you think that an area of 10,000 acres is sufficient? Yes; but even with 10,000 acres no poor man would be able to go on the land, for he would have to make improvements in the shape of water.
3528. Can you state whether much of the resumed area in close proximity to the railway from Nyngan to Cobar has been taken up since the construction of that line? Yes; a good deal of it. As far as Hermidale very little of the land available, where the line goes through the resumed areas of the runs, is not taken up now.
3529. Can you say whether that increase in occupation has been mainly due to the construction of the railway from Nyngan to Cobar? In a great measure it has. The scrubbing by the West Bogan scrubbers has assisted it since; but the opening of the railway was the main cause.
3530. Do you think that a similar result would follow from the extension of the railway from Cobar to Wilcannia? It would, near the towns.
3531. The present proposal is to build a line which, though called a light one, would cost something like £2,400 a mile up to the Talyawalka Creek;—do you think that the wants of the district would be met by the construction of a much lighter line, at much less cost, with a speed of about 10 miles per hour? Yes, I do.
3532. Would such a line, while coping with all the available traffic, give all the main advantages which a railway usually confers on a district? Yes; for that district; because, at present, the people there have no facilities at all. It is necessary to make either a railway or a road there, and I think that the railway would cost about the same as the road. If a railway had been open now to Wilcannia it would have got a lot of the Broken Hill traffic.
3533. You have had considerable experience in forwarding goods in this district? Yes.
3534. And you are of the opinion that the character of the road between Cobar and Wilcannia has considerably hampered the transmission of goods west of Cobar? It has altogether blocked it, except in exceptional cases.
3535. Can you state whether a good road could be constructed at a moderate cost, or not? It could not.
3536. Do you think that a railway from Cobar to Wilcannia would offer the pastoralists of this district facilities for the carriage of fat stock? Yes, it would.
3537. Would the severe losses which are usually experienced in times of drought, in this western district especially, be minimised by the running of this railway? Yes, they would. Pastoralists would be able to get their stock away sooner.
3538. Can we reasonably expect that such traffic would form a fairly large item in the returns of this railway? Yes, I think it would.
3539. At present, owing to the long distance from a market, and the absence of quick communication, pastoralists are unable to send any except large consignments of sheep to market;—would this railway enable them frequently to dispose of small lots of fat stock? Yes, it would.
3540. You indicated, in replying to a previous question, that it might probably happen that the river Darling would be a serious competitor against this railway? Yes, in certain cases.
3541. Would you explain that in detail;—in what lines? The river-carriage is cheaper for the distance. As regards the carriage of the class of traffic likely to go to a mining district, the river could not compete against the railway, neither could it compete against the railway as regards the carriage of produce. This railway would be made use of for special class traffic—that is, as regards produce, coke, and coal, or matie—in regard to which no river could compete against a railway; and for a great portion of that distance I think that, if the Railway Commissioners were to make the concessions they make below Murtee, we might secure the whole of the traffic. I mean that they would have to treat this railway as they now treat the Bourke line.
3542. If the same policy were pursued with respect to the freights on the railway from Cobar to Wilcannia as has been pursued at Bourke, would this railway then secure the bulk of the trade? I think it would.

3543. With respect to the carriage of wool, is it to be feared that the river would prove a serious rival to the railway, presuming, of course, that the same arrangements were made in the case of the Wilcannia railway as have already been made at Bourke? No; I think that the river, instead of taking traffic from the railway, would bring traffic to the railway. I may mention that in this district, close to the route proposed for this railway, there is any amount of ballast, and that the line would tap a district which would supply firewood for the mines—which is a very important item. There is a big traffic in firewood here now.

J. Leah.

16 Oct., 1899.

Halbert James Edgar, hotelkeeper, Cobar, sworn, and examined:—

3544. *Mr. Watson.*] You were formerly owner of Mulga Downs station, about 60 miles from Cobar, off Wilcannia road? Yes. H. J. Edgar.

3545. How long have you been a resident of the district? Since 1881.

16 Oct., 1899.

3546. Do you think that this proposed railway would be of any material benefit to the people between Cobar and Wilcannia? I think it would be of great benefit to them.

3547. In what way would it serve the pastoralists? By enabling them to get their sheep away. Sometimes they have 1,000 or 1,500 fat sheep, which it would not pay them to drive to the railway at Cobar. But if this railway were constructed they could truck those sheep to Sydney. When I was at Mulga Downs I often had 1,000 or 500 fat sheep which I could have sent away if I had had a railway within a reasonable distance; but it would not have paid me to travel them to Nyngan, and put them on the line there. The distance to Nyngan from Mulga Downs was too great, and the sheep would have been only stores when they reached there. It is only in exceptional years that a man can travel fat stock a great distance in this district, and maintain them in a fit condition for the market.

3548. And does it sometimes occur that although the season is not favourable enough for travelling sheep a great distance, they are fat on the station? Yes.

3549. In the matter of supplies, would this railway be of any benefit to the pastoralists? I think so, and also in getting the wool away. They could get the wool away more quickly, and could also get station supplies easily and quickly.

3550. And more cheaply than by road-carriage, do you think? Yes, I think so.

3551. Mr. Harper, the Railway Traffic Manager, estimates the charge for the carrying of wool over the projected line from Wilcannia to Cobar at 13s. a ton, with, I suppose, a proportionally smaller charge from any point nearer to Cobar than Wilcannia is;—do you think that that rate would permit of teamsters competing against the railway? No; I do not think that they could compete against the railway with that rate.

3552. Even in a good season? Yes; I do not think they could compete against the railway, even in a good season.

3553. Therefore, a saving of the difference between the present charge for the carriage of wool and that amount would accrue to the pastoralist, and also a saving on the cost of the carriage of his station supplies? Yes.

3554. Can you say what the cost of carriage now is from any particular point you may care to mention along that route? From Fulham to Cobar the charge at the present time is £2 10s. a ton.

3555. How far is that? The way the teamsters have to go, the distance would be 100 miles, I think.

3556. Of course, in a good season the charge would be lower than that? Yes.

3557. What would be the minimum charge in a good season? I do not think that the teamsters could do the carrying for less than £1 per ton, even in a good season. Carriage has never been less than £2 10s. in good seasons.

3558. And it is proposed that this railway should carry twice that distance for 13s. a ton? Yes.

3559. If this proposed railway were constructed, do you think there would be any development in the way of smaller holdings, and therefore a larger population along the route? I daresay there would be. I suppose that, if there were a railway along there, some people would be trying if they could do any good with the smaller holdings.

3560. Do you think that there would be a greater probability of a man being able to live on 20,000, 30,000, or 40,000 acres, with a railway, than is the case at the present time? Certainly, a man might be able to live on that acreage if he had a railway.

3561. What was the area of your holding at Mulga Downs? Sixty-four thousand acres.

3562. Taking the general average of the country in that direction, do you think that if a man had a railway within a short distance of his holding, he could make a living on 50,000 or 60,000 acres? Yes, unless the seasons became too bad altogether.

3563. Assuming he had average seasons? Yes; I think he could then.

3564. There seems to be a general impression among the people whom we have examined that 10,000-acre blocks are rather small for this class of country, away from the river frontage? Yes, rather small. I do not think that anything under 20,000 acres would be sufficient.

3565. But if we could get men to take up every 20,000, 30,000, or 40,000-acre block out there, that would mean a large population in the district, with those men and their families? Yes, it would.

3566. I understand that there is a fairly large area of land in that direction which is now open as resumed area? Yes.

3567. And, consequently, there would be no necessity for resumption, in order to provide land for settlement, if this proposed railway were constructed? No.

3568. As one with some experience in pastoral matters, do you think that a man could afford to pay the State a higher rent with a railway than without one? Certainly, he could pay the State a higher rent with a railway than he could without one.

3569. Therefore, it is possible that, although the direct loss, or apparent loss, on such a line as this, might be fairly large, the indirect gain to the State from increased rentals would be fairly considerable? Yes, it might.

3570. And go to make good the loss which the Railway Department might suffer? It might. It just depends on the season.

3571. Are there, to your knowledge, any indications of mineral deposits near the route of the proposed railway? Yes. Gold has been found as far as Bulla, in the ranges to the left of the route proposed for this line, and at Mulga Downs I got a nice little prospect. It was a piece of quartz picked up on the side of the hill at Mulga Downs.

3572.

- H. J. Edgar. 3572. In what class of country was that? Slate on its edge.  
 3573. That is looked upon as likely to contain gold? Yes.  
 16 Oct., 1899. 3574. Were there any indications of copper or of other minerals anywhere in the vicinity? I have heard that south of Mulga Downs specimens have been found—on Barnato run. During the time I was at Mulga Downs a good many prospectors came, but because of want of water they could not stay there.  
 3575. The late Mr. Wilkinson, when Government Geologist, expressed the opinion that a good deal of the country between Cobar and Wilcannia was likely to prove metalliferous,—but that as it had been covered over by alluvial deposit it might be difficult to discover the whereabouts of the lodes;—it would, however, appear from what you say that all the country is not of that flat alluvial description, but that some of it is broken and hilly, and it is quite possible that other outcrops might be found? Yes.  
 3576. Do you know sufficient of mining matters generally to be able to express an opinion as to whether any of the country between here and Wilcannia is likely-looking country, broadly speaking? Yes, it is very likely looking for mineral.  
 3577. And this railway would probably lead to a closer prospecting of it than has been the case up to the present time? Yes, it would.  
 3578. When you were at Mulga Downs did you attempt any cultivation there? No, not personally. Just prior to my leaving Mulga Downs I did prepare a paddock for cultivation, which my brother, who succeeded me, cultivated, and got a good crop from. That country will grow anything, if you can get a rainfall. I have seen a crop at Bulla Bulla, near Jacob's Well—at the time Mr. Campbell was there—which was as nice as anything I have ever seen in the district; indeed, it was a very nice crop.  
 3579. Do you think that ordinarily the rainfall is sufficient to justify a man putting a certain proportion of his land under wheat? Yes. If he could get (say) 12 inches, and if the rain fell just at the time he would like it to fall, 12 inches would be enough for a crop.  
 3580. I mean, do you think that a man with a 10,000 or 20,000-acre block, engaged mainly in pastoral pursuits, would be justified, in view of the average rainfall, in putting in several hundred acres for crop,—assuming he had facilities for getting it away? Yes, I think he would.  
 3581. Therefore, if the proposed line were constructed, we might expect, you think, concurrent with smaller pastoral settlement, a certain amount of development in agriculture? Yes.  
 3582. I understand that you are well acquainted with the land for 100 miles from Cobar? Yes.  
 3583. How would you describe it generally—as good land or poor land, or what? It is land in places which, if it were grubbed, would be good land. There is a lot of good land, although there is some hilly country. Any of the flat-lying land would grow crops.  
 3584. Is not some of the rising ground, where the pine is, good land also? If it were ringbarked and scrubbed it would grow grass. The pine, sandy country, with a fair rainfall, will grow splendid crops.  
 3585. At present there is not a great deal of direct goods traffic between Cobar and Wilcannia, is there? I do not think there is any at all, except by the mail.  
 3586. I suppose that one reason for that is the fact that there is no permanent water along the track, except at the Cobar end? That is all—Government tanks. From Jacob's Well into Wilcannia teams could not travel.  
 3587. There are no Government tanks between Jacob's Well and Wilcannia, nor any other wells? No.  
 3588. The last Government tank towards Wilcannia is Bulla tank? Yes.  
 3589. Do you know of any reason why the Government did not complete the chain of tanks to communicate with Wilcannia? I do not know.  
 3590. Pastoralists who might desire at present to bring their sheep in towards Cobar, if their stations were beyond Bulla, would have to rely on private owners for any water they might be able to spare? Yes.  
 3591. And I do not suppose that, in these later dry seasons, they would have been able to spare much? No.  
 3592. So that, in default of a railway being constructed there, there would appear to be a necessity to put down a sufficient number of tanks to complete the line of communication? Yes.  
 3593. *Vice-Chairman.*] Can you state whether the absence of a railway, while you were occupying Mulga Downs, was so serious a handicap as to lead to your abandoning the holding? It was partly the cause; and the rabbits.  
 3594. With railway facilities for getting away small consignments of stock, you would practically add to the carrying capacity of the run, would you not? Yes.

Robert Kinkead, storekeeper, Cobar, sworn, and examined:—

- R. Kinkead. 3595. *Mr. Shepherd.*] How long have you been in Cobar? Going on for twenty years, I think.  
 3596. You are aware of the proposal for the construction of a railway from Cobar to Wilcannia? Yes.  
 16 Oct., 1899. 3597. Have you given it any consideration? Yes, I have taken it into consideration.  
 3598. Would you kindly make a statement in regard to this proposal? Personally, I should think that it would be a national benefit to have this line. It would bring us into contact with a very large population at Broken Hill, and also in touch with Wilcannia and White Cliffs; and I think it would be of great benefit in that way. Besides that, I think it would open up the country between Wilcannia and Cobar for closer settlement than there is at the present time,—not as things are at present; but if bores were put down, and artesian water were found, I have no hesitation in saying that you have as good country here as any other part of the Colony. Want of water is the great drawback. As to the benefit that some people think would be derived by Cobar from the construction of this line, I think it would be *nil*. In my opinion it would be rather injurious to Cobar; but I think that Cobar should not be considered in a matter of this sort at all, when by the construction of this line you would be benefiting the many.  
 3599. That is the proper way to look at it—from a national point of view? That is the way I look at it. As regards the description that has been given to you of the land between here and Wilcannia, I think that that land is very auriferous in places, here and there; and, therefore, that eventually the line might be the means of opening-up some gold-mines. Gold has been got out there, I know.  
 3600. Do you know the distance from Cobar of the locality where gold has been found? I think between 60 and 80 miles. Further on, I think that some gold has been got at Baden Park—100 or 120 miles from Cobar. Tintago is also a place where I think gold has been got.  
 3601. Do you regard the opening of this railway as likely to assist stockowners? Yes, I certainly do.  
 3602.

3602. In what way would it assist them? In times of drought it would assist them, and in good seasons they would have a means of sending their stock to market. It has been stated that artesian water cannot be found in the district, but we may yet find that it can be found.
3603. I suppose you are aware that experts have examined the country, with a view of ascertaining whether it is likely that artesian water will be found? I am aware of that.
3604. And they have given rather an unfavourable reply? Yes, I believe so. But, with due respect to those people, I am told that they gave the same opinion in regard to other places, and still artesian water has since been found there.
3605. What effect do you think this railway would have on Wilcannia? I think it should be the means of making Wilcannia a good town, by bringing back some of its old prosperity to it. I know, in reference to Cobar, that if we had not got the railway here at the time we did get it, we should not have been in existence now.
3606. Of course, Wilcannia is the principal town that would be affected by this railway? It would be.
3607. But how do you think that it would affect the transmission of goods;—do you think that store-keepers and others would be likely to use the railway in getting goods from Sydney, and transmitting wool and that kind of thing to Sydney, in preference to using the river? I certainly do think they would be more likely to use the railway—that is, were the rates to compare at all favourably with the river rates. I do not mean to say that they would give twice the amount to send the goods by the railway as they would have to pay to send them by the river, but they would have a more speedy and a surer transit by rail than by river. Sometimes goods are stuck up on the river for a long time.
3608. Are you aware what the cost of this line is estimated at? No; but I do not think that the railway would cost a great deal in construction. I suppose it would be a light line over level country, and would not cost very much.
3609. It is estimated to cost £497,000? Yes, but the distance is very long.
3610. And the estimate of income, so far, is £6,800 a year? I do not think the income at the start would be sufficient to pay the interest on the capital outlay.
3611. The annual cost is estimated at £27,310; that would leave the country at a loss of £20,510 per annum to begin with? I quite understand that.
3612. Do you think there is any reasonable prospect of the railway improving the condition of things to such an extent that this amount would be likely to be met within a reasonable time? I do. I have every reason to think so. In the first place, there would be closer settlement. The land is pretty good between here and Wilcannia, and the railway would be likely to get traffic from Wilcannia, and also Broken Hill and White Cliffs; and I think that things would improve, and the traffic receipts would most likely come up to the expenditure.
3613. You think, then, that the country would be justified in spending this amount of money? I do. I think this district has a right to be opened up. You are getting an increased population in the Colony, and you want a place to settle people in.
3614. Do you think that this railway would be likely to induce small settlers—homestead lessees, for instance—to take up small areas of country, from 10,000 to 20,000 acres? I think it would. The land is good enough; the drawback is want of water.
3615. Do you consider that the rainfall is sufficient to justify anyone in going in for agriculture? Not at the present time.
3616. Of course, we may look upon the last four years as exceptional—such as are not likely to occur again perhaps in a lifetime? I hope not. They were bad.
3617. What is your opinion about cheap lines—that is, constructing lines to go at a much less rate of speed than do those which we have at present—say, at the rate of about 10 miles an hour;—do you think that such a service would be acceptable to the people of this district? I think it would.
3618. Do you think it would be sufficient for them? I think it would be very much better for them than the mode of service by road which they have at the present time. A 10-mile an hour service should be very acceptable to them.
3619. A railway of that character could be constructed at much less cost, and possibly Parliament would be willing to vote the money required for the railway, provided its construction would not cost so much as the estimate given here? Yes.
3620. There is another question in connection with this railway—a very expensive portion of it is a bridge across the river at Wilcannia;—do you think that the town of Wilcannia, and the surrounding district, would be equally well served by the railway stopping this side of the river instead of crossing it? The town of Wilcannia would be as well served.
3621. The proposed site for the Wilcannia station is, I believe, about half a mile on the other side of the river, so the majority of the townspeople would have some distance to go to reach the station, even if the line were constructed as proposed; and if the alternative proposal as regards the terminus were adopted, they would simply have to cross the present road-bridge and go about half a mile on this side of the river; and the placing of the terminus there would effect a very large saving, which would reduce the estimated expenditure to a great extent? I think it would be better for the Wilcannia people to have the line terminate on this side of the river, rather than not to have the railway at all.

William Henry Bannister, butcher and homestead lessee, Cobar, sworn, and examined:—

3622. *Vice-Chairman.*] How long have you been in the district? For about twenty years. I think that the proposed railway, if constructed to Wilcannia, would be of immense good to the district in the same way as the line from Nyngan has been to Cobar,—for I firmly believe that if it were not for the construction of the railway from Nyngan to Cobar this town would hardly have been in existence at the present time. I also think that if the railway were carried through to Wilcannia,—although I must admit that at the present time the outlet is not very good,—it would have the effect of opening up an immense area of country, and would do a lot of good. Looking at the matter from a homestead lessee's point of view, I may say that very little land has been taken up by homestead lessees between here and Wilcannia, for the simple reason that at present they would have no means of getting their produce taken away. The distance to a railway is too far for the produce to be carted by teams, but if the proposed railway were constructed they could get their produce taken away the same as we do here, although, owing to the

W. H.  
Bannister.  
16 Oct., 1899.

bad seasons, the last few seasons we have had very little taken away. Looking at the proposal to construct this line from a stock-buyer's point of view, I may say that all last year and part of this I could have bought fat stock at Kallara and Mount Browne, and other places in that part of the country, if I could have brought the stock to Cobar by rail; but the country being in such a bad state, I had no means of getting them to Cobar. We could not drive them. A railway from Cobar to Wilcannia would induce people to take up a large quantity of land for homestead leases, because then they would be able to get their produce to market.

3623. What area for a homestead lease do you think is sufficient, with a railway, to enable a man to make a decent living for himself and family? Nothing less than 10,240 acres. We have proved that beyond doubt. I have 10,240 acres, and could not do any good with that area were it not for working it in connection with my butchering business.

3624. How far is your holding from Cobar? Seven miles.

3625. Is the character of the country in the direction of Wilcannia generally as good as the holding you have? It is about the same until you get nearer to the river, where the country becomes a little better. I have never been in Wilcannia, though I have been close to it.

3626. And you say that, even with 9,190 acres, you find it difficult to make a do of it? Yes; I think you could make a living on that area with a railway and anything like fair seasons.

3627. You said that, although you would have been able to purchase sheep at Kallara and Mount Browne, the difficulties of transit prevented you from doing so? Yes; I could not get them in.

3628. That state of things practically applies to every pastoralist some distance from the railway at Cobar? Yes.

3629. But if the proposed railway were constructed, small consignments of stock could be trucked and sent to the Sydney market? Yes. Pretty well all the stock I have had to supply to this town in the last eighteen months, has come by rail to Cobar, and, if the proposed railway had been constructed to Wilcannia, it would have been better for me to go that way rather than to draw my supply of stock from the other way. I have been getting it from Bourke and Bathurst—in fact from anywhere I could get it.

3630. Do you think that we may reasonably anticipate that those resumed areas near the route proposed for this railway would be taken up if the railway were constructed? I think so—as homestead leases, but not as homestead settlements. I believe that hardly any would be taken up as homestead settlements. The conditions are too severe, and people will not take the land up under the small area conditions, and put their money into it. This homestead settlement is not suitable for the Western Division. What applies to the Eastern or the Central Division will not apply to the Western Division, where you want a larger area and more liberal land laws for you to be able to do any good with the land.

3631. *Mr. Watson.*] Those resumed areas, about which *Mr. Dick* has asked you a question, have been open since 1884? Yes.

3632. And hardly any of them have been taken up? None have been taken up between here and Wilcannia, except odd ones.

3633. Broadly speaking, they are still vacant? Yes.

3634. So it would appear that if we wish to do anything with them we must give means of communication to people who are likely to take them up? That is my view of the matter. I believe that if this railway were made, a large number of those areas would be taken up, because people could then get their produce away. In a general way, I believe, this railway would have the same effect on Wilcannia as the Nyngan to Cobar line has already had on Cobar. I may also say that I think that all people dealing in stock, or having any produce to remove, would rather send it by railway even if they had to pay a little more than by water, because, although you pay a little more, you get your returns from your agents perhaps in a week, whereas you would have to wait perhaps a month or more if you were to send by water.

Henry Burt Welsh, manager, The Meadows and Kew stations, sworn, and examined:—

H. B. Welsh. 3635. *Mr. Watson.*] How many miles are your stations from Cobar? The Meadows is 42 miles from Cobar, and Kew is about 100 miles from Cobar.

16 Oct., 1899. 3636. You know of the proposal to construct a line of railway from Cobar to Wilcannia? Yes.

3637. Do you think that this railway would affect you in any way, beneficial or otherwise? Yes; it would be beneficial to us in every way, I think.

3638. Affording you a better method of getting rid of your wool, and also your fat stock, when you have any? Yes.

3639. And giving you a good way of getting your supplies? Yes; it would be to our benefit in every way.

3640. Have you had any losses on your stations during the recent drought? Not at Kew, because we have had no sheep there, because of want of water; but we have had losses at The Meadows, though not very heavy ones.

3641. But you have had one of your stations practically unstocked? Yes.

3642. And that of itself is a loss? Yes; especially when you have to pay a high rent for the land.

3643. Do you think that this railway would be of advantage to pastoralists by enabling them to get stock away, during a drought, to more favoured parts of the Colony? Yes; I think it would be, especially out towards Wilcannia.

3644. You think that, by that means, there would be a chance of saving some of the sheep which otherwise would be lost? Yes, in a really bad time.

3645. Where do you send your wool to at the present time? To Cobar.

3646. From both stations? Yes. We have had The Meadows for about twenty years, but Kew only the last two years, during which we have sent the wool from there to Cobar.

3647. You have always sent your wool in from The Meadows to Cobar? Yes.

3648. Have you shorn the sheep at Kew in either of the two years you had that station? No; we have shorn the sheep at The Meadows. We should have shorn them at Kew if we had had water, and then should have brought the wool into Cobar.

3649. Have you any resumed area on either of those runs? Yes; on The Meadows only. Kew is all leasehold.

3650. What is the extent of the resumed area on The Meadows? Sixty-four thousand acres.

3651. Do you think any of the country between Cobar and Wilcannia which would be served by this railway would be suitable for homestead leases, or for other smaller forms of pastoral settlement? Yes; I think a lot of it is, principally nearer to Wilcannia—that is, if the railway were constructed. 3652.

3652. You think that the taking up of land in suitable spots would be likely to follow the construction of the railway? I suppose it would. H. B. Welsh.

3653. Have you ever tried cultivation at The Meadows? Yes. We usually put in wheat every year, and in anything like a good season we get a crop. Although this season has been a very bad one, we shall be able to cut after the recent rain. 16 Oct., 1899.

3654. What do you anticipate you will get from it this year? We may get a quarter of a ton per acre at the very most.

3655. It will be worth cutting, at any rate? Yes.

3656. What area have you usually put in? We generally put in between 20 and 30 acres, but this year we have only 10 acres in.

3657. What has been your average yield? The yield varies a great deal. Sometimes we get an exceptionally good crop, but I suppose that it would average about a ton to the acre. We have had a great deal more than that.

3658. Do you think that you would be likely to go in for a greater area of cultivation if you had a railway adjoining the property? No, I do not think so; at any rate, not much more.

3659. Cultivation is not in your line, I suppose? No; the soil is good enough to grow produce, but rainfall is the drawback.

3660. We find every day that pastoralists are going in for cultivation, even in places that were considered, a little while ago, too far west for cultivation to be thought of there? Yes. We should be able to send a good deal by the railway from the two stations, in the way of fat stock and wool.

3661. You think that the construction of this railway would be of benefit to yourself and to the district generally? Yes; to everybody in that part. I may say that prior to our taking possession of Kew station cultivation was tried there, and some crops were taken off in fair seasons.

THURSDAY, 19 OCTOBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. |  
WILLIAM THOMAS DICK, Esq. |

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Charles Frederick Arno Thierman, mine-owner, White Cliffs, sworn, and examined:—

3662. *Chairman.*] I believe you have had a knowledge of that district, and between Wilcannia and Cobar, for the last twenty years? Yes, very nearly twenty years. C. F. A. Thierman.

3663. I believe that the evidence that you wish to give us is in reference to the mineral resources of that part of the country? Yes. 19 Oct., 1899.

3664. Will you kindly tell us, to begin with, your views of the White Cliffs district particularly, its resources, and the probability of its permanence as a mining centre? At present the most developed mines are at White Cliffs. The opal mines there went ahead because the produce of the mines could be sent away by the parcels mails. No coal, fuel, or timber was required. The produce of the opal mines can be removed very inexpensively.

3665. Will you tell us how the mines began to be developed? The original discovery was made by a party of kangaroo hunters. They wounded a kangaroo, and in catching the kangaroo they found some opals on the surface.

3666. When was that? Seven or eight years ago. Since then a number of leases have been taken up, and buyers have gradually come from the continental countries to buy up the products of the mines, and the opals have been brought into prominence in the market.

3667. Is it not within the last couple of years that the field has assumed large proportions? It is only within the last eighteen months or two years that it has become of importance.

3668. And during that time the population has considerably increased? Yes; there are between 2,000 and 3,000 people there now. I think there are probably 3,000.

3669. Can you tell us how many other claims there are being worked there? There are the old leaseholds which were granted by the Government in 40-acre blocks. There must be about fifteen original mineral leaseholds of about 40 acres each. Since those were issued the Government have altered the regulations, and they only allow areas of 100 feet square; but there is a very large number of such claims being worked under the present system. A block of 100 feet square is held by each miner.

3670. Can you give us any idea as to how many of them are being worked at present? Some hundreds.

3671. Can you give us an idea how many of them are being remuneratively worked? Opal-mining is a peculiar occupation. There is nothing on the surface to guide the miner. He merely sinks a shaft and takes pot luck. When he gets to a certain level he expects to strike "potch," and he follows it.

3672. What is "potch"? It is the opal matrix.

3673. When he strikes that what does he do? He follows it horizontally. They are all horizontal, with some few exceptions. Sometimes they strike upright, owing to a dislocation.

3674. How do the rich opals occur? The "potch" gradually begins to show up colour, either green or blue, and sometimes small sparks of red fire. Sometimes they have to follow it a long way, and sometimes they come upon it at once.

3675. Is there any rule as to the size of a rich, marketable opal? No, there is no guide. A miner may get £10 or £1,000 worth in a few hours, and a parcel of opals which he has found may consist of half a dozen qualities of opal. There may be a few ounces of exceptionally high value; then 10 or 20 ounces not quite so good; then a large quantity of inferior opal,—opals which are streaky and have not got a pattern.

3676. Then if a miner comes across one of these rich patches it may run out again? It always does. Then the miner just follows on the same layer again.

3677.

C. F. A.  
Thierman.  
19 Oct., 1899.

3677. At what depth do they get these opals? The greatest depth, to my knowledge, is something like 44 feet; but there are levels in some blocks only 6 inches under the surface; they are also 3 feet, 4 feet 16 feet, and so on. In some claims they find nothing until they get down 22, 24, and 26 feet. You merely go down through successive, horizontal layers of sedimentary rock.

3678. The greatest depth that you know at present is 44 feet;—is there reason to suppose that the opals cease to exist at that depth? No reason whatever. At a depth of 44 feet the rock formation becomes more soapy, and it is called soapstone. An exploration which took place quite recently, in deeper ground, shows that the opal matrix continues at greater depths; but there has been so much shallow ground available that there was no necessity to go into the deeper ground.

3679. Nobody has tested the ground to ascertain whether opals could be got at greater depths? Not yet. There have been some shafts sunk deeper, and one got some opal matrix, but there has been no opening-out work done.

3680. Has there been any expert at the mines, sent by Government to test the permanency of the field? The only scientific man who has been out there was Father Curran, and that was three or four years ago.

3681. Has the exploration for opals by all the miners there been a remunerative one. Yes. I think with most of them it was merely a matter of perseverance; they strike the opals sooner or later.

3682. Do you think, from the number of people working there, that it seems a permanent field? Yes. When I left there were, I believe, more men employed in getting opals than had been employed there at any previous time.

3683. Is it a kind of mining that can be carried on by individuals without the outlay of capital? Yes.

3684. They merely sink shafts and drive; and they have the ordinary hand-winding gear? They merely use the windlass. In most cases they paddock the stuff out.

3685. Do you know what value of opals has been taken out of the field during the last eighteen months? That is very hard to come at; but I know that Mr. Heydt (a countryman of mine) and his wife, are buying for the biggest opal firm in Germany. Their purchases amounted to something like £27,000 worth in five months.

3686. Are opals a commodity that varies in value? Yes, subject to fashion.

3687. Does that fashion affect the value of opals to any great extent? No. The fluctuations to which the value of opals is subject are principally brought about by the buyers when some very large finds all come together.

3688. You think, then, that it is the ring of buyers that largely affects the price? The buyers only, because at the present time there is only one opal field of importance in the whole world, and that is the White Cliffs field. The Hungarian and Mexican fields are nearly worked out, and the Indian opals have not nearly the fire of the White Cliffs opals.

3689. Is there any use for opals except for jewellery purposes? First-class opals very seldom get into the trade. There are many people in Europe on the look-out for first-class opals. Second-class opals are used for jewellery, and inferior-class opals are used for buttons for ladies' ball dresses, and for studs.

3690. So there is a variety of uses for opals, independently of their use for jewellery? Yes.

3691. Opals are used largely for other purposes? Yes; for ornamental purposes, for mosaic work, and articles are inlaid with opals; little card-cases and boxes are ornamented with them. They are used very much, especially on the Continent.

3692. Is there anything at the present time to indicate, with any degree of certainty, that this opal-field is a permanent one? Yes, undoubtedly. In the ground which is now worked there are years of production in sight. Only last year a field broke out 9 miles away from White Cliffs—the Bunker field. There are a number of men out there, and there is an almost unbroken formation between there and White Cliffs, which indicates that there are opals all the way.

3693. So that, as far as indications go, this opal-field is not confined to White Cliffs, but it extends a considerable distance beyond there? It extends northwards for miles. There have been opals found to the north as far as Purnanga and Momba pastoral holdings, about 25 miles north of White Cliffs. The same opal-bearing country extends right away towards Yancannia—that is, north and north-west.

3694. Then, according to your views, this opal industry in that district is likely to be a permanent one? Yes, undoubtedly. Sometimes, in case of a great war, the value of the opals is reduced; but that is only temporarily.

3695. Are there any other opal-fields besides those which you have mentioned in Germany and Hungary and India? There are opal-fields in Queensland. The Queensland opal is very brilliant; but it is so impure and so brittle that it is no good for the trade. You cannot get a pure gem in Queensland as you can at White Cliffs. At the present time opals are found at White Cliffs which have not their equal anywhere in the world.

3696. In the markets of the world, has this field already attained a notoriety? Yes; very much notice is being taken of it now. The Consul for Austria, in Melbourne, published a letter recently, on account of some Vienna firms that want to open up a trade in connection with the field.

3697. Independently of the lady and gentleman you have mentioned, are there persons from other countries purchasing opals on the field? Yes, about twenty. Messrs. Hoffnung & Co. have a representative at the field; Newman, of Melbourne, has one; and numerous German firms have representatives there.

3698. So that the market for the minerals is necessarily confined to export buyers, who have to send the opals to jewellers to be treated? Lapidaries in Europe are represented.

3699. It is not an article that can be treated by the people who find it—opals must be treated by lapidaries? Yes; so far that is the case. Several attempts have been made to have the opals treated by a co-operation between the buyers and the lapidaries, but it has not worked well.

3700. Are there any other kinds of minerals in the White Cliffs district, where the opal industry is so flourishing? Yes; about 30 miles to the west of White Cliffs.

3701. Take the district you have mentioned as the opal-bearing district at White Cliffs, and the land away up to the north—are there any other minerals there? No; not where the sedimentary rocks exist.

3702. You think that the district you have mentioned as opal-bearing is confined to the gem only? Yes; that is, so far.

3703. You do not think there are other minerals in those particular places? They have not been found yet. At Momba there are igneous rocks coming to the surface where copper has been found, but the mineral has not been developed.

3704. Are you willing to say whether in opal-bearing country other minerals are excluded, as a rule? I think that district will be exclusively confined to opals.
3705. Now, will you tell us about other minerals to the west of Wilcannia and west and north-west of White Cliffs? About 30 miles west of White Cliffs a great north and south range runs along, which takes its starting-point somewhere to the south-west of Wilcannia, and it runs from there in a north-westerly direction through the western portion of Menamurtee, Gnalta, Nuntherungie, and Wonominta; thence to Ponto Hill, to the west of Lake Cobham; and from there to Mount Browne, Milparinka, and Tibooburra.
3706. You say there is a belt between Wilcannia, Nuntherungie, and Tibooburra—what width do you think that mineral country would be? At Nuntherungie it will be 4 or 5 miles wide.
3707. What character of minerals does it contain? Principally copper and silver.
3708. How do you know that? I did a lot of exploring out there. We hold a lot of mineral country at Nuntherungie—close on 1,000 acres.
3709. Is there a copper outcrop there? Yes; we have immense outcrops of copper. We have an outcrop there 100 feet wide, but it is poor ore. About 2 miles further north we have outcrops of far richer ore, but they are smaller—they are principally at Bunker Hill.
3710. Have you done any sinking? Yes. In the case of the copper-well we have sunk 110 feet, and we have driven 110 feet in, and got a fine vein of copper all the way. It is a gossan lode.
3711. As far as you have gone, are you able to say whether the vein would be of a payable character? Yes; I am very strongly of opinion that it is highly payable for copper.
3712. Have you had any of the ore treated? We have had no large parcel treated, but such tests as we have made show very fair results for copper.
3713. Does the silver you mention occur in connection with the copper, or separately? It occurs partly in conjunction with the copper and partly separate. But the silver-lode at a greater depth begins to show copper. We are down only 90 feet so far.
3714. Was the silver you have come across in small patches, with a big outcrop such as they have at Broken Hill, or is it a distinct kind of country? The silver occurs in large spar lodes; it is in the form of chloride.
3715. Have you had any of that tested? Yes. Four tons of it went about 75 ounces to the ton, and there was about 50 per cent. of lead.
3716. Was there any copper? It was taken out before we reached the copper zone.
3717. That would be payable, would it not? Yes; that could be obtained in large quantities.
3718. It would pay well? It will pay well immediately there is any kind of machinery on the ground. We are in treaty for that now.
3719. How do you get on with regard to water for mineral development? In the mineral leases which we have got there, there are four shafts down to water-level, and in at least two, the water supply is very considerable. We watered 3,000 sheep in a very dry summer, out of one shaft. That means several thousands of gallons a day, and it is probable the water will increase.
3720. Is the water pure or brackish? We are living on it; but it contains copper in solution.
3721. It could be used for machinery purposes? Yes. It does not contain anything that would corrode boilers.
3722. Is the district you have mentioned—White Cliffs and the belt between Wilcannia and Tibooburra—watered by the Paroo or any of its tributaries? No; the Paroo River runs north and south a considerable distance to the east of that district.
3723. There is nothing to water that dry country? No, only flood-waters. The creeks sometimes are raging rivers, and at other times perfectly dry. They are generally dry; but when they are in flood they are rivers miles in width.
3724. So that it would appear that to get a permanent supply of water for that district sinking must be relied on? Either that or excavation—either wells or tanks.
3725. Have they tried boring for water there? Not in that district exactly; but they have away out towards Mount Browne. About 36 miles to the south-east of Milparinka there is a bore which struck a heavy supply of water, but it does not flow. I believe they are going to put a pump into it.
3726. I suppose the belt you have mentioned as existing between Wilcannia and Tibooburra embraces what is known as the Mount Browne district? Yes.
3727. That has got the name of being a very rich mineral district? Yes.
3728. Do you believe in that? I do. But they have a battery out there which is in the wrong place.
3729. Is there anything besides copper and silver there? There is only gold at Mount Browne.
3730. You said something about the machinery being in the wrong place? The present machinery belongs to a syndicate at Milparinka, and was erected some years ago. It is in the wrong place altogether. There are large beds of gold-bearing cement out there which will pay well when communication is opened up between Milparinka and Tibooburra. At Mount Browne there is deep alluvial.
3731. Are the disadvantages with regard to the want of water and want of communication keeping the place back? Under present conditions, to bring gold-saving machinery out there would cost about five times as much as the machinery would cost from the foundry.
3732. I suppose under present circumstances it is almost impracticable to get machinery? Yes, until there are better means of communication.
3733. How far is Mount Browne from Wilcannia? It is 167 measured miles from Wilcannia to Milparinka.
3734. But supposing a railway were constructed to Wilcannia would that be practicable? I believe that if a railway from Cobar to Wilcannia were constructed, machinery could be got out there cheap, especially in the wool season, because teams would be carrying wool. They would take the machinery out and bring the wool back again.
3735. The country between Wilcannia and Milparinka is well watered with Government tanks? Yes. If you draw a line from Mount Browne eastward to Bourke, north of that you can get artesian water; but coming southward from Mount Browne, down towards Broken Hill, we seem to lose the artesian water; the water does not rise.
3736. But still water is got there? Yes, there is water.
3737. It would be necessary to raise it by pumping? Yes.
3738. From your knowledge of that north-western part of the Colony which you have described, and from your

C. F. A.  
Thierman.  
19 Oct., 1899.

C. F. A.  
Thierman.  
19 Oct., 1899.

your conviction that it is largely possessed of minerals of various kinds, do you think that without better means of communication it is impossible to get that part of the country developed, to do justice to its natural resources? The Cobar to Wilcannia line will open up that country.

3739. You think that without some further means of communication than there are at present, it is absolutely impossible to develop the natural resources of that part of the country? Not altogether. In good seasons the richer classes of ore can be sent away at a profit. That line would bring us into contact with the coal-field, and that would allow the treatment of immense quantities of medium and poor ores locally, and then the product could be sent away.

3740. The present disadvantages, and the very frequent occurrence of drought there, make the district almost uninhabitable? Yes. If Broken Hill had no railway communication, that town would be just in the same state.

3741. Seeing that that is such a dry corner of the Colony, do you think it likely that if the mines were largely developed, the stuff would be treated locally; or would the crude ore be sent away? Both. Crude ore would be sent away, and furnaces would be erected out there to reduce ores. Then the bullion would be sent away to the refineries, which would have to be either on the river Darling or at Lithgow.

3742. Would not the want of water militate against the use of machinery? No. We should have tanks and underground water. Close to the mines we have a very high sandstone range, and almost anywhere at the foot of that range, you can get water at a very shallow depth—you can get it a few feet from the surface. People sometimes think that that country is very badly off for water, but it is a better place for underground water than Wyalong—a great deal.

3743. Is it as well off for water supply as Cobar? It is better off than Cobar.

3744. There are proper tanks? Yes; there is a splendid tank close to my company's mines, a tank 25 feet deep, which contains 23,000 cubic yards, and held 18 feet of water when I left, after a tremendous drought. The station people were wishing that it would go dry, so that they might get the weeds out of it. Excavation for tanks is very cheap out there now, the charge being only 6d. per cubic yard.

3745. With regard to the railway project from Cobar to Wilcannia, do you think that that would be the best line to construct in order to tap that north-western corner? That would be a natural highway to open up that country. But there are other mines besides those to which I have referred. There is one on the Ponto Hills, between Wanaminta and Cobham Lake. It was discovered by a man named Sullivan. It is being developed at present by local people, and it is shaping very well. I saw it just after Sullivan had pegged it out, and it looked splendid.

3746. Then you are of opinion that in that part of the country to the north-west of Wilcannia there are minerals in very large quantities—opals, copper, silver, and gold? Yes. The railway would be practically the means of opening up that country, so that it could be profitably worked. It will give access to those fields, and will bring away mine products, and carry stores, timber, building material, and coal.

3747. You say, as a practical mine-owner in that district, having interests there, and having known that part for many years, that the one necessity of the district is to get better means of communication? I do. There is no doubt that the mineral output from those fields, at Nuntherungie and Wertigo will be very considerable.

3748. And the people there at present are suffering very great disadvantages, especially in dry seasons, from the very heavy rate of carriage they have to pay? Yes. Of course, the present has been an exceptionally bad season.

3749. But that is a part of the country which is liable to drought? Yes.

3750. And that makes fodder and horse transit very dear? Yes. It has cost me, for my little party, since Christmas, £150 for horse-feed. Chaff at present comes principally from South Australia.

3751. *Mr. Shepherd.*] Is it not a fact that the field which is being worked at present, is composed chiefly of 40-acre leases? Do you refer to the opals or the copper.

3752. To the opal-field? No; there are only ten or twelve original opal leases which were granted by the Mines Department before the regulations were altered regarding opal-mining.

3753. But do not the original 40-acre leases still hold good? Yes.

3754. And those large leases are principally being worked on tribute? Yes. There are as many as 160 men working on one 40-acre block, to my knowledge, all tributing.

3755. Are many wages men employed there? No. Nobody works at the opal-mines for wages; every man is his own employer.

3756. It is generally considered a good poor man's mine, is it not? Splendid.

3757. What are the tools required for opal-mining? A pick, shovel, windlass, and a rope.

3758. Are the mines worked by open cuttings? Partly.

3759. And partly by tunnelling? Partly by tunnelling, partly by open cuttings, and partly by shafts.

3760. If an open cutting is used to a depth of 40 feet, what do they do with the earth? They run it out in trucks. They have light rails which can be shifted, and they run the stuff out one way one day, and another way another day. There are very large cuttings there.

3761. Is water used in getting the opals? No. Immediately a miner strikes opals he is bound to see that he has done so.

3762. How is the value of the opals determined? The value of the opal is determined according to its brilliancy, the pattern, and the fire in it. I shall have about £1,000 worth here to-morrow morning of all qualities.

3763. With regard to these tributors; who values the opals which they raise? In the first instance the miner enters into an agreement with the owner of the ground, the tributor to receive 75 per cent. of the value of the opals that he finds, and the balance to go to the owner. The opals are taken to the owner and valued. The tributor is then at liberty to sell them at the owner's valuation, or if he thinks he can get more he goes into town and puts the opals before the buyers. It often happens that he gets a lot more by that means, and it often happens that he does not get as much as the owner has valued the opals at. Opal being an article of luxury only, the value is not a standard one like that of gold. It often happens that opals are found that are worth £80, £60, or £40 an ounce. I have seen opals sold at a price as high as £100 an ounce. Opals with red, green, or orange fire are the most valuable. Then there is a certain pattern in them. When the opal is streaky, though the fire may be ever so brilliant, the opal is not so valuable. Some stuff you get hold of may be worth £3 an ounce, some £15 an ounce, some only 10s. an ounce. There are hardly two pieces of opal found which are alike.

C. F. A.  
Thierman.

19 Oct., 1899.

3764. Are the owners always open to purchase the opals at the prices they put upon them? Yes.
3765. And what if the miner does not accept? He can go round the town and see what he can get.
3766. Then he pays the owner 25 per cent. of the value of the opals? Yes.
3767. So if he gets double the amount at which the owner values the opals, he pockets all the rest himself? They are not supposed to do that. The owner must get his 25 per cent. in any case.
3768. I suppose that if the owners value the opals at a certain amount, they are satisfied with 25 per cent. of that? Yes. Those men become very expert at valuing opals in their raw state.
3769. Can you give us any idea of the area of the field which has been proved to contain opals? I should think that the proved opaliferous area is 15 miles long, and 3 or 4 miles wide. But the possibilities are very great, especially as opals have been found 25 miles north of White Cliffs, at Purnanga.
3770. What population would you estimate these opal-fields to be able to carry? The present population is over 2,500—I believe it is nearly 3,000. The cost of living in the district would be reduced if we had better means of communication, and the poor quality of opals could be mined to advantage. It would be a little help to the field because, though it would not interfere with production, it would help people to live at far less expense. We have to pay an enormous price for everything we get out here.
3771. How many men do you think the field would be capable of profitably employing? I should think 5,000 at the very least.
3772. And do you think they would find a ready sale for the opals of those 5,000 producers? Yes; there is very keen competition for the opals. The opal buyers send men to find out who are on opals and who are not, and then they watch them.
3773. Is it not a fact that the sale of opals at present is very dull? Yes, the sale of opals of inferior quality; but opals of good quality fetch more money now than they ever did.
3774. Do you think there is any fear of a market not being available? No. A war scare might have some effect. When the Spanish-American war broke out there was a lull in the business, but afterwards the opals fetched more money than they had ever done before.
3775. What are the chief difficulties that the opal-miners labour under? It is merely the difficulty of getting supplies at a reasonable cost. If there were railway communication they would be able to get provisions and forage, and all other supplies, at the ordinary rates. The railway charges would be of a uniform character. There would not be such terrible charges as we have had during the late dry seasons, for instance.
3776. Is it a fact that no prospecting has been carried on beyond a depth of 44 feet? Yes; that is so, except in one or two places where holes have been sunk, but no opening out has been done.
3777. Have opals been found at the bottom of the deepest holes that have been sunk? I know that rich opals have been found at a depth of 44 feet.
3778. And they are of a quality quite equal to the others? Yes. The deep-level opal, as a rule, is of a finer green than the shallow opal, and is not so broken up.
3779. *Mr. Watson.*] Is there any prospect of the mines you are connected with being developed in a reasonable time? Yes; there is every prospect of it. We are negotiating with wealthy people here now, and I think we shall come to terms.
3780. Assuming that a railway were built from Cobar to Wilcannia, the terminus would still be some distance from Nuntherungie? Yes.
3781. Do you think the Nuntherungie deposits are of sufficient importance to justify, with their development, the making of a tramway between Wilcannia and Nuntherungie? From the mines to the river.
3782. Yes? Yes, because there is a quantity of low-grade ore there.
3783. If a railway were constructed, you would want to get to Wilcannia? Yes; or to some point where communication is cheap, not only to bring the ore down, but also to carry explosives, mine stores, and timber up to the mines.
3784. And coke, if you were going to smelt? Yes; there will be a rough process of smelting carried on at the mines, the same as at Cobar.
3785. At Cobar I understand they reduce the ore to matte in the first instance, then ship it to Lithgow, taking a return freight in the truck? Yes; that would have to be done at Nuntherungie.
3786. That would be the cheapest method of working? Yes; it would allow the treatment of ore which it would be absolutely out of the question to treat under present conditions, and which has to be thrown on one side, if there were proper communication, and fuel could be brought on to the ground.
3787. Assuming that the existence of these deposits and their possible development at Nuntherungie were one of the factors in determining the Committee to recommend this railway, what guarantee is there that your people would not run a line to Broken Hill, in preference to running a tramway to Wilcannia? Well, if we made a line across there it would have to join the Tarrawingie line to bring coal and coke which would have to be shipped from Newcastle round to Port Pirie, taken to Cockburn, then over a private line of railway to Broken Hill; then it would have to go over the Government railway to Tarrawingie, and afterwards run over the tramline from there to the mine. That coal would cost, I should think, a good deal of money by the time it reached its destination.
3788. You think if you had a railway terminus at Wilcannia and the one now existing at Tarrawingie, it would pay you better to connect with Wilcannia by tramway? Yes; even if it were only a horse tramway. That would be the natural highway.
3789. With a view of reaching the Lithgow mines, and having only one handling of the coke or ore? Yes, it would go over the Government railway all the way; but in the other case the coke would have to be shipped round to Port Pirie and brought over different lines.
3790. Of course whether it would be worth your while to go over a number of lines owned by different people, and by sea to Newcastle or Illawarra, would depend upon whether the rates on that route were lower in the total than the rates on the other route? Yes. But from what I am given to understand the rates for coal on the Government railways of the Colony are so low that the other roundabout route could not compete; besides which, Lithgow coal is cheaper than Newcastle coal, and quite as good for the purpose.
3791. You think that if you had a chance you would rather connect with Wilcannia, in order to get to Lithgow? Yes.
3792. You think that if the mines were developed it would pay you to construct such a tramway? Yes, because I believe the possibilities of those mines are in the direction of something very big. The outcrops are

C. F. A.  
Thierman.  
19 Oct., 1899.

are extraordinarily large, and the lodes seem to be very continuous, and as deep as we have followed them down they have not deteriorated. In our copper-well the ore at a depth of 110 feet is richer than what we got when we started.

3793. And what is the width of your lode at that depth? That is between 3 feet and 4 feet. It is a perpendicular lode.

3794. And would it pay you well to work ore of that quality? Yes.

3795. You spoke of an outcrop 100 feet wide as being poorer ore;—do you think it is sufficiently valuable to pay for working, in the event of your having better communication? We have not done much in the way of work with big bodies of ore. The deepest we have gone is 65 feet.

3796. And is there any deterioration at that depth? It is just about the same class of ore that we have on the surface.

3797. Then do you think that a large lode would pay for working, supposing you had railway communication? Yes, it would be worked then.

3798. In conjunction with the other? Yes. The principal mine in the group is the Bunker's Hill.

3799. How far from Nuntherungie is that? Sixteen miles towards Wilcannia.

3800. What are the characteristics there;—is it a wide lode? Yes, a very wide lode.

3801. Of rich quality? It is of higher quality than we expected. The lode shows for about  $\frac{3}{4}$  of a mile, and there are very big outcrops. Our party were trying to keep this mine for ourselves, but we were not allowed to do it. We have to let the whole thing go as one compact lot.

3802. Then you were endeavouring to sell the others? Yes. We wanted to keep that or the copper well, and develop it on our own account; but the people we are dealing with said, "We will take the whole thing."

3803. In any case, it would require a considerable amount of capital to develop it? It is not the working of it. The principal cost is in regard to the reduction of the ore and the transit of the mine products. To open up the mine will not cost so much.

3804. Have you, or those associated with the enterprise, made any calculation as to what it would cost to make a tramway from the mines to Wilcannia or Broken Hill? Yes. I went over the whole distance between the mine and Wilcannia. It is level country, and there will be no difficulty in making a tramway; but between the mine and Tarrowingie there are long stretches of very loose, sandy country, and the line would be half the time buried in sand. There is no doubt that Wilcannia is the place to which to bring the line.

3805. Even from an engineering point of view it will be easier as regards maintenance? Yes.

3806. Could you form any estimate as to what the tramway will cost? No. But in the construction of a line for the conveyance of ore, the work need not be of a very substantial character, as long as you can drag a train of trucks over it by horse or steam traction.

3807. *Mr. Dick.*] In your contemplated development of this copper and silver country, have you considered the question of bringing the ore or the reduced material to the river, and then sending it down by river to Adelaide or Melbourne? No. If we meant to do that, when we got down the river we should have to ship it from Morgan to Port Adelaide, or Port Pirie, and that would be as expensive as to ship it from Nuntherungie to Broken Hill.

3808. Then it would be neither economical nor practicable to carry out the development of that country by such means? No. It will have to do until we have a line, and then we can only deal with ore of the highest quality, and we shall have to leave the great bulk.

3809. As regards low-grade ores, every additional handling adds to its cost, and reduces the chance of treating it at a profit? Yes. Until we get a line of railway we can only send away picked ores. We are picking the ore now—all the stuff that goes anything over 30 per cent. of copper.

3810. Are you aware that the history of the development of Cobar before the railway was made somewhat resembles what you have outlined as the history of your copper-field? Yes. Cobar was in a worse position when the mines there first started than we are in now.

3811. Is it a fact that at Cobar, just as you outlined in the case of Nuntherungie, high-grade ore alone paid the tariff, and that it was soon worked out? Yes. They sent some thousands of tons of picked ore away, as we shall have to do if we do not get railway communication. We shall have to leave all the medium-grade and poor ore behind.

3812. As soon as the railway was constructed to Cobar the medium and low-grade ores were treated at a profit? Yes.

3813. And Cobar increased rapidly? Cobar has become a place of great importance.

3814. Do you anticipate that, with the construction of a railway from Cobar to Wilcannia, and with some sort of connecting link between Wilcannia and Wertigo, either private or public, the same developments are likely to take place? Yes; there is every probability of it. There is not merely one mine, but a regular group. There are five big lodes included in twenty-five mineral leases.

3815. How does that compare with the area of rich mineral country at Cobar? It is every bit as extensive as Cobar. I do not know exactly the extent of ground held and worked there under lease. We hold 1,000 acres, and some people outside of our holding have more, and that is a very considerable extent of country.

3816. Do you think there is still a large area of unprospected country there? Yes. Between us and the Ponto Hills, and southward towards Wilcannia, there are chains of mountains which have not been prospected.

3817. May we regard that tract of country from Wilcannia north as one with certain assured mineral resources, and with perhaps large possibilities? Not north of Wilcannia, but north-west. The country north of Wilcannia is mostly flooded. The mineral country is west and north-west of Wilcannia. There is a great probability that the Nekarboo Ranges between Cobar and Wilcannia will be developed. Several things have been found out there, but it is a very waterless country. The country between Cobar and Wilcannia is worse than the country beyond Wilcannia.

3818. Will the railway as far as Wilcannia be of material assistance to that district? There is no doubt that a railway as far as Wilcannia will overcome no end of difficulties as regards mining, and any other industry which is carried out there.

3819. Could you state in what way that district could afford revenue for such a line? The line, in my opinion, would pay the interest and working expenses, and not only that, it would get the trade which is now

now passing through Wilcannia, and it would also bring a lot of trade from Mount Browne way which is now going to Broken Hill and Adelaide.

3820. As far as the mineral resources of that district are concerned, we may safely dismiss all thought of river-carriage as a means towards their development? Yes. If there were smelting works anywhere on the river, the river could be used; but there are not, and if there were smelting works on the river, they would not be in direct communication with the coal-field.

3821. The only way to make smelting possible on the river is by having a railway communicating with the coal-fields? Yes; and the natural line would be from Lithgow to Cobar and Wilcannia.

C. F. A.  
Thierman.  
19 Oct., 1899.

James William Boulton, Superintendent of Public Watering Places and Artesian Boring, Department of Mines and Agriculture, sworn, and examined:—

3822. *Mr. Watson.*] You know the line of country through which the proposed railway is to pass between Cobar and Wilcannia? Yes.

J. W.  
Boulton.  
19 Oct., 1899.

3823. During our recent visit of inspection the Committee were struck with the fact that although a chain of Government tanks had been put in from Cobar in the direction of Wilcannia, their construction had ceased at Bulla, 80 miles from Wilcannia,—can you give us any information in reference to that? I have not the papers in the Department, but the real reason for that is that between Bulla and Wilcannia, in nine seasons out of ten, there is a very fair natural water supply at Gunyulka and Poopelloe Lakes and the Talyawalka.

3824. Did I understand you to say that Poopelloe and the Talyawalka have water more frequently than not? Yes, that is the information. I remember that that was one of the reasons why it was not deemed an urgent matter when the tanks were constructed. The Department undertook the watering of that road, and made all the provision that they thought was necessary. Since then we were asked to resume that Coonavitra tank, but they wanted a very large sum for it. Then the survey of the railway seemed to indicate that there would be an alteration in the road, and that it would entirely avoid the Coonavitra. Then a further matter crept up, the alteration in the survey of the main traffic road, which is now to break off about 8 miles on the Wilcannia side of Jacob's Well, and run right up to Cultowa.

3825. How long ago was that diversion of the main road? Quite recently; so recently that we have only just got the Ministerial approval of the tank to go down between Jacob's Well and Cultowa. It is thought that they will make the route absolutely open in any season. We did not do anything between Coonavitra and Wilcannia, because of the railway. We thought the road would be deviated to follow the railway line. The railway is a considerable distance off the road, after you leave Coonavitra. The papers are with the local officer now, and I can only speak from memory.

3826. During their recent visit, the Committee travelled along a cleared road for many miles;—is it proposed to abandon it? Yes. About 8 miles from Jacob's Well there is a bend in the road, and it is from that bend that the road is to go. It will make the distance to Wilcannia considerably shorter.

3827. It is proposed now by the Lands Department that the main road shall follow a much more northerly course than has been the case hitherto? Yes. I understand it will be more direct too.

3828. Do you know whether that new road is as much subject to flooding as the old one? I think it will avoid a great deal of that Talyawalka country.

3829. You seem to be of opinion that the construction of another tank between Jacob's Well and Cultowa will be sufficient to serve the traffic? Yes; it will keep the road open then in any season, because the natural water on this road, from Jacob's Well to Wilcannia, is available for so many seasons. So they will really have the advantage of an alternative route there.

3830. The local evidence seems to point in the direction of Lake Poopelloe and the Talyawalka and Gunyulka having been dry for a considerable period. Yes, they have. They are outflows from the river. When the river reaches a decent height they get filled, but the river has not been much above summer-level for a long time, and those places have gone short.

3831. Have you been out from Wilcannia in a northerly or north-westerly direction in connection with Departmental work? Yes; I lived north of Wilcannia for fifteen years.

3832. In view of the convenience provided by your Department, which road would probably be adopted in order to get to Mount Browne, if there were railway termini at Wilcannia and Tarrawingie? The Wilcannia route, undoubtedly.

3833. Why? Because it is quicker and cheaper.

3834. Is it easier country? Yes; and you have such an objectionable coach journey from Tarrawingie to Mount Browne. You have the same from Wilcannia to Mount Browne; but it is a more direct route. Everybody would go that way to get from here to Mount Browne or Milparinka. Besides, for the goods traffic, it would be a tremendous advantage to be able to get to Wilcannia. We are shipping stuff now from the Department for a couple of bores on that road, and we have to send those things all the way round by Adelaide. They are transhipped from there on to the railway to go to Petersburg where the South Australian narrow-gauge rail system commences; then they have to be transhipped on to the narrow-gauge line, and to be handled at Tarrawingie again. If they could be put on the train at Sydney, one handling would be sufficient.

3835. As regards the ordinary transit of goods, the people would not care much whether they got them from Adelaide or Sydney, as long as they got the cheaper market? Of course not.

3836. Assuming that they had equal facilities for getting goods to Wilcannia and Broken Hill, do you think that a road to Wilcannia from Mount Browne and Milparinka is so much better watered and better drained that they would choose that route? I am sure that they would choose it; it is a far better route in every way, because out from Wilcannia, 9 miles, we have the tank called Mulga Valley Tank; then 18 miles out, the Dry Lake Tank; 32 miles out, the Beefwood Well; then beyond that, about 9 miles, is the Menamurtee Well; 11 miles beyond that is Tarella (Government) Tank; and 24 miles beyond that is the Peak Tank; then about 14 miles further, the J.K. Tank; then beyond Morden station is the Murleppa Tank; then you get the Paldrumata Bore; then Cobham Lake, practically a permanent water supply; then there is a very large waterhole beyond Cobham—the Coelly, and there is a place at Milring—a scakage; then you get to Milparinka, where there is a fine dam and Government well. From Milparinka to Tibooburra there is the Warratta Tank, and so it goes on right through to the border. You may say that we have water supplies, on the average, on that route 15 miles apart, *via* Milparinka. The other road—the road from Tarrawingie to the Queensland border—coming down from Milparinka breaks off

J. W.  
Boulton.  
19 Oct., 1899.

at about Cobham Lake, 8 miles on the Wilcannia side, and comes down to the Wonominta waterhole and the Pack Saddle, Bencannia Lake, down through Fowler's Gap to Tarrawingie. That road is very badly watered naturally, and nothing has been done by the Government on that road. We are doing a little now. We are proposing to put a tank at Wonominta waterhole, and putting pumping gear in the bore at Pack Saddle. Beyond that, the only Government watering-place is at Sandy Creek bore. One or two persons have got private tanks on the road, and travellers have been able to get water; but there is no comparison between the accessibility of the two roads. It is all in favour of the Wilcannia route. The object we had in view was to do everything we could to bring the traffic to the railway centres of this Colony.

3837. In any case the drift of trade, from the early times, as far as Milparinka is concerned, has always been through Wilcannia? To a very large extent. Until the advent of the Broken Hill railway, the traffic used to go direct to Wilcannia and down to Hay; but the opening of that railway to Broken Hill and Tarrawingie took a certain amount of traffic to South Australia. One used to be able to get rations from there fairly cheap.

3838. During the last few years of drought, Wilcannia, with no river, has not been in a position to supply? No. When I was in that district I have known wool to be detained there for four years; and I have known flour to be £40 a ton in Wilcannia. Then the teams used to go down to Burra to get supplies up. It was only in extreme seasons that the trade came from Burra. Under natural conditions the trade came through Wilcannia.

3839. You think that, with the construction of a line to Wilcannia, the trade which has been partly taken from it would return that way? I think it would. To show what the effect of watering the roads has been, I may mention that a lot of trade has come in owing to the watering of the Milparinka and Wanaaring Road, that otherwise went to South Australia.

3840. So it would seem that, although the Bourke railway is a considerable distance from Mount Browne, even at present it has been able to compete to some extent with the railway to Broken Hill? Yes; and if you extend it to Wilcannia, you will still further attract traffic.

3841. Attract the trade at a much shorter angle? Yes. I am strongly in favour of this Wilcannia railway; I lived there so long, and know what the effect will be on the country. It will render life possible on the 10,000-acre blocks, where it is utterly impossible at present.

3842. From your acquaintance with the district and pastoral pursuits, do you think that the construction of the proposed railway would have any effect in regard to small pastoral settlement? I am sure of it. It is the land-carriage that kills the small man. We have had to pay as much as £7 to £10 a ton for getting our casing up.

3843. A man who requires a small quantity has to pay more than the man who requires a large quantity, and whatever disabilities would operate against a large owner would press with increased severity upon the small man? Yes. I am confident that if they had increased railway facilities, the operation of the 1884 Land Act, as regards the taking up of homestead leases, would have been a far greater success than it has been. There is no question that the western country is good pastoral country when we have good seasons, and it is one of the most healthy parts of the country for stock that you could possibly get; and, there is another thing, if facilities were given to pastoral people to get their stock away in time of drought, things would be very much better.

3844. The railway would do that? The railway would do that, and it would help them in other ways. They would then be able to get horse feed and other goods in the district at a fair rate, which they cannot do now.

3845. During the Committee's recent visit, they found that once you get off the river the number of homestead leases taken out of the resumed area is exceedingly small? Very small.

3846. I take it as your opinion that, if a railway were constructed, that part of the resumed area would, to a large extent, be availed of for homestead settlement? Yes.

3847. *Chairman.*] You were talking about trade being drawn towards Cobar by the railway from Cobar to Wilcannia;—do you think there would be any fear of that trade going by Wilcannia down the river to Adelaide? I hardly think so. There would be some risk of that, but the river is a very uncertain factor.

3848. You seem to think the great necessity for a railway is to make habitable that north-western part of the Colony? Yes.

WEDNESDAY, 25 OCTOBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. ANDREW GARRAN, LL.D.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

William John Hanna, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

W. J. Hanna. 3849. *Chairman.*] Are you acquainted with this proposal to construct a railway from Cobar to Wilcannia? I have not made any special study of it, but I have a knowledge of the country.  
25 Oct., 1899. 3850. How long is it since you were there? About ten years.

3851. Starting at the Cobar end, what kind of country would you consider it in regard to railway construction? It is comparatively level; but it is a poor class of country.

3852. We want your evidence, particularly with regard to its suitability for railway purposes;—is it mostly red-soil country? Yes, and sandy.

3853. Do you think it would be suitable for what we now call our light lines of railway—railways without ballast? Yes, the greater part of it would be very suitable for light lines.

3854. The country is of an easy character for railway construction? Yes.

3855.

3855. Do you think it is sound country;—is there any fear of trains sinking into the ground? No, not very much. There would be in certain places, probably. Some of the black soil of the flats resembles the Talyawalka land in character; it may be a little treacherous.

W. J. Hanna.  
25 Oct., 1899.

3856. Do you know the line of railway from Narrabri to Moree? I have not been up there for about fifteen years.

3857. Do you think this is a suitable class of country for laying a light line of railway? Yes.

3858. As far as your knowledge goes, would there be many viaducts to construct on this line? There would be at the Wilcannia end for 8 or 10 miles; but there would be nothing of any magnitude on the other portion.

3859. When you get towards Wilcannia, about 10 miles on the Cobar side, then the trouble begins? Yes.

3860. I believe you have some knowledge of that country in regard to building crossings? Yes.

3861. Will you tell us about that? About the only difficulty that we have experienced there was in connection with the sinking of some of the piers of a bridge in the Talyawalka embankment. That was due to two causes—I think first, the surface scour, which, as a rule, is easily checked; the second cause is more difficult and dangerous—that is, that after long droughts the ground opens, large cracks are formed, and when the flood-water comes down it finds its way into the cracks and in some places converts what before was ground as hard as a brick into a soft mass. I think that was the chief cause of the subsidence that we had in one of the Talyawalka bridges.

3862. Were those wooden bridges? Yes; the ordinary plain beam bridges, with three pile piers.

3863. Did you drive the piers down to a great depth? The driving was about 15 feet. I built only one of the bridges.

3864. Did the one that you built stand? Yes; but it was not in such a trying position as the one that gave way. The one the piers of which sank was a bridge over one of the principal water-courses. The one I built was over a shallow water-course, where the water had more spread, and the current was not so much concentrated.

3865. Do you think the difficulties there are so great that it would very largely increase the cost of railway viaducts? No, I do not think so.

3866. How would you avoid that softening of the surface about the pier? I do not think it could be avoided.

3867. The piers would have to be of a very substantial character in a place like that? Not necessarily so. I should think piles would be as good in that ground as concrete—they are so much lighter.

3868. You do not think it will be necessary to go in there for big concrete piers to cross the Talyawalka Creek? I do not think so.

3869. A strong wooden bridge is all that would be required? Yes. I do not think it would be necessary to take much more than ordinary precaution, because this was the only bad case that we had, and it was not a very serious matter.

3870. This broken country extends for about 10 miles on the Cobar side of Wilcannia? Yes, from 8 to 10 miles.

3871. It has been suggested that possibly the railway, made with the view of saving expense, may stop 10 miles short of Wilcannia;—do you think that would suit the purposes of the traffic, or would it not be really avoiding the very part where you want to get over the rough country in bad weather? I do not think it would be allowed to remain there.

3872. If the work is carried out, you would not advocate that the railway should stop short of Wilcannia? No; certainly not. The township is on the opposite side of the river to Cobar. It would not be advisable to go right into the town. There is a very good site for the terminus on the opposite side of the river, a sandy rise, which would be found suitable for railway buildings.

3873. I suppose the road from Cobar to Wilcannia is really only a bush road? That is all. The only money we have spent upon it has been in clearing, with the exception of that portion which crosses Talyawalka Creek, about 8 miles.

3874. It is not in contemplation to form and metal that road? No; there is not sufficient traffic to justify such an expenditure.

3875. So I suppose that for many years to come it will be left as at present, a kind of bush track, or railway communication may be provided for that part of the country? Yes.

3876. It would be almost absurd to attempt to form the road? The traffic would never justify it.

3877. How much a mile is spent on this class of road? It varies very much according to the amount of the traffic on the road—probably from £3 to £5 per mile.

3878. You are pretty well acquainted, are you not, with that part of the country? Yes; fairly well.

3879. Have you formed any opinion as to whether railway construction would be advisable or not in the interests of that part of the country, also whether it is likely to bring in a fair return to the State? I do not think it would pay now.

3880. What do you mean by "now"? It is too late. If the line had been constructed before such good communication was established with South Australia probably the traffic might have been retained by New South Wales.

3881. You are speaking now of a line to Broken Hill? No; only of a line to Wilcannia. Business arrangements are so complete now that I do not think it would be possible to divert the traffic which is now going to South Australia. The small amount of traffic that would remain for the line from Cobar to Wilcannia would not give anything like a fair return on the cost of construction.

3882. I suppose you are aware that White Cliffs is likely to develop into a large mining centre? Yes.

3883. That part of the country will have a considerable future owing to the minerals it contains;—do you think that if a line were constructed to Wilcannia the trade would come by way of Wilcannia and Cobar to Sydney? Probably it would, but that would depend very largely on the freight to Sydney as compared with that from Broken Hill to South Australia. Ore is carried very cheaply to South Australia.

3884. You think they would send it the cheapest way? Most decidedly.

3885. You assert that trade relations are very strong with South Australia;—do you say that from actual knowledge, or from hearsay? I was about seven years at Wilcannia and Broken Hill, and I am giving my own opinion from personal observation.

3886.

- W. J. Hanna. 3886. You think that that part of the Colony is estranged from New South Wales? I think it is too late now to divert the traffic.
- 25 Oct., 1899. 3887. *Dr. Garran.*] I understand that you have metalled a portion of the road over the Talyawalka flat? Yes.
3888. Have you had any flood over it since you made that piece of road? Yes.
3889. A strong flood? We had one that went right over the embankment.
3890. Did it do any damage to your road? Yes; but not so much as I anticipated.
3891. What was the nature of the damage? It cut through the embankment in one or two places, washing away part of it.
3892. How high was your embankment? I should say from 7 to 9 feet.
3893. If the coaches drive on that road when the water is still over it, they will have to be very careful to keep on that bank? They would not go over the embankment; it would not be safe.
3894. I understand that one might almost drive a coach over when the water is up? No; it would be too risky. When the water was over the embankment it would be soft, and they might come upon a place where it would give way.
3895. Is there a pretty rapid current? Not a very rapid current—a current of about 3 miles an hour.
3896. Suppose the embankment had been lower, would it not have been safer? I do not know that it would.
3897. Supposing it had been only 2 feet above the ordinary level? The damage would have been less; but I do not think it would have been less in proportion.
3898. How many days was the water over your road? It must have been a week. I am alluding to the exceptionally high flood that did so much damage in Bourke in 1890.
3899. It would not do to make the railway as low as your road? No.
3900. The railway works must be carried higher than that? Yes, if you want to keep them dry, and keep the railway running at all times.
3901. It is quite impossible to lay a railway on the surface, and take your chance of its being safe? It is not impossible, but would be risky; there would be a good deal of repairing required, which would probably amount to relaying after each heavy flood. Still it is worth considering, in the event of a railway being constructed there, whether it would not be advisable to take that risk, as the extraordinary floods occur so seldom.
3902. It is a question of the cost of repairs after the construction of the line? Yes.
3903. If the railway did take the surface level it would probably be shut up for several weeks in the case of a big flood? Yes.
3904. There is no other way of avoiding the expense of crossing this 7 miles of bad country unless you take the risk of a surface line? No other way; it would require a viaduct across the greater part of that length.
3905. Even in the case of a common road, you have raised the banks 7 feet? Yes, we have. The total distance is about 8 miles. We have only constructed an embankment about half-way across. It was started at first with a view of getting over the worst creeks and deepest water, and then gradually extending it.
3906. None of it has sunk owing to the softness of the ground? No.
3907. Have you any pile-driving? Yes; the bridges in that embankment are all on driven piles.
3908. Do the piles stand well? Yes, except in the instances I have mentioned.
3909. As far as you have gone you have gained a little experience as to what the railway works there would have to be? Yes.

THURSDAY, 26 OCTOBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. ANDREW GARRAN, LL.D.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

William John Hanna, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and further examined:—

- W. J. Hanna. 3910. *Mr. Watson.*] Were you in charge of the Wilcannia Road District when some of those bridges were placed in position? Yes.
- 26 Oct., 1899. 3911. How long were you there after the road bridges were erected? From memory, I may say that only one was erected during my term at Wilcannia, and I do not know that any have been erected since.
3912. When Mr. Dick and I went over the projected route from Wilcannia towards Talyawalka Creek, 8 or 9 miles according to the railway survey, we saw several bridges—I think nearly half a dozen of them? Yes.
3913. Were they all erected in your time? No, only one. The one on the Cobar or eastern side, the longest one, I think.
3914. Had any of those bridges sunk whilst you were there through the erosion of the soil round the piles? Yes; two or three settlements had taken place, but not anything serious had occurred. The bridge you probably saw went down after I left. I think the pier must have sunk about 4 feet.
3915. Around quite a number of the piles, or sections of piles, supporting the bridges, we noticed that the soil had been scooped out by the action of the flood-waters, to a depth, in some cases, of 5 or 6 feet, and in other cases to a greater depth? Yes.
3916. With the apparent result of leaving the bridges much less safe than they otherwise would be? Quite so.
3917. Do you know whether any precautions are to be taken to prevent that in regard to future bridges in that locality? The precaution we take in a case of that kind is to surround the pier with stones, which check the current striking the piles. It is the eddy produced by the current striking the piles that stirs up the earth, which is very fine, and carries it away.
3918. Is that an expensive operation? No; it is inexpensive.
- 3919.

W. J. Hanna,  
26 Oct., 1899.

3919. And it is quite sufficient to keep the pile from being undermined? In most cases it is.
3920. Then further along towards Wilcannia we find certain portions of the road consisting of a metal track laid level with the surrounding country, and liable to be flooded? Yes.
3921. That was some distance after we passed the embankment;—there we were informed there had been a soaking away of the black soil from under the metal, letting it settle below the surface of the surrounding country, and it afterwards had to be made up again? I did not think the surface would wash away from underneath the metal; but I should not have been surprised to have heard that it had scoured on the down stream side. If it occurred in that way I should think it was due to the water getting into the cracks which I described yesterday, and carrying a portion of the soil away in that way.
3922. It seems that the Talyawalka Creek about there consists of quite a number of channels, any one of which might be looked upon as the main one? The Talyawalka Creek itself is the main channel, and the others are overflow channels. There are several of them.
3923. Do you know of any method by which the extent of flooded country to be crossed could be reduced—I mean any other track which would give us a chance of reaching Wilcannia without crossing so much flooded country? I do not think there is any place where you would get a narrower crossing than at the site of the present road.
3924. The railway follows the Ivanhoe-road during the last 10 miles? Yes; the Cobar-road joins the Ivanhoe-road about 8 miles from Wilcannia. The reason for that was that the extensive works necessary between the high ground and Wilcannia should be common to both roads.
3925. The railway is to cross the Talyawalka Creek to Wilcannia, at about the same place? Yes; the length will be practically the same, I should think.
3926. And you think that that is about the best possible place that we could get? I am certain about that.
3927. There are a number of small sandhills taken advantage of by the railway surveys? Yes; and the road also takes advantage of those sandhills.
3928. It seems that any viaduct for railway purposes would require stones to be put round the piles to safeguard them? Yes, to check the eddy; either that or sheathing.
3929. It is proposed in this scheme to run an embankment for some  $3\frac{1}{2}$  miles of that last 8 or 9 miles to the river? That would be about half the distance.
3930. Hardly half? I should think it would hardly be safe.
3931. You think it would require more viaducts? I think so.
3932. After that 8 miles between the high ground on the eastern side of the Talyawalka Creek and the Darling River there is to be  $2\frac{1}{2}$  miles of ordinary construction and 3 miles of embankment, leaving only  $2\frac{1}{2}$  miles as a viaduct;—do you think that would be sufficient? I do not think it would.
3933. Has your experience been that the floods have occasionally run over embankments that you have constructed? Only once; that was in 1890—the flood that did so much damage at Bourke.
3934. For a considerable portion of the route you had no embankment? None, I think, on about two-thirds of it. When the water was running over the bank it seemed to me about 4 to 6 inches higher on the upper side than on the lower side. There was, in places, a strong current over the bank.
3935. Then, if your embankment had been constructed the whole distance, with the exception of openings or bridges, the water would have been a good deal higher than the 6 inches you speak of? Undoubtedly.
3936. Do you think it is probable, then, that more than  $2\frac{1}{2}$  miles of opening would be required? I certainly think so.
3937. Or else they would probably have the line below water level in a bad flood? Yes.
3938. It would seem to be almost as good to make no attempt to get above the high-water level as to only do it in a partial way? A flood like that of 1890, I think, should be provided for.
3939. If an attempt is to be made to get above high-water mark it must be above the 1890 flood-level? Yes.
3940. And that would probably require more viaducts or openings than are at present provided for? That is my opinion.
3941. The alternative is not to attempt to make any banks to carry the railway on, with the certainty of having water over it in flood time? Yes.
3942. *Mr. Dick.*] Is it a difficult or expensive matter to maintain that 8 or 9 miles of road across the Talyawalka area once the road is formed? I do not think so. I should say that the cost of maintenance would be rather below the average, the climate being so dry.
3943. Owing to the fact that it is very seldom flooded? Yes.
3944. Could that road be put into a condition to carry a heavy and continuous traffic which might be brought by a railway terminating just outside the Talyawalka flooded area, without much expense? The whole of the flat is under water in flood time, from the dry ground right into Wilcannia, with the exception of the sand-hills.
3945. Would it be an expensive matter to put the road in that condition? It would be rather an expensive matter, inasmuch as a larger number of flood openings would have to be provided than we have provided in the existing embankments—that is, in proportion to the length.
3946. Would that necessitate the carrying of the embankment right through to the bank of the river at Wilcannia? Yes; with the exception of the sand-hill.
3947. That would be necessary only if you desire to keep your road above flood-level, would it not? Yes.
3948. Suppose we left the road at its present level, and during a time of flood carried passengers by boat from the station or somewhere outside the Talyawalka area, would any material inconvenience be felt by the people of the district from such an arrangement? It would have the effect of stopping all traffic except the passenger traffic, but at such times all heavy traffic is carried by the river.
3949. How would the construction of a road above the flood-level compare with that of a viaduct and an embankment to carry the railway, both as regards original cost and the cost of maintenance? In this case I should say there would be very little difference between the cost of construction, or the difference would be comparatively small.
3950. Then, if it is deemed advisable to take the railway to within 9 miles of Wilcannia from that point of view it will be desirable to construct it right up to the river bank? Yes, most decidedly.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper. 3951. *Chairman.*] When you were examined on the 5th of April last, you gave a statement of the probable traffic that would accrue to the line between Cobar and Wilcannia, if constructed? Yes.
- 26 Oct., 1899. 3952. In that statement, which you were afterwards examined upon, you seemed to have gone carefully into the probable inward and outward traffic; but have you taken into consideration in that estimate any indirect earnings that would accrue to the general line of railways? No; I have given simply the sectional earnings of the line.
3953. Have you gone into that question since? It was mentioned to me that I was to be questioned on it, and I shall be glad to answer any questions about it. No one could tell what the profit for the main line would be out of that traffic.
3954. Admitting that your figures were correct, and that the direct result of the construction of this railway for that particular length would be an income amounting to £6,812 16s. 8d. a year, would it not be possible to say, if the bulk of that traffic came on to Sydney, what profit would accrue to the main line? We do not know what is the net profit of any particular items on the main line. We cannot tell what profit there is on passenger traffic separately from the goods traffic.
3955. But would not the main line benefit considerably if an additional amount of traffic came on to it? Yes, on some of the items. "Considerably" is rather a comprehensive word. The main line would benefit by any new traffic that found its way on to it.
3956. What you mean is that unless you could positively say that this traffic on any portion of it was certain to come to the railway that does not now come to it, you could not say that the main line would be benefited? It would depend upon the conditions under which it was given to us, and upon the class of traffic. If it were carried at a half-penny or three farthings a ton per mile we should make no profit out of it. The trucks would probably have to be hauled back empty between Wilcannia and Cobar. With such a low grade traffic as produce there would be no profit at all.
3957. The intermediate traffic would be infinitesimal? Yes, except during the wool season. There would be a profit; but the difficulty is to tell you what the profit would be.
3958. You could not give us any indication as to the amount? No, it would depend upon where the traffic was hauled from. Naturally wool would be hauled to Sydney. Produce might be hauled from Dubbo, Narramine, Orange, or Sydney.
3959. Would what you say apply to the passenger item? It would apply to that too. As a matter of fact, probably a good deal of that passenger traffic would be absolutely local, confined to the line between Wilcannia and Cobar.
3960. Witnesses have told us that the road is now so objectionable with the two nights which have to be spent in the coach, that people often go round by Broken Hill to Sydney? I should imagine that if their interests lie to a certain extent in that direction, they would continue to go that way. They have a much shorter coach journey to Adelaide.
3961. With regard to additional earnings by means of passengers, this position presents itself: suppose you did not have to put on any additional carriages to accommodate passengers from Cobar to Sydney to bring on the passengers that were conveyed from Wilcannia to Cobar and back, then would not the earnings of the railway be increased to that extent? My difficulty is in telling you what proportion of passengers would avail themselves of the line. It would be a guess as to what the passenger traffic is likely to be on that line.
3962. Has not the experience been that where these lines have been extended to such places as Cobar and Bourke, the passenger traffic has become a very large item? You mean the passenger "travel." Of course it has increased, but the greater distance you get away the less proportion there is of "travel," on account of the higher fares preventing people from travelling so frequently.
3963. Since you were examined we have had some experts in mining matters here, and Mr. Pittman has furnished us with a map showing that in that district between White Cliffs and Tibooburra there is a considerable stretch of mineral country, comprising large copper and silver deposits;—have you, in your estimate of probable traffic, looked at the possibility of there being a large population there that would give you a passenger traffic? My impression of that district is that its traffic will inevitably go to Tarrawingie or Broken Hill. That route has the advantage of a shorter railway distance, and the difference in road-travelling is not so great as to counterbalance that. As a matter of fact, the trade finds its way by that route now.
3964. If it came into Wilcannia, do you think that the minerals to be treated would be likely to come by way of Cobar, or to go down the river to Port Pirie? Of course, I do not know the nature of the minerals in that district, or whether it would pay to carry them over such a long land route. I should not think the traffic would ever assume a very large volume. If the developments were of such a character as to warrant the minerals being carried over that distance, and there were a great quantity of them, there would be a development in the shape of a railway.
3965. Supposing a second Cobar were to break out a little to the north of White Cliffs, do you think that would be a good thing for the railway? Its position would not be so favourable as Cobar, because you would have the added distance, and I imagine that under Federation the better route for these people would be by an extension from Tarrawingie.
3966. *Mr. Watson.*] They say they cannot get to a coal-field that way? At Port Pirie they can treat all the ores from Broken Hill. It would be a greater distance to Eskbank than to Port Pirie, and the sea-freight added would not represent anything like the difference in mileage. I think it is 52 miles from White Cliffs to Wilcannia. The place is 576 miles from the coal supply. Then Port Pirie is 253 miles from Broken Hill, Tarrawingie is 42 miles, that makes 295 miles, and another 100 miles to Adelaide, making 395 miles, as against 576 miles.
3967. Would there not be considerably more handling if the ore went down to Port Pirie? Assuming that the narrow gauge were extended to Tarrawingie, there would practically be no handling at all. The stuff would go through on narrow-gauge trucks.
3968. I suppose you will admit that the renewal of working at the Cobar Copper-mine has made a great addition to the railway traffic? Yes, in more ways than one; because that and the development of gold-mining have added so much to the population; and whilst we derive a large revenue from the carriage of ores and coal, we also derive a much more profitable revenue from the carriage of supplies for those engaged there. But at Cobar we have the whole business; there is no guarantee that we should have the business, so far as supplies are concerned, at either Wilcannia or White Cliffs. 3969.

3969. Do you know what tonnage of coal goes from Lithgow to Cobar? No; but I could get it for you.
3970. I suppose it would be a considerable item? Yes. A lot goes from Rix's Creek in the north also, which clearly shows that the western coal does not represent all that they want at Cobar. I will get a return showing the quantity of coal the company carry to Cobar, and the quantity of matte sent to Eskbank.
3971. I understand you to say that, in addition to the river, you think that the tramway at Tarrawingie is also a serious competitor for any traffic north of Wilcannia? Yes; for any traffic north and north-west of Wilcannia.
3972. The Tarrawingie tramway would not be a competitor for minerals unless it were extended to the field? No. I can scarcely conceive that large quantities of ore will be carried to that point.
3973. We have been told that if the railway line were taken to Wilcannia they would make a tramway to connect the mineral field with the railway? Yes; I daresay you have often heard of these projected schemes. I do not know that they could make a tramway there that would pay.
3974. *Chairman.*] Have you given any attention to the idea of making these light railways of lighter and cheaper material than they are made of at present? The only experience we have had is what we call our pioneer lines.
3975. Do you think we could go further in that direction? I do not. The Condobolin line is a line without ballast, and, as regards that line, we are limited to three classes of engines. We have to haul considerably less loads than we haul on the main line.
3976. Sixty-pound rails are provided for on this line;—are they the lightest that you would recommend? I should not advise that we should have lighter rails, and you require plenty of sleepers under the rails if you are not going to use ballast.
3977. As regards this western country, do you not think that, with the advantages of better communication, having the grand soil that there is there, and with anything like a rainfall, there would be inducements for people to go out there and settle on blocks of (say) 20,000 acres? Unfortunately the rainfall is not there, and that is a thing we cannot provide for. I do not know what they could produce out there, unless it is wool, and the rate for wool is a cheap one.
3978. Has this opinion always prevailed since you recommended the line to Cobar;—have you always held the view that that part of the country would not pay for a railway? Personally, I have always entertained that view.
3979. But has not Cobar been a surprise to you? Yes, I must confess that it has; but the circumstances of Cobar are vastly different from those of Wilcannia. Cobar was practically in the middle of our railway system. They had not the advantage of a river there. Wilcannia has a river, and it has the advantage of the Tarrawingie line.
3980. You are aware now that Federation will probably be accomplished within a reasonable time; do you think that the prospects of a railway to the Darling at Wilcannia are better now since Federation is likely to come about than they were before? I should think they would be, because, assuming that such improvements are not made in the river as will provide for the trade of Wilcannia, then I think in all fairness the question should be faced (if it is necessary to give railway communication) as to which is the better point to give railway communication from. Naturally, one would say, looking at the thing fairly, and dismissing the provincial aspect of it, that a South Australian connection would be the better one.
3981. I suppose you recognise that, to get to this part of our colonies, it is necessary to have railway communication or to leave the roads almost in a state of nature, there being no middle course? I do not think much can be done with the roads.
3982. *Dr. Garran.*] When you are making a railway to a new inland township, and tapping a new centre of traffic, does the analysis of your figures enable you to form a fair conjecture as to what the passenger traffic per 1,000 of the inhabitants is likely to be? Yes, for this reason: that we take districts similarly situated on existing lines of railway, and we compare the "travel" per head of population. Of course, where they are as distant as Wilcannia, you require to discount the settlers who are nearer, by reason of the higher fare which would exist between the termination of the projected railway and the big centres of population.
3983. We are told that Wilcannia has a population of 1,000, and that White Cliffs lying behind it has a population of 2,000; that gives a population of 3,000;—could you form a conjecture as to what passenger traffic the line to Wilcannia would throw on to the Cobar line? £2,000 per annum was the estimate both ways.
3984. That is not a guess, but it is based on an analysis of existing figures? Yes. Where we can get anything like a comparison we do so. In this case it is especially difficult, because you have on one side Broken Hill, a competitor for the passenger traffic, and you have the great distance from the centres of population.
3985. You put down the amount at £2,000—that is to say, that each passenger will spend £1 on that section of the line? Yes.
3986. Have you based that £2,000 on the population of Wilcannia and the surrounding district? Yes.
3987. The Cobar traffic is practically a monopoly for the railway at present? It is, absolutely.
3988. But if you go to Wilcannia you will not have a monopoly there? No; we shall have competition from the districts around Wilcannia, both from the river and the Broken Hill railway.
3989. The Tarrawingie railway and the river would be competitors? Yes.
3990. So you would not get the same relative proportion of traffic that you would at Cobar? No; we could not expect it.
3991. The reason why Cobar has been such a success is the mineral development? Yes.
3992. If it had been a purely pastoral township, would the line have paid? Certainly not. I think I can give you the result of the pastoral industry of Cobar. We have 6,000 bales of wool from there—that is, about 1,000 tons. From that wool we derive a revenue over the whole line through to Sydney of about £6,000, and the Cobar proportion of it would be about £450.
3993. Have you got a purely pastoral township on your list which would give us the traffic to be expected from a purely pastoral place? Moree is a purely pastoral district; but it differs very materially from Wilcannia.
3994. Hay is a purely pastoral district, is it not? Yes.
3995. But you have competitors there? Yes.

J. Harper.  
26 Oct., 1899.

- J. Harper. 3996. Suppose that you had no competitors, would the pastoral traffic at Hay pay for that line? It would not.
- 26 Oct., 1899. 3997. Not if you got the whole of it? No.
3998. Bourke is not a fair district to compare? No; it has a lot of Queensland traffic.
3999. Now that the Government has bought the Tarrawingie railway, I should gather from your remarks that under Federation it would be to our interest to extend that line northerly into the mineral district? I think it is a fair thing to assume that it could be done.
4000. Would it not be a better speculation to do that than to make the Cobar to Wilcannia line, under the idea that we could bring that mineral traffic to Sydney? Yes.
4001. If the Government decided to make a railway to that mineral district, supposing that there are good mines at Nuntherungie and Mount Browne, it would be more our policy to make it from Tarrawingie than from Cobar? Yes. There would be more profit for the Government from haulage over this section of the line to the border, and I am quite sure it would be more economical, and tend more to the development of the mines.
4002. That is to say, it would suit the mineral industry better, and it would suit the finances of this Colony better? Yes.
4003. The attempt to bring the traffic by Cobar is an unnatural attempt to take it to a more distant port? It is forcing the traffic out of its natural channel.
4004. To carry it over the Blue Mountains to a more distant port? Yes.
4005. Then, looking at the imminence of Federation, and the probability that as soon as that is accomplished the railways in the district on the Darling, or near the Darling, will be made in the interests of the district, if not in the interests of Sydney, you think we had better wait before we commit ourselves to an expenditure of £500,000? That is my view—precisely the same view that I expressed in connection with the river when giving evidence in reference to the locking of the Darling.
4006. If we spend half a million in making a railway there, we cannot get the money back again? No; and if the Federal authorities decide to improve the navigation of the river, there will be practically no traffic for the railway.
4007. Suppose we made the railway, and the mineral district developed well, and the people there should wish to be connected with the Darling or with Tarrawingie, would not their wish govern the policy of the country? It would go a long way.
4008. We should then have that railway on our hands? I suppose that is what would occur.
4009. I understand your figures to mean that this line promises a loss of £20,000 a year? That is it.
4010. Would that be a serious loss just now? Yes.
4011. Hitherto we have always looked upon our railway extensions with a view to a metropolitan connection; two years hence this will be looked at by people, not merely identified with Sydney, but from a broader and more Australian point of view? I hope so, if the true Federal spirit is going to exist.
4012. And the interests to be conserved will be primarily considered? Yes.
4013. Even supposing we continue to make our railway in each Colony the Federal influence will count for a great deal? Yes.
4014. Have you given any attention to the question of the quantity of food necessary to sustain a starving sheep twelve months? No; I do not know that anyone has absolutely tried it. You can sustain sheep on very much less than is required to keep them in health and strength.
4015. I think we had a witness who said that it would require 4 lb. of food per day? That is wrong. In most districts you can feed a sheep at a cost of 6d. a week.
4016. In answer to question 549, you say, "We have carried 27,000 tons of fodder for starving stock this year,"—you have no notion of the number of sheep that were provided for? No.
4017. Then you have no figures that would give you any information as to how much it would cost to keep a flock of sheep alive during a drought? No; circumstances differ so much, and the character of the sheep differs so much.
4018. On the whole, I gather that on mature reflection your view with regard to this line is that the best policy for the country is delay? Yes, I think so.
4019. Looking at it from a railway point of view? Yes.
4020. Suppose local interests are conserved by improving the river, or making a railway to Broken Hill, that is a different question? Yes.
4021. But looking at our railway interests, do you think we ought not to be rushed into an expenditure of half a million? That is precisely what I think.
4022. *Mr. Watson.*] From that estimate of a loss of £20,000 a year, in connection with this proposed railway, you have to subtract whatever accrues as profit to the main line out of that new traffic? Yes.
4023. For 1,000 tons of wool which you estimate to come from Wilcannia the main line would get by far the greater portion of the receipts, would it not? Yes.
4024. The local line is to get £650 for wool? Yes.
4025. We were informed at Wilcannia that they could afford to pay £3 5s. for railway carriage to Sydney for wool; on that basis there would be between £2,000 and £3,000 accruing on that? Yes, the gross amount.
4026. You put down fat stock at 600 trucks, which would come towards Sydney? Yes.
4027. The proportion of the price that you put down to the local line is 29s. 8d. per truck, whereas the charge to Sydney is £10 2s. 9d.? Yes.
4028. That would be over £6,000 from that item altogether? A little over £5,000.
4029. You have not formed any estimate of the number of passengers that would travel through? No, I could not.
4030. It would be fair to assume that a much greater number would travel to Sydney by rail than by the coach and the railway? I should think so.
4031. At present the single fare from Wilcannia to Sydney is £7 1s. 6d. by coach and rail, whilst the return fare is £12 14s. 6d.; we may assume, therefore, that there would be a large increase in the number of passengers on that particular route? That is to say, including all who want to travel.
4032. Unfortunately, there being three ways of reaching Wilcannia by coach, the traffic is so distributed that it is difficult to ascertain the number of passengers? Yes; and even then you have a deal of local traffic—people travelling to stations or to Bourke.
4033. The three lines seem to be about equally distasteful to people who travel by them, with the exception

J. Harper.  
26 Oct., 1899.

exception that the one to Broken Hill offers a smaller coach journey to civilization, and for that reason is often taken; but we have a right to assume that most of the passengers would prefer, if they wanted to reach the seaboard, to come to Cobar by railway instead of going to Broken Hill or Tarrawingie without a railway? That would depend upon their ability to pay. I am committed to that estimate of 2,000 passengers.

4034. Would it be safe to say that half of those passengers would come through to Sydney? I should not think so. A thousand passengers would be three passengers every day. I do not think the population there would give that number of passengers.

4035. The miners from White Cliffs would want to travel to Sydney? Not more than once or twice a year.

4036. Is there not more travelling amongst mining population than amongst farming population? There is.

4037. At any rate, a fair amount would accrue to the main line from the passenger traffic in addition to what has been stated? Yes.

4038. With regard to the 6,000 tons of goods, was that an estimate of goods required for supplies on the field? It principally represents forage, bran, and flour. We could not look at the goods; they could carry them from Broken Hill and beat us.

4039. They cannot beat you from Broken Hill? I would not like to say they could not. The rates that operate on the river have not been brought into competition with the railway. They have the Darling trade already on their line.

4040. The river people have had competition amongst themselves locally? Yes; but the South Australian people are so satisfied to secure the trade of the Darling by the river that their rebates are aimed at river-borne traffic. If there is any possibility of their losing the traffic they will extend their rebate system to rail-borne traffic to Broken Hill.

4041. From information which the Committee gathered at Wilcannia and on the river, there does not seem any possibility of bridging the distance between Wilcannia and Broken Hill unless by the construction of a railway, so as to compete with this railway to Wilcannia? We should have to charge £10 a ton for ordinary merchandise, and to-day they are delivering goods at Broken Hill at something like £2 4s. 6d. a ton. They are carrying goods from Broken Hill to White Cliffs, 150 miles, at £3 10s. a ton.

4042. They have to employ camels? The rates have gone up everywhere where they employ camels. Our rate, even if they had six truck-loads, would have to be nearly £8 a ton for truck loads of 6 tons. There is a margin between that rate and the other of £4 10s., available for road carriage.

4043. That is, taking it as delivered at Broken Hill? At Wilcannia. If the goods are carried at £3 10s. a ton from Broken Hill to White Cliffs—a distance of 140 miles—there is nothing to prevent them from being delivered at £3 10s. a ton at Wilcannia from Broken Hill.

4044. The evidence was that there were no such charges possible between those points by road; but that, of course, if a railway were constructed the rates would be lower? My information was obtained from contracts that have been made at the rates mentioned. I do not know whether that rate for the Kallara wool was contradicted at Wilcannia; but I am in a position to prove it. It is 50s. a ton. That shows what the rate can be.

4045. That 50s. a ton is by river? Yes.

4046. But we are speaking about road-carriage? I mention that to show that the information I have about the road-carriage is probably as reliable as the information that I had about the river-carriage. I had a conversation with you the other day about the stock estimate. They can truck their stock through for Broken Hill for £6 5s. 3d. per truck. Our rate is £10 2s. 9d.—a difference of nearly a shilling per head of sheep.

4047. They would have 150 miles of travelling? The stock are not all produced in the neighbourhood of Wilcannia.

4048. Once you leave the river you get away from the fattening country? Anything on the river would find its way to Bourke; it would not come down to Wilcannia.

4049. Do you mean that they would go by river from Wilcannia to Bourke? Not from Wilcannia. Most of the best country lies to the north of Louth, not below Louth; and anything at Louth would go through Cobar or Bourke.

4050. The evidence given to us all down the river was that you do not get into poorer country till you got some distance below Wilcannia, towards Menindie? The rent of the runs would indicate pretty well where the best country is.

4051. In any case people reasonably near a railway with fat stock will go to that railway rather than go the same distance by road? Yes; if the road is not favourable.

4052. But the road can hardly ever be very favourable for travelling fat stock, as compared with the railway? There are times in that country when stock will fatten while travelling.

4053. Is it not an advantage, from a butcher's point of view, to have sheep or any other kind of stock ready for killing as soon as they are fat? Yes.

4054. They do not want to fatten them off and on again? But, on the other hand, it is better to have them carried 300 miles than 600 miles by rail. The shorter the time they are in transit, and the lower freight, would operate in favour of Adelaide as the stock market for that district.

4055. Would it be a lower freight? Yes; it is £6 5s. 2d.

4056. That is after travelling to Broken Hill by road? Yes; and they would have to travel to Wilcannia by road. There would be no extensive production of fat stock anywhere within 50 miles of Wilcannia, because the country is not suitable for fattening purposes.

4057. Can you tell us roughly what proportion would represent, on the traffic we have mentioned, the profits the main line would get? I could not do that.

4058. I mean roughly? Not even roughly. It would depend on the conditions under which it was carried. If our waggons balanced—if we had loading in either direction—the profits would naturally be greater.

4059. A good deal of the country which the Committee travelled over between Cobar and Wilcannia seemed of very fair quality, and a large proportion of it has resumed areas open for settlement? Yes.

4060. It was stated in evidence that if a railway were constructed, the smaller pastoralists might be willing to take up those resumed areas, because then they would not only be able to get supplies more

- J. Harper. cheaply, and to get their wool away more easily, but they would have an outlet for fat stock;—any traffic of that description would be largely in addition to what you have estimated? Any that came to us. I was going to mention the case of a district which was thrown open for homestead settlement, where the conditions were fairly favourable—that is to say, they were within a comparatively easy distance of a railway. It was between Byrock and Brewarrina. I think that there are very few homestead leases in that district now, and there is no comparison between that country and the country between Cobar and Wilcannia. I would rather have 1 acre there than 10 acres at Wilcannia.
- 26 Oct., 1899. 4061. *Mr. Dick.*] How much wool now goes past Bourke down to Adelaide or Melbourne? No wool goes past Bourke.
4062. The policy now pursued by you attracts to the railway the wool from half-way to Wilcannia, and practically all towards the east of the Paroo River? Yes.
4063. Do you think the construction of a railway from Cobar to Wilcannia and the adoption of the same policy which has been pursued at Bourke would lead to practically the same results, namely, that wool for some distance below Wilcannia, and from the direction of Mount Browne, Milparinka, Tibooburra, and all other places, would all concentrate at Wilcannia for carriage to Sydney? No, I do not.
4064. Will you indicate why you think a different result would follow in places apparently so similar? For this reason: as far as Dunlop and Toorale stations are concerned, the owners have large interests in New South Wales. We make a contract which includes those two clips of wool in connection with other clips, and the business of the owners is concentrated in Sydney; but there is no inducement to send any of the clips below Dunlop and Toorale to Sydney. Winbar and Kallara have been quoted better terms than Dunlop and Toorale, but they will not bring us their wool.
4065. Are there not some stations south of Bourke that have not those special conditions attaching to them, and whose wool still goes to Sydney? The wool from the intermediate districts between Dunlop, Toorale, and Bourke comes to Sydney by reason of the fact that they find it difficult, in consequence of our having the Toorale wool, to get freight down the river. They are practically compelled to come to us.
4066. From what we gathered on the river, there seems to be no dearth of steamer competition, the steamers are numerous, and the business hardly pays? They have had bad seasons, and competition is keener to Wilcannia than it is above Wilcannia.
4067. Considering that the railway, if constructed, would undoubtedly deprive the steamers of all their present traffic in the way of fodder, would the railway be able to successfully compete with the steamers for that wool at £3 a ton? I should not like to say that we could successfully compete at £3 a ton. Even assuming that we were in a position to do it, I do not think it would be a good thing to charge £1 a ton less from Wilcannia than from Bourke, and less than we charge from Cobar. Then there is another phase of the matter to be looked at. A great deal of that wool would have to be shipped from Sydney, the conditions being such that it would have to go to either Adelaide or Melbourne as it does now. It is in the hands of Adelaide or Melbourne houses or financial institutions.
4068. Is there much wool shipped from Sydney to Melbourne? Yes, a considerable quantity.
4069. In reply to the previous question, did you consider the effect of the certainty and regularity of despatch by rail, as against the uncertainty of carriage by the river, together with the question of insurance? Of course I can speak by comparison, as far as the railways around the river are concerned. At Karaberry, on the Murrumbidgee, we cannot get the wool, and at Toganmain, within 9 miles of the railway station, we have to quote a rate which barely pays us, to prevent the wool from going down the river. The same applies to stations within a comparatively short distance of Hay.
4070. Then your estimate includes about how much wool which might be obtained from the district of which Wilcannia is the centre? About one-half. I have taken more than half really.
4071. You feel certain that very little more, if any more, can be obtained by a railway constructed to Wilcannia? I should rather think it would be less.
4072. Several witnesses whom we examined indicated that if a railway were constructed from Cobar to Wilcannia they would be able practically to increase the carrying capacity of their runs, inasmuch as at frequent periods during the year they would be able to truck small loads of fat sheep which the cost of droving now prevents them from sending away to market? You can only judge on that relatively. We have never had since Cobar has been opened—and it has had some good seasons—more than 300 trucks of stock from Cobar in any year, and that is a far better district than the Wilcannia district. The Wilcannia country is not a fattening country, and it is more central for them to go to Broken Hill from a great deal of that district than to go to Wilcannia.
4073. How would you compare the possible traffic area around Wilcannia with the actual traffic area at Bourke;—is it much inferior? Yes; Bourke has south-western Queensland traffic, and we have there a large area of splendid country where we nearly always get rain. At Bourke you have Queensland to draw on, because, whilst the Queensland Government put a tax on wool coming into this Colony, they will let as much live stock come in as we can take, without duty.
4074. You do not think that Wilcannia is the centre of as good a district as Bourke? Certainly not.
4075. In regard to mineral development, are you aware that the construction of the railway from Nyngan to Cobar has led to the development of the Nymagee field? That, coupled with the high price of copper, and the improved method of treating the ore.
4076. Has not the railway had a real influence on the Nymagee field? Yes; but the influence is not very great there. They only got the benefit of about 25 miles of railway transit.
4077. Presuming that there is a large area of cupriferous country to the north of Wilcannia, do you think it is likely that a similar development will take place after the construction of a railway to Wilcannia? I do not think it would under the same conditions as Cobar, because you would have over 200 miles of additional haulage for the purpose of dealing with your ores, and that would necessarily affect their value.

TUESDAY, 31 OCTOBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).  
WILLIAM THOMAS DICK, Esq. | JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

George Marshall, surveyor, Sewerage Construction Branch, Department of Public Works, sworn, and examined:—

4078. *Chairman.*] You are a surveyor in the Public Works Department? Yes; in the Sewerage Construction Branch. I was formerly in the Railway Construction Branch. G. Marshall.
4079. *Mr. Watson.*] I understand that you were engaged in correcting the surveys of the Cobar-Wilcannia railway? Yes. 31 Oct., 1899.
4080. How long ago? Between nine and ten years.
4081. That is the most recent survey that has been made of the proposed line? Yes.
4082. At that time it was looked upon by the Construction Branch as part of the projected line towards Broken Hill, was it not? Yes.
4083. And with a view of carrying the possible through traffic from Broken Hill to Sydney or Lithgow? Yes.
4084. Do you think that if the Department had aimed only at reaching Wilcannia they could have made any reduction in the cost of the line, in view of the fact that then it would be only a branch line instead of a through line? I think they could make a slight reduction.
4085. In which portion of the estimate could the reduction be made? In the earthworks.
4086. And in the grades? Yes; by adopting steeper grades you would get less earthworks.
4087. From Cobar to the Talyawalka, which is about 156 miles, the cost per mile is set down at £2,575 14s., of which earthworks and culverts make up a sum of £600 per mile;—do you think that that might be reduced? It would greatly reduce the cost if, instead of building the railway above flood-level, the lines were laid on the surface, letting the floods run over them.
4088. But the survey, generally speaking, keeps out of the ordinary flooded country till you reach Talyawalka? Yes.
4089. The estimated cost of earthworks, at £600 per mile, was on the basis of a grade of 1 in 100? Yes.
4090. If you increase the grade to 1 in 75, and have a surface line, what saving per mile do you think may be effected out of that £600? About 30 per cent.
4091. That would be nearly £200 per mile? Yes.
4092. Do you think there are any other items in the estimates in which a saving might be made? No; I cannot think of any other.
4093. Do you think there can be no beneficial alteration in the direction of the surveys? No; I am sure of that.
4094. Then, with regard to ballast, you are aware that since that survey was made a greater number of lighter lines have been made almost without ballast? Yes.
4095. Do you think that the country between Cobar and Wilcannia is of a character that would enable ballast to be dispensed with? Part of it; not the whole of it. There is a lot of rotten country there which would require ballast.
4096. What proportion of the whole would that be? I suppose about half of it.
4097. The charge per sleeper has been put down at 4s.;—do you think that sleepers might be obtained at a less price than that? I could not say.
4098. Then, with regard to the last section, from the Talyawalka into Wilcannia—the estimated cost, roughly speaking, is £10,000 per mile;—was that estimate made in view of the experience of the Roads Branch with regard to road-bridges which they had put in over the same ground? I hardly think so.
4099. When your survey was made, were the road-bridges in existence? Yes; they were right across the Talyawalka.
4100. Had any of them then sunk and been raised again? I believe that one or two had.
4101. Consequently, in making up this estimate of £10,000 per mile, you would have in view the experience of the Roads Branch? Yes.
4102. Out of that last 9 miles it is estimated that there are 7 miles below flood-level? Yes.
4103. And in that 7 miles they propose to have 4 miles of opening? Yes.
4104. Do you think that would be sufficient? I hardly think so. I do not think you could block any portion of the water there that has any current at all.
4105. You do not think it would be wise to have an embankment where there is a current? No.
4106. So the estimate there would have to be increased? I think so.
4107. It has been suggested that the terminus of the railway might be made, without any great disadvantage to Wilcannia, at a sandhill about a quarter of a mile from the river bank, a little distance above the town? Yes.
4108. Can you inform the Committee what saving would be effected if that were done, as the saving would mean a certain amount of viaduct over the low-lying land, and a bridge over the Darling? I should say about £33,000 would be the amount of the saving.
4109. Of that £33,000, the viaduct is responsible for £15,000, and the bridge for £18,000? Yes.
4110. Do you think that £18,000 would be sufficient to cover the cost of a bridge;—I understand that the road-bridge cost more than that? I could not say. I never went into the question.
4111. Taking £33,000 as being saved, what would be a fair amount to be put down as the annual cost of maintenance;—do you think 7 per cent. would be too much? I should say about 7 per cent.
4112. It has been suggested that, with the view of catching the river traffic, a siding might be run down from the sandhill of which I have spoken to the river bank;—would that cost much? It would not.
4113. It would only be about a quarter of a mile? About that.

4114.

- G. Marshall.  
31 Oct., 1899.
4114. That would enable the railway to effect a junction with the river just as cheaply as if you went to the other side of the stream, would it not? Yes.
4115. Because from a station on the other side of the stream you would still require a siding to get down to the river-bank level? Yes.
4116. Did you go into the question of water supply in your survey? We had nothing to do with that.
4117. *Chairman.*] Do you, as a railway surveyor, recommend these alterations which have been suggested? Yes.
4118. You recommend the raising of the grade from 1 in 100 to 1 in 75? That would be for a very light line, and for trains of slow speed.
4119. Would it increase the running expenses much? I should not think so.
4120. One in 75 is what you would call an easy grade? Yes.
4121. The alterations suggested, if made, would probably effect a saving of about £60,000? Yes.
4122. Do you think that the bridge across the Darling at Wilcannia is sufficiently stable to carry a light-line of railway or tramway? I should think it would; I could not say for certain.
4123. There was some idea that if a railway were constructed as far as Wilcannia, and kept on the Cobar side of the river, private enterprise would construct a tramway to go to White Cliffs and Tarrawingie;—do you think that the bridge would carry a tramway? I should say so.
4124. Have you consulted Mr. Deane about altering the grade to 1 in 75? No; I made my survey for a grade of 1 in 100.
4125. That grade of 1 in 100 would be attained pretty well by going in a straight line and filling in the hollows? Yes.
4126. The grade of 1 in 75 would be got by going over an undulating surface? Yes.
4127. By the character of the country between Cobar and Wilcannia, do you not think there would be danger of a line with a grade of 1 in 75, following the irregular surface of the ground, being damaged when floods occur? There would be damage done in the watercourses, certainly.
4128. Would that involve much additional cost for repairs to the embankments? I think it would; but the country there is flooded very seldom.
4129. If it were country subjected to frequent heavy rainfall, then it might be a serious item; but rain is so infrequent there that you do not think that would be taken into calculation? No.
4130. What distance apart have you provided for the sleepers to be on the line? I have not considered it.
4131. I suppose you would not recommend rails of less than 60 lb. weight? No.
4132. That is the cheapest rail that we could safely lay down? Yes.
4133. How long is it since you made a survey of this line? Between nine and ten years.
4134. There has been no survey made since? No.
4135. You accompanied this Committee in their recent trip between Wilcannia and Cobar, and I suppose you did not see any necessity for a fresh survey of the country? No.
4136. The railway from Cobar to Nyngan, I suppose, you look upon as very much more substantial than it need be? It is substantial. I did a portion of that survey, too.
4137. *Mr. Dick.*] Are you aware that a new road has been cleared from Cobar to Wilcannia *via* Cultowa? I was not aware of it.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane.  
31 Oct., 1899.
4138. *Chairman.*] Since you were examined before, the Committee have inspected the projected line between Cobar and Wilcannia, and feeling that that part of the country is very much in want of some better means of communication, we thought we would call you again and see if there is any possibility of still further reducing the cost of construction of the line, either in the way of raising the grades, or stopping at the Cobar side of the river? I should be very glad to reduce the estimate if it can be shown to be possible. The only chance that I can see of reducing the cost would be by stopping short of the river. It seems as if the cost of the bridging of the main channel could be saved if that would be a satisfactory terminus for the line. The saving would be about £18,000.
4139. *Mr. Watson.*] That is the bridge over the Darling? Yes; and there would be, of course, the length of permanent-way, and the embankment on the other side.
4140. On this side, about a quarter of a mile from the river, which bends towards Cobar at that point, there is a sand hill extensive enough in area to be used for station yards, and so on; if the line stopped there, it would be at least 1 mile short of the projected terminus? Yes; about 1½ mile.
4141. The engineer from your Department who was with us estimated that if a terminus were made at that sand-hill, there would be a saving of £15,000 in the cost of the viaducts, and of £18,000 in the cost of the bridge;—do you think that that would be approximately correct? There would probably be about 45 chains of viaducts saved, besides the main span; that is, 2,970 feet—or, say, 3,000 feet of viaducts saved at £3; that would be about £9,000, which, added to the £18,000 for the bridge, would make £27,000. Then there would be, in addition to that, say, a mile and 30 chains, at £2,400 per mile; that is, £3,300. That would be £30,300.
4142. I am informed that the road-bridge would cost over £30,000;—would the structure need to be so solid and well-built as that? I always reckon that a railway bridge, although it has to carry heavier weight, is a little less costly than a road bridge. I have not to incur the cost of decking.
4143. If you made a high-level bridge it would cost more, would it not? I daresay it would.
4144. *Chairman.*] At the Cobar end of the line, do you think the grade could be increased from 1 in 100 to 1 in 75? I should not like to venture an opinion on that. The Railway Commissioners were so anxious in the case of the Nyngan to Cobar line to have the grades altered from 1 in 75 to 1 in 100 that I would rather refer to them for that. Of course, they maintain that a line of this character can only be cheaply worked if it is built in such a way as to enable them to have long trains running, carrying big loads.
4145. There is no probability of having heavy through traffic from Wilcannia, such as there might have been from Broken Hill? No.
4146. *Mr. Watson.*] Consequently, though a grade of 1 in 100 might be necessary in a line to Broken Hill, in a line to Wilcannia a grade of 1 in 75 might be sufficient? That is possible. I think it is a matter that the Railway Commissioners might be asked their opinion upon. There is one point in connection

connection with which a little saving might be effected—that is, in knocking out the ballast altogether. I would rather not do it; it is only £75 a mile. If it were left out altogether, the ballasting might have to be done afterwards. H. Deane.  
31 Oct., 1899

4147. *Mr. Levien.*] It would be rough travelling without the ballasting, would it not? Not at all. It is very smooth travelling on those earth lines. I only provide a very small proportion of ballast, so as to be able to use it in very soft places, and in the station yards.

4148. *Chairman.*] Has the price of rails altered since you prepared your estimate? Yes; the price of rails has gone up very considerably. When this estimate was made I reckoned upon getting rails in Sydney at about £5 5s. per ton. The last quotation of rails that I have from England is £6 15s. f.o.b. Taking freight and all charges into consideration, you would have to add 15s. a ton, bringing the amount up to £7 10s. That would mean that the rails would be £2 5s. a ton more than is shown in the estimate. It makes a difference of £270 per mile. I understand the prices are likely to be maintained for some time, but no one can really be certain.

4149. *Mr. Watson.*] Suppose the construction of the line were entered upon, you would not require rails for some time to come? No; it would have to be surveyed first. It will take a year to complete the surveys.

4150. *Chairman.*] What would be the saving of a grade of 1 in 75 as against a grade of 1 in 100 per mile? I am afraid I could not say right off.

4151. Would it be about a third? I do not think it would be anything like one-third. It is only where the line goes over the ridges that there would be any saving at all. The line has been laid out so as to be as near the surface as possible. If I had been able to get quite down to the surface, of course the earthworks would have been put down at very much less per mile. Do what we will, we cannot get out of some cuttings and banks.

4152. *Mr. Dick.*] In regard to that item—culverts, £200 a mile; total, £31,200,—have you made the same provision for that sort of work on this line as you do in districts where you have more rain to deal with? Each line is taken by itself. The necessary culverts are estimated according to the character of the line. Generally speaking, of course, on this line there would be little rain. The country would usually be dry, and the culverts would have nothing to do. But there are times of heavy rainfall, when you must have means of getting the water across the line.

4153. You do not think that that item could be reduced at all? I do not think so. It is not a high estimate, when you consider the immense amount of carriage that would be necessary for all the timber that you require to make the culverts. The timber would have to be brought from one end of the line or the other.

4154. *Mr. Watson.*] It is a great deal higher than on the line from Dubbo to Coonamble;—on the first section of that line, Dubbo to Gilgandra, which is the worst section to construct, the amounts are—earthworks, £308 per mile; box drains and timber bridges, £182 per mile; total, £482,—as against £600 on this line? You must take them separately.

4155. The ruling grade is the same? The Dubbo to Gilgandra line is an easier one than this.

4156. It is not nearly so easy as the section from Gilgandra to Coonamble? But the earthworks are only half the length in that section as compared with the first part. I notice, in comparing the Dubbo to Gilgandra line, that box-drains and timber-bridges for the first section are put down at £182 per mile. Then there is the bridge over the river. In this case I have only £200 down for culverts, but the Dubbo district is almost in the heart of a timber country. In this case you have to bring the timber from each end of the line. You get red-gum from the river and ironbark from the eastward. I should like to point out that I have recently had instructions that 7s. a day is to be the minimum wage for labour. Our previous practice was to pay 6s. to ordinary men, and in a few cases 6s. 6d. That means that we should have to pay 7s. and 7s. 6d. It means a very serious difference in all contracts if 7s. is adopted as the minimum. It does not matter what the contracts are—whether building bridges or earthworks—it means that every one of these works must be proportionally increased in cost, because the price, not only of labour, but of material, depends ultimately upon the original labour expended upon them.

4157. Have not the contractors been paying at least 7s.? No; I am certain they have not.

4158. *Mr. Dick.*] What proportion of this £497,000 would be direct payment for labour, and not for material? I should say that with the exception of the bridging of the main channel, which would be steel with a good deal of cement used in the piers, it is all labour.

4159. Would you say that half of the £497,000 would be direct payment for labour? It looks to me as if it would, because the cost of sleepers, ballast, and so on, is all proportional to the original labour.

4160. That is quite true, but your instructions only deal with the labour you actually engage; if you put down sleepers at 4s., the fact that you were instructed to pay 1s. extra for labour will not increase the price of those? No; except so far as putting them on to the road is concerned.

4161. *Chairman.*] That 4s. is the tender price, is it not? Yes, inclusive of freight. I do not think I should be very far wrong in saying that about half depends on labour, and is directly proportional in cost to the price paid for labour.

4162. Could you say how many men, whose wages would be affected by this new regulation, would be employed on the construction of this line, and for how long? I have not made any calculations about that. It depends very much upon how the work would be tackled. No doubt it would be started from each end by arranging to get the rails brought up the river. There is a very much larger proportionate amount of labour involved in carrying out a line of this kind than appears at first sight. There are all the men employed in the bush getting sleepers, and men employed in getting ballast, besides the men who are engaged on the line, and who are chiefly those engaged in doing the earthwork, building bridges, and laying the permanent-way. There is a great deal of labour involved outside of all that.

4163. When the Department is carrying out these works by day-labour, is it not the custom to get timber for both sleepers and station buildings supplied by contract? Yes.

4164. Then that portion would not be affected by the new rule? It would, because there is a minimum clause as to the rate of wages.

4165. *Mr. Watson.*] Is it not a fact that the sleepers are got by piecework? I do not know whether that is always so.

4166. Do not the sleeper-getters receive so much per sleeper? If one class of men get more for their labour, it will affect them all round.

4167. Seeing that sleeper-getting is merely a matter of competition, whatever factors are at work in raising

or

H. Deane. or lowering the price of sleepers it will be absolutely independent of any minimum rate which the Minister may fix? I would not say that it would be absolutely independent; I think that raising the rate will have its influence.  
31 Oct., 1899.

4168. *Mr. Dick.*] I find that in 1889 an estimate was submitted for this line of £497,000; an amended survey was made in 1892, and the same estimate was submitted; and now in 1899 we have the identical amount—£497,000;—has the price of anything varied sufficiently during that period to make any alteration in the estimate, or has the variation been of such a character as to neutralise itself? That is just how it is. Some prices have gone down, and some have gone up, and it has about balanced itself. I am under the impression that I explained that on a former occasion when giving evidence.

4169. *Mr. Watson.*] When your engineers were last along this route some nine or ten years ago, there was no thought then of building surface lines, was there? This was all intended to be a surface line.

4170. The experience that we have had of light surface lines had not then occurred, had it? No.

4171. And the idea of nearly all the railway engineers then in the Colony was, I understand, to make stout, serviceable lines? Yes.

4172. Do you not think it possible that with another survey the cost of the earthworks might be reduced on this line? I doubt it very much, because the work was very carefully done in order to get a surface-line. Although it was the practice before to put more earthwork in, and to make everything heavier, yet at the time this survey was made a very great amount of care was expended in trying to get the best surface line possible. Then, after you have done that, it is a question of grading on the sections in the office.

4173. Would it not be possible that, when the engineer is looking forward to a large traffic, he would go in for a heavier line than he would if the idea were to serve only a much lighter traffic; as far as we can see, if the line is constructed, the traffic for a good few years will be comparatively light; it has occurred to some Members of the Committee that it might be possible to make something more in the nature of a tramway, with a much reduced rate of speed, on the natural surface, and perhaps by that means making a large saving in the aggregate on earthworks, culverts, and so on? I do not see how any saving could be effected in rails and sleepers. To carry big loads, the very lightest rails you could have would be 60-lb. rails. As regards earthworks, the only way I see to lessen them would be to put in steeper gradients. No doubt that would lessen the earthwork very considerably. The grade could be steepened and at some later date, without going to any undue expense, it could be improved; but I should recommend the Committee, in the first instance, to get the opinion of the Railway Commissioners as to the advisability of steepening the grades, so as to find out exactly what it would mean as regards the cost of working. I should be very glad to inform the Committee what the reduction in cost may be by the adoption of, say, a 1 in 75 grade, instead of a grade of 1 in 100. There would be no difficulty in working that out.

4174. What class of sleepers do you propose to use? The round-top sleeper, made of ironbark, red-gum, or any timber than can be got, but there is nothing else but those timbers to be had in the district.

4175. Would the cost work out at about the same amount whatever kind of timber was used? I think it would. You can get ironbark split in the bush very much more cheaply than you can get red-gum sleepers sawn; but taking freight into consideration I think they would come to about the same price. You could only get red-gum at the Wilcannia end, and you can only get ironbark at the Cobar end.

4176. The rate seems rather high for sleepers from Dubbo to Cobar; I understood you to say in the Dubbo inquiry that you could get sleepers at about 2s. 6d.? We have paid from 2s. 2d. to 2s. 6d.; then the freight is 1d. for every 13 miles.

4177. Is that what the Commissioners charge? Yes. I have tried my best to get other timbers for sleepers. I have offered every inducement to sleeper-getters and contractors to supply other classes of timber; but it always resolves itself into this, that in ironbark country you get ironbark, and in red-gum country you get red-gum. Boxwood sleepers have been obtained, but they are not to be depended upon. Box grows very hollow, and you cannot get the thickness of timber requisite to hold the spikes. It would not be safe to reckon on less than 4 inches of timber to hold a railway spike. With less than that you would have an unsafe road. The spikes would draw. Then the rails would slip out of position, and the train would be thrown off the road. Of course I understand that the Committee would like to have a reduction in the estimate if it were shown to be possible. I need not say that if, by very careful economy, the earthworks cost less than the estimate, or the culverts or any other item cost less than the estimate, the Loan Vote would get the benefit of it; but it is a thing that you cannot promise beforehand.

4178. It might be possible to get something more in the nature of a tramway for country such as this, with station buildings of the most primitive description, except at the terminus, and everything on the lightest and cheapest possible scale, pending any increase in the traffic which would justify the erection of better buildings? Yes; but I should like to point out that the stations and sidings on the line have been cut down to an absolute minimum. I am afraid that any alteration that might be made in regard to them would be in the way of increasing the cost.

4179. The general idea was to have everything connected with the line of the lightest description, and it was only anticipated that low speed would have to be submitted to? Well, you could not make a tramway cheaper than a line of this character. An ordinary tramway would cost a good deal more than this line. A tramway on an ordinary road costs £3,000 or £4,000 a mile.

4180. You have in your estimate £2,575 per mile for 156 miles of this road, as compared with under £2,000 per mile on some of the others which are held to be similar light lines;—it does not seem to me that this class of country is so much more broken as to justify the difference? But you have to take the distance into consideration, and the cost of freight. Even the water supply is rather a big item. It means sinking tanks on several parts of the road, and big tanks too, because if they are to stand several years of drought you must have very big tanks.

4181. There seems to be a pretty good catchment? I do not think there will be any difficulty about finding places where the water can be collected when the rain comes; but it may be years before the tanks are filled after they are made.

4182. *Mr. Levien.*] I suppose this item of £10,920 for water supply is necessary;—would you have to have the number of tanks that you propose upon the line? I think it would be very unwise to have a less number.

4183. You have given every consideration to the reduction of the estimate? I have cut it down as low as possible. 4184.

4184. Do you think in view of the fact that the men are to have 7s. a day, and that the cost of the rails is increased, that there is any chance of reducing this estimate at all? I do not see how it is to be reduced, except by stopping short of the river. If the Railway Commissioners consider that the gradients might be steepened, we might lessen the earthworks. H. Deane.  
31 Oct., 1899.

4185. What is your own opinion as to having grades of 1 in 75, instead of grades of 1 in 100? I have always avoided giving an opinion on that subject, because I know that the Railway Commissioners are the best authorities on it. When the Railway Commissioners were appointed, I think they rather objected to any opinion from others on traffic questions. It depends very much upon the loads to be carried, and before I could give an opinion of any value on the subject, I should have to get some data to work upon. I should have to go to the Railway Commissioners for their estimate of the amount of traffic, and the kind of loads that they would carry.

4186. You think that this item of £10,000 for water supply is absolutely necessary? Yes.

4187. There is no chance of reducing that? No. There would have to be five or six water supplies along the line, one about every 30 miles. Sometimes you cannot get them exactly at even distances, and you have to put them in closer. You must not put them too far apart; but you may put them a little closer than is necessary. Then the excavated tanks would have to be large, probably very much larger than the average, so as to hold a large supply to stand a drought.

4188. Are there good holding-places for water there? Yes; I believe plenty of good places can be selected.

4189. *Chairman.*] Is your estimate of £497,000 based upon a minimum wage at 6s. a day? Yes.

4190. Where railway construction goes on by day-labour, do you discriminate between the good workmen and the inferior workmen as to what you pay? We try to get men who are up to a certain standard.

4191. Would you pay a good man 6s. a day, and an inferior man 6s. a day? No. If we made 6s. the standard, we should have to secure reasonably good men.

4192. That would apply with regard to the 7s. a day? Yes.

4193. You are not likely to have to pay more than 7s. a day? No, except in special cases, such as getting ballast. There are certain operations in which the workman is paid a little more than the ordinary earthwork labourer.

4194. The main increase will be owing to the extra 1s. a day to be paid? Yes.

Ernest Macartney De Burgh, M. Inst. C.E., Assistant Engineer, Bridges Branch, Department of Public Works, sworn, and examined:—

4195. *Chairman.*] Do you know the bridge constructed at Wilcannia over the river? Yes; I built it.

4196. Did you personally supervise the erection of it? Yes.

4197. Is it a good substantial bridge? Yes; a good class of bridge.

4198. It is only constructed for the purpose of carrying road traffic at present? That is all.

4199. In considering this railway it has occurred to the Committee that possibly a light engine and a train might go over this bridge;—do you think it is sufficiently stable for that? Well, if I am to take a light engine to mean an engine such as they run at present on those back country roads, the lightest that they have now in use, the bridge will not carry them. There are many different definitions of what a really light engine is. I find that the lightest engine that they have now in work, class C 79, is too heavy for the way in which the strains are provided for in the Wilcannia bridge.

4200. What is the weight of those engines? The engine weighs in steam 37 tons, and the tender 21 tons 18 cwt., and its length is 47 ft. 6 in. between the buffers.

4201. *Mr. Watson.*] What is the greatest weight of the wool waggons that go across? The heaviest weight that we provide for is that of the traction engines. We make provision for two things—one is a densely-packed crowd of people, as many as can be packed on the floor of the bridge, and we get a certain load over the whole deck. The result of that gives the greatest strain on the main girders. We allow for a traction engine 16 tons, and to have the whole of that 16 tons on four wheels, 10 ft. 4 in. apart. That causes the greatest strain in the floor-beams of the bridge. But the lightest of these locomotives that they are using, such as they have on the Moree line, gives a more severe loading than that.

4202. But it is spread over a much greater wheel-base? No, it is less; they concentrate as much as they can on the two drivers, and they are only 8 feet apart.

4203. Would a 16-ton engine be the greatest weight that you could take over that bridge? Yes, on such a short base.

4204. It was suggested that if this line were constructed to Wilcannia the mining company might be willing to construct a tramway to connect with Wilcannia, and it was thought that in that case it might be possible to make arrangements for that company to work their tramway across the bridge; of course, they need not necessarily use the Railway Commissioners' engines to drag their trucks; I was wondering whether an engine heavy enough for their purposes going at a very low rate of speed could not be taken across the bridge with safety? It appears reasonable to suppose that an engine with the same load upon its driving-wheels that a traction engine drags along—and a traction engine draws heavy loads, and has to contend with the roughness of the road—could get across. The loads of driving-wheels prescribed by the Light Railways Act in Ireland, passed in 1883, are less than those of these traction engines; but then you are met with the difficulty about the loading of trucks.

4205. A 6-ton truck altogether loaded would not weigh as much as 16 tons, would it? No. But then there would be a row of them.

4206. Could they not take them over in smaller numbers at that one point than at any other point? Any load of more than 14½ cwt. to the foot run of the bridge would be too much for the main structure, and anything heavier than a traction engine would be too much for the floor.

4207. A company working their own mines, if they brought a heavy load to the river, they could afford to take it over in sections, could they not? Yes. They could take over one truck at a time.

4208. *Chairman.*] I suppose a road bridge is differently constructed from a railway bridge? Yes. The strains are arranged to meet the different forms of loading. There may be as much material in one structure as in the other, but they are differently arranged.

4209. Then with regard to this bridge what would you say would be the greatest weight of engine and tender that would run over it on rails? Just the limit I have already mentioned for traction engines—16 tons on four wheels.

- E. M. De Burgh, M.I.C.E.  
31 Oct., 1899.
4210. *Mr. Watson.*] With a wheel basis of 10 feet? Yes. As to continuous loading in a long train of vehicles, the load should not exceed  $14\frac{1}{4}$  cwt. to every foot length of the bridge. Every train of vehicles that was above  $14\frac{1}{4}$  cwt. for every foot of its length would not be safe on the bridge. There is a little engine running on the line at Camden, which has been running across an old bridge of ours for years.
4211. What did that bridge at Wilcannia cost? It cost between £18,000 and £20,000. It is an iron and steel bridge throughout. There would have to be a good deal of remodelling of the floor of the bridge to lay rails on it, and there would have to be a new deck put on it.

WEDNESDAY, 1 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. ANDREW GARRAN, LL.D.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and further examined:—

- H. McLachlan.  
1 Nov., 1899.
4212. *Chairman.*] The Committee have visited and inspected this line since you were here before, in conjunction with the railway and road surveyors, and it has occurred to them that possibly some saving could be effected in the construction of the line by increasing the grade from 1 in 100 to 1 in 75;—I believe you have consulted the Commissioners on that point, and we should like to know their views on the matter? I may say that I have not had an opportunity of discussing the matter very fully with the Commissioners, as they were hard pressed this morning; but I had a chat with them on the subject. There does not seem to be any great object to be gained in the increase of the grade. In the first place, it does not mean a very big item in regard to the cost of construction. There is no great advantage if you consider the difference in interest, and the annual cost of working. At the same time, for the comparatively small difference you can get the great advantage of a grade of 1 in 100. You have to recollect particularly that, in connection with these light lines, you cannot work heavy engines over them; consequently, the engines with which you work them will be of comparatively light power; therefore it is desirable to get as easy a grade as possible. Another thing, we do not expect a great deal of traffic from the Darling; but the Committee seem to think that there may be a development of mineral traffic, or that it may be a valuable line from a stock point of view. When you move stock at a time of drought, you have a concentrated traffic. For twelve months the traffic may never amount to much, then it may come all at one time; therefore it is desirable that you should get the utmost advantage out of the line at the most reasonable cost. For instance, take the grade of 1 in 75. The "C" class of engine which would be used would take a load of 230 tons; that would be the weight behind the engine. But on a grade of 1 in 100 the load would be 300 tons, and you have this further disadvantage, that if you have a different grade coming into Cobar you will have to break the train-load at Cobar. The grade being easier on the Cobar line, you would be able to take a bigger load on the main line than you could on the branch; therefore you could not have economical working in connection with the branch. We have been reducing the grades considerably on the main line. Looking at the matter from an economical point of view, I do not think that, for the small saving in construction that could be effected there, it would be desirable to increase the grade.
4213. In case of a congestion of traffic, could you take a bigger load than 230 tons? Yes, you could take a bigger load on the line from Cobar and from Nyngan; but to make that line profitable, you want to haul big loads long distances.
4214. How many sheep would 230 tons represent? Roughly, I should say a little over 2,000.
4215. Do you carry as many as that in one train? Yes; the load on the main line is a bigger one than that.
4216. Are the rates for that kind of traffic good? The rates would be good enough if you could get loading both ways, but the trouble about the stock traffic is that the loading is only one way, and you have to run the trucks empty to pick up the loading. That is an important consideration. You must bear in mind that you cannot use the same class of engines on light pioneer lines as on the solidly-built main lines.
4217. On the main line you sometimes have difficult grades? Yes; but we can use more powerful engines, and where the grades are particularly difficult we can use a banking engine. The Railway Commissioners have cut out most of the bad grades on the Western line. At the Zig-zag a banking engine can be used, so that we can drag a big through load.
4218. What are your worst grades? There are grades of 1 in 30 and 1 in 33 on some sections.
4219. Mr. Deane has sent in a memorandum showing that by making the ruling grade 1 in 75 instead of 1 in 100 we should effect a saving of £8,750? Yes, about £240 a year.
4220. Is that not worth taking into consideration? I should not think so. At 3 per cent. it would be £250 a year. Under all the circumstances of the case, I should not be in favour of increasing the grade.
4221. Unfortunately, at the present time, although we should save that amount in reducing the grade, the cost of railway material has gone up? Yes, it has gone up very seriously; it has increased wonderfully during the last six months.
4222. It has been suggested that a kind of tramway might be made over that kind of country, and that tramway engines might be used? Then you still further reduce your load, and you have to have light engines. A tram cannot run far without taking coal and water. I do not think that a tram can run above 12 or 15 miles without taking in water, and water is one of the troubles in that district. You want a really good tender.
4223. *Dr. Garran.*] Those grades are all running through little ridges? Unfortunately, a good number of them are against the load.
4224. For some years there will be no heavy traffic on the line, but if there should come minerals to make

a concentrated traffic we could reduce the grade? That would be a matter for the engineers. The Commissioners have not seen the detail plans. There seems to me a fairly considerable length where the grades would be 1 in 75.

4225. The load you could carry on a grade of 1 in 75 would be quite enough if we could get that every day? Yes; if we could average it.

4226. Excepting in the wool season, there is really no concentrated traffic possible? No. From the nature of the country the traffic would very likely be a concentrated one.

4227. What you could take on a grade of 1 in 75 would be superabundant? Yes; if you could get it every day.

4228. You will always bring lighter loads into Cobar from Wilcannia than on the line from Cobar to Nyngan? Yes, you would think so; unless there were big loads of stock, or anything of that kind.

4229. You could carry a great many loads of stock on a grade of 1 in 75? Yes.

4230. You could carry all the sheep and stock that you would want to carry over a grade of 1 in 75? Yes; with the "C" class of engines.

4231. So the difficulty would not be an immediate one? No, I think not. It is the general principle I am speaking of.

4232. *Mr. Levien.*] I suppose you would run mixed trains? Entirely.

4233. Would they run daily? I think they would run perhaps three times a week each way.

4234. You do not think it would pay to have a daily service? No.

H.  
McLachlan.  
1 Nov., 1899.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

4235. *Chairman.*] Could you explain that  $3\frac{1}{2}$  mile item? Yes. The line was originally laid out with 1 in 75 grades. In making up the estimate after examining the plans, I came to the conclusion that the ruling grade could be changed from 1 in 75 to 1 in 100 by adding  $3\frac{1}{2}$  miles to its length. I therefore deducted simply what was added for altering the grade, namely,  $3\frac{1}{2}$  miles at £2,500, making £8,750. It was previously £2,575 per mile, but I have left out the ballast.

H. Deane.  
1 Nov., 1899.

4236. Would that alteration of the grade to 1 in 75 cause  $3\frac{1}{2}$  extra miles owing to the undulation of the country? Yes; it was caused by having to go round and rising gradually. The line is lengthened for the purpose of getting the grade.

4237. Will you read your statement? It is as follows:—

COBAR TO WILCANNIA.

Saving through stoppage on east side of river—			
Bridging main channel.....	£18,000		
3,000-foot viaduct, at £3.....	9,000		
$1\frac{1}{2}$ mile formation, at £2,400.....	3,200		
			30,200
Saving through leaving out ballast, 156 miles at £75.....			11,700
Saving through making ruling grade 1 in 75, $3\frac{1}{2}$ miles at £2,500.....			8,750
			£50,650
		Total.....	£44,145
Increase of cost due to price of rails (£5 5s. to £7 10s.), say, 163 $\frac{1}{2}$ miles at £270.....			£44,145

4238. *Mr. Watson.*] You would not require the rails for this particular line within twelve months from the present time? No; because the line would have to be surveyed.

4239. So there would probably be a delay of at least twelve months? I have very little doubt that there would be.

4240. And during that time the price of rails may fluctuate? Yes, they may; although the opinion is rather that they will uphold their price.

4241. What was the cause of the sudden inflation of prices? The improvement in trade and the extra demand.

4242. No special reason is to be assigned? I am not aware of any, because it is not only in England, but also in America and on the Continent—everywhere. The competition of America has been very keen, and would have tended rather to diminish than to increase prices.

4243. *Dr. Garran.*] Suppose you were to lay out your line with a grade of 1 in 75, and afterwards it became wise, in view of the traffic, to reduce the grade to 1 in 100, could you not do that without going outside the fences and taking a more circuitous route? Yes; it could be done by cutting down.

4244. At no very great expense? It would cost more than £8,000, but it would not be a very serious matter.

4245. If you were to stop your railway at the hither side of the Darling River to avoid that last 7 miles of soft country, you would have to fit up a terminal station with water supply, turn-table, and other requisites? Yes.

4246. And if you afterwards pushed the line on to Wilcannia or across the river you would have to shift those things? Yes.

4247. If you are going to make a station at Wilcannia within a moderate time it is hardly worth while to go to that expense on this side of the river, is it? No, it would not be.

4248. This saving you speak of is only to stop a quarter of a mile from the river? The total length that we should be short would be about 2 miles.

4249. What would the saving be if we stopped at this side of the Talyawalka Creek? Roughly speaking, it would be a little over £90,000.

4250. I suppose, as far as the traffic is concerned, that we should get all the traffic at that place that we should get by going to Wilcannia? Possibly.

4251. If a man wants to send his sheep or his wool, or to send ore, he would send them there? Yes.

4252. If he wanted to travel himself he would go there? Yes; but there would be extra travel and carriage by road.

4253. But that would not affect the railway? No; except that we should lose the carriage for that distance.

4254. Might it not pay to lose that instead of making that bit of line? Yes; it is a most expensive piece.

4255. *Mr. Watson.*] If the suggestion just made by Dr. Garran were carried out, and the line stopped

H. Deane. at the Talyawalka Creek, would it then be expensive to run a surface extension from the Talyawalka Creek to the river—say, a tramway to carry the traffic in other than flood-time? I do not think there would be any advantage in making a tramway. You would have to make it so that the ordinary rolling-stock could be carried on it.

1 Nov., 1899.

4256. Could it be made for a small cost, so that it would allow the floods to go over it without injury? These high floods, I suppose, are rather scarce, so that the line could be placed below flood-level, except where marked channels are shown upon the map. I should say that if anything of that sort were done, it would be far better to extend the line right through, and have the terminal station on the other side of the Talyawalka channel, to allow the line to be placed below the flood-level, to let the flood go over it, than to have a terminal station on this side of the flood-water channel, and have to have an extension for what would practically be another large station, because we should have to have plenty of accommodation for trucks, and so on, near the river.

4257. Could you tell us what difference that would make in the cost of running the last 7 miles to the south-eastern side of the river below flood-level? I should think it would make a difference of something like £30,000. You see the viaduct is 20,500 feet, and is put down at £51,250. In place of that you would have to have an embankment which would not always follow the surface. You could not follow the small undulations, and it would be more bank than an ordinary railway, and you would have some bridges to construct. Without going into the matter very carefully, I should think the saving would be between £30,000 and £35,000.

WEDNESDAY, 15 NOVEMBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Cobar to Wilcannia.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and further examined:—

C. E. Rennie. 4258. *Chairman.*] You have prepared a statement and plan showing the amount of revenue that would be derivable from leasehold areas in certain districts west of Cobar? Yes; from all classes of Crown lands.

15 Nov., 1899.

4259. And the area you have included for the purposes of that calculation starts at Cobar, and then goes in a north-westerly direction up to Wanaaring, thence in a south-westerly direction towards White Cliffs, about 50 miles to the west of White Cliffs, thence coming down in a southerly and easterly direction to the Darling River, about 40 miles south of Wilcannia, thence in a north-easterly direction to Cobar? Yes; that is the area.

4260. Will you give us the information that you have got? Within that area there are about 14,784 acres of conditional purchases, returning about £739 a year. There are converted pre-leases containing 18,936 acres, returning £172. Then there are miscellaneous leases, embracing 1,088,921 acres, returning an income of £4,520; there are leasehold areas, embracing 7,895,683 acres, returning an income of £23,854; occupation licenses, 4,234,676 acres, returning £5,925; total revenue, £35,260. That is exclusive of land tax and revenue from mining occupation. There is an area of 151,000 acres at present unproductive.

4261. You have not included in that calculation any allowance from revenue from mining? That estimate does not include any revenue from mining occupation or from land tax.

4262. *Mr. Watson.*] The proportion of land in the resumed areas is a little more than half of that held on leasehold? Yes; rather more than half.

4263. That, of course, is available for homestead leases at the present time? Yes.

4264. Consequently, if the railway were taken there, the resumed area would be available for smaller classes of settlement? Yes; if sufficiently attractive.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Cobar to Wilcannia.

APPENDIX.

A.

COST OF LIGHT LINES OF RAILWAY.

Office of the Railway Commissioners of New South Wales,  
Sydney, 26 October, 1899.

Dear Sir,

I am unable to furnish you with the exact details upon which the estimate of £1,750 per mile for light lines was based, but I have no doubt that the estimate was at the time perfectly correct. It was, in connection with this estimate, assumed that the line would run over almost perfectly level country, and that there would be no expensive earth-works to be dealt with. As you are aware, the cheapest line that has been built up to the present time is that from Jerilderie to Berrigan, at a cost of £1,814 per mile.

As regards constructing any of these lines at the present time, the increased price of rails must be considered. In the estimate referred to, the rails were calculated at the rate of £4 per ton; the price at the present time is £7 10s., and therefore the cost would have to be increased by about £350 per mile.

The Chairman, Public Works Committee.

Yours, &c.,  
CHARLES OLIVER.

B.

[To Evidence of T. H. Bell.]

COPY OF PETITION TO PARLIAMENT.

Cobar-Wilcannia Railway League.

The following will be submitted by petition to Parliament:—

1. That the towns and districts enumerated desire, and are very much in need of, a regular and speedy means of communication with Sydney and the other centres of population in the Central and Eastern Divisions.

2. That the means sought are by the extension of a line of railway from the Cobar terminus to Wilcannia, a line already surveyed and marked out, and cost estimated by the Railway Department at the rate of a trifle over £3,000 per mile—162 miles, cost £497,000.

3. That by the construction of this line of railway, the bulk of the trade and traffic which now goes to Melbourne and Adelaide will be drawn to the capital of our own Colony.

4. That this trade would immensely benefit Sydney and intervening districts.

5. That this district would send wool and live stock and take back merchandise and produce.

6. That the extent of this traffic, as ascertained from records of trade done at Wilcannia, would be 6,500 tons of wool, skins, and tallow (outward) at £4 13s. 4d. per ton, £30,333 6s. 8d.; 2,500 tons general goods (inward) at £6 13s. 4d. per ton, £16,666 13s. 4d.; 1,500 tons produce (inward) at 20s. per ton, £1,500. Total, £48,500.

7. The figures supplied under clause 6 are guaranteed by two members of the committee, who have derived them from their own books, which books they are prepared to submit to the inspection of any authorised officer. (An officer of the Railway Department has already inspected these books and taken copious extracts therefrom.)

8. That there would be a large increase in sending fat stock to the Sydney and other markets, which stock, from want of means of transit, now fall off in condition, lower prices having to be accepted for them as stores, with the risk of no sales being possible and the ultimate death of the stock. As an instance of loss resulting from this cause, we are authorised to quote the fact that in 1895 on one station alone eleven thousand (11,000) sheep had to be slaughtered and the carcasses burnt, the skins alone affording revenue; whereas, had there been railway facilities, not less than seven thousand (7,000) of these would have been trucked to the metropolitan or other markets. This is by no means an uncommon experience. It is to be borne in mind that, for the most part, the pastoral industry in this district has to depend at the present time for its revenue on the sale of wool alone, very little being received for the value of the carcase. Were railway facilities afforded, it is certain that the carcase would bring its value, because it often happens that small lots of fats are ripe for market which cannot be sent on account of the high relative cost of droving small lots, as well as the risk of the roads being impassable, and the inevitable loss of condition in the time occupied in travelling such immense distances. In most seasons fat stock can be driven to Wilcannia without serious loss of condition, but cannot reach the metropolitan or other fat stock markets without being very much wasted and for which only store prices can be obtained.

9. That the estimated annual cost of working this line, as made by the Railway Commissioners in 1891, is £27,310—(interest at 3 per cent. on £497,000, £14,910, and working expenses £12,400).

10. That the revenue estimated by your petitioners, based only on the figures of clause 6, and not including any stock or contingent traffic, which would be a large item, amounts to £48,500, which would pay at the rate of 9½ per cent. on the capital expended (£497,000), and after deducting working expenses (£12,400), would leave net profit £36,100, or equal to 7¼ per cent. on capital invested.

11. That Wilcannia is the centre of a vast pastoral district, the area from which the traffic would be drawn being forty (40) million acres, carrying four (4) million sheep, and paying a revenue to the Crown of about £125,000, reckoning at 3s. d. per acre. The district to be served by the proposed railway has an annual surplus exceeding 500,000 sheep, and the number of these that would go by rail to market would be not less than 150,000, which, at 1s. 6d. per head, would afford an additional revenue of £11,250. This is proved by the fact that for the thirteen years ending 31 December, 1898, 104,000 fat sheep were sent away annually to market from about half the 40,000,000 acres to be served by the railway. Particulars of the stock traffic for the remaining portion of the district to be served are not readily obtainable by the committee. Thus the fat sheep to be carried by rail would considerably exceed the figures here given. Before the imposition of the Victorian Stock Tax, an average of about 20,000 head of cattle from the south-western parts of Queensland passed through Wilcannia annually. It is certain that were railway facilities afforded, fats from these mobs would be trucked to Sydney from Wilcannia, which must at the present time travel on and take their chance in a store market. The district also produces a large surplus for export from which is estimated a revenue of £3,000.

12. That the construction of this line will open up and develop an extensive district, rich in mineral deposits, such as gold, opal, silver, copper, and tin. These deposits are proved beyond doubt, the output from White Cliffs alone during the past twelve months reaching over £100,000, and supporting a population of 1,600.

13. That by the development of these mineral resources, towns such as White Cliffs and Cobar would spring up, absorb surplus labour, and vastly increase trade and railway revenue.

14. A considerable population has been employed in gold mining for the past twenty (20) years, but owing to the difficulties of transit, works on a large scale have been paralysed, many reefs of 2 oz. to 3 oz. to the ton are, after this lapse of time, still unworked, for the reason before mentioned. As a corroboration of this, we would instance the Mount Browne goldfield, which at one time gave employment to about 3,000 men.

15. The value of passenger traffic by coach on the Cobar, Bourke, and Broken Hill lines, from and to Wilcannia, is £5,000. The destination of the bulk of the passenger traffic by the Wilcannia to Broken Hill coach is either Melbourne or Sydney, which the proposed railway would necessarily carry. The South Australian traffic would still go by Broken Hill. Therefore the minimum revenue derivable from passenger traffic, immediately the railway is opened, must be at least equal to the value of the present coach traffic.

16. Wool and supplies must be carried by the railway for the district lying between Wilcannia and Cobar, because the heavy land carriage to enable them to reach the Darling would place the Darling route at a disadvantage compared with the railway.

17. The following is a re-capitulation of sources of revenue :—

Under clause 6 .....	£48,500
Estimate of sheep traffic (clause 11) .....	11,250
Cattle traffic.....	3,000
Passenger traffic (clause 15) .....	5,000

£67,750

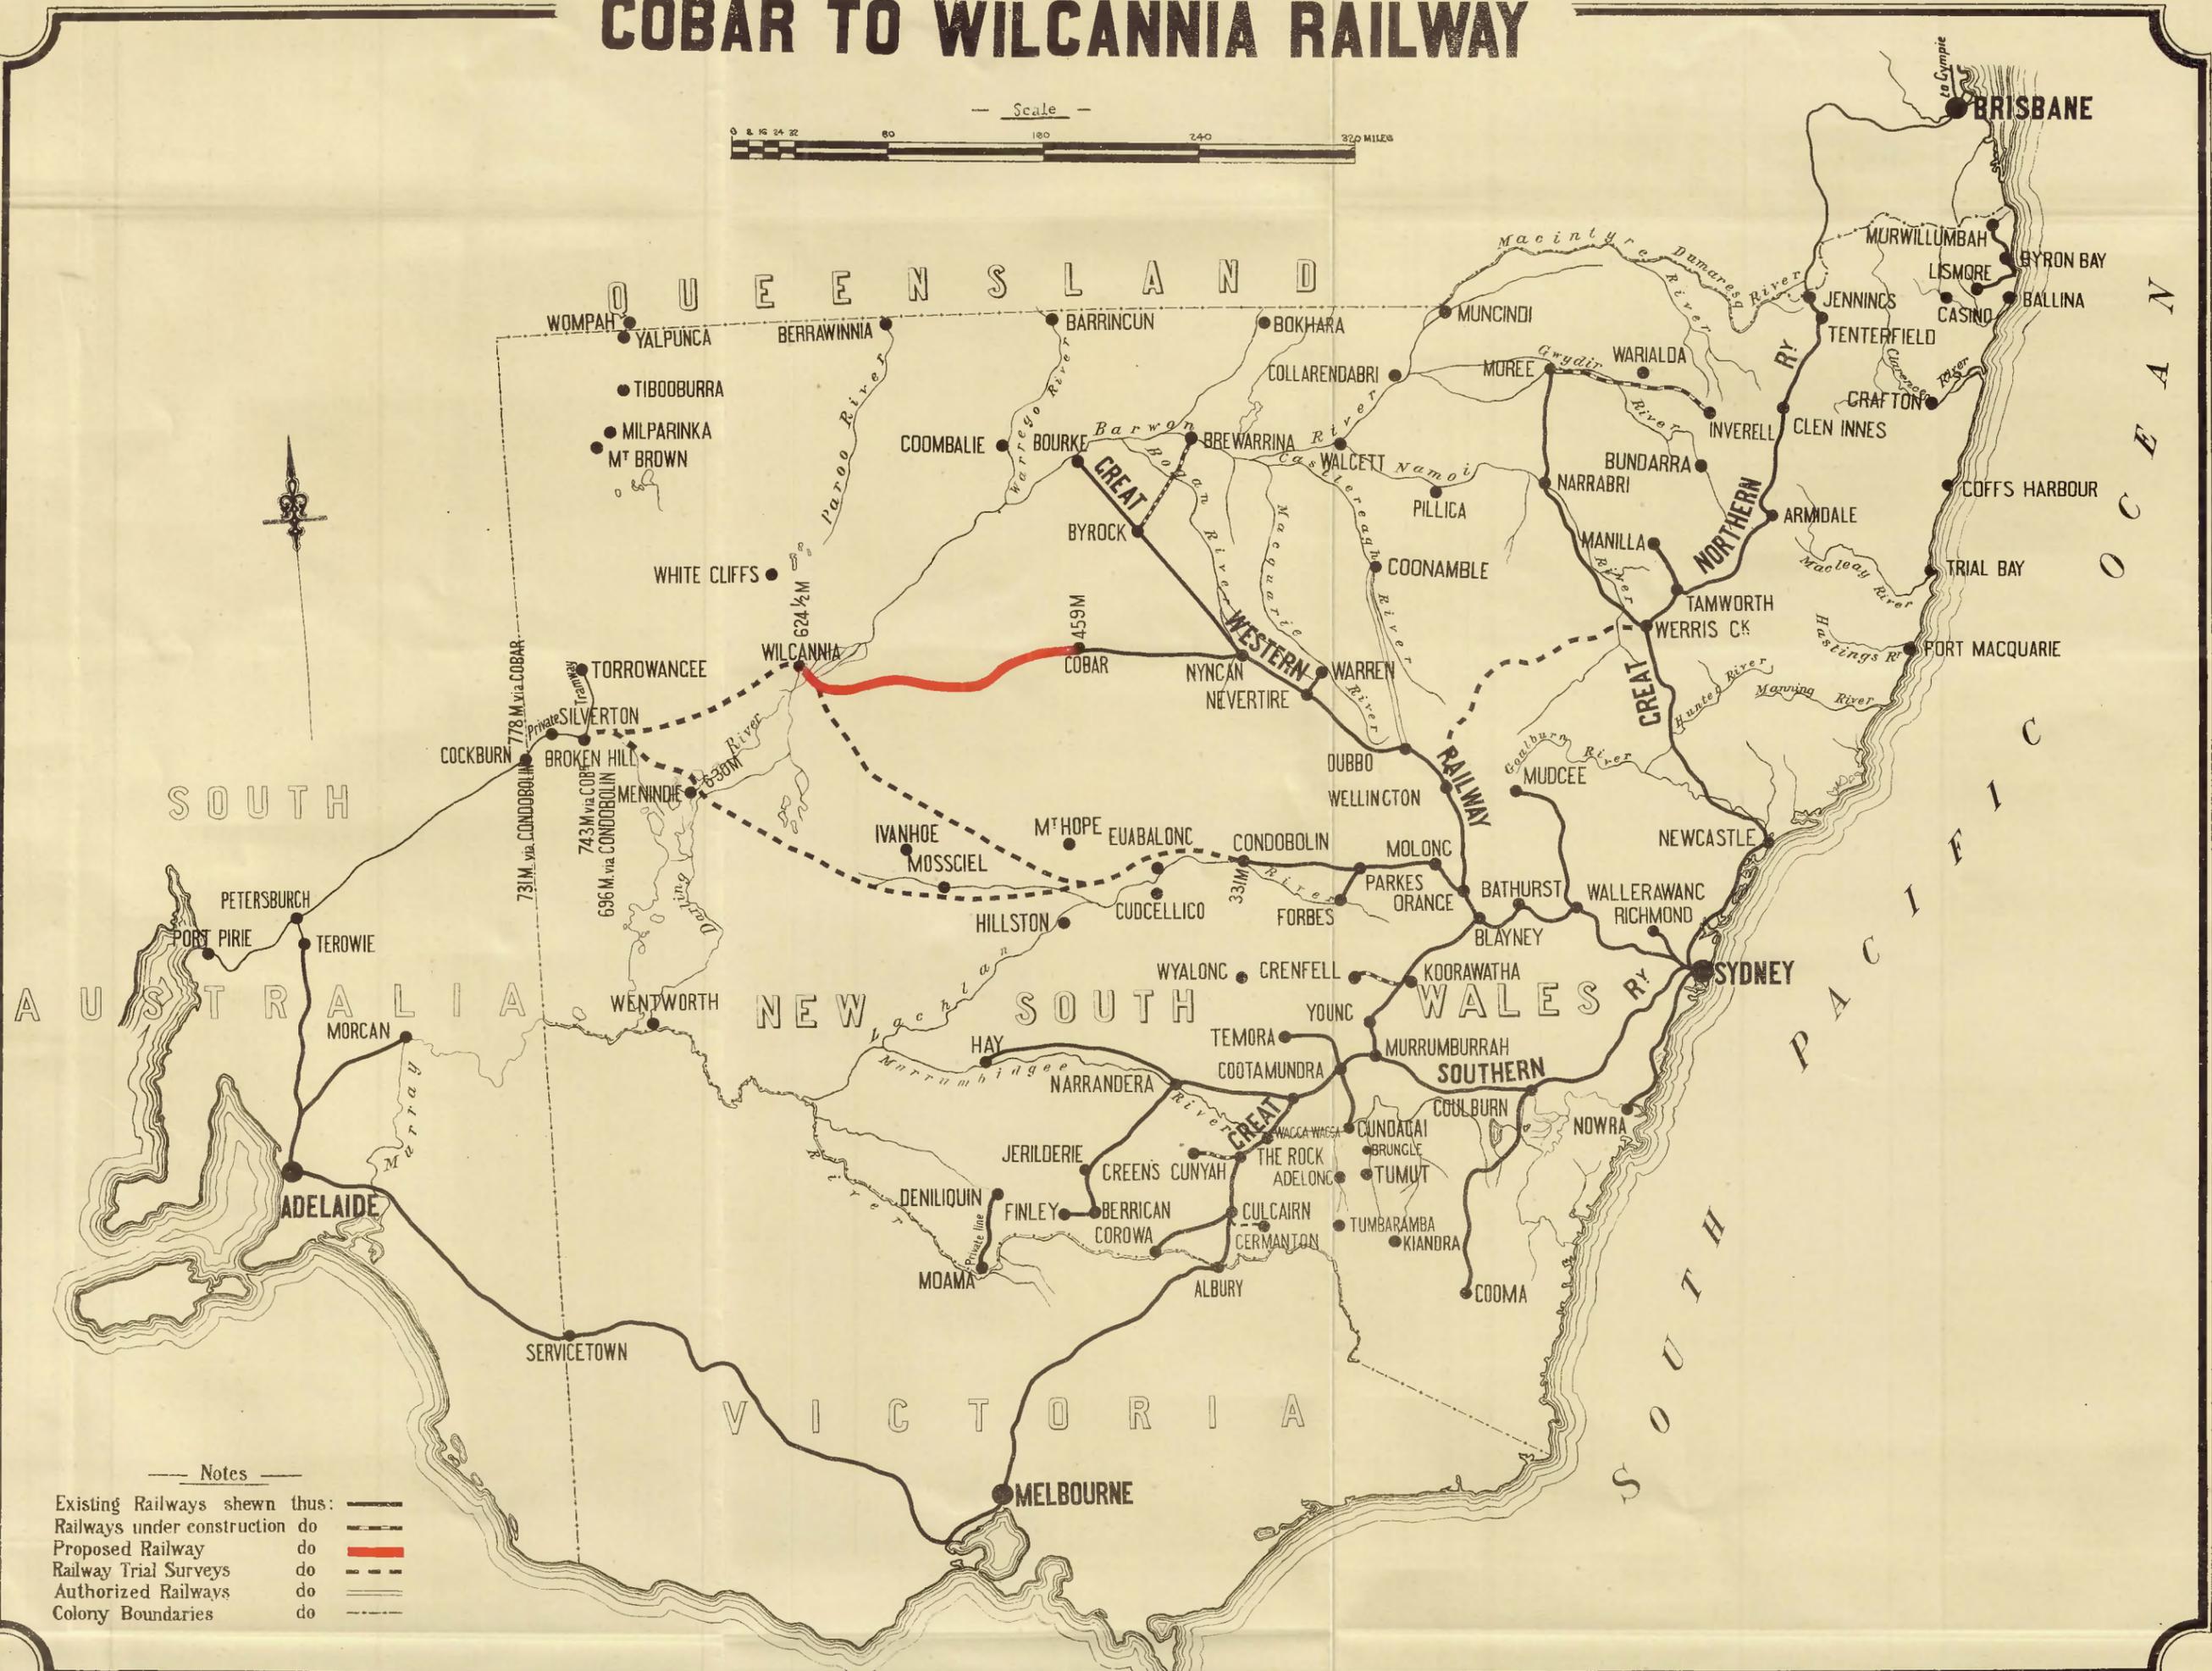

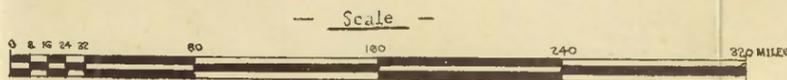

Which gives a net return after deducting working expenses (£12,400) of  $11\frac{1}{2}$  per cent. on capital invested.

And your petitioners now pray your honorable House to take such steps as will lead to the construction of the railway from Cobar to Wilcannia.

And your petitioners as in duty bound will ever pray.

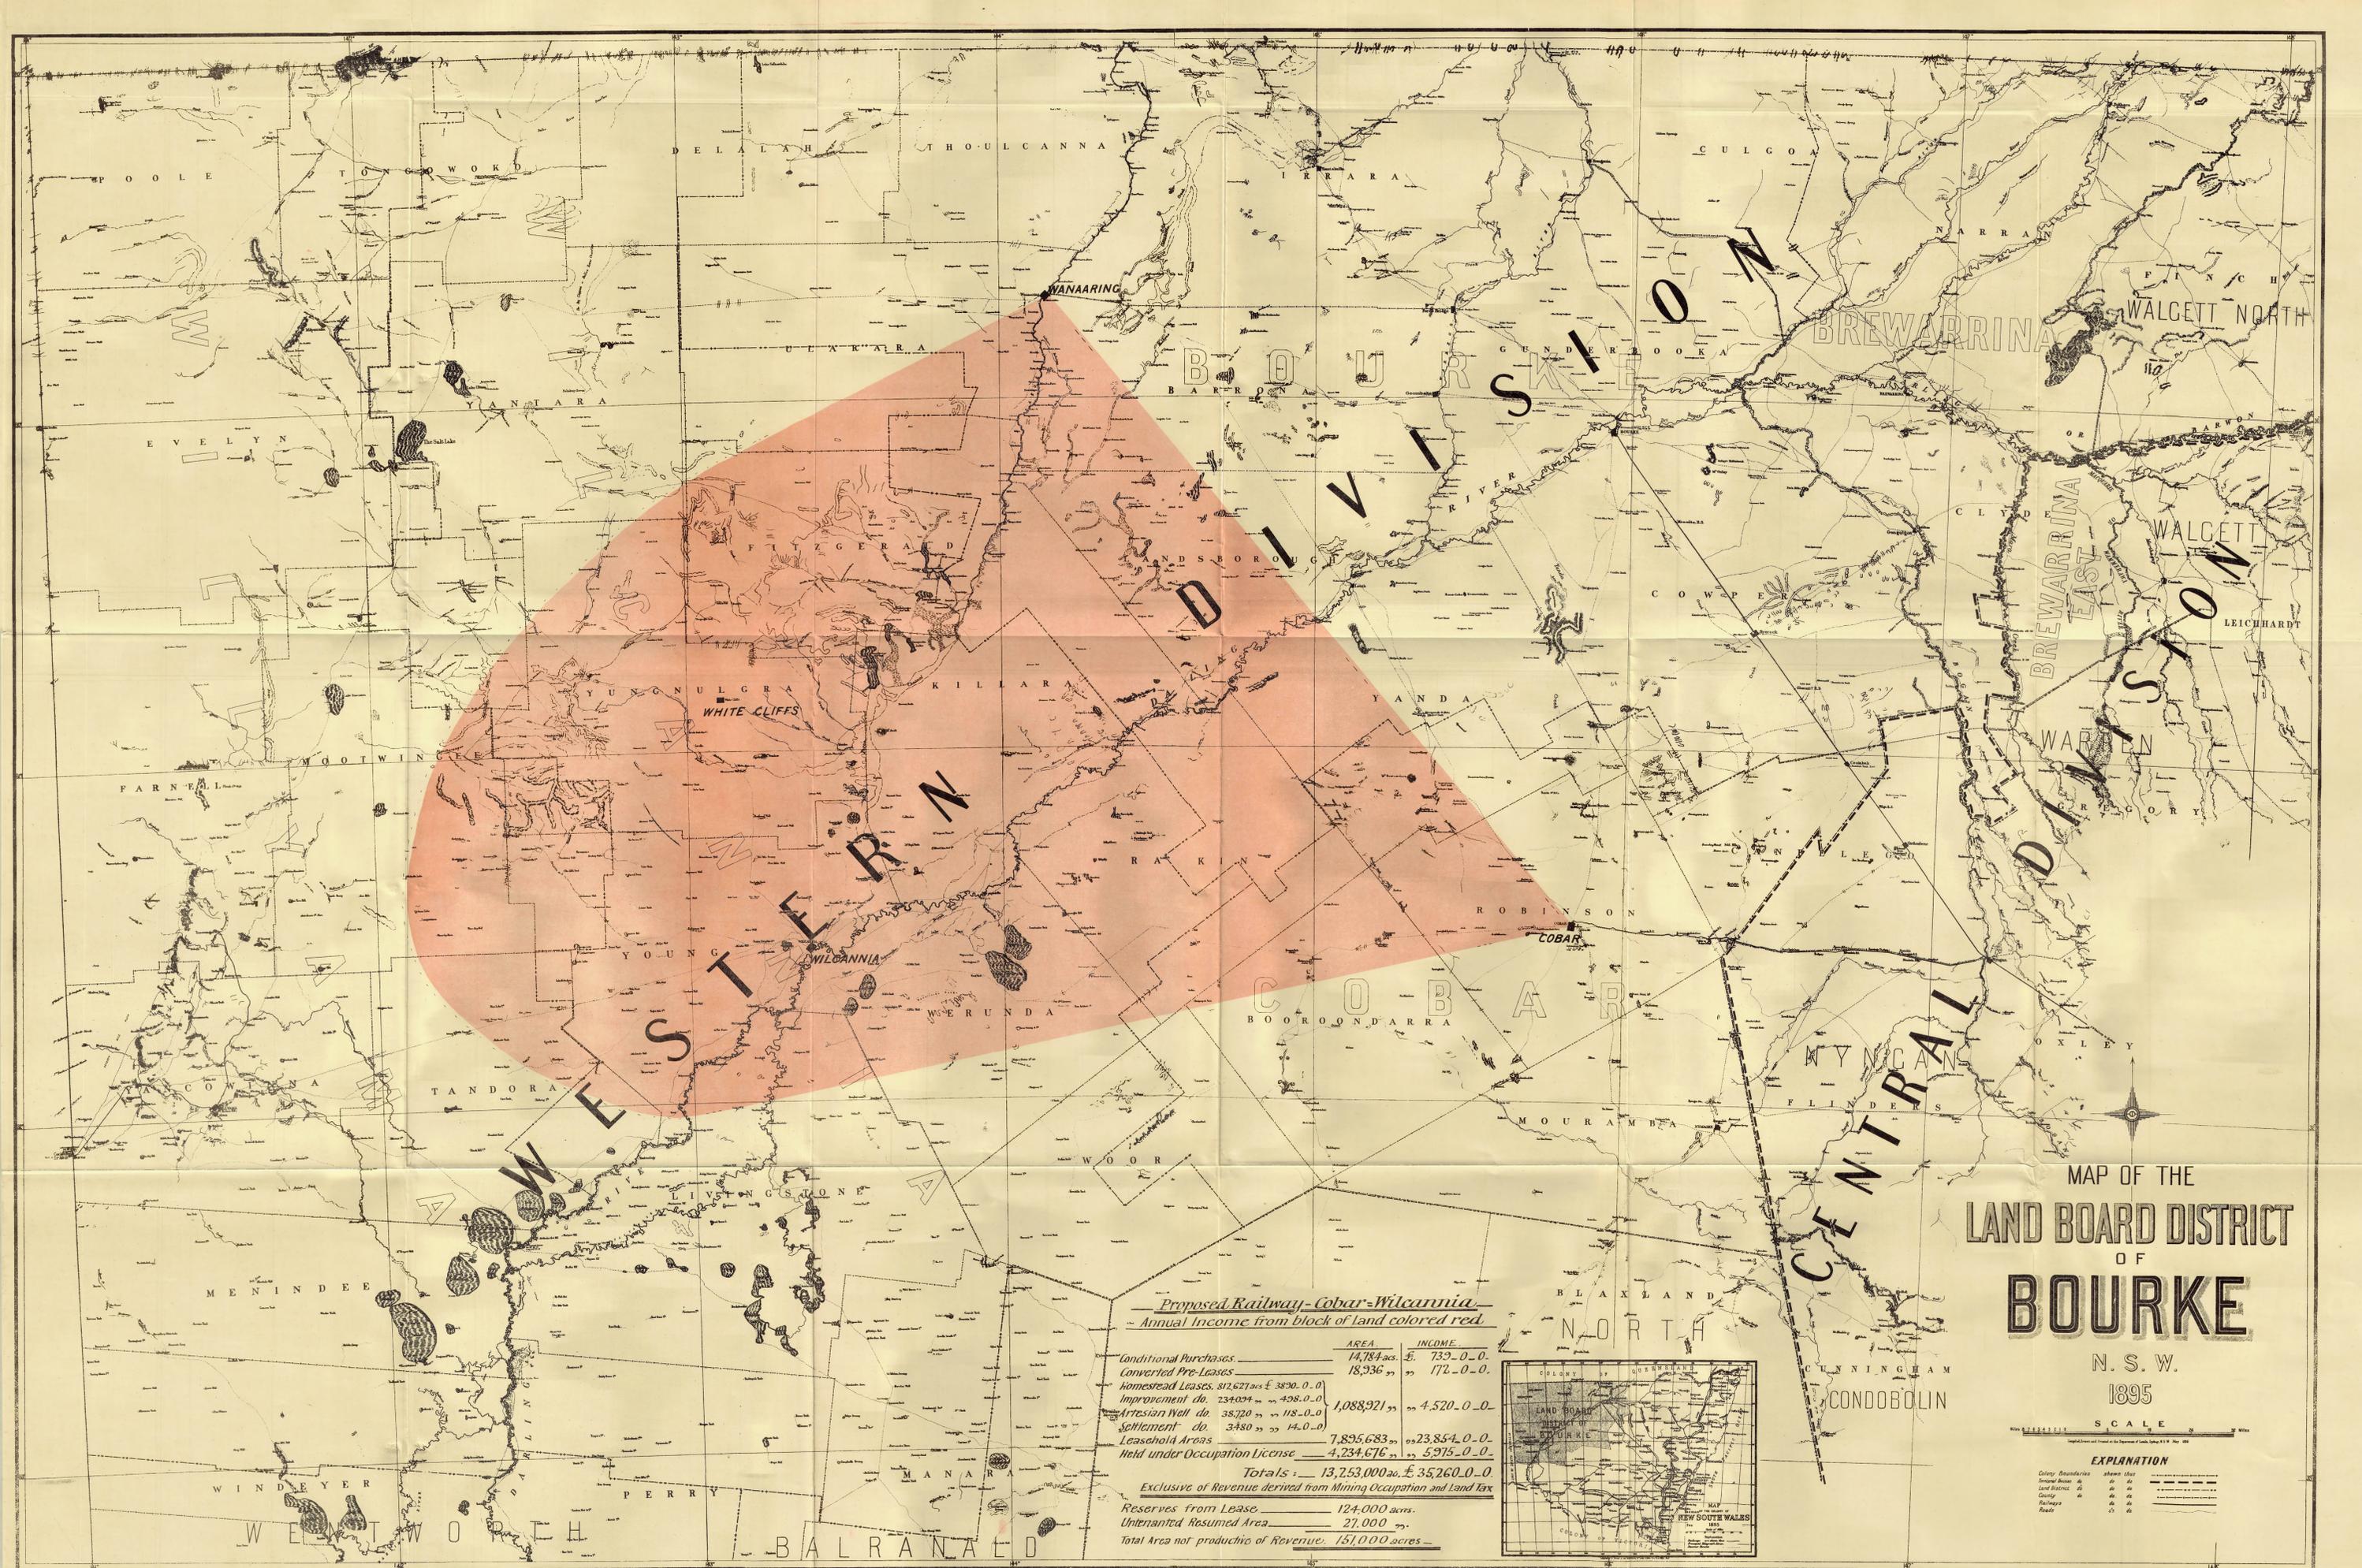

[Two plans.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## RAILWAY FROM GRENFELL TO WYALONG.

### REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of Railway from Grenfell to Wyalong," have, after due inquiry, resolved that it is expedient the proposed railway should be constructed; and, in accordance with the provisions of sub-section (IV), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

#### RAILWAY EXTENSION TO WYALONG.

1. Railway extension to Wyalong has been under consideration since 1894, a few months after the discovery of the Wyalong gold-field. In that year a proposal to construct a railway to the field from Temora was inquired into by the Parliamentary Standing Committee on Public Works, and a resolution arrived at that a decision in the matter should be deferred for six months, so that at the end of that time the importance or otherwise of Wyalong as a goldfield and a district of settled population might be determined with more certainty than was then possible. In 1895 the project was again referred to the Committee, and on that occasion definitely negatived, the Committee being of opinion that the prospects of traffic on the line were not sufficiently encouraging, and that the future of Wyalong was not so certain as to justify the construction of the line in anticipation of what might be the condition of the goldfield and district some years hence.

The present proposal originated in a suggestion made by the Parliamentary Standing Committee on Public Works in October, 1896, in their report upon a proposed line of railway from Condobolin to Broken Hill, wherein it was pointed out that a line from Cowra or thereabouts to Grenfell, and thence in a westerly direction through the Bland country to Wyalong and Hillston, would pass through a vast area apparently suitable for wheat-growing. The survey of a line from Grenfell to Wyalong, in conjunction with that from Koorawatha to Grenfell, was approved in January 1897, and completed in December of the same year.

#### DESCRIPTION OF THE RAILWAY.

2. The proposed railway is an extension of that from Koorawatha to Grenfell. It commences at the end of the permanently-staked Koorawatha to Grenfell line, 309 miles 35 chains from Sydney *via* Harden, and, curving round to the left, bears in a westerly direction to a spur of the Weddin Mountain Range, which it crosses at 310 miles 40 chains. Thence it runs parallel to the Forbes-road until it crosses the road

road at 313 miles 70 chains, from which point it proceeds in a southerly direction to travelling stock reserve 530, which it crosses at 315 miles 40 chains, and then bearing due west, passes over Weddin Creek at 318 miles 20 chains, and a main spur of the Weddin Range at 320 miles. There the line takes a south-westerly direction, crossing Caragabal or Blind Creek at 332 miles 65 chains, and the road from Bimbi to Marsden at 335 miles 35 chains; thence running nearly due west to 342 miles. Bearing south-westerly from that distance, travelling stock reserve 2,332 is crossed at 345 miles 60 chains, travelling stock reserve 574 at 347 miles 30 chains, Bland Creek at 348 miles 70 chains, and Back Creek at 353 miles 50 chains, from which point, running a little more westerly, it passes over the permanently-staked line, Temora to Wyalong, at 365 miles 60 chains, and thence going due west, parallel with the Wyalong township alignment, it ends in West Wyalong at 368 miles 35 chains from Sydney *viâ* Harden, and 326 miles 47 chains *viâ* Blayney. The ruling grade on the line is 1 in 100, and the sharpest curve 14 chains radius. The works are fairly light.

From Grenfell, to a point about 12 miles westerly from that town, two routes have been surveyed and are shown on the map, the northern one being that proposed for adoption. It is shorter than the other by half a mile, and is the more suitable for connecting with Forbes. The southern, from an engineering standpoint, presents the least difficulty, and though half a mile longer is the cheaper to the extent of £5,450; but the adoption of the northerly route would save the construction of  $5\frac{1}{4}$  miles of line at a cost of £11,000, if it should at any time be considered desirable to construct a railway from Grenfell to Forbes.

#### AN ALTERNATIVE ROUTE VIA BIMBI.

3. An alternative route *viâ* Bimbi, which was surveyed in response to representations made by the residents of the locality, leaves the direct line at 308 miles 42 chains, and for the most part passes along travelling stock reserves. Bimbi is reached at 326 miles, and at 334 miles Euroka station is about  $2\frac{1}{4}$  miles south of the line. Bland Creek is crossed at 348 miles, and Back Creek at 354 miles; and the route junctions with that of the direct line at 362 miles 68 chains on the Bimbi mileage, and 361 miles 16 chains on the other, the extra length being 1 mile 52 chains. West Wyalong, by this route, is 370 miles from Sydney *viâ* Harden, and 328 miles *viâ* Blayney. The line is very gently undulating to the neighbourhood of Bimbi, except at 318 miles, where there is a moderate cutting and bank. Apart from this, only easy grading is necessary to obtain a surface line. Beyond Bimbi, the flat western plains are reached. The ruling grade is 1 in 75, and the sharpest curve 12 chains radius, but this occurs only once; the other curves are easy.

This route, however, involves back shunting at the Grenfell station, to which there are serious traffic objections; moreover the line is not nearly so direct as the other, and the country about Bimbi is within 20 miles of Grenfell by a good road, and not more than 30 miles from Young.

The Committee endeavoured to ascertain whether a route could be found midway between that proposed and the one *viâ* Bimbi, so that the railway should conveniently serve the settlers around Bimbi as well as those to the north of the Weddin Range; but the intervention of those mountains, and the expense of crossing them south of the point selected, make this impracticable.

#### ESTIMATED COST OF THE PROPOSED LINE.

4. The estimated total cost of the proposed line is £142,292 10s., or an average of £2,411 14s. 9d. per mile. This includes—Earthworks, £11,682; timber bridges, £9,912; level crossings, cattle stops, and fencing, £3,540; permanent-way materials, £37,582; freight, £8,564; plate-laying, ballasting, and sleepers, £31,541; station works, including sidings, £9,399; station buildings, &c., £7,490; water supplies, £5,000; telegraph, £885; gradient and mileage posts, £885; and engineering and contingencies, calculated at  $12\frac{1}{2}$  per cent., £15,810.

RAILWAY

## RAILWAY COMMISSIONERS' REPORT.

5. The Railway Commissioners show by their report upon the railway that until there be a development of traffic upon the line the traffic returns will be £3,249 below the expenses, exclusive of any loss on the Temora line by diversion of traffic. The estimated annual cost they give as—Interest at 3 per cent. on capital expenditure, £4,269; cost of maintaining permanent-way, and traffic and locomotive expenses, £4,843; or, together, £9,112. The traffic estimate is £5,863, comprising merchandise and live stock, £2,589; passenger traffic, £2,054; mails, £720; and parcels, £500. "No doubt," the report observes, "the district has considerable prospects, but it is not a matter of certainty that the time has arrived for Wyalong to have the benefit of railway connection. If, however, it is decided that the railway should be extended to Wyalong, the extension, in the opinion of the Commissioners, should be from the proposed Grenfell line."

## THE COMMITTEE'S INQUIRY.

6. In their inquiry with regard to the proposed railway, the Committee examined witnesses in Sydney, and at Grenfell, Wyalong, Barmedman, Reefton, and Temora; and they inspected the railway route, and to some extent the country in its vicinity. Evidence was also taken with reference to connecting Wyalong with the railway system at Temora, and the route surveyed for that line was inspected. At Wyalong the mines were visited, and inquiries made as to the permanency or otherwise of the mining industry in the town and district.

## INSPECTION OF THE RAILWAY ROUTES.

7. Prior to their visit of inspection and inquiry through the districts to be served by the proposed railway route, the Committee travelled to Grenfell from Young *via* Iandra and Brundah, in order to acquaint themselves with the classes of agricultural land that will be within the influence of the railway from Koorawatha to Grenfell. At Grenfell the Committee divided into two parties, one of which inspected the direct route from Grenfell to Wyalong, while the other proceeded to Wyalong by the route *via* Bimbi. Going direct, the Committee travelled by way of Bogolong, Piney Range, Caragabal, Oakhurst, and Back Creek—a course which enabled them to examine to a considerable extent the nature of the land in the immediate vicinity of the route, and for some distance on either side. As far as Caragabal, but particularly between Grenfell and Piney Range, land suitable for wheat-growing was very plentiful. About Piney Range, and for some miles beyond, a number of very fine wheat fields amply testified to the productiveness of the soil. As is usually the case through a long stretch of country, inferior patches of land were met with; but the great bulk of what was seen is undoubtedly good agricultural land, principally of a light-red loamy nature. At Little Caragabal some extensive plain country was passed, and on Caragabal holding, some miles further on, black-soil plains were the prevailing feature of the country traversed. On the Oakhurst run similar conditions were found, though on this property, as is the case on Caragabal, there are belts of land covered with myall. Portions of these plains, which are known as the Bland country, being intersected by the Bland Creek, though possibly capable of growing crops, may be more rightly regarded as pastoral land, specially valuable for the fattening of stock. Indications were apparent of the flooding of some of the plains through the overflow of the Bland after exceptionally heavy rains; but heavy floods are infrequent, and will not, according to the evidence of the engineers, endanger the line. On Back Creek holding, and on some of the other pastoral properties, cultivation has been carried on to the extent necessary for home use. Between Back Creek and Wyalong the country is timbered, and the soil largely of the light-chocolate loam suitable for wheat. Some of it is covered with mallee.

The section of the Committee who inspected the Bimbi route followed the main road from Grenfell in a southerly direction for about 8 miles, travelling close to the railway line. They found the country, on either side, to be of a rich agricultural character, with patches here and there cleared, and under wheat.

Continuing

Continuing in a southerly direction, and wide of the railway line, for about 3 miles to Tyagong Creek, and on Aramagong station, they saw a large tract under wheat—all red soil. Turning then to the west, down the creek to the junction of Tyagong and Burrangong Creeks, about 11 miles from Grenfell, they proceeded close to the line, until reaching Bimbi. On Aramagong West, they found a tract of about 800 acres under wheat, and also various other large patches of wheat cultivation along and within sight of the route. It was pointed out that the whole of the country, on either side, was suitable for agriculture. Many wells were seen, providing ample water at slight depth. After leaving Bimbi they made a divergence in a southerly direction through Mr. Caldwell's property, passing large areas under wheat, and some in preparation for crops. Thence they proceeded through Euroka station, on to the main road from Bimbi to the Bland Creek, due west; crossing the travelling stock route from Marsden to Morangarell (about 41 miles from Grenfell and 20 miles from Bimbi), and nearly midway between the northern and southern surveyed lines. From this point, after crossing the low country between the Bland and Back Creeks, a direct westerly course was followed to Wyalong, in close proximity to the two surveyed lines. The country between Grenfell and Bimbi was found to be very suitable for agriculture, and of a reddish, sandy loam, limited, on its northern side, by the Weddin Mountains, but stretching out indefinitely on the south and east. Large areas of country under wheat were passed. After leaving Bimbi, more wheat and the same class of good agricultural country were seen for about 5 miles towards the Bland, where the soil changed to a greyish colour and of a slightly clayey consistency, suitable for pasture. From Back Creek, about 14 miles from Wyalong, agricultural country was again encountered, extending to Wyalong, and varying somewhat in character.

#### THE COUNTRY TRAVERSED BY THE PROPOSED LINE.

8. The proposed railway, running in an almost direct line to Wyalong, divides the country between the Parkes to Condobolin and the Narrandera to Hay railways; and, in addition to passing through considerable areas of agricultural land between Grenfell and Wyalong, it would open up good country beyond Wyalong towards Hillston and Cudgellico, where land, however valuable, cannot be properly developed until afforded the advantage of railway communication.

Following the line from Grenfell good agricultural country is passed through for between 20 and 30 miles, a fair proportion of which is under cultivation and producing good crops of wheat; and northwards, towards Forbes, there is first-class wheat-growing land. At a distance of about 25 miles from Grenfell, the Bland plain country is reached, and this may be generally described as rich pastoral land, though the evidence taken by the Committee at Grenfell shows it includes patches fit for agriculture. One witness examined there, for instance, a farmer and grazier, whose holding is situated 29 miles from Grenfell and 4 from Caragabal station, north of the line, has 125 acres under cultivation, and 500 cleared and ready for the plough; another, located 26 miles west of Grenfell, is cultivating 450 acres; while in a third instance, 30 miles to the south-west of Grenfell, there are 220 acres under crop and a prospect of the cultivated area being increased yearly. Each of these is within the area of what comprises the Bland country, though the soil upon the holdings is not the black plain soil regarded as suitable for pastoral purposes only. But the Bland plains, merely as a grazing area, are first-class fattening country, and in judging the probable results from the construction of the proposed railway it should be borne in mind that the pastoral industry is by no means an insignificant factor in connection with the traffic of the line. The extent of black-soil plain country along the route of the railway will contribute its share of the traffic.

From the western limit of these plains agricultural land is again traversed to Wyalong, around which place, and out west to Yalgogrin and Rankin's Springs, and on towards Hillston and Cudgellico, settlement is fairly plentiful and cultivation carried on to more or less extent. The District Surveyor describes the country between Yalgogrin and on towards Rankin's Springs, as for the most part, very excellent soil for agriculture. Three-fourths of it, he says, would grow first-class wheat.

wheat. Around Ungarie, and on towards Cudgellico, there is land of a similar description, some of it cultivated, but most of it lying idle for the reason that its distance from a market precludes farmers from taking it up and putting it under crop. On a leasehold area comprising 80,000 acres, and thrown open three years ago for settlement, there are said to be 60,000 acres of first-class agricultural country not taken up, the distance from a railway being too great to allow of profitable cultivation. This, and much more land of a similar character, would be developed if railway communication were within reasonable distance. Under present circumstances it is beyond the reach of the farmer, and is of little use to the pastoralist, the expense of maintaining it in a condition suitable for grazing being greater than the tenure of pastoral leases justifies.

The Committee are informed by the Chief Draftsman of the Department of Lands that along the route of the line from Grenfell to Wyalong, and within a limit of 20 miles on each side of it, there are 932,000 acres of alienated land, and 144,000 acres of leases other than pastoral leases—that is scrub and settlement leases; 346,000 acres of reserves, and 388,000 acres of Crown lands. Of the leasehold areas there will be available to be dealt with for settlement, between the years 1899 and 1904, 179,000 acres, and there are at present held under occupation license 133,000 acres, which are open to settlement, and 76,000 acres practically untenanted. Between Grenfell and Hillston direct, within the same limit of 20 miles on either side of the route, there are 1,470,100 acres of alienated land, 377,900 acres of leases other than pastoral—that is settlement, homestead, improvement, scrub, and inferior leases—766,600 acres of reserves, and 1,908,300 acres of Crown lands which may be divided into 737,700 acres of leasehold area, the leases of which will expire between 1899 and 1904, and 110,600 acres, in the Western Division, the leases of which will not expire until 1918; 479,400 acres held under occupation license, and 580,600 acres practically untenanted. For the route Grenfell to Hillston *via* Cudgellico, the statistics given are:—alienated land, 1,618,600 acres; leases other than pastoral, 424,100 acres; reserves, 806,400 acres; and Crown lands, 1,871,200 acres, which are made up of 565,500 acres, the leases in connection with which will expire between 1899 and 1904; 289,000 acres of Western Division leases, which will expire in 1918; 550,300 acres held under occupation license; and 466,400 acres practically untenanted.

It has not been possible to ascertain with exactness the proportion of agricultural land included in these extensive areas, but the evidence goes to show that it must be very large, and, generally speaking, the Government Astronomer states, the rainfall in these districts, excepting from consideration the country at the extreme western limit of them, is in excess of what is deemed to be sufficient for wheat-growing.

#### WYALONG AS A GOLD-FIELD.

9. The condition of Wyalong as a gold-field is important to the inquiry, not so much in regard to the traffic which the mines may contribute to the railway—for the evidence indicates that contributions from that source will not be a heavy factor—as in respect of the population which the place is likely to maintain, and the settlement in the surrounding district which the permanent prosperity of the field will bring about. The expert witnesses examined by the Committee see no reason to doubt the field's permanency, but they express the opinion that the mines are not likely to support a larger population than is there now, as, although at the first Wyalong was what might be called a poor man's field, the decomposed granite rock in which the gold-bearing reefs were then found being soft, the rock in which the reefs are now found is hard granite, requiring the employment of large capital. Substantial works at a good depth are what are now necessary.

The field is a peculiar one, and at the time of the Committee's visit the question whether payable stone would be found at depths greater than 300 feet was yet unsettled. Only a few of the mines were working with satisfactory results, and those, together with the remainder of the claims on the field, were anxiously awaiting the outcome of operations which were being carried on in one of the mines at a depth of 600 feet. Since then rich gold has been struck at 637 feet, a fact that indicates the permanency of the field.

The

The country about Wyalong is of granite formation, and according to the scientific evidence the fissures filled with the auriferous reefs probably descend to a great depth, carrying rich stone, if not continuously, at intervals all the way. This is one indication of the permanency of Wyalong as a gold-field, and another is the finding of sulphide of zinc and lead phosphate in the gold-bearing quartz. In the opinion of one expert "there is no presumption we could fall back upon to say why gold should give out in Wyalong." The known auriferous area, it is explained, is very much fissured, and was probably a focus of earth movements. Outside this area fissures were probably not formed. While, however, the gold-producing capacity of Wyalong may to this extent be limited, there is gold-bearing country further west at Yalgogrin, where the reefs are mostly in slate, and it is regarded as quite possible that gold and other minerals may yet be discovered as far west as Hillston and Menindie, and northwards towards Condobolin.

#### THE RAILWAY COMMISSIONERS' ESTIMATE OF TRAFFIC.

10. On the question of the probable traffic which will be secured by the proposed railway, it is the opinion of the Railway authorities that, although except within the area of a few miles west of Grenfell there is not at present much settlement along the route, the fact that a great deal of the land is of a very good agricultural description, with the areas under crop increasing, a large portion of it excellent for pastoral purposes, and the whole very promising, it is certain that with the construction of the line there will be a great increase in settlement, and, in time, a satisfactory traffic. As already stated, the traffic estimate of the Railway Commissioners amounts to £5,863, which estimate includes £3,000—£2,300 for goods and £700 for passengers—for traffic which, by the construction of the railway, will probably be diverted from the Temora-Cootamundra line. The following are the details:—

		<i>Goods.</i>							
				£	s.	d.	£	s.	d.
Coming in at Wyalong—									
	1,500 tons at 5s.	...	...	...	375	0	0		
	2,000 „ 12s. 6d.	...	...	...	1,250	0	0		
	661 tons of wool at 9s.	...	...	...	297	9	0		
	656 „ ore at 1s. 6d.	...	...	...	49	4	0		
	<hr/>								
	4,817 tons.						1,971	13	0
Coming in at the Bland Crossing—									
	80 tons of goods at 5s. 8d.	...	...	...	22	13	4		
	60 „ at 11s. 4d.	...	...	...	34	0	0		
	740 „ of wool at 9s.	...	...	...	333	0	0		
	570 trucks of stock at 6s. 10d.	...	...	...	194	15	0		
	<hr/>								
							584	8	4
Coming in at Wheogo—									
	25 tons of goods at 5s.	...	...	...	6	5	0		
	181 „ wool at 3s.	...	...	...	27	3	0		
	<hr/>								
	206 tons.						33	8	0
	<hr/>								
	5,903 tons and 570 trucks of stock.						2,589	9	4

		<i>Passengers.</i>							
				£	s.	d.	£	s.	d.
	5,000 at 10s.	...	...	...	2,500	0	0		
	500 at 7s. 6d.	...	...	...	187	10	0		
	<hr/>								
	5,500				2,687	10	0		
	Less diversion from Temora—2,000 passengers								
	at 6s. 4d.	...	...	...	633	6	8		
	<hr/>								
							2,054	3	4
	Mails, £720; parcels, £500	...	...	...			1,220	0	0
	<hr/>								
	Total	...	...	...	...	...	£5,863	12	8

The foregoing figures are based on the present estimated traffic prospects. They make very little allowance for agricultural development, and, under the circumstances,

circumstances, the annual loss upon the line which the Railway Commissioners' Report shows, is not regarded as an unreasonable one to face. The carriage of ore from the mines, which is included in the Railway Commissioners' traffic estimate, is a matter which some of the witnesses examined upon it do not regard as an important source of revenue, as they predict that the ore raised will be treated on the field by processes which do not involve even the carriage of fuel. But much in this direction depends upon further mining developments in the district. There are smelting works at Dapto, where considerable quantities of ore from Wyalong have been smelted, and works for the treatment of ore of the same kind by the electrolytic process are being erected at Lithgow. It may be found by the mine owners at Wyalong profitable to continue to send part of the products of their mines to these works; or smelting works may be erected at Wyalong, where, in addition to the ordinary battery treatment, the cyanide and chlorination processes for extracting the gold from the ore are the only methods now in operation.

The Committee, in their inquiry as to the probable traffic results from the construction of the line, found the question hampered by the condition of much of the country, and the losses sustained by farmers and graziers, consequent upon the prolonged drought. At present matters in this respect may be said to be at their worst; should better seasons prevail, there is every probability of the Railway Commissioners' traffic estimate being exceeded.

#### THE TEMORA TO WYALONG ROUTE.

11. Of the route from Temora to Wyalong, which has had careful consideration by the Committee, as being a suggested rival of that from Grenfell, much can be said that is favourable; but it does not commend itself to the Railway Commissioners, and cannot be regarded as a line that will serve the western country as satisfactorily as the one from Grenfell. It is shorter, cheaper in cost, and the country it passes through is mostly good agricultural land; but to construct it would be to leave a gap of 59 miles between Wyalong and Grenfell without a railway, the distance to Sydney from Wyalong by rail would be several miles longer than by way of Grenfell, and it is probable that while the cost of construction would fall on this Colony, the trade of Wyalong and the surrounding district would be diverted elsewhere. During the inquiry, it has been suggested that, in extending the railway from Temora, it should go due west through Ariaah, towards Gunbar. Such a line would divide the country between the Grenfell-Wyalong-Hillston line and the railway from Narrandera to Hay, and complete a batch of four parallel lines by which the requirements of the districts between the Lachlan and the Murrumbidgee Rivers would be adequately met.

#### CONCLUSION ARRIVED AT.

12. The proposal to construct this railway must be looked at broadly, and the line regarded, not as one in the interests of Wyalong, but as a railway intended eventually to serve by subsequent extension the country west of Grenfell as far as the Lachlan. The true national policy in extending railways westward towards the Lachlan River is, in the opinion of the Committee, to construct them in the manner represented by the present proposal and by the suggested extension from Temora towards Gunbar; for such lines must lead to an increase of settlement and production, and prove valuable feeders of the main railway system. If they could be constructed still more cheaply than up to the present it has been found practicable to build pioneer lines in the interior, it would be an additional advantage. The Engineer-in-Chief considers that he has reached the limit of cheapness consistent with stability; but it seems to the Committee that every effort should be made to reduce the cost still further by using a less expensive sleeper than is now obtained, ballasting as little as possible, and providing station accommodation only to the extent absolutely necessary. This would require the adoption of light rolling stock and the running of trains at a low rate of speed, but even these would be a great advantage to the districts served, and as traffic increased the line could be improved.

The resolution passed by the Committee is shown in the following extract from their Minutes of Proceedings of 12th and 13th September, 1899 :—

Dr. Garran moved,—“That, in the opinion of the Committee, it is expedient the proposed Railway from Grenfell to Wyalong, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Shepherd seconded the motion.

Mr. Dick moved,—“That the motion be amended by the insertion of the word ‘not’ before the word ‘expedient.’”

The Chairman ruled the amendment to be out of order, in accordance with a ruling on 24th November, 1897, that the object of the amendment could be attained by voting against the motion, and that any further amendment could be put before the Committee, subsequently, as a direct motion.

The motion was passed on the following division :—

Ayes, 4.	;	Noes, 3.
Mr. Perry,		Mr. Dick,
Mr. Shepherd,		Mr. Watson,
Dr. Garran,		Mr. Levien.
Mr. Trickett.		

W. J. TRICKETT,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 19 September, 1899.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### RAILWAY FROM GRENFELL TO WYALONG.

TUESDAY, 30 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Grenfell to Wyalong.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you brought a statement in reference to the proposal to construct a Railway from Grenfell to Wyalong? Yes.
2. Will you be good enough to read the statement? It is as follows:—

GRENFELL TO WYALONG.

R. R. P.  
Hickson.  
30 May, 1899.

This proposal in conjunction with the Koorawatha to Grenfell line originated in October, 1896, in a suggestion made by the Parliamentary Public Works Committee in their Report upon the proposed Railway from Condobolin to Broken Hill, and by Mr. Greene, M.P. With the approval of the Minister, Mr Surveyor Jamieson was sent to explore and report on the country between Wyalong and Cowra with a view to selecting the best route for a railway junctioning with the line between Cowra and Young. Koorawatha was selected as a starting point, and the Bill for the construction of the line from Koorawatha to Grenfell has recently been passed by Parliament.

The survey of this line in conjunction with that from Koorawatha to Grenfell was approved by Mr. Secretary Young in January, 1897, and completed in December of the same year.

Under the direction of the Engineer-in-Chief for Railway Construction, two routes have been surveyed, one *via* the Weddin Range, and the other *via* Bimbi, the former being eventually adopted.

The following is an estimate and description of the line as supplied by Mr. Deane:—Revised length, 59 miles; estimated cost, £142,292 10s., or £2,412 per mile, exclusive of cost of land and compensation.

This proposed railway commences at the end of the permanently staked line, Koorawatha to Grenfell, at 309 miles 35 chains from Sydney *via* Harden; thence curving round to the left it bears in a westerly direction crossing a spur of the Weddin Mountain Range at 310 miles 40 chains; thence it runs parallel to the Forbes-road, which it crosses at 313 miles 70 chains; thence in a southerly direction to travelling stock reserve 530, which it crosses at 315 miles 40 chains, and bearing due west Weddin Creek is crossed at 318 miles 20 chains, and a main spur of the Weddin Mountain at 320 miles. Here the line takes a south-westerly direction crossing Caragabal or Blind Creek at 332 miles 65 chains, and the road from Bimbi to Marsden at 335 miles 35 chains; thence it runs nearly due west up to 342 miles; thence bearing south-westerly travelling stock reserve 2,332 is crossed at 345 miles 60 chains, travelling stock reserve 574 at 347 miles 30 chains, Bland Creek at 348 miles 70 chains, and Back Creek at 353 miles 50 chains; thence running a little more westerly up to Wyalong, where it crosses the permanently staked line, Temora to Wyalong, at 365 miles 60 chains, and running due west parallel to the township alignment, it ends at 368 miles 35 chains.

The ruling grade on this line will be 1 in 100, and the sharpest curve 14 chains radius. The works will be fairly light.

By direction of the Minister, the Railway Commissioners, on the 29th November last, were asked to report in accordance with the provisions of the Public Works Act. This report was received on the 13th December, and is as follows:—

Proposed line of Railway from Grenfell to Wyalong—60 miles.

In accordance with the provisions of the Public Works Act of 1888, section 13, we beg to report as under:—

*Cost of Construction*—

The Engineer-in-Chief for Construction estimates the cost of construction of a single line of light railway, exclusive of land and compensation, at about..... £142,292

*Annual Cost*—

Capital expenditure, at 3 per cent. .... £4,269  
Estimated cost of maintaining permanent-way, and for traffic and locomotive expenses ..... 4,843

Total annual cost ..... £9,112

*Traffic Estimate*—

Merchandise and live stock .. £2,589  
Passenger traffic ..... 2,054  
Mails ..... 720  
Parcels ..... 500

Total annual traffic..... £5,863

R. R. P.  
Hickson.  
30 May, 1899.

From the information which is obtainable after careful inquiry the estimated revenue cannot be stated at a larger sum than is mentioned above. Comparing this sum with the annual working expenses and interest on capital it will be observed that there will be a considerable shortage until the traffic largely develops.

No doubt the district has considerable prospects, but it is not a matter of certainty that the time has arrived for Wyalong to have the benefit of railway connection. If, however, it is decided that the railway should be extended to Wyalong, the extension, in the opinion of the Commissioners, should be from the proposed Grenfell line.

CHARLES OLIVER,  
Chief Commissioner.  
W. M. FEHON,  
Commissioner.  
DAVID KIRKCALDIE,  
Commissioner.

The final action was taken on 22nd December, 1898, when the Minister moved in the Legislative Assembly that the proposal be referred to the Public Works Committee.

From the Lands Department I have received the following information with regard to the tenure of land within 20 miles of each side of the line :—

Alienated land.....	888,250 acres.
Settlement and improvement leases .....	55,940 „
Reserves .....	342,470 }
Crown lands.....	429,950 }
	772,420 acres.

It might also be mentioned that strong representations have been made in favour of railway connection with Wyalong from Temora, a distance of 38 miles 46 chains, the estimated cost of which is £104,430, or £2,707 per mile.

3. Do you produce the plans and Books of Reference? I do.

4. Has a proposal to construct a line from Temora to Wyalong had consideration by your Department? Yes.

5. The cost of the line from Grenfell to Wyalong is set down at £2,412 per mile, and the cost of the line from Temora to Wyalong is estimated at £2,707 per mile? Yes.

6. Have you any information to furnish as to the nature of the country through which the proposed line from Grenfell to Wyalong will pass? I cannot speak of the country from my own knowledge. I have not been through it.

7. The annual loss which is shown by your statement is £3,249;—has the Department any information as to whether a line of railway through this district would enable settlement to take place, and thereby reduce that loss? No; but you can get that information from the Lands Department.

8. Is it not usual for your Department to get that sort of information before submitting these lines? No.

9. There is nothing in the papers to show the class of country through which the line is to pass? The officers who surveyed the line can tell you exactly the class of country it passes through.

10. Can you tell us whether there is a railway reservation along the route of the proposed line? Not from my own knowledge. The railway surveyor will be able to tell you that.

11. All the information you have to give the Committee is given in the statement you have read? Yes.

12. *Mr. Watson.*] You said that the estimated cost of the line from Temora to Wyalong is put down at £104,430, or at the rate of £2,707 per mile? Yes.

13. In saying that, I presume you are going on the estimate made by Mr. Deane in 1894, which I see comes out at that rate? Yes.

14. Are you aware that during the following year Mr. Deane put forward a revised estimate, allowing for a further length of a mile and a half, and yet bringing out a reduced total of £92,000? I see that is so.

15. You remember a previous inquiry into a proposed extension from Temora to Wyalong? Yes.

16. There was an inquiry in 1894, in which the estimate was given which is given in your statement to-day;—the line was estimated to cost £104,430, or £2,707 per mile? Yes.

17. But in 1895 Mr. Deane put in an amended estimate, which brought down the total cost to £92,000? Apparently; but I would like you to ask Mr. Deane for an explanation of that. I did not make a statement in connection with a railway from Temora to Wyalong.

18. You have seen his evidence showing a rate of £2,300 per mile, although he allows for an additional length of a mile and a half? That is right.

19. Were you not at one time stationed in the Southern district? No.

20. Therefore you have no knowledge of that country at all? No.

21. I presume you have heard of the Bland Plain, through which Bland Creek runs? Yes.

22. Have you ever heard it associated with close settlement? I have.

23. Or as being mainly pastoral country? I happen to know a good many people from that district, and in that way I have a fair knowledge of what the district is, but I cannot speak of the district from personal knowledge.

FRIDAY, 16 JUNE, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

H. Deane.  
16 June, 1899.

24. *Mr. Watson.*] Have you been over the route of the proposed line from Grenfell to Wyalong? I have been over the line from Grenfell towards Caragabal. I have not been over the rest of the line except at Wyalong itself.

25. Can you describe the character of the country between Grenfell and Caragabal? The country is very good. In most parts it is of an agricultural character—red soil, until you get near the Caragabal run, and there you get into the flat country with black soil.

26. How far is it out of Grenfell before you reach the Weddin Range? Between 10 and 11 miles.

27.

27. Up to the Weddin the country is easy, I understand? The crossing of the first range to the west of Grenfell presents some difficulties, and there are some heavy cuttings and banks; otherwise it is fairly easy. The work at the Weddin Range is not so heavy as it is over the first range. H. Deane,  
16 June, 1899.
28. You have two alternative routes shown on the wall maps, one being more northerly than the other? Yes.
29. Both routes trend towards the Piney Range Crossing of the Weddin? No; they cross very nearly at the same spot,—that is to say, within about a mile of one another.\*
30. From an engineering standpoint, which route presents the least difficulty? The southern one, but it is half a mile longer. The estimated saving by going on this dotted line to the south is £5,450, but the line is half a mile longer. And there is this also to be remarked, that if a line is some day made towards Forbes, the upper line—that is the line submitted—would save a good deal of construction. Starting by the southern line, it would be  $5\frac{1}{4}$  miles longer to get to Forbes, and the cost of the extra connection would be about £8,000. Therefore, the net cost of completing the whole system—that is, going from Grenfell to Wyalong and from Grenfell to Forbes by that method—would be £2,550; but suppose, as I recommend, this northern line were taken, there would have been  $5\frac{1}{4}$  miles of the Forbes line already saved. If the southern line were taken for a line to Wyalong, and a separate line were taken to Forbes, the total extra expense in doing that would be £11,000; so that what is to be considered is that the upper line is the shorter by half a mile, also serves better for the line to Forbes, and in that way saves very considerable expense.
31. Is the first range just out of Grenfell a portion of the Weddin Range, generally? No; it is an independent spur. The Weddin Range runs approximately north and south, with a bend in the middle at the Weddin Mountain; the range just to the west of Grenfell also runs nearly north and south with a slight north-east and south-south-west trend. About 10 miles south-west of Grenfell it curves round and meets the southern extension of the Weddin Range. It is not very much of a range down there. The range falls away as it goes down south.
32. What is the character of the land between that range just west of Grenfell and the Weddin Range proper? It is more or less undulating.
33. Is it scrub country, or fit for settlement? It is all fit for settlement, I think, so far as I had the opportunity of observing, and so far as the reports show. It is good for settlement up to the base of the range proper.
34. What grades do you get, then, between Grenfell and the main Weddin Range on either of the routes? We have got a grade of 1 in 100.
35. Will that apply to the crossing of the Weddin Range? Yes. There is no difficulty in crossing the range, because it is comparatively flat at that part, and the line will go through a kind of saddle. This alternative line goes through a saddle, and where the northern line crosses the range flattens out considerably.
36. I think you said that that land from Weddin to Caragabal was mostly red soil? Very largely red soil.
37. For what distance do you reckon the red soil extends west of Weddin before you reach the clayey soil? I do not know that I took any note of the distance.
38. At any rate the red soil extends some little distance west of the Weddin? Yes.
39. Probably it is an alluvial which has been washed off the mountains? It is very good soil for agriculture for a long way out.
40. You know the character of the soil on the Bland Plains—that is after you leave the red soil? Yes.
41. It is a black clayey soil? So I believe; I have not been across the Bland.
42. Do you know that it is very frequently flooded? Yes.
43. Of course you are aware that latterly there have been no wet winters? No.
44. Since 1894 there have been no wet winters? No.
45. Consequently, from an engineering standpoint, it would have been in a better state during the last few years than it has been for a very long time previously? Yes.
46. Have your officers who have been engaged on the detailed survey got any particulars as to the flooded area and the depth and the velocity of the water in flood-time? They have reported on the flood-levels. There is a considerable extent of flooded country; but the current is for the most part slow, and the depth of the water for the most part very small. In going through the question of the waterways on this line, I added £1,500 to the estimated expenditure over and above what the surveyors recommended. That would be chiefly applied in crossing the Bland and Back Creeks.
47. In crossing the two main creeks? Yes, and the flooded waters.
48. Did your surveyors get any information on the point of the stability of the land in wet weather to carry anything? I do not remember whether they have; but we have in all parts of the Colony had to cross country which has been pronounced to be very boggy, and I have never found any difficulty with it. When you drain the line by side ditches, and throw up an embankment, you make a firm foundation for the permanent way.
49. I should imagine that in this case, as there is practically no outlet for the water—it lies so long on the surface—the flow is comparatively nothing—that your draining in a very wet time would not be of very much value? You would keep the top of the formation well above the water.
50. You see the country is almost flat where the Bland crosses the line between Young and Temora, and from there on to Lake Cowal it is almost flat, and any flood which comes down, simply comes along at the rate of half a mile an hour, or perhaps less? Yes; the fall must be very small.
51. I should think that the fact that the fall is so small would militate against the success of any attempt at draining? Yes, if the water lies about the country extensively. Of course, the making of a railway, and the making of side ditches, would not drain away the water; I do not propose to make ditches to drain it to another part of the country, but only to keep it off the particular track we are using. I should have no fear whatever of any soil I have met with in New South Wales making a firm foundation for a permanent-way. The case is quite different with an actual swamp, which is composed mostly of vegetable matter. In this case it is earth, although at times it is very soft.
52. A squatter who resides on the Bland told me a little while ago that he has seen a hut disappear from the scene in a very wet winter; I assume that the fact that there has been no wet winter since your surveyors have taken this route in hand would be some disadvantage, so far as arriving at proper data on the subject is concerned? They have instructions always to get the best information from the residents:

\* NOTE (on revision) :—This refers to the deviation shown on the compilation of parish maps, not to the Bimbi route.

- H. Deane. 53. The distance between Grenfell and Wyalong is about 57 miles? It is 57 miles to the Government township, and 59 miles to the point where we propose to go.
- 16 June, 1899. 54. In that length of 57 miles, how many miles do you estimate would be taken up in crossing this black, clayey soil on Bland Plain? I daresay there might be 4 or 5 miles of the worst of it.
55. How high is the embankment which you have provided across the plain? The water does not generally rise high. All you want to do in a case like that is to bring the top of the formation (say) about a foot above the possible level of the water, so that in parts where the water was only 6 inches deep it would be only necessary to make the embankment about 18 inches high. Between these higher places one would naturally run on a level, so that it might be any depth above that, according to the position and the levels of the ground. I should say that the formation over the worst places, that is the long flats, but not over the parts where there is a defined watercourse, is from 4 to 3½ feet high; and that would be quite sufficient, according to the flood-levels which have been observed.
56. You do not anticipate any probability of any of the embankments being washed away, as the velocity of the flood is not very great? No; I should put very extensive openings, and I am now getting some very heavy rails with a view to making, cheaply, low viaducts in situations like that. In that way I shall be able to make these low waterways very cheaply, giving perhaps nearly double the length which has been previously given for the same cost.
57. How will the cost of these low viaducts of the new description compare generally with the cost of earthworks;—a third more costly or double as costly? I daresay they would come to four or five times the amount of the earth-works.
58. What have you allowed in the way of bridge-work for the crossing of the main Bland Creek? I have not worked it out quite in that way, but I think it will come to about 1,000 feet of viaduct and bridge. For the main opening there I have about 240 feet, and then a viaduct on each side would probably be between 700 feet and 800 feet altogether.
59. You have not been over the country between Wyalong and Caragabal, but you have been over the route of the proposed line from Temora to Wyalong? Yes.
60. What was your impression of that route so far as engineering practicabilities were concerned? It is quite a practicable route. You get grades of 1 in 100. The worst part of that route is a belar swamp, between Barmedman and Wyalong.
61. What is the extent of the swamp? I do not remember exactly, but it is a good distance.
62. Did you attempt to find out whether that could be avoided by a detour either to the east or to the west? It could be lessened by keeping over, I think, to the east.
63. Do you think it would be possible by a detour to get round that—or to some extent, anyhow? Yes, I think our line avoids a great deal of the swamp that there is on the road.
64. The distance from Temora to Wyalong is 40 miles? Yes. I would point out that the line as laid out to Wyalong only went to the Government township, so that you would have to add nearly 2½ miles to that length. There were two surveys made—one where the line crossed round on the south side of the Government township, and the other where the line kept on the right-hand side of the Government township; and either of these lines reaches to a point 2½ miles short of the point which is reached by the Grenfell-Wyalong line.
65. The cost of constructing the 2½ miles additional length by either route would be about the same? It would be just the same. On the second survey the line was lengthened a little to get better grades. There was a deviation, I know, at Barmedman; and there was another slight deviation at a hill a little beyond there.
66. Going to the same terminal point, the line from Grenfell would be about 59 miles as against 42 miles in the case of the line from Temora? Yes.
67. So that it would mean 17 miles less to construct if you went from Temora? Yes.
68. Do you know whether the distance from Sydney *via* the Southern line to Temora is much greater than the distance *via* the Western line to Grenfell and Wyalong? From Wyalong to Sydney the distance *via* Grenfell, Koorawatha, and Harden is 368 miles 35 chains, the distance *via* Koorawatha and Blayney is 326 miles 47 chains, and the distance *via* Temora is 333 miles 35 chains. So that going by the Grenfell line and the western line it is about 7 miles shorter than going by Temora.
69. So that by 17 miles more construction you save between 6 and 7 miles in a total length of 340 miles? Yes.
70. That is the advantage from the construction of the 17 miles of extra line across the Bland? Yes, besides of course the amount of country which is served.
71. How does the country between Temora and Barmedman compare generally with the country between Grenfell and Caragabal? There is a great deal of good country between Temora and Barmedman. The good country there is probably of very much the same character as that west from Grenfell; but there is a patch of scrub country which you pass through in going from Temora to Wyalong.
72. It is at Reefton, where there is a gold-mining centre? Yes.
73. Between Barmedman and Wyalong what is the character of the land near the main road, or off the main road? I do not think it is as good there.
74. Have you been off the road between Barmedman and Wyalong? Only a very short distance.
75. Did you hear anything which led you to believe that the character of the land was any different from the character of the land at some distance away from the direct route? I suppose, going east of the route, the country rises pretty soon on to the range. As regards the character of the country, I should not pretend to make a comparative statement of any great value, because the times at which I visited the districts were rather far apart. If I were deputed to make a comparison I would make a round trip, and compare them at the same time under the same conditions.
76. I think, in theory, Hillston is the object aimed at in the projection of this line out west? Yes, that is laid down, I believe, as the ultimate terminus.
77. Have you been over the route between Wyalong and Hillston? Not yet; I have been over the country between Wyalong and Cudgellico, but I have not been to Hillston; we have a survey just completed between Wyalong and Hillston.
78. Of a more direct character than the original projection *via* Lake Cudgellico? Yes; the first survey which was made to Hillston went direct from Barmedman.
79. That was before Wyalong was discovered to be gold-bearing? Yes; that is shown on the map. Then an idea was to go up to Lake Cudgellico, and thence to Hillston; but the more recent survey has been from Wyalong direct instead of Barmedman.

80. Have your officers furnished any information which you can give about the country generally between Wyalong and Hillston? I have only just received it, but I shall be very pleased to lay it before the Committee.

H. Deane.  
16 June, 1899.

81. In his statement the Under Secretary for Public Works says that the line from Temora to Wyalong is estimated to cost £104,000, or at the rate of £2,707 a mile. In this case he seems to have taken the earliest and necessarily least detailed survey as the basis for the statement? Yes; that estimate was reduced to £92,000.

82. In 1895, I understand, you put before the Committee a revised estimate of £92,000 for a line longer by some 2 miles, or at the rate of £2,300 per mile? Yes.

83. The cost of a line from Temora would be at the rate of £2,300 a mile, while the cost of a line from Grenfell would be at the rate of £2,412 a mile, showing an apparent saving of £112 a mile? Yes.

84. And a total saving in capital cost of about £50,000—the difference between £92,000 and £142,000? To that sum of £50,000 we should have to add the cost of the 2½ miles extension to West Wyalong.

85. Roughly speaking, it would be an expenditure of £5,000? It would be rather more than £5,000, because there would be an extra station as well. It would be a little over £6,000.

86. The Temora-Wyalong line would cost £44,000 less than the other? I dare say that would about represent the cost.

87. With the disadvantage of Wyalong being 6 miles further from Sydney by rail? Yes.

88. Do you know whether the Western line is more suitable for running extra traffic on than the southern line;—the grades are heavier on that route, are they not? I could give an opinion, but it would come with very much better authority from the Commissioners.

89. *Vice-Chairman.*] Have you prepared a detailed statement of the expenditure? I have.

90. Will you be good enough to read the statement? It is as follows:—

## GRENFELL TO WYALONG—DIRECT ROUTE.

27 January, 1899.

Estimated cost of a single line of railway 59 miles in length with 60-lb. rails. Ruling grade 1 in 100.  
Sharpest curve, 14 chains radius.

Description.	Estimated cost.	Average per mile.
Earthworks .....	£ 11,682 0 0	£ 198
Timber bridges .....	9,912 0 0	168
Level crossings, cattle stops, and fencing .....	3,540 0 0	60
Permanent-way materials .....	37,582 9 4	637
Freight .....	8,564 17 6	145
Plate-laying @ 1s., £5,192 .....	31,541 8 0	535
Ballasting, (1) @ 3s. 6d., £4,543 .....		
Sleepers @ 3s., £21,806 8s. ....		
Station works including sidings.....	9,399 14 2	159
Station buildings, waiting sheds, £715; platforms, £400; station-masters' houses, £700; loading banks, £650; goods sheds, £365; grain sheds £500; 5-ton cranes, £400; 20-ton weighbridges, £500; trucking yards, £1,080; engine-shed, £550; carriage-shed, £380; coal stage, £200; turntable, £550 .....	7,490 0 0	127
Water supplies, No. 3 .....	5,000 0 0	85
Telegraph .....	885 0 0	15
Gradient and mileage posts.....	885 0 0	15
Engineering and contingencies, 12½ per cent. nearly .....	£126,482 9 0	268
	15,810 1 0	
	£142,292 10 0	
Average cost per mile .....	£2,411 14 9	

91. That is comparatively much cheaper than the extension from Koorawatha to Grenfell? Yes; on the whole, the country is very much flatter; with the exception of those two ranges which I have mentioned the country is very easy.

92. The saving is very marked in regard to earthworks, timber bridges, and level crossings? Yes.

93. That is accounted for by the more favourable character of the country, is it not? Of course the level crossings are very much fewer in this case than in the other, the country not being so thickly settled.

94. In that case the cost of the station works was estimated at £187 per mile, but in this case I see the cost is estimated at £159 per mile;—will they be of a cheaper character? No; they will be of very much the same character, but there will be fewer of them.

95. In the case of both station works and station buildings, the cost is much cheaper in this case? Yes.

96. Water supply is estimated to cost £85 per mile in this case as against £101 per mile in the other case? In the case of the Grenfell line I reckoned that the supply of water would be rather expensive at the Grenfell end. There is one expense distributed over 29 miles, and there is a smaller amount allowed in this case. Dividing it by the mileage it comes to less per mile on this line than on the Grenfell line.

97. Will the supply for both lines be provided by means of tanks? By excavated tanks or dams.

98. There is no creek supply? No.

99. The line from Temora to Wyalong ran chiefly along a main road? Yes.

100. Do you get that advantage with this line? No; you cannot follow any roads with this line.

101. Will it be largely private land that it will pass through? Yes; it passes through alienated land for 33 miles 75 chains, and Crown lands 25 miles 5 chains, total 59 miles.

102. It is all unimproved land, not cultivated land, that it goes through? There is very little that is cultivated.

103. The land resumptions would not be very expensive? No.

104. On the whole, which line of the two is the easier to construct? As regards ease of construction I do not think there would be any difference.

- H. Deane: 105. It is the extra distance which will make up the extra expense? Yes. The Grenfell-Wyalong line is a little more per mile; that means that the works are a little heavier.
- 16 June, 1899. 106. It will be of the same character as one of our light lines? Quite the same.
107. Have you given any consideration to the question of policy as to which is the best way of reaching this western country—whether by this means or whether by an extension from Condobolin? No; except that it has appeared to me that it cuts up the country better and serves the country better.
- 108-9. The Grenfell-Wyalong line divides the country better? Yes. It looks as if the Temora line ought to be extended from Ariaah and Warri, and west from there.
110. It is between the two mother lines that the greater conflict would appear to occur, after you begin to go out towards Broken Hill; the Railway Commissioners were apparently of opinion that any further extension by way of Wyalong would be a kind of competitor to an extension from Condobolin to Broken Hill;—have you considered that view of the case? So it would; the extension beyond Condobolin has been condemned.
111. Do you think this line is likely to be constructed at your estimated cost? I think it will about cover it. I should not like to have any less, I think the estimate is, perhaps, rather tight in some cases.
112. The estimated cost of the line from Cootamundra to Temora was considerably exceeded—by between £3,800 and £3,900 a mile? I do not think the estimate was so exceeded, but the authorised cost was exceeded.\*
113. Why was that? It is a ballasted line; it is a line which was made on the old system. It is a line which was very carefully surveyed too; but if I were laying out that line again I have no doubt that I could reduce the cost to some extent. I should make it, perhaps, a little longer, to avoid cuttings. There are a good many cuttings and banks on the Cootamundra-Temora line—they are not very large, but with the present method one would try to avoid these as much as possible by lengthening the line.
114. Is the character of the country generally similar to the character of the country from Temora to Wyalong, and from Grenfell to Wyalong? Not unlike in the first part of it.
115. Has the Koorawatha-Grenfell line been started yet? No; the plans are not quite ready.
116. Tenders have not been invited? No.
117. *Mr. Watson.*] Do you purpose inviting tenders? Yes; it is proposed to do that line by contract.
118. *Dr. Garran.*] Has any survey been made from Young to Wyalong? I am not aware of any except from Grenfell.
119. If this line to Wyalong is made at all, it is intended deliberately to be a section in the direction of Hillston? Yes.
120. And even Hillston itself is a possible stepping-stone on the road to Menindie? Yes; that would be the way Menindie would be reached, if the line were continued to Hillston.
121. The present idea is that, if we go to Menindie at all it will be *via* Hillston? I think so.
122. And *via* Wyalong? Yes.
123. At any rate you look upon this line as proposed, not as a complete line in itself, but as part of a sketch for the future, is not that so? I should not like to speak for the Government or the Minister in that respect, but that is evidently the idea which appears on the face of it. It would naturally follow, I think.
124. So far as you are concerned, as an engineer, you merely consider the section which is put before you from time to time? Yes; but I know that a line has been surveyed to Hillston.
125. This Committee cannot shut its eyes to the fact that there are other projects looming in the distance? No.
126. Then looking at Hillston and Menindie as a further object lesson, we are to have three possible routes—by way of Condobolin, by way of Grenfell, and by way of Temora? Yes.
127. On purely engineering grounds it appears that a line from Temora to Wyalong is the shorter and the cheaper? Yes.
128. Do you think the Grenfell line divides the country better? That is how it appears to me.
129. So far as settlement is concerned is there any ground of preference between the Grenfell and the Temora line? I should not say there was.
130. Have you noticed on your travels whether there was any wheat growing at all on either of these routes? Yes; there is a little wheat growing to the west of Grenfell, but not very much because at present the carriage is rather heavy.
131. Is there any wheat growing around Temora now, since the line has been made? It is some time since I visited that part. I believe there is some.
132. Are we getting too far west for wheat growing? Not at all; there is a good deal of wheat grown down Mirrool Creek.
133. You have an engineering difficulty of a moderate character in crossing Bland Creek, I understand? Yes.
134. You require 2 or 3 miles of viaduct? There will be a good length; but I do not think it will amount to that, because the velocity of the stream is so small. There will be no objection to throwing an embankment over the greater part of the distance.
135. It would not run away with an embankment? No.
136. If you allow sufficient get away for the water an embankment would stand the pressure? Yes.
137. The preference which you give to the line from Grenfell, I gathered from your evidence, is entirely due to the possibility of an extension to Forbes? That is so, as regards the choice of routes out of Grenfell, because a difference of half a mile would not be anything.
138. We are hardly likely to have a line from Grenfell to Forbes unless we have one from Grenfell to Young? I do not think it would depend upon that.
139. Is there any strong inducement to make a line to Forbes from Grenfell now that we have a line from Parkes? No; I have not heard of it being brought forward for a long time.
140. Would it shorten the distance from Forbes to Sydney? I think not.
141. Supposing a line were made from Temora to Wyalong, and there were a considerable amount of agriculture at Wyalong, the farmers at Wyalong would have equal access to the Melbourne market and the Sydney market by the Temora route? Yes. 142.

\* NOTE (on revision):—I find on looking the matter up that the total cost, including the arbitration award, was £154,898, while the estimate, together with additional works, and bonus to contractors subsequently awarded, was £142,200.

142. Better than they would by the Grenfell route? Yes; it is rather a question whether that is wanted. H. Deane.
143. Sometimes the market for produce might be better in Melbourne than in Sydney? You have the whole of that Riverina country to the south, and if any of our produce should go to Melbourne in the future it will be from Riverina rather than from the country which lies to the north of it. 16 June, 1899.
144. The best market, generally, for these western cultivators is to supply the pastoral country to the west of them? I suppose so.
145. It is only their surplus which they have to send to the shipping ports? I suppose they would supply, in the first instance, the towns of the district.
146. When they have got more than they can sell in the district it must go to the ports for shipment? Yes; and that is what will happen, no doubt, in a year or two, if not this year.
147. So that it is only the agricultural surplus we have to consider in looking at the best method of getting to a port of shipment? Yes.
148. Still, sometimes it may happen that freights are cheaper from one port than from another? Yes.
149. And it would be an advantage for these Wyalong people to have access to either market, would it not? In a case like that I am not quite sure that I altogether agree with the premises as to there being an advantage at Melbourne as against Sydney.
150. But the outward freights depend a good deal on the congestion of shipping in the port, do they not? Yes.
151. Sometimes there is more shipping in one port than in another—it varies very much? Yes.
152. Nearly all other things being equal, it is an advantage to an inland township to have two strings to its bow in shipping its produce? Very likely, I should say.
153. But that is to be counted as one of the elements in the competition between these two routes? I think it is only a small one.
154. If there were no prospect at all of extending the line from Grenfell to Forbes, you would give the preference to the south-about route? In the matter of expense I would certainly recommend the southern route.
155. So far as crossing the Bland is concerned, would there be any difference in cost between the two lines—that is the direct line from Grenfell and that *via* Bimbi? No; they meet again at 13 or 14 miles from Grenfell. I think a little explanation is necessary here. This dotted line which is shown on the wall-map is a deviation *via* Bimbi. The deviation, which I referred to before as being half a mile longer, and as costing £5,450 less, is a small deviation from west of Grenfell, shown on the parish maps; but the Bimbi deviation which is shown on the wall-map, and is very much further south, stands rather on a different footing. Perhaps I had better explain that.
156. Would that go to Grenfell at all? Yes; the line from Koorawatha will have to make a bend to the south, and following down Emu Creek.
157. That would be a very circuitous line? It would. It is not so much longer as one might imagine. It is only a little over 3 miles longer, because you see on the northern route the line twists about a good deal to get over the first range; whereas by going *via* Bimbi, the country is very easy all the way; there are no ranges to cross.
158. If you are going to take that Bimbi route, it would be shorter for you not to go into Grenfell township; but to leave the main line a mile or two before you get into Grenfell? Yes. The total cost of that line is £141,512—that is to say, it is about £700 less than the cost of the direct route. But I think the opinion has been expressed that with the exception of the country you pass through immediately after starting at Grenfell, which is already served by the Koorawatha-Grenfell line, the country is not so suitable for agriculture as it is on the route over the Weddin Range.
159. The Bimbi route will go through country as good, on the whole, I suppose, taking it for the whole length? It is very easy country.
160. Would the crossing of the Bland by the Bimbi route, be easier than by the route you mentioned? It is just about the same; you cross a few miles higher up.
161. The higher you get up the Bland, I suppose the less the flood? I do not think we go far enough up for it to make any real difference.
162. In the route which is submitted to us, you go round on the north side of Weddin Mountain? Yes.
163. It would skirt the spurs just on the base of them? Yes; there is an extension of Weddin Mountain north, and we go through a kind of saddle by one of these routes, over the flattening out of the spur by the other.
164. Does it involve many little culverts? No; there is nothing to speak of.
165. What is the nature of the rock in that Weddin Mountain—granite or sandstone? I am afraid that I cannot inform you.
166. Is it a rich grass country? The mountain itself is, I think, pretty steep; but it is very good country round the foot of the range.
167. Is it good grazing country? Yes; it is good wheat-growing country as well.
168. The line from Koorawatha to Grenfell was considered to be justified on its own account, exclusive of any possible extension? Yes.
169. The extension to Wyalong is to some extent an after-thought? Yes.
170. If we can connect Wyalong with Koorawatha, we give the people two routes to Sydney, do we not—either the Southern line or the Western line? Yes. I know it is an advantage sometimes to have an alternative route.
171. *Mr. Dick.*] From an engineering point of view, is there any advantage in the Temora-Wyalong route over the Grenfell-Wyalong route? No, except as a matter of total cost.
172. Is there any flooded country to be passed over on the Temora-Wyalong route, similar to that found on the other route? No; there is only that swampy place I mentioned between Barmedman and Wyalong, and that is easily got over.
173. You do not look upon that as a serious element in the construction of the Grenfell-Wyalong line? No.
174. There is a swampy area even along the Temora-Wyalong route? There is some gilgai country with belar.
175. Is it a fact that that gilgai spot has been avoided by a later survey? We are on the right-hand side of the road there.
176. By that means you avoid it to some extent? Yes, very much reduce it. 177.

- H. Deane. 177. Will there be any difficulty in obtaining timber for sleepers on the Grenfell-Wyalong line? Not so very much, I think. Some of them may have to come from a considerable distance. The ironbark in the district grows in small patches only.
- 16 June, 1899. 178. On the Temora-Wyalong route ironbark is fairly plentiful? It used to be; but I am afraid that it is very much cut out now.
179. Do you know that they are obtaining ironbark sleepers for the railway at Reefton? I know that.
180. It will be fair to assume the timber will be more cheaply obtained on the Temora-Wyalong route than on the Grenfell-Wyalong route? I expect it would.
181. Would you use square sleepers? No; I should use the round-topped sleepers.
182. Have you noticed that in the recent improvements which the Commissioners have been carrying out on the various lines, drains have been made with concrete piers, and old rail supports instead of the old box-drain, making practically an everlasting drain? Yes.
183. Do you think it would be advisable to do that sort of thing on this line? No, because I cannot get my material carried for nothing. I have gone into that question; it would cost about half as much again, or twice as much to use that construction on new lines.
184. If you could avoid that difficulty would it not involve material reduction in the cost of maintenance by the Commissioners? I do not think it would make very much difference. It would make a difference in the maintenance of these particular openings and bridges, but that forms such a very small portion of the total cost of maintenance that I do not think it worth considering.
185. What is the ordinary life of a box-drain? I suppose a box-drain of good timber would last twenty or thirty years. Buried in the ground it will be well preserved. I do not use box-drains very much; if I have a deep bank I prefer to put in a concrete culvert, and if it is a shallow bank I put in an open water-way of timber.
186. I suppose the usual precautions have been taken in the survey of this line to avoid the necessity for future deviations as much as possible? It is only a trial survey, you know, at present. During the final location of such a line there are sure to be some slight deviations found to be necessary.
187. *Mr. Shepherd.*] I think rather more than half the land between Grenfell and Wyalong is alienated? Yes.
188. Have any steps been taken to ascertain whether the owners are willing to give the land free if a railway is taken by this route? I do not think they have been asked.
189. The cost of the land would be likely to add very largely to the estimated cost of the line? I think not; I do not think the value of the land taken would be very much, and then, of course, under the Public Works Act the betterment principle can be applied. It has been applied already; we have not lately paid very much for land, even where it has not been made compulsory to get the land free. I think there is very much greater liberality in that respect on the part of owners than there used to be.
190. *Dr. Garran.*] You said that a part of this line may be utilised as a future Forbes line;—but would you take exactly the same route if you were merely surveying a line from Grenfell to Forbes? Yes.
191. Must you get through that gap to get to Forbes? Yes.
192. So that it would really be 4 or 5 miles on the way to Forbes? Yes.
193. *Vice-Chairman.*] By the Bimbi route, do you go along any roads? On the Bimbi route we follow the travelling-stock reserve for a considerable distance. We go between 22 and 23 miles through either travelling-stock or other reserves.
194. That is from Bimbi outwards? Yes.
195. And you go for a good distance through a Government reserve before you get to Bimbi? Yes.
196. Would that be a 3-chain road? It is a 5-chain road.
197. The Act authorising the construction of the Koorawatha-Grenfell railway provided that the land through which it passed should be given by the owners;—has that been done? It has been done—that is to say, a great deal of the land has been given, and a guarantee has, I believe, been furnished of the cost of the rest. The only real difficulty which has occurred on that line was, I think, with regard to a piece of land at Koorawatha and some suburban allotments at Grenfell.
198. *Mr. Watson.*] I understand you to say that you do not think the engineering difficulties are any greater on the Grenfell-Wyalong route than on the Temora-Wyalong route, and yet, on the Temora route, the cost per mile is less by about £112? Yes; I pointed that out, but in speaking as to there being engineering difficulty, perhaps it would be as well to understand exactly what that means. I do not think it follows that the line is more difficult to construct because it is a little more costly per mile. I should only call those engineering difficulties if there are tunnels or bridging of important rivers where special precautions would be necessary.
199. You would have no bridging to do on the line between Temora and Wyalong? There are the Barmedman Creek and that swampy place with gilgai country beyond Barmedman, otherwise there will be very little of importance in the way of watercourses to cross.
200. On the Temora-Wyalong line for box drains and timber bridges you provide £154 per mile, while on the other line for timber bridges alone you provide £168 a mile? That means the same.
201. Box-drains, too? I do not think there will be any box-drains, but if there are they are included.
202. You spoke of having added £1,500 to the estimate of the Grenfell-Wyalong proposal to provide against contingencies in that way? It is to provide extra waterways at those important creeks.
203. Is that sum included in this estimate? Yes; I put down £1,500 above what the surveyors recommended, because I was not satisfied that the waterways were quite sufficient.

WEDNESDAY, 21 JUNE, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Hon. George Henry Greene, M.L.C., sworn, and examined:—

204. *Chairman.*] You are a Member of the Legislative Council, and a grazier at Iandra, in the Grenfell district? Yes.

205. Do you know anything of the proposal before the Committee? Yes; I have a fair knowledge of all the country between Wyalong and Grenfell.

206. Will you oblige the Committee by stating your views in reference to it? I am very clearly of opinion that there is no point from which the western wheat-growing districts can be so easily tapped as by line from Grenfell to Wyalong. Of course, I take it for granted that Hillston is the objective point, and taking a national view of the question, I consider that no line can possibly be found which will serve so large a district at so small an expense. Some question has been raised in certain quarters as to the effect of a line from Temora to Wyalong, and it has been said that that line can be constructed at a less cost than the proposed line from Grenfell to Wyalong; but, against that, it must be considered that not nearly so large a district would be served. Every mile of the railway from Grenfell to Wyalong will be productive of good to the country. On each side of that line to the full limit at which any line could be of service there is good land. Up to the present time very little money has been expended in that direction, and the road for waggons or teams is most difficult from Grenfell to Wyalong, whereas from Temora to Wyalong a large sum of money—I think something like £15,000—has been expended in making a good road. In the absence of a railway from Temora to Wyalong no portion of that district would be more than 20 miles from a railway line, and if that line were constructed a huge extent of country from Temora on the south, up to Forbes on the north, would practically be without railway communication. Further, I have no hesitation in stating that the country I mention, or a great portion of it, between Temora and Forbes, is infinitely superior both for agriculture and pastoral purposes to the district which would be served by a line from Temora to Wyalong.

207. Do you look upon the proposed line as a local line? By no means. It seems to me to be the shortest route by which Wyalong and Hillston can be approached from Sydney. Compared with the route *via* Temora, I think there is a saving of 7 miles. The proposed line would also give Wyalong an opportunity to draw a supply of coal from Lithgow and other coal-fields, and thus obviate the necessity for sending huge quantities of ore to Footscray and Ballarat, in Victoria, for treatment.

208. Will you describe the country between Grenfell and Wyalong as nearly as possible—that is, the proportion of agricultural to pastoral land? For the first 2 or 3 miles from Grenfell the line would pass over some stringybark country over which I believe a light gradient has been found. From that distance on to within, I think, about 10 or 12 miles of the Bland, the country is forest country of a very superior character for wheat-growing. I know of my own personal knowledge that the crops on the north side of the Weddin Mountain, at the foot of which the proposed line would pass, have been the best grown in the Grenfell electorate, notwithstanding the drought. I also am of opinion, although I have not been along the surveyed line close to the Bland, that good red-soil country can be found in close proximity to it; but that portion which is not fit for agriculture comprises the pick of that part of New South Wales for fattening and breeding stock. I would describe it as first-class fattening and healthy country, and also agricultural country. On the other side of the Bland the same thing applies for several miles, and after that, going on to Wyalong, there is a varied description of country. There is some scrubby, poor-looking country, but useful when cleared. There are strips of mallee; but I may mention that the mallee is of a description that is quite equal to the best mallee country they have in Victoria, which, excepting in the late drought, has produced very good wheat crops.

209. Are you acquainted with the country from Wyalong out westward? I have only a general knowledge of that country; but some of it I know to be superior country. There is also some very poor mallee country. As to the proportion of each I cannot speak.

210. Do you think Wyalong will become a depôt for the country round about there? I have no doubt about it. I have every reason to believe—and I am now expressing the opinion of experts to whom I have spoken—that Wyalong will develop into a permanent field. If that is the case, now that the nomadic population has pretty well disappeared, the remaining population will probably increase more rapidly as the mines become developed. In course of time I have no doubt it will become a large depôt.

211. You are of opinion, then, that the construction of this line will increase production in the district? I have no doubt whatever of that. For my own part I can say this—and I know it is also the opinion of my neighbours who are engaged in wheat-growing—that we should consider the line as giving a great stimulus to our production, inasmuch as it will open to us a very important market, and the production of the Grenfell district is simply limited by our power of disposing of our produce.

212. How is the land held? A certain proportion has been alienated by the Crown, and is freehold, and there is also a large area of Crown lands; but that is a point upon which you would get accurate information from the Lands Department.

213. How is the land which is held privately being worked now? Up to the limit at which we can make use of the railway, there is a large amount of agriculture. When we get beyond the limit at which the railway will help us, cultivation practically stops. I am speaking now of the land beyond Grenfell, up to the limit at which land is supposed to be served by a railway.

214. *Mr. Watson.*] How far beyond Grenfell would you say the influence of the present terminus extends, so far as agriculture is concerned? I think the railway would give very little assistance to any produce grown over 20 miles from it. At the present time they are clearing land beyond Grenfell in preparation

Hon.  
G. H. Greene.  
M.L.C.

21 June, 1899.

for agriculture. Of course, when the railway takes away the produce to the east of Grenfell, it means a better local market for that in the west, so that indirectly the neighbourhood to the west of Grenfell is being assisted by the railway through the produce to the east being removed; but the amount of cultivation there is now comparatively small.

215. *Chairman.*] We may take it for granted that 20 miles is about the limit at which it will pay to cart agricultural produce to the railway? I think so.

216. And you think that the further you go west with the proposed line the more land will be put under agriculture? I have no doubt whatever of that. It is the only way in which we can make purchased land pay. We cannot make it pay by simply keeping stock on it.

217. You have had some experience in the leasing of land upon the halves system;—how far does that tend to bring land into use? It tends in every way to bring a much larger area under cultivation. If I could not lease my land on the halves system I would give up cultivating it on the large scale upon which I now cultivate.

218. You have been farming large areas on the halves system, and you have been quite satisfied with the results? So far, I have every reason to be satisfied with the results. The best men I have now—the men farming the largest areas—are those who came to me six years ago, and who have worked steadily on ever since. They are working there now, in spite of the terrible trials to which they have been subjected through the bad seasons.

219. In your opinion there is no danger of the land going out of cultivation;—suppose, for example, a line were constructed to develop certain country, and it were found afterwards that the farmers were not satisfied with the result and allowed the land to go out of cultivation, there would then be a loss,—you do not think that is likely to happen in this case? I am of opinion that the system of which we are speaking has come to stay—I mean the system of co-operation. We have arrived at the very best method of employing all surplus labour, and putting capable men, who have not the advantage of capital, on the soil. I may say that the system has been subjected to the most severe tests to which any method of cultivation could be subjected, and the results are there to be seen at any moment.

220. *Mr. Trickett.*] When the proposal to construct a line from Koorawatha to Grenfell was before the Committee, you then, I believe, advocated the ultimate extension of the line on to Wyalong and Hillston;—I suppose you regard the extension now proposed as part of that line? I have regarded the whole thing in a national light. The proposal is the easiest, I think, by which the district, of which Hillston is the centre, could be tapped.

221. In what sense do you use the word “national”;—for what purposes would the line be a national line? For the purpose of getting the best result from that part of New South Wales—bringing that part of the country into direct communication with the capital—for the purpose of supplying the capital and also for the purpose of export.

222. You were not speaking of the line as a national line in the sense of being a through line to Broken Hill or some other point in that direction? No; that might be desirable afterwards. I am not thinking of any extension beyond Hillston at present.

223. You notice from the plan that the broad red line is to the north and that the dotted line to the south is marked “*via Bimbi*,” connecting Grenfell and Wyalong;—which of the two routes, in your opinion, would be the better? I have never compared the lines with a view to giving evidence on that point, but, having regard to further construction, possibly connecting with Forbes, there would be a gain in adopting the line to the northward; it would also divide the districts better between the country to the north and the south.

224. Could you tell us which, in your opinion, would be the better line as regards country most likely to be settled upon? I think that in that respect both routes are probably about equal; the country on both sides of the mountain is very good country.

225. You have not made a detailed comparison? I have not made a study on that point because, in the district between Grenfell and Koorawatha, we should all of us be perfectly satisfied with either route.

226. Do you look upon the whole of that length of country as one which could be utilised by farming? Yes; I do.

227. The land there is mostly alienated? A good deal of it is alienated; but I understand—I do not speak from personal knowledge—that there is also a large area of unalienated land.

228. Near the proposed line of railway? Yes; I have no doubt whatever that the unalienated land would be largely increased in price. It would become a much more valuable asset to the country when the line is constructed, as it could be disposed of at special rates.

229. Taking the northern line from Grenfell to Wyalong, would you describe its course;—excepting the ridge you have to negotiate shortly after leaving Grenfell, would you regard the rest of the country as good agricultural land? I would, with the exception of what is actually on the mountain.

230. When you approach Wyalong there is mallee country? There is a good deal of mallee country about there. I have not been along the railway line, but I have been many times along the road to Wyalong. There is mallee of, I should say, a superior character.

231. Is the clearing of the mallee country expensive? I have had no experience in it, but I have gone over that very large estate of Mr. Lascelles, in Victoria, where many thousands of acres have been cleared, and by the methods upon which, I understand, they now work, the clearing is comparatively cheap.

232. You own a large area of country which you have leased out on the halves system;—what class of country is that,—is any of it mallee? No; it is all box forest.

233. That can be made available for agriculture much more easily than can the mallee country? I fancy so; but only under certain conditions. It is more easily cleared when the timber has been ringbarked and has been quite dead for a number of years. In box forest, to enable you to clear cheaply, the timber should have been ringbarked for nine or ten years, and all suckers and undergrowth should have been kept down. Then the country could be cleared at from 8s. to 12s. and 14s. an acre, whereas, in its green state, it cannot be cleared under £2 10s. to £3 an acre. The mallee, in its green state, can be cleared at a very much less cost than that; but, as I say, I have not had actual experience. I am carrying out a plan which I formed twenty years ago, of making a large agricultural estate, and having that in view, I took the initial step of ringing the timber, with the exception of that which I thought necessary for shade and shelter for stock. I am now reaping the benefit of the ringing by having my timber dead, so that I can clear at cheaper rates, averaging, I should say, about 10s. an acre.

Hon.  
G. H. Greene,  
M.L.C.  
21 June, 1899.

234. But with the increased cost of clearing virgin country, would wheat-growing still be a profitable enterprise? Very few men can afford to clear the green forest with the intention of immediately growing crops; but as nearly all the country out there has been ringbarked for a number of years, that difficulty will not manifest itself to any extent.

235. As regards the country which you have leased for wheat-farming, will the soil last without resting? I think that in that country, and in the country further west of which you are speaking, all the soil will last. There is some country up towards the Bland Plains which could be profitably and successfully cultivated for five or six years without any rest; but for my own part, I would not cultivate it longer. The system is coming by degrees into practice of throwing certain areas out of cultivation, and putting in such crops as cowpea, rape, buckwheat, and even lucerne. My experience is, that after land has been cultivated for a certain number of years, with the consequence that the yield of wheat is reduced, you can bring it back to its original fertility by a proper method without any intervening loss. You can grow crops by which stock can be fattened, and the residue of the crop can then be ploughed into the ground, supplying those constituents to the soil which have been taken out by the wheat crop; so that there is practically no limit to be put upon the time during which the land can be cultivated, worked in conjunction with stock. Under proper management you can keep down the weeds, and at the same time keep the ground fit for cultivation.

236. With a rest of one season? I do not say one season; perhaps three or four, or even more. One reason why share-farming is likely to be more successful than other farming is that the landowners have, in most cases, a fairly large area of land, and can, therefore, afford to let land which has been used for a certain time rest, allowing it in that way to regain its original fertility. The small farmer often comes to grief, and cannot live upon his land, because he cannot afford to buy stock and make use of the balance which is not cultivated, as the capitalist can do.

237. *Mr. Watson.*] Is it not a fact that a great number of small farmers are keeping sheep, following a portion of their land from time to time to provide feed for them? I think so; we are trying to teach them that.

238. *Mr. Trickett.*] It amounts to this: that any man who goes in for wheat-growing to a considerable extent must have double the area of land which he cultivates at any one time? At the very least, double.

239. With regard to the crops in this locality, could you tell us what succession of crops is necessary to make agriculture a paying concern, supposing you had a drought such as we have had recently; you might give us your experience during the last few years; they have been a pretty severe test as regards dry weather? My experience of cropping for the last six years has been that I have had up to 27 or 30 bushels an acre in places even in bad seasons; but if the cultivation had been inferior, the same land would perhaps have scarcely given seed. On the whole, I can state this without any hesitation, that the results have been infinitely superior to those I could have obtained by keeping stock.

240. *Mr. Watson.*] What was your average last season? I do not think it was 5 bushels to the acre. I had some thousands of acres upon which we never put the stripper or reaper. We simply turned the stock into it.

241. It was an exceptionally bad year? Yes; but in spite of that the same men are going on, and the area this year under wheat will be the largest we have ever had.

242. *Mr. Trickett.*] Does the rainfall come at the right time of the year in this district to suit wheat-growing? It is uncertain, and that is the drawback. Previous to the last few years our rainfall averaged about 28 inches in twenty-one years, but the last few seasons have been altogether exceptional. There has not been one-half of that quantity.

243. What is the lowest rainfall in that locality which you regard as being necessary for the growth of cereals? If I could make the rain come at a suitable time, I could grow wheat with 15 inches in the year.

244. Can you put down the general rainfall at 21 or 22 inches? More than that. I think that over a number of years it would come up to 28 inches; but that is a matter concerning which Mr. Russell can speak with absolute accuracy.

245. Do the farmers who have started under the arrangements you have mentioned stick to the business—are they a stable population? I think the share-farmers are fairly stable; but it is not the wish of those men who let their land on shares to chain farmers to the land; because we encourage—I speak for myself—the men to get their own holdings. In many cases I have helped them to acquire holdings when they were in a position to do it. The object of share-farming is to assist that large class of the population who, with implements and horses of their own, are still not in a position to obtain their own land and till it. My capital and their labour make a combination which has hitherto been quite successful. Probably some of my men will, if we have good crops next year, be in a position to say, “Well, Mr. Greene, I think I can go and set up for myself.” Possibly I may give them some help. That is a position which we hope, by degrees, they will all reach; but for every man who would leave under such circumstances, there are a dozen ready to take his place, so that although the same men may not be permanently on the land, the institution is a permanent one. I have at the present time far more applications for land than I can satisfy.

246. Between Grenfell and Wyalong, how is the country watered? It is very poorly watered naturally, but the people in that district have gained the experience which makes them look out for a water supply by making dams and tanks, and storing the natural water as well as they can. In ordinary seasons we are very well provided, although it is naturally a dry country.

247. The Bland Creek runs along that way? It is now, I think, dry. Lake Cowal is dry—a fact almost unprecedented in the opinion of those who have lived there for forty years.

248. Is there any artesian water in that part of the country? I think not.

249. It has not been bored? I do not think so. If it has not been tried it is on account of the opinion given by experts in the Mines Department, that it is of no use to bore for water.

250. In the course of our inquiries we have heard a good deal about irrigation for various purposes;—do you regard it as profitable to irrigate land for such crops as wheat crops? Most certainly not.

251. It would not pay? No; but I may mention that Mr. Donkin is an expert in irrigation. He has works of his own, and can give you evidence on that point.

252. Do you regard the Wyalong population as a fixed population now? Yes.

253. On account of the mining industry, I suppose? Yes.

254. Have you observed whether, within the past two years, the population has grown or otherwise? I have been very little at Wyalong within the last two years; but I gain all the information I can about it from people who are connected with the place; and it appears to me that the population, if it is not increasing,

- Hon. G. H. Greene, M.L.C.  
21 June, 1899.
- increasing, is not diminishing. It is a question of finding gold—of getting permanent reefs. No doubt, if the reefs diminished in quantity and value, the population would become less; whereas, on the other hand, if there were fresh developments, the population would largely increase.
255. If Wyalong were not in the question at all, or even if the population of that place were likely to be considerably diminished, you would still recommend the construction of a line in that direction, with a view to its ultimate extension to Hillston, as a means of opening up a large tract of agricultural country? Yes; if Wyalong were blotted out to-morrow, I would still advocate a line to Hillston. There is another point which should be considered: a great quantity of wool which should come to Sydney is now taken to Victoria; and I have no doubt a line to Hillston would be the means of intercepting some of that traffic. Sydney would be a great gainer by a line to Hillston.
256. In the construction of the railway from Koorawatha to Grenfell, the land through which the line passed was given to the Crown—the owners were liberal? They had to be liberal; the Crown pays nothing for the land.
257. They were asked to give the land, and they responded liberally? Yes.
258. You do not regard that as unfair? I do not consider it unfair, in one way; but it is a very poor system of betterment, for the simple reason that the man who gives his land (say) halfway between two stations 10 miles apart, has a certain amount of injury done to his land and still gives it; whereas the man with land adjoining the station, and on one side of the railway, has to give nothing, and still reaps the greater advantage.
259. That is an objection in detail to the mode of carrying out the betterment system; but looking at it as a whole, you are in favour of it? I am a thorough believer in the betterment principle.
260. *Mr. Watson.*] I understand you to say that there was good land west from Grenfell to within 10 or 12 miles of the Bland Creek? Yes; I believe in many cases the good land extends on to the creek, but upon that point you will be able to obtain better evidence from men who are actually living on the land.
261. If the good land extends to within 10 or 12 miles of the Bland—that would be about 25 miles from Grenfell—as far as you are aware the good country extends as far as that? I think so; but I do not speak with certainty. I have never gone into the question with a view to giving evidence on that point.
262. Suppose the good land extends 25 or 26 miles from Grenfell, it would still be within the influence of the terminus there, as far as dragging traffic to Sydney is concerned? It would help it. It would be better than nothing, I admit.
263. You admit that land within 20 miles of the Grenfell terminus would be within its influence for agricultural purposes? Yes.
264. So that the greater portion, if not the whole of the land which you know to be good, would be served, as far as the export of produce eastward is concerned, by the Grenfell terminus? Yes—that is, agricultural produce; I do not include stock.
265. As regards the land from within 10 or 12 miles of the Bland to a similar distance on the other side towards Wyalong, have you had any experience of that in wet weather? Yes.
266. And in dry weather? Yes.
267. Do you think it is any more than good pastoral land? As I have already said, I have never looked at the land with the intention of giving evidence concerning it, but I know it well.
268. Does not a large part of it consist of black clayey soil? There is a good deal of that.
269. How do agriculturists generally view that land;—do they not generally regard it as unfit for agriculture? I should think a great part of it would be unfit for agriculture, but it is admirable for pastoral purposes.
270. As you approach Wyalong, 10 or 12 miles the other side of the Bland, you get into some fair land? Yes.
271. That portion of 15 miles or so would be within the influence of the line if it went from Temora to Wyalong and terminated there? Yes.
272. So that the best land on the proposed line would in either case be within 20 miles of a railway if the other route were adopted? Yes.
273. From your experience of pastoral pursuits, would you say that it is so imperative to be close to a railway for the shipment of wool as for the shipment of agriculture produce? It is not so imperative, but it is a great help—a great benefit.
274. There is the saving of carriage? Yes.
275. But the fact of a pastoralist being within 40 or 50 miles of a railway would not affect the growth of wool. The pastoralist would not cease wool-growing from the fact that he was 40 miles from a railway? No.
276. Nor would the construction of a railway increase the production of wool on land suitable only for wool growing? No; the land would be put to its best use for the growth of wool, quite independently of the railway.
277. So that, as to the pastoral land upon the proposed route, there is no reason to suppose that the taking of a railway through it would increase the production if it is merely pastoral land? It would be greatly to the benefit of those making use of the land. Of course, it would not increase the production, because there is as much stock there now as the land can carry.
278. You know the country round about Wyalong pretty fairly;—would you say that approaching Wyalong from any direction the land is pretty much of the same character? I think the land is better approaching Wyalong from the Grenfell side; but I speak subject to correction upon that point.
279. There is near Wyalong some good mallee country—red soil? Yes.
280. It extends pretty well round Wyalong, does it not? Yes; but there is bad mallee in some places.
281. You made some reference to the Victorian mallee? Yes; I said that the mallee country on the Grenfell side of Wyalong is equal to the best mallee country in Victoria as to soil.
282. I think you said you thought that country round Marsden was better than that between Temora and Wyalong? I think it is.
283. For what purposes? I think the country between Grenfell and Wyalong, taking it all through, is very much superior to the country between Temora and Wyalong.
284. Do you know that they are growing wheat at present as far out from Temora as Barmedman, and that the wheat is taken into Temora for milling and shipment? Yes; I do not know much of the wheat-growing there. I never saw much grown there, or very much in the way of improvement.
285. You have not been there lately? No.

286. Have you ever been off the surveyed road between Temora and Wyalong? I have been across from Barmedman towards Morangarell, and I know that there is a great deal of very poor country about Trungley.

287. Have you been along the surveyed road between Barmedman and Wyalong? Yes.

288. Have you been over the country to the right or left of the surveyed road? I have been to Reefton. I have not been far on either side; I have not been much to the west.

289. You said you thought it desirable to give the people at Wyalong the best opportunity to reach Sydney by the shortest route, the difference in distance being 6 or 7 miles? Yes.

290. Do you know anything as to the grades on the Western line? I know that they are very similar to those on the Southern line.

291. Is it not a fact that the grades on the Western line are much more against the load than they are on the Southern line? I am informed by expert authorities that there is very little difference between them, and that that difference will be rapidly removed.

292. Do you think that a difference of 6 or 7 miles in a total run of 330 makes much difference in the cost of running passengers or goods? If I wanted that information myself I should ask it of an expert. I would not presume to go against the opinion of an expert in the Department.

293. You know that the construction of a line from Grenfell to Wyalong involves a greater length of actual construction, of 17 miles, as compared with the route from Temora? I suppose it would require greater construction if there is a greater distance between the points.

294. The difference is 42 miles as against 69;—the extra cost of the line from Grenfell to Wyalong is estimated at between £40,000 and £50,000? That may be so.

295. If you were informed that the construction of a line from Grenfell to Wyalong involved going 17 miles further at an extra cost of between £40,000 and £50,000, would you think that in order to cross the Bland that extra cost of construction was justifiable? Most certainly, in view of the larger area that will be assisted by the railway.

296. The first 20 miles of the line, no matter which starting-point you take, is within the influence of a terminus? Yes; but you cannot suppose that being 20 miles off is a good as being 10 or 5 miles off.

297. At each end of the proposed line you would have 20 miles of land within the influence of a terminus, taking Grenfell for the terminus at one end and Wyalong as the other? Yes; but the outside limit is not as good as the inside limit.

298. Practically the only additional country served by the Grenfell to Wyalong route would be the Bland country? It would serve country exactly in proportion to the additional length. It would probably serve more in proportion than would be served on the other line, because the country is better.

299. You stated that if the line were constructed from Koorawatha there would be an opening for agricultural produce from Grenfell to go west? Yes.

300. I suppose you know that Temora is also an agricultural centre? Yes; a small centre.

301. You are not aware that it is one of the largest shipping points for wheat upon the railway, according to statistics, for recent seasons? I am not.

302. You admit that sufficient wheat and other produce is produced round about Temora to supply people to the west, if a line were constructed from that point? The people there would have to exhibit a little more energy than they have hitherto shown.

303. As to the quantity of ore which goes to Victoria from Wyalong at the present time, is that because of the lack of fuel, or because of the lack of proper appliances to deal with it locally? I do not know the minutiae of their business. I only suggested that it was probable that the ore would be treated locally. I go upon the general principle that it would be advantageous to the community there to have easy and cheap access to the coal.

304. That depends upon whether it is necessary to use coal for the reduction of ore;—are you aware that, as far as Wyalong is concerned, the ore they are treating now does not require coal for its reduction? I do not know that. It may or may not be the case.

305. Is it not the fact that large works have been recently started at Wyalong which treat a larger quantity of the ore which requires special treatment? I believe chlorination and other works have been constructed there.

306. No greater amount of coal is required for chlorination than for battery treatment? That I do not know.

307. I think you said that if a railway were taken to Hillston there was the possibility of wool which now goes to Melbourne being drawn to Sydney? Yes; Sydney would be its natural outlet.

308. I suppose what is known as the zone system of rates, whether the point of immediate departure from the railway system were at Temora or Grenfell, would not make much difference to the people of Hillston in the carriage of wool? It might be in the wrong zone.

309. With only a difference of 6 miles between the two routes? It might be on the wrong side of the division between the zones.

310. Do you know anything of the freights paid on the wool which is sent from Hillston to Melbourne? I have not made a study of the question, but I know that Victoria offers great inducements, extending up to 60 per cent., on wool taken from a certain distance to the north of the Murray.

311. Is Hillston a greater distance from Melbourne than from Sydney? I have not looked into that question at all. I merely suggested the general principle. I am not posted up in the details.

312. As to the port of shipment for wool as between Melbourne and Sydney, probably, with the advent of Federation, rates will be so arranged that the wool will have to find its nearest port—that is the probability? Quite so. People would then make use of the railway I suggest all the same.

313. Do you know where wool is at present sent to from Hillston;—is it sent towards the Hay line? I could not say. I have not been there for many years.

314. *Dr. Garran.*] What is the population of Grenfell now? I really forget. I think it is about 4,000. I have not come prepared with any statistics.

315. Is it an advancing township, or is it stationary just now? I think I may say that it is stationary, although there have been fresh works established there for treating tailings—two cyanide works—and it is thought by Mr. Slee, who will probably give you evidence on the point, that there is a great undeveloped wealth of gold yet in the Grenfell district.

316. Are the tailings to which you refer old tailings? Yes.

Hon.  
G. H. Greene,  
M.L.C.

21 June, 1899.

- Hon.  
G. H. Greene,  
M.L.C.  
21 June, 1899.
317. Is there much fresh mining going on now at Grenfell? I do not think there is much fresh mining.
318. Was the mining there principally alluvial or quartz mining? I think both.
319. I gathered from what you said that you looked upon the line between Koorawatha and Grenfell as running through a district which will be a great fodder-providing district for the west? Yes.
320. It will provide wheat, hay, and other fodder besides? Yes; wheat and hay would be the two chief items.
321. Does the district grow lucerne? Yes; but not as it is grown on the rich alluvial flats on the rivers; but it grows fairly well.
322. Would the hay be principally wheaten or oaten hay? Chiefly wheaten.
323. Of good quality? Yes.
324. You think there is a market in the west for that fodder? I have no doubt whatever of that.
325. Do you think the line extended from Grenfell to Wyalong would also pass through good fodder-producing country? Yes; a great part of it; I think four-fifths of it would be of that character.
326. With the rainfall diminishing as you go west? Yes.
327. The more westward you go the more risky farming is? Yes.
328. But you would be nearer to your market? Yes.
329. So that Wyalong hay-growers would have a pull over the Grenfell hay-growers in carriage? On those occasions on which it is necessary to send to the west. In good seasons there would probably be a supply in the west, in which case they would have to send to other markets.
330. When you say that there would be a supply in the west, do you refer to the pastoralists growing their hay, or to its growth by selectors? Whoever might hold land in close proximity to the line; it would be mostly selectors.
331. Supposing the line were extended still further from Wyalong to Hillston, would it go through fodder-producing country? I think a great deal of it would be first-class agricultural land.
332. In good seasons it would produce good hay? Very good hay.
333. In a previous inquiry by another Committee, one witness said that the land around Hillston, on the eastern side, was some of the finest in the Colony;—is that so? I cannot say from experience; but I have no reason to doubt it.
334. It will grow good hay? Splendid hay and splendid wheat.
335. So far as the pastoral country between the Lachlan and the Darling is concerned, it would, in a good season, be better supplied from Hillston than from Grenfell? Yes.
336. So that, although in a good season like this, when you are at the terminus of a railway you would have a good market for hay, you might lose it if the line were continued to Hillston, supposing the season were a good one? We should have to take our chance of the market. That is the experience in all sorts of business. On certain occasions it will pay us to send east, and on other occasions it will pay us to send west. We must be subject to the laws which govern distribution.
337. Supposing the squatters at Mossiel or Ivanhoe wanted hay, they would be able to get it cheaper at Hillston than at Grenfell? If they had hay at Hillston.
338. They have rich land there, and in a fair season they might have it? Yes; they might have a large supply to send west.
339. Do the people of Grenfell exhibit any indisposition to advocate this line? I think they are in favour of sending it out west.
340. From a feeling of interest? I think they consider that the district and the town with it would gain an advantage by the line being sent west.
341. They will have the advantage that the railway will give them carriage to the west? I think so.
342. They think they have a personal and pecuniary interest in the line going westward? I think so.
343. I gather from what you said to Mr. Watson, that between Grenfell and Wyalong for the first half of the country the land is better on the whole for agriculture than in the latter half? Yes.
344. As you get to the Bland country you get into purely pastoral country, and when you get to Wyalong there is mallee scrub? There is a large quantity of good land between the Bland and Wyalong.
345. Before the scrub begins? Yes. There are different kinds of scrub besides mallee. There is scrub and forest mixed, and a considerable portion of that land is fit for agriculture.
346. You think the whole of that country will be settled, with the exception of the flooded land? I see no reason to doubt it.
347. If the line marked in broad red on the plan is so far good, the southern line by way of Bimbi would, I suppose, pass through the same sort of country? It is more level country, and more open in places, but I do not know that there is much difference in point of actual facility and suitability of agriculture, but it is good land also.
348. If the southern route were taken *via* Bimbi, a few miles might be gained by not going into Grenfell at all? Yes.
349. But I suppose the Grenfell people would not like to be left out? No.
350. They would not like the continuation to start a few miles to the south of Grenfell? No. There is no doubt that if Grenfell were left out, however, a shorter route might be found from Koorawatha to Wyalong.
351. The argument in favour of the northern route is that it would be part of the distance towards Forbes? Yes.
352. Do you think it likely that there will be a line to Forbes for a long time to come? No.
353. It would be a cross-country line where there is no cross-country traffic? Yes; I should not think there would be much traffic.
354. From what you know of the country between Koorawatha and Grenfell, you still think that that line will prove remunerative to the Government? I think so. I think there has been more work done in the way of agriculture and other improvements upon that land than in any equal area of similar country in New South Wales.
355. Is it country that will pay for improvement? I think so.
356. You spoke of the length of time which it has taken you to clear your box-forest country;—if it takes as long as that for a new settler to clear his land, a good long time would elapse before he would receive any return for his investment? Nearly all the land upon the route we are speaking of is ring-barked; that has been done by the lessees. I do not know how far or to what extent it has been done, but I know of great areas. The selectors, of course, prefer ring-barked country if they can get it.

Hon.  
G. H. Greene,  
M.L.C.  
21 June, 1899.

357. Do they have to pay for that improvement? The original cost of ringbarking.
358. It will pay them to do that? Certainly. I, myself, if I were taking up land, would willingly give 5s. an acre more for land ringbarked where the ringbarking had cost only 1s. The improvement to the ground is so great and the facilities for clearing are so great.
359. It is worth your while, you think, to give 5s. per acre more for land which cost 1s. five years ago to ringbark, instead of your having to wait five years? Yes, provided the timber is all killed.
360. Time is money? Yes; and the land is greatly improved.
361. Is box timber good timber for many purposes? Fair timber. You can get fencing stuff out of it, but it is not equal to stringybark or ironbark.
362. Will it make sleepers? That is doubtful. I think that possibly it might.
363. Does ringbarking destroy the value of a tree for timber? It would depend upon the time the tree remained standing after ringbarking. A tree which has been ringbarked will have the sapwood all rotting off in from fifteen to twenty years.
364. When a ringbarked tree is left standing, does it season as well in that perpendicular position as it would if it were cut up and placed in a horizontal position in a timber yard? It will season, but I have never found such timber to be of much use when it has been left standing after being ringbarked. Some years ago I was constructing a new fence and the men asked me if they might split the old ringbarked timber. I told them they might, but I found that I had made a great mistake, because a couple of years after the posts were put in the ground all the outside timber, the sap timber, rotted off and the posts were reduced to pretty nearly half their size.
365. What is the value of box timber per acre? That would depend upon its proximity to a railway. I have to pay men to burn it off; I get nothing for it.
366. It is a drug? Yes.
367. You have not wasted as much you think in the value of the ringbarked timber as you have gained in value to the soil? The timber is practically useless except for firewood. When we let a contract for ringbarking we mark all the trees that are to be kept before the work is commenced; we save all the timber which we consider to be of use for shade or building purposes.
368. The timber was formerly valueless, but now that there is to be a railway will the timber be more valuable if it be left standing? Not in our lifetime.
369. The best course is to clear it away? Yes.
370. You are not destroying anything of value? No; and the improvement resulting to the land from the decomposition of the small branches is very great. It adds greatly to the fertility of the soil.
371. This soil you speak of, is it as light as the soil of the Murray, which is being so much cultivated now? It is very much of the same character as the soil of the Murray away back from the river. There is no alluvial soil.
372. It is all disintegrated volcanic rock? It is granite country. It does not appear to be volcanic.
373. Could you work a three-furrowed plough over it? Yes; I get a great deal of my work done by three-furrowed ploughs. I work in some places ten-furrowed ploughs; but that is only on land previously cultivated, and in a suitable condition to be worked.
374. It is represented to us that the Murray land is so valuable because it is so easily ploughed;—is your land as easy to plough? It is easily ploughed.
375. As easily as the Murray land? Yes.
376. Have you as good a rainfall as there is on the Murray? Better, I think.
377. Do you get 20 inches? We had an average of 28 inches over 21 years.
378. You said that purchased land could not now be made to pay merely by stocking? I think not.
379. The time has come when tillage is the best method of putting it to use? Yes.
380. Will you apply that observation to the whole of the land as far as Wyalong? I do not know; I have never worked the land on the Bland, but I fancy that on none of that land is fair interest made on the cost of the freehold.
381. When the land was bought years ago at £1 per acre to protect the run, it was thought then that for pastoral purposes it was worth £1 per acre? I do not think so. A good deal of the land purchased in those days consisted of picked spots to prevent selection over the rest of the run; the land was purchased to protect the run.
382. It has added to the general capital cost of the property? Yes.
383. It was not purchased with any expectation of making 5 per cent. out of the land itself? Taking one year with another, I do not think sheep or cattle on the freehold land would make 5 per cent.
384. Since that time the price of wool has fallen? Yes.
385. At present it would not pay to give £1 per acre for land for pastoral purposes? Except in special cases. The upset price is now more than £1 per acre. It is 25s. per acre for freehold land. There has also been a great amount of improvement, so that the cost is a great deal more than £1 per acre; it is probably £2 per acre in many cases. It would be very hard to net 5 per cent. upon that amount by keeping sheep and cattle.
386. Is 25s. per acre the Government valuation? Yes, and often more than that.
387. Suppose the proposed railway were extended to Hillston, do you think your observation would hold good, that the whole of the land in that district would be worth more for tillage than for pastoral purposes? I would not say the whole of it; but, perhaps, 4-5ths of it would.
388. That is a very important matter, because the line to Hay was made through pastoral land, and from then till now it remains pastoral;—the idea of the line settling population has not been realised? That is true; but in this case I will venture to say that any statement which has ever been made as to what would be done in the future if a railway were made through the district, has been more than carried out by the people there. They have shown an energy and a desire for improvement which has been unequalled in any other part in New South Wales.
389. Still the owners of the large estates on the Murrumbidgee are as anxious for profit as are most other human beings? But many of them are very conservative, and they do not like the idea of breaking up their land.
390. But if they could see that there was more money to be made by leasing the land to farmers than by running sheep upon it, would they not take that course? They might; but a great deal of the land there is quite unfit for agriculture.
391. Why? On account of the dry seasons, and the clayey nature of the soil.

- Hon. G. H. Greene, M.L.C.  
21 June, 1899.
392. Is the soil clayey? Yes, on the plains; and it is nearly all plain country down there.
393. If your view then is correct about the profitableness of tillage, there would be a reasonable prospect of the line to Hillston settling a number of people on the soil? I think so.
394. We have been told that the construction of a line to Temora has greatly increased the agricultural settlement in the neighbourhood of Temora, so that we have some experience of what a line will do under certain circumstances? Yes.
395. It is important for us to ascertain, if we can, whether an extension to Hillston would have a similar effect? Judging from what has taken place in the past in the district of which we have been speaking, in view of the construction of the railway, I should say that it would. If the Committee visit the district of which I have been speaking, they will see in one day far more than I have been able to describe. No Member of this Committee has ever been in that district without saying that what he has seen has far exceeded his expectations. I am speaking now of the Grenfell district.
396. Referring to the fertility of the soil, you express the opinion that after five years of tillage it would be necessary to give the land a rest? It would be desirable.
397. What do you do with the farmers when you turn the sheep on to their land? We clear fresh land. In some cases we clear the land to order. If a tenant wants land from me under certain conditions, I allow him to pick his own land, and then clear it for him.
398. As long as you have land open for occupation? Yes.
399. If you had let all your land what would you do? I should have to curtail my operations.
400. Because five years is necessary for recuperation? I might, perhaps, under those circumstances, allow the land to rest for, perhaps, three years.
401. Is the land of which you are speaking too hard to be ploughed in dry seasons? New land is too hard to be ploughed in dry seasons. For instance, this last season my men had to discontinue ploughing new land for about a fortnight—that is, until the rain came. At the end of last month they recommenced, and they have been going on ploughing new land ever since.
402. When once land has been ploughed, is it possible to turn it directly after the harvest, even if the season is dry? Yes; no matter how dry the season is.
403. Is it not better to plough the land immediately it is cropped;—does it not oxygenate the land by turning it up to the air? Yes; it is a great improvement.
404. Do they do that? Yes; in some cases.
405. It is equal to manuring, is it not? Not quite equal.
406. It is partial manuring? The difference between that and absolute manuring is that in manuring you put some commodity into the soil. With the other process you render the soil into such a condition that you can get more out of it. In the one case it is possible to exhaust the land; you get more crop sometimes, but when you put in suitable manure you absolutely replace the fertility of the soil.
407. Merely ploughing the soil does not enrich it,—it only enables it to give off its power? Quite so.
408. Do you not enrich the soil by oxygenating it? I suppose so; just as certain nitrogenous plants will improve the soil.
409. Do you put up residential buildings for your tenants? No. As a rule, the men have land of their own; but finding that they are not capable of working it as it should be worked, they take land from me, and they reside on that land during the time they are putting in the crop and taking it off. For the residue of the time they go back to their own homes, where they have a certain amount of property to look after. When a stranger comes into a district, and I find him a desirable person as a settler, I let him put up a residence to suit himself, and he stops on the land all the time; but that is a matter of special arrangement.
410. In the case of the bulk of the settlers, then, if you allowed the land they have been cultivating to rest and cleared a fresh piece of land for them, they would still have their old homes to live in? Yes; but as a rule their homes are easily shifted and they like to live where their work is.
411. I gather from you that to farm properly in your part of the country a man requires to begin with some degree of capital and some degree of skill? With some degree of capital. I have put men on to the land who have not had 6d., but it is rather hazardous. Some of them pull through well and others do not seem to care. They are quite willing to work as long as the responsibility and risk rest with me.
412. I am talking of putting men on land which they have selected themselves, they want capital and skill? Yes.
413. To talk of putting an ignorant poor man on the land in the hope that he is going straight away to thrive is nonsense? Yes; it is the worst penalty you can inflict upon him.
414. The first thing he wants to do is to borrow money? Yes.
415. You think that by making use of another man's money he gains? Yes; it gives him access to natural opportunities. It is better for himself in every way.
416. What interest, if it is a fair question, do you charge the men for what you lend them? In a great many cases I charge no interest at all. I charge no interest on running accounts which extend for perhaps a year. When I have to make short loans with bad security, I charge as high as 10 per cent. In some cases I have offered the men, if they could give me security, to reduce the interest to 5 per cent.
417. It is better for them to pay that interest than not have the money? Yes.
418. Do they manage to stagger under it? In most cases they have done better than their neighbours on adjoining land, working their own land.
419. In that case they must make more than 10 per cent. out of the land? Yes; 10 per cent. is only on a small portion of their indebtedness. In some cases I receive no interest at all; it is a question of risk.
420. Does the crop pass through your hands as security? Yes.
421. You sell it? Yes, I act as the men's agent, when desired.
422. That is part of the bargain? Not necessarily. Some of the men want to sell themselves. In those cases I give them permission. The crop is divided on the field, and they can do what they like; but in practice they ask me to take control of it, because I can more easily arrange for the carriage, and can, perhaps, sell better than they can sell themselves. The money is put to my credit in the Bank and I have to furnish them with an account of everything, showing them the account sales; they then get a cheque for what is coming to them.
423. When you take charge of the sale, do you choose your own time for selling? Yes; but not without consulting the men. Until last year, I sold nearly all the wheat in two parcels to the local millers.
424. In harvest time the weather is generally very dry? Yes. 425.

Hon.  
G. H. Greene,  
M.L.C.

21 June, 1899.

425. So that you can leave the wheat on the ground without any fear for a time? Sometimes we have heavy rain in January; but we have had pretty good experience in the best methods of stacking wheat to prevent it from being injured.

426. There are no large barns in your neighbourhood? No; and if there were, it would not pay to shift the wheat, because the double handling would be too expensive.

427. It has to be carted into the nearest township at once? The wheat is made into stacks, and is afterwards carted to the nearest railway station.

428. Will the millers take charge of the wheat and let you sell it when you like? They do so nominally; but in practice, once the wheat gets into the miller's charge, he keeps it. If you take it away, he charges you for storage, for insurance, and for delivering the wheat back again; so that, as a rule, the wheat remains in the hands of the miller once it goes there, no matter what the agreement is.

429. When you sell to him, will he let you sell when you like? He will name a price which he will give you on the spot, and if you do not take it he will say, "I will keep the wheat for a certain time." Some of them will keep it for a certain time without charging you storage, and at the end of that time they will give you the market price, or you must take it away; and, as I have pointed out, it is almost impossible to take it away, because the charges are so heavy.

430. Suppose the wheat is in the mill for a couple of months, do the millers charge storage? No.

431. So that you can get the wheat housed directly after the harvest? Yes.

432. Is there much competition among the millers? At Young there are two mills, but there is very little competition.

433. I gather that on the whole you think the line to Wyalong from Grenfell is better, in the interests of the country, than the suggested extension from Temora? Yes.

434. But would not the line from Temora give the Wyalong people the advantage of a double market—that is, Melbourne and Sydney;—would that not be better than the market they would get with the other line? Possibly; if they wanted to do business with Melbourne it might be a little better.

435. It would be shorter to Melbourne than to Sydney from Temora? I am not sure of the distance; perhaps it would.

436. Do you think the matter of sufficient importance to be considered in determining the question? I do not think it is of much importance; but a saving of 7 miles in distance for all time to come is a matter of great importance.

437. You are assuming now that the Wyalong people will send to the Sydney market? Yes.

438. But as long as they get a fairly good market in the west they will be satisfied—they will only send to Sydney when they cannot sell locally? The chances are that the bulk will go to Sydney after the local market is exhausted.

439. The question of supplying fodder to pastoralists has been before the Committee on several occasions;—do you think that if the line is extended from Wyalong to Hillston a large number of farmers will grow fodder for the squatters, instead of the squatters growing fodder for themselves? I think that, probably, most of the squatters would grow enough fodder for themselves in good seasons, but in seasons of drought Hillston would not be able to supply them.

440. The farmers you speak of would not have a market in the west, except in dry seasons? It would be an additional market; there would be the local market and the market for export. The other would be something to the good. In some years it would be of no advantage at all; in other years it would be.

441. You say that your people would grow their hay to send to the east generally, and that now and then they would get a god-send in the shape of a dry season in the west? Yes.

442. They will have a good market to the east? I suppose they would have a practically inexhaustible market for wheat.

443. But for hay? They must be guided by the market. When the crop was ripening they would have to decide whether they would deal with it by converting it into hay or keeping it for wheat.

444. In what month of the year must they decide whether they will cut the hay? In the beginning of December.

445. It would depend upon the look of the crop and upon the rainfall? Yes; and upon markets elsewhere.

446. On the whole, does it pay best to cut the hay or to grow for wheat? Hitherto, it has paid best to cut for hay; there has been more money per acre in it.

447. Is it less exhausting to the soil? There is very little difference between the two courses. All that the wheat requires has been taken out of the soil before you cut it for hay; in fact, the way to get good wheat is to cut it before ripening and allow it to ripen in the sheaf.

448. You let the ear form fairly well before you cut the hay? Fairly well, but it must not be too pronounced.

449. You get the nutriment of the grain to some extent in the hay? Yes; but you must not allow the nutriment in the stem to run up into the ear. You want the saccharine matter to remain in the stem.

450. You keep the nutriment in the stalk, where you want it? Yes.

451. Still, if the ear does form at all, there is nutriment in the grain? Yes; but if it is allowed to become too far advanced a great deal of it will drop out and be lost.

452. Upon the land between Koorawatha and Grenfell, what are you looking forward to growing most—wheat or hay? If there were a railway, I should think that about half the crop at least would go for hay. I have gained considerable information respecting farming on the Western line, at Wellington and Narramine, and they found there that with railway accommodation it paid them better to cut their crop for hay than to strip it for wheat; but that was simply on account of their being right on the line. The hay is nearly always cut into chaff, and the carriage of chaff is much heavier than the carriage of wheat.

453. It is more bulky? Yes; because the whole of the produce goes away. In the case of the wheat, you send away only what is taken out of the head. On the railway line, it pays them far better to cut for hay. Thousands of tons are sent west from Wellington and Narramine.

454. As chaff or hay? As chaff. Not 1 per cent. of the wheat which is cut for hay is kept for hay; it is cut into chaff, and bagged before it is sent away.

455. What do you regard as the minimum price for wheat which will pay? I believe we could make wheat pay at between 1s. 6d. and 2s. a bushel.

456. Delivering it at the nearest railway platform? Yes.

- Hon.  
G. H. Greene,  
M.L.C.  
21 June, 1899.
457. The farmers to deliver? Yes; it would certainly pay at 2s.
458. In a previous inquiry in connection with the Temora line, 2s. 6d. was mentioned as the lowest price? That is quite probable; but every year we are advancing in our knowledge, and in better methods of dealing with the land. There is also better machinery.
459. Are you farming on a sufficiently large scale to make it worth while to use reapers and binders? Yes; some of the farmers put in as high as 800 acres.
460. Does each man keep his own machinery, or do you keep the machinery? Each man keeps his own machinery; but as a rule I have to pay for it, and they pay me as soon as they are able.
461. Does it pay each man to invest separately in a machine? Yes; because, as a rule, each man has quite as much as he can take off with one reaper and binder if he worked at it from the first day of the season to the last. I do not think you could do more than 250 acres in one season.
462. The use of modern machinery is now cheapening the cost of production? Greatly.
463. Ten years ago you could not have worked your land so cheaply as you do now? No; it would have cost three times as much ten years ago.
464. You can grow wheat now at 1s. a bushel less, and can still make a good profit? Yes. I can sell wheat now at one-half the price at which I sold it ten years ago.
465. And you have not reached the absolute limit of labour-saving machinery yet? No.
466. In your opinion there is a fair opening for future agricultural settlement in this country? I think so.
467. Permanent settlement? Yes.
468. *Mr. Shepherd.*] You have had more experience than has any other man in the Colony in the letting-out of farms to small settlers? Yes, possibly.
469. What is the size of the farm you usually let to them? I do not give any man under 100 acres; but they can have as much land as they can satisfy me that they can harvest.
470. How long do you allow them to cultivate without spelling the land? Up to five years.
471. You do not make any arrangements for applying green manure to the land, or anything of that kind? No. We may come to that later on; but with so much virgin land it is easier to clear new land, and to give the men that and recoup the tilled land by putting it under crop which can be fed off by stock.
472. Do you usually treat the land yourself after the settlers are done with it? No.
473. You do not allow it to lie idle? Sometimes I allow it to lie idle for a year. I stock it heavily to get rid of the wild oats and growth of that sort. I generally plough the land and sow rape, cowpea, buckwheat, or lucerne. At this moment my people at home are ploughing for lucerne. We employ the farmers who have their crops in in that way; it prevents their being idle.
474. Have you black soil generally where you are growing lucerne? No.
475. Does the lucerne do well in red soil? Yes; I have found it in odd plants growing in roads which are so hard that you can hardly drive the pick in a couple of inches.
476. You do not think it would pay better to grow lucerne than to grow wheat? Not on a large scale in that district.
477. You prefer the line from Grenfell to Wyalong to the line from Temora to Wyalong? Yes.
478. More than one-half of the land is alienated between Grenfell and Wyalong? I do not know whether that is the case; probably it is so.
479. We have returns showing that 880,000 acres have been alienated, that 342,000 acres have been reserved, and that there are only 429,000 acres of Crown lands; roughly speaking there has been more land alienated than there are other classes of land; that, of course, would be no objection to a railway—in fact it would be rather an advantage if the owners of the land did not require compensation? I would not give them any. We have provided all the land for the line from Koorawatha to Grenfell, and I do not think there will be any difficulty in getting the land in this case. I have had a great deal to do with getting the land free of expense for the line between Koorawatha and Grenfell, which is a much more thickly populated place, and the land has all been given.\*
480. I heard you say, some time ago, that there was some first-class fattening country upon the proposed route, but that it was not fit for cultivation? Yes. A good deal of the country on the Bland is equal to anything in New South Wales for carrying stock and for fattening purposes, but the soil is of too clayey a nature for cultivation. It could be cultivated, but we find that the best land for cultivation is the forest land.
481. It is very usual for persons going out to look for good agricultural land to judge as much from the pasture as from anything as to the quality of the land? I should judge more from the timber.
482. With reference to the clearing of the land, do you say that it can be cleared at from £2 10s. to £3 per acre? I dare say you could get it done for that if the timber were not bad. You could not get it done at that price in stringybark, appletree, red-gum, or ironbark.
483. The mallee country, you think, can be cleared for less than that? I am not sure whether it can be done for less, because I have never had it done; but I have seen a great deal of that class of country which has been cleared in Victoria, and I fancy that the expense of clearing in the first instance was not very great, but I believe there were a great many after expenses. There were a good many roots in the ground, and they had to use stump ploughs. That had to be added to the initial cost of clearing. There was probably a good deal of after-cost.
484. The mallee country in Victoria is generally of a light loamy character; I suppose the soil here is of the same class? It is generally a red, friable soil.

\* NOTE (on revision):—I should like to add that the Lands Department offered to give in exchange to those who surrendered their land for railway purposes, other land of equal value taken from unnecessary roads and reserves. This arrangement made the task of securing the land much easier.

THURSDAY, 22 JUNE, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

John Boyd Donkin, civil engineer and grazier, sworn, and examined:—

485. *Mr. Dick.*] You have resided for some years near Marsden? Yes.

486. You have a good knowledge of the country which will be served by the proposed line? Yes; I may mention that many years ago I was Government Surveyor in this district. I made feature surveys of the Weddin Range; of the Bland Creek from Cootamundra right down to the Lachlan River; and of the main divide between the Lachlan and the Murrumbidgee. Since then I have been living at Lake Cowal. I was also interested in property at Wyalong and Mandamah. The country, proceeding from Grenfell towards the Bland along the line marked on the plan in deep red, for about 30 miles out, or to within about 8 miles of the Bland, is all open, level country, excepting the spurs running down from the Weddin Mountain. It is box and pine country, and is adapted to agriculture. A large area, say, up to 15 or 20 miles out from Grenfell, has been cleared for the plough. The rainfall at Grenfell has averaged about 28 inches, I believe. At the Weddin the rainfall drops to 24 inches, and at a point about 30 miles out it is about 22 inches. When you reach the Bland Plain country you find an enormous area of good pastoral land, which stretches right up towards the Lachlan; there is no bad country in it. That would describe the country for an area of about 20 miles north of the line, and the same may be said of an area 20 miles on the south side. The Bland Creek takes its rise at Coota, and the country through which it passes is level; there is only a foot fall to the mile. It overflowed its banks at a point where the proposed line crosses, in 1890, and it spread out from 2 to 3 miles, at a depth of from 6 inches to a foot; but that would be only backwater. Proceeding on from where the broad red line crosses the Bland Creek, you reach red and black plains which stretch away for a distance of about 7 miles to the Barmedman or Back Creek. These plains are almost entirely pastoral land. With the exception of picked spots on the Liverpool Plains, I should say that they comprise the richest pastoral land in New South Wales. In the early days the settlers on the Bland Creek were dairying. They made a large quantity of cheese, and it was carted to Sydney by bullock teams. If the proposed railway went through that country, it is my opinion that a very large extent of it would again be used for dairying purposes. The Bland Creek is not a very difficult creek to bridge over; the waters are still, and the same observation applies to the Barmedman Creek. After leaving the Back Creek, going on towards Wyalong, the country is again timbered, and there are stretches of mallee and other scrub in between the box. The timber country would all be fit for agriculture.

J. B. Donkin.

22 June, 1899.

487. *Mr. Shepherd.*] Do I understand you to say that the mallee is mixed with the box? Yes. I regard the proposed line as a national line, going out from Sydney, through Hillston, and on towards Menindie. One of the routes which have been projected goes up through Cudgellico, and down the Lachlan to Hillston. A southern route passes through Yalgogrin, and on to Hillston in that direction through Rankin's Springs. That line would pass through a great deal of very rough country, although there are some patches of good country to be found. I, myself, think that an intermediate route might be found, which would avoid the bad country. It would miss out Cudgellico, Euabalong, and other settlements on the river; still it would be a good line.

488. *Dr. Garran.*] If you were going on to Wilcannia instead of to Hillston, you would take the route you now suggest? Yes.

489. Would it matter very much if you missed Hillston? I do not think it would be of very great consequence, because the Gunbar district to the south-east of Hillston is already served to a great extent by the Hay line. Of course, the nearer to Hillston the line goes the greater probability there is of it serving the country towards Gunbar, which is very good. The line from Molong to Parkes and Forbes serves a certain area of the country of which I have been speaking; but the Lachlan River is bridged only at Forbes, Condobolin, and Cowra, and settlers on the south side of the river can only reach the Forbes line by crossing at one of those points. They would be able to reach the proposed line without crossing the river.

490. *Mr. Dick.*] We may take it from your general statement that going west from Grenfell you first reach an area of land suitable for agriculture;—then you come to an area of inferior land, and further on beyond the Bland you come to another area of good agricultural land? I should not call the Bland an inferior area, except from an agriculturist's point of view; it is a very rich area for pastoral purposes.

491. How far out from Grenfell does the first area of good agricultural land extend? Thirty miles. I am, of course, omitting the spurs of the Weddin Mountain.

492. Have you altered your opinion in regard to the extent of that agricultural land since you gave evidence in reference to the Euabalong proposal in 1897;—you then said:

950. What is it like on the western side of Grenfell? It is good country on the western side of Grenfell for 10 miles; then it pans out into open plains, much the same as the country past Narrandera. You get on to box timber country towards Wyalong.

951. Between Grenfell and Wyalong what area is available for agriculture? To the west of Grenfell 10 miles; then it is open plain.

952. Is it good wheat country? No.

953. For how many miles? About 15 miles.

? I see that I there said that the area of wheat-growing land extended out for 10 miles, but I think that must have been a misprint.

493. You now think that wheat-growing country may be said to extend out for 30 miles? I do not know that the whole of that area can be described as good wheat-growing country, because wheat-growing depends so largely upon the rainfall, and, as I have already pointed out, you have a diminishing rainfall as you approach the Bland.

494.

- J. B. Donkin. 494. How far east from Wyalong does the good agricultural land extend going towards the Bland? It comprises the whole of the area up to Back Creek, say about 15 miles.
- 22 June, 1899. 495. Your statement amounts to this: that there are practically 45 miles upon the whole route of good agricultural land? Yes; but I must qualify that statement by this remark—that although the land is good, it is only one season out of three, going towards Wyalong, that they would get a fair crop on account of the deficient rainfall.
496. Does that statement apply also to the land near Grenfell? No; the rainfall there is greater. They had an average of 28 inches in twenty-one years. As you get on to the Bland country the rainfall diminishes, and when you reach Wyalong it is about 20 inches.
497. Is there an average of 28 inches from Grenfell to the Bland? No; only about 10 miles out from Grenfell.
498. That 10 miles, then, would practically be the limit of what you might call good agricultural land? Yes, having regard to the rainfall.
499. As to the area round about the Bland Creek, is it not the fact that it alternates between two conditions—one of flood and the other of excessive drought? The country on the east side is very little flooded. The red ground on that side comes right down to the creek at places. On the west side there has been a flood only once in the past five years. The 1891 flood, I think, was the last. The flood only lasts two or three days; the water then all passes away.
500. You said you regarded the line as part of a national line extending to Hillston, and even further;—do you think the proposed line could stand on its own bottom, assuming it to be constructed only as far as Wyalong? Yes; my reason for saying that is this: That some years ago the late Chief Commissioner for Railways told me that the Forbes line, which I use, was one of the only lines that was paying, and that line, to my own knowledge, passes through 20 miles of ironbark country which has never produced a single bag of wheat. The line under consideration passes through good country, the greater part of which can be put under the plough. A great deal of the remaining area could be used for dairying purposes. If any line will pay, I should think it likely that this line will do so.
501. How far are you from the railway at Forbes? Forty miles.
502. Do you think that an excessive distance for the carriage of your produce? Yes.
503. What do you regard as a fair distance from a railway station for profitable carriage? I think you might put down the distance at 20 miles. We can send a vehicle that distance and back on the same day. It takes two days if the distance is in excess of 20 miles.
504. Would not a great portion of the agricultural land of which you have spoken round about Grenfell be within a 20-mile radius of that town? Yes.
505. And would not the good land at the other end of the proposed railway be similarly served if a line were made from Temora to Wyalong? Yes.
506. It amounts to this—that both areas of good land between Grenfell and Wyalong would be served if a line were constructed from Temora to Wyalong? Yes; but I would point out that the country on the route from Grenfell is good, not only along the proposed railway but for a distance of 20 miles to the north and south of it.
507. Would not a 20-mile radius from Grenfell include a great portion of the good agricultural land? The best part of it. But the people on the south of the Lachlan would make use of the railway in preference to crossing the river to the Forbes or to the Condobolin line. A large area of country to the south of the Lachlan would be served by the proposed railway.
508. Is not a great area of the agricultural land south of the Lachlan—that is, between the Lachlan and the proposed line—nearer to Forbes than to the proposed line? A large extent of it would be in that position.
509. Towards Lake Cowal the land is more fitted for pastoral pursuits than for agriculture? Yes.
510. In that case a few more miles of carriage would not be a great handicap? Not a very great handicap. I should like to mention to the Committee, however, that, as regards dairying on the Bland Creek, some of the settlers there are now breeding lambs; there are not many parts of the country which are adapted to the breeding of crossbred lambs. I have been breeding them for the English market for the last few years. We have had a terrible drought to contend with, but I have been able to send 5,000 crossbred lambs to England, and in the present year, although we are still fighting the drought, I hope to be able to send 10,000.
511. Have you used artificial grasses? I have now adopted the plan of spelling certain paddocks. I keep the grass in those paddocks, and although we have had a drought, at Christmas time I had old grass 1 foot and 1 foot 6 inches in height. That was in a paddock which had been spelled for six months. I have come to the conclusion that the only way in which we can pull through is to save a certain amount of the run in just the same way that you would save growing crop. I have used various kinds of feed, but I find it cheaper to spell the paddocks in the way I have described, and let the sheep feed themselves. I save the grass just as if it were actually a crop.
512. You said that some years ago there were a number of persons dairying on the Bland Creek;—why did they discontinue? They discontinued because they found that cattle did not pay. In those days there were 30,000 people at Forbes and the same number at the Lambing Flat diggings, and there was a good market in that direction.
513. You anticipate that, if the proposed line is constructed, a number of settlers on the Bland will return to dairying? If the Government were to take a railway through my property I should have a thousand cows in six months' time, because I believe that under those circumstances dairying would pay better than agriculture.
514. Where would you get your market? I should send the butter down to Sydney.
515. Having a carriage of 300 miles, would you have any chance of competing successfully with the southern and northern dairymen? It is not a question of the local market. There is the London market. I send my crossbred ewes to London at the present time. If I were to sell them in Sydney they would hardly pay for the railway carriage; but by sending them Home I get 8s. and 9s. for them.
516. What would be the difference in the profit in the local and in the Home market? Lambs have been sold here for 4s. and 5s., and in London they realise from 9s. to 12s. New Zealand lambs have fetched in the London market from 10s. to 12s., and I do not think they are any better than the lambs we can breed.
517. Will you describe to the Committee the land between Temora and Wyalong? From Temora, for

18 or 20 miles towards Barmedman, the country is box country with pine and sifting bush. There is a dense undergrowth in many places. When the land has been cleared it is good agricultural land. There is also a good deal of hopbush. From Barmedman on towards Wyalong the scrub is more dense, with belts of mallee. J. B. Donkin.  
23 June, 1899.

518. Is the last 18 miles from Barmedman to Wyalong inferior to the last 18 miles on the proposed line from Grenfell to Wyalong? I do not think it is so good. There would not be a great deal of difference, but on the whole I do not think it is as good; there are more belts of mallee. I saw the other day that some leases were gazetted near Barmedman, and I was at the Lands Office this morning, and asked for particulars. There are two blocks with a frontage to the road, and they are gazetted as improvement leases. With the permission of the Committee I will read the Government description of these two blocks of 2,000 acres. It is as follows:—"Generally level, or gently undulating country, with a couple of low stony ridges of granite and slate formation, with soil of part red sandy loam, part red clay, and part gilgai country; timbered with box, pine, yarran, belar, and ironbark trees, and covered with dense scrub and undergrowth of sifting bush, dogwood, camomile, wattle, pine, and hopbush. No natural water supply, but good facilities exist for its conservation by excavating tanks. Rainfall, about 21 inches per annum. Rabbits, wallabies, and dingoes are numerous." In the month of May three leases of about 20,000 acres were gazetted in the country across from Barmedman, on the west side of the surveyed route. I know that country very well; it is nothing short of a howling wilderness. I surveyed the range passing up between Barmedman and Mandama. Budegower, where these leases are gazetted, is 20 miles from Barmedman. I saw the surveyor of the district the other day, and he said he was camped near these very leases. The homestead, he said, was deserted, and he was living in the house, and the whole place was infested with dogs and rabbits. Here is a description of the three improvement leases. The first is as follows:—"About 2,500 acres of rough sandstone ridges, poor soil, the remainder slightly undulating country, red loamy soil; timbered with box, pine, and oak, and covered with a dense scrub of pine, wattle, &c., with ironbark and currawong on the ridges; no natural water supply, but good facilities exist for its conservation by means of tanks and dams. Rainfall, about 20 inches per annum. Infested with rabbits and dingoes and anthrax." I should like to point out that in obtaining evidence in reference to this proposal the Committee will find that there is a great deal of feeling in the matter—that is, whether the line should go from Temora or from Grenfell. It does not make much difference to me personally which way the line goes; but I know the country on both routes, and in my opinion the country between Temora and Wyalong cannot be compared with the country on the other route.

519. Do you mean from an agriculturist's or from a pastoralist's standpoint? From both standpoints. I myself have tried agriculture.

520. Considering the rival lines from the point of view of mineral development, upon which line would there be the greatest mineral development? I do not think it would make very much difference. The whole of the country from Wyalong to Yalgogrin is mineral; and as to Wyalong itself, I think it is only in its infancy.

521. Is there not mining at Reefton and Barmedman? I do not think there is much mining there now.

522. You do not anticipate much mineral development upon that route then? I do not. Speaking of the railway from a pastoralist's point of view, I must say that although 20 miles may be considered a fair distance from a railway, there is a great advantage in having a line only a few miles distant from your property. It is of great advantage, having regard to the breeding of fat stock for market. On nearly every occasion when I have had fat stock ready there has been a glut in the market before they could be got down. If you are within a few miles of a railway you can get your stock down in a few hours, and in time of drought it is of great importance to be able to get your feed up rapidly for starving stock. On the Burrawang station, which uses the Condobolin line, they have been paying £40 a day for feed for stock. People, generally, are not aware of the thousands of tons of fodder which are brought to the drought-stricken districts from the Hunter and other parts of the Colony.

523. But there is an absence of grass and water in the districts of which you are speaking, only at a time of excessive drought? Yes.

524. I suppose that for many years things have not been as bad as they have been lately? The drought of 1888, I think, was just as severe, but it lasted only two years.

525. You have had some experience in irrigation? Yes.

526. Do you anticipate that the construction of the proposed line will develop irrigation? I do not think so, because there is no water with which to irrigate. In 1888, I had three large centrifugal pumps at work, pumping 8,000,000 gallons a day for stock. I found that the area I could irrigate was only limited. I have used a large quantity of water upon my own garden during the past ten years; I have had to pump 5,000 tons of water once a fortnight to keep the garden going. Of course, the present drought is exceptional. The Bland Creek has not been known to be dry before to the knowledge of white men; but it is now as dry as a bone. My lucerne is all dead, and my fruit-trees also.

527. What is the depth of Lake Cowal? Fifteen feet, in the centre. I may mention, for the information of the Committee, that there is not a drop of natural water in the whole of the country between the Lachlan and Murrumbidgee.

528. *Mr. Trickett.*] Did you irrigate for crops or for grass? For grass; but the country has been in such a terribly parched state, that although I have pumped a large quantity of water upon it, you could not see where it went to.

529. *Mr. Levien.*] Are there any wild fowls on the lake ordinarily? Yes. If I had a railway through my property I could send home frozen ducks as well as frozen lambs. I may mention that I have, within two months, put down 200 bores for water; we go to a depth of about 100 feet. We go through solid clay. I have never struck a stone yet. The lake drains about 4,000 square miles of country.

530. *Mr. Shepherd.*] Have you no artificial grasses at all on your run? I have grown lucerne.

531. I suppose you feed and spell alternately? Yes.

532. What kinds of natural grasses have you grown chiefly? I have the Mitchell grass, but only in small quantities; but I have the best fodder plant in Australia, the trefoil. I have known stock to fatten upon trefoil seed two years after it has been upon the ground. There is a large quantity of trefoil; the only disadvantage is that it has a burr which damages the wool to a great extent. One reason why, I think, the country would be such a good country for dairying purposes is, that we should have such a stand-by in the trefoil. We have also sow-thistle, crew's-foot, nardoo, and barley-grass. The stock will eat the whole

J. B. Donkin. whole of the grasses there; but the place has been so eaten out that it is now as bare as the street. Since last October we have had only 7 inches of rain. The highest we have had at a time has been 50 points, but the ground has been so dry that it has had no effect upon it.

22 June, 1899.

533. When you preserve the grass in the paddocks of which you have spoken, do you allow it to seed? Yes. Through the grass not being allowed to seed a great deal of it has been eaten out. On the Darling Downs they have had, in some years, to give up breeding lambs, because all the good sheep-grass has been eaten out. In regard to my irrigation works, I may mention that I have spent £2,000 upon them, and I have 10 miles of drainage. I was at one time very enthusiastic about irrigation. I was a member of the Water Conservation Commission, and I saw what was done in Victoria. I thought we could make a great success of it here, but I am sorry to say that it was not a success with me.

534. Have you any saltbush? Yes; but the greater part of it has been eaten out. I think it is much over-rated as a fodder plant. The sheep only eat it medicinally. I see they are growing it now in California upon some of the saline plains because they cannot grow anything else there; but I would never grow saltbush where I could grow good grass such as we grow.

535. Is not the saltbush a good fattening plant? I do not think it is as good as the grasses. Where it grows all the herbage is sal-salaceous. I have sent down some of our water for analysis, and the Government Analyst told me that it was within three points of salt water. He said he did not think it could be so salt.

536. Does not the fact of the saltbush disappearing to such an extent go to show that it has been a valuable fodder plant? I do not think so. I have been over the country a good deal during the last twenty-eight years, and I do not think I have ever seen stock eating it, although, of course, they do so. It is eaten, however, when all the other feed is gone. Moreover, it will not stand feeding; it is very soon eaten out.

537. It is a fodder plant which requires protection? It is of no use to do that if you cannot put stock on to it. The sow thistle grows very well at Lake Cowal. I have seen the sow thistle 3 or 4 feet in height. I find that the best way is to treat the grasses generally as one would treat the crops. If we do that I believe we can keep stock through the biggest drought Australia has ever seen.

538. As to the line from Grenfell to Wyalong, what is the probability of traffic between those two points? Wyalong, until gold was discovered there, was a very desolate country, given up to dingoes. There is now a population of from 4,000 to 5,000 people there. Mining has not gone ahead there very rapidly, but if there were a railway I think many capitalists would be induced to go there. The mines are nearly all held by small holders, and there is not the capital there should be. I am of opinion that gold is to be found, not only at Wyalong, but some 20 miles beyond it. Another point to be considered in connection with the extension of the railway to Hillston is that the people in that direction send their wool down to the river, and it goes into Victoria by water-carriage. I think we might easily catch a great deal of that traffic.

539. What is the present outlet for Wyalong? The principal traffic is by road to Temora. Large quantities of stone have been sent to Ballarat for treatment.

540. What would be the principal loading from Wyalong? It would be entirely stone for treatment elsewhere, and wool from the different stations out beyond.

541. They are not producing grain there? None to speak of at present.

542. What are the chief products of the farms there? From Temora outwards most of the selectors work sheep and agriculture; but it is only within the last few years that they have gone in for agriculture at all, and that has been done principally around Temora. The rainfall there, however, is only 21 inches, as against 28 inches round about Grenfell.

543. At what period do they generally get rain? It is very uncertain. If they do not get a rainfall in February or March they are unable to plough. Fifteen inches would be quite sufficient for the growth of wheat if it fell at the proper time. This year we have had up to the present time only 4½ inches. If the whole of that rain had come at once we should have had plenty of fodder and crop too. If wheat gets enough rain to start it, with genial showers throughout the winter months, it does not require much rain afterwards; therefore, a place with 28 inches of rain has a much better chance than has comparatively dry country with a rainfall of only 20 inches. The fact is that we are too far south for the monsoons from Queensland and too far west for the coastal rains. Excepting the Weddin Mountain, we are out of the influence of any hills or ranges.

544. Has there been any attempt to put down bores at Wyalong? I am afraid that for artesian water they will have to go to a great depth, possibly to 4,000 feet.

545. What is the nearest bore to Wyalong? I do not know of any within 100 miles of the place, and I never heard of a bore being put down there. In my own case I have used only the ordinary wood auger and the gas-piping. We go down to about 100 feet and then strike an underground drift.

546. What is the extent of the Bland Plain? It extends from Marsden right away through to the Lachlan.

547. Is not any of that plain country fit for agriculture? I think it is too clayey. No doubt it will grow a good crop; but it is very stiff soil, and there are a number of gilgai holes with little patches of water lying, perhaps, for a week or so 2 feet in depth.

548. *Mr. Leven.*] Regarding the proposal apart from all the local feeling, which line would you advocate? I think the best line is the one before the Committee.

549. How many miles are you from Wyalong? Twenty-four miles.

550. Upon which route do you consider there is the most population, between Grenfell and Wyalong or between Temora and Wyalong? There will be more population on the Temora route on account of the centres at Barmedman and Reefton.

551. Are there any towns between Grenfell and Wyalong? Only one—Marsden, and that is about 10 miles north of the proposed line.

552. I suppose there will be more small holdings between Temora and Wyalong than on the other line? I can hardly say. Out from Temora, to some distance towards Barmedman, there are some; but there is also a great number of small holdings 10 or 15 miles out from Grenfell.

553. On which line do you think there would be the greater number of small holdings? I think the greater number would be between Temora and Wyalong.

554. You think Wyalong would be a good centre? I do.

555. Do you not think it would be better served by a line from Temora? The Grenfell line is, of course, J. B. Donkin. the longer line; but, on the other hand, it would serve a greater area of country. Moreover, the people of Hillston and out west would be better served by a line from Grenfell than from Temora, the distance from Sydney being 6 or 7 miles shorter by that route. 22 June, 1899.

556. There is good wheat country, you say, from Wyalong, right out towards Hillston? The wheat country is in patches, and the rainfall diminishes tremendously. At Hillston it comes down to 12 or 14 inches.

557. Supposing a railway were constructed from Wyalong to Hillston, considering the great population between Wyalong and Temora, would there not be a good market there for the produce grown out west? If the railway goes out to Hillston, you will find the people producing in that direction, and they will make use of the local market.

558. Supposing that there are good seasons? Yes.

559. Have you any agricultural land? Only in small patches—the bulk of my land is pastoral land.

560. I suppose that in a very dry season the black-soil country would not be of much use for dairying? It would be of use if you saved sufficient grass—if you did not overstock.

561. But if you were some distance from the railway it would not be of much use to you for dairying? Not if it were too far away; when I spoke of dairying, I had in my mind small holdings, and mine is only a small holding.

562. How many landholders would the line from Grenfell benefit from the point of view of dairying? I do not suppose there would be more than from ten to fifteen, at present. But we can let dairying lands on the halves principle in just the same way that land can be let for the growth of wheat.

563. But it would be of no use letting out the black-soil country there upon the halves system? Yes; I myself would not hesitate to let that description of country on the halves system; it is what I propose to do.

564. Do you think many persons would take it up? I think that if a railway were constructed they would do so; because I think that in that case it would be found that dairying paid better than agriculture.

565. But there would be no wheat-growing in the black-soil country? No, it is entirely pastoral country.

566. Therefore, if a drought came like the present drought, it would be of little or no use? It would not be of as much use as in a good season, but in the present drought even the red-soil country is of no use. Mr. Greene, of Landra, told you, only yesterday, that in the past season he had no crop to speak of.

567. Did he not say that he turned his wheat into hay? I understood him to say that there was a large area into which he did not put the stripper at all; he simply allowed the crop to rot upon the ground. In a drought the pastoral country would only suffer in the same proportion as the wheat-growing country.

568. You say that out towards Hillston the rainfall diminishes very rapidly;—what would be the state of affairs there? That is not black-soil country; it is red country all the way through.

569. Looking at the question without prejudice, you are inclined to think that the railway, then, should go from Grenfell to Wyalong? I think so, for the reasons I have stated.

570. Is there a large area of Crown lands between Grenfell and Wyalong? The leasehold areas of some of the runs will be falling in, and there will then be a large area of Crown lands available for settlement, but I cannot say how many thousands of acres.

571. Do you think there would be any large proportion of good agricultural land in those areas? Of course, the best part of the country was taken up some years ago, but the whole of it is the same; there is not much difference between one acre and another.

572. You think, then, that upon some of the leasehold areas there would be found good agricultural land? Yes.

573. Is there much Crown land from Wyalong to Hillston? There it is practically all Crown land.

574. And you think it is absolutely good land? The land is good enough, but the rainfall is light.

575. *Dr. Garran.*] Will the Bland country, of which you have spoken, grow ordinary lucerne? We have never tried to grow it there, because the land is very difficult to cultivate. It is very stiff, and the lucerne seed is very small; the soil breaks up into great clods. No doubt the lucerne would do very well if you could get it in.

576. You would not derive much advantage, then, from growing lucerne, as compared with the natural trefoil? No; I have tried all these things. The lucerne, while I kept it going, and put water upon it, used to give me five or six crops a year.

577. You think that nature has given you the best dairying fodder? Yes; I have come to the conclusion that the best fodder is the natural grasses.

578. Will the cattle do equally well all the year round on that food, without any change of diet? Yes; I do not think the mutton and beef grown upon the natural grasses can be excelled by any beef or mutton grown in the whole country. The people of Sydney have no idea what our beef and mutton are like. I do not think a great deal of the meat eaten in Sydney is fit to be eaten. The graziers throughout the country spent £130,000 quite recently in forming depôts for country killing, but it was a new enterprise, and it went to the wall. When I was here last year I met a gentleman from London, representing a New Zealand firm, and he has made an offer for all the properties of which I have spoken. We hope to see them started again, and run by an English company. I hope shortly to be able to freeze from 8,000 to 9,000 lambs a year at Forbes.

579. Where the country is fit to carry sheep, is the natural trefoil as good feed for them as for cattle? Yes, and for horses too. I imported 150 Lincoln sheep from New Zealand; but they got too fat and would not breed.

580. I understood you to say, on a former occasion, that one of your irrigation experiments failed, because in taking the water to the land you were irrigating, 75 per cent. of it was lost through it being taken in an open cutting;—could you not have carried the water through iron pipes? Yes; but the cost would have been very great.

581. Do you think that if you had been nearer to the supply you would have had the same failure? If you are going to cover any considerable area of country you must convey the water some distance.

582. You also mentioned in a previous inquiry that you had grown oats successfully by irrigation;—what was the size of the patch of oats? About 40 acres.

- J. B. Donkin. 583. How much water did you put on? I suppose it would take about 24,000,000 gallons for the entire crop. There would be three days' pumping on 40 acres.
- 22 June, 1899. 584. Was the crop a paying one? I used it for fodder; it was grown at a time of drought.
585. Do you think that, as a general rule, it is profitable to irrigate paddocks? I think the expense of lifting the water is too great. When water can be conveyed by gravitation, as on the Murrumbidgee and other places, it will pay, but when you are put to the expense of raising it by machinery, it is different. I do not think that, unless there were a large population and a good market, it would pay.
586. The expense of lifting makes the difference between loss and gain? Yes.
587. Have you tried irrigation for orchards? Yes.
588. Was it a success? Yes; in my garden I could grow any kind of fruit, but this year the whole of my trees died. The water which I thought was never-failing has failed.
589. Have you tried to grow vegetables? Yes; they grow splendidly. If I had sufficient water I could supply Wyalong with vegetables.
590. You say that your irrigation has been a failure;—in what particular respect has it been a failure? In my case all the water has given out. Another reason is that I have had to raise the water, and the cost of machinery, firewood, and labour has been very great. For the purposes for which I have used the water—that is, for pastoral purposes—I found it would not pay.
591. Your experience seems to show that, even where you are favourably circumstanced, it will not pay the squatter to grow fodder for his own stock? I do not think so. The best thing the squatter can do, I think, is to keep his own fodder in the shape of grass. I have 15,000 ewes lambing now, and it will be impossible to feed them with artificial fodder.
592. Practically, you only half stock your land? Yes; I make the sheep feed themselves.
593. You do not grow any artificial food? No.
594. You think that the proper course is to under-stock? Yes.
595. Supposing some fodder to be required upon a station, would it pay the squatter better to get it from a farming district than to grow it himself? That is the farmer's own business. We have been buying some hundreds of thousands of tons from the farmers in the good agricultural districts. Our business in the pastoral country is to grow grass.
596. It sometimes greatly affects a proposal to make a railway—whether the better method is for the squatter to supply himself with fodder, and be independent of the farmer, or to depend upon the farmer in the agricultural districts? I have been trying all sorts of things for the past twenty years, and I am only just beginning to find out now what succeeds best. I do not think it will pay the squatter, as a rule, to grow fodder for his stock.
597. If the squatter depends for his artificial food upon the farmer, there will be a traffic for the railway in hay? A number of them are trying to grow artificial food, but I do not think it pays them to do it. For my own part, the money which I have spent upon irrigation would have been very much better spent in other directions. I think that, as a rule, the squatter will do better to buy artificial food from those who can grow it better than we can.
598. In regard to fat stock going to market, do you find that it deteriorates more between your land and the railway station, or on the railway itself? There is no doubt that the stock are considerably knocked about upon the railway. I have seen ten or twelve cattle in a truck, and I have seen nine out of the number knocked down. Sheep also are sometimes very much knocked about. The cattle are, after a rough journey of that sort, put for a fortnight into starvation paddocks at Homebush. They are then driven to the Abattoirs, killed immediately, and brought into Sydney for food. Owing to the climate, it is hard to keep meat in Sydney; but in our district at this time of the year we can keep portion of a beast for two or three weeks.
599. How much do you suppose your stock would fall off in weight from the railway station to Sydney? My lambs would average from 35 to 40 lb., and I have no doubt they would deteriorate to the extent of 5 lb.; but it is not so much the loss by weight as the loss in quality of which I complain. I went over a butcher's shop in Dublin some time ago, and I asked the manager if he had obtained any mutton from Sydney. He said he got 200 or 300 carcasses from Sydney, but that he would never get any more of those scrubs.
600. You are looking forward to chilling your meat at Forbes? Yes; that is what I have been working for for some years.
601. You think the difficulties which have hitherto stood in the way of country-killing will be overcome? Yes; I see that a new company is to be started at Blacktown.
602. *Mr. Levien.*] Do you think that frozen meat is as good as other meat? Undoubtedly. There is no reason why the meat eaten in Sydney should not be equal in quality to the meat eaten in many of the country districts.
603. Do you know whether the chilling-works at Young have been suspended lately? They have been shut up.
604. Why? It is not the general custom of the country to use chilled meat. We have a great monopoly to break down, and we have been fighting it for the past twenty years. The Sydney Corporation have their yards, and they get good interest on their money. The butchers also have an interest in the yards and the abattoirs, and are not inclined to give them up. If the people insisted on getting country-killed meat a change would very soon take place. I cannot say what the practice is now; but I was at the Abattoirs once in the summer. They were killing sheep in the heat of the day, and throwing them on to the carts almost before they were dead. I believe that that practice has since been amended; but it is monstrous to think that the people of Sydney should have to eat such meat. Decomposition sets in very rapidly, and in such a climate as ours it is impossible for the butchers to keep their meat. No doubt they lose a great deal in that way. In America and in London they have freezing-rooms alongside the shop, which are kept at a temperature of 40 degrees. A sheep might be in one of these rooms for three weeks, and still be perfectly sweet. Moreover, the meat in such circumstances is not exposed to the dust and dirt of the street as it is here.
605. *Dr. Garran.*] You said, I think, that you thought the whole of the country between Yalgogrin and Wyalong was mineralised;—have you noticed any surface indications? I think that in the whole of that country claims are now being worked.
606. There were no surface indications at Wyalong, were there? Yes. Mr. Neeld, a Victorian selector, discovered gold at Wyalong.

607. You have been in the country between the Lachlan and Menindie;—is there any elevated land J. B. Donkin between those places? There are a few hills.
608. I mean between the head of the Willandra Billabong and the nearest point of the Terrawinnia Lake? <sup>22 June, 1899.</sup> There is no elevated land that I know of.
609. Could you construct a canal which would give a continuous waterway from the Lachlan to the Darling? I should think so.
610. What is the distance between the waters of the Willandra and the waters of the Terrawinnia Lake? I could not say; but I should think about 100 miles.

FRIDAY, 23 JUNE, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

John Boyd Donkin, civil engineer and grazier, sworn, and further examined:—

611. *Mr. Watson.*] I think you said that you looked upon the construction of a railway from Grenfell to J. B. Donkin. Wyalong and thence to Hillston as a national project? Yes.
612. Is there any national reason for following the Western line from Sydney and on to Grenfell as against <sup>23 June, 1899.</sup> following the Southern line from Temora to Wyalong, reaching Hillston in that way? I do not think there is any very great difference between the two routes, except that the line from Temora to Wyalong would make an awkward angle. A line taken through Grenfell to the west would be almost a direct line from Sydney.
613. But looking at the matter from a national point of view, we have already laden the Western line pretty heavily with cockspurs and branches in different directions, actual or projected? I do not think the Western line is already more heavily laden than is the Southern line with its branches to Hay and Gundagai.
614. Are the grades not better on the Southern line than on the Western line? I think that as a rule the grades are better on the Southern line, although from Picton to Hilltop, in about 20 miles, there is an ascent of 1,500 feet, and there is no grade so severe as that on the Western line. After you pass that one point on the Southern line there are easy grades all through.
615. Koorawatha is nearer to Sydney *via* the west than *via* the south? Yes.
616. Do you know that a large proportion of the sheep and cattle shipped at Cowra and Koorawatha goes *via* the south to Sydney, although the Western line would be nearer? I am not aware of that, nor can I see the object of it.
617. Do you think that the saving of 6 miles in reaching Wyalong *via* the western, as compared with the southern connection, is of any great moment from a national point of view? I do not think that difference in distance is of much importance from a national point of view; but there is the advantage of coal on the Western line. In case Wyalong develops into a large place—and there seems every probability of its doing so—it will be an advantage to have the coal nearer.
618. I should imagine that there was timber enough about Wyalong to keep them going a long while? There is plenty to keep them going for one hundred years.
619. And it would suffice, unless there is some development which requires the use of coal? Yes.
620. I understood you to say that the projected line from Grenfell to Wyalong, as shown on the map in a deep red line, follows dry ground right down the Bland? Yes.
621. When you speak of dry ground do you mean all red soil? Yes, I am speaking now from my general knowledge of the country. I have not followed the surveyed routes right through; but from my general knowledge of the country, and from what my neighbours have told me, I believe that the red soil goes right down to the creek on the eastern side; on the western side I know there is splendid land.
622. You see the lighter red line marked "*via* Bimbi,"—do you know whether as you approach the Bland Creek by that route there is much difference in the country, comparing it with the country on the northern route? Not very much; but I think it is thickly timbered, and inclined to be scrubby. It is not so good, I think, for 10 miles back; otherwise the whole country is much the same.
623. I imagine that the northern route must follow something in the nature of a spur for some distance? Yes; otherwise the country about there is all very level.
624. Have you any of what is known locally as the "pug country," down your way? No.
625. It does not extend so far down? No; you find that about Morangarell.
626. I understood you to say that the last time that part of the country was flooded was in 1891? Yes.
627. Was it not flooded again in 1894? That was a small flood; it was hardly perceptible. It would not affect the country much excepting on the western side of the creek.
628. Since then it has been extremely dry? Yes. I would point out with regard to the Bland Creek that it is a very fine stream, almost like a canal, and with a 5-foot overshot dam water could be thrown back for 5 or 6 miles. The whole of the way down the creek you could make a splendid supply of water in that way.
629. Have you been at Carumbi, on the Bland? Yes.
630. They have an overshot dam there? Yes; I have not seen theirs, but I have seen many of them.
631. There are many across the creek? Yes.
632. And they have been successful in the storing of water? Yes.
633. Do you think, leaving out of account your own place right on Lake Cowal, that further up the creek they would be able to go in for dairying with any chance of success? At Curraburrima they had a large number of cows and were dairying in 1872, but since then practically nothing has been done. It was a question then of supplying the diggings.

- J. B. Donkin. 634. But if anyone went into dairying now in that district they would have to compete with the coastal districts, where the climatic conditions are so much more favourable to the industry? No doubt; but they would have more land and they could go in for dairying on a larger scale. The Camden Co-operative Company have 2,000 odd cows, and they let the land out on the halves system. As far as I can see, although they have had to contend with the drought, they have been doing very well indeed. I am referring now to the land at Camden Park.
- 23 June, 1899. 635. Is that better land than yours? Their country is not so good as ours, but they have a greater rainfall and a better market. Notwithstanding that, I think that land out in our direction might be let upon the halves system for dairying purposes just in the same way that Mr. Greene, of Iandra, lets his land for agricultural purposes. I think it could be made to pay just as well under dairying; that is supposing there were a railway.
636. Is it not harder in dry seasons to keep big stock than sheep alive? Yes.
637. During the last four years you have, unfortunately, lost a large number of sheep on the Bland? Yes.
638. Do you think that during the last four or five years it would have been possible to keep big stock alive there? I must point out that all through the country lately, men have been keeping sheep for wool, and not for fattening. Under other conditions, of course, it is necessary to keep grass. It is a question of whether you overstock or not.
639. You know the Jeraldera run;—would you consider that they overstock; the lessee is usually looked upon as one of the most provident pastoralists we have? I think he has been carrying about one sheep to the acre, and no country that I have seen in New South Wales will do that.
640. He has lost an enormous number of sheep lately? It was from overstocking; but the land there will not do for dairying.
641. Still you think that it will be possible, higher up the creek than Marsden, to carry on dairying? There is the same country from Marsden to Morangarell, and in that country certainly dairying could be carried on.
642. But not as well as where you are? No; an enormous amount of silt has been brought down to Lake Cowal from Lambing Flat and Temora; every flood puts an inch on to it. The whole country there is covered in time of flood.
643. As to the country to the west of Barmedman, how far west should you have to go before you reached the bad country you were speaking of yesterday? A couple of miles.
644. Do you think it is as close as that? Yes. Mr. Amos, the large railway contractor, has had a large run there for twenty years, that is within 3 miles of Barmedman, and it is a terrible place. The country to the east of the line from Barmedman is not so bad.
645. On the eastern side there is some good country? Yes; but even there there are some patches of bad country.
646. Is there much difference in the country round about Wyalong, whether you approach it from the east or the south? I do not think there is much difference; but if anything, the approach is better from the east, because joining on to the plain country, the land is better.
647. I think you said that there was more mallee on the Temora route than on the other route? Yes.
648. Is it not a fact that mallee does not commence on the Temora route until you get close to Wyalong? I suppose that would be about 10 miles out of Barmedman. It may not be the case exactly on the line of the road, but it is so not far off from it.
649. Do you think the mallee there can be treated as it is treated in Victoria, where they roll it in preparing the ground for wheat? I fancy, although I have never actually seen the mallee there except in coming across from South Australia, that it is a lighter mallee than ours. I think ours is what they call "bull mallee." It has a very much larger stem than the other mallee, and I am afraid it would be a very difficult job to cut it down.
650. It would be more difficult to roll than the Victorian mallee? Yes; but I may mention that wherever the gum grows—and the mallee is a gum—there is a certain amount of water under the ground.
651. You spoke yesterday of the possibility of creating a large traffic in fat stock from along the Bland to the nearest railway; do you know that the chilling works at Young have been closed down for some time? Yes.
652. Yet Young, under present circumstances, would be fairly accessible for fat stock from as far out as Marsden? I do not think so.
653. In good seasons how far do you think the influence of Young would extend as far as the reception of stock for chilling is concerned? I do not think it would be above 40 miles.
654. That would be about half-way between Bimbi and Marsden? Yes; but it is a bad route for grass and water. I know that stock following the Bland Creek went up there last summer, and had to go the whole way to Young without a drink.
655. The presumption is that the works having been closed down at Young, there has not been sufficient stock within a 40-mile radius latterly to keep them going owing to the dry seasons? I think the works at Young have been used principally for boiling down stock which would have perished. They have been used for that, I think, more than for the chilling of fat stock. I am not aware of many fat stock being treated there. There has been no certain market for chilling and freezing, and people all through the country are growing now for wool, and not for fat stock. That was one reason why the different places have not been supplied with fat stock as they otherwise would have been.
656. During the last four or five years, owing to the development in the methods of shipping frozen meat for the Home market, the works would have been successful if we had had good seasons to afford a fair supply? I do not think the works at Young have the means of freezing meat. The works at Forbes cost £15,000, and they did only chilling. Weddell & Co. are taking the matter up, and they will have to convert the whole of the works into freezing-works so that the meat may be sent down without deterioration. If the meat is only chilled, there is the possibility of deterioration, and it does not answer to chill and to afterwards freeze.
657. You think, then, that the works at Young were not complete? That is my opinion. One great drawback to the trade has been that there has been no convenience of late years for connecting with the large ocean-going steamers. The meat has to be lightered alongside, and that involves too much handling. In New Zealand the meat goes direct to the ship's side. I was informed some time ago that while the men are having their smoke-time the meat is often left sweltering in the sun.

658. You think that one cause of the comparative failure of the works at Young was that they were not provided with freezing apparatus? Not only that, but the growers have not gone into the business as they might have done. They have not laid themselves out for fattening. We buy store stock at 3s., and send them down and sell for 5s. The 2s. of profit which we ought to have goes to the Railway Commissioners. We, therefore, find it pays better all over the country to sell stores. Hitherto we have been really working for the Railway Commissioners. J. B. Donkin.  
23 June, 1899.
659. Where do you sell your stores;—where are they fattened? They are taken over to Liverpool Plains, and, as you know, an English Company have works at Aberdeen. They buy all that can be obtained there.
660. When Mr. Bruce, the Chief Inspector of Stock, was giving evidence in reference to another proposal, he said it would be advisable, in his opinion, for the Railway Commissioners to have some better method of transmitting stock long distances—that is, from one district to another where they could be fattened. What do you think of a proposition of that sort;—is it worth considering? No one sends stock by railway now in that way. The rates are prohibitive except in a time of drought when there is a rebate. For store stock the rates are absolutely prohibitive.
661. What would it pay you to give to have sheep transported quickly from (say) Grenfell to the Liverpool Plains, as against the present method of taking them over the stock routes? You could take them over the stock routes at 4d. per head if there were any number—say from 5,000 to 10,000.
662. Does not that involve loss of condition? That is not material. No store stock could afford to pay double that price for railing.
663. What would be the approximate cost per head for that distance? I cannot say exactly, but it costs me now 1s. 6d. from Forbes to Sydney, and other expenses bring the cost up to 2s.
664. You see upon the plan three circles drawn round the different termini of Grenfell, Temora, and Wyalong,—do you think they would fairly represent the influence of each terminus on the surrounding country? Yes.
665. The area of country which would remain unserved if the two lines terminated, one at Grenfell, and the other at Wyalong, would be comparatively small—I mean the area between those two centres? There would be a large area to the north unserved.
666. But that would be largely a pastoral area? Yes.
667. It would be hardly fair to fix the limit of railway influence at 20 miles for pastoral purposes? Of course 20 miles is better than nothing, but it is a great advantage to have the line nearer. If you are 20 miles away, allowing for the time it takes to get the stock trucked, they would be nearly a week getting down. If the line were nearer they could be sent off in twenty-four hours.
668. But it has never been assumed that in pastoral country it is necessary to have a railway at a closer distance than 20 miles? With pastoral products it is a question whether they will pay or not, and during the past five years I do not suppose that more than 5 per cent. of the properties in New South Wales have been paying. With regard to this particular line, several of the pastoralists, although the line will go through their runs, are not in favour of it. When the leasehold land is thrown open within a certain distance of a railway, the lessee is not so likely to obtain the land, and many of them are not aware of the advantage of sending fat stock away. I suppose I am the only pastoralist in the district who will give evidence in favour of this line.
669. Taking Federation as being practically secured now, would it not be possible that the pastoralists of your district might sometimes find a better market in Melbourne for fat stock than in Sydney? The markets all over Australia will be pretty well assimilated. We have been shut off from Victoria by the stock-tax to some extent; now that market will be open. If Wyalong goes ahead we shall find a market there for our stock.
670. But if you were making towards Wyalong you would go straight through; you would not use the railway? On the Bland it is all good travelling country, and you could get your stock to the railway in good condition, whereas going to Wyalong there is a good deal of scrub and no grass. I would rather have 25 per cent. less area and a railway through it than have the larger area with no railway.
671. With the possibility of another market opening in Melbourne, in consequence of the abolition of the border tariff, would it not be an advantage to have a connection which would give you from Wyalong an advantage of 83 miles in reaching Melbourne with no greater loss than 6 miles in reaching Sydney? I do not think that would be a very great advantage; we are too far away from Melbourne for stock. The large area of country in Riverina would come in before we did. Years ago, when there were all cattle in that country, I used to send my cattle to Melbourne overland. There was a better market for cattle then.
672. Before the stock-tax was imposed, the greater part of the cattle going into the Melbourne market went through from Queensland? Yes. In good seasons the stock passing my place to Victoria average 30,000 cattle and 3,000 sheep; that would be the number passing south, and a great proportion would go to Victoria.
673. Those figures apply to a period since the imposition of the stock tax? Yes.
674. The stock tax did not have the effect of barring them completely? No; Victoria depends to a great extent on Queensland cattle for fattening; the only effect of the tax is that people in Victoria have to pay more for the stock.
675. Looking at the matter again from a national aspect, do you think that for the serving of a small area of pastoral land which is outside of the circle which you see drawn upon the map, the country would be justified in expending an additional £50,000 of State money—that being the difference between the cost of a line from Grenfell to Wyalong, and a line from Temora to Wyalong? It is very difficult to say.
676. If you were looking at the matter from the point of view of a private speculator, would you say it was worth while? If I owned the land from Grenfell to Wyalong I would run the railway through it.
677. But the State does not own it? It owns a great part of it. On the Temora route, when you get past Barmedman, the country is very inferior. Taking the whole of the route through from Temora to Wyalong, the country will not produce what the country from Grenfell to Wyalong will produce. I was referring yesterday to the cost of fodder. A gentleman from Riverina told me this morning that he sent over 3,000 tons of hay down the Murrumbidgee. This tremendous demand in the western country, in time of drought, must be of great advantage to the agriculturists in those parts of the Colony where crops can be grown. If we grew the crops ourselves they would be shut out of the supply. I have here a short extract from the *Forbes Times*; it says: "It is said to cost £40 a day in providing artificial food for 40,000 sheep that are hand-fed at Burrawang, owing to the protracted drought." This supply is available largely on account of the railway; they bring the sheep alongside the line and throw the feed off—there is no cartage at all.

- J. B. Donkin. 678. You would not look upon that as a factor in making a railway pay, but merely as a matter of necessary convenience to persons engaged in pastoral pursuits? I look at it in two ways; first of all the supply is necessary to keep the stock alive; and then, in the second place, it provides an outlet for persons in that part of New South Wales who are able to grow crops; it provides a market for them.
- 23 June, 1869. 679. But it is only once in a number of seasons that there is any necessity for it? Unfortunately it has been the case for the past four or five years. With regard to our droughts, I am inclined to think that Mr. Russell cannot be far out in his nineteen-years period. Before 1852, when we had the biggest flood recorded in New South Wales, there was a protracted drought; the same thing occurred in 1839; after the flood of 1852, there was a great drought. We then come on to 1865, and 1868, and in 1870 there was a large flood all over Australia, very nearly up to the 1852 level. We then went on to the 1885, 1886, and 1888 droughts; there was then another big flood in 1891. Whether we have come to the bottom of the present drought or not it is hard to say. I may mention that in the lake I have found the butts of gum trees which must be 200 years old, and after boring 15 feet we have often got the bark of almost fresh gum trees.
680. From that you assume that the lake has been at a lower level than you have ever known it to be? Also that there must have been a much more protracted drought. The country is now absolutely bare, and the water runs off much more quickly than it used to do thirty years ago, when the kangaroo grass was 4 or 5 feet high. In the Cootamundra flood, fourteen or fifteen years ago, 10 inches of rain fell in a few hours; it came down and swamped the whole country, destroying a number of sheep. I should not be at all surprised if we had a long series of droughts before we got to the bottom of the present one.
681. *Dr. Garran.*] Is the Bland Creek a waterway which will lend itself to damming along the whole of its course? Yes.
682. If it were dammed would it hold back water enough to stand a two or three years' drought? Yes.
683. If it would do that, would it not better serve the purposes of irrigation than has been the case? It would be pumped out in a few weeks.
684. Sufficient water would not be preserved? No.
685. It would only be of use for the watering of stock? That is all.
686. You said yesterday that the line from Wyalong to Hillston would go through some rough country—is that ironbark ridges or rock, or what is it? There are very few ironbark ridges, but there is a good deal of scrub—hop bush and sifting bush.
687. You did not refer to any engineering difficulties? No; there are none whatever.
688. Would the line if it were taken up towards Cudgellico clear that rough country? To a great extent.
689. If it were taken to the Willandra junction would it do so? It would clear it to a great extent then. The country to the north of the projected line is better than to the south. The nearer you come to Cudgellico the better the country.
690. Although Hillston would be a good objective for some reasons, so far as the intervening country is concerned it is not? No.
691. *Mr. Trickett.*] When you gave evidence before the Committee in September, 1897, as to wheat-growing round Grenfell, you then stated that you did not think that more than one in twenty crops would fail as regards rainfall;—I suppose the recent drought has rather upset that calculation, has it not? I do not think that round about Grenfell they have lost more than two crops. There has been an unprecedented drought for five years on end, and they have lost only two crops.
692. Even in such a severe drought? Yes; and they have generally a rainfall of 28 inches.
693. You also stated at that time that the railway from Koorawatha to Grenfell would pay expenses at once? Yes.
694. Do you still think so? Yes.
695. Do you think that would apply to the extension from Grenfell to Wyalong? I would hardly go as far as that, but I believe that as mining and other industries are developed in that direction it will pay. If any line in New South Wales will pay that is the line.
696. You based your calculation in regard to the line from Koorawatha to Grenfell chiefly on wheat-growing? Yes.
697. In going from Grenfell to Wyalong you have two strings to your bow; you have the agricultural and mining industry? Yes; and also the pastoral industry.
698. You admit that as you go westward the possibility of heavy crops and consequently good returns to the railway diminishes? Yes.
699. A good deal has been said from time to time about the removal of starving stock by means of railways; that would be a source of traffic which you would have upon nearly all these railways out in the west; we had a gentleman here the other day, a large stock and station agent, who expressed the opinion that that is rather an over-rated idea, because in droughty seasons there are not the green pastures available to which large quantities of stock could be taken; is that the case? Until this year there has always been some part of the country which has had a fair season. Of course the country at Kiandra and on the Snowy Mountains is always available. Every inch of it has been stocked within the past six months; stock can always be removed to the Snowy Mountains.
700. In a general drought out west then, as a rule, there would be green pasture available to the eastward? Yes; my experience in twenty-five years is that there is generally some part of the Colony to which stock can be sent for feed.
701. Available for large quantities of stock? Yes. The present drought, of course, is quite exceptional. I do not think people in the future will suffer to the extent they have done in the past, because they are making better provision for water and they will not stock up their runs so heavily. The country will not produce what they have been trying to make it produce.
702. Personally you have no preference in the matter of a railway as between Grenfell and Wyalong and Temora and Wyalong? No.
703. You regard the line from Koorawatha to Grenfell, Wyalong, and Hillston, as a dividing line between the Condobolin line on the north and the Hay line on the south? Yes. I regard it as a trunk line which ought to go down from the Willandra to Menindie.
704. *Chairman.*] You are decidedly of opinion that the line proposed will open up more country than will the line from Temora to Wyalong? Yes.
705. You think it would divide up the country much better? I regard it as part of a main line, running through good country to the west.

706. I think you stated also that there was a probability if the line were constructed into pastoral country that it would open up a trade which would make business for agriculturists in the Eastern Division? Yes. J. B. Donkin.  
23 June, 1899.

707. In a season of plenty I suppose they would not want any produce out there? No; the main traffic then would be wheat, pastoral produce, and mineral traffic.

708. Would there not be a traffic in fodder for working cattle and horses? At Wyalong.

709. But not further out? No.

710. *Mr. Watson.*] I think you said the rainfall at Grenfell was 28 inches? Yes.

711. What is it at Caragabal? Twenty-two inches; at Bogolong it is 25 inches: it gradually falls off.

712. The greater part of the trade to Wyalong at present goes *via* Temora? Yes.

713. Therefore, if a line were taken from any other point to Wyalong, you would be taking so much trade away from a line which is already in existence? Yes.

714. To that extent you would diminish the possibility of that line paying? Yes. I stated yesterday that up to the present we had had  $4\frac{1}{2}$  inches only during the last six months. Going southwards from the Lachlan, on the Bland towards Morangarell, there is nothing but open plain country, and in the absence of timber presumably the rainfall would be less; but this morning I received information that at Marsden the rainfall had topped the record for the whole district, within the past twenty-four hours there having been 2 inches 10 points of rain.

Alexander Wilson, stock and station agent, sworn, and examined:—

715. *Mr. Watson.*] Do you know the country between Koorawatha and Wyalong? Yes; I have travelled over nearly the whole of the roads in that district.

716. Do you know the country between Koorawatha and Grenfell? Yes.

717. You know that a railway will shortly be under construction to Grenfell? Yes.

718. Will you describe the country as far as you can between Grenfell and Wyalong, along the deep red line marked on the plan? For the first few miles you have to crawl round the hills, so to speak—that is, the broken end of the Weddin Mountains. I do not know the little details of the turn; but when you get clear of the mountain there is fairly good wheat land—some of it is very good—for 12 or 15 miles, or perhaps a little more, pretty well half-way to the Bland Creek. Then you get on to lower country with more black soil, and inclined to be wet.

719. Do you say that the good wheat land will extend 15 miles from Grenfell? There would be 5 or 6 miles working through the hills, and there would then be another 15 miles of first-class wheat country.

720. From that on to the Bland it is grazing country? There is more heavy, wet land; there are patches of red box forest in between patches of heavy, black soil.

721. How far would that plain land extend;—how soon would you reach it in going to the Bland westward? At Caragabal, you first get on to the plains; but there are patches of hard, dry, red forest after that. The country, 6 or 8 miles, I think, from the Bland I should describe as heavy grazing country.

722. On the other side of the Bland again, until you reach Barmedman or Back Creek, what is the character of the country? It is first-class grazing land, and at places there are what I should consider very middling wheat land. I should not call any of it first-class wheat land.

723. From the Back Creek to Wyalong, what is the nature of the country? There is a good deal of heavy, belar forest, very crab-hole; it is rough, and is not suitable for cultivation, although you get a heavy crop of grass when the country is ringbarked. On towards Wyalong you get into a mixture of light mallee with box forest, with an undergrowth of scrub; that description would apply to the approach to Wyalong on either route.

724. Taking a circle round Wyalong, the country on all sides is much the same? There are patches of mallee and box forest.

725. The general characteristics are the same all round? Yes; in some places there is pine.

726. How would you describe the country between Temora and Wyalong? From Temora to Barmedman, except the hard ridges, the greater part of the land is very fair wheat land; that applies to the whole distance on both sides. Occasionally, on the western side, there are indications of poor land pretty near the surveyed line.

727. From Barmedman on to Wyalong, what is the country like? It is distinctly poorer, although there is fair wheat land in places. Speaking generally, from Barmedman to Wyalong the country is much the same as that which I described a few moments ago on the other route. There are occasional patches of mallee, and there is what you would call middling wheat land.

728. Some distance out from Barmedman towards Wyalong there is a patch of gilgai country;—do you think it could be avoided by going to the right? I should not think it would be worth while to go to any expense to make a detour. The amount of filling required would not be a serious item.

729. Have you been off the surveyed route between Temora and Wyalong east or west? Yes, a little on both sides.

730. Do you know the country for some distance to the westward? I think 7 miles would be the furthest point to which I have been on that side.

731. As far as you have been, what is the character of the country? It is just what I have described. I came on to one of the hard ridges, but there is no really poor country in the distance I travelled.

732. Have you been out any distance on the eastern side? I have been from Cootamundra and various other points up to Morangarell. I have also been through from Reefton to Marsden.

733. Then you have a pretty fair idea of that country? Yes.

734. Could you describe it? There is a great variety of country there.

735. Take the country from Reefton to Marsden? There are some patches of wheat country with occasional hard hills in between round about Trungley. There is altogether a considerable area of good wheat land. When you get close to the Bland near Morangarell you get into the beginning of the heavy grazing country—low black-soil country with a little red mixed in between.

736. The plain country begins round about Morangarell? Yes.

737. On the other side of the projected line towards Marsden there is similar plain country? You might draw a line direct north from Caragabal, and you would find that all the land lying to the west of that is heavy grazing country liable to slight flooding—that is, from 6 to 18 inches.

A. Wilson.

23 June, 1899.

- A. Wilson. 738. It is not suitable for agriculture? I should not say so.
- 23 June, 1899. 739. The plain as it goes north widens, does it not, with the fall of the water? Yes; if you take a line from Caragabal to the Lachlan you may say that all the land to the east of that is good wheat land. To the west there are a few patches of what I may call downs country. It is open country but is undulating, and is different from the low plains.
740. Taking the line you have mentioned due north from Caragabal to the Lachlan, how far west of that line would the plain country extend at Lake Cowal? Not very far. The plain country makes round to the western side of the lake, but it does not go very far in that direction. You then get into the Humbug country, which is forest and scrub. That comes down to the lower end of the lake.
741. You see the blue circles marked upon the plan round Grenfell, Temora, and Wyalong;—assuming that a railway were to terminate at either of those points, do you think the blue circle shown on the map would fairly represent their spheres of influence for agricultural purposes? Not so far as Wyalong is concerned.
742. How would the circle represent the sphere of influence from the terminus at Grenfell? It has to compete with Young on the one hand, and with Forbes on the other; you could not describe the sphere of influence as going further than half-way to Forbes, or half-way to Young; business connections are already established with those places.
743. Take the area to the westward? You might extend it a little further to the westward. If you came 3 or 4 miles further to the westward you would cover the whole agricultural patch in that direction.
744. If a railway were at Grenfell the sphere of influence of that terminus would include nearly all the good wheat land immediately to the west? Yes.
745. At Temora the terminus, for agricultural purposes, would take in Barmedman and Mandamah? Yes, for wheat alone. It would practically have an influence even to Wyalong, and perhaps further. I fancy that wheat from beyond Barmedman comes into Temora now. Very little, I believe, is grown beyond Barmedman. There is cultivation towards Ungarie; but the whole of that has been absorbed by Wyalong; the local supply is inadequate for Wyalong.
746. What would you consider the sphere of influence from the terminus at Wyalong? It would command all the country to Rankin Springs and the Dundoo Hills. I do not think it will extend beyond that, because the country going towards Condobolin is better country for teams and stock to work through. There is a large area of inferior, scrubby country going right through from the Dundoo Hills to Mount Elliott.
747. Are you referring to the sphere of influence at Wyalong, for agricultural purposes? I do not assume that a terminus at Wyalong would include agriculture out as far as the points I have named; but it would assist to develop the country. I do not think it would bring about immediate development as far as the points I have named.
748. What are the prospects of settlement beyond Wyalong in any direction? The land all round Wyalong has been rapidly taken up; land which has been thrown up as pastoral land has been readily taken up in small holdings. One thing which has caused the country to the west and south of Wyalong to go seriously back has been the rabbits. It has been largely depreciated by the rabbits. It has been one of the worst patches of country in New South Wales so far as rabbits are concerned.
749. The district is in the Central Division? Yes.
750. Then within the next year or two there ought to be land for settlement through the running out of the leases? Yes, there will be a considerable area.
751. So that assuming the land to be good enough, the probability is that it would be taken up? No doubt a good deal of it will. There is already a good deal of settlement on the resumed areas which were thrown open years ago in the back country away from Mirrool Creek. Although it is dry country it is not difficult country in which to conserve water, because it is undulating with occasional hard hills.
752. Do you think the land out towards Ungarie from Wyalong is fit for agriculture? A considerable proportion of it is. About 10 or 12 miles from Ungarie there are considerable areas under cultivation. I was there recently, and I was surprised to find the large area under crop notwithstanding the bad season.
753. And notwithstanding the distance from market? They reckon they have a good market close at home; that is their only hope at present.
754. Without a railway they could not supply any other market but Wyalong? It would not pay except in an extreme drought, perhaps.
755. As to the general prospects attending the tapping of Wyalong with a railway, do you think that is an advisable course on the part of the State? I think so.
756. From the standpoint of the development of the country, and also with the object of assisting the residents of Wyalong? Yes; I was recently at Wyalong for about ten days. I had been there several times before. I was there when the rush first broke out. I went up with the Sectional Committee which travelled from Temora to Wyalong in 1894. I then thought that the construction of a railway was decidedly premature, but I have been to Wyalong several times since then, and when I was there recently I was struck, considering the extreme drought and the serious condition in which the place was through the want of water, at the enormous confidence which everyone seemed to have in the stability and permanence of the place. There is a great deal more money being spent now in the development of the mines. In some cases they have gone down to 450 feet, and they are very pleased with the prospects of the reefs. Notwithstanding the difficulties under which they are now living, and they have to bring beef and mutton from Gundagai to Temora, and then take it out to Wyalong—and notwithstanding that there is no water in either of the towns, except a little in the house tanks—notwithstanding that the teams have to go 2 or 3 miles out after delivering their loads before they can get a drink of water, no one seems to think of leaving the place as being a bad place in which to live.
757. The main portion of the meat consumed at Wyalong comes at present from Gundagai and other places in that direction? So I was told. Even some of the stations are getting meat out from the butchers at Wyalong.
758. A gentleman who gave evidence here yesterday said that he thought that the Bland country might be utilised for dairying if there were a railway;—do you think there is much prospect of a general development in that direction? It seems to me a little enthusiastic; but I see no reason why it should not be the case, because in some of the northern districts of Victoria, in the Goulburn Valley, and at Echuca, where there is drier country, dairying is carried on at considerable profit. The rainfall at Lake Cowal would be similar to the rainfall in the northern parts of Victoria. 759.

759. But their rainfall is a little more reliable, as to falling at a good period? Yes; they have better winter rain than we have. They have summer droughts more frequently; but they do not often have a drought right through the winter. A. Wilson.  
28 June, 1899.
760. Is their country as dead level as ours? For 60 or 70 miles along the Murray, opposite Corowa, the country is just as flat as it is on the New South Wales side.
761. How much nearer, if anything, are they to a market? They are only about one-third of the distance which our settlers would be.
762. That would be a considerable factor? Not for dairying produce. That is one advantage attaching to it. You get 1 lb. of produce worth 9d., whereas wheat would be worth about  $\frac{1}{2}$ d. a lb. Dairy produce would, therefore, stand a good deal of transit which the other produce could not endure.
763. But you require quicker and better methods of handling? No doubt that adds to the cost; but 2d. per lb. on the transit of a pound of butter is less than 25 per cent., whereas 2d. per lb. in the case of wheat would be an impossible rate.
764. Assuming that it would be possible to carry on dairying in the neighbourhood of Lake Cowal, where there is probably a larger quantity of grass, do you think the prospects of success hold good further along the Bland? I would not say that for the next ten years it would be a source of income to be calculated upon for a railway.
765. It has been extremely difficult to keep any sheep alive there during the last two or three years? Yes; the loss has been enormous.
766. Would it not have been even more difficult to keep big stock alive? It would be absurd to start dairying there unless you were within 12 or 15 miles of a railway, because you would stand to lose the whole of your herd in a time of pinch. All the big stock in that country have been removed.
767. Do you know the flat country near the Koorawatha Mountains? Yes.
768. Do you know whether the rainfall there is better than it is on the Bland? Yes; the rainfall there to the east of Koorawatha is getting on towards 30 inches, if it is not quite 30 inches.
769. There would be considerably more rainfall than out on the Bland? Once you get west of the Dividing Range you may calculate that the rainfall diminishes at the rate of an inch per annum for every 50 miles you go west; sometimes more.
770. If you were informed that people had tried dairying within 1 mile of the railway at Koorawatha, and that, although they were used to it and had followed it up in other places, they had there made a failure of it, would you think that dairying was likely to succeed on the Bland? I would not encourage the idea of its being an immediate source of profit for a railway. We have seen districts which have been given up, so to speak, as failures for wheat-growing and dairying, but a later tide of settlement has made a good thing out of the same lines of produce. Sometimes the want of capital is responsible for the first failure; there is a bad season to begin with, and the man is ruined at the start.
771. With regard to the country between Wyalong and Hillston, two routes are projected, one going to the northward towards Lake Cudgellico;—can you give us any idea of the country between these points? Not much.
772. You have been between Condobolin and Hillston, down the Lachlan? Yes.
773. But you have not been along the direct route between Wyalong and Hillston? No; I am familiar with the country on the direct route only from what other persons have told me who have been there.
774. As to what you have seen yourself, what is your impression of the country between Lake Cudgellico and Hillston? It is a very dry patch of country. Some of it is capable of great improvement and will grow wheat, but that is a long way in the future. I would not say that it is capable of immediate development for wheat-growing purposes.
775. Do you think Hillston is a fair objective to aim at in railway construction? Decidedly, from a national point of view. If a line is to tap the rather important pastoral district of Willandra, then, from a New South Wales point of view, that is the way to go.
776. Would you tap it by going to Hillston direct from Wyalong, or by going *via* Lake Cudgellico? I would go straight to Hillston.
777. You think that is the better route? That is my deliberate opinion.
778. Is Hillston the depôt for the Willandra country? It is the central point for a large tract of country to the north and west. Moreover, if you go to Cudgellico, you are undercutting the Condobolin line very considerably. I think the direct route is the more rational way of opening up the country. It may cost you more to go to Hillston by the direct route, and you may have to go through some poor country, but you would not be robbing an existing railway to the same extent.
779. If, as a private speculator, you were given authority to construct a line to Wyalong, and your engineers reported that it would cost £142,000 to take a line from Grenfell to Wyalong, and between £40,000 and £50,000 less to take a line from Temora to Wyalong, which would you sooner construct as a purely business matter? On the whole, I should be inclined to say that the Grenfell route would be the better one. There is no doubt in my mind that if Wyalong has the permanence which it shows every indication of having now, either the consumption of fuel will have to become very large, or the transit of ore will have to become very great. The question is where you can nearest get fuel, and also a means of treating the ore. It seems to me that Lithgow is the place to make for. You can get no coal worth speaking of on the other line until you get to the coast, and it would be 180 miles to Lithgow.
780. Do you think that, with the large supply of wood which they have at Wyalong, coal is likely to be a matter of great importance to them for some years? I think so. You must remember that there is now at Wyalong a population of between 4,000 and 5,000, and it certainly gives no indication of falling off. I was at Wyalong three years ago, and I had occasion then to notice the country, because I was there in connection with what is known as the Ricketson case. I had then to inspect the country which surrounds Wyalong, and I had to do the same thing about two months ago. The difference which I noticed was very striking. A big clearance had been made of the large timber in the country extending out quite 3 miles from Wyalong. I asked the price of wood, and they told me that it cost them from 8s. to 10s. a load.
781. Some time ago, in giving evidence upon another proposal before the Committee, you said you thought it would be advisable to connect the Northern and Southern railway systems? I have long had that opinion.

- A. Wilson.  
23 June, 1899.
782. Had you then the idea of following that up with another connection between the Western and Southern lines? In giving evidence on the proposal to take a railway from Condobolin to Menindie I spoke in favour of this present proposal. I then stated that in my opinion the best route for a railway would be from Young to Grenfell and Forbes, and thence from Parkes through Peak Hill to Narramine.
783. Since then the line from Koorawatha to Grenfell has been sanctioned, and it is not likely that if that is constructed another line would be taken from Young;—but do you think that with the two sides of that angle it would be a wise thing to construct a line from Grenfell to Forbes—would you take a wider sweep than Forbes and keep more westerly, reaching the Southern line further down? I have thought whether it would not be worth consideration to take a line from Forbes through Wyalong down to Narrandera, eventually making a connection between Melbourne and Brisbane through the back country. I admit that the construction of a line from Koorawatha to Grenfell has dislocated my ideas on the subject, but the line to which I refer would open up a large extent of territory. It would not answer the requirements in view at the present time. It would not do away with the necessity for one of the two lines to Wyalong. You would still have to reach Wyalong by a direct route.
784. Do you know whether there are any ironbark ridges at Reefton from which sleepers could be obtained? As far as I have seen there is very little valuable timber in any of the country. On some of the harder ridges there is a little ironbark, but not much.
785. Is there any ironbark on the route from Grenfell to Wyalong? There is no timber of much value on that line; it is all white box, which is of no value except for firewood. There are little patches of gum which might be used for fencing-posts, but there is nothing beyond that.
786. Is the convenience of getting coal the only factor on which you rely for the construction of the line from Grenfell to Wyalong? That would be a factor; but taking the line all through, I think it would command more traffic than would the line from Temora to Wyalong. Mile for mile I do not think it would be any more expensive to construct. To my mind, the cheapest line to construct per mile, although the route might be longer, would be the line *via* Bimbi.
787. You have stated that the land which is outside the spheres of influence marked upon the plan is pastoral land;—I refer now to the spheres of influence at Grenfell and Wyalong? Yes.
788. What kind of land would be unprovided for in the construction of a railway from Temora to Wyalong;—would it be only pastoral land? It would be chiefly pastoral country.
789. Then from the point of view of settlement you think that the conditions would be met by the construction of a railway from Temora? Yes. There would be nothing but pastoral settlement unprovided for, looking forward for some time to come.
790. But you think the factor of conveying coal to Wyalong is worth consideration in connection with the starting-point? I think that is looming in the immediate future.
791. Are you aware of the direction in which trade goes to and from Wyalong now? The bulk goes from Temora to Wyalong; there is a certain amount of flour traffic from Young. I am told that teams go from Young to Wyalong, and carry the flour as cheaply as it can be carried from Temora, although it is very much further.
792. But the greater portion of the traffic goes from Temora? Yes; all the package traffic, without exception.
793. Then the construction of a line from Grenfell to Wyalong would rob the existing line to Temora of portion of the traffic it now receives? Yes; it would undoubtedly diminish largely the traffic on the Temora branch.
794. And, consequently, render that little bit of Government property less remunerative than it is now? No doubt.
795. *Chairman.*] We wish to ascertain as nearly as possible which of the two lines—the proposed line or the alternative route—will develop the most country? Of course, the one line is longer than the other. I think that perhaps, on the whole, the line from Temora to Wyalong will develop more country; but it is about an even thing, I think. There is some better country on the Grenfell route; but there are patches of country which are more or less pastoral country, whereas the land on the line from Temora to Wyalong would be all capable of improvement. The rainfall would not be very different, except that in going to the south-west you are more apt to get winter showers, which are more valuable for the crops. Every mile you go to the north-east the less likely you are to get winter rain, and the more likely you are to get summer rain.
796. What are the crops grown to the north of Wyalong towards Ungarie? Only wheat.
797. Have you talked to the farmers there about their prospects? Yes. I saw a number of them at Wyalong a short time ago, and I was surprised at the confidence they all exhibited as to their future prospects, notwithstanding the drought. They had crops out there this year which, turned into hay, gave them about £5 a ton.
798. They have proved that agriculture will pay out there? They are quite jubilant about it. One man out towards Ungarie has 2,000 acres under cultivation.
799. Whatever line is constructed, there will be a considerable amount of country to develop? Yes; some of the mallee country near Wyalong is very good land indeed.
800. As the leases fall in the land will be taken up for agriculture? I think that a great deal of it will. People with business interests in the town and others wanting accommodation for stock have taken up land round about Wyalong, and there has been a very great improvement in the place for a distance of about 10 miles round.
801. You think that country is well worth developing by a railway? I think so. I was not of that opinion five years ago; the mining was then an unknown quantity. If you were to go to Wyalong now you would be surprised at the apparent permanence of the place and the confidence of the people in their prospects.
802. You have made several visits to the district, and each succeeding one has tended to convince you that the district is a growing one, and is not likely to go back? I do not think it is. It will have its vicissitudes, of course, but it must come through. The soil has certain capabilities in it, and there is no fear of the district being a failure.
803. Those on the land now do not talk of leaving it? No, certainly not.
804. They are more inclined to add to their holdings? The areas thrown open have been mostly taken up, and there is no opportunity for extension. Some blocks near Wyalong which were thrown open were very small blocks, and I do not think there was much demand for them.
- 805.

805. Has there been much competition for the larger blocks when they have been thrown open? Not much, I think, because all the runs, in consequence of improvements, got a full extension of their leases. All the men out there now were there after the division of the runs; they took up the resumed areas.
806. Are they looking forward to the time when the leases will fall in? I do not know about that; but there are always people coming up from the south and the south-west looking about the land. There are no complete blocks of 2,560 acres at present available. At Lake Cowal quite recently, I believe, there was a considerable competition for settlement leases.
807. *Dr. Garran.*] Although you admit that this is a tempting farming district, still I suppose the settlers expect to lose a harvest now and again? A man must calculate to lose a harvest once in five or six years.
808. The settlers calculate that it will pay them to do that? Yes. If they get a half a crop in a year like the past year they may come out better than when they get a good crop in an ordinary year, so long as they are not brought into too close competition with other sources of supply.
809. I take it that a drought is only a forced fallow; the ground gains something from it? Yes; a drought is not always an unmitigated evil. I think it is necessary for Australia that droughts should be recurrent at shorter or longer intervals, because otherwise people would get a false idea of the land, and would use it unjustly.
810. You said that you thought that the coal traffic was rather an important factor looking to the future of Wyalong? Yes.
811. Have you calculated what, at the existing freight, it would cost to put coal down at Wyalong from Lithgow? No; that is outside my usual line of business.
812. What I want to find out is how dear wood must become before it pays to bring coal from Lithgow to Wyalong? A similar question arose at Cobar. At one time the extension of the railway there was practically in the same stage as this proposal is in now. I had the same opinion of that extension at that stage that I had five years ago of the extension to Wyalong. The Cobar railway was subsequently carried out, and the coal traffic was one of the arguments put forward in favour of the construction of the line. At that time the Great Cobar Company had constructed a line of from 12 to 15 miles in length to bring wood in. They said that the cost of wood was becoming so heavy that unless the price of copper went up, or the yield of the mine improved, or there was some other source of fuel supply developed, the mine would not pay. The stage to which you refer came about two or three years afterwards.
813. How dear did wood become there? I should think it would run to about 12s. per ton; it was not so much the cost of the wood as that the wood was not the best class of wood for their purposes.
814. What is the comparison between a ton of wood and a ton of coal? I should think it would be about  $2\frac{1}{2}$  of wood to 1 of coal, but that is only a guess.
815. Do you know what the price of coal at Cobar is at the present time? No.
816. Do you know whether coal or coke is principally taken to Cobar? A good deal of both—a considerable quantity of coke.
817. Would coke, instead of coal, suit the furnaces at Wyalong? There are similar processes there, I understand, to those adopted at Broken Hill; they are somewhat similar to the modern process at Cobar.
818. Do you know whether the cyanide and chlorination processes depend more upon coke than upon coal? They depend more upon water than on fuel; there are cyanide works in operation at Barmedman and Wyalong at the present time.
819. From the tenor of your answers one would imagine that the coal traffic does not loom very large as an element in the traffic of the railway, then? Until you get into touch with such a trade you cannot say what it will become; it is not like a traffic depending upon natural production. I do not think the Committee should lean too much on the prospects of coal traffic.
820. *Mr. Dick.*] In regard to these rival routes, upon which is the greater mineral development likely to take place? Certainly on the route from Temora to Wyalong; on the other line there is no prospect of development from a point 7 miles out of Grenfell until you get close to Wyalong, whereas on the other line at any point there is a possibility of mineral discovery.

WEDNESDAY, 26 JULY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

821. *Chairman.*] The Railway Commissioners, in their statement, estimate a loss on this proposed line of £3,249 per annum? Yes.

822. I presume that the estimate has been made up in the usual way? Yes; after a very careful examination of the country by the Commissioners, and also after obtaining reports from officers who went specially to the district to obtain traffic and other particulars.

823. In their Report the Commissioners say—

No doubt the district has considerable prospects, but it is not a matter of certainty that the time has arrived for Wyalong to have the benefit of railway connection.

? Yes.

824. In estimating for the probable traffic on lines that have been constructed to open up agricultural districts, is it not a fact that the traffic has exceeded the estimate considerably in most of those places? I would not like to say that off-hand. I think the Commissioners' reports have generally been borne out. I do not think there has been anything remarkable in the way of any increase.

- H. J. McLachlan.  
26 July, 1899.
825. Well, put it in this way;—has increased cultivation by the settlers taken place to a considerable extent by virtue of railway communication? I would not like to say that of my own knowledge, not having any particular case in view at the present moment.
826. You see that the only justification for constructing railways is that they will facilitate and increase settlement? Yes.
827. We have constructed several light lines;—has increased settlement taken place and increased traffic been brought to the railways by reason of their construction? I daresay that one of the best answers would be that there has been a general increase in agricultural development and settlement, particularly within the last five years, and that has been due to the railways generally, because this development has taken place along the railway lines.
828. Then, as a matter of fact, the railways have increased development in the agricultural districts? Yes. As a matter of fact, without railways agricultural development in the interior would be impossible, because agricultural produce cannot afford to pay a high rate of carriage, such as would be the case if it had to be carted for any distance.
829. And that has not increased the loss on the railways to any considerable extent? No. Last year in relation to the railways was almost as satisfactory a year as we have ever had.
830. You have constructed a line of railway to Temora from Cootamundra? Yes.
831. Is that a paying line now? No.
832. Does it pay interest? Of course, the mineral resources of that line have been considered to be a big reason for constructing that line. On the Cootamundra to Temora line the loss, after deducting working expenses and interest, was £3,500 in the year ending 31st December, 1897.
833. Is the loss steadily decreasing or being maintained? Last year, from an agricultural point of view, was not a particularly good one, but for the last three or four years there has been practically no improvement on the Cootamundra-Temora line.
834. Attributable, I presume, to the bad season? The bad season; and I think that practically there has been very little difference in the operations at Wyalong; in fact, 1896 was a better year than 1897.
835. Would any considerable portion of the traffic to be drawn to this proposed line be drawn away from the Temora line? Yes.
836. Therefore, if this proposed line were constructed, it would add to the losses on the Temora line? Yes, it seems to me so.
837. Can you give the Committee reasons why the Commissioners have come to the conclusion that the time has not arrived for Wyalong to have the benefit of railway connection? One reason, principally, is that the railway from a financial point of view would not be a success, and the Commissioners consider that Wyalong is reasonably well off in regard to railway communication. The people there have a good road and not an extravagant distance to carry goods.
838. *Mr. Watson.*] I suppose the term "good road" is comparative? It is a level road; there are no grades of 1 in 10.
839. *Chairman.*] I suppose it is comparatively good because there is comparatively little traffic on it? It is a level road. Cartage on that road, I think, has averaged about 15s. a ton.
840. *Mr. Watson.*] It is higher than that now? The information we had some time ago was that cartage could be got for about 15s. a ton from Wyalong to Temora. I am inclined to think that the Commissioners got that information a couple of years ago when they were inquiring into the matter; in fact, the Commissioners in their report on the Cootamundra to Temora branch, said this—
- In view of the great uncertainty of the future of Wyalong the Railway Commissioners recommend that the proposed extension of the Cootamundra-Temora branch line be deferred for six months or until such time as there can be no reasonable doubt as to the future of the place.
- There has been very little difference in three or four years, so far as traffic is concerned. The Commissioners go on to say in their report—
- I am to add that the Commissioners have ascertained that both passengers and goods are being carried at reasonable rates between Temora and Wyalong, and therefore no hardship would be consequent upon the postponement suggested.
- That was, of course, four or five years ago. The Commissioners were up there in 1895, and with regard to the rate they then reported—
- The Public Works Department have placed the worst portions of the roads in fair order, and the cost of carriage between Temora and Wyalong is as low as 15s. a ton, passenger fares being equally reasonable, and there does not appear to be any great disability consequent on the want of railway communication.
841. *Dr. Garran.*] A serious tax upon the railway revenue is the heavy loss from one or two lines that are very unproductive? It is a tax.
842. Such a line as the Mudgee line, for instance? Yes.
843. And the South Coast line? Yes.
844. Where you come to lose £20,000 a year on one railway the loss is serious? Yes; one of the heaviest losses is on the section from Tamworth, north.
845. That was constructed more for intercolonial purposes than for local purposes, was it not? Yes.
846. Therefore it is scarcely fair to take that as a sample railway made to open up the country? No. The line from Goulburn to Cocma entails a very heavy loss.
847. But where you come to the railways that are pushing out into agricultural districts, and which do not entail upon you a loss of more than £3,000 or £4,000 a year, and where there is a prospect of settlement the case is very different? Yes, it is.
848. The Temora line has not been directly productive, but has it not caused a great deal of agricultural settlement around Temora? Not to my own knowledge. It may have done so, but I have not the figures or the facts before me.
849. Has it not greatly facilitated trade with Wyalong? Yes, it must have assisted Wyalong. When the railway was opened Wyalong was not working, but within a few months of the railway being opened Wyalong broke out, and we had a big rush of traffic. That first year the line paid better than it does now.
850. But the Wyalong trade is not a contemptible addition to your traffic? No. A flourishing gold-field always gives you a good business.
851. So if the line to Temora does not directly pay, it has been a valuable line to the country? Yes, from a national point of view.

852. And may almost be considered justified in the light of our present experience? Yes. I do not think the Commissioners look upon that line as being a burden in any sense of the term. For—apart from regarding it from a national point of view—there is a certain value in the amount of traffic which it brings to the parent line, for which we have made no allowance in the figures to which I have already referred. H.  
McLachlan.  
26 July, 1890.
853. Do you make allowance for what it brings to the main line? Not in the figures I have quoted.
854. So the loss may not be so great to you? If you could work it out, the loss to the railways, as a whole, would not be £3,500 a year.
855. Because, with your existing appliances, you can work that branch without any very enormous additional expense? Yes, on the main line.
856. And it does throw some traffic on to the main line? Yes.
857. With regard to the line before us, from Grenfell to Wyalong, with the exception of a small area of land which is rather pastoral than agricultural, we are told that there are fair prospects of increased settlement all the way along to the Bland? I think that is so up to the Bland.
858. We are told that there is a constant stream of practical farmers coming across from Victoria looking out for good selections in our Colony? That is so.
859. And, I presume, you have noticed that they all like to get within reach of a railway if they can? Yes.
860. Because the struggle for life is far easier than if they had to go farther into the bush? Yes. As a matter of fact, agricultural produce cannot afford to pay a heavy rate for cartage.
861. They like to be within 15 miles of a railway station? At the outside, 20 or 25 miles. Beyond that it becomes practically unprofitable.
862. If we wish our Colony to be attractive to this class of settlers, we must have land available for them within 15 or 20 miles of a railway station? I should think so. The point is, whether you have not sufficient land already available which answers that condition, and which might be opened up without going to the expense of constructing new lines of railway.
863. If we had, would they not go to that part of the country? At present, land without railway facilities is naturally cheaper. Cheap lands attract them, and afterwards they ask the Government to make it up to them by giving them a railway.
864. But is not the best land within reach of the older railways now almost all private property? I suppose most of it is taken up.
865. So if a new settler wants to get new land on the cheap Government terms, he must go a little outside the old boundaries? Yes; if he wants to get cheap land. But it opens up the question whether we are to be pioneers, and the railway is to be saddled with the expense of opening up new country. The Commissioners have, more than once, suggested that if the Government does expect that of them, they should have a set-off as is done in Victoria by writing down the railway capital.
866. Would it not be better to give you the surplus over £1 an acre on land adjoining the railway, more than the land would otherwise fetch? Some such suggestion has been made by the Commissioners—that the increased value of the Crown lands should be credited to the railway by writing down the railway capital, and that we should have to pay the working expenses only.
867. With regard to the 8,000,000 acres that are to fall in in a year or two, I suppose that a large portion of that land is worth more than £1 an acre if it is within 15 miles of a railway station? That is assuming it is good agricultural land.
868. I am speaking of the best quality land; and if the State were anxious to get the value of this land it could get more than £1 an acre for it? Yes.
869. Would it be fair to get that in order to provide railway facilities out of the surplus? The Commissioners have looked at the matter from a commercial point of view.
870. They have intimated that they think the pressure on the capital account might be fairly reduced by some contribution from the extra value they give to the land? Yes; when you make a line presumably for the development of the country. They look on the matter from a commercial point of view, and how it is going to affect them financially.
871. Of course your Department looks at the whole question necessarily from a Departmental point of view? Yes.
872. You want to make your Department pay? Yes. At the same time the Commissioners always consider what they think will be the best route to take, both in the interests of the country and of the railway traffic; for instance, in this question they point out that they think that the Grenfell-Wyalong is the better route, as against the Temora-Wyalong.
873. But the Government, taken as a whole, is not only a great railway proprietor, but it is also a great landlord? Yes.
874. And, therefore, the Government, and this Committee, also, as an adviser of the Government, have to take both those points into consideration? We quite recognise that.
875. Whereas your Department principally confines itself to the payableness of the proposed railway? Yes; in fact, I think that is the intention of the Act which says that the Commissioners shall make a report as to the practical financial prospects of the line; it does not ask them to look at any national question particularly.
876. But, although we are called upon to report on the financial prospects, we are not supposed to ignore the national results of settlement? No. I should think that would be within your duty.
877. There has been a point raised before the Committee between the policy of extending from Temora and the policy of extending from Grenfell; if you take the Grenfell connection, you connect with your line at Koorawatha? Yes.
878. And that gives you the choice of going to Sydney *via* either the Western or the Southern line? Yes.
879. If you choose the Western line it helps the traffic on the present unremunerative cross line between Blayney and Murrumburrah? Yes.
880. And with you that would be a consideration? Yes, that would be a consideration. But there are two or three important considerations in connection with the Koorawatha route. First, we reckon to open up better country. Another very important item is, that as it is a mining district it gives you the most direct access to a coal-field. That is a very important consideration, if you are considering the length of the routes.

- H. McLachlan.  
26 July, 1899.
881. We have had some evidence to the effect that the quantity of coal used at Wyalong is not likely to be so very great as to materially effect your receipts;—do you think it would be? That is a question more for a mining expert; but I should think that, for a mining field, cheap fuel would be a consideration. I can understand that very little of it has been carried to that district up to the present time because of the distance it would have to be carried by road.
882. Have you at all gone into the question if it would pay better to concentrate at Wyalong and send to Lithgow for treatment, or to send the coal to Wyalong for entire treatment there? I do not feel competent to express an opinion on a question of that sort.
883. It would pay you best, I suppose, if you had full trucks both ways? That is of course what we always try to get—loading both ways.
884. If you had a certain amount of concentrates going to Lithgow, and the same trucks carried back full loads of coal to Wyalong, that would suit you? Yes.
885. If you had only one train every other day, it would pay you very well? Yes.
886. It has been pointed out that if we connect with Temora, although we get no advantage in connection with Sydney, we do get an advantage in a shorter connection with Melbourne;—how would that affect your receipts? Well, we would not get so long a carriage; therefore, that would be rather against us.
887. But would you get more per mile between Wyalong and Albury than between Wyalong and Sydney? We should, at the present time.
888. But if you came under the proposed Inter-State Commission you would not, I presume? Of course a longer haul is always recognised by any railway company to be less expensive per mile than a shorter haul; but the gross result would be less from the Melbourne side, I should think, on account of the very much longer distance that the freight has to be carried on the other side—250 as against 130 miles.
889. On the whole—if the agricultural produce of Wyalong and that district all went down to Melbourne—you would make a little less than if it all came to Sydney? Yes; but, on the other hand, from the information we have, we think there is not a great deal of agricultural country around Wyalong. You touch the agricultural country in coming from Grenfell.
890. We are told that it is all agricultural country to Hillston, and that some of the very best agricultural land is south of Hillston;—is there any special freight to Hillston, which the Commissioners always speak of as the possible terminus? It is looked upon as an objective point. It is a point that you fix your mind upon as being a centre.
891. Is it a large township? No; but it is a central point, and it has always been debatable whether we should go from the south or from the west to it.
892. It would be a good point at which to sweep a certain class of traffic? Yes. It is also about the latitude where we would look for a central point for a cross-country line.
893. Some witnesses have intimated that a little further north, towards Willandra, would be rather better? It is only a matter of degree—the difference is only a few miles. The point we had in view was to go across from Cobar or from Hillston; and as we pointed out, the further south we travelled the more likely we should be to intercept business.
894. It is quite immaterial to the Commissioners whether the line goes a few miles one way or the other? It would not matter much.
895. You wanted to strike the Lower Lachlan? That was the point.
896. And even if there were to be a slight loss in extending the line to the Lachlan, do you think there would be good general grounds for submitting to that loss? So far as the Hillston line is concerned, I have not consulted the Commissioners in regard to this line. At present, they are not looking at an extension of the railway beyond Wyalong.
897. But, in one or two reports, they refer to further extension as a desirable thing? They originally had the idea of going from Condobolin, but that was a considerable time ago, and I think that if they were going to report on the question again they would like to study it afresh.
898. If the present proposal to go from Wyalong to Grenfell had been carried out before the line to Condobolin were considered, do you think the line to Condobolin would have been recommended? Yes, I think it would, because you are going almost northerly there.
899. You think that the line from Parkes to Condobolin is far enough north not to be a surplus line? Yes. I think that on its own merits a line in that part of the country would have been recommended.
900. Is there any mineral country to the north of Condobolin which would be worth striking from that point? There is a lot of copper country, I believe, not yet developed, but that is a matter upon which the Mines Department could better express an opinion.
901. You would rather see the mining developed before you make the railway? Yes.
902. But you do not object to making a railway into visible agricultural district, in hope of development? An agricultural district suits us better for railway purposes, as it does not get worked out.
903. You know there will always be something in it? Yes.
904. So far as the detail working of the line is concerned, an extension of the line from Grenfell to Wyalong could be worked, I suppose, with your maximum cheapness? Yes. We have put down the expense at £4,800 for 60 miles, and we know from the experience of other lines that that line could be worked at about that rate—that is, running a train every second day.
905. Going one way one day and back the next? Yes.
906. That would be superabundant for the present traffic? Yes.
907. Would that be a mixed train? Yes.
908. And a mixed train would travel faster than the coach? Certainly.
909. And I suppose at half the price? Yes, for produce, and for passenger fares, it would be very much cheaper than the coach.
910. You are not afraid of the teams cutting you out on the line? No.
911. As they do on some of the great trunk lines still? They have not cut us out. The proportion of traffic carried by team is extremely small.
912. Well they are enough to cut the road up? One team may do that. The team traffic is in such a small proportion that it is not worth considering, so far.
913. It is not an appreciable loss to you? No.
914. I noticed the other day some heavy machinery going to Lucknow by road? I think the public get a bigger idea of this traffic than is justified, because a team takes two or three weeks on a road, and gets reported from several places. We have seen one team reported in the paper eight times. 915.

H.  
McLachlan.  
26 July, 1899.

915. And I suppose with some consignees time is not a great object? No, not in connection with some parcels.
916. Although the Commissioners do not warmly recommend this line, they do not condemn it? No; they recognise its merits in regard to the development of the country.
917. It may mean a small loss for a few years? Yes.
918. But there is a fair prospect of its making its money in time? I think there is a prospect; but at the same time the Commissioners do not recommend it. They think it had better be held over for some little time.
919. Do you think, if the line were made to Wyalong, you would get any of the Hillston traffic at Wyalong? I think Hillston is rather a long way off to get that traffic to Wyalong.
920. Where does the Hillston traffic go to now? Some of it drifts to the South-western line, and the other goes south to the rivers. It is divided.
921. Some of it goes to the Hay line? Yes; some comes in at Carrathool.
922. To get the whole of the Hillston traffic you would have to go right to Hillston? Yes.
923. And on the whole you prefer a connection between Wyalong and Grenfell to one between Wyalong and Temora? Yes.
924. It would fit in better with your working arrangements? Yes; and the Commissioners, taking everything into consideration, think it is the better connection, with a bigger promise of development.
925. *Mr. Trickett.*] Did I rightly understand you to say that the line from Cootamundra to Temora had been a losing line? Yes.
926. Could you let us have a return appended to your evidence, showing what the loss has been since that line was opened? I can do that [*Vide Appendix*]. I think it was opened in 1893 or 1894.
927. On two former occasions the Commissioners have given evidence that they did not see their way to recommend the line from Temora to Wyalong? Yes.
928. Do they see any reason to change their opinion at the present time? No.
929. You regard that line as being a line that would really serve only local interests—it would not serve the country generally? It would be largely local interests. There would be a certain amount of traffic drawn from the district immediately around it, but it would not serve so much country as a line from Grenfell, which the Commissioners think should be undertaken if you are going to make a line to Wyalong at all.
930. I understand that they do not regard it as a line which should be constructed to tap the western country? I would not say that. They have not looked at that recently; but some years ago, when they looked at that question, they recommended an extension down the Lachlan *via* Euabalong; but circumstances have altered a great deal since then. For instance, you are making a railway to Grenfell, and the Commissioners simply look at this line as a line to Wyalong, and not beyond it.
931. Are you aware whether the water supply to Wyalong has been perfected? No.
932. In a former report one of the reasons given with regard to the possibility of Wyalong not being in such a good position as it might have been, was that there was no permanent water supply there? That report was from the Mines Department.
933. You are not aware whether that has been improved? Not of my own knowledge.
934. Is there a daily service now to Temora? Yes.
935. How long has it been established? Three or four years.
936. Has that improved the traffic at all? It has, but not greatly. Of course, the circumstances hardly afford a fair comparison, because at the time we introduced it the Wyalong field had not long started, and there was a big rush of people going up, and also building material, and so on; therefore, the comparison can hardly be considered a fair one.
937. Do you consider that all the traffic between Wyalong and Sydney, each way, is sent *via* the Temora railway? Yes; I think it is.
938. Then that line gets all the benefit at present of the trade to and from Wyalong? Yes. With regard to the road carriage, I may say that an officer who was in the district in December, 1898, says—
- The lowest rate of team carriage between Wyalong and Temora is 15s. per ton, while the average rate, when the roads are good, is quoted at £1 2s. 6d.
939. On the Koorawatha to Grenfell line, a system of betterment has been introduced as regards the landholders adjoining the line? Yes.
940. Do you think that some such system should be applied if the line were extended to Wyalong? The Commissioners have always recognised that some such principle would be an equitable one to introduce where a railway would lose, so as to enable the railway to be recouped to some extent. The Commissioners made a direct recommendation to that effect in connection with the Green's Gunyah line, and I think that their recommendation led, practically, to the adoption of the principle by Parliament.
941. And although there was some objection at the time to that principle on the branch from Koorawatha to Grenfell, yet I understand that the landholders have "toed the mark" and given the necessary land? Yes. That has been dealt with by the Works Department, and apparently they have arranged for the land to be given by the landholders.
942. And you regard it as an equitable arrangement? Yes.
943. *Chairman.*] In estimating the revenue from lines in these producing districts, do the Commissioners ever credit them with the increased traffic on the suburban lines? No.
944. Seeing that it would be impossible to live in or about Sydney, unless people went into the country to produce, do you not think that some portion of that traffic might be credited to these lines which you have termed not paying? Well, it would be impossible to work out the figures. They say that the traffic over the section of the line itself pays so-and-so. Any development which that line may create is of value to the parent line; but it would be impossible to show it in figures.
945. But still it does profit from working for those who handle produce in Sydney? Yes. Any development of the railways in the country is, of course, good for the railways generally, but it is impossible to show it in figures. We show the actual results on the section itself.
946. Still it would be a fair thing to consider that, would it not;—when you are reporting as to whether in the opinion of the Commissioners, a proposed line should or should not be constructed, has that matter ever

H.  
McLachlan.  
26 July, 1899.

ever been considered? Yes. If you recollect, the Commissioners on several occasions have almost said that if a new line into agricultural country would pay its working expenses, and if the cost of construction were deemed reasonable, it would be, perhaps, a fair case for the country to make that railway, leaving the interest to be paid by the additional traffic thrown on the main line. You will find that they have referred to that several times.

947. *Mr. Levien.*] I suppose you know nothing of the country between Grenfell and Wyalong? No; I have not been over it, but Mr. Harper has, and he will be able to give you details as to the country.

948. Which line do the Commissioners favour? Grenfell to Wyalong. This Committee asked the Commissioners to report as to the different routes, and in a letter of 16th June to the Under Secretary for Finance and Trade, a copy of which, I suppose, you have, the Commissioners said:

The capital cost of the Grenfell-Wyalong extension would be greater, but a larger area of good country would be opened up, and consequently the prospects of intermediate traffic are better.

949. There is not much difference between going from Sydney to Wyalong *via* Grenfell and from Sydney to Wyalong *via* Temora? About 5 miles shorter *via* Grenfell.

950. But as a matter of construction? There are 20 miles more to make.

951. Which is the most expensive line per mile? I think the cost per mile would not vary very much. I think there are a few more creeks to pass on the Grenfell country, but the character of the two countries is similar.

952. *Mr. Watson.*] The Commissioners have stated that the country between Grenfell and Wyalong is better and more likely to produce traffic than is the country between Temora and Wyalong? Yes.

953. Have they ever inspected that land themselves? Yes; they have been over both routes personally—over every mile of it.

954. Do they regard black-soil plain country as being good from a railway point of view—as likely to produce anything? The rainfall is better about Grenfell than it is about Wyalong or Temora.

955. But the point so far as the rainfall at Grenfell is concerned is settled, because the Grenfell line has already been decided upon;—I believe that the rainfall on the Bland is as low as it is at Wyalong or Temora? But still the Bland crossing is 45 miles from Grenfell.

956. You see on the map a blue circle that is drawn around Grenfell—that is approximately a radius of 20 miles around Grenfell? Yes.

957. Would it be proper to assume that the land within that 20 miles radius of Grenfell would be served by the line which it has already been decided should be constructed to Grenfell? I would sooner that the officer who went with the Commissioners should give information about the probable traffic.

958. I suppose it is fair to assume in regard to any railway constructed to a certain point that it has an influence for a certain distance in all directions beyond the terminus? Very much.

959. Especially with regard to agricultural products? Yes.

960. It has an influence for a certain distance all around the terminus? I think that for agricultural production you may, as an approximate estimate, take 20 miles on either side—that is, assuming that there is no railway on either side of it nearer.

961. We have before the Committee the evidence of men who are supposed to know the country thoroughly, that the agricultural land out of Grenfell towards Wyalong does not extend more than 20 miles? It does not extend the whole way, but there is a better prospect from Grenfell, the Commissioners think, than from Temora.

962. You admit that you yourself do not know that there is? No; I have not been over the district.

963. You stated that the question of coal supply to Wyalong might, in the future, assume some prominence? Yes; that might be an argument in favour of going by the west.

964. You are aware, I suppose, that they do not use coal to any extent at Wyalong now? Yes. The carriage, if nothing else, would be prohibitory of that at present.

965. Do you know why they should use coal when they have plenty of wood? But the wood soon cuts out. Take the Cobar line, for instance. We carry a very large quantity of coke and coal to that district.

966. Is not the country about Wyalong naturally much more heavily timbered than that about Cobar? It may have been.

967. Do you know the difference in length of haulage in going from Lithgow to Wyalong *via* Temora and in going from Lithgow to Wyalong *via* Koorawatha and Grenfell? Sixty-three miles.

968. Can you give a rough estimate what that difference would amount to per ton;—that is, 292 miles from Lithgow to Wyalong *via* Temora, and 229 miles *via* Koorawatha and Grenfell? About 4s. a ton.

969. What rate, approximately, would that be per mile? Approximately, about three farthings, tapering off.

970. You admit that there will be a necessity to earn more money on the Grenfell connection than on the Temora connection? Yes.

971. A necessity to earn more money to square accounts, because of the extra capital cost, and, presumably, the increased cost of maintenance. Yes. Of course, if an equal quantity of goods were carried on both lines you would get 60 miles against 40 miles of freight.

972. But your total distance to Sydney would not be any greater? I am speaking only of the extension.

973. But it would not matter, in essence, to the Commissioners whether it were carried over a branch for 900 miles or over the main line for that distance? You are assuming the business would be all with Sydney. If the whole of the business were to be to and from Sydney the through rates would not probably vary very much.

974. You would want to get more traffic to earn expenses and interest on the Grenfell connection than you would on the other? Yes.

975. In the estimate the Commissioners made with respect to the Temora-Wyalong extension in 1895, they calculated the interest at 4 per cent.? Yes.

976. On £85,000? Yes.

977. In the calculation they put before the Committee on this occasion, the interest has been put down at 3 per cent.? Yes.

978. So if we were considering the question of constructing a line *via* Wyalong, it would be fair to put down the interest at the same sum? Quite so.

979. During the last four years—from 1895 until to-day—has there been any reduction in the working expenses, mile per mile? The expenses of the Temora line for the last three or four years have been practically the same.

980. Would the estimate of the Commissioners to-day for constructing a length of, say, 40 miles, be lower than a similar estimate made by them four years ago? I am inclined to think it would be slightly lower, but I do not know that there would be much difference. I have not the Temora report before me, and I do not recollect what it was. The working expenses would be about the same. H. J. McLachlan.  
26 July, 1899.
981. But I am justified in putting the interest here down at 3 per cent. instead of 4? Yes, quite justified.
982. That is, the two lines would compare, so far as annual expenses were concerned, in this way. The Grenfell to Wyalong line would cost £9,112 per annum, and the Temora to Wyalong line would cost £6,100? Yes.
983. What do you think would be a fair deduction to make from the present income of the Temora branch because of the subtraction of the Wyalong trade? That matter was gone into by the Chief Traffic Manager, in connection with figures which I will ask him to bring along with him to the Committee. He has made some allowance for it, I know, in his traffic return for this Grenfell-Wyalong line. I spoke to him particularly about that point. I would not like to quote the figures from memory, but I shall ask him to bring them along with him.
984. I suppose that if a line is constructed *via* Grenfell and Koorawatha, the Commissioners contemplate taking the traffic over the Western line? It is the shorter road, and I daresay that most of the traffic would be taken that way.
985. That would involve a much longer train journey as regards time? I should not say very much longer, because a passenger could travel by the mail-train for some distance, and travel by a mixed train for a longer distance; you, however, do not look at the thing only to-day, but further ahead. You would have a longer run by the mail-train on the Southern line.
986. That, of course, would get you a little ahead? Yes.
987. Is it not a fact that, taking the 172 miles on the Western line to Blayney, which is the take-off point for Koorawatha, if you are going to Wyalong by that route, the mail-train takes almost two hours longer in going that 172 miles than the mail-train takes in going a similar distance on the Southern line? Yes; the Western line is heavier, and there are more frequent stoppages.
988. Are not the grades worse on that line? Yes; the road is a bit heavier. The Southern line would be quicker at the present time.
989. So, over the portion that passengers travel by mail-train on the Western line—172 miles—they would lose nearly two hours? Yes; the road is heavier, and the stops are more frequent.
990. So the actual loss of time over 172 miles on the Western line to Blayney is two hours? Yes.
991. I presume that the mail-trains travel about the same speed? Yes; they do under the same conditions.
992. I mean that there is no effort to hurry one against the other, irrespective of conditions? No.
993. Therefore, there is a certain amount of saving of time so far as the Southern line is concerned? Yes.
994. One of the factors in the extended line is that the grades are such that it takes the mail-train longer to travel on the Western line? Yes.
995. If that is so in regard to passenger traffic, does it not mean a greater cost of haulage, so far as freight is concerned, to take it by the Western line? I do not think you can work it out in figures that way. As a matter of fact, you have the same ruling grade out of Sydney in both cases. From Picton to Mittagong you have as heavy a grade as on the Blue Mountains, and one single grade would rule the road for a long distance. We have been cutting out a lot of the western grades to make the road easier. It is very difficult to compare isolated cases of that kind.
996. In the Koorawatha-Grenfell inquiry a question was asked in that connection, and I understand that the reply given was that the adverse grades on the Western line were in extent greatly in excess of those on the Southern line? Yes, the western road is the heavier; but it would be impossible for anyone to say whether there was any difference in the working cost. You would have to start away with the same load out of Picton as you do out of Penrith practically.
997. And does one set of engines always take a load right through? Well, it is the same grade. I think you may say, generally, that the Western road is heavier, but it would be impossible to give any idea of the relative cost of working the two sections.
998. The return you quoted was with respect to the earnings of the Temora line during last year;—have you any figures dealing with the previous year? Yes; I have promised to submit a return covering the time since the line was opened, and I will send that in.
999. I think that the return for last year was exceptionally bad, because Temora had to depend mostly on wheat? Yes; I stated in reply to Mr. Trickett that the year before was a much better one. As a matter of fact, it was £1,500 better; but I will send in a return from the time the line was opened.
1000. It has been acknowledged that Temora, although at one time having a lot of mineral development of an alluvial character, is now dependent almost solely on farming? Yes; the first year of the Temora line was, I think, the best year we ever had on it; but Wyalong broke out about the same time.
1001. And there was a rush of traffic in consequence of that? Yes, and not only that, but a lot of produce had been held back until the line came into the hands of the Government.
1002. Do you know anything in regard to the population of Wyalong at the present time? The district population is, I believe, said to be about 5,000.
1003. The Commissioners in 1895 were rather apprehensive of the population falling off considerably? Yes. The population of Wyalong, and within a 5-mile radius, is said to be 4,200. That is the information which we got locally.
1004. You are aware, I suppose, that between Grenfell and Wyalong there are no centres of population? There are several stopping-places.
1005. Yes, stopping-places, but no aggregations of people? There are no towns.
1006. Whilst between Temora and Wyalong there is at least one town of fair size? Yes, Barmedman.
1007. Do you think that the fact that the Crown still possesses a fair quantity of land on the Temora-Wyalong route should come into the Committee's consideration? I think that is a fair point. But we understand there is also a large area of Crown land along the other line.
1008. It does not seem to show much on the map? Well, in the report we had from the local officer, he said that the leasehold areas of Crown land expiring from 1898 to 1900 amounted to 324,000 acres—that is, within 20 miles on each side of the line. That would be, I suppose, part of the 8,000,000 acres mentioned this afternoon by Dr. Garran.

H.  
McLachlan.  
26 July, 1899.

1009. *Mr. Dick.*] In reply to Dr. Garran, you stated that you thought it would be a fair thing if it could be arranged that all the increase in value over £1 per acre brought about by the construction of the railway line, say, from Grenfell to Wyalong, should be credited to the Railway Department? I would not fix a figure. I think that if a railway going into a district increases the value of the Crown lands, purely by the construction of the railway, it is only a fair thing that the capital cost of the railway should be credited with some of the enhanced value. In Victoria, for many years, I think, the Government allowed £200,000 a year to the credit of the railways, on account of the enhanced value of Crown lands by reason of railway extension. I believe the Victorian railways have been credited to the extent of £3,000,000 or £4,000,000 owing to that.

1010. Such a principle would be difficult of application to a railway between Grenfell and Wyalong, according to the evidence we have received, because nearly the whole of the land along that line is alienated? Well, as I said, according to the evidence of one of the local officers there were 324,000 acres of leased Crown lands which could fall in by the end of next year.

1011. That is within the 20-mile limit? Yes.

1012. I think you also stated that the Wyalong trade now goes to Temora? Yes.

1013. As a general thing, is it not wise to preserve, as far as possible, existing channels of communication, when you propose to construct a railway line—other things being equal? Other things being equal, I daresay it is; but I do not think there is a great deal in that.

1014. Well, presuming that the line from Grenfell to Wyalong were constructed, you would really have two lines—the line from Wyalong to Koorawatha and the Temora line—dividing the trade which now goes from Wyalong and the surrounding districts? Yes.

1015. Without, for some years at any rate, bringing about any increase in the total amount of traffic? Of course, if the railway were going to be made purely for the purpose of serving Wyalong, that would be a strong point in favour of extending it from Temora; but you are making the line to open up 60 miles of country, and the Commissioners say that a better country would be opened up and developed outside Grenfell, and on the road from Grenfell to Wyalong. Wyalong is not the only consideration in this matter. As a matter of fact, Wyalong did not exist, you may say, beyond six years ago as a centre. It is only a new place, and there are no long-vested rights in connection with its establishment.

1016. We have been assured by witnesses from the Grenfell district that the whole of the agricultural land along the proposed line to Wyalong is probably within 30 miles of Grenfell? As a matter of fact, there is comparatively little agricultural cultivation about Wyalong. I think 3,000 acres is about the outside. Wyalong, therefore, has not much cultivation of its own to be considered.

1017. At present two-thirds of the agricultural land will be served by the Koorawatha-Grenfell extension? Yes.

1018. Well, taking that point into consideration, and the fact that over 20 miles of the Cootamundra section of the line is already served by railway, does it not seem—taking a general view—that the construction of a line from Temora to Wyalong would open up a larger area of country now unserved by railway communication of any kind than would the extension from Grenfell to Wyalong? I cannot see that.

1019. We are assured by witnesses that two-thirds of the agricultural land situated along the Grenfell-Wyalong line will be served by the Koorawatha-Grenfell extension? Yes.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

C. E. Rennie.  
26 July, 1899.

1020. *Dr. Garran.*] Have you any statement to make in reference to the land on either side of the proposed line? I have a statement here of the tenure of land within 20 miles on each side of the proposed railway from Grenfell to Wyalong, and also from Grenfell to Hillston direct, and also Grenfell to Hillston *via* Cargellico.

1021. Give us first the statement in regard to the line to Wyalong? On the Grenfell to Wyalong line there are 932,000 acres of alienated land; 144,000 acres of leases, other than pastoral leases—that is, scrub and settlement leases; then there are reserves, 346,000 acres; and Crown lands, 388,000 acres.

1022. Do you know anything as to the quality of this Crown land? No; I have no knowledge of the character of the land. These are merely figures taken from the official maps.

1023. How much land will be available for settlement within the next few years of all that you have mentioned? Between 1899 and 1904 there will be 179,000 acres of leasehold area which will be available to be dealt with for settlement, and there are at present held under occupation license 133,000 acres, which is open to settlement, and there are 76,000 acres which are practically untenanted. Part of that area may be held under annual lease, but it is not under any more fixed tenure.

1024. When the line from Temora to Wyalong was under the consideration of a previous Committee, did you give any similar evidence as to the land available on that line? I gave evidence on previous occasions about these lines, but I cannot say whether it was exactly the same line.

1025. Can you give us exactly the same information in regard to the line between Temora and Wyalong as you have now given in regard to the line between Grenfell and Wyalong? I have not the figures here.

1026. Can you produce them another day? Yes.

1027. Now will you give us the figures as between Wyalong and Hillston? I have not the information in that form. I have it for the whole line, Grenfell to Hillston. I should require to take the figures out and find the differences.

1028. Perhaps you will put that before the Committee another time? Yes. I can now give you the details for the whole length—that is, Grenfell to Hillston direct, and Grenfell to Hillston *via* Cargellico. The figures for the total lengths are as follow:—Grenfell to Hillston direct: Alienated land, 1,470,100 acres; leases other than pastoral, 377,900 acres. That includes settlement, homestead, improvement, scrub, and inferior leases. Then there are 766,600 acres of reserves, and 1,908,300 acres of Crown lands. That is divided between 737,700 acres leasehold area, the leases of which will expire between 1899 and 1904, and 110,600 acres (in the Western Division), the leases of which will not expire until 1918. There are held under occupation license 479,400 acres; and practically untenanted, 580,600 acres. Then for the line Grenfell to Hillston *via* Cargellico, the figures are: Alienated land, 1,618,600 acres; leases other than pastoral, 424,100 acres; reserves, 806,400 acres; and Crown lands, 1,871,200 acres. Those are made up as follows:—565,500 acres, of which the leases will expire between 1899 and 1904; 289,000 acres—that is, Western Division leases—the leases of which will expire in 1918; 550,300 acres held under occupation license; and 466,400 acres practically untenanted.

THURSDAY,

THURSDAY, 3 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

Edward Fisher Pittman, A.R.S.M., Government Geologist, Department of Mines, sworn, and examined:—

1029. *Mr. Watson.*] You have recently paid a visit to Wyalong, have you not? Yes; I was there two or three days.
1030. From that visit, and the report of the officers in your Department, you are able to express some opinion as to the possibility of mining development at Wyalong? Yes.
1031. Will you give the Committee some idea of what the possibilities are? I think it is a fact that Wyalong can now be regarded as developed into what I should call a permanent field.
1032. You think it is? I think it is an undoubted fact. It is the best gold-field that we have in New South Wales at present as regards its production, and there is every indication that the reefs will be permanent.
1033. You are speaking of Wyalong and its immediate vicinity? Yes.
1034. Have you got any statistics as to the yield at Wyalong? I cannot say that I remember the yield.
1035. At what depth are they working now at Wyalong? At various depths. The richest mine is at a depth of about 300 feet; but some have got down to nearly 600 feet.
1036. Are there indications of permanency at that depth? I did not go down that mine. They told us it was at present in a barren patch; but I do not anticipate that that will continue. I think the probability is in favour of their getting on to gold again.
1037. Of course, it is frequently the case in mining that you come on a barren patch and find the gold again below? Yes; that is an essential feature of the Wyalong gold-field. The reefs are very variable; they thin out to nothing, then make again to a considerable width. This claim, which is said to be on a barren patch, is only 17 feet.
1038. Which is that? The Bantam.
1039. You see no reason to doubt the permanency of the field? No.
1040. Did you see any indication there of sulphide? Yes, most of the gold is being obtained from sulphide ores.
1041. Do you think that would necessitate coal for smelting furnaces to any considerable extent later on, or can the ores be treated by the present method? I think the ore is being satisfactorily treated at the present time on the field.
1042. You do not anticipate that there will be any great demand for coal there? No, I should not think so.
1043. Do you think that the class of ore which they are now in is likely to continue? Yes; I think so, undoubtedly.
1044. Have you visited Barmedman with a view to inspection? I have not.
1045. Have any of your officers? No; I cannot say that they have. There has been really very little doing at Barmedman.
1046. Have you had any opportunity of inspecting the range of country from Wyalong to Hillston? No; I cannot say that I have been along that line. I have been to Yalgogrin.
1047. What are the prospects there? They seem very good indeed. It is a similar class of country to what we have about Wyalong. They have obtained some very good returns from there.
1048. Were there any number of claims working there? Yes, a good number.
1049. Were they down any depth? I cannot tell what was the greatest depth. The greatest depth that I went down was about 150 feet.
1050. In any case, you think the prospects are encouraging? I do.
1051. You have not had an opportunity of ascertaining what prospects there are further out towards Hillston or Lake Cudgellico? No; I have not been along that line. I know the country to the western boundary of the colony. There are mining properties about Mt. Hope, Nymagee, and Cobar. There is a lot of mineral-bearing country in that direction, although at present, beyond what I have mentioned, there are no mines being worked in a large way.
1052. Of course you know the general tenor of the report of the late Rev. W. B. Clarke in reference to that south-western country? Yes.
1053. Did he express any opinion as to the probabilities of gold being found in that part of the country? I do not remember.
1054. I was under the impression that he said it was likely to be a gold-bearing country? That country is of such a geological nature that it is probable that he would say so.
1055. Do you know of any gold developments between Grenfell and Wyalong? I do not.
1056. Or anything which might lead you to believe that there might be any there? I am not aware of any. I should not be surprised if gold or other minerals were found there. It is country where you would expect to get minerals. It consists of palæozoic rocks chiefly.
1057. *Dr. Garran.*] What leads you to think that Wyalong is a permanent gold-field? Well, I gave some evidence before this Committee some years ago, and I stated then that I had every reason to believe that it would be. I was asked whether I thought the reefs would exist at a depth of 200 or 300 feet, and I said they would, and it has proved true. They are richer at a depth of 300 feet than they were then. The field is clearly richer at a depth of 300 feet than on the surface, whilst the character of the reefs remains the same.
1058. As the reef gets into the harder rock, does it diminish in size? No. I was asked that question five years ago, and I said I had every reason to suppose that it would not, and it does not, diminish in size. The reefs are of the same character on making and thinning. In 10 feet you will get them thinning out to an inch or two, or making to 4 or 5, and, as I saw recently, to 12 feet.

- E. F. Pittman, A.R.S.M.  
3 Aug., 1899.
1059. Does that indicate that the gold is an infiltration into the rock? Yes.
1060. And the width of the vein depends upon what the width of the old fissure was? Yes.
1061. Can you guess how deep those veins are likely to go? It would be purely guess-work. In Charters Towers they have gone down 1,000 feet, and more.
1062. Is Charters Towers the nearest analogue to Wyalong? Yes; it is a reefing district, the gold is in reefs in granite.
1063. Are the veins there uncertain and occasionally thin, as they are at Wyalong? No. In Charters Towers gold-field they are more consistent in width, as far as I know.
1064. Are there any known indications of the possibility of discoveries of minerals between Hillston and Menindie? Only as far as the rocks themselves are concerned. I do not know of any minerals having been found yet, but I should expect some to be found there.
1065. There is no impossibility? None, whatever.
1066. The minerals would be covered over? Yes; by the surface deposits.
1067. You do not expect to find surface indications? No.
1068. At Wyalong there were no surface indications? No.
1069. It was an accidental discovery almost? Yes.
1070. And the same thing might occur anywhere between the Lachlan and the Darling? Yes.
1071. The whole of that country might turn out, at any time, to be mineral country? Yes.
1072. The probability is that this alluvial deposit has covered over mineral ranges? Yes.
1073. And we have to find out where they are? Yes.
1074. You could not give the same statement with regard to the country north of Menindie? There you get into the artesian water basin, which is not mineral-bearing.
1075. Between Hillston and Menindie, we are not in the artesian water area? No.
1076. How far does it go? It comes a little south of Bourke.
1077. The east Darling country is not artesian? No.
1078. And for that reason it may be mineral country? Yes.
1079. When we get into the artesian country, we may say good-bye to mineral discoveries? Yes; except in isolated cases, where the palæozoic rock crops up.
1080. Then, if we extend this line of railway to Wyalong, we shall not be taking it into a dead or decaying gold-field? No; I see every indication that Wyalong is a really live gold-field.
1081. But as to the country between Grenfell and Wyalong, there is nothing to be said about it? Only as to the possibility of minerals being found there in the future.
1082. There is nothing on the surface? No.
1083. Does the change from black soil on the Bland Creek, indicate subterranean minerals? No; it increases the difficulty of discovering them.
1084. What has made the difference between that black soil country and the other? Black soil generally results from the decomposition of basalt. I cannot say whether it is the case there, or whether it is simply flood soil.
1085. Is not a great deal of the red soil from the disintegration of trap rock? Yes.
1086. Is it supposed that there is more ironstone in the red soil than in the black? Yes.
1087. Is there anything to indicate the mineral character of the country between Wyalong and Condobolin? No; I do not know of anything. That again would be palæozoic country, so there is every possibility of minerals occurring there.
1088. Do not mineral deposits often lie in lines of longitude? I think that is only a coincidence. The strata of the palæozoic rock is in a northerly and southerly direction, and the minerals may fall in the lines of the rocks in which they occur. But the mere fact of certain gold-fields being in a line north and south with others is a mere coincidence. You can find similar lines in other directions in other places.
1089. There is nothing to be inferred from the fact that it is in the same meridian of longitude? I do not think so.
1090. *Mr. Trickett.*] Although you regard Wyalong as a permanent field, do you regard it as a poor man's field? I should not regard it as a poor man's field. It was when it was first opened, because the decomposed granite rock was so soft; now it is hard granite.
1091. It is a field now that requires to be developed by capital? Yes; in that way a good deal of labour should be employed, possibly more than would be if it were in the hands of ordinary miners.
1092. The reefs do not get richer as they go down? The lowest level of Neeld's claim is the richest yet, and it is down 300 feet.
1093. Do you know how many people there are at Wyalong at present? I do not know of my own knowledge, but I have heard that there are 3,000 or 4,000.
1094. Has there been any alluvial gold discovered there? No. I may state that the Minister is sending me down next week to choose some sites for bores for alluvial. I reported that I thought there was every probability of there being alluvial deposits there, only they are so difficult to find that the ordinary miner can hardly be expected to find them, and I recommended that some bores should be put down.
1095. Does the gold require expensive treatment at Wyalong? The treatment of sulphides is more expensive than the treatment of free gold.
1096. Do you know what the treatment of the gold costs? I do not.
1097. What is the average yield? They talk about 20 to 30 oz. a ton in Neeld's claim.
1098. What is the average? They say that is the average of the face that we looked at.
1099. Do you know what is the area around Wyalong in which they find payable gold? I cannot speak from memory, but we have published a geological map which shows all the lines of reef.
1100. How many batteries are there going at Wyalong at present? Four or five.
1101. And how long has the field been in existence? Since the end of 1893.
1102. In five years they have got four batteries going? Yes.
1103. Is that a big development for a gold-field? It is a fair development. It is certainly the most productive gold-field that we have at present in New South Wales.
1104. Did you see any claims lying idle when you were there? I only went with a Ministerial party, and I did not make a close inspection of the field.
1105. You do not know whether there are any claims lying idle? I think it is very likely that there are a good many; but I did not go round to see.

1106. Do they refine the gold locally? Yes; they have the chlorination process and the cyanide.

1107. Since you were there before, had the place increased in population and in activity? I hardly think it had increased in population, because the first time I went there was at the height of a great rush—people were arriving every day in hundreds. The field has now a decidedly well-settled appearance; it has all the signs of a permanent field.

1108. I suppose it is a field that can only be developed by the introduction of large capital? It has always been my opinion that any other method of dealing with it was bound to be a failure, because ordinary working miners cannot put down the same class of work as a company. In a field like that you want substantial workings carried to a good depth.

1109. When you were at Wyalong last did you inquire how many claims were on payable gold? No; I did not. But the report by Mr Watt, geological surveyor, gives all that information.

1110. How did you go to Wyalong? I went from Temora.

1111. What state was the road in? It was in a very bad state. We left Temora about half-past 10 in the morning, and we did not reach Wyalong until 8 o'clock at night.

1112. Do you think the development of the place is retarded by their having to cart goods from Temora to Wyalong;—is there a want of supplies or machinery there? There is no want of supplies or machinery, but no doubt they cost more than they would if they had railway carriage. I notice one thing, and that is that they obtain supplies and machinery from Melbourne, and their gold goes to the Melbourne Mint.

1113. I suppose that possibly the promoters belong to Melbourne? They are Victorians. They declared to me that their reason for going to Melbourne was that they could do better business there, that they could get their machinery cheaper at Melbourne, and get more for their gold, and that they could get rid of their gold at night, which they cannot do here. On the other hand, the Deputy-Master of the Mint here assures me that it is not true about the price. He admits that they cannot leave their gold and get a receipt for it at night. They can leave it with the constable at the gate, but he will not give them a receipt.

1114. Is it a fact that the arrangements of the Mint at Melbourne are more favourable to them for the disposal of their gold than they are at the Sydney Mint? I am telling you what Mr. Neeld assured me of. On the other hand, the Deputy-Master of the Mint assures me that it is not true that they get more for their gold in Melbourne. Mr. Neeld says he can get better prices in Melbourne, and that he can take his gold there at any time, day or night, and get a satisfactory receipt. He also states that he can get his machinery cheaper in Melbourne than in Sydney. He declared that, personally, he preferred to deal with Sydney, but that it paid him better to deal with Melbourne.

1115. *Mr. Watson.*] I suppose in Melbourne they keep the office open so that gold can be weighed and proper receipts can be given? I understand so.

1116. *Mr. Trickett.*] Is there another mining field between Temora and Wyalong? Yes.

1117. Is that likely to become a big field? It is rather dull at present.

1118. You do not look upon it as being so rich as Wyalong? No; it is not such a promising field as Wyalong.

1119. Is it the same character of country? No.

1120. Are there reefs there? Yes, there are reefs; but they are not in the same class of rock; they are in slate at Reefton, in granite at Wyalong.

1121. Did you hear at Wyalong any demand for railway communication? Yes; they are very much troubled about railway communication at Wyalong. They consider that they were practically promised a reconsideration of the question six months after the last inquiry; but I think that, generally speaking, they are inclined to blame the Temora people, who opposed the railway.

1122. Did the Wyalong people favour any particular route? They do not care where it comes from, so long as it comes there. They would favour the route that is most likely to be adopted.

1123. Did you see much traffic on the road? Yes, a good deal.

1124. Was it inconvenienced by bad roads? Yes. I look upon it as the worst road that I have travelled on for many years.

1125. Is it a bush road? Yes. It is simply impossible to get out of a walk between Barmedman and Wyalong. After rain it is just like a glue-pot.

1126. Did you pay any attention to the character of the country, independently of its mineral nature? Yes; it seems to be a class of country that would grow anything, provided that it had a sufficient rainfall.

1127. Is much cultivation visible? No; there is not much cultivation.

1128. Then, I suppose that, as regards the Wyalong district, the gold-field will be looked upon as the chief factor for feeding the railway? Yes.

1129. *Chairman.*] Do you think the construction of this railway would increase the development of that field in any way? Undoubtedly it would.

1130. You think that the mines would be more fully worked if a railway were constructed there? I think so. I think the effect of a railway would be to cheapen everything. If you have cheaper carriage to the field you have cheaper mining, and therefore better mining.

1131. Have you any knowledge of the country between Grenfell and Wyalong? No; I have not been along that line at all.

1132. You could not say whether the country about there is fit for agriculture? No.

1133. You have no doubt as to the permanence of the Wyalong gold-field? I have no doubt whatever about it.

1134. Are there any indications, further west, of a permanent field? I think Yalgogrin would be a permanent field, but it has not been developed.

1135. You think there are possibilities there? Yes.

1136. You have no doubt that the extension of a railway to a gold-field tends to the better development of that field? I think it is so, undoubtedly.

1137. That is independently of their getting supplies cheaper? Yes; the cost of carriage is reduced, and consequently there are better facilities for working. I think Wyalong would have been a better field today, considerably, if the railway had been extended to the field four years ago.

1138. *Mr. Shepherd.*] Is it not a fact that a good deal of stone has been carried to Temora from Wyalong? I was not aware of that. But my time was so taken up on my visit that I could not make inquiries.

1139. I think we have had it in evidence that a good deal of stone has been carted to Barmedman from Wyalong;—if they have four crushing-plants there, are they able to treat certain descriptions of stone.

or

- E. F. Pittman, A.R.S.M.  
3 Aug., 1899.
- or have they to send it away to be treated somewhere else? I think the probable cause of the crushing of the stone at Barmedman, if they are doing so, is the want of water at Wyalong. Wyalong is continually suffering from droughts.
1140. If stone is being carted away to any extent, of course a railway would be a great help in making the carriage of the stone so much cheaper? Yes.
1141. I think nearly the whole of the traffic is between Wyalong and Temora; but there is very little between Wyalong and Grenfell? There is no traffic between Wyalong and Grenfell.
1142. Is the country between Temora and Wyalong fairly good? Between Barmedman and Wyalong, I should say it is better than between Temora and Barmedman. It seems to be country that would be good enough if they had plenty of rain.
1143. Have they ample supplies of timber? Yes.
1144. Is the field very extensive? No; it is rather a confined field.
1145. It is possible that it may be opened out more extensively? As far as the prospecting has gone, they have not extended it much—they have not developed it laterally or longitudinally.
1146. You are satisfied that it is likely to be a permanent field? Yes; I think there is absolutely no reason for doubting it now.
1147. The mining industry is an industry that is likely to feed a railway, and if that failed the railway would be a failure? Yes.
1148. With regard to carting stone;—of course, it would pay them better to carry the stone on the railway than to cart it? Yes.
1149. Railway communication might possibly enable them to crush a much larger quantity of ore than they are doing at present? Yes. In the event of their being short of water it would enable them to take the stone to Barmedman, and have it crushed there.
1150. *Mr. Dick.*] You do not think that the character of the minerals obtained at Wyalong is such as would necessitate the furnace treatment and the use of coal? They are using furnace treatment there now.
1151. Do you think that the construction of the railway would lead to a large consumption of coal? I hardly think they would use much coal. They are using wood in their furnaces.
1152. Is there much furnacing going on? Not a great deal, but still they are using furnaces.

TUESDAY, 8 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

- J. Harper.  
8 Aug., 1899.
1153. *Chairman.*] Have you had an opportunity of making yourself acquainted with the proposal before the Committee, to construct a railway from Grenfell to Wyalong? Yes.
1154. Do you know the country well between Grenfell and Wyalong? Yes; I have travelled over it.
1155. Will you give your opinion as to what it is like? A great deal of it is very good agricultural land, a great portion of it good pastoral land, and generally it is very promising country.
1156. Is it fairly well settled? There is not much settlement, except within a few miles of Grenfell. Of course, there is the outlying township of Marsden along the route of the proposed line, lying to the north.
1157. Is it a class of country which is likely to induce settlement? Yes; I think there would be a great deal of agricultural settlement along the route of the proposed railway.
1158. Did you notice any farming being carried on? Yes; there is farming for at least 20 miles, travelling from the direction of Grenfell.
1159. Does any of that produce find its way to an existing railway? Yes.
1160. How far? For a distance of about 50 miles. It finds its way to Grenfell, or to the railway at Cowra or Young. They have no other market.
1161. How long have they been farming that land? Not for very long, beyond Grenfell.
1162. Have you had an opportunity of knowing whether they are satisfied with their prospects? When I passed through there, they certainly were satisfied. A number of Victorian farmers who were there regarded it as equal to anything they had seen anywhere.
1163. Is the railway from Koorawatha to Grenfell under construction? Yes.
1164. If that line is continued to Wyalong, do you think it will serve country which will be brought under the plough? Yes; we passed from 30 to 35 miles of very good agricultural country; then you reach pastoral country, black soil, which is not so suitable, until you begin to approach Wyalong, and you come there to agricultural country.
1165. Have you been west of Wyalong? Yes.
1166. Is there any agricultural country there? If you go far enough west, to Hillston, there is certainly a very large area of good country. In the immediate neighbourhood of Wyalong the country is not good.
1167. What is the case if you take Wyalong as the centre for a radius of 20 miles? Generally speaking, it is mallee and inferior country; but when you go further west and reach Ifumbug Creek, and still further west, you reach very good agricultural country.
1168. Is it proposed that Wyalong is to be the terminus for a long time? I should imagine not. I should think you could now scarcely look upon any point on the railways as a terminus, unless it might be Sydney and Newcastle.
1169. Do you think that there will be enough traffic on the line, if constructed, to give anything like a reasonable return? I am inclined to think that, since the estimate was given, the prospects of Wyalong, judging from what we can read, have improved. If its mining prospects are only nearly as good as predicted, I should say that a line there would be justified.
- 1170.

J. Harper.

8 Aug., 1899.

1170. Has there been an alternative proposal for a railway from Temora to Wyalong? Yes.
1171. How would the two lines compare? I should favour the one from Grenfell to Wyalong.
1172. Why? For the reason that it will better divide the country, as between existing lines, and, in my opinion, will pass through very much better country. It will represent a line, assuming that it will be extended westward, which will be practically midway between the Lachlan line and the Southern line. It is also closer to Sydney by a few miles; and if it is going to develop, as it is indicated it will, into a great mineral field, then it would be an advantage to be 100 miles closer to a source of coal supply.
1173. Will there be any traffic in fuel for Wyalong? That will depend upon the development of the field. When the Cobar railway was built it was never anticipated that there would be such an enormous fuel traffic as has since developed.
1174. Generally speaking, have the anticipations of the residents in the different localities seeking railway communication been realised? Not in all cases.
1175. Has that been the case, generally speaking, in connection with those lines which have been asked for in order to develop agricultural country? I am afraid that the list of non-paying lines indicates that it has not, in a good many cases. But there is another phase of the question which I think should be looked at by this Committee. The interior of the country cannot be left without railway communication; and even if there is no immediate prospect of the lines paying, there certainly are outlying portions of the country which are entitled to railway communication, and which will pay in future.
1176. Does not each mile of additional line do good to the existing line? Yes; I might quote the Cobar railway, which certainly did not pay when first built, and which gave no indication of paying, but it is now paying well.
1177. *Mr. Watson.*] I think you indicated to-day that you were rather inclined to liberalise your estimate of the possibilities of the railway to Wyalong, in view of the later developments in mining? Yes; and as a matter of fact as far as even the estimate of produce is concerned, I should say it is a low one.
1178. In 1895, your then estimate was made when the question of connecting Wyalong *via* Temora was under consideration;—was not that estimate based on a probable permanent population of 1,800? Yes.
1179. Since then has the population remained between 4,000 and 5,000? Yes.
1180. To that extent, your then estimate has been bettered? Yes, I would like to explain the circumstances under which that estimate was made. I then had before me the report of the Government Geologist, and I think his evidence was before the Committee at that time, and it was to the same effect,—that is, that Wyalong would be a shallow field, and that when the granite was reached the field would, practically, pan out. As everyone knows, that prediction has not been realised. As they get deeper into the granite the country has improved.
1181. In any case, the fact that the gold yield has increased year by year, and that the population has not decreased to any extent, justifies you in modifying what you said previously? Decidedly.
1182. Of course it is inevitable, in connection with any new field, that a lot of people will rush there, for whom there is no chance of employment, and, consequently, there must be a diminution of population as compared with the first onset? Yes; that was the view I took in 1895, when it was practically a new field.
1183. I think in 1895 you also thought that if a railway were extended to Wyalong it would not be taken as the basis of an extension to Hillston? No; because at that time the question of an extension from Condobolin along the Lachlan was under consideration. The other proposal had not come under the consideration of the Department at all.
1184. You were then in favour of reaching Hillston by Condobolin? Yes.
1185. Do you now think that it should be reached from Wyalong? I fancy that, seeing that Wyalong has developed favourably, there are stronger reasons to-day for an extension to Hillston, through Wyalong, than there were then, because you pass through the centre of a large population, which promises to be permanent; whereas that cannot be said so far as the extension from Condobolin is concerned. The position has absolutely altered in that direction since 1895.
1186. The body of population on the route ought to help traffic? Decidedly.
1187. How long is it since you travelled between Grenfell and Wyalong? About twelve months.
1188. How long is it since you travelled between Wyalong and Temora? The same time; we came back by that route.
1189. Were you speaking from your own observation when you said there is good land 30 miles out from Grenfell? Yes.
1190. In a direct line? I would not like to say it is all good land, but generally speaking it is good land practically for 30 miles along the route of the railway.
1191. Did you follow the actual route of the railway *via* Bimbi? No, we did not go so far south as Bimbi; we took two or three tracks between the bush, and we recrossed the line several times. We did not adhere to the track.
1192. After passing this length of good agricultural country, did you get into the pastoral, black-soil country? Yes; on the Bland.
1193. How far was it from the Bland that you reached that black soil—how many miles away from the creek? My memory does not serve me on that point; but I should think that it was probably 10 or 12 miles.
1194. When you crossed to the other side, what class of land was it on the western side of the Bland, at the crossing place? Black soil for a little distance, then we began to get into scrub.
1195. Have you ever been at Marsden, or north of Marsden, towards Lake Cowal? I have been at Marsden; but I have never been out to Lake Cowal.
1196. In your report you say that you think there will be a certain amount of traffic attracted to the Grenfell-Wyalong line from the north, which would not be attracted to Wyalong if it were connected by rail with Temora? Yes; my impression is that the produce from the Bland country would not find its way into Wyalong if the line were built *via* Temora; it would continue to find its way into Grenfell. Previously it found its way into Cowra or Young.
1197. Do you anticipate getting any large amount of traffic from the Bland country? Yes.
1198. Of what nature? Wool and stock.
1199. Do you think that would be too far removed from either Grenfell or Wyalong, supposing each were a terminus? I daresay that in the view of those who have to pay for the carriage it would be too far.

- J. Harper. 1200. In any case, would it be more than 30 miles? It would be a distinct improvement on what exists to-day.
- 8 Aug., 1899. 1201. Would it be more than 30 miles away? I think from the Bland crossing it is a little further. I think it is 45 miles from Grenfell to the Bland crossing.
1202. I said that either from Grenfell or Wyalong, it would not be more than 30 miles—assuming it to be 45 miles, what would you regard as the limit of attraction, with respect to stock and wool, of a railway; we know that a railway terminus will attract traffic from a certain distance, and in the case of agricultural produce we fixed the limit at from 20 to 25 miles;—what is the limit for stock and wool? As far as stock and wool are concerned, there is practically no limit, because they have to find their way to market.
1203. Is there the same necessity to push a line out in a country growing only stock and wool, as there is when you want to touch agricultural country? No.
1204. I want to know whether, in your opinion, you are likely to get from the Bland country generally any other traffic than wool and stock? No.
1205. You will notice that Forbes, on the Lachlan, is distant from Sydney 290 miles? Yes.
1206. Grenfell, from Sydney, *via* the Western line and Koorawatha, would be distant from Sydney 266 miles? Yes.
1207. Then, assuming the limit of attraction of the existing terminus at Grenfell to be 20 miles, that would make it 286 miles? Yes; that is from the point of production.
1208. Is it not probable that a large proportion of the stock would be trucked at Forbes, except in the case of stock which would be close to Marsden? No; as far as Lake Cowal it would certainly all come in to the Bland crossing.
1209. From 20 miles out westward from Grenfell on the proposed line, the distance to Sydney would be exactly the same, as far as trainage is concerned, as it is from Forbes? Yes.
1210. Would there not be an equal chance of attracting traffic from the intervening country? Yes.
1211. Does the good agricultural country come in again as you go northward to Forbes? Yes.
1212. Would the produce of that agricultural country probably go to Forbes? Undoubtedly it would go to Forbes.

WEDNESDAY, 9 AUGUST, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Grenfell to Wyalong.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

- J. Harper. 1213. *Mr. Watson.*] Do you produce a map showing the district affected by the proposed railway? Yes. The area within the brown etching represents the country 25 miles west of Grenfell. The next area, within the blue etching, represents the country, generally black soil, for a distance of 45 miles from Grenfell. The pink etching represents the area from which it is anticipated traffic would come in at Wyalong. The leasehold and resumed areas are shown, and as it is an 1896 map the probabilities are that they will remain as they are shown on the map.
- 9 Aug., 1899. 1214. Assuming the Grenfell line to be finished, and Grenfell to be the terminus, how far westward do you think the railway would be available for agricultural purposes? I should think that, as under existing circumstances wheat is carried from Grenfell to Young, you may reasonably expect that it will come from a radius of 30 miles. I do not mean to say that under all conditions it would pay to cultivate wheat; but with good prices and seasons, no doubt it will pay. The inducement would not be a strong one to settle that distance from a railway terminus when there is so much other land available closer to railway termini.
1215. Taking 30 miles as the extreme limit for agricultural purposes, is it fair to assume that within 20 miles there would be a fair development? I should think so. There is some exceptionally good soil in that neighbourhood; but it would depend largely on circumstances. I would not like to say that if land were available closer to existing or projected lines of railway that people would be disposed to undertake the cartage by road over that distance.
1216. In this case we are dealing with land which at present is largely alienated within the 30-mile radius? Yes; I am referring, not only to Crown land, but to all the alienated land, the owners of which might be disposed to throw it open for agriculture.
1217. You think that under existing circumstances it is possible that the line to Grenfell would affect and serve land 20 miles westward;—it might be so under existing circumstances, but is it a reasonable assumption to say 20 miles? Yes; the circumstances would have to be favourable, even with regard to 20 miles. It would be necessary to have good crops and good prices.
1218. Is it not the case that all round the district, and for years past, they have cultivated that land fully 20 miles from a railway? Yes, decidedly; but in past years prices have been better than they probably will be when we begin to export produce in larger quantities.
1219. Have we not for some years past been governed almost by the state of the outside market? That is the tradition to some extent. We are supposed to be governed by Mark-lane prices; but I do not know that that is quite the case with regard to local prices.
1220. Yet, within a few pence, have we not been governed by outside prices, plus the cost of carriage? Yes.
1221. Seeing that during the last three or four years there have been very low prices, and the people have continued cultivating at a distance in that district fully 20 miles away from a railway, is it not probable that they will continue to do so? Yes, that is a reasonable assumption; but it is very difficult to

to understand what their position may have been during the last two or three years, or to what extent they may have become involved.

J. Harper.

1222. Assuming that between 20 and 30 miles is the distance over which the Grenfell terminus will exercise an influence, would not that go pretty well to the full extent of the agricultural country as far as we know? Yes; all the red-soil country until you touch the black soil.

9 Aug., 1899.

1223. Do you anticipate that the construction of a line towards Wyalong through that country would make a very considerable difference in the amount of land which will be put under cultivation within the 30-mile limit? I should imagine so. A considerable amount of land north and south of the line, within 20 miles of it, would be put under cultivation.

1224. If you go any considerable distance south, will you not get within the influence of Young—so that you could hardly expect to go 20 miles south? I am only speaking approximately. You will notice that in the map I have not gone more than 5 miles south on account of the influence of Young.

1225. Would it not be probably cheaper to use the railway at Young, if the road cartage were not too far, than to use the railway, say, 10 or 15 miles west of Grenfell? Yes, if it were south of Grenfell.

1226. If you go too far north of the proposed line, will you not come within the influence of the Forbes terminus? I have not allowed for anything in that direction. The extreme limit I have gone to is nearly 30 miles from Forbes.

1227. Have you been over the line between Wyalong and Temora within twelve months? I was over that country twelve or fourteen months ago.

1228. Did you notice any increase of settlement there, as compared with what you saw on your previous visit between Wyalong and Temora? Very little.

1229. Do you still think that the answer given by you in 1895 on that subject will hold good. The following is an extract from the evidence on that occasion:

Can you tell the Committee the character of the settlement between Temora and Wyalong? There is absolutely none, except mining. There are about half a dozen selectors on the road.

What have you to say with regard to that? Yes; it is practically the same now. I fully expected that the mining development at Wyalong would have led to more farming development in that part of the country.

1230. Do you still say there are only half a dozen selectors on the road? I do not say that; there might be twice as many, but I expected there would be a great many more by this time.

1231. I want to know whether, on the last visit, you noticed any alteration since that statement was made four years ago? It is almost imperceptible.

1232. Do you think that answer is approximately correct now? Twelve months ago I noticed very little difference in the amount of settlement between Temora and Wyalong.

1233. Would you be correct in saying that twelve months ago there were only half a dozen selectors there? I did not take the trouble to count the number of selectors at that time. I was not interested in the matter, as I was only returning home by that route.

1234. Supposing a line from Grenfell to Wyalong were not constructed, and the line now under construction remained at Grenfell, and another railway from Temora to Wyalong were constructed, how much of the country between Wyalong and Grenfell would be left unserved? In view of the policy of railway extension which we are now pursuing, I should think that any portion of the country 10 miles away from Grenfell would be badly served. As far as practicable in districts of that character, pioneer railways should be brought within 10 miles of people who wish to successfully cultivate for export.

1235. Does not that go against the generally-accepted idea of a 20-mile limit? No; I think 20 miles is considered the outside limit. I think that, in view of the policy which appears to be guiding the country in this matter—that is, to provide facilities for the development of agriculture—the road carriage should be reduced as far as possible, so that farmers on both sides of the line in agricultural districts should have the advantage of railway transit to market.

1236. Would not that involve rather heavy expenditure in railway construction? Yes; but I take it that there is some method in designing the whole of these railways. I cannot conceive that this line has been designed simply to run between Grenfell and Wyalong. I take it that it is a small portion of a western extension. It seems to me that, for the present at least, it would fairly equally divide the Western line at Condobolin from the South-western line.

1237. But in the meantime, I presume, we have to take into consideration the possibility of the line paying on its own basis? Yes, decidedly.

1238. The land which you have marked on the map as within the Bland area, which is approximately all black soil, would be traversed by the railway for a distance of about 22 miles? Yes.

1239. So that you have to cut out that section, so far as agricultural production is concerned, with our present knowledge of what can be done with that soil? Yes; but I would add, that whilst considering the agricultural interests, the pastoral interests should not be neglected, and from that area there would be large quantities of stock and wool traffic. It is splendid pastoral and fattening country. My estimate is that between 600 and 700 trucks of fat stock will be sent from that district to the metropolitan market.

1240. Do you think that that stock would not go to one of the three points which would be available if a railway were constructed from Temora to Wyalong, those being Grenfell, Wyalong, and Young? I should imagine that the better point to which it could go would be that where they would have the shortest transit to market, and where there would be the shortest distance for driving the stock on the road before being trucked. My experience is that, when settlement becomes closer, the pastoral industry requires more railway transit for fat stock than it did seven years ago when the country was open. As far as Wyalong is concerned, it would be a much greater distance. It would be 30 miles further for the Bland area. A point 40 or 50 miles from Grenfell would be in the Bland area, where facilities would be given for trucking stock and wool.

1241. Assuming that they went to the shortest point from which they could reach Sydney—say Grenfell—do you think that 40 miles of road would deter the owners from sending fat stock to market? No, I do not suppose it would, because our experience shows that 1,400 miles does not deter them from sending fat stock to market. It is quite within our experience that fat stock comes that distance from Queensland.

1242. Is it not a fact that you now get at Young a great deal of the fat-stock traffic from the Bland? Yes.

1243.

- J. Harper. 1243. If the season is good, and they have fat stock, will they send it a reasonable distance to market?  
Yes.
- 9 Aug., 1899. 1243½. The advantage you would get with regard to this railway, as far as the Bland is concerned, is that you would get another 50 miles of railway freight? That is an advantage certainly, as far as considering the merits of the line is concerned; but, I think, we are entitled to look at the matter in another way. While every attention is paid to the agriculturist we should see that the interests of the pastoralists are not neglected.
1244. Is there any chance of the stock traffic paying, as far as constructing railways is concerned, unless you have a very large area to serve? Certainly not.
1245. Would it be likely that the stock traffic from the Bland country would itself pay for constructing a railway? No. If it were merely a question of dealing with the stock traffic from the Bland country, I should say that there is no justification for a railway.
1246. Would not the main traffic for a line from Temora to Wyalong be gathered at a terminal point—that is, about Wyalong? Yes; but there would be intermediate traffic at Barmedman.
1247. What I mean is that the main objective in building a line is Wyalong? Yes, Wyalong and the west, and, to a limited extent, the south.
1248. But Wyalong and the west would be the main thing to be aimed at, and consequently the greater portion of the traffic would come from there? Yes.
1249. Does that traffic mainly go by way of Temora now? Yes.
1250. In so far as we succeed in attracting in a new direction from Wyalong to Grenfell, will you take it away from the existing line at Temora? Yes; but I may add that it is always urged that a railway will develop more traffic. The probabilities are that so much traffic will be created at Wyalong by the construction of a line from Grenfell as will compensate for anything which will be lost to Temora. I think that that is a fair thing to assume.
1251. Would it compensate for the full amount of traffic which goes from Wyalong to Temora now? I should hope so. The district will be developed by the railway passing through it, and the country to the west of Wyalong will also be developed; agriculture, and possibly mining, will be developed, and any loss in the trade between Wyalong and Cootamundra will be compensated for.
1252. At present, does all the traffic practically go by way of Temora? Yes.
1253. Do you make any allowance in your estimate for loss which would be sustained on the Temora line? Yes; that estimate presents a net estimate, less the amount, which to-day is obtained at Temora.
1254. What would that loss amount to? About £3,000. That is the value of the Wyalong traffic to-day at Temora.
- 1254½. Yet the Temora line shows a deficit? Yes.
1255. So that with the construction of the Grenfell-Wyalong line it will show a still heavier deficit? It would immediately; but I do not know that it would, subsequently.
1256. What new avenues could be opened up for Temora? I think there is a very strong possibility of agricultural development taking place west of Wyalong. Then there would be the agricultural development which would take place between Grenfell and Wyalong, and that would compensate for the loss which might be sustained on the Temora line. Personally, I do not regard it in any sense as a competitive line with Temora. The Temora line was built, as Members of this Committee know, for a specific purpose, before Wyalong had been heard of. It is not as if the line from Cootamundra had been built subsequently to reach Wyalong. The Wyalong traffic came in quite incidentally.
1257. For what specific purpose was the Temora line built? It was built as an agricultural line primarily, and to a centre of settlement which did not promise at that time as well as Wyalong does to-day.
1258. But should the fact of its having been built to reach Temora, and to go into agricultural land, prevent the consideration of its suitability as a starting-point of another development? No. I wish to make my position absolutely clear. This line is not projected as a rival line with the Temora line, and it is not as if the line to Temora has been designed for the purpose of reaching Wyalong.
1259. What is your opinion of the country between Wyalong and Temora? I do not think it is nearly as good as the country between Grenfell and the Bland country.
1260. That is, you do not think the land between Temora and Wyalong is as good as the land between Grenfell and the point where the black soil commences? Yes.
1261. Do you know the country round Temora? Yes.
1262. Did you ever see that country before the railway was taken through in the early days? Yes; I was out in that country when the line was in projection.
1263. Do you know that it is now considered that the land around Temora is fair wheat land in good seasons? Yes.
1264. Was there much difference in the appearance of the Temora land before the railway was made, and in the direction of Barmedman? Yes; the land in the neighbourhood of Temora struck me as being much better than a great deal of the land between Temora and Wyalong. It falls off as you go towards Wyalong. I am not going to decry the quality of the land in which the mallee grows, but I am only speaking of it as regards practical settlement. I went to Temora when the rush first broke out precisely as I went to Wyalong, and I carried away fairly vivid impressions of both trips. I have no hesitation in saying that the country between Temora and Cootamundra, where I travelled at that time long before I travelled for the purpose of reporting on a railway, seemed to me to be better land than that which I travelled over between Temora and Wyalong, when the rush to Wyalong first broke out. That impression was confirmed when I last travelled over it.
1265. Do you know that they are growing wheat right up to Barmedman now? Yes.
1266. Of course, beyond that there is no appearance of cultivation to any extent? No.
1267. Have you ever been off the road between Barmedman and Wyalong? I have been about 4 or 5 miles back to the east from the road.
1268. Was there any difference in the appearance of the country east of the road between Barmedman and Wyalong? Yes; there are patches which are better than the land between Barmedman and Wyalong—there are flats which are better.
1269. I think you stated yesterday that you attached some importance to the wisdom of connecting Wyalong with the Western railway, with a view to reaching the coal resources? It is a matter worth considering, but it is a question on which geologists could give a better opinion.

1270. The Government Geologist, in his evidence a few days ago, told the Committee that he did not think there would be any variation in the character of the ore which would be obtained at Wyalong—that the same class of ore would continue to be obtained at the lower levels;—is it not a fact that there is no necessity for using coal to smelt the ore at present obtained? Of course, I would not like to differ in any way from the opinion of the Government Geologist, as he is a better authority than I am on that subject. I incidentally mention that matter because we have the experience of other fields. I heard only the other day that it was anticipated there will be some very rich silver and copper developments in the Inverell district. That was overlooked before, and it is only the fact of a railway being constructed there which has opened up the prospect of those deposits being dealt with.

J. Harper.  
9 Aug., 1899.

1271. You have referred to the fuel requirements at Cobar, but are not the requirements at Cobar quite different from those at Wyalong, seeing that it is smelting from beginning to end at Cobar? Yes. But the whole of the district we are referring to is understood to be a mineral district—practically the whole district, both west and north-west—and it is hard to tell what developments may take place.

1272. Have there been any prospects, so far, of anything except gold? I cannot say.

1273. Have you heard of any other prospects, except gold, around that district? No.

1274. Do you think that, on the whole, a line from Grenfell to Wyalong would give better results than a line from Temora to Wyalong? Yes.

1275. Do you not think that, to some extent, it is right to consider the people who are already engaged in traffic with each other—for instance, trade relations are already established between the Temora and Wyalong people;—if other things were equal, would you not be justified in considering the fact that these trade relations already exist? Our experience is that when a railway line is opened trade relations of that character cease to exist. The facilities given by railway communication enable people to seek other markets and avenues for business. I can mention an instance which has occurred only within the last fortnight. An officer was sent to Manilla to prepare a time-table which would be satisfactory to the residents of that district. We were under the impression that their trade relations with Tamworth having existed so long they would naturally desire a service which would continue those trade relations, but, to our astonishment, 90 per cent. of the people there did not study Tamworth in the matter at all. What they wanted was communication which would bring them within the readiest access to Newcastle and Sydney. As far as they were concerned, having a railway, Tamworth had ceased to exist, except as another town on the line. They selected a time-table which gave them the readiest communication with Newcastle and other places. I do not mean to say that the Tamworth people would quite approve of the same thing, but it is the people at the other end whom we have to consider.

1276. In that case, is it not possible that the consideration would come in that passengers would be benefited by having communication with a mail train, while the goods would suffer nothing? As far as that is concerned, I suppose that both Manilla and Tamworth, and also Wyalong and Grenfell, would do their business with Sydney or Newcastle houses.

1277. Would you think it worth consideration if it were a fact that the Wyalong people desired a connection by way of Temora? That is a matter for the Committee to consider. If a line were built from either point to Wyalong, I do not know whether the people there would consider either Grenfell or Temora.

1278. The Temora line junctions with Cootamundra, and practically with the Gundagai line; by that means it is possible to get from Temora into the hilly country with a comparatively short run;—do you think it is worth considering that the people west of Wyalong would, by that means, have a chance of getting their stock into the hilly country, if necessary, by means of a much shorter run? The last season has been quite a novel experience, so far as the movement of stock is concerned. Although the people north of Wyalong might be desirous of getting to the hilly country about Gundagai in the event of a drought of a general character, it is an open question whether they could get there, because our experience is that the whole of that country was occupied by Riverina squatters, who were able to pay a better rent for the country, owing to the high class and value of their stock. Ninety-five per cent. of the stock which went to Gundagai came from the Riverina.

1279. But that does not show that there was not room for a little more? Practically there was no more room.

1280. Does it follow that there would always be a drought in the Riverina at the same time that there would be one at Wyalong? The whole thing is problematical. Large portions of the Central Division, in the neighbourhood of Wyalong, such as Orange and other places, would be equally as available as Gundagai; and, in fact, that part of the country was availed of by western squatters—I refer to the country around Dubbo and Orange. We carried enormous numbers of stock to those districts. As a matter of fact, we rarely carry starving stock; it is quite exceptional, and I hope it will continue to be so.

1281. Can you tell the Committee why the Commissioners seem to be anxious to load the Western line with branches, in view of the fact that the grades on that line are heavy? Would you be surprised to hear that there is twice as much mileage of 1-in-40 grades on the Southern line between Cootamundra and Sydney as there is between Blayney and Sydney.

1282. I would not be surprised; but I suppose I am stating a fact when I say that the grades are heavier on the Western line? As a matter of fact, there are 8½ miles with a grade of 1 in 40, and 1 mile of 1 in 35 on the Southern line, while on the Western line, in the direction of Sydney, there are 4 miles of 1 in 40, and 1 mile of 1 in 35. I may also add that the Commissioners have now, either in construction or in projection, deviations and grade reductions which will take out the greater part of those grades, with the exception of one or two points, where the assistance of another engine will neutralise the effect of the grades.

1283. Are they not doing the same on the Southern line? Yes.

1284. If the grades are practically good on the Western line, how do you account for the fact that the mail train takes one hour fifty minutes longer to get to Blayney from Sydney than it does to get the same distance on the Southern line? The stops on the Western line are more numerous and longer, for the reason that we have only one through train on the Western line, which has to take all the traffic, whereas on the Southern line we have the Express and the Mail trains, so that there are two trains to do the work of one on the other line.

1285. I have counted the stopping-places in your time-table, and I find that in that distance on the Western line they only exceed the stops on the Southern line by seven? A greater time is allowed for

- J. Harper. the stops for the reason I have indicated—that is to say, the greater volume of business, on account of there being only one train, causes nearly an hour's difference between those points.
- 9 Aug., 1899. 1286. Do you know that there has been a fair amount of mining development between Temora and Wyalong? Yes.
1287. There may be developments there in future, and do you not think that matter should be considered? That is a matter for the consideration of the Committee. I should not be disposed to consider it from what I saw. When I was there four or five years ago there were a number of localities where mining had been started and had been abandoned.
1288. I have now found what I was referring to with regard to the difference in the grades on the Western and Southern lines;—in an appendix to the evidence given by Mr. Deane, in connection with the line Koorawatha to Grenfell, there is a statement showing that the total rises against the load from Grenfell to Sydney, *via* Young and Harden, or on the Southern line, was 6,841, while the total rises against the load on the Western line, *via* Koorawatha and Blayney, was 7,598? They are being reduced, and Mr. Deane would include everything up to 1 in 100, which is neither here nor there.
1289. But 1 in 75 is the highest given in this return? We are now reducing the number of the grades on the Western line, which were 1 in 40, to 1 in 75.
1290. But are you not also making great alterations on the Southern line? They are being carried out more extensively on the West, for the reason that the volume of traffic on the West is so much larger than on the south.
1291. But will not that volume of traffic become greater if you continually run your branches on to the Western line? That is all the more justification for reducing the grades.
1292. Although you starve the other line? I do not consider that.
1293. *Mr. Twickett.*] When Mr. McLachlan was here he promised to furnish us with some more figures through you? I do not know that I can give you any more.
1294. What do you think will be a fair reduction to make from the Temora branch owing to the subtraction of the Wyalong trade? I have already stated that £3,000 is allowed for that: £700 for passenger traffic and £2,300 for goods traffic.
1295. He also promised to give us a return of the earnings of the Temora line since it was started, up to the present;—did he hand you that? No; but I think I can give you the returns up to the end of last year, showing how the figures stood, as far as the line was concerned, after providing working expenses.
1296. Have you gone into the question of the population of Wyalong? Yes; I have had a return furnished to me showing that the population is 4,300.
1297. Then the population has decreased since we had this connection with Wyalong before us last time? Yes; but it was practically a new rush at that time. I think it has now settled down, and may be regarded as fairly stationary.
1298. The water supply was considered at the last inquiry;—do you know what condition that is in at the present time? I did not hear any complaints about it twelve months ago. I do not know how it is now.
1299. Have you a detailed statement of your traffic estimate? Only a general statement.
1300. Have you not sometimes handed in statements with regard to the estimated traffic from various stations? I have not been able to go into it in that detailed way. My time is more limited than it used to be, but still the figures have been worked out just as accurately, the only difference is that I was then able to devote more time personally to it. The traffic coming in at Wyalong is estimated at 1,500 tons of goods, at 5s., £375; 2,000 tons, at 12s. 6d., £1,250; 661 tons of wool, at 9s., £297 9s.; 656 tons of ore, at 1s. 6d., £49 4s.; total, 4,817 tons, £1,971 13s. At the Bland crossing—80 tons of goods, at 5s. 8d., £22 13s. 4d.; 60 tons, at 11s. 4d., £34; 740 tons of wool, at 9s., £333; 570 trucks of stock, at 6s. 10d., £194 15s.; total, £584 8s. 4d. Wheogo—25 tons of goods, at 5s., £6 5s.; 181 tons of wool, at 3s., £27 3s.; total, 206 tons, £33 8s. Total, 5,903 tons, and 570 trucks of stock, £2,589 9s. 4d. That is allowing the reductions I have mentioned for the Temora traffic.
1301. Then, in a statement which the Commissioners have handed in, the revenue from passenger traffic is estimated at £2,054; mails, £720; parcels, £500; making a total of £5,863? The passenger traffic is made up in this way: 5,000, at 10s., £2,500; 500, at 7s. 6d., £187 10s.; total, 5,500, £2,687 10s. Less, diversion from Temora, 2,000 passengers, at 6s. 4d., £633 6s. 8d., leaving a net total of £2,054 3s. 4d. for passengers.
1302. Is the item of mails calculated on the usual mileage? Yes, £12 per mile. You will observe in that that very little credit is given for wheat or anything of that kind. It is an unknown quantity as far as that district is concerned.
1303. When you were examined before on the Temora-Wyalong proposal in 1895, you then put down the probable estimate of earnings of that railway at £2,764? I did not allow for a population of more than 1,800—that was including the intermediate population at Barmedman.
1304. You then put it down at £2,764? Yes.
1305. What is your present estimate of that traffic? I have made no estimate; that has not been before me.
1306. Do you think it is more at present? It would naturally increase with the settled population.
1307. Could you give the Committee even a rough estimate? I would not like to undertake it.
1308. When you made up that estimate of £2,764, on what basis did you make it? I took the actual wool and stock traffic which we then had. I based it on the average rate of consumption per head which we know fairly represents what each unit of population would consume. That was on the basis of 1,800, and that included the intermediate population. Everything we did was to form an estimate on the then population.
1309. When the Temora-Wyalong proposal was before us was it your opinion, and also, I think, the opinion of the Commissioners, that it would be judicious to let that railway stand over? Yes.
1310. Is that still your opinion? Yes. If an extension is to be constructed to Wyalong, I certainly prefer it from Grenfell.
1311. Now that the Parkes-Condobolin line is constructed, and the Koorawatha to Grenfell railway under construction, do you not think it is desirable to construct the Temora-Wyalong line as a means of tapping the western country? I do not think a line from Temora to Wyalong is desirable. My view is that a western extension towards Hillston should take place by way of Grenfell and Wyalong.
1312. Was it made a condition that the land through which the Koorawatha-Grenfell line is to be made should be given free by the owners? Yes.

J. Harper.  
9 Aug., 1899.

1313. Has that been carried out? So I learn from Mr. Deane.

1314. Was there not also a kind of betterment clause put in the Act? I do not remember that; but such a condition was put in another Act.

1315. Do you regard that as an equitable provision? There is very much to be said for and against the betterment principle; I have not considered the question.

1316. Do you consider that the principle of betterment is equitable? Yes.

1317. But you do not wish to pledge yourself to the mode of carrying it out? No.

1318. At the present time, does all the trade to and from Wyalong and the metropolis go by way of Temora? Yes.

1319. Would the people of Wyalong be much prejudiced by having to divert their course of trade if a line were constructed from Grenfell? Taking into consideration the fact that the whole of their business is with Sydney, and that the haulage is 6 miles less by the proposed line, they would not have much reason to complain.

1320. If the feeling at Wyalong is in favour of a connection with Temora, I suppose it must be a kind of sentimental feeling, because the actual cost of transit will not be more? It will be less by 6 miles.

1321. *Mr. Dick.*] It is a fact, I believe, that the estimate for the Wyalong to Temora extension is £50,000 less than that between Grenfell and Wyalong? I cannot tell, as I have not got the figures before me.

1322. Can you give even an approximate estimate of the traffic to be derived from the construction of the Temora to Wyalong line? I cannot do so now; but I should anticipate there would be more from the Grenfell-Wyalong line, by reason of the fact that it would attract the whole of the Bland wool and stock traffic, which would not be taken to Wyalong if a line were constructed from Temora to Wyalong. The disposition would be to continue on, as Mr. Watson indicated, to Young with their stock. That country is intersected by the Grenfell to Koorawatha line, and they would have to go back, to reach Wyalong with their stock. You may practically take Marsden as the centre of the district. As you will observe from the map, in order to reach Wyalong they would have to go back on their route to the market. Their disposition would be to continue as at present—to go to Grenfell or to Young. Hence I should expect a smaller traffic on a line from Temora to Wyalong than on a line from Grenfell to Wyalong. Then, as I have already stated, I consider that the country at least 30 miles west of Grenfell is better than that between Temora and Wyalong.

1323. Do you not anticipate any intermediate traffic between Wyalong and Temora, and also westward of the proposed Wyalong to Temora line? Decidedly. There is settlement at Barmcdman. The population at Barmcdman is not as great as that at Marsden, by 220.

1324. Taking the so-called rival routes, Grenfell-Wyalong and Temora-Wyalong, does it not appear to you that the Temora-Wyalong would open up and supply a larger area of new country as yet unserved by railway than the Grenfell-Wyalong line? No. There is, however, a lot of excellent country west of Temora, and the question will have to be determined some day as to how it can be served. Probably it would be done by a line running parallel with the Southern line. A line was projected from Coolamon in that direction to Ariaiah, but the Committee rejected it. I have not the least doubt that some day a line will have to be projected west from Temora to this country, which is excellent agricultural land. But a line between Temora and Wyalong would be of very little advantage to the country in the direction of Ariaiah.

1325. Could you prepare an estimate of the probable traffic on the Temora-Wyalong line? Within a fortnight, perhaps, I could have it done. It would have to be investigated on a number of points. I am extremely doubtful whether traffic from the Bland district would find its way into Wyalong; it would continue to go to Grenfell or Young. It would have to be discarded from the estimate of stock and wool traffic, which I have included in the line from Grenfell to Wyalong. An officer would require to go to the district and pick up the information.

1326. *Mr. Watson.*] Do you anticipate any great amount of traffic being attracted towards the line from Grenfell to Wyalong from the south of Wyalong—that is, towards Barmcdman? No.

1327. Would Wyalong be further from Sydney than Temora for such traffic? From the pink edging you will see that approximately about 10 miles of country are shown there, but it is all mallee country, and there is nothing in it at present.

1328. *Dr. Garvan.*] With regard to starving sheep, we have had a great deal of evidence as to the possible value of westward-stretching railways in drougthy years, and we have been told that this year something like 15,000,000 sheep have been lost through drougth;—if we had had those railways which have been spoken of, do you think we could have found feed for 15,000,000 or 20,000,000 sheep in the highlands? I am certain you could not. As a matter of fact, we removed altogether 1,250,000 sheep, and they were removed all over the country, some from as far as Queensland in the north. I know that it was only with the utmost difficulty, and by paying most extraordinary prices, that country was procured for that number. If it had not been for the fact that the drougth did not affect the Central Division in certain districts, they certainly would not have been able to accommodate that number.

1329. If 2,000,000 of sheep had come forward, or more, could they have been accommodated? No; the necessary country could not have been found. As a matter of fact, they exploited the whole of the Coast district as far as Port Stephens, especially with cattle, and a good many came back as bad as when they left.

1330. In a drougthy year, could sheep be sent on to the eastern slopes without any fear of foot-rot? I think there would not be much fear of foot-rot; but there might be of fluke.

1331. I understood you to say that the country about the foot of the Australian Alps is pretty well taken up by the Riverina squatters? Yes.

1332. Do they pretty well stock it with their own sheep? That country was rented this year, and speaking approximately, I think that about 100,000 sheep were sent there, and that exhausted the country which was available.

1333. Then that Australian Alps country could not have taken up 1,000,000 sheep? Apparently not; because that was all they sent there. I know that Mr. McCaughey, who sent his sheep there, paid a very high rent.

1334. When people indulge in general talk about the value of pushing railways to the west for starving stock, is there some illusion about it? Such railways would assist in saving starving stock by enabling them to carry fodder. Enormous quantities of fodder were taken to the sheep during this drougth.

1335.

- J. Harper.  
9 Aug., 1899.
1335. Would it pay to take fodder to the ordinary class of sheep? No; but a great many of our flocks are of such a character, they have been bred up for so many years, that they are worth preserving even at a greater cost than their value. That is the case, especially with Riverina sheep.
1336. With regard to the least valuable sheep, we have had evidence that it is better to let them die than to take food to them? No doubt that is the experience. As a matter of calculation, it may be assumed that it would cost 5d. a week to feed a sheep. That does not seem to be a very large amount; but in six weeks it would come to as much as you would get off that sheep, because that amount would represent the value of the wool.
1337. If we had an unlimited market for frozen meat, would it be a good thing to have railways to take the sheep down before they perished? Yes; but at present they are only valuable for their wool. There is no inducement, with the limited market which we have, to fatten them.
1338. We could not look for any great paying traffic in the conveyance of what we call starving stock? No. Of course, in the interests of the country it would be a good thing to be able to carry the starving stock to better country; but, as a matter of fact, the carriage of starving stock has involved the Commissioners in very serious loss, for this reason: 50 per cent. rebate is given, and the carriage is infinitely more costly than in the case of ordinary fat stock. The movements of the waggons and engines are so erratic, and the demand is so strong, that we frequently had the following occurring during three or four months, when the removal of the stock was being carried out to the utmost extent: perhaps forty sheep-waggons were sent from Flemington to Hay, or somewhere in Riverina, to remove stock to Gundagai; there was a very short full haulage, and a very long empty haulage. On arrival at Gundagai, the same waggons would frequently be required to be sent direct from Gundagai, perhaps, through to Bourke, empty, in order to bring sheep to Dubbo.
1339. So far as the Railway Commissioners are concerned, the starving stock business is a losing one? Yes, so far as carrying the stock is concerned; but ultimately it will be an advantage.
1340. If we are to occupy Riverina, stock it up, and expect to keep the stock alive through dry seasons, we must find artificial feed? Yes; otherwise the stock must die.
1341. Are these the only alternatives at present? Yes.
1342. Is the railway now before us one of those lines where we are called upon to face an initial loss in the hope of making it good in a few years' time? Yes.
1343. As an expert in traffic, would you recommend that as a good policy to a Government which is the great landowner as well as the great railway proprietor? Yes; it is absolutely good policy, and as you have invited my remarks on the subject of policy, I think that, associated with these non-paying lines, some provision should be made for a sinking fund—that is to say, the ordinary business of existing lines should not be called upon to bear entirely the burdens of these non-paying lines. I can foresee what inevitably must happen if we continue to construct these non-paying lines, and if, at the same time, the Railway Commissioners are expected by the country to return interest on the capital cost, as well as working expenses; that is to say, freights and fares must be maintained at a level which I consider is abnormal, as far as the development of the country is concerned.
1344. That is to say, if the people of the district want a railway which will impose a loss upon the general revenue of the Department, they should make a contribution to cover that loss? I would not advise that, in the sense that the district should be burdened. My own opinion is that the general revenue should bear these losses, or some portion of them. The railway debt is increasing year after year. Of course, it is not for me to indicate from what source this should come; but, as a matter of fact, it is the users of railways and the people who are developing the country who are really meeting those losses now.
1345. Does not the general revenue bear the loss now? No; the Commissioners are paying the interest on the capital cost, and that can only be done by the users of the railways contributing the money to do it.
1346. Do you think the users of the railway should be willing to pay such fares and freights as would make the line a paying line? No; not the users of that individual line.
1347. But taken as a whole? They are doing it to-day. What I mean is that the whole cost of developing the country generally should not fall upon the users of the railway.
1348. Do you think that the proprietors of the land who get their land increased in value should pay it? I think the great proprietor of the land—the Crown—should have made provision long ago to write down the interest. It might have formed a fair charge against the Crown lands as alienated, and as their value was improved by the railways.
1349. Would it be fair that wherever a new line is made all the unsold land within 20 miles on either side should be sold at a railway valuation—that is to say, supposing any enhanced value is given to it? As a matter of fact, I think that is the position to-day. I think the land is sold at a price including the added value by reason of the railway being there.
1350. Is not the land taken up at the upset price? As far as leasehold land is concerned, when it is assessed, the fact of its being close to the railways is taken into consideration.
