148. *Mr. Hyam.* Can you tell me the length of the country that would be affected by flood and by backwater on the Grenfell to Wyalong proposed extension? I am afraid I cannot tell you that now, without reference to the section of the line. My experience with regard to flooded country is that the accounts, as a rule, are very much exaggerated. Where water stands during rain, where it appears on the surface, it is looked upon very often as flood country, whereas that is simply the effect of local rainfall which cannot get away quickly.

149. Do you not think that the construction of that embankment to carry the railway across the Bland would have the effect of backing up a lot of this water in the early part of a flood, unless you had a great number of openings, and would it not conduct the water down the sides of the embankment, and possibly wash them away? No, it would not wash them away. It might dam up the water if the waterways were not sufficient, and the water might go over the rails. But the mere contact with the embankment would not cause it to wash away. However, if I were authorised to construct that line, I should take very great care to investigate the matter and to be quite sure that we had got the right thing, if it were possible to get the necessary information. That is one reason why, in these estimates, I like to include a considerable amount for contingencies. You do not know what direction the demand may come from—whether in the way of waterways or increased cost of earthworks; but it is always very desirable to have a stand-by in the way of contingencies, and I have that in connection with this line. I think that having that reserve, so to speak, I shall be perfectly safe in this estimate.

150. You would be within your estimate? Yes.

151. You spoke of two viaducts, one on each side of the bridge—would these be timber viaducts. Yes.

152. Are they included in the estimate? Yes.

153. They would be long viaducts? Yes.

154. Would they be very high? No, the worst part only 3 to 4 feet high, except in the main channel of the creeks.

155. Would the bridge over the Bland Creek be of wood or of iron? Wood. It is cheaper, and sufficiently durable.

156. What would be the average height of the embankment across this country? I can find that out for you.* I have been making lately a very cheap kind of waterway with 100 lb. rails. Previously, in using only the 60 lb. rails over the smaller openings, only a short stretch could be given, but for these light railways I find that one can use the 100 lb. rails as bridge girders for lengths of 5 feet, and by putting a couple of piles and a head-stock on those, to serve as a pier, I get a very cheap and efficient waterway. The water can rise up to the under side of the rails and there is no obstruction in the shape of wooden beams or stanchions. I save the sleepers over that part, so altogether it comes out very cheap.

WEDNESDAY, 26 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. CHAIRMAN).

|--|---|--|
| THE HON. PATRICK JANDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, J.L.D.
THE HON. SOLOMON HERBERT HYAM. | } | JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN McFARLANE, Esq. |
|--|---|--|

The Committee further considered the expediency of constructing a line of Railway from Temora to Wyalong.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

157. *Chairman.* Have you a statement to make in regard to the traffic on the proposed railway? I produce the following report of the Railway Commissioners:— J. Harper.
26 Sept., 1900.

Office of the Railway Commissioners of N.S.W., Sydney, 26 September, 1900.

Proposed Line of Railway from Temora to Wyalong—41 miles 48 chains.

In compliance with the request of the Honorable the Minister for Public Works, and in pursuance of the Public Works Act of 1888, section 13, we beg to report as follows:—

Estimated Expenditure—

| | | |
|---|--------|--|
| Engineer-in-Chief's estimated cost of construction (exclusive of land resumption), £126,810, at 3 per cent..... | £3,804 | |
| Maintenance, traffic and locomotive expenses..... | 4,438 | |
| | £8,242 | |

Estimated Revenue—

| | | |
|-------------------------------------|--------|-----|
| Merchandise and live stock | £2,980 | |
| Passengers, parcels, and mails..... | 2,735 | |
| | £5,715 | The |

* NOTE (on revision):—The average height would be less than 1 foot.

J. Harper.
26 Sept., 1900.

The expenditure is based upon a train service every week day. When this line was last reported upon—on the 11th May, 1894—the future of Wyalong appeared so uncertain that its construction could not be recommended.

There is now, however, every indication that the settlement has become permanent, and, in our opinion, the time has arrived when Wyalong should be afforded the advantages of railway communication.

In compliance with a request from the Minister for Public Works, we reported, in December, 1898, upon a proposal to connect Wyalong with Grenfell; and, having had the advantage of traversing both routes, we had no hesitation in stating that when the time arrived for Wyalong to have the benefit of railway connection it should be from Grenfell.

We are still of that opinion, notwithstanding that the distance from Grenfell is about 17½ miles greater than from Temora.

The country is capable of greater development. The objective point, Wyalong, will be brought 8 miles nearer to Sydney than by the Temora route, and about 60 miles nearer to the western coal-fields—a factor which we regard as of considerable future importance.

Although increased cultivation has taken place between Temora and Wyalong since 1894, approximately one-half of that which now exists is within 14 miles of existing lines.

The Common Seal of the Railway Commissioners of New South Wales was herewith affixed this 26th day of September, one thousand nine hundred, in the presence of,—

W. M. FEHON,
Deputy Chief Commissioner.
DAVID KIRKCALDIE,
Commissioner

H. McLACHLAN.

I also put in the following report:—

25th September, 1900.

Estimate of Traffic for a proposed Railway, Temora to Wyalong, 41½ miles.

As directed by the Commissioners, I have had very careful inquiries made as to the probable traffic to be carried by this proposed railway, which is shown to be 41½ miles in length, and estimated to cost £126,810, or £3,048 per mile, exclusive of land and compensation, the ruling gradient being 1 in 100.

When an estimate for this line was made by the Commissioners in 1894, Wyalong had only been a few months in existence, and there was practically little or no intermediate traffic to be served; but according to the latest information I find there has recently been considerable agricultural development within a radius of 20 miles of Temora, in the neighbourhood of Reefton and Barmedman; and there has also been an increase in the Wyalong district since the consideration of the Grenfell-Wyalong proposal. The intermediate traffic between Temora and Wyalong, which was not an important factor at the time this question was previously dealt with, is now deserving of consideration. Altogether there are about 23,000 acres of cultivation to be served at the following trucking stations:—

| | Miles from Temora. | Acres under cultivation. |
|-----------------|--------------------|--------------------------|
| Reefton | 12 | 11,000 |
| Barmedman | 22 | 5,000 |
| Wyalong | 42 | 7,000 |
| Total..... | | 23,000 |

But the bulk of the cultivation shown for Reefton is within 14 miles of the existing line at Temora, although it will be better served at Reefton.

Wyalong is reported to be in a very prosperous condition, the output of gold having increased every year, and has reached as high as 46,675 oz., valued at £178,700. The population is also reported to be almost stationary, and numbers about 4,200, but including the district the proposed line will serve, about 6,000 souls.

Assuming that Wyalong will retain its present population, the following is my estimate of the traffic, based upon a favourable year for wool and stock, namely, 1894-5 season, and upon the latest information concerning agriculture and general goods traffic:—

| Description. | Tons. | Trucks. | Amount. |
|----------------------------|-------------|-----------|---------|
| Goods traffic | 4,120 | ... | £1,532 |
| Wool traffic | 1,982 | ... | 595 |
| Agricultural produce | 7,700 | ... | 601 |
| Live stock | ... | 600 | 252 |
| Totals..... | 13,802 | 600 | £2,980 |

| | |
|---------------------------------|--------|
| Passenger traffic..... | £1,381 |
| Parcels and other coaching..... | 350 |
| Mails..... | 504 |
| Total..... | £2,735 |

| <i>Summary.</i> | |
|------------------------------|--------|
| Goods, wool, and stock | £2,980 |
| Coaching and mails | 2,735 |
| Total..... | £5,715 |

The trafficable area allowed for is as shown in the accompanying map. It takes in Trungley, Barmedman, and Cooraboorama stations. The Bland country, Marsden and Lake Cowal on the east and north-east; and Mandamah, Wyalong, No. 3 Wyalong, Yalgogrin, and Narriah stations on the west, and also extends about half way to Condobolin and Euabalong on the Lachlan River, in which area the following principal wool clips are embraced:—Billabong, Younger Plain, Ungarie, Wollongough, Four-bob Camp, Bolygamy, Murringreen, Youngara, Bygalorie, Malonga.

From the wool stations enumerated there would be a diversion of 102 tons of wool from Condobolin, 110 tons from Whitton and Narrandera, and 336 tons from Young; total, 548 tons. The loss by diversion from the three first-mentioned points would amount to about £110. No loss would be sustained on the consignments diverted from Young.

In dealing with the estimated traffic, consideration has been given to the influence of the Grenfell section, and the proposed line from Temora to Gunbar. I think the estimate furnished is a liberal one in every direction.

J1 HARPER.

I also put in the following tabulated statement:—

ESTIMATE of traffic for proposed Railway, Temora to Wyalong—41½ miles.

Goods Traffic Estimate.

| Trucking point. | Distance from Temora. Miles. | Goods traffic. | | | Wool traffic. | | | Stock traffic. | | | Agricultural produce. | | | Total Goods, &c., traffic. | | |
|-----------------|------------------------------|----------------|-------|--------|---------------|-------|--------|----------------|-------|--------|-----------------------|-------|--------|----------------------------|---------|--------|
| | | Tons. | Rate. | Amn't. | Tons. | Rate. | Amn't. | Trucks. | Rate. | Amn't. | Tons. | Rate. | Amn't. | Tons. | Trucks. | Amn't. |
| Reefton | 12 | 60 | 3/- | £ 9 | ... | ... | £ | ... | ... | £ | ... | ... | £ | ... | ... | £ |
| | | 40 | 2/- | 4 | 138 | 2/6 | 17 | ... | ... | ... | 3,700 | 1/- | 185 | 3,938 | ... | 215 |
| Barmedman | 22 | 200 | 6/- | 60 | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... |
| | | 220 | 3/- | 33 | 556 | 4/- | 111 | 400 | 6/5 | 129 | 1,700 | 1/6 | 128 | 2,676 | 400 | 461 |
| Wyalong | 42 | 1,750 | 11/- | 963 | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... |
| | | 1,850 | 5/- | 463 | 1,288 | 7/3 | 467 | 200 | 12/3 | 123 | 2,300 | 2/6 | 288 | 7,188 | 200 | 2,304 |
| Total | | 4,120 | ... | 1,532 | 1,982 | ... | 595 | 600 | ... | 252 | 7,700 | ... | 601 | 13,802 | 600 | 2,980 |

| <i>Coaching Traffic Estimate.</i> | | |
|-----------------------------------|--------|----------|
| Passengers, 5,000 at 7s. | | } £1,881 |
| " 750 at 3s. 6d. | | |
| Parcels and other coaching | | 350 |
| Mails, 42 miles, at £12 | | 504 |
| Total | | £2,735 |
| <i>Summary.</i> | | |
| Goods, wool, and stock | £2,890 | |
| Coaching and mails | 2,735 | |
| Total | | £5,715 |

J. Harper.
26 Sept., 1900.

I may state that the traffic of Barmedman would not come in under the Grenfell estimate; but the quantity of the traffic which would come in at the Bland crossing under the Grenfell estimate is also shown in this estimate as likely to be attracted towards Wyalong. I put in the map to which reference is made in my report upon the estimate of traffic over the proposed railway.

158. I believe that the last estimate of revenue for the Grenfell to Wyalong extension was £5,863? Yes.

159. Seeing that the distance is 40 per cent. longer, would it not be reasonable to expect, if the country were equally good, that the estimate of traffic would be 40 per cent. higher? No.

160. For what reason? Because you are controlled by the influence of local rates—that is to say, of maximum rates. For instance, the maximum rate for the Southern line is £5 a ton. Wherever the rate exceeds that you could not credit the lines with it.

161. Do you mean that the Wyalong-Temora extension will rob existing lines more than will a Grenfell-Wyalong extension? No. I have indicated in my report all that the line will rob existing lines of, namely, about £110.

162. Do the Railway Commissioners and yourself still hold to the opinion that the district between Grenfell and Wyalong is capable of greater development than is the district between Temora and Wyalong? Yes.

163. Have you had an opportunity of seeing the Bland country recently? I have not been through it since 1898. Of course I do not know what agricultural development has been going on there; but, I think the Railway Commissioners hold the view which they have all along expressed, namely, that a Grenfell to Wyalong line will better divide the country, and that, with a line at Wyalong, the district between Wyalong and Temora will be served within 20 miles from a central point of a line on either side.

164. *Mr. Shepherd.*] Do you not think that the country between Wyalong and Temora would be fairly well served by a line running from Grenfell to Wyalong? That is the point I have indicated just now as being the view of the Railway Commissioners—that, from a central point, there would be a line 20 miles on either side.

165. The furthest point would not be much more than 20 miles from a railway? That is so.

166. You state that the Railway Commissioners favour the construction of a line *via* Grenfell? So they have stated in their report which I have read.

167. Did you report on the comparative returns of the two lines? Yes; the returns are comparative as far as the different items are concerned, and the map indicates, generally, the areas which would be served by either line.

168. Are the returns in favour of the Grenfell-Wyalong line as against the Temora-Wyalong line? No; the earnings are greater on the Temora-Wyalong line.

169. But still there is room for greater development on the Grenfell-Wyalong line? That is so, and the Grenfell-Wyalong estimate did not include agricultural produce, although it is only fair in that connection to say that the agricultural produce shown in the Temora-Wyalong return only represents £601.

170. And being a line parallel with other lines the Grenfell-Wyalong line would possess another advantage as opposed to a cross line, and would divide the country better? It is the view of the Railway Commissioners that it would divide the country better, and it is also my own impression.

171. *Mr. Watson.*] I notice in the estimate given to the Committee last year in connection with the Grenfell-Wyalong proposal, that you have put down, as coming upon that line at the Bland crossing, traffic which will return £584? Yes.

172. Can you tell the Committee where, with a line constructed from Temora to Wyalong, you anticipate that that traffic will go? A great deal of it will go to Barmedman.

173. Will any of it go into Wyalong? I daresay that some of it will find its way into Wyalong.

174. All that you have credited Barmedman with is £461—that is, inclusive of the amount which will come in from Bland Crossing? I will show you how the items are made up. Barmedman is credited with 556 tons of wool, the greater part of which is Bland wool. Then there are 400 trucks of stock, which will be Bland stock. Then, at Wyalong, there are 1,288 tons of wool which represent a certain proportion of the Bland wool, and 200 trucks of stock.

175. What I want to get at is this: you have an attraction towards Barmedman of a certain proportion of the Bland trade in wool and stock; how much of the traffic which, with the construction of the Grenfell line, would have gone to the Temora line, have you credited to Barmedman—that is, the traffic proper to Barmedman? I could not separate the items.

176. Have you included the 400 trucks of stock, the greater part of which you say comes from the Bland, and the 556 tons of wool, a great part of which comes from the Bland, and which leaves very little either of stock or wool to come from the district immediately around and westward of Barmedman. In the Grenfell estimate you see that 740 tons of wool were shown as coming in at the Bland Crossing, and 661 tons of wool as coming in at Wyalong. That is practically 1,400 tons of wool.

177. Your estimate shows that the stock traffic will be 600 trucks, which is about the same as you expected upon the other line? I do not expect any fat-stock, except from the Bland district.

178. Do you think you have given a full and liberal estimate in regard to agricultural produce? Yes.

179. Have you counted upon the influence which the construction of a new line will have upon agricultural produce? I have dealt with the country actually under cultivation. In the case of the Grenfell to Wyalong line, I did not give any estimate under that head at all. My estimate is in respect of all the land cleared at the present time.

- J. Harper.
26 Sept., 1900.
180. Once you get past Barmedman and out to the west—leaving out of consideration for the moment any possible competition on the part of any future line which may go towards Gunbar—you find a great area of agricultural country which has not yet been touched;—do you anticipate that there might be any revenue coming from that country later on? Wherever there is good agricultural land within easy reach of a railway line I should expect that, under ordinary conditions, there will be cultivation.
181. Your estimate of 7,700 tons of agricultural produce is based upon the land either under cultivation or cleared for cultivation? Yes; and it assumes that all the wheat in the vicinity of Reefton will be brought to the proposed line, instead of going into Temora.
182. The probability is that they would not cart it 10 miles by road when they can get it carried that distance by rail? It depends, I suppose, on the distance they are from Temora.
183. What has led to the increase in the working expenses? The difference in working expenses is chiefly due to the increased cost of maintenance. The traffic expenses are almost the same.
184. Do you anticipate that the cost of maintenance on a line from Temora to Wyalong would be greater than it will be on a line from Grenfell to Wyalong? There will be more miles to maintain on the Grenfell-Wyalong line.
185. Should not the saving of 17 miles of haulage make a little reduction in the cost of working expenses? On the other hand, you have the increased cost of maintenance.
186. The estimate of working expenses on a line from Temora to Wyalong is £4,438 per annum; last year the estimated working expenses upon a line from Grenfell to Wyalong was £4,843—the difference between the two being about £400;—the cost of maintenance of the Grenfell to Wyalong line will be greater than that of the Temora to Wyalong line? That is so.
187. The cost of running, I should imagine, will also be greater on that line, because of the greater length of it? Yes; proportionately.
188. It seems strange to me that there is not a greater reduction in working expenses than £400;—can you say whether, in connection with the Grenfell to Wyalong line, it was estimated that six trains per week would be run? Precisely the same in both cases.
189. It seems a small reduction in the cost of maintenance when there is a saving of 17½ miles out of 59;—there is a saving of 40 per cent. in length, with approximately the same number of stations. On the Temora to Wyalong line, I presume that there would be a station at Reefton, Barmedman, the Half-way House, and Wyalong. On a line from Grenfell to Wyalong there would, I presume, be a station at Weoga, Bland Crossing, Piney Range, and Wyalong? As far as Wyalong is concerned, the traffic expenses will be the same. We should have an officer in charge at Barmedman on the Temora-Wyalong line, and probably an officer in charge at Bland Crossing on the Grenfell-Wyalong line. We should possibly have a caretaker at Reefton on the Temora-Wyalong line, and possibly one at some point on the Grenfell-Wyalong line. The traffic expenses would be almost the same on both lines. I am unable to speak with regard to locomotive expenses, but I am sure that the Commissioners would be properly advised, because the estimates are worked out on the mileage which would have to be run in each case.
190. I should have thought that the difference would have been greater than that which has been mentioned, especially when you consider the difference in length of construction; that means a saving of haulage and a saving in maintenance, one line being subject to some extent to floods, and the other being over dry country along its whole course? I can only give the figures as those of the Railway Commissioners. I may state that my traffic charges are almost the same; they scarcely differ. Of course, they would not vary in proportion to the mileage.
191. On your estimate of revenue—without a line allowing for increased land to be put under cultivation—there is an apparent deficiency of £2,500 per annum? That is on interest and working expenses.
192. Do you think that would be too great a risk to undertake, leaving out of consideration for a moment your opinion regarding the respective routes? Certainly not, because the Railway Commissioners have indicated, in connection with previous railways, that where a line will pay working expenses, and show a reasonable prospect of paying interest, they are prepared to recommend it.
193. In the statement which you have read, the Railway Commissioners say that there is a greater prospect of development between Grenfell and Wyalong than there is between Temora and Wyalong; have you any information which will show us where that possibility of development lies;—in view of the fact that the District Surveyor's evidence is that there are only large holdings of land suitable for pastoral purposes between Piney Range and Wyalong, is there any likelihood of those holdings being developed? I should not think that they would be developed from an agricultural point of view.
194. Apart from those holdings, where is the land which is available for development? Between Grenfell and the black soil—Piney Range.
195. Is it not apparent that there is just as great an amount of country suitable for development between Barmedman and Temora as there is on the other side? A great deal of that is already under occupation, and is shown in the return.
196. Beyond Barmedman again, and north-westerly from it, is there not a large area of land suitable for agriculture which is at present too far away from railway communication? I should imagine that that country will be served by a line at Wyalong, no matter whether it goes from Temora or Grenfell.
197. Assuming that the land about Buddigower would be within a reasonable distance of a line at Wyalong, could not the same be said in regard to the land about Piney Range, which is within 20 miles of the existing terminus of Grenfell? Decidedly; but that would not meet the whole of the case, because if the line were extended to Wyalong, it would suit that country as far as Piney Range is concerned, and it would leave the people at Buddigower in precisely the same position as are the Piney Range people, and then they would not be very much closer to the proposed line.
198. They would be closer at what we call the Half-way House; however, none of the land so far spoken of as suitable for development would be more than 20 miles from a railway, even if the proposed line were constructed? I could not speak of my own knowledge.
199. *Dr. Garran.*] You have shown us an encouraging increase in the agricultural development of the country between Wyalong and Temora; I presume that has been partly due to the mining activity of the neighbourhood? More or less.
200. And to the fact that there is a fairly good road between Temora and Wyalong? The whole of it is not a good road.
201. North of an imaginary line from Grenfell to Wyalong there is a very large block of country extending from

from Grenfell to Forbes on the east, to the river on the north, to the eastern side of Lake Cowal on the west, and to the imaginary line itself on the south;—is not a great deal of that block of land fitted for mixed farming? I believe so.

J. Harper.
26 Sept., 1900.

202. Would not the construction of a railway between Grenfell and Wyalong thoroughly stimulate the development of that large area of country? That is my impression. I may mention that, as a matter of fact, no agricultural results were shown in the report on the Grenfell to Wyalong line. They were only indicated generally; but you have before you an absolute development of the district to be served by the proposed line.

203. If you look at the wall-map you will see two proposed lines converging at an acute angle, which will over supply a certain district. If we construct those lines, and do not construct a line from Grenfell to Wyalong, we shall leave the large square area to which I have referred without any accommodation additional to what it possesses at present, namely the line north of the river. If we construct the Wyalong and the Gunbar line we shall over supply part of that country? That is so.

204. *Mr. Watson.*] With regard to the area of country mentioned by Dr. Garran, and assuming that a terminus remains at Grenfell and one at Wyalong, do you think there will be any agricultural country at a great distance from a railway between those points? That I am not in a position to say.

205. The country easterly from Wyalong, so far as Back Creek, which is the extent of the country suitable for agriculture, will be served from the Wyalong side? Yes.

206. The cultivation on the Humbug Creek will be served as well by a line from Grenfell to Wyalong as by a line from Temora to Wyalong? Yes; the north-west portion of Humbug Creek.

207. It will make no difference to the people of Humbug Creek whether the line goes *via* Grenfell or Temora? No. The only thing is, that it will increase the number of what are called cock-spur lines. If the line is extended from Grenfell to Wyalong, it will represent, in the future, a more valuable section of line than will the other one.

208. So far as the pastoral aspects of the Bland are concerned, the people there will not be at any great disadvantage? No; they will have to come a greater distance, of course, into Barmedman.

209. Do you think that will be too great a handicap for them? Of course, it will be a handicap for them. I may mention that I have given Barmedman and Wyalong full credit for all the traffic of the Bland country. Whether, of course, any portion of the traffic will go into Forbes—29½ miles—or whether it will or will not go into Grenfell, I cannot say; but I have practically given the proposed line credit for the whole of the Bland country traffic, so as to leave no doubt about the matter.

210. Assuming that the Bland country, as far as the lake country, is more than 25 miles from a railway, is that too far for people to convey their stock to that railway? Assuming that it is 25 miles, it is not too great a distance.

211. *Mr. Shepherd.*] Are you well acquainted with the country about Barmedman and Wyalong? Only by travelling through it six or eight times.

212. Have you been off the line to the west? Yes. I have been in the neighbourhood of Rcefton, and I have been to Maudamah, and in the neighbourhood of Buddigower, coming into Barmedman from Rankin Springs. Generally speaking, I have been a good deal about the district.

213. Have you been any distance to the west? Yes; right through to Hillston from Wyalong.

214. Do you consider the following description of that country by Mr. J. Wilkinson, the manager of the Buddigower station, to be a fair one:—

From 75 miles to 150 miles west of Barmedman and Wyalong is a dense scrub of mallee, ironbark, pine, and other useless scrubs, and is only a harbour for wild dogs, rabbits, and other noxious animals.

—? West of Wyalong and Barmedman there is a great deal of very worthless country; but I would not like to say how much; in fact that is one of the reasons why the Commissioners have reported adversely against the line.

215. *Mr. Watson.*] As against the quotation just read by Mr. Shepherd, have you read the evidence given by Mr. District-Surveyor Sharpe, stationed at Forbes, in regard to the land to the south; he says that on Buddigower, which comprises 80,000 acres, there is a large area, three-fourths of which is first-class agricultural country; it is leasehold area, which was thrown open three years ago? I have not read the evidence.

1900.

| | PAGE. |
|--|---------------|
| Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works..... | 1-5, 66-69 |
| Hugh McLachlan, Secretary to the Railway Commissioners | 5-6, 69-70 |
| John Harper, Chief Traffic Manager, Department of Railways | 7-10, 56-58 |
| John Charles Hunt, fruit-grower, Dural | 10-14, 25, 36 |
| William Rudlan Hawkins, fruit-grower, Dural..... | 14-17, 42-43 |
| James Purser, fruit-grower, Castle Hill | 17-18 |
| Christopher John Moore, fruit-grower, Castle Hill | 19 |
| John Speir Heron, fruit-grower, Pennant Hills | 19-20 |
| Samuel Fagan, fruit-grower, Galston, Dural, and Arcadia..... | 20-23 |
| Sholto Montgomery Cay, fruit-grower, Galston | 23-24 |
| Joseph Basil Byford, baker and storekeeper, Galston .. | 24-25 |
| Oliver Thompson, storekeeper, Galston | 25 |
| Luke Gallard, fruit-grower, Kenthurst .. | 25-27 |
| Joseph Hemers, nurseryman and fruit-grower, Kenthurst..... | 27-28 |
| John Williams Foster, fruit-grower, Dural | 28-30 |
| James Edward Dale, fruit-grower, Glenorie | 30-32 |
| Alfred Trethowan, fruit-grower, Arcadia | 32-34 |
| Wellesley Walsh, fruit-grower, Arcadia..... | 34-35 |
| Samuel James Moore, junr., fruit-grower, Dural and Galston | 35-36 |
| Harry Moore, fruit-grower, Arcadia | 37-38 |
| Edwin Hall, fruit-grower, Kenthurst | 38 |
| Cecil Purser, medical practitioner, Petersham | 39-40 |
| Francis Alexander Nicholson, fruit-grower, Maroota, near Glenorie | 40-41 |
| John Garratty, builder, Parramatta..... | 41-42 |
| The Hon. Jacob Garrard, President, Metropolitan Board of Water Supply and Sewerage. | 43-46 |
| Sobey Lyne Vivian, land-owner, Castle Hill | 46-48 |
| Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works | 48-50 |
| Oswald Gordon Morton, Road Superintendent, Roads Branch, Department of Public Works | 50-51 |
| Broughton Barnabas O'Connor, Esq., M.P. .. | 51-55 |
| Stephen Edward Perdrian, Surveyor, Department of Lands | 56 |
| William Edwin Tunks, clerk, Land Valuation Branch, Department of Public Works | 59 |
| Frank Farnell, formerly M.P. for Ryde | 59-63 |
| Charles Robert Scrivener, Staff Surveyor, Department of Lands | 63-64 |
| James Bordley Brown, Inspector of Conditional Purchases, Metropolitan District, Department of Lands..... | 64-66 |
| Harry Richardson, Traffic Superintendent, Department of Railways .. | 76-77 |

PLAN.

Railway from Carlingford to Dural.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

RAILWAY FROM CARLINGFORD TO DURAL.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Carlingford to Dural," have, after due inquiry, resolved that it is not expedient the proposed railway be constructed, but the Committee recommend that steps be taken to have surveys made for a tramway along the road from Carlingford and Westmead to Dural, plans and estimates of cost prepared, and reports obtained from the Railway Commissioners on the subject, with a view to ascertain whether requirements may be met by a tramway along either route; and, in accordance with the provisions of sub-section (IV), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

PRELIMINARY REMARKS.

1. The present inquiry is the second carried out by the Public Works Committee respecting the proposed railway, the first inquiry having been made in 1898, when the Committee, by eight votes to five, negatived the proposal, on the grounds that the traffic would not be sufficient to make the line profitable, and whatever it might be a large proportion of it would be withdrawn from the Great Northern Railway, and that the fruit-growers of the district could, without further railway expenditure, find, by means of existing roads and railways, reasonable transit for their fruit to market. On that occasion the proposal was coupled with one for the purchase of the Rosehill-Carlingford Railway, which the Committee recommended, and which has since been effected for the sum of £22,500.

In the official statement prepared for the information of the present Committee by the Under-Secretary for Public Works, it is explained that in order to make full use of the Rosehill-Carlingford Railway, and render it profitable, the line must be taken on to Dural. "The districts of which Dural is about the centre," it goes on to say, "are in themselves held to be entitled to better railway facilities than they now enjoy, comprising as they do some of the richest horticultural regions of the Colony. There is a large and prosperous population already settled there, and the proposed line, it is believed, will open up for settlement a further large extent of rich country."

DESCRIPTION

DESCRIPTION OF THE PROPOSED RAILWAY.

2. The proposed railway, 9 miles 6 chains in length, would commence at the point where the Rosehill-Carlingford line now ends, 17 miles 37 chains from Sydney, and follow the course of the road to Pennant Hills and Dural until about a mile and a quarter beyond the Pennant Hills Post Office, where the road would be crossed, and the line approach the main road from Parramatta to Dural. Then, crossing and re-crossing this road four times, the line would end on the east side of it, at Dural, 26 miles 43 chains from Sydney. The ruling grade is 1 in 40, and the sharpest curve 10 chains radius. The country passed through is undulating, and notwithstanding that the steep grades and sharp curvature on the constructed portion of the branch would be continued, the works would be moderately heavy. The land required is practically all alienated.

ESTIMATED COST.

3. The estimated total cost of the line, exclusive of land and compensation, is £67,690, or £7,459 per mile. The earthworks are the largest item, £22,843. Including the cost of land required for the line, the estimated total cost would be £75,690.

RAILWAY COMMISSIONERS' REPORT.

4. The Railway Commissioners' report is unfavourable to the proposed line. They estimate the annual cost at £4,822, and the traffic revenue at £1,025, the difference being £3,797. "We reported upon this proposal," they say, "on the 4th November, 1897, when the capital cost was estimated at £57,000, and stated that in our opinion the line would prove unprofitable. We are still of this opinion, and cannot, therefore, recommend its construction—at least until experience has been gained of the working of the line from Clyde to Carlingford."

THE COMMITTEE'S INQUIRY.

5. The Committee have taken very full evidence on the proposal before them, and have inspected the route of the proposed line and the district to be served. Besides examining official witnesses, every facility has been given the residents of the district and others interested in the railway question to state before the Committee anything they desired to put forward in support of the proposal, and an opportunity was afforded the residents, through one of their principal representatives, to peruse the official evidence, and to reply to it where they thought necessary. As far as possible, therefore, the evidence obtained is complete.

THE PRINCIPAL POINTS IN THE INQUIRY.

6. The chief points which appear necessary to be considered in relation to the proposal are as follows:—

- (1.) The reasons put forward in support of the proposed railway.
- (2.) The nature of the districts which the railway is intended to serve.
- (3.) The traffic prospects in connection with the line.
- (4.) The existing railway and road facilities available.
- (5.) Whether requirements may be met by some modification of the proposal.

REASONS IN SUPPORT OF THE PROPOSAL.

7. The principal reason in support of the railway, put forward in the statement prepared for the Committee by the Under Secretary for Public Works, is that in order to make the Rosehill-Carlingford line profitable it is necessary to extend that railway to Dural; but, in reply to this, the Committee were informed that this is certainly not the opinion of the Railway Commissioners. The reasons which actuated them in approving of the purchase of the Rosehill railway were that industries are
springing

springing up near the Parramatta River. One of these is the Austral Meat-works, which, though not in operation now, will be soon, and another is the Australian Kerosene and Oil Company's works. Then there is already a railway business connected with the Rosehill Racecourse amounting to £2,000 per year, and additional traffic arising from this on the main line between Clyde and Sydney. The other reasons advanced in support of the proposed line are those put forward by the residents of the district asking for a railway. The fruit-growers, it is said, are hampered by the difficulties attendant upon the conveyance of their fruit to market to an extent that reduces their profits, and prevents an increase of cultivation, such as would take place if the facilities for reaching a railway were improved. There is a large quantity of private land which, it is stated in evidence, has not yet been brought into cultivation, and also a considerable amount of Crown land suitable for fruit-growing which has not been touched. The district, it is pointed out, is one of the most attractive in regard to scenery, and one of the most healthful in New South Wales, and would be largely used for residential purposes if the means for travelling to and from Sydney by railway were sufficiently easy. Although the Great Northern railway is close to the different fruit-growing centres in the district, it cannot be reached, it is explained, without travelling a considerable distance—in some cases from ten to twelve miles—over roads of very steep grades, and, in wet weather, exceedingly heavy.

NATURE OF THE DISTRICT TO BE SERVED.

8. The scenery of the district is undoubtedly attractive, the climate healthy, and fruit-growing is carried on extensively. The population of those places which are regarded as interested in the construction of the proposed railway is given as 2,583, and the acreage in the hands of the fruit-growers 32,578 acres, of which 6,857 are cultivated, principally as orangeries, 5,260 acres bearing fruit, and 1,204 acres not yet bearing. 393 acres are under other tillage. Comparing these figures with those put before the Committee in the inquiry of 1898, they represent an increase since that date of 89 in population, 1,795 acres cultivated, and 1,314 acres bearing fruit. The names of the different fruit-growing centres to which these figures relate are,—Dural, Kenthurst, Glenhaven, Galston, Arcadia, Castle Hill, Pennant Hills, and Glenorie.

TRAFFIC PROSPECTS.

9. The traffic prospects in connection with the railway, as given by the Railway Commissioners and the Chief Railway Traffic Manager, are much less favourable than those put before the Committee by the residents of the district. The total revenue expected by the Railway Commissioners is, as stated in their report, £1,025, which is made up as follows:—

| | | | | | | |
|--|-----|-----|-----|-----|-----|--------|
| 150,000 cases fruit, at 1d. | ... | ... | ... | ... | ... | £625 |
| 2,000 tons special class goods, at 1s. | ... | ... | ... | ... | ... | 100 |
| Sundries | ... | ... | ... | ... | ... | 100 |
| Passengers | ... | ... | ... | ... | ... | 200 |
| Total | ... | ... | ... | ... | ... | £1,025 |

The estimate for the carriage of fruit is based upon the assumption that the people proposed to be served by the line would pay double the rate now charged on the Great Northern Railway.

The local traffic estimate is as follows:—

Traffic along the whole length of the line.

| | | | | | | |
|-----------------------------|-----|-----|-----|-----|-----|--------|
| 313,400 cases fruit, at 2d. | ... | ... | ... | ... | ... | £2,611 |
|-----------------------------|-----|-----|-----|-----|-----|--------|

Intermediate Traffic.

| | | | | | | |
|-------------------------------------|-----|-----|-----|-----|-----|--------|
| From Castle Hill and Glenhaven | .. | ... | ... | ... | ... | £460 |
| From Pennant Hills | ... | ... | ... | ... | ... | 212 |
| Carriage of manure, 2s. 6d. per ton | ... | ... | ... | ... | ... | 275 |
| Total | ... | ... | ... | ... | ... | £3,558 |

In

In addition to which it is stated there would be a considerable traffic in the carriage of horse-feed to the district, and of white metal from the district to Sydney to be used on the roads, and, as with the railway, private residences in the district would increase in number, there would be a large passenger traffic. The fruit traffic is represented as below what it may be fairly estimated at, for, as the district contains 5,260 acres of bearing trees, the average number of trees on an acre being 100, and the production of fruit one case to a tree, there would be 526,000 cases to send away annually.

It will be observed that the rate in the local estimate for the carriage of fruit is given as 2d., while that stated by the Railway Commissioners is 1d., and that the locally-stated rate for carrying manure is 2s. 6d., as compared with the Railway Commissioners' 1s. The 2d. rate, it is explained, is used in the estimate because the fruit-growers are willing to pay double rates in order to get the railway, as these represent far less expense to the growers than is involved in the present system of carting their fruit to the Great Northern Railway at Pennant Hills or Hornsby. The matter was discussed at a meeting of the Railway League representing the whole district, and it was unanimously decided, the Committee are informed, that the growers could afford to pay a charge of 3d. per case from Dural to Sydney.

With regard to manure, it costs the growers at the present time, the evidence states, about 8s. per ton to get it from the railway to their orchards, and therefore, the willingness with which they will pay a railway rate of 2s. 6d. is apparent. The loss of the traffic on the Northern line, it is contended, will be compensated for by the carriage on the Clyde to Sydney line, as well as by the higher rates on the proposed line between Carlingford and Dural.

One other matter which the residents of the districts advanced as a reason in support of the railway, is the statement that there are large areas of Government land which would be enhanced in value if the railway should be constructed, and which would be taken up for fruit-growing purposes; in proof of which it is alleged that in the districts of Glenhaven and Arcadia, land inferior to these have been selected and are now supporting a considerable population. On this question the Committee examined two witnesses well acquainted with the district—one a Staff Surveyor of the Department of Lands, and the other the Inspector of Conditional Purchases for the Metropolitan District. Their evidence does not entirely agree; but while one of them states that of the Crown land open to settlement within 10 miles of the proposed line, about the parishes of Berowra, Maroota, Frederick, and Cornelia, not more than 10 per cent., as an outside estimate, is fit for cultivation (where he made an absolutely careful examination of the country he has not found anything like that); the evidence of the other is to the effect that of the available Crown land not more than one-fourth is really cultivable. Generally speaking, he says, while the best land in the district has been taken up, and is now under fruit, there is a fair amount of land which, with better facilities for getting to market, would undoubtedly be put under fruit-culture.

EXISTING FACILITIES FOR GETTING TO MARKET.

10. At the present time the fruitgrowers of the district find a market, by way of roads, well constructed, but of somewhat steep gradient, to the Great Northern Railway at Hornsby and Pennant Hills, or by way of easier roads to Parramatta. Portions of the roads, no doubt, in wet weather are difficult for heavy traffic; but taking them as a whole they are well maintained, and there are ample supplies of road-metal in the district. There is a steep gradient on the road to Pennant Hills Station, but the carts when loaded with fruit travel down hill. In a similar manner the road between the fruit centres and Hornsby is steep in places, but it is down hill from Galston to the valley of Berowra Creek, and a grade of 1 in 15 on the rise from the valley to the railway. A new road from Arcadia to Berowra, which will materially shorten the journey to the railway, is in course of construction.

Under the present system, in addition to finding a market for the fruit in Sydney, it is admitted that fruit can be and is sent at a satisfactory profit from any place in the district to Melbourne and New Zealand.

QUESTION

QUESTION OF A TRAMWAY INSTEAD OF A RAILWAY.

11. While it seems improbable that the proposed railway would pay, owing to the heavy capital cost involved, the Committee are of opinion that cheaper carriage would lead to the development of the district, and have endeavoured to ascertain the possibility of serving the residents with a tramway at a low cost. The Engineer-in-Chief for Railway Construction, stated that a tramway could be constructed from Westmead to Dural for under £44,000, with a grade of 1 in 30, and keeping mainly to the existing road. Against this a tramway from Carlingford to Dural, also following the road for the most part, could be constructed for about £33,000. The latter route seems to be preferred by the Railway Commissioners, for, though it would have to compete to some extent with the Northern line, it could be worked in conjunction with the existing railway to Carlingford. The Westmead line, however, would be further from the existing railway, and would serve more country to the westward.

CONCLUSION ARRIVED AT.

12. In view of the much smaller cost of a tram-line, as compared with that of the proposed railway, and the fact, as will be seen from the evidence, that the fruit-growers admit they would be fairly served by a tramway, the Committee are of opinion that steps should be taken to have a survey for a tram-line made along the road from Carlingford to Dural, and also from Westmead to the same point, plans and estimates of cost prepared, and reports obtained from the Railway Commissioners on the subject. The proximity of the Great Northern railway to the proposed railway line, and the element of doubt as to a railway between Carlingford and Dural paying, to which a careful consideration of all the circumstances of the case gives rise, lead the Committee to the conclusion that the proposal submitted should be negatived with the object of meeting the requirements of the district by means of a tramway.

RESOLUTION PASSED.

13. The resolution passed by the Committee is shown in the following extract from the Minutes of Proceedings:—

Mr. Watson moved,—“That, in the opinion of the Committee, it is not expedient the proposed railway from Carlingford to Dural, as referred to the Committee by the Legislative Assembly, be carried out; but the Committee recommend that steps be taken to have surveys made for a tramway along the road, from Carlingford and Westmead to Dural, plans and estimates of cost prepared, and reports obtained from the Railway Commissioners on the subject, with a view to ascertain whether requirements may be met by a tramway along either route.”

The motion was seconded by Dr. Garran, and passed.

W. T. DICK,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 27th November, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM CARLINGFORD TO DURAL.

TUESDAY, 28 AUGUST, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee proceeded to consider the expediency of constructing a line of Railway from Carlingford to Dural.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] I understand that you have an official statement with respect to the proposed line of railway from Carlingford to Dural now under consideration by this Committee? Ycs; I have a statement which was prepared by the Under Secretary. It reads as follows:—

H. Deane.
28 Aug., 1900.

RAILWAY FROM CARLINGFORD TO DURAL.

The proposal before the Committee was referred by the Legislative Assembly for the Committee's consideration on 2nd August, 1900, in the following terms:—

“That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of railway from Carlingford to Dural.”

The proposed line of railway will extend from the terminus of what is known as the Rosehill line at Carlingford to the village of Dural, a length of 9 miles 6 chains.

The question of its construction has already been before the Public Works Committee. After due inquiry in January-February, 1898, the then Committee, by a majority of eight to five, negatived the proposal on the following grounds:—

- (1.) That the traffic upon the proposed railway extension would not be sufficient to make the line profitable.
- (2.) That whatever the traffic might be, a large proportion of it would be traffic withdrawn from the Great Northern railway.
- (3.) That the district is so situated in regard to road communication with, and distance from, the existing railways, that fruit-growers can, without further railway expenditure, find reasonable transit for their fruit to market.

The Committee's decision was arrived at on 13th April, 1898, and attention is now invited to the report and evidence respecting the proposal as then presented to Parliament.

Since that date, although there may not have been any specially marked developments in the districts to be served by the proposed line, a step of great importance, and closely related to the proposal, has been taken in the purchase by the Government of the Rosehill Railway. During the inquiry in January-February, 1898, the question of acquiring the Rosehill Railway—that is, the privately-owned line running northwards from Clyde on the Government main line to Carlingford with a deviation to Parramatta River, having a total length of 5 miles 48 chains—had been prominently before the Committee, and they recommended that the purchase be made if the price did not exceed the sum of £20,000. The original cost of this line was stated to have been £110,000; and it was offered to the Government for the sum of £25,000.

The purchase has just been completed for the sum of £22,500, and it is estimated that it only requires a further outlay of some £8,000 to put the line in first-class trafficable condition. In order, however, to make full use of the purchase and render it profitable, the line must be taken on to Dural. The districts, of which Dural is about the centre, are in themselves held to be entitled to better railway facilities than they now enjoy, comprising, as they do, some of the richest horticultural regions of the Colony. There is a large and prosperous population already settled there, and the proposed line, it is believed, will open up for settlement a further large extent of rich country.

The official description of the line is as follows:—

CARLINGFORD TO DURAL RAILWAY.

Length, 9 miles 6 chains; estimated cost, £67,690, or £7,459 per mile, exclusive of land and compensation.

This extension of the existing branch line from the main suburban railway near Clyde platform to Rosehill and Carlingford, begins at 17 miles 37 chains from Sydney, and follows the course of the Pennant Hills Road, and crossing the continuation to Dural of that road, about a mile and a quarter beyond the Pennant Hills Post Office. Approaching the main road from Parramatta to Dural, it crosses and recrosses it four times, and ends at the east side of the same road at Dural at 26 miles 43 chains from Sydney.

The ruling grade is 1 in 40, and the sharpest curve 10 chains radius.

The country passed through is undulating, and notwithstanding that the steep grades and sharp curvature on the constructed portion of the branch are continued the works will be moderately heavy.

The land required is practically all alienated.

H. Deano. The following is the statutory report of the Railway Commissioners on this proposal:—
 28 Aug., 1900.

Office of the Railway Commissioners of New South Wales, Sydney, 6 July, 1900.

Proposed Extension of Railway from Carlingford to Dural—9 miles 6 chains.

In accordance with the provisions of the Public Works Act of 1888, we beg to report as follows:—

| | |
|--|---------|
| <i>Cost of Construction—</i> | |
| The Engineer-in-Chief for Construction estimates the cost of construction of the line (exclusive of land resumption and compensation) at | £67,690 |
| <i>Estimated Annual Cost—</i> | |
| Capital expenditure at 3 per cent. | £2,031 |
| Cost of maintaining permanent-way and for traffic and locomotive expenses | 2,791 |
| | £4,822 |
| <i>Estimated Traffic Revenue</i> | £1,025 |

We reported upon this proposal on the 4th November, 1897, when the capital cost was estimated at £57,000, and stated that, in our opinion, the line would prove unprofitable. We are still of this opinion and cannot, therefore, recommend its construction—at least until experience has been gained of the working of the line from Clyde to Carlingford.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this sixth day of July, one thousand nine hundred, in the presence of, —
 W. M. FEHON, Deputy Chief Commissioner.
 DAVID KIRKCALDIE, Commissioner.
 H. McLACHLAN.

The estimated cost is stated as follows:—

CARLINGFORD TO DURAL.

REVISED estimated cost of a single line of railway 9 miles 6 chains in length, with 60-lb. rails. Ruling grades, 1 in 50 against, and 1 in 40 with the load. Sharpest curve, 10 chains radius. New fastenings; new 4-ft. 6-in. T.O.'s; full ballast; sleepers, 2,464 per mile.

| Description. | Estimated Cost. | Average per mile. |
|--|-----------------|-------------------|
| Earthworks | £ 22,843 9 10 | 2,517 |
| Culverts and small timber openings | 5,197 10 0 | 573 |
| Overbridge | 5,102 3 0 | 502 |
| Level crossings, road diversions, and fencing | 4,281 6 8 | 472 |
| Permanent-way materials (rails taken at £7 10s. per ton) | 7,769 6 0 | 856 |
| Freight | 167 16 6 | 18 |
| Platelaying at 1s. 2d. = £931 14s. | 7,759 15 3 | 855 |
| Ballasting at 4s. = £3,194 8s. | | |
| Sleepers at 3s. 3d. = £3,633 13s. 3d. | | |
| Station works, including sidings and signals | 1,922 5 4 | 212 |
| Station buildings; waiting sheds, £220; platforms, £242; loading banks, £286; station-master's cottage, £270 | 1,018 0 0 | 112 |
| Water supply | 1,500 0 0 | 165 |
| Gradient and mileage posts | 149 14 9 | 17 |
| Telegraph | 149 14 9 | 17 |
| Miscellaneous | 1,000 0 0 | 110 |
| | £58,861 2 1 | |
| Engineering and contingencies, 15 per cent. (nearly) | 8,828 17 11 | 973 |
| Total cost | £67,690 0 0 | 7,459 |

- I have also the plan and the parish map showing the course of the line, and also the book of reference.
2. In the first part of the report it states: "In order, however, to make full use of the purchase, and render it profitable, the line must be taken on to Dural"; and later on in the report it states that the Railway Commissioners are hostile to the extension of the line to Dural;—can you explain those two opposite statements? The Public Works statement has not been prepared by myself; the Under Secretary for Works is responsible for it
 3. And you do not know why that first statement was put in? I do not.
 4. Starting from Carlingford and going on to Dural, could you give the Committee approximately the distance of this proposed extension from the Sydney-Newcastle line, say from Eastwood, Pennant Hills, and Beecroft, then at the widest portion, then from Dural to Hornsby? The distance from the end of the purchased line to the Eastwood station is a trifle over 2 miles in a direct line.
 5. Then from Beecroft bend? The nearest approach of the line to the bend near Beecroft Station is as nearly as possible 1 mile.
 6. And now in the widest portion? Perhaps I had better take the terminus from Hornsby—that is a little over 4 miles.
 7. Could you state what the widest point is about a mile south of Dural? It is about 5½ miles.
 8. That is the maximum distance of the proposed extension from the Newcastle and Hornsby line? Yes.
 9. What is it that makes the cost of the earthworks so exceedingly high;—I see that they are put down at £22,843, or £2,517 per mile? The country is very rough, and it is sharply undulating. In fact, the undulations are so sharp that they do not lend themselves to the smallest available radius of a curve.
 10. Could you tell us what saving you would effect if you reduce the grading from 1 in 45 to 1 in 30? I do not think it would be very material. The book of reference shows the character of country it passes through; some of it is grass, and some bush land, and some of it orchard land.
 11. Mr. McFarlane.] Since the Government have taken over the line from Clyde to Carlingford, has it been working? Only to the racecourse. I made an inspection in company with Mr. Firth and Mr. Parry, of the Railway Commissioners' Department, with a view to seeing to what expense it would be necessary to go in order to render the line fit for carrying traffic.
 12. Is that beyond Rosehill? Yes. The Railway Commissioners wish, in order to provide for the running of traffic beyond the Rosehill Racecourse, to make considerable alterations at the Clyde Station; some of that expenditure would no doubt have to be incurred, whether this extended line had been purchased

H. Deane.
23 Aug., 1900.

purchased or not; but a great deal of the expenditure is necessitated by the purchase of the extension. The estimated cost of alterations at the Clyde junction is about £3,000. The Commissioners propose to widen the right-hand platform, and to put up waiting-sheds and lay a new line on the right-hand side of the junction, and a loop for running the engine round, an overbridge across the whole of the three lines of rails, with steps and approaches to the platforms, and complete new interlocking arrangements. At the same time they will shift the signal-box from its present position to the other end of the station. A number of other items of expenditure are necessary, such, for instance, as gate-houses at the crossings. I think there are four level crossings between Clyde Station and the river. Some extra accommodation is also necessary at the stations along the line. A loop at the terminus is also required. I have not the details at present with me of all that is required; but, altogether, the improvements will cost something over £7,000 in order to make the railway convenient for working.

13. Was any estimate of the traffic made by the Railway Commissioners prior to the purchase of the line from Clyde to Carlingford? I find on looking on page 3 of the evidence bound up with the last report that the report of the Railway Commissioners is very similar to that submitted by them now, and it only varies to the extent of the interest on the actual expenditure. The cost of maintaining the permanent-way, and traffic and locomotive expenses, is put down at £2,791. The estimated traffic revenue is £1,025. In the previous report the interest on capital expenditure was put down at £1,710. Now it is put down at £2,031; that is, of course, due to the interest to be paid on the larger sum.

14. Would that be the traffic of the proposed line? Yes.

15. I am referring to the estimated traffic of the proposed line from Carlingford to Dural? I do not think the Railway Commissioners have furnished any particulars of that traffic; the only report I find is on page 3 of the printed report, which is headed "Rosehill Railway."

16. Did the Railway Commissioners anticipate that the Rosehill line would pay after they purchased it for £22,500? I am scarcely in a position to say what inducements they had in their minds when recommending the purchase of the line. I have no doubt that they all thought it would pay. There is a good deal of traffic now at times to the Rosehill Racecourse, but I am not in a position to say what the receipts are. The line might pay very well when only about £25,000 to £30,000 has been paid for it, and it might pay very badly if the capital cost was £110,000.

17. Could you state where there is much traffic, or has been much traffic, between Rosehill and Carlingford? The line has never been worked.

18. Do you think there will be much traffic on the proposed extension to Dural? I am afraid not.

19. Are the different places *en route* thickly populated? The country is very well suited for residential purposes, but you could scarcely call it thickly populated. It is nearly all orchard or grass land. There is some bush still left.

20. Do you think that the construction of the proposed line would cause a denser population? Yes; I think so.

21. Do you think it likely that additional land would be cut up into blocks for orchard purposes if we made the proposed line? Do you mean for residential purposes.

22. Yes? I think it is very likely some of the land would be cut up for residential purposes. It is a beautiful bit of country, eminently fitted for residential purposes.

23. Is there a likelihood of an increased traffic in produce and fruits? Yes.

24. Would it induce further production? It would, undoubtedly.

25. Would that be at the cost of the Northern line to some extent, through its being so close to it? I think it might give a greater impetus to settlement there, and greater cultivation of the land than the Northern line has already caused; although I should say that the whole of the country will eventually be cultivated, and the traffic from the land adjacent to the Northern line would go to that line, and so in a certain sense this line would compete with the Northern line. At present, I think, a great deal of the produce comes into Parramatta by road.

26. The average distance between the two lines is about 3 miles? Yes, not more than that.

27. Do you not think that is rather close? It is rather close for lines where the chief return is derived from carrying produce. It is only 3 or 4 miles from the terminus to Parramatta.

28. And the construction of the proposed line will be to make the purchased line from Clyde a paying one? I think it would contribute to that result.

29. Do you think both together would pay—that is to say, with a total purchase of £67,000 and £30,000—that would be about £100,000 in all? It would be very difficult for me to say. I should not consider the extension a very good investment.

30. *Mr. Levien.*] What is the length of the line to Rosehill which the Government purchased for £22,500? Five miles 48 chains altogether. I think it would be 4 miles 48 chains without the sidings to the wharf.

31. They bought the 5 miles for £22,500? Yes.

32. Do you not think it was very cheap? Yes.

33. What did it cost originally to construct? It is said to have cost £110,000.

34. What could it be constructed for now? I can only repeat the answer I gave at a previous inquiry, when I stated that it would cost between £40,000 and £50,000 for construction alone. I adhere to that statement now. I afterwards made an estimate, and I estimated that it would cost £45,000.

35. Then these 9 miles 6 chains which it is proposed to construct at an estimated cost of £67,000 are really not cheap as compared with the line which has been bought for £22,500? No.

36. The Rosehill line was bought very cheaply? Yes, very cheaply.

37. Do you not think it best to go on constructing this line, considering that you have got it so cheap;—is it not better to continue it to Dural? It is a matter of calculation whether it is going to pay or not.

38. You say that the purchase has just been completed, and that a sum of about £8,000 is required to put it in good working order;—that is, the whole of the 5 miles 48 chains? Yes.

39. Then the actual cost would really amount to about £30,500? Yes; a little under that.

40. Considering the district and its growing capabilities, do you not think it best to complete the line, even though the expenditure goes up to £67,000? I am not in a position to give an opinion. There is another important consideration: What is going to be paid for the land. £67,000 will not cover the whole cost.

41. That is the actual expenditure of the Public Works Department? Yes, on construction.

- H. Deane. 42. The report you have read to the Committee says the line must be extended to Dural? That is the Under Secretary's statement, not mine. I do not see any necessity for it myself.
- 28 Aug., 1900. 43. You do not express any opinion as to the probable traffic? No.
44. It is all valuable land along there, and would be subject to greater cultivation if the line were extended? It is very good land.
45. *Mr. Hyam.*] Have you been over the proposed line? Yes.
46. You know the country pretty well? I have been over it more than once.
47. Have you been as far as Galston? Yes; the country is patchy beyond that.
48. Beyond Galston it is inferior country? Yes.
49. You would not look for so much traffic beyond Galston? You get to the sandstone beyond Galston.
50. Can you tell me the distance from Clyde to Carlingford by rail? It is 4 miles 48 chains.
51. You say that the line from Clyde to Carlingford has not been worked? No; the Rosehill line is working, but not the other.
52. It is completed, is it not? Yes; and it is in pretty good order.
53. Would it not pay to work it to Carlingford? The Railway Commissioners intend to work it as soon as they get the alterations made—the alteration at the junction, and one or two extra things along the line.
54. That will be in the near future? Yes. I believe they have already started to make the points and the crossings, and to do the interlocking work.
55. With regard to the bridge over the Parramatta River, connecting the Rosehill line with Carlingford, is it a good bridge? It is an old style of bridge, not suitable for heavy rolling stock. It will do for the engines which it is intended to use for working this line.
56. Would it be sufficiently strong to carry freight trains and passenger traffic? Yes, with the lighter class of engines that will be used.
57. About 40-ton engines? Yes; they would not be heavier than the suburban engines.
58. The bridge would not carry express engines? No; I believe the bridge was never designed for heavy traffic. I went over it just before it was completed, and I suggested it should be stiffened up, and it has been stiffened up to some extent. If it had been designed in my branch I should have made it very much stronger. I make all bridges to carry the heaviest engines; but it will do for the purpose for which it was intended.
59. Would an ordinary suburban engine be able to take a fairly good load up these heavy gradients—1 in 40, with a 10 chain curve? I think as much as will be wanted. The chief portion of the loading will be down-hill. There will be very little back loading. I think the grade on the purchased line is 1 in 35.
60. Personally, you are not in favour of the extension of this line? No; you mean in constructing.
61. Yes? It is the best that could be made out of it. It is an expensive bit of line. It does not look as if it were a line that would ever pay.
62. Under no circumstances could there be an extension beyond Galston? No.
63. Even if the line was taken beyond Dural to Galston, that would have to be the terminus—it could not go on? No; the country is so broken.
64. *Mr. Levien.*] Why do they not open the line to Carlingford? The purchase has only just been completed.
65. The line has been built for some time;—was it the Rosehill junction that prevented it from going on to completion? No; the money has only just been paid over. The transfer has only just been effected; about a week or a fortnight ago.
66. There are no engineering difficulties that are keeping it back? No, nothing whatever.
67. *Dr. Garran.*] On the plan before the Committee there is a possible line marked west of Castle Hill;—has that any advantages over the Carlingford route? No; I do not think it has. I think if the line is to be taken to Dural now that this purchase has been made, it would be best to extend it from the purchased line; but if that line had not been carried across the Parramatta River from Rosehill I should say that the western route would be worth consideration.
68. Could you not now turn off from Carlingford and go to Baulkham Hills and to Dural? No, there is too great a drop.
69. So that you have got to keep to this ridge now that you are on it? Yes.
70. There is no other way, except sticking to the ridge? No; you are running along ridges and spurs all the way.
71. Are the roads anything like the Blue Mountain line? They are much on the same principle; you cannot get away from the one route. It is a difficult class of country.
72. But so far as the ridge is concerned, you are pinned to it when once on it? Yes.
73. Is there any range going out towards Kenthurst? I have not been to Kenthurst.
74. There has been a good road made from Galston to Hornsby? Yes.
75. All the fruit goes that way? I am not sure; it is a very steep drop into the Berowra Creek valley.
76. *Mr. Hyam.*] That line from Westmead *via* Castle Hill—after leaving Castle Hill, would there not be a big hill and cuttings? Yes; an awkward hill there. The line takes a curve through it.
77. It would be very expensive work? We go round it. I think there is a large cutting at one special point, but we can get round it right enough.
78. Would this railway serve the Castle Hill people with their produce—or do you not think they would rather go into Parramatta instead of facing the hill? I think they would get used to the hill, but for some time they might go into Parramatta. Eventually they would take the shortest route in spite of the hill.
79. *Mr. Watson.*] Has a survey been made of the line from Parramatta to Dural, following the main road, *via* Baulkham Hills and Castle Hill? Yes.
80. Could you tell the Committee what that was estimated to cost? I am working it out now, and I dare say I shall be in a position to give the Committee the latest figures in the course of a day or two.
81. That line appears to follow the main road, except a little piece near Parramatta? Yes. I propose to go along Church-street, Parramatta.
82. *Mr. Hyam.*] Was there not a private tramway there? No; that is in George-street, and goes down to the river.

83. Was there not a private line of tramway surveyed from Parramatta to Dural? No; we have had surveys along the road. H. Deane.
84. *Mr. Watson.*] If that road were followed by a tram-line it would be considerably further from the Northern line than the proposed Carlingford railway? Yes, it would; but it would follow the same general line of population. 28 Aug., 1900.
85. With regard to these alterations you speak of as being necessary at Clyde—before the Railway Commissioners sanctioned the purchase of the line it could be worked—is it not a fact that very heavy traffic has been worked from that junction on the Rosehill line already, in connection with race meetings, eight-hours' sports, and so on? Yes.
86. Then can you explain why, to work the two or three trains that will be necessary for this little extension beyond the Parramatta River, there should now need to be so great an expenditure for alterations? I should prefer to leave that to the Railway Commissioners or their officers to reply to. I would point out that the Rosehill traffic is an exceptional thing, whereas the traffic on this line from Clyde will be of daily occurrence, and the line, of course, should be made suitable for it. In other words, you can put up with an insufficiency of arrangements on an emergency; but you would not consider it proper to have insufficient arrangements if the line were worked continuously.
87. It seems strange to me that they can deal with a vast number of people on such occasions as the Eight-hour Demonstration and big race meetings and yet not be able to deal with a smaller amount of traffic that has to be provided for day by day;—do you know whether they propose debiting the £8,000 to the Construction Branch? The money will be found by the Public Works Department. The purchase of the line has been made by the Public Works Department, and the Railway Commissioners are anxious that the line should be put in proper condition for continuous working.
88. It looks as if they were asking for more facilities now than they have been working under for years past, seeing that the greater part of this expenditure is to be made at the Clyde junction? *Mr. McLachlan* will be able to give you better information than I can on that point. The traffic to the Rosehill Racecourse is occasional; but the traffic on this line would be daily.
89. *Mr. Hyam.*] Did the Government survey a line of tramway from Parramatta to Dural? We have surveyed a tramway there. I think there was also a proposal for a private tramway.
90. I think you gave evidence to a Select Committee in regard to that proposal—and it was condemned by a Select Committee of the Upper House—we considered the preamble not proved? Yes.
91. That is not the tramway you refer to? No.
92. It was not possible to take the tramway further than Castle Hill, because of the physical difficulties? I think my evidence in regard to the matter would be scarcely reliable, as I should have to give it from memory, and I would rather look the matter up.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

93. *Chairman.*] Have you any general statement to make to the Committee in regard to the proposal for constructing a line of railway from Carlingford to Dural? I have nothing further than what is contained in the report of the Railway Commissioners. H.
McLachlan.
94. In the report of the Under Secretary it is stated that in order to make the purchase of the Clyde to Carlingford line profitable, it will be necessary to extend the line to Dural;—that evidently is not the opinion of the Railway Commissioners? No. 28 Aug., 1900.
95. Have not the Railway Commissioners reported strongly against it? Yes.
96. I suppose there has been no similar proposal made for a short line of 5 miles to run at an average of 3 miles from the nearest railway? No; it seems to me that it cannot be held to be a necessity that the line should be extended in order to secure its profitability, because the district traffic partly goes to a competing line. Pennant Hills station is only $1\frac{1}{2}$ mile away by a good road, and you have this further advantage, that it is 2 miles nearer Sydney by the present line.
97. Where does the Dural traffic go to now? Some of it goes into Parramatta, some goes across to Hornsby. Most of the district traffic goes to the Pennant Hills Station.
98. Is there any hope that a line to Dural might tap a large district to the north and west? No; because the country beyond Dural, and especially beyond Galston, is very broken. Galston itself is a very fertile place, but as soon as you get beyond that you get into very broken country. The area of good country is limited.
99. The estimated traffic revenue from the proposed line is £1,025 per annum;—how much of that would represent traffic diverted from the Hornsby line? I am not quite sure on that point. I do not think consideration has been given to it.
100. Do the Railway Commissioners anticipate that the Clyde to Carlingford purchase is likely to prove profitable, considering the price they paid? The Commissioners considered it a reasonable thing to do in many ways. One reason which actuated them was that industries were springing up near the Parramatta River. Then there was also good business to the Rosehill Racecourse; the revenue from that was equal to £2,000 per year, and it brought business to the main line; they thought that as the line could be obtained so cheaply it would be wise to purchase it.
101. It has been suggested that the proposed line would open up a large district suitable for residential purposes? I think that is a claim that will not hold water. We have a line nearer Sydney, and alongside the proposed line, only 3 miles away, and passing through equally good country; and yet that does not show much in the way of establishing a large residential population.
102. Taking the whole line, from Carlingford to Dural, at the estimates set down, and excluding the cost of land and other compensation, the average cost per mile has been about £6,000—in order to make a line of that cost profitable it would require to be taken through exceedingly rich country? Yes; it would require the traffic of a large area.
103. Do you know within what radius this line would draw traffic? I think the traffic from Castle Hill would go into Parramatta. The farmers generally bring in their fruits and take back supplies. A large amount of fruit traffic goes to the western stations—that is, a great deal of Parramatta fruit, at certain times of the year, goes to Bathurst, Wellington, and other places on the Western line. And the growers would still find it equally convenient to come to Parramatta with it.
104. So that this line could hardly be expected to bring traffic from the east, and only traffic from a very restricted area on the west? That is what I think. 105.

- H.
McLachlan.
28 Aug., 1900.
105. It would practically have a dead-end at Dural? Yes.
106. *Dr. Garran.*] When you have made the improvements at Clyde, which are to cost £8,000, the line will have cost the Department a little over £30,000 altogether? Yes.
107. Is the interest on that not very heavy? No.
108. And if you get your working expenses paid on this line, the burden would not be very heavy? No. Indirectly we look to the business on the original Rosehill line to help to outweigh the deficiency on the line to the north of it.
109. But you can pretty well make the Carlingford line a self-supporting line;—there is no need to go on further for the purpose of making that productive? No.
110. So that this proposed extension to Dural must be considered entirely on its own merits? That is how the Commissioners consider the matter.
111. The line to Carlingford would be a complete property itself? Yes.
112. And it would not be a great burden? No, considering all the circumstances.
113. *Mr. Shepherd.*] I see the estimated annual cost is set down at a little more now than it was set down at in 1898? The interest cost may have gone up a little.
114. In the Commissioners' report, read to the Committee just now, it says, "Capital expenditure at 3 per cent., £2,031"? It is due entirely to a different estimate from the Engineer-in-Chief. Mr. Deane increased his estimate.
115. Then now the line is really estimated to cost a little more than it was estimated at two years ago? I take it that that is due to increased cost of labour and materials. I understand that the capital cost would be increased by something like £10,000 by the purchase of land. It would run along the frontages of a large number of properties.
116. From the estimate of revenue it would appear that the district has remained precisely in the same state as it was in two years ago? Yes; there has been no development to any great extent.
117. And there is no more encouragement now than there was two years ago to construct the line? The Commissioners think not.
118. *Mr. Hyam.*] When the alterations are made at the Clyde junction, is it the intention of the Railway Commissioners to open the line to traffic as far as Carlingford? Yes.
119. Would it be a daily service? Yes.
120. Only one train a day? More than one train a day.
121. Will it be opened almost immediately? As soon as the line is ready to work. We have not been formally advised by the Government that the line has been taken over.
122. And Carlingford for the time being will be the terminus? Yes.
123. Suppose you had bought the railway only to the river, before the bridge was erected—I suppose there is no doubt that in that case the Commissioners would not have constructed that portion of the line between the river and Carlingford? I think not. It was there, however, and was offered for little more than nothing.
124. But for that you would not have constructed that part of the line? No; I think not.
125. *Mr. Watson.*] Mr. Deane, Engineer-in-Chief, informed us that it was proposed to expend something like £8,000 in connection with the Carlingford-Rosehill railway;—the greater part of that expenditure would be made in improvements at the Clyde junction? £3,000 out of £8,000 would be expended at that junction.
126. Can you say why it is necessary to go in for such a large expenditure there, in view of the fact that you have had a large traffic there for years past? We dealt with it under different circumstances. Now we are going to have a branch-line service; and the Commissioners are going to have platforms for transfers, and to deal with goods traffic. They are also introducing a proper interlocking system. One was a direct through service; this will be a branch-line service.
127. Will you run through trains from Sydney for this branch? No.
128. People desiring to go that way will have to change at Clyde? Yes; and the Commissioners desire to provide proper accommodation and facilities for the public.
129. Do you know whether the Railway Commissioners have looked into the suggestion to run a tramway from Parramatta to Dural, along Baulkham Hills way? I think they did some years ago, and they were not favourably inclined towards it; they did not think there would be sufficient business to pay. The road is fairly good now, and the cartages are not long.
130. *Mr. Hyam.*] Do you remember that some few years ago there was an idea for running a tramway from the Parramatta Railway Station to Castle Hill? Yes; I think the Parramatta River Company proposed to do it.
131. You gave evidence before a Select Committee in regard to that proposal? Yes.
132. Was your evidence in strong disapproval of that tramway? Yes.
133. I think you then stated that it would be possible to take it to Castle Hill, but that it could not be continued to Dural, on account of some obstacle—some big hill, I think? I think that was outside of Galston. The Commissioners did not think the prospects of the tramway were such as to make it remunerative. They were not in favour of it.

WEDNESDAY, 29 AUGUST, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESBAY CRAWFORD SHEPHERD.
 The Hon. ANDREW GARRAN, J.L.D.
 The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVIEN, Esq.
 JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

134. *Chairman.*] You understand the nature of the inquiry now before this Committee? Yes.
135. *Mr. McFarlane.*] I see, by the last Committee's report regarding the proposed railway from Carlingford to Dural, that the estimated traffic is supposed to yield £1,025 per annum? Yes.
136. What would that traffic consist of;—have you the details on which that estimate was framed? Yes. The information was given by me in 1898, when I was being examined by this Committee. I then stated that I did not think, taking all circumstances into consideration, that this section would produce more than the following traffic:—150,000 cases fruit, at 1d., £625; 2,000 tons special class goods, at 1s., £100; sundries, £100; passengers, £200; making a total of £1,025.
137. Has there not been some increase during the last two years? Not any quantity. The increase would not be appreciable; not sufficient to vary that estimate, as it was an outside estimate I gave.
138. Has there been no increase of population or settlement? There may have been a small increase of population.
139. Would that not mean an increased passenger traffic? It would be inappreciable. It was an absolutely outside estimate that I gave, and it would cover any small increase there has been in the way of population or production since I gave it.
140. Is there much country to be served by the proposed line? Not very much.
141. What extent of country would it serve? About as far as Galston and Kenthurst. Pennant Hills would come in at a point between Dural and Carlingford.
142. Is it similar country in that direction? Yes; it is all broken country. A good deal of it is agricultural country, but some of it is inferior.
143. Is most of the land that would be served by the proposed line as good as that now served by the present line? Not the larger proportion of it. A large proportion is not cultivated at all where the line would serve.
144. Is it suitable for orchard purposes? More or less.
145. Do you think the construction of the proposed line would cause an additional area of land to be cultivated? I do not think so. The estimate I have given supposes, practically, that the people proposed to be served by the line would pay rates double those which are now charged on the existing line. When last examined by the Committee I expressed a doubt as to whether they would pay them.
146. The proposed line from Carlingford to Dural is only a short distance from the Northern line? Yes.
147. The average distance from it is something like 3 miles? I think from 2 to 3 miles.
148. Then, do you think that the construction of this line would interfere with the traffic on the Northern line? Decidedly. It would create very little new traffic for itself for a good many years to come. No doubt by-and-by it would become a large residential area; but at present there is not much population.
149. Then, this estimate you have made of the traffic, namely, £1,025, has reference only to the new line;—would not that revenue be got, to some extent, at the expense of the existing line? No; the estimate is based on the assumption that the people would be willing to pay double the rate now charged on the present line.
150. Do you think they would use the new line at double rates? That is very doubtful; there are some who would use it. As a matter of fact, on the mileage the addition to the existing line rates is only about $\frac{1}{4}$ d. to $\frac{1}{2}$ d., and you notice in my former evidence that I have given an arbitrary penny; that would be practically in addition to what we are getting on the main line at the present day. For instance, Pennant Hills people are paying us an additional penny now.
151. Could you say whether the proposal for the line now under consideration arose out of an agitation on the part of the residents—the fruit-growers in the locality? I do not know who started the agitation; but I imagine that the proposal did come from them.
152. Would it be any great convenience to the fruit-growers to cart their fruit 3 or 4 miles? No doubt if you have the railway station closer to their property it would be an advantage to them; but the wider question is, would it be to the general advantage of the community. I do not think the district is in a bad position as compared with many other districts of the Colony.
153. It is well served by railways now? I think so.
154. Where do the fruit-growers at Dural send their fruit to? A great deal goes to Pennant Hills; some of it goes to Hornsby—but it chiefly goes to Pennant Hills. There are varying distances. In my evidence before the last Committee I gave the distances; for instance, there is one point on the line, Regan's, that would come within half a mile of the line; Thompson's is at the junction of the Pennant Hills road; that is another point from which fruit would come in; then a portion of Kellyville would not be more than $2\frac{1}{2}$ miles away.
155. Do you think the construction of the proposed line would have the effect of increasing the residential population of the locality? There is no doubt about it that in the near future—but not in the immediate future—there will be a large residential population. There are some very fine sites for residences. But, in the first place, I think the sites on the Milson's Point line will have to be exhausted before the people go Dural way. There would always be more trains per day on the Milson's Point line, by reason of its connection with the Great Northern line.
156. Has population increased on the main Northern line, towards Hornsby? Nothing like what was anticipated.
157. And in view of that you do not think there would be any material increase of population along the proposed line? I should certainly expect it to increase on the Northern line before it increased on the other.

J. Harper.
 29 Aug., 1900.

- J. Harper. 158. You have no knowledge of the recent purchase of the line from Carlingford to Clyde? Yes.
- 29 Aug., 1900. 159. What is your opinion concerning that? I think it was a very good bargain at the price that was paid for it. I think the fact of having acquired the right to the railway—which in my opinion should never have been parted with—will probably be to make it pay.
160. You think the traffic along it will be sufficient to make it pay? I think so. Of course you have the advantage of the Meat Works there. They are not in operation now, but they will be again soon; and then you have the Australian Kerosene and Oil Company's Works.
161. Apart from the traffic on the line to Rosehill, do you think a line to Carlingford would pay? Certainly not.
162. And on the proposed new line there will not be any special advantage? No, we did not look to the records of traffic very much, so far as the country beyond Carlingford is concerned; a great deal of the traffic of that district finds its way down to the wharf at Ermington.
163. And you think there would not be much increase of population along the proposed line? Unless the people engaged at the Clyde Works and other industries took up their residences in that direction.
164. How long has that line been constructed? I should think about nine or ten years.
165. I understand it has only been worked as far as Rosehill? That is all.
166. Has the line from Rosehill to Carlingford been constructed ten years? I do not know when it was completed; but I think it would be about nine or ten years. It was open to the river in 1898.
167. So that in reality only one portion of the line from Clyde to Carlingford has actually been used? That is so.
168. Can you give any opinion as to why the remainder of the line is not used for traffic? Mr. Chapman, in his sworn evidence in 1898, said it would not pay to work it.
169. Is it the intention of the Railway Commissioners to work the line as far as Carlingford? Decidedly.
170. Do you think it would pay to work it? The Carlingford section on the Northern side of the Parramatta River is not an appreciable quantity. It is the portion of the line beyond that that would add to the working expenses.
171. I understand that considerable outlay has to be incurred to make the line serviceable? Yes; the junction requires to be completed, and other improvements are also wanted.
172. Do you think the proposed extension would help to make the other part of the line more remunerative? No; I should think it would be a drag on it, considering that the proposed expenditure is £67,000, and that there will be additional working expenses. I should think the outlay would not be recouped by the revenue received from it.
173. You do not think it would induce additional traffic? I do not think so.
174. *Dr. Garran.*] In estimating the traffic for the new line, I think I have understood, from your previous evidence, that you always look about to see what are the prospects of increasing settlement and production? Yes.
175. Now, do you think that in the districts that would be served by this railway the quantity of fruit and other things grown there would be much increased by making this railway? I do not think it would to any extent.
176. Pretty well all the land fit for fruit-growing is already laid out in orchards? A very large proportion of it.
177. Do you think the mere construction of this line would in a few years double the fruit production, or, say, in ten years? No; I should not think so.
178. So that you do not look for any great increase in the traffic simply by making the railway? No. One of my reasons for that is that at the present time the district is very largely served by the main line, and along the river on two sides of it. When you get to the south-western portion of it it is served by the Richmond and Windsor line.
179. With better approaches to the existing lines and stations, would the orchardists be fairly well served by the existing line? Yes; by improving the grading of the roads and metalling them.
180. Plenty of good metal is obtainable—plenty of traprock and bluestone? Yes.
181. You do not consider that the making of this line on to Dural would help to make the existing bit of railway more profitable than it would be without it? On the contrary; I think it would rather add to the burden.
182. We were led to understand by a witness, yesterday, that it might very nearly pay expenses as far as it extends to Carlingford? Yes; that, of course, would be due to the traffic to Rosehill.
183. It is very profitable on a few holidays? Yes.
184. But it is only a few days in the year that you get them? Yes; but we get a good deal of traffic on holidays.
185. And that has to help to pay for the line to Carlingford? Yes.
186. But the Rosehill to Sydney line is a non-paying one? Yes.
187. You do not think the finances would be improved by adding the proposed extension? No, I do not.
188. The part that is least served by the railway would be that between Pennant Hills and Dural? Yes.
189. The part between Carlingford and Pennant Hills is well served now? Yes. A portion north of Carlingford, a mile or two beyond the cross roads, is well served by the Pennant Hills station.
190. We are told that from Dural, right across to the junction of the Northern line at Hornsby, is only about $4\frac{1}{2}$ miles? Yes; it is good hard country there.
191. The Dural people have to come round by way of Pennant Hills;—if we had a better road across there, would the people be as well served as if this proposed railway were constructed? It would simply be an improvement.
192. Could they make a shorter road to Hornsby? I cannot say.
193. Then this is not a district that would promote much fresh settlement on the soil? That is a very difficult question to answer. No doubt, under given conditions, fruit cultivation in the county of Cumberland would increase; but it would take an enormous quantity to represent much-increased traffic on the railway.
194. But it may become a residential district? Yes; but not in the immediate future.
195. We have a good deal to fill in before we can open fresh ground for settlement? Yes.
196. It would be a considerable distance from the city? Yes.
197. There is no immediate source of profit in that? No; the disposition of people would be to go and live where the best service exists.
- 198.

198. Is the fruit trade, on the whole, a fairly profitable trade for you? No; but you get indirect advantages arising from fruit cultivation, in the shape of supplies which are carried back. J. Harper.
199. But the freight itself? It is a very low freight; by the time you have carried the empty cases on the return, there is very little left for us. 29 Aug., 1900.
200. It is the return business and incidental passenger and other traffic that helps to pay? Yes.
201. I suppose these people, as a rule, get their supplies from Parramatta? A great deal of it is carted from there, and then there are supply carts that go about the neighbourhood; there are only one or two stores in the whole district.
202. And it used to be the custom for fruit-growers to take out a load of manure when they went in with their produce—if they did that they would still stick to their carts? Yes.
203. You do not think much manure would be taken by the railway? Not very much.
204. You take the stuff from Homebush? Yes; that is carried away by railway.
205. You get a profit out of that? We get the freight on that; but that is not much when you take the cost of loading up.
206. Do you load it up? Yes; we do it by contract.
207. And you get a fair price for carrying it? The ordinary rates.
208. They pay you better than bringing produce in? They pay the same rate. It is a very low rate for manure.
209. *Mr. Watson.*] Was there not a tramline projected from Parramatta to Baulkham Hills, to Castle Hill, and on to Dural;—do you think there is any greater prospect now for traffic for such a line along there? You would get more passenger traffic on that road—a good deal of the local traffic, people from Parramatta—but I do not think it would be quite the same amount of traffic as on the other one, because the rates would have to be high to pay. Then you would have to tranship at Parramatta unless it was practically a railway line.
210. Could you not run a tramline in that direction? No; the curves, &c., would not permit of it.
211. *Chairman.*] I understood you to say that the rates on the proposed line would be higher than those on the main Northern line? I have estimated them higher, otherwise there would be absolutely no profit at all; of course in framing my estimate I assumed that people would pay 3d. per case extra; they never undertook to do that, but they undertook to pay 1d. additional, and I have given them the benefit of it.
212. If that scale of rates was imposed, would it not induce them to go rather to the main line than patronise this extension? My opinion is that many of them would not pay the 1d., but would go to the main line.
213. How far west do you think this extension would draw traffic? Certainly not from Pennant Hills, or Baulkham Hills, or Castle Hill. I think a considerable portion of the traffic of the western side of the road would continue to go to Parramatta; it is an excellent road.
214. Could you say that on an average it would draw traffic for 4 miles on the west? Yes, it probably would.
215. And how far from the north? That would depend upon the roads which lead to the main line. At present the road is good to the main line.
216. How far north? From Galston.
217. Yes—The traffic on the other side of this line would come from an extremely restricted area? Yes; some of the roads might be both better metalled and graded. Outside that area there is still good communication with Parramatta, and the North Coast line, and the line to Carlingford.
218. And it is a line that cost something over £7,000 per mile? Yes; it will cost about £57,000 altogether, I think.
219. How is the Richmond branch paying? It is amongst the non-paying lines.
220. It has been an expense to the country from the time it was constructed? Yes; a mistake was made in the first instance, in the construction of it, in its not having been properly graded. It was really built for a horse tramway.
221. How many years has the Richmond line been working? Over thirty years.
222. Has there been any appreciable improvement, recently, in the returns? I do not think so, speaking from memory.
223. Is the district somewhat similar to that which would be served by the line from Carlingford to Dural? It is a larger agricultural district than the one that it is proposed to serve by the Dural line; it is a fruit-growing district all along to the Kurrajong.
224. Is it a more populated district? Yes; the population is considerably larger, and the line also has the traffic from the Riverstone Meat Works, which represents more than all the other traffic put together on the proposed line. It has created a large settlement and increased population. The loss on the Blacktown-Richmond line, in 1899, was £5,940; that was £1,700 worse than it was in 1893.
225. Could you give the total traffic on that line? No, I cannot; but the capital cost was £198,000.
226. Could you give us the figures after deducting the Riverstone traffic from the total traffic on the Blacktown-Richmond line? I cannot give the exact figures, but of the goods earnings of £6,489, £1,560 is due to the Riverstone Meat Works.
227. *Mr. Shepherd.*] Has a new estimate been made as to the traffic that we should get on this proposed line of railway from Carlingford to Dural since the estimate that was made two or three years ago? No; it is precisely the same. We know that the quantity of freight to be carried has not increased during that period.
228. It was stated, two and a half years ago, that there were 7,438 acres of bearing trees, which represents 150,000 cases of fruit; at the same time there were 24,382 acres of non-bearing trees? Yes.
229. Were they worn-out trees or young trees? A great many of them were worn-out trees.
230. It does not say so in the return? No; but there is nothing like that quantity in the district. Those 150,000 cases practically represent the whole of the fruit of the district, and a great deal of it was grown east of the proposed line, and would naturally go to the main Northern line, under any conditions.
231. Because, even if a fourth of those trees were young trees, and would by-and-by be bearing, they would give a large quantity of traffic? Yes; but our returns do not show that that has been the case.
232. *Mr. Hym.*] What is the length of line from Richmond to Blacktown? 16 miles 12 chains.
233. And you say that it cost £198,000? Yes. I have explained that that large expenditure is due to the way in which the line was first laid out; a great deal of it had to be regraded.

- J. Harper. 234. It would not cost that much now? Nothing like it. It might be constructed now for probably £3,000 or £4,000 per mile. It is easy country; much easier country than that beyond Carlingford.
- 29 Aug., 1900. 235. I suppose, during the thirty-five years of its existence, it has been undoubtedly a great loss to the country? Oh, yes. I do not think the loss has ever been lower than £4,000 per year.
236. And this proposed railway to Dural, if constructed, would be on the same footing? It would be even worse, I think.
237. Mr. Levison.] What is the revenue from the Windsor and Richmond line? I think it is £11,688 a year.

MONDAY, 10 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.
The Hon. ANDREW GARRAN, LL.D. | ROBERT HENRY LEVIEN, Esq.
The Hon. SOLOMON HERBERT HYAM. | JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

John Charles Hunt, fruit-grower, Dural, sworn, and examined:—

- J. C. Hunt. 238. Chairman.] I understand that you have prepared some statistics which show the area of land under fruit in the district which would be served by the proposed extension of the railway from Carlingford? Yes. My statement is as follows:—
- 10 Sept., 1900.

| Place. | Population. | Acres. | | | | | |
|---------------------|-------------|----------|----------------|----------------|--------------|----------------|------------------|
| | | Holding. | Cultivated. | Bearing. | Not bearing. | Other tillage. | No. of holdings. |
| Dural | 417 | 4,698½ | 1,229½ | 942 | 217 | 70 | 69 |
| Kenhurst | 370 | 8,236 | 886½ | 682½ | 181½ | 23 | 134 |
| Glenhaven | 64 | 823¾ | 114½ | 84½ | 30 | | |
| Galston | 441 | 6,174½ | 1,056½ | 824 | 198½ | 34½ | 150 |
| Arcadia | | | | | | | |
| Castle Hill | 990 | 8,028½ | 2,489½ | 2,041 | 282 | 166½ | 200 |
| Pennant Hills | | | | | | | |
| Glenorie | 301 | 4,618 | 1,081½ | 686 | 294½ | 99½ | 89 |
| | 2,583 | 32,578¾ | 6,857½ | 5,260 | 1,203½ | 393½ | 642 |
| | Increase 89 | | Increase 1,795 | Increase 1,314 | Decrease 357 | Decrease 163 | |

239. Within what distance of the proposed extension does that cultivation lie? Between Castle Hill and Pennant Hills; we have taken into account almost entirely the country on the western side of the proposed line. There are very few holdings on the eastern side of the line there included in the statement which I have read.

240. Would the whole of that cultivation lie within an average distance of 5 miles from the proposed extension? Yes, for the first part of the distance; but getting out towards the end of the line the area to be served by it would extend much further away from it.

241. What is the greatest distance to the north of the proposed terminus from which you have drawn your figures? About 11 miles.

242. It has been pointed out to the Committee that the proposed railway would be within a mile and a half of the Northern line at its nearest point, and within 5 miles at its furthest point:—why, then, cannot people in the district use the Northern line? Although Dural is only 4 miles in a straight line from the Northern railway, it is impossible to get to that railway by road in less than 10 or 11 miles, because of an almost impassable creek which runs nearly parallel to the railway almost from Pennant Hills. Although the Northern railway is so close to many parts of the district, a great many people have to travel 20 miles by road in order to get to it. My own orchard is within 4 miles of Hornsby in a straight line, but it takes me 19 miles to get there by the surveyed road, which goes over very hilly and rocky country. I go chiefly to Pennant Hills, which is within 9½ miles of my place.

243. At the present time there are 7,857 acres under cultivation in the district;—how does the area now under cultivation compare with the area under cultivation five years ago? The area now under cultivation shows an increase of 1,795 acres over the area under cultivation two years ago. Those figures will appear to be wrong if you refer to the statistics given about two and a half years ago, but at that time we included the Carlingford district in our calculations, whereas this time we have left that district out of consideration.

244. Is the district capable of being still further cultivated? Yes; I think that the cultivation might be made three times as great as it is now. There is a large quantity of private land which has not yet been brought under cultivation, and there are also many acres of Government land which have not been touched.

245. Is the Government land in the district suitable for fruit-growing? A great deal of it is.

246. Then why has it not been taken up? Largely because it has been reserved from sale. Some of it is included in population reserves, while some of it has been surveyed and an upset price put upon it. Land which would cost £1 an acre, if selected in the ordinary way, has been reserved at from £3 to £7 an acre.

247. Is that timbered country? Yes.

248.

J. C. Hunt.
10 Sept., 1900.

248. What would be a fair average price for clearing the timber off the land in the district? From £6 to £14 an acre.
249. How many acres would be required to enable a man to make a decent living by fruit-growing there? About 10 acres of good land would support a family. I know instances where people are doing well on that area, and are purchasing more land.
250. What is the staple fruit-crop in the district? Citrus fruits.
251. What proportion do the citrus fruits bear to the other fruits grown in the district? About nine-tenths of the fruit grown in the district is citrus fruit.
252. Does that fruit suffer much from road carriage? No; but summer fruits suffer very greatly.
253. What is the most material handicap to the production of the district at present? The loss of time occasioned in the taking of fruit to market. The smaller growers are now half their time on the roads. It takes such a man two or three days a week to drive his fruit to the Northern line.
254. If a man had 20 acres under fruit, would he have to give a great deal of his time to the cultivation of his land? Yes; all his time, and it would be profitable for him to employ another man to help him.
255. Then every day spent in carting would be so much time lost? Yes.
256. Do you think that the road cartage seriously interferes with the speedy development of the district? I am sure that it does.
257. Have you included the Baulkham Hills district in your returns? No; we only included the district which we knew would use the proposed railway.
258. Have you made an estimate of the number of cases of fruit which would be sent to the proposed railway? Yes; there are 5,260 acres of bearing trees in the district, and, averaging them at 100 trees to the acre, and at one case to a tree, that would give a traffic of 526,000 cases to the railway.
259. What rate would be charged per case from Dural to Carlingford? The rate to Sydney at the present time is a penny a case from Pennant Hills or Parramatta, and 1½d. from Hornsby. I estimate that 313,400 cases of fruit would be sent along the whole length of the line, and I put them down at 2d. a case for that portion of the journey between Dural and Carlingford, because we should be willing to pay double rates, in order to get the railway.
260. That would mean a revenue of about £2,611? Yes.
261. What would the intermediate traffic be worth to the railway? I have estimated that £160 would be received from the Castle Hill and Glenhaven traffic, and £212 10s. from the Pennant Hills traffic. Mr. Harper has stated that 150,000 cases is an outside estimate for the whole of the traffic of the district; but such a statement is ridiculous, because there are sixty-nine growers in Dural alone, and three of those growers sent to market as many as 30,000 cases of fruit a year.
262. I think that Mr. Harper assumed that a certain amount of traffic would go to Parramatta, and that some would go to the Northern line? We have not included any traffic except such as would come to the proposed line. The traffic on the proposed line would be very much greater than his estimate.
263. Do you think that the residents of the district would be satisfied to pay a special rate? The matter was discussed at a meeting of the railway league representing the whole district, and it was unanimously decided that the growers could afford to pay a charge of 3d. per case from Dural to Sydney.
264. Do you think that the residents of the district would be inclined to pay a special tax of so much per acre instead of a special railway charge? I cannot say, but I think that such a charge would be likely to press unfairly upon small growers. Where a man has the fruit to send away he can afford to pay the railway charge; but if there were an acreage tax it would have to be paid even by men who had no fruit to send away.
265. Why do not the fruit-growers employ carriers to take their fruit to the railway station, and thus save their own time? The carriage of fruit is a different thing from the carriage of other produce. Fruit is a perishable article, so that it is impossible to store it, and it must be sent away when it is ready. If a man employed a carrier he would, perhaps, not be there just when he was wanted, and he might come when the grower was not ready for him.
266. Therefore it is incumbent upon every grower to use his own vehicles to draw his produce to market? Yes; though sometimes one grower will get another grower to carry a few cases for him.
267. Have you seen other fruit-growing districts in the Colony? Yes.
268. How do those districts compare with the Dural district? Other districts may have better soils than our district, but, considering its general suitability and its nearness to the city, I do not think there is a better fruit-growing district in the Colony, especially for citrus fruits.
269. Do you get a good yield, year in and year out? Yes; there is generally a good yield every year. The inferior land which we despised a few years ago is now proving the better land for citrus fruits.
270. Is there any disposition to make the district a residential district for city men? There are suburban residences near Carlingford and in towards Parramatta, and several round Dundas, and I know of gentlemen who would be ready to come to the district to live directly it was given railway communication. Visitors come to the district now to stay there a few weeks.
271. It has been stated that Glenorie is practically a dead end, so far as traffic is concerned—that no traffic will come from the district further north? Five years ago there was not a residence between Glenorie and Wiseman's Ferry, but now the country is occupied for the whole distance.
272. What is the character of the holdings there? In a 40-acre block they can always get a fair area of land to cultivate there, and 5 miles from Glenorie there is one of the finest orchards in the district, although it is only about five years old. Then the ridge, going out towards Pitt Town, is also occupied by fruit-growers, and so, too, is the ridge going out towards Kenthurst. There are three ridges in that district now occupied by fruit-growers which were not occupied a few years ago.
273. How far west of a line from Dural to Glenorie does the good country extend? Taking the road from Dural to Glenorie as such a line, the good country extends about 8 or 9 miles to the west of it.
274. And how far to the east? From 4 to 7 miles.
275. As far as the Berowra Creek? Yes; that creek limits the country on the eastern side. It is the upper portion of the Berowra Creek that separates the Dural district from the Northern railway.
276. And there is a considerable area of country within those limits which has not yet been developed? Yes.
277. *Mr. McFarlane.*] What is the yield of a tree in a fairly good season? We think it a very low average yield to get only one case to the tree. In some places the average yield is two or three cases to the tree.

- J. C. Hunt.
10 Sept., 1900.
278. Has there been any failure in the crops during the last seven or eight years? No; but every now and then the production of a tree decreases. We generally find that a citrus tree bears two fairly heavy crops, and then a lighter crop, though, of course, that falling off in the crops does not occur with every tree in the orchard at the same time.
279. Where is the bulk of the fruit sent now? To Pennant Hills, and to Horusby through Galston.
280. Is there likely to be much traffic upon the proposed line? I cannot estimate the passenger traffic; but I have given you the population of the district.
281. Is the business of the district transacted with Sydney or with Parramatta? Most of the business at the extreme end of the district is done with Sydney.
282. Do you think that if the proposed line were constructed the balance of the land which is fit for fruit-growing would be used for that purpose? A fair proportion of it would, though I do not say that the whole of it would go under cultivation immediately.
283. Is there a noticeable increase in the area put under fruit each year? Yes; nearly every grower adds a little to his area each year.
284. How long has that increase been going on? The statistics show that the increase has been continual.
285. Do you think that the whole of the fruit-growers would agree to pay 2d. a case for the carriage of their fruit on the proposed line? Yes; those at the Dural end would.
286. Would not the imposition of such a charge have a tendency to send the traffic to the Northern railway? No; because it would cost twice as much to cart to the Northern railway.
287. Are there many roads from the district to the Northern railway? No; there is the main road towards Pennant Hills, and a road through Galston to Hornsby.
288. What is the country like north and north-west of Galston? It is somewhat the same as the country north of Glenorie. The soil is poorer than the soil about Dural; but it is good orchard land.
289. If the proposed railway were constructed, would it open up a large area of that country? Yes; and I believe that every acre there that is suitable for fruit-growing would be taken up.
290. Would Dural be the nearest point on the proposed railway to that country? Yes.
291. That country does not lie nearer to the Northern railway? No; it is 5 or 6 miles nearer the proposed railway, and the traffic would have a better road to come over.
292. Is much of the country timbered? Yes; the greater part of it. There are very large areas of timbered country down about Galston, and the greater part of many of the holdings round about Galston has not yet been cleared. There is an unlimited supply of timber.
293. Is this timber on Crown land or on private land? There is timber both on the Crown land and on the private land.
294. Is it timber suitable for market? Yes; it is suitable for firewood, for girders, and for sawing. There are ironbark, black-butt, mahogany, gum, blood-wood, and oak in the district.
295. Would there be much timber traffic upon the proposed railway if it were constructed? A great deal of firewood would be sent over the line. Thousands of tons of timber are now destroyed which would be made use of if a railway were constructed. I cleared 7 acres of ground last year, and every bit of the timber on it had to be burned to get it out of the way.
296. The Railway Commissioners estimate the traffic revenue of the proposed line at £1,025 per annum;—do you think that that is a low estimate? I think that it is a very low estimate. Mr. Harper stated, in reply to Question 203, that he did not think much manure would be taken by the railway, but, in my opinion, a great deal of manure would be carried over the line. It would be profitable to use half a ton of manure on every acre cultivated. The manure is not used now, because it costs too much to bring it out; but, if there were a railway, there would be something like 2,000 tons of manure used in the district lying round Dural. Mr. Fagan has carted a great deal of stable manure from Pennant Hills, but that manure is so bulky that it is very expensive to cart it. I use a great deal of "B and B" manure, which I obtain from the Sydney Meat Works. We estimate that £275 would be received by the railway authorities for the carriage of manure alone. We put down 2s. 6d. per ton for the carriage of the manure. At the present time it is sent from Auburn to Pennant Hills by train, and then carted out. At the Carlingford end of the line they do not use so much manure, but we have allowed £50 for the carriage of the manure used at that end of the district.
297. Would there be much traffic in produce from Sydney—horse feed? I think that every bit of the dry feed used in the district would be brought by rail.
298. Is much produce grown in the district? Very little. I grow a little hay, but I am about the only person in the district who does. A good many people grow their own green stuff, but all the hard feed used in the district is brought from Sydney.
299. *Mr. Shepherd.*] In your statement, you have estimated that there are so many non-bearing trees in the district;—are those young trees that have not yet come into bearing? Yes.
300. You have not taken into account worn-out trees? No; we have only taken account of bearing trees, and of young trees that are coming into bearing.
301. How many acres of orchard can one man work? From 7 to 10 acres.
302. How long does a crop last? I begin to cart my crop about July, and I am sending away until the end of February, or until the beginning of March.
303. As a rule, you have two crops a year? The lemon crop lasts pretty well the whole year round, and the orange crop from July until February. Our fruit hangs better than the fruit grown in other districts. I have had two crops coming in together.
304. Is 100 trees to the acre the general thing in the district? Yes.
305. What is the age of the trees that you have put down as bearing? From 5 to 6 years and upwards.
306. The older trees ought to produce more than a case to the tree? Yes; some trees always produce more than a case, and I have known a tree to produce twenty cases; but I have put down one case to a tree as the average yield.
307. At what age do the trees begin to fall off in their yield? When they are about 40.
308. What is the manure chiefly used in the district? I use the blood and bone mixture sold by the Sydney Meat-works Company.
309. Is there any lime in the soil? The soil is deficient in lime.
310. Do you not use bone-dust? Yes; bone-dust is largely used. People manure according to their fancy, and they may use bone-dust one year, and the "B and B" mixture another year.

311. Is orange-growing as a rule pretty successful? Yes.
312. Are those who are engaged in fruit-growing in the district satisfied with the results they obtain? Yes. A number who were only struggling a few years ago are pretty well-to-do now. I know one case where a young man, who was axeman to the Survey Department, took up a piece of poor ground, and in ten or twelve years he has become an independent man.
313. Is the fruit grown in the district generally sent to the nearest railway station? Yes.
314. There is not much of it carted into Sydney? No; not a case.
315. It is consigned to agents in Sydney? Yes.
316. At what distance from a railway can a man carry on fruit-growing successfully? I think that 4 miles is a fair distance.
317. A man living 4 miles from a railway station could send away two loads a day? Yes.
318. Do you not think that if the railway were constructed, and you were charged a special rate of 2d. a case, you would petition the Commissioners for a reduction of the freight? Of course, people always want to get things as cheaply as they can; but we should be greatly in pocket if we had to pay only 2d. a case, and we should have to use the railway if the Commissioners refused to make the rate any lower.
319. *Mr. Levien.*] To make fruit-growing a success, it is necessary to be able to get the fruit expeditiously to market? Yes.
320. A delay of a few hours sometimes makes a great difference in the price obtained? Yes.
321. Does road cartage injure the fruit? It injures the summer fruits.
322. Does your fruit obtain better prices in one part of the season than in another? Yes. The later on in the summer we send it, the better the price. A fortnight ago oranges were worth 4s. a case in Melbourne; to-day they are worth from 8s. to 10s. a case; and next month they will be worth from 15s. to 16s. a case. We can always keep our fruit back longer than they can keep back the fruit in districts south of us. We do not begin to sell until their season is fairly well advanced.
323. Why are the clumps of timber left which the Committee saw on some of the holdings? A great deal of timber has been left because the holders have not yet been able to use all their land; but narrow strips are also left as shelter strips to break the force of the westerly winds. Sometimes a belt of timber will be left right round an orchard in order to protect it.
324. Is the district a health resort? I am not a medical man, but I believe it to be one of the healthiest districts in the Colony. Dr. MacLaurin has for some years recommended his patients to go there, and evidence will be given by medical men as to its value as a health resort.
325. Is its drainage good? It is undulating country, and very easily drained. We find that surface drainage is generally sufficient, though in a few cases we make stone drains, or use piping.
326. Are you able to conserve water in underground tanks? Yes; by digging down into the shale.
327. *Chairman.*] What would be the distance from Dural to Sydney by the proposed railway? Twenty-five or 26 miles.
328. The rate for fruit from Gosford, which is 50 miles, is only 2½d. a case;—would the Dural people be satisfied to pay 3d. a case for half the distance? I think so. It costs us more than that now, and we lose a great deal of time in carting.
329. How far north of Dural is the country suitable for orchards? Right on to Wiseman's Ferry.
330. *Dr. Garran.*] But that is all sandstone country? Yes; but there is good land there, both in the valleys and on the ridges.
331. Is the land as good as the land in Mr. Pye's orchard? It is similar land. I do not think you could get poorer land than Mr. Pye's was, and he grew some of the finest oranges in the district.

J. C. Hunt.
10 Sept., 1900.

TUESDAY, 11 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

John Charles Hunt, fruit-grower, Dural, sworn, and further examined:—

332. *Chairman.*] You desire to make a statement to the Committee? Yes. The statement which I desire to make is largely in reply to evidence which has been given during this inquiry. It is as follows:—

J. C. Hunt.
11 Sept., 1900.

In reply to Question 136, the witness not only gives an estimate that is far too low, both as regards the number of cases of fruit to be carried and the rate to be charged per case, but he adds an estimate of 2,000 tons of special goods, at a rate of 1s. per ton. I would point out that this amount of special tonnage would be exceeded in amount by carriage to the districts that would receive their goods at the terminus of the proposed extension; and taking into consideration the fact that it now costs the growers of those districts about 8s. per ton to get manure from the present railway to their orchards, the rate the witness proposes to charge, viz., 1s., is altogether out of proportion to the benefits derived. In my own case it takes a man and a four-horse team a day to carry 3 tons from Pennant Hills station. I think the amount of rate we propose to pay for such goods over the proposed line, viz., 2s. 6d., much nearer the mark than the 1s. per ton. I would draw attention to answer given to Question 145. The witness states that the estimate given supposes double rates. This is misleading. It may be so if taken as per mile rate at which such goods are carried long distances; but the present rate at which manure is carried from Auburn to Pennant Hills is 2s. 5d. a ton, and therefore 1s. a ton over the new line would not represent double rates.

In dealing with answer given to Question 148, I wish to point out that, as the growers are willing to pay a special rate over the new line and the usual rate over the old line, the loss to traffic on the Northern line would be compensated for by the carriage on the Clyde to Sydney line; and I would emphasise the fact that the growers are willing to pay the extra charge, and that although it may seem to the Committee a heavy rate in comparison with existing lines, still to the grower it would be a large saving on present haulage.

The

J. C. Hunt.
11 Sept., 1900.

The reply to Question 146 is also very misleading, for while the actual distance is not great, the distance by road from the terminus is from 8 to 10 miles, and correspondingly distant along the route, the districts beyond the terminus being at much greater distance.

The replies to Questions 175 to 177 I take strong exception to. Given railway communication, there is not the slightest doubt but that the output from the districts served would be very much greater, for the following reasons:—

1. The time now spent on the roads would be spent in improving the orchards.
2. With cheaper manures a very much larger amount would be used, and as manure is essential to the production of fruit a larger crop would result.
3. Land now lying idle would be brought under cultivation, and fresh holdings would be taken up at distances that are now too great to allow of this being done.

In reply to the statement that the districts would not double their production, say, in ten years (answer to Question 177), I would draw the Committee's attention to the expansion that has already taken place—

Galston, about sixteen years ago, had a population of six families, now 150.

Kenthurst, at the time named, had only five or six holdings, now 134.

Glenorie, with less than ten at the same time, has now eighty-nine, and where one school supplied the education for all these districts, including Dural, there are now eight Public schools. Taking this development into consideration, and also the fact that only about one-quarter of the holdings are under cultivation, also that there are large areas of land yet to be taken up, I think it only fair to assume that the growth of these districts would be more than double within the time named by Dr. Garran in his Question, viz., ten years.

In regard to the Government lands, I would draw the attention of the Committee to my evidence given before the last Committee, under Question 2282.

It is desired to bring under the notice of the Committee the fact that there are large areas of Government land which would be enhanced in value by the construction of a railway. In the Carlingford district, and within a short distance of the proposed route, there are about 300 acres. In Dural, about 2 miles from the proposed terminus there is an area of several hundred acres of fair orchard land. At Arcadia there are large tracts of land suitable for orchards. Part of this land is surveyed into blocks averaging 35 acres each, and described as being good. It is considered that this land would fetch £5 per acre. The greater portion of the whole of the Government land is reserved from selection. The tract of country between Glenorie and Wiseman's Ferry has already been brought under the notice of the Committee, but it is desired that the Committee's attention should again be drawn to its importance. In proof that these lands would be settled upon, I beg to say that in the districts of Glenhaven and Arcadia inferior lands to these have been selected, and are now supporting a considerable population.

I would also refer to the evidence given by Mr. Fagan, on the 19th January, 1898. He says, in reply to Question 1018 of the minutes of evidence taken during the former inquiry, that:

There is a reserve on the other side of Arcadia of some thousands of acres. It is about 5 miles from where I live.

Then, in reply to Question 1021, he says:

That this reserve would be very well suited to the production of citrus fruits and passion fruit. There is a great area of country to be taken up there, and I am sure a great many persons will be willing to settle upon it.

I take exception to the answer given to Question 213, viz.: That traffic would not be drawn from Castle Hill. We have in taking statistics allowed for all growers who would be likely to use the Parramatta line, but certainly a large portion of the Castle Hill district would be served by the proposed line, and would be used in preference to existing lines. As one of those responsible for the statistics placed before the Committee, I take strong objection to answers given to Questions 229 and 230. The whole of the non-bearing trees, representing young orchards and not old worn-out trees as stated by the witness, and 150,000 cases given by the witness does not at all represent the amount of fruit grown. I also wish to state that I have an unlimited supply of timber upon my holding, and, if I could get closer railway communication, I should be prepared to erect a sawmill in order to cut up that timber for firewood. It would pay me to do that, and the sending of the wood away would give traffic to the railway. Since the Dural railway was under inquiry in 1898, a first-class white-metal quarry has been opened up within about three-quarters of a mile of the proposed railway, and there are millions of tons of the very best white-metal to be obtained from that quarry. Then, near Glenorie, there is a blue-metal quarry, which has been tested by the Government officials, and the stone has been pronounced to be of the best quality, while there is an unlimited supply of it.

333. *Mr. Shepherd.*] Do you not think that the imposition of special rates upon the proposed line would be likely to drive some growers on to the Northern line? No; because it would be cheaper for the growers in the district referred to in my statement yesterday to pay the special rates which I quoted than to send their produce to the Northern line. For instance, we put down an extra halfpenny a case for fruit going from Pennant Hills, and it would not pay the growers who would use the proposed railway at Pennant Hills to drive their fruit to the Pennant Hills station on the Northern line in order to save that halfpenny. Then for the Castle Hill district we have put down an extra penny a case. As the fruit-growers in that district are from $4\frac{1}{2}$ to 5 miles from the Pennant Hills station on the Northern line, they would find it cheaper to pay the special rate on the proposed line than to lose time and incur expense in carting their produce to the Northern line. The Dural district is 10 miles from the Pennant Hills station on the Northern line, so that it would not pay to cart fruit there from the district if there were a railway to Dural. Still less would it pay people living out towards Galston and beyond Dural to cart their fruit to the Northern line.

334. But, where people were nearly equi-distant from the two lines, they would naturally send their fruit to a line on which the freights were cheaper? In our estimate of traffic we have not included any of the country on the eastern side of the road which runs along the route of the proposed railway.

335. *Mr. Harper,* in reply to question 228, admits the existence of 24,382 acres of non-bearing trees in the district;—I understand that those figures are wrong? Yes; an error crept into the Glenorie statistics through the figure $\frac{1}{4}$ being mistaken for the figures 14, and that, of course, affected the total.

William Rudlan Hawkins, fruit-grower, Dural, sworn, and examined:—

W. R.
Hawkins.
11 Sept., 1900.

336. *Mr. McFarlane.*] How many acres have you under fruit? Twenty acres, including the bearing and non-bearing trees.

337. Is any of your land not under fruit? Yes; about 4 acres.

338. Is that land suitable for fruit-growing? Some of it is.

339. Would you like to make a general statement to the Committee? Yes; I assisted in the compilation of the statistics which were given to the Committee yesterday by Mr. Hunt, and I wish to state that the figures read by Mr. Hunt are as nearly correct as we could make them. With regard to the imposition of a special rate on the proposed railway, I should like to say that I know that the people of the district are prepared to pay such a rate. To take my own case as an example, I can now send to the Pennant Hills station,

station, on the Northern line, using two horses, about fifty cases of fruit in a day; but when I get back I cannot use my horses any more that day, so that practically the day is spoilt for anything else. If, however, the proposed railway were constructed, and I had to pay 2d. a case extra on the fruit sent along it, the charge on fifty cases would be only 8s. 4d., and I should save a day. It would, therefore, be much cheaper to me to put my fruit on the tram at Dural than to cart it to the Pennant Hills station, on the Northern line, although the freight on the Dural line might be higher than the freight on the Northern line. There are gentlemen living in the district who have been paying 3d. a case for the carting of their fruit from Galston, but this year the carrier has refused to take it for that sum.

W. R.
Hawkins.
11 Sept., 1900.

340. Where was their fruit carted to from Galston? To Hornsby.

341. A distance of how many miles? About 10½ miles. The growers with whom I, as a member of the Railway League, have come into contact are all ready to pay a special rate, and I do not think that there will be the slightest cavil at its imposition. I wish to emphasise what Mr. Hunt said in regard to the quantity of manure that would be imported into the district if the proposed railway were made. A large quantity of manure from the Flemington yards, of stable manure from the city, and of lime and hair from the tanneries, would be brought into the district if the proposed railway were constructed. One carter alone last year drew something like 200 tons of lime and hair, which came from the tannery at Concord, to Kenthurst, to Middle Dural, and to Upper Dural.

342. *Mr. Hyam.*] Was that manure sent to the Pennant Hills Railway-station first? Yes; and carted from there.

343. *Mr. Levin.*] What would the distance be? About 9 miles to Dural, from 12 to 14 miles to Kenthurst, and about 15 miles to Upper Dural.

344. *Mr. Hyam.*] What is the cost of carting from Pennant Hills to Dural? From 8s. to 8s. 6d. a ton. Very large quantities of stable manure and other loose manure would be brought into the district by the proposed railway. I would rather use the loose manure than bone-dust; but at the present time the cost of bringing such manure into the district is so great, because of its bulk, that we have to use more concentrated manures. We use about half a ton of manure such as bone-dust to the acre, but if we could get stable manure we should use several tons to the acre. I should like to bring under the notice of the Committee the valuable character of the timbers in the district. At Arcadia and Galston we have magnificent timber. We have ironbark there which would be suitable for girders and railway sleepers, and would last for a number of years. There is not the least doubt but that that timber will be used directly the railway is brought to Dural. A relative of mine was offered £2 for his trees as they stood, but he refused to sell his timber until the railway should come. We have also an abundance of good black-butt, and at the far end of Glenorie, at Blue-gum Creek, we have an unlimited supply of turpentine and blue-gum. The turpentine is a timber eminently suitable for piles, and at the present time is very costly.

345. *Mr. McEurlane.*] What area of ground does the marketable timber within easy reach of the proposed railway cover? It begins 6 or 7 miles beyond the proposed terminus, and extends to Beckett's Forest, 7 miles out.

346. Is there good timber on both sides of the proposed line? Yes; timber that is suitable for post and rails, and for firewood. Mr. Hunt has stated that he will be prepared, as soon as the railway is brought to Dural, to erect a saw-mill on his property, and I have a relative who is going to do the same thing.

347. Does the marketable timber to which you refer come close in to the Northern line? No; it is shut off from the Northern line by the Berowra Creek. It grows out more towards Galston and Arcadia.

348. How far is it from the Northern line? From 12 to 15 miles.

349. Is any of it cut and sent down by train now? Yes, some of it. Mr. Mander had contracts for the supply of sleepers and girders, and he was drawing timber from the district for a considerable time. He drew his timber to Parramatta. There is any quantity of good timber still untouched.

350. Is there any marketable timber upon the Crown lands, which would be within the influence of the proposed railway? Yes; most of the timber about Glenorie is on Crown lands.

351. Do you think that the timber trade will give a large amount of traffic to the proposed railway? There is no doubt of it. The trade has not developed for want of a railway.

352. What class of ironbark is it—grey or red? I should call it red ironbark. The inside wood is a dark red colour. It is timber that is generally used for girders and sleepers.

353. Is there any quantity of timber which is suitable for those purposes? I cannot tell you how much there is, but I know that when I was running a store, I supplied twenty men, who were getting sleepers and piles for, I suppose, a period of two years.

354. Is the timber sufficiently large for saw-milling? The timber to which I refer is from 2 to 5 feet in diameter, and there is plenty of it going up 70 feet as straight as a rush, and without a branch. I have brought with me a specimen of the stone obtained from the white-metal quarry referred to by Mr. Hunt. That quarry is within three-quarters of a mile of the proposed railway, and about a mile and three-quarters from the proposed terminus at Dural. It is one of the best quarries that the Government own, and the stone from it is now being used on the Dural Road. I have also brought a specimen of the stone from the blue-metal quarry which has been discovered up near Glenorie, though it has not yet been opened up. The Government Geologist says that there is an unlimited supply of that stone, and that the deeper we go, the better it will be.

355. Has the white-metal been in use long enough to enable you to form an opinion as to its lasting qualities? Some of it has been on the road for twelve months—stone which was picked up on the surface before the quarry was opened, and it has stood better than any white-metal we have used before. The chief ganger, who is working the quarry, says that it is the best quarry that the Government own, and to give you an idea of its quality I may say that the men who were employed to break it grumbled at receiving 1s. 9d. a yard, and are now receiving 2s. 3d. a yard, a wage that was never heard of in our district before.

356. Will the stone you refer to compare favourably with the blue-metal which is used in various parts of the Colony? We prefer the white-metal to the blue-metal, because it settles more easily; but it will not last so long.

357. Is it your opinion that if the proposed railway were constructed large quantities of this stone would be brought by train to Sydney and to other places? I think so.

358. Do you think that it could be obtained more cheaply than stone can be obtained in other localities about Sydney? The man working it has told me that it can be worked more cheaply than any other quarry which the Government own.

W. R.
Hawkins.
11 Sept., 1900.

359. Do you think that land in the district which is not now under cultivation would be put under cultivation if the proposed railway were constructed? Yes, because we should have so much more time for attending to our orchards, and greater facilities for sending our produce away. We are sometimes stuck up now with our carting.

360. What is the average size of the orchards in the district? I can hardly say, but I suppose the largest orchard in the district would be about 200 acres in area.

361. Is the land in the district which is not under cultivation suitable for cultivation? Yes; most of it is suitable for fruit culture.

362. Would the balance be put under fruit if the proposed railway were made? A great deal of it would. I think that the production of the district would very nearly be doubled if the proposed railway were made.

363. Would the fruit-growers, in the district referred to by Mr. Hunt, all use the proposed railway rather than the Northern line? Yes, all of them, because it would pay them to do so.

364. Do you think that the imposition of special rates will send some of them to the Northern line? No; because we have not included in our estimate the traffic from properties at all likely to use the Northern line.

365. Is any other fruit besides oranges grown in the district? We grow both citrus and deciduous fruits, and there are also a few vineyards in the district; but there is very little agriculture there. Mr. Hunt is about the only person in the district who grows hay.

366. Is there a considerable amount of horse-feed used in the district which is not grown locally? In Dural, Kenthurst, Galston, Arcadia, and Glenorie, there are 412 holdings, the produce of which would be sent to Dural station, while their supplies would be brought from there. It is reasonable to allow at least two horses to each holding, because that number of horses is required in order to work the orchards, and to draw produce to the railway station. Each of these horses would require 56 lb. of corn, 56 lb. of chaff, and 20 lb. of bran per week. That is a very low ration, being below the Government ration. If all that horse-feed were brought by train to Dural it would mean a total traffic of 52 tons per week.

367. But you do not allow for the feeding of some of the horses on grass? Ours is a very poor grazing district, and we keep very few but working horses, and they must be fed. In the Pennant Hills and Castle Hill district there are about 200 horses, and they would require to be fed at the same rate.

368. Where does most of the produce used in the district come from now? From Sydney. It goes as far as it can by rail, and then it is distributed through the district by carts from Parramatta, Pennant Hills, and Hornsby. Many of us buy produce by the truck load, while others get it from the store-keepers.

369. Has there been a marked improvement in the district during the past ten years? Yes.

370. How long have you been living in the district? All my life; I was born there.

371. In what direction has the district improved? The number of residences has increased, and there has been an increase both in the population and in the production of the district.

372. Has the increase in production been a marked one? Yes; within the last ten years we have nearly doubled our acreage under fruit.

373. Do you think that the increase is likely to continue? I think so; and I think that the district will improve at a greater rate if railway facilities are given.

374. Is the road cartage injurious to the fruit? Yes; and during the winter months our roads are almost impassable. I have had to put my fruit on to a dray more than once for fear of upsetting or of breaking the springs. Although a case of fruit might be very carefully packed—as well packed as if it were intended for show—by the time it got to Pennant Hills, if the roads were rough, it would be all shaken up.

375. Are there any particular days when you send in your fruit? There is fruit going in nearly every day, but most of the fruit from Dural and Galston is sent out of the Colony now, and, under present arrangements, we have to pick on the Friday and Saturday and send to the railway station on Monday, in order to catch Tuesday's boats. If the railway came to Dural, and we had an early morning train, we need not pick our fruit until Monday, and then it would be two or three days fresher when it reached the market.

376. *Mr. Watson.*] Where is the exported fruit fumigated—in Sydney? Yes.

377. Would there be time for fumigation if the fruit did not leave Dural until the Tuesday morning? Yes; if there were an early train. Of course, freshness is everything with fruit.

378. *Mr. McFarlane.*] Where is your fruit chiefly sent to? Chiefly to Melbourne, to Brisbane, and to New Zealand. Mr. Hunt was asked yesterday whether the line did not come to practically a dead-end at Glenorie, so far as traffic was concerned, and Mr. McLachlan speaks of it as coming to practically a dead-end at Dural. He makes that statement in reply to Question 105, and it was because of that evidence that I was anxious that the Committee should see the country beyond Dural, out towards Glenorie, Kenthurst, and Galston. Mr. McLachlan's evidence upon that point is incorrect.

379. *Chairman.*] How far beyond Arcadia does the good country extend;—does the country become inferior as you go out in that direction? Six or 7 miles beyond Arcadia you come to Calabash, an arm of the Berowra Creek; but there are thousands of acres throughout that district which are fit for cultivation, and especially for the growing of lemons and passion-fruit. The best passion-fruit sent to market is grown upon poor soil, and Arcadia is becoming noted for the passion-fruit grown there upon poor soil. Mr. Deane, in reply to Question 18, informed the Committee that there would not be much traffic "on the proposed extension to Dural;" but a little further on, in answer to Questions 21 and 22, he contradicts that evidence by stating that he thinks

it is very likely some of the land would be cut up for residential purposes. It is a beautiful bit of country, eminently fitted for residential purposes.

Then, in reply to Question 23, he admits that there is a likelihood of an increased traffic in produce and fruit, which he says would undoubtedly induce further production.

380. *Mr. Shepherd.*] Mr. Harper says, in answer to Question 227, that he knows that the quantity of freight to be carried has not increased since an estimate of traffic was made two or three years ago? There has been a marked increase in the production of the district every year.

381. How long is it before an orange tree becomes remunerative? A tree begins to bear when it is four, five, or six years old; but it does not come into full bearing until it is eight, ten, or twelve years old, and seedlings do not give a full crop until they are nine or ten years old.

382. Then I suppose that, two years ago, there were a number of orchards which had been planted a few years previously, and had not come into bearing, but which would now be bearing freely? Yes.
383. What is the cost of cultivation per acre, including the cost of manure? If we hoe, it costs about £1 an acre, and we use about half a ton of manure to the acre. At the present time, I am paying £5 5s. a ton for bonedust, and I have to draw it from Pennant Hills, so that it costs me nearly £6 a ton, or about £3 an acre. Many of us cultivate with ploughs instead of with hoes, and that is much cheaper. I could not answer your question without considering the whole matter carefully.
384. Cannot you say what your orchards costs you per annum to cultivate? I pay about £60 a year in wages, but the men are not always employed in the orchards. In wet weather they often work in the bush.
385. What is the average yield of a tree over five years old? I have about 15 acres in bearing, and last year I pulled 2,000 cases, and about 1,900 cases the year before. Mine is only a young place, and the trees are not yet in their prime.
386. I suppose the returns you get for your fruit vary? Yes, according to the time of the year. In July and August fruit is very cheap, but I have not picked an orange for market yet. We expect to get high prices in October, November, and December.
387. Do you cultivate only citrus trees? I had an acre of plum trees, but I grubbed them out, because I found that the citrus trees paid me better.
388. What proportion does the area of land under stone-fruit and passion-fruit bear to the area of land under citrus fruits? At our end of the district there is not much stone-fruit grown.
389. What is the average life of a stone-fruit tree? I cannot say, but I should think from twenty to thirty years. There are apricot and pear trees in my father's orchard, which are as old as I am. Peaches are not so long-lived as other trees.
390. How does a stone-fruit tree compare with an orange tree in the matter of longevity? I think they will both continue to produce for about the same length of time, if they are properly attended to. Mr. Harper's estimate of 150,000 cases for the production of the district is a ridiculous one, because as the total acreage under bearing trees is 5,260 acres that gives a return of only 28 cases to the acre, and we could not live on that.
391. *Mr. Hyam.*] In averaging your crop, do you take in the non-bearing, as well as the bearing-trees? No.
392. How many trees have you to the acre? About 100.
393. Then your yield has been about a case and a quarter to the tree? Yes.
394. Is that the general average for the district? Plenty of orchards give a better return. I can point to orchards which would give twice as good a return as that.
395. But none of the orchards give a smaller return? Yes, some of them do. There are some orchards which would not average more than three quarters of a case to the tree.
396. That would mean a return of 75 cases to the acre? Yes.
397. Would it pay to grow fruit with a return of only 26 cases to the acre? No.

W. R.
Hawkins.
11 Sept., 1900.

James Purser, fruit-grower, Castle Hill, sworn, and examined:—

398. *Mr. Hyam.*] Have you lived in the district long? I was born there, fifty-nine years ago.
399. Have you been growing fruit all your life? I have been amongst fruit all my life, and I have also been connected with other business. I have been fruit-growing for thirty-five years.
400. Have you a large area under fruit? Yes, a good area. I have something like 7,000 fruit trees in all, including both citrus and deciduous fruit trees.
401. Is a large part of your area under citrus fruits? Yes; I have rather more citrus fruits than deciduous fruits. I have about 4,000 lemon and orange trees, the rest of the trees being stone-fruits; but chiefly apples.
402. Do apples grow well in the district? Yes; we grow as fine apples there as can be grown in New South Wales. I have about 1,000 trees in one square block, some of them thirty years old, and I have pulled as many as fifteen cases from a tree.
403. Do plums and pears do well in the district? Yes; I have pulled as many as 700 cases of plums in one season.
404. How many acres have you under cultivation? About 60 acres. As a rule we plant about 100 trees to the acre, but in some places, round the creeks for instance, my trees are planted closer together than that.
405. Is your place far from the route of the proposed line? No; the line would go within a few rods of my property.
406. How far are you from the Carlingford railway station? Fully 6 miles.
407. If the proposed railway were constructed, would you use it? Yes; but I do not advocate the construction of the railway merely because it would go near my own property. As a matter of fact, I do not really require the railway, though it would certainly benefit me; but I want to see the Colony go ahead, and become prosperous, and I know that there are hundreds of fruit-growers who are worse off than I am, and who require the railway.
408. The Northern railway serves you very well? Yes; I have a good road to it, and I do not mind the distance. I live in a secluded spot, and I am free from bad characters.
409. Do you think that a railway would bring undesirable characters to the district? It would bring both good and bad.
410. What is the size of your holding? I have 112 acres altogether. I disposed of some of my land lately.
411. If the proposed railway were made, would you be likely to increase your cultivation? I have not planted out any fresh land lately; but I have occasionally to replace an old tree with a new tree.
412. Do you think that the country between Glenorie and Dural is good country for fruit-growing? I have travelled throughout New South Wales, so that I am able to make a comparison, and I say that there is no part of New South Wales which is better adapted to the growing of all kinds of fruit than the district extending out in a northerly direction from Parramatta for a distance of 20 or 30 miles. It is in the northern part of that district that the people most need the assistance of the Government. The average rainfall is a sufficiently good one to enable us to grow all kinds of fruit without irrigation, and it is a part of the Colony where the Government should try to establish closer settlement. The Premier stated

J. Purser.
11 Sept., 1900.

- J. Purser. stated only recently that it was on the country near the seaboard that we should try to settle our people, and I agree with him.
- 11 Sept., 1900
413. If the proposed railway were constructed, would it bring about more settlement? Yes; I do not believe that any part of New South Wales would be more sought after.
414. Would the area under fruit be increased? Yes; because there are thousands of acres which at the present time have not been cultivated, and are not even cleared; but that land would be brought under cultivation if the proposed railway were made.
415. Is it not possible that, with a large increase of production, the fruit market would become over supplied? No; the market for citrus fruits is better now than it has been for many years past.
416. Is a big export trade likely to develop? Yes; because we can produce good fruit, and there will, therefore, be a demand for it all over the colonies, and, in time, in foreign markets also. Mistakes have been made in the past, but eventually the export trade in fruit will be a successful one.
417. Do you find it profitable to export your fruit? Yes.
418. Is it better to export it than to sell it locally? The large growers keep back the best fruit for the local market.
419. Do you not send away the first-class oranges? Not as a rule. On the whole, we do not send away the best fruit.
420. Do you send away apples? Yes.
421. Very early apples? Yes; I can send away apples in the second week of November. I produce samples of oranges taken from old Parramatta trees. Some of the trees from which these oranges were plucked are 60 years old.
422. I presume that they are seedlings? Layers from seedlings.
423. The life of a seedling is longer than that of a grafted tree? Not if the graft is put on to good healthy stock.
424. Would there be any traffic besides fruit from the district? Fruit would be the chief traffic, but there are thousands of bushels of peas grown in the district, and other vegetables are also grown there. I have received from £25 to £55 a week for vegetables alone, and others have cleared this winter as much as £160 an acre from cauliflowers; they have got 5s. a dozen for them on the ground, and eight dozen go to the rod. There is a market for all the vegetables that we can grow.
425. Do you know anything of the timber in the district? At the far end of the district there is plenty of good timber, and the construction of the proposed railway would cause the erection of saw-mills, and thousands of tons of timber would be sent from the district.
426. Do you think that traffic would come from Kellyville on to the proposed line? Yes. Kellyville is about 8 miles from Parramatta, whereas at one point—by the road coming to Castle Hill, near the public school—it would be only 5½ miles from the proposed railway, and at another point only 3 miles.
427. That is a large fruit-growing district? Yes; it is a place that is just springing up.
428. Do you know the quarries to which the last witness referred? I have not inspected them, but I am satisfied that what has been said of them is true.
429. Do you think there would be much goods and passenger traffic on the proposed railway? Yes. Mr. Harper estimates the entire annual traffic of the line at £1,025, which is absurd, because I think that the passenger traffic alone, including excursions, would make up as much as that.
430. Do you think that the district would attract tourists? Yes; and I am satisfied that it will be much sought after as a health resort. It is within a few miles of the city, and at an elevation of from 600 to 800 feet, and when it becomes known people will resort to it as a sanatorium. I have heard medical men say that there is no more healthy climate in the Colony than we have there. Although the days may be hot, there is generally a north-east wind, and in the evening we get a south-east breeze to cool the atmosphere. Whereas the climate on the Blue Mountains is often very severe, we have a genial climate.
431. Do the trees continue to bear well in your district? Yes. If an orchard is well looked after, pruned, and manured, and the trees are first-class, I think they will live 100 years.
432. What about apple-trees? I have apple-trees which were planted thirty-five years ago, and which are doing as well now as they did twenty years ago. The district has gone ahead by leaps and bounds during the last five or ten years. Notwithstanding the present inconveniences, gentlemen have come to the district, and spent thousands in building houses and in laying out orchards there, and, if the proposed line were made, the country would undoubtedly be taken up for residential purposes, as well as for fruit-growing.
433. How many cases per acre do you get from citrus trees? I have had as much as 500 cases to the acre.
434. Would 125 cases be a big average yield? Not for a good bearing orchard.
435. What is the average yield? That is a difficult thing to answer, because some years the crops are better than in other years. Next year I expect to have 100 tons more fruit than I have this year, or than I got last year.
436. The Commissioners estimate the average yield at twenty-six cases to the acre;—have you known a yield to be as low as that? Not for a well-kept orchard. I do not think the average yield of the district would be much under 100 cases.
437. What is the average for stone-fruit? It would be about the same as for the citrus fruit.
438. *Chairman*] Would it be profitable for you to cart your fruit into Parramatta instead of paying an extra 1d. per case to have it sent over the proposed railway? No. I could afford to pay 2d. a case.
439. How do you get your manure now? I have it carted out from Parramatta.
440. What does that cost you per ton? I could not engage a man to cart it for less than 7s. 6d. a ton.
441. Could you afford to pay 2s. 6d. a ton for the carriage of manure on the proposed line? Yes. I am satisfied that the fruit production of the district is very much larger than the Commissioners' estimate, and that the resources of the district are much greater than most people imagine. Glenorie is a new place, but from there on to the Hawkesbury there are thousands of acres which have not yet been taken up, but which would be suitable for the growing of all kinds of fruits. The soil which produces fruit is very unlike good agricultural or good grazing land. Land which, twenty years ago, would hardly have been taken as a gift, when cultivated produces first-class lemons, oranges, and passion-fruit; and if the proposed line is constructed, I believe that the whole of the country to the north will be taken up, and that, ultimately, the railway will be carried across the river right north towards Cassilis, and that it will open up splendid country.

MINUTES OF EVIDENCE—RAILWAY FROM CARLINGFORD TO DUBAL.

Christopher John Moore, fruit-grower, Castle Hill, sworn, and examined :—

- 442. *Mr. Shepherd.*] How far are you from the proposed railway route? It almost touches my land.
- 443. What extent of orchard have you? About 30 acres.
- 444. Is that the whole of your holding? No; I have 48 acres altogether.
- 445. Are the 30 acres all in bearing? Yes; the youngest trees are just coming into bearing.
- 446. I suppose it was not all planted at the one time? No; there are about 20 acres in which the trees are from 3 to 10 years old, and 8 acres are old orchard, though some of the old trees have been dug out and new ones planted. I have apricot trees which were planted sixty-five years ago, and are still bearing good fruit.
- 447. What is the average yield of a 10-year-old tree? About a case.
- 448. Is that counting two crops, or only one crop? One crop. The season before last I took 1,500 cases off 10 acres.
- 449. Do you use the scarifier through the summer? Not very much; I generally use the plough and the hoe. As a rule, I plough twice a year.
- 450. What manure do you use? Stable manure, and bonedust, and stock-yard manure.
- 451. What does it cost you per acre to cultivate? It is rather hard to say, because the men are not regularly employed in the orchards; but I should think that it costs something like £7 an acre.
- 452. Your return would be something like 100 cases to the acre? Yes; that would be an average crop. I grow summer fruits chiefly.
- 453. What kinds? Apricots, plums, and peaches.
- 454. Do summer fruits give as good a return as citrus fruits? Scarcely as good; but eight or ten years ago, when I planted my orchard, the return from summer fruit was every bit as good as the return from citrus fruit.
- 455. Do you find it necessary to use subsoil drains? No; I am on a hill, and there is a good slope all round.
- 456. Do you agree generally with the evidence already given? Yes.
- 457. Is there anything you would like to add for the information of the Committee? I know the whole of the country for miles on each side of the main road from Glenorie to Wiseman's Ferry. There are thousands of acres of good orchard land there, and there is good orchard country across the river right on to Wollombi.
- 458. Do you think that the construction of the proposed railway would give an impetus to the cultivation of fruit in the district? Yes.
- 459. What proportion of the country within easy reach of the proposed railway is still uncultivated? One half, or perhaps more.
- 460. What would you consider an average holding in the district;—I suppose 10 acres would be about the smallest holding? Yes; I should think that 50 acres would be about an average holding. There are a lot of large holdings in the district; but there are not many as small as 10 acres.
- 461. How many acres would support a family? Twenty acres, if the trees were well attended to.
- 462. *Chairman.*] Are the residents of the district unanimously of opinion that they could afford to pay special rates on the proposed railway? Yes; all that I have spoken to.
- 463. Both inwards and outwards? Yes.
- 464. Do you think that there is any doubt that the proposed railway, if constructed, would draw the whole of the traffic to and from Castle Hill? I feel certain that it would.

C. J. Moore.
11 Sept., 1900

John Speir Heron, fruit-grower, Pennant Hills, sworn, and examined :—

- 465. *Chairman.*] The proposed railway would go quite close to your property? Yes.
- 466. Do you agree in the main with the statements which have been made this afternoon as to the probable development of the district, if the proposed railway were constructed? Yes.
- 467. In your immediate vicinity, is there much room for the further extension of orchard-growing? Not so much in our immediate vicinity. The district there is more closely settled than it is further out.
- 468. Do you suffer serious disadvantages at the present moment through want of railway communication? No.
- 469. How far are you from the Pennant Hills station on the Northern line? Two and a half miles.
- 470. Have you a pretty good road? Yes.
- 471. If the proposed railway were constructed, and a rate of 2d. a case were charged on it, would you continue to send your fruit to the Northern line? The advantages of sending to either line would be about the same in that case, but if the extra rate on the proposed line were only a half-penny a case, it would be a distinct gain for me to be able to send it to the proposed line.
- 472. If the total charge were 1½d., would you send your produce along the proposed line? Yes.
- 473. How far would the nearest station on the proposed line be from your property? I am told that there would be a station at the foot of Regan's Hill, and that would be within a quarter of a mile of my property.
- 474. If there were an extra rate of 2s. 6d. a ton upon the manure carried upon the proposed line, which line would you use? The balance would be equal.
- 475. Does it cost you 2s. 6d. a ton to have things carted from the Pennant Hills station? That is the rate always charged. We had a house built about five years ago, and the contractor paid that rate for the cartage of the material used, though wages were lower then than they are now. Probably the carting would cost 3s. a ton now. It would probably cost 6d. a ton to cart from the proposed line.
- 476. What development would take place beyond Dural if the proposed line were constructed? I do not know that country very well, so that I am not prepared to give a definite answer to that question; but I think that there would be a great development. I know that there is a great deal of unoccupied land in the district which is suitable for fruit-growing.
- 477. From what you know of the district, would you say that the producers there are prosperous? I think that they are as prosperous as any class of people similarly situated.
- 478. Do you look upon the district as a superior fruit-growing district? Yes.
- 479. Would the proposed line go through your property? No; but it would go through some property belonging to my mother.

J. S. Heron.
11 Sept., 1900

- J. S. Heron. 480. Have the residents considered the question of compensation? I think that where a small holding is cut in two, or where a building is destroyed, the people would require compensation.
- 11 Sept., 1900. 481. Have any of them considered the advisability of giving their land for the construction of the railway? I have not heard the matter discussed, so that I should not like to make any statement in regard to it.
482. Would the people of the district sooner pay special rates on the proposed line, or subscribe to a guarantee fund to make good half the estimated loss, the payments to be proportionate to the advantages received? It would be difficult to answer that question without knowing how much each one would be expected to pay; but I think that the people would prefer to pay special rates.
483. *Mr. Hyam.*] How many acres have you under cultivation? Forty acres of my own, and 20 of my mother's.
484. Is it all in full bearing? No, very little of it. Twenty acres of orchard is less than two years old.
485. What is a fair average yield, per acre, for good bearing trees? I think about 100 cases, if the trees are well looked after.
486. And that answer would apply to both citrus and summer fruits? Yes.
487. You would not grow fruit for a yield of forty-six cases to the acre? No; it would not pay to do so.
488. *Mr. Watson.*] Does the fruit which is sent from the district go away by railway, or is some of it sent by steamer down the Parramatta River? It is nearly all sent by rail; very little goes by steamer.
489. Where do you send yours from? By railway from Pennant Hills. With reference to Mr. Harper's statement about the non-productive orchards in the district being old orchards, I should like to say that no part of my holding can be classed under that heading.

WEDNESDAY, 12 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

| | | |
|--|--|-----------------------------|
| The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | | JOHN CHRISTIAN WATSON, Esq. |
| The Hon. SOLOMON HERBERT HYAM. | | ROBERT HENRY LEVINE, Esq. |
| | | JOHN McFARLANE, Esq. |

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Samuel Fagan, fruit-grower, Galston, Dural, and Arcadia, sworn, and examined:—

- S. Fagan. 490. *Mr. Watson.*] What is the area of your Galston holding? The total area of our holdings at Galston and Dural is something like 450 acres, of which about 181 acres are under fruit.
- 12 Sept., 1900. 491. Where do you send your fruit at the present time? We send most of it to the railway at Hornsby, and the balance, when the roads are fair, to the Pennant Hills railway station.
492. So that the whole of it is taken away by rail? Yes; though in holiday times we may send an occasional load by road to Sydney, but that is very rarely done.
493. What would be the effect of the construction of the proposed railway upon the country beyond Dural, out towards Galston and Arcadia? The proposed railway would be a great help to the fruit-growers in the district, because it would enable them to send their fruit to market more quickly, and in better condition than they can now. It would be a great advantage to them in many ways.
494. Would it lead to the cultivation of larger areas? I feel satisfied that if the proposed railway were made, a great deal more land in the district would be put under cultivation.
495. How far is Arcadia from Dural? The middle part of Arcadia would be about 6 miles from Dural, but Arcadia runs back a good way.
496. What would be the northern limit of the country from which the proposed railway would draw traffic? Beyond Arcadia there is a lot of Government land, which I understand is reserved from sale now, but no doubt there are some thousands of acres there which will be taken up in the near future, if the railway is made. A good deal of the country there is broken country, but, with attention, fruit can be grown very successfully upon it.
497. How far north does that country run? Ten or 11 miles beyond Dural. The outskirts of it would be 12 or 13 miles beyond Dural.
498. Do you think that Glenorie would be the limit? No; I understand that there is good country for fruit-growing right on to what is known as the Forest.
499. How far is that from Dural? I am not quite sure, although I have been through the district.
- 500-1. Are the 181 acres which you have under fruit-trees all in full bearing? No; only about 130 acres are in bearing.
502. In an average season how many cases do you get from your trees? Last season we marketed 15,000 or 16,000 cases.
503. It has been stated that the total production of fruit in the district which would furnish traffic to the proposed railway is about 150,000 cases per annum;—do you consider that an under-estimate? Yes. There are about 5,260 acres of bearing fruit-trees in the district which would send traffic to the proposed railway, and we allow for a case to the tree, and 100 trees to the acre, though the yield is very often more than that. On that basis, the total yield of the district would be 526,000 cases. If Mr. Harper's figures were correct, the yield per acre would be only twenty-seven or twenty-eight cases, which would not pay expenses.
504. It has been said by a number of the local residents, that if the proposed line is constructed they will be willing to pay a rate of 3d. a case from Dural to Sydney;—could you afford to pay such a rate? It would pay me well to do so. At the present time we maintain our own horses and lorries for the carrying of the fruit to a railway station, and it takes a driver with a lorry and a team of four horses pretty well a day to take fruit to Hornsby at the present time. At 2d. a case, that is equal to about 10s. 8d.; but if we had only to draw to Dural we could send away three or four loads in a day, and we could afford to pay the extra sum you mention. If we have more fruit than we can cart with our own teams, we have to pay 3d. or 3½d. a case to get it taken away.

S. Fagan.

12 Sept., 1900.

505. To the railway station? Yes.
506. And you pay another 1d. a case to get that taken from the railway station to Sydney? Yes.
507. Then you would save 1d. or 1½d. a case if you could send your fruit from Dural? Yes. Yesterday we had rather more fruit pulled than we could take away ourselves, and had to hire someone to cart it, and we expect to have to pay him at the rate I have mentioned, because that is the usual charge.
508. Do you think that the people living round about you would be likely to do the same? Yes. We try to do what is best in our own interests, and other people will do likewise. I feel satisfied that they would be only too glad to pay the extra rate to get the railway.
509. Does any considerable portion of the fruit from the district go to markets along the Northern, Southern, or Western lines, or does it all go to Sydney for distribution? I do not think that very much of it is sent away direct to those markets. Most of it goes to Sydney, though, no doubt, there is a little up-country trade.
510. Is the greater part of the fruit sent from the district consumed in the Sydney market, or is a lot of it shipped abroad? A great deal of it is shipped abroad.
511. Then it is of importance to have the fruit carried by rail instead of by road? Yes; because if it is carried by rail it can be put upon the market in better condition than if it is carried by road.
512. The importance of rail carriage is greater where you have an export business than where the fruit is intended for home consumption? Yes; but people everywhere like to get their fruit as fresh and nice as they can.
513. Would the proposed railway serve the Kellyville district as well as the Dural district? I have no doubt that the Kellyville people would use the line, because it would be within a reasonable distance of them.
514. It would be nearer to them than any other railway? Yes, very much.
515. Can you say anything with respect to the passenger traffic that is to be expected from the district? I have not made an estimate of it; but there are two coaches running daily from Galston to Hornsby, and a daily mail coach from Dural to Parramatta.
516. Is there only one coach running between Dural and Parramatta? Only one coach runs right out to Dural; but there are three or four running out to Castle Hill.
517. Do most of the people in the district want to get to Sydney, or do they want to get to Parramatta? A great many of them take the train from Parramatta to Sydney.
518. Is not Parramatta an important business centre for the people in the district? No; not a very great business centre. Very few of the people in the Dural and Galston districts get much from Parramatta.
519. People who went to the Northern line would probably take the train right on to Sydney? Yes, and the majority of the fruit-growers out there do that.
520. The people interested in Simpson's line of railway paid nearly £6,000 for the land they resumed to make the 3 miles 28 chains of railway between the Parramatta River and Carlingford, so that it appears likely that land resumption will be a pretty heavy item in connection with the expenditure upon the proposed railway? It is more than likely that the piece of railway already made taps some of the most valuable properties in the district.
521. Can you compare the land through which the railway has been constructed as far as Carlingford with the land through which the proposed railway would go? I am acquainted with a good part of it, and I think that a great deal of it would not be anything like so valuable as the land which was resumed for the construction of Simpson's railway. As you get further out the land becomes of less value.
522. Do you think that the owners of land in the district would be willing to contribute towards the cost of resumptions? I could not say, but no doubt some of them would.
523. Would it be worth your while to do so? If any contribution had to be made, I would rather make it by paying higher freights.
524. There will be a considerable deficiency in the working of the line, even if the local estimate of traffic proves to be correct, and this deficiency will be largely increased if the cost of resuming land is anything considerable;—the local people, however, have not considered that aspect of the question? I do not think they have; but, for my own part, I should be quite prepared to make the contribution.
525. If any contribution were asked for, I presume that you would rather pay it in yearly instalments than as a lump sum? Yes.
526. Do you think that the proposed railway will be largely used for the conveyance of manure? Yes; I think that a good deal of manure would be carried on it. We consider that it would be profitable to use about half a ton of manure to the acre, which would mean about 2,200 tons for the land under cultivation round about Dural, Galston, Arcadia, and Kenthurst, while the Castle Hill people would probably use, at a very low estimate, 1,000 tons, making in all 3,200 tons. Then we should also be glad to use large quantities of stable manure and street sweepings, if we could get it sent up in the trucks.
527. What rate could you afford to pay for the carriage of manure? 2s. 6d. or 3s. a ton. It costs us now 8s. or 9s. a ton to cart it from the railway station.
528. But you would still have a certain amount of carting to pay for? Yes; but I am allowing for that.
529. How much manure do you use in a year? We use a great deal. During the last three months we have had to cart from Hornsby about 62 tons of manure and other things. During the previous four months we carted about 150 tons of bricks, lime, and other building material from Pennant Hills.
530. Would you require for your own holding half a ton of manure to the acre? If we could get it brought to Dural by railway we should use quite as much as that; but very often now, if the roads are bad, we cannot get manure when we require it, and we have to do without it. During June the roads were very bad, so that it was almost impossible for us to cart at all.
531. I suppose you would use manure most during the winter months? I do not say that. We are always using manure, more or less. We have a large place, and it takes a long time to get round it; but as we work the ground we manure it. Very often we use a great deal of manure in the autumn. The proposed railway would bring a good deal of agricultural produce into the district. There are 442 holdings in the district, and the people occupying those holdings keep from one to a dozen horses; but, allowing two horses to each holding, and a weekly ration of 56 lb. of corn, 56 lb. of chaff, and 20 lb. of bran to each horse, that means a total consumption of about 52 tons per week, or 2,704 tons per annum.
532. Fifty-two tons per week would give a return to the Railway Department of about £1 18s. a week, the freight credited to the new line being about 9d. a ton at ordinary rates? We should be prepared to pay

S. Fagan.
12 Sept., 1900.

pay more than the ordinary rates. At the present time we pay 4s. 2d. a ton for single-ton loads, 3s. 1d. a ton for 2-ton loads, and 2s. a ton for full truck-loads from Sydney to Hornsby, and it costs us 8s. or 9s. a ton to cart the produce from the railway station. When I was carting the building material to which I have referred, I used the Pennant Hills Road in preference to the Hornsby Road, although it is the shorter by 4 miles; but the Pennant Hills Road is the safer and better. In some places the curves on the Hornsby Road are so sharp that you can hardly get round with a load of timber. There is very fine timber in the district, and there would, no doubt, be a fair amount of timber traffic. We have ironbark, white mahogany, blue-gum, and other timbers.

533. Where is the ironbark to be found? I know of as fine ironbark at Galston and Arcadia as there is in the Colony. The supply of firewood in the district is unlimited, and, if there were a railway into Dural, it would, no doubt, be sent to market. During the winter months, when it is rather wet to work in the orchards, people employ some of their time in clearing new ground; but we have to burn the timber which we take down, to get rid of it. If there were a railway to Dural, we should find it more profitable to cut that timber into billet-wood, and send it to Sydney. This would help the fruit-growers, and would lead to an increase of cultivation.

534. *Mr. Shepherd.*] The Railway Commissioners estimate that there will be an annual loss upon the line of £3,797;—do you think that that is a fair estimate? No. As I have pointed out, Mr. Harper has very considerably under-estimated the fruit production of the district.

535. The Commissioners' estimate is exclusive of the cost of land resumption and compensation;—do you think that the majority of the people in the district would be willing to give what land is required free of cost? I am not prepared to answer that question; but, no doubt, some of them would do so.

536. What is the value of the land within a mile or two of the proposed route? It is very hard to say; but it is worth between £10 and £20 an acre. No doubt, if the line is made, its value will increase.

537. Land that has been planted and improved would be worth more than that? It would be worth a little more.

538. Do 5,260 acres include the young non-bearing orchards? No; only the bearing orchards. There are 1,203 acres of non-bearing trees in the district. Some of those trees will come into bearing every year. We had some trees which were giving about half a case to the tree, but I did not put them down as bearing, because they are not in full bearing; but, in another year or so they will be what I should term bearing trees.

539. At what age do the trees give a fair yield? The trees begin to make a good return when they are from four to six years old; but a great deal depends upon the way in which they are looked after.

540. You estimate the average yield as a case to the tree? I think that is a very reasonable estimate. As this evidence is taken on oath, we do not want to run the risk of making an excessive estimate.

541. As a rule, you have two crops a year? With some kinds of fruit. The lemons bear two or three crops a year, and the passion-vines bear two crops. The citrus crops last the greater part of the season.

542. Does a case to the tree represent the yield for a whole year? Yes.

543. I suppose all the orchardists in the district are pretty well satisfied that the proposed line if made would be self-supporting within a reasonable time? I think that they are.

544. Would you be willing to give a guarantee to make good a portion of any deficiency? I should be quite willing to do so, and I believe that a number of others will also be willing to do so.

545. How far is your property from the nearest railway station on the Northern line? Our Arcadia property is about 12 miles from a railway station, our Galston property, 8 or 8½ miles, and our Dural property, about 9½ miles by either of two roads.

546. What does it cost you on the average to cart your fruit to the railway station? I think that it costs at least 3d. a case. During the wet months we have to feed our horses, although they are kept idle. If we were carting every day, no doubt the expense per case would be less. It is, however, a great inconvenience to us to have teams constantly on the road at times when we could better employ them in connection with the cultivation of the orchards.

547. Your property would be within about a mile of the proposed railway? Yes; one of them. Our properties would be from a mile to 7 miles from the proposed railway.

548. *Mr. Hyam.*] Have you much land under cultivation at Arcadia? About 30 acres.

549. Is it an orange orchard? The trees are most of them orange-trees.

550. Is the Arcadia country good country for orchards? Yes; fruit-trees do very well there.

551. Where do you cart your fruit from there? At the present time we cart the greatest part of it to Hornsby, a distance of about 12 miles.

552. Where do you cart the Galston fruit to? It is taken on to Hornsby by the waggon which comes from Arcadia.

553. How far has it to go? Eight or 8½ miles.

554. By a bad road? The road has a hard surface; but it is a dangerous road, because it is very steep in places, and has very sharp curves. Sometimes, when you are going round a curve, one or two of the horses in the team have to do nearly all the work.

555. The road from Galston to Dural is fairly level? It is not a level road, but it is a fair road in dry weather.

556. It is a much better road than the Hornsby road? Yes.

557. Then it is not likely if the proposed railway were made you would take your fruit to Hornsby, even though the rates on the Northern line might be lower than the rates on the Dural line? No.

558. What kind of soil have you at Arcadia? There is black soil there, and further on there is sandy loam, which has proved very suitable for fruit. It suits passion-fruit, and it suits citrus fruits very well.

559. Is not the black soil very shallow? It is not very shallow. It is fair soil, and suits fruit-trees.

560. Do you not get the rock close below it? Not too close.

561. What is the subsoil? Red clay, and down further you get pipeclay and shale.

562. That is on the Galston side? Yes.

563. But what is the soil like when you get well into Arcadia? When you get beyond the places which are cultivated now, you come on to sandy loam.

564. It is fairly white sand? If anything, it is a dark sand. It is more a loamy sand.

565. You have a very good orchard at Arcadia? Yes; I believe it is as good as there is.

566. Is it as good as your orchard at Galston? It is very much better. It is one of the best orchards out there.

567. Galston country is good country? Yes.

568.

568. Do you call the soil there black soil? Yes; there are trees out at Arcadia which are older than I am, and they bear very good fruit still. S. Fagan.
569. How old is your Galston orchard? Some of the trees must be 40 years old. I was born on the property, and I am 38. 12 Sept., 1900.
570. *Chairman.*] How would you describe the soil in your Arcadia orchard? There is a road there, on one side of which there is good black soil, and on the other a loamy sand.
571. Is the sandy soil good for fruit? Yes; it is very suitable for fruit.
572. Is there any large area of land round about Arcadia which is not yet under fruit, but which is suitable for fruit? Yes; further to the north there are some thousands of acres which are locked up from settlement at the present time.
573. Do you consider your orchard at Arcadia as good as the Dural orchard? I look upon it as rather better; it is older and more profitable.
574. Can we take it for granted that the soil in that orchard is typical of the soil in the district? Yes; there is a lot of land out there which would make quite as good orchards if proper attention were given to it.
575. Is it a fact that land, which some years ago was regarded as inferior, is now coming into favour, and is proving as productive as the richer land? The poorer sandy land is at the present time doing better than a great deal of the black soil and the richer land. It is very suitable for passion-fruit, lemons, mandarins, and oranges; but it requires more manure. If we could get stable manure, which we believe in very strongly, there are thousands of acres in the district, upon which people could make a very comfortable living.
576. Without a railway, they are handicapped? Yes.
577. Which would you rather travel—the road to Dural, or the road to Hornsby? The road to Dural at any time.
578. Do you think that if the proposed railway were constructed, the producers of Arcadia, Galston, and the country to the north would use it, even if the rates were higher than the rates on the Northern line? Yes; it would pay me to use it, and I think that what would pay me, would pay the smaller growers.
579. Has the road between Galston and Dural been improved since the Dural railway proposal was under the consideration of the Public Works Committee in 1898? Yes; they have cut down part of the road and formed it, and some of it has been metalled since the last inquiry.
580. *Mr. Levien.*] But nevertheless you would sooner have the railway? Yes.

Sholto Montgomery Cay, fruit-grower, Galston, sworn, and examined:—

581. *Mr. Shepherd.*] Where do you cart your fruit to? To Hornsby Junction. S. M. Cay.
582. How far is that from your place? About $7\frac{1}{2}$ miles. 12 Sept., 1900.
583. What is the extent of your holding? Forty acres, about twenty of which are under cultivation, but some of the trees are very young.
584. How long have you been there? Four or five years.
585. I suppose you know the district well? I cannot say that I know it very well, because I have been pretty hard at work on my holding all the time, but I have driven about the district a bit.
586. What is the character of the country round about Arcadia? It is dark soil, and some of it sandy soil.
587. Is it suitable for orchard work? Very much so, as far as I can judge by the appearance of the trees there.
588. I suppose there is not much cultivation in Arcadia yet? A good deal of fruit is grown there.
589. Is that fruit sent to Hornsby railway station? Yes, almost entirely.
590. What distance is it from Arcadia to Hornsby? Nearly 12 miles.
591. Is there a fairly good road from Galston to Hornsby? The surface of the road is fair enough; but I consider it a dangerous road, and a road which is very hard upon horses. You cannot hurry your horses on it, and you have to spell them frequently, and if anything goes wrong you may break your own neck and kill your horses too. It is a road which I should not use if I could avoid it.
592. I suppose the journey to Hornsby and back occupies nearly a day? Yes; a man cannot do very much else in a day.
593. Is there much land beyond Dural which could be brought into cultivation if the proposed railway were constructed? There are hundreds of acres there which are very suitable for fruit-growing.
594. What sort of timber is there in the country beyond Dural? Ironbark, white gum, and other timbers.
595. Useful timbers? Yes; very useful timbers. Some of the land is very heavily timbered.
596. I suppose that in the event of the proposed railway being constructed it would pay to send that timber by rail to Sydney? Yes; and I believe that handsome offers have already been made for even the dead wood on the ground now.
597. Has the timber in the neighbourhood of the route of the proposed land been destroyed? Most of it was burned off in clearing the land. The long road carriage prevents people from sending timber to market now.
598. Are the people in the district willing to pay special rates on the proposed railway? Yes. I am a member of the Railway League, and I know no one who would be unable to pay special rates.
599. Have you had any conversation with the residents of the district as to their willingness to give what land may be required for the railway? No.
600. Is much improvement taking place between Galston and Arcadia? Yes; the district is being improved every year. Every year each one plants a little more ground—it may be only an acre, or it may be more.
601. Would the construction of the proposed railway give an impetus to the development of the district? Yes.
602. Have you any doubt about the line becoming self-supporting within a reasonable time? No. It might not be self-supporting at once, but it would become so in the future.
603. Do you agree with Mr. Fagan's evidence? Yes; in every instance. I have gone through his figures, and I believe that they are correct, so far as I can judge. I consider that the Hornsby road is
not

- S. M. Cay.
12 Sept., 1900.
- not a fit road for the traffic of the district, and the people of the district use it only because they have no choice. A horse cannot pull a fair load upon it day after day, and half a ton makes a very good load.
604. Have you to manure your land at Galston? Yes, every year. I am doing so now.
605. What kind of manure do you use? I use bone-dust a great deal; but I change about. Sometimes I use the Colonial Sugar Company's manure, and at other times other manures.
606. Are your trees in pretty good health? Yes, most of them; but I should like to use more manure than I do.
607. *Chairman.*] Would you use more manure if the proposed railway were made? The railway would offer an inducement to me to use more manure, the carting is now a big item.
608. A disease which attacks the trunk of the trees near the ground used to be very prevalent in the district some years ago; is it very prevalent there now? They call that disease "collar rot." It is not more prevalent than it was, and, in fact, seems to be declining. My neighbours do not complain about it very much.
609. Do you drain your orchard at all? Yes.
610. Do you use subsoil drains? Yes. I am putting in some now.
611. Do the growers seem pretty satisfied with the returns which they get from their orchards? Yes, taking them as a body they seem to be contented.
612. What are the principal fruits grown in the district? The citrus fruits.
613. Passion-fruit? Yes. The growing of passion-fruit is on the increase.
614. *Mr. Hyam.*] Do you think that "collar rot" is a disease? The Department say that it is; but I fancy that it is not. I think it is caused sometimes by a blow from a hoe, and sometimes by want of drainage. I had a patch of orchard where the trees were affected by the disease when I came to the district; but the land there was very badly drained, and I am convinced that if it had been properly drained the trees would have been healthy.

Joseph Basil Byford, baker and storekeeper, Galston, sworn, and examined:—

- J. B. Byford.
12 Sept., 1900.
615. *Mr. McFarlane.*] Have you resided in Galston for any length of time? A little over two years.
616. Have you a knowledge of the district through which the proposed railway would pass? I have become acquainted with it since I have been living in it.
617. Would you class it as a good fruit-growing district? Yes, so far as I know, it is fairly good.
618. Have you a knowledge of fruit-growing? No; I do not know anything about it.
619. Do you have many goods sent to Galston? Yes; on the average I have from 25 to 26 tons a month carted from Hornsby.
620. General merchandise? Yes.
621. Where do you get your supplies? From Sydney, by railway to Hornsby.
622. How far is Galston from Hornsby? Seven and a half miles from where I live.
623. How much does your carting cost you per ton? 8s. 6d.
624. Do you consider that a fair charge? Yes; that is a very fair thing.
625. You have also to pay railway charges from Sydney to Hornsby? Yes.
626. If the proposed railway were brought to Dural, do you know what it would cost you to get up the goods? At the present time I can only bring one load a day from Hornsby to Galston, but if the proposed railway were made I could bring up three loads a day, because my place is only 3 miles from Dural, and I have a good road. I should be willing to pay special rates on the proposed railway.
627. Do you think that if the railway were made your business would increase? Yes; because I could sell my goods more reasonably.
628. Would there be more settlement in the district? Yes. The district is going ahead now. My carting during the first month that I was there amounted to only 14 tons, but now it has increased to 25 or 26 tons a month.
629. Was there only one person in your line of business at Galston when you went there? Yes; and now there are two.
630. Have you heard complaints from the fruit-growers as to the disabilities under which they labour in having to cart their fruit to the Northern railway? Yes; I have frequently heard them complain.
631. Do you think that they have substantial reasons for their complaints? Yes.
632. Some of the fruit-growers in Galston are much further from Dural than you are? Yes; the Arcadia people are much further away.
633. If the proposed railway were made, and special rates were charged upon it, would those fruit-growers use it rather than send their produce to Hornsby? Yes. All of those fruit-growers have to come past my place, and it would be nearer for them to go to Dural than to go to Hornsby.
634. Do you think that if the proposed railway were made the Galston people would discontinue sending to the Northern line? Yes; they would all go to Dural.
635. Even though the rates on the Dural line were higher than the rates on the Northern line? Yes. The road from Galston to Hornsby is very steep and heavy, and it takes us a day to go to Hornsby and back.
636. What is the road like between Galston and Dural? It is a very good road. The Hornsby road is very good, so far as its surface is concerned, but its grades are very heavy.
637. How far in the direction of the Northern line would the Dural railway influence the traffic? I think that three people out of four would go to Dural.
638. That is taking the whole of the country between Dural and the Northern line? Yes.
639. What goods do you generally get up from Hornsby? All sorts of goods; but principally produce—chaff, corn, and so on. I am a general storekeeper.
640. Is the importation of produce on the increase? Yes; it has steadily increased from month to month since I have been there.
641. Is not any produce grown locally? No.
642. Is it all obtained from Sydney? Yes. The people in the district find that fruit-growing pays better than growing produce.
643. Is the land suitable for growing produce? No.
644. So that the traffic in produce will be permanent? Yes.
645. And will increase as population increases? Yes.

646. Is it a fact that your carter, in coming from Hornsby to Galston, has to unload part of his goods when he gets to the creek, because he can only take part up the hill? Yes. The grade is too heavy to allow him to draw as big a load up to the top of the hill as he brings down. J. B. Byford.
12 Sept., 1900.
647. That means a considerable loss of time? Yes.
648. Have you to do the same sort of thing on the Galston to Dural Road? No, because that is a level road; there are no hills there.

Oliver Thompson, storekeeper, Galston, sworn, and examined:—

649. *Chairman.*] How long have you been engaged in business at Galston? Nearly two years. O. Thompson.
12 Sept., 1900.
650. From which railway station do you draw your supplies? From Hornsby.
651. Do you find any difficulty in bringing them to the store with reasonable despatch? We can get our goods delivered; but it costs 8s. 6d. a ton for carting.
652. If the proposed railway were made, and the rate for merchandise was 2s. 6d. a ton more on it than on the Northern line, would you have your goods sent to Dural? Yes.
653. What would the cartage be from Dural to Galston? About 2s. 6d. a ton.
654. It was stated, when this question was last under consideration, that the roads from Galston to Dural is bad in wet weather, whereas the road from Galston to Hornsby goes through hard country, and has been thoroughly drained and metalled;—do you agree with that statement? Yes. In wet weather the road from Dural to Galston gets cut up a bit; but it is a good road in fine weather.
655. But the length of the Hornsby-road, and its heavy gradients, discount its advantages considerably? I think the people would rather go through the mud to Dural than use the Hornsby-road.
656. It was also stated that it was doubtful whether traffic from Arcadia and Galston would go to the proposed railway at Dural? I think that it would all go to Dural.
657. Even if special rates were charged on the Dural line? Yes.
658. Do you look upon the fruit-growers in the district as fairly prosperous? I think they are pretty well to do.
659. Do you have business relations with the people right out beyond Arcadia? Yes.
660. Has there been any development in the fruit-growing industry there? Yes; there has been great development.
661. How far beyond Arcadia has this development taken place? Right down to Berowra.
662. Do you think there is any chance of the produce from Arcadia and the country further north going to the Northern line if the Dural line is constructed? I do not think so.

John Charles Hunt, fruit-grower, Dural, sworn, and further examined:—

663. *Chairman.*] You desire to make a statement about the Dural to Hornsby Road? Yes. The creek which that road crosses was at one time considered impassable, but, through the influence of some people from Sydney, a track was made across to Galston, and the surveyors converted it into a zigzag road; but in many places that road goes along the side of sheer precipices, where, if you were to fall over the side, you would drop hundreds of feet, and if your horse stumbled, nothing would save you. There have already been two accidents on the road, and in one case the horse was killed. I will not allow my teams to go that way, for fear of accidents, and I know that it is a source of anxiety to other people who send their teams that way. While the surface is very good, the grades are very heavy, and the curves are so sharp that very often the shaft or pole horses have to do all the work while the driver is getting the leaders into position. Mr. Fuller, who does Mr. Byford's carting, has to unload when he gets down the hill into the creek, and leave half of his load on the side of the road, returning for it later on. The road is a dangerous one, although it has a good hard surface. J. C. Hunt.
12 Sept., 1900.

THURSDAY, 13 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. SOLOMON HERBERT HYAM.

ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Luke Gallard, fruit-grower, Kenthurst, sworn, and examined:—

664. *Chairman.*] Have you a statement to make to the Committee? I have a few figures which I should like to give to the Committee. The district which I represent has developed considerably since 1898, when the Dural railway proposal was last before the Committee, the population having increased by forty-seven, the area of the holdings there by 651½ acres, and the area under cultivation by 136½ acres. The area under bearing trees has increased by 255 acres; but there has been a decrease in the non-bearing area. Of course, a lot of the trees that were not bearing two years ago have come into bearing since. If the district continues to develop at that rate, it will double its production in ten years, even without a railway, and I ask, therefore, what would it not do with a railway. We have not taken in the Carlingford district this time. The figures which I have just given are for the Kenthurst district only. In the whole district, excluding Carlingford, *i.e.*, from Pennant Hills to Glenorie, the population has increased by eighty-nine, the holdings by 1,440 acres, the area under cultivation by 1,000½ acres, and the area under bearing trees by 1,313½ acres, while there has been a decrease in the non-bearing area and in the acreage under other tillage. The great increase in the bearing area and the decrease in the non-bearing area, show that a great many of the trees which were returned last time as non-bearing were trees that were coming into bearing; and if the proposed railway is sanctioned, and the construction of it carried out at once, many of the trees that are now non-bearing will be bearing trees before it can be completed. Between Castle Hill and Glenorie I have reckoned five individuals to a family, which, on the present population, gives 417 families. If only one member of each family L. Gallard.
13 Sept., 1900.

- L. Gallard.
13 Sept., 1900.
- family made a trip a week, the Commissioners would receive, at 2s. 3d. for the return ticket. £2,430 8s. 9d. from the passenger traffic on the line. Then there is the fruit traffic. Castle Hill extends about three-quarters of a mile from Rogan's Hill, towards the Northern line, and I have, therefore, not taken into account the whole of the fruit from that district, because possibly some of it would go to the Northern line. Making allowance for that, I estimate that there are 4,719½ acres in the district, which, at 100 trees to the acre, would mean 471,950 trees, and, at half a case to the tree, 235,975 cases, which, at 2d. per case, would return to the railway £1,924 15s. 10d. There would also be a large manure traffic. There are 5,301 acres in the district under fruit-trees, bearing and non-bearing, and, allowing a third of a ton of manure to the acre, that area would require 1,766 tons, which, at the rate of 5s. to the ton, would give a return to the railway of £441 10s. I estimate that the carriage of horse-feed and other stores would also return to the railway the like amount. Then there would be a considerable timber traffic—fencing stuff, rails, sleepers, and so on, which, allowing for one truck-load daily, at 2s. a ton, would return £5,564 4s. 7d. Twenty years back the population of Kenthurst had not reached thirty; but now our population is 370; and whereas sixteen years ago we had only one school and found it difficult to get fourteen children to attend it, we have now two schools and an attendance of about ninety-six children.
665. Is there room for the further expansion of the fruit-growing industry in Kenthurst? Yes.
666. What land is available for settlement there? A great deal of land has been taken up there by selectors, in the hope that they would get a railway; but there is still land to be taken up, and there are a lot of large holdings, which, if there were a railway, would be cut up, and would give opportunities for closer settlement.
667. A large number of non-residential selections were taken up some years ago? Yes; in areas of from 100 to 340 acres; and very little has been done to that land. The development of the district to which I have referred is due almost entirely to the owners of about twenty-five holdings, who have been active in working their places, and who are people who use manure for their land. A third of a ton per acre is a very low average supply of manure for the land in our district, and, in fact, we could do with twice that amount; but I have averaged the requirements of our district with those of some of the richer districts in the vicinity. The soil in our district is poorer than that in any other district; but it answers to manure, and when the land is well manured, our fruit competes well with that of other districts. One man in our district uses £6 worth of manure—about a ton and a half to the acre—and another man £4 10s. worth to the acre. There are six or seven people in Kenthurst who use over a ton to the acre, and they get good results from their land in consequence, being the most prosperous growers we have.
668. Would that quantity of manure be used every year? Yes. By using manure in this way these people were able to get very much better returns with very little extra labour.
669. What lands are there in the Kenthurst district not under fruit? Some of the non-residential selections to which I have referred, while most of the people in the district do not cultivate the whole of their holdings. For my own part, I have about 80 acres at Kenthurst, and only 13 of them are under fruit; but within a few years I could double my cultivation if we had a railway, and a great many others would do the same. The roads lately have been bad enough to take the heart out of anyone who used them, and last year we had some terrible experiences. On two occasions I saw men digging their carts out with shovels, and a few months back many of those who were driving carts were obliged to carry shovels with them to fill the holes in the roads, so that they could get along safely.
670. Is the bad state of the roads a serious obstacle to the success of the fruit-growing industry? Yes, because it makes it much more costly to get our fruit to the railway.
671. What does it cost you to cart your fruit to the railway station, taking time and labour into consideration? With really good roads it would cost 3d. or 4d. a case to send fruit from Kenthurst, but with the roads we had last year it would cost not less than 6d. a case. I had as strong a horse as anyone round about, but I could not take a load of more than twelve cases from my place to the railway station.
672. Where do you take your produce? To Pennant Hills.
673. What distance are you from Pennant Hills railway station by road? About 9½ miles. From the Round Corner the distance is between 7 and 7½ miles.
674. Why do you not take your fruit to Hornsby? To get to Hornsby we should have to go through Dural. To go towards Riverstone we should have to travel about 11 miles.
675. In allowing for a yield of only half a case to the tree, do you not think that you are under the mark;—other witnesses have allowed for a yield of a case to the tree? That was decided upon as a fair average, taking the good orchards with the bad, but it would not be a fair average for the good orchards. I can refer you to a place where, only three years ago, they took 700 cases off an orchard.
676. Mr. Harper gives the average yield of the district as about twenty-six cases to the acre;—do you think that that is under the mark? Yes. We should not be able to live upon such a yield. He also said that there would be no increase in the settlement of the district, and he did not seem to be able to recognise the possibilities of our district, which, from the residential point of view, are as good as that of any suburb. We are at an elevation of from 700 to 800 feet above sea-level at the top end of the district, the climate is equal to that of the Blue Mountains, and all the surroundings are good.
677. It has been suggested that a larger area of good land would be opened up if the railway turned off to the north-west through Glenhaven, and went up Cattai Creek;—do you think that that is a reasonable suggestion? I do not. I think that it would be better to continue the railway through Dural towards Maroota and Wiseman's Ferry.
678. Has your part of the district made as rapid progress as other parts of the district which would be served by the proposed line? Our part of the district and the Dural-Glenorie district are about the two most progressive districts which the line would serve. People settled in our district years ago, and they are obliged to go on doing something in order to get a living. They deserve consideration, because they went there before there was any talk of a railway, and settled there, while in other parts of the Colony railways are often made to induce settlement.
679. *Mr. McFarlane.* Do you think that a case to a tree is an excessive estimate of the average yield of the district? Not for a decent orchard.
680. But for the whole of the producing orchards? I should say that three-quarters of a case to a tree would be more like a fair average than half a case.
681. *Mr. Lovien.* What is the average weight of a case of fruit? About 60 lb. A case of plums will weigh as much as 90 lb., whereas a case of passion-fruit will not weigh more than 30 lb.

682. Fruit is a thing which you would have to get to market as quickly as you can? Yes; and the railway would save us a lot of time, and enable us to look after our orchards better. If the proposed railway were made, we could pull the summer fruit and send it into market all in the one day; whereas, now, the fruit is in the case a night, and sometimes two nights, before it gets to market, and that decreases its value to the extent of 1s. or 1s. 6d. a case. Summer fruit often decreases one-fourth in value in that way. During the last two years there has been a midday train from Pennant Hills, and people who are able to pick their fruit in the morning, and send it down by that train, get 1s. and sometimes 2s. a case more for it than those who cart their fruit in from long distances, and pick it the night before.

L. Gallard.
13 Sept., 1900.

683. *Mr. Hyam.*] Can you grow peaches at Kenthurst? Yes; but they get knocked about a good deal in the carts. It is not profitable to grow the very tender kinds. With regard to my statement as to the average yield of a tree, I would like the Committee to bear in mind that that is the average of bearing and non-bearing orchards; but I think that three-quarters of a case to a tree would be a fairer average. I know of places where they have taken 400 cases off an acre, and one place where they took 700 cases off an acre.

684. *Chairman.*] What would you consider a fair average yield for the bearing orchards, year in and year out? The average yield for bearing orchards would be over a case to the tree, or about three-quarters of a case to the tree, taking the bearing and non-bearing orchards together. I mentioned half a case as the lowest estimate I could make. With regard to the proposal to put a tax upon the land in the district in order to pay for any loss on the line, I should like to say that I would rather see this loss made up by the imposition of extra rates on the fruit sent by the line, because if such rates were imposed they would fall upon men who were able to pay them. If a man had a large quantity of fruit to send away he would be able to pay a considerable amount to the railway, and if he had less he would not pay so much.

685. *Mr. Shepherd.*] How about the men who have large properties which they do not improve at all? Of course it might be a good thing to get at them.

Joseph Hemers, nurseryman and fruit-grower, Kenthurst, sworn, and examined:—

686. *Mr. Hyam.*] What kind of fruit do you usually grow? Chiefly citrus fruits, though stone fruit is grown in some parts of the district.

J. Hemers.

687. Have you many trees in full bearing? I have not many trees in full bearing myself, the oldest trees in my orchard being about three years old.

13 Sept., 1900.

688. You have not a great acreage under fruit-trees? I have 9 acres under cultivation.

689. What is the size of your holding? About 30 acres.

690. If the proposed railway were constructed, would you increase your cultivation? Yes.

691. How far would you be from the proposed station at Dural? About 2 miles.

692. Which railway station do you use now? Pennant Hills.

693. How far are you from it? Between 8 and 9 miles.

694. The last witness stated that fifty cases to the acre was a fair average yield for an orchard;—do you think so? I understood him to say that that was the average yield of full-bearing orchards and orchards only just coming into bearing, taken together; but I know a place where a man took 700 cases of fruit off an acre of lemon trees in one year. Half a case to the tree would be a very low average for full-bearing trees. If people use manure they can get very large returns from the soil.

695. Taking the trees just coming into bearing and the trees in full bearing, what would be a fair average yield? About a case and a half to a tree.

696. That is 150 cases to the acre;—do you think the district could produce as much as that? Yes, if it were cultivated and manured properly.

697. Are there any neglected orchards in the district? Yes.

698. Many? Not many.

699. Are they producing any fruit? Some of them may be producing crops.

700. Are they owned by people who live in the district, or by people who live away from the district? Most of them are upon non-residential selections, and the people who own them have a little work done upon them occasionally, perhaps by men who do not understand their business, and therefore the places go back.

701. But it would not be fair to include those orchards? Not in estimating the average yield.

702. The land you speak of was thrown open for selection fourteen or fifteen years ago? About fifteen years ago.

703. Was it taken up for speculative purposes? Yes.

704. Is it still held by those who took it up? Yes. I went out to the district fifteen years ago as caretaker for a 300-acre selection, which to-day is no further improved than was necessary in order to comply with the provisions of the Land Act. Five or six years ago they were trying to subdivide that area.

705. Do you think that if the proposed railway were made people would buy this land and come into the district to settle? Yes. There are thousands of acres in the district which are capable of producing good fruit, but which are now in a natural condition.

706. What is the character of the Kenthurst soil? It is a sandy loam, with occasional patches of black soil. It is a remarkable district, because you will find a patch of black soil 20 or 30 acres in extent, while the surrounding soil will be loamy soil.

707. Is the loamy soil good for fruit? It is all good soil for fruit.

708. It requires a great deal of feeding? Yes; but with feeding it produces fruit of first-rate quality.

709. Are there any old orchards in the district? Two or three.

710. How old are they? They were old fifteen years ago.

711. Do they still bear well? Yes.

712. The trees show no signs of deteriorating? As the old trees begin to die out they are replaced with new trees; but some of the best orchards in the district, where the trees were planted fifteen years, are in full bearing now, and the trees are a picture to look at.

713. Would you be prepared to pay double rates on fruit sent over the proposed line? Yes. I was at a meeting of the Railway League when it was decided to agree to pay special rates on all produce carried over the third section of the proposed line.

714. Do you think that the people in the district generally would agree to pay special rates? Yes. The people of the district were well represented at that meeting.

715.

- J. Hemers. 715. Did anyone object to pay special rates? No.
 13 Sept., 1900. 716. Have you carted any fruit to the railway station? Yes; and I have also paid to have some carted. I have paid 6d. a gin-case and 3d. a box to have fruit carted to the Pennant Hills railway station—a distance of 8 or 9 miles.
 717. Then you could afford to pay extra rates upon the proposed line? Yes; because it would make the carriage of the fruit cheaper, and it would save my time. A man is better employed in attending to his orchard than in driving a cart.
 718. Have you noticed any disease among the trees in the district? Yes; there are several diseases, such as scale, black spot, and other ordinary diseases.
 719. Are the people able to combat those diseases? Yes, we prevent them to a certain extent; but so far as the red scale is concerned, I do not think it is possible to eradicate it, because it seems to be a climatical disease.
 720. There is very little scale on the oranges themselves? That is due a good deal to the manuring they receive.
 721. Do you find that there are more speckled oranges where the trees are starved? Yes; healthy trees appear to throw off diseases.
 722. You do not think that these diseases are likely to destroy the fruit-growing industry? No, because we are able to keep them down.
 723. Do you think there is room for an increase of production in the districts around Kenthurst? Yes, in the country between Kenthurst, Glenorie, and Cattai Creek.
 724. What do you think of the country near Cattai Creek? It is good fruit-growing country. The traffic from the country west of Cattai Creek goes into the Windsor line.
 725. Anything 3 miles beyond Kenthurst would not be likely to come to the proposed railway? Traffic comes to Pennant Hills railway station from places 5 miles beyond Kenthurst.
 726. Therefore it would come to the proposed railway? Yes.
 727. And the traffic from out Glenorie way would also come to it? Yes.
 728. What is the country like from Glenorie to Wiseman's Ferry;—is it suitable for fruit-growing? Yes; it is all similar country.
 729. Why do you state the average yield of the district as a case and a half to the tree? Because of what I have seen of it. I have known mandarin trees, only 3 years old, to bear three-quarters of a case to the tree.
 730. *Mr. Shepherd.*] At what age do you think a tree is in full bearing? At 7 or 8 years.
 731. The yield is not likely to increase after that age? With good working and manuring it may increase a little for the next two or three years. A tree will keep improving if you keep feeding it.
 732. Is the country beyond Dural likely to be largely planted with fruit-trees? Yes.
 733. Is it as good as the country through which the proposed line would pass? Yes.
 734. Has much improvement taken place at any distance beyond Dural? Selections have been taken up there, but other witnesses will give you information with regard to that part of the district. The country out there consists of flat ridges divided by very deep creeks. Glenorie and Kenthurst are very close together, so close that in a straight line the distance is not more than a mile and a half, whereas to go round with a cart would mean a journey of 12 miles.
 735. Mr. Harper stated that there had been very little development in the district during the last two years;—do you think that that is a correct statement? No, I do not.
 736. What would be the average acreage of orange trees coming into bearing this year? It is very hard to say; but in the last three months I have supplied between 5,000 and 6,000 young trees, and not 100 of them have gone out of the district. The last witness had something like 2,000 or 3,000, and very few of them went away from the district. Mr. Harper stated that the non-bearing orchards referred to in the last statistics were chiefly old orchards which were dying out. There may be a few orchards on the main road, but most of the orchards are replanted from time to time with young trees. On the back lying ridges they are continually planting young trees. I think that Mr. Harper was altogether mistaken when he made that statement.
 737. How is the land in the old orchards prepared for replanting? The old trees are grubbed out, the soil is well worked up, and a load of new soil is carted in to give the new trees a fair start. Under that treatment the old orchards will continue to produce good fruit.
 738. Do you not consider that the soil of an orchard is to some extent worn out by the time the trees begin to be worn out? Yes; but every two or three years we cart in new soil and artificial manure to keep the trees healthy.
 739. I suppose you find that by cultivating and manuring the land you are able to keep the trees free of disease? Yes; the better the trees are looked after the fewer signs of disease are seen.

John Williams Foster, fruit-grower, Dural, sworn, and examined:—

- J. W. Foster. 740. *Mr. McFarlane.*] How long have you been residing at Dural? I have had property in Dural for
 13 Sept., 1900. some years, but I have only been residing there permanently during the last six months. I have been a property-owner in the district for upwards of thirty years.
 741. Have you a good knowledge of the country through which the proposed railway would pass? Yes; I know every acre of it.
 742. Do you consider it a good fruit-growing district? I consider it the best fruit-growing district in the Colony.
 743. What has been your experience? If a place is properly looked after, fruit-growing is a paying industry.
 744. How many acres of land have you under fruit? About 25 acres.
 745. Have you much land that is not under fruit? Yes; 170 acres in Dural. Twenty acres of that area, however, are cultivated for fodder.
 746. Is the land sufficiently good to grow fodder? Yes; with a little manure.
 747. Is there any special reason why the whole of your land is not under fruit? If I could get my fruit away more easily, I would cultivate more land. The land there is worth very little if it is not cultivated.
 748. Is the rest of the land suitable for fruit-growing? Yes; every acre of it. 749.

749. Is it in close proximity to the route of the proposed railway? It lies 3 miles north of the proposed terminus at Dural. J. W. Foster.

750. There is not a large proportion of the land in the district under fruit? No; when I left Dural, some fifteen or sixteen years ago, there were only four families living north of my holding, but when I was compiling statistics to place before the Committee, I found that there was something like 100 holdings, and a population of over 300 persons, north of the proposed railway, and at least 3 miles from it. 13 Sept., 1900.

751. What area of country do those figures include? They include the Glenorie district.

752. Is the land in the district through which the proposed line would pass, which is not now under fruit, sufficiently good for fruit? I feel sure that it is, though some of the most exposed parts on the highest hills may not be.

753. Has there been any tendency to increase the area under fruit each year? Fifteen or sixteen years ago there were not 50 acres under fruit there; but at the present time there are nearly 700 acres of bearing trees, and 300 acres of non-bearing trees.

754. Do you know the country to the north and north-west of Dural? Yes.

755. How does it compare with the country between Dural and Carlingford? It is broken country; but a great deal of it is adapted for fruit-growing. The best orchards in the district are on a poor, sandy, loamy, soil.

756. Is much land under fruit at Galston? Yes, a large area.

757. What is the land like round Glenorie way as compared with the land near Carlingford? The land at Carlingford and Castle Hill has a heavier soil than the Glenorie soil. The Glenorie soil is the better for fruit-growing, though it takes a little more manure. I do not think they can grow passion fruit at Carlingford.

758. Have you experienced any difficulty from the want of railway facilities? Yes.

759. Where do you send your fruit? At the present time I am paying to have it carted to Pennant Hills.

760. What does it cost to have it carted there? Sixpence a case.

761. What is the distance? Nine and a half miles.

762. Are there other fruit-growers in your neighbourhood who have to do the same thing? I think there are a few; but most of the people there do their own carting.

763. How much of the country lying towards the northern line would the proposed railway serve? That part of the district is very broken country. There is an enormous gully between the two lines.

764. There is not much cultivation there? No.

765. Do you think there ever will be? No.

766. What is the condition of the road between Dural and the Northern line? It is a very difficult road to travel in bad weather. Last winter it was impassable. It is a very hilly road.

767. What would you consider a fair average yield per tree for a productive orchard? Taken together, trees just in bearing and full-bearing trees, I think that a case to a tree would be a fair average. I have pulled 200 and 250 cases to the acre off trees 7 and 8 years old.

768. There are usually 100 trees to the acre? Yes; and a yield of 100 cases to the acre is a low average yield.

769. Would the yield of other fruit besides oranges be about the same? It might be a little less; but I have not had much experience of summer fruit.

770. If the proposed railway were constructed, do you think that the whole of the fruit-growers within a reasonable distance of it, and to the north and north-west of it, would use it, even though the rates might be higher than those on the Northern line? The majority of the fruit-growers there would sooner use the Dural line, even if they had to pay special rates.

771. In the event of the proposed line being constructed, from how far north and north-west of Dural would fruit come to it? The proposed railway would influence the country right through to Maroota—15 miles.

772. Would it bring about the opening up of new country for fruit-growing, and the cultivation of land along the route which is not now under fruit? I am sure that, if the proposed line were made, nearly all the land in the district would be used for fruit.

773. Do you think that the district generally is improving? I am certain that it is.

774. Is it steadily improving? Yes.

775. Is the area under fruit increasing? Yes; every year.

776. Are there many private residences in the district owned by people living in Sydney? I think there are a few in Glenorie, but not many. The majority of the people having holdings there are *bonâ fide* settlers.

777. Would the construction of the proposed line increase the number of private residences? I am certain that it would. I should like to contradict the statement of Mr. Harper that there is very little settlement north of Dural, and very little land there to be taken up for settlement. There are thousands of acres there open for selection. There is the Canoo Ridge and the Maroota Ridge, which contain some of the best orchard land in the Colony.

778. Do you consider Mr. Harper's estimate of revenue a fair one? No; I think it a mistaken one. 150,000 cases of fruit at double rates would return £1,200 a year.

779. Is 150,000 cases a fair estimate of the production of the district? No; I think it is an underestimate.

780. Have you a knowledge of the timber in the district? Yes; there is a great deal of timber in the district. Between Glenorie and Wiseman's Ferry there has hardly been a tree cut, and you can get the very best timber there—blue-gum, black-but, and mahogany, amongst others.

781. Is that on Crown land? Yes. There might be some difficulty in getting some of it out; but it would all be got out in time.

782. How far would the marketable timber be from the proposed railway? Some of it would be 20 or 25 miles away.

783. On an average, how far would it be from the proposed line? About 15 miles.

784. How far from the Northern line? About 30 miles.

785. Do you get supplies from Sydney? I deal from the local storekeeper.

786. *Chairman.*] Do you require to work your orchards just at the time when the fruit is ready for market? Yes; this is the time of the year when people are taking their fruit to market, and it is also the proper time for cultivating the orchards.

787.

- J. W. Foster. 787. Would it pay a man to save 1d. a case—8s. 4d. a day—by carting his fruit to the Northern line instead of sending it to the Dural line? No; it would not pay a man to neglect his orchard to cart his fruit a long distance.
13 Sept., 1900.
788. Could the timber in the district be profitably drawn 15 or 20 miles by road? I do not know; I have had no experience in connection with the timber trade. In the Galston district there is plenty of ironbark within 4 or 5 miles of Dural. Mr. Harper stated that the proposed railway would rob the existing lines, but I should like to point out that the line from Clyde to Carlingford is an existing line.
789. *Mr. Hyam.*] If the Commissioners open the Carlingford line, will you send your fruit there instead of to Pennant Hills? No; because it would be fully a mile further.
790. *Chairman.*] During the last inquiry some of the witnesses stated that they would be willing to pay 3d. a case to send fruit over the proposed line, but the railway authorities were of opinion that such a charge would send traffic to the Northern line;—do you think that that is so? No; I feel certain that the people living along the first and second section of the line would be willing to pay higher rates, though I cannot speak for people down about Pennant Hills.
791. Does a difference of 7 miles in cartage make a material difference to the grower of fruit? Yes; if a man has only to drive a short distance, he has all the more time to devote to his orchard. If the proposed railway were made, the Kenthurst and Glenorie people could take their fruit to the Dural station and be back by midday, whereas the journey to Pennant Hills and back takes a whole day and part of the night. The road into Dural is a very evenly graded road.
792. The Commissioners estimate a large loss upon the line;—would it be more to the advantage of the people in the district, to secure a railway, to pay special rates for the carriage of goods over the line or to submit to the levying of a tax upon their land, the tax to be modified by the distance from a railway? I think it would be fair to make the producers pay on what they send to the railway. I think that those who use the railway should be those who have to pay for it. No doubt, if the railway is constructed, the value of the land in the district will increase, and the landholders there will have to pay a higher land-tax.
793. Do you agree with previous witnesses, that there would be considerable traffic in manure? I am certain of it. Our great difficulty now is to get manure brought out from the railway station. A man cannot bring a return load of manure with him after sending fruit away, because he has generally a cart-load of empty cases to bring back.
794. What does it cost you to cart manure? I get mine from a local man.
795. How much manure is used to the acre, on the average? I agree with Mr. Gallard that at least a quarter of a ton to the acre is required, and for a full-bearing orchard half a ton to the acre would be a very fair average. Manure ought to be put on every year.
796. *Mr. Shepherd.*] Half a ton of what kind of manure? Bonedust, or artificial manure. It costs about £4 10s. or £5 a ton.
797. *Chairman.*] Do you know the stone quarries which have been discovered in the district? Yes. The white metal is the best that I have ever seen, and the quarry is inexhaustible. The blue metal quarry has never been properly opened up, but I think it is first-class stone, and inexhaustible.
798. How far is the blue metal quarry from the nearest point on the proposed railway? About 5 miles.
799. Do you think that that stone would be used for railway purposes generally, just as the Bombo stone is, if the proposed railway were made? There is no doubt about it. It would almost pay to run a line up there. There is a very level grade from Dural.
800. Is the white metal suitable for heavy traffic? I do not think it is quite as lasting as blue metal, but it makes a much better road for traffic. The Government would save £100 or £150 a year in the carriage of mail matter if the proposed railway were constructed.
801. *Mr. Hyam.*] How long have you been in the district? All my life.
802. Have you ever known a total failure of the fruit crop in the district? I have seen a great many failures through neglect, and sometimes through bad trees having been supplied by the nurserymen.
803. But have you ever known a general failure of the citrus crops? Yes.
804. And of the stone fruits? No.
805. Have there been failures from drought or excessively wet weather? I do not think drought interferes with the crop much, but occasionally the winter weather interferes with trees in low-lying places.
806. Some five years ago you had very heavy frost throughout the district;—did they interfere very much with the fruit-trees? In some of the low-lying places.
807. But on the higher lands? I do not think so.
808. Did they affect the trees about Galston and Dural? I did not hear of any being affected.
809. Frosts do you no harm? Nothing to speak of. They sometimes nip the tops of the young trees.
810. How many failures of crops have you had since you have been in the district? It is very seldom that there is a failure. If you have a bit of a failure with the summer fruit crops, you perhaps gain in the citrus crops.
811. You have never known the total failure of the fruit crop? No. When one fruit crop has been a failure, another crop has been a success.

James Edward Dale, fruit-grower, Glenorie, sworn, and examined:—

- J. E. Dale. 812. *Chairman.*] How far do you live from Dural? Six and a half miles.
13 Sept., 1900.
813. It has been stated that Glenorie is the extreme limit from which traffic will be drawn to the proposed railway;—what is your opinion of the country beyond Glenorie? Five miles north of Glenorie, on the Wiseman's Ferry road, there is one of the best orchards in Central Cumberland.
814. Where is that? At Maroota, or what is commonly known as the Five-mile Forest. That orchard is a young orchard, just coming into bearing, and is situated on what was formerly a special area. I took up a portion of that special area as a conditional purchase, at £7 an acre; but the Government reduced the price to £5, and afterwards to £3 an acre. There are three young fellows there, who hold 60 or 80 acres, and they have about 20 acres cleared and planted. The soil is a sandy loam.
815. How much country north of Glenorie is there suitable for fruit-growing? Between Glenorie and Wiseman's Ferry there are 15,000 or 20,000 acres good for orchards. The whole district is suitable for orchards.
816. It is not being developed now for want of railway facilities? No.

817. Would the extension of the railway to Dural lead to its development? Yes; I know lots of people who would take up that land if it were not so far from a railway station. At the present time the Maroota people have to bring their fruit into Glenorie, and send it from there. It is too far for them to cart it into market in one day, and the last part of the road, that from Dural to Pennant Hills, is the worst. J. E. Dale.
13 Sept., 1900.
818. East and west of Glenorie is the land suitable for fruit-growing? Yes; there are ridges and spurs there upon which there is the very best land for orchardists. A lot of that land is in special areas.
819. Has there been any inquiry for that land recently? Yes; but everyone thinks it is too far from the railway.
820. Is the distance a handicap because of the waste of time it involves in carting, or because of the deterioration of the fruit on the road? It is a handicap for both reasons.
821. Citrus fruits do not suffer very much from road carriage? They do if the roads are bad, as they have been during the last two years. There is land where summer fruit could be grown; but without a railway it would be impossible to grow it, because it could not be carted to market.
822. Have you any statistics relating to the Glenorie country? Since the last statistics were taken, there has been an increase of 300 acres in the holdings there, and an increase of 232 acres in the area under bearing trees.
823. Is it the general complaint in the district that progress is hindered by the want of railway communication? That is the principal drawback.
824. Do you do your own carting? Yes.
825. What does it cost you? I can cart twelve cases a load in wet weather, and about fifteen when the roads are good, and it takes me the whole day to get to the station and back, leaving at 6 o'clock in the morning, and getting back at 5 or 6 o'clock in the evening, and next day I have to spell the horse altogether.
826. What does that cost you per case? Sixpence a case. People have been carting fruit for that, but they found that their horses would not stand it. With regard to Mr. Gallard's estimate of the average yield, I should like to say that I have 270 trees of "Emperor" mandarins, which are 6 years old, and an expert who looked at them this year, before I pulled any, estimated the yield at 400 cases.
827. Would a case to a tree be a fair average yield? Not for full-grown trees. There are some trees in the district which always average five or six cases, whilst some of the large apple trees yield from ten to twelve cases. I should think that a tree which yielded only one case is hardly in bearing.
828. Have you ever paid for the carting of manure? Yes, 15s. a ton. If you can get someone to bring it as back carriage, you pay about 10s. a ton.
829. Would the construction of the proposed railway substantially improve your condition? Yes.
830. How much further north would its influence be felt? A good way further north. The Government have a lot of special area land there which would all be taken up if the proposed line were made. That land would be considered cheap at £3 an acre if the line were made.
831. *Mr. Shepherd.*] What is the distance from Dural to Wiseman's Ferry? Twenty-four miles.
832. At what distance from a railway station can an orchard be profitably worked? At Glenorie we find it profitable to work our orchards at a day's journey from the Pennant Hills railway station.
833. But what would you consider a fair thing—8 or 10 miles? I do not think a man should be more than 6 miles away. A man who is only that distance from a railway station can pick his fruit and take it to market in the same day.
834. I suppose you never use stable manure? It is too far to cart it.
835. How many tons of stable manure would you consider equivalent to a ton of bone-dust? I could not give you an estimate, as I never used stable manure in large quantities; but I believe that it would be better than the other manure if we could get enough of it, because it adds to the soil.
836. Is the country towards Wiseman's Ferry very rough? Yes; but there is good land on the ridges, and the sandy loam has been proved better than the black soil. It does not get so hard in dry weather, and it can be worked almost immediately after heavy rains, when you cannot work the black soil for a week. The roots of the trees do not rot in that soil, because the soil does not hold the water.
837. Is there much cultivation on towards Wiseman's Ferry? Yes, a good deal.
838. I suppose the people there send their fruit away by steamer? Yes; but if the proposed railway were made it would come to Dural, because the freight on the steamers is very heavy, and the running of the steamers is uncertain. Sometimes fruit lies on the wharf for a week.
839. Do you cultivate citrus fruits exclusively? Apples and citrus fruits.
840. Do you find that apples do pretty well? Yes.
841. What varieties do you grow chiefly? Alsopp's and the Lady Carrington.
842. Which give you the best return—apples or oranges? I think oranges. We grow apples on the low ground, which is liable to frosts, and, perhaps, a bit wet at times.
843. *Mr. Hyam.*] How long have you been living at Glenorie? Eight years.
844. How many acres have you? I have 12 acres cleared; the total area is 54 acres.
845. Have you had any experience in fruit-growing in any other part of the country? No; I had no experience before I went there.
846. I suppose you have done fairly well? Yes; I am very well satisfied, and I am improving every year.
847. I suppose there is plenty of room there for men who are desirous of settling? Yes; there is a lot of ground to be taken up. The Bank of New South Wales has a lot of property there which would be sold if there were railway communication. The bank sold a block of about 30 acres opposite my place last year.
848. What did they sell it for? From £8 to £15 an acre.
849. Cleared land? No, bush land; but it is superior soil. The whole of it is good, from fence to fence.
850. Is it heavily timbered? Yes.
851. Is the timber of any value? It was beautiful timber, but they burnt it all to get rid of it. There was ironbark, white mahogany, and blue-gum.
852. What does it cost to clear that land? £10 an acre; it is very heavily timbered.
853. With a railway, could you make use of the timber? I have heard it said that the value of the timber would pay for the cost of clearing.
854. Would you be willing to pay extra freight on the proposed railway? Yes; I would pay anything rather than do the carting I have to do now. I question if I could get my carting done all the year round for 6d. a case. I am 16 miles from Pennant Hills.
- 855.

- J. E. Dale.
13 Sept., 1900.
855. *Mr. Shepherd.*] How do you prepare the land—by trenching or by ploughing? By ploughing deep.
856. With a sub-soil plough? Very few use sub-soil ploughs, because of the expense.
857. To what depth do you plough? To a depth of 9 inches. The loamy soil does not require to be ploughed so deep as the heavier soil.
857½. Do you generally make sub-soil drains? Yes. We find draining a great advantage.

FRIDAY, 14 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | The Hon. SOLOMON HERBERT HYAM.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Alfred Trethowan, fruit-grower, Arcadia, sworn, and examined:—

A.
Trethowan.
14 Sept., 1900.

858. *Chairman.*] Have you any statistics in regard to the district which the proposed railway would serve which you would like to give the Committee? I think that other witnesses have gone pretty well into the matter of statistics, but there are a few things to which I should like to draw attention. Mr. Smith, the Engineer for Roads, and Mr. Harper, of the Railway Department, when examined during the former inquiry, and Mr. Harper, when again under examination during the present inquiry, stated that the Galston and Arcadia people would not use the proposed railway, but would go to Hornsby, the road there being the better one. That, however, is not so. We can draw quite one-third more to and from Dural than to and from Hornsby, and the journey takes only one-third the time. At the present time we have to pick our fruit one day and cart it to the railway station the next; but, if the proposed railway were made, we could pick and cart in the fruit on the one day, and it would arrive in Sydney twenty-four hours fresher than it does now. Summer fruit deteriorates sometimes 50 per cent, by being kept in the cases in hot weather, and the knocking about on the road is bad for all fruit. Mr. Harper also stated that there was not much country beyond Galston to be served by a railway, as the land there was broken sandstone country; but, in replying to that statement, I should like to say that there are thousands of acres beyond Arcadia, towards Coba and Calabash, which is really first-class land for passion fruit. No better passion fruit comes into the Sydney market than that which comes from that district, and it can be brought into the market at times when it is worth a lot of money. The soil is also good for citrus fruits, some of the best citrus orchards in the Colony being planted on sandy loam. I know of trees 40 years old which, although they were neglected for fully twelve years, are to-day bearing as well as any trees I know; and they are on this sandy loam. From Galston we should have only 3 miles to go to the proposed railway terminus at Dural, whereas it is 8 miles to Hornsby; and the road, as I have stated, is a very heavy one. Mr. Harper has also stated that he does not think there would be much increase in the production of the district if the proposed railway were constructed; but there are many people in the district who have only one-third, and some who have only one-half, of their holdings planted, and, no doubt, if the proposed railway were made they would plant more ground. When I came to the district fifteen years ago, there were very few families there, and there was no school at Galston. When we did get a school it was difficult to get as many as sixteen children to attend it; but now we have a school with an attendance of nearly 100 children, and another school at Arcadia with an attendance of nearly fifty children. There is some very choice ground round Arcadia, which would be planted if the proposed railway were made, and that would bring about a still further increase in the population. Mr. Harper has estimated the total fruit production of the district at 150,000 cases per annum, or about twenty-eight cases to the acre; but the fruitgrowers could not live upon so small a yield as that. There are some orchards in the district which average three cases to the tree, and I think that the smallest average yield would be one case to the tree. If we had a railway we could use much more manure than we are now using; but the long cartage is so expensive that we cannot use a great deal now. It would pay us to use a larger quantity of manure, because in doing so we should increase our yield, and I believe that we could use as much as $\frac{1}{2}$ a ton to the acre. Mr. Harper also stated that most of the non-bearing trees in the district were old worn-out trees; but in Arcadia there are no old worn-out trees, so far as I know, and, as a matter of fact, most of the non-bearing trees there are young vigorous trees which are coming on well. If the proposed railway were made, all the people in the Arcadia district would use it. Mr. Harper has stated that most of the supplies used in the district come from Parramatta; but the only supplies which come to Arcadia from Parramatta are what are brought by one butcher. All the goods that are used there are either imported directly from Sydney by the growers, or are obtained from Sydney through the storekeepers at Galston.

859. Where do the storekeepers get their supplies? Mostly from Hornsby, though one of them gets some of his supplies from Parramatta and from Pennant Hills. The Hornsby-road is an extremely trying road for horses.

860. What area is there in and around Arcadia suitable for fruit-growing? There are thousands of acres of good land beyond Arcadia which are good for fruit-growing, besides the land in Arcadia. The land to which I refer belongs to the Government, and runs out towards Coba.

861. Does the yield per acre in the Arcadia district compare favourably with the yield per acre in the Dural and Castle Hill districts? Yes; and in the near future our district will put those districts in the shade.

862. Is your soil superior for fruit? It seems to suit citrus trees better than the soil around Castle Hill does.

863. If there were an extra charge of 2d. a case upon the fruit sent on the Dural line, would the fruit-growers of Arcadia use that line, or would it pay them better to send to Hornsby? They would use the Dural line, because they would make a saving by doing so, both in money and in time. Although it has been stated that the fruit can be carted for 3d. a case, it is only the large growers, who can pack a full waggon, who can get it taken for that. The ordinary charge is 6d. for the large gin-cases, and 3d. or 4d. for the half-cases.

A.
Trethowan.
14 Sept., 1900.

864. If the proposed railway were constructed, could you pull your fruit and get it to market in the one day? Yes. We could pull it until as late as 3 or 4 o'clock in the afternoon, and then have time to cart to the train at Dural. Last year I sent some apricots to Hornsby, but they were in the cases all night, and the weather happening to be very hot, when they got to market they did not fetch half of what they would have brought if they had got there twenty-four hours earlier.

865. If the fruit-growers in the district used more manure, the Railway Department would benefit in two directions—by the increased traffic in manure, and by the increased traffic in fruit? Yes; I believe that in twelve years Arcadia will produce twice as much fruit as it does now. My own orchard yields twice as much now as it did two or three years ago, and I expect to double my production again in the next five years.

866. Upon what area there could a man make a decent living by fruit-growing? I believe that a man with an ordinary family could make a nice living on 5 acres in Arcadia.

867. What is the average size of the holdings there? They vary very greatly.

868. What is the largest holding that you know of? Mr. Fagan has about 40 acres of orchard, Mr. Samuel Moore has about 25 acres, Mr. William Black has about 30 acres, and Mr. Harry Moore has a large place.

869. Those are what you consider large holdings? They are the largest orchards there.

870. Do you anticipate that there will be a large traffic in timber to the proposed railway? There is some first-class ironbark in the district, suitable for girders, sleepers, and other purposes; and there is any quantity of timber which is suitable for firewood. No doubt, with a railway to Dural, there would be a great deal of timber traffic. On the Southern and Western railways they draw firewood for a distance of 8 or 9 miles.

871. If the rate on manure on the Dural line were 2s. 6d. a ton higher than on the Hornsby line, could people afford to bring their manure from Dural instead of from Hornsby? Yes. In my own case, I could cart three loads of manure from Dural in a day, and bring a third more in each load than I could bring from Hornsby, from which place I could only bring one load in a day.

872. *Mr. Shepherd.*] How much per tree do the forty-year old trees which you have mentioned produce? They average three or four cases to the tree, year in and year out, but they are not doing what they will do. On the sandy loam, and with the climate that we have, we can get twice as much for our fruit as people closer to town can get.

873. I have known over twenty cases to be pulled from a tree? There are two trees in Arcadia which have yielded over thirty cases, but they are in an exceptional situation, and where the yields are so heavy the fruit is generally not of the best quality.

874. As a rule, the older the tree the better the quality of the fruit, because the skin is thinner? Yes, but if you give too much manure you will get thick skinned oranges even on an old tree.

875. What varieties of orange do you chiefly grow in Arcadia? Chiefly the common orange.

876. The Parramatta orange? I have some St. Michael oranges and some Saleta oranges, but we class them with the common oranges. The trees in our district bloom late, and the fruit will hang until Christmas time, with very little waste. Nearer town the fruit will not do that.

877. Do the people of the district stick to one or two kinds of oranges, or do they try some of the more recent kinds—such as the Washington navel? Some of them have tried Washington navels, and have cut them down to make room for Emperor mandarins. A man going on to the land in Arcadia can begin by planting passion fruit vines on trellises, putting his fruit trees in between the rows, and in twelve months or two years the passion fruit vines will bear enough to pay for the working of the orchards, and after that he will be able to get a living from the passion fruit while the orange trees are growing.

878. Do they chiefly use orange stocks or lemon stocks in the orchard? Both. The orange stock is supposed to take longer to grow the trees on, and some people fancy the lemon stock because it throws a lighter coloured orange, which sells well in the Sydney market. The old trees that I have spoken of are either layers or seedlings.

879. Is not the road from Galston to Hornsby in good order? Yes; but it is a very steep road, and you have to go down and climb a hill in whichever direction you are proceeding. The steepness of the road causes the traffic to tear it up a good deal, so that it is a most expensive road to keep in repair. Then, too, it is a dangerous road to travel. The least thing may send a horse over the side. I think that three horses have gone over the side already.

880. How many orchards are there in Arcadia now? Taking Galston and Arcadia together, the population is 441 people; the acreage of the holdings, 6,174½ acres; the area under cultivation, 1,231½ acres; the area under bearing trees, 824 acres; the area under non-bearing trees, 198½ acres; and other tillage, 34½ acres. Arcadia has come forward within the last fifteen years, there being only two or three people there before that time. It is a most vigorous district, and the orchards there seem to be growing fast and bearing well.

881. Is there a likelihood of a large increase in its production? I think that in ten years' time the production will be twice, if not thrice as large as it is now. As the trees get older, people will have to employ more labour to attend to them, and new holdings will be planted out, and they will require the employment of extra hands. During the last few years people have been employing more labour than they employed formerly.

882. *Mr. McFarlane.*] When cases have been spoken of in this inquiry, have gin-cases been meant? Yes. We use gin-cases, packers, and half-cases. There are two half-cases to a gin-case, and four gin-cases will fill five packers. The great advantage Arcadia has is in having the fruit hang so late in the season, so that we can get a higher price for it than can be obtained by orchardists living nearer to Sydney.

883. How does the land at Arcadia compare with the land round Dural? We have some of the same kind of soil in Arcadia that they have in Dural, and that soil is very good for summer fruit; but the sandy loam seems to suit the oranges and mandarins even better. In Arcadia we have both sandy loam and rich black soil. It is the sandy loam that produces the best passion fruit.

884. In which direction does the country run from Arcadia that you say will be developed if the proposed line is made? It runs out for 7 or 8 miles towards Cobscook, which is in the direction of the Hawkesbury.

885. How far would that land be from Dural? The furthest end of that district would be 16 miles from Dural; but some of it—Government land—is within 7 or 8 miles of Dural.

886. What is a fair distance from the railway station for a fruit-grower to be? In Arcadia people have made fruit-growing pay even when they had to cart their fruit to Parramatta, a distance of 18 or 20 miles.

A. Trethowan. 887. But people living within 6 or 7 miles of a railway would make the industry pay much better? Yes, because where a man has a long distance to cart his fruit he must be a great deal of his time away from his orchard.

14 Sept., 1900.

888. Would the country people in the country between Dural and Carlingford have 17 miles to cart their produce now? No; you would have to go out beyond Kenthurst to get a distance of 17 miles.

889. The distance which the proposed railway would serve is within 17 miles of a railway now? Yes. I believe that most of the people round Kenthurst cart their fruit to Pennant Hills; but the country is very rough.

890. What are the roads like between the proposed line and the Northern line? The road to Hornsby is what is called a good road, but it is a very heavy road on horses. I took a horse, with which I was offered a 30 cwt. trial a short time ago, and which is regularly fed on grass with some dry chaff added, to Hornsby a short time ago with a load of ten gin-cases—about 5 cwt.—and when I got back I could take the girth up 4 inches. Another man, who was offered a ton trial up the Hornsby Mountain with a horse, took that horse to Hornsby with a load of ten cases, and found that it had quite enough to do to get there and back in a day. Going towards Pennant Hills or Parramatta you get very heavy pulling, but the horses get a spell on the down-hill bits. The Hornsby road is a metalled road, but the grades are very heavy, and the curves are very severe. Coming out of Hornsby the road drops nearly 600 feet, and then you have to rise again between 800 and 900 feet.

891. Apart from fruit, would there be any traffic on the proposed railway? Yes; there would be a traffic in firewood, sleepers, and girders. There is a lot of timber there which is suitable for wheelwrights' work. Then, at Dural and at Glenorie, there are metal quarries which will prove very valuable. A coming industry in the district is poultry raising. When we can get our eggs to market regularly we can get a penny, and sometimes 3d., a dozen over the ordinary quotations, and lots of small growers there now have as many as 100 fowls. If there were a railway, they would have food for the fowls sent up by train, and would send back eggs and poultry.

892. How do you get horse-feed and fowl-feed for the district at the present time? Our most direct way is to get it from Hornsby, while the Dural people get it from Pennant Hills. If we had a railway to Dural, it would pay us better to grow fruit on the ground that we now use for growing horse-feed.

893. Is there a large area of land in the district upon which there is marketable timber growing? Yes. Out on the Government reserves towards Coba there is any quantity of turpentine, ironbark, and grey-gum.

894. Is there good timber on any of the private land? Yes, first-class timber.

895. Has any of it been cut for market? During the last three years sleepers have been supplied from Arcadia for railway purposes, and fifteen years ago, timber was taken from the district to make sleepers and girders.

896. Was that timber drawn to the Western line or to the Northern line? The timber sent away during the last two or three years has been drawn to Hornsby, and the timber sent away fifteen years ago was drawn to Parramatta, a distance of 16 or 18 miles.

897. *Mr Hyam.*] What is the size of your holding? I have 40 acres.

898. How many acres are under crop? I am making a fourth of my holding over to my son. I have 10 acres of orchards, and about 2½ acres under crop, and my son has 2½ acres planted out.

899. Do you grow passion-fruit as well as citrus-fruit? Yes, we have some passion-fruit.

900. Do you grow any stone-fruit? Yes; I have about an acre of stone-fruit—apricots, apples, and peaches.

901. Do summer fruits do well there? Yes; but in summer the carting spoils their condition, and summer fruit improves in flavour the longer it hangs on the tree.

902. Will your district produce as much and as good fruit as the Castle Hill and Dural districts can produce? Yes. We have as good soil for summer fruits, and we can beat them in growing citrus fruits.

903. What crops do you grow? Oats, corn, and sorghum. I had corn last year which was over 10 feet high. I sow it in very close together, and cut it for chaff.

904. Is the yield sufficient to make the cultivation of the ground profitable? I think it pays us to grow produce for our own use; but if there were a railway to Dural, it would be more profitable to use the land for fruit.

905. Can you grow oats, maize, and sorghum on the land without using manure? Yes; but we get better crops by manuring. The people who had the place on which I am living over forty years ago grew oats on parts of it without using any manure. They did that for years, and grew the oats for market.

Wellesley Walsh, fruit-grower, Arcadia, sworn, and examined:—

W. Walsh

906. *Mr. McEurlane.*] Have you been long in the district? About eighteen months.

907. Previous to that where were you living? In the Orange district.

14 Sept., 1900.

908. Have you been engaged in fruit-growing long? Not for a good many years before coming to Arcadia, and that was in England.

909. How does the Arcadia district compare, so far as its fruit-growing capabilities are concerned, with other parts of the Colony with which you are familiar? A great deal of fruit is grown in the Orange district, but, I think, that the land in the Arcadia district is equally good for many kinds of fruit. We cannot grow citrus fruits and passion fruit in the Orange district, and, I think, that the summer fruit grown in Arcadia is as good as the summer fruit grown in Orange. Of course, fruits like cherries grow in Orange while they will not grow in Arcadia.

910. Do you cultivate much land? My orchard is only a young one. Last year I put in 6 acres of passion fruit vines, and I am doing some more planting this year.

911. What area have you under fruit? About 20 acres; but most of the trees are not bearing yet.

912. Have you a large holding? About 60 acres.

913. Is the land which you have not cultivated suitable for fruit-growing? About 10 acres of it are.

914. On the whole, how much of the land in the district is suitable for fruit-growing? I do not think I could give you an estimate. There are holdings where every acre could be cultivated, while on other holdings not more than 50 per cent. of the land is suitable for fruit.

915. How far are you from a railway station? I am about 12 miles from Hornsby.
916. Is that too far to cart fruit? It is a great distance, and the road is a very heavy one, so that it is a long day's work to take one's fruit into the station, and one cannot take a very big load.
917. Can you get there and back in a day? Yes.
918. What would you consider a fair distance to have to travel? Six or 7 miles. That would enable us to pick our fruit and to send it in on the same day, but now we have to pick it and pack it the day before.
919. Is that a disadvantage? Yes; especially to summer fruit, and to passion fruit in the summer.
920. Do you think that the fruit industry has been hampered by this long carriage? Yes, and especially the growing of summer fruit. A great deal more summer fruit would be grown in the district if the district were nearer to the railway station. A man attempted to grow strawberries in the district, and found that they would grow very well, but he could not get the fruit to market in a proper condition for sale.
921. Would strawberries stand a long carriage? They will not stand much carting, but with a railway to Dural they could be landed in Sydney on the same day as they were picked.
922. Is there much room for the expansion of the fruit-growing industry in Arcadia? Yes; I know of 650 acres between Arcadia and Galston, which are held by three private individuals. That is now heavily timbered bush land. The timber upon it is very valuable, and the land itself is some of the best orchard land in the district. If it were cut up into orchards, it would produce a large quantity of fruit. Then, there is a lot of land beyond Arcadia, out towards Cobs Creek, which is suitable for fruit-growing, and especially for passion fruit.
923. Is it the poorer land which is adapted for passion fruit-growing? Yes; the sandy loam. The frosts are not sufficiently keen in that district to hurt passion fruit.
924. How far is that country from Dural? From 7 to 15 miles.
925. It would appear from the evidence which has already been given that 15 miles is too great a distance to cart fruit? No doubt it takes away a certain amount of the profit to cart fruit such a great distance; but before the Hornsby line was made the fruit-growers of the district had to cart their fruit into Parramatta, a distance of 18 or 20 miles.
926. What is your opinion of the road to Hornsby? It is a very difficult road. The horses which are used by fruit-growers are generally light cart-horses, and they cannot draw heavy loads.
927. What is the load which is generally carried? Half a ton is a good load to take to Hornsby. I never attempted to take so much myself.
928. Is that a one-horse load? Yes; but it is a good load for one horse. Then there is back loading, in the shape of horse feed, poultry feed, groceries, and so on.
929. What are the roads like from Arcadia to Dural? The road into Dural is a much better road than the Hornsby road.
930. Do you think that the timber in the district is good marketable timber? Yes; it is supposed to be some of the best. There is ironbark, turpentine, and mahogany in the district.
931. Is there any large quantity of timber? The 650 acres to which I have referred are heavily timbered. There is also good timber on the Government land beyond Arcadia.
932. Do you think that if the proposed railway were constructed that timber would be sent to market? Yes, I think so.
933. Would the timber traffic be a permanent thing? It would take a good many years to get rid of all the timber, and as the trees are cut down the land would be used for fruit-growing, which in its turn would give traffic to the railway. Then there would be a certain amount of tourist traffic on the line, and it is more than likely that the district would become a health resort, because of its splendid climate. There is no reason why Dural should not become a suburb of Sydney.
934. Do you think that land would be sought there for residential purposes? I think so. The climate is equal to that on the North Shore line, and it is better than that on the Mountains, because you escape the very cold weather that they get at places like Blackheath and Mount Victoria.
935. Is there anything grown in the district besides fruit? Not at the present time; but if the railway were nearer you could grow vegetables. The land will grow excellent vegetables.
936. Do you obtain your horse-feed from Sydney or from Parramatta? From Sydney. I never go to Parramatta for anything.
937. Would the traffic in horse-feed be a considerable item? Yes; and it would increase.
938. Has it increased during the past few years? I should judge so from the statistics I have seen.
939. What is an average yield for an acre of orchard in that district? I have made inquiries from some of the oldest orchardists about there, and 100 cases to the acre has been given to me as a fair estimate. Passion-fruit would run about 150 cases to the acre.
940. Does not the yield fluctuate? Yes; it varies, of course, with the seasons that we get.
941. Do you think that that estimate is a fair one, allowing for that fluctuation? I take that to be the estimate of the average yield. Of course, in some years the fruit would be more plentiful than in other years.
942. Would you be prepared to pay a higher rate on the proposed railway than on the Northern railway? Yes; I think that I could afford to pay 2d. a case extra to send my fruit from Dural. I think that it would be cheaper by two-thirds to send to Dural.
943. How far is your property from Dural? From 6 to 7 miles.
944. Would the residents of the district be willing to pay a higher rate on the proposed railway? I think so. I might mention that poultry-raising is an industry which is growing in the district, and one which I believe will increase very largely. That, of course, will give a large amount of traffic to the railway.

Samuel James Moore, junr., fruit-grower, Dural and Galston, sworn and examined:—

945. *Mr. Shepherd.*] What is the extent of your holding? I have 46 acres in the Galston district, 25 of which are under cultivation.
946. How long have you been engaged in fruit-growing? Fourteen or fifteen years. I purchased the Galston property nine or ten years ago, when it was forest land.
947. How far are you from a railway station now? Between 9 and 10 miles. Where I live at Dural is about

W. Walsh.
14 Sept., 1900.

S. J. Moore,
junr.
14 Sept., 1900.

- S. J. Moore, junr.
14 Sept., 1900.
- about as far from Pennant Hills as my Galston property is from Hornsby. I send to Pennant Hills from Dural, and to Hornsby from Galston.
948. How near would you be to a station if the proposed railway were constructed? Five miles from Galston; my Dural property is close to the terminus.
949. Could you afford to pay a special rate upon the proposed railway? Yes; I am paying now to have my fruit carted to the railway station, and last season I paid 2½d. a case for 3,107 cases to a man who had back carting to Byford's store. Under these circumstances, I could easily pay 1½d. per case on the proposed railway, and even if I paid 2d. a case I should be in pocket.
950. Is it the pretty general feeling of the orchardists in the district that they could pay a special rate on the proposed railway? I think so.
951. Have you met with any opposition to the proposal? No. Most of the large growers would only be too glad to pay a special rate. The bulk of my fruit goes from Galston to Hornsby, and the road by which it has to be carted is a very steep and winding one, so that very often the shaft horses have to do the whole of the pulling. It takes much longer to travel the 9 miles to Hornsby than it would take to travel a similar distance on an ordinary road.
952. Is the whole of your orchard in bearing? Yes; the whole of the Galston orchard.
953. What is the average yield per acre? Last year my trees gave 160 cases to the acre, but I do not say that that is the average yield for the whole district. I sent 3,107 cases away by one man, and about 900 by a second man, because one contractor could not take the whole of them. I pulled altogether over 4,000 cases, and between the 6th of August and the 19th December I paid for carting £41 6s. 2½d. to one man alone.
954. Do you grow citrus fruits exclusively? Yes; at Galston, because it is too far from a railway for summer fruits, although the land is admirably adapted for them.
955. The river comes in pretty close to Galston at one place, and I understand that money has been voted to make a road down to the water;—is it likely that steamers will ever compete for the traffic of that part of the district? No.
956. How many trees do you plant to the acre? 100 or 110.
957. Are the trees planted on the square or on the quincunx principle? They are generally planted at distances of 19 x 21 feet. I think that 100 trees to the acre is as much as the land will carry.
958. Do you use much manure? Yes; bone-dust, blood and bone, phosphate, and other manures. I use a lot of stable manure.
959. Would the summer fruit suffer so much if it was gathered when it was not quite ripe? Summer fruit should be allowed to ripen before it is sent to market. We do not export much summer fruit, and for local markets the fruit should be sent in fresh and ripe. We can grow apples very well in the district, and although we can grow peaches, apricots, and plums, it is not worth while to send them to market, because of the loss in condition caused by the road carriage.
960. Has any attempt been made in the district to can or preserve the summer fruits grown there? Only for household use.
961. Have you any means of watering your orchards in times of drought? No.
962. Is your land drained? Some of it is, where I think drains are necessary.
963. Subsoil drains or surface drains? Subsoil drains, about 3 feet deep.
964. Does not the land pay an orchardist better where it is drained than where it is not drained? I cannot say that I have proved it to be so. I think the orchards in which I have no drains do as well as those where I have drains.
965. What is the nature of your soil? I have a loamy sand, and I have also a black soil, with clay and shale beneath.
966. Do you grow citrus fruits on both soils? Yes.
967. Which do you find to be the better? I think that the oranges hang better when they are grown on loamy soil. That soil is poorer than the other, and does not force the growth of the tree as the black soil does.
968. Are diseases more prevalent amongst trees grown in one kind of soil than amongst trees grown in the other? No.
969. With care and cultivation you can keep your trees pretty clean? Yes, fairly clean.
970. To what depth do you work the soil before planting? Nine or 10 inches at the first ploughing.
971. Do you use the plough or the scarifier? The plough. I do not use the scarifier at all, though sometimes I put a light harrow over the land.
972. Do you think that the estimated loss upon the railway will be made up? I think so. I think that there is a great future before this line, and that it will pay on its merits.
973. Do you think 150,000 cases an under-estimate of the fruit production of the district? Yes. Not a fraction of the land that could be used for fruit-growing has yet been cultivated. The men who were referred to by Mr. Trethowan hold some of the finest land in the Galston district, and they are only waiting for the railway to put that land into use. It is very heavily timbered land, and I know of trees there which are worth £2 on the stump. There is an unlimited supply of timber in the district.
974. Is the timber usually burnt off now when the land is being cleared? Yes; except a little that may be required to make a fence. If there were a railway it could be sent to market. In many other parts of the Colony people draw timber for miles, and make a living out of it.

John Charles Hunt, fruit-grower, Dural, sworn and further examined:—

- J. C. Hunt.
14 Sept., 1900.
975. *Chairman.*] I understand that you desire to supplement your evidence? I wish to say, in regard to the statement of Mr. Trethowan, that people had done well by orcharding who had had to cart their produce long distances; that these men had to get up at 2 o'clock in the morning, and travel all day, to get their fruit to market. While they have been able to make fruit-growing pay, it has been at the expense of their health and comfort. With regard to the probable produce traffic on the railway, I should like to say that there is no grain grown in the district for horse-feed—all that is grown is a little greenstuff. I think that I am the only person in the district who grows crops for hay.

Harry

Harry Moore, fruit-grower, Arcadia, sworn, and examined:—

H. Moore.
14 Sept., 1900.

976. *Mr. Hyam.*] How far are you from Dural? Five miles.
 977. What is the extent of your holding? Fifty-six acres. I have 30 acres under orchard.
 978. Is your orchard in full bearing? Yes.
 979. The whole of it? All but a couple of acres of young trees.
 980. Is it an old or a new orchard? The oldest part of it is about 14 years old.
 981. What kind of fruit do you grow? Chiefly common oranges, lemons, and mandarins. I have also a few apples, peaches, pears, and plums. Apples do well there.
 982. Is the ground that you are cultivating as good as the ground round about Dural or Castle Hill? Yes.
 983. Does it give you the same results? I believe it gives better results.
 984. How many cases do you send to market in a year? About 3,000.
 985. Where do you cart your fruit to? To Pennant Hills, as a rule. Perhaps one load out of ten goes to Hornsby. I can take heavier loads to Pennant Hills than I can take to Hornsby.
 986. Do you do your own carting? Yes.
 987. How far are you from Pennant Hills? About 13 miles.
 988. And from Hornsby? Between 10 and 11 miles.
 989. Can you get to Pennant Hills and back in a day? It takes a day.
 990. Is it an easier day's journey than to Hornsby? Much easier.
 991. Can you do it in less time? In about the same time, but it is easier, and you can take a bigger load. The road to Hornsby is very steep, and has a great many curves in it. There are seven turns on the Zig-zag.
 992. How far are you from Dural? Between 4½ and 5 miles.
 993. If the proposed railway were constructed, how many loads a day could you take to it from your place? Three.
 994. I suppose the grade of the road from Arcadia and Galston to Dural is a fairly good one? Yes.
 995. Could an ordinary horse draw from half a ton to three-quarters of a ton over that road? Yes.
 996. Is the road in fairly good condition? Yes.
 997. If the proposed line were constructed, could you pull your fruit and send it into market in the one day? Yes; I could pull my fruit up to 4 o'clock in the afternoon then.
 998. I suppose you are compelled now, by your distance from market, to confine yourself to the growing of citrus fruits? Yes.
 999. If the proposed railway were made, could you also grow summer fruits? Yes.
 1000. What summer fruits would grow best with you? Apples and peaches would do very well.
 1001. Can you grow all varieties of apples? Not all varieties. We grow the early apples very well.
 1002. Do you grow plums? Yes; eight or nine kinds of plums.
 1003. How do you find the Japanese plums answer? Very well.
 1004. They come into bearing very early? Yes; and bear very heavily.
 1005. Which varieties do you grow chiefly? The Blood Plum and the Purple Monster.
 1006. Do you find that a good bearer? Yes.
 1007. Are those good plums for export? I think so, but we do not export any. There are thousands of acres in the district which are as suitable for fruit as the land which is already cultivated.
 1008. Is the balance of your land suitable for fruit? Yes, every rod of it.
 1009. If there were a railway to Dural, would you go in for more cultivation? Yes.
 1010. Do you know the country in the direction of the Hawkesbury? Yes; a lot of good country. The soil is chiefly a sandy loam, but there are just as good orchards in that soil as in the black soil.
 1011. And the fruit hangs longer? Yes. I have only very little of that sandy loam in my orchard, but I have found that it suits lemons better than the black soil does.
 1012. Do your trees attain any great height in this so-called poor soil? Yes.
 1013. Is the growth as good as on the black and red soils? Yes. Only last week I cut 7 feet of growth off trees growing in sandy loams, and I left 2 feet of wood on them.
 1014. Do you know of any older orchard in the district than yours? Yes; Mr. Fagan's is an old orchard, and Mr. Waddell's is an old orchard. The two or three people who have old orchards there used to cart their fruit into Parramatta, and the journey used to take them a whole day and part of the night as well.
 1015. Are the trees in those old orchards still in a healthy state? Yes; they are beautiful trees.
 1016. Do you grow oranges for export? We do not export many; we send most of our oranges to Sydney.
 1017. Does the fruit grown on the poorer soil keep better than the fruit grown on the heavier soils? Yes.
 1018. How much manure do you use to the acre? I do not suppose we use half a ton to the acre. We should use more if it were not for the carting.
 1019. If the proposed railway were constructed, would you use much more manure? Yes; a great deal more. If the railway were constructed, we should use a lot of stable manure and street sweepings.
 1020. Would people use the railway to bring up manure from Sydney and Homebush? Yes; at the present time, however, it costs too much to cart manure from a railway station. Stable manure makes soil, whereas the artificial manures do not.
 1021. Would the construction of the proposed railway permit of larger settlement in the district? I am sure that it would.
 1022. Would the private land between Dural and Arcadia be cut up and brought into use if the proposed railway were made? Yes; I know that many of us are only waiting for the construction of the railway. There is any quantity of timber on that land.
 1023. Would your land compare well with the land in the Kellyville, Kenthurst, and Glenorie districts? Yes; it is quite as good, if not better.
 1024. Could you afford to pay special rates upon the proposed railway? Yes.
 1025. Could you also afford to pay special rates for manures? Yes.
 1026. What does it cost to cart manure from Pennant Hills? About 9s. a ton.
 1027. You could not pay a very high rate on stable manure? We could pay a fair rate.
 1028. Do you think that 150,000 cases is a fair estimate of the yield of the district? No. I think that the yield is about 526,000 cases.

- H. Moore. 1029. Have you been long in the district? Yes; I was born in Dural.
- 14 Sept., 1900. 1030. The greater part of the produce of the district would be sent to the railway? It would all be sent to the railway.
1031. Do you think that a special rate on the proposed line would drive some of the traffic to the Northern line? No.
1032. How are the roads between Arcadia and Pennant Hills? In wet weather they are very bad; but at other times they are pretty good. They are grading the road now, and metalling it.
1033. What is the greatest distance from a railway station at which a man can make fruit-growing pay? Six or 7 miles is a fair distance.
1034. Could people from 7 to 15 miles from Dural make fruit-growing pay if the proposed railway were made? Yes. Some people are carting fruit similar distances to Hornsby; but there is not much profit in it.
1035. Some of the people at Galston used to cart their fruit to Parramatta, a distance of 21 miles? Yes; but they were all day and half the night on the journey. If the railway went to Dural a great deal of extra land would be cultivated, while the timber in the district would provide traffic for the railway in the shape of firewood, sleepers, and girders.

Edwin Hall, fruit-grower, Kenthurst, sworn, and examined:—

- E Hall. 1036. *Chairman*] How far is Kenthurst from Dural? My place is 9 miles from the Dural Post Office. Kenthurst is a very wide district. I am about 2½ miles from the Cattai Creek, on the road from the Castle Hill road to Pitt Town.
- 14 Sept., 1900. 1037. Is much of the land in the Kenthurst district suitable for fruit-growing? Yes. In the parish of Nelson there are three big roads; one of these is the Pitt Town road, which starts at what is known as the Round Corner, and goes right on to Cattai Creek. On both sides of that road there is uninterrupted settlement for a distance of 10 miles. There are ninety farms on that road.
1038. Where do the growers there send their produce at present? To Pennant Hills and to Parramatta. It has been stated that we are well served by the Windsor line; but, although we are nearer to that line than we are to other lines, we cannot use it, because the approach to the Cattai Creek is too precipitous, and the creek sometimes rises in flood to a height of 50 feet.
1039. Would the construction of the proposed railway materially benefit the people of Kenthurst? Yes. We have as good land as there is in the district, but it is not worth much to us if we cannot get means of sending our produce away.
1040. How would you describe the soil there? It is a sandy loam, and grows very fine lemon-trees. The finest orchards in Australia are within a couple of miles of my place—orchards like Mr. Wrench's orchard and Mr. Edwards' orchard.
1041. Is there any Crown land there good for settlement? The land is all taken up, and we are waiting for some means of getting our fruit away.
1042. What is the average size of the holdings there? It is difficult to say, because they vary so much. The soil is extremely suitable for fruit, though the country is very broken. There are glens where there is a peaty soil, upon which you could grow all the vegetables required to supply Sydney.
1043. Is Kenthurst a new place? It is new in the sense that it is least opened up of any of the districts there; but the orchards which are there show it to be high class ground for fruit.
1044. What is the average yield of those orchards? There are plenty of trees there which would give a yield of seven or eight cases to the tree. The yield of an orchard depends very much upon the way in which it is cultivated.
1045. Would 100 cases to the acre be a fair average? If I were to pick out six or eight orchards which I know of I should say it would not be anything near it. Besides the road I have mentioned, the district is traversed by the Rouse Hill Road, which is 8 miles long, and the Porter's Ridge Road, which is 2 miles long. On the three roads there are 20 miles of unbroken settlement. A man who has an orchard next to mine sent some of his fruit to the Agricultural Department, and the people there thought so much of it that they had it photographed for the *Agricultural Gazette*. I have about 4 acres of young trees, which are not yet bearing, and I will put 25 acres under fruit the day that the railway is started. We do not have to wait five years for a return in that district, because we can get a tolerable return from passion-fruit in eighteen months.
1046. Do the residents of the district regard the construction of the proposed railway as absolutely necessary for its fullest development? Yes, unquestionably.
1047. Has fruit-growing been seriously retarded in the district for want of means of communication? Yes. There are men with some capital out there who would put money into their places if there were a railway. I should like to open market gardens there if I could see a way of getting my stuff to market.
1048. *Mr. Hyam*] Have you been long in the district? Twelve years—seven years where I am now.
1049. A good deal of land is held there for speculative purposes? Not so much. Most of the holders cultivate part of their land, and would be glad to cultivate more.
1050. Was not a good deal of the land there taken up by city people, who only made sufficient improvements to comply with the conditions of the Act? Yes, some of it was.
1051. If there were better facilities for getting the fruit to market would more of the land be brought into cultivation? Yes. There is no place in the Colony where you can grow citrus fruits so well as in that district. There are no frosts there, and the fruit hangs well.
1052. How much land have you? 248 acres, about four of which are planted, while twelve are ready for planting.
1053. You have more land there than you can ever use for fruit-growing? I will use nearly all of it in some way or another. Of course, some of it is very broken country.

MONDAY, 17 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Cecil Purser, medical practitioner, Petersham, sworn, and examined:—

1054. *Chairman.*] Do you know the district to be served by the proposed railway? Very well; I was born in the district.

C. Purser.
17 Sept., 1900.

1055. What is your opinion of it, from the point of view of a health resort;—is it a place to which, with railway communication, it would be desirable to send convalescents? Yes; anywhere from Castle Hill to Dural, Galston, or Glenorie, I do not think you could find a better district to which to send convalescent patients. It might be equalled, but it could not be excelled. It is from 600 to 900 feet above the level of the sea. It is altogether out of the reach of the sea air. The only difficulty I have experienced in getting patients there has been the inconvenience in regard to carriage. It is only within the last two or three years that I have been able to send patients there at all, because no one in the district ever thought of opening a boarding-house to receive them. During the last couple of years, however, I have sent patients from time to time to the district between Dural and Galston. It is an excellent district for any form of chest trouble, and for patients who wish to recoup.

1056. Do you think the district is superior to that from Ryde towards Hornsby, or from Hornsby to Milson's Point? Yes. I have patients at Hornsby at present, and I would be glad to get them to Dural if I could. You do not get out of the range of the sea atmosphere at Hornsby. There is no doubt that if the railway were constructed, residential sites would be obtained, and houses built.

1057. *Dr. Garran.*] Hornsby is only 5 miles from Dural, and there is no ridge between the two places? At the same time, you are altogether away from the sea atmosphere at Dural. Up to Hornsby you get the sea air.

1058. In order to bring about a change you require a range of hills or forests between you and the sea air, and you have not that in the locality to which you refer? There is forest, more or less, all the way from Pennant Hills to the Hornsby heights; it is wooded all the way.

1059. Is it not getting cleared very quickly? No; there are parts there which it would be impossible to clear, extending from a width of 2 to 4 miles.

1060. But it is the timber on the ridges which affects the prevalence or otherwise of the sea breeze? Yes; but no sea breeze reaches Dural, and it certainly does reach all the way up the North Shore line.

1061. Then, when a strong sea breeze blows, you get a comparatively still air there? You get the fag-end of a north-easter there, but it has not a depressing effect, because by the time it reaches there the moisture has pretty well gone out of it.

1062. You get none of its damp chill? No, and none of its depressing effect. I lived in the district until seventeen and a half years of age. I visit it frequently. I have visited all parts of the Colony—the Southern, Western, North Shore, and Illawarra lines, and when I wanted to invest and to build a cottage for myself I selected Castle Hill. I have been in private practice for seven years, and it is only within the last two years that I have been able to get a place there to which to send patients. Another point in its favour is that, excepting in the very wet weather, when the roads are bad, you can obtain splendid drives, which you cannot do on the North Shore line.

1063. Are you familiar with the medical institutions of Parramatta? Yes.

1064. Knowing what we know now about the climate of Parramatta, and the climate of the higher ground north of Parramatta, would it not have been an enormous advantage to the health of the inmates of those establishments if they had been located on the northern side? There is no doubt about it. Parramatta is a very hot place.

1065. Then, if we ever think of rebuilding those old shanties, we ought to go further north? You could not get a better site, a more salubrious climate, or a more open place than the district to which I have referred.

1066. Your special praise of the district begins about Pennant Hills? Yes.

1067. Could you go as far north as Arcadia? Yes; but I would prefer to go the other way—to Glenorie, on the Wiseman's Ferry Road.

1068. Is Galston in a hollow, sheltered from the sea breeze? Yes.

1069. I suppose that sometimes the wind sweeps down into the hollow? You will get that wherever you go.

1070. I mean that a hollow is not always a protection from a breeze? Not necessarily.

1071. *Chairman.*] Do you think the district would offer attractions to residents of Sydney as a summer resort? I feel sure it would. People who have visited the district have endeavoured to obtain accommodation there, but have failed. Two people whom I sent up last Saturday had to travel 7½ miles from the railway, which is rather too far.

1072. Has the district ever been considered as one suitable for consumptive hospitals? It has been thought of. There is no doubt that a sanatorium as far out as Glenorie or North Dural would be well situated.

1073. Do you think that the district from Castle Hill towards Dural, and onwards, would be as suitable a locality for a consumptive hospital as Thirlmere? In some respects I think it would be more suitable. Patients, of course, do very well at Springwood; but I prefer Dural or Glenorie, because you avoid the excessive cold of winter. Again, at Springwood, you cannot get the drives.

1074. You regard the fact that there are numerous interesting drives in the district as an important factor in the recovery of patients? Yes, because there is such a change of scenery.

1075. *Mr. Shepherd.*] Have you found the climate of the district particularly salubrious? Yes, more particularly in convalescing chest cases, such as acute bronchitis and pneumonia. It is also good for people who have been overworked.

1076.

- C. Purser.
17 Sept., 1900.
1076. Do you think the district would be likely to be sufficiently populated, as a sanatorium, to affect the railway receipts? I think it would, eventually. Of course, it has also to be considered from a visitor's point of view. Personally, I would go there much more frequently if I could do so by rail. My experience of the coach from Parramatta to Castle Hill, and on to Dural, is that seven times out of ten you cannot get a decent seat in it.
1077. Is there any particular portion of the country, between Carlingford and Dural, which is more likely to be recommended as a sanatorium than others? Anywhere from Castle Hill to Dural, and beyond, to the 5 and 10 miles forests would be suitable.
1078. As the district is a fruit-growing one, it is not likely to be thickly populated? I do not think it is likely to be thickly populated.
1079. And that would be greatly to its advantage as a sanatorium? Yes. If the North Shore line goes on as it is doing at the present time it will become too thickly populated, and the people will want to get further away.
1080. *Mr. McFarlane.*] What is the condition of the country with regard to settlement? I had not been beyond Dural for five or six years, until two years ago. Then I went for a trip through Galston and Arcadia, which are practically new places, both in regard to the increase of population and the increase of the area under cultivation. In the following year I was on the Wiseman's Ferry Road, and at North Dural, Glenorie, and Maroota. These places could be hardly recognised, because, during the last ten years orchard after orchard has been planted. Again, Kenthurst, when I was a boy, only boasted of three or four houses, and now a large number of orchards are there.
1081. Has there been any marked increase in the population and in fruit-growing during the last ten years? There has been a marked increase in the number of orchards and in the number of new residences.
1082. Does that remark apply to the district between Carlingford and Dural or to the whole of the district? More particularly with regard to Dural, Kenthurst, Arcadia, Galston, and Glenhaven. The latter is a new place altogether. There must be fifteen or sixteen orchards on that ridge, at least.
1083. How does the country between Dural and Galston compare with that between Dural and Carlingford, in regard to fruit-growing? Galston and Glenorie are supposed to produce some of the best oranges obtainable. Going further out, the bulk of the fruit grown is passion-fruit and stone fruit, which seem to do well. The oranges, of course, are far better there than they are at Carlingford or Seven Hills.
1084. Do you think that the land which has been laid down is suitable for fruit-growing? I should think that there is as much, and more, land suitable for fruit-growing, as there is already under cultivation.
1085. Is the area of cultivated land increasing every year? Yes; every year I go out I see new orchards.
1086. Do you think the proposed line, if constructed, would have the effect of causing an increased area to be placed under cultivation? Yes; because the wear and tear caused by carriage on the roads would be far in excess of what you would have to pay in railway freight.
1087. Would not a number of those who are growing fruit between the proposed line and the Northern line continue to send their produce to the Northern line? Some of the Pennant Hills people may do so, but not beyond. The whole of the Dural, Galston, and Arcadia people would not cross the ridges and Berowra gullies. It would be far easier for them to bring their produce to Dural than to Hornsby.
1088. It has been stated that the roads leading to the Northern line are not of the best? They are not only not of the best, but they are hilly. For instance, I have a farm $8\frac{1}{2}$ miles from Parramatta station, and I do not suppose that it is more than $5\frac{1}{2}$ miles to Pennant Hills station by road, but the wear and tear is so great that it is much easier to go to Parramatta station. That is due to the hills.
1089. What is the character of the roads from the fruit-growing centres to the proposed line? The proposed line runs pretty well parallel with the main Northern road. I presume there would be stations at intervals, and that there would be a very little distance to travel.
1090. Do you think the residents within the influence of the proposed line would send their fruit on the line at a higher rate of carriage than is now paid on the Great Northern line? I believe they would. I have heard the matter spoken of, and I understand the bulk of the large fruit-growers would be willing, if they had railway facilities, to pay increased rates. It would save their time, and the wear and tear of horses and vehicles. Again, I think they would get better prices for their fruit, which would be put upon the market in a better condition.
1091. Would that be an important consideration? Yes; they would get enhanced prices, and I think that would help to recoup them for the payment of increased rates, presuming they had to pay them.

Francis Alexander Nicholson, fruit-grower, Maroota, near Glenorie, sworn, and examined:—

- F. A. Nicholson.
17 Sept., 1900.
1092. *Mr. Hyam.*] Where is your residence? At Maroota, almost 5 miles due north of Glenorie, on the Wiseman's Ferry Road.
1093. What is the size of your holding? I, and two brothers, own 120 acres.
1094. What is the character of the soil? Sandy loam.
1095. How much have you under orchards? Twenty-seven acres, of which 15 acres are my own.
1096. What do you grow? Citrus and passion fruits. The whole of my ground is double planted.
1097. Is the orchard a young one? Yes; it has only been planted two years. The citrus trees are not bearing yet.
1098. Do you grow stone fruit? A little. We do not grow more on account of the difficulty of getting to market.
1099. Is the land better adapted to citrus fruit than to passion-fruit? Only on account of the difficulty of getting to market. When the citrus trees are 4 or 5 years old we shall do away with the passion-fruit.
1100. What return would an acre of passion-fruit give you? Off 8 acres I have sent away 350 cases. The vines are planted 15 and 20 feet apart—that is about twice the usual distance apart. On account of the shelter the country is specially adapted to the growth of passion-fruit.
1101. What elevation are you? Over 900 feet.
1102. Have you much frost? Very little. We are at the extreme end of the present cultivated area. We have the only passion-fruit orchards which are at present unaffected by frosts. The bush shelter is a factor in our favour.

F. A.
Nicholson.
17 Sept., 1900.

1103. Are many people residing in the neighbourhood? There are only eight or ten families between Glenorie and my place.
1104. Is the land between Glenorie and your place taken up? Nearly all. A number of working men live there, and they improve ground in their leisure time. There are about eighteen holdings of that description between Glenorie and our place, a distance of 5 miles.
1105. Is there any settlement beyond? Not for a considerable distance. Five or 6 miles away from us three or four selections were taken up, but the people were, I think, starved out, owing to the distance from a railway.
1106. Where do you carry your fruit? To Pennant Hills station, a distance of over 18 miles.
1107. Can you go there and back with a load in one day? It is really a day and a half's journey. At present I am carting fruit to Glenorie, and pay 6d. per case from there to the station. I am working short-handed. My place is not in full bearing, and it pays me better to engage someone to cart most of my fruit rather than keep additional horses myself. If I had to cart myself it would cost me 9d. a case. There is only one man in Glenorie who makes a trade of carting.
1108. How far are you from Dural? Eleven miles.
1109. Could you go in and out in a day? Yes. The road is rough between our place and Glenorie, and the road from Dural to Pennant Hills is a difficult one.
1110. Have you heard anything about the proposal to charge an extra rate over the proposed line, and would you be willing to pay it? With the greatest of pleasure.
1111. It would not stop you from patronising the railway? No; and no one else in the neighbourhood in which I live.
1112. What sort of timber is to be found in the locality in which you live? There is abundance of first-class turpentine, red mahogany, stringy-bark, and blue-gum, and some ironbark.
1113. Is there any black-butt? Not where I am residing. You have to go 5 miles out for that.
1114. Is much turpentine to be found? To get abundance of it you must leave the ridges and go into the gullies.
1115. What manure do you use? Artificial.
1116. Where do you get it from? Pennant Hills.
1117. What does it cost for carriage? It costs 15s a ton to land it at our place from Pennant Hills.
1118. If the railway were constructed to Dural, would it lessen the cost? I think it could be obtained then for 7s. 6d. a ton at the outside.
1119. How much manure do you use to the acre? On 15 acres, since 1st January last, I have used 7 tons. I have to give the passion-fruit and the trees another dressing between now and the summer.
1120. Is it necessary to use that quantity every year? Nothing less than that. After passion-vines reach 2 years of age they should have at least a ton of manure to the acre in twelve months. We can grow fruit there, not so much on account of the rich quality of the soil, but on account of its retention of moisture in hot weather.
1121. Are there many orchards in full bearing in the neighbourhood? There are three about 6 years old, but two of them have been neglected.
1122. Will your land grow any kind of crop? Yes; it is the best land I have ever had anything to do with for vegetables.
1123. With the use of artificial manures? Yes.
1124. Do you use stable manure? None whatever. It is good ground for potatoes, tomatoes, pumpkins, peas, beans, cabbages, and cauliflowers. I was told that the ground would not grow cauliflowers, but last year I grew some weighing 10 lb.
1125. Have you plenty of water there? Yes, we were specially favoured last summer. We had more rainfall in the shape of thunderstorms and showers than they had at Glenorie, 5 miles away. Those conditions have prevailed each summer I have been there.
1126. Is there much timber suitable for girders and piles in the locality? Yes; in the gullies where I live, and further out, there is abundance.
1127. How much further out? Six miles, or 16 or 17 miles from Dural station.
1128. What do you think is a fair return, in your district, for a tree in full bearing? A case to the tree. I know of 1 acre of lemon trees from which they picked 283 cases of lemons in twelve months. It was a well-manured patch.
1129. I suppose that, up to a certain point, the more manure you give the trees the better the return? Yes, if you manure in the winter. If you leave it too late in the spring you will, when you get hot dry weather, do considerable damage.
1130. Is the country adapted to the growth of stone fruit and apples? Yes.
1131. I suppose you could not possibly cart the softer fruits to market on account of the distance? No.
1132. Could you cart them to Dural if you had a railway there? Yes.
1133. If the railway were constructed, could you pick your fruit in the morning and have it in Sydney in the evening? Yes; I could do the trip from my place to Dural with a load in three and a half hours.
1134. Have you any further information with which to supply the Committee? In the district between Glenorie and Wiseman's Ferry there is a considerable amount of country which has not been cultivated, and which is suitable for passion and citrus fruits.

John Garratty, builder, Parramatta, sworn, and examined:—

1135. *Mr. Shepherd.*] Are you well acquainted with the country traversed by the proposed railway? Yes; *J. Garratty.* with about 8 miles of it from Carlingford.
1136. Have you ever been engaged in growing fruit there? Yes; more's the pity. I suppose it was not my occupation, and I could not make it pay. I have attended to give evidence in regard to the suitability of the district for buildings and small holdings. I consider it one of the best districts in New South Wales for that purpose. If the proposed line were constructed, it would open up the country, and would be a great boon to the Sydney people, and there would be no difficulty in disposing of land with small houses upon it. I have built several houses in the district, and I have had no difficulty in selling them.
1137. Have you been employed in many instances to put up buildings? Yes; I have been doing it all my life, until I got 12 acres of land along the route of the proposed line, and it cost me £100 an acre to clear and plant it.

- J. Garratty. 1138. Has the district been largely used by business people in Parramatta and Sydney for residences?
Yes.
- 17 Sept., 1900. 1139. How do the people get backwards and forwards? By coach.
1140. What railway do they come to? To the Northern line or to Parramatta station.
1141. What distance have they to travel? Some of them have to travel 4 miles to Parramatta. The construction of the line would be a great advantage to the Sydney people, who would be able to obtain fruit straight from the trees, instead of having it carried along a dusty road. There is a great difference in the flavour of fruit obtained near the tree and that obtained in the market. I have not the slightest doubt that, if the line were constructed, it would pay in a very short time. I was in Sydney for over thirty years, and never knew there was such a nice locality as this so near to Sydney.
1142. You say that you had 12 acres of land out there? Yes; I had 12 acres of land under cultivation. I kept the trees for seven years and worked at them; but I got nothing from them, as the trees were too young.
1143. To what do you attribute your failure? The trees were too young when I sold out. I built three houses upon the land, and sold each of them.
1144. What kind of fruit were you growing? Oranges, lemons, apples, peaches, nectarines, and passion-fruit. The trees bore some fruit after the second year.
1145. Many of those would bear very quickly? The passion-vines bear very quickly.
1146. The peaches ought to bear the second year? They require a great deal of attention, and some one to understand them. Some of them came to perfection and died off again, and I could not tell the reason why. I think the black aphid got to the roots.
1147. Did you not understand fruit-growing? No.
1148. Did you attribute your failure to that fact? It was not due to the want of labour, cultivation, and manure. I think it was due to the soil; fruit land requires a good depth of soil.
1149. How far is your place from the station? 500 yards from the Kissing Point Road station.
1150. That part would not be affected by the proposed line? No.
1151. In the buildings which you have put up, have you used the local timber? No, because we could not get it sawn timber. The local timber would be useless except for slab huts.

FRIDAY, 21 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

William Rudlan Hawkins, fruit-grower, Dural, sworn, and further examined:—

Mr. W. R.
Hawkins.
21 Sept., 1900.

1152. *Chairman.*] Do you desire to supplement the evidence you have already given? Yes. I desire to put in the following statement:—The large discrepancy between the estimate given by the Chief Traffic Manager, of fruit that would be carried over the proposed railway, and that given by the League, has led me to examine the figures, and I wish to lay before the Committee the result. Mr. Harper has adhered to the statistics given by him before the former Works Committee as practically correct, and on them has based his evidence at the present inquiry, so I will, in comparing them with the League's statistics, also take those statistics placed by the League before the last Works Committee, so that any increase which we show in the present statistics will not come into unfair comparison. Mr. Harper, in his report (page 27), says that for the districts of Dundas, Carlingford, Rydaimere, and Ermington, which practically comprise the trafficable area of Simpson's line, the estimated production of fruit is 120,000 cases per annum. If you turn to the statistics taken by the League you will see we only claimed an average of one case per tree on 925 acres, or 92,500 cases for the districts named, and which, Mr. Harper says, is governed by the existing Carlingford to Clyde line; so that Mr. Harper's estimate is 28,000 cases more than we claim; but when we compare the statistics of the districts that would be governed by the proposed extension a totally different result is found. The figures for the districts (page 28)—Castle Hill, Kellyville, Galston (which comprises Galston and Arcadia), Pennant Hills, Kenthurst, and Dural (which comprises Dural and Glenorie)—are given as 250,000 by Mr. Harper, and 398,700 by the League, and in the League's estimate Kellyville is not included, which makes the League's figures less than they should be. The difference between the two estimates is 148,700 cases. Now, taking Mr. Harper's figures as being correct, the area that produces 120,000 cases, in the case of Carlingford, &c., is 925 acres, while the area that only produces 250,000 cases is 3,987—or, in other words, the Carlingford district produces a little over one and one-third cases per tree, while the other districts produce about three-fifths of a case per tree. The statistics show that the proposed extension would serve an area more than four times as large as the area served by the Carlingford-Clyde line, and, taking Mr. Harper's estimate for the Carlingford districts as correct, it is only fair to assume that the League's estimate would be more than realised in the other districts. There is another aspect in which the statistics may be examined, to which I wish to draw the Committee's attention. In the case of Carlingford, &c., 90,000 cases are deducted as produce that would be carried by water, at 2d. per case (Question 269), leaving 30,000 cases to be carried at $\frac{1}{2}$ d. (page 28). For the other districts, 100,000 are deducted as the amount that growers would still send to the Northern line, leaving 150,000 to be carried over the proposed extension, at an extra 1d. freight per case—assuming (page 28, bottom of page) that a certain number of growers would be willing to pay the extra 1d., assuming also, I suppose, that the growers of the 100,000 deducted would not be willing to pay for any convenience. Mr. Harper admits that, for some reason, growers are willing to pay 2d. per case by boat in preference to 1d. by train (answer to Question 629), and yet he deducts 100,000 cases, because he thinks growers would not pay an extra penny for the convenience of a railway. The assumption that only 150,000 cases out of the 250,000 would be carried by

by train may possibly be explained by the basis on which Mr. Harper works out his figures. In his report, page 28, he says:—"The estimate of quantity is also, in my opinion, too sanguine. Most of the fruit-growers employ horses on their holdings; then employed labour is relatively cheap, and cartage for several miles extra, which is all that is involved, would be amply compensated for by the difference between the present railway rate—1d. per case from all North Coast stations except Hornsby in the district, and 2½d. *via* Rose Hill. The difference amounts to 5s. per ton, which is nearly equal to the ordinary rate paid for a man, horse, and cart for the whole day." I wish, just here, to correct two errors that Mr. Harper has made in the part of his report which I have just read, *viz.*—that the difference per ton would amount to exactly 3s. 9d. per ton, and not 5s.; and that 10s. a day is paid throughout the district for hire of man, horse, and cart. This would show, not, as Mr. Harper suggests, about an even balance, but the difference between 3s. 9d. and 10s. per ton in favour of the grower sending by rail. I only wish to add that, as far as the statistics taken by the League are concerned, the acreage is correct, the only estimate made in the statistics being in regard to the number of cases, and there was no other way in which an estimate could be taken but that taken by the League.

Mr. W. R.
Hawkins.
21 Sept., 1900.

MONDAY, 24 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.

JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

The Hon. Jacob Garrard, President, Metropolitan Board of Water Supply and Sewerage, sworn, and examined:—

1153. *Mr. McFarlane.*] I believe you formerly represented the electorate of Central Cumberland? Yes.
1154. Have you a knowledge of the district through which the proposed railway will pass? Yes; I think I know it as well as anyone.

The Hon.
J. Garrard.
24 Sept., 1900.

1155. Do you desire to make a statement, giving your views in connection with the proposal? The first question is as to what would be the zone of traffic which would be influenced by the line, if constructed. My idea is that the traffic from about one-third of the distance between Castle Hill and Baulkham Hills would go to the line. A good metalled road exists from Baulkham Hills into Parramatta, and it is a down grade. I think the division of the traffic would commence, roughly speaking, half-way between Castle Hill and Baulkham Hills.

1156. How far is that from the proposed line? From 1½ miles to 2 miles. At present the Kellyville traffic comes along the New Windsor Road, and on to Parramatta via Baulkham Hills. That road winds considerably. The distance between what is called the Cross Roads at Baulkham Hills, and the centre of Kellyville, is from 4½ to 5 miles. A road runs from near Kellyville, past the show-ground, and up to Castle Hill. There is a probability, therefore, that some portion of the Kellyville traffic—I do not say much of it—will go to the railway. In addition, there is another road from the main road to a branch of the Cattai Creek. On the borders of the Cattai Creek there is a considerable amount of settlement, some portion of which I have no doubt would tap the Dural line by going through Glenhaven. At the present time there is no bridge there, but the road runs through Glenhaven to the creek. There is a good grade and a good road there in all weathers. The soil is sandy loam, which forms a good road in the worst of weather. I think, therefore, that some portion of the Kellyville traffic, instead of facing the long roundabout road, would go *via* Glenhaven to the railway, if constructed; but, as I have said before, not very much of it. With reference to the Rouse Hill Ridge road, which runs from the Round Corner, at present the traffic for half-way—about 3 miles to 3½ miles from Round Corner—finds its way to Parramatta or to Pennant Hills, the other portion going out *via* Rouse Hill to the Windsor line at Riverstone. I think that the traffic for another 2 miles at least on that ridge would undoubtedly come to the proposed railway, instead of to Riverstone. In other words, you would attract more traffic to the proposed line, because the road to Riverstone is a bad one. It is a severe grade. It is true that there is not much settlement there at present.

1157. What point is that? Annangrove and the Rouse Hill Ridge Road. There is not much settlement there compared with other portions of the district. At Kenthurst marked progress has been made. The settlers are all small landholders who cultivate a comparatively small area, and cultivate it well. Some of the most intelligent people in the whole of the district are to be found there, and they are people who pull well together. At present the whole of that traffic comes to Pennant Hills. The Kenthurst road continues on to Pitt Town. There is not much settlement along the same, but it is gradually extending outwards. Six miles from Round Corner, along the road, I should mark as the division of the trade running towards Dural and that towards Windsor. If you bring the line to Dural—and the same thing holds good in regard to Rouse Hill—you exclude several miles of country the traffic of which would come to the line. With regard to Galston, there may be a difference of opinion as to whether the trade at Galston and Arcadia would come to a railway whose terminus is at Dural. I know the district intimately—I live now, and have been living for five years, at Hornsby—I have not the slightest hesitation in saying that I believe that owing to the heavy grade on the road from Galston via Berowra Creek to Hornsby, which necessitates only half a load being carried at a time—the hill is from 2½ to 3 miles long—at least 80 per cent. of the trade of Galston and Arcadia would go to the railway station at Dural. The reason why the other portion would not go to Dural is simply because it might sometimes suit the convenience of the producers to send it to Hornsby. Perhaps a man might want to go into Sydney and back quickly. Therefore, he would take a light load and catch the more frequent train service at Hornsby to Milson's Point. The trade of the Main Northern road out to Glenorie would, of necessity, come to Dural. One witness, in giving evidence, has stated that Glenorie is the limit of possible cultivation. That I dispute. From
Glenorie

The Hon.
J. Garrard.
21 Sept., 1900.

Glenorie to Wiseman's Ferry, a distance of about 15 miles, there are admirable spurs of land suitable for cultivation. It is not the deep rich soil which you find about Dural and Castle Hill, but it is the sandy, loamy soil, which seems to so admirably suit the citrus and passion fruits. I have had the opportunity of comparing the growths of different portions of the districts, and if I were starting orcharding, I should certainly prefer the sandy, loamy soil to the soil of the Dural or Castle Hill districts. I desire to point out that there is land still available for cultivation beyond Glenorie. In addition to that, it seems to me that a considerable amount of traffic will soon come there, because I think, if the railway is extended to Dural, it will be extended further on. Take the tourist traffic which now exists on the Windsor railway and down the river. Many people object to the long trip from Windsor and to the liability of being stuck up on the river. If people go by way of Windsor, they have a journey of 7 or 8 miles before they get into the steamer, and then the fear of being stuck up on the mud flats. If that fear could be removed, and tourists could make a round trip to Peat's Ferry, and up the river to Wiseman's Ferry, and back to Sydney by the Dural railway, traffic would be encouraged. We all know the objection, from a tourist's point of view, to coming home by the same route as we leave. Therefore, round trips are always prolific of more trade than those which go and return by the same way. I may state that the population of these districts has largely increased. The district was included in the old Central Cumberland electorate, which I began to represent in 1890, and its growth has been remarkable. At Castle Hill the growth during that time has not been so large, because the land was fairly well cut up. Nevertheless, there has been a great growth there, as evidenced by the large increase in the number of children. I attended the school sports the other day, and I happened to come across the teacher at Castle Hill. When I vacated the position of representative of the district, there was ample room in the school for children; but now it is crowded out. At Annangrove a school was established a little time ago. At Kenthurst there has been a remarkable increase in the population during the last four or five years, necessitating larger school accommodation. The same can be said of Dural, Middle Dural, and Glenorie. There is a large school at Galston, and another one at Arcadia. All this goes to show the great growth of the district. I feel persuaded that, with railway communication, there will be a large increase, not only in the number of orchards, but in residences. The district is specially suited to those who suffer from lung or pulmonary troubles. I have given a good deal of attention to that question during the last four or five years, owing to the fact that my wife is a sufferer. In view of my knowledge of the district, I feel certain that, with the construction of a railway, there would be a great demand for residences along that hilly country.

1158. Taking the country between Dural and Carlingford, and more particularly between the proposed line and the Northern line, what distance would the proposed line tend to serve the fruit-growers between it and the Northern line? I look upon the piece of country between Carlingford and Pennant Hills as being an unprofitable piece; but you cannot have the extension to Dural without that. In other words, the country from Carlingford to Pennant Hills is now served by the Northern line.

1159. Do you think that the proposed line would catch traffic which now goes to the northern line from between Pennant Hills and Dural? Undoubtedly. I should imagine that 40 per cent. of the trade of the districts to which I have referred now goes to Pennant Hills, 30 per cent. to Hornsby, and the balance may filter through to Parramatta.

1160. It has been stated in evidence that the country between the proposed line and the Northern line is difficult to travel over, and that it is difficult to construct roads, owing to the steep grades? Undoubtedly it is, in the northern part. The only access between the two main ridges upon which the railway runs, and what you may call the Dural-Kenthurst district is at Pennant Hills, and on the road from Galston to Hornsby the country is rough.

1161. Where, between the proposed line and the Northern line, is the most difficult part to be found? Between Pennant Hills and Dural. What is known as the back road, although it cuts off about 2 miles, is not much used, excepting by the people living near to it, because of the heavy gradients. The country between the road from Dural to Pennant Hills, and the main Northern line, is broken up. There are spurs of land there suitable for cultivation. The traffic on the eastern side of it would go to the Northern line, and on the other side by the road on the west. As you get further down, immediately opposite Hornsby, the country is broken and rough. You cannot get across. The only accessible way is by the road which has been made from Galston to Hornsby. A road, which is shown on the map as a straight road, zigzags for 3 miles, and that is where the whole of that traffic has to come up. It was not possible to zigzag on the western side of the creek, and, therefore, it is steeper still, and the people travel with light loads. Whilst people could carry 15 cwt. with two horses up the grade towards Hornsby, going home they could not carry more than 10 cwt.

1162. Can you say whether the fruit-growers of the district have suffered much hardship in being compelled to convey their fruit and other produce to the Northern line? There is no doubt they have, especially with the summer fruit. The rough roads and steep grades knock the summer fruit to pieces. They also necessitate a long round, and it must cost them something. I may state that Mr. Harper, in giving evidence, estimates the production of the fruit of the district at 150,000 cases per annum. I think he has very much understated it.

1163. The residents put a much higher estimate upon the production? I should think so. Personally I should multiply it by three.

1164. Do you think that, if the proposed line were constructed, the fruit-growers within a reasonable distance of it would send their fruit to market by it rather than by the Northern line? I have given you my reasons why I think they would.

1165. Are you aware that it is proposed to charge local rates on the proposed line? I can quite understand that, and the people ought to be quite able to pay them, because of the saving they will affect on the present means of transit.

1166. Do you think, notwithstanding the local rates, they would use the proposed line, if constructed, rather than continue the present system of sending their produce to the Northern line at Parramatta? I think so. Besides, it will pay them to do it. It must cost them now about 3½d. to 4d. a case from the more distant parts about Dural and Galston. The railway freight from Hornsby is 1½d. or 1¾d., and Pennant Hills or Thornleigh about 1d. Therefore, it seems to me that they would be well able to pay 3d.

1167. I suppose the fact that they would be able to get their fruit to market earlier and in better condition by the proposed line, than by carting it the distance you mention to the Northern line, is an important consideration?

consideration? Very important. In wet weather the road between Castle Hill and Dural gets into a heart-breaking condition, and carts are frequently stuck up. I have seen the horses taken out of the carts, because of the condition of the road, and the fruit left behind.

The Hon.
J. Garrard.

24 Sept., 1900.

1168. What is the condition of the roads leading to the proposed line from the outlying districts? The worst parts are between Castle Hill and Dural, on account of the shale and clay. From Pennant Hills to Castle Hill—with the exception of one little patch—there is white metal upon the road. When you get past Dural you get into harder country—into more sandstone and loam, and that is less difficult to travel over than is the clayey soil. All the out-lying roads, therefore, are fairly good.

1169. Has the district progressed materially during the last twenty years? In a most remarkable degree. I do not know of any other district which has increased in the same ratio. I am speaking more particularly of Galston, Arcadia, Kenthurst, and Glenorie. All the other portions of the district have increased more or less, but in those portions progress has been remarkable.

1170. Are the holders principally small holders? Yes.

1171. The Committee, who went through the district, noticed that there were considerable portions not yet used for fruit cultivation;—is the balance of the land not now under fruit suitable for fruit-growing? I think so, excepting well down in some of the valleys, where the country gets rough, and where you find the sandstone. The greater portion of the area still unused is, in my opinion, capable of fruit production.

1172. Do you think that if the proposed line were constructed it would have the effect of causing the land which is not now under cultivation to be put under cultivation? Yes. It would pay people a great deal better to obtain their feed for their horses and cattle from other districts, and put the ground which they at present use for grazing under fruit cultivation.

1173. Are the sites for residential purposes, to which you have referred, better than those along the Northern line to Hornsby? They have more extended views. If I were fitting out a place as a residence for a person suffering from lung trouble, I should go further out than between Castle Hill and Dural. I should go 2 miles beyond Dural towards Glenorie. Although I might miss a little of the extensive view, I should get what is more desirable—a sandy loam instead of a clay subsoil.

1174. Has there been a large increase in the number of sites which have been purchased for private residences on the Northern line as far as Hornsby? The increase has been marvellous. You get an altitude there of 500 to 600 feet in a shorter distance than along any other road from Sydney.

1175. Do you think there would be a corresponding increase in regard to residential sites on the proposed lines? Perhaps it would not be so rapid and so large, because of the distance.

1176. There would also be more trains on the Northern line? Yes.

1177. Do you think there would be much trade, apart from the fruit trade, on the proposed line? There would be the trade which arises out of it. There would be the supplies to the people living in the district. I have no doubt a great deal more manure would be used in the orchards.

1178. I believe that manure is largely used in connection with fruit-growing? Yes; and it would be more largely used were it not for the cost of getting it there.

1179. Some evidence has been given respecting the large quantities of marketable timber in the locality? Beyond Arcadia there is a very large area of Crown land. There is some good timber lying between the Northern line and the proposed terminus at Dural. There are some Crown lands there. There are Crown lands north of Arcadia and about Glenorie. Between Dural and the main Northern line there will be 1,000 acres of Crown lands upon which there is good timber. At Arcadia, on private as well as on public lands, there is splendid timber on what is known as Hall's grant.

1180. Would that be opened up if the proposed line were constructed? I have not the slightest doubt of it.

1181. Have you any further information to supply? No. I may point out that it is merely because of my knowledge of the district that I have attended to give evidence. Personally, it would be to my interest to concentrate all the traffic from the district at Hornsby, because I am a property owner there. I merely mention that to show that I am not biased in the matter.

1182. *Mr. Hyam.*] Do you think the importance of the district justifies the construction of the railway? I do. I think the mistake made in the past has been in holding out inducements to men to go too far away, and they have landed the State, in taking conveniences to them, in an enormous expense, and have sometimes ruined themselves, because they did not at first realise all their difficulties. If you utilise the lands in or near the seaboard you form a stepping-stone for population later on to go further out.

1183. You have stated that, in your opinion, Dural is not likely to be the terminus? My opinion is that, if the line is constructed, the Railway Commissioners will see the desirability of extending it on towards Wiseman's Ferry.

1184. *Mr. Shepherd.*] What proportion of the fruit-growers of the district have to cart their fruit more than 10 miles? I should think 80 per cent. of the growers now send their fruit to Pennant Hills and to Hornsby, and if you gave them a railway you would intercept the lot.

1185. What would you consider a fair distance to successfully cultivate fruit, from the railway? People have done it at Glenorie successfully, but after a very hard struggle, and that is distant from Parramatta 15 to 17 miles, and from Pennant Hills, 14 to 15 miles.

1186. Would you consider it a fair thing if a person could take a load in and out on the same day? Yes.

1187. Do you not think that the lines, as shown on the map, are too close to justify the construction of the line? They would be, if the country were accessible. Between the present terminus at Rosehill, and Pennant Hills, they are comparatively close together, but you are tied up to that ridge to get to the district beyond, because there are depressions between those two points which cannot carry a railway. Beyond Pennant Hills the country is of such a nature that it would be impossible to get across.

1188. You are aware that the Government have already purchased the line to Rosehill? Yes. I do not know what you are going to do with the Rosehill line unless it is continued. Although obtained very cheaply—£22,500—it will practically be of no use for earning money unless it is extended.

1189. *Chairman.*] You have indicated that there is room for extension for fruit culture in the district;—have you made any rough estimate of what extension is likely to take place owing to the construction of the line, say within a period of five or ten years? I should imagine, but I am not quite sure, that the population in the area to which I have referred, is between 4,000 and 5,000. I have not the slightest doubt that, given a railway to Dural, you may, within five years, reckon upon the population nearly doubling.

1190.

- The Hon. J. Garrard.
24 Sept., 1900.
1190. And with that the amount of cultivation as well? Yes.
1191. Is it a fact that the best patches of the good orchard country are already occupied? No; there is plenty of timbered country which has been left. It has been left in some instances to serve as break-winds, but primarily to obtain the leaves which fall, in order to feed the orchards. That is due to the difficulty of obtaining manure from Sydney. That land is just as good as the land which has been cultivated.
1192. I suppose you know that the estimate for the construction of the line is £7,000 per mile? Yes. It is not a country through which a cheap line can be taken. Its very altitude prohibits a cheap line. Therefore, I am not prepared to challenge the statement of the engineers who have worked out the cost; but I think the future will justify it.
1193. Even with the handicap of a high initial cost, you think that the possibilities of the district are sufficiently great to justify the construction of the line? I do.

Sobey Lyne Vivian, land-owner, Castle Hill, sworn, and examined:—

- S. L. Vivian.
24 Sept., 1900.
1194. *Mr. Shepherd.*] In what way are you connected with the district through which the proposed line will run? I bought property there nine years ago, and I am gradually developing it. I have a desire to live upon it and make it my home.
1195. Have you any statement to make to the Committee? I take the statistics as given to you by the President of the League in Dural as correct, knowing the men who have compiled them. I am not, however, connected with the League, nor was I asked to give evidence by it. I have found from experience that the number of cases of fruit per acre, as mentioned by Mr. Hunt and others, is well within the mark. My trees are small, and when they are older they will certainly bear a larger quantity of fruit. I have 30 acres of land, including 10 acres of orchard, all of which has been taken from the bush itself.
1196. In what portion of the district is your property? Beyond Castle Hill, at the Eight-mile post.
1197. To what station do you carry your fruit? Pennant Hills, a distance of 5 miles.
1198. Do you find that a handicap? I certainly do. I cannot get it carried to the station under 3d. a case.
1199. What do you consider a fair distance from a railway station for orchard cultivation? I can cultivate my orchard at a profit where it is; but the handicap is that I can only grow certain classes of fruit. There are many other classes which I could grow, but which at present I am unable to touch. At present I have planted out citrus trees between the summer fruit-trees, intending to do away with them as I have so poor a system of getting the summer fruits to the market. It is not because the summer fruits do not pay; but they get injured and damaged before they can be got to market.
1200. What do you consider a fair distance from a railway station to successfully cultivate an orchard? I could cultivate citrus fruits 10 or even 15 miles from a railway station, but under great difficulties. At the same time I could not cultivate summer fruits more than 2 or 3 miles away.
1201. How long have you been cultivating? I purchased the land in 1891.
1202. What is the age of your citrus trees? I have some in their seventh year.
1203. What do you estimate you get per tree? Just over a case.
1204. You find the citrus fruits pay you best? Simply on account of the carting.
1205. What number of citrus trees do you plant to the acre? 125; I put them in on what is known as the septuple principle—an equilateral triangle, instead of in squares.
1206. What is your opinion as to the proposed line being a success? I am absolutely certain it will be a success. I have spent many days and weeks in the district at various times, and I have seen an enormous amount of traffic on the road,—not only in the shape of fruit traffic but in passenger traffic,—people going out for holidays. There is an enormous population there which would be able to use the railway. I do not think the amount put down by Mr. Harper, as to the passenger estimate, is anything like what it should be. I have information which has been given to me voluntarily, showing the names of gentlemen who are prepared to develop their properties, and four of whom are prepared to take season tickets on the line. Mr. W. H. Fleming (who has an office in Hoffnung's Chambers), has 40 acres of land just beyond Dural, which has been selected from the Government under the non-residential clause. He has complied with the requirements of the Government, and is now waiting for some means of conveyance before he goes on.
1207. Are all the properties you propose to name at present uncultivated? The one to which I have referred is quite uncultivated. Five acres have been cleared, and a fence has been put round it, and a room of some sort erected.
1208. Have these people stated that they will bring their properties under cultivation if a railway is constructed? They are only anxious to do so. Mr. Mason (who is employed by W. Gardiner & Co.), has a holding on the Kenthurst Road. He is already cultivating, and he would be prepared to extend his present dwelling—he is not using it himself, only residing there occasionally, as business permits,—as well as to develop his orchard. This gentleman has already, at his own expense, imported direct from America several of the new varieties of trees. I do not know the extent of his area, but he has about 10 acres under cultivation. I think he selected so that he would not have less than 40 acres at all events. The next two are brothers—Mr. E. E. Hassall, who has 20 acres, and his brother R. M. Hassall, who has 100 acres. Mr. R. M. Hassall would be prepared to build. At present he has no residence on the property, and both would be prepared to live there and travel daily to Sydney. Both are anxious to develop their properties, but they find it would be useless unless railway communication were provided. Mr. M. H. Johnston, at present employed in the Bank of New South Wales, would be prepared to build and live on his property at Dural. His property is near to Mr. S. Moore's, and it is well within the railway influence. He would, of necessity, have to journey to Sydney every day. When the present Carlingford line was being constructed I took a house for one year at Granville, where I at present live, with the option of renewal for one, two, or three years, the stipulation being that I thought the line would be continued, and that I should be able to live on my own property. I have been there for five years, and it has not been constructed yet. That shows the purpose I had when I bought the property some years ago.
1209. Have you had conversations with a number of the residents of the district in reference to the proposed railway? Yes, when opportunities offered.

1210. A great many have stated their willingness to pay a special rate in the event of the railway being constructed;—do you fall in with that view? At the present time it costs me 3d. a case, and if the railway be constructed it will then cost me 1d. S. J. Vivian.
24 Sept., 1900.

1211. A special rate might be 2d. a case? Even in that event it would be an advantage.

1212. Do you think that the owners would be willing to give the land required for railway construction free of cost? Some might, but I think there are many poor men to whom giving the land would mean ruin. For instance—if a man has 5 or 10 acres of land, and you go through it and ruin it, it stands to reason that he must have compensation; but there are many larger holders who would be prepared to give the small percentage of land you would require from them.

1213. Are you aware whether the proposed line goes through much cultivation in its course? There is a lot of land which is simply bush land, which is not under cultivation. I do not think there is a large percentage of it under cultivation.

1214. In the event of the Government having to pay for the land, at what would you estimate the value per acre? I could scarcely venture an opinion. I bought land, as good as any you can find in Castle Hill or Dural, at £10 an acre, but I also paid £22 10s. an acre for similar land formerly.

1215. At what would you fix the average? About £15 per acre.

1216. Do you think the fruit-growers of the district, who would be served by the proposed railway, would be willing to contribute a certain amount until the line became self-supporting, so as to relieve the Government from loss? I do not think the estimate, showing a loss upon the line of £4,000 per annum, is a correct one. The imposition of an acreage tax to cover expenses would press harshly upon those who have selected, say, 50 to 70 acres, with the object of getting 20 acres of good land out of it. There is a good deal of that country upon which you can only get 20 to 45 per cent. of good land. Therefore, an acreage tax would hardly be a fair one.

1217. Do you think a special rate would be a fairer rate than a tax on the land? I do. Of course, if you impose a tax it might force some of the land held for speculative purposes—if there is any—to be brought under cultivation.

1218. Have you any further information? I desire to use more manure on my property. I do not want to use the bush leaves, which has been the usual method of fertilising the ground, as it deprives the land I hold in reserve of the nutriment I want in it. At present I cannot afford, on account of the cartage, to use as much manure as I would desire. Even 5 miles of cartage is an expensive item.

1219. Do the orchards suffer very much during droughty seasons? Not where they are well cultivated. In spite of all the dry weather last summer I lost nothing.

1220. Do you mean by well-cultivated, working the ground deeply before planting, or cultivating after the ground is planted? Both. I may state that there is a large increased growth to be had out of strawberries and tomatoes—things with which we do not even supply ourselves at the present time. In that district where we get so little frost there would, with easy transit to the city, be a large production in those articles. I also think that the poultry industry would be largely developed.

1221. Is there much waste of stone-fruit in the district? I think the waste is enormous. I, myself, have had the peaches knocked off the trees, and would not send them to market. I may state that, notwithstanding the thousands of pounds which have been spent during the last few months in making the Castle Hill to Dural road sound, it is still a big drawback. To-day I cannot go to Parramatta or Pennant Hills without crossing over unmade and unformed roads.

1222. Do you find the fruit-growers of the district a fairly prosperous class? Whenever a fruit-grower gets a chance he buys more land, clears it, and plants it. I know of one man who went through the court, not on account of his orchard, but on account of other entanglements, and the first thing he did when he was clear was to buy more land and plant it.

1223. *Mr. Hyam.*] How far is your place from the proposed railway line? One-half mile.

1224. Are you in the heavy-soil country? Yes.

1225. With a railway would you cultivate more than you are cultivating at the present time? I should be very glad to cultivate the lot.

1226. Can you produce good stone and summer fruits? Yes; I have apricots there now over an inch in size. Of course, I cannot grow summer fruits successfully without a railway.

1227. Will you, with the construction of a railway, continue the growth of summer fruits? Yes.

1228. But not without? No.

1229. Would there be a great increase in the growth of summer fruits in the district if the line were constructed? I believe that on certain portions of the land they would be grown.

1230. Do you find that the yield of summer fruits is about the same as that of the citrous fruits? I think we can grow peaches, apricots, nectarines, apples, and pears, as well as they can be grown in any district in New South Wales.

1231. *Chairman.*] Have you any further information? With regard to the question of firewood, I find that I cannot get rid of the timber on my place for firewood. It is not a question of price; but I cannot even give it away. Once I managed to sell 500 tons, which had been cut into lengths, for £20. The purchaser carted it away, and said he did not want any more, because the cartage was too great.

1232. If the railway were constructed, I believe that large quantities of timber would be cut up and sent away for firewood; it would be a great assistance to a small man to get a few pounds for his timber on the ground;—reference has been made to the construction of a tramway through the district? I am afraid a tramway would be inadequate to the requirements of the district. If the figures are correct, the 526,000 cases representing the produce of the district would give 10,000 cases a week. The bulk of it would have to be carried in eight or nine months. That means 2,000 cases, or 75 tons per day. That carried over 12 miles on a tram would hardly, I think, be a fair thing for the fruit. Apart from that, a tram is not proverbial for its speed, and I think the people would prefer to get into their own carts or sulkies, and travel the road themselves. It might do for a few of the poorer people, but certainly not for a man who has a buggy of his own. I know men who even now do not use the 'bus. If there were a railway station within a reasonable distance of their home they could dispense with a certain amount of horseflesh, and save time as well.

1233. *Mr. Watson.*] I understand that the passenger traffic is not likely to be of great moment? I do not think that the estimate of the Railway Commissioners has treated the line fairly. I do not think an estimate has been made of the season-ticket holders who will go out there.

S. L. Vivian 1234. The experience of the North Shore line, from that point of view, has not been very gratifying? I think the crossing in the ferry may, to a great extent, have militated against that line. The Dural district is away from the sea atmosphere. Personally, I could not live at Manly or Sydney, but I can do so at Dural.

1235. Does the proposed line go through your property? No.

1236. Do you think it would pay you or other holders near to the route of the proposed line to make any contribution towards the cost of land resumption? I volunteered to Mr. Hunt to give £30. I spoke to the two Mr. Hassalls, and they would be prepared to give £70. On one occasion a list of those who would give was prepared. On that occasion Mr. Mason promised to give something, but what it was I do not know, and he is still prepared to give the amount offered. I do not think the resumptions should involve much cost. The land is not worth as much between Castle Hill and Dural as it is about Carlingford.

1237. We are told that it is better land? It is better land, but it is not in such close proximity to Sydney.

1238. *Mr. Hyam.*] Are you aware that the proposed line will go through two or three orchards? I cannot say.

1239. What do you think is the value of a full-bearing orchard per acre? £10, at the outside.

TUESDAY, 25 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LUNDESAY CRAWFORD SHEPHERD. |
The Hon. SOLOMON HERBERT HYAM. |

JOHN CHRISTIAN WATSON, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

W. A. Smith. 1240. *Chairman*] Are you in charge of the Metropolitan District? Yes.

1241. I believe that the district to be served by the proposed line is a section of the Metropolitan District? Yes.

1242. Have you any general statement to make concerning the nature of the roads of the district, and the amount of annual expenditure upon them? Yes. I produce the following statement, showing the scheduled roads affected by the construction of the proposed line:—

STATEMENT showing Scheduled Roads affected by the construction of proposed Railway from Rosehill to Dural.

| Name of Road. | Expenditure from 1892 to 1896-7. | Expenditure from 1897-8 to 1899-1900. | Total. |
|---|----------------------------------|---------------------------------------|--------------------|
| Kenthurst Post Office to Porter's | £ s. d.
120 0 0 | £ s. d.
81 0 0 | £ s. d.
201 0 0 |
| Galston Road to Berowra Creek | 530 0 0 | 92 0 0 | 622 0 0 |
| Galston to Dural | 238 10 0 | 290 0 0 | 528 10 0 |
| Galston to Middle Dural | | 135 10 6 | 135 10 6 |
| Galston to Pagan's | 170 0 0 | 333 5 6 | 503 5 6 |
| Hornsby to Galston | 6,864 7 6 | 1,266 8 10 | 8,130 16 4 |
| Mobb's Hill to Rogan's Hill | 1,276 14 4 | 33 1 6 | 1,309 15 10 |
| Pennant Hills to Mould's Corner | 650 14 0 | 1,996 16 1 | 2,647 10 1 |
| Pennant Hills Road to Beecroft Station (Murray Road) | 178 2 0 | 133 1 9 | 311 3 9 |
| Round Corner, at Dural, to Wiseman's Ferry, Old Northern Road .. | 972 10 0 | 1,107 19 9 | 2,080 9 9 |
| Parramatta to Pennant Hills Road | 452 17 10 | 316 7 3 | 769 5 1 |
| Baulkham Hills to Round Corner, at Dural | 1,756 19 0 | 1,169 0 1 | 2,925 19 1 |
| Broken Back Bridge to Pennant Hills | 619 16 7 | 421 2 9 | 1,040 19 4 |
| Castle Hill Road, at Banks', to Dural Road | 110 0 0 | 63 0 9 | 173 0 9 |
| Old Castle Hill Road to Government Reserve | 105 0 0 | 54 0 0 | 159 0 0 |
| Round Corner, at Dural, to Rouse Hill | 525 0 0 | 276 0 0 | 801 0 0 |
| Rouse Hill and Dural Road via Kenthurst, at Fisher's | 422 0 0 | 246 0 0 | 668 0 0 |
| Cattai Creek, at Pearce's, to Great Northern Road, at Black's | 110 0 0 | 190 0 0 | 300 0 0 |
| Castle Hill Hall to Banks', late Old Northern Road, to Government Reserve | 101 0 0 | 86 17 6 | 187 17 6 |
| Aitken Lane | | 43 13 4 | 43 13 4 |
| David's Road | | 43 0 0 | 43 0 0 |
| Pearce's Corner to Pennant Hills | 306 15 0 | 630 6 8 | 937 1 8 |
| Ray's Road, Carlingford | 98 5 8 | 299 6 2 | 397 11 10 |
| Schedule A II. | | | |
| Parramatta to Pennant Hills | 330 0 0 | 199 6 10 | 529 6 10 |
| Battingen Lane | 176 0 0 | 85 6 8 | 261 6 1 |
| £ | 16,114 11 11 | 9,592 11 11 | 25,707 3 10 |

1243. Out of the total amount, the Galston to Hornsby Road is put down at £8,000? Yes.

1244. Does that £8,000 represent a certain annual expenditure, or has a large sum of money been spent in making the road recently? The original construction of the road—that is simply the formation of the line of road—cost about £5,400. That includes the two bridges and the road.

1245. Is that out of the £8,000? Yes, and the rest has been for maintenance and metalling.

1246. Does the return you have put in include the money recently spent on the road to Dural? Yes.

1247. Which of the roads do you find requires the largest annual output to keep in order? What is called the New Line Road is a very bad road. The North Road from Baulkham Hills to Castle Hill is a very

very expensive road to keep up; and the Hornsby to Galston Road has also been very expensive. Of W. A. Smith. course the cost of maintaining that road is now less expensive, because the metalling has been completed.

1248. Will the construction of the proposed railway ease your department in the way of annual expenditure? I do not think it will very much. ^{25 Sept., 1900.}

1249. Do you think it will lead to the necessity for the construction of more short roads to the stations along the railway? Yes, I think it will. Assuming that it opens up the country, certainly more accommodation roads will be required amongst the various farms.

1250. What length of experience have you had in the use of white metal for road making in that district? With a break of four years, I have had thirteen year's experience.

1251. Do you look upon it as a superior article for road construction? Yes, for second-class roads—not for very heavily trafficked roads.

1252. It is suitable for the character of the traffic which is common to that district? Yes. It would not suit the Main Western Road or the Main Southern Road, but it is suitable for all the roads in the Pennant Hills and Castle Hills district.

1253. Is it a costly metal to work? No, it is rather easy to work.

1254. How would you compare it with blue metal? I should say it is worth about 70 to 80 per cent. of the value of blue metal.

1255. *Mr. McFarlane.*] Does it last as long as blue metal? No; not under similar conditions.

1256. I mean for an ordinary road? No; under similar conditions it would not last anything like blue metal.

1257. Does it wear out or crumble? It does not crumble; it wears very well indeed. Probably Members of the Committee will have noticed it around Sydney, in the vicinity of La Perouse. As it wears down, each stone seems to keep in its true position, and it wears to the very bottom without breaking up. You see upon the road little sections of individual stones which have been put down, and they wear flat and smooth.

1258. Can it be obtained in the district? Yes, since we have found a new quarry.

1259. Do you think it would be used for road purposes outside the district? I think that would depend very much upon whether blue metal came more freely into the market than it does at the present time. At present blue metal is very expensive, and there is really only one source of supply for Sydney.

1260. Could the white metal be obtained from that district for other suburbs as cheaply, or more cheaply, than blue metal can be obtained now? Yes; I should say 1s. 6d. to 2s. 6d. a yard cheaper.

1261. Are large quantities of it available? Yes, very large.

1262. If the proposed line were constructed, do you think it would be used for conveying this metal to other parts? I do not think so, unless a loop line were constructed to the quarry.

1263. How far is the quarry from the proposed line? About $1\frac{1}{2}$ miles.

1264. Is it between the proposed line and the Northern line? Yes.

1265. How far is it from the Northern line? A very long distance. Hornsby would be the nearest place.

1266. What distance is that? Four or 5 miles, and there is no road across.

1267. Has any of the metal from the quarry you are speaking of been conveyed to any other part for road-making, by the Northern line? No, it has not been used outside the immediate district.

1268. Have you a personal knowledge of the district through which the roads you have enumerated pass? Yes.

1269. Evidence has been given concerning the country between the proposed line and the Northern line, and it has been stated that it is very difficult for road-making, owing to steep grades? That is so. The country is rather mountainous between the two lines all the way along. Much of it is very rough and useless.

1270. It has also been stated that, even on the existing roads, a full load cannot be drawn in the direction of the Northern line from some place along the proposed line? I do not think that is so, except in the case of a few very unimportant roads in the vicinity of Castle Hill. There are rather steep roads leading from the orchards to the main roads; but as far as the main roads are concerned, horses can draw heavy loads.

1271. Where is the main road to which you refer? In the vicinity of Castle Hill. The steep grades are on the road from Baukham Hills to Dural.

1272. I am speaking more particularly of the roads between the proposed line, and the Northern line, along which the fruit-growers have now to send their produce? The grades are very good on the existing road, excepting at Thompson's corner, near Pennant Hills. That is rather steep. Apart from that, there are no other steep hills about the main roads.

1273. What is the condition of the road from Galston towards Hornsby? In perfect order. The grades are rather steep between Galston and Berowra Creek, but in that instance the loads would be going downhill to the railway station. As soon as you begin to ascend from Berowra Creek to Hornsby, the ruling grade, which is an up grade, is 1 in 15. When carts return they are generally empty, or are carrying manure only. In one place the grade is 1 in 10.

1274. Do you think that if any one stated that only half a load of fruit can usually be carried towards Hornsby, that he would represent the true condition of the road? No. A horse can draw a ton easily up a grade of 1 in 15, and the fruit-growers at Galston and surrounding districts who bring their stuff to Hornsby have a ruling grade of 1 in 15 up hill. Down the hill they have a grade of 1 in 10, which of course does not matter.

1275. What sort of a road is it? It is metalled from end to end.

1276. Would you class it as a good road? Yes.

1277. Are there any other cross roads leading to the northern line between the Galston and Hornsby Road and the road from Castle Hills to Pennant Hills? No, there are no roads of any importance about there.

1278. Would it be difficult to construct roads there if they were required? Yes, the country is very precipitous about there. From the top of the ascent to Berowra Creek there is a fall of 700 ft, and the same on the other side.

1279. *Mr. Hyam.*] In how many miles? About 2 miles.

1280. *Mr. Watson.*] Do you mean 2 miles in a direct line? No, along the road. As the crow flies it will only be $\frac{2}{3}$ of a mile.

1281. *Mr. McFarlane.*] Then the Dural people have to send their produce in a very round-about way to reach the railway station by the existing road? Yes. They come to Pennant Hills *via* New Line Road.

- W. A. Smith. 1282. If a road could be constructed from Dural to Hornsby, would there not be a great saving in distance? It is very rough country, and it would be very expensive.
- 25 Sept., 1900. 1283. Is road metal expensive? Not so expensive now that we have the white metal at Dural. Previous to our finding that white metal we had to get blue metal, which is very expensive.
1284. Have you sufficient material locally for the construction of bridges and culverts? In connection with bridge building we usually get the best timber from Wyong. For instance, Radley's Creek and Greek Creek bridges were built with timber obtained from Wyong.
1285. It has been stated in evidence that very valuable timber for piles and girders can be obtained near to where the proposed railway will run;—have you any experience of its quality? Yes; the timber is very good, but I think the district is one of the past, so far as timber is concerned.
1286. Do you think that the best of the timber has been picked out? Yes, except on a few private properties, and I do not think the owners allow it to be cut. Those properties, however, are comparatively small. I do not think much of the country, so far as the timber industry is concerned.
1287. Would the timber be sufficiently good for railway sleepers? It is principally black-butt, and it is about the best black-butt I have ever had to deal with; but I do not think there is enough of it to place much importance upon it.
1288. Do you think there would be any considerable traffic in timber in the event of the railway being constructed? I do not think so. If the timber were there, it would be drawn now to Pennant Hills, Hornsby, or Parramatta.
1289. Has much of it been drawn in those directions in the past? Not in my time; but I understand that prior to—from twenty-five to thirty years ago—the timber trade was very extensive.
1290. *Mr. Hyam.*] What does the white metal consist of? Vitrified sandstone.
1291. Is it porphyritic? No; it is simply the stone which has been fused around the basalt dykes, where the basalt has intruded into the ordinary sandstone. Wherever there is white metal there is supposed to be basalt in the vicinity.
1292. Do you consider it a good road-metal? It is a first-class road-metal.
1293. Do you consider it as good as blue metal? No; but for all second-class roads it is very good.
1294. How is it fractured? It is very tough and hard to break.
1295. Does it wear round? No. It settles down very hard indeed in the road, and the surface wears perfectly smooth and flat.
1296. Does not basalt wear well? Not if it is not looked after and properly maintained.
1297. Are you aware that there is a basalt quarry some distance from Dural? Yes, on Mr. Black's land.
1298. Do you know the quarry? I have seen it, and I know where it is.
1299. Evidence has been given to the effect that there is a great deal of basalt about there? Yes; but it is rather inaccessible at the present time. I believe it is 4 or 5 miles from the road.
1300. *Mr. Shepherd.*] Have you any idea of the quantity of cultivated land the proposed line passes through? If you take the Dural end of it—assuming that there is a station at Dural—it will serve, approximately, 1,500 acres of cultivated land.
1301. What I want to know is the area of cultivated land through which the railway, if constructed, would pass? I am unable to state.
1302. Does it pass through any? I should imagine it does in certain places; but I am not quite sure.
1303. What is the distance from Hornsby to Galston by the road? Six miles.

Oswald Gordon Morton, Road Superintendent, Roads Branch, Department of Public Works, sworn, and examined:—

- O. G. Morton. 1304. *Chairman.*] I believe you have made a report to the Department respecting the white metal quarries in the Dural district? Yes; also in regard to a basalt quarry. The report is as follows:—
- 25 Sept., 1900.

Dural Metal Quarries.

Parramatta, 18 September, 1900.

I have to report that I visited and examined, on the 17th instant, the metal quarries in the vicinity of Dural, from which stone is likely to be obtained, and conveyed by the proposed Dural railway extension for the repair of roads in the county of Cumberland.

At present only one quarry is being worked, and that is situated at a point about 1 mile 30 chains east of surveyed line at Dural. This quarry is on Crown lands, and from which, when existing works have been completed, there will have been removed some 4,500 cubic yards of what is known as "vitrified sandstone," or "white metal." This quantity will make no material impression on the quarry, which covers, as at present worked, about 1 acre of ground, and there is in sight at least one half-million tons of stone. It is capable of further development, when twice that quantity could be obtained if necessary.

Should a loop line be constructed to the quarry—and there are no engineering difficulties in the way, the country being all practically level—I anticipate that a large quantity of this metal would be conveyed annually over the line for the repair of roads through the Western suburbs and other roads in the Metropolitan and Parramatta districts.

The cost of quarrying this stone I estimate at 1s. 2d. per cubic yard; conveyance by rail at similar rates to those in existence on the Great Western Railway, viz., 1s. 6d. for the first 15 miles; loading and unloading in trucks, 6d.—would bring the cost at Clyde junction to 3s. 2d. for spawls; the breaking, drawing, spreading, &c., would increase the cost to about 6s. 9d. or 7s. per cubic yard, and it would, for roads other than the heavily-trafficked main roads, be extensively used. Basalt is now principally used, and is costing this year from 11s. to 12s. 9d. per cubic yard. The supply is limited to two sources, namely, the South Coast Metal Co's quarries at Kiama and the Fmu Gravel Co. at Peurith. The Department has no basalt quarry which could be profitably worked in the county of Cumberland, and this Dural quarry, being on Crown lands, would, I think, make us, to a certain extent, independent of private supplies in metalling second-class roads, although I do not think the stone would be used for roads outside the county of Cumberland.

I also examined the stone at what is known as Black's quarry. It is of a basaltic formation, but has never been worked; but from what is in sight I should judge a good quarry, covering between 1 and 1½ acres, is to be worked. It is, however, 5 miles from the nearest point of the railway, and this distance renders it of no value for any other than local works.

I have, &c.,

O. G. MORTON,
Road Superintendent.

1305. Is the white metal likely to be used for anything but the making of second-class roads. I think not.
1306. Is the Railway Department likely to require it? I think not.
1307. Do you know what is the grade of the road from the quarry near Glenorie towards Dural? It is a rising gradient. I think the ruling grade is 1 in 15.
1308. What is the grade from Glenorie to Dural? The road is a gradually rising one.

1309. Would a road coming from Glenorie be on the down grade? Yes; nearly all the way. O. G. Morton.
1310. What is the cost of breaking up the white metal as compared with the blue metal? The cost of breaking varies, according to the labour market, from 1s. 3d. to 1s. 9d. per cubic yard. Basalt varies from 2s. 3d. to 2s. 9d. per cubic yard. 25 Sept., 1900.
1311. Do you look upon the basalt quarry as one which the proposed line is likely to develop? No, it is too far away. It means haulage by road for 5 miles.
1312. The Railway Commissioners at present obtain broken blue metal, by rail, from the south? Yes, cheaper than they could get it from the Dural district. I have obtained a metal supply from Kiama to Liverpool for 10s. 9d. per cubic yard. That was conveyed by steamer to Sydney, and thence to Liverpool by rail.
1313. Is there any other basalt quarry besides the one at Black's? Yes, there is another about midway—what is known as the Pennant Hills quarry. That was reported upon by Mr. Smith in connection with the former inquiry.
1314. Is that likely to be developed by the construction of the proposed line? I look upon that quarry as being fully developed now. It is rather an expensive quarry to work. The white metal, I think, will take its place. At present it is leased to the Municipal Council, and they charge 2s. 7d. for the spawls, which is rather a high price. In fact it cannot compete now against the Emu or Kiama quarries.
1315. You do not regard the white metal as a metal which is likely to be used outside the district? If the line were there it would be used as far up as Liverpool. By second-class roads, I mean roads other than the main roads, such as the Great Western and Great Southern roads. It would be extensively used, I think, in all the minor streets of the western suburbs, starting, for instance, at Strathfield, and going through Auburn, Granville, and Rookwood.
1316. Then we may reasonably expect some traffic upon the line from the white metal? I think so. At present they are confined to using the soft sandstone and the basalt, and the white stone would come in between the two.
1317. Mr. Hyam.] You say that the Railway Commissioners get the bulk of their metal for railway purposes from Illawarra? I could not say, authoritatively. They have their own quarries there, and machinery for breaking and screening.
1318. Under those circumstances, it is not likely that they would patronise the local metal? I think not. I do not think it is hard enough for railway works.
1319. You do not think that it would answer for ballasting a railway line? No.
1320. Supposing the line were constructed to Glenorie, would Black's quarry be accessible? Yes.
1321. Close to the railway line? Yes.
1322. How far distant from the railway line would it be? I think it would be within 30 chains.
1323. Do you consider Black's quarry a good one? Yes.
1324. Is there a large bulk of stone there? Yes.
1325. Is there much earth upon the top of it? No; it is right up to the surface.
1326. Have you seen the Prospect quarries? Yes.
1327. Is it anything like them? No; you could remove a foot of soil, and then you would be upon the metal.
1328. Has the quarry been proved to any depth? I have seen it down to a depth of 4 feet, and I think it would go down 15 to 20 feet.

FRIDAY, 28 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

THE HON. PATRICK LINDSAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.

THE HON. SOLOMON HERBERT HYAM.
ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Broughton Barnabas O'Connor, Esq., M.P., sworn, and examined:—

1329. Mr. McFarlane.] You represent the electoral district of Sherbrook? Yes.
1330. Have you a knowledge of the district through which the proposed line will pass? Yes; I have an intimate acquaintance with the whole of it. I have known the district for the last thirteen years. B. B. O'Connor, Esq., M.P. 28 Sept., 1900.
1331. How would you describe the character of the country generally? The district through which the railway will pass is of an undulating character in some places. The grades are steep; but there would be no serious obstacle to railway construction. The quality and productiveness of the soil is quite apparent to those who visit the district. It is of such a character that small holdings of 10 to 14 acres are quite sufficient to supply a man with a competency, and a very good competency too. The only difficulty which stands in the way of a man going there and taking up a small quantity of land for an orchard is the difficulty of transporting his produce to a convenient railway station. For instance, a man must cart his produce from Kellyville to Parramatta, a distance of 10 miles.
1332. Dr. Garran.] How far to Pennant Hills? He would have to come from Baulkham Hills, and then go to Castle Hill, in order to go to Pennant Hills.
1333. Would he have to come as far south? Yes, as far south as Baulkham Hills, because that would be the only good road he would have. The other roads are of such a character that it would be impossible for him to take his fruit the other way. Although, according to the map, one district may be close to another, by reason of the character of the intervening country, it is impossible to get at it. If a man did not come to Baulkham Hills, he would have to come down within 1 or 2 miles of the place, and cut across into Castle Hill, and he could not do that in bad weather. That is the important factor in determining the question of the necessity of the railway to this district. The main portion of the citrus fruit is gathered from June and July right up to November.
1334. Do you know where the trigonometrical board is at Castle Hill? Yes.

1335.

B. B. O'Connor, Esq., M.P.
28 Sept., 1900.

1335. Is it not a good road from there to Pennant Hills? Yes; but you would have to go down through Kellyville to get there. The gradient from Baulkham Hills to Parramatta is a down gradient. Going the other way he would have to toil up steep hills all the way, and even if it should be shorter—although I do not think it is—he would never think of going that way, by reason of the difficulty of travelling the intervening country. The district from Glenhaven to Kellyville, and further west, is quite of recent growth. A tremendously large settlement has taken place there. The orchards are of quite as good a character as the orchards between Carlingford and Dural. They are quite as productive and quite as profitable.

1336. *Mr. McFarlane.*] Would that hold good in regard to Galston? Undoubtedly. The whole of the country between Carlingford and beyond Galston, right to the Hawkesbury River, is cultivated. The only thing which militates against the increased production of the district is the fact that a man has to carry his produce such a long distance. A man at Kenthurst has to carry his fruit to Pennant Hills. To bring a ton of fruit from Kenthurst to Pennant Hills you require two horses.

1337. During the thirteen years you have been in the district has there been any marked increase in its development? Undoubtedly. Speaking generally, Glenorie, Galston, Kenthurst, Kellyville, and the intermediate districts, are the growth of that period. It is only seven years since Galston was refused a postal delivery for three days a week, unless the people guaranteed the loss upon it. Now the profits of the Postal Department amount to £50 or £100 per annum. The whole of these districts, right away to Arcadia, are entirely new country which has been opened up. When Central Cumberland was one electorate the furthest point north to which a politician would go to speak was Dural. He would speak in Dural for the whole of the district north, east, and west of it. Now a politician would speak in six or seven places, and would get an audience of from sixty to seventy people in each place. Kenthurst is a thickly-settled district, with small farms. The character of the settlement around Kellyville is characteristic of the settlement around Galston, Kenthurst, Glenorie, and Arcadia. Arcadia is producing passion-fruit which is topping the market. The producers have to carry their stuff from Arcadia right away to Hornsby. The Roads Department had such an opinion of that district that they constructed a road—they had to make it zigzag—from Hornsby to Galston, and it cost them from £12,000 to £15,000.

1338. What class of country is it for road-making between the proposed line and the districts you have mentioned and the Northern line over which the fruit-growers have to carry their fruit to the railway station? The steepness of the grades, and the large amount of soil, makes it necessary to expend a tremendous amount upon the construction of roads. It is necessary to make them of metal, in order to enable people to travel over them. Between Castle Hill and Dural and to the north traffic was suspended whilst the Department were making the road to which I have referred. The Pennant Hills Road is of such a character that in wet weather you cannot get along it, and when the road is dry you require two horses to do the work of one.

1339. Is there a road between the Galston and Hornsby Road and the Dural Road? No; the country is of such a difficult nature that it would be impossible to construct one except at an enormous outlay of money, and that is the only possible way the Kenthurst people have of getting out. They must either go to Pennant Hills or to Hornsby.

1340. Some of the fruit-growers have stated that it frequently happens that they can only take half a load towards the railway station? That is so—in other words, they require two horses to a one-horse load.

1341. Can you state what percentage of land is under cultivation for fruit-growing within the influence of the proposed line? No; but I saw the statistics compiled, and I know they were accurately and honestly taken.

1342. Is there not a large area which is not being utilised for fruit-growing? Yes. The quantity of land not under cultivation largely exceeds the amount under cultivation.

1343. Is the land which is not under cultivation suitable for fruit-growing? Yes. The only thing which has hampered the extension of the industry is the difficulty of transport.

1344. Do you think the construction of the proposed line would cause the whole of the land to be utilised for agricultural purposes? Every bit of it. Strange to say, that particular belt of country between Carlingford and Dural, or between Dural and Kellyville, or between Dural and Galston, is of such a fertile character, and so suited to the growing of fruit, that I do not think there would be 20 acres which would not be cultivated. It is the same class of country from beginning to end.

1345. How far to the North and North-west would the proposed line serve, if constructed? It would serve Kenthurst right out to the Cattai Creek. It would serve about 5 miles beyond Glenorie, that I know of. I know of people who immediately the line is constructed will go in for orcharding, 5 miles on the other side of Glenorie.

1346. Do you think that the fact of the proposed line, if constructed, being in close proximity to the Northern line, will have the effect of diverting a lot of the traffic which now goes to the Northern line? It is a case of "needs must where the devil drives." The only way a man has of getting out is that way. A man at the present time is absolutely debarred from getting manure for his orchard; it is too costly for him. The down gradients of the roads are towards the station. No attention is paid to the grades coming from the station. For instance, anyone who has been over the road between Hornsby and Galston, knows that they get down from Galston to the Berowra Creek by means of a zigzag. They get out of the creek to Hornsby in a similar way. You can understand that if a man takes a lot of fruit from Arcadia, his horse is not fit to bring back manure, the up-grades being so steep.

1347. Is a large quantity of manure used by the fruit-growers? Yes, and more would be used if it could be obtained more cheaply. I live at Fairfield, on the Southern line. A large number of tanyards are there. The lime and hair are valuable to the fruit-growers. They have endeavoured to obtain this at a certain price, but were unable to do so. They are unable to go above that price, because the cost of bringing it from Pennant Hills or Hornsby is so great. Therefore, valuable as that manure is, they are forced to have some other kind, or do without.

1348. Are you aware that if the line were constructed local rates would be charged? Yes.

1349. Do you think the fruit-growers generally would be willing to pay a local rate? I am sure they would; it would be cheaper for them to do so. Another element which has to be taken into consideration is this: There are, at present, men who sometimes go out with their fruit at 3 and 4 o'clock in the morning, and do not get back till 8 and 9 o'clock at night. That means about eighteen hours, whereas if
the

- the railway were constructed it would only mean four or five hours. It is only reasonable to suppose that they would be willing to pay a local rate, as it would mean such a lot in the matter of time.
1350. They would be able to get their fruit to market more quickly? Yes.
1351. I suppose that is an important consideration? Yes, especially when the market is up.
1352. What is your opinion of the country along the proposed line for residential purposes? I am of opinion that it would become the favourite suburb of Sydney. It is a magnificent situation: it possesses magnificent views, extending in many places for miles. You can look right down the valley of the Parramatta, across to Prospect Reservoir, and to Windsor. In fact, at Dural, on a clear morning, you can see the houses at Windsor. I would live in the district myself if the railway were constructed. All the people I know, who have visited the district, state that it is the most lovely they have ever been in. Along the Northern line numerous residences have sprung up; and the surroundings of that district are not to be compared with those of the Dural district. People would not hesitate to reside in the Dural district if it came to a choice between the Northern line and the Dural district.
1353. I presume there is a better train service on the Northern line than there will be on the proposed line? But in the first instance there was a very bad service on the Northern line. It was only after repeated pressure had been brought to bear that the Commissioners gave anything like a decent service, and that only in the morning and evening. One objection is that after you get out of the train you have to cross the water.
1354. Do you think that within a reasonable time after the construction of the line, the passenger traffic will be an important item? The general opinion of business people, such as auctioneers and others whom I have consulted is, that if the line is constructed the settlement and development of the country will follow, and that it will be the most favourable district for residential property in and around Sydney. That is the opinion of the auctioneers of Parramatta.
1355. Do you think the construction of the proposed line will assist in making the line from Clyde to Carlingford, which the Government have purchased, a paying one? I do. I cannot understand, bargain or no bargain, why the line between Rosehill and Carlingford was ever purchased, if it was not intended to carry it on to Dural.
1356. I suppose you are aware that the cost of the proposed line, per mile, is rather high? Yes; and it came as a surprise to myself, and to a good number of people who are interested in the line. I have consulted a man who is a large contractor, and he said to me,—“I only hope that the construction of the line is thrown open for public competition. I am prepared to build the line for hundreds of pounds per mile less than the estimate, and I should then make a large sum of money out of it.” That is the opinion of a man who is a very large contractor.
1357. Is there a large area of Crown lands within the influence of the proposed line? Yes; on the other side of Glenorie. There is a large amount of Crown lands in and around Arcadia.
1358. Are they suitable for settlement or residential purposes? I know a man named Frater, who is building a large hotel to the west of Arcadia. That is a private speculation. There are some magnificent sites there. A man named Clegg is erecting a large house on the point overlooking Berowra Creek. Mr. Chillcott, a prominent commercial man, has also gone to Arcadia, and has spent a large amount of money. A man named Barnett, an hotel-keeper, of Woollahra, has expended £5,000 in the cultivation of fruit at Arcadia.
1359. There is a considerable discrepancy between the estimate of the Traffic Superintendent and of the residents in regard to the number of fruit-cases sent to market;—do you think the railway estimate is a low one? I know that Mr. Hunt and Mr. Fagan, who made up the estimates, are above reproach in a matter of this character. I would be quite content to believe that theirs would be a truer estimate than that of the Railway Department.
1360. They base their calculation at 100 cases per acre of fruit-bearing land;—do you think that would be a fair estimate? If Mr. Hunt or Mr. Fagan gave an estimate as to the productiveness of an acre for orchard, I am sure it would be absolutely correct. I would be content to pin my faith to their estimate.
1361. Is there any other matter to which you desire to draw attention? I think that if the line is built it will soon prove its value to the country, from a financial point of view. The development of the district would be extraordinary. That statement is borne out by the development which has taken place without a railway during the last two or three years.
1362. Do you think that the country north of Dural is of such a character that if the proposed line were made its further extension would be warranted? Yes; the line is bound to go north towards Glenorie.
1363. *Mr. Hyam.*] Do you think that the district around Glenorie and further out is a good one for invalids? I have been told by a Sydney doctor that the Arcadia and Dural districts are better than the Blue Mountains for invalids.
1364. Are those districts out of the influence of the sea air? Yes.
1365. You state that if the line is constructed it will, in your opinion, eventually be extended? Unquestionably. Originally it was intended that the Northern line should go in the direction in which the proposed line will be extended.
1366. Do you know the country from Glenorie for a distance further out than 5 miles? No; but people tell me it is just as good land as that around Glenorie.
1367. Do you know what sort of timber is to be found about Arcadia, and north of Glenorie? It is either box or ironbark. The turpentine timber is to be found there. There is any amount of timber between Dural and Kenthurst, and on the west of Dural.
1368. In your visits to the district have you noticed whether there are any neglected orchards—take Kenthurst and Kellyville, for instance? There are no neglected orchards here. There are any amount of young orchards, which are continually being added to year by year.
1369. You have stated that if you had facilities for reaching the district you would live there;—do you know of many other people who would do the same? Yes; because of its magnificent climate.
1370. Do you think the importance of the district warrants the construction of the proposed line? Yes.
1371. *Dr. Garran.*] The remarkable characteristic of this district for the last ten years seems to have been the extension of orchards on land previously neglected;—is there much equally good land still remaining? Yes. As soon as you pass Dural there is an immense amount of land suitable for orchards. There is also an immense amount of land suitable for orchards around Castle Hill.
1372. It is sandstone country, scored with gullies? Yes.

B. B. O'Conor,
Esq., M.P.
28 Sept., 1900.

- B. B. O'Connor, Esq., M.P.
28 Sept., 1900.
1373. Is the cultivatable land on the ridges, the slopes, or in the valleys? It is all cultivatable until you get towards Hornsby. Of course, you cannot get into the gullies there, but as you go towards Hornsby the quality of the land begins to decrease until you get to Berowra Creek. From Berowra Creek to Hornsby you could not cultivate. It is rocky, precipitous country.
1374. Is there much Winamatta shale left on the flat tops? Yes.
1375. In the older country that class of ground was principally picked upon for growing orchards? Yes; by reason of the perfect system of drainage.
1376. In the country beyond is the soil too dry? No. The old idea in regard to orchard property was that you must get on to Winamatta shale? Towards Arcadia there is a shale which is entirely different from that around Dural and Kenthurst, but yet it is of such a nature that it is producing even better fruit than that produced upon the Winamattas shale.
1377. Some years ago great damage was done to the trees, many of which died, and the explanation was that the wet season had been too much for them in that clayey country;—is the new country which has been taken up likely to rot them in a wet season? No; it is a peculiar class of country. It is like sand interspersed with a large amount of this peculiar kind of soil. It is a self-draining soil; there is no clay in it.
1378. Is it self-draining in a dry season? No.
1379. During the last ten years have they had a fair test of dry and wet seasons? Yes; during the last five years they have had a greater test of dry than of wet seasons.
1380. I can understand that this country would stand a wet test very well; but has it stood a dry test? It has stood it magnificently.
1381. Better than the old clay-topped ridges? Yes.
1382. Going along the railway from the junction, northwards to the Hawkesbury River, the country seems to be very sandstone? Yes; between Hornsby and Berowra Creek the country is useless.
1383. If the market for citrus fruits keeps good, is the quality and the quantity of the land sufficient to give a promising outlet? Unquestionably. I do not know of any industry in which a man—given, of course, a knowledge of it—would be more likely to succeed.
1384. Is it not a fact that in the majority of cases in which people having business in Sydney, have endeavoured to manage an orchard with hired labour, the result has been failure? That is so.
1385. It requires a man to reside on the property? Yes.
1386. And to have learned his experience? Yes.
1387. It is not a business for everybody? No; a man cannot say, "I will plant a tree and get a crop from it." I know of plenty of men who, disregarding the experience of those who have resided there, have failed in the industry.
1388. The soil in the district of which we have been speaking is quite different soil from that in the Seven Hills district? Yes; of course you get the Winamatta shale about Seven Hills.
1389. Has the Seven Hills country been more successful than the old Parramatta country? No; I should say that the best fruit in the citrus family is grown around Galston, Glenorie, Kellyville, and Kenthurst, on quite new ground. They get the best prices in the market, and the fruit hangs longer on the trees.
1390. You say that the sandstone stuff which was formerly condemned is now coming into popularity? It is.
1391. In the top soil in the sandstone country, is no trace left of the Winamatta shale, or is it only reducing in quantity? It is reducing in quantity.
1392. The North Road to Wiseman's Ferry is about the worst specimen of sandstone country you have? From the Northern line to the Berowra Creek is very bad country. On the Wiseman's Ferry Road there is no bad country whatever, right up to Glenorie.
1393. The worst part, then, is along the route to the ferry? Yes.
1394. And the country along the old Wiseman's Ferry Road will, you think, be found to be cultivatable? Undoubtedly.
1395. Between the Dural country and the Hawkesbury River, due west, there is a lot of country around Cattai Creek;—is that too clayey to work? No; I know men who are out there now and who are doing well.
1396. Would the construction of the proposed line assist the cultivation of land in that district? It would.
1397. If that country were taken up and proved productive, in which direction would the Dural line have to be extended to accommodate it? The only extension of the line would be due north to Glenorie, and on to Wiseman's Ferry.
1398. Not more to the west? No; it should go straight ahead, and it would divide the cultivatable area.
1399. You think, according to the present lookout, that, given a sufficient amount of transit, there is a possibility of the extension of the citrus fruit-growing business in the northern part of the county of Cumberland? I am sure of it. If the line is constructed you will see it almost immediately.
1400. *Mr. Hyam.*] Of summer fruits as well? Yes.
1401. *Dr. Garran.*] It is very easy to prove that this may be a nice district for orchards; but what we have to look at is the painfully practical "£.s.d." part of the business,—what can you say that would encourage us to think that the proposed line would pay? The greatest proof I have is the prosperity of those who are engaged there at the present moment.
1402. Which are the most struggling parts of the district? Kenthurst, Glenorie, Galston, and Arcadia.
1403. Galston has a pretty good road now? Yes; but it is a zigzag to the Berowra Creek, and also to Hornsby.
1404. A man would require to put on an extra horse? That sometimes means a large amount to a small man. The people in that district drive the best heavy horses I have seen, and give £20 to £25 each for them.
1405. How long does it take a man to get from Galston to the station and back with a load of fruit? Two and a-half to three hours. Galston, of course, is the nearest point to Hornsby.
1406. Is there any good orange-growing country between Galston and Hornsby? No. As soon as you start to descend the zigzag the orchard property ceases.
1407. That is rather a long distance without good soil? No; it is merely a gully. From Galston to Hornsby,

Hornsby, as the crow flies, it is no great distance. The people cultivate right up to the ridge where it descends to the Berowra Creek.

1408. I am merely drawing attention to the large area of non-productive ground the road goes through? Yes; and that road was constructed at an enormous expense to the State to get these people an outlet.

1409. If there had been a railway to Dural you could have had a shorter route to it? Yes.

1410. And you might have had more cultivatable land on the route? Yes. If the railway had been constructed years ago the saving to the country in the money which has been expended on the roads would have been a tremendous item.

1411. Have you ever tried to ascertain what quantity of oranges can be produced within a 10-mile radius of Dural in order to make a line pay? No. All I can say is that if a railway is constructed I am satisfied that the whole of the land about Dural will be put under cultivation. A man who has an orchard has now to employ a man for a great portion of the year to do nothing else but cart his fruit a distance of from 10 to 15 miles, and he has to use two horses to do one horse's work. That, of course, naturally tends to restrict the amount of land under cultivation.

1412. Do you know whether anyone has endeavoured to ascertain what will be the actual area of fruit-growing land within a radius of 10 miles of Dural if the proposed line is built? I do not know that anyone has.

1413. Allowing six years for the trees to mature, what will be the probable growth of oranges at the end of that period? That is too big a problem for me to deal with.

1414. I want to know the area which would be actually under cultivation if the railway were constructed? Between Dural and Glenorie it is impossible to find 10 acres of land which could not be used in an orchard.

1415. Within 10 miles of the road on each side? I would not go to that extent.

1416. *Mr. Hyam.*] Would you go 3 miles on each side? I would go that on the east, and further on the west.

1417. *Dr. Garran.*] With regard to the west, we had interesting evidence from Dr. Purser, who showed that for climatic purposes the Dural district is superior, on account of it being screened from the damp, chill north-easters by the trees;—of course, the more you cultivate the country the more you will take that screen away? That seems to follow as a natural consequence.

1418. It is always understood that orange trees do not like a strong wind; they like to be screened by a belt of trees;—of course, the timber belt of trees may be taken away at any time? That is a rock upon which they all split. For instance, one man will say that with westerly winds the orchards will not be so good. At Kellyville, however, there are no trees at all. From Rouse Hill to Windsor there are no trees which can have any appreciable effect upon the climate. The Kellyville fruit, however, reaches the highest price in the market.

1419. Which is supposed to be the worst wind for orange trees? A westerly wind.

1420. I suppose that the question of sheltering fruit-trees by belts of timber trees has not taken much hold of the people? Of course, the pressing necessity has not arisen.

1421. *Mr. Shepherd.*] Have you ever lived in the district? No, but I will do so if there is a railway there.

1422. What do you consider is a fair distance for a man to cart his fruit to enable him to carry on an orchard successfully? As soon as he goes over 5 miles I do not think he has a fair chance of making it a success.

1423. A good many of the orchards are not more than that from railway stations? Kellyville, Kenthurst, Glenorie, Galston, Arcadia, and Dural are over 5 miles away.

1424. Do you think that the land which is not under cultivation is equal to that which is under cultivation? It is identically similar.

1425. Is it not usual to pick out the eyes of a country? I admit that. The reason why a large amount of land is not under cultivation is because whole families have held tremendous tracts of country, and have only cultivated certain spots. Land which at one time was disregarded, and was thought nothing of, has been found to be magnificent country, and has been cultivated.

1426. Are there still many large holders of land there? No.

1427. Do you think those who do hold considerable portions would be likely to cultivate any portion of their land themselves, or let it out? I think the demand for land would increase so much that they would sell to small holders. Of course, a large portion of the land was taken up as residential and non-residential selections around Kenthurst, Glenorie, and Arcadia. A lot of those selections, unfortunately, were non-residential.

1428. Do you not think that a weak point in connection with the proposed line is the fact that it runs so closely to the Northern line? No, because of the difficulties which exist in getting to the Northern line. Whilst you are close to it in point of distance, you are a long way from it in point of time.

1429. I believe that at one point it is only a mile from the Northern line? Yes; but as you advance it becomes more divergent.

1430. But even the furthest point is under 5 miles? Yes; but it would be impossible to get across there.

1431. So that a good deal of the country within easy distance of the line is useless for cultivation? That is so.

1432. There appear to be a good many orchards in the district which have been thrown out of cultivation, can you account for that? Yes; the cultivation of the orange has been made so difficult. I know a doctor who wanted to go to Dural. First he had to go from Parramatta to Hornsby; then across the good road between Hornsby and Galston, approaching Dural from that end. Many men have been ruined by reason of the fact that on account of wet weather and bad roads they have been unable to take any part of their crop to market.

1433. Have any of the orchards been neglected because the owners could not get their fruit to the railway? Yes; in addition, they have been unable to obtain manure. They were compelled to allow the orchards to keep on eating up what nature provided, and then they were unable to put in artificial manure. The result was that the trees had to go.

1434. You say that you consider the estimated cost of the construction of the line excessive? Yes, in view of the information I have obtained from a large contractor.

1435. Do you not think that people are often in the habit of talking big about these things? I do not think

E. B.
O'Connor,
Esq., M.P.
28 Sept., 1900.

B.B. O'Connor, Esq., M.P. think there is a solitary instance where the railway authorities have estimated a line at so many thousand pounds per mile, and have then afterwards reduced it by thousands of pounds per mile.

28 Sept., 1900. 1436. Is it not a fact that the estimates are generally under rather than over the mark? No; I would not say that. I think the experience is that the Government get their work done for less than they anticipate.

1437. The annual expenditure on the line will be over £4,000, and the annual income over £1,000? One man—Mr. Hunt—authorised me to say that he would guarantee to contribute to the revenue of the Colony £100 per year.

1438. Do you think that the line is likely to be self-supporting within a reasonable time? Yes, I honestly believe it will. I believe that any man who visits the district will be so struck with it that he will reside there if he can. Anyone who knows anything about fruit-growing would select it for fruit-growing. The country only wants to be seen to be appreciated.

1439. Are you personally aware whether a large number of the fruit-growers are willing to pay a special rate? Yes; they are prepared to do that until the line becomes self-supporting.

1440. You have stated that the purchase of the Rosehill-Carlingford line is not likely to be a good thing for the State unless it is extended:—will you tell us how the land between Carlingford and Rosehill compares with the land between Carlingford and Dural for fruit-cultivation? The Rosehill-Carlingford section is not likely to earn much to the State by the growing of fruit.

1441. Can you offer any opinion as to whether the Kellyville traffic would come to the proposed line, or whether it would go to Parramatta? It would come to the proposed line. I believe it is proposed to construct a tram from Parramatta to Baulkham Hills. I find, however, that it is not intended to carry fruit upon it.

1442. That being out of the way you think the Kellyville traffic is certain to come to the Dural line? It must do so.

Stephen Edward Perdriau, Surveyor, Department of Lands, sworn, and examined:—

S.J. Perdriau, 28 Sept., 1900. 1443. *Chairman.*] You produce a map showing the details of Crown lands in the district which will be served by the proposed railway? Yes; the map shows the Crown and reserved lands. Near Baulkham Hills is a patch of Crown lands 780 acres in extent. The land from Kenthurst to Maroota, which is not yet alienated, is generally of a uniform character, and not attractive for settlement. There is a very small portion of Crown lands not yet alienated likely to be cultivatable.

TUESDAY, 2 OCTOBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.
THE HON. ANDREW GARRAN, LL.D.

THE HON. SOLOMON HERBERT HYAM.
JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and further examined:—

J. Harper, 2 Oct., 1900. 1444. *Mr. McFarlane.*] Some of the fruit-growers who have given evidence, estimate the fruit production per annum at a much higher amount than that mentioned in your statement;—you stated that the amount was 150,000 cases per year? My estimate was arrived at by obtaining the actual number of cases of fruit which had been carried from all parts of the district.

1445. Could there be any possibility of any fruit going in some other direction than that from which you obtained your information? No; the returns were obtained at the stations from which the fruit would go—Hornsby, Thornleigh, and Parramatta. Those are the three points which fruit from that district would reach. It will be observed that I have allowed for 150,000 cases to be carried on the line, out of a total of 250,000 cases which were carried from the whole of the district, including points which would not be affected by the line. It will also be observed that I credited that fruit at 1d. per case; whereas, as a matter of fact, if the rates are charged which, no doubt we shall have to charge if the line is constructed, they will be, as I have stated, 1½d. and 1¾d. per case: that is to say, ¼d. and ½d. upon each case of fruit, instead of 1d., as mentioned. Therefore, even assuming that you double the amount of carriage, the estimate will not be exceeded.

1446. Would any fruit go by steamer? Yes; but that would not affect the proposed line,—that is really between Carlingford and the river. If you look at my evidence in connection with the Rosehill to Carlingford line, you will see that I pointed out the quantity of fruit which went by the river; and if you double the estimate the effect will be precisely the same.

1447. Mr. Hunt stated that 526,000 cases would be the total production of the district? I may say that Mr. Hunt gave me a great deal of information. He allowed me access to his books. A great deal of that fruit finds its way by river and by road. Mr. Hunt embraced too large an area altogether as the trafficable area of the proposed line. I took the precaution to have the actual number of cases of fruit sent by rail taken out of our books.

1448. He based his estimate in this way: He stated that the total number of acres of fruit-bearing trees was 5,260;—he estimated that 100 trees went to an acre, and that there would be a case of fruit from each tree? That is absolutely an estimate. My information was as to the actual number of cases booked at the various stations, and that I obtained from the official books. Again, the district was very liberally treated, inasmuch as I estimated that 150,000 cases of fruit would be carried by rail out of the 250,000 cases which are carried altogether from the whole of the district. I allowed 1d. per case for these, instead of 1½d. and 1¾d., which would be the normal rate, over and above the existing main line rate.

1449. Evidence was also given with regard to the country between Dural and the Hawkesbury River, and it was stated that the development of fruit-growing was rapidly increasing? As a matter of fact, the

J. Harper.
2 Oct., 1900.

the carriage of 100,000 cases of fruit at the increased rate of $\frac{1}{4}$ d. per case would only mean an extra £108 a year to the railways. If they were carried at $1\frac{1}{4}$ d. per case it would mean an extra £216 a year. It would thus take a good many hundreds of thousands of cases of fruit to pull up the estimate.

1450. It has been stated that a very large area suitable for growing purposes exist, and that it would be put under cultivation if there were facilities for sending the fruit to market? I have no doubt that such areas would be found, but, as I have already indicated to the Committee, in view, to my mind, of the necessity of railway extension to undeveloped and more distant parts of the country, I do not think this is a line which has any pressing claims. I may also mention that this is a line which is, more or less, a rival line. I may instance the Belmore line, upon which we are losing to the extent of £7,000 a year. When that line was under consideration all kinds of things were hoped and promised of it.

1451. Is not that a line which depends solely on passengers? Yes; but the promise was there. In one case fruit was promised, and in the other case passengers were promised; and if you get passengers who travel regularly you make more profit out of them than out of fruit.

1452. It is difficult to guarantee passengers, and it may be more easy to guarantee fruit? Yes; but if you guarantee fruit traffic you still have the figures I have quoted before you. Each additional 100,000 cases of fruit carried at $1\frac{1}{4}$ d. per case, instead of at 1d. per case, would mean an additional revenue of only £216.

1453. Do you think the country beyond Dural is of such a character as to warrant the extension of the line, if constructed, further on, to meet the requirements of the fruit-growing industry? I should not think that the circumstances of the Colony will warrant the extension of the line in country of that character for fruit-growing purposes.

1454. One of the arguments used by nearly the whole of the fruit-growers who have advocated the construction of the proposed line, is that the country between the proposed line and the Northern line is very difficult to traverse, owing to its steep grades? Yes; but there is a good road from Galston into Thornleigh. No doubt the roads of the district would be improved if they were regraded.

1455. Would that be a costly matter? I should not think so. As a matter of fact, I am firmly convinced that the roads of the district should be improved; but when it comes to the question of constructing and maintaining a railway line it is a very different thing.

1456. Evidence has been given to the effect that the proposed line would help to make the newly-purchased line from Clyde to Carlingford pay? I do not think it would, if you added the capital cost and the working expenses of the other line to it.

1457. Would the Rosehill and Carlingford line be likely to pay without further extension? As a matter of fact, by far the most profitable portion of that line, if not now, in the near future, will be to the river; and I think that that weighed with the Commissioners—I know that it weighed with me personally—in suggesting its acquisition, the object being to obtain connection with the river and with the manufacturing industries which have been, or will be, established there, together with the traffic to the Rosehill racecourse.

1458. The fruit-growers have also stated that there will be considerable traffic for fruit-growers if railway facilities are afforded them;—they state that the cost of maintaining manure almost prohibits them obtaining the supplies they require? I have allowed a good margin for that. I think I have allowed £1,000 to cover it.

1459. The witnesses stated that half a ton per acre was required every year? Our experience in that direction is this: The main Northern line, which practically runs into a fruit-growing district, does not carry much manure upon it.

1460. It is also stated that there would be considerable traffic in the future upon the proposed railway in the conveyance of horse-feed? That is a very poor item. As far as the carriage over the 9 miles of railway is concerned, it would repay us something like 6d. a ton. It would require a good deal of that carriage to make the line pay.

1461. Particulars have been given as to the probable quantity of chaff which would be consumed in the district? I think the estimate I have given is fairly liberal enough to meet the traffic.

1462. Your opinion is that the estimate of 526,000 cases as the yield of the district is excessive? It is, in view of our experience. I am not giving you our experience as orchardists, but our experience as carriers of fruit.

1463. Then you think, from the information you have received, that the estimate you have given represents the amount of fruit which would be carried? The impression I have gained from our books is that my estimate will cover the revenue from that source. As I have stated, the margin which has been allowed is of such a character that even if the trade did increase by 100,000 cases per annum, it would only mean a difference of £108 or £216, according to the distance over which the fruit is carried.

1464. A number of the witnesses were very hopeful that there would be a large increase of population in the district, and that a large number of people would use the district for residential purposes, the result being that there would be a good deal of traffic with Sydney? To-day we have Hornsby and the North Coast line, with a very frequent train service, and the population certainly has not increased in the way in which it was anticipated. As a matter of fact, it has increased very slightly. We are asked to believe that a branch line, such as this, or with a correspondingly small train service, would offer attractions greater than those on the existing Northern line. As far as a residential population is concerned, we have largely to rely upon those who have their businesses in town. We have not a very large leisured class who can afford to reside at a distance; and our experience on the Northern line, as I have stated, has not been favourable.

1465. Do you consider that a similar class of country to that through which the proposed line would pass? A great deal of it is. I do not do think there is much difference in the elevation of Hornsby or Pennant Hills.

1466. Has not the line from North Shore to Hornsby had the effect of taking population into that district? Decidedly; but look at the difference in the two lines. That is practically a suburban line, with a maximum distance of 13 miles to Hornsby Junction. The average distance over which the population travel is only about half that distance, to Chatswood. That is a material difference compared with a line distant 27 miles from Sydney. We have not found a residential population of any great extent, excepting those who are engaged in their avocations on the spot, going to Penrith, Campbelltown, or anywhere on the main Southern line. Liverpool, a distance of 22 miles, is about the limit from which we have any large number of people travelling to and from their business, and that is on the main line. The disadvantage

- J. Harper. of the proposed line from a residential point of view, would be the fact of its being a branch line, and with no dense population which would justify a frequent train service.
- 2 Oct., 1900. 1467. What is the distance from Sydney to Dural? Twenty-seven miles.
1468. *Mr. Shepherd.*] Have you been over the country from Galston to Hornsby? Yes.
1469. Did you take much notice of the country about Galston? There is very good orchard country about there.
1470. Did you notice a good deal of scrub and ironstone? Yes; but in this part of the country you find good orchard land under so many varying conditions.
1471. I suppose that one great object of the construction of the line is to bring into use the line from Roschill to Carlingford;—I suppose that that line is almost a dead letter? No; we should have a certain amount of traffic between Carlingford and Parramatta and Sydney. There is a larger population settled in that neighbourhood—that is, the population is comparatively more dense than it is at Dural. Then it has the advantage of being so much closer to town.
1472. I notice that your estimate of the probable revenue is the same as it was two years ago? Two years ago I gave an estimated rate per case of one penny. During those two years, our experience in regard to promises which have been made to pay additional rates in certain places has been such that I look upon them with very grave doubt. Even assuming that you doubled the estimate of 150,000 cases—and I am quite sure that the production has not been doubled—and charged the normal rate of $\frac{1}{2}$ d. and $\frac{1}{4}$ d. per case, it would practically amount to the same thing.
1473. I suppose you are aware that an almost unanimous expression of opinion has been given to the effect that the fruit-growers are willing to pay a special rate? Yes; but our experience is that when people make promises of that kind as soon as the line has been opened two or three months they want trains run at mail-rate speed, and precisely the same rates charged as those which they would pay on the main line. The proposed line will run absolutely parallel with the Northern line, upon which fruit would be carried at a lower rate than upon the other.
1474. The residents of the districts are clamouring for the proposed line, and if they are willing and promise to contribute a special rate, do you not think that it is fair that they should pay it until the line becomes self-supporting? But they cannot bind themselves. If we sought to impose the special rate, no doubt a large number of them would use the main line. We could not prevent them doing that if they wished to do it. If it meant to them a difference of 1d. per case in carriage, that is undoubtedly what they would do.
1475. Then you do not pay much attention to the expression of their willingness to pay a special rate? No; we have had such extraordinary experiences in connection with matters of that kind. It is no exaggeration for me to say that I have known, within three months of the opening of a line, the Commissioners approached and requested to charge through rates instead of local rates. Again, after it has been stated that a 12 miles an hour service would be all they required, and they have been allowed a 15 miles an hour service, they have agitated, within twelve months, for a 20 miles an hour service.
1476. *Dr. Garran.*] Have you seen the evidence of the fruit-growers? No.
1477. Do you know whether it would be possible to make a cheaper line? I should not think so. In a country of that character, a strong, well-built line would be required.
1478. You do not think there is any hope in that direction? I do not think so. If they contoured the line, so as to follow the ravines, it would not be as useful; therefore, I do not think it is possible to make it cheaper.
1479. *Chairman.*] Do you know the Kellyville district? Yes.
1480. Is not that a thriving district? Yes; it is one of the most thriving places in the district.
1481. *Mr. Hunt*, in making an estimate from which traffic would be drawn, omitted Kellyville? My estimate includes Kellyville. My estimate was made up from the actual number of cases carried by rail.
1482. The fact that *Mr. Hunt* omitted to include Kellyville seemed to indicate that he had exercised a certain amount of care in making his estimate? I am convinced of that. I went through the figures with him, and derived a good deal of information from the books he had. His was an estimate of the number of cases of fruit produced; my figures represented the actual number of cases received at the railway stations.
1483. The fruit-growers who gave evidence were pretty well agreed as to the number of cases of fruit which could be obtained from each tree, and stated that it would not pay them to grow anything less? Even if 520,000 cases of fruit were produced, the whole of it would not come upon the proposed line.
1484. To what other line would it go? To the main line at Pennant Hills, or at Hornsby. It is an open question whether some of the Galston fruit would not do so under any circumstances.
1485. The witnesses allow that some of the Galston fruit would go along the Pennant Hills Road;—they say, however, that the road from Galston to Hornsby is of a very heavy grade, and that there is no chance of improving it, so that there is no possibility of fruit going there? I think that if there were a difference of 1d. per case in the freight the grade would not stop them.
1486. I put the question to several of those who are residing there whether a difference in freight of 2d. per case would induce them to go to the main line, and they said that it would not be a sufficient inducement if there were a line at Dural;—they stated that from Galston to Dural they could, on the down grade, make two or three trips per day, whereas, in the other case, it would take them the whole of the day and part of the night to make one trip? That is not our experience.
1487. This question and answer is typical of the evidence we obtained:—
- Do you think the residents of the district would be satisfied to pay a special rate? The matter was discussed at a meeting of the Railway League representing the whole of the district, and it was unanimously decided that the growers could afford to pay a charge of 3d. per case from Dural to Sydney.
- If that rate could be maintained, do you think the line would come close to being a profitable one? No; as a matter of fact, it could not be maintained. I do not see how the Commissioners could possibly make a rate of that character when they are charging a rate of one-third that amount on a line within a few miles of the one under consideration.

William Edwin Tunks, clerk, Land Valuation Branch, Department of Public Works, sworn, and examined:—

1488. *Mr. Shepherd.*] Have you any statement to make with reference to the value of the land in the district through which the proposed line will pass? I inspected the land through which the line will pass, and assuming that a strip $1\frac{1}{2}$ chains wide, and including sites for two stations—20 chains x 5 chains, and 25 chains x 5 chains—is taken, there will be affected twenty-nine blocks of orchard lands. Out of that we take 54 acres; thirty-two blocks cleared, 56 acres; six blocks unimproved, 14 acres; making a total area of 124 acres to be occupied by the line, including the stations, and that I estimate is worth £5,950. There are some buildings on the land. Four buildings I estimate at £550; severance at £3,000; forced sale, £650; and the cost of transfers and conveyances, £550. That will make a total of £10,700. I deduct, under the 24th clause of the Public Works Act, £2,700 for betterment, and that would leave a balance of £8,000.
1489. That would include the whole of the land taken up by railway stations and everything else, as far as Dural? Yes, and including the station at Dural.
1490. Does that include any land under cultivation? Yes; twenty-nine blocks of orchard land.
1491. *Mr. Hyam.*] Do you mean orchard lands or orchards? I should have said actual orchards.
1492. *Mr. Shepherd.*] I suppose you have estimated the value of the crop which is on the ground? Yes; it is principally citrus and stone fruit.
1493. Your estimate includes the whole valuation to Dural? Yes; over the whole of the 9 miles.
1494. How did you arrive at a conclusion as to the value of the orchard land? From my knowledge of orchard property. I was reared on a fruit farm, and I possess one at the present time myself. I know exactly what they cost, and I know what they are selling for in the district, and what the people are asking for them. If anything, my valuation errs on the side of liberality.
1495. You have been engaged in the fruit industry yourself? Yes. At present I hold an orchard and work it, but not in that district.
1496. Are you acquainted with the whole of the district to be served by the proposed railway? I am acquainted with the southern end of it.
1497. Do you consider that the land which has not been brought under cultivation is equal to that which is under cultivation, or have the best portions been picked out? I think the best portions have been picked out; but I consider the residuo of a very good character for orchards. Mr. Godby's farm, at Sandhurst, has produced fruit equal to any in the district, and that on very poor land; it was very stony and sandy. Of course, plenty of manure was used, and the quality of the fruit was excellent. It was superior to anything in the district.
1498. Can you form any rough estimate as to the quality of land in the district which would be likely to be brought under cultivation? I should say that three-fourths of it would be fit for cultivation.
1499. Can you offer any opinion in regard to the country beyond Dural? I know about 5 miles of the country on either side of the proposed line, and I think that three-fourths of it will be fit for cultivation.
1500. *Mr. Hyam.*] How long have you been in the Government Service? I have been connected with the Land Valuation Branch for the last twenty years.
1501. What value do you put upon an acre of orchard land in full bearing? It is variously estimated from £50 to £100.
1502. How do you grade them? According to the quality. Some are in good condition, and have been well cared for, and are first-class orchards.
1503. Do you estimate £100 an acre for a good orchard in full bearing? That would be a fair thing for a citrus orchard in first-class order.
1504. What sort of an orchard would it be that you would value at £50 an acre? One which bears evidence of neglect, and would consequently require time and money to restore it to first-class condition.

WEDNESDAY, 3 OCTOBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

| | |
|--|-----------------------------|
| The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq. |
| The Hon. ANDREW GARRAN, LL.D. | ROBERT HENRY LEVYEN, Esq. |
| The Hon. SOLOMON HEBBERT HYAM. | JOHN MCFARLANE, Esq. |

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Frank Farnell, formerly M.P. for Ryde, sworn, and examined:—

1505. *Mr. Watson.*] I believe you were formerly a Member of the Legislative Assembly? Yes; I represented Ryde. F. Farnell.
1506. Are you well acquainted with the district through which the proposed line will pass? Yes. 3 Oct., 1900.
1507. Do you desire to make a statement to the Committee? I have a knowledge of the district extending over a period of thirty-five years, and I have watched its growth from the time I was 3 years of age. The districts which the line will touch were, of course, not settled in the early period of the time I have mentioned, and it is only during the last ten or fifteen years that noticeable development has taken place. This question is one which has not alone agitated the minds of the residents of Castle Hill and Dural, and the district beyond, but it has also been considered over and over again by the several Governments. Indeed, I may say that the line had every possibility of being constructed when I was representing Central Cumberland, about 1891, and it was only the simple fact of a diversity of opinion existing as to the route the proposed line should take that precluded the proposal being submitted to Parliament in the shape of a Bill. At that time it had every prospect of being favourably considered by the existing Government, and I have no doubt there would have been sufficient evidence adduced before the Committee to warrant them in recommending Parliament to pass the necessary Bill authorising its construction. The obstacle which was placed in the way was that which inevitably occurs in connection with all proposals of this character—that is, people submitting rival routes. Proposals were submitted to construct a line from Westmead to Dural; another one was proposed as an extension from Rosehill—that is the project under consideration—and another proposal was to run a branch from the Northern line, starting

F. Farnell.
3 Oct., 1900.

starting from Pennant Hills, the objective point in all these cases being Dural. Since that period developments have taken place which, to my mind, clearly prove beyond doubt the necessity for giving the residents and settlers the facilities afforded by railway communication. It has, I believe, been asserted by the railway authorities, that the line will not be a profitable one. In my official capacity as a member of the Public Works Committee some time ago I had to consider the evidence which was brought forward. It may appear to the members of the Committee that I was somewhat biased or prejudiced because of the views I have just expressed; at the same time nothing will turn me from the opinion at which I arrived some years ago, and which I hold to-day, namely, that the progress of these districts is being materially retarded owing to the want of proper railway facilities being given. The products of these districts are of a perishable character, and they require as little handling as possible. The people who resided there twenty years ago were prepared to carry on their operations in the old groove, and, consequently, it was an expensive thing for them to plant orchards and get their produce conveyed to market. Since the Northern line has been opened up facilities have been given to growers—more particularly about Dural—to get their produce to market in a more speedy way. Still those facilities are far from satisfactory. They are somewhat hampered in their operations by the fact of not having the best of roads. Although one or two main roads may be in a fair condition the branch roads or feeders are not in such a condition as to offer encouragement to people to place further areas under cultivation. I have seen these districts develop from settlements of three or four people. Take, for instance, the Kenthurst and Glenorie districts. I have known the time when there were only two or three residences there. There are now some hundreds there. One of the features which mark the progress of a district is to be found in the establishment of Public Schools. In the districts to be served by the proposed railway there are now no less than eight or nine Public Schools where, I suppose, ten years ago, only one existed. That appears to me to be a sure sign of the improvement and settlement of the district. The people are anxious to increase their holdings, and to put increased areas under cultivation. The output from the district is very considerable, but the people are hampered on account of the want of proper roads and facilities for getting perishable fruit to the market. I am satisfied that if railway communication were given they would be able to use a great deal more fertilisers than they use at the present time. The haulage is very costly indeed, and, of course, the time taken up has to be considered. If they could get their manures more speedily, they could utilise the time otherwise occupied in attending to their orchards. One point which has struck me very forcibly is that when the railway officials were giving evidence they referred to the probable receipts of the proposed railway if constructed. I have come to the conclusion that they have under-estimated the value of the products and of the freight which would accrue to the line. I must admit that in Mr. Harper the Railway Department has a splendid officer, and one who has had a great deal of experience; but in this instance I hardly think he has gone closely or searchingly enough into the industries which are applicable to the district. There is not the slightest doubt in my mind that the prospective freight of the line will be doubled within a very short period. I speak from a knowledge of the people of the district, who seem to be inclined even to be saddled with an extra rate—a local or special rate—if it is thought desirable by Parliament to incorporate such a provision in a Bill authorising the construction of the line. They are so anxious to obtain the convenience of a railway that they are prepared to pay—and it will be a saving to them—from 1d. to 2d. per case more, as a local rate, towards making up any deficiency. I have not the slightest doubt that the Crown lands which are available beyond Dural will be readily taken up, and that the available timber reserves and forests will be utilised to a very great extent. It seems to me that the district is one which can command sympathy, not only from the fact of the settlers cultivating the soil and producing, but also from the fact that it can be made into a great sanatorium. The district is one of the most healthy in the Colony, and it is within the suburban area prescribed by the Railway Commissioners. I have not the slightest doubt that residential areas would be taken up, and that there would be a great deal of settlement under that heading. One feature in connection with the proposal which has struck me as worthy of consideration is that as the Government have already taken up the Rosehill to Carlingford railway, it seems to be natural that the line should be extended. Of course we know the conditions under which that line has been acquired. They have been very favourable; but even though it may be supposed that there would be a slight loss in connection with the project, I look upon it in this way: That the prospective development is sufficient to justify the construction of the line, even though there may be an annual loss for a short period. The main line must gain by the traffic which will be taken over it from the proposed line.

1508. The chief point of objection at present seems to be the fact that the proposed line would go close to the existing Northern line at one or two places, and at no point would be further than 5 or 6 miles from it;—do you think there is a reasonable chance of both lines attracting a fair amount of traffic if the proposed line is constructed? Yes. I think the Northern line will return a certain amount of traffic which it gets at the present time from the Dural, Glenorie, Kenthurst, and Galston districts; but a great deal of the traffic which goes to the Northern line at present will come within the influence of the proposed line. At the same time, with the increased production, the loss, otherwise credited to the Northern line, would be made up by the extra carriage of products. I would point out that the nearest point of a railway from Dural is Hornsby, and that is 10 miles distant by road. Galston, I think, is about the same distance from a railway station. The line certainly runs a little near to Beecroft and Pennant Hills.

1509. There is, I believe, a good road between those two points? Yes; but as a matter of fact not a great deal of fruit is sent from that district.

1510. What distance is it by road from Dural to Pennant Hills railway station, on the Northern line? Eight or 9 miles, and they have very bad roads to go over. All the district lying to the west and north-west of Castle Hill and Dural, as well as the district north, would be served.

1511. What do you regard as the maximum distance which it would pay a man to cart fruit? They were compelled to carry it to Parramatta in the old days.

1512. Under present conditions, prices, and yields, how far from a railway would a man be justified in commencing fruit-culture, assuming the land to be good enough? He should not be more than 10 miles away. That means 10 miles there and back, or a day's labour in going to and from a railway station.

1513. The Commissioners' estimate is that the annual expenditure on the line will be £1,800, irrespective of land resumption, and that the income will be £1,000 per annum; that estimate is based on a charge of 1d. per case upon 150,000 cases;—the local estimate is 500,000 cases at 2d. per case;—do you know sufficient of the district to be able to say which of those estimates is nearer the mark? I would

would be inclined to say that, if the railway were constructed, it would mean an output in production, in no time, of 300,000 cases. F. Farnell.
3 Oct., 1900.

1514. Even if 2d. per case is charged on 300,000 cases, unless there are other large items of revenue, it would not mean that the line would be a paying one;—then you would leave out of account any subtraction from the revenue of the Northern line? The Northern line, as a Northern line, would lose the traffic, but the railway system, as a whole, would not lose it. If I thought for a moment that the traffic of the Northern line would be interfered with to any considerable extent I would not advocate the proposed line. It is more particularly the districts beyond which require serving, not the districts within a mile or two of the Northern line. The objective point right through has been Dural. I think the promoters of the private line looked for the traffic they were going to get beyond Dural rather than between Pennant Hills and Rydalmere.

1515. Do you think it would pay the people of the district to make any contribution towards the cost of land resumption or the maintenance of the line? I have always opposed such a thing being incorporated in any Bill. I look upon it as imposing a state of things which is exceptional, and I have thought that if a line could be charged with it—that is, by the imposition of an extra rate—the people would be prepared to pay it in that way, whereas they would probably not be prepared to purchase the necessary land. Of course, the land can be secured pretty cheaply now.

1516. Might not the imposition of a higher or special rate on the proposed line have the effect of causing people to continue to send their goods to the Northern line? No. The tremendous advantage which would be obtained from the facilities which would be afforded would compensate them over and over again. They would never go to the Northern line, because fruit is a commodity which requires very gentle handling, and the less handling the better. It is not likely that they would carry it an extra mile if they could afford it. They would rather pay an extra rate than carry it an extra mile. If the proposed line is constructed they will be able to pick their fruit in the afternoon and to send it away at night. At present they have to pick it in the afternoon and to send it away the next day. It is probably sixteen or seventeen hours on the journey before it reaches the market, and then it is, perhaps, kept for a few hours in the market.

1517. Unless there is some system of guarantee or contribution by the local landowners, do you think it is practicable, from a financial standpoint, to build lines so closely together, even in Central Cumberland? This project stands in a somewhat different position from any other proposal, because one section has already been taken over. It is a question as to whether it is more economical to extend the existing line than to start one which would not run parallel, say, from Westmead. It appears to me, looking at the matter from all points of view, that the present-proposal is the more economical of the two. It has always been my opinion that the proposed line will serve the people better, and that it will also serve a greater district.

1518. *Dr. Garran.*] Were you born in the Ryde district? Yes.

1519. And I suppose you could see orange-trees from every window of the house in which you lived? Yes.

1520. The orange-growers, in those days, took their produce to the river to send it to Sydney by steamer or carted it to Parramatta or Sydney? Yes.

1521. Were those the only methods of carriage they adopted? Yes.

1522. Do you recollect when the orange-growers first obtained the benefit of railway communication? The first occasion was when the Northern line was constructed.

1523. Was it not when the Western line went to Seven Hills? Yes; that was when the fruit-growers first obtained the benefit of railway communication.

1524. Do you know whether that railway communication greatly stimulated orange-culture in the Seven Hills district? I think it did.

1525. Did not orange-culture exist before the railway was constructed? Yes; but I think larger areas were cultivated, and it induced greater settlement.

1526. Could you say whether it doubled the settlement? No.

1527. I want to ascertain the definite influence produced by a railway the first time it was brought to bear upon the citrus business;—you think an impetus was given? Yes, I am certain of it.

1528. The second occasion was when the Northern railway was constructed? Yes.

1529. Taking the district from the water's edge on the northern side of Parramatta River right up to the junction, has there been much increase in orange cultivation since the line was opened? Yes; all the districts I have mentioned have come within the influence.

1530. But has there been a large increase of cultivation? Yes; and of settlement.

1531. Do you think the citrus cultivation has doubled? Yes.

1532. Has it more than doubled? I could safely say it has doubled. New orangeries have been planted within 4 or 5 miles of the line.

1533. Has it given a help to the orangeries further out? It has done that as well.

1534. What would be most likely to strike a person now in going up the line—the increase of residential houses, or the increase in orangeries? If he went into the districts of Dural, Kenthurst, Galston, and Glenorie, he would be surprised at the great cultivation. I might state that a great many of the districts which originally comprised orchards has been cut up for residential purposes. Take, for instance, Beecroft, and round about Pennant Hills and Hornsby. The people there have found it more profitable to sell their land at from £300 to £400 an acre than to cultivate it.

1535. Its value for house-building was too much for people to keep the land under orange-trees? Yes.

1536. Is that the only reason why it went out of cultivation? Yes.

1537. And, of course, new land has since been taken further back? Yes.

1538. Looking at what the influence of the two railways has been, do you think there is anything to justify us in saying that a line from Carlingford to Dural would greatly stimulate orange cultivation? I am sure it would.

1539. Then you advocate the line, not merely in order to help those who are already cultivating, but because you think a great deal more land will be brought under cultivation? Yes.

1540. I understand you to say that you do not anticipate that the line will obtain much traffic between Carlingford and Pennant Hills, inasmuch as it runs close to the Northern line? That is so.

1541. And it would only help the people lying between that part and the Baulkham Hills Road? Yes.

1542.

- F. Farnell.
3 Oct., 1900.
1542. Is not that pretty well taken up? Yes. There are some hundreds of acres of Government lands available there which, no doubt, if the line was constructed, would realise a very good price. It does not pay a man to give a heavy price for land if he intends to be an orchardist.
1543. Would not the land from Carlingford and Pennant Hills and the Baulkham Hills Road be too valuable for residential purposes to make it worth while going to the expense of planting an orchard? I have no doubt that would happen.
1544. If that is so, we cannot expect too much additional cultivation between the proposed line and the Baulkham Hills Road? No; I think that district would be more residential.
1545. Then the effect of the line on citrus cultivation would begin at Castle Hill? Yes.
1546. And would go on from there to Dural, and further still, if the line were extended? Yes.
1547. So that only about two-thirds of the proposed line will act directly in stimulating fresh cultivation? Yes.
1548. The settlers who are already in the district beyond Dural commenced their orchard work simply with the accommodation afforded by road and the existing railway? Yes.
1549. They have faced all the difficulties upon the assumption that they might not obtain anything better than that for years to come? But during the last two or three years they have been led to believe that the proposed railway was likely to be constructed. No doubt that has acted as a stimulant.
1550. What I mean is, that they have laid out their money and labour with only the existing accommodation? Yes.
1551. Do you think we have reached the limit of orange cultivation in that district, having regard only to the existing accommodation? Speaking personally, I would not care to go out any further.
1552. How far would you like to be from the river or railway if you were growing fruit? Not more than 10 miles.
1553. Are there any orangeries now which are more than 10 miles from Dural? No doubt there are.
1554. Even before the road was made from Galston, they used to come round to Pennant Hills? Yes.
1555. How far is that? About 10 miles from the centre of Dural.
1556. Do you know of many orange-growers who are at the present time more than 10 or 12 miles from a railway? Yes; there are orange-growers who are 16 miles away—out towards Galston, and the other side of Kenthurst.
1557. I suppose they obtained the land cheaply, in the first instance? Some of them did.
1558. Do you anticipate, to the west of Dural, and between that and the Cattai Creek country, any development of orange cultivation? Yes; I think there will be a development there, although the whole of the land is not of one character. There is some inferior land; but whatever areas are available for settlement will, no doubt, be taken up immediately there is any prospect of the line being constructed.
1559. You admit that there will be a loss on the line at first? Yes.
1560. Looking at the matter, not from the local, but from the legislative point of view, how much loss do you think would be justifiable? I am not in a position to be able to estimate what would be the probable traffic. I am satisfied that the estimate of the railway authorities is only one-half of what it should be.
1561. Supposing that their estimate is right, and that we shall lose £4,000 per year upon the railway in stimulating further development, do you think it would be worth while for the country to bear that loss? Yes, I do.
1562. You would not care to face the maximum loss which the Railway Department estimates? No—that is for a year or two. I contend that it will be wiped off within a reasonable time.
1563. In five years? Yes. I should say that there could be no harm in risking a loss of £20,000 in five years. Ultimately the return would recoup the whole of it.
1564. Do you think the construction of the line would lead to fresh *bona fide* settlement? Yes.
1565. And the settlement of orchardists is a good kind of settlement? Yes.
1566. As a rule, they are able to live comfortably, and to bring up their families decently? Yes.
1567. Do you think there is any danger of the fruit trade being rapidly overdone? I think not. I think that under Federation we are going to have an increase in the produce of the Colony generally.
1568. Still the neighbourhood of Parramatta is not the only place in which we can grow oranges? I am aware of that; but it is one of the best of places.
1569. Do you think the trade will be over-stimulated in other parts? I think not.
1570. You know how easy it is to glut a colonial market? Yes. I might tell you, however, that the fruit-growers have been labouring under serious difficulties for years, on account of the serious restrictions laid upon trade by the other Colonies—I refer to restrictions as to the import of fruit.
1571. That is only within the last two or three years? For many years they have been met with all sorts of obstacles by the other colonial Governments. Of course, they will disappear with Federation.
1572. Every Government will have the control of its own imports as far as disease is concerned? But not as far as the imposition of duties is concerned.
1573. Do you know the country north of Dural? Yes.
1574. Do you think that, if the line were constructed, and it proved to be fairly satisfactory, there would be a reasonable prospect hereafter of its further extension? No; I think it will go almost to its limit when it goes to Dural.
1575. You look upon Dural as the terminus? Yes. I think 10 miles beyond Dural would embrace the area which would really be suitable for cultivation purposes.
1576. Some of the witnesses have stated that there are pieces of good land all the way to Wiseman's Ferry? There are patches of it; but it would not pay to go beyond Dural.
1577. *Mr. Shepherd.*] Are you thoroughly acquainted with the whole of the country as far as Wiseman's Ferry? Yes.
1578. Does the country seem to be suitable for orange-growing all the way out? Not all the way out. The country round about Dural, and to the north of it for 8 or 10 miles, seems to be peculiarly suitable, but further on it is patchy.
1579. What about Galston? That is a most suitable place for orange-growing; there is no better in the district.
1580. Is there not a good deal of scrubby and ironstone land there? It is thickly timbered, and there is a good deal of scrub.
1581. You say that there are a large number of Public Schools in the district? Yes.

1582. Do the people seem to be fairly well off and prosperous? They are a very industrious set of people. They are a people who live, one might say, as a community by themselves, inasmuch as they do not allow any means to exist whereby their earnings may be frittered away. They do not allow any public-houses in the district. F. Farnell.
8 Oct., 1900.

1583. A good many of the settlers have complained that their fruit is damaged in carrying it to market;—is that a fact? Yes, it is. I have seen it over and over again. I have seen hundreds of cases sent away, not one of which has landed sound.

1584. Is that not due to the fact that they allow the fruit to get too ripe? No. They have to pull it the day before they send it away. It occupies them a day to get it to the nearest railway station, and then there is the train journey. Of course, you know that a few hours will affect fruit.

1585. Does that remark apply to citrus fruits? No; not so much as it does to stone-fruits.

1586. Supposing that 10 miles is a fair distance from a railway to enable a person to cultivate an orchard, do you think that the construction of the line would be justified, in view of the fact that it would run parallel to another railway? They are not exactly parallel, although they are parallel at certain points. There would be a certain portion of the traffic now within the influence of the Northern railway which would come to the proposed railway. Of course, no one can contend for a moment that the Northern line will not be robbed, to a certain extent, of the present traffic. I hold, however, that it is necessary, in the interests of the fruit-growing industry, that the residents of this district should be given railway facilities, in order that the general public may obtain the citrus and stone fruits in as good a condition as possible, and also in order that the fruit-growers may obtain a fair return for their products.

1587. The Northern line and the proposed line will not be more than $3\frac{1}{2}$ miles apart at the widest portion? As the crow flies, they will be 5 miles apart, and from $9\frac{1}{2}$ to 10 miles apart by road.

1588. Is there much good land on the eastern side of the proposed line? Very little. The line would depend on the west, the north-west, and the north.

1589. Do you not think that a line further to the west would be preferable to the proposed line? No; I think the proposed line will be the most serviceable line, and will meet the requirements of the several districts better than any other.

1590. The estimate in regard to the proposed line shows that the working expenses will considerably exceed the revenue? But the railway officials are not infallible. I may mention one instance. It was contended by Mr. Harper himself, in connection with the proposed extension from Narrabri to Moree, that the line would not pay for axle grease. We find, however, that that is a section which pays almost better than any section of our railways outside the suburban area.

1591. Your opinion is that the proposed line will become self-supporting within a reasonable time? Yes; within five years.

1592. Have you been through the district of late years? Yes.

1593. Have you noticed whether the best portions of the land had been taken up, or whether the land which is still uncultivated is equal to that which is being cultivated? I believe it is. There are hundreds of acres which are still available which are equal in every respect to the land which is being worked profitably.

1594. Have you noticed several orchards which have been thrown out of cultivation? Yes.

1595. Can you give any reason for that? One reason is that the people who originally took up the holdings have depended too much upon Nature, and have not used fertilisers to any extent. They did not understand the fruit-growing industry as it is understood to-day.

1596. One would have imagined that any one who had once cultivated an orchard could easily obtain expert assistance? No. Some of those orchards have been worked for fifty and sixty years.

1597. *Mr. Hyam.*] Do you know the country from Dural to Glenorie? Yes.

1598. Do you think it is probable that if the line is constructed to Dural there will be a further extension to Glenorie? I do not think it would be required. The people of the district and the settlers of Glenorie would be satisfied to be within the influence of the line as far as Dural.

1599. You have referred to the district as a sanatorium? I spoke more particularly of the district about Castle Hill, Baulkham Hills, and Pennant Hills.

1600. Do you not think that the proper place for a sanatorium would be at or beyond Glenorie? Of course, I am not a competent authority, but I think any of the districts could be included within the category of sanatorium areas. The best evidence of the health of those districts is that no doctor can live in them.

1601. Is it your opinion that the people 5 or 6 miles beyond Glenorie would be within easy access of the railway? I think they would be well satisfied.

1602. Do you know the country between Galston and Hornsby? Yes.

1603. Do you think the road between the two places serves the district as it ought to be served? No.

1604. What is the chief objection to it? The cartage is too far, and the grades are not sufficiently easy to allow of a good load being carried. They can only carry half or quarter loads at a time.

1605. Judging by the development of the district the road has answered very well up to the present? It has given the fruit-growers some means of getting their fruit away.

1606. I suppose you think that the time has arrived when they should obtain better facilities for sending goods to market? Yes.

1607. Do you consider that the importance of the district is sufficient to warrant the construction of the railway? I do. The fruit-growers, as a community, do not trouble the Government much; they pay the ordinary taxes, and they have had little consideration in the past, although they have a great many difficulties to contend with. They are asking for the proposed line, not only as a means of improving their condition and the productiveness of the district, but also as a means of proving the products which they send to the public for consumption.

Charles Robert Scrivener, Staff Surveyor, Department of Lands, sworn, and examined:—

1608. *Chairman.*] On the eastern side of the proposed line there are two patches of Crown land which are unoccupied;—can you tell us what is the general character of those areas? One has a frontage to Lane Cove River, adjoining the Field of Mars Common subdivision. There is another large area north-west of Thornleigh. Both of them contain land of a very inferior character. The smaller area would not be useful for fruit-culture. It might possibly be used later on for residential purposes.

C. R. Scrivener.
8 Oct., 1900.

C. R.
Scrivener.
3 Oct., 1900.

1609. How would you describe the irregular-shaped pieces of land around Arcadia and Glenorie and on to Maroota? There is a large reserve north of Arcadia which was originally reserved for railway purposes. I have examined it to ascertain what land there is in it suitable for occupation, and in an area of 5,000 acres I could only find about four blocks which would be so suitable.

1610. What was the area of each of the blocks? Forty acres. I should say that not 10 per cent. of that area would be suitable for other than residential occupation.

1611. Do you think that the whole of the land suitable for orchard culture from Dural to 5 miles north of Glenorie has been taken up? The greater portion of it has, as well as a good deal which is not suitable.

1612. Do you look upon that part of the district as one capable of much greater development in the shape of orchard culture? I do not think it can ever carry a heavy population. There is land near the junction of what we call the North Road, or the road from Dural to Wiseman's Ferry, and the road from Windsor to Wiseman's Ferry, which is better than that about Dural, and it is, relatively speaking, within easy distance of water, and yet only a little of it has been selected. That land is within 6 or 7 miles of steam carriage on the Hawkesbury.

1613. Would you say that, as a general rule, the country going north from Dural to the Hawkesbury becomes inferior? It does. The same may be said of the remaining lands about Kenthurst and Maroota. Some years ago we made a subdivision of what we considered to be the best lands about Maroota. The amount taken up has been very small indeed.

1614. Is it a fact that land which, a few years ago, was regarded as being too poor for orchards, is now being worked at a profit? Yes. It depends entirely on how you make the calculation. You can grow fruit or anything else in raw sand if you add fertilisers in a certain proportion, and that is how fruit is grown in that country.

1615. We have also been informed that within easy reach of the proposed line there are some patches of good forest land. Can you state where they are? I made an examination of a great deal of the Maroota land. I think that on some of the private lands about Maroota there is ironbark. I was unable to find any large quantities of it on the Crown land. Turpentine is to be found occasionally in the gulleys, but it is very difficult to get at.

1616. You do not think it is likely that much revenue will be derived from timber if the line is constructed? I should certainly say no—not even for firewood. Of course, in places, there is oak timber which could be used for firewood, but that is the only timber I know of, and there is not much of it.

1617. *Mr. Shepherd.*] What proportion of land would you describe as being fit for cultivation—I refer to land which has not been taken up, and which is within 10 miles of the proposed line? I should say that an outside estimate would be 10 per cent. of the remaining land. Where I have made an absolutely careful examination of the country, I have not found anything like it. I should say that a liberal estimate would be 10 per cent.

1618. That would include 10 miles on the western side of the line and beyond it? That is so. It includes the whole of the Crown lands about the parishes of Berowra, Maroota, Frederick, Cornelia, and Nelson. From some parts of the parishes—Frederick, Berowra, Cornelia, and Maroota—the produce would not come to the railway.

1619. Would that proportion be maintained still further north—up to Wiseman's Ferry? The parish of Frederick embraces Wiseman's Ferry, and I think the limit would not be exceeded there.

1620. Is the country broken and rocky? Extremely so. There are narrow spurs, which, in places, are not 5 chains wide. They widen out, and a man with a good deal of energy might cultivate there, but no one else.

1621. I suppose that, on account of the very rough country between Dural and Wiseman's Ferry, it would be difficult to reach a market with fruit? Of course there is a road to Wiseman's Ferry; it is not in the best of condition, but down-hill. There is not, however, a vast amount of traffic upon it; it is the mail road from Windsor.

1622. *Mr. Hyam.*] Have you had an opportunity of observing the orchards about Glenorie, and between Glenorie and Dural? I was there last Wednesday.

1623. You have stated that a great deal of the land which has been taken up there is unfit for cultivation? A large proportion of it is.

1624. Is not some of the land fit to be cultivated? Yes; in making reappraisements lately we found that the proportion of the land which was cultivatable was about 30 per cent. of the area occupied.

1625. In which particular district is it? About Kenthurst, between Dural and the Cattai Creek.

1626. Would that remark apply to Glenorie as well? I think it would apply equally well to it. I am speaking of Crown lands. Some of the older grants embraced the better land, and there the proportion would be larger.

1627. Do you mean that there is only 30 per cent. of cultivatable land or of bad land? Thirty per cent. of cultivatable land, which is now occupied for fruit culture.

1628. What about Kellyville and Glenhaven? About Glenhaven it is much the same. Kellyville is a private subdivision, and there the land—especially near the Windsor Road—is of a different class altogether.

1629. Do you think the trade of Kellyville would be attracted to the Dural railway? I do not see what they would want with the railway. Their trade would come by the main road. They have a good road through Baukham Hills to Parramatta.

1630. *Chairman.*] Could you say that the land north of Arcadia resembles in character the land between Hornsby and Berowra? Very much indeed; it is the same class of country.

1631. *Mr. Shepherd.*] The Chairman some time ago asked you a question respecting land which has been passed over, and which has afterwards been found fit for cultivation. I suppose it is usual to take up the best land first, and when that is absorbed, to take up land which has probably been passed over? Of course, that is absolutely the case. If people will have land, of course they must take what there is.

James Bordley Brown, Inspector of Conditional Purchases, Metropolitan District, Department of Lands, sworn, and examined:—

J. B. Brown. 1632. *Mr. McFarlane.*] Have you a good general knowledge of the country through which the proposed line will pass? I have known it intimately for the last fifteen years.

3 Oct., 1900. 1633. How would you describe it? It is good sandstone country. It is rough and scrubby in parts. The timber is not very valuable; but portions of it, when cleared, make fairly good orchard and straw land. It will not grow maize strongly; but it will grow wheaten hay or oaten hay.

1634. How would you class it as a fruit-growing district? Generally speaking, it contains some of the best fruit land we have. The only land I know of to compare with it for fruit-growing is the Kurrajong Heights. J. B. Brown.
3 Oct., 1900.
1635. Has there been any considerable development in fruit-growing in the district during the last fifteen years? Yes. I should say that the area under cultivation has doubled in that time. Most of the fruit-growers tell me that fruit-growing does not pay; but, as a rule, they drive out in buggies, and add a few acres every year to their cultivated land.
1636. Is the land which is not under cultivation suitable for fruit-growing? A large amount of it would be, with easy access to market.
1637. Is the bulk of the land which is not being used for fruit-growing equal or approaching to that which is being used for fruit-growing? I scarcely think it is; I think the best land is under fruit; but there is a fair amount of land which, with better facilities for getting to market, would undoubtedly be put under fruit-culture.
1638. Do you think the construction of the proposed line would add materially to the area which would be put under fruit? I think it would. Many of the old residents have a considerable quantity of land which they could put under fruit if they had facilities for getting speedily to market. Although they are within a reasonable distance of Pennant Hills, in wet weather the roads are scarcely trafficable. I have seen the roads in such a condition that it has been as much as one could do to get a horse and a light buggy over them.
1639. What roads do you refer to? Those leading from Dural to Pennant Hills, or Parramatta, or Berowra Creek. The road to Berowra Creek is a recent one, and I think the greater portion of it is now metalled. Still there are very heavy grades upon it.
1640. Is there anything in the contention of the fruit-growers that they are heavily handicapped in having to traverse the roads in order to get to a railway station? I think there is.
1641. Would it be possible to improve the condition of the roads? Yes; that is always possible.
1642. Would it be very costly? I think it would, because they have not road-metal there of good quality. The road metal they use is generally slate.
1643. Have you any knowledge of the white metal which is to be found there? There is a sandstone which grinds up as soon as you get any heavy traffic upon it.
1644. Do you think the white metal is good for road-making? I am not able to say.
1645. How would you compare the land between Dural and Carlingford with the land which is used for fruit-growing purposes on the Northern line near Hornsby? I should say that the Dural and Carlingford country is the better for fruit-growing.
1646. Would a larger percentage than that to be found on the Northern line be fit for fruit-growing? I think so.
1647. Have you a knowledge of the country between Dural and the Hawkesbury River in a northerly direction? Yes.
1648. What is your opinion of it? I think there is a fair amount of country beyond Dural which would be available for fruit culture. Six or 7 miles beyond Dural there is land which has been conditionally purchased at £7 per acre.
1649. Was it taken up for fruit-growing? Yes; principally for passion-fruit. There are citrus fruits upon it as well, but I think it is found that passion-fruit pays the best. One man told me he had 2 acres of passion-fruit, and that there was not a week during the year in which he did not send a few cases to Sydney, and that he realised out of his 2 acres, within twelve months, the sum of £90.
1650. Has there been much increase in settlement during the last ten years north of Dural in the direction of Wiseman's Ferry? Six miles beyond Dural there has been a large increase. A few people went to live further north than that, but they were so handicapped by the distance from the road, and by its terrible condition, that they had to leave.
1651. For how far beyond Dural would you class the country as being fairly good for fruit-growing? Twelve miles. At a place known as the Little Forest and Beckett's Forest there is some exceptionally good land.
1652. Is there fair land beyond that point to the Hawkesbury River? I am speaking of the land on the main road. The land runs off in spurs, and it is upon the crowns of the spurs that you find the best land. The gulleys, of course, are useless.
1653. How would you compare the country north of Dural with that between Carlingford and Dural? The better land is between Carlingford and Dural. Six miles beyond North Dural the land gets poorer.
1654. Is there a large area of Crown lands available for settlement? I am not able to state the exact area; but I should think there is something over 1,000 acres which might be made available. I do not think more than one-fourth of the land, out of every 40 acres, is really cultivatable.
1655. Are you referring to Crown lands? Yes. I am not speaking of the Crown lands already occupied.
1656. Do you think that the importance of the district, in view of the fruit-growing industry, warrants the construction of a line of railway which would be close to the Northern line? I do not know that I am competent to express an opinion. It is an important district with a large population. I may state that 10 acres of good land will keep a family there, and the population is increasing fairly fast—faster than in any country district I know of.
1657. In the event of it being found desirable to construct the proposed line, do you think there is anything to warrant it being continued in a northerly direction beyond Dural? I do. Beyond Dural you would bring a larger amount of Crown lands within the influence of the railway.
1658. Do you think there would be a marked increase in settlement if railway facilities were given? If railway facilities were given, I believe every acre of it would be rushed, and taken up almost immediately.
1659. Do you think it would be largely taken up for residential purposes between Carlingford and Dural? There is no doubt that it is a healthy district, and that there is every inducement for people to take up residential sites.
1660. Have you any knowledge in regard to the marketable timber to be found within easy distance of the proposed line? I do not think there is a large amount of marketable timber there. There is not a great deal to be found until you get 10 or 12 miles beyond Dural.
1661. You would not consider the timber traffic of the railway an important item? No. I think there would be a large traffic in fruit and passengers.

- J. B. Brown. 1662. *Chairman.*] Do you think it is a district which is likely to develop very much further in the way of orchard culture? I think that with increased facilities for getting to market a much larger area would be put under fruit.
- 3 Oct., 1900.
1663. Do you find the people of the district complain of the present difficulties of transit? Yes.
1664. Do you think that that is a material handicap to them? Yes.
1665. Do you think that, with railway construction, the area under orchards could be doubled? Quite, and perhaps more.
1666. That is in the district to be served by the proposed line reaching as far as Glenorie? Yes.
1667. Do you know what is the average yield of fruit per acre? No; but I should say that three cases would be a large average per tree, and that would mean about 300 cases to the acre. No doubt the ground would have to be manured to produce that.
1668. Do the people complain of the difficulty of getting manure to their orchards? They complain of the heavy cost of cartage.
1669. Do you think that with a rate practically double that which is now charged on the Northern line, the orchardists within easy distance of the proposed line would patronise that line, if constructed? I think they would; it would be to their advantage to do so.
1670. Which do you think would serve that part of the country best—a tram-line from Westmead to Parramatta or Dural, or the proposed extension from Carlingford? The proposed extension from Carlingford.
1671. Do you know whether there is any inquiry in the district for small plots of land for residential purposes? There is an inquiry, and they are still being sold occasionally. I think it would be a large residential district if people had the means of getting there. They complain that there is no line of coaches, and that they cannot get there on Sunday.
1672. Do you think that with a railway to Dural the district is likely to commend itself to city men for residences? My experience of city men is that they do not like to get beyond half-an-hour's journey from Sydney, and that journey could not be done under an hour or an hour and a half.
1673. *Mr. Hyam.*] Do you find that the people who have taken up the land have complied with the Act as regards improvements? The great majority have. Those who have not done so have had to forfeit. We have had very few forfeitures.
1674. I suppose you have had some? Only odd ones.
1675. Has the land which has been forfeited been taken up by other people? Yes; I think that those who forfeited took up the land for speculative purposes.
1676. Was much of the Kenthurst land thrown up by the people who took it up? No; they have it still.
1677. Are they doing anything with it? No; they are waiting for some one to come along and buy it. It is lying there unimproved, except what was necessary to comply with the Act.

WEDNESDAY, 21 NOVEMBER, 1900.

Present.—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

|--|--------------------------------|
| The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | The Hon. SOLOMON HERBERT HYAM. |
| The Hon. ANDREW GARRAN, LL.D. | JOHN CHRISTIAN WATSON, Esq. |
| JOHN McFARLANE, Esq. | |

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 1678. *Mr. Watson.*] When you were last before the Committee you promised, if possible, to supply particulars of the estimated cost of the proposed tramway from Parramatta to Dural, following generally the main road *via* Baulkham Hills? I think I mentioned that there was a tramway proposed to Baulkham Hills.
- 21 Nov., 1900.
1679. The tramway is shown on the map as having been surveyed as far as Dural;—the survey, I believe, was made before the Rosehill line was resumed? The line I have been considering is one to Baulkham Hills, but the line on to Dural would be of much the same character as regards permanent way, except that the present proposal to carry a line to Baulkham Hills contemplates an electric line, and the estimate would include the rolling-stock and power. The permanent-way portion of the line to Baulkham Hills, nearly 5 miles from the starting point at Parramatta, is estimated to cost a little over £20,000, or about £4,000 a mile.
1680. Is that for permanent-way without equipment? Yes; the electrical equipment would about double the amount. The line, as regards permanent-way, might be carried on to Dural, cheapening the work a little by keeping on the road. As regards equipment, it would not be the same thing, because it would not pay to apply electrical equipment to a long extension such as that to Dural. The traffic would be so small that you could not get a good average load on the engine.
1681. *Dr. Garran.*] You think that steam would be cheaper? Yes; if you carried a line on to Dural, and if you had the first part worked by electricity, certainly the end portion ought to be worked by steam.
1682. *Mr. Watson.*] Can you say what are the grades of the road as far as Baulkham Hills in connection with which you propose to use electricity? The worst grade is about 1 in 19½.
1683. Would it be practicable to use steam on that grade at a low rate of speed? Yes; we have grades in Sydney and its neighbourhood on the tramways of 1 in 17; 1 in 18 is considered about the maximum, but we have one or two grades of 1 in 17.
1684. *Dr. Garran.*] What is the stiffest tram grade we have in Sydney? There are one or two grades of 1 in 17. I do not exactly remember where they are, but there is one out at Waverley, I recollect, although it is only a short length.
1685. *Mr. Watson.*] What load would the steam motors at present in use draw on such a line as that you have mentioned at Parramatta, assuming the track from Baulkham Hills to Dural to be as easy as that from Parramatta to Baulkham Hills? I should think three or four trucks—probably four. From
Dural

H. Deane.
21 Nov., 1900.

Dural in the direction of Parramatta the grades would be easier, and they could be made even better than they are. The grades I have given are, of course, adverse to the outward traffic.

1686. If it were decided to construct a tramway in lieu of the suggested railway, I suppose the cost—taking into account the large resumptions in the case of the railway—would work out at about half the cost of the permanent-way? It would be very much cheaper to construct a tramway, because you would be able to follow the road nearly all the way, and avoid very large resumptions.

1687. Would there be a much greater cost of maintenance on a tramway as compared with a railway, taking into account the cross-road traffic? I do not think so, if the tramway could be carried along the side of the road, as, no doubt, would be the case. If the tramway were carried in the middle of the road the maintenance would be a very serious item, because the Railway Commissioners would have the responsibility of the repair of the principal part of the road.

1688. In the estimate which was prepared for the tramway as far as Dural, was it contemplated to make the line in the centre of the road, or to make it alongside the existing road, involving, of course, the cuttings where necessary? It was always intended that the tramway should be laid along the side of the road.

1689. The estimate covered the cost of the cuttings? Yes.

1690. I understood from your previous answers that you advocated keeping the line at the side of the road? Yes; away from the part of the road where the wheeled traffic runs.

1691. It would not materially interfere with access to gates and other conveniences? No; you could still leave space for a footway 10 or 12 feet wide.

1692. Where the general traffic would cross the tramline, would the rails be knocked about to any considerable extent? No; we should have to fill up and make a good surface.

1693. You would use guard-rails? Yes.

1694. The traffic generally in that district is not of a heavy character, it is mostly that of light vehicles—spring-carts and drays? I think the vehicles are pretty heavily laden sometimes. The roads used to be in a terrible state from the traffic, and there is at times a good deal of it. I suppose it would consist chiefly of drays and carts laden with produce from the orchards, and the oscillation in the case of two-wheeled loaded vehicles causes a great deal of wear.

1695. Suppose it were proposed to run the tramway along the suggested route, and to use steam, would you require any special equipment in the way of trucks, or would you use the ordinary trucks with the existing steam motors? The wheels would have to be specially adapted to the tramway, because it would go through the main street of Parramatta—that is, Church-street. Of course, there you must have guard-rails, and the truck wheels would have to suit the curves.

1696. Could you give us the distance from Parramatta to Dural by road? The total distance would be about 12½ miles. The first 5 miles of construction to Baulkham Hills, as I have said, would cost a little over £20,000, and the second portion of 7½ miles would cost about £24,000, making £44,000 altogether. That would include all the cutting down of grades and so on, giving a grade of about 1 in 30 approaching Parramatta.

1697. If the trucks used on such a tramway had flanges suitable for straight running, could they be run into Sydney over the ordinary line so as to avoid the transhipping of the freight? They could be; but I do not know whether the Commissioners would care to do so. The trucks could be run in just the same way that the tramway motors from the Ashfield line are run into Eveleigh over the railway, but I should imagine that a good deal of care had to be exercised in taking them over the points and crossings where they would be likely to be derailed unless they were taken along very carefully.

1698. Would it be possible by making a deviation near Parramatta to avoid going through the streets, and thus render it practicable to use the ordinary trucks? You could, of course, go along other streets than Church-street; for example, you could go along O'Connell-street, but you would lose a good deal of traffic in the neighbourhood of Parramatta. It has been estimated in connection with the Baulkham Hills proposal, that a good deal of revenue would be obtained within a certain radius of Parramatta—that is, within the first 2 miles—from local traffic.

1699. But you would not necessarily lose all that by going into a street a little further back than Church-street? I should be afraid that you would lose nearly the whole of it. I do not think many people would care for walking through into another street. O'Connell-street is the second street from Church-street.

1700. Would it not be possible to get a route along a street not used so much as Church-street? The line I at first recommended followed Marsden-street, and crossed the river just below the Dam, turning round at the back of King's School into O'Connell-street which it followed into Clifford-street, turning into the Windsor-road just before you get to the bridge.

1701. That route, of course, does not provide for the pick-up traffic in Church-street? No; it was thought at that time that it was undesirable to go along Church-street with a steam tramway, especially as the Lennox Bridge over the Parramatta was pronounced to be not strong enough for the purpose. In the case of an electric tramway, however, the conditions would be entirely altered; there would not be the same objection.

1702. Assuming the main objective to be Dural, would it be practicable to start from O'Connell-street, and keep straight on until you joined your original survey, near the King's School? You could not join the railway at O'Connell-street.

1703. You think you could run ordinary trucks along the route you have just mentioned, speaking from an engineering standpoint? No doubt the ordinary permanent-way could be laid down there. The only thing is that the curves are small. I doubt whether you would get ordinary four-wheeled trucks round by whichever route you might adopt. Unless you adopted the railway route to Westmead you would have, I think, to provide special rolling-stock at the Parramatta end. As soon as you get outside Parramatta, you could adjust your curves so as to admit of the use of ordinary trucks. It would add somewhat to the length of the line; but probably the cheapest way of meeting all requirements would be to have a tramway for passengers along Church-street, and connect with the main line for trucks out at Westmead. That is a matter that requires very serious consideration, because I am not certain at the present moment whether suitable junction arrangements could be made at Westmead.

1704. *Dr. Garran*] If you took the route through the back streets, could you make use of the Lennox Bridge, or would you have to make another bridge? If we went from Westmead there would be only an ordinary timber bridge over the Parramatta; you would not have to touch the Lennox Bridge.

- H. Deane.* 1705-6. But suppose you crossed the river parallel with Lennox-street? Then you would have to build a bridge of some kind.
- 21 Nov., 1900. 1707-8. Would that be more expensive than the reconstruction of Lennox Bridge? No; I do not think it would.
1709. You would have to make some alterations at Lennox Bridge if you took the traffic over it? It would be good enough as it is for an electric tram.
1710. But you would have to widen it, would you not? I do not know that that would be necessary; it is only a short bridge.
1711. *Mr. Watson.*] As far as either the goods or passenger traffic is concerned, after you get a few miles away from Parramatta there would be no objection to junctioning? No; I do not think so.
1712. Would the total cost be approximately the same for a tram-line junctioning at Westmead as for a line junctioning at Parramatta? I think it would be a little less for a line junctioning at Westmead. The construction would be easier, I think.
1713. Are we right in inferring that a line to carry the ordinary trucks could be constructed from Westmead to Dural for a little over £44,000? Yes; I think you can depend on that.
1714. That would serve all the goods traffic and so much of the passenger traffic as is beyond the suburban influence of Parramatta? Yes.
1715. Do you remember what number of trucks are usually taken in a train by the small locomotive on the Camden tram-line? No; I do not remember.
1716. It would be more powerful, I presume, than the ordinary steam motor? They are pretty light locomotives on the Camden line; but I could not give you trustworthy information on the point. It would be easy, of course, to have a stronger locomotive if you had a line laid with fairly good curves. You could have a better locomotive than the existing motors, which are intended to go round very sharp curves.
1717. Do you think that the line to which I have just referred from Westmead to Dural, following generally the main road, after you strike it near Parramatta, would permit of easy curving? Of sufficiently good curving.
1718. Sufficient for a heavier class of locomotive? Yes; but the whole matter would require to be worked out.
1719. *Dr. Gavan.*] What is the idea of starting from Westmead at all? You cannot get off from the railway line at Parramatta. The line there is over the level of the street, except just at the Parramatta station itself, which is on a little bit of a hill.
1720. It is a question of levels? Yes.
1721. Is Westmead lower than Parramatta? I do not think there is very much difference between the two places; but there is a dip in between.
1722. But the climb from Westmead to Baulkham Hills is just as bad as the climb from Parramatta to Baulkham Hills? Yes.
1723. It is rather a shorter distance? Yes; but it would not make very much difference, because the first part of the tramway through Parramatta would be approximately level. You would have to rise from about the same point in either case.
1724. If you had a tramway up Church-street, how would you get on to the railway level? The line would come up into the goods yard by one of the roads.
1725. It would be a pretty stiff climb, would it not? No; it could be done with a grade of about 1 in 40. Of course you could not get exactly on to the level of the rails; you would come in at the back of the goods yards, which is somewhat lower.
1726. Then was the idea to unload and transfer the freight? No.
1727. But you would want to take the tramway on to the level of the rails, would you not? Yes; but the connection would be made further on.
1728. You would have to go some distance beyond the goods-shed to make a connection;—would it not be rather awkward to take the trucks some distance beyond the goods-shed, and then shunt them back? I think it could be arranged very easily. You would land the passengers near the goods-shed.
1729. But you would have to take the goods further on, and then shunt back? There would be no shunting back; the goods trucks would be drawn out by an engine from the station-yard, and put on to the fore part of a train.
1730. Whatever course is adopted, it would be necessary for you to take the goods beyond the actual platform? Yes; but there would be no additional running.
1731. *Chairman.*] Why was not the proposal to build the tramway proceeded with? I could not say; I do not think it was thought sufficiently well of. There have been such a number of rival schemes, that there may have been some difficulty in making a selection.
1732. Do you know why the private line proposed from Castle Hill was not gone on with? I believe it was considered by the Legislative Council that the preamble of the Bill was not proved.
1733. *Mr. Hyam.*] Do you think there is any possibility of reducing the cost of the construction in the case of the Carlingford-Dural railway? Not appreciably, I think. The location of the line is bound partly by the admissible curvature, and partly by road-crossings. You could not very well cheapen it by putting in steeper grades, because the grades are already only such as should be allowed.
1734. Could no easier route be found? I think not. A great deal of attention has been paid to the location of the line. Several deviations have been tried on both sides of the road, and I am sure that no better line can be got. The road runs along the ridge, and you are bound to follow the ridge; otherwise you get into difficulties.
1735. Speaking of the difficulty of taking the trucks direct into Sydney, would not the cost of working the traffic be seriously affected, if the goods had to be unloaded and reloaded? There would not only be all the extra charge for unloading and reloading, but there would be the possibility of damage to the fruit from the extra handling, which is a thing to be avoided.
1736. The fruit freight upon the line would hardly bear the increased cost of two handlings? No; without having consulted the traffic officers on the question, I might say that I think the best way to serve all the traffic would be to run a goods line from Westmead, and a passenger line along Church-street, and to join the two somewhere beyond the crossing of the creek.
1737. Running all the goods traffic to Westmead, in order to avoid a change of trucks? Yes.
1738. The trucks would then run through from Westmead to Sydney? Yes; otherwise you would require

- require to have special goods trucks to run over the sharp curves going through Parramatta, and you would have the extra handling involved in shifting the goods from one truck to another at Parramatta.
1739. Speaking generally, do you prefer the idea of constructing the tramway to the extension of the railway from Carlingford? I think it would serve the interests of the place better.
1740. You have no doubt that it would answer the same purpose? I think it would.
1741. Have you any idea of what rate of speed would be observed upon the tramway;—I suppose it would be about 8 or 9 miles? About that, I should think. At times no doubt they would run faster than that. If there were a good bit of straight running, they could safely run 12 or 15 miles an hour.
1742. That is a high rate of speed on a tramway, is it not? They can run much more than that if required.
1743. With any degree of safety? Yes.
1744. And with a big load? With a fair load.
1745. I mean with a passenger carriage and two or three trucks? I should not recommend running faster than 15 miles an hour. That would be about the maximum; but I do not think there would be any particular danger, except at the sharp curves in running at a higher speed.
1746. There are very few instances of trams leaving the rails on the curves? It very seldom occurs; they are always protected by guard rails.
1747. *Chairman.*] Would you offer an opinion upon this point: which of the two tramways, the line running through Parramatta and keeping to the side of the road, or the line from Westmead, would best service these two purposes—the development of the fruit industry and the carriage of passengers? I do not think either of them would serve both purposes.
1748. *Dr. Garran.*] You do not contemplate the goods traffic from this branch line being carried as separate trains into Sydney;—it would be hooked on to other trains? Yes; I do not think the train loads would be big enough to go through separately. With regard to a question put to me by Mr. Watson some time ago, I should like to say that although the general passenger traffic would be just as well served—I mean the passenger traffic to and from the main line—by the Westmead line as by the other line, I think a certain amount of traffic might be lost if the line went to Dural from outside the junction of the two lines. Persons from outside wanting to come into the heart of Parramatta would scarcely care about coming up to the Parramatta station, and for that reason it is possible that some of the traffic might be lost.
1749. You mean persons wishing to come into the shops at Parramatta? Yes. I believe the Parramatta people would object, as they objected some time ago to any proposal bringing traffic past Parramatta, as it were.
1750. *Mr. Watson.*] The Westmead line would still land the passengers at the Parramatta station? Yes.

H. Deane.
21 Nov., 1900.

Hugh McLauchlan, Secretary to the Railway Commissioners, sworn, and further examined:—

1751. *Mr. Watson.*] The Engineer-in-Chief for Railway Construction stated that a light tramway line might be constructed from Westmead towards Baulkham Hills, following that road on to Dural at a comparatively low cost—something like £4,000 a mile—and in speaking of the probable traffic from Dural the residents calculated an output of fruit equal to 500,000 cases per annum. Spreading that over nine months of the year, it runs out at something like 13,000 cases a week as a maximum. There might be under that estimate, say, 3,000 cases a day? Yes; the traffic would be very heavy about December or January.
1752. Assuming that you had to carry 3,000 cases a day, how many trucks would it be necessary to load? It would depend upon whether the fruit were packed in gin or packing cases. Oranges are often packed in gin cases, and summer fruit in packing cases. We generally load about 200 gin cases or 300 packing cases, to the truck. The average would be about 250. That would mean twelve trucks for the 3,000 cases.
1753. Could you say whether a locomotive similar to that in use on the Camden line would draw twelve trucks to the load? It depends upon the grade.
1754. Assuming the grade to be 1 in 30, would it take six trucks? Yes; I should say it would take six.
1755. So that in two loads it would be possible to bring in the 3,000 cases? Yes.
1756. Assuming that you had to divide the train in two, there would be no difficulty in dealing with it? No; naturally you would make more than one journey, because you would run mixed trains. If you took the roundabout way you suggest, however, I think the traffic would still come to the old line. There would be a local rate from Dural to Westmead, and another local rate from Westmead to Parramatta, and I think you would find business would still be principally with the Pennant Hills station.
1757. If the contention of the Dural people be correct, it would pay them to give something extra to get on to the Carlingford railway;—that being so, it must be assumed that it would pay them equally well to get on to the Westmead line? Yes; but that would be a more expensive proposal than the other line.
1758. The total cost of the proposed line from Carlingford to Dural is £67,690, plus the cost of land resumption, which would be about £8,000 or £10,000; Mr. Deane states that the tramway from Westmead to Dural, following the main road the greater part of the way, with a grade of 1 in 30, can be put down for less than £44,000? But I should like to know what the distance would be.
1759. It is 3 miles greater, but the reduction of the cost per mile leaves a saving? The public will have to pay for the length of haulage, and if a tramway is desired, I cannot see why you should not make it by the shortest route—that is, by an extension from Carlingford. If you wish to supply the Dural district with a tramway I cannot see any need for constructing one from Westmead when you could construct one from Carlingford, a much shorter distance. By doing so you would save the additional haulage.
1760. But would such a line serve the Baulkham Hills district equally well? You must bear in mind that Dural is the objective point. Both lines would merge on to that point. It is not altogether a question of first cost; there is the question of daily cost to be considered.
1761. What is the distance from Clyde station to Westmead? It is a little over 2 miles, I believe.
1762. I find that it is 26 miles 34 chains from Dural, *via* Carlingford to Sydney, and that the distance by the other route, *via* Westmead to Sydney, is 27 miles 40 chains;—I suppose the difference in the cost of haulage, in the case of fruit, would not be very much for the extra mile? It would not be very much. I thought the difference in distance was greater.

H.
McLauchlan.
21 Nov., 1900.

- H. McLachlan. 1763. Practically, the haulage would be much the same by either route? Yes; but you must also look at the matter from the point of view of the passenger business. A mile to a passenger means something.
- 21 Nov., 1900. 1764. Would a tramway serve the people of Baukham Hills and Castle Hill, going from Westmead, to better advantage than would a tramway from Carlingford to Dural? It might; but a tramway from Westmead, if it were carried by the side of the main road, would be more costly to maintain than would a tramway from Carlingford to Dural; and there would be the maintenance of 9 as compared to 12 miles.

FRIDAY, 23 NOVEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LYNDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 1765. *Chairman.*] Since giving evidence before, you have had an opportunity of investigating a proposal to connect Carlingford with Dural by tramway instead of by railway? Yes. I am sorry to say that we have no information as to levels on the road between the end of the Carlingford line and where it would join up with the Parramatta and Dural tramway, but I imagine that there would be no great difficulty in carrying a line through there. For a short distance the present line would have to be continued through the orchards so as to get up on to the road. And from there I daresay it could be carried, with a few deviations, practically along the road. I think the cost of such a line would be about half what the railway would cost. And there would be very little land resumption; so that item would be very nearly knocked out.
- 23 Nov., 1900. 1766. *Dr. Garran.*] We should like to know the levels on the road from Carlingford to Dural and also from Westmead to Dural? Yes. I have the levels between Westmead and Dural.
1767. With regard to the wear and tear of tram-road rails on a road, can you get any information as to the life of a tram-road rail in the city? There is no information such as would be useful to the Committee.
1768. It would not be a corresponding wear and tear? No. Some of the tram rails of course wear for a very short time, but that is largely due to the action of the brakes in stopping as well as to the road traffic over the rails. But in a line of this kind, with a small amount of traffic, they would probably last for a very long time. I do not think there is any experience to show that they would wear out at all rapidly.
1769. If you laid a rail on the road, by the side, as you propose, you would not make it stick up as on a rail-road, but it would be level with the road? It would be level on the outside, but there would be a little dish between the rails.
1770. Because you could not prevent carts from going on to the track when it is on a part of the public road? You could not prevent them from going on to the track. It would be all right for a cart that got on to that track would be able to proceed very well, but of course the driver would not choose it.
1771. In wet weather these roads get very bad, and we constantly hear of the carters complaining; if your track happened to be the better they would use it;—for instance, if you had an asphalted portion, and it was very smooth, the carters would use your road in preference to the main road? The road would be made of broken metal, and would be kept fairly smooth, so that anybody could travel along it; but it would be like a newly-made road.
1772. You think there would be no difficulty on that score? No difficulty at all.
1773. *Chairman.*] Would not the construction of this tramway materially reduce the ordinary traffic on the road? No doubt it would.
1774. Can you state what load you are likely to be able to draw along a tramline from Carlingford to Dural, over the proposed grades? I should like to work the whole thing out. As this is a very important modification of the proposal, perhaps I may be allowed to suggest that it had better be worked out very carefully. I think the Committee would then have something really valuable to go upon.
1775. I suppose that in any case, it would require an ordinary locomotive to take trucks over the line? I cannot exactly say. Of course there is a difficulty in the way of making use of the small tram-motors. The drawbars are so much lower in level than the drawbars of the ordinary rolling stock, and therefore some adjustment would have to be made. I suppose it could be done readily enough; but, if it were not, every pull of the tramway locomotive would pull down, and you would lose a lot of force, and the reaction would tend to tip up the locomotive and cause an uneven rocking or pitching motion which would be very undesirable.
1776. Do you think that Mr. Hanna could give us some rough outline of the grades on the roads? I think he might be able to do so; but I do not think there is anything in the way of grades at all bad. I have been over the roads. The really bad place is on the other line. At Castle Hill, where the road forks, there is a very awkward hill, and whether we made a tramway or a railway, we should have to deviate round that.
1777. But that would not affect the Carlingford-Dural line? No; it does not affect the branch line from Carlingford. An ordinary tramway would cost from £2,500 to £3,000 per mile, if placed on the road; but here and there we should have to depart from the road, and perhaps go around a hill or enter into a little cutting, and so on, and I think that if you put the amount down at £3,500 per mile that would cover all the cost.

Walter Alexander Smith, District Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

W. A. Smith.
23 Nov., 1900.

1778. *Mr. Watson.*] You know the main road from Carlingford to Dural—the one going by Pennant Hills? Yes.

1779. Can you give the Committee a rough idea of the grades along that road? The worst grade is at Thompson's corner—the junction of the Carlingford and Pennant Hills road,—the road leading to Pennant Hills railway station.

1780. *Dr. Garran.*] Is that the summit-level on the whole road? Very nearly. It rises slightly from Pennant Hills to Castle Hill. Speaking from memory, I should say that the altitude of the road varies from 650 feet to 720 feet.

1781. *Mr. Watson.*] Can you say what would be the worst grade between Carlingford and Dural? There would be two bad grades,—one at Milson's Hill, near Castle Hill; and the next worse grade would be just below Thompson's corner.

1782. What are those grades? I have no section of them; but I should say that Thompson's corner hill would be about 1 in 13, and Milson's Hill about 1 in 12.

1783. Would there be any great difficulty in making cuttings at those places to reduce the grades, say, to 1 in 25? It could not be done.

1784. Would it require any considerable deviation to get that grade at those two points? No; it would not be a very serious matter.

1785. Is the rest of the road generally a fair grade? Yes. Those are only the two serious grades.

1786. Speaking generally, would you say that it would be an expensive matter to get a ruling grade of 1 in 25, or 1 in 30? It would be rather expensive at those two places, because the gullies are very precipitous near Pennant Hills, and this road is right on the ridge, which falls away suddenly in different places; but, on the whole, it could be done without very great expense.

1787. Supposing you were taking a tramline from Carlingford to Dural, would it be better to follow the main Castle Hill road rather than what is known as the "back road"? The back road, or, as it is known, the New Line Road, would be a very expensive road. It is nothing but up and down hill. The grades are very long and steep.

1788. So that, from a tramway point of view, the better track would be the main road? Yes; I should call the back track, or New Line Road, impracticable.

John Charles Hunt, fruit-grower, Dural, sworn, and further examined:—

1789. *Chairman.*] Since you gave evidence, some time ago, two or three suggested alternatives have been placed before the Committee, as means by which Dural could be served with railway communication; one of these being a tramway from Westmead, which would join the Baulkham Hills road a few miles out from the main line; another being a tramway starting from Church-street, Parramatta, and following the road out to Dural; and the other being the construction of a tramway from Carlingford to Dural, constructed, as far as possible, along the side of the road;—can you state whether any of these three proposals meet with your approval, as representing the fruit-growers of the district? As you are aware, I am the Chairman of the Rosehill Railway League, and I certainly think that the road from Carlingford to Dural is the shorter; and as I am associated with the fruit-growers living along that route, I should prefer a line from Carlingford to Dural to any other line.

J. C. Hunt.
23 Nov., 1900.

1790. That is, you prefer the railway as proposed? Yes; I should prefer that to a lighter line.

1791. Would either of the two tramways—one from Westmead and the other from Parramatta—serve as large an area of fruit-growing country as the Carlingford-Dural line would? Yes, I should think so. I should like to ask whether the ordinary rolling stock, that is used on the railways, would be used on any of these lines?

1792. It is suggested that on the Carlingford-Dural line the ordinary rolling stock could be used? If a tramline that would not carry the ordinary rolling stock were laid down it would be of no use to the fruit-growers.

1793. In whatever way this district may be opened up by rail, you regard it as absolutely necessary that the ordinary rolling stock of the railways should be able to run upon it, so as to avoid the necessity of transshipping? Yes. I gave evidence on that point on the last occasion. I then stated that the transshipping would do away with any benefit that might arise from having a tramway. The less handling fruit gets the better. The fruit would be injured by the extra handling.

1794. Presuming that the ordinary rolling stock could be run to Carlingford—trucks which could run right through on the main line either to Sydney or Melbourne, as you might desire—would a tramway, as suggested by Mr. Deane, supply the wants of the people of the Dural district and the surrounding districts? In the absence of a railway, of course it would be better than nothing; but I should like to see a railway constructed, if we can possibly get it. In the absence of a railway, I daresay that for a time a tramway would carry all the fruit that would be produced in the district.

1795. Mr. Deane has informed the Committee, as a rough estimate, that the cost of the tramway from Carlingford to Dural would probably be less than half the cost of the railway, and that the absolute cost of the Carlingford-Dural line would be even less than that, as it would avoid the necessity for expensive land resumption; that, of course, has a material effect on the finances of the line, a matter we are supposed to inquire into;—taking that into consideration, and also the fact that the officials estimate the annual expenses, without considering land resumption, at £4,822, and the estimated revenue at £1,025, do you think that, under the circumstances, the tramway is a proposal which should be seriously considered? I should think so.

1796. Would it hinder, in any way, the development of the district? That is one of the points I wish to touch upon. There is, no doubt, a great future before that district, and, whatever may be said as to the probability of its expansion and development, I think they have been under-estimated. There is no doubt in my mind that in a few years a railway will become a positive necessity there. A tramway would, no doubt, be of some service at the present time; but I believe that the incurring of a greater expense at once, by the construction of a railway, would be justified in a very few years.

1797. *Mr. Shepherd.*] Do you think that the tramway would pay from the start, supposing that it cost only about half as much as the railway would cost? I think so.

1798.

- J. C. Hunt. 1798. What do you think of the routes proposed? I should prefer a continuation of the line from Carlingford to Dural.
- 23 Nov., 1900. 1799. Of course, the same objection would apply there to a tramway that now applies to the railway—being so close to the Northern line? Yes, it would.
1800. That is a serious objection on the part of many; of course, the further line would be more than double the distance from the Northern line, and consequently, I suppose, would open up a much larger area of country? It would be more equi-distant between the two present-existing lines.
1801. Is the good fruit-growing country extensive in a westerly direction? It is all about the same kind of country.
1802. Of course, the tramway would run at a slower speed than the railway;—do you think that would be any very great objection? It would be an objection, certainly. The shorter the time used in transmitting our fruit would be to the advantage of the fruit-grower, there is no doubt.
1803. The speed, at the outside, would not exceed 15 miles an hour, and probably would be a little less than that? If they keep to the road from Parramatta, right to Dural, it is an up-hill grade the whole way to Dural.
1804. Do you know the whole of the country? Yes, well.
1805. And the line from Parramatta, you say, would be a steeper grade than the line from Carlingford? It would be necessary, no doubt, to make some deviations, either way; but starting where Mr. Watson has suggested, you begin a grade right away at the Old Mills, and there is about a mile before you get to the top of the first grade.
1806. Do you think that the fruit-growers along the line would be as ready to contribute towards any deviation, in the event of the line being a tramline, as they would be if it were a railway; of course, the deviation would be very much less? I am not prepared to answer that question.
1807. Is there anything further you would like to state in reference to the new proposals? I think that at several points, where they might be induced to keep to the road to save resumption if they do construct the tramline, it would be far better and cheaper in the long run to make some deviations, as Mr. Deane suggests. The haulage would be very much easier, and no doubt in the future that would save a great deal of expense.
1808. Of course, you are much more likely to get a cheaper line than a dearer one, and I suppose that under those circumstances you would be quite satisfied with the tramway? I would be more satisfied with a light railway or tramway than with nothing; but I am still of the opinion that the district justifies a railway, and that in a few years it will be a necessity. There is no doubt that with a railway the district would develop far more quickly than it would with a tramway.
1809. *Dr. Garran.*] Have you ever seen the tramway from Camden to Campbelltown? No.
1810. If you have the railway you will have to take your goods to the stations? Yes.
1811. The trains will not pick up between the stations? That would be one of the objections. Whether there were a tramway or a railway it would be necessary to have a fixed time at which the train should start and arrive.
1812. Do you know that the way our railway system is worked, the trains stop only at certain platforms or stations, and that you must take your goods there? Yes.
1813. A tramway might pick up your goods exactly where the branch line joins the main road;—would not that be more convenient for your fruit-growers? Yes, if there were stated places to take in things; but it would certainly be necessary, in our business, to know within a few minutes the times when the trains would start.
1814. A great many of your orangeries are in the valleys, and the fruit-producers have to go up by second-class roads to get on to the main road? Yes.
1815. Well, if the tram stopped there to pick up your fruit, that would be more convenient for your fruit-growers than if they had to go 2 or 3 miles along the road to get to a station? Yes; so long as they had a fixed place for picking up.
1816. For that purpose the tram would be rather more convenient to some of your people than the railway would be? It would be convenient to have stations at the junction of the roads.
1817. Would a tram service that would run three or four trucks, at the rate of 12 or 15 miles an hour, practically go as fast as you would want to go? Yes, it would.
1818. If I understand your evidence rightly, your trouble is caused by the bad state of the roads in wet weather, as well as the distance? Yes.
1819. The bad state of the roads in wet weather is a great drawback? Yes.
1820. You want to send your fruit in a hurry to catch a particular market, and if the weather happens to be very rainy your horses cannot drag an ordinary load right through? Yes.
1821. If you could get as far as the tramway, and then get your goods taken the rest of the way on the rails, you would get over that trouble? Yes.
1822. The road part of your journey will be much easier? Yes.
1823. And that would be a benefit to all your fruit-growers? Yes.
1824. The mere question of time is not of so much importance to you? Travelling up to 15 miles an hour will be fast enough for all purposes.
1825. Are there any days in the week on which your traffic goes in in greater quantity than on other days? It is greater on the Monday and the Thursday, or else on the Tuesday and Friday, according to when it will catch the Melbourne boat.
1826. What determines your desire to send a greater quantity on any one day or another;—is it the export business? Yes. But I take it that if the proposed railway is constructed a great deal of the fruit will go direct to Melbourne by rail, so long as there is no transshipment. It would be put on goods trucks and sent right through to Melbourne by railway all the way.
1827. Does any of your fruit go that way now? All the Seven Hills citrous fruit goes that way now. The objection is that it has to go to Sydney to be fumigated and handled several times. But Mr. O'Sullivan is constructing a fumigating-shed at Albury, and is going to charge the same rate as for ordinary fumigating, and the fruit will be fumigated there. That will necessitate only one handling.
1828. If you were to get your fumigating done on your own orchards satisfactorily you would not have that trouble? We cannot get it done there. An inspector has to be present.
1829. You think there is no chance of getting your orchard so clean as to get over that difficulty? Not at

at the present time. But with a fumigating-shed at Albury there will be no necessity to send that fruit at all to Sydney. It will go direct to Melbourne by rail. The rail-carriage is nearly as cheap as water-carriage, and the fruit is carried much better. J. C. Hunt.
23 Nov., 1909.

1830. You must change at Albury, because of the break of gauge? Yes.

1831. But you would fumigate there? Yes. Mr. O'Sullivan is having a fumigating-shed built there now.

1832. Then this tramway would serve you as well as a railway if ordinary trucks were run on the line? Yes.

1833. And that is all you stipulate for? Yes.

1834. The Camden tram goes 8 miles in half an hour—that is, at the rate of 16 miles an hour;—that is quite quick enough for you? Yes, I think so.

1835. Whether you had a railway or a tramway, your shipments would be the same;—what would you call a full day's export from your district on your business day? Sometimes from Pennant Hills twelve or fourteen trucks go away in a day, and I should say ten to twelve trucks full weight. With lighter haulage it would necessitate more trucks, and less weight in each truck.

1836. Is that all by one train, or spread over two or three trains? Spread over two or three trains. Some goes by passenger train at the present time.

1837. A suitable tramway could deal with that traffic as well as a railway could? Yes. If one train would not take it all, they would no doubt send two or three trains.

1838. It is not a very large amount of traffic for a railway to carry? No.

1839. A tramway could easily manage that? There is no doubt there would be a great industry in wood-cutting for a few years, and that would necessitate other trains, but these could be run in the middle of the day.

1840. The Camden tram carries a great deal of wood—in fact, that is the principal paying freight; and that is a very good test of what a tramway can do with regard to wood traffic;—you would not expect to task your tramway more severely than the Camden tramway? I think there would be more traffic on our line than on the Camden line.

1841. What, in wood? I think so. They are drawing wood to the Camden line now 12 or 14 miles.

1842. Much of your fruit could be as well carried at night as in the day? Under some conditions. We could send our fruit away on Tuesday morning, and catch the Melbourne train Tuesday night.

1843. Will the profit on the citrus fruit bear the heavy expenditure of railway freight all the way to Melbourne? There is very little difference.

1844. Do you mean to say that the water-carriage to Melbourne does not cut the railway rate? They are having a cut at one another.

1845. I am afraid the Railway Commissioners make very little profit out of you? They charge something like 10d. a case, I think.

1846. How much do you consider the handling costs, per case, at present? About 2½d. for the handling in Sydney.

1847. Exclusive of the fumigating? No; 2½d. for fumigating and cartage; and then there is wharfage.

1848. I am talking of the handling from one truck to another to go to Melbourne? That costs us nothing.

1849. The Commissioners do that free? Yes.

1850. All you object to in the handling is the knocking about? Yes, and the delay.

1851. It costs you nothing out of pocket? No; they charge for the whole journey.

1852. If this tramway were made, the Commissioners would make you a charge from Dural to Melbourne? Yes.

1853. And they would do the handling at Albury as well? Yes. They do that now.

1854. Do you ship any fruit to Tasmania? Not to Tasmania, but to New Zealand.

1855. It must, of course, be taken from the railway to the ship? Yes.

1856. Is that done by cartage in Sydney? Yes.

1857. It would be of no use to run that fruit down by railway to Darling Island, I suppose, because the steamers would not go there to load it? No. They go from a Darling Harbour wharf.

1858. And they would not shift from that? No.

1859. It seems to me from your statement that a really first-class tramway would be quite equal to your present requirements? There is no doubt that it would be equal to present requirements; but I firmly believe that a railway would be more suitable to the development of the district, as regards residential sites and otherwise; and I believe that in the future there would be an extension to the Northern line. The old survey ran right through the district to Singleton.

1860. Mr. Hyam.] I gather from your evidence that you favour the railway in preference to the tramway? I certainly do.

1861. Do you think that a tramway would not develop the district as rapidly and as advantageously as a railway would? It might carry the fruit; but, for passenger traffic, it would be detrimental to the district. The railway would attract far more population to the district.

1862. In reply to Dr. Garran you said you thought that a tramway would answer for the present? Yes.

1863. Do you look upon the matter in this light: that even if you had a tramway a railway would be an absolute necessity in a few years? Yes.

1864. It will be almost imperative to have a railway? I believe that it will be within ten, fifteen, or twenty years—in fact, I believe that a railway will be running through there then.

1865. And this tramway would be no good? No good, of course, then.

1866. You think, therefore, that the better plan would be to construct the railway at once, in preference to a tramway? Yes; I think the first cost would be really the best cost. I have some evidence here given by Mr. Harper; but that bore on the old tram system. It does not apply to the proposal, as I understand it, now before the Committee. But I think that travelling along the roads is an objection to the tramway. I think that such things are better off the roads if possible.

1867. Do you think that a tramway along that road would hinder the ordinary traffic in any way? There is always a danger in connection with traffic.

1868. Do you not think that, through having the tramway there, some of the present vehicular traffic would decrease? No doubt some of it would.

- J. O. Hunt.
28 Nov., 1900.
1869. To a considerable extent? Yes; but if the tramway picked up goods at the junctions of the different roads, there would, no doubt, be increased traffic from other directions.
1870. Failing the railway, I suppose you would be satisfied with a tramway? Well, I would sooner have it than nothing at all.
1871. The rolling stock that would travel over this tramway could travel on any of the tramways? I understand that.
1872. A great consideration is to get your fruit into the market without any transshipping, and with little handling? Yes. There is no doubt that there will be a great saving in time and labour.
1873. I suppose the people of the district are not aware of this altered proposal, and you do not know their feeling in regard to it? No. I received a letter only yesterday, asking me to attend to-day, and I did not communicate with anybody.
1874. You could not venture an opinion as to the feeling of the people of the district? I take it that they would be better satisfied with a light line than to have nothing.
1875. *Mr. Shepherd.*] Have you to bring your fruit into Sydney to get it fumigated? Yes.
1876. What do they charge you per case? One penny per case.
1877. Did you ever apply for local fumigating treatment? No; it would not answer unless they did it near the railway, and then there would be delay and handling there.
1878. Are you obliged to fumigate all your goods, whether for exportation or not? Only for exportation.
1879. *Mr. Levien.*] Supposing the Committee should not recommend the construction of a railway, would you be content with a tramway? It would be better than nothing.
1880. It would run more often than a railway would? There is no doubt it would be of advantage to us.
1881. *Mr. Hyam.*] In the event of the railway being constructed, the people of the district, and I think you also, have consented to pay an extra rate on fruit—a double rate, I believe? Yes, a double rate.
1882. Would you agree to pay that double rate for a tramway? I would be willing to pay according to the advantage I received. If the cost be brought down as much as Mr. Deane says it will be, I do not think it will be necessary to charge a double rate.
1883. If the trucks were to be run more frequently, would you get your fruit away as you desire? No doubt the people would be willing to pay a certain amount for a certain benefit. But I do not think it would be necessary to pay double. If the tramway were put down at half the estimated cost of the railway, I believe the people of the district would have to pay very little more than the ordinary rates.
1884. But if the tramway did not pay expenses, would you object to paying an extra rate? I would not object to paying a little extra.
1885. The full amount you agreed to pay for the railway? I would certainly pay up to all the advantage it would be to me, and am willing to pay something over and above what the carriage costs me at present.
1886. *Dr. Garran.*] You would be willing to pay extra freight so long as in the long run you gained by so doing? Yes, I would.
1887. And you think that would be the general feeling? Yes, I think so.

James Purser, fruit-grower, Castle Hill, sworn, and further examined:—

- J. Purser.
28 Nov., 1900.
1888. *Mr. Watson.*] Since you last gave evidence the Committee have had suggested to them the propriety of constructing a tramway in lieu of the proposed railway, alternatively from Westmead to Dural, following the main road after the first mile or so; and, as against that, a tram line from Carlingford to Dural, also following the main road after leaving Carlingford a short distance;—can you say how, in your opinion, that would affect the district? We have certainly not had much time to think over it, and I am not here to turn my coat and go against the railway, for undoubtedly we prefer a railway to a tramway; but if you cannot see your way to recommend a railway, we had better have a tramway than have nothing at all, or be situated as we are at present. I consider that a tram line would meet the present circumstances of the fruit-growers, if it were laid down as a strong line that would carry the fruit and all other produce of the district. A tram line from Parramatta or Westmead would be preferable to a tram line from Carlingford, because it would open up a far larger area of country. The country from Parramatta to Castle Hill is splendid country. The Baulkham Hills district is a good district. The land is good, and there is plenty of land available for settlement, and the people of the district, right through to Castle Hill, and on to Dural, are connected in business chiefly with Parramatta. My father was a resident of Parramatta seventy years ago, and I have always done my business in Parramatta, and we have an interest in Parramatta. That tram line would link the surrounding districts to Parramatta, and would be good both for Parramatta and for the people of the surrounding districts. I am not here to advocate a tramway in preference to a railway, but as you are considering the difference in cost between a tram line and a railway, I say let us have a tram line rather than the inconvenience we suffer from at present, for it would be far preferable. There is no one in any part of New South Wales to whom a railway or a tramway connection with the city, through Parramatta, would be more acceptable than the people of Parramatta, and those living on the lands around Parramatta. We have been agitating for the last thirty years for better communication than we have at present, and I believe that these districts are deserving of that communication. We are in a good sanitary position, and the land is good. We can produce all kinds of fruits that can be produced in almost any tropical part of the world, and we are so situated that I am sure people would take up land there for settlement. Better communication with the city will induce people to settle in these districts, because of their healthiness. From Parramatta out to Dural the land is all good. If a man takes up 5 acres of land it will produce anything he likes to plant in it. These districts are not poor districts. The line would go through a prosperous part of the country. The people in these districts are, I think, the most well-to-do people now getting a living on the land in New South Wales. Their average income runs from £100 to £2,000 a year. You can pay the expenses of working a farm with about one-third, or a little over one-third, of your returns. Nothing can be produced from land like fruit for profit. It is a well-to-do part of the country, and it would pay the Government, for the sake of the prosperity of the country, to construct a line there, because it would cause people to settle where they could get a living. I believe there are no districts in the country which can surpass the northern districts of Parramatta; therefore, I would go in for a line from Parramatta rather than from Carlingford, because it would open up country that would take in Kellyville, and up to Cattai Creek on the left, and also right away to Dural. I should prefer a railway, because I believe that in the future it would open up the country better than a tram line would. 1889.

1889. You know the two roads—the road from Carlingford to Dural, and the road from Parramatta to Dural? Yes, well. J. Purser.
1890. Which do you think, without any alteration of grades, is most suitable for tramway traffic? From Parramatta. 23 Nov., 1900.
1891. Is that an easier grade? Yes, by far.
1892. Not so steep as from Carlingford? Not to compare with it.
1893. The objection to going through Parramatta itself with the suggested tramway is that, if you were to do so, you could not lay down such a line in the streets of Parramatta as would allow you to use the ordinary large trucks which would be required to carry the fruit on the main line;—and, to get over that difficulty, it is suggested that you should start from about Westmead, and join the main Baulkham Hills road just about the bridge near Murray's mill? If that is a fact, we would prefer it from Westmead, because we must have a line sufficiently strong to carry the fruit and other produce.
1894. It is necessary that you should have rolling stock that will go on the main line? Undoubtedly.
1895. Otherwise it will not be of much value to you? No.
1896. Assuming that such a tramway were constructed as would carry the rolling stock referred to, would it then be worth the while of the people of the district to pay an extra rate, as suggested, in respect to the proposed railway? I think so. I believe the people would be so pleased at getting what they have been asking for the last thirty years that that would not cost them a thought.
1897. That would be, of course, only until the line paid? Yes.
1898. Do you think there would be a greater probability of the line paying if it were taken *via* Baulkham Hills than by Carlingford? Yes, two to one.
1899. You think that the extra traffic coming in from Kellyville, and west of Baulkham Hills, would make up the additional revenue required? Yes; I am not exaggerating when I say two to one.
1900. You think the people about Pennant Hills are well served by the present Northern line? Yes.
1901. But that the Baulkham Hills people would naturally prefer the line that went near them? Yes; and also, Kellyville, and right away to Cattai Creek.
1902. In the estimates put before the Committee by the local people they did not count on getting a great deal of the Kellyville traffic for the Carlingford-Dural Railway? No; very little.
1903. So that any traffic got from there by a line going *via* Baulkham Hills, would be in addition to the estimates previously put before us? Just so.
1904. Mr. Hyam.] You know the road from Dural to Castle Hill? Yes.
1905. Supposing the tramline be extended from Castle Hill to Dural, is there not a very big hill to get over—Rogan's Hill? There is only one hill—Rogan's Hill.
1906. Is it not a serious obstacle? I think it could be cut 5 feet or 6 feet, at little expense; and then the grade would not be very bad. It would not be so bad as the grade of Kenny's Hill, on the Camden line.
1907. There was a proposition, some years ago, to run a tramway from Parramatta to Castle Hill, with the idea of extending it to Dural; and in the evidence put before the Committee, everyone agreed that it was impossible to take a tramline over Rogan's Hill? Well; it is only a very short hill.
1908. It is your opinion that a tramway could go over it? Yes; the difficulty could be easily got over.
1909. The Engineer-in-Chief suggested that in order to get over that difficulty a deviation should be made so as to go round Rogan's Hill? No doubt that could be done. On two occasions surveys have been made through my property in order to miss the hill.
1910. Would that deviation be expensive? I do not think it would. It would go through a great deal of my property, and I would give it to-morrow for nothing.
1911. Even if it were for a tramway? Yes. That is, if the deviation did not go through the orchard, but only through the paddocks. I heard Mr. Hardy say that he would give his land free, and my son has property which I am sure he would give free. Probably the Bank of New South Wales would also give theirs free. Little more than that would be required; and, therefore, I think the deviations would probably cost nothing for land. I do not think you would have to buy more than fifty rods, and perhaps the people owning that would be willing to give it.
1912. You think there would be very little to pay for land resumption on that line? Yes.
1913. I think that Mr. Deane said, as regards his proposed line, that the heavy goods traffic could be dropped at Westmead, and put on to the main line, and the passenger traffic taken on to Parramatta? That is a good idea.
1914. You think that idea is workable? Yes.
1915. Dr. Garran.] You have an idea that if we constructed the Baulkham Hills line, we should draw a good deal of traffic from west of that line? Yes.
1916. How far? I consider you would take in from 6 to 7 miles by the Baulkham Hills line. There are many people who would prefer that line to the Seven Hills line. Though they might be a mile or two nearer to the Seven Hills line, that is such hilly country that I am sure they would prefer the Baulkham Hills line.
1917. You see the map on the wall? Yes.
1918. Does the end of that map reach to about the full distance of what you would call the land that would be drained of traffic by that line? Yes.
1919. Or would you go beyond the margin of that map? I believe that people beyond the margin of that map would prefer the Baulkham Hills line to the Seven Hills line.
1920. There is a road running to the west from about Castle Hill, and another running to the west from about Dural; is it good orchard country along both those roads? Yes. In fact it is the best land in the country for fruit-production.
1921. So that we should really accommodate traffic by making the Baulkham Hills line, which we should lose by making the Carlingford line? Yes.
1922. Therefore, that would help to make the line pay better? Yes; I feel sure the line would pay well, because people have been asking so many years for better communication than the present, that it would certainly be availed of very much.
1923. If we had a tramline as far as Dural, would there be any necessity to carry it further along the road at some future time? I have no doubt that it would go further north. There is orchard land further on than Dural. At Glenorie there is good orchard land that could be selected right away to the river.
- 1924.

- J. Purser.
23 Nov., 1900.
1924. Would a tramway greatly assist you in the bringing of manure to your land? It would. It is costly to purchase manure at Parramatta, and draw it to my place from there; but if I could get it to within a mile or two of my place by rail, I would have several tons of it.
1925. In working either a railway or a tramway, you could unload heavy goods only at platforms or stations where there is a siding? Yes.
1926. You could not do that at every branch road? No; there would be certain stopping places.
1927. You might stop at a branch road to take up cases of fruit, because they could be put in quickly? Yes.
1928. But you could not unload manure there? No.
1929. Do you think there would be a return traffic in the way of manure? Yes.
1930. What is the principal manure you would like to introduce into the district? We use all kinds of bone-dust and lime manure; and if we could secure stable manure we would use much of it.
1931. In starting a new orangery, would you begin with lime at once? It is according to the land. A subsoil of clay requires more lime than sandstone land does.
1932. Are the fruit-growers handicapped at present, on account of the cost of carting lime? We are very much handicapped.
1933. In the old days you used to think that the ridges were the only places that would grow oranges? Yes.
1934. You have altered your opinion? I have.
1935. Now you think that the flats are better? Well, we want protection from the winds.
1936. Does not the wind sweep down the hills? No; the hills protect the fruit-trees.
1937. Without having protecting trees? Yes. I have very little damage done by winds in my place, and it is just protected by hills. I consider that the passenger traffic on the tramline would be very great.

MONDAY, 26 NOVEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIE, Esq.

The Committee further considered the expediency of constructing a line of Railway from Carlingford to Dural.

Harry Richardson, Traffic Superintendent, Department of Railways, sworn, and examined:—

H.
Richardson.
26 Nov., 1900.

1938. *Chairman.*] We are seeking some information concerning the possibility of working a tramline either from Westmead to Dural, or from Parramatta to Dural, or from Carlingford to Dural; the points we should like a little information upon are, first, whether the grades on the proposed lines, which are nowhere worse than 1 in 30, and which in most cases would be against the empty trucks, and with the heavy loading, would preclude the use of tramway motors—for instance, in drawing the traffic;—and also whether the tramway motors could be conveniently coupled on to the ordinary railway trucks, with the view of taking fairly large loads over the proposed lines? First of all, there is a difficulty with the coupling. You cannot couple the tram motors to our existing rolling stock. We are using a tram motor on the Morpeth line, running between Morpeth and West Maitland. But that is comparatively level country. There we have what we call a "dummy" truck, which we place between the tram motor and the waggons, and that dummy truck is fitted with duplicate couplings, and will couple either on to the motor or on to the railway trucks.
1939. Is the dummy of any great weight? The weight of an ordinary truck.
1940. To that extent it would be a handicap? Yes; it would be, I suppose, about 4 tons in weight.
1941. Would that be a very serious handicap? It would be a handicap on a 1 in 30 grade. Of course, the dummy could be used without loading it up. On the Morpeth line we load it up with goods, but that means transshipping at the junction. On a line like this we would be compelled to load it up; we could not afford to pull an empty truck about on such a grade.
1942. If it were found undesirable to use a dummy of that kind, would a small engine, somewhat similar to that in use on the Camden tramway, be able to deal with the traffic expected over this line, and which the evidence goes to show would not be more than about 3,000 cases of fruit in any one day? Yes; it would do it if it made three or four trips a day. A motor such as we have on the Camden line could take only about four ordinary trucks. That would convey about 24 tons of fruit each load on a 1 in 30 grade. On the Camden line, which is a 1 in 20 grade, we are taking only two trucks and a passenger car; and on the Yass line, which is a 1 in 43 grade, we are taking six trucks and a passenger car. We use the same kind of engine on the Camden and Yass lines—a small engine made for the purpose.
1943. What is the weight of that engine, and what is its traction power? I cannot tell you.
1944. How would the power of those two engines—the one on the Yass and the other on the Camden line—compare with the power of a tram motor? Just about the same.
1945. Would there be any very great economy in using a tram motor instead of the ordinary locomotives, such as are in use on the other lines? On the Morpeth line we have only one man to attend to the motor.
1946. It would require two men on an engine? Yes.
1947. Is there any other way of getting over the difficulty of the coupling besides that of having a dummy between the cars and the engine? Not unless you have an engine without buffers.
1948. Could that be done in the case of a tram motor? They could not alter the present tram motors to do that.
1949. If you had to build a new motor you could do it? Yes; but the existing motors could not be altered. They would have done it for the Morpeth line if they could. The framework is altogether different—the frames are lower.
1950. *Dr. Garran.*] In addition to the coupling difficulty, there is also a difficulty about the flanges of the wheels, which are quite different on those used on the city tramway, and those used on the general lines;—could you get over that difficulty? Yes; there would be no trouble at all.
1951. You could lay a tramline on this road for the ordinary trucks without any difficulty? Yes.
1952. So that is not a serious matter? No.
- 1953.

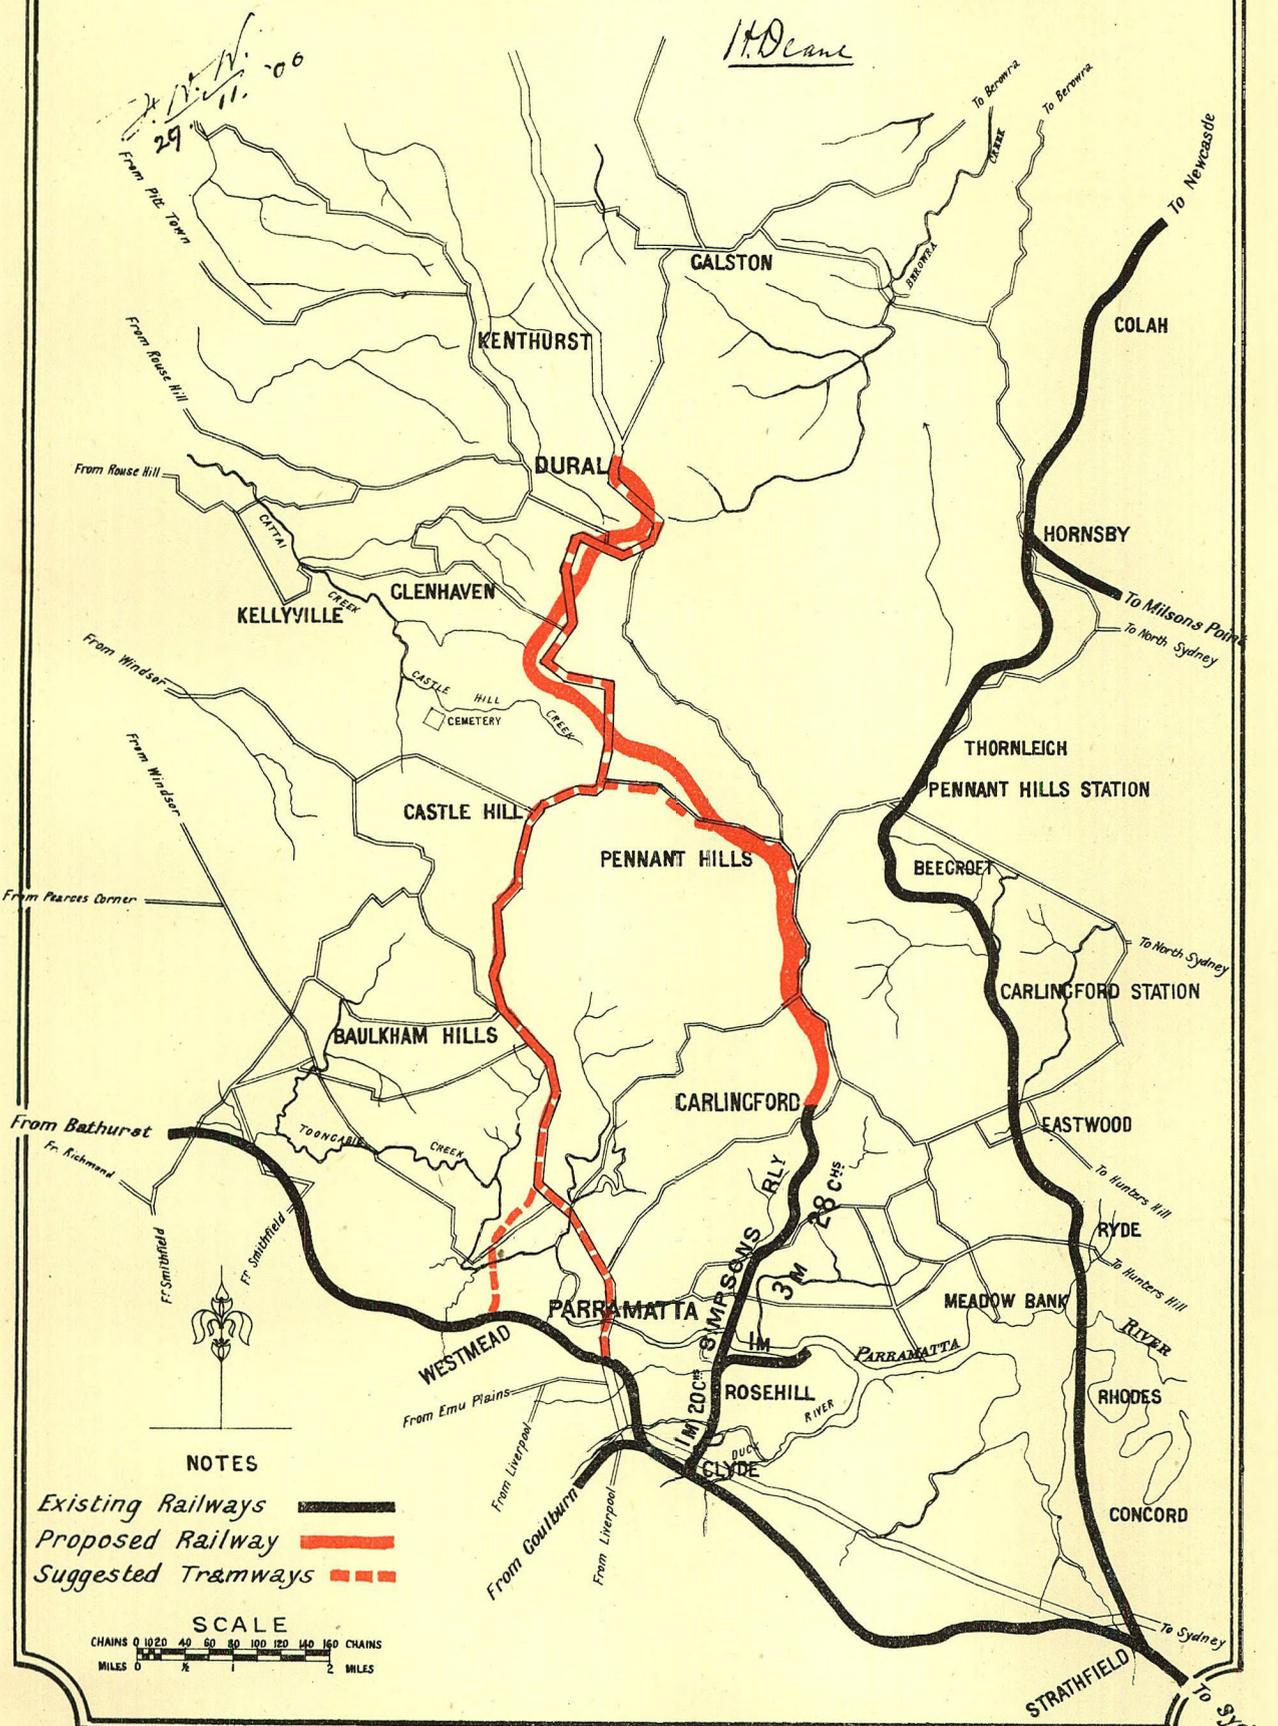

II.
Richardson.
26 Nov., 1900.

1953. And the other matter we spoke of would be entirely got rid of, if we had fresh engines for this line? Yes.
1954. The difficulty would exist only if we wanted to use up the existing old motors? Yes.
1955. So there would be no difficulty in the nature of the case itself? No.
1956. *Mr. Hyam.*] Do you know anything of the traffic of this district? No, I do not. I have no idea what the traffic would be. Besides fruit, I think there would be a firewood traffic.
1957. Do you think that a tramway would meet the requirements of the district for the time being? I daresay it would.
1958. In preference to building an expensive railway? Yes. From what I know of the country, I should think so. I think there is not a great deal of traffic out there. Fruit is the principal thing.
1959. There is a great deal of very close settlement? Yes.
1960. *Chairman.*] Can you tell us whether the wear and tear of the rails would be greater in the case of a tram-road laid on the road, as this is proposed, than in the case of an ordinary railway or tramway? I believe it is. I have not much experience of it, but I am told it is.
1961. *Dr. Garran.*] You had the Camden tramway under your special care? When it was first opened.
1962. Not since? No.
1963. Have you not the whole of the Southern line under your care? No; only the Western and the Northern lines.
1964. In bad weather, especially if this line were laid by the side of the road, this would be a better road than the ordinary road, and perhaps the carts would all go on it? Yes.
1965. Will an ordinary tramline stand the wear and tear of a heavy cart full of manure, or laden to the top with fruit? Yes, I think so. I recollect the Camden line some years ago. There was heavy traffic there, and that line stood it.
1966. Would that refer to special crossings, where you had guards, or to the general run of the line? The general run of the line.
1967. You understand that this line would be sometimes in cuttings, and sometimes on little embankments on the side of the road? Yes.
1968. And the ordinary road traffic would run right on to it in bad weather? Yes.
1969. And you think it would stand that? Yes.

[One plan.]

CARLINGFORD TO DURAL RAILWAY

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PROPOSED RAILWAY FROM MANILLA TO BARRABA.

(REPORT BY MR. ROBERT E. JONES, M.I.C.E.)

Printed under No. 10 Report from Printing Committee, 30 August, 1900.

Report on Proposed Railway from Manilla to Barraba.

Muswellbrook, 18 May, 1900.

UNTIL recently the whole of the very large scope of country lying between the North and North-west lines was assumed to be adequately served by those railways; but at the inquiries held by the Public Works Committee respecting proposals for branches from Tamworth to Manilla, and Moree to Inverell, it was found the great growth of settlement within the abovementioned area demanded some better access than that already provided; hence both lines were authorised. The first-named has been constructed, and is now duly open for traffic; whilst the Moree-Inverell line is being made, and, in fact, its first section to Gravesend has been in use by the public for some months past. It is, however, alleged that what has been done is not sufficient, and that a large stretch of country lying between Manilla and Bingara, 68 miles in length by about 45 in breadth, bounded east and west by natural barriers of high mountains, is still imperfectly served, so that a further extension of railway is needed, and the line that will afford the greatest relief at the cheapest cost is believed to be that from Manilla to Barraba, which, although not all that Bingara residents would like, is still as much as can reasonably be expected. It is not lost sight of that a connection with the cross-line from Moree to Inverell may at some time be deemed a national requirement, as forming part of an alternative line to Queensland; but with the Moree railway already constructed to within 73 miles of the Border at Goondiwindi, it is extremely doubtful the large cost of making a line 75 miles longer to Barraba will be incurred, even though an additional amount of local traffic were to be obtained thereby. The idea, too, of continuing a railway to Inverell *via* Bundarra is not now wise, as such a line would serve but little of good country, would be very expensive to construct, and in most injurious competition with the railway now being made from Moree. It is very possible the Great Northern line should have adopted the Bundarra route in preference to that over the "Moonbis," but this mistake, if it be one, cannot now be altered, unless ample justification be shown for such a duplicate railway.

The extension from Manilla to Barraba must, therefore, be dealt with on its own merits as giving improved access to 1,955 square miles, or 1,250,989 acres of country, of which 605,260 acres may be considered alienated, 472,194 still belonging to the Crown, but open for selection or sale, whilst 173,535 acres rank as reserves, which must remain as such.

As denoting the character of the country within the trafficable sphere of the proposed railway, the acting district surveyors of Tamworth and Moree classify it thus: Of alienated lands arable, 18 per cent. (mean for both districts), balance, 82 per cent., grazing. Crown lands are put as all pastoral, except a trifle over 1 per cent., which ranks as cultivable land.

With very great diffidence I venture an opinion that in the Tamworth district the percentage of arable country is put too low, both for alienated and unalienated lands (7 per cent. for whole), and as I do not wish to be accused of lessening the importance of the district, I have increased the cultivable lands to what I consider is justified, and classify them as follows:—

| | acres. | | acres. |
|--|---------|------------------|-----------|
| Alienated, grazing | 470,260 | Cultivable... .. | 135,000 |
| Unalienated, grazing | 455,893 | " | 10,701 |
| Reserves available, grazing | 5,000 | " | 600 |
| | 931,153 | | 146,301 |
| | | | 1,077,454 |
| Reserves not available for sale | | | 173,535 |
| Total of trafficable area | | | 1,250,989 |

331—

It

Country unserved.

Manilla to Barraba railway sufficient.

Connection with Moree-Inverell line not necessary.

Alternative line to Queensland. Extension *via* Bundarra to Inverell.

Manilla to Barraba railway. Area served.

Character of country.

Percentage of cultivable land.

| | |
|---|--|
| Enhancement of land served by railway. | It must, I think, be conceded that a railway enhances the value of the country it serves, but to what extent, and how this increment is to be arrived at, is a matter open to much difference of opinion, and is a question difficult to solve. |
| Advantages of railway. | First of all, there is the lessened cost of rail as against road haulage; increased facilities for transmission of goods, stock, &c.; greater comfort and quicker travelling for passengers; brings the district served into closer contact with the large centres of population and the markets for their produce, whilst the cheapened rates for freight induce larger areas to be cultivated, and fresh industries to be brought into existence. To reduce these benefits to a monetary value is by no means easy, but that an increment to land is given by the advent of a railway through or near to it is certain. The Acting District Surveyor of Tamworth puts the enhancement on the arable land alone, whilst the officer at Moree thinks it is doubtful if any increase in value would arise in his part of the district served by a line to Barraba, but the existence of the latter might lead to an increased demand for Crown lands that otherwise might not be occupied. Personally, I think some increment would occur to nearly all the lands to be served, and it will not be outside the mark to assess the amount at £38,630, although it must not be forgotten the low price now ruling for wheat, the principal product of the district, with the high rates for wool, militate against increased land values, as with half sheep to the acre the saving in wool carriage amounts to little. |
| Increment value difficult to be assessed. | |
| Bingara northern boundary of area served. | It will be noticed on the attached plan that I have made Bingara the northern boundary, and have taken its traffic as belonging to the line to Barraba, although it might be thought the former town would prefer to use the Moree to Inverell railway. I find, however, this will not be so, as to reach the nearest point on the latter line, viz., Kelly's Gully, means going north 21 miles by road, and then 466 by rail to Sydney, as against 38 by road to Barraba, and 340 by rail. The trade interests, too, of the residents of the Bingara district are largely with Tamworth, and as both passenger and goods rates should favour the Barraba, or shorter, route, it is, I think, reasonable to assume it will get this traffic; indeed, I understand even with the railway at Gravesend but 26 miles away, much of the supplies, &c., for Bingara comes 68 miles by road <i>via</i> Manilla. |
| Population. | The population within the trafficable sphere of proposed railway is 5,049, of which the Barraba patrol district contains 1,849. |
| Stock. | On the land served by a line to Barraba I find the stock depastured, as per latest returns from Tamworth, Warialda, and Moree Inspectors, were 3,839 horses, 14,559 cattle, and 485,409 sheep. Reckoning the usual average for cattle and horses, the whole stock equal half a sheep per acre. |
| Cultivation and crops. | Regarding crops, there are 425 farms within the trafficable sphere, with, last year, 20,213 acres under cultivation, of which 15,091 under wheat for grain produced 273,517 bushels, whilst 2,618 acres were cut for 4,283 tons of hay. Maize did not do well, 1,086 acres giving but 14,239 bushels. Fruit and other crops occupied the balance of 1,418 acres. |
| Description of route. | I need not dilate on a description of the route which the line will take; suffice it to state, it leaves the existing railway at Manilla township, crosses the Namoi near its confluence with the Manilla River, then follows the west bank of the latter to near Mr. Barling's, where the Upper Manilla station is proposed. The residents here suggest a deviation to bring the line nearer the post-office, &c., a matter, however, outside my province to deal with. Line then continues to Tarporley and Black Springs, generally following the main road. Crosses Barraba Creek $1\frac{1}{2}$ mile from the terminus, which is at $240\frac{1}{2}$ miles from Newcastle, on the east side of the main road and south end of Barraba township. Length of line, $30\frac{3}{4}$ miles. |
| Deviation wanted at Upper Manilla. | |
| Works. | Earthwork and gradients are heavy, the country passed through being for much of the distance of a broken character. An expensive bridge will be needed over the Namoi at Manilla. Ballast is fairly plentiful along the route, but sleepers will have to be brought by rail from other localities, as there is little, if any, suitable ironbark within a reasonable distance of the line. |
| Post-offices. | The number of post-offices within the trafficable sphere is 9, having a revenue in 1898 of £2,140; there are also 8 receiving offices. |
| Schools. | Schools number 18, of which 4 are half-time. Scholars on roll at time of my inspection, 669. |
| Mining. | Gold-mining exists at many places throughout the district, notably Crow Mountain, Woods' Reef, Ironbarks, Top Bingara, &c., whilst at the Gulf, near Cobbedah, an English company has an extensive copper-mine, with 81 men at work at time of my visit, which number, I understood, would be probably much increased. The output is about 100 tons copper per month. At Bingara, 236 miners' rights were issued, of which 127 were for the Barraba district. Sixty-six leases were applied for, including 3 for dredging on the Big River and Ironbarks Creek. The total number of miners employed on the fields was, in March last, 411. It is stated 250 oz. of gold were forwarded from Barraba bank in 1899, whilst from Bingara a far larger quantity was sent, although not approaching what was won a few years back, when several of the gold-fields mentioned were in a very flourishing condition. At present little of the precious metal is obtained. I think, however, the Gulf and other copper-mines are likely to provide employment for many hands for some years to come. |
| Gulf Copper-mine. | |
| Dredging. | |
| Gold obtained. | |
| Other industries. | There are no other industries beyond pastoral and farming, latter chiefly wheat-growing, for which the district is eminently suitable. It is stated that, with railway communication, dairying will develop and become an industry of some importance, although I am inclined to doubt this; fruit-growing also may somewhat increase. |
| Townships served—Upper Manilla. | The townships passed through are Upper Manilla, which, although scattered, contains hotel, 2 stores, church, school (28), hall, blacksmith, post and telephone office, the receipts of which, in 1890, were £45, as against £77 in 1898, and still increasing. |
| Barraba. | Barraba is an unincorporated township on the Manilla River, and has a very improving appearance, with several good buildings. It contains 4 hotels, 6 stores, bank, doctor, solicitor, 3 auctioneers, hospital, 3 churches, court-house, wool-scouring works, police barracks, school of arts, 2 halls, usual tradespeople, &c.; also has local newspaper. Post and telegraph office receipts for 1898 amounted to £778; 1899 return, when published, will, I am sure, show a fair increase, as the letters sent, compared with 1898, were 21 per cent. more, with an increase of 35 per cent. in telegrams. In 1890 the receipts were £607. With regard to the public school, there are now 137 scholars on roll, whilst in 1892 there were but 89. |
| Cobbedah. | Cobbedah is situated 11 miles from Barraba; possesses post-office, hotel, store, and it is the nearest township to the Gulf Copper-mine, 10 miles distant, where there is a school (40), stores, &c. |
| Gulf Copper-mine. | |
| Bingara. | Bingara is situated on the Gwydir or Big River, 38 miles from Barraba, with a fairly good road, although hilly, especially south of Cobbedah. Is a municipality containing about 800 people, with usual Government |

Government buildings, 5 large and several small stores, school of arts, council chambers, 3 churches, hall, 4 hotels, bank, doctor, solicitor, 2 steam flour-mills, saw-mill, usual tradespeople, convent and school (12), public school (188); publishes a newspaper. Is a well-kept town, and beautifully situate. As showing the progress of this place, I find in 1890 post-office receipts were £851, whilst in 1898 they reached £1,082; in fact, Bingara has a prosperous appearance.

Other small townships served are Horton, Eulourie, and Top Bingara.

Other townships.

The mean rainfall at Barraba for the last eighteen years was 28.70, and for Bingara it averaged, for twenty years, 31.39; 1898 was a dry year, with low records at both places, Barraba having 18.03, Bingara 15.93, as against 22.60 and 25.52, respectively, for 1899.

Rainfall.

Barraba has, except on Sunday, a daily mail from and to Manilla and Bingara; once a week to Bundarra, Burindi, &c.; twice to Woods' Reef; and tri-weekly to Rockmoor, Glenridding, &c. From Cobbedah mails go to Moree once *via* Pallal, and to Gulf three times a week.

Mails.

The road from Manilla to Barraba is constructed for three-quarters of its length, and may be considered a fairly easy track. A low-level bridge is now being erected over the river at Upper Manilla, whilst the Namoi is spanned by a most expensive iron structure at Manilla. From Barraba the roads are by no means bad to Burindi, Horton River, Bundarra, Long Arm, &c. All but the last are classified and receive annual grants. The total yearly votes for roads between Manilla and Bingara amount to not less than £3,300.

Roads.

Road votes.

The estimate for a light line from Manilla to Barraba, 30½ miles, furnished me this week by the Engineer-in-Chief for Railway Construction, is £136,000, or £4,422 per mile. The interest at 3 per cent. per annum amounts to £4,080.

Estimate of railway.

Annual interest

Having for guidance an almost similar extension in another part of the Colony, I am able to estimate the cost of working and maintaining the proposed railway to Barraba at £3,500 per year; so that before the undertaking can be considered a commercial success the annual receipts must realise the sum of £7,580.

Cost of working.

Total annual cost.

I have endeavoured with the best means at my disposal to get an idea of the probable revenue of the suggested railway, and in dealing with the various items of traffic, have made allowances from 10 to 30 per cent. for expected increases. I have, however, taken "local" or "special," and not through, rates for all classes of freight, Barraba wool being put at 6s. per ton, and its wheat, maize, &c., at 4s. 6d., as all the residents I saw stated they would be prepared to pay special charges. I have assumed that a small portion only of the Bingara wheat or flour would come to Barraba; but with regard to the goods and other items of traffic from and to the former place, have been credited to the line under review, although the Railway Commissioners may state we can get the benefit of this loading *via* Gravesend at a merely nominal expense, and, therefore, for such traffic the Manilla-Barraba line will be in hurtful competition. As to this, I am assured by the Bingara residents that, with almost similar truck rates to Gravesend and Manilla, very little of their traffic uses the former route. Also that this will be the case when the Inverell line reaches the point nearest Bingara, *viz.*, Kelly's Gully.

Revenue.

Barraba line competing with Moree-Inverell line for Bingara traffic.

From a commercial point of view I am bound to put forward this question of constructing an apparently competing line; but apart from this is the district around Barraba, and which admittedly is not served by the Moree-Inverell route, to be left without railway communication in consequence of the circuitous access given to the town of Bingara by the northern cross-line?

Barraba district entitled to railway.

For the railway to Barraba I consider the direct revenue will amount to £5,594 per annum, which exceeds the cost of working by £2,091, but leaves a deficiency of £1,986 on whole annual charges. That seems to me to be the position of matters so far as regards the Railway Commissioners; but there are other factors which should, I think, be taken into consideration, amongst them being the enhanced value of land served, which I assess as follows:—Alienated, £28,361, which will give an increased land tax of £118 3s. 5d. per annum, whilst the increment on Crown lands can be put at £10,259, which, at 4 per cent., equals £410 7s. 2d., and I think this latter amount might be increased by £70 9s. 5d. for unalienated lands that otherwise would not be occupied. Some credit should also be given for increased traffic on the main or parent line owing to the opening of the extension to Barraba, and although it is seldom that any saving can be shown in road maintenance, owing to works being required on new roads to the railway at different points, in this case I think the abnormally large vote for the Manilla to Barraba road can be reduced by a greater sum than will be required for the new tracks to the railways.

Direct revenue.

Deficiency.

Indirect revenue.

Saving on road maintenance.

Net deficiency

Altogether it may be taken that the deficiency of £1,986 can be reduced to £1,100.

It is possible the opening up of this rich district may lead to the development of the dairying, fruit, and mining industries to a considerable extent; but these are matters of speculation, and credit cannot be given for such hypothetical revenue. Seeing, however, the probable State loss will be so small, I have come to the conclusion that a reasonable case has been made out for favourable consideration of a light line of railway from Manilla to Barraba.

Recommendation.

I have, &c.,

ROBERT E. JONES,

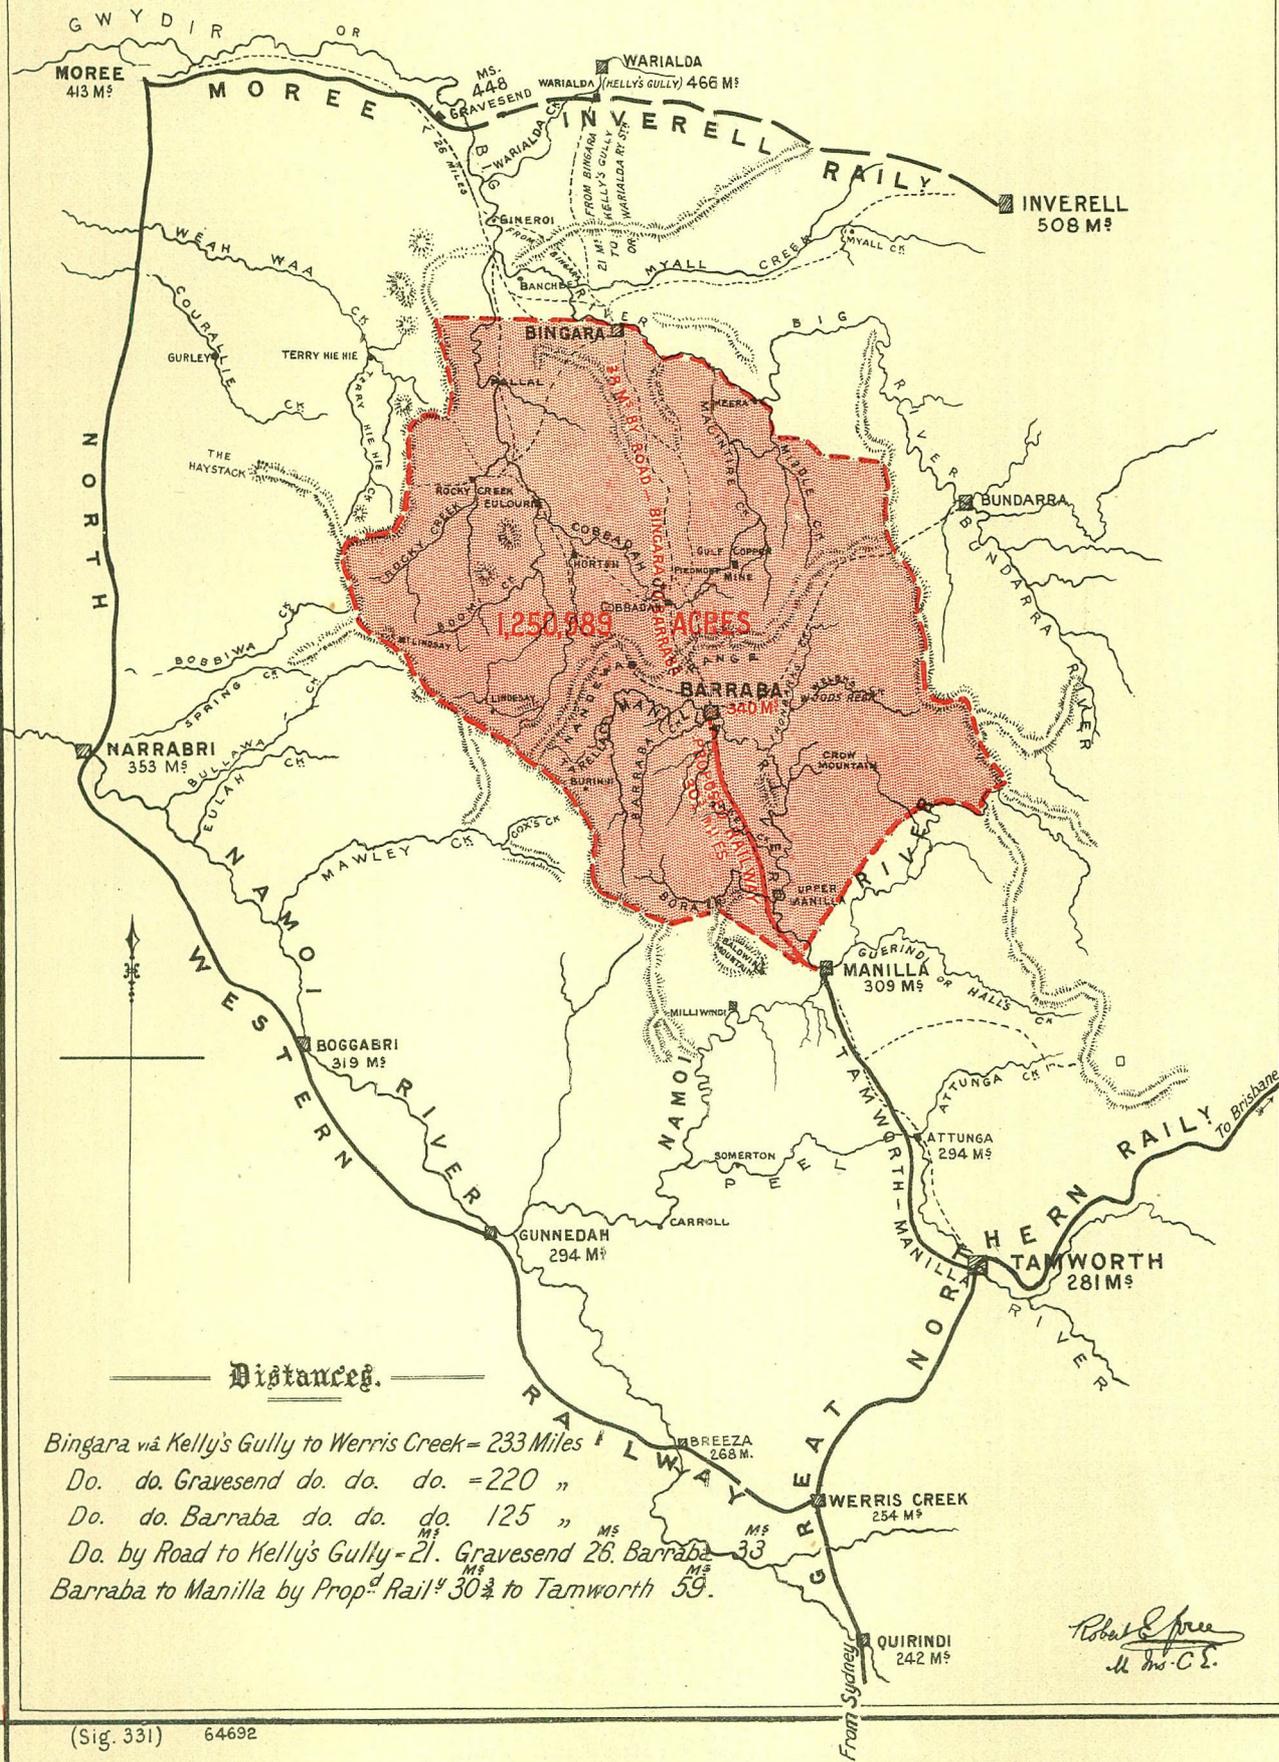

M. Inst. C.E.

The Under Secretary and Commissioner for Roads, Sydney.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE
LEGISLATIVE ASSEMBLY.

VOTES No. 10. TUESDAY, 3 JULY, 1900.

20. ACCIDENT TO ALBERT BURBANK ON RAILWAY PREMISES, TAMWORTH:—Mr. Gillies moved, pursuant to Notice,—
- (1.) That a Select Committee be appointed to inquire into and report upon all the circumstances attending the accident to one Albert Burbank, on the railway premises at Tamworth, on the 2nd day of July, 1897.
- (2.) That such Committee consist of Mr. Bennett, Mr. Edden, Mr. Dight, Mr. Meagher, Mr. Wilks, Mr. Spence, Mr. Thomas Brown, Mr. Nicholson, and the Mover.
- Question put and passed.

VOTES No. 63. THURSDAY, 25 OCTOBER, 1900.

2. ACCIDENT TO ALBERT BURBANK ON RAILWAY PREMISES, TAMWORTH:—Mr. Gillics, as Chairman, brought up the Report from, and laid upon the Table the Minutes of Proceedings of, and Evidence taken before, the Select Committee for whose consideration and report this subject was referred on 3rd July, 1900; together with Appendix.
- Ordered to be printed.

1900.

ACCIDENT TO ALBERT BURBANK ON RAILWAY PREMISES, TAMWORTH.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 3rd July, 1900, "to inquire into and report upon all the circumstances attending the accident to one Albert Burbank, on the railway premises at Tamworth, on the 2nd day of July, 1897,"—have agreed to the following Report:—

Your Committee, having examined the witnesses named in the List* (whose *See p. 5. evidence will be found appended hereto), find as follows:—

1. That on the morning of 2nd July, 1897, Mr. Albert Burbank, a dentist, carrying on business in the Northern and North-Western Districts, met with a serious accident on the platform of Tamworth Railway Station, whilst travelling in fulfilment of his business engagements.
2. That, from evidence adduced at the inquiry before your Committee, they are of opinion that the defective lighting of the Tamworth Railway Station, and the negligence of the Railway employees, contributed in no small degree to the accident in question, whereby Mr. Burbank has been rendered permanently unfitted to practise his profession; and as a consequence his wife and family, together with himself, have endured great hardship.
3. That notwithstanding frequent overtures being made to the Railway Commissioners by Mr. Burbank and his friends, with a view to affecting an amicable settlement, all such efforts failed, the Railway Commissioners denying all responsibility.
4. That the injuries sustained by Mr. Burbank, who was forty years of age, consisted of a broken leg at the knee-joint, his nervous system received a severe shock, and for a time Mr. Burbank's life was in danger.
5. That Mr. Burbank instituted an action for £2,000 damages against the Railway Commissioners. The trial took place at Tamworth Circuit Court on the 12th and 13th days of April, 1898, before Mr. Justice M. H. Stephen and a jury of four. Mr. Burbank, in evidence before your Committee, has sworn that, although he had eleven principal witnesses, and nine sub-witnesses in support of his case, for some unaccountable reason only three witnesses were called for plaintiff. As a result of the trial the jury found a verdict in favour of defendants.
6. That your Committee have taken exhaustive evidence in this matter, and are of opinion that Mr. Burbank was not fairly represented at the trial at Tamworth, and that the production of evidence now given before your Committee has materially changed the aspect of this case.
7. That, after giving all the circumstances of this subject and its surroundings full consideration, your Committee recommend the case of Albert Burbank to the favourable consideration of the Government.

J. GILLIES,
Chairman.

No. 2 Committee Room,
Legislative Assembly,
25th October, 1900.

PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 1 AUGUST, 1900.

MEMBERS PRESENT :—

| | | |
|-------------------|-------------|--------------|
| Mr. Thomas Brown, | | Mr. Dight, |
| Mr. Gillies, | | Mr. Meagher, |
| | Mr. Spence. | |

Mr. Gillies called to the Chair.

Entry from Votes and Proceedings appointing the Committee *read* by the Clerk.

Albert Burbank called in, sworn, and examined.

Witness *handed in* newspaper report of the case Burbank v. Railway Commissioners (*Appendix A*).

Witness withdrew.

[Adjourned till To-morrow, at 11 o'clock.]

THURSDAY, 2 AUGUST, 1900.

MEMBERS PRESENT :—

| | | |
|---------------------------|-------------|----------------|
| Mr. Gillies in the Chair. | | |
| Mr. Thomas Brown, | | Mr. Dight, |
| Mr. Edden, | | Mr. Nicholson, |
| | Mr. Spence. | |

Albert Burbank recalled and further examined.

Witness withdrew.

[Adjourned till Wednesday, 15th August, at 2.30 o'clock.]

WEDNESDAY, 15 AUGUST, 1900.

MEMBERS PRESENT :—

| | | |
|---------------------------|-------------|--------------|
| Mr. Gillies in the Chair. | | |
| Mr. Dight, | | Mr. Meagher, |
| | Mr. Spence. | |

The Chairman read a letter, dated 6th August, 1900, from the Council Clerk of the Borough of Tamworth, intimating that no formal resolution had been passed as to the imperfect lighting of the Tamworth and West Tamworth Railway Stations, their attention having only been drawn to the fact, and that these matters were referred to at a meeting held on 13th July, 1897.

Hugh McLachlan (*Secretary to the Railway Commissioners*) called in, sworn and examined.

Witness *handed in* return showing the consumption of gas at Tamworth Railway Station for three months prior and subsequent to 1st July, 1897 (*Appendix B1*); Departmental record of James Playford, railway porter (*Appendix B2*).

Witness withdrew.

William Henry Cooke (*Record Clerk, Department of Inspector-General of Police*) called in, sworn, and examined.

Witness *handed in* Departmental record of John Beeby, formerly constable at Tamworth (*Appendix C*).

Witness withdrew.

[Adjourned till To-morrow, at 3 o'clock.]

THURSDAY, 16 AUGUST, 1900.

MEMBERS PRESENT :—

| | | |
|------------|----------------|------------|
| Mr. Dight, | | Mr. Edden, |
| | Mr. Nicholson. | |

In the absence of the Chairman, Mr. Dight called to the Chair *pro tem*.

William Henry Cooke recalled and further examined.

Witness withdrew.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

WEDNESDAY, 5 SEPTEMBER, 1900.

MEMBERS PRESENT :—

| | | |
|---------------------------|--|-------------|
| Mr. Gillies in the Chair. | | |
| Mr. Thomas Brown, | | Mr. Dight, |
| Mr. Nicholson, | | Mr. Spence. |

Hugh McLachlan recalled and further examined.

Witness

Witness handed in Departmental record of John C. White (*Appendix D.*)

Witness withdrew.

Ordered, that Mr. J. C. Thom, Solicitor to the Railway Commissioners, be summoned to give evidence next meeting.

[Adjourned till Wednesday next, at 2:30 o'clock.]

WEDNESDAY, 12 SEPTEMBER, 1900.

MEMBERS PRESENT:—

Mr. Gillies in the Chair.

Mr. Nicholson, | Mr. Spence.

James Campbell Thom (*Solicitor to the Railway Commissioners*) called in, sworn, and examined.

[Adjourned till Wednesday next, at 2:30 o'clock.]

WEDNESDAY, 19 SEPTEMBER 1900.

MEMBERS PRESENT:—

Mr. Gillies in the Chair.

Mr. Dight, | Mr. Nicholson.

Committee deliberated.

Ordered, That Mr. J. C. White, Railway Department, be summoned to give evidence next meeting.

[Adjourned till Wednesday next, at 2:30 o'clock.]

WEDNESDAY, 26 SEPTEMBER, 1900.

MEMBERS PRESENT:—

Mr. Gillies in the Chair.

Mr. Thomas Brown, | Mr. Dight,
Mr. Spence.

James Campbell Thom recalled and further examined.

Witness withdrew.

John Charles White called in, sworn, and examined.

Witness withdrew.

[Adjourned till Thursday, 4th October, at 2:30 o'clock.]

THURSDAY, 4 OCTOBER, 1900.

MEMBERS PRESENT:—

Mr. Gillies in the Chair.

Mr. Dight, | Mr. Nicholson.

Committee deliberated as to their Report.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

THURSDAY, 25 OCTOBER, 1900.

MEMBERS PRESENT:—

Mr. Gillies in the Chair.

Mr. Dight, | Mr. Spence.

Chairman submitted Draft Report.

Same read, amended, and agreed to.

Chairman to report to the House.

LIST OF WITNESSES.

1900.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

ACCIDENT TO ALBERT BURBANK, ON RAILWAY
PREMISES, TAMWORTH.

WEDNESDAY, 1 AUGUST, 1900.

Present:—
MR. THOMAS BROWN, | MR. DIGHT,
MR. MEAGHER, | MR. SPENCE.
J. GILLIES, ESQ., IN THE CHAIR.

Albert Burbank called in, sworn, and examined:—

1. *Chairman.*] You are a dentist, practising at West Maitland? Yes.
2. Will you state to the Committee the facts of your case? Yes. I was, with my wife and family, a resident of Tamworth, New South Wales, previous to 2nd July, 1897. I also visited ten towns on the Northern and North-western lines. I built up, by energy and at great expense, a valuable and expanding business. The earnings averaged £74 per month. I was a strong healthy man at 40 years of age, and one month prior to 2nd July, 1897, I was passed by the medical referee (Widows' Assurance Society) as a first-class life. Following my occupation, I went to the Tamworth railway platform to proceed by the (about) 1.45 a.m. Brisbane mail up-train to meet my professional engagements that day at Gunnedah. I did not leave by that train, because on its arrival my right leg was broken at the knee-joint by and through the negligence of the Railway Commissioners' servants, as hereinafter detailed. I had a specially-constructed box, in which to carry my working instruments and materials, which measures about 2 ft. 9 in. high by 18 in. square—strongly made, iron-shod at bottom, with name, "A. E. Burbank, dentist," and a notice, "Keep this end up," painted on the top end. When loaded for outward journeys its weight is about 80 lb., and this weight allowance is carried free on the owner's passenger ticket; and it had often been carried on the line by the same train. The box was always sent up overnight, to convenience the railway officials. This was done on the night of 1st July, 1897, at 9 p.m., by a carter and a young man, as on several previous outward journeys. These persons stood the box on a spot arranged for by the railway officials on the platform between the parcel room and the Armidale end of the station building, so as to be handy for the van. The carter and young man pasted a railway label on the top of the box, and addressed it thus:—

| | |
|--------------------------------------|-----------|
| NEW SOUTH WALES GOVERNMENT RAILWAYS. | |
| PASSENGER'S LUGGAGE. | |
| From | TAMWORTH. |
| To | GUNNEDAH. |

By following this custom, at the request of the railway officials, the box has travelled as required on several previous occasions to its addressed station. During several of the journeys from Tamworth the

A. Burbank. box had sustained gross ill-usage by being roughly handled in turning it over and over like a bale of wool, and also reversing its proper standing position, ignoring the notice, "Keep this end up." At other stations the box has been put out of the van on to the platform on its wrong end, and roughly. I complained to the Tamworth station-master on account of rough handling of the box by Guard David Peterson (inward journey). It was so put out at another station, on to a newly-asphalted platform, and worked along for some distance, so as to nearly obliterate the painted address and notice with tar from the asphalt. When I complained to the guard, he replied, "You are lucky to get off with only that much; we have no time to treat goods as so much gingerbread." I suffered considerable loss by breakages and valuable material spilled during many journeys. On another occasion the van did not draw up to the platform at a certain station, and my box was thrown bodily out of the van on to the railway track, splitting the box up in two places, breaking and spilling goods, and destroying a part of a 12 guinea instrument. This continued gross carelessness by the railway servants forced me to either personally watch the box in the van, or pay an hotel groom to do so. This explanation regarding the box is important in connection with what follows. On the morning of 2nd July, 1897, I arrived on the Tamworth railway platform to proceed by the Brisbane mail up-train, which leaves about 1.45 a.m., intending to proceed to Werris Creek, and thence to Gunnedah. I purchased a ticket for Gunnedah, then went into the telegraph room to remove my small packages—left overnight there by my lad, by special advice of other porters, because they had said, "The parcel room doors are always closed before the train's arrival"—and left these parcels on a seat on the platform. I then went along to the end where my box usually stood to see if the label was correctly addressed—which was the end towards Armidale. The lighting at that (Armidale) end was so bad—there being no post lamp lit outside the verandah, and the parcel room doors close to the box being shut—that I struck a match to enable me to see the label on my box, I was satisfied that the correct address was on the label, and then went back to the Sydney end of the platform. At this time I saw the night officer (White) in the ticket office, while the porter (Playford) was walking along towards the Sydney end of the platform. The train was notified as three-quarters of an hour late. I sat on a seat at the Sydney end, and near the ladies' waiting-room; while there I saw John Milligan sitting on a raised article on the platform, about in line with the outer end of the verandah. I could dimly see the right side of Milligan's face, for beyond Milligan no lamp was alight. I looked in the direction of the post lamp (Sydney end), but there was no light there. Mr. Victor Burbank was on the platform standing with me about 1.35 a.m., and he spoke of the bad lighting on the station, referring also to the difficulty he had experienced on the previous night of his arrival to find his portmanteau. (These remarks were made consequent on his seeing me striking a match to see the label on my box.) Before the train arrived, Mr. Ben. Owen came on the platform and passed me; that time without recognition. When Mr. Owen returned again, and was near enough, I rose up from my seat and spoke to Mr. Owen, who then failed to recognise me on account of the dim light until I turned half round to the centre light under the verandah, at the entrance door. At this time there were only three lights alight, and they were under the verandah, viz., the centre light, the light at ladies' waiting-room, and one near the clock. The station was in semi-darkness. The gas-jets were low, and the globes dirty. The station was thus insufficiently lit. When the train arrived, three-quarters of an hour late, I placed my smaller parcels in one of the carriages on the train which had over-shot the end of the verandah at the Sydney end, while the guard's van was half its length over-shot and under the verandah at the Armidale end, and walked quickly towards the van. I passed the night officer (White) outside the Sydney end of the verandah, and holding out my ticket, said, "I am going down to see my box put safely in the van." In less than a minute I was at the van. The guard (Gregory) was then rapidly putting articles into the van from off a hand-truck immediately in front of it, while another truck alongside held several packages that had been put out for Tamworth. I turned to the porter (Playford), who was standing between the trucks and the parcel room, and asked, "Is my box in—'Burbank'?" The porter turned towards where the box stood, and replied, "Oh, I forgot it; will you give me a hand?" The guard was then closing the van doors. The porter called to the guard, "Don't shut the doors; this box is going on." The guard replied, in surly tones, "Hurry up, I can't wait; I'm late as it is." I said, "I am a passenger to Gunnedah." From the spot where I and the porter had been speaking to the guard, to reach the box where it stood, I passed the doors of the parcel room. I then noticed they were closed, and that there was no light—and I am prepared to swear this distinctly and positively—and the place was in the same state as when I went to look for my box, and had to light a match to see the label. I and the porter went to the box, and each of us took an end. I had the top end and the porter the bottom end. I assume that it was the duty of the guard to relieve a passenger of porter's work instead of ordering him to "hurry up." The train had then been in less than three minutes. The box being thus carried by the porter and myself towards the van, and when abreast of two hand-trucks then on the platform near the van-door—as was afterwards stated by the porter—one of my feet struck against some heavy article lying upon the platform, I was thus tripped and thrown forward on my right knee—partly over the obstacle; I was unable to release my hold upon the box until I fell full length to the ground—following the drop on my right knee. The contact of the box with the platform caused a severe cut to the little finger of the right hand, and the fall on the platform breaking the main thigh-bone at, and obliquely into, the knee-joint. Further injury was caused by a severe strain to the back. I was unable, at the time, to realise the serious nature of the break, and lying face down, although in great pain, I called to the guard, "For God's sake put the box in, and throw me in the van; I must go." I was then about 3 yards from the van door. The guard replied, in surly tones, "I can't wait for you; come on by the next train." The doors of the van were slammed, and the train started, leaving me behind. Some people came around and helped me up; but finding I had no power in the leg, and seeing my foot turned, I said, "My leg is broken; I cannot stand; put me down again," and they helped me to sit down on the platform. A policeman stooped down, and pulling me by the coat, said, "What's the matter, mister? Who are you?" When told "Mr. Burbank," and that the leg was broken, the policeman said to those persons around, "It is Mr. Burbank, the dentist; he has broken his leg." I knew Constable Beeby very well by sight; but when he spoke I could not distinguish him, as the light was so bad, until some one named him. They called for a light, and the night officer (White) went for his lamp, brought it, and turned the light upon my face. Constable Beeby remained at my back supporting me. John Milligan came to a wicket-gate at the end of the station-house, in a fence guarding the railway station, which is almost opposite where I was sitting on the ground, and some 10 yards away. When Milligan spoke I recognised his voice, and asked Milligan not to leave

me,

me, or let them take me to the Hospital, as some one present suggested. A little later on I asked Milligan to go and wake up my brother, who had left about half-an-hour, and also to tell my wife of the accident. My brother was a few hundred yards away at a boarding-house, and came down to the house where I was living shortly after. Before going away, Milligan got the ambulance stretcher down from where it was hanging on the station wall. I saw him bring it and place it alongside of me. The stretcher was without the simplest accessories for ambulance work; there were no shoulder straps for carrying, and no substitute for a pillow; but by sitting up in the stretcher, with a sack taken from the 'bus horse, a pad was made to steady the broken bones. In this manner, Constable Beeby, White (night officer), and Playford (porter) helped to carry the stretcher towards my home. Mr. George Howlett met the party, and relieved one of them in the carrying. Mr. Howlett asked Constable Beeby how the accident happened, and Beeby replied, "Mr. Burbank fell over some bacon on the station while helping to carry his box to the van, and has broken his leg." John Ryan (a contractor carrying mails from the railway to the post office) was sent to call Dr. Wilson to attend to me just after the accident. Ryan came back to my house—in front of which both Mrs. Burbank and Mrs. George Howlett were standing. Ryan asked if the doctor had come yet. Mrs. Howlett knew Ryan well. She went over to Ryan—on to the footpath next the road—and asked him, "How much is Mr. Burbank injured?" (The 'bus-driver had previously brought warning of the accident.) Ryan replied, "I don't know; I didn't see the accident, but they said he fell over something on the station in the dark." Mrs. Burbank also asked Ryan, "Did Mr. Burbank fall between the train and the platform?" Ryan replied, "I don't know, Mrs.; I didn't see it; but I think he had a buster and hurt his ankle." Frank Grant (my stepson, aged 16) asked Ryan how the accident happened, and Ryan replied, "I didn't see it, but I think he tumbled over something in the dark up at the station." Dr. John S. Wilson attended at my house, and placed me under chloroform, while the broken leg was being set. Constable Beeby remained with other persons in the room to assist Dr. Wilson. Dr. Wilson asked Beeby, in the presence of about six persons, "How did the accident happen?" Beeby replied, "Mr. Burbank was helping the porter to carry his box to the van, and fell over some bacon, in the dark, on the station; and it's a wonder they haven't more accidents there." Beeby repeated this statement to Mrs. Burbank whilst he was standing in the dining-room having some whiskey before leaving the house. Beeby made the same statement to Mr. J. Whitehead, hairdresser, of Tamworth, when having a shave in the morning. (See Whitehead's court evidence.) Beeby also made the same statement to Mrs. George Howlett, alone. The leg was broken at and above the knee-joint, obliquely—a compound fracture of the thighbone. The knee-cap was displaced, tearing the contiguous muscles and ligatures. I suffered serious shock to the system, and for some weeks my life was despaired of. I endured extreme agony while lying on boards and a thin mattress for two months in the one position, and this pain and suffering continued with more or less severity from 2nd July, 1897, until March, 1898. The boards were then removed from the bed. During this period I was alternately moved from my bed to a bath-chair, and was in a condition that necessitated constant nursing night and day. My hair turned colour from dark brown to grey during the first month of my illness. I began to pass gallstones, which the doctor ascribed to the shock, as I had never before had similar experience. The little finger of my right hand was cut and bruised at the time of the accident, by contact between the box and the ground, when I fell forward over the obstacle lying there. I was paralysed in the right hand and arm (consequent upon the injury when I fell) for four months. My eyesight has been affected injuriously, and I am now unable to read for any length of time. I was unable to discard the crutches until January, 1899 (nineteen months after the accident). In walking, it is necessary now (September, 1899) to use two sticks, and I am permanently lame. Although the bone and muscles have become attached again, the injury has left the joint ankylosed, so that the knee will only bend half way. The excessive osseous and muscular growths have enlarged the knee-joint, and above it, so much that the knee is always in a bent-forward position, and so weak and flaccid that little weight for standing can be put upon it. The fracture gives excessive pain with every wet change of the weather. I am continually subject to cramp in the leg-muscles. The foot on the same side is always swollen and painful, due to the drawn-up ligatures and muscles, and the length of the leg has decreased 1 inch, requiring a built-up boot to equalise the height. Both right leg and knee are essential factors in working the treadle-lathe in a dentist's business; but it is now impossible to use the injured leg with any strength, from the continued pain, weakness, and stiffness. I am gaining unnaturally in weight, and suffer in health through the want of exercise and inability to take it. One month prior to the accident, on 2nd July, 1897, I was passed as a first-class life by the Widows' Assurance Society medical referee in Tamworth. Shortly after the accident I dictated a letter to my brother, Victor, who wrote to the Railway Commissioners in Sydney, informing them of the accident, describing the manner of its occurring, with a reference to the bad lighting, and also proffering an invitation to the Government Medical Officer to consult with Dr. Wilson regarding the injuries. The Railway Department returned an answer by post-card to the effect "that they were satisfied with the inquiries made, and refused to accept any responsibility." The Tamworth Town Council, on or about the second week in July, 1897, discussed certain complaints regarding the bad lighting on the local railway stations, East and West Tamworth, made by persons having business at them, and the aldermen drew attention to the recent serious accident, in which a man's leg was broken. A resolution was passed authorising the Mayor to see the stationmaster, and request him, in consequence of many complaints regarding the bad lighting at both stations, "to arrange for a better condition of lighting." I consulted a local solicitor, who obtained an opinion from a barrister. The barrister's opinion was "that Mr. Burbank had a very strong cause of action against the Railway Commissioners." The solicitor received a complete list of witnesses' names whom I considered would know sufficient of the facts regarding the accident, and the condition of the lighting on the station on the morning of 2nd July, 1897, and of other matters relative, to ensure a successful result in my action for damages against the Railway Commissioners. The evidence of the witnesses, I believe, could easily have been obtained by the solicitor, either by commission *de bene esse* to examine one witness, then ill, and since dead, and to examine two other possible absentees, and the remainder by voluntary attendance and subpoenas—in all, twenty-two witnesses—fourteen main witnesses and eight sub-witnesses. Between 2nd July, 1897, and the appointed date of the trial, 9th April, 1898, I was too ill to see witnesses personally, and my solicitor continuously assured me that he (the solicitor) was working hard and making every effort to secure the attendance and evidence of all those persons named to him as possible witnesses. At the same time the solicitor expressed an opinion that, as the case was such a clear and good one, it was more than probable the Railway Commissioners would make advances to settle the

A. Burbank.
1 Aug., 1900.

A. Burbank. the case without law. About Christmas time, 1897, the solicitor had made arrangements to go to Sydney, and it was decided between myself and him that he would see Mr. Oliver and explain the desire for an amicable settlement. On the solicitor's return from Sydney he delayed a week before seeing me and then explained that he had seen Mr. Oliver at the Test Match (cricket) then being played, but was referred by him to Mr. Thom (Solicitor to Railways). He then afterwards saw Mr. Thom, and said that Mr. Thom's instructions from the Commissioners were to "fight" the case. The trial, "*Burbank v. Railway Commissioners*," took place at Tamworth on 9th and 10th April, 1898, before Judge Stephen and a jury of four. From fourteen main witnesses for the plaintiff, only one was called and gave evidence; and from eight sub-witnesses, only three were called and gave evidence; two others were called, but "objected to."

1 Aug., 1900. 3. *Mr. Meagher.*] Who was your counsel on the occasion of your trial? Mr. Garland.

4. *Chairman.*] Who was your attorney? Mr. F. W. Tribe. I have a report of the proceedings which appeared in a local newspaper which I will now hand in. [*Vide Appendix A.*]

5. Did you apply for a new trial? The solicitor told me I could not apply when I wished to do so; but I am sure that at the time I could have applied.

6. Could you have found the necessary funds had you wished to proceed? No; that was the difficulty I was in. I had to borrow money from my brother and others, and to raise money on my life insurance policy. I was unable at that time to do anything at all, and I asked my solicitor if possible to apply for a new trial. That was about a fortnight after the case was heard when he came to see me. He then said, "You cannot; the notice of appeal must be given at the time of the verdict in the Court." I said, "It seems a very peculiar thing, because other evidence might be discovered afterwards." The solicitor replied, "That may be so; but you cannot do anything now."

7. Do you think that if all your witnesses had been in attendance at the trial a different verdict would have been recorded? I am sure it would have been. I should like the Committee to draw their inference from what is said as to why witnesses were not there. I have obtained affidavits from the missing witnesses, and they are prepared to say what their reasons were for not appearing, willing as they were.

8. Do you think they were influenced not to attend? There was an under-current at work somewhere. Of course, Tamworth is only a small town, where almost everyone is a friend of some other person there.

9. You were doing a good business prior to this accident at Tamworth? My returns showed that I was doing a business equal to £74 a month.

10. Your medical expenses, incidental to the accident, were very great? The doctor's account was £84.

11. Did you also lose your business? I lost everything, absolutely.

12. What have you since been doing;—how have your family been living? On the bounty of a great number of persons. I have had to raise money by various ways. My brother lent me sufficient money with which to get along for the time being, but for a great number of months we were almost starving. I made every effort to see the Commissioners and to ascertain if they would do anything for me. I got so low down that we were on the point of being turned out of the house because we could not pay the rent. I could not work, and had to get about with the assistance of crutches. My wife endeavoured to earn something by sewing work, but she succeeded in earning only a few shillings. I will mention to the Committee certain facts which came to light after the trial. I know now that my solicitor purposely prevented my witnesses from coming near the Court. I have had evidence to prove that willing witnesses could have been brought to the Court. The solicitor told me, in two instances, that the witnesses were absolutely hostile. I was sick and could not get out—except in a Bath chair—and I had to trust to my solicitor during the whole time. I gave him the names of all the witnesses, and referring to one of them he said: "If you have this man he will do you more damage than enough. I have questioned him and can get nothing sensible out of him. He seems so opposed to you that I am afraid that if you put him in the box what he would say would lead to your losing the case." Referring to the same witness, I said: "But he was on the platform, and if there is any justice in the case at all he would speak the truth." He said: "What I intend doing is to subpoena the man in order to prevent the other side from getting him; because, you see, he is a friend of White, the night officer." I said: "That is very cruel." With regard to another witness, a commercial traveller, whose name I gave to the solicitor, he said "Commercial travellers do not like being brought away from their business. He did not actually see the accident, and therefore he would be useless to us. If we take an unwilling witness into the box it is more than likely you would not get any good out of him." And he added: "We have so many witnesses that there is no fear of our losing the case."

13. It was owing to the serious condition of your wife and your children, and your own condition, that some one in West Maitland advised you to apply for a Parliamentary Committee of Inquiry? Yes. I may say also that a majority of the people in Tamworth were incensed at the verdict given. There were a number of witnesses prepared to testify to the habitually bad lighting of the railway station, and I relied greatly on a resolution passed by the Tamworth Borough Council, which was to my mind strong evidence that at a previous time the station had been a badly lighted station. The witness, John Beeby, the constable of whom I have already spoken, swore that he went through the parcel-room doors to get the ambulance stretcher; but that fact does not appear upon the Judge's notes. I can prove that he said, "I know the parcel-room door was open, because I went in to get the ambulance stretcher." Then the witness John Milligan says that Beeby was holding me up at the back, and that he, Milligan, got the stretcher from off the two hooks on the platform. The stretchers, as the Committee are, perhaps, aware, are never kept in the parcel-room. The same man (Beeby) spoke to the doctor and to several persons in my bedroom, and distinctly said, in my hearing, and in that of others, that I fell over a side of bacon in the dark on the station, and he added, "They will have a lot more accidents there." He also made a similar statement to Mr. George Howlett, who was living next door to us at the time, and who assisted to carry me down to the house. He asked how the accident had occurred, and Beeby said, "Mr. Burbank fell over some bacon on the station." At that time I had not the remotest idea what I had fallen over. If any one had said that I had fallen over a log of wood it would have been just the same to me. This man, Beeby, however, persistently said that I had fallen over a fitch of bacon, and it turned out in the court that it was so. The man made the statement to all the people in my bedroom, and to my wife outside in the dining-room. He made the same statement to Mrs. Howlett and to Frank Grant. He said, "There was a bad accident at the station; Mr. Burbank has broken his leg." He was asked how it "occurred," when he said that I had "fallen over some bacon in the dark," using exactly the same words which

he

he had used to Dr. Wilson. It was to be presumed, therefore, that Beeby would have been a favourable witness. Then there was John Ryan, the mail contractor, who took his bags from the station to the post-office, and who went for the doctor. He came back to my house, and Mrs. Howlett, who was standing on the footpath outside, and who knew him well as a long resident of the place, asked him how it was that I had been injured. He said he did not know, but that I had fallen over something at the station. My wife then said, "Cannot you tell me how he was injured; did he fall between the train and the platform?" He said that he did not see the accident, but that he had been up to the station for his bags. He had left the platform within only one minute of the train going. Ryan lost his contract for carrying the mails for some reason I am not sure about, but at the time of the trial he was put into the box and asked in whose employ he then was, and he said that he was in the employ of the Railway Commissioners. With regard to the witness Beeby, I should like to say that three weeks or more before the court case came on he was in the horrors with drink. He shot a dog belonging to one of the residents of the place, and went out into the bush armed. He was captured 10 miles out in the bush by the police, was brought into the lockup, and was sent down to the receiving house in Sydney. On the second day of the trial he was wired for, and in the witness box he said that he had had a sunstroke, that the station was a well-lit station, and that he saw me trip over my toes; also that he had not told Dr. Wilson, Whitehead, Mrs. Burbank, Mrs. Howlett, Mr. Howlett, Victor Burbank, and Frank Grant, anything about the case at all. The Judge said that Beeby seemed to be a straightforward honest man, and that it was more than probable he was telling the truth to the court. The only witnesses called to prove what Beeby had said were Dr. Wilson and the hairdresser; the others were left out. John Ryan in the court denied having said anything to Mrs. Burbank, or seeing her at all that morning. He said that he had not spoken to her about the case in any way. He also denied seeing Mrs. Howlett, or speaking to her about the case in any way. John Milligan, the hotel porter of whom I have already spoken, was at the wicket gate, and the station was so imperfectly lit that I could not distinguish who he was until I heard his voice. He had done a good deal of work for me, and I knew his voice. That is how I recognised him. He left Tamworth to work in Sydney, and he said beforehand that he would be willing to give evidence for me. He could have been subpoenaed; but my solicitor told me he could not find him anywhere. I found him afterwards. Then Mr. Ben Owen, a commercial traveller, could have given valuable evidence for me; but the solicitor prevented me from seeing him and finding out why it was he would not give evidence. Then Mr. George Tribe, the hairdresser at Tamworth, was subpoenaed by my solicitor, and was for two days attending the court without being called, as the solicitor had said that he was adverse to me. My wife and I could have addressed him at the court; but did not do so, because we felt that if he were adverse, as the solicitor had said, he would be likely to be an enemy. Mrs. George Tribe was not called, and was not spoken of as a likely witness by the solicitor; but has since said that at that time she was willing to attend at the court. Mr. Victor Burbank, my brother, was on the station on the night of the accident. I had not seen him for a long time. He wished to tell me something of a private nature, and he said he would run up to see me away as he was to go away himself on the following day. He stood for twenty minutes on the platform, and saw me light a match to ascertain if the label was on my box. The box had been taken to the platform at 9 o'clock on the previous night by the carter and my stepson, and the custom has been to put it in a spot indicated by the porters so as to be convenient for the train. They would then get a railway label, address it correctly and stick it on the box. The box has been placed there a full dozen times under similar circumstances, and has always gone away to its destination. On this particular night of the 1st July, my stepson placed a label as usual on the box. He had some small parcels for me, and asked the porter if he could leave them in the cloakroom. The porter said, "No, do not leave them in the parcel-room, because the parcel-room doors are always locked when the train comes in; but put them inside the telegraph room door, and tell him where you have put them. He will then be able to get them when the train comes in at 2 o'clock." I have always adopted that custom, and have taken my parcels from there in order to save me from taking them from the house. To see that the label was strictly addressed when I came on to the platform at a quarter to 2 o'clock in the morning, it being a dark and foggy night, I walked to the end of the platform and lit a match. This was before the train arrived, and the fact of my striking a match shows that I knew the place was badly lit; otherwise there would be no necessity for me to light a match. I saw that the label was correctly addressed. It had the words, "Tamworth" and "Gunnedah" written on it in pencil; yet the night officer and the porter both swore that there was no label on the box, and that there was no address to it. I took the trouble afterwards to tell them at the house to look when the box came back in order to see that the label was there, and they told me that the label was there; but some one had been rubbing the names out. I have the label with me; it still has marks of the pencil-written names, "Tamworth" and "Gunnedah." It can be seen from what remains that the two words were written upon the label. I got the lad to write roughly upon a piece of paper the words "Tamworth" and "Gunnedah" as he usually writes them, and I now produce the words so written, together with the label. It will be seen that the label has been rubbed. I have travelled a great deal with the box, and I looked at it, as I say, to see that the label was properly written. I satisfied myself that everything was correct. That was at a quarter to 2 o'clock. The train was delayed three-quarters of an hour; but the men to whom I refer say that in the interval they looked at the box, and that there was no label upon it. Mr. Victor Burbank, my brother, was in the room with the doctor, and heard Beeby say what he had to say. I gave his name to the solicitor; but he said, "We shall not want him." My brother, I may say, was going to America. Then there was Mr. Fox, a commercial traveller. We have written to him, and he says that at no time has he known the station to be a brilliantly-lit station. Then there is Mr. A. J. Morris, an employee at Lewis Brothers, at Tamworth, who voluntarily went to the Court, and remained there for two days, neglecting his business, in order that he might be called as a witness. I repeatedly told my solicitor to call him; but he neglected to do so. Mr. Morris has since given me an affidavit supporting what I say. He says that he went to the station to meet a friend, about three days before my accident, and that the station was so badly lit towards the end of the platform that he missed his friend, and could not see him. Then there is Arthur Pittman, an hotel-porter, who also promised to give evidence for me, and who was coming to the Court to do so. Previous to the case coming on, however, he was taken ill with typhoid fever, and was sent to the hospital. I begged my solicitor to get an affidavit from him; but he put me off from time to time, and said that the man was unable to speak, and so forth, until the man died, and I could not get him.

14. What would he have proved? That the station was dark, and was very badly lit.

15.

A. Burbank.
1 Aug., 1900.

A. Burbank. 15. *Mr. Meagher.*] Did he know of the condition of the station, as regards lighting, on the night of the accident? No; but he said that he could show that the station had always been a badly-lit station. With regard to Mr. A. J. Cooke, commercial traveller, he gave me an affidavit to say that on that particular morning the station was very badly lit. He remarked upon the fact on the morning on which the accident had occurred. I have affidavits from Mrs. George Tribe, Mr. George Tribe, Mr. Ben. Owen, Mr. J. Milligan, and Mr. A. J. Cooke, all serving to show that the lighting was very bad at the time of the accident. Had these witnesses been called—that is to say, the principal witnesses of whom I have spoken—their evidence would have put quite a different complexion on the case. I think that the jury were swayed in this way: in order to show them that the station was a very well lit station, the judge allowed them to go on to it on the first night of the trial. The station was magnificently lit up that night—the globes were all freshly cleaned, and new burners were put in, all the available lamps being lit.

16. *Chairman.*] Did you accompany the jury? No; they did not say that I was to go up. I said afterwards that I thought, for the sake of fairness, I should have been allowed to go, and to show the jury how the lighting was at the time of the accident. Of course, any jury is affected by what they see; and had the jury seen the station as I saw it, and as certain witnesses saw it, it would have made a material difference in their minds. I wrote to my brother Victor, in America, and I told him that I had lost my case, and I will read to the Committee what he says in reply.

17. *Mr. Meagher.*] He was not there at the time of the accident? No; but he was there half an hour before the accident took place. He wrote to me as follows:—

Your news about the absolute breakdown of your action against the railway people astounds me. I thought the case was as clear as daylight, and you had so many witnesses on your side, too. You do not give me full particulars, more than that it was proved that the station was well lighted, and it was your own fault. That fact might have been sworn to, but never proved; that I will take my oath on. But you had that policeman (Beeby) on your side, for he saw the whole accident, or was he not called? I should have thought that his evidence would be most conclusive and valuable. I remember well his describing how the accident occurred. It was through him that I knew the cause of the accident. Dr. Wilson asked him when he was in the room with us all, how the accident occurred, and he said that you had fallen over a fitch of bacon while helping the porter to carry your box to the van, and he did not suppose you could see the bacon, as it was so dark there. I was surprised, for I thought it had been an accident with the train itself. Now, I should have thought that no further evidence would be necessary on that point, because there were yourself, Dr. Wilson, Connie and Frank, and myself, present, when he explained it, and he said at the same time that there would be more accidents yet if they were not careful. And I would not wonder at it if there were, for the night I arrived—the night before your accident—there were no lights, except those under the verandah of the station, and they were miserable and dull enough. I did not know which end of the train the van was, it was so dark and misty-looking. I walked up to one end, and it was only by the noise of the engine and the reflection from the fire I knew where I was, because there was no light there. Then I went back to the other end, and could see a pile of goods heaped on the platform; but could not distinguish my portmanteau until I had lit a match and found it, and it was only as I was going up the platform that any light came, and it was from the guard's lantern, as he was coming back from the van. It must have been pretty dark, for he passed me without seeing me, until he heard me walking, and turned his lantern on me, and I said, "I am taking my portmanteau," and went on. I do wish I could have been there to give evidence, for I saw the station three nights without lights—that is, outside the verandah. I am sure that night I speak of, any one would be liable to fall over such a thing as half-a-dozen fitches of bacon, for I only saw the luggage at the van, because it was heaped up. I thought when I got out of the train what a dismal, miserable-looking station this is; it seemed like going into a dead place, for even where there were lamps they looked swamped in dirt and scarce able to emit any light. Why, the whole town could have been able to testify to that. Well, that is one night I can swear there were no lights beyond the verandah, and the other was the night of the accident, when you and I stood talking on the platform. I told you then what a miserably-lighted place it was, and pointed out to you how there were no lights on the preceding night, for it recalled it to my mind when I saw you go to look if there was a ticket on your box, and struck a match to make sure they had put it on. Even you, where we stood near the entrance, could not see past the dull patch of light. When I left you, and was going home, I could not help thinking that the station seemed to be completely dead. The third time I saw that there were no outside lamps was on the night after the accident. When Connie came and took my place with you, I had a mouthful of supper and went home; but on my way I thought, "Now, I will just go and see definitely to-night if those lamps are lit," for it was just about time for the train to come from Brisbane end. I got there about ten minutes before it arrived; the time was about ten or fifteen minutes before 2 a.m. (I was thinking of Sydney at the moment, and waited until it left), and no more light was shown than those of the previous nights, viz., under the verandah. I think if I were you I should mention this to your solicitor, and see if my evidence taken here, or a statement made before a local J.P., would be accepted, for these are facts I can swear to. But if they would not hear Beeby, the policeman, as a witness, perhaps they would not hear me. It seems that he and I are the most important witnesses, for he described the accident to us in your bedroom—to Dr. Wilson and us all—and I can swear that on three consecutive nights as to their being no lights beyond the verandah. And from what I remember of the position of the station and your box when I saw you looking at it with a match, you must have been in a very dull light, because it would be about half way, I should judge, between the dull verandah light and the unlighted lamp on the platform, and therefore Beeby's explanation that he did not suppose you could see the bacon as it was so dark seemed so reasonable. I remember, further, that there was a sort of mist or dullness in the nights at that time, making it all the more necessary for good lighting. I have good cause to remember it, for I caught a cold in the damp air that I have not completely got over even yet. Now, Al., I do not know that there is more that I can say, only that if you find that my evidence would count, if the case be not absolutely past, I will do all in my power to get it to you as soon as you should notify me. I do so heartily regret that I should be away, for I am sure that they could not refuse to hear me; or else, where would the justice be?

I will now read to the Committee some of the affidavits to which I have referred. The first is the affidavit of John Milligan, and is as follows:—

New South Wales, }
to wit.

I, JOHN MILLIGAN, of Tamworth, in the Colony of New South Wales, waiter and night porter, do hereby solemnly declare and affirm that: I have been living for some months in Sydney, but for eighteen years before I was living in and about Tamworth; I was there at the time that Mr. Burbank met with his accident; I believe it was the 2nd July, 1897; I knew him well; I know the railway station there well; I was at that time night porter at Pugh's "Royal Hotel," and it was part of my business to attend at the trains coming in and going out at the station; I went up there on the night of the accident on the 'bus; I used to travel backwards and forwards on the 'bus; I saw the condition of the station that night as to lighting; I can swear most positively that it was not lit up, and that lamps were not well alight so that people could see readily all over the station; I know that the side lamps in the side yards were not alight; I say positively that the front doors of the parcels room facing the platform were not open and throwing a light on to the platform; I say that the platform was comparatively dark, and was not well lighted; I had to be on the platform that night more than once in my business; I had to meet the passengers at the quarter to 2 train that morning; the train was late about half or three-quarters of an hour, and I sat on a box at the Sydney end, waiting for the train to come in, and I could then see that the outside lamp at that end of the platform was not lighted without moving, and that the platform was not well lighted, and when I rose from my seat I saw that the parcels room doors were not open but closed; the telegraph room door was open, but did not give much light; there were no passengers for me that morning, so that I had nothing to distract my attention from what was going on; I went up and down the platform in front of the train, as it was my custom, asking for passengers; there were none, and I saw then that the whole platform was in total darkness; I had seen Mr. White, the night officer before this; I saw Mr. Burbank on the station making ready to go away before the train came in; I saw him go across the platform, and light a match to look for his luggage apparently; I and the 'busman waited till the train had gone,

gone, and then started to go home, and as the 'bus was passing the little gate at the end of the station-house, someone called out to bring the 'bus to take a man that had broken his leg; Frank Wakely was driving the 'bus; he turned round and drove close against the fence in which the gate was, and I could not see the fence, as the lamp at the end of the platform was not alight, till we were close against it; it was slightly foggy, and I then saw someone lying on the ground near the Armidale end, under the verandah, and the Policeman Beeby holding someone up; although I knew Mr. Burbank so well, I could not recognise him for want of light, even when I was pretty close to him; someone said, "Bring a light," and Mr. White, the night-officer, went away and got a lantern and turned it on to Mr. Burbank's face; I had previously said, "Who is it?" and some person replied, "It's Mr. Burbank; I think he has broken his leg"; when he heard me speak he said, "Is that you, John?" I said, "Yes; what's the matter, Mr. Burbank?" I have read in a newspaper report of the case that Mr. White said he never had his lamp out of his hand; I say, if he said so, that is not a correct statement; I saw him go with his tablet and his lamp towards the ticket-office; he put his lamp down on the stool outside, went into the ticket-office, left his tablet there, and came out, leaving his lamp on the form, and did not pick it up till he went to get it, when someone called for the light; it was proposed to put Mr. Burbank on a door and take him to the 'bus, but I said "There's the ambulance," and I went to where it was hanging, and got it down; it was not in good order, and, after a little trouble, I got it right, and Mr. Burbank was put on it; at Mr. Burbank's request I went to the "Imperial Hotel," at the opposite corner, to wake up his brother, and then came back; Mr. Burbank then requested me to go down and break the news as gently as I could to his wife, and as time was going on, and we had to catch the next train, we started, and on the way we stopped, and I told Mrs. Burbank what had happened; I have read in the before-mentioned report that Constable Beeby swore that he went into the parcels room and got the ambulance; I say this statement if made is untrue, for the ambulance was not kept in the parcels' room, and he did not get it, but I did, and the constable was still standing behind Mr. Burbank, holding him up by the shoulders; on that same morning I saw Ryan, the mail-man, go hurriedly across the platform with his mail-bags; I was for a whole twelvemonth going to and from the train, most often twice every night, and I left last January; the platform was not well lighted, and frequently at the back of the platform the lamp was not lighted at all, and I have lit it from the step of the 'bus, and have climbed up and lit it when the 'bus has gone a little too far; it was a well-known fact how badly the place was lighted; I have seen passengers who were strangers frequently stumbling at the steps through there not being sufficient light; for a little while after the accident the place was lit up better, and then it all died down again; if the night-officer, or anyone else, swore the place was well lighted on the night of the accident, and for some time before, I say positively it is not the truth. And I make this solemn declaration as to the matters aforesaid, according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

Subscribed and declared at Tamworth, this 21st day }
of November, A.D., 1898, before me,—

W. E. TEXTY, J.P.

JOHN MILLIGAN.

18. Who prepared that affidavit? Mr. R. W. Thompson. I have also received the following letter from Mr. George Howlett:—

Mr. A. E. Burbank.

Dear Sir,

Pitzroy-street, Tamworth, 18 July, 1899.

Yours of yesterday's date, re stretcher, to hand. In reply I beg to state that I went to the railway station this morning, and the stretcher was there, hung on two iron brackets just outside the parcel-room door. The brackets are fixed on the Sydney side of the doorway, and the stretcher occupies about two-thirds of the wall space between the parcel-room doors and the weighing machine.

Yours faithfully,

GEO. HOWLETT.

19. You can show that that is Mr. Howlett's handwriting? Yes; the following also is Mr. Howlett's declaration:—

New South Wales, }
to wit.

I, GEORGE HOWLETT, of Tamworth, in the Colony of New South Wales, teacher of shorthand, do hereby solemnly declare and affirm that: I know Mr. Albert E. Burbank, formerly of Tamworth, dentist, and I remember his being hurt on the Tamworth railway station on the morning of the 2nd of July, one thousand eight hundred and ninety-seven; at that time he and Mrs. Burbank occupied one-half of the house in which I was living in Tamworth; I heard of the accident to Mr. Burbank through one John Milligan, and I being then in bed, got up, dressed myself, and hurried out to see what was the matter; I met the party who were carrying Mr. Burbank on a stretcher, and I then assisted to carry him; one of the party was a man named Beeby, who was then a constable, but who has since resigned from the Force for some reason; I asked Beeby how the accident happened, and he said Mr. Burbank was helping to carry his box to the van, when he tripped over a side of bacon, and hurt his leg, and I believe it is broken; I noticed that the morning was dark and foggy. And I make this solemn declaration as to the matter aforesaid, according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

Subscribed and declared at Tamworth, this 4th day }
of July, A.D., 1899, before me,—

GEO. HOWLETT.

C. HEWITT, J.P.

20. Where was Mr. Howlett when the case was being tried at Tamworth? He was at his business at Tamworth, and could have been easily called as a witness. The other affidavits are as follows:—

New South Wales, }
to wit.

I, ARTHUR J. MORRIS, of Brisbane, in the Colony of Queensland, draper, do hereby solemnly declare and affirm that: In the middle of the year 1897, I was residing in Tamworth, being then in the employ of Messrs. Lewis Brothers there; I knew Mr. A. E. Burbank, who was then also residing in Tamworth, and practising as a dentist; I heard that he met with a severe accident on the railway station at Tamworth on the morning of the 2nd of July in that year; I was on the platform of the station at Tamworth on a morning a few days before that date to meet a friend who was going to Sydney by the morning train, but I found that the station was so badly lighted, from the fact that there was no lamp lit from under the platform verandah, that I could not see whether my friend had arrived or not; to my knowledge, the Tamworth station was generally very badly lit; I attended at the Court on Mr. Burbank's case for two days, but I was not called as a witness. And I make this solemn declaration as to the matter aforesaid, according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

ARTHUR JAMES MORRIS.

J. B. HALL, a Commissioner for Affidavits for New South Wales, residing in Queensland.

STATUTORY DECLARATION.

I, FRANK GRANT, moulder, of Elgin-street, West Maitland, late of Tamworth, in the Colony of New South Wales, aged 17, do hereby solemnly and sincerely declare as follows:—I am step-son to Mr. Burbank, dentist; I know that he was injured in Tamworth, 2nd July, 1897; I assisted a carter on previous occasions to 1st July, 1897, to deliver Mr. Burbank's dental box at the Tamworth railway platform; I did assist the carter on the night of 1st July, 1897, about 9 p.m., and I saw the box placed at a spot near the parcel-room, as instructed to so place the box by a porter; I procured a railway label, and wrote on it in distinct letters the words "Tamworth, Gunnedah," and I pasted the label firmly and in a conspicuous place on the top end of the box; I have on many previous occasions written Mr. Burbank's destination of journeys on similar labels, and on all other occasions the box has arrived at its addressed town; if, as I am informed, that the porter and night-officer both stated in Court that there was no addressed label on Mr. Burbank's box—if they stated it, I say that they spoke untruths, because I have removed the label that I put on from off the box since the accident, and it still bears my writing, although an attempt has been made by some person to rub the label and writing, and so partly destroy its legibility; I knew Constable Beeby; he said to me on the morning of 2nd July, 1897, these words, "Mr. Burbank fell

over

A. Burbank. over a side of bacon in the dark up at the railway station"; I knew a man named John Ryan; he spoke to me on the morning of 2nd July, 1897; he was standing in front of Mr. Burbank's house, and I asked him if he knew how the accident happened; Ryan replied, "I do not know, I did not see it; but I think he tumbled over something in the dark up at the station"; at the same hour on 1st July, 1897, about 9 p.m., I placed some parcels of Mr. Burbank's inside the entrance doors to the telegraph office at the railway station (after delivering the dental-box) instead of in the parcel-room; I was so advised by a porter, because he said that at the early morning train, and on its arrival, the parcel doors were always closed. And I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the ninth year of the reign of her present Majesty, intituled "an Act for the more effectual Abolition of Oaths and Affirmations taken and made in various Departments of the Government of New South Wales, and to substitute Declarations in lieu thereof, and for the suppression of voluntary and extra-judicial Oaths and Affidavits."

Declared at West Maitland, this 31st day }
of July, 1900, before me,— }

F. GRANT.

STATUTORY DECLARATION.

I, CONSTANCE BURBANK, of West Maitland (late of Tamworth), wife of Albert Burbank (dentist), in the Colony of New South Wales, dentist, do hereby solemnly and sincerely declare as follows:—I was informed of the accident to my husband on the morning of 2nd July, 1897, and was standing in front of my house in company with Mrs. Geo. Howlett; I there saw a man named John Ryan, mail contractor, who was then returning from warning Dr. Wilson of the accident; Ryan asked if the doctor had arrived, and Mrs. Howlett spoke to him; I also spoke to Ryan, and addressing him, said, "Did Mr. Burbank fall between the train and the platform?" and he replied to me in the following words:—"I do not know, Missus; I did not see it (meaning the accident); but I think he has had a 'buster' and hurt his ankle"; I also know a man named Beeby, who was then a constable of the New South Wales police; on 2nd July, 1897, I saw him in the bedroom whilst Dr. Wilson was attending to my husband; I there heard Dr. Wilson ask Constable Beeby how the accident occurred, and I heard Beeby reply in the following words, as nearly as I can remember:—"Mr. Burbank was helping the porter to carry his box to the van, and fell over a side of bacon in the dark on the station, and it is a wonder they have not had more accidents there, it is so dark"; after Beeby had finished assisting Dr. Wilson, I gave him a drink of whisky in my dining-room, and Beeby then voluntarily repeated his previous statement made to Dr. Wilson as to how the accident occurred; and Beeby further told me that he saw Mr. Burbank light a match, and go up to where his dental-box stood on the platform, and he said that he then noticed how dark and badly lit the station was. And I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the ninth year of the reign of her present Majesty, intituled "An Act for the more effectual Abolition of Oaths and Affirmations taken and made in various Departments of the Government of New South Wales, and to substitute Declarations in lieu thereof, and for the suppression of voluntary and extra-judicial Oaths and Affidavits."

I, GEORGE TRIBE, of Tamworth, in the Colony of New South Wales, hairdresser, do hereby solemnly declare and affirm that:—I know Mr. Albert E. Burbank, formerly of Tamworth aforesaid, dentist; I heard of his being hurt on the railway station at Tamworth on the morning of the 2nd day of July, one thousand eight hundred and ninety-seven; I was on the platform of that station with my wife on that morning; I was seeing her off to Sydney by the train which should leave there about 2 o'clock in the morning; I saw the said Mr. Burbank that morning, but I did not see the accident; he was coming on to the station when I first saw him, where there was light enough in the hall of the station to see him; I then saw him sitting on a seat, and pointed him out to my wife; I could not distinguish his features, and my wife asked me how I knew him in the dark, and I explained that I had seen him before that morning in the light of the hall; the platform was very badly lighted, and towards the Armidale end it looked to me quite dark; it was, in my opinion, disgracefully lighted, and was made worse by the lamps being dirty. And I make this solemn declaration as to the matter aforesaid according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

L. HYMAN, J.P.

GEORGE JAMES TRIBE.

In the Supreme Court of }
New South Wales. }

Albert Edwardine Burbank, Plaintiff, and the Commissioners for Railways, Defendants.

I, MARY TRIBE, the wife of George Tribe, of Tamworth, do solemnly and sincerely declare as follows:—I was on the railway station at Tamworth early in the morning of the second day of July, in the year one thousand eight hundred and ninety-seven; I intended to go to Sydney by the train which should leave Tamworth at ten minutes to 2 that morning; my husband accompanied me to the train, which was late that morning; in consequence of the delay, my husband and myself were kept at the station about three-quarters of an hour; we went to a carriage as soon as the train came in, and my husband saw me into the carriage; before I got in I had observed how dark the station was, and how badly it was lighted; I observed that the lamp at the Sydney end of the station, beyond the platform, was not lighted at all; I know that the platform itself was badly lighted, and whilst I was waiting for the train I observed this: I saw some one sitting on a seat on the platform, and my husband pointed him out to me as Mr. Burbank (who was afterwards hurt); I could not distinguish his features as it was too dark, and I asked my husband how he could tell him in the dark, and he replied that he had seen him come in through the hall of the station, which was lighted; I saw my husband talking to the night officer just before the train came in; I said to my husband, "How dreadfully dark the station is; what a shame it is not lighted better"; it was quite dark to me beyond the clock on the station from where I was sitting, which was at the Sydney end of the platform, and I got into a carriage outside the awning or verandah of the platform, and then saw that the lamp outside was not alight on the Sydney end; I saw there was a light in the waiting-room and under the clock when we came on to the station, and the centre lamp was lit just before the train came in, but these lights did not give sufficient light, in my opinion. And I make this solemn declaration conscientiously believing the same to be true as to the matters aforesaid according to the law in this behalf made, and subject to the punishment by law provided for any wilfully false statement in any such declaration.

STATUTORY DECLARATION.

I, BENJAMIN JAMES OWEN, of 288, Sussex-street, Sydney, in the Colony of New South Wales, manufacturer, do solemnly and sincerely declare:—I very well know Mr. A. E. Burbank, formerly of Tamworth, dentist, who, as I am informed, and verily believe, met with an accident on the railway platform at Tamworth on the morning of the second day of July, 1897: I was on that railway platform early on the morning of that day, as I intended to be a passenger by the Brisbane mail train, which was about to arrive from Sydney, and which was timed to leave Tamworth at 2 o'clock a.m.; I was at the Sydney end of the platform, where my carriage was, and I declare positively that that end of the platform was not properly or sufficiently lighted that morning, but very indistinctly lighted, the light being very low and dim—too dim altogether; the lights are ever so much better now; I do not believe that the first lamp at the Sydney end was lit at all—at any rate, the far end was in total darkness; I saw the said Mr. Burbank on the platform that morning, and though I passed him pretty close, I could scarcely recognise him on account of the dim light, indeed the fact is I passed him without recognising him until he spoke to me, and he was then standing between the main door of entrance and the Sydney end of the platform. And I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the ninth year of the reign of her present Majesty, intituled "An Act for the more effectual Abolition of Oaths and Affirmations taken and made in various Departments of the Government of New South Wales, and to substitute Declarations in lieu thereof, and for the suppression of voluntary and extra-judicial Oaths and Affidavits."

GEORGE WATT, J.P.

BENJAMIN JAMES OWEN.

New South Wales }
to wit. }

I, A. J. COOK, commercial traveller, representing Biddell Bros, wholesale confectioners, of Darling Harbour, Sydney, in the Colony of New South Wales, do hereby solemnly declare and affirm that:—

1. I arrived at the Tamworth railway station by the Brisbane mail, on the morning of the 2nd day of July, 1897, from Walcha-road; I heard that Mr. Burbank, dentist, had met with an accident that morning; on arrival I noticed the lighting of the station, and it was very poor.
2. I have always looked upon the Tamworth railway station as an imperfectly lighted one.

Subscribed and declared at Sydney, this 3rd day }
of August, A.D. 1899, before me,— }
F. H. BURTON, J.P.

ALEX. J. COOK.

With regard to Mr. George Tribe, I should like to say that he is willing to make an affidavit to this effect: That on the night when the jury went out to see the lighting of the station he stood on the platform, and made this remark to the station-master, Mr. Wise:—"Come, Wise, this is too bad; you are lighting the place up brilliantly. It is nothing like what it was when I saw it on the morning of the accident." The station-master shrugged his shoulders, and said, "I have to do it, you know." If I had been able to produce this witness he would have given this evidence for me, and other evidence which would have been valuable. There is a discrepancy between the evidence of White (the night officer) and the evidence of Playford (the porter). White said, "I lit the gas on the platform for the passenger train. I lit three under the awning, and one on each side of the awning, outside post-lamps. Playford came on duty at 1 o'clock. I was still on duty. I lit the five in the earlier part of the night. After the passenger train left I turned out the post-lamps and the middle lamp of the three. I saw Playford light the ones on the posts and the middle one."

THURSDAY, 2 AUGUST, 1900.

Present:—

|-------------------|-------------|----------------|
| MR. DIGHT, | | MR. EDDEN, |
| MR. THOMAS BROWN, | | MR. NICHOLSON, |
| | MR. SPENCE. | |

J. GILLIES, ESQ., IN THE CHAIR.

Albert Burbank recalled and further examined:—

21. *Chairman.*] You were referring at the close of the sitting of the Committee yesterday to some discrepancy between the evidence of White and Playford? Yes; I read an extract from the Judge's notes showing what White had said. According to the report of the local newspaper Playford said,— "I went on duty at 1 a.m. on the 2nd July. All the lamps on the station were alight. The night officer would light some of the lamps, and it was my duty to light any that I did not find lighted. When I came on duty on the 2nd I lighted the two post-lamps outside the covered way, and the lamp in front of the ladies' waiting-room. The others I found alight." Those that he found alight were two under the awning. When he came on duty he says that he lit the outer post-lamps and the one over the ladies' waiting-room. White says that when the 9 o'clock train went out he turned out the two post-lamps and the one under the centre of the awning. He was cross-examined by Mr. Garland, and he said, "I did not see Playford light the lamps. I saw him go to do so." I should be glad if the Committee would obtain a copy of the resolution passed by the Tamworth Borough Council referring to the bad lighting of the station. I saw it in print, but I have not a copy. The resolution was carried in July, 1897, and it is important, because the evidence in my case hinged upon the good or the bad lighting of the station. I should also like to get an exact record of the gas consumed on the Tamworth railway station for the three months prior to July, 1897, and for the three months after that date, in order that it may be seen whether or not there was an increase during the latter period. I do not know what the proceedings of the Committee will be, or whether when the other side put their case I shall have a reply, but, in case I have not, I should like to make my wishes known now. There is another matter I should like to find out. I have every reason to believe that the station-masters are paid a bonus—whether they get it directly or not I do not know—to run the stations as cheaply as they possibly can, and for that reason the station at Tamworth has been notoriously badly lit. I have affidavits going to support my contention that the station was very badly lit on the morning of the accident.

22. *Mr. Edden.*] Can you prove that the station-masters do receive bonuses of the nature you describe? It is known in the Railway Department. I have heard it from railway men themselves. It is a difficult matter for me to produce them. It occurred to me that there might be a record in the Department, because if the practice were followed it would be done under cover of something or would be done

A. Burbank.
2 Aug., 1900.

openly. I am told by commercial travellers and by railway men that it is a recognised thing that station-masters are paid bonuses for running the stations as cheaply as possible. When I left Tamworth, after being ill there and impoverished for nearly twelve months, I was out of business, I was not earning anything, and I was under very great expense. I felt that there was something amiss, and that my witnesses had not been called correctly. I was sure that, if I had received better advice, I could bring the whole matter to a more definite conclusion. I therefore asked the Railway Commissioners to give me a pass for myself and family to West Maitland. They sent me a pass, and when it was presented to the station-master (Wise) on the railway station he made this remark, "Damn the fellow and his pass." I should be glad if the Committee would obtain for me the departmental record of John White, who was night officer on 2nd July, 1897, and the same record of Playford, the porter, at that date. From the Police Department I should like to have the record of Constable Beeby, late of the force. It would include the report from the police at Tamworth, and the medical report in reference to Beeby in the month of May, 1898, covering, of course, the period up to his resignation.

23. *Chairman.*] What is your object in trying to get these records? To show that these men were so unreliable that they were willing to swear anything. They committed absolute perjury. I should like also the report from the railway people as to Wise's statement that no complaint had ever been made of the bad lighting on the Tamworth station. To qualify that, I quote the fact that a man named Morrison had his leg broken through falling off a portion of the Tamworth platform, about the year 1890. If this matter comes before the Railway Commissioners they may read this, and take it upon themselves to hold an inquiry into Wise's conduct; and it is only in that connection that I make the statement that Wise has left his work during business hours to show intending tenants over his houses.

24. You want to show that he frequently neglected his duty? Yes. I desire also to make this statement: That Harry Cousens, the foreman of the jury, was drunk during two days after the case, and was seen arm-in-arm with Wise, the station-master. I have a witness who saw him. Whether my solicitor will produce him now or not, I do not know. My solicitor is against me now. He tried to show his friendship to me in many ways to hide his deficiencies. He told me of this occurrence after the case; but I have another witness who saw Cousens.

25. *Mr. Dight.*] Who is Cousens? A stock and station agent. Wise, the station-master, is a personal friend of Mr. Tribe, the solicitor. Cousens, who was foreman of the jury, is also a personal friend of Tribe's.

26. *Chairman.*] This being a civil case, had you any opportunity of fixing the jury—of seeing that it was composed of men who would be likely to go straight? I was only able to speak with my solicitor when I was brought down in a cab to the Court. I saw among the eight jurymen on the panel Cousens. They balloted for four, and Cousens was one of the number chosen.

27. *Mr. Edden.*] Did you challenge or object to any of the jurymen? No; I left that to my solicitor. He told me that Cousens had business with the Commissioners, and I said, "We had better cross him off." Tribe said, "No; do not cross him off; he is bound to be with us." I should like to refer to some remarks of the Judge in quoting excerpts from some other judgments, because it had some influence probably upon the jury. He said, addressing the jury, "If you give a verdict for the plaintiff you must remember that our experience is that where professional men claim substantial damages, and get them, it is not long before they have their surgeries and waiting-rooms full of patients, and have more business than they were doing previously; and on account of this, when a medical man gained a large sum of money from the Railway Commissioners after the Redfern railway accident, a special Act was passed by which the amount was limited to £2,000." Looking towards the barristers, Judge Stephens said, "Some of the legal gentlemen will remember the case I refer to." Mr. Scholes said, "Yes, your Honor—Dr. Maher." The Judge replied, "I am not mentioning names; but that is the case I refer to." Again he said, "You must also remember this, gentlemen of the jury, in considering your verdict: The plaintiff may be injured; but it is a question as to how much he is injured, and how far his injury will affect his chance of renewing his business, because, gentlemen of the jury, a man may have an accident which has the appearance of being of a permanent character, and yet it is not so; but I will cite you the case of a very serious accident, more serious than this one, that happened to a gentleman, a Member of Parliament, who had both his arms and his legs cut off, and yet was able to mount his horse and ride; and he could shoot, and a very good shot he was, too. So, gentlemen of the jury, you will be guided by this case when considering your verdict."

28. *Chairman.*] I presume he was referring to the House of Commons case? Yes.

29. But the member, I thought, was born in that way? Yes; I merely mention the matter, because I wished to point out that cases of that sort going to a jury must have a very strong effect upon them. It seemed to me, from hearing the Judge cite such a case for the information of the jury, that he favoured the defendant. It must be taken in conjunction with the fact that he allowed the jury to attend the railway station at night, when the station authorities lit every lamp—there being newly-cleaned globes with fresh burners, making a really brilliantly-lit station, and his not having the sense of justice to insist upon me, the plaintiff, going to the station also, and showing the jury how I saw it on the morning of the accident. I consider that that was not a just way in which to treat a plaintiff. What I say may seem irrelevant, but when I come to the end of the case, I think the Committee will see that it has every bearing upon the final position in which I find myself at this moment. It is known, of course, that the verdict was for the defendants. Before leaving the Court, a message was sent to me through my solicitor that the Commissioners could be approached by friends of mine—that if they would make representations to the Commissioners it was possible that they might make a grant of money to me. They quoted the case of a reverend gentleman—a Catholic priest—who was injured, and to whom the Commissioners gave a sum of money upon such representations. Two of my friends were in communication with the solicitor, Mr. Tribe, and they met together with the intention of sending a joint letter to the Commissioners. Tribe was to write it. He came to my house and told me that the letter had been written and sent to the Commissioners. At that time, knowing how unjust the verdict was, I asked Tribe if it were not possible to appeal against it. He said, "No, we are too late; the notice had to be given on the termination of the case." On the occasion of another visit, Tribe said that he had received a private message from his agents in Sydney, Messrs. Curtiss and Barry, to the effect that his letter had been received by the Commissioners, and was being favourably considered. He said his agents had special means of knowing what took place in the Commissioners' office. I wrote a letter to one of the local newspapers, the *Tamworth News*, the original of which I now produce. It is as follows:—

To

To the Editor,—
Sir,

Hill-street, Tamworth, 15 April, 1898. A. Burbank.

Will you kindly grant me space in your next issue to express my heartfelt and grateful thanks to those fellow townsmen—both witnesses and friendly supporters—who so loyally stood by me in my recent Court trials. It is not politic for me to vent any personal animus or reiterate publicly my own convictions regarding the case, but it may be granted that I am appalled at the serious financial results the verdict has thrown upon me, and, added to my physical disablement, the outlook may truly be a dark one. I acted throughout as the spirit of truth dictated to me, but the uncertainty of law results is amply indicated in this case.

I shall be favoured if my friends and sympathisers will accept an open invitation to at any time call and see me for an exchange of opinion, as I am unable to leave the house.

Very faithfully,
A. BURBANK.

30. That letter did not appear in the newspaper? No. It was returned to me, with an intimation from the editor, Mr. Joseph, who is since dead, that Mr. Tribe thought it best not to publish it, as it would spoil my chances with the Commissioners, and Tribe's efforts, with other friends, to induce them to assist me financially. Joseph afterwards told me that the Commissioners were sending up for copies of the local newspapers to see the report of the case. I could not get a correct opinion as to the appeal. I was in this position at that time: I was unable to afford any money to pay lawyers fees further than the men I had employed; but I felt that there was something amiss. I did not wish to show my feeling of resentment towards Tribe; but I was at the same time afraid to consult other solicitors, for fear they might communicate with him. I asked Mr. Joseph, the editor, how long an appeal would lie after a case had been decided. He did not know. He said also, "I think you would be wise to let the business stand as it is, and put up with the verdict, because the Railway Department would fight you with all their power to beat you." I again saw Tribe, and he said everything was going favourably in connection with the matter, and that the Commissioners had sent up for copies of the local newspapers.

31. *Mr. Edden.*] Before you proceed further with your explanation I should like to ask you a few questions. On the morning of the accident, you had a box on the platform. What became of that box after the accident;—was it taken straight away from the station on that morning? No; on the next morning, at about 11 o'clock.

32. In whose charge was the box up to that time? In charge of the railway authorities.

33. Did you book the box? There was no necessity to do so.

34. Was it not overweight? No. I am allowed to carry 85 lb., and the box was only 80 lb.

35. Was it labelled? Yes. That is sworn to in affidavits.

36. Was it the box falling upon your leg that caused it to be broken? That is what one man says was the cause; but I have an affidavit to prove that he has committed perjury.

37. *Chairman.*] Did Tribe submit to you a copy of the letter which he says he sent to the Railway Commissioners? No. Briefly stated the case is this: Mr. Harry Stoddart called upon me at my house, and said, "Some friends of yours with myself are having a letter sent to the Commissioners, asking them to consider the case, and see if they can give you a grant of money. Tribe is acting for us, and will write the letter. I want you not to place too much reliance upon what may be done as the outcome of that letter. So you may put the matter entirely from your mind now, and see by and by what will come of it." His object was to dissuade me in my then state of health from dwelling too much upon the possibilities of the recommendation. I never again mentioned the matter to Stoddart, trusting implicitly in Tribe. The reason I continued to trust in Tribe at that special time was that he came to my house on one occasion, and expressed regret at losing the case, and said he had done his best. That is the point at which Tribe commenced to give me information about the letter having been sent. I saw Tribe again about the matter, and he said that Cousens, the foreman of the jury, was going down to see the Commissioners on business, and that whilst there he would speak to them, and support the letter which had been sent on my behalf. I told Tribe that Cousens had lost his chance of doing me justice, and that I did not want his interference now. Tribe replied, "You are foolish to object to Cousens, because he has influence with the Commissioners. If any man can help to get a grant for you, he can." I saw Tribe afterwards, and he said, "I have just received an account from my agents, Curtiss and Barry, and they mention your fees." He added, "Of course, Curtiss and Barry would expect fees for keeping me informed on your behalf." He said, however, that, as he knew I had no money, he would pay Curtiss and Barry himself. I again saw him, and he said he could not understand the delay regarding the favourable consideration of my case by the Commissioners, but that his agents had written to say that, after careful consideration, the matter had been passed on to another Department—he thought the Treasury. I again saw him, but he began to get impatient, and he said he was doing his best in my interests, and could not understand the delay. He advised me to watch the list appearing in the daily newspapers, showing the amounts granted in the monthly supply bills. I determined to leave Tamworth and sift the enigma myself, and I asked Tribe to raise a loan on our furniture. He was weeks preventing my raising any money to get away, although there were three men in the town who would have lent some money to me on the furniture. I should mention that Tribe came up to see me about June, 1898, and said that he was going down to the city to defend a case against the Debt Collecting Company, and that while down he would inquire the reason why no answer had come to our letter. On his return he said he was strongly advised by Mr. Harris, in the solicitor's office of the Commissioners, not to see Mr. Oliver and explain matters, because everything was going favourably, and an interview would look as though Tribe was only asking for me so that he might get extra fees for himself. I suspected Tribe's *bona fides*, and sold what furniture we had, and came to Maitland. I had then been ill a year—a helpless cripple, on crutches. That ends my connection with Tamworth up to that date. With reference to the statement of the Commissioners that I should have made an advance to them with the object of arriving at an amicable settlement, after the case, with the object of their making a grant to me, I find that, notwithstanding the representations Tribe had made to me on the subject, no letter had been written. As soon as I left Tamworth I intended going down to see the Commissioners, and at that time I did not want Tribe to understand what my feelings were towards him. I wanted to finally test him, to see whether he had been playing a game to suit himself. In that connection I wrote this letter to him:—

Dear Mr. Tribe,

Elgin-street, West Maitland, 22 July, 1898.

You will be pleased to hear that we arrived safely, and are located at the above address. Whilst I had a little cash at command I thought it best to run down to Sydney and see really how things were going, and endeavour to interview Mr. Oliver. Mr. Harris received me kindly, and spoke most sympathetically, but Mr. Oliver was away at some country inspection. He seemed to know little, if anything, of any joint letter from you and other Tamworth friends; but he informed me that Mr. Cousens had received a letter from the Commissioners shortly after his return to Tamworth, in which they

A. Burbank. they informed him (Cousens) that they refused absolutely to entertain any request on my behalf. The Commissioners regarded the claim as a business matter, and having chosen to settle it by going to Court, I must abide by the result.
 2 Aug., 1900. That Cousens has taken upon himself to withhold the receipt of a letter from the Commissioners bearing such momentous news away from you and me—for all those long days of heart-breaking anxiety—is, to say the least of it, uncalled for.

I will concede that his anxiety to repair his cruel verdict by a conciliatory appeal to the Commissioners was a natural one, but my own judgment and suggestions should have been consulted before such an extreme step was taken by him. I can see now, dear old friend, how keenly and more hopeless you were in feeling for me as time after time I came for even a scintilla of hope of good news—and all that time Cousens held the key to my fate in his pocket.

Oh, the cruelty of it! May God deal even-handed justice out to those who have so cruelly wronged me. Will you get from Cousens a copy of the letter sent to him, and a verbatim statement of his interview with Mr. Fehon? Would you, as an alternative, advise me to write to Cousens myself and ask him how far he pressed my cause with Fehon, and any other matter he chooses to give? You must forgive any vivid expressions of personal feeling in this letter, but I know myself to be the victim of an iniquitous injustice, and my heart revolts.

I forgot to tell you that I had the pleasure of seeing Mr. Garland—he was kindness itself, and he gave me some friendly advice, which I will act upon. I only wish my prospects in business had not been so rudely upset, and so cut short my life amongst you all in Tamworth; but time will never efface from the memories of my wife and myself the genuine friendship and sterling worth that was shown us by so many of its residents. Be assured, dear friend, of the valued help and advice from you being appreciated, and may I ask a future loyal co-operation should I find it necessary to appeal to you?
 Believe me, very sincerely,
 ALBERT BURBANK.

I received no reply, no communication, from him from that date to this. I wrote to Mr. Stoddart, one of the friendly committee who were supposed to have sent the letter to the Commissioners, and I asked him what was the purport of the letter which had been written. He replied that no letter had ever been written, and that after he had seen me Mr. Tribe advised that no letter should be sent, but that as Cousens was going down he would do better than any letter. I decided to go and see the Commissioners and request a hearing, so as to place certain facts before them in support of the letter supposed to have been sent by Tribe on my behalf by my friends at Tamworth asking for a grant of money.

38. *Mr. T. Brown.*] When you waited upon the Commissioners, you were under the impression that your friends had sent the letter? Yes; I saw Mr. Harris, the managing clerk of the railway solicitor, and who is responsible for the whole of the legal work done then and during the trial. At this date, about 3rd August, 1898, the Commissioners were away on tour, and I told Mr. Harris that I wanted to see Mr. Oliver and explain to him how justified I felt in bringing the action, and that although I was defeated in the Court I thought that I could show a good case for a grant of money. Mr. Harris said, "I feel sure that Mr. Oliver will not see you." He also said, "Do you know the strongest witness against you in the Court?" I said, "Who?" and he answered, "Your box; partly on account of size, and the jury believing that it contained a great weight." I said, "The jury had no evidence leading them to believe that, because my evidence was that it contained only 80 lb."

39. *Chairman.*] If it had contained more than that weight, you would have been charged for it? Yes.

40. *Mr. T. Brown.*] Was any evidence submitted to indicate that it contained a greater weight? The other side said that it contained over a hundredweight; but they never weighed it, and the same box has gone out on twelve or more different occasions in the same way in connection with my business. The box was in Court, and they never tested its weight. My evidence gave the weight of the box at under the ticket allowance of 85 lb. I was asked by Harris whether there were not many entries at the different stations showing that I had paid excess upon the box. I replied, "Yes; I always paid when I carried excess weight during my journeys. That was caused through an accumulation of plaster models at each of the ten towns I visited; but I always went away light from Tamworth." I asked Mr. Harris why no reply had been sent in answer to the letter from my friends, supposed to have been sent through Mr. Tribe. He went in to see Mr. McLachlan; but when he returned he said, "Mr. McLachlan does not know anything about any letter; but Mr. Cousens came in to see the Commissioners, and Mr. Fehon saw him. Mr. McLachlan also saw Cousens when he was here, and a letter was sent to him informing him that the Commissioners would not do anything for you. You had brought an action against them, and, being defeated, you must put up with the consequences." It was at that time that I wrote the final letter to Tribe, and got no reply. I came again to Sydney in August, 1898, when I could ill-afford the expense, and I again saw Mr. Harris.

41. As a matter of fact, you had to borrow money for your expenses? Yes; when I saw Mr. Harris he said, "Mr. Oliver will not see you." I said I would not go back to Maitland without a hearing. I was then taken into Mr. Kirkcaldie. That was on 9th August, 1898. I asked him for consideration of a money gratuity, in regard to which an application had already been sent in by my friends at Tamworth to the Commissioners. I did not know that at that particular time that no letter had been sent. I did not make the discovery until after that date. I pointed out the serious nature of the accident, the destruction of my business, and my inability to properly renew it. I also pointed out that the porter had led me over the obstruction. Mr. Kirkcaldie replied that I had brought an action against the Commissioners and had been defeated, and now asked for a gratuity. He said, "Why did you not approach the Commissioners before taking action?" I said, "I did on two separate occasions." The first was by letter, two days after the accident, written by my brother; and the second occasion was when Tribe came down at Christmas, in 1897, when I instructed him to see the Commissioners and ask for a consultation, and then he was told that the Commissioners preferred to fight the case. In answer to the first letter the Commissioners had said that they would not recognise any responsibility. Mr. Kirkcaldie expressed surprise that I had made any attempt to approach them, and he asked me if I would close the interview and allow him to make inquiries, and that he would communicate with me again. On that same evening I received a private letter delivered from Mr. Harris, to this effect:—

Dear Sir,
 Mr. T. W. Harris wishes me to write you asking that you will kindly see him some time after 7 o'clock this evening. He may be detained a little after 7; but will you kindly remain in so that he may have an opportunity of seeing you.
 Yours truly,
 RAILWAY SOLICITOR'S OFFICE.
 WALTER S. FULLWOOD.

Mr. Harris called at the Coffee Palace, in Pitt-street, at 9 p.m. He said that the object of his visit was to convey a message from Mr. Kirkcaldie. He was to say that if I would write a letter denying the sentence in a letter written at my dictation by Mr. Victor Burbank, in which I held the Commissioners responsible for my accident, and would also express my regret for bringing the action, he was told to say that the letter would be favourably considered at a meeting at 10:30 the next morning by the Commissioners. During the conversation I pointed out that I had an object in view in seeing the Commissioners on this special

special visit, and that I desired to place certain facts before them showing that I felt justified in all that I had done. While not saying "Yes" or "No" to him I was anticipating that night hearing from Mr. Kirkcaldie in continuation of our interview. Mr. Harris strongly advised me, "as between you and I and the gatepost," that it would be best for me to write the letter and let him take it straight away, because he said, "You know you have no show of reopening the case, and this offer is the only means you have of getting anything out of the Commissioners. The Commissioners have heard the facts from start to finish, and all you may say will not alter their opinion." I replied that the Commissioners had heard only one side, and that my story would put a different complexion upon the whole affair. He said "You will be foolish to attempt any explanation, as it will spoil your chances now." I declined to write any letter then, and returned a message that I was gratified at being met with Mr. Kirkcaldie's courteous words, but I desired to carry out my resolve to continue our conversation of yesterday with him. Mr. Harris made an appointment for 9:30 on Thursday.

42. *Chairman.*] Was there no definite offer made to you by the Commissioners? Yes. As you will see, Mr. Kirkcaldie referred at once to the letter written two days after the accident, saying that I held the Commissioners responsible, and said that it was not holding out the olive branch. I replied that it was written by my brother, who was a layman, and was a *bona fide* statement of my condition and knowledge at that time. Mr. Kirkcaldie doubted the letter being written by a layman, and at my dictation, but I assured him it was so. I then explained to him that my solicitor had told me that he had come down at Christmas time, and had seen the Commissioners, but that his answer was that they would fight the case. Mr. Kirkcaldie said, "How can you come and ask for any consideration after the court action." I replied that what I did was not without justification, having regard to the condition of the station, and I then gave him a general outline of the cause of the accident, but he checked me from going into particulars of the case, and said, "If you will withdraw your objectionable sentence in that letter, and express regret for having taken the case to court, I will place your letter before the Commissioners for favourable consideration." I said I would not commit myself to such a lie. Mr. Kirkcaldie said, "But I presume that now that you have lost your action you do regret what you have done." I said, "I regret losing the action, and my money, and being crippled for life. A different verdict would have been given if I could have had the case heard, as in Equity." Mr. Kirkcaldie replied, "Is it plain, Burbank, that you want more law; but you have no earthly chance of having the case reopened, unless, as Mr. Harris says, you take it to the Privy Council." I said, "Supposing I have new and definite witnesses, can I bring the case on again?" He replied, "No: I will give you my assurance that after the jury decided against you you had no chance in the world, not with fifty witnesses." I said, "Well, Mr. Kirkcaldie, I cannot doubt you, and as I am so poor, and my family are in want, if I write a letter expressing regret, and stating that I did not desire to take action from the first—will that do?" I meant by that that I relied upon the solicitor's interview with the Commissioners showing that I was anxious for a private settlement. "Yes," he replied, "You must say that you were ill-advised in taking proceedings by your solicitor and barrister. Then let us have your letter as soon as possible, and I will represent the matter as favourably as I know how to the Commissioners." I then wrote the following letter:—

The Railway Commissioners,—
Gentlemen,

Elgin-street South, West Maitland, 11 August, 1898.

Since my interview with you, and after calm reflection, I beg to ask your favourable consideration for the gratuity to help me to lighten the dreadful distress which, through the unfortunate accident, has befallen myself, wife, and children, and enable me to re-establish my business as a dentist which was broken up through my inability to continue it.

I can only assure you, gentlemen, that it was originally my intention to leave the justice of any decision in your hands; but during my physical and mental suffering I was induced by a solicitor and barrister to take legal proceedings, which I now see were ill-advised. Whilst regretting the course that was taken, may I crave your sympathy and practical help in view of my crippled condition and the long effort it will be to recoup, by working, the expenditure to date of £544. Trusting for a favourable reply.

I am, &c.,

A. E. BURBANK.

I purposely put in the amount of £544, because I wanted to show to the Commissioners that if they gave me any help at all it must be an amount which would assist me to pay the debts which were consequent upon the accident, and also assist me to pull my business together again. The reply received was as follows:—

Sir,

Office of the Railway Commissioners, Sydney, 13 August, 1898.

I am directed by the Railway Commissioners to acknowledge receipt of yours of the 11th instant, and to express regret that you should have suffered such heavy expense endeavouring to maintain an action in which you never had any prospect of success. I am further to point out that by your course of proceeding you have forced them, in the exercise of a public duty, to expend large sums of money in carrying on their defence, which, although justified by the anticipated result, cannot be viewed with unmixed satisfaction.

Had you originally approached the Commissioners in the spirit displayed by your letter now under reply, you would no doubt have been treated with exceptional consideration.

Even now, and although you have without success invoked the aid of the Supreme Court against them, the Commissioners, reviewing the lamentable circumstances which you describe, are prepared to express their practical sympathy by a grant of £100.

I am, &c.,

H. McLACHLAN,

Secretary.

Mr. A. E. Burbank, Elgin-street South, West Maitland.

This letter was in contradiction, firstly, of what I state was the condition of my case, and secondly, on the action that I took,—that is to say, the Commissioners say "An action in which you never had any prospects of success." I know the prospects of success I had had my witnesses been all available, and had the case been tried under those circumstances. They also said, "Had you originally approached the Commissioners in the spirit displayed by your letter now under reply, you would, no doubt, have been treated with exceptional consideration." I made the only attempt I could to approach them through my legal advisers.

43. And you are satisfied that he did not approach them? Yes. Being in that position, and being so poor at the time, and being so very ill and on crutches, I was compelled under the circumstances, believing myself deserted by men who should have supported me—indeed, I had no alternative but to accept the amount. This is the letter I wrote to the Railway Commissioners in reply to their offer:—

The Railway Commissioners,—
Gentlemen,

Elgin-street South, West Maitland, 15 August, 1898.

Your communication dated 13th August, to hand, and in reply I shall avail myself of your offer to present me with a grant of £100, and hereby accept it. My financial necessities are abnormally pressing, and may I ask for a realisation of your favour at the earliest moment.

I am, &c.,

ALBERT BURBANK.

The

A. Burbank. The Solicitor for the Railway Commissioners replied as follows :—

2 Aug., 1900.

Sir,
arranged.

I beg to inform you that on Monday next I shall be in West Maitland when I will hand you cheque for £100 as arranged.

Solicitor for Railways' Office, Sydney, 24 August, 1898.

I have, &c.,

JAMES C. THOM,

Solicitor for Railways.

As a matter of fact he disappointed me, and it was over a week before he came up and paid me the money. 44. Mr. Dight.] But you did get it eventually? Yes. I accepted the money from Mr. Thom under protest. I gave the following receipt to him :—

"To amount agreed to be paid to above-named Albert Burbank as an act of grace, and in full satisfaction and discharge of all claims and damages whatsoever in respect of injuries sustained by him at Tamworth on the date, 2nd July, 1897."

In receiving the cheque I protested to Mr. Thom that I had been treated unfairly in being given only £100, and that that would pay only a little more than the medical expenses. I said that I thought I might have been granted a more substantial amount, considering my great injury. I said I thought another "nought" should be added to the cheque. I told him that the doctor's account came to £84, and he remarked, "Is the doctor's account so much as that?" At that time, as I say, I believed that I was deserted by all the witnesses who could have appeared, and I was influenced to come to that decision by what my solicitor had told me regarding them. When I found that the Commissioners charged me with bringing an action in which I never had any prospect of success, I went to Mr. Thompson, the solicitor at West Maitland, and asked him whether he could advise me in the case, and from that time he and I worked to obtain interviews with the missing witnesses, with the result that everyone whom I have mentioned as a favourable witness for me at the trial, and who could have been called, has given me a sworn affidavit, which I have already produced. Having obtained these affidavits, Mr. Thompson advised me that it was only right that I should address my case again to the Commissioners, pointing out the witnesses I now had, and that had their evidence been given, the verdict would probably have been altered. I then saw the Member for the district, Mr. Gillies, and asked him if he would look into the merits of the case, telling him that I had been advised to approach the Commissioners, and Mr. Gillies verified my version by seeing the Commissioners, and he said he would endeavour to get me an interview with them. Mr. Thompson took it upon himself to write a letter to Mr. Thom, of which this is a copy :—

Burbank v. Commissioners.

Dear Sir,

You will remember this case, tried at Tamworth, in which you got a verdict for the Commissioners, and you know that they afterwards made him a concession of £100, being satisfied themselves, I believe, that he had sustained very severe injuries, and had been injudiciously advised in not approaching them in the first instance in a conciliatory manner.

Some time since he saw me on the matter, and he so satisfied me that he had a good case that I determined, as a matter of kindness, and without charge, to do what I could to get the matter reconsidered; for I felt quite certain that the Commissioners, individually and collectively, would be willing to do him absolute justice, even although they had already made the concession, if they were satisfied—firstly, that he had a good case; and, secondly, that the concession did not meet its merits.

I heard in various ways that there were a great number of witnesses who might have been called to prove and support the case that he wished to make, but who were not called, and amongst them were Mr. Benjamin Owen, Mr. Cooke, Mr. Howlett, Mrs. Howlett, Mr. George Tribe, Mrs. Tribe, John Milligan, and others; but it appears his then solicitor was so confident of success that he did not consider it worth while to lengthen the case by calling them.

The result of my inquiries has been to show me, as a man of some experience in our profession, that his confidence was misplaced, and that every available witness should have been called; and the strong probability is, if they had been called, that Mr. Burbank would have had a verdict for a large amount.

I say a large amount, for he was crippled for life, with the further result that he cannot follow his business as a dentist, as he cannot get about without a pair of sticks, and is permanently disabled from using the treadle, which is an absolute necessity in his business, as his working leg is shortened, and he is now, therefore, on the verge of pauperism.

The amount which the Commissioners were good enough to allow him, covered by a few pounds only what he paid his doctor and his chemist, while his actual expenses up to that time were upwards of £500, and no part of it went to his former solicitor, or his counsel, or to myself.

Quite a number of the witnesses who might have been called have volunteered to make declarations, some of which go to show that Ryan (since dismissed by the Commissioners), Beeby, the policeman (since retired from the force), and other witnesses for the Commissioners, whose living depended on their evidence, were wrong in that evidence, and that the account given by Mr. Burbank, as to the character and cause of his accident, was absolutely correct.

These declarations Mr. Burbank purposes to place before the Commissioners, if they will kindly grant him an interview, and, on the strength of the evidence contained in them, to ask them to make an extraordinary precedent in his case, and, although they have already made the concession referred to (for which he is very grateful), that they will reconsider the whole of the circumstances; and, as the result has been so serious to him, that they will grant him such a sum as will recoup him in some measure for the pain and misery which he has suffered so long, and for the attendant pecuniary loss.

I do hope that in thus addressing you, you will not consider I am going out of my way when I further ask you to lend your weight on the side of mercy, for I am very sure from what I have seen of you that you would be one of the last to press for strict legal rights as far as the Commissioners are concerned, if you are satisfied that Mr. Burbank in this matter, whilst kindly and, in their view, liberally treated already by the Commissioners after they had beaten him, was brought to his present miserable condition, bodily and financially, by the carelessness and negligence of their servants; or that such carelessness and negligence in any degree contributed to it.

I, of course, anticipate that you will be consulted in the matter, or otherwise I should not have troubled you with my views; but in any case I can ask you to excuse me for addressing you at such length, for I know of no sadder case than to see a strong able man, who was making a good living in a proper and decent way, struck down so as to be almost helpless and unable to support himself and his wife and young children.

Mr. Gillies obtained an interview with the Commissioners for me after some difficulty. I saw Mr. Commissioner Fehon and Mr. Commissioner Kirkcaldie on 3rd August, 1899, in the presence of Mr. J. Gillies, M.P. for West Maitland, at 2.30 p.m., in Mr. Fehon's room. Mr. Fehon reviewed my case, and said in effect:—"You have come, Mr. Burbank, as I understand from Mr. Gillies, to ask the Commissioners further consideration of your case. We are custodians of the public purse regarding the railways, and unless you can show very great reasons for our doing so, we cannot give your case further consideration. We have already tested your claim against us in a Court of Law, when you were defeated. Even after that decision you came to us, and we gave you £100, so that we fail to see how we can further listen to an appeal from you. Mr. Gillies tells us you have come with some documents to show us, and has asked us if we will hear what you have to say." I then gave a *resumé* of the case, with clear details, regarding each of my witnesses, and how the accident was caused. I produced a number of affidavits from several independent persons who were present on the morning of the accident, and whose evidence would have altered the complexion of the case had they been present. I gave the reasons why I believed these witnesses were not allowed to be present at the trial, and I said that I had obtained their affidavits,

because

because they had not been called upon to give evidence through the neglect or connivance of my solicitor, A. Burbank. Tribe, who could have obtained their several statements by ordinary legal procedure. The Commissioners combatted all the statements and information I gave them, and doggedly refused to admit that I had brought anything before them strong enough to alter their view, or to induce them to reconsider my request for an increased gratuity, or to induce them to doubt their servant's honesty. Mr. Fehon repeatedly said, "You see, Mr. Gillies, he has not given any new material to warrant us in interfering again in the matter." Mr. Gillies answered, "I think, Mr. Fehon, that Mr. Burbank has shown you by his affidavits and statements that your servants have either committed perjury, or that there has been very grave injustice done throughout the whole case." I further said, "My reason for seeing you is, that if I can show you where an injustice has been done me through your servants, you would acknowledge the seriousness of my statements supported by these affidavits, and thus give me a chance to prove to you that your servants deceived you by their statements regarding the cause of the accident, and the extent of your responsibilities. Upon those false statements you built up your defence to the action." Mr. Fehon eventually said, "I will tell you what you can do. Write out a letter detailing all you wish to say about the accident, and what you desire done, and let me have it as soon as convenient. I will lay the matter before the Commissioners, and let you have an answer. My reply was the following letter:—

The Railway Commissioners,—
Gentlemen,

Victoria Coffee Palace, 3 August, 1899.

I have the honor to approach the Commissioners relative to my position and health, following upon a broken leg which occurred in July, 1897, at Tamworth railway station. As is known, I brought an action against the Railway Department for damages, with the result that a verdict was given against me. In writing now I beg to appeal to the generosity of the Commissioners to assist me with a monetary grant in my almost helpless condition, consequent upon the peculiar and serious nature of the injury. The break occurred across the main thigh bone, obliquely, and into the knee-joint—a compound fracture, wholly displacing the knee-cap and tearing the contiguous sinews and muscles. Although now the bone and muscles have become attached again it has left the joint ankylosed so that the knee will only bend half way, and the excessive osseous growth has enlarged the knee-joint and above it so much that it is always in a bent position, and so weak and flaccid that little weight or standing can be put upon it. The same side foot is always swollen and painful, due to the drawn up ligatures and muscles, and the length of the leg has decreased 1 inch, requiring a built up boot to equalise the height. I have explained the injuries so fully, because both right leg and knee are the essentials to work the treadle lathe in my business as a dentist; and, although I have tried to use the leg, I find it impossible to do so from pain and weakness. Owing to my long-continued illness I am now unfitted to resume dental work and am reduced to the verge of starvation. I have a delicate wife and small family dependent on me, and, in my helpless state, they share my poverty. I have existed during the long interval of two years upon the bounty of my friends, from whom I have borrowed money, and also obtained credit for food from many tradespeople in Tamworth and Maitland, who have hoped with me that the time would come when I could get back to work and pick up a neglected personal business connection again; but the wish is hopeless. I know my dental career is ended. I must begin life again in a different sphere. In this earnest appeal to the Commissioners to help me—if they will do so, may I explain how keenly, mentally, I feel my downfall, when, had I been in my usual health during the past two years I would have earned £800 per year, but on the reverse, that amount is lost with all future dental business, and I have contracted debts of honor to £500. Under all these distressful circumstances may I hope for the Commissioners' monetary help in order to give me a business footing again and enable me soon to earn my freedom from these obligations. I must apologise that my letter is long and earnest, but I feel that the lives of myself, wife, and children rest upon your decision. May I ask, as an exceptional favour, that I know your wishes as early as convenient. I attach a copy of Owen's affidavit, which was not available at my interview.

ALBERT BURBANK.

A letter was written in reply to Mr. Thompson's letter by Mr. Thom, in these terms:—

Railway Commissioners' Ats: Burbank.

Dear Sir,

Solicitor for Railways' Office, Bridge-street, Sydney, 20 July, 1899.

I am in receipt of your letter of 17th instant, written on behalf of the above-named plaintiff, in which you seek to have his claim reconsidered by the Railway Commissioners.

I have brought all the circumstances attending the trial, and the subsequent payment to Mr. Burbank again under the notice of the Commissioners, and am instructed to inform you that the case cannot be reopened.

Yours truly,

JAMES C. THOM,
Solicitor for Railways.

R. W. Thompson, Esq., Solicitor, West Maitland.

Here is the reply which they sent to my letter of the 3rd August, 1899:—

Sir,

Office of the Railway Commissioners, Sydney, 8 August, 1899.

With reference to your letter of 3rd instant, relative to accident to you at Tamworth in July, 1897, and asking the Commissioners to grant you further assistance, I am directed by the Railway Commissioners to inform you that the matter has had their further consideration, and I am to express their regret that the circumstances of the case are such that they do not feel justified in reopening it, unless you can establish the statement made by you that some of the principal witnesses at the trial committed perjury in the interests of the Railway Commissioners when the action taken by you was defended.

I have, &c.,

H. McLACHLAN,
Secretary.

Mr. Albert Burbank, Victoria Coffee Palace, 208, Pitt-street, Sydney.

Subsequent to that, I consulted with my friends, and they thought that the only way to have the matter investigated, and show that an injustice had been done to me was to ask the Member for the district to bring the matter before the House and ask for a Select Committee, which has been done. I think my case is one in which the Commissioners have shown an absolute callousness as to whether I lived or died. They never communicated to me one word of sympathy, or inquired by writing one line whether I was alive or dead. I lay for a full week between life and death, and they sent me no message of condolence or inquiry as to my condition. I might have died like a dog for all they cared. My wife and children, more especially my wife, have suffered with me. My wife has been very much broken in health, and the accident has made me comparatively an old man, and has ruined my business, so that at the present time I cannot earn more than an average of from 25s. to 30s. a week. I can only live now through my wife assisting me by taking boarders.

45. Are you liable at any time to fall down on account of your accident? I can never go out at night-time, because I slip so easily. It is only on very favourable occasions that I can use one stick; as a rule I have to use two sticks. I have fallen completely down on the ground by simply trying to take a step a little longer than usual.

46. I believe that within the past fortnight you had a serious fall? Yes, within the past three weeks; I am liable at any time to fall. From earning a full competence to a condition of penury is a big drop. I would ask now if it lies in the power of the Committee that they will deal as between the Commissioners and myself in an equitable way. I will explain what I mean. I have had to appear here totally unprepared, as far as legal knowledge is concerned, and I should not like the Commissioners to have the advantage of a legal man present to argue their case before the Committee.

WEDNESDAY,

WEDNESDAY, 15 AUGUST, 1900.

Present:—

MR. DIGHT,

MR. MEAGHER,

MR. SPENCE.

J. GILLIES, ESQ., IN THE CHAIR.

Hugh McLachlan called in, sworn, and examined:—

H.
McLachlan.
15 Aug., 1900.

47. *Chairman.*] You are Secretary to the Railway Commissioners? Yes.
48. You are cognisant with the circumstances of the case of Albert Burbank against the Railway Commissioners at Tamworth? Yes.
49. Have you brought a report showing the consumption of gas at the Tamworth Railway Station during the three months prior to 1st July, 1897, and three months subsequent to the 1st July, 1897? Yes.
50. Do you produce it? Yes. [*Report produced. Vide Appendix B1.*]
51. Do you also produce the departmental record of Jas. Playford, a porter at the Tamworth Railway Station? Yes. [*Report produced. Vide Appendix B2.*]
52. Mr. Wise, the Station-master at Tamworth, made a statement regarding this matter, and said that no complaint had ever been made with regard to the lighting of the station. Do you know anything of the statement? I have no record of any such report having been made. He may have made a statement at the inquiry which was held at the Tamworth Court. I have no official report to that effect. I cannot trace one.
53. Do you wish to say anything about the matter of your own accord? I do not know that it is necessary for me to say anything about the matter. I dare say the members of the Committee are fully cognisant with all that has occurred. This man met with an accident on the Tamworth Railway Station, and sued us for damages. The case went into Court, and was tried by a perfectly impartial tribunal, a thoroughly independent jury. The jury was composed of local townspeople and had no interest in the Railway Department. The case lasted two days. The jury inspected the premises, and saw the station lit up, and then found that Burbank had no claim against the Department. That was a little better than three years ago. Burbank, a year after, wrote a letter to us admitting that he had been ill-advised in taking an action against the Department, and asking that the Commissioners would, as an act of grace, give him something to lighten the distress in which he was placed. I believe the foreman of the jury also saw the Commissioners, stating that he knew Burbank was hard-up, and suggesting that as an act of sympathy the Commissioners might do something for him. He said he knew the man had no claim, but said it would be a graceful act on the part of the Commissioners to take such action in consideration of all the circumstances of the case. The Commissioners, purely as an act of grace and out of sympathy with the man, made a grant of £100. Since then Burbank had been endeavouring to get more; but the Commissioners were quite satisfied that the occurrence was quite accidental, and due to no fault or negligence of the officers of the Department. Burbank had taken the case into Court, and it was tried quite impartially by people who had no interest in us, and they found their verdict for the Commissioners. If Burbank had a claim, he had every opportunity of establishing it. We had no feeling or prejudice against him. He was quite unknown to us, and, if the Commissioners could have leaned to the side of mercy, I am sure they would have done so. This is shown by their action in making the grant they did after he had admitted that he was ill-advised in taking the action.
54. Are you aware that it was at the instance of the Railway Commissioners that he wrote those words, that he had been ill-advised? He may have done so. I do not know of my own knowledge. He did write it and he did take the action which was tried in a court of law.
55. Have you ever heard any complaints with regard to the defective lighting of the Tamworth railway station? Not that I remember.
56. Did not the Tamworth Borough Council communicate with the Railway Commissioners in July of 1897 drawing attention to the Tamworth and West Tamworth Railway Stations and stating that they were deficiently lighted? They might have done so; but not to my knowledge.
57. But they may have done so? Yes. They may have done so, and I may have dealt with the communication; but I have no recollection of it.
58. With regard to Station-master Wise, or the actions of the Railway Commissioners generally with regard to station-masters—do the station-masters receive a reward for services rendered in keeping down expenses at the different railway-stations, in saving lights, and so on? No.
59. Is there no understanding with regard to bonuses? No.
60. With regard to Porter Playford. Is his reputation good according to the record of the department? His reputation is said to be very good. That is according to the record of the department. I do not know him personally.
61. Are you aware whether the solicitor for the Railway Commissioners endeavoured to prevent witnesses from attending at the court at Tamworth when Mr. Burbank's case was proceeding against the Commissioners? No. I would suggest you call the solicitor.
62. Can you swear that they did not try to prevent witnesses from attending? No. I would know absolutely nothing about that. Mr. Thom would act, and we also had a Counsel, and their action would be determined by themselves.
63. Was there a case on all fours with this one in which a man named Belisario, a dentist, was injured? I recollect something of the case; it was a very long time ago.
64. Did the Railway Commissioners give £5,000 to settle the case? My recollection is that Mr. Belisario got a verdict against us. It was a long time ago, and my memory of the case is not perfect; but I think he got a heavy verdict against us, and £3,000 was paid.*
65. Was the case a similar one to this? Yes.
66. *Mr. Spence.*] Is it not a fact that the officers of the Railway Department are expected to keep the platforms clear when passenger trains are departing? Yes, as far as it can reasonably be done; but it cannot always be absolutely clear.
67. *The Chairman.*] Was there not a claim allowed recently of a similar nature? Yes; luggage was being wheeled up on to the platform and being put into the train, and a person ran into the barrow.

68.

NOTE (on revision):—I do not recollect the circumstances.

68. But did not the Commissioners recognise the claim? No; they declined to recognise it, and thought the verdict against us a most unjust one. We are sure there was no negligence. The people in this Colony are not spoon-fed, and are always expected to exercise a certain amount of care.
69. *Mr. Spence.*] In the case of leaving goods on the platform, would not that be carelessness? Everything would depend on the circumstances. The train is only a limited time at the platform, and some goods must necessarily be left on the platform if it is to be put aboard or delivered by the guard.
70. But is it not the duty of the Commissioners to provide men to receive the goods? Yes; we have men on the platform, not only the guard, but porters. This evidence was thoroughly sifted and settled by the jury of townspeople who tried the case at Tamworth, at the time when the incidents were fresh in the memory of witnesses.
71. *The Chairman.*] Mr. Burbank does not hold that? I can understand that a man who has lost his case may not be satisfied with the trial.
72. Is there no case within your knowledge where a jury could be mistaken or got at? It does not make any difference to us, personally, and we had no interest in preventing a fair trial. We understood the men on the jury to be thoroughly reliable people. Mr. Cousins, the foreman of the jury, appears to have a very high reputation.
73. *Mr. Spence.*] Perhaps evidence was not put forward at the time, which would have altered the appearance of the case? You might have expected to get fresher evidence when the case was new and the accident a recent occurrence. The Commissioners did not seek to exclude facts. They always desire to incline to the side of liberality and generous treatment, so far as their duty to the public will allow them.
74. If the station were defectively lit on the occasion of the accident, would the station-master be blameable?—If there were any neglect we would blame the station-master.
75. *The Chairman.*] Do you know if the station-master and the foreman of the jury and the solicitor who appeared for Mr Burbank were very intimate friends? No. I know none of them except by repute, and they are spoken of as being men of standing and character.
76. Perhaps you will remember it was sworn that there was no label on the box? No. I do not recollect it. I did not read the depositions.
77. I think you will admit that the Railway Commissioners try to shirk responsibility in these matters? No. If it is considered there is a case against the Department we will try and settle it. But if there is no case of negligence against us we must safeguard the public interest and prevent unjust claims being made. We are not spending our own money, but the money of the public, and therefore must be careful to protect the public.
78. Your solicitor would naturally try to win the case? When the Commissioners told him it was not a case they could meet, he would naturally do his best to get evidence to support the view.
79. If a dentist doing a good business was permanently injured and unable to follow his calling for three years, and it were proved that the injury was caused by the neglect of the Railway Commissioners' servants, do you think £100 would be a sufficient sum to vote him? No.

H.
McLachlan.
15 Aug., 1900.

William Henry Cooke called in, sworn, and examined:—

80. *Chairman*] You are a clerk in the office of the Inspector-General of Police? Yes.
81. You are here on his behalf? Yes.
82. Do you appear at inquiries like this frequently on his behalf? Yes; I generally appear when papers are to be produced, as I am the Record Clerk of the Department.
83. You were asked to produce a record of Constable John Beeby, formerly a constable of police at Tamworth? Yes.
84. Have you brought the record? Yes; I produce it, signed and certified by the Inspector-General of Police. (*Vide Appendix C.*)
85. Personally, do you know anything about this man? Not beyond what I learned in the records.
86. Was he employed in the Police Department in July, 1897? He joined the force in 1865 and was discharged on 6th February, 1899.
87. Then he was in the employ of the Department in 1897? Yes; he was then stationed at Tamworth.
88. Was he a reliable man as far as the Department knew? Yes, fairly. In the charges against him on the defaulters' sheet are four charges of drunkenness, for which he was discharged.
89. Would you say, in spite of those four charges of drunkenness, that he was fairly reliable? Would you think a man addicted to drink reliable? He might perform his duties to the public very well.
90. And yet be a drunkard? Yes.
91. Do you want this Committee to believe, Mr. Cooke, that a policeman who is a drunkard can perform his duties well towards the public? No, I should not say that, but I should not like to say that he was not a reliable man. Eventually, after the four charges on the sheet, his Superintendent considered that he was not fit for police services, and he was discharged.
92. How comes it that this man was allowed to get drunk four times in the force; why was he allowed four chances;—was there any favouritism? I cannot say. The Inspector-General dealt with each charge.
93. Is it a usual thing to allow a policeman to be charged four times? I could not say.
94. Are there not cases where men have been discharged for one offence? I would not like to say that.
95. It might be said that Beeby was favoured by the Inspector-General of Police? I do not know that. I cannot question the Inspector-General of Police. I simply produce the record. It shows the details. The second charge was for assault, and there are two charges after that before the man was discharged. Why he was given these chances is a matter solely for the Inspector-General of Police, who goes through the papers. I can speak of nothing except what is on the charge sheet.
96. *Mr. Dight.*] Was there a charge against Constable Beeby shortly after the date of Mr. Burbank's case against the Railway Commissioners? There was no charge between 1895 and 1898.
97. Is there nothing in the record there about his having gone out into the bush and been brought back in delirium tremens? No.
98. Nothing about having shot somebody's dog? No.
99. Nothing about his having the horrors and running wild in the bush? No.
100. *Chairman.*] That shows what the Inspector-General knows.
101. *Mr. Dight.*] Is there no record in March or April of any charge of drunkenness? Yes. On March, 1898, being drunk and fighting in the police barracks at 1 a.m., to be reduced one grade in rank and if again reported the papers to be submitted to the Inspector-General.

W. H. Cooke.
15 Aug., 1900.

- W. H. Cooke. 102. Could you say from your own knowledge, or from any documentary evidence in your possession, whether about the time Beeby was in the horrors with drink, he shot a dog belonging to one of the residents of the place, whether he went out into the bush armed, and was captured 10 miles out in the bush by the police and then brought in to the lock-up and sent down to the Receiving House in Sydney? I could not say that.
- 15 Aug., 1900.
103. *Chairman.*] Do you mean to say there are no records in the department about this man having been sent to the Receiving House in Sydney? There may be some, but they do not appear in this sheet.
104. You produce the sheet? Yes.
105. Are you prepared to say it is a full and correct record of Beeby's conduct while he was a policeman? No; I am not.
106. Is it possible there may be some omissions? I could not say.
107. *Mr. Spence.*] Would this not be just the official record, and would there not be other documents and papers on which these decisions would be based? Yes; it may comprise voluminous papers. The charge would perhaps be drunkenness, and it might include a variety of offences. It might be reported by many officers in the district and comprise many details, but there is nothing to show on this Superintendent's record. It is simply a summary, a record of charges against Constable Beeby by the Superintendent of Police at Tamworth. Every man in the force has a similar sheet in which charges against him (if any) are recorded.
108. It would be inquired into fully and dealt with before the record was made up? Yes; in each case the Inspector-General gives his decision after considering the report of the police and the Superintendent and the man's own defence. In this case the Inspector-General reduced the accused man twice.
109. *Mr. Dight.*] When was he discharged? On 6th February, 1899. He was not permitted to resign, but discharged. I presume he was incorrigible. There may be other charges against this man in the district, but the only thing I am instructed to do is to produce a copy of the official defaulters' sheet.
110. *Chairman.*] Was not the Inspector-General summoned to appear? Yes; but when documents are required I generally appear, as I am the records clerk. The papers can all be produced, if required.
111. I think, if this were another court, Mr. Fosbery would be found guilty of contempt of court, and I have a very good mind to compel him to come.
112. Could you give the Committee any reason why Mr. Fosbery did not attend here this afternoon? No.
113. Is it not because he is attending a meeting of the Public Health Board? No, I think that met yesterday.
114. *Mr. Dight.*] Would there not be papers in the department to show if this man were sent to the Receiving House at Darlinghurst or not? Most decidedly, yes. I can produce any papers you want in detail.

THURSDAY, 16 AUGUST, 1900.

Present:—

MR. EDEN,

MR. NICHOLSON.

C. H. DIGHT, ESQ., IN THE CHAIR.

William Henry Cooke recalled and further examined:—

- W. H. Cooke. 115. *Chairman.*] We adjourned yesterday for the purpose of enabling you to furnish us with certain papers with regard to Constable Beeby. Have you those papers? Yes; I have the papers. "Constable Beeby, Tamworth, on sick leave in Sydney; returned to district, and asks for transfer from Tamworth."
- 16 Aug., 1900.
116. What are those papers? The first is from the Superintendent at Tamworth. It is respecting the drunkenness of Constable Beeby, at Tamworth. The Committee asked for certain papers. Perhaps I had better read them. The first is a telegram from the Superintendent at Tamworth, and is dated 26th March: "Constable Beeby, after coming off duty, 4 a.m., this day, appears to have put on plain clothes and left barracks. Not missed till being called for dinner. Ascertained he was seen about 8 miles out, on Nundle-road. Police in search of him.—THOMAS KENDALL." That was at 3 in the morning. This statement refers to another report by Sergeant Gamble to the Superintendent at Tamworth. Sergeant Gamble "Begs to report, for the information of his Superintendent, that Constable Beeby went on night duty on 25th instant, at 8 p.m. The Sergeant saw him several times up to 10 p.m. He was, apparently, all right then. Constable Caldwell, who went on night duty at 10 p.m., saw Beeby at 3 o'clock next morning. He also saw him (Beeby) coming off duty at 4.15 a.m. He appeared all right then. Beeby returned to barracks, and put on plain clothes. He was seen by Mr. Sutherland, Public School teacher, 8 miles from Tamworth, about 8 a.m., travelling on foot towards Dungowan. Two constables were sent in search, and found him at "Dungowan Hotel," 14 miles from Tamworth, apparently out of his mind. A buggy was obtained and Beeby was driven to Tamworth police station. He is now under restraint. When at Dungowan Court, Beeby asked Constable M'Fie to lend him his revolver. Constable M'Fie said 'What do you want it for?' Beeby replied, 'You know!' The Sergeant has been informed that on Friday night last Constable Beeby threatened that he would shoot him (the Sergeant) and then shoot himself." The next in order of date is a certificate obtained by Beeby from Dr. Harris, the Government Medical Officer at Tamworth—"I hereby certify that I have twice examined Constable John Beeby, and find him in a state of great mental depression, in fact on the verge of insanity. I certainly consider that he is not at present fit for police duty, and might do himself or others an injury. I, therefore, recommend that he be sent to the Police Dépôt for the purpose of further observance.—H. L. HARRIS, M.B., Ch.B., Government Medical Officer, Tamworth, 27/3/98." There is also a telegram from Superintendent Casey, at Tamworth, to the Inspector-General, at Sydney. "Constable Beeby found 15 miles away yesterday. Government Medical Officer twice examined, and certificates state great mental depression on verge of insanity; likely to injure self or others. Recommends should be sent Police Dépôt. I am sending him mail-train to-night. * * * * * The remainder is about the opening of the show, and the police arrangements. Then there is a memorandum, "Sergeant Gamble's report"—
117. That is from the Superintendent? Yes.

118.

118. *Mr. Edden.*] At Tamworth? They are all from Tamworth. "Sergeant Gamble's report and Dr. Harris's certificate, forwarded for the information of the Inspector-General. Constable Beeby has, I am informed, been peculiar in his manner for some days. As far as I can learn, he has not been drinking. WALTER C. CASEY, Superintendent. The Inspector-General of Police, Sydney." That was on 27th March. On the same date "Constable Beeby, No. 6,797, respectfully begs to make application to Superintendent Casey for a transfer from Tamworth to some town in the district where he will not be subjected to the insulting remarks thrown at him on every hand by the public of Tamworth. The constable does not refer in any way to his comrades. The constable has no choice, and asks for none, as to where he might be stationed. JOHN BEEBY, constable." Constable Beeby was down in Sydney after the report. He asked for a report as to himself. Superintendent Brennan, by arrangement, sent Beeby to the Police Surgeon, Dr. Paton. This is the memo.: "Will Dr. Paton please examine the bearer, Constable Beeby, and report as to his mental and bodily state, and advise as to the best course to adopt under the circumstances, for the information of the Inspector-General of Police? MARTIN BRENNAN, Superintendent of Police, Eastern District." All these papers went to the Police Surgeon, so that he should have the chance of seeing them. On 1st April Constable Beeby makes an application "for seven days' leave of absence owing to ill-health. The Constable's nerves are unstrung, and he feels that a few days' rest will recruit his health. The Constable had two days' leave last November while on escort duty from Tamworth to Sydney." This was submitted by Superintendent Brennan for the consideration of the Inspector-General of Police. Mr. Fosbery approved. Dr. Paton reported on 1st April (this is the first time that the Police Surgeon had seen him): "Constable Beeby has been an inmate of the Reception House for the past five days, during which time he has shown no indication of insanity." This is signed, and to it is added, "I recommend that he be granted sick leave." A few days after that he goes back to the Police Surgeon. "Constable Beeby appears to be mentally and physically well"—this was on 9th April. "I should like to see him again in seven days' time.—R. T. PATON. Approved, E.P." Then Beeby on 10th April makes application "for extension of sick leave from the 10th instant to the 16th instant." This was submitted by the Superintendent for the consideration of the Inspector-General; the Inspector-General approved. After the expiration of six days he is sent by Superintendent Brennan, who has charge of all the men who come to Sydney, for further report. The report is made by Dr. Taylor, acting Police Surgeon. Dr. Taylor says, "Dr. Paton will resume duty on Wednesday next; as he had Constable Beeby under observation in the Reception House and knows more of his case than I do, I advise that the Constable return here for examination on Monday, next.—G. W. TAYLOR, acting Police Surgeon, 16th April." On the same date, Beeby writes, "Constable John Beeby, No. 6,797, respectfully begs to make application to Mr. Inspector-General Fosbery for a removal from the Tamworth district. The Constable begs to state that owing to his recent illness, Tamworth or any other hot climate would not agree with him, and if he is sent back to the country the Constable fears it would result in a general break down of his constitution. The Constable humbly begs for a trial as probationary constable in one of the suburban divisions so that he might have home comforts for a time. The Constable has always been under double expense while stationed in the country, as it has been his duty to assist in maintaining a home for his mother and one sister in Stanmore. The Constable's residence at present is in Douglas-street, Stanmore. If Inspector-General Fosbery would consider the Constable's application, he will try and prove himself worthy of any consideration.—JOHN BEEBY, Constable." No action appears to have been taken on that—no approval one way or the other. The Superintendent at the depôt considers it necessary to send him again before the Police Surgeon. This is on 18th April, so that the time is not long between the date of his coming to Sydney and the date of this final examination.

119. *Chairman.*] Would this be the Monday following Dr. Taylor's memo.? Yes, the 16th.

120. He recommends him to come on Monday? Yes. That is two days afterwards. Following is Dr. Paton's report:—"I have the honor to report that on 28th March I examined Constable Beeby. He then appeared to be mentally well; but as he complained that he suffered from severe headache and had no knowledge of what took place on the 24th, 25th, and 26th—that is the action at Tamworth—and as he had been certified to be on the verge of insanity by a medical man on the 27th, I recommended his removal for observation to the Reception House. He remained in the Reception House for five days, during which time he exhibited no sign of insanity. I have seen him twice since his discharge from the Reception House, and on each occasion he has been mentally and physically well. He states that just previous to illness at Tamworth he had exposed himself to the sun whilst fishing. This may have been the cause of his illness. Considering all the circumstances, I recommended that Beeby should not be sent back to Tamworth, that he should be sent to some other station, preferably in a cool climate, and that his commanding officer should see his medical history. In my opinion his former condition is not likely to recur." This is signed by Dr. Paton. Mr. Fosbery put a minute on that: "Referred to Mr. Casey for observation. I cannot transfer an ill-conducted man to another district, but have no objection to his transfer to Nundle, Bingara, Murrurundi or some cooler climate than Tamworth." Beeby at this time is still attached to the Tamworth district. Superintendent Casey further reports on the 24th April: "I beg to report that there is no cool station in this district where I could send Constable Beeby. There is no foot constable at Nundle. At Murrurundi there is only an acting-gaoler (recently transferred from Brewarrina), and at Bingara there is a married constable with a large family, transferred from Sydney on account of his wife's health. Constable Beeby must, I think, remain at Tamworth, which is, I am certain, as cool as any station in the north-western district, and where there are an officer and two sergeants to look after him. I regret to say I have now no confidence in Constable Beeby, and fear he will give trouble. His defaulter-sheet was sent to Sydney with papers on 16th March last and not returned." Inspector-General Fosbery wrote on the report this minute:—"Very well. P. C. Beeby should be cautioned and reported upon specially in a month or two, when, if his conduct is not entirely satisfactory, his services will be dispensed with." This is on 26th April, and is addressed to Superintendent Casey. On 3rd May Superintendent Casey writes at the foot of the paper—"The Inspector-General's minute noticed and now returned. WALTER C. CASEY, Superintendent, Tamworth, 3/5/98." That finishes up the batch of papers.

121. *Mr. Edden.*] That is all the papers that you have in the case? Yes. We have others. But the next relate to when he was discharged.

122. What was the idea that suggested that he should be removed because of "the insults of the people"; what did they insult him about? I cannot say. That is not shown in the papers. Beyond what is shown there, I do not know anything about Constable Beeby.

W. H. Cooke. 123. It seems a very funny thing? It indicates no doubt that something is wrong. He says that he received a sunstroke while he was fishing; that might have affected his mind. It might have made him fancy things—might have made him think that someone was watching him or insulting him. It might have been an hallucination.

16 Aug., 1900.

124. *Chairman.*] Have you produced all the papers bearing on the case? The next lot of papers is dated 1899, when he was discharged from the service.

125. *Mr. Edden.*] Oh! he was discharged? Yes, for continued drunkenness. It was shortly after that.

126. *Chairman.*] We have already evidence that he was discharged. Burbank in his evidence said that he had resigned? No; he was discharged. He was not given the option of resigning.

127. It was stated in the last day's evidence that he was discharged: "He joined the force in 1895, and was discharged on 6th February, 1899"? Yes.

128. The charge against him on the defaulter-sheet was drunkenness, for which he was discharged. I do not think we need go into any evidence about that. Burbank stated in his evidence that he knew or had ascertained that he had resigned. But we have evidence now that he was discharged. It may not be material, but if it should be we can call the witness afterwards? He put in an application to resign in February, 1899, when the next offence took place, but the Inspector-General discharged him; he did not give him the option. Possibly Burbank is not quite up in the difference between discharge and resignation.

129. In the sheet it says he was discharged—"6/2/99. Discharged this day." Beyond these papers, you do not know anything personal about the case? Nothing whatever.

130. You have no further evidence to offer? No.

WEDNESDAY, 5 SEPTEMBER, 1900.

Present:—

MR. DIGHT,

MR. SPENCE,

MR. NICHOLSON.

J. GILLIES, Esq., IN THE CHAIR.

Hugh McLachlan recalled and further examined:—

H.
McLachlan,
Esq.
5 Sept., 1900.

131. *Chairman.*] You were requested by the Committee to furnish the career of John C. White, the night-officer at Tamworth Railway-station on the night of the accident to Mr. Albert Burbank? I hand in the history of White in the Railway Department. [*Vide Appendix D.*]

132. You know what evidence has been adduced before the Committee;—do the Commissioners intend to rest on the evidence, or do they intend to call any witnesses in rebuttal of any evidence? We know nothing of what evidence has been given, but I would suggest that the Committee should call the solicitor who conducted the case for us. I do not know whether you might not call the foreman of the jury. I do not know him personally, but they say he is a very good man. The matter was out of our hands. It was tried and decided by a jury. We do not intend to move further in the matter; but as the case was conducted for us by our solicitor, I think it would be just as well if you called him. Personally, he is not prejudiced one way or the other.

133. Do you forget that he is the man who induced Mr. Burbank to sign a clearance for £100? Perhaps he can explain that. He has no personal interest in the matter.

134. The solicitor to the Commissioners has to look after his billet? The Commissioners are influenced only by considerations for the public interests. They never heard of Mr. Burbank before the accident happened. It happened three years ago, and the case was tried on the spot by a jury who, I take it, were wholly unbiassed. It is, perhaps, a little difficult now to adduce evidence. It does not reflect on the Commissioners in any way, and they have no feeling in the matter.

135. I suppose you will admit that many times a jury give a verdict which, on a retrial, or before the Full Court, is reversed? Yes, and it was quite open to Mr. Burbank to move for a retrial.

136. In view of the evidence on the record of White's career, would you take it that he is a man on whose word you can rely? Certainly; I do not see that that evidence would implicate his honor. They are mostly minor offences of which he was guilty, such as the not checking of tickets. Personally, I do not know him. I asked one or two of the traffic officers what sort of a character he had, and they said he was a man of good character.

137. *Mr. Spence.*] Did you not take it from the record that he is somewhat careless? He was a bit lax in carrying out his duties.

138. I notice that in 1897 there were a dozen cases? They were minor offences, such as not checking tickets and leaving lamps unlighted, not reflecting on his word.

139. As night officer, would it not be part of his work to see the lamps were lighted? He would be in charge of the station practically. There would be a number of others about.

140. It was his place to see that they were lighted? Yes; I do not think there is a shadow of doubt that the lamps were alight.

141. *Chairman.*] You have not read the affidavits of all the witnesses who say it was not lighted? Our solicitor, who conducted the case and heard all the evidence, would certainly be a better witness than I am.

142. Is the very strictest economy enjoined on station-masters and persons in charge of stations by the Commissioners as to the lighting of stations? Naturally, they are told to be economical in everything; but there are no special instructions from the Commissioners, that I recollect, to save money in lighting, except the general instruction that they have to save everywhere; economy in small things is the secret of the success of any concern.

143. You take it that strict economy is insisted on throughout the whole Service? Certainly; in fact, we would be bankrupt, and so would the Colony, if we did not carry it out.

144. You do not think that is detrimental to the interests of the public who are travelling? No, because no economy is to be carried out which entails risk; that would be certainly a qualification consistent to the direction.

WEDNESDAY,

WEDNESDAY, 12 SEPTEMBER, 1900.

Present:—

MR. NICHOLSON,

MR. SPENCE.

J. GILLIES, Esq., IN THE CHAIR.

James Campbell Thom, Solicitor for Railways, sworn and examined:—

145. *Chairman.*] Are you the Solicitor for Railways? Yes.

146. Have you brought a letter which Mr. R. W. Thompson wrote to you on this matter of Mr. Burbank? Yes.

J. C. Thom.

12 Sept., 1900.

147. Will you be good enough to read the letter? It is as follows:—

Burbank v. Commissioners.

Dear Sir,

West Maitland, 17 July, 1899.

You will remember this case tried at Tamworth, in which you got a verdict for the Commissioners, and you know that they afterwards made him a concession of £100, being satisfied themselves, I believe, that he had sustained very severe injuries and had been injudiciously advised in not approaching them in the first instance in a conciliatory manner.

Some time since he saw me on the matter, and he so satisfied me that he had a good case that I determined, as a matter of kindness and without charge, to do what I could to get the matter reconsidered; for I felt quite certain that the Commissioners individually and collectively would be willing to do him absolute justice, even although they had already made the concession, if they were satisfied, firstly, that he had a good case; and, secondly, that the concession did not meet its merits.

I heard in various ways that there were a great number of witnesses who might have been called to prove and support the case that he wished to make, but who were not called, and amongst them were Mr. Benjamin Owen, Mr. Cooke, Mr. Howlett, Mrs. Howlett, Mr. George Tribe, Mrs. Tribe, John Milligan, Mr. Fox, Mr. E. Davis, and others; but it appears his then solicitor was so confident of success that he did not consider it worth while to lengthen the case by calling them.

The result of my inquiries has been to show me, as a man of some experience in our profession, that his confidence was misplaced, and that every available witness should have been called; and the strong probability is, if they had been called, that Mr. Burbank would have had a verdict for a large amount.

I say a large amount, for he was crippled for life, with the further result that he cannot follow his business as a dentist, as he cannot get about without a pair of sticks, and is permanently disabled from using the treadle, which is an absolute necessity in his business, as his working leg is shortened, and he is now therefore on the verge of pauperism.

The amount which the Commissioners were good enough to allow him covered by a few pounds only what he paid his doctor and his chemist, while his actual expenses up to that time were upwards of £500, and no part of it went to his former solicitor, or his counsel, or to myself.

Quite a number of the witnesses who might have been called have volunteered to make declarations, some of which go to show that Ryan (since dismissed by the Commissioners), Beeby, the policeman (since retired from the Force), and other witnesses for the Commissioners whose living depended on their evidence were wrong in that evidence, and that the account given by Mr. Burbank as to the character and cause of his accident was absolutely correct.

These declarations Mr. Burbank proposes to place before the Commissioners if they will kindly grant him an interview, and, on the strength of the evidence contained in them, to ask them to make an extraordinary precedent in his case; and although they have already made the concession referred to, for which he is very grateful, that they will reconsider the whole of the circumstances, and, as the result has been so serious to him, that they will grant him such a sum as will recompense him in some measure for the pain and misery which he has suffered so long, and for the attendant pecuniary loss.

I do hope that in thus addressing you you will not consider I am going out of my way when I further ask you to lend your weight on the side of mercy, for I feel very sure from what I have seen of you that you would be one of the last to press for strict legal rights as far as the Commissioners are concerned, if you are satisfied that Mr. Burbank in this matter, whilst kindly, and, in their view, liberally treated already by the Commissioners after they had beaten him, was brought to his present miserable condition bodily and financially by the carelessness and negligence of their servants, or that such carelessness and negligence in any degree contributed to it.

I, of course, anticipate that you will be consulted in the matter, or otherwise I should not have troubled you with my views; but in any case I can ask you to excuse me for addressing you at such length, for I know of no sadder case than to see a strong able man who was making a good living in a proper and decent way struck down so as to be almost helpless and unable to support himself and his wife and young children.

Yours faithfully,

R. W. THOMPSON.

148. Are you responsible for the legal business of the Commissioners in this case? I am, and I conducted the whole case.

149. Do you wish to make a statement regarding your knowledge of the case? I was not present at the trial at Tamworth. As soon as the action was reported the Commissioners placed the facts before me for an opinion as to whether they showed any liability on their part. I obtained from the Chief Traffic Manager a statement of all the available evidence, and having considered this statement I advised the Commissioners that they were not responsible. Thereafter a letter of demand was written by Mr. Burbank's solicitor. He was formally told that the Commissioners regretted that they could not accept any liability. Then in due course a writ was issued, and the trial of the issue came on on the 12th April, 1898, at the Tamworth Circuit Court, before Mr. Justice M. H. Stephen and a jury of four persons. The trial lasted most of the 12th and part of the 13th April, and the Commissioners were represented by Mr. Scholes, of counsel who was instructed by my chief clerk, and the plaintiff, Mr. Burbank, was represented by Mr. Garland, instructed by Mr. Tribe. From what I can learn of the case the evidence was gone into exhaustively, and the jury viewed the place of the accident in the day-time, and again at night with the lights in such a condition as they wished for the purpose of their observation. His Honor summed up in the usual way, and the jury after some considerable retirement found a verdict for the defendants, the Commissioners. The next I heard of this case was—I do not know what the preliminaries were—that the Commissioners had decided, notwithstanding the result of the trial, to pay Mr. Burbank the sum of £100. I wrote him on the 24th August that I should meet him at West Maitland—I had some legal business there,—and pay him the cheque. I was prevented by some means from being there on that date; but on the 31st August I wrote him again to meet me at West Maitland Police Court on the 1st September. I met him on the 1st September at the Police Court at Maitland, and then paid him a sum of £100, and he signed a usual voucher which is in these terms:—

2 July.

To amount agreed to be paid to the above named Albert Burbank as an act of grace, and in full satisfaction and discharge of all claims and demands whatsoever, in respect of injuries sustained by him at Tamworth on 2nd July, 1897.

I

J. C. Thom. I paid the cheque to Mr. Burbank, and obtained a receipt, and that is the last I know personally of the matter. On receiving the letter from Mr. R. W. Thompson, I wrote a statement of the position of the matter for the consideration of the Railway Commissioners in these terms:—

12Sept., 1900.

Solicitor for Railways Office, Sydney, 18 July, 1899.

Memo. to the Secretary.

Railway Commissioners ats. Burbank.

HEREWITH I hand you letter received to-day from Mr. R. W. Thompson, West Maitland, with reference to this action.

It will be remembered that the plaintiff brought his action in respect of personal injuries received through falling over a bag of bacon on the railway platform at Tamworth on 2nd July, 1897.

The case was heard at Tamworth before His Honor Mr. Justice Stephen and a jury of four on the 12th and 13th of April, 1898, when a verdict was returned for the Commissioners.

The Commissioners subsequently gave the plaintiff £100 as a gratuity.

As I pointed out in my opinion of 14th July, 1897, before proceedings were commenced, there was ample evidence to show that the Commissioners were in no way responsible for the injuries sustained, and the statement made by Mr. R. W. Thompson that he had been satisfied that the plaintiff had a good case, indicates either that he has been deceived as to the true facts, or does not appreciate their relation to the law of negligence.

All available evidence was called at the trial, at which plaintiff was represented with exceptional skill by Mr. J. Garland, of counsel instructed by Mr. Tribe.

With regard to the suggestion that the verdict was the result of the plaintiff's misplaced confidence in his legal advisers, I can only say that the issue was tried before His Honor Mr. Justice Stephen, and a local jury, who heard evidence at great length, inspected the lighting of the station premises, and listened to every appeal which forensic skill could make to their natural sympathies, with the result shown.

I do not consider it necessary to discuss the proposal to submit declarations challenging the accuracy of witnesses who were sworn and gave their evidence under the strictest cross-examination, further than to express the view that such a course, after a full and fair trial, of an issue of fact, is not only valueless, but highly improper.

I have never spoken to Mr. R. W. Thompson on this subject, and, therefore, cannot account for the singular confusion of ideas which leads him to make a personal appeal to myself in the cause of mercy, but submit the letter, as, I presume, is intended for the Commissioners' consideration.

I may add, in conclusion, that Mr. Scholes, who held the Commissioners' retainer, quite agrees with me in the view above expressed, that the case was exhaustively tried, and that no other verdict could have been properly given.

JAMES C. THOM,

Solicitor for Railways.

After submitting that statement to the Commissioners, I had their instructions to write to Mr. Thompson a letter, of which this is a copy:—

Railway Commissioners ats. Burbank.

R. W. Thompson, Esq., Solicitor, West Maitland,—

20 July, 1899.

Dear Sir,

I am in receipt of your letter of 17th instant, written on behalf of the above-named plaintiff, in which you seek to have his claim reconsidered by the Railway Commissioners.

I have brought all the circumstances attending the trial, and the subsequent payment to Mr. Burbank again under the notice of the Commissioners, and am instructed to inform you that the case cannot be reopened.

Yours truly,

JAMES C. THOM,

Solicitor for Railways.

150. After the accident to Mr. Burbank, did you call upon the officers of the Railway Department in Tamworth to supply you with any reports? Yes.

151. Have you got the reports? I have not got the reports here; they are part of the Secretary's papers.

152. You stated that the case was gone into exhaustively at the trial;—how many witnesses were examined on the part of the plaintiff? Speaking from memory, seven or eight.

153. If you knew that there were five or six witnesses who ought to have been called, who it was understood would be called, but who were not called, would you then say that the case had been gone into exhaustively? I could not think that, knowing the man who represented the plaintiff.

154. If there are witnesses who have now signed declarations saying that they were prepared to be called, and were not called, and those declarations are at variance with what your witnesses stated, then would you state the case was gone into exhaustively? I should say yes, for this reason: That the persons who were charged with the trial of the case would be much better judges at the time—seeing the jury and the inclination of the Court—as to whether a witness should be called, than anybody could be now. I should say that even then the case was exhaustively tried; but these gentlemen who were connected with the case knew of these witnesses—that is stated—and there may be reasons which they could not remember themselves for not calling them. Their manner of telling their story might decide counsel not to call them, although on paper it may appear to be a good story.

155. You said a letter was written by the plaintiff's solicitor just after the accident? I said in the ordinary course a letter of demand was written.

156. Do you remember what solicitor wrote it? My impression is that it was Mr. Tribe.

157. Was it Mr. Burbank's brother who wrote the letter? It is difficult for me to say. What I meant to convey in my evidence was that the preliminary warning was given of intention to sue.

158. Did Mr. Burbank himself write the letter through his brother, or did his brother write it? I could not say. I was under the impression that a solicitor wrote the letter. It would appear as a letter of demand. I have not got it here; but if it should appear to be material I will produce it.

159. Was not it Mr. Burbank's letter through his brother? He may have written it. I am under the impression that the solicitor wrote a letter of demand. I am assisted in the impression by knowing that it is not the custom for any solicitor to issue a writ against anyone without giving some intimation. By the term "letter of demand" I meant a letter written by a solicitor before action.

160. You received one? I am under the impression that I did.

161. From the solicitor? To the Commissioners. It would strike me as very peculiar if they did not.

162. Is it not possible that these two communications went? Very likely. I do remember a long letter sent by Mr. Burbank.

163. Did you receive notice within a week of the accident from Mr. Victor Burbank, plaintiff's brother, and place it before the Railway Commissioners? I should not like to swear. I think it is very likely that we did. Notice was received immediately.

164. Did Mr. Burbank's brother write to the Commissioners, and ask them to send the Railway Medical Officer up to see the condition of the plaintiff, and to consult Dr. Wilson with a view to eliciting the facts? I could not say.

165. *Mr. Spence.*] I suppose this matter really would not come under your notice? Not at that stage. J. C. Thom.
166. *Chairman.*] You say that the jury viewed the station;—did they see it in the day-time? At 12:40 p.m., by a note on the brief, and then again in the evening. 12 Sept., 1900.
167. Did the plaintiff accompany the jury? I could not say, as I was not there.
168. Did your counsel accompany the jury on the occasion? No. In the daylight everybody was there. I do not know when the inspection took place as night. The jury expressed a wish that they should see the place, and they gave certain orders to some sheriff's officers, in whose charge they were, to have certain lights disposed of in such a way as to bring the state of the lighting of the station into the same state as had been presented to their minds by the evidence which had been given.
169. On the evidence of your own side? The whole of the evidence had not been given. The whole of the plaintiff's evidence had been given, and the case was reopened by the consent of the defendant to allow the plaintiff to call fresh evidence on the question of lighting the station on the following day.
170. Then the railway station-master, I presume, was notified that the jury were going to view the station on the night they did? I have no doubt but that he would be.
171. Supposing the lights were defective, would the station-master be to blame for the station not being sufficiently lighted? Undoubtedly he would be to blame.
172. And would it be to the interest of the Railway authorities to light the station more perfectly at the time it was viewed by the jury than it had been at the time of the accident? I should think not. I remember that objection was taken to the view.
173. *Mr. Spence.*] Who was to say as to what condition it was in at the time of the trial if the evidence had not been heard? The plaintiff's evidence had been given as to how the station had been lit, as to whether the light was in a certain parcel room, and as to what lights were lighted, and the jury, on the evening, reduced the light of the station to the condition it was in, or was said to have been in, on the night of the accident by the plaintiff.
174. *Chairman.*] Have you any record to prove that the jury were allowed to see the station in the day-time? I have only a note on Mr. Schole's brief that the Court adjourned at 12:40 p.m. to enable the jury to see the station.
175. Did your Department deny all responsibility with regard to that accident when they were appealed to in their defence of the action? Yes, undoubtedly.
176. How would the jury be able to know the condition of the station on the night of the accident as compared with the condition of the light at the time when they viewed it? Only by the evidence which described the lighting on the occasion of the accident.
177. Then if a lot of additional evidence has been produced in the form of statutory declaration, denying the statements which were made by your witnesses, would you think that the jury were in a position to judge at the time without the evidence having been called? I would like to understand what the additional evidence means. The question, I take it, is that if a balance of testimony could be got against what was placed before that jury, would that not probably alter their minds.
178. Yes? Undoubtedly it would.
179. If by some accident or oversight evidence which would have been favourable to the plaintiff was omitted, if afterwards the evidence was committed to statutory declaration, and if the balance of it was opposed to the view of the Railway Commissioners as to the lighting, would you think that Mr. Burbank had a fair trial? Yes, I would, because the evidence was all known before the trial.
180. *Mr. Spence.*] Is it not fair to assume that the case was one in which it was not altogether too clear that there was no liability, and that very little evidence either way might possibly have turned the scale? I think not, the case being so abundantly clear. In the last opinion I gave of it I said that the plaintiff could not possibly succeed at a fair trial. The amount of testimony, and the directness of it, was so overwhelming, that a local jury, whose sympathies must have been the other way, gave a verdict for the Commissioners.
181. In the first instance, your own recommendation would be naturally based on the report you received from the railway officers? Yes. I am advised by counsel that there never was the slightest hope for the case throughout the trial, and any evidence which contradicted what the conditions would be must necessarily, by probabilities, be incorrect.
182. *Chairman.*] When accidents occur on railways or railway premises, is it the custom for the Commissioners to endeavour if possible to have a satisfactory settlement without going to law? They invariably do, and in the great majority of cases they succeed.
183. Did you, or did anyone for you, communicate with Mr. Burbank between the date of the accident, which occurred on the 2nd July, 1897, and the date of the trial, which began on the 12th April, 1898, with a view to bringing about a satisfactory settlement? I knew that the case was absolutely clear. The Commissioners never attempt to make a settlement where the evidence is so strongly in their favour that they would be giving away public money for nothing if they tried it. This was such a case as that, as the result has shown.
184. If you were not present at the trial, and heard all the evidence, how would you know anything about the evidence laid before the jury? Simply from the notes taken by counsel at the trial. I began my evidence by saying I was not present at the trial. I cannot speak of my own knowledge. I prepared the brief in the case, and I saw after it came back the evidence which had been given on oath.
185. Did you base your defence on the evidence supplied to you by the employees of the Railway Commissioners? Yes; and on other evidence collected. There was other evidence called besides that of the employees in the railway service.
186. Could you produce the reports of the officers which were handed in to you? I could, undoubtedly. I could have produced every paper from the writ of summons up to the present moment if I had thought that they would be gone into. I only had notice to produce this particular letter. I can produce every paper, and, of course, the Supreme Court records contain the official papers.
187. Would you expect railway employees to give evidence which would be likely to militate against themselves? I would. I invariably impress on railway employees that their first duty is to speak the truth and take the consequences, and I believe very many of them do so. It is only human nature to believe that there are some who do not. In this case there is no inducement for these men to say anything which is not correct, as far as I can see.
188. Can you tell the Committee of any case where railway employees have given evidence in Court against the interests of the Commissioners? Certainly not. I should never have allowed it to go into Court if they would.

- J. C. Thom. 189. You say that if their evidence was going to be against the Commissioners you would not allow them to go into Court? Yes.
- 12Sept., 1900. 190. You said you produced the evidence of the railway employees and others just now;—did you at the trial produce evidence from any witness who was likely to be unbiassed or disinterested? Yes; I think there were one or two. The postmaster, I believe, was one. I am at a disadvantage in speaking from memory.
191. Say from business men of Tamworth or people who are reliable and entirely disinterested, did you have any evidence to offer? I do not think so, and I would not expect to have them on the station at the time.
192. As a matter of fact, you would not expect a witness for the defence to give evidence in support of the plaintiff's case, would you? I should expect him to speak the truth. A witness has nothing to do with the particular case he is appearing for; but I should not expect the defendant to call a witness who was likely to give evidence on the plaintiff's side.
193. You are conversant, I presume, with all the circumstances leading up to the accident? I have a recollection of them as they appeared on the papers.
194. You know Mr. Burbank was a dentist who travelled from town to town in the Northern and North-western districts? So I have been instructed.
195. In order to follow his calling he had to carry what is called a dental-box—that is a box containing machinery for carrying on his profession? Yes.
196. Of course a passenger is allowed to carry a certain weight? Of personal luggage.
197. Would you think it was reasonable for a passenger to be called upon by a railway porter to give him a hand to lift his luggage—on that occasion a dental-box—into the luggage-van? In this case, yes. The luggage was not spoken of till the train was actually in. It was not personal luggage; it was luggage which should have been paid for and booked. It was not deposited on the platform till the train was actually there.
198. Are you aware that that luggage had a ticket on it? I do not know.
199. If it was properly ticketed, as from station to station, would you not think that it was in charge of the railway employees when it was on the premises? Not necessarily.
200. If it had been sent down on the previous afternoon, and put in charge of the railway authorities, and had not yet been delivered to the owner? Certainly, in charge of the Railway Commissioners.
201. You are aware that evidence was given at the trial that there was some obstacle on the platform? That evidence was given.
202. You are aware that Mr. Burbank fell over that obstacle, which was a side of bacon? I am not aware of that.
203. Your own witnesses have said so, have not they? They have said that he said so. There is no evidence that Mr. Burbank fell over an obstacle. It was not found, as a fact, by the jury, that he fell over a side of bacon. Evidence was given, but there was no decision on it.
204. If evidence was given that one of the railway employees had hold of one end of the dental-box and Mr. Burbank had hold of the other end, and that that railway employee was taking or guiding Mr. Burbank with the other end of the box to the luggage-van, and that Mr. Burbank fell in the course of proceeding to the luggage-van, would the railway employee be responsible do you think for taking him over that obstacle? As you stated the case he did not take him over an obstacle. Taking the case you put, I should prefer to allow a jury who heard the evidence given to decide the question of responsibility.
205. In cross-examination at the trial, if I remember aright, the railway employee who had the end of the box, when asked whether he did not fall over the bacon, said, "I suppose I must have stepped over it," would not that be so? I could not say.
206. If a railway employee conducted Mr. Burbank, as the evidence shows in this case, over a fitch of bacon which was on the platform, would you not think that the railway authorities were responsible for that? I do not think so.
207. *Mr. Spence.*] Have there not been more than one case where the Commissioners have recognised their liability? Yes.
208. Was not there one at Redfern not long ago? Yes.
209. Would it not depend on the question of proof? Not necessarily. I do not know whether the bacon was on the platform or not. But assuming that it was on the platform the passenger, if it could be viewed, was responsible for what occurred. The gravamen of the case at Redfern, was that the platform was so crowded that nobody could see the obstruction, being only a few inches above the ground.
210. *Chairman.*] If it were proved that the platform at Tamworth was so dark that nobody could see the fitch of bacon, would you admit then the responsibility of the Commissioners? Undoubtedly.
211. The box that Mr. Burbank had travelling with him was under 80 lb. weight—80 lb. is the weight allowed? I do not know the weight of the box.
212. At any rate it was under 80 lb. weight;—you would not dispute the right of Mr. Burbank to take the box with him on the journey? I do; he is not entitled to carry anything but his personal luggage, and a dental-box is not personal luggage.
213. Seeing that the box had accompanied Mr. Burbank for a year or two on every trip he took up country, then would you think that he had a right to carry it? That would not alter the law; I should say that he had no right to carry it.
214. Would not the law become a matter of usage? It cannot become a matter of usage, because it is decided by an Act of Parliament. We never took any exception in this case to this box being carried in this way. That was said merely in answer to the question as to legal liability.
215. Do you mean to say that personal luggage does not include tools of trade? It might under certain circumstances.
216. Are you aware that it is permissible and recognised that jockeys can carry their saddles and gear with them in the carriage, because it is part of their tools of trade? It may be; I am not aware. I believe there are special rates for jockeys attending races, and special conditions for travelling.
217. Are there special conditions? I do not know yes or no. I could not say from memory. The question of the right to carry this particular box was never raised in this case.

218. What are the circumstances under which a man can carry his tools of trade? If a man were to carry a 2-foot rule in his pocket, no exception would be taken to that, but if a woman brought in a sewing-machine as a tool of trade, that would not be permissible, or if a man carried a lathe of a certain size, that would not be permissible. J. C. Thom.
12 Sept., 1900.
219. Do you mean permissible in the passenger-carriage or in the luggage-van? As passenger's luggage, free of charge. The English law by a great number of cases decided what is and what is not passenger's luggage, which the companies are compelled to carry to a certain weight, without additional charge.
220. Is the law applicable here? It is, and it would not cover such a box as Mr. Burbank had with him on that occasion.
221. If a person had to strike matches to look for the box on the platform, would you then say that the station was sufficiently lighted? It depends on where the box was. I should say that if a person had to strike a match in the open part of the railway station to see a box 4 feet high, the station could not be sufficiently lighted.
222. It was at the end of the station; there were two witnesses in the case named White and Playford;—do you remember them? I do not remember them.
223. They swore positively that there was not any label on the box? I do not call that to mind at all.
224. The label has been produced, and it has been sworn positively that it was on the box;—do you think that the evidence given by these two men might have weighed with the jury in their decision when they said that there was no label on the box? I do not think that fact would have anything to do with the result of the case at all. As I have said more than once here the question of the right to carry the box was never raised in the case.
225. Because it was the practice, and always had been so? It may have been; I really do not know.
226. I suppose the reason why that question was never raised was because it was understood that it was perfectly right for a passenger to carry a box;—all dentists carry their tools of trade with them in the same way? I could not say that; I do not know really.
227. Do you not think it is possible that they do so? I really do not know. I never saw a dentist's box in my life. I never saw one in travelling.
228. *Mr. Spence.*] Would it not be the duty of the railway officers to put the box into the van if it was booked as luggage and not as passenger's luggage? It would be. The railway servants, as far as I understand their duty, should put goods and luggage into the proper place.
229. *Chairman.*] The fact of a ticket being put on the box at the instance of the railway employees, and the ticket indicating that it was passenger's luggage from so-and-so to so-and-so, would not that get over anything you had to say in regard to it not being legal to carry that box? I should say after that they could not be heard to say it was not passenger's luggage. I quite admit that that would silence the person who did it.
230. Are you aware that the book of by-laws of the Railway Department makes it imperative that passengers should see their luggage placed in the van? I do not think it is a by-law; I think it is an instruction published in the ordinary circulated time-table.
231. Presumably it would be a by-law if it is an instruction printed in the railway time-table? I never heard of any by-law which made it imperative for passengers to see their luggage put in the van.
232. At any rate it enjoins on them the necessity to see their luggage put in the van? I do not recollect such a by-law.
233. Are you aware of any instances where the Railway Commissioners disputed their responsibility in regard to passenger's luggage because the passenger had not adhered to that by-law or regulation? No; I do not know of a case in my seven and a half years as Solicitor for Railways.
234. Where they tried to get out of paying by that means? I do not remember a case. No case ever came before me for an opinion on that ground during the seven and a half years I have been Solicitor for Railways.
235. But it is possible that such a case has arisen between the Railway Commissioners and passengers, and that you would not know of it? It is possible, but very unlikely. I do not think anything of that kind happens without being sent to me for advice by the Chief Traffic Manager.
236. I suppose you will admit that a passenger carrying tools of trade, such as valuable instruments and so on, would be interested in seeing that they were not thrown about the platform, as sometimes the porters do throw luggage about, in order not to have any broken? Surely—
237. You are aware that it is a habit with railway porters to injure passengers' luggage, and even goods that are paid for as excess? I am not aware that it is a habit.
238. Have you never had any claims made to you over injured luggage? Never in my life in this way.
239. Do you think the Commissioners would have such claims made without your knowing of them? I do not think it is likely. I am referring now to the habit you mentioned of their handling goods on platforms—I never heard of such being the case.
240. I have had three tin boxes utterly and entirely destroyed in four years, because of the way in which they were thrown about—on one occasion two lots being broken? I can only speak of what I have heard. These claims were not made.
241. Mr. Burbank, in his evidence, said he helped Playford, who is a railway employee, to carry the box to the van;—would this not make Playford an active agent in whatever took place while the box was being carried? I do not understand the term.
242. An accessory to the accident? In my opinion not necessarily.
243. If Playford says that he led the way whilst carrying the box with Mr. Burbank to the van in his evidence, and then says that he must have stepped over the bacon, would that implicate the Commissioners through one of their employees? I do not think so. A person carrying such a cumbersome parcel as that would be expected to look out for his safety on a well-lighted platform.
244. Seeing that Playford knew that the bacon was there, and that he went directly and stepped over it, and did not warn Mr. Burbank to look out for himself, would you admit then that there was no responsibility? He says he must have stepped over it; he does not say it was there.
245. The evidence shows that it was there? I am asked for my opinion as to whether it was negligence.
246. Seeing that he admits that he must have stepped over the bacon himself while holding one end of the box, and Mr. Burbank the other, and that, although he was aware of the fact that it was there, he did not warn Mr. Burbank to look out for himself, would you think then that the railway employees were responsible? I should say that that is not evidence of negligence. 247.

- J. C. Thom. 247. What do you want to prove evidence of negligence? It depends on the case. I should want sufficient to convince the jury which tried the case that there was negligence, and there was not sufficient.
- 12Sept., 1900. 248. *Mr. Spence.*] Do you remember whether, in the reports you received, that evidence was given about the bacon and the falling over it? There was some reference to it; I could not say exactly what it was. I think it originated in Mr. Burbank's letter.
249. Not from the officers? I think not, from memory.
250. *Chairman.*] The train was some time late. If the guard, when closing the door of the luggage-van, was told by Playford not to close the door because he was going to put the box in, and if the guard calls out in a surly and hurried manner, "Hurry up, I cannot wait, I'm late as it is," do you not think that would be a means to excite a person who was trying to put his luggage in in order to go by that train? I do not think it would excite a grown-up person—I do not think a man of the world used to travelling would take the least notice of a surly remark like that.
251. You travel a lot? A great deal.
252. Have you seen grown-up men and women who did not know hardly where they were or what they were doing when they were trying to catch a train? I have, indeed, frequently.
253. Do not you think it was the duty of the guard, under the circumstances, to have come to the assistance of the porter and helped him to put that box in the van, instead of allowing the passenger to do so? I could not express an opinion. I do not know whether there was.
254. You will not express an opinion? I would rather not express an opinion. I have no knowledge of the details of their work.
255. There was a J. C. White who was night officer at the time. You saw his evidence, I presume;—he gave material evidence in favour of the Commissioners? Yes, he did.
256. Would you think he was a very straightforward man? I do not know him at all. I should not know him if I saw him.
257. Should you think he was a man who would give reliable evidence? I should expect that of him. I have no means of judging the man's character.
258. If you thought that that man had been dealt with on thirty or thirty-two occasions by the Railway Commissioners for carelessness, for neglect of duty, and so forth, would you then think that he was a man who would be likely to give reliable evidence? That history of the man would certainly discount his value to me, undoubtedly.
259. Will you be good enough to look at his record, which I now hand to you, and let me know then if you think he is a reliable witness? I should not think he was a careful man by any means.
260. Would you think he was a reliable witness? I do not see anything here to prevent his being a truthful man.
261. If, in his evidence, he would be able to swear as to the proper lighting of the platform, and give a description of the lamps which were lit on the occasion, in view of his negligence and carelessness, proved by the sheet in your hand, do you think it is likely that he, on that particular occasion, showed himself to be what he had never shown himself to be before? I think it is very probable, as on this occasion he had a good reason for remembering the facts.
262. Would he not have been, perhaps, dismissed or something else? He had just been promoted.
263. Is it usual for railway employees to have so many opportunities as that man appears to have had? Yes; in seventeen years. Reprimand is not a serious term for a man.
264. There was one time when he got a truck off the rails;—that is not serious? In 1897 a truck was derailed.
265. He is not cautioned for that? I can only judge the gravity of these misdeeds by the gravity of the penalty attached. I see that he ceased to be fined recently. He seems to have been improving since about 1890.
266. He got a rise of about £20 for his good conduct, I suppose? I have no idea.
267. Referring to some of these charges for which he was punished, he denied the accusations made against him;—in view of that fact, would you think he was a reliable witness? Undoubtedly. A man may deny want of care. He may deny many of these offences there.
268. And yet the Railway Commissioners would punish him? Yes. Many of these offences are matters of opinion. The man himself might fairly think that he was not guilty of negligence or want of caution, and still his superiors might think he was and he might be punished. I do not see that it affects the truthfulness of the man.
269. In many of these cases he admits having been negligent and careless? That simply emphasises his honesty in that particular case.
270. Many of the charges he denied, and yet he was punished for it;—that makes him more honest, I suppose? I do not know that it affects the matter at all. I do not think that record affects a man's credibility on his oath.
271. No matter how often a man proves that he is unfit to be in the Railway Service or neglects his duty, you consider that he is still a reliable and trustworthy man as a witness? I did not make any such admission.
272. It was equivalent to that? No; and I hope that those words will not be put into my mouth.
273. Do you know a man named Beeby, who was an important witness for the Railway Commissioners? Yes.
274. He gave very important evidence for the defendants, did he not? I have no doubt he did. He would not have been called otherwise. He was called, and I have no doubt he gave important evidence.
275. The judge in summing up referred particularly to the importance of the evidence given by that straightforward man—by that intelligent witness, I think he said? I do not know that he said so.
276. If Beeby, in order to be a witness on that case, was brought up from a lunatic asylum, would you consider that he was a good witness;—would you consider that he was fit to be put in the witness-box? Direct from the asylum?
277. Within a day? Certainly not; for a man to be brought direct from a lunatic asylum to be put direct into a witness-box. I assume he was a lunatic, and not a warder?
278. No; he was running about the bush there wild before he was sent down? It is absurd to put such a man in the box.
279. That is one of the witnesses whom you had in your case;—you summoned him from a lunatic asylum? I do not know that.
280. You would not place any weight at all on his evidence, would you? If he were a lunatic, certainly not.

281. If he were just brought from a lunatic asylum where he had been detained? I should not; I would not allow him to give evidence at all. J. C. Thom.
282. And he was discharged from the Police Force subsequently over it? I should certainly not regard any man's evidence as reliable who was in that unfortunate condition of mental health. 12Sept., 1900.
283. There was a man named Ryan who was a witness for the Railway Commissioners; he was then a carter about the town? I think I remember the name.
284. Very shortly after the accident happened and before the trial Ryan was given employment by the Railway Commissioners? I do not know that.
285. After the accident he was employed by the Railway Commissioners, and at the trial he was an important witness? He was a witness at the trial; as to his employment, I do not know.
286. At the time of the trial he was an employee, but at the time of the accident he was a rousc-about about the town, carrying mails, and so on;—it is pretty difficult to obtain employment under the Railway Commissioners? I should say it is. I do not know anything of the details. I know there are hundreds of men employed there.
287. It is very difficult, as a rule, for a man to get employment from the Railway Commissioners? I do not know. I have never recommended anybody, and have never had anything to do with the appointment of anyone. I know there must be 100 a year appointed. It depends on the capacity, of course. I do not know what this man was appointed as.
288. Have you seen the affidavits which have been put before this Committee? I have seen nothing of the evidence.
289. If there are other witnesses who have sworn directly opposite to the evidence produced at the trial by the Railway Commissioners, do you not think if they had been called at the trial the verdict would have been different? If they had been believed it might have been different.
290. Seeing that of your two chief witnesses one was a madman? I do not know that. I do not know what evidence there is of it.
291. We have his record? I assume that he was a lunatic.
292. You are fair and unbiassed, I presume? I endeavour to be.
293. If there were three witnesses who swore favourably for the defence of the Railway Commissioners, and these three men are railway employees, or are concerned in this matter if a verdict were given against the Railway Commissioners, and if there are five or seven respectable trustworthy townspeople who swear directly opposite to their two witnesses, which side would you give the benefit to? It would depend on whether the fact was material to the issue to be tried.
294. As regards the lighting of the platform, even two of the Commissioners' railway employees differ as to their description of the lights which were on the platform at the time, and there are five or seven respectable townspeople who swore quite differently from what the railway employees have sworn, would you not be inclined to believe the five disinterested townspeople? I should not now, because they knew of the trial, and should have volunteered their valuable evidence then. They were known to the solicitor for the plaintiff.
295. *Mr. Spence.*] Mr. Burbank charges that they did, but that his counsel did not call them? His counsel would give you evidence on that point more directly than I could. It appears to me something unusual for a distinguished man like Mr. Garland to do.
296. *Chairman.*] If the Judge in summing up told the jury that the man might meet with a serious accident like this, and yet be not incapacitated for business, and if he referred to the case of a member of the British House of Commons, who had, by accident, both arms and legs taken off, and yet was able to do his business, and to write, and to ride on horseback, do you think that would have any influence on the men on the jury? On the question of the amount of damages; but they found there was no damage, so that they did not get to that part of the case.
297. The Judge said that both his arms and legs had been cut off, and yet he was able to follow his business? I do not know what his object was. I should like to have heard the context of that.
298. It implied that Mr. Burbank, no matter how he might have been disabled, might be able to follow his profession? That would be the inference. I could imagine a Judge saying that in order to direct a jury as to the measure of damages if the jury had arrived at the question of damages; but in this case they never got as far as that, because they found for the defendant.
299. He was summing up then? You know that a Judge must direct a jury as to what they will do in both cases.
300. Can you imagine a Judge being so ignorant as to refer to a member of the British House of Commons having both arms and legs cut off, seeing that every schoolboy knows that Caveugh is the man he refers to, and that he was born without arms and legs;—did not it strike you as being peculiar for a Judge to make that statement from the Bench? I would like to be excused from saying anything. I do not know the facts.
301. You have had the case before you, and you have had the newspaper reports? I do not remember the feature. I know that sometimes Judges do say things which perhaps are not direct to the matter at issue.
302. Still you admit that juries are frequently governed to a great extent by the summing up of the Judge? Influenced they must be, I have no doubt.
303. Are you aware that Mr. Burbank made a request to the Commissioners for a money grant subsequent to the trial? I am not aware whether he did or not. I know he was paid £100. I do not know how it came to be done.
304. You do not know how it came to be done? I do not know how he came to apply for it.
305. Have you seen all the correspondence in reference to the grant of that £100? I have not seen any other than the note with my own instructions to prepare a voucher for the money, and communicate with Mr. Burbank, and pay him.
306. Did you authorise Mr. Harris, on the 9th August, 1898, to interview Mr. Burbank? I may have—that would be a fortnight before I wrote my letter.
307. Did you instruct Mr. Harris from your office to, as it were, intimidate Mr. Burbank into writing a letter denying his previous action in the case? I did not.
308. Do you remember the letter which the Commissioners wrote to Mr. Burbank when granting the £100? I have my rough draft of the letter of the 13th August.

- J. C. Thom. 309. In that letter which you drafted there is a paragraph saying that he (Burbank) brought an action in which he never had any prospect of success? That is so.
- 12 Sept., 1900. 310. Are these usual terms to put in a letter? After a jury has given a verdict.
311. But Mr. Burbank took action before they gave a verdict, and yet you say that he never had any prospect of success? I say so now—from my knowledge of all the facts of the case he never had any prospect of success.
312. From the facts of the case as far as they appeared at the trial? Yes; I know nothing of the evidence which has been obtained since.
313. Can you tell me on what grounds you or the Commissioners came to that conclusion? On the report submitted, on the facts of the case as submitted, and then on the extreme improbability of anything else being proved.
314. In another paragraph in that letter the Commissioners say to Mr. Burbank, "had you originally approached the Commissioners in the spirit displayed by your letter now under reply, you would no doubt have been treated with exceptional consideration." Does that paragraph appear in that draft? Yes.
315. Are you aware that Mr. Burbank approached them twice previously, that is before the trial, in order to get an amicable settlement? I am not aware of it.
316. If you had thought that he had previously approached the Railway Commissioners with a view to have an amicable settlement, you would not have put that paragraph in the letter? It would depend on what took place. I do not know what we would call an amicable settlement. If I knew the facts of the case I might.
317. But there is only one way of asking for an amicable settlement? If he asks for it with a writ for £5,000 damages that is not considered so.
318. You have not seen Mr. Burbank's evidence? No.
319. When he looks back at his former prosperous condition, his good business, wife, children, and himself well provided for, and when he looks at himself now completely crippled for life, and the consequent ruin and havoc it has played with his home and family, putting yourself in his place, can you blame him in his endeavours to have the case investigated? No, I do not.
320. And seeing that the time had elapsed when he could have had an appeal against the verdict, do you think Mr. Burbank is justified in appealing to Parliament for an investigation? I do not. You are putting me in his place, and, I say, I should not think myself justified.
321. I suppose you will pardon me for saying you are an extraordinary man if you would not use every endeavour in that direction? I am asked the question, and, I say, I should not consider myself justified in taking the steps you described.
322. Will you after this inquiry is concluded require to have a copy of the whole of the evidence which has been taken during this investigation? No, I have no occasion for it. I suppose the Secretary will get a copy as a matter of record.
323. If the weight of evidence that has been brought forward conclusively proves that the accident to Mr. Burbank was caused by the carelessness of the railway employees that the evidence of two of the principal witnesses for the defence at the trial in Tamworth was valueless, and they were unreliable, and if Mr. Burbank brings forward by affidavit, which he has done, seven or eight witnesses, who are contrary in their evidence to that given by the railway employees, do you not think the Railway Commissioners should compensate Mr. Burbank in a suitable manner? I can only say, I think not.
324. No matter what befalls a passenger travelling by train, no matter who is responsible for the accident, you think he has no right to ask for remuneration? I did not express any such opinion.
325. That is what I took it to be? If your question has been taken down as it was put, I will adhere to my answer. I do not think the Commissioners have any right to supersede the Supreme Court of the Colony in its decision. A decision has been given, and a mode of appeal is provided for, and they as Commissioners have no power to deal with public money voluntarily after such a decision has been given. That is the reason for my answer; but that does not apply to every form of appeal. In your previous question you asked me if I thought an appeal under these circumstances would be justified to Parliament, and I said, by all means.
326. Seeing that Mr. Burbank was in a helpless condition, that he had not got money to fight the Railway Commissioners on an appeal, do you not think he is justified in coming here, where he gets fair play and justice, without money and without price? I do not think he is justified. Here is my former answer—that the Commissioners would not be justified in dealing with the matter.
327. *Mr. Spence.*] But they have admitted the principle? I do not know where the margin of distinction comes in in these matters. £100 is not a large sum.
328. *Chairman.*] Do you remember a case of Belisario against the Railway Commissioners? I have heard of the case.
329. Did he get a substantial verdict against the Commissioners? He did, indeed—and a very substantial one.
330. And if Mr. Burbank's case is worse than his was proved to be at the trial, do you not think the Railway Commissioners should have given him more than £100? If his case was proved to be at all identical with Belisario's, he ought to get nothing.
331. *Mr. Nicholson.*] Where a case has been tried, and other evidence has cropped up, would it not be a matter of courtesy and fair play for the Commissioners to reopen the case? Undoubtedly; it would be a matter of appeal; they would be compellable to do it. If a case were decided, and evidence brought up which could not have been produced at the trial of the case, the law will grant a new trial on this ground within a reasonable time.
332. I take it that that is the position of the case of Mr. Burbank? I am not aware of that.
333. Even criminal cases are reopened by the Crown when fresh evidence can be adduced? Undoubtedly. It is a common ground for reopening a case that evidence has been discovered which was not available at the time the decision was given.
334. *Chairman.*] You agree that Mr. Burbank, being able to produce additional evidence, is quite right in bringing his case before Parliament? Undoubtedly, if it is evidence which was not obtainable at the former trial. That is the whole distinction to my mind.

WEDNESDAY, 26 SEPTEMBER, 1900.

Present:—

MR. THOMAS BROWN, | MR. DIGHT,
MR. SPENCE.

J. GILLIES, Esq., IN THE CHAIR.

James Campbell Thom, Solicitor for Railways, recalled and further examined:—

335. *Mr. Dight.*] With reference to the jockeys, I notice that at the last meeting of the Committee the question came up about passengers being allowed to take tools of trade with them;—the Chairman asked a question about these jockeys, and you answered, “I believe there are special rates for jockeys attending races, and special conditions for travelling”;—then you were asked by the Chairman, “Are there special conditions?” and you replied, “I do not know yes or no; I could not say from memory; the question of the right to carry this particular box was never raised in this case”;—these special conditions for jockeys would not apply, I take it, to another person with different luggage; for instance, to a dentist carrying a dental box? No; they only apply to special trains for special race meetings on special days. J. C. Thom.
26 Sept., 1900.
336. There were several questions put to you about this dental box of Mr. Burbank’s;—this question was asked, “Do you mean permissible in the passenger carriage or in the luggage-van?” and your reply was, “As passenger’s luggage, free of charge; the English law, by a great number of cases, decided what is and what is not passenger’s luggage, which the companies are compelled to carry to a certain weight without additional charge”;—the Chairman then asked, “Is the law applicable here?” and you replied, “It is, and it would not cover such a box as Mr. Burbank had with him on that occasion”;—the present law would not allow Mr. Burbank to take that box as passenger’s luggage free of charge? That is so.
337. Even supposing that it had a luggage label put on it? The presence of the label would not affect the question of the right to carry it.
338. So that, as the law stands, notwithstanding that Mr. Burbank has said that this box had been carried for him frequently free of charge on the train from one place to another, that did not give him the right to have it carried free? It did not. In answering these questions I am only expressing an opinion on the law.
339. As Solicitor for Railways, that is your construction of the law? Exactly; and that is given after reference to a great number of cases I referred to.
340. You can see that the question is a very important one in its bearing on this case;—Mr. Burbank states in his evidence that he was allowed to carry this box, so long as it did not exceed 80 lb., free of charge on the railway by virtue of his passenger ticket? I know that that has been his impression.
341. You say distinctly that, as the law stands, he was not entitled to do so? I say he is not entitled to do so.
342. *Mr. Brown.*] Do you know whether the Commissioners have any special regulations for this kind of luggage? I am not aware of any.
343. *Chairman.*] If it is not recognised that passengers have a right to carry their tools of trade as passengers’ luggage, why is it done every day in the year nearly with regard to dentists? I do not know whether it is or not. It may be that, unknown to me, he may have had some arrangement with the traffic authorities. They have perfect power to make arrangements with him to carry distinguishable property as passenger’s luggage. I do not know of it in this case, though. I am speaking as to the general law, which is that the passenger is entitled to carry up to the weight allowed all property suitable to his condition in life for his comfort on the journey, or at the other end of it. That is a short statement of what the law is.
344. *Mr. Brown.*] Although that may be the law, supposing the traffic recognise the principle in practice of allowing this kind of luggage to be carried, that would hold the traffic responsible for any damage arising? To the luggage—I should say so, undoubtedly. They would be estopped from setting up any other state of things.
345. *Chairman.*] If that is the law as you state, why is it that commercial travellers are allowed to carry 4 cwt of samples? Because there is a special regulation made for commercial travellers’ luggage up to something like 5 cwt. It is carried at a certain rate one way, and free the other.
346. It is carried for nothing as passengers’ luggage? I do not remember these things by heart; but I know there is such a regulation made under the 53rd section of the Act.

John Charles White, Railway Officer, sworn and examined:—

347. *Chairman.*] In 1897 you were employed as night officer at Tamworth Railway Station? I was. J. C. White.
26 Sept., 1900.
348. You remember an accident happening to a dentist named Albert Burbank? I do.
349. You were in charge of the station that night, I presume? I was.
350. The lighting of the platform was under your supervision on that night? It was.
351. Do you remember how it was lit that night? Yes, it was lit the same as always.
352. What do you mean by the same as always? The same lights as were lit for the mail.
353. How many lights were there? I have not seen the place for some time now. I believe there were five.
354. How long were you night officer? About twelve months.
355. You ought to be able to know how many there were? I believe there were three lights under the awning, and one post-lamp on either side.
356. How far from the awning would that be? Ten yards, probably.
357. How far would the platform extend beyond those limits? To the far end, perhaps 15 yards. I am not quite sure about the distance.
358. That accident happened on the 1st July, 1887? I know it happened in July. I could not tell you the exact date.
359. Did you turn out any lamps that night on the platform? What time do you mean—before the mail?
360. Any time during the night? There are two passenger trains there. There is one that comes in at 9.5, and, of course, they are lit for that train. Then they would be turned down until the people started to come for the mail. They would not be kept up all the time when there are no trains, 361.

- J. C. White. 361. The custom is to turn out the lamps when the train is not at the station? When there is no one there we turn them down. We do not have them going.
- 26 Sept., 1900. 362. You do not turn the lamps out? No, not right out.
363. In your evidence in the Court at Tamworth did you say that you turned out all the post-lamps and the middle lamp under the awning? I might have said that I turned them down.
364. Your evidence says that you turned them out? I probably turned them down.
365. Are you sure whether you turned them out, or whether you simply turned them down? I would not like to say for sure whether I turned them right out. I know I would reduce the light for the sake of saving the gas. We have to do that.
366. Have you to be very economical? We are not supposed to leave the place dark; we are supposed to be economical and not to waste it unnecessarily when there is no traffic there. We are supposed to use the gas as traffic demands. If there are no trains or anything about, of course we do not want the same flare up as when there are trains about; it is not necessary.
367. Was there a man named Playford working on the platform that night? Yes; he was the porter.
368. What did he do when he came on duty at 1 a.m.;—had he anything to do with the lamps? Suppose I was busy at the time, and the lamps wanted attending to, he would do it. I would see to it myself as a rule, sometimes he would. It was an understood thing that I was responsible for them. If other duties prevented him from doing it I would do it. I cannot say on what particular night who did it. I am not quite sure at present.
369. Did he light any lamps after 1 a.m., do you think, on that morning? Probably he did. There are lamps to light outside the station. He would light that lamp, and then there would be the one in the hall of the waiting-room to light.
370. If you turned out any lights on the platform, would Playford have to light them when he came on? Yes; or I would if he had not the time.
371. And Playford did light some of the lamps on that occasion? Probably he did; he must have lit some of them. I cannot particularise now the lamps he lit.
372. If you simply turned them down, and he turned them on, you would not say that was lighting the lamps? It is lighting them to a certain extent. They are of no use as they are, when they are turned down.
373. You say you turned them out in your evidence, and now you do not know whether you did or not? I say I turned them down.
374. No; you said you did not know whether you turned them out, or whether you turned them down? If the lamps were down, they were of no use as lamps; it is just the same as turning them out.
375. *Mr. Brown.*] When the lamps are down they are practically out, as far as light is concerned? Yes; that is what I meant. I might turn them right down to perhaps a glimmer, so that when they are wanted again, all a man has to do is to turn the tap, and there would be a full blaze again.
376. During the time you were in charge of that station, was it customary on the part of several of the officers to turn the lights down, or turn them out altogether—which practice obtained? Suppose the moon was to rise, they would be turned right out, because we would not want them again, say, outside.
377. But on the platform? There was a lamp near the lower end—that is, towards Sydney. That lamp would be turned down.
378. It would not be turned out altogether? Not that lamp.
379. *Chairman.*] Do you remember seeing anything on the platform that night—anything lying about? Yes.
380. What was there, do you remember? I know I saw Burbank's case there.
381. Did you see anything which anyone would be likely to tumble over there? No, I did not.
382. Do you think there was anything there which anyone would tumble over? No.
383. You do not think there was? Not without they went right up against the wall.
384. If Playford says there were two sides of bacon sewn up in canvas on the platform he is not telling the truth? That is after the mail came in. You are speaking of the time when I went on duty, I presume?
385. I am speaking of the time prior to the accident to Burbank? I am talking of the time before the mail. A case which comes out of the mail is a different matter. There must necessarily be goods on the platform when the mail comes in. We have to put them out.
386. *Mr. Brown.*] That is, goods that come with the mail for the station are put out on the platform? Yes.
387. You say that previous to the coming of the mail there was nothing on the platform? That is right.
388. *Mr. Spence.*] When did you see Mr. Burbank's box on the platform? When I came on duty.
389. What time was that? I came on at 6 o'clock. It was sometime during the evening I saw it. Long before the mail came I saw the box.
390. Whereabouts was it located? It was up near the parcels office against the wall.
391. Against the wall? Yes.
392. Did you notice if it was labelled? I noticed that it was not labelled.
393. What time was it when you noticed that it was not labelled? Some time before the mail came I noticed the box. I believe I referred to Playford about it. I asked him if he knew anything about the box. I was looking to see where it was to go.
394. You do not know how it came there? No.
395. *Mr. Spence.*] You examined it to see if there was a label on it? I did.
396. Can you account for the fact that a label has been produced to the Committee with an address on, sworn to as having been on the box? If the label is produced it was not on the box when I saw it, and I do not believe it was ever on the box, because that is what I looked at.
397. Was there enough light there to see? Any amount of light.
398. Can you remember at what time you looked for it on the box? I could not tell you exactly the time I looked for it; but when a man has his parcels to get ready for the mail, of course he looks over these things.
399. The presumption is, then, that at the time you would be looking for it it would be just when you were expecting the mail, and after the lights had been turned up? Not necessarily just before the mail. I would start my work before that.

400. It would not be during the period when the lights were turned down? Oh, no. Even if it was, the light would not be down so far that I would not be able to see, and I had my hand-lamp. J. C. White.
401. Would any of your officers help Mr. Burbank to put a box on a train which was not addressed? It appears they did in this case. 26 Sept., 1900.
402. Is it not the rule to see that it is labelled before it is put on? That is the recognised rule.
403. I believe it is an admitted fact that some one was helping him to put this box on when the accident occurred? Yes.
404. Is not that an assumption then, that it must have been labelled? Not at all.
405. Would it not be fair to assume that? If we had known to whom the box belonged it would have been a different thing. We would have seen the man and asked him. I did not know the man, to tell you the truth. When he came up and said it was his box, and he wished it to go on, of course we would not leave it behind then. We could explain to the guard that we really did not know. I was not there at that time. When he came up I was away.
406. It is allowable for a guard to break what may be called a regulation in a case like that? It is not allowable; but if a man is travelling on business like Mr. Burbank was, and carried, as it were, his business with him, it would be useless to go without that box. If he said to the guard, "I forgot to get my box labelled. Will you take it for me?" Certainly it is not right to do so; but I am not saying that he would not do it.
407. Burbank states that he did have it labelled, and as far as you know there was no label on it? I know perfectly well there was not.
408. *Mr. Brown.*] Whose duty was it to label it? It was his duty to come and tell us where he wanted the box to go to, and it was our duty then to label it in his presence.
409. *Mr. Spence.*] Did he come to you at all when he came to get his box put on? He never came near me at all.
410. *Mr. Brown.*] When a box of this description is brought over by Mr. Burbank, or his agent, as stated in this case, to your office, whose duty was it to see to the labelling of the box;—was it your duty, or was it the duty of some other officer? Of course, if he came to me, it was my duty. If I was doing anything else, perhaps taking a telegram, I would tell the porter to do it. I had not him on at that time; he would not come on until 12:30 or 1.
411. Were you solely in charge at that particular time? I was solely in charge.
412. *Mr. Dight.*] Was it possible for this box to be lodged on the station early in the evening, and for the ticket to be put on before you came there, or must it have come under your notice at any time it came during that afternoon? If it came before 6 o'clock I was not there. It may have been put on then. I am speaking about the time from 6 o'clock. I did not notice that it was labelled then.
413. When you first took up your duties that night was this box there, or did it come on to the position where you saw it some time during the time you were on duty? I did not notice it come there. When I noticed it it was on the platform. I did not see it brought there.
414. Was that any considerable time after you had taken up the duties of the platform? I suppose it might have been 8 o'clock; I could not say exactly when. A lot of goods, what they call outwards, to go by the goods train, would be up near the wall.
415. Was it possible for that box to have been on the platform before you took up duty for the night? It would be possible to put it on the platform. It may have come on at 5 o'clock.
416. *Mr. Spence.*] Had you seen the box often before? I do not think I had.
417. Was not Mr. Burbank in the habit of travelling? I believe he was. I believe I had seen the box there; but there was such a number of boxes that I would not take any particular notice.
418. There are not a number of dentists travelling, and I thought you might have been acquainted with him? I do not know the box that way.
419. Is there anything you had to depend on regarding the light, other than your own memory;—is it not possible, for instance, that one of these lamps might not have been turned up? No; I was always very particular about the mail train.
420. Was it the custom to turn them all up regularly for every train at night? Yes; for the passenger, and for the mail, they were always alight.
421. None of them left out at any time? Not that I know of, unless, as I said before, on a bright moonlight night, when the side-lights might be out.
422. And the lights under the awning were always lit? Yes.
423. Those on each side were sometimes left out on light nights? On a moonlight night I have seen them out, although, as a rule, I always like to have them going.
424. *Chairman.*] Was the night of the accident a clear night? It was not a very clear morning.
425. It was moonlight? No; it was not moonlight. I believe it was a bit of a misty night, as far as I can remember. I know it was a very cold night.
426. Mr. Burbank was a regular traveller on his business? I do not know; I could not say that.
427. Had you not seen Mr. Burbank on many occasions travelling? I had seen him; but I assure you that I did not know him.
428. *Mr. Brown.*] Prior to this accident, you did not know him? No; I did not know Mr. Burbank when I saw him on the platform—he was lying down at the time. I asked what his name was, so that I did not know him.
429. *Chairman.*] Did not Mr. Burbank travel regularly on his professional tours from that station? He might. There are plenty of men travelling whom we do not know. We might know a Member of Parliament, because he has a pass, and that is all we would take notice of in that way.
430. *Mr. Brown.*] Supposing a man was travelling regularly from the station at which you were stationed, you might not know him for the first few trips, but you would get to know him after a while? There are plenty of men I do not know there. I did not go about much, and I can assure you I did not know Mr. Burbank.
431. *Mr. Dight.*] How long had you been night officer previous to this accident? I think I went there on the 23rd January of the same year.
432. As night officer you would be in full charge of the station? Yes.
433. And it would be your duty to see to any luggage, if there was any luggage, on the platform not labelled? To see to it, and if I did not know myself to ascertain if those under me did.

J. C. White. 434. Did you do that when you saw this box there? I am not sure now that I did not speak to Playford, asking him if he knew anything of it—if any one had said anything to him. I believe I did, and he did not know.

26 Sept., 1900.

435. You have already stated that you did not know Mr. Burbank;—previous to this occasion, can you remember him as having travelled, or as bringing this particular box, even although you did not know him personally? I would not like to say that I did not know the box, but it never impressed me so that I would remember it. No doubt I had seen it before, but there was nothing attached to it that I would remember it by. I cannot say that I had. For one thing, I did not know Mr. Burbank. If I had, the thing would have been different.

436. As a traveller, he would be allowed to carry a certain weight of luggage with him free as passenger's luggage, would he not? If he came under the heading of a commercial traveller he would, or he might have a special permit; I am not quite sure about that. A commercial traveller is allowed to carry a certain amount of weight as personal luggage. He probably came under that head.

437. If Mr. Burbank or anybody else came to you as the officer in charge of the station, and wanted to send an article of luggage free of charge that he was not entitled to send free, I suppose it would be your duty to see that it did not go—to see that he paid for it? Yes, if it was not personal luggage; but if he came under that head, or had a special permit to have this box carried—a case, I believe, has existed of that kind—I would not question it.

438. This is an important matter with reference to this case, and that is why I want to get from you whether he was entitled to take this box as passenger's luggage, free of charge, or whether he was not? The only answer I can give to that question is this: That if he came under the head of commercial travellers he is allowed a certain weight, or if he has a permit from the Commissioners to carry in certain boxes he would then be allowed to take it. It occurred so long ago that I cannot remember whether he had a permit or whether he came under that head. It is a point I am not quite clear on. I know that would be the question which would arise in my mind.

439. *Mr. Spence.*] Would not the fact of a porter helping him with the box be an argument that he did have a permit, and that the officers recognised his right to take the box? I would not say that. For instance, if you were going away by train, and ran up to the porter and said, "There is my luggage there, and I want it to go," he would not know what was in your luggage; he would help you in with it; he would not stop to question when the mail is about to leave whether it was a legal thing to carry. That would be found out at the other end, and then they would charge him.

440. *Chairman.*] If the porter knew that Mr. Burbank was a travelling dentist, and that that was a box containing his tools of trade, would he not help him to carry it? He would help him.

441. If requested? It is his duty to assist when he is asked. But the question Mr. Spence put to me was whether if he ran up at the time and asked him, if he would put it in. I can only say that in the excitement of the moment he would help. He is not to know what was in the box.]

442. *Mr. Spence.*] Do you not think that Playford knew Mr. Burbank, and knew what was in the box? I am sure he did not. I did not know the man, and Playford was more a stranger than I was.

443. Have you any ground for saying that he did not know Burbank? I am pretty sure he did not know him without he knew more of the people than I did, and I do not think he did know.

444. You had no personal knowledge of what took place between Burbank and Playford? No, I had not seen.

445. Then you cannot swear to what you did not know? I am only saying that I do not know whether Playford knew him or not. I do not think he did, because he was not as long in the place as I was, and I did not know him.

446. A man might be there a day and know him? He might. I have my suspicions whether he did know him or not.

447. *Mr. Brown.*] Supposing this box had been put on the platform in time, properly labelled, was it any part of Mr. Burbank's duty to assist or to see that it was put in the van it was intended to go by? He has no right to touch it when he hands it over.

448. When it is handed over to your possession it then becomes the duty of yourself or of your officers to see that it is put in the carriage it is intended for? Yes. He is supposed to see that it is properly labelled, and then we put it in.

449. *Mr. Dight.*] But supposing the box were brought on to the platform, and just put down there and labelled by other people not connected with the railway station at all—that is, labelled to go to this place—and supposing it was a box that ought not to go as passenger's luggage, would it then be the duty of a porter to put it in the van? He has a right to question it then. If he did not think it was personal luggage, and he knew nothing of the labelling, the question would naturally arise: "Where did this come from; how was it labelled?" but that could not very well occur.

450. Mr. Burbank has stated that he sent the box down to the station by a lad and a cart, and that they put it on the station and labelled it, at about 9 p.m.;—you stated, I think, that you noticed it on the station some time after you came on duty? Yes.

451. Did you see that it was not labelled? It was not labelled.

452. If they did put it down in that way, and put a label on it, that would not devolve upon you or the porter the obligation to see that it went into the van? If I knew nothing about the box I would naturally question it; but if he says he brought it on to the station and labelled it, how would it be labelled without we knew something about it?

453. They say they labelled it? How would they get into the office? It is not likely that they would go foraging round the office.

454. *Chairman.*] Are passengers not in the habit of asking some one for a label and putting it on themselves frequently? No doubt in a rush they may ask for a label.

455. And they get it? Yes; if he had asked me I would have been sure to know about the box, would I not?

456. You were fourteen months on Tamworth Railway Station, and you did not know Burbank? I can assure you that I did not know Mr. Burbank.

457. And you were there fourteen months before this accident occurred? No; since the 23rd of January of the same year.

458. Then why did you swear at Tamworth that you were fourteen months at Tamworth Railway Station? I suppose that is the whole time I was there. The trial took place three weeks after I left there.

459. Do you admit that Mr. Burbank was entitled to carry that box with him as passenger's luggage? *J. C. White.*
Under the condition I stated in answer to Mr. Dight.
460. If you were not aware that he came under the category of commercial travellers, or had a special permit, why was he allowed always to carry his box? I suppose he must have come under that heading if he carried it before, and he apparently did. *26 Sept., 1900.*
461. You believe he must have come under the heading? I have already stated that I cannot say now whether he came under that head or whether he had a special permit, and I judge if it was carried before it would have been carried under the existing circumstances—either as a commercial traveller or with a permit.
462. Consequently he was entitled to carry it? He would be entitled to carry it if those conditions existed, but I cannot say that they did.
463. If you know a man is travelling backwards and forwards and carrying on his business, would you not, as a night officer, or as an officer in the Railway Department, recognise him as a commercial traveller, when he had tools of trade like that? I would no doubt recognise it with the authority of my superior. I would not take it on my own. I am only to do as I am told. The law is laid down to me, and I am supposed to use my own discretion; and if I think anything wants further advice on the subject I know where to go to. It would not do for every man to carry what he wants on the railways.
464. How do you account for Mr. Burbank carrying this box always with him without paying for it;—why was he allowed to do it? For the very reason which I stated a while ago.
465. That you believed he came under the head of commercial traveller? Yes; I stated that before.
466. *Mr. Spence.*] Do you think there was any one in the Department who had the slightest knowledge of Burbank, or knew who he was? I am not in a position to say. I know that I did not know him.
467. *Chairman.*] Did you see that box on the platform in the early part of the evening? I saw the box before the mail came.
468. Was it labelled then;—did you look for a label, or see it labelled? I looked to see if there was anything on it which would guide me.
469. And what was the result? That there were labels of old standing on it. I cannot tell you now what they were. They were not legible, and there was nothing for a railway man to go by.
470. *Mr. Spence.*] No name on the box? I am not quite sure about that. I believe it was printed on; I am not quite sure about it now.
471. Do you think it is likely that a dentist would carry a box of costly and valuable tools about without having his name on it? It is not a very likely thing to do. I believe there was a name; I am not quite sure about it.
472. Would it not seem likely that, not finding a label, you would look for a name to see whom it belonged to? Yes. I would not like to say for sure that there was a name on it. I have an idea that there was a printed name on it, but I am not quite sure about it. I fancy there was; but even that would be no guide to him.
473. *Mr. Brown.*] As the officer in charge it was your duty to see whether there was a label on? Yes; it was my duty. It would not matter if there were a dozen names on it, the label was the guide; we do not go by the names.
474. *Chairman.*] The name "A. E. Burbank, dentist," was branded on the box in large letters, and the words "keep this end up" were painted on it;—you examined that box? Yes.
475. Do you not think you ought to have seen whether it had a label or not before the train was starting? I am just saying that there was not a label on it.
476. Was it not your place to inquire and see that there was one put on before it went away? How could I put a label on when I did not know where it was going to, and how could I tell whom it belonged to when I did not know the name. I did not know Mr. Burbank. If I did not know the man, the name would be no guide to me.
477. You are a very careful officer, are you not? I do not say that I am very careless.
478. Are you exact in carrying out your duties? I endeavour to do my duty.
479. You are a careful cautious officer? I am a careful officer.
480. Then you could not make any mistake as to whether there was a label on or not? No.
481. You are not in the habit of making mistakes? In what way do you mean?
482. You are so careful that it is almost an impossibility? I do not say that I am infallible.
483. You are so careful that it is almost an impossibility for you to make a mistake? I would not like to say that I am that careful, but I say I am careful as regards doing my duty.
484. Have there ever been any faults found with you in the discharge of your duty by the Department? Yes.
485. Not many, I suppose? Departmental errors, that is, irregularities in railway working—perhaps misjudging the time of running of a train, or something of that description.
486. You were never found fault with, I suppose? Yes. A man who has been fourteen or fifteen years in the railway service cannot go through without a scratch. I suppose there are little slips I have made.
487. You have never been fined? I have been fined.
488. Often? I could not tell you how often; but I have been fined for the things I have done.
489. You have been promoted lately? No.
490. Did your removal to Newtown involve any increase in salary? No.
491. It did not? It did not. It might be a better position; but there has been no increase in my salary since I came to Sydney.
492. I suppose you applied to come down here? I did, because my home was here. I have been keeping two homes.
493. I suppose there would be no reason to think that you could be mistaken as regards the lights that were on the platform that night? No.
494. You could not make a mistake as regards the station being well lit when the accident occurred? The station, as I said before, was lit as provided for by the Department—all the lights I could get.
495. You are told to be very economical as regards the use of the gas? I am told not to waste it.
496. If you show your vigilance, or your care, in the conduct of your station, do you receive any commendation or reward from the Commissioners? No.
497. Not you specially, but railway employees? I do not know.

- J. C. White.
26 Sept., 1900.
498. You get nothing extra from them? I never did, and I do not think there is any provision made for that. If you do your duty, although you might have a bit of bad luck sometimes, still if you do your work they recognise it, I am happy to say.
499. *Mr. Dight.*] Were you there when the jury went to see the station lighted up? Yes; on the night of the second day of the trial, I think it was.
500. Can you say whether the station was lighted in anything like the same state when the jury viewed it as it was in on the night Mr. Burbank met with the accident? It was lit the same at the time the jury viewed it.
501. I think you said that there were several old labels on the box when you saw it? Yes.
502. More than one? Yes.
503. *Chairman.*] You look upon yourself as being rather out of the common as regards care as a night officer—attention to business as a night officer? Not out of the common. We are all careful.
504. You are all careful? That is our duty. I endeavour to do my duty. I do not hold myself as being better than other men.
505. Have you been fined at all? I told you that I have.
506. Often? I cannot tell you how often I have been fined. As I said before there were irregularities in railway working, such as misjudging the crossing of a train or something like it.
507. But that is nothing;—you would not look upon allowing trains to cross, and being likely to cause a collision, as anything serious? I should think you would. What would become of us if we did not. We are taught to use the utmost caution. I may say that all through my career I have never once been charged with insobriety, and I have never once had an accident with the exception of one night. The unfortunate fellow Ryan is dead, and perhaps I should not speak of him. The wind caught the sheeting of the truck and brought the truck back. It fouled another road as I was coming in, and two wheels left the road. That is the only derailment I have had.
508. Did you ever pull the signal off when the line was not clear? No, sir. Do you mean in a crossing?
509. "Signal pulled off when line not clear";—you were charged with that, were you not? Not to my knowledge—not when it was not clear.
510. You were severely reprimanded for it? Not that I remember.
511. You swear that? So far as my remembrance serves me, I was not guilty of pulling the signal off when the line was not clear.
512. If you were reprimanded for anything, surely you would know what it was for? Yes; we have been through a lot in the space of fourteen years, and I cannot remember every detail.
513. If it has been said that you were once reprimanded for pulling the signal off when the line was not clear, would that be true or not? I would question it.
514. That means to say it is not true if I have been told that by anybody? I would question the matter very strongly, too. I have already said that I never caused an accident.
515. You never had gates broken? Yes; but not I. I unfortunately was in charge.
516. Were you reprimanded? I was reprimanded for not looking after Connell. I remember the circumstance, and that was when the gates were broken on some road at Tamworth. I was fined or reprimanded, with Connell, for not seeing that he did his duty. I was inside issuing tickets and looking after the packing of parcels while the mail was coming. It lost a minute. Connell failed in his duty, and I suffered.
517. *Mr. Brown.*] You were held responsible? I was held responsible; but I could not be in two places at once. He certainly put the gates right for the mail; but somebody must have crossed and left one of them foul.
518. *Mr. Dight.*] Might it not be the same as to the charge of pulling the signal off—that you, being in charge, would be responsible when somebody else might have erred? Yes; I do not remember the case. What the Chairman referred to was the crossing of a train. He used the expression, "Pulling off the signal when the line was not clear." I judge from that that he means that the line was foul—that is, an engine fouling a truck or part of a train.
519. It is in your Departmental record that you were reprimanded for pulling off the signal when the station was not clear, and you say you do not remember it? I can tell you one instance.
520. My question was, "Might it not have been the same in that instance as when the gates were broken—that although you were not actually the one to pull the signal off, you were responsible for the one under you who did"? No; and I will tell you why. For me to pull off a signal for a train, when another train was foul, and perhaps just avert a collision, I would not be here to-day. That is the way the Department would look at that. It is an enormity. A thing like that would be impressed on my mind, and I do not remember it. I have an idea what the Chairman does mean. I think he means in regard to a train being foul from the way he puts it. When railwaymen say the line is not clear, they mean that the line is not clear for traffic—that is, that some part of the train or trains are blocking the main line.
521. *Mr. Brown.*] In this particular instance which has been referred to here, can you give us any information relating to that case from memory;—will your memory call that to mind now? I remember an instance where there were gates situated a good distance away from the station—down in the cutting. On one occasion these gates were controlled or stood just near the home signal. Of course, there was a gatekeeper there, who was supposed to look after them. One night the boy went to sleep; the passenger challenged them, and as she challenged I saw the light go flash across the line. There are two red lights when the gate is going across like that. It shows white inside the lamp. When I saw that light go across I thought gates were passing, although it was not a very good light at any time, and I pulled off. It appears that young Ryan did not get them quite clear, and the passenger touched them, breaking the handle or something of that sort. I think that is what the Chairman referred to. I do not know how they put it down. That does not say the yard was not clear. My yard was clear. They are supposed to look after the gates; but still they are under the control of the home signal.
522. So that in this particular case which you remember, the trouble you got into over it was really the outcome of somebody else's neglect? Yes, and I was responsible for it; you are in charge, and you cannot watch everybody. If those under us do not do what we think proper, we have the option to go to our superior officers about them; but a man does not often feel inclined to do that.

523. *Chairman.*] Were you fined six times, do you think, in your career? Taking the fourteen years, I suppose I was. J. C. White.
26 Sept, 1900.
524. *Mr. Brown.*] Were you fined for what would be called any serious neglect of duty or offence during the time of your service? No; the worst case is with reference to the gates. I was reprimanded or fined—I am not sure which now—for not seeing that Connell did his duty. Those were the words used. I have never been charged with insobriety, nor have I ever had a serious accident.
525. *Chairman.*] You do not think it is anything serious to pull off the signal when the line is not clear? I never pulled off the signal when the line was not clear.
526. Yet you got severely reprimanded for it? You put it the other way about. I have explained what that refers to.
527. *Mr. Brown.*] In this departmental record there are two entries relating to gates? Yes.
528. Then the instance you relate to did not refer to one set of gates? No; they are two distinct things.
529. *Mr. Dight.*] They were not the same gates? No.
530. *Chairman.*] If you had a man under your charge for a few years, and he had been fined, reprimanded, and threatened thirty-two or thirty-three times, what would you think of that man? It all depends on how it came about.
531. Would you think that he was an officer who would be very observant on a night like that on which the accident occurred, and would know all about the surroundings? There are often circumstances connected with a man's career that are not most pleasant, and it all depends what code of honour you get. Some men can work well, and if a man has one over him that treats him in a proper way he will be a success, otherwise he will be a failure. I am not making any charge. I am only saying that you must not judge a man by length of service. From what I can see, the charge levelled against me is carelessness.
532. Of what? From the way you are speaking, you seem to think that I am a very indifferent officer. I cannot help that. I know I have always endeavoured to do my duty, because I have thoughts of promotion, and others to look after besides myself; but I still maintain that if the Railway Commissioners did not think me a careful man, or a man with an ordinary amount of brains, they would not have put me to the places they did when I left Tamworth. You know the country, I suppose, as well as, if not better, than I do. I was put on the side of a mountain at the mouth of that tunnel, where the grade is 1 in 40, where all the engines come to be detached and attached, and so on, where the late Mr. Eddy said the utmost care must be exercised in the working of that place, because one slip would mean a loss of life and a loss of property and rolling stock.
533. *Mr. Dight.*] Where was this? At Ardglan, a very dangerous place. On one occasion an engine failed down towards Murrurundi. I had the mail train mixed up with these trains to marshal her through. On another occasion a wheel came off a goods train. I had the same performance to go through, and I am proud to say I met with the approbation of my superiors. I am only stating that matter, as you seem to think me such an indifferent man. I have not much to stand on. I do not think it is fair to judge me by past history in everything. There are so many mistakes a man can make, that it really looks an enormity when there is nothing in them. If they did not treat every little detail in that way they could not work the railways. If a man delays a telegram five minutes he is fined, because it might mean a stock waggon missing its train and putting the stock out of the market. A man with errors like that creeping in would get a history in no time.
534. Would you call errors in train-book nothing? I can explain that to you if you will allow me.
535. *Chairman.*] You consider yourself a more than ordinary careful and reliable officer do you? I consider myself an ordinary careful officer. I am not saying that I am better than my fellow officers.
536. *Mr. Spence.*] And you quote as proof of that the positions you have held? Yes.
537. Have you ever known a man promoted in the railway service who had a working sheet as bad as yours? Yes.
538. You have;—do they get on by influence? No, they do not; because they look at these offences, as I am trying in a humble way to point out to you.
539. I suppose if a man is reprimanded and suspended for three days with loss of pay it is nothing—only a harmless offence? It is not a harmless offence.

ACCIDENT TO ALBERT BURBANK, ON RAILWAY PREMISES, TAMWORTH.

APPENDIX.

A.

[To Evidence of Albert Burbank, Esq.]

[The Tamworth News, Tuesday, 12th April, 1898.]

TAMWORTH CIRCUIT COURT—CIVIL JURISDICTION.

Burbank v. Railway Commissioners.

Tuesday, 12th April.

THIS was a case in which Albert E. Burbank, surgeon dentist, of Tamworth, sued the Railway Commissioners of New South Wales on account of their alleged negligence in their management of the Tamworth railway station, and the insufficient lighting of the same, whereby in the month of July last he met with a serious accident, resulting in injuries which had rendered him unable to practice his profession, and had put him to expense for medical and surgical attendance, besides causing him great pain of body and mind.

Damages were laid at £2,000.

Defendants entered a general plea of not guilty.

Mr. J. Garland, instructed by Mr. W. F. Tribe, appeared for the plaintiff; and Mr. E. Scholes, instructed by Mr. D. W. Harris (for Mr. J. C. Thom, solicitor to the Railway Commissioners), for the defendants.

Jury: H. L. Cousens, W. Johnston, H. J. Watts, and J. Dixon.

Mr. Garland, having explained the facts of the case to the jury, called the following evidence:—

Albert Burbank Burbank, surgeon dentist, stated:—I have been carrying on my profession for twenty years; I came to Tamworth in January, 1897, and made it my headquarters, visiting ten other towns periodically; my income was about £70 per month; for the purpose of my business I used to carry my dental apparatus in a box, which would weigh about 70 or 80 lb.; on the evening of the 1st July I sent the box to the Tamworth railway station; arrived there myself about 1.30 a.m. on the 2nd; it was a dark winter night, and there was no moon; at the ends of the station it was very dark; think there are five lamps on the platform, the two on the outside—the end lamps—were not lighted. [A plan of the platform was put in.] My dental box was at the door of the parcels office, and the accident took place at a spot close by; went to look at the box before the arrival of the train, to see that it was properly labelled; it was so dark that I had to light a match to identify the box; there was no lamp lighted beyond me at the Armidale end of the platform; the train was about an hour late; when it arrived I placed my small parcels in a carriage standing at the Sydney end of the platform; walked smartly on, and meeting the night-officer showed him my ticket, and told him I was going to see my box put in all right; have only seen two officers at the station at night—the night officer and a boy about 16 or 17; went on to the guard's van, the tail of which was directly opposite the parcels room door; saw the boy standing there, and said to him, "Is my box there—Burbank?" he jumped back to where the box was, saying, "Oh! I have forgotten it; will you help me with it?" he took one end of the box and I the other, and he called to the guard, "Don't shut the door; this box must go on;" the guard said, "Hurry up, I have no time, I can't wait for you"; I said, "I have my ticket, I am a passenger"; the boy backed towards the van, and I went forward, holding my end of the box; there was a heap of goods about 2 feet 6 inches high, which the boy avoided by going on the outer side; as I got abreast of the goods my foot struck something hard which was lying separate from the heap; my right foot struck it, and in trying to recover myself my left foot also struck it, and I fell forward on my right knee; could not see what I stumbled over; was anxious to get into the guard's van, but the guard would not wait for me; after the train had gone I sat on the platform in great pain; some people came, but I could not distinguish their faces, it was too dark; Constable Beeby pulled me by the coat, but he did not recognise me, though he should have done, neither did I know him until the night officer came with a lantern; some of those present carried me home on a litter, and Dr. Wilson attended to my injuries; I was in bed two and a half months; during that time and up to now receiving medical treatment; Dr. Wilson's bill up to now is £86; my leg was broken obliquely and into the knee-joint; I am not able now to use my leg; I cannot put weight on it—if I try to do so it bends forward; my right hand and arm were paralysed for four months; am quite unable to practice my profession; the right leg is the principal factor in mechanical dentistry, owing to the necessity for the use of the lathe and the dental engine, which are worked with a treadle.

[A letter, written by plaintiff's brother, two days after the accident, notifying the Railway Commissioners of the accident, and informing them that they would be held responsible for it, was put in.]

Witness (continuing): I could not see what was on the platform, as it was too dark; have often been to the Tamworth station to catch the same train; so far as the number of lamps lit was concerned, the state of the station was on this occasion the same as on every previous occasion when I was there; there was no other light than that from the lamps.

To Mr. Scholes: The accident happened opposite the parcels office; would not swear whether the door of the office was open or shut, but it was dark there; I did not touch them to test it; noticed both before and after the accident that the two outer lamps of the platform were unlighted; never saw a dentist use a lathe in a sitting position; it is an unreasonable position, as there would be no purchase; a dentist's lathe requires full pressure of the leg and body; my travelling expenses and hotel expenses are about £20 a week.

Frank Weekly, bus-driver, stated:—I have been in the habit of going to the Tamworth railway station in the night; was there on the morning of the 2nd July; it was a dark, foggy night; was inside the station when the train arrived; there were only two lamps outside, those under the covered way; there was no other light on the station when the train was in; two men are employed at the station during the night; when the train was in on the night of the accident the door of the parcels office was closed; had no passengers, and was on the point of going away, when I was called back; drove to the small gate of the station, so that I was pretty close to where plaintiff was; looked along the platform in the direction of where plaintiff was lying, but could see nothing, owing to the darkness; he would be about 10 or 15 feet away from where I was; saw White, the night officer, come up with a light.

To Mr. Scholes: I arrived at the station about 1.20 a.m.; the train is due at 1.45 a.m., and on the morning in question it was about thirty or thirty-five minutes late; do not know exactly when I was first spoken to about giving evidence in this case; could not see any people outside the parcels office; the two lights that were alight were the last two on the Sydney end under the platform; there was a good deal of luggage packed up by the wall of the parcels office.

John Smith Wilson stated:—I am a duly qualified medical practitioner, and practice my profession in Tamworth; I was called in to attend plaintiff on the morning of the 2nd July; he was suffering from a fracture of the thigh at the knee-joint; the attachments about the knee-joint were very much torn, the whole structure being injured; saw plaintiff within three-quarters of an hour of his accident; he also complained of pain about the right shoulder and side, and was in a state of collapse; administered an anæsthetic and set the leg, the operation taking about three and a half hours; a fracture affecting the knee-joint is much more serious than one affecting the bone, owing to danger of stiffening of the joint; plaintiff was in bed for six weeks before I removed the splints, and for some time afterwards; the bone had united well, but there was a shortening of the leg; the right leg is now three-quarters of an inch shorter than the left; plaintiff has made very little progress in the use of the leg during the last three months; it is now for purposes of work practically useless; the leg may improve slowly, and I think it will, but plaintiff will never have as full and free use of it as he had before; after being on crutches for a short while plaintiff became partially paralysed in the right arm and side, and remained so for about ten days; I have been in constant attendance on plaintiff since the accident, and am so still; a few weeks before the accident plaintiff was accepted as a first-class life by the Australian Widows' Life Office.

To the Jury: Plaintiff will never be able to use his leg so well as formerly for his profession, owing to the shortening of the limb and the stiffening of the knee-joint.

To Mr. Scholes: In time plaintiff may be able to rise his leg to turn his dentist's lathe in a minor degree.

David

David Carter, dental surgeon, stated that it would be impossible for a man with a shortened leg and stiffened knee-joint to drive a dental lathe.

In cross-examination by *Mr. Scholes*, witness said it was possible for hydraulic pressure to be used for the driving of a lathe, but it was not practicable for work in the country.

This was the plaintiff's case-in-chief.

The following evidence was called for the defence:—

James Thomas Playford, porter at the Tamworth railway station, stated:—I went on duty at 1 a.m. on the 2nd July; all the lamps on the station were alight; the night officer would light some of the lamps, and it was my duty to light any that I did not find lighted; when I came on duty on the 2nd, I lighted the two post-lamps outside the covered way and the lamp in front of the ladies' waiting-room; the others I found alight; did not see *Mr. Burbank* before the train came in; when the train arrived the brake-van pulled up nearly opposite the parcels office door, which was then wide open; the office is lighted by two gas jets, and these were alight; there was a light in the brake-van, and also a sidelight outside; took some luggage out of the van—a tin trunk and some parcels—which I placed alongside the Sydney side of the post; there were also a couple of sides of bacon sewn up in canvas, which I placed on the opposite side of the post; then placed some luggage which I had on two barrows into the van; just as the guard was closing his doors, plaintiff came up and inquired if his box had been put in; he pointed out the box to me, which was on the Armidale side of the parcels room door; we got hold of it and started to carry it to the van; backed towards the van, and *Mr. Burbank* followed me; just as I was going to put my end of the box on the floor of the van, plaintiff's end dropped, and I saw *Mr. Burbank* lying on the floor of the platform; did not see him fall, and I cannot say how he was lying; did not tell *Mr. Burbank* I had forgotten his box; it was not labelled nor addressed in any way; could see the parcels and the bacon on the platform; do not think plaintiff tumbled over the bacon; should think the box weighed about 2 cwt.

To Mr. Garland: I examined the box very carefully with the night officer when I came on duty that night, and there was no label on it; my duty is to look after the lamps; if they are not all right I get the blame for it; always lit the outside lamps; was relieving at the time of accident; the outside lamps were alight for the mail train every night during the last week in June; when the train comes in I look after the luggage, and the night officer goes up and down the train; our whole attention is taken up with our duty; the station is sometimes very crowded; there is often valuable property in the parcels office; on most occasions the doors of the office are locked whilst the train is in the station; on the night of the accident the doors were wide open; it is my duty or the duty of the night officer to see that the doors are locked.

To Mr. Scholes: There were not usually many people on the platform at the time of the arrival of the mail train.

John Charles White, night officer, formerly employed at the Tamworth station, stated:—I went on duty at 6 p.m. on the 1st July; lit the gas on the platform for the passenger train, three lamps under the awning, and the two post-lamps outside; after this train was out of the way I turned out the two post-lamps and the middle lamp under the awning; *Playford* came on duty at 1 a.m.; saw him light those that I had previously turned out; when the mail train arrived I was at the Sydney end of the platform, and then walked to the rear of the train; the brake-van drew up almost opposite the parcels room door; there was a light in the van, and a tail light on the train; the parcels office doors were open and two gas jets were alight; it is my duty to lock the doors or leave them open, as I think fit; I could see plainly what was going on outside the parcels office; always carry a hand-lamp at night; did not have to hold my lamp to *Mr. Burbank's* face to see who he was; a box, some small parcels, and a package of bacon was all that was taken from the van and placed near a post; after I had finished at the van I went to the front of the train and signalled to the guard to start; not receiving the response I expected, I went back to see what was wrong, and I then found plaintiff sitting on the platform; at that time all the lamps I have mentioned were burning.

To Mr. Garland: I have been thirteen years in the service of the Department, and I was fourteen months in Tamworth; *Playford* was here longer than a fortnight before the 2nd July; did not see *Playford* light the lamps; saw him go to do so; saw him light them during the last week in June; will swear that the whole of the lamps were lit during the whole of that week; the doors of the parcels office were always open also; the station is now lighted the same as it always was; saw *Mr. Burbank's* box in the early part of the evening; could not find any railway labels on it excepting some old ones; there was not a complete railway label at all; saw a label that I could not make out, and I took it to be one affixed when the trunk was coming here; the night was a bit misty; the parcels room doors are left open to give more light; it is not part of my instructions to have the parcels office doors shut and locked when the trains come in; I am responsible for the lighting of the station when I am on duty.

Wednesday, 13th April.

Mr. Scholes informed his Honor that the jury had, at his (his Honor's) suggestion, visited the station the previous evening, and inspected the lighting arrangements; he could now continue the taking of evidence in support of the case for the defence.

Frederick Gregory, railway guard, stated:—I was the guard of the up-mail train on the 2nd July; on arrival at Tamworth on that day the big doors of the brake-van were opposite the doors of the parcels office; there were three lights burning in the van, and my doors were open; the lights on the station were all alight; the doors of the parcels office were both open, and the lights in the office were burning; saw persons, boxes, and parcels on the platform clearly; I put out some parcels and a package of bacon; the latter I remember particularly, as it had been over-carried; did not see *Mr. Burbank* fall; had received the signal to proceed from the front of the train, when someone called out, "Hold on, guard, my box has to go in"; had given the driver the signal to go before the gentleman spoke; then signalled the driver to stop, and I saw *Mr. Burbank* going towards his box; I was on the platform, and could see the box; asked plaintiff if the box was booked, and he replied, "No, but I am going to Gunnedah with it"; opened the van doors to take in the box, and then looking round I saw plaintiff lying down and the box on his leg; he was lying on his side on the bag of bacon, and the box on his legs; his feet were lying out from the bacon; stepped across and helped *Playford* to lift the box off; plaintiff then commenced to scream; I could see he was hurt, and said he had better see a doctor.

To Mr. Garland: I never told anyone I would see plaintiff did not get a farthing out of the Commissioners; may have spoken to people about the case; know *Mr. Whitehead*, hairdresser, by sight; was in his shop the other day; said I was in Tamworth on this case, but I do not remember saying in *Mr. Whitehead's* presence that plaintiff was suing for £2,000, but he would not get a penny; when the train is in the station my post is near the luggage van; cannot swear the two outside lamps were alight on the night of the accident.

To His Honor: When I said that the station lights were all alight, I meant the three under the covered way.

Frederick Howe, mail guard, stated:—I was on the up-mail train on the 2nd July in the travelling post office; did not see the accident; was on the platform, and I noticed that the three lights under the verandah were burning; the lights in the brake-van were alight; the doors of the parcels office were open; know this because I went in there through the doors opening from the platform; could see parcels and boxes on the platform clearly.

To Mr. Garland: I have always been of the opinion that I could see things clearly on the platform; spoke to *Dr. Wilson* two days after the accident; did not tell him that plaintiff tripped and fell, because it was too dark to see things on the station; did not say, "There has been another accident owing to the darkness of the station"; did not say anything to *Dr. Wilson* about the station being dark; cannot swear that I went into the parcels office on the 30th June, but I am often in there; you can get into the parcels office through the telegraph office.

John Ryan, formerly mail contractor, stated:—I used to carry the mails from the station to the post office; was at the station on the morning of the accident; was standing between the wicket-gate and the parcels room door; was on the platform when the train came in; believe the three lights under the platform were burning; the parcels room doors were open as well as those of the brake-van; cannot say if the post-lamps were alight; saw the accident happen; saw plaintiff and the porter come for the box; they took hold of it, and as they were carrying it to the van plaintiff slipped and the edge of the box caught him above the knee; saw a piece of bacon on the platform, but I cannot say if plaintiff fell over it or not; am almost sure the box came down on plaintiff's leg; could see everything clearly on the platform.

To Mr. Garland: I am now in the employ of the Railway Commissioners; know *Mr. Aisbett*, and he saw me about the case about three weeks ago; don't know if I told him that plaintiff slipped over a piece of bacon; did not tell *Mr. Aisbett* that the outside lamps of the station were not alight; *Mr. Aisbett* was writing whilst I made my statement, but I don't remember if he read it over to me; never spoke to *Mrs. Burbank* that I am aware of; did not say to her on the night of the accident that I did not see the accident and did not know how it happened; know *Mrs. Howlett*, but I never spoke to her about the accident.

Constable

Constable John Beeby stated :—I was on duty on the platform of the station on the morning of the 2nd July : when the train came in I was in front of the ladies' waiting-room ; was on the platform about ten minutes before the train arrived ; walked along the train and stood opposite the booking office door : saw plaintiff jump out of a car and run along the platform ; he called out to the porter something about a box ; walked to the door of the parcels office, and just then I noticed the "right away" was given for the train ; saw Playford and plaintiff catch hold of the box, one at each end, plaintiff carrying his end lower than the porter ; they were hurrying to the van when I saw plaintiff fall ; could not say positively how he fell, but I believe he tripped in walking ; he was carrying the box in a stooping position ; when I got up to him the box was on the ground ; examined a parcel after, and found it was two sides of bacon in canvas ; at the time of the accident it was leaning against a post on the left-hand side of the parcels room door, and it was leaning there after the accident ; was looking at plaintiff when he fell ; am sure he did not fall over the bacon ; the parcels office doors were open and the gas was alight in the office and burning brightly : the lamps under the verandah were burning brightly, but I cannot say if the post-lamps were alight ; could see parcels and things on the platform distinctly ; immediately after the accident, and I found Mr. Burbank was hurt, I went into the parcels office to look for the stretcher, the doors being wide open.

To Mr. Garland : I was often on duty on the station ; it is well lighted ; have seen a light out when a train came in ; never stumbled against anything on the station or knew anyone else to do so ; know Mr. Whitehead, the hairdresser ; did not tell him the day after the occurrence that plaintiff had met with an accident owing to the bad lighting of the station ; did not tell Dr. Wilson or Mr. Burbank that the accident occurred through the bad lighting of the station.

[This was the defendant's case-in-chief.]

Mr. Garland called the following evidence in reply :—

Henry Stoddart, partner in the firm of T. J. Treloar & Co., merchants, stated :—I frequently go to the station after it is lighted at night ; was at the station to meet the 9.15 train a few nights before the accident ; was up there last night ; it was then lighted very much better than it was just previous to the accident.

To Mr. Scholes : The pressure of gas is generally turned off slightly after 11 p.m.

George Morrison, manager of the Bank of New South Wales, stated :—I went up to the station last night, and I was also there at the end of June last ; the lighting now is infinitely superior to what it was then.

Michael Edward Moran, contractor, stated :—I am an alderman of the municipality ; have been on the railway platform several times, and I was there last night ; it was then better lighted than ever I saw it.

William Frederick Tribe, solicitor, stated :—I was at the railway station with Mr. Morrison during the last week in June ; the outside lamps were not then lit ; went to the station last night ; the lighting then was very much better than in June last.

Dr. Wilson (recalled) stated :—I went to the station last night ; it was much better lighted than on previous occasions ; saw Constable Beeby on the morning of the accident ; asked him how it happened, and he said, "Mr. Burbank tumbled over something in the dark," or words to that effect ; know the witness Howe ; don't recollect having any conversation with him about the accident.

James Frederick Whitehead, hairdresser, stated :—Know Constable Beeby ; he came into the shop for a shave on the morning of the accident ; asked him the particulars of it, and he said, "Burbank, the dentist, was running along the platform with a box, and he tripped over a bag of bacon" ; he added, "It is a badly-lighted station at any time, and where he fell it was in complete darkness."

To Mr. Scholes : I have known Mr. Burbank about three or four months ; went to his place to cut his hair ; was asked about the case about a fortnight or three weeks ago.

To Mr. Garland : When I went to see plaintiff I told him what I knew about the case through Constable Beeby.

Emily Howlett, married woman, stated :—Mr. and Mrs. Burbank were living with me at the time of the accident ; know the witness Ryan ; he came to the house on the night of the accident ; asked him how it took place, and he said, "I don't know ; I did not see it."

To Mr. Scholes : I have no clear recollection of how long Mr. and Mrs. Burbank lived with me after the accident.

Constance Burbank, wife of the plaintiff, stated :—At the time of the accident I was renting rooms from Mrs. Howlett ; I moved to my present residence in Hill-street on the 18th September, and have lived there ever since ; I know the witness Ryan ; I saw him on the night of the accident ; he told me he did not see the accident.

To Mr. Scholes : I knew an accident had happened before my husband was brought home ; I was naturally very anxious, but was very calm.

Arthur Aisbett, managing clerk for Mr. Tribe, stated :—The witness Ryan came to Mr. Tribe's office ; he made a statement which I wrote down and read over to him ; Ryan told me that Mr. Burbank tripped over a piece of bacon ; he also said that two of the station lamps were not lit.

The following additional evidence was called for the defence :—

George Wise, station-master at Tamworth, stated :—I have been station-master here for about thirteen years ; I was not on the station at the time of the accident ; I am often on the station at night ; was there last night doing what was required by the jury ; the class of burners in use last night was the same as we always had ; the light last night was the same as usual ; no improvement has been effected in the lighting since the accident ; at times we replace the burners—as one has been required we have put in a new one—but the whole of them have never been replaced at once ; nothing has been done to increase the power of the lights.

To Mr. Garland : One new burner was put in a week ago ; I cannot say if the whole of the burners have been replaced since July last ; witness White is now employed as night officer at Ardglen.

Constable Hammond stated :—I was on duty in June last on the railway station ; there is an additional light now as compared with then, but the rest of the lights are the same in brightness as before.

To Mr. Garland : Before the arrival of a train the lamps are turned up ; I do not remember the witness Playford ; I call the station well lighted, and it was well lighted last June.

Constable Caldwell also stated he noticed no difference in the lighting of the station now as compared with last June ; he considered it was a well-lighted station.

This concluded the evidence.

Counsel addressed the jury at length, his Honor summed up, and the jury, after a short retirement, returned into Court with a verdict for defendants.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

STEEL RAILS CONTRACT.

(CORRESPONDENCE IN CONNECTION WITH THE PROPOSED.)

Printed under No. 19 Report from Printing Committee, 4 December, 1900.

Messrs. William Jamieson and H. F. G. Keats to The Premier and
Colonial Treasurer.

Dear Sir,

Sydney, 23 May, 1900.

Referring to our conversation *re* the erection of Iron-smelting and Rolling Mills in New South Wales, we have the honor to make the following proposition:—

That on the Government guaranteeing to take 100,000 tons of rails extending over a period of about four years, and not less than 25,000 tons in any one year (the price to be paid for such rails being the price quoted in Great Britain, plus steamer freight and all other expenses incidental to exporting such material from Great Britain), we are prepared to erect the necessary smelting and rolling mills within a period of two years from the date of signing the contract, and at the same time deposit a reasonable amount, say up to £10,000 (ten thousand pounds), to show our *bona-fides*.

Within the two years above-mentioned we expect to be in a position to not only supply the above-mentioned 100,000 tons of rails, but to supply all the colonies with iron and steel of every description. The ore used will chiefly come from Tasmania; but as it is often advantageous to blend different ores, we expect to be able to use a very considerable quantity of New South Wales ore, probably 25 per cent.

At the same time we beg to point out that the number of men employed about the reduction works will be very much greater than at the mine or mines from which the ore is got, irrespective of those employed winning the necessary coal and manufacturing the necessary coke for such an undertaking. As we are anxious to proceed with this business as quickly as possible, we would be obliged if you would answer this letter as soon as you conveniently can.

We have, &c.,

WILLIAM JAMIESON.

H. F. G. KEATS.

P.S.—The reason why Tasmanian ores will have chiefly to be used is simply because, after exhaustive investigation, we find that the ores there are of such high quality, and so free from impurities, that the only use at present we can make of any known New South Wales ores will be as a blend.—W.J.

Ack. please.—F.K., 24/5/1900. Ack.—C.E.F.R., 29/5/1900. Submitted.—F.K., 31/5/1900.

The Under Secretary for Finance and Trade to Messrs. William Jamieson and
H. F. G. Keats.

Gentlemen,

The Treasury, New South Wales, Sydney, 29 May, 1900.

I am directed by the Honorable the Premier and Colonial Treasurer to acknowledge the receipt of your letter of the 23rd instant, relative to the subject of the erection of Iron-smelting and Rolling Mills in New South Wales.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

William Jamieson, Esq., to The Premier and Colonial Treasurer.

Dear Sir,

Prell's Buildings, 58, Queen-street, Melbourne, 30 May, 1900.

We wrote you the letter *re* erection of smelting and rolling mills, and posted it in Sydney before we left there, and hope you duly received it.

Enclosed is a printed report of the iron mine we have by the Government Geologist of Tasmania, also by Dr. Robertson, of New South Wales, with whom I dare say you are acquainted.

We would be glad to know if you have received the letter we posted to you in Sydney.

Yours, &c.,

WILLIAM JAMIESON.

Ack. please.—F.K., 7/6/00. Mr. Robberds. Acknd.—C.E.F.R., 7/6/00. Submitted.—
F.K., 19/6/00. For Cabinet. Advise that this proposal will be agreed to.—W.J.L., 31/7/00.
Mr. Robberds.—F.K., 31/7/00. Done.—C.E.F.R., 3/8/00. Records.

[Enclosure.]

TASMANIAN IRON.
BLYTHE RIVER HEMATITE.

Dear Sirs,

This creek, or inlet of the sea, is situated on the north coast of Tasmania (Bass' Straits), about 4 miles east of the deep-water harbour of Emu Bay. Here a concrete breakwater has been built and connected to the Van Diemen's Land railway to Mount Bischoff. Vessels of large tonnage can at all states of the tide discharge or load here. It is intended to extend the Government railway from Ulverstone to this port, and to extend the breakwater to admit any size of steamer, in which case this would probably be the port of call and departure of fast passenger and other steamers to Victoria. From recent discoveries (silver-lead) adjoining the extensive tin-mine of Mount Bischoff, and the certainty of the Van Diemen's Land railway being extended to the silverfields of Mount Zeelan and Mount Dundas, the Whyte River and Headwood, and White Cliffs, there is every likelihood of Emu Bay becoming the great shipping and commercial port of the island, and being fixed upon as the site for extensive smelting works. Negotiations with this in view are at present being conducted. A range of hills, about 500 feet in height, separates Emu Bay from the Blythe River.

The Blythe River runs for several miles through a narrow gorge, between tilted quartziferous schists. The river appears to have cut its way through these schists for a depth of 500 feet. The apex of the high land is in parts covered by a rich red basaltic soil, and masses of fine-grained clinkstone are to be found amongst the dense virgin forests of myrtle, stringy-bark, sassafras. The undergrowth is well-nigh impenetrable.

The river banks are steep, and along the eastern slope a bridle-track has been cut for a distance of 7 miles to the first ironstone outcrop. This, however, could be reached by a track branching off the public road on the top of the eastern range, and crossing Elchell's selection.

The whole of the known iron outcrops are contained (with one exception) in a leasehold of 640 acres, taken up along the gorge. On the top of the spur, east of the gorge, and probably 600 feet above the river (which is here a torrent), large masses of iron appear among the rich soil and dense forest. This can be traced for several chains, and is apparently 3 chains wide; but thus, from the density of the jungle, must only be considered as an estimate. Following this to the eastward, masses of conglomerate, enclosing splintered pieces of hematite, are seen. I consider this rock has been formed subsequent to the deposition of the iron, and not likely to prove the country rock.

In Mr. O'Keefe's 50-acre selection adjoining, the mass of ironstone is also seen out-cropping from under the basalt.

Under the basalt, across the west boundary of O'Keefe's, a huge mass of solid ironstone forms a cliff on the steep bank of the gorge. This enormous mass is continuous to the bottom of the gorge, through a fall of possibly 550 feet. The river gushes past masses of ironstone, and the huge wall rises in similar cliffs on the western slope, and for a similar height. Apparently the mass is not less than 3 chains wide, but this has not in any way been clearly defined.

I think there can be no doubt as to the identity of this deposit with the solid masses of ironstone described at B., and in O'Keefe's selection.

The quantity of ironstone is incalculable. Large veins occur at intervals for 2 miles up the gorge (which, however, is well-nigh untravelable), and I have no doubt but that they are a continuation of the Upper Penguin deposits.

The ironstone is remarkably hard, dense, and solid. In appearance it is identical with the Penguin deposits, but contains rather more specular ore.

I know of no deposits of iron ore so pure, and consequently so admirably fitted for producing the highest and best brands of iron and steel, or from surface indications give so much promise of extent.

Messrs. Henry Law & Co., Bank Chambers, Launceston.

TASMANIAN IRON.

Dear Sirs,

When on a recent visit to Tasmania on colliery business, I had the opportunity afforded me of inspecting a portion of the extensive peroxide of iron deposits that have but recently been brought to light on the North Coast of the Island.

I personally examined one of the deposits that outcropped on Government land and on small adjoining selections. These occur within a mile of the line of railway at present being built by Government, and say 1½ miles from a tidal harbour that readily admits vessels drawing 12 feet of water. The deposit I saw is in the midst of a partially-cleared forest, as well as on land cleared by a selector. It is easily accessible to either rail or harbour.

No exploring or prospecting work of any description has been done.

Large masses of ironstone, or as detached boulders, can be seen strewn among the undergrowth or roots of trees, and these are bounded or enclosed among slate rock, and are contiguous to many of basalt. I have no doubt that the origin of the enormous mass of ore appearing on the surface may be referred to the stupendous volcanic forces of which the intrusive rocks of the vicinity bear evidence.

A selector's road crosses the mass of ironstone, and judging from the physical appearance seen on this highway, the deposit appears to have a trend to the north-west, and to be about 350 yards in width. Whether other veins or masses exist, or whether slate rocks are associated with the ferruginous deposits, is as yet unascertained.

Following this trend, the deposit can for some time be traced at intervals both east and west. Towards the west several very strong deposits have been exposed. Four miles west, at the spot referred to, about 3 miles from the sea, on the bank of a tidal river, and at a spot where the stream pierces the mountain range, in a deep gorge surrounded by a primeval and dense forest of large and valuable timber, enormous masses of solid ore are seen. The principal masses are seen on some free selectors' ground as well as on Government land. In the bottom of the gorge, and on both sides of the steep banks, enormous masses of the finest ore appear.

The quantity of the ore is incalculable. No specific data as to extent or quantity exists; yet the general appearance convinces me that one of the most extensive deposits of the finest ore exists, and in easily accessible positions for transmission by rail or by sea. All that one is warranted in saying is that a prolific zone of rich iron ore exists, that extends over several miles of country, in parts easily accessible, and in a condition that will permit of its being mined at a very low cost—at less money than any other deposit yet discovered in Australia.

These deposits are within 15 miles of a harbour where the largest class of intercolonial steamers can enter, and to this harbour the Government line of railway is being completed. At this place there will be exceptional facilities for the cheap production of iron.

Contiguous to some of the outcrops are extensive deposits of excellent limestone.

The virgin forests would supply charcoal for reduction purposes.

The quality of the iron ore was obviously exceptionally fine, and its similarity to the E. L. Mcnektion ironstone of Algeria, now so very largely exported to America for steel-making purposes, is striking. It is superior to the iron mined in the Biscay and provinces of Spain, from whence millions of tons are annually sent to Britain and Northern Europe.

As, however, it is impossible to distinguish by a physical examination whether deleterious elements might not exist in chemical combination, and knowing that the Beaconsfield deposit, 55 miles east, contains chromium that rendered it unfit for metallurgical purposes, I picked up two specimens taken from situations, say 3 miles apart, numbering them Nos. 1 and 2. I advised you to hand these to Mr. W. A. Dixon, of this city, who has had a large experience in assaying Colonial iron ores. The following are Mr. W. A. Dixon's assays—

| | No. 1. | No. 2. |
|--------------------|---------|---------|
| Silica | 0.50 | 0.22 |
| Oxide of iron..... | 99.05 | 99.41 |
| Sulphur | 0.05 | 0.37 |
| Phosphorus | Traces. | Traces. |
| Metallic iron..... | 60.33 | 69.58 |

Continuing Mr. Dixon's remarks:—"These are wonderfully fine ores, and neither contains any alumina. There is no chromium present, and they are both quite dry."

The importance of the above will be apparent to those who possess a knowledge of the metallurgy of iron and steel. The great defect of Australian iron ores is the high percentage of silica and, worse than that, of alumina, that they contain.

On Mr. Dixon's original assay I have adhibited my certificate of the locality from whence the ore he assayed was obtained.

As

As the result of an accidental conversation with yourself on the subject of this extraordinary fine ironstone, he addressed to you the following letter :—

[Copy.]

“Sydney, 3 April, 1891.

“With regard to our conversation yesterday on your ironstone, and the quantity of limestone it will require to flux it, I have looked over the analysis of both samples, and find that if you had good limestone it would require 7 cwt. as a flux for 100 tons of ore. As your ore is of exceptional purity a thorough examination of the limestone, coal, &c., should be made, as, if these are equally fine, you should be able to produce iron of great value, quite equal to the best Swedish or Russian.”

Of the excellence of the iron from such a pure stone there can be no question. The cheapness of the stone, and the facilities existing for delivering the same at a deep water and safe harbour, and the proximity of lime will enable coke to be imported from New South Wales at a low cost, and iron in the form of pig and merchant bars of steel produced at a less cost and of a better quality than is possible on the Australian Continent.

The value of these deposits on the future of Tasmania cannot readily be over-estimated.

Yours, &c.,

JAMES R. M. ROBERTSON, M.E.F.G.S., &c.

Messrs. Henry Law & Co., Bank Chambers, Launceston.

Dear Sir,

Technical College, 301 Pitt-street, Sydney, 30 April, 1891.

With reference to our conversation the other day on the subject of working your Tasmanian iron ore, my impression is that, as you have large supplies of timber near at hand, you should go for the production of charcoal iron. Your ore is of such exceptionally good quality that, with charcoal, it would produce iron equal to the very best Russian or Swedish brands; such iron as is used for the production of steel for tools and cutlery. From what I know of the growth of timber in Tasmania there would be very little expense incurred in keeping up a supply of wood for charcoal from generation to generation; indeed, it would only require the prevention of the destruction of saplings and young trees. The demand for such iron is, of course, not unlimited, but the price is so high; and coals such as you have could be used for heating the blast, &c.

Under ordinary blast furnace work a very superior iron for steel-making could be made with coke, the ore being free from phosphorus—the steel in this case being for rails, boiler-plates, &c. With the supply of Tasmanian tin close at hand there should be, for the better class of steel, the making of a large business in tin plates, the demand for which in Australia is now great and yearly increasing. There is also a likely market in California, and all along the West Coast of North America, where the canning industry for fruits, vegetables, fish, &c., is growing yearly.

I remain, &c.,

WILL. A. DIXON, F.I.C., F.C.S.

H. Law, Esq., Bank Chambers, Launceston.

Dear Sir,

Technical College, 301, Pitt-street, Sydney, 11 May, 1891.

Referring to our conversation last Friday on the use of your iron ore for fluxing purposes in the smelting of silver ores, I have no doubt but that it would suit admirably for that purpose.

Your ore contains 99 per cent. of oxide of iron, so that the ore would only require to supply 1 per cent. or thereabouts of its contents to flux the impurities it contains. Of the iron ores of New South Wales but few contain less than 20 per cent. of impurities for which flux has to be provided, which shows at once the superior quality of your deposits.

I remain, &c.,

W. A. DIXON, F.I.C., F.C.S.

H. Law, Esq.

TASMANIAN IRON ORES.

(From the *Australian Mining Standard*, No. 81, 20 July, 1891.)

REFERRING to the article which appeared in our last issue under the above heading, we have since learned that a sample of the iron ore from the property of Messrs. Henry Law & Co., near the Blythe River (Tasmania), weighing about 4 cwt., was forwarded to Messrs. Parke and Lacy Co., of Sydney, and that they took this raw ore, and employing an ordinary blast furnace produced first-class castings, samples of which are now in our office, and can be examined by those interested. This production of merchantable castings direct from the raw ore is certainly a step in the right direction towards the development of our iron-mining districts. Messrs. Parke and Lacy Co. show samples of puddle bar-iron, wrought-iron, pig-iron, and castings, all produced out of this 4 cwt. of raw ore.

The experiment was conducted at Halliday's Engine Works, 20, Erskine-street, Sydney, by Mr. W. Brazenall, who holds a certificate of merit from the Commissioners of the London Exhibition, 1889. Mr. Brazenall informs us that he charged an ordinary foundry furnace with $\frac{3}{4}$ cwt. of the Tasmanian iron ore and about 14 lb. of limestone, and ran the iron smelted into pigs. He afterwards made castings of various descriptions from the pigs thus produced, and had a cast mandril put into the lathe to show that the iron was not too hard for machining. The iron proved of the very highest quality, of exceedingly fine and close grain, and very tough. In addition to the cast-iron, a small quantity of puddle-bar iron was secured, owing to the furnace not being entirely adapted for producing cast-iron, and wrought-iron has been worked up with the most satisfactory results. Mr. Brazenall, who has had large experience in the manufacture of iron, and Mr. Halliday, both speak in enthusiastic terms of the quality of the ore.

Gentlemen,

301, Pitt-street, Sydney, 16 March, 1891.

The samples of ironstone Mr. Law left with me for analysis contained—

| | No. 1. | No. 2. |
|---------------------------------|--------|--------|
| Silica | 0.50 | 0.22 |
| *Oxide of iron | 99.05 | 99.41 |
| Sulphur | 0.50 | 0.37 |
| Phosphorus | Traces | Traces |
| | 100.05 | 100.00 |
| * Containing metallic iron..... | 69.33 | 69.58 |

These are wonderfully fine ores, and neither contain any alumina. There is no chromic iron present, and the ores were both quite dry.

Messrs. Henry Law & Co., Bank Chambers, Launceston.

I remain, &c.,

WILL. A. DIXON, F.I.C., F.C.S.

TASMANIAN IRON ORES.

(From the *Australian Mining Standard*, No. 81, 20 July, 1891.)

REFERRING to the article which appeared in our last issue under the above heading, we have since learned that a sample of the iron ore from the property of Messrs. Henry Law & Co., near the Blythe River, Tasmania, weighing about 4 cwt., was forwarded to Messrs. Parke and Lacey Co., of Sydney, and that they took this raw ore, and employing an ordinary blast furnace produced first-class castings, samples of which are now in our office and can be examined by those interested. This production of merchantable castings direct from raw ore is certainly a step in the right direction towards the development of our iron-mining districts. Messrs. Parke and Lacey Co. show samples of puddle-bar iron, wrought-iron, pig-iron, and castings, all produced out of this 4 cwt. of raw ore.

The experiment was conducted at Halliday's Engine Works, 20, Erskine-street, Sydney, by Mr. W. Brazenall, who holds a certificate of merit from the Commissioners of the London Exhibition, 1889. Mr. Brazenall informs us that he charged an ordinary iron foundry furnace with $\frac{3}{4}$ cwt. of the Tasmanian iron ore and about 14 lb. of limestone, and ran the iron smelted into pigs. He afterwards made castings of various descriptions from the pigs thus produced, and had a cast mandril put into the lathe to show that the iron was not too hard for machining. The iron proved of the very highest quality, of exceedingly fine and close grain, and very tough. In addition to the cast-iron, a small quantity of puddle-bar iron was secured, owing to the furnace not being entirely adapted for producing cast-iron, and wrought-iron has been worked up with the most satisfactory results. Mr. Brazenall, who has had large experience in the manufacture of iron, and Mr. Halliday, both speak in enthusiastic terms of the quality of the iron.

From

From Mr. Montgomery's Report.

On 5th March, 1894, Mr. R. Quiggin, the present proprietor, had Mr. A. Montgomery, the Tasmanian Geological Surveyor, to report on the mine, who says: "The samples taken were forwarded to Mr. W. F. Ward, Government Analyst in Hobart, with instructions to have them carefully examined for all impurities likely to interfere with the quality of the iron to be made from the ore. He reports the analysis as follows:—

| | |
|----------------------------------|----------------|
| Iron peroxide (= iron 66·4)..... | 95·2 per cent. |
| Silica..... | 4·8 " |
| Phosphoric acid..... | Traces " |

This ore is of excellent quality, being practically free from all impurities with the exception of the silica. It resembles the well-known Cumberland Red Hematite, so long used for the production of steel by the Bessemer process."

According to this analysis, the Blythe River hematite is one of the finest and purest in the world, ranking with the famous Spanish, Algerian, and Cuban ores, which are now exported in very large quantities to the United Kingdom, United States, France, and Germany, for the manufacture of Bessemer steel. The deposit must be one of the largest also, containing many millions of tons. The data for calculating its size are very insufficient, but taking them such as they are, a rough calculation may be made which will serve to give some idea of it. On the south side of the river the ore is seen for a horizontal distance of about 8½ chains, and rises to a height of 250 feet above the stream; on the north side it rises to 500 feet above the river, in about 50 chains horizontal distance, and then falls a little, say, to 400 feet, for another 16 chains. Taking the width of the ore-body at 66 yards, these measurements give the cubic contents of the deposit under the visible outcrop down to the level of the Blythe River as slightly over 10,000,000 cubic yards, or at 3 tons to the cubic yard, 30,000,000 tons. It is not to be supposed that the ore terminates where the outcrop disappears under the superficial basalt, or that it only goes down to the level of the Blythe River, while the width also is probably underestimated, so that the deposit is clearly of enormous extent.

It is, too, most favourably situated for economical working, the steep sides of the river gorge giving exceptional opportunities for mining by open quarrying. Working faces could be opened at different levels on both sides of the river, so that an army of men could be at work at one time quarrying in ore steps, and it could be lowered to the river by self-acting tramways, and in some places even by shoots, by gravitation, at very small expense. The cost of mining ought to be very low.

The Blythe River is at all times a considerable stream, and would be able to supply power for working air-compressors, electric lighting appliances, and concentrating machinery. The latter would sooner or later be required as the best way of getting rid of the piles of second-class ore that would rapidly accumulate in working. The possession of this good water-power would be a large factor in the economical working of the mine.

The gorge of the Blythe is pretty steep and rough, but I do not think any serious difficulty would be found in making a railway down it from the mine, a distance of between 6 and 7 miles. The present track on the eastern side of the river is 6½ miles from the mine to the main road, and to the surveyed line of the Ulverstone to Burnie railway. It seems highly probable, however, that the western side of the river would be the better one for the line to the mine. It has also been proposed to take a railway direct to Emu Bay, but I understand there are serious difficulties in the way of doing so. Going down the Blythe River, and then along the Ulverstone Burnie railway the ore would have to be carried about 12 miles to reach the Emu Bay Breakwater for shipment, and the grades would be easy ones, so the item of carriage of ore to the port of shipment ought to cost but little.

The iron mine, therefore, possesses the advantages of enormous quantities of ore easily mined, of great purity of the mineral, and of proximity to a deep-water port, also of ample water-power; and if any mine of iron will pay in the Australian colonies this one should.

REPORT ON A DEPOSIT OF IRON ORE AT THE BLYTHE RIVER.

Sir,

Geological Surveyor's Office, Launceston, 5 March, 1894.

I have the honor to report upon a deposit of hematite iron ore on land held under mineral lease from the Crown by Mr. R. Quiggin on the Blythe River, some 7 miles from its mouth. On the 16th January last I made a superficial examination of the deposit, but, as it is still quite in a state of nature, and in no way opened up by cuttings or mining works of any sort, I was not able to make such a minute study of it as its importance undoubtedly deserves. Before it can be properly examined, and its extent and value accurately estimated, a considerable amount of time, money, and labour will require to be expended in clearing, trenching, and sinking upon it. From what is even now visible, however, it is quite clear that the ore is present in enormous quantity, and in a position affording splendid facilities for cheap mining, and there is every inducement to open quarries upon it, and try it in a practical manner, provided it can be shown that there is any reasonable probability that iron-smelting can be made to pay in the Australian Colonies under existing conditions of the labour market, prices of fuel, and demand for the metal. As to this I shall have something to say later on, but first it is necessary to describe the mining property itself. The accompanying map, copied with slight alterations from one by Mr. Peart, authorised surveyor, kindly lent to me by Mr. Norton-Smith, of Burnie, will illustrate the description.

The iron deposit may be reached by either of two routes from the main road connecting Ulverstone and Burnie, the easier one being along the road through the parish of Stowport, lying between the Blythe River and the Heybridge Rivulet to Ellis's, O'Keefe's, and Etchell's selections. The ore is met with on O'Keefe's western section, and on the adjacent Crown land, on which Mr. R. Quiggin holds under mineral lease the following sections:—1,061-91M, of 40 acres; 1,009-91M, of 73 acres; 851-91M, of 78 acres; and 856-91M, of 80 acres. As shown on the map, the outcrop of the deposit traverses the first three of these sections and the western part of O'Keefe's purchased block. The second route to the mine is along a track which runs up the eastern side of the Blythe River to it; but this is now in bad order, and not practicable for horses. Going over these two routes, the structure of the country is fairly visible, the sections afforded by the deep gorge of the Blythe River, and along the coast line, showing it very plainly. The main country rock is of sedimentary origin, consisting of sandstones, slates, and occasionally limestones of probably Silurian age, or even older. No fossils were seen during my visit, and I could not hear of any having ever been got in this vicinity, so there were no data for determining the age of the formation. The strata dip at high angles, and are very much metamorphosed, at times approaching schists and quartzites. Their general strike is north-east and south-west, conforming closely in this to the strike of the iron ore deposit. These older strata are seen all the way up the Blythe River gorge to the mine. The valley of this stream is a deep one, the bottom being 500 feet below the agricultural selections on each side of it at the place where the hematite crosses. This farming land is fairly flat on the whole, though a good deal undulating, and is composed of basalt of Tertiary age which covers the older rocks first mentioned. It is found on both sides of the Blythe River valley, and decomposes to a fertile agricultural soil.

The deposit of iron ore has been cut through by the Blythe River, and is found on each side of its valley rising up the slopes until it disappears under the basaltic capping. The outcrop is about 5 chains in width, and even allowing for loose stones from it gravitating down hill, and making it appear wider than it really is, I do not think that there can be less than about 200 feet in width of ore on an average; along its length it has been traced, and is easily visible for 74 chains, or close on a mile. The ore crops out in large lumps, and the surface soil is full of it, and at several points, some of which are marked on the map, it stands up in large rocks and cliffs; these afford the best sections of the ore-body yet available, and a careful inspection of them shows it to be a massive hematite with a large proportion of very pure high-grade ore. In some parts there is a good deal of quartz mixed with the hematite, sometimes in strings and veins, and sometimes in angular fragments; I also noticed a good many pieces of jasper and of siliceous hematite. The north end of the ore mass seemed rather more siliceous and impure than the parts close to the river. The whole deposit is, therefore, by no means a pure high-grade hematite, but there can be no doubt that very large quantities of very pure ore with little silica could be obtained without much picking. Till the mass, however, is actually cut into and tried there are no data for estimating what proportion the pure ore bears to the entire mass, or how much lean ore would have to be quarried and rejected in obtaining each ton of first-class stuff. This is a factor of the greatest importance in calculating the cost of mining the hematite, and will require to be attentively studied during the progress of preliminary exploratory work. In the bed of the Blythe River there is a large amount of very good ore, representing no doubt the hardest portions of the stuff which has fallen into it, the softer and more friable matter being washed away by the water. Waterworn ore is found in the bed of the stream for some distance down, and nearly a mile below the mine I noticed rounded boulders of it in an alluvial

alluvial terrace, probably quite 20 feet above the water's level. It would probably be worth while ascertaining if the bed of the stream could not be worked profitably for the fine hard ore which has been concentrated in it by natural sluicing operations. As it was quite impossible for me, in the undeveloped state of the mine, to obtain a sample of the ore which would at all fairly represent its average bulk value, and as such a sample would indeed be of no particular use, inasmuch as in actual working a lot of lean ore would be necessarily rejected, I only took a few samples of the best-looking boulders in the river for analysis. They may be looked upon as fairly representing the best ore, but from inspection I should judge that many thousands of tons of equally good stuff could be readily obtained. What the average yield of such first-class ore from the bulk of the deposit would be is, as already remarked, only to be ascertained after it has been opened out by trenches and cuttings. The samples taken were forwarded to Mr. W. F. Ward, Government Analyst in Hobart, with instructions to have them carefully examined for all impurities likely to interfere with the quality of the iron to be made from the ore. He reports the analysis as follows:—

| | |
|----------------------------------|----------------|
| Iron peroxide (=iron 66·4) | 95·2 per cent. |
| Silica | 4 S " |
| Phosphoric acid | traces. |

This ore is of excellent quality, being practically free from all impurities with the exception of the silica. It resembles the well-known Cumberland red hematite, so long used for the production of steel by the Bessemer process.*

According to this analysis, the Blythe River hematite is one of the finest and purest in the world, ranking with the famous Spanish, Algerian, and Cuban ores, which are now exported in very large quantities to the United Kingdom, United States, France, and Germany, for the manufacture of Bessemer steel. The deposit must be one of the largest also, containing many millions of tons. The data for calculating its size are very insufficient; but, taking them such as they are, a rough calculation may be made which will serve to give some idea of it. On the south side of the river the ore is seen for a horizontal distance of about $8\frac{1}{2}$ chains, and rises to a height of 250 feet above the stream; on the north side it rises to 500 feet above the river, in about 50 chains horizontal distance, and then falls a little, say, to 400 feet, for another 16 chains. Taking the width of the ore-body at 66 yards, these measurements give the cubic contents of the deposit under the visible outcrop down to the level of the Blythe River as slightly over 10,000,000 cubic yards, or, at 3 tons to the cubic yard, 30,000,000 tons. It is not to be supposed that the ore terminates where the outcrop disappears under the superficial basalt, or that it only goes down to the level of the Blythe River, while the width also is probably underestimated, so that the deposit is clearly of enormous extent.

It is, too, most favourably situated for economical working, the steep sides of the river gorge giving exceptional opportunities for mining by open quarrying. Working faces could be opened at different levels on both sides of the river, so that an army of men could be at work at one time quarrying the ore in steps, and it could be lowered to the river by self-acting tramways, and in some places even by shoots, by gravitation, at very small expense. The cost of mining ought to be very low.

The Blythe River is at all times a considerable stream, and would be able to supply power for working air-compressors, electric-lighting appliances, and concentrating machinery. The latter would sooner or later be required as the best way of getting rid of the piles of second-class ore that would rapidly accumulate in working. The possession of this good water-power would be a large factor in the economical working of the mine.

The gorge of the Blythe is pretty steep and rough, but I do not think any serious difficulty would be found in making a railway down it from the mine, a distance of between 6 and 7 miles. The present track on the eastern side of the river is $6\frac{1}{2}$ miles from the mine to the main road and to the surveyed line of the Ulverstone to Burnie railway. It seems highly probable, however, that the western side of the river would be the better one for the line to the mine. It has also been proposed to take a railway direct to Emu Bay, but I understand there are serious difficulties in the way of doing so. Going down the Blythe River, and then along the Ulverstone-Burnie railway, the ore would have to be carried about 12 miles to reach the Emu Bay breakwater for shipment, and the grades would be easy ones, so the item of carriage of ore to port of shipment ought to cost but little.

This iron mine, therefore, possesses the advantages of enormous quantities of ore easily mined, of great purity of the mineral, and of proximity to a deep-water port, also of ample water-power; and if any mine of iron will pay in the Australian Colonies this one should.

I have not been able satisfactorily to convince myself whether this deposit is a true lode or an ore-bed, but incline to the latter opinion. The strike of the ore-body coincides as nearly as possible with that of the enclosing country rocks, and in one or two places I thought traces of stratification in the ore itself could be detected. The purity of the mineral, too, rather favours the ore-bed explanation. On the other hand, the occasional strings, veins, and angular enclosures of quartz rather point to its being a lode. Similar strings, and veins, however, occur in the surrounding country rock, and it seems possible enough that those in the ore are similarly formed by infiltration of silica into cracks and crevices of its mass long after it was formed. It seems most probable that the ore-bed was originally a mass of brown iron ore deposited along with the sandstone and slate strata when the latter were laid down as horizontal layers; in the course of time the strata have become tilted on edge, and the brown iron ore has become changed to the red hematite. From a mining point of view it matters little whether the ore is in a lode or in a nearly vertically-dipping bed, as the method of working is the same in either case; but if it could be proved to be a bed or sedimentary deposit greater confidence would be felt as to its remaining of fairly uniform quality over long distances in length and depth. When some mining work has been done it will probably be easy to definitely settle the question of the classification of this deposit.

It is not the only one in this part of the country, for not many miles away, near the Penguin River, there is another large iron-ore deposit, which is described as quite similar to the Blythe River one, but which I have not myself seen, and possibly many others lie concealed beneath the superficial basaltic covering.

There can be little doubt, when the time comes for making iron in the Australian colonies, these iron mines will be of immense value to their owners and to the country. The important question now to be considered is: Can they be profitably worked at the present time? It should be the work of a specialist in the manufacture of iron, thoroughly conversant with the European and colonial iron markets, and with the conditions under which the metal is made elsewhere and would have to be made here, to give an answer to this; and only such a one can speak with authority on the subject. Having only a general knowledge of the problem, I cannot claim any such authority, and any opinion now expressed by me would require to be verified by a specialist before being acted upon; but I have endeavoured to gather together some reliable facts and figures, which may serve to throw light upon the question. By the kind assistance of the Government Statistician I have been able to obtain returns from all the Australian colonies, except Queensland and Western Australia and from New Zealand, of the value of iron and iron goods imported into them, which will give some idea of the demand for iron that already exists. As the classification adopted by the various colonies is not uniform, I have not found it possible to combine all the returns in one table, and therefore present them as revised for the five years ending with 1892.

* Including steel cordage.

As will be seen, the item "Manufactured iron goods" in the above tables includes a great deal more in the returns of some of the colonies than in those of others. Taking the grand totals for the five years as they stand, however, their sum amounts to £27,559,112, and if we include Queensland and Western Australia, whose returns I have not been able to get in time for this report, we may safely estimate the grand total for all the colonies at £30,000,000, or at the rate of £6,000,000 worth of iron goods per annum. To get greater accuracy it would be necessary to deduct the exports of iron from each colony to ascertain the amount used; but against this we may place the large value of iron goods of all sorts not shown in the tables, and probably this would quite compensate for the exports. It is, therefore, clear that a very considerable market exists, which would be able to absorb the produce of a fairly large smelting-works.

Should iron-smelting be begun in Australia it is probable that for some years the production would be confined to pig-iron, iron and steel rails, iron and steel rods, bars, girders, columns, and other simple shapes, and foundry material, though in course of time no doubt it would be found possible to compete with Europe in manufactured goods of all sorts. Turning again to the tables, it will be seen that the imports of pig-iron, rod and bar iron, unmanufactured steel, and steel and iron rails and railway material amount to the grand total of £5,753,281, which may, however, include locomotive engines in the cases of New South Wales and Tasmania. However, counting in Queensland and Western Australia, it should not be far from correct to assume the colonial consumption of the above sorts of iron as averaging about £1,000,000 in value annually for the period quoted. It is not to be supposed that one smelting establishment would be able to supply all the different brands of iron required for manufacturing purposes, or could beat all foreign competitors so thoroughly out of the field as to be able to hold a monopoly of it; still the figures show a market large enough to encourage us to believe that our own iron-smelters would not have any surplus metal requiring to be exported for sale. It is not probable that for many years to come Australia will be able to compete with Europe and America in the open markets of the world; but if we can hold our own within our own domain, and consume all the iron we can produce, the iron-manufacturing industry would soon need no special fostering.

Now let us try to arrive at some estimate of what it would cost to make iron locally. To get at this we must first see what it costs elsewhere. I am indebted to "The Mineral Industry, 1892," by Mr. R. P. Rothwell, for most of the facts and figures on this head now to be quoted.

From tables prepared by the United States Labour Bureau, under the Honorable Carroll D. Wright, Commissioner, covering the period between 1887 and 1890, it appears that the total cost of one ton of run-of-furnace pig-iron, as reported by twenty-six establishments in the Northern District of the United States, averaged \$13.94 (= £2 18s. 1d.), and in twenty-four establishments in the Southern District, \$10.75 (= £2 4s. 9½d.); one establishment on the Continent of Europe gave the average cost per ton as \$11.03 (= £2 5s. 11½d.). The details of cost at the above fifty United States establish-

ments

ments are of interest as showing the main items of expense and their relative importance, and are therefore quoted, the average costs being taken :—

| | Northern. | Southern. |
|-----------------------------|----------------|----------------|
| Ore | \$6.96 | \$3.47 |
| Cinder, scrap, &c. | .58 | .01 |
| Limestone | .50 | .47 |
| Coke | 3.33 | 4.46 |
| Coal | .37 | .00 |
| Total minerals | \$11.74 | \$8.41 |
| Labour | 1.47 | 1.53 |
| Officials and clerks | .18 | .16 |
| Supplies and repairs | .51 | .61 |
| Taxes | .04 | .04 |
| Grand total | \$13.94 | \$10.75 |

In the same tables the cost of charcoal iron is given from seven establishments in the Northern States, and from one in the Southern, ranging in the former from \$14.45 to \$25.24 (average \$19.46) per ton, and in the latter being given as \$10.27. The writer of the article on iron in "The Mineral Industry," however, says :—"It is not at all likely that the average cost of hot-blast charcoal iron anywhere in the country is below \$14."

The average cost per ton of Gray forge iron in the Northern District of the United States is given as \$13.50, in Great Britain as \$8.03, and on the Continent of Europe as \$9.06. No. 1 foundry iron in the Northern United States is given as costing on an average \$13.86 a ton, and on the Continent of Europe \$7.74, excluding taxes. Spiegeleisen on the Continent cost \$15.07, only one establishment's figures being quoted, however. Basic or Thomas iron on the Continent cost \$9.63, and in Great Britain \$10.89 a ton. The average cost of Bessemer iron in the Northern United States was \$15.37, in Great Britain, \$10.33; and on the Continent of Europe, \$11.74.

The average figures for Bessemer iron and Gray forge iron respectively made in Great Britain, quoted in Mr. Wright's Report, are in detail made up as follows :—

| | Bessemer iron. | Gray forge iron. |
|--|----------------|------------------|
| Cost of ore per ton, of pig | \$6.09 | \$3.63 |
| " cinder and scrap | 0.23 | 0.10 |
| " limestone | 0.20 | 0.32 |
| " coke | 2.64 | 2.74 |
| " coal* | .0075 | .02 |
| " labour | .6625 | .67 |
| " officials, clerks, &c. | .055 | .04 |
| " supplied repairs..... | .43 | .33 |
| " taxes | .015 | .02 |
| " items not detailed..... | | .06 |
| Total cost of pig | \$10.33 | \$7.93 |
| Number of establishments reporting | 4 | 3 |
| Number of furnaces | 4 | 6 |
| Average output per day per furnace | 76 tons | 78 tons |
| Tons of ore used per ton of pig..... | 1.8 | 2.45 |
| " cinder and scrap | .07 | .22 |
| " limestone | .345 | .45 |
| " coke | 1.175 | 1.08 |
| " coal | .0025 | .007 |
| Average cost of ore per ton | \$3.39 | \$1.48 |
| " cinder and scrap per ton | 0.32 | 0.45 |
| " limestone per ton | 0.58 | 0.71 |
| " coke per ton | 2.25 | 2.53 |
| " coal per ton..... | 3.00 | 3.00 |

* In one Bessemer and two Gray forge establishments about 1 ton of coal is used along with every hundred tons of coke.

It is not explained why the coal should cost more than the coke per ton, but it is probably not the same as that from which the coke is made, and may, perhaps, be anthracite brought from some distance. The smelting, however, is substantially all done with coke.

It is seen from the above that the most important items of cost of making Bessemer iron, which is what we have at present to consider, as the Blythe River iron-mine yields an excellent Bessemer ore, are the cost of the ore and the cost of the coke used for smelting it, these two amounting to 84½ per cent. of the total cost of production. Most of the Bessemer ore used in Great Britain is now imported from Spain, the deposits of West Cumberland and North-west Lancashire only supplying about 2,500,000 tons a year, against about 4,000,000 tons imported. According to the contributor of the article on the "Mineral Industries of the United Kingdom," in Rothwell's "Mineral Industry," 1892,—"About 20 per cent. of the total make of pig-iron in the United Kingdom is now, and has for some years past, been produced from imported ore, a large part of which is delivered to the furnaces at 11s. per ton, the average content of iron being 50 per cent." The proportion quoted is stated to have risen to 25.2 per cent. in 1892. (Engineering and Mining Journal, 1893, page 494.) From the above tabular statement it appears that during the period of Mr. Wright's investigation, the average Bessemer ore used at four British establishments cost per ton \$3.39 (=14s. 1½d.), and yielded 55½ per cent. of pig-iron, which we may take as equal to, say, 53½ per cent. of pure iron. Allowing for losses in smelting, we may estimate that the ore would assay about 57 per cent. iron. According to the return of imports into the United Kingdom during the same period (1887 to 1890), the average value of the imported ore (which is mostly Bessemer ore) was 15s. a ton. It is probable that the recent heavy fall in the value of silver will have lowered the price of Spanish ore, as Spain is monofarally a silver standard country. In estimating the relative prices at which the British and Australian smelters respectively would purchase their Bessemer ore, I do not think, there ore, that we should put down the cost to the former at more than 11s. a ton, the price quoted by "The Mineral Industry's Contributor."

At what price, now, could we deliver the Blythe River ore to a smelting establishment? Taking into consideration that coke is a bulky, and therefore expensive cargo to carry, and that, as shown above, nearly as much weight of coke as of ore is used in the first smelting, without counting the coal and coke used afterwards in converting the pig-iron into merchantable rails, rods, sheets, and so on, it is pretty clear that it would be cheaper to send the ore to Newcastle to be smelted than to try to reduce it in Tasmania. This would have the further advantage that the metal would be at once available for distribution throughout New South Wales and Queensland, without the expense of freight from Tasmania. Smelting at Newcastle seems to me the only hope of success with the Blythe River and Penguin ore.

The mine being admirably situated for mining the ore cheaply, it seems a quite safe estimate, even after allowing that a good deal of second-class ore unfit for smelting had to be moved and rejected while picking out the pure mineral, if we put the cost of winning it at 3s. a ton. The distance to Burnie Breakwater being 12 miles, another shilling should cover the freight to the port. The freight from Burnie to Newcastle will be a very important factor in the calculation, and I have been at some pains to get reliable figures on this head. Seeing that vessels taking coal and coke from Newcastle to Melbourne, Adelaide, and Port Pirie can call at Burnie on their return trip and load with iron ore, it is pretty certain that if shipments of 300 or 1,000 tons of ore a week (enough to keep one large furnace in work) or over could be guaranteed to the shipping companies, contracts could be made to carry it at 5s. a ton. Allowing 2s. a ton for contingent and profit, the ore could then be delivered at Newcastle for about 11s. a ton, or about the same price as the British smelter pays for his Spanish hematite.

As

As regards the price of coke, however, the position is much less satisfactory. While the British smelter pays, as shown above, from 9s. 4d. to 10s. 6d. a ton for his coke, the best coke delivered at Newcastle cost 25s. a ton. As the best coal is now sold in Newcastle in the trucks at 7s. 9d., and small coal at 4s., it seems likely that coke could be supplied considerably cheaper, probably at not more than 20s. a ton at the outside, if a local furnace were in a position to make large contracts for it. The quality of the New South Wales coke is not, perhaps, quite as good as the English, but is susceptible of improvement with the use of coal-washing appliances and greater care in manufacture. In a report, dated 22nd December, 1892, by the Government Geologist of New South Wales, Mr. E. F. Pitman, it is pointed out that there is not so much difference between the English and German cokes and the best New South Wales makes, as is generally supposed. After comparing the analyses of nine samples of foreign coke supplied to the Broken Hill and Port Pirie smelting works with those of fourteen samples made in different parts of New South Wales, he says:—"It will be observed that some of the Welsh coke used at Broken Hill contains a higher percentage of ash than the colonial coke made by either the Purified Coal and Coke Company, Wallsend, or the Singleton Colliery Companies; also that the average percentage of ash, calculated from the nine samples of foreign cokes in use at or in transport to Broken Hill, amounts to 7.26, which is only 0.6 per cent. lower than is contained by the coke made at the Purified Coal and Coke Company's ovens, Wallsend." Mr. Pittman summarises his conclusions as to the relative quality of the New South Wales and foreign cokes as follows:—"Some of the cokes at present manufactured in New South Wales are nearly equal, as regards ash, to the average of the imported cokes in use at the Broken Hill smelting works. Several of the cokes at present manufactured in New South Wales are superior, as regards percentage of ash, to some of the imported cokes in use at Broken Hill. That in regard to strength, or capacity for resisting pressure, the cokes manufactured in New South Wales are superior to some of the imported cokes at present in use at Broken Hill."

The ash of the New South Wales cokes is admitted to be somewhat more siliceous, and consequently more refractory to smelt than that of the average English ones; but, as a set-off to this, it contains less sulphur and phosphorus. In the Records of the Geological Survey of New South Wales, Vol II, Part III, 1891, page 110, it is stated in a paper by Mr. J. C. H. Mingaye, F.C.S., (Government Analyst, that "as regards the presence of sulphur, the coals of New South Wales are exceptionally free from that element, and, I think, will, without doubt, compare in this respect with coal in any part of the world." At page 114 of the same paper Mr. Mingaye again says:—"The ashes of the coals of New South Wales yield much less phosphoric acid than the English, which is greatly in their favour when the coals or cokes are required to be used for iron-smelting purposes," and he quotes the mean percentage of phosphoric acid in five samples from the Northern District of New South Wales as 7.26 per cent., and in six from Great Britain as 1.843 per cent. The purity of the coke from sulphur and phosphorus will allow of the production of very fine iron from the pure Tasmanian ore, and is an advantage which few but iron-smelters will adequately realise.

As a set-off against the siliceous ash of the Colonial coke, the great purity of the ore might be urged, but it would be premature to do so until actual shipments have been sampled. If the ore can be kept of the same average grade as the Spanish ore (say) from 59 per cent. to 61 per cent. iron, it is as good as we have any right at present to expect it to be, though there is much reason to hope that a higher average value could be maintained.

Taking the English figures above given for Bessemer pig-iron as a basis, we may now attempt a rough estimate of the cost producing a ton of pig at Newcastle:—

| | |
|--|-----------|
| 1.8 tons ore, at 11s. | £ 0 19 9½ |
| 0.7 ,, cinders, &c., at (say) 2s. | 0 0 1½ |
| 345 ,, limestone, at 4s. | 0 1 4½ |
| 1.2 ,, coke, at 20s. | 1 4 0 |
| Total materials | £2 5 3½ |
| Labour, officials, supplies, &c. (say) | 0 10 0 |
| Total cost of pig | £2 15 3½ |

As against \$10.33 or £2 3s. 0½d. in England, the extra cost being about 12s. 3d.

The handicap which the Colonial smelter would have as against his English competitor is the freight on the latter's goods out from England. This is very variable, according to the exigencies of the shipping trade, ranging from occasionally a nominal sum up to as much as 25s. a ton. After a good many inquiries, it seems to me to be pretty safe to take 12s. 6d. a ton as about the lowest average freight on iron from London to these Colonies. As regards New South Wales and part of Queensland, the local smelter would have the whole of this in his favour; but when he had to ship from Newcastle to Melbourne, Adelaide, New Zealand, and Tasmania, it is doubtful whether the freight on his goods, owing to the high intercolonial rates prevailing, would not be almost as much as if they were sent from London. The Newcastle manufacturer would then have a slight advantage in New South Wales and Queensland, but could hardly meet English competition elsewhere in the Colonies. It must be remembered that the case of pig-iron is the one most favourable to the Colonial smelter, as the higher rates of wages and coal here will make the further working up of the metal into merchantable shapes relatively more costly than in Great Britain.

It is possible that a powerful company acquiring the iron-mines, and also coal mines of its own, and making its own coke, might be able to reduce the cost of producing iron to a figure approaching the British cost, the facilities for bringing the ore and coke together at Newcastle, and for distributing the product afterwards, being really unusually good. The case in favour of a trial at making iron in these Colonies seems good enough to warrant its being investigated in all its details by a skilled specialist in the manufacture. The attempts hitherto made at iron-smelting have been failures, or very partial successes, but it seems to me that the proposal to reduce sea-borne ore at Newcastle has points in its favour which were wanting in other instances.

As showing the value of a deposit of high-grade Bessemer ore, the following notes on the iron deposits of Cuba, taken from "Rothwell's Mineral Industry, 1892," will be of interest:—"The Cuban iron-ore deposits, one of the most important groups of Bessemer iron mines in the world, are found on the range of mountains called the Sierra Maestra, which skirts the southern coast of the province of Santiago de Cuba. The ore can be mined with great facility by means of side-hill cuts. The average analyses of the cargoes have been between 58 per cent. and 65 per cent. of metallic iron, and about 0.02 per cent. of phosphorus." A syndicate of Pennsylvania capitalists obtained a concession to build a narrow-gauge railroad from the mines to the port of Santiago de Cuba, a distance of 17 miles. "The line was laid through a very mountainous country, and the first car-load of ore was shipped late in 1884. Since then the output has been increasing year by year, and in 1891 it amounted to 330,000 tons. To haul the ore from the mines to the port there are at present in use about twenty locomotives, and over 2,000 cars, while the total number of men employed averages about 1,500. The company has built an iron pier at the harbour of Santiago de Cuba high enough to allow the railroad cars to dump directly into the steamers. There are no ore-docks; so the company must have sufficient cars to allow the loaded ones to be sidetracked until the arrival of the steamers, every two or three days. The company controls a regular line of iron steamers plying between their pier at Santiago de Cuba and Philadelphia or Baltimore. Most of the ore is consumed by the Pennsylvania Steel Company and the Bethlehem Iron Company. It is estimated that over \$3,000,000 has been spent in this enterprise, with gratifying financial results. In 1890 the Sigma Iron Company, composed of Philadelphia capitalists, was organised, and purchased another group of mines in the same mountain range, about 30 miles from Santiago de Cuba. It has constructed 5 miles of standard-gauge railroad. An ore dock of 5,000 tons capacity was built in the open sea, and will be protected from the prevailing south-east winds by a breakwater now in process of construction. The first shipment of ore from this group of mines arrived in Philadelphia a few weeks ago in the American whale-back steamship "Joseph L. Colby." A portion of the cargo went to the Midvale Steel Company, whose analysis gave:—Metallic iron, 67.576 per cent.; phosphorus, 0.014 per cent.; sulphur, 0.026 per cent.; silica, 1.460 per cent."

The importance to all the Australian colonies of the establishment of an iron-smelting industry in their midst can hardly be over-estimated, seeing that there is, perhaps, no other that gives a greater stimulus to national progress. If it can be successfully established it will go far before long to render us less dependent upon the outside world for markets for our foodstuffs and raw materials and for manufactured goods, by encouraging a manufacturing population who will consume the former and supply the latter, for the development of coal and iron industries always carries with it progress in other branches as well. The question of fostering it by the removal of restrictions on intercolonial trade and by other means is, therefore, well worth the consideration of colonial statesmen.

In conclusion, I would urge the owners of the Blythe River Mine to have the deposit opened out by mining works far enough to allow accurate estimates to be formed of the quantity and value of the ore available, and to make sure that neither

neither the quantity, quality, nor cost of winning it has been miscalculated, and to have the whole question of smelting it and disposing of the iron thoroughly looked into by an experienced iron manufacturer. In my opinion, the time has come for such a thorough investigation of both mine and market, and the magnitude of the issues at stake demands that care and expense should not be spared in these most necessary preliminaries. I have to thank Mr. Wm. Jones, of Burnie, Mr. J. W. Norton-Smith, Mr. J. T. McDonald, of Salisbury's Foundry Company, Launceston, and Messrs. Huddart Parker & Co.'s and the Union S.S. Co.'s, of New Zealand, Managers, for much information as to freights, &c.; the Government Statistician, Mr. R. M. Johnston, for tables of iron imports into the Colonies, and the Under Secretary of Mines, Sydney, for information as to prices of coal and coke at Newcastle, and for Reports on the Coals and Cokes of New South Wales.

I have, &c.,

A. MONTGOMERY,

Geological Surveyor.

The Secretary for Mines, Hobart.

The Under Secretary for Finance and Trade to Messrs. William Jamieson and
H. F. G. Keats.

Gentlemen,

The Treasury, New South Wales, Sydney, 3 August, 1900.

With reference to your letter of 23rd May, I have the honor, by direction of the Honorable the Premier and Colonial Treasurer, to inform you that the terms proposed therein for the erection in this Colony, within two years, of Iron-smelting and Rolling Mills, viz.: That this Government guarantees to take 100,000 tons of rails extending over a period of about four years, and not less than 25,000 tons in any one year, at a price equal to that quoted in Great Britain, plus steamer freight and expenses incidental to exporting such materials from Great Britain, are accepted.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

The Under Secretary for Finance and Trade to Messrs. William Jamieson and
H. F. G. Keats.

Gentleman,

The Treasury, New South Wales, Sydney, 7 September, 1900,

With reference to my letter of 3rd ultimo, intimating that the terms proposed in your communication of 23rd May last for the erection in this Colony of Iron-smelting and Rolling Mills, had been accepted, I am now directed by the Honorable the Premier and Colonial Treasurer to inform you that a deposit of £10,000 (ten thousand pounds) must be made with the Treasury as a guarantee that your share in the undertaking will be faithfully carried out.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

The Secretary, Blythe River Iron-mines (Limited), to The Under Secretary for
Finance and Trade.

Sir,

Blythe River Iron-mines (Limited), Bank-place, Melbourne, 10 September, 1900.

I have the honor to acknowledge the receipt of your letter of the 7th instant, to Messrs. Jamieson and Keats.

The expert who has been imported from England is now visiting the mine, and on his return, he, with the directors, should, within a fortnight, go to Sydney, where they, no doubt, will be able to fix up everything satisfactorily.

I have, &c.,

H. L. CUMMING,

Secretary.

The Under Secretary for Finance and Trade to The Secretary, Blythe River
Iron-mines (Limited).

Sir,

The Treasury, New South Wales, Sydney, 24 September, 1900.

With reference to correspondence which has passed relative to the proposal of the Blythe River Iron-mines (Limited), to establish Iron-smelting and Rolling Mills in New South Wales, I have the honor, by direction of the Honorable the Premier and Colonial Treasurer, to inform you that the deposit of £10,000 stipulated for by this Government must be made forthwith or other arrangements will probably be entered into. The offer cannot be kept open longer.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

The Secretary, Blythe River Iron-mines (Limited), to The Under Secretary for
Finance and Trade.

Sir,

Blythe River Iron-mines (Limited), Bank-place, Melbourne, 25 September, 1900.

I have the honor to acknowledge the receipt of your letter of the 24th instant.

Mr. Jamieson, one of the directors of this company, is now in Sydney, and I have written asking him to call and arrange the matter with you.

I have, &c.,

H. L. CUMMING,

Secretary.

William Jamieson, Esq., to The Premier and Colonial Treasurer.

Dear Sir,

"The Australia Hotel," Sydney, 26 September, 1900.

I have just received a copy of a letter sent to H. L. Cumming, Secretary of the Blythe River Iron-mines, from F. Kirkpatrick, Under Secretary for Finance and Trade, in which he states "that the deposit of £10,000 stipulated by this Government must be made forthwith, or other arrangements will probably be entered into. The offer cannot be kept open longer."

Mr. Keats is now in Tasmania with Mr. Darby, our expert from Great Britain, and I expect Mr. Darby here early next week, when I hope to have the pleasure of introducing him to you.

I may say we have no intention of not carrying out our proposal, and would be glad if you would kindly grant me an interview, so that I could explain to you what steps we are taking to further the business in question.

I arrived here a few days ago on other business, and was on the point of requesting an interview with you, when I got the letter above referred to. I am cabling Mr. Keats on the subject.

Please kindly telephone or write me when I can have an interview with you. I would be glad if you could make one on Friday or later, as I, at present, have arranged to go out of town to-morrow.

Yours, &c.,

WM. JAMIESON.

Messrs. William Jamieson and H. F. G. Keats to The Premier and Colonial Treasurer.

Sir,

"The Australia," Sydney, 4 October, 1900.

Herewith we have the honor to hand you draft for £10,000 to be held in Suspense Account, pending the signing of contract between the Government and our company, as arranged with Sir William Lyne.

We have, &c.,

WILLIAM JAMIESON,

H. F. G. KEATS,

Directors, Blythe River Iron-mines (Limited).

£10,000 credited to Trust Fund on 4th instant.—S.R.C., Revenue Branch, 5/10/00. The Under Secretary.

Messrs. William Jamieson and H. F. G. Keats to The Premier and Colonial Treasurer.

Sir,

"The Australia," Sydney, 4 October, 1900.

We understand the arrangement arrived at last night to be ~~as~~under, and we shall be glad to hear that you agree.

A deposit of £10,000 to be forthwith placed by us in the Treasury to Suspense Account until the contract be signed. (This will be done this morning).

That you undertake to give us orders at the market price of the day in Great Britain, plus steamer freight, duty and all charges incidental to importation for 100,000 tons of rails over a period of four years, and at least half of your other requirements that we manufacture, and for a further period of four years you agree to give us half of your total requirements, if any other works are making steel in New South Wales, and in the event of ours being the only works, then the whole of your requirements will be placed with us on the same terms.

Delivery to commence when our works are completed; but in any event, within two and a half years from the signing of the agreement to carry out the above. On reasonable grounds, however, this time may be extended, with your permission.

The deposit of £10,000, plus interest, to be returned to the company on the carrying out of the agreement.

We have, &c.,

WILLIAM JAMIESON,

H. F. G. KEATS,

Directors, Blythe River Iron-mines (Limited).

Acknowledge please.—F.K., 4/10/00. Submitted.—F.K., 5/10/00. My reply was that I would not agree to anything beyond the first or previous letter. Mr. MARTIN.—What would a duty of 10 per cent. on cost of rails referred to amount to?—F.K., 8/10/00.

I shall have to inquire what is the present market value of steel rails in Sydney before I can say what a duty of 10 per cent. would represent per ton. The papers might be submitted to the Honorable the Premier for the purpose of ascertaining whether the agreement outlined in Messrs. Jamieson and Keat's letter of 4th October meets with his approval; thereafter, the contract might, perhaps, be drawn up. I suppose that it is desired that the negotiations with the Australian Iron Syndicate (Limited) shall go no further.—J.R.M., 11/10/00. The Under Secretary.

The Premier and Colonial Treasurer to Messrs. William Jamieson and H. F. G. Keats.

Gentlemen,

The Treasury, New South Wales, Sydney, 24 October, 1900.

I have the honor to acknowledge the receipt of your letter of the 4th instant, and in reply thereto to say that the terms proposed and accepted by the Government for the erection in this Colony, within two years, of Iron Smelting and Rolling Mills were: that the Government guarantees to take 100,000 tons of rails, extending over a period of about four years, and not less than 25,000 tons in any one year, at a price equal to that quoted in Great Britain, plus steamer freight and expenses incidental to importing such materials from Great Britain. These are the terms set forth in your letter of the 23rd May, and agreed to as per Treasury letter to you of 3rd August.

There was no condition in original letter with respect to half of the other requirements of the Government that you might manufacture, nor to any agreement in regard to a further period of four years. Should, however, there be no other iron works in New South Wales then, the Government would feel disposed to give orders for further requirements on the same conditions, pending the erection of such works or other arrangements being made.

I have, &c.,

WILLIAM JOHN LYNE.

Statement.

Statement.

Public Works Department, Railway Construction Branch, 27 November, 1900.

STATEMENT of steel rails (60 lb.) purchased by the Public Works Department since 1893:—

| Year. | Contractor. | Price, f.o.b.,
London. | Price, f.o.b.,
New York. | Freight. | Insurance. | Cost, c.i.f.,
Sydney. | Quantity. |
|-----------|------------------------|---------------------------|-----------------------------|----------|------------|--------------------------|-----------|
| | | £ s. d. | £ s. d. | s. d. | s. d. | £ s. d. | tons. |
| 1893..... | Bolckow Vaughan | 3 17 3 | | 7 9 | 0 6 | 4 5 6 | 14,150 |
| 1895..... | Dowlais Company | 5 0 9 | | 7 9 | 0 6 | 5 0 0 | 5,000 |
| 1897..... | Ebbwvale Company | 4 7 6 | | 7 9 | 0 6 | 4 15 9 | 15,000 |
| 1897..... | Peabody & Co..... | | | | | 5 0 0 | *2,000 |
| 1898..... | Cammell & Co..... | 4 5 3 | | 5 3 | 0 6 | 4 11 0 | 10,000 |
| 1900..... | Barrow & Co. | 6 11 6 | | 16 0 | 0 6 | 7 8 0 | 19,000 |

* Tendered at c.i.f., Sydney.

The cost of 80 lb. rails has been practically the same.

H. D.,
Engineer-in-Chief.

J. Stirling, Esq., to William Jamieson, Esq.

Blythe Iron-mine.

Sir,

Burnie, 15 November, 1899.

As requested, I visited the above property this day, in company with Mr. William Jones, who stated that in addition to an estimate of cost for mining and placing the ore f.o.b. steamer at Burnie, you wished an estimate of the quantity available. In reply I have the honor to forward you the following report:—

Situation.—The ore, which, in my opinion, is a lode running S.S.W. to N.N.E., crosses the valley of the Blythe River, almost at right angles some 6 miles from its mouth, and offers special facilities for cheap extraction, as the cliffs rise from the river at a slope of about 2 to 1 to 400 feet in height on the west, and 500 feet on the east side.

Extent.—The western slope has been cleared and burnt off for some 10 chains from the river; but the lode can be traced further. At the river the width appears to be from 150 to 200 feet. About 5 chains from the river, and some 200 feet above it, a trench has been run about 400 feet across the lode ore all the way. About 10 chains from the river and 400 feet above it several small trenches on the west side of the lode have been cut, all exposing solid ore, while on the east side a huge mass is exposed rising 60 feet sheer above the surface as one place. This appears a magnificent body of iron.

On the east side no work has been done except felling and scrubbing, consequently no very reliable data can be obtained; but the lode stands out boldly. About 15 chains from the river and 500 feet above it the width appears about 200 to 250 feet. A little further on the basalt covers the lode which appears again on the surface some 35 chains further east, and 650 feet above the river level, from this point I followed it some 10 or 15 chains further east. The width apparently from 150 to 200 feet; but the level falling to 570 feet above the river. The country here being very scrubby I did not go further; but the indications were that the lode continued.

From the above, and taking river level as the bottom, I estimate the quantity as 14,000,000 cubic yards, and allowing 30 per cent. for faults, poor stone, &c., gives 9,750,000 cubic yards. Taking the specific gravity at 5, we get $3\frac{3}{4}$ tons per cubic yard—equal to 36,750,000 of tons. Even allowing the figures to be large owing to no opening up on the east side, it appears to me that 25,000,000 to 30,000,000 of tons is a conservative estimate. In addition to the lode above described there is a large amount of good ore outside the above limits, which may be shed; but may just as likely be a portion of the main body, &c.

I have, &c.,

J. STIRLING.

P.S.—I should have mentioned that from 8,000,000 to 9,000,000 tons of ore can be iron before it will be necessary to remove the overburden above mentioned.—J.S.

The Secretary, Blythe River Iron-mines (Limited), to The Premier and Colonial Treasurer.

Sir, Blythe River Iron-mines (Limited), Bank-place, Melbourne, 17 November, 1900.

By request of my directors, I have the honor, for your information, to hand you herewith reports of the Blythe River iron deposits, by Mr. A. Montgomerie, M.A., and Mr. J. Stewart, C.E.

The available ore you will observe by these reports is estimated to considerably exceed 20,000,000 tons of ore.

The iron deposits were recently visited by Mr. John H. Darby, an English ironmaster of wide known repute and experience, who was chosen and sent out from England by the investors concerned to inspect and report on the deposit with a view to the establishment of iron and steel works in Australia. Mr. Darby's report will not be available until it has first been submitted to his principals; but he informed my directors his measurements substantially support the estimates of Messrs. Montgomerie and Stirling in respect of tonnage of ore.

Mr. Darby informed my directors that the ore is unusually pure and good, and was in the highest degree suitable for the production of iron and steel of the finest quality; in fact he could not speak more highly than he did of the extent of the ore, and its suitability for the production of high class iron and steel.

Mr. Darby also inspected several more or less suitable sites for the proposed works. He estimated the capital cost of the works at £750,000, and the probable yearly wages expenditure in connection with the works at £250,000.

In

In giving you this information my directors instruct me to add that (presuming that a satisfactory arrangement had been arrived at with your Government for the erection of the works in New South Wales) the site most favoured by Mr. Darby is at Sydney. In view of this matter my directors would point out and emphasise to you the enormous advantages to New South Wales, and especially to Sydney, certain to follow if the works are erected there.

Quite beyond the benefits to be anticipated from the heavy initial expenditure involved in erecting the works, and the annual distribution of so large a sum as I have indicated amongst the wage-earners of Sydney, there would also be amongst various other advantages a very considerable direct gain to your railways from the haulage of fuel, fluxes, and other material, and in addition of still greater importance would be the centralisation at Sydney of the numerous important subordinate iron and steel trades of Australasia.

I have, &c.,

H. L. CUMMING,

Secretary, Blythe River Iron-mines (Limited).

The Secretary, Blythe River Iron-mines (Limited), to The Premier and Colonial Treasurer.

Sir,

19 November, 1900.

I have the honor to inform you that in the hurry to catch the mail I omitted from my letter of 17th inst. Mr. Stirling's report, which I now enclose.

Since these reports the iron deposits have been much opened up and exposed to show, without doubt, that there are tens of millions of tons of first-class ore available.

The deposits were comparatively a small part of the undertaking upon which Mr. Darby had to report. His instructions embraced reports on—

1. The deposit of hematite iron ore on the Blythe River, near Burnie, Tasmania.
2. The site of the proposed iron and steel works, having regard to assembly of the iron and steel making materials, application of surplus power from the blast furnace gases, and the distribution of the finished—rolled—steel. The source of the fuel—coal and coke—and limestone.
4. The output and extent of the proposed works, estimate of outlay, and cost of producing steel.
5. The finished articles to be produced.

When he left he had made a rough draft of his report to the extent of 1 and 2, and I may inform you that in the part relating to the mine he states:

"In my estimate of the probable quantity I have taken the river bed as the bottom of the ore, though it is nearly certain to extend downwards much further. The width of the deposit, measured by myself where the sides are well defined; the weight of ore at 3 tons per cubic yard; the cubical contents of the deposit arrived at in this way has been divided by two, yet the tonnage amounts to 24,500,000 (twenty-four millions five hundred thousand) tons of selected ore.

"My general impression is that there is sufficient ore near the Blythe River to supply iron and steel works capable of making 3,000 (three thousand) tons of finished steel per week for many years to come. That the quality of the ore is excellent and not surpassed by any in Europe or America."

The actual production of the ore, although the groundwork, is a very small part of the undertaking of this company, the whole of which will undoubtedly be by far the largest industrial concern in the Australian Colonies. It will involve the raising, transporting, and converting into iron and steel 250,000 tons of iron ore per annum, which will further involve the raising, or purchasing and transporting, of 300,000 tons of coal per annum. All this coal will no doubt come from New South Wales mines, and as the whole production of New South Wales is under 5,000,000 tons per annum you will see what an increase and impetus this will give to the coal-mining industry. Considerable quantities of limestone will be required—about 60,000 tons per annum.

The ore, coal, and limestone must all be conveyed to the neighbourhood of Sydney, if the works be established there, and even then only the initial part of the undertaking will be accomplished.

The next step will be to convert the coal into coke and the ore into iron and steel. Then the greatest part of the work commences, namely, the conversion of the raw material into commercial articles, such as rails, plates, sheets, bars, rods, angles, &c., &c. You will see the enormous amount of work to be done and labour involved and money expended in erecting the necessary works, &c., before the undertaking can become a going concern, also the great annual expenditure and number of people that will be employed from the start.

The undertaking will also necessarily create many secondary industries—we are advised that manufacturers of finished goods, such as tin plates, galvanised iron, &c., in England are only waiting for us to be able to supply them to put up works close to our works on a large scale to turn out finished products from our steel, which will involve the expenditure of large capital and annual sums in wages, &c. A great manufacturing centre will be created and established, turning out finished articles that will go to all parts of this continent and probably India, the East, and New Zealand.

New South Wales will be the Colony to reap, as a Colony, the whole benefit.

The wages and capital will be spent there; the goods will be distributed over her railways, and she will get the benefit of the shipping.

Work and good wages will be provided for engineers and skilled artisans of every class, as well as for miners, sailors, and all sorts of workmen.

You will, no doubt, readily perceive from the foregoing outline of what is proposed the establishment of these works will rank as the most important commercial industry as yet contemplated in Australia.

This present time, when Australia is about to be federated, seems most opportune for the commencement of such a business that in itself will mark an epoch in Australian history, and I am sure you will agree with my directors that the establishment of such an enterprise should be encouraged in every possible way, and people who engage their capital and energies therein are deserving of every consideration, particularly by the Colony most likely, as the centre of the industry, to benefit from it.

I have, &c.,

H. L. CUMMING.

The Hon. Sir Wm. Lyne, Premier, New South Wales.

[One plan.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

CAST SCRAP IRON AT NEWCASTLE.

(RETURN SHOWING THE QUANTITIES SOLD BY THE RAILWAY DEPARTMENT DURING THE YEARS
1897, 1898, AND 1899.)

Printed under No. 10 Report from Printing Committee, 30 August, 1900.

[Laid upon the Table of the House in accordance with promise made by the Honorable the Minister for
Railways in answer to Question No. 23 in Votes and Proceedings No. 26 of the 8th August, 1900.]

Question 1.

The number of tons of scrap iron that have left the Locomotive Department, Newcastle, during years 1897, 1898, and 1899?

Answer.

| | | | | | | | |
|----------|-----|-----|-----|-----|-----|-----|-----------------|
| 1897 ... | ... | ... | ... | ... | ... | ... | 108 tons 9 cwt. |
| 1898 ... | ... | ... | ... | ... | ... | ... | Nil. |
| 1899 ... | ... | ... | ... | ... | ... | ... | 10 tons. |

Question 2.

The number of tons of cast-iron scraps or old chairs that have left the Permanent-way Department, Newcastle, during the years 1897, 1898, and 1899?

Answer.

| | | | | | | | |
|----------|-----|-----|-----|-----|-----|-----|----------------|
| 1897 ... | ... | ... | ... | ... | ... | ... | 75 tons 3 cwt. |
| 1898 ... | ... | ... | ... | ... | ... | ... | 122 " |
| 1899 ... | ... | ... | ... | ... | ... | ... | 120 " |

Question 3.

Who were the purchasers, and at what price per ton?

Answer.

Messrs. J. B. Barclay, R. Gibson, Mr. Marsh, A. Head, and Morison and Bearby, at £3 per ton. The Department, as a rule, utilises its own cast scrap, or disposes of it, to assist the contractor for the supply of iron castings to the Department. The weight sold to each of the purchasers for the three years is as follows:—

| | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|-----------|
| J. B. Barclay | ... | ... | ... | ... | ... | ... | 411 tons. |
| R. Gibson | ... | ... | ... | ... | ... | ... | 11 " |
| Morison and Bearby | ... | ... | ... | ... | ... | ... | 11 " |
| Mr. Marsh... | ... | ... | ... | ... | ... | ... | 2 " |
| F. A. Head | ... | ... | ... | ... | ... | ... | 12 cwt. |

Question 4.

Was a docket or ticket issued from the Department to the purchaser with each ton or load?

Answer.

The scrap is weighed by the Department, either on a cart or a truck weighbridge, and account is rendered for the weight, payment preceding delivery.

Question 5.

Question 5.

Was any preference given to any manufacturer?

Answer.

The scrap has been sold principally to the contractor to the Department for supplying iron castings. This has been done to ensure the prompt delivery of castings, and care is taken to see that the scrap supplied to the contractor is in proper proportion to the weight of castings he supplies. The minute from the late Comptroller of Stores covering the matter, and approved by the Commissioners, is as follows:—

“Referring to my conversation with the Acting Chief Commissioner yesterday, I have to state that Mr. Barclay called to see me yesterday as to the terms on which he would be allowed to obtain cast scrap iron during the currency of the contract referred to; the price he is at present, and has for some years past been paying, being £3 per ton.

“At the same time Mr. Barclay drew my attention to a representation he had made to the Commissioners asking for an allowance on the exceptional quantity of small and intricate castings which he had for some months past been called upon to supply in connection with electrical work, and gave me to understand that he was expecting the Commissioners to make some allowance in connection with the present contract.

“As I have before reported, there is no doubt that there has been a considerable increase in the number of small castings he is and has been called upon to supply, and his contract price, even the increased one for next year, is very low indeed for such castings.

“The market price for cast scrap iron is about £4 per ton at the present time; but in view of the facts just stated, and also that Mr. Barclay was paying his present price of £3 for cast scrap iron when that was the very full market price, I recommend that he be allowed, during the currency of his next year's contract, to receive the cast scrap iron at the same price—£3 per ton—as he is at present paying.”

Question 6.

Were tenders called for these materials by the Locomotive and Permanent-way Departments Newcastle?

Answer.

No; but consideration has been given to any application from local manufacturers whenever scrap was available.

Question 7.

If not, will he see that tenders are called for in future?

Answer.

The question will have consideration if at any time there is any large quantity of surplus scrap, but it is probable the Department's requirements will absorb that which is available.

1900.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MONTHLY RETURNS OF ACCIDENTS.

(RAILWAYS AND TRAMWAYS, NOVEMBER, 1899, TO APRIL, 1900)

Printed under No 2 Report from Printing Committee, 28 June, 1900.

RETURN (*in part*) to an Order made by the Honorable the Legislative Assembly of New South Wales, dated the 21st September, 1898, That there be laid upon the Table of this House,—

“Monthly returns showing the number of accidents, fatal and non-fatal, and the cause thereof,—(a) upon vessels belonging to New South Wales; (b) upon vessels belonging to other countries whilst within the jurisdiction of New South Wales; (c) on wharfs, wool stores, factories, workshops, mines, quarries, buildings in course of erection, and on “railways.”

(*Mr. Samuel Smith.*)

RETURN to an Order of the Legislative Assembly, dated 21st September, 1898, showing fatal and non-fatal Accidents which have occurred in the New South Wales Government Railways and Tramways during the month of November, 1899.

| Date. | Locality. | Names of Persons Injured. | Persons outside Department. | Nature of Injuries. |
|--------|--------------------|---------------------------|-----------------------------|---|
| 1899. | | | | |
| 2 Nov. | Bathurst | McEwan, W. | Passenger | Slightly injured. Fell from carriage. |
| 5 " | Waverley | East, Claude | " | Killed whilst travelling in tram. Struck by shaft of a sulky. Verdict, Coroner's inquest, "Accidental death." |
| 7 " | North Shore | Kennedy, — | " | Foot bruised. Alighting from tram in motion. |
| 9 " | Paddington | Smith, Mrs. H. C. | " | Fractured collar bone and scalp wound. Knocked down by motor. |
| 9 " | Waterloo | Clarke, H. | Passenger | Ankle broken. Attempting to board tram while in motion. |
| 11 " | Redfern | Langham, S. | " | Injured. Stepped in front of motor and was knocked down. |
| 14 " | Forest Lodge | Simpson, H. | " | Head injured. Thrown out of sulky through colliding with tram. |
| 14 " | Newtown Road | Jennings, — | Passenger | Fatally injured. Fell from tram car and run over. Verdict, Coroner's inquest, "Accidental death." |
| 16 " | Campsie | Prosser, H. | " | Slightly injured. Alighting from train in motion. |
| 22 " | Newtown Road | Mcade, Jno. | " | Left leg injured, necessitating amputation. Alighting from tram in motion. |
| 23 " | Newtown | Cartwright, R. | " | Fractured leg and arm and scalp wound. Thrown out of cart through collision with tram. |
| 23 " | Croydon | Bardsley, Mrs. | Passenger | Slight injury to face when alighting from train in motion. |
| 28 " | Normanhurst | Hayden, — | " | Head injured. Fell from passenger train. |
| 30 " | Lilyvale | Sewell H. | " | Foot crushed by wheel of truck when jumping on brake-lever of truck. |

RETURN to an Order of the Legislative Assembly, dated 21st September, 1898, showing fatal and non-fatal Accidents which have occurred in the New South Wales Government Railways and Tramways during the month of November, 1899.

| Date. | Locality. | Names of Persons Injured. | Servants of Department. | Nature of Injuries. |
|-----------------|-----------------------|---------------------------|-------------------------|---|
| 1899.
1 Nov. | Randwick | Jackson, William.. | Boilermaker .. | Slipped into an engine pit, and motor apron fell on his hand. |
| 2 " | Nyngan | Lindburg, L. | Shunter | Slipped, and run over by trucks during shunting operations, resulting in abrasions and slight cuts on body. |
| 3 " | Redfern... .. | Graham, W..... | Acting Fireman.. | Finger injured when uncoupling two engines. |
| 5 " | North Sydney | Morrison, R..... | Labourer | Tendons of right leg ruptured whilst wheeling a barrow of concrete up a plank. |
| 6 " | Harden | Carroll, P. | Porter | Fatally injured. Fell when applying side truck-brakes, and run over by trucks. Coroner's inquest verdict, "Accidental death." |
| 8 " | Abercrombie-street | Lawler, Thos. | Tram Conductor | Struck on leg by shaft of sulky, and knee injured. |
| 10 " | Bondi Junction ... | Crawford, Alf. | Tramway Fireman. | Foot bruised by lid of water hydrant falling on it. |
| 10 " | Goulburn | Blackshaw, C. | Fuelman | Foot injured by coal falling on it. |
| 11 " | Minare | Cosgrove, R..... | Guard | Fatally injured. Run over by train during shunting operations. Coroner's inquest verdict, "Accidental death." |
| 11 " | North Sydney | Ivers, James..... | Labourer | Whilst engaged excavating, quantity of earth fell on him, resulting in fracture of left shoulder. |
| 12 " | Clyde | Watsford, G. | Cleaner | Finger bruised through pieces of coal rolling down from bunker. |
| 13 " | Eveleigh | Padley, T. | Labourer | Right foot injured by axle box falling on it. |
| 13 " | Eveleigh Waggon-shop. | King, J..... | Labourer | Hand injured. Thumb became jammed when releasing capstan-rope off a waggon. |
| 13 " | Eveleigh Waggon-shop. | Duffy, R. | Labourer | Hand injured. Fingers jammed against buffer of waggon when releasing capstan tow-rope. |
| 14 " | Emu Plains | Agland, John | Porter | Thigh fractured. Slipped off coping of platform and fell between engine and platform. |
| 16 " | Eveleigh | Hennessy, R. | Labourer | Leg injured. Jammed between buffer and sheet of iron through latter slipping off stack. |
| 16 " | Clyde | Cavanough, A. | Shunter | Finger crushed. Jammed in draw-hooks when removing couplings. |
| 17 " | Epping | Donnelly, J. | Flagman | Fatally injured. Run over by train. Coroner's inquest verdict, "Accidental death." |
| 18 " | Redfern | Edney, G..... | Shunter..... | Arm injured coupling up engine and carriage |
| 19 " | Maitland | Whitely, G. | Gatekeeper | Fatally injured. Run over by train. Coroner's inquest verdict, "Accidental death." |
| 20 " | Albion Park | Barford, Jas. | Porter | Arm injured. Caught between buffers of trucks. |
| 21 " | Eveleigh | Bagley, S..... | Driver | Back injured. Slipped and fell against engine foot-plate. |
| 22 " | Bulli | Davis, J. R. | Guard | Hand bruised. Jammed when removing a coupling. |
| 24 " | Nevertire | Aanensen, J..... | Guard | Fingers crushed. Brake-van door accidentally closed on his hand. |
| 25 " | Penrith (Ash-pit) .. | Toms, R. | Fuelman | Right hand crushed. Had his hand on rail which was caught by flange of engine wheel. |

RETURN to an Order of the Legislative Assembly, dated 21st September, 1898, showing fatal and non-fatal Accidents which have occurred in the New South Wales Government Railways and Tramways during the month of December, 1899.

| Date. | Locality. | Names of Persons Injured. | Servants of Department. | Nature of Injuries. |
|-----------------|---------------------------------------|---------------------------|-------------------------|---|

Flaherty, J. | | Concussion of brain. Fell whilst alighting from tram in motion. |

RETURN to an Order of the Legislative Assembly, dated 21st September, 1898, showing fatal and non-fatal Accidents which have occurred in the New South Wales Government Railways and Tramways during the month of September, 1900.

| Date. | Locality. | Names of Persons Injured. | Servants of Department. | Nature of Injuries. |
|---------|---------------------|---------------------------|-------------------------|--|
| Aug. 31 | Ultimo | Waterhouse, J. ... | Labourer | Foot injured. Caught between frame and truck. |
| Sept. 1 | Pitt-street | O'Connor, M. I. ... | Fireman | Ankle sprained. Foot twisted when stepping from motor. |
| " 1 | Darling Harbour ... | Bogal, T. | Labourer | Shoulder bruised. Caught between trucks. |
| " 1 | " | West, S. | Shunter | Fingers crushed by wheel of truck. Fell whilst shunting. |
| " 1 | Bon Accord | Ogden, W. | Guard | Leg crushed. Slipped under truck whilst shunting. |
| " 5 | Wallsend | Robertson, A. | Fireman | Head cut. Fell from foot-plate of engine whilst changing discs. |
| " 6 | Rock | Egan, D. | Porter | Fingers crushed. Whilst pushing cattle-waggon from race, Egan fell under the waggon. |
| " 7 | Bathurst | Cleary, J. | Labourer | Leg injured. Slipped and fell whilst wheeling a hand-trolley. |
| " 12 | S. Clifton | Ray, H. | Cleaner | Hip jammed and bruised through door of waggon, which he was trying to close, falling. |
| " 12 | Junee | Houston, G. | Labourer | Side injured. Slipped and fell whilst carrying spring on top of tender. |
| " 13 | Murrurundi | Thurlow, T. | Cleaner | Thigh injured. Struck against lever when jumping off engine to hold the points. |
| " 15 | Eskbank | Osborne, W. | Fuelman | Hand injured. Caught in pawl of turntable whilst turning engine. |
| " 17 | Singleton | Stewart, J. | Guard | Rib splintered and back hurt. Fell on stove, owing to sudden stoppage of train. |
| " 17 | Curlewis | Bagnall, F. | Fireman | Fatally injured. Crushed between engine and sheep-race. Verdict of Coroner's jury, "Accidental death." |
| " 18 | Bridge-street | Forster, T. | " | Right hip and thigh injured. Caught between coke-stage and car whilst placing coke on a motor. |
| " 19 | Eveleigh | Beran, J. | " | Heavy piece of wood slipped from his hands and fell on his foot, injuring same. |
| " 19 | Sydney | Matthews, R. M. ... | Porter | Leg and head injured. Fell between truck and platform. |
| " 21 | Hornsby | Almond, John | Shunter | Ankle sprained. Fell when alighting from car. |
| " 22 | Eskbank | Jeffery, Peter | " | Finger caught between drawhook and coupling and crushed. |
| " 26 | Penrith | Francis, W. | Porter | Collar-bone broken. Caught between waggon and platform of stockyard. |
| " 26 | " | Cochrane, J. | Fuelman | Arm strained by tip-chain of coal-skip slipping off. |
| " 27 | Darling Harbour ... | Featherstone, R. ... | Junior porter ... | Hip and back bruised. Fell between platform and van. |
| " 27 | " | Laney, J. | " | Toe crushed whilst drawing portable engine on to weighbridge. |
| " 27 | " | Wright, P. | Porter | Head wounded. Struck by handle of crane while unloading boiler. |
| " 27 | Redfern | York, W. | Driller | Right foot injured owing to breaking of sling carrying part of a crossing which York was drilling. |
| " 27 | Ultimo | Ewart, A. | Turner | Small bone of wrist broken. Hand caught and squeezed in belt of machine. |

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MONTHLY RETURN OF ACCIDENTS.

(RAILWAYS AND TRAMWAYS—OCTOBER, 1900.)

Printed under No. 19 Report from Printing Committee, 4 December, 1900.

RETURN (*in part*) to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated the 21st September, 1898, That there be laid upon the Table of this House,—

“Monthly returns showing the number of accidents, fatal and non-fatal, and the cause thereof:—(a) Upon vessels belonging to New South Wales; (b) Upon vessels belonging to other countries whilst within the jurisdiction of New South Wales; (c) On wharfs, wool stores, factories, workshops, mines, quarries, buildings in course of erection, and on railways.”

(Mr. Smith.)

RETURN to an Order of the Legislative Assembly, dated 21st September, 1898, showing fatal and non-fatal Accidents which have occurred in the New South Wales Government Railways and Tramways during the month of October, 1900.

| Date. | Locality. | Names of Persons Injured. | Servants of Department. | Nature of Injuries. |
|--------|---------------------|---------------------------|-------------------------|--|
| 1 Oct. | Narrandera | McGuiness, W. | Labourer | Shoulder injured. Struck by engine when pushing trucks. |
| 1 " | Picton | Gray, E. | Shunter..... | Hand injured by coupling, which slipped whilst coupling engine to carriage. |
| 2 " | Eveleigh | Harris, T. | Labourer | Pelvis bruised. Whilst roping waggons across traverser, Harris went between some waggons being shunted and was jammed between the buffers. |
| 3 " | 108 miles south ... | Murray, C. | | Knocked down by train while walking across bridge and fatally injured. Verdict of Coroner's jury, "Accidental death." |
| 3 " | Rushcutter's Bay . | Pyne, J. | | Pelvis fractured and right thumb dislocated through striking plank when jumping in order to avoid a falling derrick. |
| 4 " | Wallerawang | Lovett, C. F. | Shunter | Hand caught by coupling and crushed whilst attaching vehicles. |
| 6 " | Redfern..... | Ryder, W. J. | Attendant | Back injured. Fell on couplings whilst crossing between carriages. |
| 6 " | Eveleigh | March, W. | Labourer | Toe fractured by piston rod of mill-engine slipping from his hand on to his foot. |
| 7 " | Homebush | Schofield, J. | Porter | Fatally injured. Fell under trucks whilst alighting from train in motion. Verdict of Coroner's jury, "Accidental death." |

| Date. | Locality. | Names of Persons Injured. | Servants of Department. | Nature of Injuries. |
|--------|----------------------|---------------------------|-------------------------|---|
| 8 Oct. | 149-48 miles west... | Hanna, J. J..... | Ganger | Fatally injured. Run over by train whilst traversing line on tricycle. Verdict of Coroner's jury, "Accidental death." |
| 8 " | Randwick | Holland, F. J. | Shop boy | Toe fractured by draw-bar falling on it whilst Holland was lifting the bar from trolley on to platform. |
| 11 " | Newcastle | Willis, C. | Signaller..... | Muscles of leg ruptured whilst alighting from train in motion. |
| 11 " | Randwick | Curnow, H. G..... | Blacksmith | Arm wounded by fragment of a rod (with which he was working) striking same. |
| 12 " | Botany | Bark, J..... | Labourer | Toe crushed by sleeper falling upon it. |
| 15 " | Young | Hardman, J. A. ... | Porter | Knee sprained. Struck by bale of wool falling from truck. |
| 15 " | Old Junee..... | Conroy, P. | " | Knee injured. Struck by wool hook while loading wool. |
| 15 " | Eveleigh | Black, H. | Fitter..... | Right arm injured. Jammed by end of boring bar, which slipped and fell. |
| 16 " | " | Harmey, J. | Waggon builder. | Wrist sprained. Foot slipped off sheep-van and Harmey fell. |
| 18 " | Narrabri West..... | McPherson, J. | Porter | Rib fractured. Struck by bale of wool, which fell from wool bank. |
| 20 " | North Sydney | Collins, F..... | Lineman | Shock to system. Collins caught hold of live feeder cable and fell to ground. |
| 22 " | Sydney | Stewart, J. | Guard | Nose injured through falling from platform. |
| 22 " | Eveleigh | Fernley, G. | Apprentice | Foot injured by sharp edge of plate, which slipped from machine and fell thereon. |
| 23 " | Harden | Bushell, W. | Fuelman | Leg broken through prop beneath truck door giving way, precipitating him to ground. |
| 24 " | Darling Harbour ... | Young, J. | Brake-van cleaner | Hip bruised. Fell from buffer stops whilst cleaning window of van. |
| 25 " | Nowra | Vial, G..... | Porter | Arm sprained. Crushed between cart and truck whilst loading cream. |
| 25 " | Eveleigh | Parker, A..... | Fitter | Top of finger cut off by link when coupling up suspension link. |
| 27 " | Croydon | Gottey, G. H. | Porter | Finger crushed by fender falling when cleaning up office. |
| 28 " | Morce | Tanner, E. | " | Hand crushed between draw-looks of carriages whilst shunting. |
| 28 " | Junee | Grant, — | | Tooth knocked out. Fell on platform whilst alighting from train in motion. |

RETURN to an Order of the Legislative Assembly, dated 21st September, 1898, showing fatal and non-fatal Accidents which have occurred in the New South Wales Government Railways and Tramways during the month of October, 1900.

| Date. | Locality. | Names of Persons Injured. | Persons outside Department. | Nature of Injuries. |
|--------|---------------------|----------------------------|-----------------------------|--|
| 1 Oct. | Park-street | Turner, J..... | | Fatally injured. Fell whilst alighting from tram in motion. Verdict of Coroner's jury, "Accidental death." |
| 3 " | Edinburgh-road ... | Bryce, Mrs. | | Slipped and fell whilst alighting from tram in motion, fracturing her thigh. |
| 3 " | Railway..... | Armstrong, Mrs. ... | | Shock to system owing to collision between two trams. |
| 4 " | Tuggerah | Mead, H. | | Arm broken. Struck by handle of crane whilst lowering log into truck. |
| 10 " | Tempe | Bourko — (3 years of age). | | Head injured and body bruised. Run over whilst trespassing on line. |
| 12 " | Balmain | Benson, G. | | Concussion of brain and shock. Fell whilst alighting from tram in motion. |
| 13 " | Railway | Ford, J..... | | Knee and wrist injured. Fell whilst alighting from tram in motion. |
| 14 " | Sans Souci | Hill — (6 years of age). | | Head injured. Jumped from tram in motion and fell. |
| 19 " | Darling Harbour ... | Wilcox, E. | | Elbow dislocated. Fell from lorry whilst unloading wool. |
| 22 " | Railway..... | Puxley, Mrs..... | | Arm fractured. Fell whilst alighting from tram in motion. |
| 24 " | Darling Harbour ... | Pitt, G..... | | Leg injured. Fell between truck and platform whilst unloading goods. |
| 26 " | High-street | Pert, Miss M. | | Leg bruised. Struck by rail of gate which had been run into by train. |
| 27 " | Newtown | Campbell, M. | | Concussion of brain and lower jaw injured. Walked in front of tram in motion, and was knocked down. |
| 30 " | Railway | Kennedy, J. | | Hip, thigh, and foot injured whilst attempting to board tram in motion. |
| 31 " | Sans Souci | Parry, — (infant)... | | Head injured. Struck by car lamp, which fell from hanger. |
| 5 " | Eveleigh | Kelly, Mrs. | | Hands cut. Fell whilst alighting from train in motion. |

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

REPORTS FROM RAILWAY COMMISSIONERS
ON TRAMWAY PROPOSALS.

(RETURN RESPECTING.)

Printed under No. 12 Report from Printing Committee, 20 September, 1900.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated the 4th September, 1900, That there be laid upon the Table of this House,—

“The most recent Reports from the Railway Commissioners on the following tramway proposals:—The Spit Road Tramway; the Kensington Tramway; the Rose Bay and Dover Point Tramway; the Dawes Point Extension; the Enfield to Mortlake Tramway; the Adamstown Tramway; and the Waratah Tramway.”

(Hon. J. H. Young.)

REPORTS, &c.

1. Spit Road Tramway.
2. Kensington Tramway.
3. Rose Bay and Dover Road Tramway.
4. Dawes Point Tramway (extension to Miller's Point).
5. Enfield to Burwood and Mortlake Tramway.
6. Broadmeadow to Adamstown Tramway. (Two papers.)
7. Tighe's Hill to Mayfield (Waratah).
8. Letter *re* Tramways—
Tighe's Hill to Mayfield (Waratah).
Broadmeadow to Adamstown.

No. 1.

Proposed Tramway Extension from Spit Road Junction to the Spit.

New South Wales Government Railways, Office of the Railway Commissioners,
Sydney, 16 March, 1899.

HITHERTO the Commissioners have reported unfavourably upon the proposed extension of the North Shore line to the Spit, and there are even now no strong grounds for concluding that it would be remunerative.

The Commissioners, however, recognise the importance of the extension, to the large residential area around North Shore, as affording direct communication with Middle Harbour, which should prove an attractive pleasure resort. They have, therefore, considered the proposal more as an extension which may be justified on the ground that it will bring additional traffic to the existing line.

376—

[600 copies—Approximate Cost of Printing (labour and material), £3 2s. 9d.]

The

The Commissioners think that there is a reasonable probability of additional traffic being developed on the existing lines which, with the traffic over the extension, will avert any considerable loss. Under all the circumstances they are now of opinion that the construction of the additional length of line is worthy of favourable consideration.

It would, however, not be wise to proceed with the extension until some experience has been had of the North Shore trams after conversion into a purely electrical system worked from the central powerhouse at Ultimo.

No. 2.

Branch Tramway Line to Kensington and the Rifle Range.

New South Wales Government Railways,
Office of the Railway Commissioners of New South Wales,

Sir.

Sydney, 13 January, 1898.

With reference to your memorandum of the 22nd ultimo, forwarding a request from the Minister for Public Works that the Railway Commissioners would state whether there are any reasons for modifying their report, dated the 12th April last, in connection with the construction of the branch tramline from the main Randwick line to Kensington and the Rifle Range, I am directed by the Commissioners to state that the matter has had careful consideration, and while, owing to altered arrangements which have since been made in connection with the working of traffic it might be possible, without much inconvenience, to make provision for the additional service from the present yard at Bridge-street, the construction of the tramline cannot for other reasons be recommended, primarily on the ground that there would be a very considerable yearly loss on the working, irrespective of the payment of the annual interest charge on the capital expenditure. Even if it were not so, it would be most undesirable while the system of traction is undergoing a change to make an extension in any direction where the future motive power cannot be availed of from the outset.

The Commissioners, therefore, recommend that the further consideration of this matter be deferred until the conversion of the present steam system into that of an electric system.

I have, &c.,

H. McLACHLAN,

Secretary.

The Under Secretary for Public Works, Sydney.

No. 3.

Proposed Tramway Extension, Rose Bay to South Head.

Office of the Railway Commissioners of New South Wales,

Sydney, 22 July, 1899.

IN accordance with the request of the Minister for Public Works, that we should furnish him with our opinion in regard to the working expenses and probable traffic there would be upon this line, we beg to report as follows:—

| | |
|---|---------|
| The capital cost is estimated by the Engineer-in-Chief for Construction to be | £35,243 |
| The working expenses would be, approximately, per annum ... | £2,519 |
| Interest on capital, calculated at 3 per cent. | 1,057 |
| | £3,576 |

To obtain this amount it would be necessary that the extension should carry, at 2d. each, 214,560 passengers each way per annum. As far as the residential population between the present terminus and South Head or Watson's Bay is concerned, we are of opinion that the prospective traffic would not justify the construction of the line, particularly in view of the regular steamer service between the City and Watson's Bay. The line would have for years to rely on a purely pleasure and excursions traffic.

The experience, so far as regards the Rose Bay line, has been favourable, but the novelty may wear off unless some attractions more than at present exist are offered, such as the provision of a park on the eastern side where there is land more suitable for the purpose than anything else. This land is privately owned, and a suitable area should be conveyed free to the Government before any extension of the Rose Bay line is undertaken.

The surroundings of South Head have attractions to the sight-seer not possessed by Rose Bay, but as a place of resort for excursionists of the picnic class it is perhaps less attractive.

There is an absence of suitable recreation area to any extent at South Head. This should be provided by the landowners, who would be benefited by the extension, before the line is made.

Subject to these reservations and to all other land required being conveyed free to the Government the line is worthy of favourable consideration.

The position of the terminus may require some further consideration, but it is unnecessary to delay the report in this connection.

CHARLES OLIVER,
Chief Commissioner.
W. M. FEHON,
Commissioner.
DAVID KIRKCALDIE,
Commissioner.

3

No. 4.

Tramway Extension to Miller's Point.

New South Wales Government Railways, Office of the Railway Commissioners,
Sydney, 16 March, 1899.

Sir,

With reference to your B.C. communication of the 24th ultimo, relative to the opinion of the Railway Commissioners as to the paying results of a tramway extension to Miller's Point, I am directed to inform you that the Railway Commissioners have carefully considered the proposal, and entertain no doubt that the extension would ultimately prove a profitable one, but they strongly urge that it should not be undertaken until after some experience has been gained in connection with the working of the George-street line, together with the conversion of some portion of the western suburban trams.

I have, &c.,
H. McLACHLAN,
Secretary.

The Under Secretary, Department of Public Works.

No. 5.

Proposed Tramway Extension—Enfield to Burwood and Mortlake.

Office of the Railway Commissioners of New South Wales,
Sydney, 3 August, 1899.

THE Honorable the Minister for Works having asked for the opinion of the Railway Commissioners in this matter, we beg to report as follows:—

| | |
|--|---------|
| The estimated cost of the line is | £16,322 |
| The interest on this sum, at 3 per cent. per annum, is | £490 |
| Estimated working expenses, viz. :— | |
| Traffic department | £262 |
| Locomotive department | 1,597 |
| Permanent-way department | 800 |
| | £2,659 |
| | £3,149 |

| | |
|---|--------|
| From a careful estimate of probable traffic which has been made, the gross annual income cannot be estimated at more than (per annum) | £1,700 |
| This, as will be seen, would leave a deficiency on the annual liability for interest and working expenses of | £1,449 |

It is therefore impossible to recommend the construction of the extension until there is a better prospect of it being worked without such a considerable loss.

Should this extension again come up for consideration it would be desirable to consider the route from Enfield to Liverpool-road and on the Mortlake side of Burwood, *via* Crane-street, into Brewer-street.

CHARLES OLIVER,
Chief Commissioner.

W. M. FEHON,
Commissioner.

DAVID KIRKCALDIE,
Commissioner.

No. 6.

Sir,

Office of the Railway Commissioners, Sydney, 25 April, 1899.

With reference to your B.C. communication of 19th instant, asking that the Commissioners might favour the Honorable the Minister with their views on the proposal to extend the tramline from Broadmeadow to Adamstown, I am directed to inform you that the matter has had consideration, and in the opinion of the Commissioners the position has not changed since the letter to you of the 21st October last. The Commissioners, therefore, beg to suggest that the matter be further deferred.

I have, &c.,
H. McLACHLAN,
Secretary.

The Under Secretary, Department of Public Works.

Proposed Extension of Tramway—Broadmeadow to Adamstown.

New South Wales Government Railways, Office of the Railway Commissioners,
Sydney, 18 August, 1897.

WITH reference to the minute of the Honorable the Minister for Public Works of the 11th instant, requesting that the Railway Commissioners would say whether certain information recently laid before him furnished grounds for varying the opinion they had previously expressed in regard to the proposed extension of the tramway from Broadmeadow to Adamstown, we beg to state that the revenue from the estimated traffic has always been calculated at a slightly higher figure than the sum of £1,140 per annum, recently represented to the Minister as being the probable revenue; and the estimated result of the

the working would show a loss, after payment of interest and working expenses—without making any provision for the additional rolling stock—of something over £500 per annum. Moreover, the additional trams that would have to be placed on the lines would render it necessary to either duplicate portion of the existing main line or provide crossing loops, which would represent a further expenditure.

The Newcastle lines, as a whole, at the present time—although there is a considerable improvement within the last year—do not yet approach the net return necessary to pay interest on capital; and it is not deemed desirable to burden the tramway capital by further expenditure in Newcastle and suburbs at present.

CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

No. 7.

Sir, Office of the Railway Commissioners, Sydney, 7 September, 1898.

Referring to your letter of the 30th ultimo, in which you intimated that the Minister desired the Railway Commissioners to say whether the conditions had now sufficiently changed to warrant the extension of the tramway from Tighe's Hill to Mayfield, I am directed by the Commissioners to say that they have caused further inquiry to be made into this question, with the result that they find the circumstances have not altered since they last reported upon the matter, and they cannot therefore recommend the extension.

I have, &c.,

H. McLACHLAN,
Secretary.

The Under Secretary for Public Works, Sydney.

No. 8.

Sir, Office of the Railway Commissioners, Sydney, 4 November, 1899.

The Commissioners notice, by the Press, that the Minister for Works has stated that tramway extensions are to be undertaken—

1. From Tighe's Hill to Mayfield (Waratah).
2. From Broadmeadow to Adamstown.

Further, that the Railway Commissioners had expressed themselves in favour of both lines, and the works will be gone on with at once.

I am directed to say that the Commissioners have not reported in favour of the extensions being made, but have advocated that consideration of the extensions should be deferred.

While the Commissioners would be prepared to recommend the favourable consideration of the proposals when rolling stock was available, on the conversion of the steam to electric trams, they urge that they should be deferred for the present, as, if carried out, the lines could not be properly equipped without adding fresh cars, which would be unprofitable, in view of the early conversion of the steam system of trams in the metropolis.

I have, &c.,

H. McLACHLAN,
Secretary.

The Under Secretary, Department of Public Works, Sydney.

PLAN.

Electric Tramway along Castlereagh and Pitt streets.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

ELECTRIC TRAMWAY FROM BELMORE PARK TO FORT MACQUARIE.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a double line for an electric tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets," have, after due inquiry, resolved that it is not expedient the proposed tramway should be constructed; but they recommend that the suggestion of the Railway Commissioners, by which a single line would be constructed from Belmore Park through Castlereagh, Bligh, and Loftus streets to Fort Macquarie, returning by single line through Pitt-street, be adopted; and, in accordance with the provisions of sub-section (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

REASONS FOR THE PROPOSAL.

1. The proposed tramway is submitted as a means of relieving the congested traffic on the George-street trams. The volume of traffic at present in George-street, considered in conjunction with what it will be when the steam trams of the Western Suburbs have been converted to the electrical system, has convinced the Railway Commissioners that some means of relief must speedily be found, and the best method offering is to divert some of the traffic into another street or streets. Two ways of meeting the difficulty presented themselves—by laying a double line in Pitt-street to Circular Quay, or by laying a double line in Castlereagh-street and Bligh-street to Circular Quay. Both schemes, it is believed, may ultimately be required; but as Castlereagh-street affords more facilities for traffic than Pitt-street, it was decided to adopt the Castlereagh-street proposal as a first instalment, and the work was referred to the Public Works Committee on 12th July last. Subsequently the Commissioners modified their views so far as to recommend an alteration in the proposal by constructing a single line from Belmore Park through Castlereagh, Bligh, and Loftus streets to the proposed terminus at Fort Macquarie, with a return single line through Pitt-street. They make this recommendation, they explain in a minute dated 25th July, 1900, because the experience gained since the George-street line was opened strongly indicates that the amended proposal will best meet the public convenience.

THREE SCHEMES BEFORE THE COMMITTEE.

2. Since the Castlereagh-street scheme was submitted, another has been referred to the Committee, by which it is proposed to construct a double line of electric tramway from Belmore Park along Pitt-street to the Circular Quay. The Committee have, therefore, had before them three schemes—two referred to them, and one suggested, as follow:—

1. A double line for an electric tramway from Belmore Park to Fort Macquarie by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

2. The suggestion of the Railway Commissioners that there should be a single line from Belmore Park through Castlereagh, Bligh, and Loftus streets, to the proposed terminus at Fort Macquarie, and return by single line through Pitt-street.
3. A double line of electric tramway from Belmore Park along Pitt-street to the Circular Quay.

DESCRIPTION OF THE CASTLEREAGH-STREET AND THE CASTLEREAGH-PITT
STREETS TRAMWAYS.

3. As first proposed, the tramway would branch off the existing steam tramway in Belmore Park at a point opposite Castlereagh-street, and would traverse that street to its intersection with Hunter-street, and thence proceed along Bligh-street to Bent-street, the whole of this length being a double track. From Bent-street a single line would be taken along Loftus-street to Circular Quay, and thence by the front of the Custom House into Young-street, and back to Bent-street, where it would rejoin the double track. This would provide a service between Belmore Park and Circular Quay in the vicinity of the Custom House. To convey passengers to Fort Macquarie, and to provide for shunting and storing the cars there, lines would be carried across Circular Quay and along the back of the wharfs. The permanent-way would consist of 83-lb. rails, laid on sleepers between Belmore Park and Liverpool-street, in macadamised road; from Liverpool-street to Hunter-street the road would be wood-blocked; thence to Circular Quay the track would be on macadamised roadway; and on Circular Quay it would be wood-blocked. A car-house, extensive enough to accommodate seventy-two cars of the largest type now in use, but of a design in keeping with the site, would be built, and the necessary shunting yards and offices provided, at Fort Macquarie.

The alteration suggested by the Railway Commissioners would vary the original scheme by laying a single line in Castlereagh, Bligh, and Loftus streets, and thence carrying it round Circular Quay into Pitt-street, branch lines being extended to Fort Macquarie.

DESCRIPTION OF THE PITT-STREET PROPOSAL.

4. The scheme by which a double line would be laid in Pitt-street would branch off the existing steam tramway in Pitt-street, at a point near Gipps-street, and traverse Pitt-street to its intersection with Circular Quay, the whole of the length from Gipps-street being a double track. The main lines would be extended along the Quay until they joined the double track extension of the existing tramway to Fort Macquarie.

The permanent-way would consist of 83-lb. rails, which would be laid on sleepers between Gipps-street and Bathurst-street, in macadamised-road; from Bathurst-street to the Circular Quay they would be laid on concrete, the permanent-way being wood-blocked. The poles would be erected on each side of the street—a plan which, in the case of a single track, would allow of the rails being placed so far from the kerb as to give plenty of room for ordinary vehicles, but would decrease the width required for a double track.

ESTIMATED COST OF THE CASTLEREAGH-STREET AND OF THE CASTLEREAGH-PITT-STREET TRAMWAYS.

5. The total cost of the original scheme is estimated at £70,150 as far as Circular Quay, and £110,000 including the extension to Fort Macquarie and the car-shed. The alteration, providing for a single line in Castlereagh and Pitt streets, would entail, the Committee are informed, an additional expenditure of about £9,000.

ESTIMATED COST OF THE PITT-STREET PROPOSAL.

6. The total cost, exclusive of land and compensation, of the double line in Pitt-street is estimated, approximately, at £76,672, comprising road construction £31,835, outside electric work £7,087, power plant £12,750, and rolling stock £25,000. Land resumption, at the corner of Pitt and Alfred streets, near Change Alley, would increase this estimate by between £5,000 and £6,000. To this should be added the cost of the extension to Fort Macquarie and of the car-shed.

RAILWAY COMMISSIONERS' REPORT.

7. The Railway Commissioners' report is very favourable to the construction of the proposed Castlereagh-Pitt street tramway, but it does not give an estimate of either working expenses or revenue. The construction of the tramway is rendered necessary, the Commissioners say, by the conversion of the steam trams to electric traction, and the consequent inability of George and Elizabeth streets to carry the traffic; and they, therefore, cordially support the proposal. The only additional revenue that will be derived will be due, they state, to increased traffic, and, although it is not possible to foretell with any degree of accuracy what this will amount to, they have no hesitation in saying that it will fully justify the construction of the line.

With respect to the statutory report of the Commissioners on the Pitt-street double line proposal, their report upon the Castlereagh-street scheme, and their minute suggesting a single line along Castlereagh and Pitt streets are taken as complying with the requirements of the Public Works Act.

THE COMMITTEE'S INQUIRY.

8. The Committee have carefully inquired into the proposals before them, but have not examined many witnesses. Several matters associated with the question of electric tramways, necessary to be investigated if one or other of the proposals under consideration were the introduction of the system into the city, did not call for inquiry, as they were fully investigated when the George and Harris streets tramway was being considered. It appeared to be sufficient to clearly understand the details of the proposals, and the reasons for them, ascertain, as far as possible, what objections might fairly be advanced against them, and be in the position to judge whether one or other of the schemes was the best that could be put forward to secure the object in view, or whether it might, with advantage, be varied. Advertisements and paragraphs in the newspapers inviting evidence from anyone desirous of expressing his views on the matter, failed to bring forward more than a few witnesses; and it is noticeable that—with one exception—no business firm in Pitt or Castlereagh streets made any protest against the carrying out of any one of the proposed schemes, or expressed any desire to be heard in the inquiry.

THE TRAM TRAFFIC IN GEORGE-STREET.

9. The evidence of the Traffic Superintendent of the Department of Tramways is to the effect that George-street has now nearly as many trams as can be accommodated there, and there are still the Glebe Point, Leichhardt, and Balmain lines to be provided for when converted to the electric tram system. At the present time there are running into George-street daily, during the busy hours, sixty-three trams with seventy-three cars from the Dulwich Hill-Newton line, and thirty-seven trams and seventy-four cars from the Railway and Pymont lines. Of that number, at least fifty-four trams are in George-street at the one time, and, evenly spaced, they would be at intervals of 150 yards, or forty seconds headway. But this even spacing is not always possible, owing to the cross cable and vehicular traffic in the street. During the busy hours, over ninety trams run each way in George-street in an hour, or 180 trams in the hour, and the total number running backwards and forwards daily is 2,300.

METHOD OF RELIEVING THE GEORGE-STREET TRAMS.

10. The first step towards relieving George-street, after the construction of the proposed new tramway, would be to take the railway traffic from the George-street trams, which would be done by putting an end to the practice of running those trams into the Redfern railway station, and by running the Castlereagh and Pitt street trams into the station instead. At present a large proportion of the passengers who travel in the George-street trams do so from and to the Redfern station; with the new lines in operation all passengers wishing to travel from or to the station would require to do so by the Castlereagh or Pitt street trams.

The

The George-street trams would stop in George-street opposite the station, as the trams from the Western Suburbs do now, to take up or set down passengers; but, in view of the advantages offered by the Castlereagh and Pitt street trams, it is thought very few railway passengers would travel by way of George-street. The diversion of the railway traffic, the tramway authorities say, will give immediate relief, and further relief will be afforded by diverting a portion of the Western Suburbs tram traffic into Castlereagh and Pitt streets. The existing tramway lines and points from George-street into the railway station will fit in with the Castlereagh and Pitt street lines, and additional expenditure in that direction will therefore be unnecessary.

OBJECTIONS TO THE TRAMWAY.

11. The objections to the proposed tramway, as they appear in the evidence, were chiefly urged by several master carriers whose horse teams use Castlereagh-street, and by the Registrar of the Metropolitan Transit Commission, who explained to the Committee that Castlereagh-street was needed for traffic driven out of George-street, and that Pitt-street, from its narrowness and the number of vehicles passing through it, is the most congested street in Sydney. In the inquiry relating specially to an electric tramway in Pitt-street, the proprietor of the Hargrave-street and Point Piper road omnibuses protested against the Pitt-street proposal on the ground of its interference with omnibus and other vehicular traffic, and the risk to life and limb which a greater congestion of traffic than at present exists in the street would cause.

The complaint of the master carriers will be met to some extent by a rearrangement about to be made of the goods business in connection with the railways. At the present time, the general goods business in truck loads is conducted at the Sydney goods shed, adjoining the produce shed, at the Redfern Railway station, and the railway authorities are about to call for tenders for additional accommodation at Darling Harbour for the purpose of dealing with it there. By this change, Redfern station will be relieved to the extent of 1,000 tons of goods per week, and the team traffic in Castlereagh and Pitt streets should thereby be materially lessened.

The objection mentioned by the Transit Commission Registrar is based on what he considers to be consistent with good traffic regulation, but at the same time he admits that if George street is to be relieved there is no alternative but to use either Castlereagh or Pitt street for the purpose. As for the present vehicular traffic in Pitt-street, which consists largely of omnibuses plying to the Eastern Suburbs, it appears inevitable that it must give way and find a route somewhere else, as vehicles of the kind have had to do in relation to George-street. In any case the omnibus traffic to the Eastern Suburbs has only a short life before it, for, with the conversion of the steam trams now running through Oxford-street to the electric system, omnibuses to the suburbs of Paddington, Woollahra, Waverley, &c., must be greatly reduced in number.

It is admitted that this omnibus traffic exists because the steam trams now running to the Eastern Suburbs do not sufficiently meet public requirements, and that if these trams were frequent enough to deal with the traffic the omnibuses could not successfully compete with them. The conversion of the Eastern Suburban trams to the electric system would supply what the travelling public want, and, by doing away with the necessity for an omnibus system, very quickly lessen the vehicular traffic in Pitt-street. Recognizing this, the Committee endeavoured to ascertain whether the Railway Commissioners could undertake to have these trams converted by the time the Castlereagh and Pitt street electric tramway was constructed and ready for use. They were informed that this was not practicable; but it appears to be certain that electric trams will be running to the Eastern Suburbs before any necessity arises for laying two lines of tramway in Pitt-street, and with one line only in the street, and that on one side, the interference with vehicles should not be very great. In any case, the Committee are assured, no more traffic will be transferred to Pitt-street than is absolutely necessary to relieve George-street. As things are at present, the conversion of the Western Suburbs tram service to the electric system cannot be further proceeded with until relief in George-street is obtained. When the Western Suburbs steam trams have been replaced by electric trams they can be added to those dealing with the Eastern Suburbs traffic, and in that way assist in relieving the traffic in Pitt-street.

A representative of a large wholesale firm in Pitt-street informed the Committee that a tramway in the street would greatly inconvenience their business by obstructing the movements of their drays and carts, but this appears to be a difficulty that must be expected to occur at times in any street, and cannot be avoided. The risk of accident to street traffic under the single-line scheme, it is pointed out in the evidence, would be minimised by the trams travelling only one way.

THE COMMITTEE'S RECOMMENDATION.

12. As the evidence very forcibly shows the necessity for relieving the tram traffic in George-street, and the suggested single line along Castlereagh-street with a return line through Pitt-street appears to be the best of the three schemes submitted, the Committee are of opinion that the Castlereagh-Pitt-street proposal should be carried out. The Castlereagh-street scheme would interfere least with vehicular traffic, but it is very doubtful whether it would effect the object which it is absolutely necessary should be secured, that of relieving the George-street trams of railway passengers. The destination of most travellers by the railway, coming into the city, is in the vicinity of George or Pitt streets, and west of those streets, and electric trams in George or Pitt streets meet their convenience. But it is very improbable that they would travel by trams running in Castlereagh-street only, especially to the railway station, seeing that those trams would involve to many a long walk uphill through King, Hunter, or Bridge street. They would still take the George-street trams, and the present highly inconvenient and dangerous congestion of traffic in connection with those trams would continue. With trams running from the railway station along Castlereagh-street, and returning through Pitt-street, railway travellers, the Railway Commissioners and the Tramway authorities are of opinion, would find no difficulty in using the new routes, for by coming through Castlereagh-street, direct from the station, the walk into the city, from any point, would either be on the level or downhill, and Pitt-street being so close to George-street, the tramway in the former street having the special advantage of being connected with the railway station platforms, the inducement to take the Pitt-street trams in preference to those in George-street would be quite sufficient to make the former popular.

RESOLUTION PASSED.

13. The resolution passed by the Committee is shown in the following extract from the Minutes of Proceedings:—

Mr. Watson moved,—“That, in the opinion of the Committee, it is not expedient the proposed double line for an electric tramway from Belmore Park to Fort Macquarie by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets, should be constructed, but they recommend that the suggestion of the Railway Commissioners, by which a single line would be constructed from Belmore Park, through Castlereagh, Bligh, and Loftus streets to Fort Macquarie, returning by single line through Pitt-street, be adopted.”

Mr. Hyam seconded the motion.

Mr. Shepherd moved,—“That the motion be amended by the omission of the word ‘not’ between the words ‘is’ and ‘expedient.’”

The amendment was negatived on the following division, upon the question “that the word proposed to be omitted stand part of the motion” :—

| | |
|----------------|---------------|
| Ayes, 5. | Noes, 2. |
| Mr. Dick, | Mr. Shepherd, |
| Dr. Garran, | Mr. Levien. |
| Mr. Hyam, | |
| Mr. Watson, | |
| Mr. McFarlane. | |

The motion was passed on the following division :—

| | |
|----------------|---------------|
| Ayes, 5. | Noes, 2. |
| Mr. Dick, | Mr. Shepherd, |
| Dr. Garran, | Mr. Levien. |
| Mr. Hyam, | |
| Mr. Watson, | |
| Mr. McFarlane. | |

W. T. DICK,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 27 September, 1900.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC
WORKS.

MINUTES OF EVIDENCE.

ELECTRIC TRAMWAY FROM BELMORE PARK TO FORT MACQUARIE.

TUESDAY, 7 AUGUST, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDSAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee proceeded to consider the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works,
sworn, and examined:—

1. *Chairman.*] I understand that you have a statement you desire to read in respect to this inquiry? Yes; the statement of the Under Secretary for Public Works. It is as follows:—

H. Deane.

7 Aug., 1900.

ELECTRIC TRAMWAY FROM BELMORE PARK TO FORT MACQUARIE BY WAY OF CASTLEREAGH AND BЛИGH STREETS.

The proposal before the Committee was referred by the Legislative Assembly for the Committee's consideration on 12th July, 1900, in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie by way of Castlereagh and Bligh Streets, with single lines down Loftus and Young streets."

This proposed tramway, which is intended to provide a means of relief to the congested traffic on the George-street trams, originated in the representations made by the Railway Commissioners to the Premier and Minister for Railways in the beginning of the present year. Their experience of the volume of traffic then existing in George-street, considered in conjunction with what it will be when the steam tramways of the western suburbs have been converted into the electrical system, convinced them that it would be quite impracticable to bring all the traffic into George-street, and that some means of relief must speedily be found.

Two ways of meeting the difficulty presented themselves, viz., by laying a tramway (1) in Pitt-street to Circular Quay, or (2) in Castlereagh-street and Bligh-street to Circular Quay. Both schemes, it is believed, will be ultimately required, but as Castlereagh-street affords more facilities for traffic than Pitt-street, the Minister decided to submit the Castlereagh-street route as the first instalment.

The following is the official description of the line:—

Belmore Park to Fort Macquarie Electric Tramway.—Report on Route.

This tramway branches off the existing steam tramway in Belmore Park at a point opposite Castlereagh-street, traversing Castlereagh-street to its intersection with Hunter-street, thence along Bligh-street to Bent-street, the whole of the length from Belmore Park being double track.

After leaving Bent-street a single track is taken along Loftus-street to the Circular Quay, and thence along Young-street, joining the double track again at Bent-street.

The main lines are carried across the Circular Quay, and traverse the back of the wharfs on the eastern side to Fort Macquarie, where an extensive car-house with necessary shunting yards and office accommodation will be provided.

The permanent-way will consist of 83-lb. rails, which will be laid on sleepers between Belmore Park and Liverpool-street in macadamised road: from Liverpool-street to Hunter-street the road will be wood-blocked, thence to the Circular Quay macadamised roadway, and the whole of the portion laid on the Circular Quay will be wood-blocked.

The turnouts to the car-house being of 60-lb. rails laid on sleepers and ballasted.

The car-house will be of brick, and will accommodate seventy-two cars of the largest type now in use; it will be so designed as to be in keeping with the site upon which it is to be built.

The total cost is estimated approximately at £110,000.

The statutory report of the Railway Commissioners on the proposal, is as follows:—

Office of the Railway Commissioners of New South Wales, Sydney, 10 July, 1900.

Proposed line of Tramway from Belmore Park to Fort Macquarie by way of Castlereagh and Bligh streets (double track), and Loftus and Young Streets (single track).

Complying with the request made by letter, dated the 2nd instant, at the instance of the Honorable the Secretary for Public Works, and in accordance with the provisions of the "Public Works Act of 1888," section 13, we beg to report as follows:—

| | |
|-------------------------------------|----------|
| Estimated cost of construction..... | £110,000 |
| Interest at 3 per cent. | 3,300 |

The construction of this line is rendered necessary by the conversion of the steam trams to electric traction, and the consequent inability of George and Elizabeth streets to carry the traffic, and we therefore cordially support the proposal.

H. Deane. The only additional revenue that will be derived from the line will be due to increased traffic, and although it is not possible to foretell, with any degree of accuracy, what this will amount to, we have no hesitation in stating that it will fully justify the construction of the line.

7 Aug., 1900.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this tenth day of July, one thousand nine hundred, in the presence of,—

H. McLACHLAN.

W. M. FEHON,
Deputy Chief Commissioner.
DAVID KIRKCALDIE,
Commissioner.

I put in the plans on a 40-foot scale, also a section of the line and the book of reference. I also hand in a detailed estimate of cost. The estimate is as follows:—

| <i>Approximate Bill of Estimated Quantities and Cost.</i> | |
|---|----------|
| Castlereagh-street— | |
| Road construction | £26,212 |
| Outside electric work..... | 6,038 |
| Power | 12,750 |
| Rolling-stock | 25,000 |
| | 70,050 |
| Circular Quay— | |
| Road construction | 5,363 |
| Outside electric work..... | 1,337 |
| Power | 2,875 |
| Rolling-stock | 5,000 |
| | 14,575 |
| Car-house..... | 17,000 |
| Traffic offices | 1,000 |
| Track construction..... | 7,375 |
| | 25,375 |
| | £110,000 |

2. Can you give us any details of the interference with private property which the construction of this line will involve? The only interference with private property will be at the corner of Bent-street and Bligh-street. I have already called the attention of the Minister to the necessity of taking steps towards resuming that piece of property, and the Land Valuer has the matter in hand. It seemed to be necessary to take some prompt steps, because an advertisement appeared in the papers calling for tenders for the rebuilding of that hotel. As regards other property, it will be necessary to cut into the corner of the land used by the Education Department, at the corner of Loftus-street and Bent-street; and at Fort Macquarie it will be necessary to resume the land occupied by the drill-shed, and to pull down the remaining portion of the fort and do some levelling there.

3. Will the interference with the Education Office site be sufficiently large to interfere with its value as a building site for a large Government building later on? I do not think so. It only just rounds off a very acute angle. The portion to be resumed is not occupied by any building at present.

4. In that statement of estimated quantities and cost I find the item of "Power" under both headings—Castlereagh-street and Circular Quay? Yes.

5. Will you inform the Committee why you have that item under each of those two heads? It will be necessary eventually to provide power to run the trams on each section of this new line.

6. It will come from the one source? Yes; but the Railway Commissioners are now taking steps to obtain further power at Ultimo. The power-house and plant at Ultimo were intended only for the existing trams, and, if the traffic had stood still, they probably would have been enough; but the traffic has increased by leaps and bounds since the George-street line was laid and opened and the Enmore line converted, and there is no doubt that a very large increase of power will be necessary; so it would seem to be only fair, when a new line is projected, to provide in the estimate for the power that will be required to run the traffic of that line.

7. *Mr. Watson.*] You said that the power-house at Ultimo was designed to serve only the George-street line? No, the existing system of trams at the time it was projected.

8. Attention has been drawn to the fact that the amount expended on the Ultimo power-house has exceeded by a very large amount that which it was estimated it would cost; I think that the estimate for the power-house and the George-street scheme was £130,000;—the cost ran up, eventually, to considerably more than that, did it not? No. If I may be allowed, I would correct that statement. The cost of the George-street line and the power required to work the estimated traffic will not exceed the estimate that was made at the time that scheme was projected—that is, £130,500. I think that when all the details are worked out and every item separated—everything charged to its own proper head—it will be found that the cost of the George-street scheme and the power provided for it comes out pretty well. But there is this to be borne in mind all the same: Mr. Elwell, who was the adviser in electrical and traffic matters to the Railway Commissioners, and also the late Chief Railway Commissioner himself, thought that forty small cars would be sufficient to work the traffic on George-street. However, it turned out, almost from the commencement, that forty cars were not enough, and they had to run seventy or eighty cars. That means, of course, that a good deal more power was used than that at first estimated. Then, again, for George-street, the power was to be derived by a small addition at the Rushcutters' Bay power-house, but before any steps were taken to add to the power at Rushcutters' Bay, it was decided that a central power station at Ultimo should be commenced, from which power for all the electric trams in Sydney and the neighbourhood could be supplied. That has been carried out, and a plant providing about 5,000 horse-power is there. Of course, the estimate for that large power-house was consequent upon an estimate made of the power required for working the whole of the tramway system at that time with an unincreased traffic. I am not responsible for any estimate that was made at that time, and I do not propose to say anything about it, but it looks as if that power might have been sufficient if the traffic had not given such proof of increasing as it has done already.

9. Irrespective of this proposed line down Castlereagh-street, by how much is it proposed to extend the capacity in horse-power of the Ultimo station; I understood that 5,000 horse-power was in the first instance laid down;—do you know how much it is proposed to extend that, irrespective of the present proposal? I cannot tell you officially, but probably the Railway Commissioners will be prepared to give you that information. I understand that the power will be doubled. I know that the Chief Commissioner has been making inquiries in America, with the view of getting proposals for a very large increase of power which will practically double the power now available.

10.

H. Deane.
7 Aug., 1900.

10. What horse-power will these two items, in connection with the present proposal, £12,000 odd and £2,000 odd—or a total of about £15,000—represent? About 625 horse-power.
11. *Chairman.*] In paragraph No. 3 of the main report you handed in there is a suggestion that Pitt-street might have been taken for this kind of traffic;—would you care to offer any opinion as to the present respective merits of those two streets to cope with the increased traffic of George-street? Pitt-street would have many advantages on account of its position, but it was thought to be more advisable to lay down a tramway in Castlereagh-street first, seeing that it was very much clearer of traffic. Later on, there is no doubt, Pitt-street will be required, but it was thought inadvisable at the present time to bring forward a proposal to lay down a tramway there.
12. Taking a general view of the matter, would it not seem that the nearer you got to the present congested line with a parallel line, the more chance there would be of relieving the congestion? Yes; I do not think that the Minister would have any objection to my saying that I strongly urged him to put in both Pitt-street and Castlereagh-street, so that the Public Works Committee would have both matters to deal with, and could recommend either one or both of them.
13. I suppose that all sorts of trams, such as railway, Newtown, and Botany trams, will be sent down the proposed line—that some of each of them will be sent down Castlereagh-street? I do not know how the Railway Commissioners will divide the traffic, but the present idea is to have a separate line for the railway traffic. So, I think that the principal idea is to take the railway traffic down Castlereagh-street.
14. *Mr. Shepherd.*] I suppose the Castlereagh-street line could be more easily laid down than the Pitt-street line, there being less traffic and fewer obstructions? Yes. There is no doubt that it is clearer of traffic—very much so.
15. *Chairman.*] In regard to interference with property, will the area taken in Belmore Park be large? No; only just the little piece shown on the plan—a piece about 120 feet long, and 30 feet wide.
16. Of course the piece between that and the existing tram-line will be practically of no use? Yes.
17. At that corner, will it be necessary to provide any special safety appliances, seeing that there will be two tramways issuing from the park so close to one another at that corner? It will have to be fenced off.
18. I am referring to the street;—the construction of this tram will add a new danger at that corner, and I was wondering if you would require any special safety appliances there? I do not think so. There is a good distance between the two.
19. What distance is there on the street between the two? It is about 130 feet or 140 feet clear.
20. *Dr. Garran.*] Is Castlereagh-street wider than Pitt-street? It is about the same width.
21. Do you remember the double tram-line that used to be in Pitt-street? I never saw it.
22. If you employ the present power at Ultimo to work this Castlereagh-street line, you put an additional task on that power—a task that was not originally intended? Yes.
23. Then, will you delay converting the eastern lines, because you will not have enough power to convert the western and the eastern lines, and take this Castlereagh-street line in addition? Not until we get new power.
24. Then something must be postponed? Yes.
25. Which is it going to be? The Railway Commissioners, I believe, feel that the western suburban trams must be dealt with first, they having already started with that side; it is absolutely necessary to complete that side first.
26. Then the eastern trams, going off at the Liverpool-street corner and up Oxford-street, will be steam trams as at present? Yes; for some time to come.
27. Until you are ready? Yes.
28. Will you run this Castlereagh-street tram right into the present station yard? I think so.
29. Then do you mean to cut off the access of the George-street line into the station yard? Access would not be cut off; there would still be those roads leading into it.
30. For a week or so we had the old steam trams running into the station yard after the construction of the George-street line, and the electric trams stopped at the gates? Yes.
31. That gave the steam line a pull? Yes.
32. When they altered that by turning the steam line out of the yard and putting the electric in, that gave the electric line a pull? Yes.
33. And the consequence was that the steam line was knocked sky-high;—if you want to get some of the railway traffic off the George-street line, will not the best plan to do it be to keep the George-street line out of the station yard? I think so.
34. And make the people who want to go to the railway get into the Castlereagh-street tram? I think that is what would have to be done in order to avoid that very inconvenient crossing of the trams which is taking place at the present time.
35. You would get rid of that danger altogether? Yes.
36. And you would lighten the traffic on the George-street line? Yes.
37. But so long as you allow the George-street electric line to go into the station yard you will have people who live in George-street, or to the west of it, getting into those cars? Yes. There is no doubt that the most convenient way will be to reserve George-street for the western lines and Castlereagh-street for the railway traffic. What the Commissioners may finally decide to do, of course, I cannot say, but that is the idea that I know they have at the present time in order to ease the traffic, and avoid the crossing of trams, which at present is so productive of delay.
38. Perhaps you may have had some experience of this—that it is very easy to give the people a privilege, but very hard to take it away from them? Yes, I know that.
39. Are you prepared to be offered up as a sacrifice? I think they ought to have had Castlereagh-street first. It is very difficult to go back and take away a privilege.
40. Is Mr. Kneeshaw an officer under you? No; he is under the Railway Commissioners.
41. You are not responsible for how the lines are used after they are made? No.
42. Supposing it should be found when this Castlereagh-street line has been made that, with the mere share of the railway traffic it will get, there is not quite enough business for it, could you not then take on part of the eastern suburban traffic? I think it is possible. Perhaps the Botany line traffic would come in very conveniently.
43. As you come off towards the Circular Quay you split your double line into two pieces at one place? Yes.

- H. Deane. 44. Is that because neither street is wide enough for a double line? It is more convenient to do it in that way. There are generally a good many drays standing in the lower part of Young-street.
- 7 Aug., 1900. 45. Is there any specific advantage in splitting, if you are not obliged to do it? It is proposed in this scheme to make a loop in front of the Custom-house, so that some portion of the traffic can be run round the Custom-house, without going right out to Fort Macquarie. That is a very great advantage.
46. *Mr. Watson.*] You will have the cars running continuously? Yes.
47. *Dr. Garran.*] You practically make a loop of Young and Loftus streets? Yes.
48. At Fort Macquarie, have you ample ground for all you want to do there? Yes. The upper plan shows how the traffic will be worked. There is a large car-shed, and there is a double line running to the left of the car-shed with various cross-overs. They unite at the end of the car-shed, and the cars go round on a single line and enter the return line to the Circular Quay, and from one of those lines there are diverging roads into the car-shed.
49. Will you have enough standage room for the cars there? Yes.
50. There is no necessity to reclaim any ground from the harbour? No; there is no necessity to reclaim any ground.
51. If you adopt this loop at the end, will you give up the existing loop on Circular Quay? I think that will come about as a matter of course.
52. Of course, this will involve running the George-street trams 200 or 300 yards further? Yes.
53. But you will get all the passenger traffic at the Man-o'-War Stairs, and from some of the large steamers at Circular Quay. Yes.
54. There is a little passenger traffic there to be picked up? There is a good deal. At times there is an enormous traffic there. All day long, if you go down there, you may see people going backwards and forwards to the boats, the Man-o'-War Steps, and the Gardens.
55. You would take people to the Gardens, and they would enter them on the level, instead of going up or down hill? Yes; it will be a very convenient way of access to the Gardens.
56. *Mr. Watson.*] Should any part of this expenditure be debited to the general working of the tramway system;—for instance, the car-house will be available for use by the cars that belong to the George-street system as well as by those belonging to this proposed Castlereagh-street section? Yes, it will.
57. Therefore, the expenditure, so far as the last £25,000 shown in the estimate, or perhaps £40,000, is concerned, seems to be for the convenience of the general tramway system, and not confined alone to the Castlereagh-street section? The last £25,000, because the other has its own particular traffic to carry. That is of no particular convenience, except for the purpose of running cars in the morning and in the evening to the car-house. But the last item, £25,375, may be said to be for a convenience that will be shared by all the trams coming down to the Circular Quay.
58. In view of that, do you think that your car-house will be large enough to accommodate the cars from the George-street line, as well as those from the Castlereagh-street line? Yes; because there will be, eventually, car-houses all round the outside of the city. There is a large one at Newtown; it is proposed to have a large one at Kensington; and there will be, eventually, others situated outside the city. In this estimate I have provided thirty new cars—that is, long cars, double bogey—whilst the car-house itself is intended to accommodate seventy-two.
59. Which car seems to be the most popular and generally satisfactory? I think that the St. Louis cars are liked the best.
60. Are they satisfactory in their working, as well as popular with the public? I think so, but the traffic officers could best say. I know that the new cars are all to be of that longer type. The Railway Commissioners have decided that.
61. *Chairman.*] Has the experience of the George-street electric tram modified the views of the Railway Commissioners with respect to which car is best suited to the Sydney traffic? Yes. The original view was that single-truck cars should be used. Those were the first provided for George-street; but now the feeling is very strongly in favour of the double-truck cars—the long cars—they being more capacious and more equal to requirements.

THURSDAY, 9 AUGUST, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVYEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

- H. McLachlan. 62. *Mr. Watson.*] The Railway Commissioners seem to favour the construction of the proposed line? Yes; they recommend its construction.
- 9 Aug., 1900. 63. Is it their idea that this line will afford relief to the western traffic, or is it proposed mainly as a pick-up line? Largely to afford relief. Of course there will be a certain amount of pick-up traffic, but in the opinion of the Railway Commissioners two streets will not carry the tramway traffic—that is, George-street and Elizabeth-street—and they think it is absolutely indispensable that we should have some of the trams going through another street.
64. In what way has it been suggested that they may arrange the traffic so as to relieve George-street? The proposal is that the railway traffic should be taken *via* Castlereagh-street—that is their present idea. At the present time we have the railway traffic and the Newtown traffic in George-street, and during the busy times of the day those two services seem to take up the accommodation very largely; for instance, between 5 and 6 o'clock, I think we have as many as eighty-seven trams running up George-street for those two services alone. Of course, we have to convert the whole of the western suburban lines. We have the Leichhardt, the Glebe Point, and the Balmain lines to convert in addition to what has already been

been done, and it would be impossible to bring these three other routes into George-street; and Elizabeth-street will certainly require all the accommodation we can give it for the eastern suburban traffic. I am to add that the Railway Commissioners want to vary this proposal in regard to the question of route. I am not sure whether a subsequent minute they submitted to the Minister—a minute of the 25th July—is before the Committee.

65. Perhaps you might read it; what we have is dated 10th July? This is a subsequent minute, dated 25th July:—

Office of the Railway Commissioners, Sydney, 25 July, 1900.

Proposed line of tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets (double track), and Loftus and Young streets (single track).

SINCE writing our report of the 10th instant on this subject, we have looked further into the matter, and now desire to submit, for the favourable consideration of the Honorable the Minister for Public Works, the desirability of varying the proposal originally submitted by constructing a single line from Belmore Park through Castlereagh, Bligh, and Loftus Streets to the proposed terminus at Fort Macquarie, and returning by single line through Pitt-street.

We are constrained to recommend this alteration in the original proposal, because the experience gained since the George-street line was opened strongly indicates that it will best meet the public convenience.

The congestion which is now taking place in George-street impels us to point out to the Honorable the Minister that the work is of great urgency.

W. M. FEHON,

Deputy Chief Commissioner.

DAVID KIRKCALDIE,

Commissioner.

66. Have the Railway Commissioners formed any idea of the additional cost of carrying out that suggestion as compared with the cost of the proposal before us? They understand it means an additional cost of from 20 to 25 per cent. So far as I recollect, the estimated cost of the proposal before the Committee is £110,000. The permanent-way for a single line will cost about £50,000, and the car-shed and rolling stock, I think, £60,000. The additional cost of the permanent-way for a line in Pitt-street, I think, would be about £20,000 or £25,000. That is what the Commissioners understand would be the additional cost, over and above the estimate for the proposal now before the Committee.

67. Would the Railway Commissioners suggest the construction of those single lines in such a way as would permit of each of the streets being served by double lines at a later period, if that were thought desirable? Yes.

68. That is, by putting the track sufficiently on one side to obviate the necessity of removing it? Yes; on the left-hand side.

69. On the east side of Pitt-street, and on the west side of Castlereagh-street? Yes.

70. That would be practically going with the course of the traffic? Yes. The Railway Commissioners' idea is to have the lines, though single, laid in such a way as to permit of their duplication if found necessary at a later date.

71. Do you think that that arrangement would be likely to attract the railway traffic away from George-street, with the station on the site it occupies now? I do not think it would make very much difference to us. If we get the railway traffic now where it is, we would get it just the same practically under this proposal, because we would start these trams from the railway station; people would go straight from the trains into the trams.

72. That would be in going away from the railway station; but, would there not be a tendency on the part of the people in business west of George-street to take the George-street tram with the view of reaching the railway station in the evening? Pitt-street is very close to George-street. It is only a few steps from George-street into Pitt-street.

73. That would be an additional reason for making the return journey *via* Pitt-street, instead of *via* Castlereagh-street? Yes; that is what I have suggested.

74. When you had that new arrangement working, you would cease running any of the George-street trams into the railway yard? Yes; and that would afford very great relief in connection with the crossing near the old watch-house. You would be able to get a straight run for the Newtown and the western suburban trams.

75. And that would probably permit of a greater number being run? It would certainly facilitate the working very considerably, because at the present time the trams have to cross there, and if you travel by a tram you generally find that you have to wait there a little time, owing to the junction arrangements.

76. Where will the Pitt-street line join the tramway system going to the railway station? It will come in near Hordern's refreshment-room—at the junction of Pitt-street and Garden-road.

77. The Railway Commissioners mention Loftus-street as part of the route of the suggested single line? Yes.

78. Would they prefer that street to Young-street for a single line? That is a matter of detail that would be dealt with if the proposal be approved. They would have practically an independent loop, so as not to interfere with the George-street line, and going into Pitt-street.

79. That would be in front of the Custom-house, and past the "Ship Inn," or behind it? That is a matter of detail that the Commissioners have not absolutely determined, but which they could arrange.

80. There is rather an awkward turn near the "Ship Inn," and unless you were to resume that hotel, or the vacant land behind it, there might be an awkward entrance? It might be found more convenient to cut the corner in front of the Custom-house, and go *via* Macquarie-place into Pitt-street; but that is a matter of detail the Railway Commissioners have not absolutely decided upon, and which would have to remain in abeyance until after a consultation with the engineers.

81. Still, that is a matter that will have to be looked into, for it would seem that if you want to get into Pitt-street, from the Circular Quay end of it, you will need to make some resumption, either where the "Ship Inn" is, or immediately behind it, where there is a lane that runs near some vacant allotments? You would go behind the "Ship Inn," I think.

82. The lane behind the "Ship Inn" is very narrow, but I understand that there is some vacant ground there, or ground with some paltry buildings upon it? Yes; that is, Change-alley. Personally, I think it is a question whether it would not be wise for the Government to resume Change-alley, because it is an obstruction of that square, and is, I take it, not a valuable property. Its removal would certainly improve the appearance of the Quay very considerably.

H.
McLachlan.
9 Aug., 1900.

H.
McLachlan.
9 Aug., 1900.

83. It is more than probable, I should imagine, that you would pick up some traffic by going *via* Macquarie-place? That is a detail the Railway Commissioners have not tied themselves too; they simply submit this as a principle, and leave the details to be arranged.

84. So they do not commit themselves to Loftus-street in preference to Young-street for that branch? No; they would not say absolutely at the present time.

85. The grade of Loftus-street is a little better than that of Young-street, is it not? I am not sure.

86. But whether it is or not would not matter if you were going towards the Quay? No; you would be going down in either case.

87. Have the Railway Commissioners thought out the possibility of extending the eastern suburban system to the Quay? Yes.

88. What is their proposal in that regard? Their proposal is to branch off in front of the "Métropole Hôtel," and thence to run down practically so as to join on about the Manly Beach steamer jetty.

89. Would it join on with the line that is before us now, because that goes down Young-street? It might join on with that. You would have to have a certain number of crossings where traffic converges at certain points. The Railway Commissioners' idea is to branch off in front of the "Métropole Hôtel," and then run down in front of the Custom-house. The question of the junction arrangements would have to be carefully thought out; but roughly speaking, that would be their proposal.

90. It has occurred to me that, if the Railway Commissioners were to run the eastern suburban trams down to the Quay, they would get a lot of traffic that now encourages buses to run up Pitt-street? Yes.

91. The eastern suburban buses rather monopolise Pitt-street, and largely, I think, because there is at present no chance of people taking a tram up Pitt-street from the Quay? As a matter of fact, the Railway Commissioners have had a plan drawn out, many months ago, for the bringing of the eastern suburban trams in to the Circular Quay, and that is part of the conversion scheme.

92. That would not be attempted probably before the electric system is applied to the western suburban traffic? No; the proposal is to convert the western suburban lines first.

93. As I understand, then, the suggestion is, not that you should utilise the whole of Castlereagh-street for the eastern suburban trams, but should merely junction with the proposed Castlereagh-street line at Bent-street, and go down Young-street? The idea was to use Castlereagh-street practically along the greater part of its length for the railway traffic.

94. But the suggested extension of the eastern suburban lines would junction with the scheme before us at Bent-street? Somewhere about there. The proposal is to run off in front of the "Métropole Hôtel" at Bent-street. We should turn off from the present steam road near the "Métropole Hôtel," and run in front of the "Métropole" to the Quay—going between that hotel and the Union Club.

95. *Dr. Garran.*] Are you going to abandon Elizabeth-street altogether? No; we shall want it for the eastern suburban traffic.

96. Will the eastern suburbs have to be content with Elizabeth-street still? Yes.

97. *Mr. Watson.*] Are the Railway Commissioners satisfied with the result of the electrical working of the trams so far? Yes.

98. That is, the result in business, of course? Yes.

99. Will it be possible to give any details of the returns, say, from the Newtown line under the electrical system as compared with the returns from that line under the steam system? Roughly, we are earning £100 a day more on the Newtown line since we converted it into an electric line. A good deal of that is due, no doubt, to going into George-street, and taking traffic formerly carried by the buses. But that is the result—practically we are earning £100 a day more. We were earning on an average £166 a day by the steam, and now we are earning on an average £256 a day by the electric.

100. But this return of £256 a day includes that which is received from the steam trams also running on the same line? There are only a few in the afternoon, and, as a matter of fact, they are not much patronised. Though they practically pick up passengers at the same point as the electric trams do—opposite the railway station—the people crowd on to the electric, and let the steam trams run practically empty.

101. Is the additional expense involved by the electrical system great? The result so far is satisfactory. Perhaps our experience is hardly lengthy enough to give us the best idea, because everything is new, and renewals are consequently not so heavy; but, so far, the result of the electrical working of the city trams is most satisfactory.

102. You have no doubt as to the electrical system ultimately paying very well? No; the Railway Commissioners have no doubt as to the success of the system. It has been found to succeed in every other part of the world, where other systems have been discarded in favour of the electric, and our experience so far shows us that that is the proper thing to do.

103. There seems to have been a number of accidents—of a minor character, certainly, but still to some extent alarming—in connection with the working of the electrical system lately; do you think that that will be avoided in the future? Sydney, I suppose, will always have a certain number of accidents, in view of the crowded traffic and the narrowness of its streets. Most of the accidents that have happened have been due largely to want of care on the part of the people injured. The carrying out of this proposal ought very considerably to minimise the liability to accidents.

104. I was not referring to that class of accidents; but I meant accidents in the working of the motors, irrespective of the danger to people walking in the streets? I think we have had very few, considering we have introduced a new system. We have really not had a serious accident from what you may call electrical or mechanical defects, and the accidents, I think, have been remarkably few for a new system.

105. As regards the accident reported in yesterday's paper, where a safety appliance in connection with a motor fused and exploded with some little force;—is it not possible to devise something that will permit of the extra power being carried away without a chance of exploding? That is an electrical matter. The engineer has the whole matter in hand, and I understand that he has taken every reasonable precaution to do away with any risk of danger from that kind of thing. He will be able to give you technical details of the matter. From what we have heard of what did happen, I should say that the report was grossly exaggerated.

H.
McLachlan.
9 Aug., 1900.

106. It is not very encouraging to people to think that at any time the machine may go off? But we have carried millions of passengers without any accident to them. Passengers, on hearing the noise coming from the safety appliance, might jump out of the tram and hurt themselves; but their injury has not been through any leakage of the electricity. Personally, I think that the accidents due to mechanical defects have been remarkably few, especially considering that we are introducing a large and new system.

107. Have the Railway Commissioners attempted to compare their returns under the penny section with those received formerly? A comparison in regard to some of the lines is rather difficult. For instance, the railway and the Newtown trams take a new and more direct route; but on other lines where the sections have been altered, the results on the whole have been unfavourable from an earning standpoint. We have had considerably more expense, and have earned less money; but, at the same time, it has been of great public convenience.

108. I was trying to find out what the result has been from an earning point of view? The result has been unfavourable.

109. It has not led to any great increase of returns? No. On some of the lines there has been a great falling off. Take the Coogee line for instance.

110. But in the case of the Coogee line there was a reduction of fares in addition to the rearrangement of sections? Yes; but of course they all came together. On the Coogee line in four months we lost £1,500, and that in the face of a better business to the race-course and the Agricultural Society's grounds—that is to say, the loss was due to the regular business on that line. We compared the receipts in those four months with the receipts in the corresponding four months of the previous year. Taking the penny sections altogether, I do not think that there has been much loss. We have picked up additional business. But owing to the rearrangement of sections, and the increased expenditure due to the cash fare system being introduced coincidentally, there has been a big difference in the net return. There is no doubt as to the success of the Newtown and the George-street electrical lines.

111. Do you anticipate that, when you have the electrical system applied to the remaining lines, there will be a corresponding increase there? I would not like to say that; but it will certainly be far better for us to have only one system at work.

112. I thought it possible that, in that event, you might get as passengers people who do not care to travel in the steam trams; but who would take advantage of the cleaner and more comfortable travelling which the electrical system affords? I think we could get the bus traffic. That has happened particularly at Newtown. But comparing the cost of steam tram working with the cost of the electrical car working, if you can get the same amount of business, then, on account of the larger number that you can carry in a steam car, I daresay that the steam car would compare more than favourably.

113. But you would have to get them all at the same time? Yes. But, as I say, the Railway Commissioners are quite satisfied with the success of the electrical system, which is proved very conclusively by the two lines we are now working.

114. *Mr. Shepherd.*] I suppose it is anticipated that relief will at once come to the George-street tram when this line is constructed? Naturally. We have at the present time seventy-four cars in the railway-Ultimo service in George-street, and, if you could turn those cars into another street, you can see what room would be afforded for other services to come into George-street.

115. It would be likely to draw the Pitt-street traffic, and, in fact, all the traffic east of Pitt-street that now goes to George-street? I think so. I think that the nearness of the two streets would be found to be quite convenient; that is, the man who now travels in George-street would find it equally convenient to walk comparatively a few yards further to Pitt-street.

116. How would you connect with the present tram-line at Belmore Park? We should run off at Belmore Park, in coming into Castlereagh-street, just the other side of that over-bridge in Belmore Park, and in going up Pitt-street we should connect with the present steam road nearly opposite Hordern's refreshment room.

117. There would be no difficulty whatever about that? No. As a matter of fact, the junctions here are child's-play. In America they are running their trams almost in every street in some cities. We have a book showing the way in which some of the American cities are covered with tramways, and ours looks like one or two lines against the great number they have in the American cities.

118. Did you notice a paragraph in yesterday's paper referring to an explosion on one of the trams? Yes. Mr. Watson has already referred to that.

119. *Mr. Levien.*] Is there any danger in those explosions? No. The electrical engineer can tell you the whole result.

120. It is merely a flash? It is a report.

121. There is no danger in it? No.

122. *Mr. Shepherd.*] It is not likely that anything serious could happen from that? No. The electrical engineer will give you a technical description of it.

123. *Mr. Hyam.*] When the eastern suburban service is converted, is it the intention to abolish the present line from the corner of Liverpool-street to the railway? No. We would, I think, keep that, though we might not immediately run a regular service upon it.

124. People coming from the eastern suburbs then would have to get off the tram at the corner of Elizabeth-street and walk down to the Pitt-street tram;—that would be rather an inconvenient way of getting to the railway? They would be better off than they are now. A man coming from the eastern suburbs to-day has to walk to George-street in order to get a railway tram.

125. No; he takes a steam tram at the corner of Liverpool-street and Elizabeth-street, and if he has the luck to catch a Botany tram he is taken right to the railway steps? Yes; in the case you mentioned the passengers would have to walk to Pitt-street.

126. I suppose that the whole of the western suburban traffic will be carried on the George-street line? That is the proposal to a large extent, if you take the railway traffic out of George-street.

127. Balmain, Leichhardt, and Glebe Point? Yes.

128. Would not that congest the traffic in George-street quite as much as at present? It would be impossible to carry all that traffic and the railway traffic in George-street; but you could carry that traffic in George-street if you were to take the railway traffic out of that street.

129. Do you think that the traffic in George-street is congested at the present time? I think there is room for more traffic there at the present time. We do not run the cars as thickly as is done in America.

- McLachlan. 130. You think that you could run the same number of cars as you are running now, even if you were to bring the western traffic in? Yes; and more. The Railway Commissioners have another idea, the carrying out of which will give relief. Some time ago we ordered material for coupling what we call the "combination" cars. If two of those cars were coupled, that would lessen the number of individual trams running.
- 9 Aug., 1900. 131. I wonder that has not been done before? The American practice is to run single cars immediately following each other; but with our congested street traffic it would probably be wiser to run them together, and have fewer individual trams.
132. *Mr. Watson.*] You are running the St. Louis cars together now? Yes; they are built to be coupled.
133. *Mr. Hyam.*] In running trailers you would have to shunt when you got to the Circular Quay, and bring the motor in front of the trailer again? With a run-round, of course, there is no shunting.
134. *Dr. Garran.*] I understand that you want this new tramway to relieve the traffic during the crush-hours morning and evening? Yes.
135. Do you think the Castlereagh-street line will have enough traffic to make it pay during portions of the day other than the crush-hours? I think so; but in this case, of course, it is not so much a question of paying as a question of absolute necessity to give relief.
136. You must take your railway traffic away from George-street? We must, in order to give accommodation there for other lines. At the present time, between 5 and 6 o'clock, on the Newtown and railway lines we are running eighty-seven trams in the hour, and if you were to throw Leichhardt—which, under the steam system, earned two-thirds of the amount earned by Newtown—Balmain, and Glebe Point upon it, I am afraid that the street would be too congested, and, of course, the traffic is growing all the time.
137. Looking at the narrowness of our Sydney streets—unfortunately for us—is it not fair to say that every street we tram we spoil very largely for vehicular traffic? It does certainly make the street less effective for vehicular traffic.
138. Well, your new plan would spoil two streets instead of one? I would not say "spoil"; but at the same time it would render the streets less comfortable for vehicular traffic.
139. On the western side of Sydney we will have George-street, Pitt-street, Castlereagh-street, and Elizabeth-street, all with tram-lines in them? Yes.
140. There will not be a single street in that portion of the city, for a vehicle to go down, clear of a tram? No.
141. Is that not rather a serious thing? It is not serious in this way. It is required to meet a public demand. Now, on the Newtown and the railway lines, on a busy day, we carry 100,000 people. There is a public demand, and other vehicles, I take it, must give way to popular requirements.
142. *Mr. Watson.*] The traffic must be picked up either by tram vehicles or by horse vehicles? Yes; the people have to be removed. You can understand what the public requirements are, when I say that on those two lines alone we are carrying 100,000 passengers on a busy day.
143. *Dr. Garran.*] Do you think that those railway passengers for whom George-street is really more convenient than Pitt-street will grumble at being shunted into Pitt-street? It is not quite so convenient, but I do not think they will feel the difference particularly. Pitt-street is a central street.
144. You think there is a public necessity for it, and that private convenience must give way? Yes. In addition to that, there is very little difference between the two centres.
145. Can you tell me whether Pitt-street is narrower than Castlereagh-street? No.
146. You have no idea of bringing the eastern suburban traffic into either Pitt-street, Castlereagh-street, or George-street at present? No.
147. The residents of those suburbs will have to be content with Elizabeth-street? That is the present idea.
148. If they want to get to George-street I suppose they will have to get out of the trams at the Elizabeth-street corner and walk down to George-street? At present it seems to me that would happen.
149. Do you know whether that happens now at all? I have not noticed that.
150. People keep in the Elizabeth-street cars, and get out at whatever cross street they want to get out at? Yes.
151. Supposing that a lady coming from one of the eastern suburbs wanted to go to David Jones', would she get out at the corner of Elizabeth-street and Liverpool-street, and go down to the George-street tram, or would she come along to King-street;—I suppose she would come along to King-street? Yes; that is what they do now.
152. And if it were a wet day, she would, perhaps, take the tram down King-street to George-street? If it were a wet day she might possibly go to the Circular Quay, spend another penny, and travel by the George-street tram.
153. King-street is the only cross connection you have? Yes.
154. You do not mean to have any other? Not at present; but, no doubt, as years go on, there will be very big developments.
155. You do not see any necessity for tramways in streets to the west of George-street? They may come in connection with the Miller's Point scheme.
156. Down Kent-street? Down Kent-street or York-street. It is very difficult to forecast what may happen.
157. You have no plans for that yet? No; it has been thought of.
158. We are to understand that this new scheme is not so much for the accommodation of the city as for the relieving of George-street of the railway traffic? Yes; and to give accommodation for other roads to come into George-street.
159. So as to be able to hook on the western traffic? Yes.
160. So long as this relief is not given you cannot carry out your entire scheme? No.
161. Will you have enough power to do this and to convert the whole of the western service besides? The Electrical Engineer's idea is that, on the basis of the present traffic, it can be done.
162. And the extra power will then be wanted for the eastern suburban traffic? Yes; for extensions in connection with the eastern suburbs. As a matter of fact, we are in negotiations now for the extra power that is absolutely necessary.
163. You will not be able to touch the eastern system unless you get extra power? That is so.
164. You will be able to do the whole of the western with the power you have now? Yes, we think so, unless there is some development.
- 165.

H.
McLachlan.
9 Aug., 1900.

165. *Mr. Levien.*] Do you not think that, in the public interest, Castlereagh-street, Pitt-street, Elizabeth-street, George-street, and York-street ought to be served by trams? I think that we shall probably have to have trams in more streets than at present, as the city grows and business increases.
166. You will admit that the proprietors of the 'buses consult the convenience of the public by driving into every street they can get into, in order to convey their passengers? Yes.
167. Do you not think that it is most advisable, in the interests of the Government, they having every facility, and the right to the road more than others have, that that should be done with the trams? That is a matter to be considered with a certain amount of reservation, because the more streets you go into the greater the expense you incur. If you can limit your traffic to one, two, or three streets, you necessarily save money in construction. If you put down tram lines in other streets you, of course, have to pay the extra cost of construction and maintenance.
168. Are not York-street, Castlereagh-street, Pitt-street, Elizabeth-street, and Clarence-street great feeders of traffic? Yes.
169. Would you propose to put down tramways along those different streets? That is a matter of expense.
170. Is it not a matter of convenience of traffic, after all is said and done? It would depend on whether the traffic would justify the expense.
171. Do you think that the traffic would do that—not looking to the present, but ahead of us? I think so. I am guided by the experience of other cities, where they find electric tramways can be worked from one central station, and a number of sub-stations, economically, and where they have divided the traffic through a number of streets. That has been the experience, so far as I can gather, in America.
172. Considering the enormous traffic that goes down George-street by the electric trams—persons who go to Kent-street, Sussex-street, and Market-street, and other streets in that direction, do you not think that it is advisable to have an extension of the tramway system? I think that sooner or later you will want to have a tramway right along York-street. That may come in connection with a tramway to Miller's Point, or there might be a tram through Kent-street and into York-street, to junction with the George-street line near the Town Hall. The Commissioners would prefer to proceed tentatively rather than to go in for very expensive schemes all at once.
173. When we know that the population is growing, do you not think it is far better to look ahead of us than to take a contracted view, merely looking forward to to-morrow? Yes; you are quite right.
174. What do you think is necessary? The way in which the Railway Commissioners look at the matter is this: In considering any proposal they always take into consideration how that proposal will be affected by further extensions which they think will be necessary some day; and any scheme they propose is always considered to be part of a comprehensive scheme. They say, in effect, "This scheme will fit in with a more comprehensive scheme which will be required later on." They work out an idea, to-day, with a view to the future. For instance, if they were putting in a railway-station building, they would erect it in such a way that, afterwards, when the traffic grew, they could in the easiest and most economical manner, add to it. Those are practically the lines on which they are proceeding in regard to the tramway extensions; but, at the same time, I do not think that it would be wise to lay down a comprehensive scheme, and spend a large sum of money in anticipation of traffic that has yet to come.
175. Do you think that the traffic in the streets I have mentioned is likely to decrease, or to increase? To increase.
176. In the opinion of the Railway Commissioners, is there any probability of the city of Sydney going back, or of its advancing, both commercially and otherwise? Every prospect of advancement.
177. Is there not, then, a greater necessity for the construction of tramways along the streets I have mentioned? I would not say that there is at the present moment.
178. I am not talking about the present moment, but in view of the advancement of the city itself and of its surroundings? The scheme that the Railway Commissioners are now submitting to the Committee is part of a scheme to meet the advancement of the city. The Railway Commissioners are actually proposing to take up two additional streets.
179. But do you not think that we ought to have more? I do not think so at the present moment. The opening up of each street must entail the expenditure of a large sum of money.
180. But, considering the advancement of the Colony generally, and especially of the city of Sydney, do you not think that, whilst we have so much surplus labour, and a chance of getting cheap labour, it is advisable to do all this work when there is such a good opportunity to do it? No, I would not; and I do not think that the Railway Commissioners would recommend anything further than they are recommending at the present time.
181. Do you think that property will advance in value? I am not an authority.
182. Well, do you think so? I take it that, as the city expands, property will advance in value.
183. In view of that expression of opinion, do you not think that it is far better now, while property is almost at a standstill in value, to do this work which we anticipate, with the increased prosperity of the Colony, will be absolutely necessary? I would agree with you to this extent: I would not say that it is desirable to do the work now; but it would be perhaps wise to get a comprehensive scheme thought out, and to proceed with the work as necessity may arise. I think it would be wise to get a scheme thought out, but not to spend the money immediately—that is, not in order to relieve any unemployed difficulty.
184. I do not care about the unemployed difficulty? I thought that was your reason.
185. I am thinking of the cheapness of labour? But the cost of labour has been considerably increased during the last twelve months.
186. Is the tramway and the railway passenger traffic increasing? Yes. In regard to the railway traffic, I might give you a little indication of what that traffic is. On a busy day 50,000 people come in and go out of Sydney by railway. A great number of these people, of course, do not travel by tram; but, as I have said, we carry on the George-street and Newtown electric lines about 100,000 passengers a day, including many of that 50,000. That shows the large volume of traffic that has to be dealt with. The opinion of the Railway Commissioners is that the trams are not a proper substitute for the railway for that business, and that the railway ought to be extended into the city to-morrow. If we had our way we would run the city railway into Hyde Park to-morrow.
187. As you have said that you would run the railway right in, do you admit that Mr. Parry is correct about the enormous number of people that go down George-street? A great number go down George-street.

H.
McLachlan.
9 Aug., 1900.

188. Do you think that those persons who walk in in the morning would come into the city by railway? Many of them would. The increased railway fare that workmen, who form a considerable portion of the traffic, would pay is $\frac{1}{2}$ d. a day each; and any man who could get to Hyde Park for $\frac{1}{2}$ d. a day extra, I do not think would waste that much in shoe leather. Besides, there is what is of importance in connection with the advancement of the country, namely, economy of time. No transfer system can be a success where you can get a direct route. That has been the experience of the world, with the exception of Sydney.

189. Then you assert that the Railway Commissioners totally disagree with our recommendation? Quite.

190. Then—on the assumption, of course, that the Committee were wrong in their recommendation—if the city railway were extended to Hyde Park all these trams would be utterly useless? I would not say that.

191. I should like you to explain;—if the Committee were wrong in their conclusion, as you say, and if the railway were to be extended to Hyde Park, what would be the use of all these tramways? Well, first of all, George-street is occupied only partly by the railway traffic. There are more cars running to Newtown and Ultimo than to the railway, and a great portion of that traffic is pick-up traffic. If you were to give the necessary relief in George-street, which would be afforded by taking the railway tram traffic out of it, you would still have as much business as you could conduct by tram in George-street.

192. That would be a chance, would it not? That is a fact, in my opinion.

193. But the people who would come in by train would not want the tramway? A great number of them would not. But we want the trams to be relieved of the railway passengers. There is any quantity of tram business to be done outside of the railway traffic. You must meet public requirements. As I say, we would run the railway into Hyde Park to-morrow if he could; but as we cannot get that, we suggest the idea of running the railway trams through Castlereagh-street. However, if you were to make the city railway to-morrow, the Railway Commissioners would still recommend the opening of Castlereagh-street for tramway purposes.

194. But, supposing that the railway were to come right into Hyde Park, what would be the use of the Castlereagh-street or the York-street tram—that is, if the railway passengers do not want to change at all? You speak as though the railway traffic constituted the whole and sole traffic of the city of Sydney; but, as a matter of fact, the pick-up traffic constitutes a very large portion of the business.

195. Of course, there is a difference between the railway traffic and the pick-up traffic; the Committee are as much aware of that fact as the Railway Commissioners are. The railway traffic is the traffic that comes right from the suburbs directly to the railway, and the pick-up traffic is the traffic that is picked up in George-street; but I am talking about the railway traffic;—of what benefit would the trams be to those persons who get into the trains, say, at Newtown? There are a certain number of people who would get out of the train at the present railway station in any case. But the great majority of the people, I believe, would go by train to King-street for the sake of getting to their destination quickly. You have only to stand at the corner of King-street or Market-street to see that the trams going to the railway are crowded when they get that far. I think a return that was compiled showed that three-fourths of the passengers left the trams at Market-street and King-street in coming into the city. As a matter of fact, I suppose that the railway traffic constitutes only a fifth of the total tramway traffic. But we should be very glad to have the trams relieved of it.

196. Then, if you had the railway right into the city, even if the city did advance, you would not want the number of tramways I have already asked you about? No, not immediately; but, of course, you have to look at what is going to happen in Sydney in twenty years. You are going to build a terminal station at Devonshire-street for all time—or, apparently, that is the idea—which we think is a mistake.

197. *Mr. Shepherd.*] Is it your opinion that the tramways cannot successfully deal with the traffic? Practically. For instance, if you had been at the Sydney railway station at 9 o'clock this morning, you would have seen 300 or 400 people jump out of single trains and rush pell-mell from the trains into the trams at the station-yard. It would be far better for us and for the people—a saving of time and money—if they could all get to their destination without changing. That has happened in all parts of the world, except in Sydney. Look at what they have done in London; and Sydney, I suppose, is going to be a smaller London some day.

198. Before the electric trams were put on, was it not found that 40 per cent. of the people arriving by train at Redfern walked into the city? That may be; but 60 per cent. is a large number to cater for.

199. Have you any reason to think that all that 60 per cent. would go by railway to King-street? Every reason to think a great number would, because King-street is a central position, and if they can do so people will go to the end of their journey without a break. From King-street, and below King-street to Market-street, a number of people travel by trams in George-street to go to the railway.

200. *Chairman.*] Can you give us the average daily number of passengers carried along George-street by trams now? We had a return taken out not many days ago. Wednesday is generally a good day, and 25th July was a Wednesday. On that day, on the Newtown-Dulwich Hill trams, we carried 56,575 passengers, and on the George-street electric we carried 40,000 passengers, making altogether 96,000 odd. On a busy day that number would practically run up to 100,000.

201. During the city railway inquiry, Mr. Kneeshaw gave us some figures, and from them I find that the average number travelling by the electric trams in George-street from the Redfern station is 13,000 each way per diem, or 26,000 in all;—would that be the full measure of the relief—26,000, say, out of 100,000— which this proposed tramway would afford? I should say that that would be full measure.

202. I thought it might be larger than that, inasmuch as the railway traffic, I suppose, occurs chiefly during two periods of the day, and is not spread generally over the whole day? In considering a day's traffic, you must not consider it as spread over twenty-four hours. There is a great rush of traffic sometimes. People are coming into town during several hours of the morning, and since the Early Closing Act came into operation a greater number of people leave work between 5 and 6 o'clock in the evening, and therefore the traffic between those hours bears a very abnormal proportion to the traffic during any other portion of the day.

203. Have you any figures giving the number of cars running each hour during the working day? Between 5 and 6 o'clock in the evening we are running along George-street eighty-seven trams from the Circular Quay and back—I mean eighty-seven in and eighty-seven out. During the whole day we run

2,292 trams along George-street, so you can see what a big proportion of trams are running during that hour. You have also to recollect that during that time every tram has its full complement; in fact, people find it difficult to get on. They will not wait to get room, but rush and crowd.

H.
McLachlan.
9 Aug., 1900.

204. It is during the busy hours that the maximum amount of relief will be afforded? Yes.

Orlando William Brain, Acting Electrical Engineer, Department of Railways, sworn, and examined:—

205. *Chairman.*] You know the proposal before the Committee? I know its general features.

O. W. Brain.

206. What increase of power in the power-house will be necessary to cope with the increased traffic that the carrying out of this proposal will bring about? By that question I take it you mean the increased traffic that will be due to the fact of having a line down Castlereagh-street.

9 Aug., 1900.

207. What increase of power will you require to carry the new set of trams on the new lines? Of course, there is a certain amount of traffic to the western suburbs which has already been reckoned upon, and which it would, in this case, be proposed to take through Castlereagh-street. That would be the bulk of the traffic that would be carried through Castlereagh-street; and then there would be additional traffic due to the fact of the tramway being in Castlereagh-street, and I take it that it is this you refer to.

208. I thought you had already made your calculations for the conversion of the western suburban system, and that the carrying out of this proposal would necessitate a still further increase in the power? That is so; but I wanted to be quite clear as to whether you meant that or the entire traffic that there would be in Castlereagh-street.

209. With respect to the increased traffic that the fact of placing a tramway in Castlereagh-street would bring about, what increase of power would you require for that line, leaving out of consideration the western suburbs idea? Accepting the opinion of the Traffic Officer, Mr. Kneeshaw, on that matter, it would take about 400 kilowatts, or about 540 horse-power.

210. I suppose your attention was directed to the statement in the paper yesterday, that in reference to an explosion that occurred in connection with a safety appliance on one of the trams? Yes.

211. Can you give the Committee any idea of what the explosion consists in, and whether there is any real danger to the public from it? The circuit-breaker that opened on that occasion is really an ordinary electric switch with a special attachment to it, which causes it to open when the current exceeds a certain limit. Every tram-car equipment now is fitted with this. If the machinery should break down, an excess current may result; or, if the man should handle his controller improperly, an excess current would result, and in either case, in order to obviate the damage that might result from an excess current—that is to say, either that the motors or the cables would be burnt up—this circuit-breaker is so adjusted that when the current becomes more than the equipment is suitable for, the circuit-breaker opens, and thus disconnects the current. The opening of a circuit-breaker of 500 volts is always accompanied by a certain amount of flash and a loud report.

212. It is simply, I suppose, that the current passes through a short distance of air? That is it.

213. Would that current, operating in that way, be likely to affect any passengers standing near on the tram, or would it be covered? In extreme cases—that is, under conditions that may occur exceptionally—a small quantity of the metal of the contact pieces of the switch may be fused and blown out. But beyond the eyes, there is practically no danger. If any one should happen, in an exceptional case, to get that in his eyes it might injure them.

214. But, practically, there is no danger to life? None whatever.

215. Is it possible for a man to intercept the current with his hands? No. It is quite an accidental danger, and it has been quite usual to fix the switches everywhere just in the same way as they are fixed here. I am proposing to make some experiments with a view of seeing whether we cannot arrange for that discharge to blow out through the roof; but that is a provision that has never been considered necessary up to the present.

216. *Mr. Leving.*] It is a great shock to anybody travelling on the tram? Yes, it is a loud noise. Of course, it depends entirely upon the current disconnecting at the time. Similarly, when the circuit-breakers at the power-house, which protect the various circuits, go, there are very loud reports. It is due to the fact that we have very heavy grades, and have to have fairly powerful equipments, and have to fix these switches in such a way that they will carry a fairly heavy current, and consequently when they open, they open with a fairly loud report.

217. When these things take place, are they reported to you? They are reported now in all cases.

218. Can you minimise them at all? The only way in which you can minimise them is by instructing the men to be very careful. In the ordinary course of things it is a matter of no importance; but it was thought that it would lead to the men being more careful in the matter as they were held to blame to some extent if they caused their circuit-breakers to blow, and they were instructed always to report it as a check on themselves, and in that way the occurrence of circuit-breaker blowing has been very much minimised since the line was opened. In the case that happened the other day it was quite an exceptional occurrence, and there was consequently rather a louder explosion than usually occurs. The man evidently forgot what he was doing, and started the tram with his hand-brake hard on, and he turned on the current more and more until there was an explosion.

219. It may be averted often in going up hill? Yes. But if the load is very heavy it may happen that the circuit-breaker will blow, no matter how careful the man may be, and also in the event of the equipment breaking down, as it does once in a while. That very seldom happens; but when it occurs in the ordinary course of climbing up hill, it is not generally attended with such a loud explosion, because it merely reaches the maximum current which it will carry, and then blows. But in the case the other day, when the man clamped the brakes on hard, and turned on the current, he no doubt turned on a tremendous current, and it was attended with a louder explosion than would occur under legitimate circumstances.

220. Still there is no danger attached to it? No.

221. *Mr. Watson.*] Do you think you could so place the circuit-breaker that there would not be any possibility of singeing people, or injuring their eyes, or troubling them at all? The switch opens on the bottom of the box, and there is a plate just underneath it, and the flash shoots out between the end of the plate and the bottom of the switch-box; and I propose to carry some suitable tube through the top of the roof, so that whatever air and metal are ejected shall simply blow out through the top.

- O. W. Brain.
9 Aug., 1900.
222. There will be no possible risk of people being injured then? No; but it involves other considerations. It is not generally done, and consequently one has to find out what it involves altogether. The checking of the flame that would result from any closing of the passage in any way might prove to be undesirable, in that it would not allow the flash to open sufficiently quickly.
223. But it would seem as though some device is necessary to continue or to help the confidence of the public in the electrical system, because women folk cannot be expected to run risks of that sort in travelling, if they can be avoided? Of course, the blowing of a circuit-breaker under those very exceptional circumstances—that is, a very heavy discharge—is about on a level with the blowing of the gauge-glass on the steam motors, which, of course, occurs, and has resulted in serious accidents on the steam motors in one or two cases, merely owing to passengers taking fright.
224. *Mr. Levien.*] Did you see the man who it was said was so much singed that his relatives did not know him? There is no doubt that that article was entirely exaggerated. I got the official reports of the occurrence at once after it happened, and the driver was held to be blameable for having wrongly manipulated his controller; but the report merely stated that a passenger named Bell said that his whiskers were singed. The official reports generally state with great care and accuracy what is to be seen. If a man gets any mark, the conductors and the drivers always report it; and the evidence in this case merely was that the man said his whiskers were singed.
225. He did not apply to the Department for compensation? I believe he did. Of course, the point of importance was simply this: That the driver could not say that the man's whiskers were singed; there was nothing to show the conductor or the driver that the man was in any way injured.
226. Who is this man—Mr. Bell? I believe that he is a ticket man on the North Shore Ferry Company's staff. There is no doubt that the details, as they appeared in the *Star*, were quite absurd, and quite contrary to the official reports we got at the time.
227. *Chairman.*] Has your experience of the working of the electric trams modified the original views the electrical department held concerning the best means of dealing with vehicular traffic? No, not generally. But, of course, the views of the department as to what would be most suitable in the supply and distribution of current have kept pace with the progress in the industry.
228. In those cases where you have cars coupled, is there a motor in each car? There are two motors to each car.
229. Does not that seem to involve a certain loss of power and increase of annual expense? No. In the United States it has been found that there is considerable economy by rather increasing the number of motors—so much so that some of the most up-to-date managers at the present time put four motors to each car, and find that has made a considerable reduction, over two motors in each car, in working expenses.
230. Would it be cheaper to have a trailer without motor? It is cheaper in the first cost, but experience has shown that the extra cost of wear and tear due to the heavy loading of the motor very much more than compensates for the saving in the first cost, and also for the increased weight involved in putting motors on every car. That is to say, that two motors doing the work of propelling one motor car and one trailer involves a greater expenditure for wear and tear than four motors propelling the same cars.
231. *Mr. Watson.*] Is it not the practice now—take, for instance, the coupled St. Louis cars—to have the forward car of the two with the motors working, and the trailer with the motors not working? No.
232. Do they have both trolley poles on the line? No; they have only the one trolley pole on the line, but it is supplying current to all four motors.
233. So the motors in both cars are working? Yes.
234. *Mr. Hyam.*] How is the connection made? It is made through, underneath the car. There is a special coupling on those cars.
235. *Mr. Watson.*] Having your power distributed over a greater number of motors gives the power a better chance of creating a connection? It does. You get, of course, the adhesion of both cars.
236. *Mr. Hyam.*] Mr. McLachlan stated that it is probable that in a very short time the eastern suburban lines will be converted to the electric system;—would you recommend the putting in of another power-house, or the supplying of power from the present power-house with additional machinery? An extension of the present power-house.
237. Have you room enough there to work sufficient machinery to give you enough power for the eastern suburban, as well as the western and North Shore lines? There is sufficient room for a great deal more than that power.
238. In the place where you are now? Yes.
239. You are supplying the North Shore line at the present time, are you not? Yes; but not entirely from Ultimo at present.
240. *Mr. Watson.*] What horse-power do you anticipate it will be necessary to provide at Ultimo for something like a completed system of tram-lines;—have you made any approximate estimate of that? Yes; 6,000 horse-power of electrical output.
241. For the lot? Yes; that is in addition to what we have now.
242. At present you have 5,000 horse-power? Yes.
243. You think that 11,000 horse-power will run all the lines at present in contemplation? Yes.*
244. *Mr. Levien.*] Are you in charge of all the power-houses? I have charge of the electrical portion.
245. How many of them are there? Three—North Shore, Ultimo, and Rushcutters' Bay.
246. Is anybody under you or over you? I have charge of the electrical staff, and I have only the Railway Commissioners over me in that respect.
247. *Mr. Hyam.*] You are the head of the electrical department? Yes; but in saying the whole of them you may have misunderstood me. As regards the Rushcutters' Bay plant, I have charge only of the electrical part of that plant. That is, primarily, a cable station. Similarly, at Ultimo, Mr. Thow has charge of the steam plant.
248. Is there not a separate power-house to serve the Rose Bay line? That is supplied from Rushcutters' Bay.

249.

* NOTE (on revision):—It is necessary to point out that I misunderstood question No. 243. What I meant to say was, that 11,000 horse-power would be sufficient to run all the anticipated traffic within the next few years upon all the present lines. I am not in a position to deal with all the lines at present in contemplation, as I have only a hearsay knowledge of many, and I have not received from the Traffic Superintendent any data whatever as to the estimated traffic upon them.

249. Whatever electricity you want for the Rose Bay extension that is supplied from Rushcutters' Bay? O. W. Brain. It is at present.
250. *Dr. Garran.*] I suppose it is much more economical to generate all the power at one place than at half a dozen scattered places? Much more.
251. Is the site you have at Ultimo a convenient one? I think it is exceptionally convenient.
252. You look upon that as the best centre for all you want? Yes.
253. You are quite content with it, any way? Yes. I think there are very few towns of the size of Sydney that have the opportunity to place a power-station in so good a location, both as regards ultimate loading and the advantages for steam generation.
254. Have you land enough to build upon? There is ample land for considerably more power than we have in view.
255. *Mr. Watson.*] In the transmission of the current, do you not lose a certain amount the greater the distance it is sent over? Yes.
256. Is that loss of sufficient moment to militate against the employment of a central station for Sydney and suburbs? Well, after the power reaches a certain magnitude, and the distance is greater than a certain length, it becomes necessary to use suitable means for that power and distance.
257. That means that you would have to erect another station if you were to get too far? No; but that you would alter your method of supplying. What would be a suitable method for a certain power and certain distances would not be a suitable method for increased power and increased distances.
258. What I mean is this: Is there any method you can employ under which you would have no loss in transmission of power? No, there is not.
259. *Dr. Garran.*] Do you lose any power by going to North Shore under the water? Yes; you lose power wherever you transmit power.
260. But I mean especially in going under the water? No; there is nothing especial in that.
261. *Mr. Watson.*] When the George-street line was being laid, I notice that you seemed to have a number of supply cables connected with the line from the power-house direct—that is, instead of having only one line, you have a number switched in and assisting the supply;—will it be necessary to connect all the lines in an elaborate fashion with these supply cables? All the lines have to have feeders out to them.

WEDNESDAY, 22 AUGUST, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

John Kneeshaw, Traffic Superintendent, Tramway Department, sworn, and examined:—

262. *Chairman.*] Have you any information to give the Committee regarding the proposal to construct a double line for an Electric Tramway from Belmore Park to Fort Macquarie, by way of Castlereagh-street and Bligh-street? I may state, in the first place, that George-street has now nearly as many trams as can be accommodated there. Then there are still the Glebe Point, Leichhardt, and the Balmain lines to be considered, when they are converted to the electric tram system. At the present time we are running sixty-three trams (seventy-three cars) from the Dulwich Hill-Newton line, and thirty-seven trams (seventy-four cars) from the Railway and Pymont line into George-street daily during the busy hours. Of that number at least fifty-four trams would be in George-street at the one time. Evenly spaced, these trams would be at intervals of 130 yards, or forty seconds headway. But this even spacing is not always possible owing to the cross cable traffic and the vehicular traffic in George-street. Over 2,300 electric trams run backwards and forwards in George-street daily. During the busy hours over ninety trams run each way in an hour, or in other words 180 trams in the hour. Since the Dulwich Hill-Newton line has been converted to the electrical system, the revenue has increased by about £100 per day, or equal to about 15,000 passengers per diem.
263. Is that on account of the Dulwich Hill-Newton traffic only, or the George-street traffic only? That includes a portion of George-street. Of late the revenue on all tram lines has increased.
264. *Mr. Watson.*] Without any decrease in the passenger traffic on the George-street line proper? There has been a falling off in the passenger traffic on the George-street line; but I attribute that more to the season of the year than to anything else.
265. Is it a heavy falling off, or a slight falling off? Only a slight falling off. As the Dulwich Hill-Newton line has increased the traffic by 60 per cent., we may reasonably expect a corresponding increase on the Glebe Point, Leichhardt, and Balmain lines when they are converted. It would then be quite impossible to run all the traffic from those lines into George-street, so that we cannot convert them unless some other outlet is provided. I have some interesting information with regard to the practice in other cities. I have here a map of the Melbourne tramways, and I would like to point out that Melbourne has practically six tramway arteries in addition to three metropolitan railway stations. Within the last few days I obtained a copy of the annual report of the Melbourne Tramway and Omnibus Company, from which I find that the total number of passengers carried on the tramways in Melbourne last year was 41,036,689, as compared with 66,244,344 carried on our lines last year, and probably from 70,000,000 to 75,000,000 will be carried this year. At the present time the number of passengers carried in George-street, between the Railway Station and the Circular Quay, inclusive of through passengers from Dulwich Hill and Newtown, is nearly 70,000 per diem. That is over half the total number of passengers carried in Melbourne, where there are six main arteries. I have a document showing examples of street tramways in the United States. From that I find that St. Louis shows 350 miles of tramways. They generally quote single track. Taking it the same way in Sydney, we have only 100 miles; but their population is only half as large again as that of Sydney. Philadelphia shows 500 miles of single track. In the case of New York the example is also striking.

- J. Kneeshaw. 266. It would appear from the document you place before the Committee, that the Melbourne system is more extensive than ours? I do not think they have quite so much mileage.
- 22 Aug., 1900. 267. In the city proper? It is more extensive; but they have these six main arterics.
268. Seeing they do not carry nearly so many passengers in the aggregate, can you inform us as to the manner in which they make good the revenue as compared to the capital expended? Within the city boundaries the fares are 1½d., but only for short distances, otherwise their fares are uniformly 3d.
269. So that, speaking generally, their fares are much higher than those in Sydney? Yes, much higher. With the exception of a few workmen's trams which they run early in the mornings, and on one or two lines competing with the railways, where the charge is 1d., they charge nothing less than 1½d. By the workmen's trams in Sydney passengers can come from Leichhardt and other suburbs practically into Sydney for 1d. in the morning.
270. *Mr. Hyam.*] What distance would that be? About 3½ miles.
271. But if they came to the Circular Quay? They would have to pay 2d.
272. Then where do you bring them to for 1d.? To the Railway Station.
273. There is a system in Melbourne by which they can check off from one line to another? Yes; there is a transfer system in Melbourne.
274. You can ride on two sections for one fare? Yes; but the sections are not nearly so long as they are in Sydney. For instance, you can go from Sydney to Botany for 4d. I do not think you can get anything like that in Melbourne, except on a line that may possibly be competing with a railway.
275. If you came in by an eastern line you could get a check-off for the railway or Newtown for a single fare? It might be rendered necessary with 3d. fares, but not whilst we have 1d. sections.
276. *Mr. Watson.*] You only count a passenger so often as he takes out a ticket? Yes. In connection with the scheme under consideration what I would like to point out is that we want additional routes. I consider that it would be better if a single line of tramway came *via* Castlereagh-street to Circular Quay and returned by way of Pitt-street. The new route would be used then primarily for railway traffic, and thus prevent the crossing of trams at the George-street junction signal box, which I have no hesitation in saying is very risky. Railway passengers who wanted to use the electric tram in George-street would not mind very much if they were landed in Castlereagh-street on the up journey into the city provided they could join on the down to the railway journey in Pitt-street. But I think they would strongly object if they had to journey to Castlereagh-street and join the trams there for the railway, and afterwards have to tranship into the train.
277. *Dr. Garran.*] They have had to do it in Elizabeth-street for years? We did not get the number then; they took the 'busses or walked from the station. I think there would be a large pick-up traffic in Pitt-street from section to section, which would help to make the line remunerative.
278. *Mr. Watson.*] A good deal of the pick-up traffic now obtainable in George-street really belongs to Pitt-street? Yes.
279. *Chairman.*] Have you considered how you propose to divide the traffic after the construction of these two lines—one down Castlereagh-street and one down Pitt-street? We should have to put a portion of the western suburban traffic into Castlereagh-street, because George-street might not be able to carry the whole of the traffic. That might possibly be arranged by running a few trams on each of the lines, or by diverting the whole of the traffic by one principal line into Castlereagh-street.
280. Would not the effect of these additional lines in the city be to make the working of the crossings more difficult and dangerous during the busy hours of the day? No; I think that what is proposed would lessen the difficulty and risk.
281. Would there be any serious interference with the cable traffic on the crossings? No.
282. After viewing the documents you have handed in, showing the St. Louis, Philadelphia, and New York systems, does it not appear to you that Sydney is greatly under-trammed? Yes.
283. Do you consider that Sydney is greatly under-trammed at present? Sydney is greatly deficient in regard to its facilities for bringing people into the city. I think it would be better if we could deal with the railway traffic by bringing it into Sydney by train, leaving the tramways to deal with the legitimate tramway traffic alone. We are short of facilities for bringing people into the city.
284. How would the tramway rates, charged in Sydney, compare with those in the United States, which are shown in the documents handed into the Committee? There is invariably a 5 cent fare in those cities. If a person only travels a block he has to pay 5 cents as compared with 1d. sections in Sydney.
285. Do you know how the average fares would work out in each case? They do not give us sufficient data to check them. But the average fare in Sydney is less than 1½d.
286. *Mr. Watson.*] Is that under the new system? Yes.
287. *Dr. Garran.*] Is there any place where the fares are lower than in Sydney? No; they have ½d. fares in Glasgow, but the sections are not so long as here.
288. *Chairman.*] When you stated that you thought the tramway passengers would not mind being put off at Castlereagh-street on the up journey, so long as they could take the tramway in Pitt-street on the down journey, did you state that in view of the fact that by far the larger portion of the traffic which the trams are likely to take comes west of Castlereagh-street? Yes.
289. I suppose you have very little means of estimating the probable increase in returns there would be on these two lines—that is to say, whether they would be profitable or not? I have really no means of ascertaining; but it is impossible to carry the whole of the traffic in George-street and we must have some fresh outlet.
290. Have you estimated what amount of relief would be given in George-street by the construction of these proposed lines? I think it would immediately relieve it of about half the traffic.
291. *Mr. Watson.*] On the present basis? Yes; after we have converted the trams to the western suburbs we should fill up in George-street again, but probably a large amount of 'bus traffic would fall out.
292. *Chairman.*] The general result of these proposals would be to relieve George-street? Yes.
293. *Dr. Garran.*] As Superintendent of the Tramway Department, is this plan for constructing tram lines along Castlereagh and Pitt streets your plan, or is it someone else's plan submitted to you for approval? I am under the impression that it was designed by the Railway Commissioners and submitted to the Works Department.
294. Has it been formally submitted to you? No.
295. You have not officially given your approval or disapproval? I have not been called upon to give an expression of opinion, but I know the Railway Commissioners are favourable to the proposal. 296.

296. Do you come here to express distinctly your approval of the proposed system of a line down Castle-reagh-street and up Pitt-street in preference to a double line in Castlereagh-street? Yes. J. Kneeshaw.
297. Your main object is to get the railway traffic out of George-street? Yes. 22 Aug., 1900.
298. Will you detail a little more fully than you have done how you propose to do that? At the present time we run trams into the station yard from George-street. We should take them off, and run *via* Pitt-street.
299. You would have no connection between the George-street tram-line and the station yard? The connection would be there, but we should not use it.
300. So that if a person in Sydney wants to be carried into the station yard he will have to take the Pitt-street line? Yes.
301. And then, if a person takes the George-street tram, wanting to go into the Railway Station yard, he will have to walk from the George-street junction to the yard? Yes.
302. For a short time after the electric trams were opened you run the steam trams into the station yard as of old, or did people get down at the gates? They got down at the gates.
303. So that people would not be worse off than they were then? No.
304. Do you recollect whether, during that short time—a week, I think it was—that a large amount of traffic was taken on the George-street tram? Yes; a very large amount of it.
305. Under the new system, those who insist on taking a George-street car will have to walk from George-street into the station yard? Yes.
306. Have you any idea as to whether people would rather go to Pitt-street and take a car that would take them right into the station yard than take a George-street car and get out at the railway gates? I think they would rather go into Pitt-street and get a tram that would take them right into the Railway Station.
307. Take ladies with children, for instance—they are very frightened of the trams and vehicular traffic opposite the Railway Station—you think they would rather walk into Pitt-street to get a tram that would take them right into the station yard? Yes. At the same time we should not get anything like the same quantity of traffic from the Castlereagh-street line.
308. My reason for putting the question, is this—you are wanting to get the railway tram traffic out of George-street, and I want to know whether the mere shifting of the traffic to the railway gates will deter so many people from taking the George-street line as will give you the relief you want? It will give us immediate relief; but it will not be long before George-street will not hold the whole of the western suburban traffic, and we shall require to put a portion of it into Castlereagh and Pitt streets.
309. When you get the Glebe, the Forest Lodge, and Annandale lines all converted, you will have more traffic than you can manage in George-street? Yes.
310. Then you will have the same trouble of crossings that you complain of now? Yes; if you put all into Castlereagh-street, but we shall divide the traffic between George-street and Castlereagh and Pitt streets.
311. All these trams will have to cross? Yes.
312. You will have the same danger then as now? Yes.
313. From what you say of the George-street traffic, it will be absolutely impossible to divert all the western trams into George-street? It would be impossible to put the whole of the western suburban traffic into George-street.
314. Would it be much of a relief to put the line down Kent-street? It would afford some relief, but it would be necessary for portions of the city to be remodelled before anything of that kind can be done. There have been schemes for running trams by way of Kent-street, but nothing very definite has come out of them.
315. Suppose in connection with the remodelling of the wharf frontages it were possible to put a tram-line into Sussex-street to take some of the traffic from the Railway Station, would that relieve George-street to any extent? It might relieve George-street, but it would intensify another evil by adding to the traffic of that very congested junction opposite the Railway Station.
316. That is you cannot get into Sussex-street without going down as far as Hay-street? Not as it at present stands.
317. So that if a line were put down Kent-street, the traffic would all have to go past the junction you speak of? Yes; unless the city was remodelled.
318. Will you give the Committee some idea of how you are going to manage the traffic going into the Railway Station,—you will not have the George-street lines going into the yard, but you will have the Pitt-street line running in;—will it go in just where it is now? Yes. The points are there. There will be the same amount of traffic, but we should be able to deal with it more satisfactorily, until such times as we shall be absolutely forced to take some portion of the western suburban traffic into Castlereagh-street.
319. Suppose the Government should adopt the scheme of putting a railway station at Belmore-road, you can divert this tram traffic to that station just as you can do to the present station? I daresay they would have better terminal arrangements at the new station; but what I wish to see is a diversion of the railway portion of the George-street traffic.
320. You do not think there will be satisfaction till you move the whole of that traffic from George-street? No. The configuration of Sydney is so totally different to that of Melbourne. As I have stated, they have six tramway arteries in addition to three metropolitan stations, whereas we have only three main tramway arteries, inclusive of the cable tram.
321. You think, so far as you have studied the habits of the people here, that those who want to go to the Railway Station from Sydney will in the main make up their minds to go into Pitt-street to get the tram? I think they will be quite satisfied to go into Pitt-street. It is only a few steps from George-street, and they will save a walk from the railway gates to the Railway Station. I think the distance from the gates to the platforms would be further than from George-street to Pitt-street.
322. How many trams are going by the junction at George-street in front of the Railway Station at the present time,—not one a minute, is it? Much quicker than that. Including the railway trams, they are running past there in busy times of the day at an average of less than twenty seconds in either direction.
323. *Mr. Watson.*] That includes the steam trams and all? Yes.
324. *Dr. Garran.*] You are trying to multiply trams from King-street to Ocean-street? Yes.
325. If you go one every half minute down George-street, and one every minute down King-street, do you not think you are overdoing the junctions? No; all trams stop a little before they reach the street intersections

- J. Kneeshaw. intersections for the purpose of picking up and setting down passengers, and whilst they are so engaged the cross trams can be taken over the street.
- 22 Aug., 1900. 326. What I want to know is this,—does your experience show you that half a minute is enough to enable them to cross with safety? Yes; thirty seconds is more than sufficient.
327. On your system, you are going to have difficult crossings four times—in Pitt-street, in George-street, in Castlereagh-street, and in Elizabeth-street—now do you think the trams will be able to keep up minute services, and cross all those lines safely? I see no difficulty.
328. Do they have such line crossings in New York or Philadelphia? I cannot say.
329. You are going by experience so far? Yes.
330. You have two crossings at present? Yes; and we have very heavy traffic on them.
331. And you add to them two more? We do not apprehend any difficulty.
332. Then you are of opinion that the proposed method of relieving the George-street traffic will in reality succeed? It will, undoubtedly, be a relief.
333. A sufficient relief for your purposes? Sufficient for the present; but I am satisfied that we shall want more relief by-and-by.
334. Suppose a new railway station is built at Belmore-road, and a tram system is carried to the railway, it would still be possible to carry a new line into Sydney? Yes.
335. The construction of a station at Belmore-road would not necessarily foreclose the construction of a railway station in the city? No.
336. Coming down to Pitt-street, do you remember the old Pitt-street tramiine? I know that there was such a line, but I do not remember it.
337. That was a double line, and it blocked the street; but you do not think a single line would block the street? No, I think it would be an improvement.
338. Do you know if any of the American streets are as narrow as ours? In New York they are quite as narrow, and have a double line of tramways.
339. Is Castlereagh-street wider than Pitt-street? I cannot say, but I fancy it may be a little wider.
340. Going down to the Circular Quay, do you approve of the plan suggested of running one tram-line down one street and back by another? That is the best arrangement that can be made, and will interfere least with the traffic at the Circular Quay.
341. Do you approve of leaving your present loops at Circular Quay, and going on to Fort Macquarie? Yes; it is very desirable that the trams should go to Fort Macquarie to enable people to have ready means of access to the Gardens; and, secondly, and a very important item, to give us increased shunting facilities; and, thirdly, to provide storage accommodation at the terminal point, in order that we may remove from the traffic what are termed the broken shift trams—that is, trams that are brought in in the mornings and evenings to meet the heavy traffic at certain hours, and are returned to the sheds during the day; further than that, additional car-shed accommodation is absolutely necessary.
342. Have you examined the plan of the car-shed? Yes.
343. Is it large enough for your purposes? Yes; so far as we can see it will be until the conversion of the eastern system.
344. Would the site allow for further extension if you wanted it? I think not; the land closer to the sea has been taken as a reserve, and fenced in; it was not thought desirable to go further.
345. Looking to the future, you will not want to enlarge that shed? It will be better to take the cars elsewhere.
346. You will have more trams than are running now? Yes, as there is an additional length of 30 chains of line, additional cars will be necessary.
347. There will be a certain amount of passenger traffic right down to that terminus? Yes, but I should not propose to take them all down there. We should still retain the existing loop at Circular Quay.
348. Can your electric cars move backward and forwards, or must they go in one direction? They can be moved in any direction.
349. So that you can shunt at a siding? Yes; shunt at any intermediate crossing-loop.
350. The motor itself can be driven at either end? From either end, and in either direction.
351. In the course of time, when you get more power, you propose converting the Elizabeth-street line also into the electric system? Yes.
352. Would all the trams run into the terminus at Fort Macquarie? No; a number of them would not run to Fort Macquarie; some would circle round in front of the Custom House buildings and go back again.
353. And going down to the Quay, you would have to keep to the "Métropole"? Yes; you would have to run *via* the "Métropole" in going down to the Quay.
354. *Mr. Watson.*] You want to go down where all the ferry boats come in? Yes.
355. And you see the necessity of connecting the ferry boats with the electrical tram services? Certainly; it is very necessary we should connect with the ferry boats.
356. But the whole, or most, of the ferry passengers are not going to the western suburbs, but into town? That is so; at the same time on holidays a very great proportion want to go to the other suburbs.
357. But the ordinary daily traffic from North Shore is of people merely wanting to come into the city? Yes.
358. And you can accommodate them now, as far as George-street is concerned? Yes.
359. And you want to give them the opportunity of running up Elizabeth-street and Pitt-street as well? Yes.
360. That is why you want to go down by the "Métropole" to the Circular Quay? Yes; that is the only way we can get down owing to the gradients.
361. Of course, to get to the Circular Quay is not merely to serve people who have come from North Shore, but rather to serve the numbers of people who go down the harbour and back again? Yes.
362. Will you not have all the traffic congested at Circular Quay? We can keep the circle round the Custom House free from existing lines.
363. Then, the loop round the Custom House will rather be a relief, and without that relief you could not manage it at all? I think it will do for the present.
364. Leaving the future to take care of itself? Yes; I hope that by-and-by the city railway will be constructed, and then relieve the trams of traffic they should not be expected to deal with.

365. In respect to the extension to Fort Macquarie, what proportion of the expenditure should be charged J. Kneeshaw. against the new line down Castlereagh-street and up Pitt-street, and what proportion to the existing service of George-street to Circular Quay? In efficiency the car-shed is expected to hold sixty cars; the additional cars that might be fairly charged to the Castlereagh-street route, bearing in mind the extra distance they have to work from the present terminus at Circular Quay to Fort Macquarie is thirty cars. Therefore we might fairly say that one-half the cost of that shed would be chargeable to their work. That would not include the sidings. 22 Aug., 1900.

366. Well, assuming that the Castlereagh-street line were not constructed, do you think it would still be necessary to have that extension, or one slightly less costly, to Fort Macquarie? I think it very desirable to run on there.

367. At present how do you arrange for additional cars during the busy part of the day in George-street? We bring them from the car-sheds at Ultimo and Newtown, and when we are finished with them we take them back again.

368. Then, many cars make extra trips for nothing? Practically that is so.

369. Otherwise you have to bring them a trip in which they earn nothing? Yes.

370. That is done by a portion of the cars in the mornings and evenings? What we term the broken shifts.

371. Can you say what proportion of the cars that includes? That includes about a third of the total number of the cars. Of course, it would be very desirable to have some of these broken shifts "stabled" at their own end of the yard, otherwise you would be undoing all the good you did.

372. By having two storage ends? Having two or three storage ends, you can economise your work.

373. Mr. Hyam.] Is there not some intention of continuing the tram to Dawes' Point or Miller's Point? I understand the Minister for Works intended to carry out the work.

374. Would that be a continuation of the George-street tram? Yes; the junction would be at the Fire Brigade Station in George-street North. But I fancy the scheme is being held in abeyance, pending the wharf resumptions. It is only a small extension, costing possibly some £15,000 or £16,000.

375. Mr. Watson.] It has been suggested that to relieve George-street on the westerly side some of the western traffic might be taken down George-street in its widest part and then along through Kent-street, branching from Liverpool-street to the back of the Town Hall? That scheme has been considered. I think it might be possible to do something of that sort later on, after the city has been remodelled on the Darling Harbour side.

376. Then if you had, in connection with this remodelling of the city, an opening towards George-street, west of Kent-street, without going into Kent-street proper, that would be of assistance in dealing with the western traffic? It would afford considerable relief.

377. Mr. Hyam.] You have not said whether you advocate any other line, in preference to the line by way of Castlereagh and Pitt streets;—do you think if you had that tram down Castlereagh-street and up Pitt-street you would discontinue the tram from the corner of Liverpool-street to the railway? No. We should still have to run some trams there afterwards. That would be a matter for further consideration. Of course, Elizabeth-street will have to be used in connection with the eastern conversion scheme. We should, in all probability, arrange some means for transferring passengers from Liverpool-street towards the western suburbs.

378. The passengers from the eastern suburbs would have to be transferred to the railway line? We should have to arrange for that.

THURSDAY, 23 AUGUST, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

THE HON. PATRICK LINDESAY CRAWFORD SHEPHERD.

THE HON. ANDREW GARRAN, LL.D.

THE HON. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

Alfred Edward, Registrar. Metropolitan Transit Commission, sworn and examined:—

379. Chairman.] You understand the nature of the inquiry before this Committee? Yes.

380. Mr. Hyam.] Have you any statement you desire to make in reference to this matter? Yes. When I had notice to attend this Committee I prepared a short statement, which I will read. It is as follows:—

A. Edward.

23 Aug., 1900.

THE placing of a tramway upon any other street running between Circular Quay and the Railway would be a distinct disadvantage to the regulation of traffic. The tramway in George-street resulted in a considerable increase in the number of vehicles using Pitt and Castlereagh Streets, especially in the former. It is now under consideration to prohibit the passage of all heavy and slow traffic along George and Pitt Streets during busy hours. If this course is adopted these vehicles will necessarily have to use Castlereagh-street, as it is the only other convenient roadway leading to the Circular Quay, which is the usual terminus. No omnibuses run along Castlereagh-street; but along Pitt-street ninety-two omnibuses run 952 trips each way, and keep up a continuous stream all day long. These omnibuses all turn to the east at Park-street, and go by way of William or Oxford Streets. Pitt-street is undoubtedly the most congested street in Sydney, and it is already a difficult matter to properly regulate the traffic upon it. It is only 36 feet wide; and as I understand it is proposed to lay a single line on one side of the street to admit of the double line being laid at any future time, the space from line to near-side kerb would be 9 feet 6 inches, and as the width of an ordinary omnibus is 7 feet 3 inches, there is not much room for trams to pass. It is evident, however, that unless George-street is to be given over entirely to the trams, and every other description of vehicle removed, that no appreciable addition can be made to the number of cars now running; and already there are far too few to accommodate the passengers on existing lines, to say nothing of those proposed to be opened to electric traction. The width of a double line of tramway would be 17 feet between the two outside rails; the width of an omnibus, as I have already stated, is 7 feet 3 inches; and the space from the tram-line to the kerb on the nearest side would be 9 feet 6 inches, so that there would be hardly room for an omnibus to pass if a double line of rails were laid.

381. You say that Pitt-street is 36 feet wide;—is that from kerb to kerb? Yes; I obtained the measurements from the City Surveyor.

382. Then it is not what they call a chain street? No; it is not.

383.

- A. Edward. 383. Is it narrower than Castlereagh-street? I did not ascertain the width of Castlereagh-street, but I should presume that it would be a little narrower.
- 23 Aug., 1900. 384. You think it undesirable to have a tramway in Pitt-street? I think it would be undesirable from a traffic point of view.
385. I suppose you are aware that it is impossible to increase the number of trams in George-street at the present time? Unless we take all the other traffic off the street.
386. The new electric trams in the end must supersede the omnibus traffic, and if the Commissioners cannot take their lines into some other street, it is the greatest certainty in the world that we must cease to construct tram-lines altogether? If more electric trams are to run from the western suburbs it is inevitable that either Pitt or Castlereagh Streets will have to be used for tram purposes.
387. What influence do you think the George-street tram-lines have had on the omnibus traffic? Wherever the electric tram runs the omnibus traffic has practically ceased to exist.
388. Supposing the proposed tramway is constructed? It will have no effect upon the omnibuses which now run up Pitt-street, for the reason that those omnibuses ply to the eastern suburbs, and the proposed lines are intended for the western suburbs.
389. From the railway? They come from a westerly direction.
390. The railway and possibly the western suburbs? It does not affect the eastern suburbs where the omnibuses ply.
391. When the whole of the steam tramways have been converted to the electric system, what effect do you think that will have upon the omnibuses running to the eastern suburbs? As soon as the trams run up Oxford-street nearly all the omnibuses running down Pitt-street will be discontinued.
392. You mean those running from the Circular Quay? I do.
393. And radiating up to the eastern suburbs? Yes; practically the whole of them will cease to ply when the electric service is extended to the eastern suburbs—that is, to Waverley, Woollahra, and Paddington principally.
394. Then whatever inconvenience these proposed trams might cause it would not be very lasting? It would not continue, perhaps, for more than twelve months. The running of the electric trams to the eastern suburbs will remove most of the omnibuses from those routes. Independently of the omnibuses, there is a large amount of vehicular traffic in Pitt-street which will not be affected by the proposed trams.
395. You state that there is only about 9 feet 6 inches clear between the kerb and the tram line? Yes, on the near side.
396. The space on the wider side of the street would have to be sufficiently wide to allow two vehicles to pass? Yes, to allow them to pass safely.
397. Then it would be better to put one line in Castlereagh-street? Yes; it would be better to have a single line in Castlereagh-street and a single line in Pitt-street.
398. Could not the greater part of the heavy traffic in Sydney be taken into York-street or Clarence-street? No; the greater part of the heavy traffic of Sydney is a direct service from the Darling Harbour to the railway and the Circular Quay.
399. Could not some of the traffic be diverted down Kent-street? To get into Kent-street it would have to go as far as Liverpool-street. Kent-street is very unsuitable for heavy traffic, as there are very heavy gradients in it.
400. The regulation of the street traffic rests a good deal with you? Yes.
401. The question is, how are you going to divert the traffic from Pitt-street in the event of the construction of the proposed tram-line? Whether the tramway is constructed or not, it is proposed to prohibit the heavy traffic from going into George or Pitt Street between, say, Bridge-street and Goulburn-street. The localities are not absolutely decided on yet, but drivers will have to take the traffic into any street they like other than George or Pitt Street. The drift of that regulation is that they would be thrown on to Castlereagh-street; a tram running down the street would not prohibit it, as there would still be a space on the side of the line.
402. Unless it was a double line? Yes.
403. If all the heavy traffic were diverted into Castlereagh-street the congestion there would be as great as it is now in George-street? No, not nearly so great. In my opinion I do not think you could prohibit the heavy traffic from going into Castlereagh-street, if you exclude it from going into Pitt-street or George-street.
404. It is not proposed to prohibit it from going into those streets, but it might occasion a great deal of inconvenience? I think you would have to rely on regulations to prevent the inconvenience. It would be impracticable to prohibit it from going into Castlereagh-street if you prohibit it from going into Pitt or George Streets.
405. From what you have stated to the Committee, I gather that you are opposed to these proposed two lines altogether? I say they would be against good traffic regulations; but I see no alternative to using either one or other of those streets to relieve the congestion of George-street. I think the necessity absolute.
406. Do you think running a single line down Castlereagh-street and up Pitt-street would be better than running a double line along Castlereagh-street? From a traffic point of view, I do not think it would be better; that is, it would be better from a passenger point of view.
407. It is a difficult problem to solve—these means of conveying people in trams? I am sure, from the travelling-public point of view, those who ride in trams, that a single line down Castlereagh and up Pitt-street, is the best; but from a traffic point of view, it is not the best.
408. Dr. Garran.] You spoke just now of traffic from Darling Harbour to stores in Sydney;—do you mean the goods station in Darling Harbour or the private wharves? Principally from the goods station.
409. What is the character of the traffic from the goods station to the warehouses in Sydney? The largest amount of traffic is wool and heavy goods coming from Circular Quay.
410. What kind of goods other than wool? Heavy merchandise, timber, and things of that sort.
411. As regards the wool, have not two or three warehouses been lately erected at Pyrmont, and does not the wool go direct from the railway to them? Yes.
412. And none of the wool intended for those warehouses would go up George-street? No.
413. Unless it is going to the warehouses in the city, that traffic does not cumber Castlereagh-street, Pitt-street, or George-street? No.

414. If the tendency be to multiply warehouses in Pyrmont, that would relieve the streets in Sydney of much of the heavy traffic? Independently of wool there is a large amount of traffic from the Circular Quay, and Woolloomooloo, and Miller's Point, where so much shipping goes. There is for instance a large traffic in salt, cement, and other merchandise, which requires the use of heavy vehicles to carry it. A. Edward.
23 Aug., 1900.
415. But the produce brought down by the railway is principally wool and timber, and if we take the wool into the stores at Pyrmont to that extent, we diminish the wool traffic in the streets named? Yes.
416. And if we develop a timber export trade by building a wharf at Darling Island we shall not have so much timber going through the streets? Quite so.
417. So also with grain—if we make a good grain wharf there we shall get that out of the streets? That would help to relieve the main streets of Sydney.
418. Coming round to the east side of Darling Harbour, the wharfs and places about Sussex-street do not send much stuff into George-street? Yes, a great deal, and there is a great deal that goes to the wharfs and other places.
419. But that is principally intercolonial and coastal produce? Quite so.
420. The stores ordered from the country have to go down Sussex-street towards Darling Harbour? Yes.
421. And you would rather trouble those streets than George-street? The traffic causes great inconvenience in Sussex-street.
422. If we had a good broad street like Sussex-street, but twice its width, and with good gradients, you would have no trouble? The whole of the traffic might then be kept out of George-street by being sent round that way.
423. If we made a wide Sussex-street, do you think we should take the traffic more on the level, by a better gradient? If a wide street were made in place of Sussex-street, and some means adopted for getting rid of the steep gradients into George-street, the difficulty would be greatly reduced.
424. Can you do it in any other way than by coming into Goulburn-street to avoid the gradients? Suppose a load of goods was at Darling Harbour, and you wanted it to go to Circular Quay, you might take it along Sussex-street by easy gradients as far as Margaret-street, but from there to George-street North, somewhere about Dawes Point, the gradient would be too high. But if a tunnel or something of that kind were introduced, the difficulty would be obviated.
425. Then you would propose to make another tunnel, something like the Argyle Cut, leading from Sussex-street into George-street? Yes.
426. You think that would be preferable to taking a longer detour? No; if you make them take a longer detour you could not keep the traffic out of George, Pitt, and Castlereagh Streets.
427. But, as the city is laid out at present, we cannot continue Sussex-street northwards with any great width? Not further than Margaret-street, unless you take the Gas Company's property.
428. Then your scheme for the city improvement would be to commence at the gas works and turn to the right in a tunnel? Practically, near Margaret-street, if a tunnel could be made from there towards the Queen's wharf.
429. That is your idea of removing the difficulty? That would remove the risk of these heavy goods going down George, Pitt, and Castlereagh Streets.
430. The traffic from the upper part of Darling Harbour;—is that circulated amongst different stores, or does it nearly all go to the Circular Quay? It nearly all goes to the Circular Quay.
431. What for? I do not know what for. But if you see the vehicles going from Darling Harbour, you invariably see them go out at Liverpool or Goulburn Street down to Circular Quay.
432. Why should produce taken from Darling Harbour go to the Circular Quay;—does it go there to be shipped? I think most of it comes by rail.
433. That would be true with regard to produce coming by the railway terminus, but not as regards produce coming by coastal and intercolonial boats? No; that is divided into all the streets. The probability is that the produce, when landed, goes along Sussex-street until it reaches George-street.
434. By turning up Hay-street? Yes.
435. Take the York-street traffic. Does most of it climb up these streets with steep gradients? Yes; they pull it up through Erskine, King, or Market Streets.
436. And then it goes in various ways? Yes, everywhere.
437. Does much of it go to the Railway Station? I am not aware; I fancy much of it is taken to the city stores.
438. All this country produce sold at Redfern is exclusively what comes down by railway? I think so.
439. So that practically we have two markets in Sydney—one for produce brought down by railway, and one for produce brought down by way of Darling Harbour? Yes.
440. Since the wharfs were built in Woolloomooloo Bay a very large quantity of cargo from there, I notice, comes by way of Boomerang-street? Yes.
441. The wool mostly goes up Macquarie-street? Yes, except that which is intended for the stores at Darling Harbour.
442. Does that travel by way of George-street or Pitt-street? They prefer, as a rule, to go by way of George-street.
443. Most of the wool is destined for warehouses at the Circular Quay? Yes; some of it goes direct from Darling Harbour to Woolloomooloo Bay.
444. Could not that carriage be more cheaply done by lighters? Practical experience points the other way.
445. Now let us come to that part of Darling Harbour between the gas-works and Dawes Point;—some of the best wharfs are there? Yes. The Chinese boats for instance lie there.
446. When the cargo is unshipped there, do they struggle up the hill with it? The cargo from the Chinese boats, for instance, is taken through a narrow little lane in which two vehicles can scarcely pass each other.
447. About as bad a transit arrangement as could be made? Could not be worse; many a horse has been killed going down that lane.
448. In regard to the widening of Sussex-street, could we get any deviation about the Gas Company's property? You would have to go through the Gas Company's property.
449. Not even by tunnel? Back to the wharfs again.

- A. Edward.
23 Aug., 1900.
450. Yes? There is a steep decline from Kent-street to the water all the way round to Dawes Point.
451. A piece of that land belongs to the City Council? Yes; that shows the slope—the original slope of the ground.
452. Originally it was very rocky all the way to Gas-lane? Yes.
453. Could Sussex-street be improved from there round as far as Dawes Point towards the Circular Quay? I do not see how a roadway could be made from the northern side of the Gas Company's property round to Dawes Point, near the water's edge, except at very great expense.
454. Is there space for it between Kent-street and the shore? More than enough space for any roadway.
455. Your new street would almost lead back to Kent-street? The street would be about 100 feet wide, and I think that would leave another 100 feet.
456. With regard to the present, how far does the traffic which comes from that part of the harbour hamper George-street or Pitt-street, or Castlereagh-street? The traffic coming from Miller's Point practically does not hamper George-street very much at all, it goes along to the junction of Kent-street and Fort-street, but the gradients in Kent-street are so bad that the carts very frequently come along York-street and Clarence-street, and enter George-street near the Town Hall; then they are a nuisance.
457. Going along Kent-street many of the warehouses in York-street would have their goods landed at them? They could do so, but they are few; that would not represent much of the traffic.
458. A good deal of hardware would be delivered? Yes; there are a good few warehouses like McArthur's and Lassetter's which would be west of George-street. The vehicles going there would not occupy any portion of George-street.
459. There is a good deal of traffic in Sydney that does not bother George-street at all? Yes; but if you go into George-street during any portion of the day you will see a large number of these heavy vehicles in the street.
460. With regard to those vehicles carrying sawn timber—I see a number of those occasionally about in the busy street in the middle of the day? Yes; and many carts with iron too.
461. Is there no regulation in regard to that? A regulation is being framed now; it has not been passed yet, but the effect of it will be that no heavy or slow vehicle, which, from its construction or loading proceeds at a walking pace, shall go into George or Pitt Streets, between Bridge and Goulburn Streets. Their chief obstruction does not arise so much from what they carry as from the pace they travel at. That traffic will be prohibited from going into those streets. The regulation will also provide that no loading beyond a certain height shall be allowed. For instance, some of the wool loads extend 20 feet from the top of the drays or waggons, and that is a dangerous load.
462. Looked at from your point of view, which is that of the inconvenience of those who walk or drive in the streets, the effect of making these two tram-lines will be distinctly to increase the discomfort of that class of people? It will be a distinct disadvantage from a traffic-regulation point of view.
463. The effect of putting a tram down a street is to spoil it for vehicles? Quite so. They absolutely spoil it for comfort and for vehicular traffic.
464. So that the fewer the streets occupied by trams the better for the public, excepting those who ride in the trams;—so that any advantage we gain in one way we lose in another? There is constant danger in putting trams in congested streets, such as George-street or Pitt-street.
465. Can you see any other remedy for it? I do not. I see no alternative but to run trams down some other streets, unless you continue the steam trams as at present.
466. But they will be continued on the electrical system? But they will want another street or two; the steam trams could be continued in Elizabeth-street, but with the introduction of electric trams the use of other streets is necessary.
467. I would like to point out to you that Mr. Kneeshaw, in giving evidence before the Committee yesterday, told us that they were running one-minute trams down George-street, and also one-minute trams along William-street; if these two tram-lines are constructed in Castlereagh-street and Pitt-street, the tram along King-street will have to cross tram-lines at George-street, Pitt-street, Castlereagh-street, and Elizabeth-street;—would that create any difficulty to the rest of the traffic? The trams up King-street would be running at one-minute intervals, and that would, undoubtedly, interfere with the other traffic. Naturally, the more streets you occupy with trams, and the more intersections there are to cross, the more congested will the traffic become, because the other traffic must give way to the trams.
468. There are still a good many omnibuses going up King-street? The minute tram service will soon stop them.
469. Some of these omnibuses go as far as the Edgecliffe-road;—will they be stopped? I think so; there will be no 'buses on the Edgecliffe-road after this week.
470. There are still some 'buses going to St. Vincent's Hospital, Potts Point, and Elizabeth Bay? It will have the same effect on them.
471. Then if branch omnibuses are not introduced to those places, the people living there will be worse served than they are now? That is a difficulty to be considered. I do not think it will pay to run 'buses. It would not pay to run a branch 'bus from William-street to Potts Point. It certainly would not pay at penny fares. The experiment was tried of running a penny 'bus along the Darling Point Road, where it met the tram. At first the fare was 2d.; but the revenue only amounted to about 6s. per day, and it cost £1 per day to run the 'bus. Then they tried it with penny fares. Then the revenue was only about 5s. per day; and, of course, the 'buses ceased running.
472. Then the effect of this new system of tram service will be to increase the convenience of those living exactly on the lines of the trams, but it will decrease the convenience of those who live at a distance from the tram-lines? Yes; they will have to walk to the trams.
473. It is a long way from Elizabeth Bay to the tram? Yes; I dare say they will try to run a 'bus from Elizabeth Bay into the city, but I do not think it will pay.
474. With regard to the difficulty I pointed out about those four streets having cross lines, will it be got over by the elimination of the omnibuses altogether? Yes, so far as the 'bus traffic is concerned; but all the other vehicular traffic must be inconvenienced.
475. Do you think these four crossings will materially interfere with the ordinary traffic? I think it will have the effect of compelling people to drive up Market-street.
476. A tram down a street is a benefit to the shopkeepers of that street? They think so.
477. It is a good advertisement for them? Yes; people can get to the shops at a cheap rate.

478. Before we had the trams in George-street to take the people, do you think as many people went down Elizabeth-street every day as went down George-street? Yes; in vehicles and trams.

479. Did the trams down Elizabeth-street take as many people who wanted to go to the business houses as went down George-street? Not if you include the walkers. Those who rode in 'buses or trams in Elizabeth-street were twice as many as those who rode in 'buses along George-street.

480. We need expect no opposition from the Pitt-street shopkeepers? No; the only way it would militate against the shopkeepers is at such places as the Co-operative Stores, Hordern Brothers, and other places to which a large amount of what we may call carriage purchasing people are brought. They are sure to fight shy of the trams as much as possible. It would not affect Farmer's, because carriages could pull up in Market-street. Once you put a tramway in Pitt-street it would never do to allow vehicles to stand there.

481. Do you recollect the double tram line that ran down Pitt-street many years ago? Yes.

482. There were great complaints then? Yes; I think from the shopkeepers' point of view they would prefer a tram down Pitt-street, because for every person who comes in a private vehicle there would be 500 come in the tram. In respect to George-street, the shopkeepers there were exceedingly anxious for the tram to be laid along that street.

483. Do you think the traffic in George-street has increased since the tramway in George-street was opened there? I think it has.

484. And other streets have been correspondingly affected? I think so.

485. So that the people in other streets who have shops would like to get that traffic back again? I dare say they would.

486. *Mr. McFarlane.*] What effect has the electric trams in George-street had in regard to the other traffic? They have had the effect of running off a large number of 'buses, and they have proved a nuisance to drivers and pedestrians; the tram bells are constantly ringing to warn people out of the way, and everybody who can goes out of George-street into Pitt-street to get out of the way.

487. Then it has had the effect of removing a portion of the traffic from George-street? Yes; part of the vehicular traffic has gone into Castlereagh-street and part into Pitt-street.

488. The traffic in those streets will therefore be more congested? Yes; Pitt-street is ever so much more congested.

489. How many lines of 'buses removed from George-street? No lines of 'buses have removed from George-street to Pitt-street, but a large number of omnibuses that used to run down George-street have been discontinued altogether.

490. The discontinuation of the omnibuses is owing to the trams? Yes; wherever a tram runs the omnibuses cease to ply. They cannot make a living.

491. What is your opinion concerning another line of tram down Pitt-street and down Castlereagh-street? To put any tram in either of those streets is a distinct disadvantage from a traffic regulation point of view. But I think it is inevitable that one or other of those streets should be taken for the convenience of tram passengers.

492. Where would the traffic in Castlereagh-street be likely to go? It must stay in the same street. There does not seem to me to be any street running in the same direction where it could go to.

493. Would not the trams have the effect of lessening the traffic generally, in addition to causing a discontinuance of a number of lines of omnibuses? It would only affect the omnibuses. This proposal would not have an immediate effect upon the omnibuses in Pitt-street, which ply to the eastern suburbs. It is not proposed to make these new tram-lines serve the eastern suburbs. Directly the whole tramway system is converted into an electric system and electric trams are run to the eastern suburbs, the whole of the omnibuses will cease to run in Pitt-street.

494. Is it at all likely that there will be a large pick-up traffic in Castlereagh-street? Very little; but there will be a large pick-up traffic in Pitt-street, going back towards the railway; but coming into Sydney there would be scarcely any pick-up traffic in Castlereagh-street.

495. In view of that do you think it more desirable to have the two lines of trams in Pitt-street, instead of one in Pitt-street and one in Castlereagh-street? I think it would be highly dangerous to put a double line of trams in Pitt-street.

496. But there are two lines of trams in George-street? But that is a wider street. Pitt-street is only 36 ft. wide. The number of vehicles traversing Pitt-street is equal to the number in George-street, and Pitt-street is much narrower.

497. *Mr. Watson.*] In the statement you made at first to the Committee, I think you said that if two lines were constructed in Pitt-street the space between the outer rail to the kerb would be 9 ft. 6 in.? Yes.

498. So that would leave room for an omnibus to pass? There would be barely room for an omnibus to stand. The space would be too narrow for an omnibus to travel.

499. Have you allowed for the tram-car over hanging the rail? No, I have only taken the width of the line.

500. The car goes over another foot? It goes over a good deal; but I do not know whether it is a foot. The distance between the two outer rails is 17 feet, leaving 9 feet 6 inches on either side, between the rail and the kerb. In my calculation, I did not allow for the overhanging portion of the car.

501. What you say is, that the result of running trams on what were formerly 'bus routes, always injured the business of the 'buses? Yes; wherever an electric tram-line runs the 'buses have ceased to run.

502. We should like to have your opinion as to the preferable method of dealing with the passenger traffic with tram and 'bus—which is the casier, leaving out for the moment the convenience of passengers,—what is the best mode of transit from a traffic point of view? I would sooner regulate the 'buses than the trams.

503. Do you think you could allow ordinary vehicles, private vehicles, say, better facilities, if you had to carry the same number of passengers by omnibus as are now carried by tram in George-street? I think it was casier to regulate the vehicular traffic in George-street, when the 'buses carried the passengers than it is now when the trams carry them.

504. But the circumstances are slightly altered: I understand there is much more danger to people travelling in George-street now than there was formerly—assuming you had to find a number of omnibuses to carry the same number of people that are now carried by tram; do you think you could deal with the general

A. Edward.
23 Aug., 1900.

- A. Edward.
23 Aug., 1900.
- general traffic as effectually as is now done? The street would be more congested, but there would be less danger attached to the traffic.
505. That means that though people would travel more slowly they would be safer? Yes.
506. *Mr. Shepherd.*] I think I gather from your evidence that you are not favourable to the proposal to put a line down Castlereagh-street, and up Pitt-street? I think it is inevitable that trams should be run in one or both of those streets; but if you look at it from a regulation traffic point of view, it is very objectionable to have any more streets taken up with trams. But I look upon it as inevitable for the convenience of passengers coming to and from Sydney, that one or both of those streets should be taken up for tramway purposes.
507. Do you think a single line down Castlereagh-street and another down Pitt-street will answer? I think if a line were laid in the centre of the roadway in both streets it would be less inconvenience to traffic.
508. You think a double line along Pitt-street would leave too small a space on each side for the general traffic? Yes, I think so. I understand the Commissioners wish to lay one line on one side of the road so that at any time they wish they can duplicate it. That would be almost as bad as to put down a double line at once, for a second line would be bound to come.
509. Do you not think it indispensable that George-street should be relieved of some of its traffic? I think it essentially necessary.
510. It is overdone at present? I think so.
511. Do you not think the construction of a line down Castlereagh-street would relieve George-street? Yes; I think so from a tramway point of view.
512. Have you any idea of any other proposal that could be made in lieu of this? Not unless it be the one that is so often referred to, that is the bringing of the railway into the City. I do not think the present proposal would be necessary if a railway were brought into the City for passenger traffic as far as King-street; there would be no necessity for either of these lines then.
513. Do you think it would be possible to also utilise one of the western streets for tram traffic—that is, a street west of George-street? There is no street west of George-street that opens up as far as the railway.
514. You might branch off at some street? The nearest street that you could branch off is Kent-street.
515. Not at the Haymarket? No; unless you resume private property, Kent-street ends at Liverpool-street. I think if you ran a double line of trams along Castlereagh-street, and did not use Pitt-street for the return traffic, most of the people would go to George-street to get home; they would not walk to Castlereagh-street; you generally have to bring them up to their doors, especially when the transit service is under Government.
516. Do you think it desirable to take this proposed tramway all the way to Fort Macquarie? I do. I think that should have been done long ago.
517. Would that not be a considerable distance, and would there not be very little traffic? There would be no necessity to run all the trams there; they need only run certain of the trams, but the laying of the line is a necessity.
518. On the whole, you are favourable to the proposed scheme on the supposition that it is inevitable? Yes, I see no alternative. The only alternative I see is to run a double line down Castlereagh-street; but to run a double line down Pitt-street, I think, would be a highly dangerous thing to do.
519. *Chairman.*] Could you give a rough idea of the percentage of traffic in Pitt-street now, which is purely 'bus traffic—that is, the number of omnibuses compared with the number of other vehicles? I think it represents about one-third of the vehicular traffic in George-street.
520. So that even after the conversion of the present steam-trams to the electrical system, and after the traffic was removed from Pitt-street, the placing there of trams would make the street more congested than it is now? I think so, particularly whilst the 'buses remain there. But even if all the 'buses were off, I think the laying of a single line of trams along Pitt-street will congest the traffic quite as much as all the 'buses that are there now do.
521. Do you think it practicable to place the line in the position the Commissioners propose? It would be very risky; it might cause great delay to the trams, if the drivers of vehicles liked to be at all obstinate. To allow a tram to pass any big vehicle such as an omnibus, that vehicle would have to go practically quite close alongside the kerb—a dead parallel with the kerb. If you look at Pitt-street you will not find 30 yards of it at any given place, between Hunter-street and Bathurst-street, that has not got one or two vehicles standing alongside the kerb. Every passing vehicle has to go outside of them, and necessarily would have to pass on the tram-line.
522. Do you think, then, that the placing of the line in that position is so serious that it should not be considered for a moment? I think it would be a good idea to stop the Commissioners from thinking of putting down a double line in Pitt-street. I think they should put down only one line, and that should be put in the middle of the street.
523. Would the construction of a single line in the middle of the street be a serious detriment to the traffic? Far less detriment than putting two lines.
524. It would be less serious? I do not like the idea of a tram in Pitt-street at all, but it seems to be inevitable. If you put both lines down in Castlereagh-street, the people would stick to George-street.
525. Do you know of any city in the world that has streets so narrow as Pitt-street? I am not much acquainted with other places.
526. *Mr. Shepherd.*] You spoke of heavy drays being an obstacle to traffic—would it not be possible to restrict that heavy traffic to certain hours of the day? A regulation is now being framed which will prohibit heavy vehicles from proceeding at a walking pace in George or Pitt streets, between Bridge-street and Goulburn-street, between the hours of 8 o'clock in the morning and 6 or 7 o'clock in the evening.
527. That would relieve the traffic of a certain amount of danger? Yes, but the difficulty is that when you put that traffic out of Pitt and George streets, it will go into Castlereagh-street.
528. I suppose these heavy drays must run in some street? Provision will be made for that.
529. Could you not restrict them to certain hours when the trams are not used? Make them deliver everything before 8 o'clock in the morning? Most of the Bonds are not open till 9 o'clock in the morning.
530. It is during two or three hours in the morning and two or three hours in the afternoon when there is an excess of traffic in George and Pitt streets? Yes.
- 531.

531. If these heavy drays were allowed to ply outside those hours, would not that be a relief to the traffic? I think they will be prohibited in Pitt-street and George-street between the hours of 8 in the morning and 7 at night, except when they want to deliver goods at any place within certain boundaries, then they will be allowed to do so from the nearest intersecting street.

A. Edward.
23 Aug., 1900.

532. *Dr. Garran.*] With regard to the Circular Quay—all these trams are intended to debouch into Circular Quay? Everyone of them.

533. With minute trams down George-street and down King-street, and one every three minutes down Castlereagh-street and Pitt-street, and the pretty heavy traffic down Elizabeth-street, will all that be able to circle round at Fort Macquarie without stopping your heavy traffic to the steamers' wharfs? I do not think it would have any serious effect; nearly all the cartages on this side of the Quay do not cross the tramline.

534. Once they get on the Quay side of the trams, they are all right? Yes. There would be exceeding great difficulty in regulating all the trams on the Circular Quay. Those running there now take up a large portion of it; and when the traffic from the western and eastern suburbs is brought down there, it cannot be regulated without some of it going up to Fort Macquarie.

535. All this traffic will have to cross this line once? Yes.

536. There will be trams coming every minute almost? Yes. Supposing they came from George-street down to Queen's Wharf, they would have to cross the line twice, because they would have to cross it at the Quay proper as well.

537. I want you to consider all these trams at work;—will there be no difficulty to those drays which are coming and going to the ships in having to cross? Yes, there would be more difficulty than there is now, because the trams are now comparatively few compared to what they will be when the eastern and western suburbs are added.

538. You cannot spare any more space at the Circular Quay for another two lines of tram rails? You could on the Quay proper, I think, because the 'buses would be taken away from there; but I do not think you could spare enough space if the continuation of the line to Fort Macquarie was not made.

539. From the foot of Phillip-street to Fort Macquarie? I do not think there would be room for four lines there.

540. But there will be great risk and difficulty with the traffic? There will be great risk of congestion when all the trams run there, they will be so frequent. The difficulty would be increased when there is a large steamer coming in and discharging a large number of passengers who want to go everywhere at once. Take, for instance, a holiday steamer returning from Manly—it has been the custom for vehicles to wait for the people, and then they will all start at one moment. Of course that is so now on the arrival of any crowded North Shore steamer, at the busy time of the day. The passengers by it want to go to almost everywhere. If the trams started at one minute intervals, and they went to twelve different destinations, some of the people would have to wait twelve minutes before they could get a start. You must have some means of sending them away quickly.

541. So far as the ferry passengers are concerned they have been greatly inconvenienced by the construction of the tramlines on Circular Quay? I think it has proved a great convenience to people coming from the North Shore.

542. Has it perceptibly diminished the omnibus traffic in George-street? As I have said, wherever the tram runs the omnibuses cease to run.

543. Ladies prefer to take the tram when going to David Jones's, or Farmer's, or Hordern's? Yes.

544. They used to take the omnibus? They used to take the omnibus up George-street or Pitt-street. There was a line of 'buses on each street, running from the Circular Quay to the Railway. There was also a line of 'buses running from the Circular Quay to Toohey's brewery, in Elizabeth-street, to Foveaux-street; but people seem to prefer the trams to the 'buses, even though they might be landed nearer to their destination by 'bus.

William Greenwood, A.M.I.C.E., sworn and examined:—

545. *Mr. McFarlane.*] Have you given much consideration to the proposals now before the committee? Yes. It was originally proposed to run a double line of tramway down Castlereagh-street, with the view of relieving the George-street tramway of the railway traffic. But since the evidence given by Mr. Deane, Engineer-in-Chief of the Railway Construction Branch, Works Department, and Mr. Hugh M'Lachlan, Secretary to the Railway Commissioners, it has been proposed to lay a single line along Pitt-street and another along Castlereagh-street, with the view of putting a double line down each street at some future time. In my opinion the Castlereagh-street line would not take 10 per cent. of the railway traffic.

W.
Greenwood.
A.M.I.C.E.
23 Aug., 1900.

546. Would the line be insufficient to carry the traffic? No. But human beings cannot be made to go like a lot of sheep. The people want to go down George-street, not along Castlereagh-street. Therefore you would not get more than 10 per cent. of the passengers to go down Castlereagh-street, even if you got as much.

547. Do you think they would object to walk the short distance from Pitt-street to Castlereagh-street? I think they will prefer to walk from the railway bridge in George-street into the station.

548. You think they would not take the tram down Castlereagh-street? No, not 10 per cent. of them.

549. *Mr. Watson.*] You think they would prefer to walk from the bridge to the station? Yes. Even now if a person wants to go to Leichhardt or Forest Lodge he walks to the bridge; and people will do the same when you have put trams down Castlereagh-street.

550. *Mr. McFarlane.*] Do you not think that, if the George-street trams are as overcrowded as they are now, people will not prefer to walk a short distance from Castlereagh-street? No, you have practical experience of that. The steam trams ran in Elizabeth-street from Newtown, but when the electric trams were put down George-street no one patronised the steam trams in Elizabeth-street. People took the George-street tram because it was to George-street they chiefly wanted to go.

551. People prefer to travel by the electric tram rather than by the steam tram? Not necessarily. Whilst they were running the steam trams from Newtown, many people paid their fare on the section as far as the railway bridge, and then left the steam tram and got on the electric tram, paying another 1d. for the George-street section.

552. I suppose you are aware that the traffic in George-street is very congested? Yes.

W.
Greenwood,
A.M.I.C.E.
23 Aug., 1900.

553. What remedy would you suggest? The obvious one is to construct a railway into the city. At the present time tramways are being, and are proposed to be, extended to the extremities, thus bringing more traffic on the trunk lines, and causing congestion, not relief as needed.

554. Do you think, if there was a city railway with a terminal station at the top of King-street, that people would walk from George-street to that station in preference to taking the tram? No.

555. For the same reason they would not walk from George-street to Castlereagh-street to reach the tram? Most assuredly not. You will see that the Railway Commissioners, in their report recently issued, state that formerly 3,000,000 railway passengers travelled by the steam trams every year; but now 9,000,000 railway passengers travel by the electric trams, simply because they want to get to George-street, or to the west of it.

556. What would you suggest in lieu of the present proposal? First of all, a railway on the western side of the city. It should start from Devonshire-street and cross George-street at Bathurst-street. There should be a station at Bathurst-street and another at Wynyard-square, and another at the Circular Quay, making three stations in the City instead of one at King-street. That would relieve the George-street traffic immediately. Still that would only be a portion of a complete scheme of a railway that would eventually run to the eastern and southern suburbs, which would still further relieve the tram traffic.

557. In regard to the City tramway extension, could you suggest a better scheme than the one that has been proposed? Use your present Elizabeth-street line as far as Bent-street, and then from Bent-street go down to the corner of the Hôtel Métropole.

558. Are you aware that the Railway Commissioners propose to have the whole of the tramways converted to the electric system? Yes.

559. Would not that cause a greater number of cars to be run than are running now? Yes.

560. In view of that, do you consider that what you now suggest would prove to be the best? You have now trams in George-street to carry part of the traffic that was formerly carried in Elizabeth-street.

561. You consider, then, the present proposal to be unnecessary? Absolutely a waste of money. There would not be any revenue from it.

562. Do you not think there would be an increase of passenger traffic as the Railway Commissioners anticipate? A railway would carry ten times as many passengers as a tramway could. Even when a railway is constructed, there would always be a large number of people to be carried by the tramways.

563. The last witness examined by this committee stated that wherever a tram was extended, the omnibus traffic was done away with? No doubt it does away with a large portion of it; but there is such a thing as live and let live; and I think there is plenty of traffic for both buses and trams. The terminations of the bus journeys are generally wide apart from the trams, and numbers of people would travel by omnibus to reach their homes. The Railway Commissioners reduced the tram fares to starve the omnibuses, with the result that the charges on the railways are double as much as they are on the trams.

564. But does not the reduction of fares mean an increase in the passenger traffic by the trams? Yes, but you take it from your railway, which is not overcrowded!

565. Not in every case? At present I can go from the railway bridge in George-street, by tram, to the Newtown Railway Station for a penny; but if I went by train to Newtown I should have to pay twopence.

566. *Mr. Watson.*] A season ticket holder would travel much cheaper? Yes, but the bulk of the passengers who travel between the railway bridge and St. Peters are not season ticket holders.

567. Would it not be cheaper to take out a season ticket from St. Peters to Sydney? A workman's ticket is the cheapest thing you can get. A workman's ticket from Newtown to Sydney costs a penny, but an ordinary person has to pay twopence, and threepence first class. The return journey, second class, costs fourpence. Whereas the ordinary fare by train from Redfern to Newtown Bridge is twopence, a person can travel by an electric tram to a point a mile beyond Newtown Bridge, *i.e.*, Enmore terminus, for one penny. They are simply starving the railways to benefit the tramways. The railway traffic is carried at about fifty per cent. of working expenses, the tramway traffic is carried at ninety per cent. of working expenses. So that the profitable traffic is diverted from the railways to the tramways.

568. That is in cases where the tramways run near the railways? Not always.

569. Do you think, from the enormous amount of traffic on the George-street trams—which is greatly in excess of the estimate of the Railway Commissioners,—that the Commissioners would be justified in making additional provision for meeting the increased traffic? The Railway Commissioners have not properly gauged the traffic in advance.

570. If the present proposal be carried out, do you think the result would be similar to what has taken place in George-street? No, it would not take 10 per cent. of the passengers from George-street.

571. Is there any local traffic in Castlereagh-street? No, none. There are a hundred people in George-street for every one in Castlereagh-street. The amount of traffic in George-street is a hundred times greater than that in Castlereagh-street.

572. In the event of the present proposal being carried out, do you think it would largely interfere with the traffic? Most assuredly. In Pitt-street it would be simply impossible.

573. Do you think the street is not sufficiently wide? Castlereagh-street is sufficiently wide to lay down a line.

574. Do you think it would be better to have two lines in Castlereagh-street than to have one line in each street? You cannot have a line in Pitt-street in any case, not even a single line, whilst a double line would be absolutely unsafe.

575. In the event of the Elizabeth-street line being found insufficient for the passenger traffic, what other proposal do you think would be most desirable? Certainly; extend your railway into the city first.

576. But apart from the railway? As a matter of fact, you must have some streets for your vehicular traffic, and Castlereagh-street is not suitable for it. You have steep grades from all wharfs. The only two streets suitable for vehicular traffic are George and Pitt streets.

577. You think, then, it will be found necessary—if the present proposal is found to be the best—to lay the lines down in Castlereagh-street? If absolutely necessary, Castlereagh-street is preferable to Pitt-street.

578. Do you think it desirable to go west of George-street? The only suitable street west of George-street is Kent-street, and that is only suitable for a single line. But there is not sufficient traffic to warrant the construction of a line there at the present time.

W.
Greenwood,
A.M.I.C.E.
23 Aug., 1900.

579. Would it not be distributing the passenger traffic better to have a line west of George-street, seeing that Elizabeth-street will soon have to carry the additional passenger traffic from the eastern suburbs? In that case what I would do would be to continue the Elizabeth-street line down Young-street, then turn on to the Circular Quay; go along George-street North, then along Port-street to Kent-street, along that street to Liverpool-street, and then double back to Elizabeth and Oxford streets, by way of Liverpool-street, so forming a complete circle. I would only put a single line in Kent-street, not a double line. By that means people from the eastern suburbs could be taken to Kent-street, and they could be picked up there on their return.

580. *Mr. Hyam.*] Would you have a single line in the centre of the street? Yes.

581. *Chairman.*] I understood you to say that we could not force the people to leave George-street? They are accustomed to it, and desire to go there.

582. The object of the present proposal is to relieve George-street of the railway traffic? Yes.

583. And you propose to shunt it down Elizabeth-street? I do not say send the railway traffic down Elizabeth-street.

584. What traffic do you propose to take down Elizabeth-street? At the present time the bulk of the railway passengers do not go along Elizabeth-street. I do not think more than 10 per cent. of the passengers go that way.

585. In what way would your proposal to send electric trams down Elizabeth-street ease the George-street trams? The only way to relieve the George-street traffic is to extend the railway into the city.

586. You do not attach much importance to your proposal to send electric trams down Elizabeth-street? The Commissioners admit there will not be any revenue from it except from the growth of traffic.

587. Presuming that the railway electric trams, instead of going down George-street, were sent down Castlereagh-street, do you think the railway passengers would prefer to walk the distance from the railway-station to the bridge rather than jump into a tram and walk to George-street from the other end? Most assuredly.

588. I think you said it was not possible to put a tram down Pitt-street from a practical point of view? I think so.

589. Can you give your reasons? Mr. McLachlan stated the line would be laid down one side of the street, and that it would be duplicated when found necessary. As a matter of fact there would be no room for an omnibus to drive there. The exact space between the tram and the kerb might be enough to allow an omnibus to stand, but there would not be enough space to allow a bus to travel with safety.

590. *Dr. Garran.*] Your scheme for going down Elizabeth-street and Castlereagh-street would satisfy people living or having business between Bent-street and Circular Quay—but suppose people want to get down at the cross streets, going towards Pitt-street, it would not accommodate any of those? No, as a matter of fact 90 per cent. of those people would walk from the Railway Station to the bridge. At the present moment passengers coming by railway and wishing to go along Elizabeth-street have either to walk to the bridge or down the stairs and under the subway to Devonshire-street to get a Waterloo tram.

591. You mean to say the people who by preference would want to go down Castlereagh-street are a negligible quantity? Quite so.

592. But it is only proposed to go down Castlereagh-street to get out of a difficulty? Yes.

593. It is not a question of where they want to go? No, but I say that what is proposed will not remove the difficulty.

594. Do you think that 10 per cent. of the passengers who want to go down Castlereagh-street would be content to be taken down Elizabeth-street? Yes; they do so now.

595. Taking the railway traffic going back, it has been pointed out to us that people would readily go from George-street to Pitt-street to get a tram to the Railway, but they would not walk up the hill to Castlereagh-street—do you agree with that? No; what I say is that the bulk of the general public is in George-street, and west of that street. Of course there is a portion on the eastern side of George-street; but the bulk of the passengers would go to the George-street trams. You could not force them to go to Pitt-street or Castlereagh-street. The distance they would have to walk from the bridge to the station would be shorter than the distance from George-street to Pitt-street. Hence they would take the first tram they came to.

596. You remember that under the proposed system, the connecting wire between George-street and the Railway Station could not be made use of? That is so.

597. And the people going to the railway would have to cross George-street at a very congested part? Yes.

598. Do you not think that ladies would prefer to go into Pitt-street and get a tram that will take them direct into the station, rather than take a tram that will cause them to walk from the railway bridge into the station? I do not think so.

599. *Mr. Watson.*] Do you think the distance from George-street to Pitt-street, at the northern end of the town, is greater than from the railway bridge into the station? The shorter distance is from the bridge to the station.

600. *Dr. Garran.*] Coming to the Circular Quay, where all these tram-lines are to run, do you think there would be a congestion of traffic on the Quay which would interfere with the dray and general vehicular traffic? I think it would damage the whole of the wharf property to extend the tramways on the eastern side of the Quay; it would depreciate both the wharfs and the storage property to from one-third to one-half its value.

601. At present the trams do go a part of the distance? Only in one corner, and that is for the purpose of facilitating shunting operations. My suggestion is that there should be a complete circle.

602. What I want to get at is, whether, with minute trams running there all day long, we shall be able to safely conduct the vehicular traffic to and from the wharfs and ferries? No; it is frequently the case that the street on the eastern side of the Quay is covered one-half its width with goods of one kind or another.

603. Have you watched the traffic since the electric trams were taken there? Yes.

604. Have they thrown any difficulty in the way of loading or unloading steamships? No.

605. But if increased, and the lines were carried to Fort Macquarie? Most assuredly; the proposal to extend the line to Fort Macquarie is wrong. The sheds should be put on land that is cheap.

606. But it is Government land? Whether or not it is of value.

W.
Greenwood,
A.M.I.C.E.
23 Aug., 1900.

607. You still adhere to the idea you expressed that the proper way to deal with the railway traffic coming into the city is by a railway? By a railway we should have stations *en route*.

608. Suppose the proposal to establish a railway station at Belmore-road is carried out, and that we find, after experience, that the trams cannot accommodate the railway passenger traffic in addition to their own, we should be just as well off in regard to making an extension into the city as we are now? Before you place your station at Devonshire-street you should first of all settle the point as to whether or not it is to be a through station or a terminal station, and unless you settle that point and determine where the city railway is to be extended to, you cannot decide the position of your station or settle the matter finally.

609. Could we not make a station with a frontage to Belmore-road, so arched and arranged as to allow of trains going through to the city afterwards if necessary? In designing a station you try to keep your roads in a straight line. And all your platforms and roads should be in a straight line. If the station is to be a very long one, a very slight deviation in the direction you are going—whether to King-street or Hyde Park—makes all the difference in regard to the design of the station. Apart from that, you make totally different arrangements for your platforms. Before designing a station you should determine whether it is to be a through station or a terminal station.

610. You would have no difficulty in coming down a grade of 1 in 60. Suppose we start in Belmore-road on a level with the present line; Mr. Deane objected that your line had to go 1 in 60, starting from Devonshire-street—but suppose we did not start at that going to Belmore-road—would that affect your proposal? The 1 in 60 grade is only from Wynyard-square to Circular Quay. The reason is that at Wynyard Square you want to keep as high as possible, in order to meet a projected North Shore line, and to keep low at the Quay, so as to go beneath the roads, in order to obstruct them as little as possible. I do not think the 1 in 60 grade an objectionable grade at all.

611. Could you descend from Belmore-road to Bathurst-street by a grade of 1 in 100 on your plan? I do not think so. The question of grades is this: in my line I did not disturb the surface of any streets except Pitt-street and Circular Quay—I exclude Devonshire-street because that may be blocked or lowered. If it were desired, we might, perhaps, get a better grade by lowering a street like Goulburn-street a foot or two.

612. By your route, could you get from Belmore-road down to your first station at Bathurst-street with a grade of 1 in 100? Yes, it might necessitate varying a street level a foot or two.

613. I am only asking this question in the possible view of a tramway service from Belmore-road. I want to know whether your scheme could still be carried out? But that station, plus this tramway, brings in no revenue, and would cost as much as a city railway. It would not attain the object aimed at; that is, liberating the traffic in George-street.

614. I am only anxious to find out whether in case we find this extension of the terminus insufficient, the placing of this station in Belmore-road would be a hindrance to us or not, if any future extension of the line into the city either by your route or anybody else's became necessary? The general direction of the Redfern Station now is more or less between Hyde Park and George-street—that is the general line of the station.

615. *Chairman.*] Have you anything further to say to the Committee? Only this, that I think the extension to Fort Macquarie would be a waste of money. There is no traffic down to Fort Macquarie. All the traffic that there might be is obtained now. You will get no more money out of the passengers if you take them there.

616. Is it not highly convenient to have at each end of your tram lines suitable shed accommodation? It is not at all necessary. It was not provided for steam trams at Bridge-street.

617. But is it not convenient? No, you should have your cars constantly at work. They have no right to be standing at all. Stable them in the suburbs, but not in the town.

618. *Dr. Garran.*] The traffic in the early mornings is all coming into Sydney? Yes, mainly. The tramway would be damaging to the whole of these wharfs and warehouses so far as the traffic is concerned.

MONDAY, 3 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

Albert Henry Nathan (Hoffnung & Co., Ltd.) sworn, and examined:—

A. H. Nathan.
3 Sept., 1900.

619. *Chairman.*] The original proposal referred to the Committee was the construction of a double line of electric tramway from Belmore Park along Castlereagh-street to Bent-street; but it has now been suggested that, in place of a double line in Castlereagh-street, a single line should be taken down Castlereagh-street and a return line up Pitt-street, these single lines being so laid as to permit of duplication should that at any time be deemed necessary;—how do you regard that proposal? We think that a tramway in Pitt-street would prove very inconvenient to our business, because of the congestion which it would cause in the street. We employ a large number of drays and carts, which come in from and go out into Pitt-street, and the street is very narrow for even the present traffic.

620. What is the width of the street in front of your premises? I believe about 36 feet from kerb to kerb. Carts when heavily loaded cannot make a sharp turn; but frequently to swerve right across the street.

621. How many trips in and out of your yard are made by the carts which go there during an average working day? I daresay between 100 and 200 carts (*i.e.*, double such number in and out).

622. Between what hours? Between 9 a.m. and 6 p.m.

623. Are a large number of carts sent out with goods daily between 4 p.m. and 6 p.m.? I think the traffic is rather heavier than at other times; but it is fairly uniform. On the average there are always half a dozen, and probably more, carts in the yard. A. H. Nathan.
3 Sept., 1900.

624. Would a single line in Pitt-street, on the side of the road furthest from your premises, greatly interfere with the working of the business? Yes, because it would bring about a greater congestion of traffic than there is now.

625. Do you know of any business as large as yours, and doing a similar cartage traffic, which is situated in George-street? No; I do not think there is one. We are, of course, indirectly affected by the George-street tramway, because the working of that tramway has driven more vehicular traffic into Pitt-street. Our carters tell us that they have to take Pitt-street in preference to George-street, in order to get through. A carter told me the other day that he had to leave his cart at the Strand, in George-street, to deliver a parcel at Farmer and Company's.

626. Do you think that to increase the number of tramways will create a special difficulty in the way of carrying on, not only your own business, but all such businesses in the city? Yes. It is now proposed to take the four chief traffic arteries of the city—Elizabeth, Castlereagh, Pitt, and George Streets—for tramways. If that is done, it will make the carrying on of business such as ours very difficult.

627. The proposal now by the Committee has been put forward with a view to relieving George-street of traffic;—do you think that a tramway in Pitt-street would considerably interfere with your carting operations? Yes. No doubt the tramway traffic will be heavier in some parts of the day than in others, and those times would be also the times of our busiest traffic.

628. Would a tram every ten minutes interfere with your business to any considerable extent? Yes; but not so much as if the cars ran so frequently as they do in George-street, and, as the city grows, the traffic will increase. I saw Mr. McLachlan on the subject lately, and he explained that it was necessary to bring the tramways to those parts of the city where there is most business to be conducted. The traffic of a city, however, concentrates in particular thoroughfares, and if you bring tramways into streets where there is very heavy traffic, you must drive some of that traffic out, and ultimately some of the business done in those streets will go into other streets, and then you must chase the traffic there by constructing trams into those streets.

629. When the George-street line was proposed, it met with considerable opposition from the business people in that street, who feared that it would injure their business; but they have found that their fears have not been realised;—do you think that your business is of such a character that it is sure to be prejudiced by the construction of a tramway into Pitt-street? The construction of a tramway in Pitt-street would cause us great inconvenience, and that would indirectly diminish our business.

630. If the construction of a tramway down Pitt-street brought a larger number of pedestrians into the street, would that be of advantage to your business? Not in the slightest degree. Ours is a wholesale business.

631. Are there many other large firms like your own in Pitt-street? There are Dalton's and Hunter's, a little lower down the street, and several others down towards the Quay. Going towards the railway station, the business houses are generally retail houses. There is a considerable congestion of traffic close to us at the intersection of King and Pitt Streets, where the vehicular traffic is delayed by the crossing of the cable trams.

632. From King-street towards the Quay, most of the business done on the western side of Pitt-street is wholesale business? There are a good many wholesale places in Pitt-street, between King-street and the Circular Quay.

633. *Dr. Garran.*] Have you only one entrance to your yard? Yes. I might point out that the postal authorities had to find another entrance to the Post Office because of the crowded state of Pitt-street, even under present conditions.

634. You cannot find another entrance? No.

635. Do you think that the George-street shopkeepers have gained, on the whole, by the immense quantity of traffic which the tramways have brought into George-street? I do not know; I am not in a position to judge.

636. Do you think that the retail business people in Pitt-street have lost business through traffic being taken into George-street? I do not think they have.

637. Have you heard any of them say that they would like a tramway down Pitt-street, to bring traffic to Pitt-street? No.

638. Have you heard anyone speak in favour of the construction of a tramway in Pitt-street? No.

639. If the tramway were constructed, and the cars ran once every five or ten minutes, your carts would have plenty of time to cross the road in the intervals? Yes; I might say, however, that if the electric tramway were now in Pitt-street, and we had not erected a warehouse there, we should not go there if we could get premises elsewhere.

640. But now there is nowhere for you to go to avoid the trams, unless you go west of George-street? Yes.

641. Do you think that if tramways are constructed down Elizabeth, Castlereagh, Pitt, and George Streets, they will tend to diminish the sites available for large wholesale houses in those streets, and throw them more to the west of George-street? Yes.

642. Is it of any advantage to a warehouse to be situated on the western side of George-street, because of the proximity of the wharfs to that part of the city? I do not think it makes much difference. When your goods are on a cart, a few yards more or less do not matter.

643. And the buying public have to go wherever the warehouses are? To a certain extent. But you must not go too far from the business centre.

644. You do not depend upon chance traffic? No.

645. And, I suppose, a great many of your orders come by post? Yes.

646. If you are within reach of the retail businesses in the town, that answers your purpose? Yes. We must be within a reasonable distance of them.

647. The trams will not run so frequently in Pitt-street as in George-street? No doubt as traffic increases the number of tramcars in the street would increase, as it has increased in George-street.

648. But the George-street lines carry a large suburban traffic as well as a pick-up traffic, whereas the Pitt-street line is only intended to carry the railway traffic for the present, though, possibly, some of the suburban traffic may come into it? Even if the cars did not run frequently, there would be great danger of serious accidents occurring in front of our premises.

- A. H. Nathan. 649. Do you never have accidents now? I do not remember any; but where there is heavy traffic in a street collisions may always occur. At times we have had as many as ten carts in our yards at once.
- 3 Sept., 1900. 650. Can they turn round in the yard and come out when it is as full as that? It is a little awkward for them, but they can do it.
651. In your opinion Pitt-street is not suited to even a single line of tramway? That is my opinion.
652. You would rather see the whole of the tram traffic carried in Castlereagh-street? Certainly.
653. If the railway trams ran up and down Castlereagh-street, would people walk from George-street to Castlereagh-street to make use of them, supposing the George-street trams did not run into the railway yard? I imagine that people in George-street would take the George-street trams to reach the railway.
654. Do you think that ladies would? I do not know. Of course, the Castlereagh-street tram would take a great deal of traffic; but I do not think the people in George-street would go to Castlereagh-street to make use of them. I have always been accustomed, when going to the railway station, to take the first steam-tram that came along.
655. You see no objection to the construction of a double line of tramway in Castlereagh-street? From a general or a personal point of view.
656. From a general point of view? Comparatively little. There are not many business places there. The street is wider than Pitt-street, and it is occupied chiefly with offices.
657. Do you think it would be a serious inconvenience to the traffic of the city if tramways were constructed in Elizabeth, Castlereagh, Pitt, and George Streets? Yes.
658. Do you see any way of getting out of the difficulty? I think that the construction of the railway into the centre of the city would avoid the difficulty.
659. That is the view taken by the Railway Commissioners;—you agree with them? Yes; I have been asked to express that opinion. I go so far as to say that the extension of the railway into the city is bound to come sooner or later, even if all these tramways are made.
660. You think that, even if a big central station at Devonshire-street is made, we shall have to continue the line into the city sooner or later? Yes.
661. Quite apart from any intention to connect with the North Shore? Yes.
662. *Mr. Hyam.*] There are not a great many business places other than offices in Pitt-street, between your warehouse and the Circular Quay? There are none so large as ours; but there are a good many warehouses and wholesale business places between Hunter-street and the Quay.
663. But between King-street and Hunter-street there are not many? There are ours, Hunter's, and Dalton's.
664. The other places in the street are chiefly auction marts and offices? Yes.
665. Then the tramway in Pitt-street would only interfere with three business places between Hunter and King Streets? Yes.
666. From King-street to Park-street there are a good many business places? Yes; and the traffic is very heavy. There is a very great deal of mercantile traffic through Pitt-street, even though there are not so many large wholesale houses in the street.
667. You say that you do not see any serious objection to the construction of a double line of tramway in Castlereagh-street? I think that such a line would be of less inconvenience than a single line in Castlereagh-street and a single line in Pitt-street.
668. Have you heard any serious objections to the construction of such a line? Yes.
669. From many people? I have only spoken to two or three people about it.
670. The question we have to consider is whether it is not better to accommodate the great number of suburban and city people who wish to travel through the streets than to regard the convenience of business places such as yours? Well, I came only to put my view of the situation before the Committee.
671. *Mr. Levien.*] If your business premises were in Castlereagh-street, would you not oppose the construction of a tramway down Castlereagh-street? Certainly.
672. You have a good knowledge of the whole city? A fair knowledge. I have known the city for seventeen years.
673. Do you think that the tramway ought to go down Pitt-street at all? No.
674. You are absolutely opposed to a line in Pitt-street? Yes.
675. Are there more business places in Pitt-street than in Castlereagh-street? I think so.
676. There is a greater length of business premises, both wholesale and retail, on both sides of Pitt-street than there is in Castlereagh-street? Yes.
677. Do you think that Pitt-street should be reserved for vehicular traffic? I think so.
678. If all these streets are occupied with tramways it would almost stop the vehicular traffic? It would seriously interfere with it.
679. The lower end of Castlereagh-street is given up to Chinamen and small dwelling-places? Yes.
680. *Mr. Watson.*] Have you considered the possibility of a reduction in the number of omnibuses by the construction of the proposed line? The tramway might reduce the number of omnibuses for a time; but, as the city increases, its vehicular traffic must increase. The effect of the recent multiplication of trams has been to knock off the 'buses on certain routes and to create new routes.
681. Do any of the 'buses which run on these new routes come right down to the Quay? I believe so. The only new 'bus that I actually know of, is a 'bus from Woolloomooloo, past Hyde Park, to the Quay.
682. If the eastern suburbs tramways were brought down to the Quay, would not that bring about a reduction in the number of 'buses? It seems probable that it would; but, so far, there does not appear to have been a reduction in the number of 'buses in the city.
683. The late Registrar to the Transit Commission told us that there had been a falling off in the number of 'buses plying in George-street since the tramway was taken down that street;—if a tramway down Pitt-street had the effect of materially reducing the 'bus traffic in that street, would not that be some compensation? If it largely decreased the 'bus traffic, it would be some compensation; but I cannot say what that compensation would amount to.
684. Are the 'buses the chief element in the vehicular traffic of Pitt-street at the present time? I do not think so.
685. What is the width of King-street, near Darling Harbour? It is about as wide as Pitt-street.
686. There is a very heavy vehicular traffic there and two lines of tramway, while shunting operations have also to be carried on in the street;—if the tramway in King-street does not interfere with the vehicular

vehicular traffic there, why should a tramway in Pitt-street do so? If the traffic in King-street is the same as in Pitt-street, and the two streets are about the same width, the conditions are similar; but if I were driving a cart, I should be less afraid of cable trams than of electric trams, because the electric trams are bigger, and move faster than the cable trams. I would sooner have an unlimited number of buses than an electric tram.

687. *Mr. Shepherd.*] At what hour of the day is most of your carting done? Probably in the later part of the afternoon; but the difference is hardly worth mentioning, because the traffic is fairly uniform all day.

688. Would it be possible to do the carting at times when the trams were not so numerous? I do not think so. We have to clear the ships as quickly as we can. We are always urging the carters for quicker delivery, and they are always telling us that they cannot give it. Then the goods in the warehouse have to be sent out as soon as they can be packed and made ready.

689. It would not be possible for you to arrange to do most of your carting when the tram business was slack? I do not think so.

690. Have you heard any complaints from any large firms in George-street about any inconvenience from the trams? No; but I have not discussed the matter with any of the George-street people.

691. *Mr. Levien.*] A tremendous number of mail-carts go into and out of Pitt-street to and from the Post Office all day long? Yes; but those are light carts, and much more easily manœuvred in the street than ours are.

692. All the heavy carts going into places like yours and Dalton's would have to cross the tram-lines? Yes, probably.

693. *Mr. McFarlane.*] What class of vehicles are employed in your carting? Drays mostly; but there are a great many lorries and vehicles of all sorts.

694. Do the carters experience difficulty in getting in and out now? Yes; there is a certain amount of congestion in the traffic. Sometimes they have to wait.

695. The construction of a single line of tramway down Pitt-street would intensify the difficulty? Yes.

696. Have you made any protest to the Railway Commissioners against the construction of a tramway in Pitt-street? Yes. Together with Mr. Dalton and Mr. Macintosh, I called upon the Commissioners.

697. Are Messrs. Dalton and Macintosh opposed to the construction of a line down Pitt-street? Yes.

698. When is your busiest time;—immediately after the arrival of a ship? Ships are always arriving, and the landing of goods is a constant thing with us.

699. If a tramway were taken down Pitt-street, would it get rid of a great deal of dray traffic in that street? Where could the dray traffic go to then.

700. If there were only a single line in Castlereagh-street, it could use that street? Yes; but drays having business in Pitt-street would have to use Pitt-street.

701. Do you think it would be more convenient to the travelling public to have a double line of tramway in Castlereagh-street than to have a single line in Castlereagh-street and a single line in Pitt-street? I think that there is more to be said for the proposal to construct a double line of tramway in Pitt-street than for the other proposal.

702. Is there much pedestrian traffic in Pitt-street? Yes, a great deal.

703. Would not a tramway in Pitt-street be of great convenience to the pedestrian traffic that now uses the street? No doubt trams are a public convenience wherever they run.

WEDNESDAY, 5 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

John James Gillham, master carrier, Circular Quay, sworn, and examined:—

704. *Mr. McFarlane.*] You have been residing in Sydney for some considerable time? All my life.

705. Have you given any consideration to the proposal to construct a double line of tramway down Castlereagh-street? Yes.

706. How do you view that proposal? I consider it a very bad proposal. Castlereagh-street is the only street in which the city on the eastern side of George-street, along which vehicular traffic can move now in safety, and, if a tram is taken down that street, there will be no convenience for vehicular traffic. I think that we have enough streets occupied by trams now. If the trams could be run underground they would be well enough; but the streets should not be taken away from the general public to accommodate tramways. A tramway should not be laid down in either Castlereagh-street or Pitt-street.

707. You are aware that the tram traffic in George-street is very congested? Yes.

708. Do you think that George-street is overcrowded with trams at the present time? Yes.

709. Then provision must be made for taking these trams down some of the other streets? I do not think that the Government should take any more streets for tramways. Some streets should be left for the people who use the roads. The Government are doing a great deal of harm to the carriers of the city, and are hampering their business very much, by driving them from one street to another by the laying down of tramways.

710. Has the tramway in George-street materially interfered with the traffic of that street? Yes; a great deal—more than the omnibuses ever did.

711. Has it not reduced the number of omnibuses? Yes, greatly.

712. And has it not in that way given more accommodation for other vehicles? No, because of the room taken up by the trams themselves. The trams run almost one on top of each other, so that it is very difficult to pass between them in order to cross the road, or to pass another vehicle.

713.

A. H. Nathan.
3 Sept., 1900.

J. J. Gillham.
5 Sept., 1900.

- J. J. Gilham.** 713. Have the trams caused traffic which previously used George-street to go to other streets? Yes.
- 5 Sept., 1900. 714. To what streets has that traffic gone? All the people who can, use Castlereagh-street. Pitt-street is generally blocked with traffic.
715. Do you think that, if Castlereagh-street had a double line of tramway in it, there would not be sufficient room in Pitt-street for the vehicular traffic? I do not think there would be sufficient room in Pitt-street if all the traffic were driven out of Castlereagh-street.
716. A tramway would not necessarily send all the traffic out of Castlereagh-street? We very often go out of our way in order to avoid heavy traffic, so that we can travel more quickly; but to go from Castlereagh-street to Pitt-street would be to go from the frying pan into the fire, because the traffic in Pitt-street is always heavy.
717. Is the traffic continuously heavy throughout the whole day? Yes.
718. Between what hours? Between a quarter to 9 in the morning and 6 o'clock in the evening, with occasional short lulls. From a quarter past 9 to about 10 o'clock there is sometimes a bit of a lull.
719. Would it create as much interference with the traffic if, instead of a double line down Castlereagh-street, there were a single line down Castlereagh-street and a single line up Pitt-street? I think that where tramways are laid down they must block the traffic. The traffic in Pitt-street would have to go at a walking pace if there were trams there.
720. Would it be better to have a single line in Castlereagh-street and a single line in Pitt-street than to have a double line in Castlereagh-street? I cannot say that I am in favour of either proposal, but I think that it would make the streets more available to other vehicles to have only a single line in Pitt and Castlereagh Streets.
721. If a single line were laid down it would not be placed in the middle of the streets, it would be placed on one side, so that in the future it could be duplicated if necessary? If that were done, the trams would block one side of the road.
722. But the rest of the street would be available? It would be available if you could cross the tram-line.
723. With a single line there would not be so many trams in the street as with a double line? There would be almost a continual stream of trams on the single line.
724. *Mr. Hyam.*] But they would all be going the one way? Yes; but you could not take up the whole of one side of the street with trams, because, if you did, people whose business premises were on that side would not be able to get vehicles to their doors.
725. *Mr. McFarlane.*] Have the trams in George-street caused any inconvenience? Yes; they cause inconvenience every day in the week.
726. Have you suffered any inconvenience of the kind you are speaking of? No; because I have no constituent in George-street who has not a back entrance.
727. Have you heard many complaints about the trams interfering with the traffic in George-street? I hear many complaints about them—people are always complaining about them. I have lived all my life in the city, and I never knew it to be so difficult to get along George-street in a sulky as it is now.
728. Is it not a fact that there are very few wholesale houses in Castlereagh-street, so that there is not much need for heavy dray traffic there? The buildings follow the traffic. In a short time there will be as much business done in Castlereagh-street as is now done in George-street.
729. The trams must be put in some street? I do not know that they should. I think that if the Government want trams to bring the suburban people into the city they should not make them at the expense of the farmers of the country. They should give the trams a new road altogether, or put them underneath the present roads.
730. Would it not be just as easy to put the dray traffic underneath the present roads? No, because it is not so easy to regulate the loads of a lorry to provide for the clearing of bridges, as it is to regulate the height of a tram-car.
731. Would it not be possible to divert part of the dray traffic to the streets west of George-street? Yes; if a new street were cut through.
732. Could not York-street and Clarence-street be used? Yes; but to get down to Circular Quay with heavy traffic you would want a new street. You cannot get down beyond Charlotte-place without going right on to the Argyle Cut, if you have any sort of a load. We use Clarence-street a great deal in the wool season to take wool to the back wharfs, such as Smith's wharf, Dalgety's wharf, and Parbury's wharf.
733. Does not a lot of the heavy traffic go down Sussex-street? Not a great deal of it—only wool that is being transhipped to Melbourne.
734. Where does the traffic mostly come from—from the wharfs to the warehouses? Most of the traffic would come from the deep-sea ships to the warehouses, but there is also a great deal of traffic from the railway, and we expect to see that traffic become much greater before many years have passed. The traffic does not come from one or two points, but from a number of points—from Woolloomooloo Bay, from Circular Quay, and from the back wharfs that I have spoken of.
735. In which direction does the traffic from Woolloomooloo Bay go? It depends upon whose the goods are. Sometimes goods are taken from Woolloomooloo Bay to Miller's Point, down King-street and along York-street.
736. That traffic would not go along Castlereagh-street or Pitt-street? No; it would cross Castlereagh-street and Pitt-street at either Park-street, Market-street, or King-street. Anything going to the railway would cross Castlereagh-street at Park-street.
737. Is there much direct traffic between the ships and the railway? Very little.
738. The traffic is from the shipping to the warehouses, and from the warehouses to the railway? Mostly. There is not a great deal of direct carting to the railway.
739. The busiest hours for the tram traffic are from 8 to 10 o'clock in the morning, and from half-past 4 to 6 o'clock in the evening;—could not provision be made for the carting of goods in the slack interval between those times? No. You cannot do as you like in regard to other people's goods; you have to deliver them when they want them delivered, not when you want them delivered. If you were a man in business, you would not like to have to withhold goods from sale because the carts had not brought them up from the wharfs.
740. Do you commence to cart the goods directly you get an order for their delivery? Yes; directly they are out of the ship.

741. Do the rest of the carriers hold similar views to those which you have expressed in regard to this proposal? They are against the Government taking the streets for tramways, and thus preventing vehicular traffic from getting along. J. J. Gillham.
5 Sept., 1900.
742. Is it in travelling along the streets, or in getting into and out of alley-ways with your loads, that you find the trams most in your way? The trams are most in our way when we are going along the streets.
743. You hold the opinion that, from a carrier's point of view, it would be better to have a single line in Castlereagh-street, and a single line in Pitt-street, than to have a double line in Castlereagh-street? Yes; because I think it would give more room to the traffic. If there had been only one line down George-street, the traffic would not have been interfered with so much. The posts down George-street take up as much room as a vehicle would take up.
744. I suppose you would have a still stronger objection to a double line down both Castlereagh and Pitt Streets? Yes.
745. *Dr. Garrahan.*] A large part of your business consists in taking goods from the ships' sides to the warehouses? Yes.
746. In what streets do you deliver most? I deliver most in York-street.
747. There you are not troubled with the trams? If I am coming from the Quay, I have to come up Pitt-street as far as Moore-street in order to get to York-street. Of course, there is no trouble in getting from the back wharfs.
748. Do you find it more difficult to cross George-street now than it was before the electric trams were running? Yes.
749. You have to wait longer? Yes; we often have to pull up and wait. Before there were any trams in the street the vehicles there would wind about and make room for one another.
750. Do you find that you lose time through the presence of trams in the street? Yes.
751. Do you lose ten minutes? Yes, fully.
752. It takes you ten minutes longer now to get a load from the Circular Quay to a store in York-street than it did before the trams were running? Yes; and if I was taking wheat down to the Quay, and I had to go along George-street, I would lose twenty minutes.
753. Where do you pick up the wheat? At the railway station.
754. What street could you take to avoid loss of time? Castlereagh-street is the only street open to me.
755. Going from Darling Harbour to the Quay, could you go round by Kent-street? Not with any load, and some days you could not go round that way at all, because the gradients are so steep. If a sudden shower falls, you may see twenty or thirty wool-teams unable to move until the street has dried again, or until the sand-carts have come round.
756. It is in contemplation to make Darling Island the place for shipping wheat from? Yes; but I have shipped more wheat from the Circular Quay than will be shipped from Darling Island for some time to come. We must always expect to have to ship wheat from the wharfs at which the ships lie now.
757. Is the wheat taken away by steamers or by sailing vessels? By steamers.
758. Do the great mail steamers take away much wheat? Yes. The French boats take away wheat every time. We have sent wheat to Woolloomooloo Bay for shipment to London, and also to Smith's wharf.
759. You have no trouble in getting to Woolloomooloo Bay? No; we have only to cross the tram-line once, at Liverpool-street; but very often we are stopped there.
760. Wherever you cross the electric tram line you have trouble? Yes.
761. Would it not be a great gain to put a double line of tramway in Castlereagh-street, and thus save Pitt-street from a tramway altogether? I do not think it would be much advantage to have only Pitt-street left for vehicular traffic.
762. It is proposed to have tramways in George-street, Pitt-street, Castlereagh-street, and Elizabeth-street—only two of these lines concern you very much, the George-street and the Pitt-street lines? They all concern me, because my carts go through all the streets. There is not a street through which I have not carted, and at all hours.
763. Do you think it would be a serious matter to have all the streets I have named occupied by the tramways? I think so. I think the tramways should be done without.
764. Your suggestion is to have either an overhead or an underground railway? Yes. It might be necessary to buy a little land, but it would benefit the country to do that rather than to construct more tramways through the streets. I am not an engineer, but I think the railway could be brought into the city without much of the surface ground being required, because a great part of the line could be kept underground.
765. Is it your opinion that whenever a tramway goes through a street that street is spoilt for vehicular traffic? Yes.
766. You deliver goods in George-street? Yes.
767. Do you find it more difficult to get into the lanes and gateways off George-street now than it was before? Yes, a great deal more difficult, because there is not enough room to turn in. If you want to go into a gateway on your own side of the road you must cross to the other side in order to turn.
768. Is the difficulty greater where there are four horses than where there are two? Yes; because four horses take up more room than two. A man can turn a two-horse waggon in its own length.
769. If, instead of being a carrier you were a warehouseman, would you choose a site for your premises in a street in which there was no tram, or in a street in which there was a tram? In a street in which there was no tram.
770. Then, on the whole, you are inclined to say to the Government, "Do not put down any more tramways in the city of Sydney"? Just so.
771. *Mr. Levien.*] You do not want any trams at all;—you would like the whole city to be given up to vehicular traffic? Unless the trams can be put under the streets.
772. How do you favour the proposal to construct a railway along to the Circular Quay? I favour it very much; that is where the railway should go.
773. Such a line would be for goods traffic; what about the passenger traffic;—do you favour a city railway? If it can be put under the streets.
774. Everything must go under the streets? Yes.

- J. J. Gilham. 775. You do not want any trams or railways in the city at all? I have no objection to the trams if they are kept in their proper place.
- 5 Sept., 1900. 776. Where is their proper place? A street made for them; they should not run in amongst the vehicular traffic.
777. Where would you make a street for them? Let the Government purchase it.
778. Would you have the Government buy a whole row of houses in order to make a street? Not necessarily. It is not necessary to purchase the whole of the surface along the route of the line. A tramway might come from Belmore Park, in between Pitt-street and Castlereagh-street, going under the cross streets.
779. Do you not think it would be better for the convenience of the public if the carrying business was done in the early hours of the morning, or late in the evening? I do not know what part of the public you refer to.
780. If the heavy merchandise traffic were carried on between 7 o'clock in the morning and 4 o'clock in the afternoon, in order to give the ordinary vehicular traffic a chance in the busy hours of the day, how would that suit? I do not think it would suit at all. I do not think any merchant should be debarred from using the streets at any time.
781. *Mr. Hyam.*] You are altogether against using the streets for tram traffic? Yes.
782. How would you carry the people who come from the suburbs—in 'buses? Yes. The Government could have left the 'buses to look after that traffic until they had made a street for it.
783. Would you be surprised to learn that 250,000 fares are collected daily upon the Sydney tramways, each fare representing a passenger? No.
784. Should we be able to get along at all if all those passengers had to be carried in the omnibuses? If all the tram passengers had to be carried in omnibuses it would increase the number of 'buses very greatly.
785. A 'bus will always get out of the way of a four-wheeled waggon? Yes; but all vehicles keep their own side of the street, and those who are in the habit of using the streets try to get on themselves, and to make room for others; but the trams do not consider the ordinary traffic.
786. Do you not think that 250,000 people should have some consideration? Yes; but not at the expense of others.
787. If the proposed tramway be constructed it will relieve the traffic in George-street? I am aware that if some of the trams are run down Castlereagh-street you will not require to run so many trams down George-street, but I think that all the tram traffic could be accommodated in Elizabeth-street or George-street.
788. The trouble is, that the traffic in George-street is congested, and the Railway Commissioners wish to remove some of it to other streets? It could be removed to Elizabeth-street.
789. You would not object to underground tramways? No.
790. Have you any idea of the cost of underground tramways and railways? No.
791. Would you be surprised to hear that it costs £1,000,000 to construct a mile of underground tramway? The expenditure of £1,000,000 in making a mile of tramway underneath the city would be much more beneficial than the spending of £1,000,000 in the country.
792. Do you not believe in spending money in the country? Yes; but by putting trams through the streets of Sydney we are cutting the ground from under the feet of the producers, in making it impossible to move their produce through the city.
793. If a tramway ran round the Circular Quay, how would the vehicular traffic get across it;—would you be able to get alongside the ships in that case? We go alongside the ships at Darling Harbour, although there is a railway there, and I suppose we would do the same at the Quay. Since the outbreak of the plague a great quantity of goods has been landed at Darling Island and at Pyrmont.
794. *Mr. Shepherd.*] You think there would be some difficulty in doing the carting of the city early in the morning? Yes; the ships generally do not start to load till 8 o'clock. If we could not start in the morning, it would be impossible for the warehouses to take their goods in in the time that would be available.
795. Have you any proposal for coping with the traffic difficulty? No; except that I think the railway ought to be taken along between Pitt-street and Castlereagh-street, underground for the most part, with occasional stopping places. The Government would have to buy sufficient land to give an approach to these stopping places; but all that would be necessary would be about 30 feet in each street.
796. What is the width of Castlereagh-street as compared with that of George-street? Castlereagh-street is a better street all through than George-street for its length; it is straighter, and it is wider. Parts of George-street are very narrow.
797. There is not so much traffic in Castlereagh-street? No; it is the only street that people can use to get quickly to any given point. Traffic comes along Castlereagh-street from Redfern, Surry Hills, and Paddington.
798. About what time of the day do you have the greatest amount of carting to do? We are kept going from 6 o'clock in the morning.
799. In carting from a vessel to a store you are obliged to take the goods away as they are landed on the wharf? Yes.
800. It would not do to leave them on the wharf for any length of time? No. When we accept a bill of lading we become responsible for the goods, should they be damaged on the wharf.
801. Would it be a great inconvenience to the carting business to stop it during the two hours in the morning and the two hours in the afternoon when the tram traffic is heaviest? Certainly; it would be an inconvenience to the merchants. A merchant might lose a sale by the delaying of the delivery of his goods for even a short period.
802. So far, very few accidents have occurred through the congestion of traffic in George-street? Yes; but I think there have been more accidents there since the trams have been running than there were during the whole of the time that the 'buses were running.
803. If another street were opened for tram traffic, it would greatly relieve the traffic in George-street? Yes.
804. That would lessen the danger of accidents? Yes, greatly.
805. It is thought that ultimately the trams will run down pretty well each of the streets east of George-street? In that case they will take those highways from the public, and the public will lose the benefits they expect to gain from the tramways by having to pay more for cartage.

806. If tramways were made down each of these streets, would they be as great an inconvenience to traffic as the George-street tramway is now? Yes; a much greater inconvenience. People will not drive down George-street now, if they can avoid doing so. J. J. Gilham.
5 Sept., 1900.

807. It is possible that one of the streets to the west of George-street may be taken for the tram traffic;—if another street be taken, the inconvenience must become less, because the traffic will cease to be congested in George-street? If we only had one-fourth of the trams now in George-street there, the tramway would not be so great an inconvenience to traffic, but in that case every other street would be carrying tramways, which would inconvenience the traffic in them. There are not enough people to be carried to make it profitable to run a tram down every street.

808. Is the cargo which is landed from a vessel generally taken to a warehouse, or to the railway station? We do not take a great deal of cargo to the railway station. There may be one load going to the railway station for every ten loads sent to the warehouses.

809. Do you think that we should do better without a tramway in Castlereagh-street? I think that the Government ought to consider the business people of the city, and not upset their arrangements by monopolising the roads. As a carrier, I have a right to protest against the proposal, because it takes away the facilities for vehicular traffic to which I have been accustomed from childhood.

810. But you have no suggestion to make for the carrying of passengers into the city? Only the opening up of a new street between Pitt-street and Castlereagh-street, or the taking of Elizabeth-street wholly for tram traffic. There is very little vehicular traffic in Elizabeth-street now, and no business houses will ever be built there. I think that it would be better to run more trams down Elizabeth-street than to lay a tramway in Castlereagh-street.

Edwin Frederick Sutton (Sutton & Co.), master-carrier, York and Market streets, sworn, and examined.—

811. *Mr. Levien.*] You have had a great deal of experience as a carrier in this city: what is your opinion of the proposal to run trams down Castlereagh and Pitt streets? I strongly object to the proposal to construct a tramway down Castlereagh-street. E. F. Sutton.
5 Sept., 1900.

812. Why? For the simple reason that, if you make a tramway in Castlereagh-street, the vehicular traffic there will be as much inconvenienced as it is now in George-street and Elizabeth-street.

813. Are you inconvenienced in your business by the tramways in Elizabeth-street and George-street? Yes. Elizabeth-street is virtually blocked to vehicular traffic. We do not use Elizabeth-street at all; but we have to use George-street to deliver goods to the business houses of a number of the firms there, and, during the last week, our vehicles were twice bumped by the trams. The distance between the kerb and the tram-line is so little that if the horses swerve when goods are being unloaded in George-street the dray either bumps against the kerbstone or against the tram. Most of the business houses in George-street have no back entrance. There are back entrances between Margaret-street and Wynyard-street, but on the other side of the road, from Bridge-street right down to the Haymarket, there are, practically, no back entrances, and all the goods must be taken in at the front from George-street. The same thing may be said of Castlereagh-street.

814. Castlereagh-street is a more convenient street for vehicular traffic? Yes. We have to use Castlereagh-street because of the tram traffic in Elizabeth-street and George-street, and the 'bus and other vehicular traffic in Pitt-street.

815. Are you delayed much by the trams in taking goods down George-street? Certainly. Sometimes a carter has to wait until a string of four or five trams pass before he can pull up opposite the warehouse at which he has to deliver his goods. So it is in Elizabeth-street, and so it would be in Castlereagh-street.

816. What about Pitt-street? I do not think it would be wise to have a tramway in Pitt-street—the street is too narrow for even a single line.

817. On the broad grounds of public convenience, putting on one side your business interests, are you opposed to the construction of a tramway down either Castlereagh-street or Pitt-street? I think it will be a mistake for the Government to put a tramway down either street. Our streets are too narrow for trams and for other vehicles as well. Tramways are right enough in streets like the Melbourne streets, where you have plenty of room. If George-street, Pitt-street, and Castlereagh-street were all occupied by tramways a carrier taking goods from the Circular Quay to the railway station would have to climb up into Macquarie-street, and take a round-about route, which will make his journey a matter of an hour and a half, instead of about half an hour, as at present.

818. An enormous number of people travel in the trams? Yes; but I do not think the number of fares collected indicates the number of persons travelling, because many people travel two or three times, and perhaps oftener, in the day.

819. But in any case, do you think the 'buses could deal with that traffic? No. The railway should bring the people into the city. We want either an underground or an above-ground railway.

820. Were you at the meeting at Burwood the other night? Yes. It sometimes takes me a quarter of an hour to drive from the Circular Quay to my office, because of the delay due to the great number of trams running in George-street.

821. Could not the carrying business be confined to certain hours of the day when other traffic is slack? No; a ship may start unloading at 7 o'clock in the morning, and her cargo must be taken away as soon as possible after it has been landed. There is no protection for goods that are left lying on the wharfs. The merchants require delivery of their goods as soon as possible, and there is no reason why they should not get it, just as a man is able to get a pound of sugar from his grocer as soon as he asks for it.

822. Do you think that a railway into the city is the only means of doing away with the inconvenience created by street tramways? That is my opinion. Elizabeth-street has been taken away from us by the running of steam trams there, and why should it not be used for railway traffic as well. Four lines of rail could be laid there, and that ought to give every facility for dealing with the traffic.

823. How would you deal with the traffic from places like Marrickville, the Glebe, and Leichhardt? They might be dealt with by a continuation of the proposed eastern suburban railway. Could not both a tramway and a railway be taken along Elizabeth-street? Four lines of railway deal with all the traffic between Redfern and the interior.

824. But people might not want to go along Elizabeth-street? Then they could take a cab to wherever they wanted to go.

- E. F. Sutton. 825. *Mr. Hyam.*] If you had four sets of rails in Elizabeth-street, how could you pick up and set down passengers from vehicles travelling on the middle line? You might have platforms.
- 6 Sept., 1900. 826. If you had island platforms, would it not be necessary to widen the street in order to give room for subways of approach, and for the spreading out of the rails to go round these platforms? Perhaps so; but at any rate Elizabeth-street is practically dead for business purposes.
827. How would pedestrians and vehicles cross these lines? It would not be worse than the present position near the railway station.
828. With the traffic in George-street as it is, it is impossible to do anything else than to make another tramway elsewhere? I think it would be a mistake to spoil more streets for vehicular traffic. Why not confine the trams to George-street and Elizabeth-street.
829. The Railway Commissioners say that the traffic in George-street is so congested that it is impossible to increase the number of trams there, and yet the number of trams must be increased in order to carry the passengers? I understand that that is so; but as the trams are working now there will be no vehicular traffic at all in George-street within a couple of years.
830. An electric tramway to a suburb practically gets rid of all the 'bus traffic to that suburb;—do you not find the 'buses an inconvenience? They are sometimes; but there is more give and take with a 'bus than with a tram. A tram-driver does not take notice of anything that is behind him. He pulls up without signalling to the traffic at all.
831. But everyone knows where the trams stop? It is hard to say sometimes where a tram will stop. Sometimes they run right across a street without stopping.
832. It was thought that the cable trams in King-street would materially inconvenience the cross traffic in Sussex-street? They do inconvenience that traffic to some extent. I have seen ten or twenty vehicles standing on each side of King-street.
833. Trams are always a serious inconvenience to the vehicular traffic of a street? Yes.
834. *Mr. Watson.*] Is King-street at its foot as wide as Castlereagh-street? I do not think it is.
835. There is a great deal of traffic to and from the wharfs at the foot of King-street? Latterly there has not been so much, because of the plague.
836. I noticed a long string of waggons there only a week ago. Before the plague a large quantity of goods was brought from or taken to there? Yes.
837. The drays did a big business there without being materially interfered with by the trams? The trams do inconvenience the traffic there; but it is to be remembered that at the foot of King-street there are only one or two wharfs, and all the drays are going to the same wharf. They form up into a line, and take their turn. If, however, there were four or five business premises at the foot of King-street, the trams would very considerably interfere with the delivery of goods to those premises. The other day a tram ran into one of our vehicles when standing outside of Sanders & Co's., in King-street.
838. *Mr. McFarlane.*] Which would interfere less with the traffic—a double line of tramway down Castlereagh-street, or a single line down Castlereagh-street, and a single line in Pitt-street? It is hard to say. I strongly object to the laying down of a tramway in either streets. If you drove all the vehicular traffic into Pitt-street, it would block Pitt-street. At the present time the vehicular traffic is divided between Castlereagh-street and Pitt-street. Even a single line of tramway would take up 8 feet of the roadway. The best thing to do is to bring the railway into the city. I strongly object to either of these tramway proposals. One is as bad as the other, and either would greatly inconvenience the mercantile community.

Thomas Hamilton, master-carrier, Engine-street, sworn, and examined:—

- T. Hamilton. 839. *Mr. Shepherd.*] How long have you been engaged in business in Sydney? For nearly seventeen years.
- 5 Sept., 1900. 840. Has your business been inconvenienced by the running of electric trams in George-street? Yes; a great deal.
841. In what way? A great deal of delay is caused by the trams.
842. You have not been able to deliver your goods as freely as before? No.
843. Do you not think that the inconvenience from which you suffer would be considerably modified if some of the tram traffic were taken down Castlereagh-street? I do not think so. Castlereagh-street is now the only clear street we have on the east side of George-street.
844. It has been suggested that, instead of a double line down Castlereagh-street, a single line might be made down Castlereagh-street, with a single return line along Pitt-street; do you think that the single line arrangement would be less inconvenient than a double line in Castlereagh-street? I think so; but I do not see that there is any room in Pitt-street for even a single line. In Pitt-street, between Market and King streets, there are a great many shops and a great deal of pedestrian traffic, so that now it is difficult to drive a vehicle along that part of the street.
845. Are the goods which are landed from the ships taken, for the most part, to the warehouses, or are they taken to the railway? They are generally taken first to the warehouses, and distributed from there to the railway, to various steamers, wharfs, and to the different merchants in town.
846. What is your opinion about the proposal to confine the carting operations of the city to certain hours of the day? That could not be done. The merchants do not open their premises until 8 o'clock in the morning, and the bonds do not open till 9 o'clock, and there is a great deal of work to be done in the time which is now available.
847. If the bonds were open at times to suit the carting, could the arrangement be made? I do not think so. We cannot get rid of the goods quickly enough now.
848. There are about four hours in the day when the tram traffic is busier than at any other time; would it not be possible to stop the carting during those four hours and do it at some other time? I do not think that it would work at all.
849. Have you thought of any way of getting rid of the present inconvenience? I think that Elizabeth-street and George-street ought to be enough for the trams.
850. Do you think that those streets would carry all the passenger traffic? Yes.
851. What is your opinion about using Sussex-street, or one of the other streets west of George-street, for tram traffic? It would not do at all.
852. The traffic there is too great now? Yes; and the streets are too narrow.

853. What sort of traffic is York-street given up to? There is a great deal of traffic in York-street. T. Hamilton.
York-street is used as a means for avoiding George-street in getting to Miller's Point and Dawes' Point.
854. Your recommendation is to confine the trams to George-street and Elizabeth-street? Sometimes we 5 Sept., 1900.
have a 15-ton boiler to carry, and that requires a clear street.

THURSDAY, 6 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

The Hon. SOLOMON HERBERT HYAM.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

William Edward Budd (Budd & Ferns), master carrier, Sussex-street, sworn, and examined:—

855. *Chairman.*] What difference has the construction of an electric tramway in George-street made to your carrying business? The George-street tramway has put us to a lot of inconvenience. We cannot get along the street now as well as we used to. It takes us a quarter of an hour longer to get from the railway station to Circular Quay now than it used to take before the tramway was constructed. W. E. Budd. 6 Sept., 1900.

856. Do you use the whole length of George-street for your carting operations? No; we can only use George-street between Liverpool and Park streets. We go along Park-street to Castlereagh-street, and then along Castlereagh-street, though sometimes we use Pitt-street.

857. If a double line of tramway was laid down Castlereagh-street, would that be a further interference with your business? Yes; because then Pitt-street would be the only street in which there was no tramway.

858. Would the construction of a single line down Castlereagh-street and up Pitt-street hamper your business? If that suggestion were carried out it would mean that George-street, Pitt-street, Castlereagh-street, and Elizabeth-street would all four be taken from us.

859. Would a single line of tramway be anything like as serious an interference with the traffic of the street as a double line? It would in Pitt-street, because there is not sufficient room there even for a single line.

860. You do not think it advisable to put a tramway in Pitt-street at all? No. I think the best arrangement would be to run half the trams in George-street and the other half in Elizabeth-street.

861. We have had evidence which shows that Elizabeth-street lies a little too far to the east of the city to make it a convenient tramway route for the great bulk of the passengers, and that it is necessary to take the tram traffic as near to George-street as possible? If the trams branched off at the intersection of Pitt and George streets, and half ran down George-street and the other half down Pitt-street, people coming from the suburbs could change there, and get into whichever tram would take them nearer to the place where they wished to go.

862. In which direction is most of your carting done? Most of it is done from the railway to the Circular Quay, Woolloomooloo Bay, and Miller's Point. To get to Miller's Point we have to go up George-street, branch off at the Town Hall, and then follow along York-street. We cannot use Kent-street because of its steepness. If a man has a heavy load to take down Kent-street, and a shower comes on, he must either wait until the road has dried again, or until the sand-carts have come round. It would relieve George-street a great deal to run half the tram traffic down Elizabeth-street.

863. If the construction of a tramway down Pitt-street did away with a great deal of the 'bus traffic in that street, would it not leave sufficient room for the other street traffic? It would be a great convenience to get rid of some of the present traffic in the street; but I do not see that that is possible. The 'bus traffic is not nearly so great now as it used to be; but, after half-past 4, it is almost impossible to get along Pitt-street, because of the number of carriages and other light vehicles there.

864. Do you anticipate that the resumption of the wharfs by the Government will alter the trend of heavy traffic very much? No, because the wharf business will be done pretty well in the same places as now.

865. *Mr. Shepherd.*] Which would you prefer—a double line of tramway in Castlereagh-street, or a single line down Castlereagh-street and a single line up Pitt-street? If one or the other had to come, in spite of our objection, I should say, "Put a single line in each street," because that would not be quite so inconvenient to the street traffic as to have a double line in Castlereagh-street; but, in my opinion, neither the double line nor the single line should be put down. I contend that George-street and Elizabeth-street are sufficient for the whole of the tramway traffic. What they should have is a railway from Redfern to the Circular Quay. The tramways are a great inconvenience to the rest of the street traffic, because the conductors will not give opportunities for the traffic to cross the lines, and for this reason a heavy vehicle often blocks a large number of light vehicles that are behind it.

866. If a double line of tramway were laid down in Castlereagh-street, you would still have Pitt-street for vehicular traffic? Pitt-street, between Park-street and Hunter-street, is the most useless street in the city for our purposes. It is always full of light vehicles, and there are very few entrances there for the delivery of goods to the business houses and warehouses. I have to take a great deal of stuff every day from Darling Harbour to the Circular Quay.

867. Have the carriers of the city had a meeting to discuss this matter? Yes.

868. Have they formulated any proposal for dealing with the present difficulty which would be more convenient than that before the Committee? Our proposal is that the trams should branch off at the railway station, and half should run down Elizabeth-street while the other half ran down George-street. We are quite willing that those streets should be taken for the tram traffic. We have been nearly hunted out of George-street.

869. Is there much traffic in Castlereagh-street now? There is not so much at the present time, but there will be a great deal when the wool season commences, about three weeks hence. The wool traffic lasts until the end of November or the beginning of December.

- W. E. Budd. 870. Is not Elizabeth-street a convenient street for heavy traffic? Not a very convenient street, because the trams there run very frequently, and it is not a business street.
- 6 Sept., 1900. 871. Would it be possible to limit the heavy traffic of the city to certain hours of the day? I do not think so. Wool is brought down by the trains during the night, and is all ready to be taken away in the morning. Then, about 10 o'clock, more wool is brought down, and more again about 12 o'clock, and at about half-past 2. We must clear the trucks as fast as we can, to enable the Railway Commissioners to use their rolling-stock economically. I have seen as many as 300 or 400 trucks of wool waiting to be unloaded. It takes a good deal of carting to get rid of so much wool as that.
872. What is your opinion about the advisability of constructing a tramway along some street west of George-street? That would not do at all. York and Clarence streets are not long enough to make a tramway in them convenient.
873. Could not a tramway be taken to Sussex-street from the Haymarket? Yes; but that would be worse than taking a tramway down Pitt-street. Sussex-street is too narrow for the traffic there now. We have often been carried on to the footpath with our vehicles in Sussex-street when the traffic has been rather heavy and the roads a bit slippery.
874. I suppose you use nearly all the street between the Circular Quay and the railway? Yes; between Darling Harbour and Castlereagh-street every day, from 7 o'clock in the morning until half-past 5 o'clock in the afternoon. We do a great deal of carting to the Quay.
875. *Dr. Garrahan.*] When you say that you have a great deal of carting from the railway, do you mean from Pymont? From Darling Harbour. It is only now and again that we bring anything from Pymont.
876. What sort of produce do you take from the railway? Flour, wheat, bran, pollard, copper, and wool.
877. Is the agricultural produce sent on board the steamers? Yes; and to various stores.
878. Is any of it taken away by the large passenger steamers? Yes; the Japanese steamers take 200 or 300 tons every time from us alone.
879. In what shape do you carry the copper? In small ingots. It goes to the P. and O. Company's steamer one week, and to the Orient Company's steamer the next week.
880. Although we have a good export wharf at Darling Island, you still have to take this stuff to the Circular Quay? Yes. The Darling Island wharf is used only to ship away large quantities of stuff direct from the country; but that arrangement is not a very satisfactory one, because the agents have to sample the stuff first, and some times, after a consignment has been sent to Darling Island, it has had to be carted away again to different stores, because it has not been good enough to send away.
881. Then your customers are likely to continue to want you to take their stuff to the Circular Quay? Yes.
882. What route do you follow in going from the railway to the Circular Quay? We come up Harbour-street, round Dixon-street, and into Goulburn-street; and then up George-street as far as Park-street, and sometimes as far as Market-street; and then along Park-street to Castlereagh-street, and down Castlereagh-street. We used to go down George-street as far as Hunter-street, and there turn into Hunter-street.
883. And that is the best grade now? Yes.
884. If you went up Liverpool-street, you would have a steep gradient to meet? Yes. We go up Liverpool-street at times, but not often. The roads have been so bad lately that we have had to take the very best route we could get.
885. Is most of the wool taken along Castlereagh-street? Yes.
886. A great deal of wool used to come along Macquarie-street; does it still? We use Macquarie-street when it is mizzling, in order to avoid the wood-blocks. To get to Miller's Point we use York-street.
887. Do you not go down Macquarie-street to deliver to the wool stores? We deliver most of the wool on the Circular Quay side.
888. Do you deliver more wool on the western side than on the eastern side? Yes.
889. That is the wool going to French and to German ports? Yes.
890. Does not that wool go into a store in Sydney to be sampled? A good deal of it does. The first clip from the station may go into store and be sold, but what follows may go straight to the boats.
891. Do the wool stores in Pymont take a large quantity of wool? Yes.
892. You do not have to drag that wool into the city? Yes; we take it from those stores along George-street.
893. And you have to take it to those stores from the railway first? Yes. Sometimes we cross the Pymont Bridge, and come up Market-street, but then we have to keep an extra horse for the Market-street hill? If we come up Market-street we go down Castlereagh-street.
894. Then all the wool which is sold in the Colony has a double handling, and a double carting, while that which goes direct from the railway to the ships is only handled once? Yes.
895. Is it cheaper to cart the wool to the Circular Quay than to lighter it there? Yes.
896. Could you not more cheaply put the wool that comes by railway on to a lighter? No, that is the difficulty. Wool often arrives at Darling Harbour consigned in the name of some of the banks, and there is no order saying where to take it. The trucks containing that wool are therefore cut out until orders come for it, and while it is waiting the trucks get so mixed up that it would be impossible to run them alongside a lighter.
897. If the wool is discharged from the trucks on to a wharf it would be cheaper to lighter it down to the Circular Quay? Yes; but it is not discharged conveniently for lightering.
898. You compete with the lighters? We use lighters at times.
899. It is sometimes cheaper to lighter than to cart? It is sometimes cheaper to lighter than to pay wharfage. You pay no wharfage for cargo which is put over a ship's side into a lighter.
900. Then there is no prospect of reducing the heavy traffic between the railway and the Circular Quay? Not by using lighters.
901. Notwithstanding that the wool is discharged at the water side in Darling Harbour, and is conveyed to the water side at the Circular Quay? Yes; but all the wool that comes down by railway is not ready to go into a store alongside the water.
902. If the wool stores were alongside the water, you could lighter the wool, and the traffic off the streets? Yes.
- 903.

903. But there is not a single wool warehouse which is really alongside a wharf? The only one that I know of is that at North Shore. We cart wool consigned there down to the lighters. The best wool stores we have are at Pyrmont, and they are likely to remain there. W. E. Budd.
6 Sept., 1900.
904. Do you think that the passenger traffic from the eastern suburbs would be content to come down Elizabeth-street? I think so. The people coming from the eastern suburbs would not have very far to walk to get to George-street if they wished to use any of the George-street trams.
905. But Elizabeth-street is not the street in which people want to be dropped? But it is necessary to study the interests of those connected with the vehicular traffic of the city as well as the interests of those who travel by trams. It is not the tram travellers who keep the country going, neither do they keep the railways going. There has not been nearly as much tram traffic in Elizabeth-street since the George-street line has been open.
906. Would you bring all the railway traffic down Elizabeth-street? No; I would bring only those who wanted to come down Elizabeth-street that way.
907. Would you take the Elizabeth-street tram into the station-yard? I would bring both the Elizabeth-street tram and the George-street tram into the station-yard.
908. There would be no room for two lines of tramway there? I think it would be an easy matter to run trams from the railway station alternately down George-street and Elizabeth-street.

Ernest Clement Vernon Broughton, Auctioneer and Valuator, sworn, and examined:—

909. *Mr. McFarlane.*] What is your opinion concerning the proposal to construct a double line of tramway down Castlereagh-street from the proposed new railway station at Belmore Park? I take it that a line of tramway in Castlereagh-street has been proposed in order to relieve the congestion of traffic now prevailing in George-street; but, as one who has resided in Ashfield for the past fifteen years, and who has had a large experience of the suburban railway system, it seems to me that the construction of such a tramway will defer the extension of a railway into the city, and it is questionable if it will afford satisfactory relief to the traffic. The increase of population in the various suburbs, combined with the popularity of the electric trams, has made the traffic so great that before very long the tramways will be unable to cope with it, and, without a railway, it must come to a dead stop. If every street in the city is to be used for tramways, it will be impossible to drive a vehicle through the city in safety. At the present time George-street is not only dangerous to pedestrians, it is also dangerous to those who drive vehicles along it. E. C. V.
Broughton.
6 Sept., 1900.
910. Part of the vehicular traffic—the 'bus traffic—will be got rid of by the construction of the tramways? Yes; but there is also a very heavy carrying traffic, and if you prohibit drays, waggons, and other vehicles from using the streets except during certain hours, you will have an outcry from the carriers and merchants, because the merchants and shopkeepers must have their goods delivered to them during the busy parts of the day.
911. Until twelve months ago, Elizabeth-street carried the whole of the tram traffic from the western suburbs? Yes; but there were no penny sections then, and the population of the suburbs was not so great as it is now. The growth of the suburbs during the last twelve months has been marvellous. Twelve months ago there were plenty of empty houses round about Waverley, Randwick, and Woollahra, but now there are practically none, and vacant lots are being built upon. There has been a great boom in building everywhere. In the western suburbs, as at Ashfield, there is not an empty house. A great number of those who used to live in the city, or in the vicinity of Darlinghurst, and out Moore Park way, were driven out into the suburbs by the plague. That in itself accounts in part for the increase of the tram traffic.
912. Is not a great deal of the traffic in George-street pick-up traffic? Yes; no doubt a large number of people from the North Sydney suburbs use the George-street tram in order to get to the Haymarket.
913. On the Castlereagh-street line, there would not be that pick-up traffic? The Castlereagh-street line, I understand, is to be a feeder to the proposed new central railway station at Belmore Park, and I am opposed to its construction, because I think it will defer the extension of the railway into the city. The people of the western suburbs are, however, thoroughly aroused to the fact that the extension of the railway into the city must be made a political question, upon which the existence of a Government will depend, and we intend to create an organisation which will bring about a finality. For years we have been promised the extension of the railway into the city. That has been one of the planks in the platform of every candidate for Parliament; but, after the election, there has always been a singular silence and apathy in regard to it. It seems strange to the residents of the western suburbs that their claims should have been overridden by gentlemen representing country constituencies.
914. But the country constituencies are just as much in favour of railway communication as the city people? There is not a strong suburban representation upon the Committee, though, of course, that may be simply an accident. I think myself that the gentlemen forming the Committee have acted conscientiously; but we who live in the western suburbs feel very sore about this matter, more especially since the proposal has appeared within measurable distance of fruition.
915. Coming back to the subject before the Committee, do you think the construction of a tramway down Castlereagh-street would interfere much with the street traffic of the city? No doubt it would relieve George-street considerably, but Castlereagh-street is a very fine street.
916. Is it overcrowded with traffic now? The traffic in Castlereagh-street has gradually increased since the George-street tramway was made. People who drive vehicles are beginning to use Castlereagh-street in preference to George-street, because they find it safer.
917. Do you think it would prejudice the interests of the business people in Castlereagh-street if a tramway were constructed down that street? I think that the construction of a tramway in Castlereagh-street would increase the value of property there.
918. Do you think that those who occupy business premises in Castlereagh-street would raise any serious objection to the construction of a tramway there? I do not see how they could make out a valid case in support of the statement that it would interfere with their business. I think that it would have a tendency to improve business in the street. Castlereagh-street has hitherto been a quiet, retired street. I suppose it is the last residential street in the city.
919. Have you noticed that the electric trams invariably do away with the 'bus traffic? Yes; the 'buses are driven off by them. 920.

E. C. V.
Broughton.
6 Sept., 1900.

920. To that extent they relieve the streets of traffic? Yes; and no one can ignore the fact that our 'buses are very unhealthy, dirty, and out of date; so that no one cares to ride in them.

921. Do you think that if the proposed tramway is constructed there will be enough room for the heavy traffic in the other streets of the city? I can hardly speak with authority upon that subject; but if Sydney becomes the commercial capital which it is hoped she will become, the heavy traffic in the streets must increase every year. The number of warehouses in the city is being increased, and the rents of warehouses have gone up, so that the dray traffic must increase.

922. When additional wharfs are constructed in other parts of the harbour, and shipping is taken away from the Circular Quay, will not the heavy traffic go in other directions? Yes. It may be possible in that way to remove the whole of the dray traffic to the western parts of the city, leaving George-street entirely free for passenger traffic.

923. And if the railway is extended to the proposed new wharfs, that will have an additional effect in reducing the heavy traffic? Yes.

924. It has been suggested that, instead of making a double line of tramway in Castlereagh-street, a single line might be taken down Castlereagh-street, and a return single line up Pitt-street;—how do you view that proposal? No doubt such an arrangement would simplify the working of the tram system.

925. Would it be a convenient arrangement for the public? I think it would be a distinct convenience to the public, though, unfortunately, Pitt-street is very narrow.

926. It is proposed not to lay the track along the middle of the street, but to lay it on one side? At first glance there appear many favourable features in that proposal. No doubt on the score of convenience and safety it is preferable to the Castlereagh-street proposal.

927. How would such an arrangement affect the vehicular traffic? I take it that the tramway would be laid along the eastern side of Pitt-street, in which case it would leave the western side of the street free, and above Martin-place there are a great many retail shops, where a great deal of shopping is done, largely by ladies and children, so that that would be a distinct convenience. It would lessen the risks of accidents very much.

928. Do you think it would give as great facilities to vehicular traffic as the Castlereagh-street proposal? I think so. No doubt it would drive the wool traffic out of Pitt-street into Castlereagh-street, and there would be more room for it in Castlereagh-street with a single line of tramway there than with a double line.

929. Do you think that it would interfere with the business of the large warehouses to have a tramway in Pitt-street? I do not see how it could interfere with them to any extent. Hoffnung's and Dalton's warehouses are both on the western side of the street, so that they would not be interfered with by the tramway. I think that the tramway would be a great gain to those engaged in the retail trade. The wholesale people depend more largely upon country constituents than upon town buyers.

930. *Mr. Hyam.*] But you are against the construction of the proposed tramway because you favour the extension of the railway into the city? I would unquestionably prefer the extension of the railway into the city. I am afraid that the proposed tramway would give only a temporary relief.

931. How would a city railway serve the passenger traffic from suburbs like Leichhardt, Annandale, Balmain, and the Glebe? That traffic would continue to be served by the George-street tramway.

932. What about the eastern suburban traffic? Provision has already been made for dealing with it in Elizabeth-street.

933. Do you think that an extension of the railway into the city would carry the greater part of the traffic from the western suburbs? Yes. Now is a favourable time for the extension of the railway into the city, because the value of real estate is not so high as it was fifteen years ago, and, therefore, any resump-tions would not cost so much; values, however, are on the increase. There is a hardening tendency in the real estate market, and in ten years' time you might have to pay a great deal more than you would have to pay now.

934. Would it surprise you to hear that it would cost over £1,500,000 to bring the railway from its present terminus into Hyde Park? I am not sure what it would cost.

935. You say that the city railway should be made a political question? Yes.

936. But people in the country are already crying out about the enormous expenditure in the city? It is a pity that in our political life people should take these parochial views. The extension of the railway into Sydney would serve the country people, inasmuch as it would make it unnecessary for them to leave the train at Redfern.

937. If the railway were extended into the city, would not many people get out at Redfern and take the George-street tramway, in order to get to places in George-street, or to places west of George-street? A fair proportion of them might do so.

938. How do you view the proposal to take a portion of Hyde Park from the people? The St. James' road scheme would not interfere very materially with Hyde Park.

939. Do you think any scheme of railway extension will be complete unless the railway is brought down to the water's edge? No; because that is the natural terminus. If the railway were brought down to the water's edge you would have railway communication right from the interior to the seaboard.

940. *Mr. Shepherd.*] Have you had conversations with many people in regard to the proposed tramway? I have discussed it generally with constituents and others.

941. Is it thought well of? It seems to be thought that the Commissioners are desirous of acting for the public good by relieving George-street of some of its traffic. The congestion of traffic in George-street is becoming greater every day.

942. Is it your opinion that the construction of the proposed line would effectually relieve the congestion of traffic in George-street? I think that to have a single line down Castlereagh-street and up Pitt-street would be more effectual.

943. Do you not think that people rather than face the inconveniences of George-street would come into Castlereagh-street to take a tram? Yes. I always use the steam trams when going to the railway station about 6 o'clock in the evening, because it is impossible to get a seat in the George-street trams at that time. From half-past 5 to a quarter-past 6 it is dangerous for women and children to attempt to use the George-street trams. The Early Closing Act has created a very large exodus from the city at 6 o'clock.

944. Do you think that the public would be as well served if the tramway were confined to Elizabeth and George streets? No.

945. Do you think that it would be better to take the tram down Castlereagh-street? I think so, in view of the possibility of confining the heavy commercial traffic to the western part of the city. The great objection to the proposal is that it would spoil Castlereagh-street for heavy traffic.

E. C. V.
Broughton.
6 Sept., 1900.

946. Would not a single line interfere less with the traffic than a double one, because all the trams would be going the one way? Undoubtedly. There would be no blocking and no delay if you had a continuous service.

947. Do you think that the tram system, when extended, is likely to prove a convenient one for the whole city? Yes. In Sydney we have much greater difficulties to contend with in providing for our tram traffic than they have in any of the other capitals. In Western Australia, which I visited some time ago, the streets in the cities are more level than are our streets, while in Melbourne they can have a perfect tram system because their streets are so wide.

948. *Dr. Garran.*] Is the immense traffic up and down George-street of benefit to the shopkeepers there? I think so.

949. Would they like the tramway removed from George-street? I think not.

950. Do you think that a tramway adds to the value of the shop property in the streets through which it runs? Yes, in the city; but, in a street like William-street, I think it depreciates the value of shop property, because people are inclined to say, "Let us go straight into town, to shops where they have everything up to date." In dealing with property in William-street, during the last year or two, I have valued it on a lower basis than I would have taken some years ago. As a matter of fact, the value of property in William-street has gone down, and business people there say that the tramway has considerably affected their businesses. Before the tramway was constructed people walking up and down the street might often be attracted into the shops by some article displayed in the windows, whereas now those people are carried through the street in the trams. I have been told by a gentleman who has a large draper's shop in William-street that there is nothing doing there now in the daytime—that all the business is done at night.

951. Do you think that the Pitt-street shopkeepers suffer by the tramway taking their customers down George-street? No; but Pitt-street is so narrow that a tram there might prevent people who can afford to drive there in carriages from continuing to do so, in which case the shopkeepers might lose their customers.

952. When there was a horse tramway in Pitt-street the shopkeepers objected to it. Thousands of people who deal with shopkeepers in Pitt-street now travel up George-street? Yes.

953. Have the George-street trams diminished the retail business in Pitt-street? No.

954. There is no desire on the part of the Pitt-street shopkeepers for a tramway in Pitt-street? I do not know what their views are.

955. Is it not a great advertisement to a shop to have an incessant line of people passing it all day long? Yes; and I think that a single line of tramway would be a distinct gain to Pitt-street.

956. Would the value of property in Pitt-street rise or fall if a tramway were made there? I think it would increase.

957. Because the trams would bring more people into the street? Yes.

958. *Mr. Shepherd.*] Property has gone down in value everywhere during the last few years? There was a great fall in the value of property owing to the bank crisis, but values are going up again now.

MONDAY, 10 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a double line for an Electric Tramway from Belmore Park to Fort Macquarie by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.

John Spencer Brunton, merchant, and ex-President of the Sydney Chamber of Commerce, sworn, and examined:—

959. *Dr. Garran.*] Are your business interests largely concerned with the facilities afforded for vehicular traffic in the streets of Sydney? Yes. I saw that Mr. Budd, of the firm of Budd and Ferns, the principal part of whose business consists in the carting done for my firm, was giving evidence a few days ago, against the proposed Castlereagh and Pitt Streets tramway, and I have felt it to be my duty, as a citizen, to come forward to support that evidence, and to show the Committee the danger and harm which would result from the making of the proposed tramway.

J. S. Brunton.
10 Sept., 1900.

960. Your carting is not done by carts of your own? No; Messrs. Budd and Ferns have done our work for the last twelve years. They began with a single dray, and now they are amongst the largest contractors in Sydney.

961. The evidence of the carriers has been to the effect that the George-street tramway has caused delay rather than danger? My opinion is that the proposed tramway will cause both delay and danger, and that the delay will be but a small thing in comparison with the danger to the general public. I maintain—as you will see by referring to the evidence given by me in the inquiry into the city railway scheme—that the time has arrived for the extension of the railway into the city. It was argued, when that extension was first made the subject of inquiry, that the making of a tramway down George-street would render the extension of the railway into the city unnecessary; but the condition of the traffic in George-street during the past few months has shown beyond doubt that the extension of the railway into the city is more needed now than it ever was before. Now it can be argued that the extension of the railway into the city is required in order to relieve George-street of traffic, and in order to carry passengers with that expedition and despatch which is necessary in these days. I would impress upon the Committee the need for

- J. S. Brunton. an extension of the railway into the city from the point of view of the saving of time which it would bring about. Since the tramway has been running down George-street, the congestion of traffic has been so great that in the busy parts of the day it takes half an hour to reach the Redfern station by tram from the heart of the city, whereas formerly the journey could be made in an omnibus in fifteen minutes, while there is not sufficient accommodation on the trams for the people who desire to use them. The Elizabeth-street tramway, which used to be a great convenience to people going to the railway station, does not now give us a service which is convenient for railway travellers, if we leave out of account the occasional trips of the Waterloo and Botany trams, which stops in Devonshire-street, opposite the subway. I am the owner of private vehicles, and I understand horses, being a very fair whip, and having the command of a squadron of Lancers, so that I know what I am speaking of when I say that the running of a tramway in Pitt-street would be dangerous to the rest of the traffic in the street. At the present time my coachman objects to go into George-street if he can avoid doing so, because of the risk of collision when driving fresh, well-fed horses through such a crowded thoroughfare. Pitt-street, however, is only 36 feet wide, and is already a crowded thoroughfare. There are, too, no fewer than three theatres in Pitt-street, all within a short distance of each other; and at night, when they are discharging, if there were a line of tramway running up the eastern side of the street, and rows of cabs and vehicles in waiting on the other side of the street, the traffic would be completely blocked. A tramway in Pitt-street is no new thing. In 1865, £175,000 were spent in constructing a horse tramway down Pitt-street, and I have it on the authority of three of the oldest and best reputed citizens of Sydney that it was the unanimous opinion that that tramway was unsafe and interfered too much with the other street traffic, so that in the end it was removed with very little difficulty. It is admitted that between 50,000 and 60,000 people use the Redfern Railway Station daily, and if the whole of the railway traffic were taken from the George-street tramway and carried into the city by train the construction of a tramway in Pitt and Castlereagh Streets would be rendered unnecessary. What should be done is to construct the railway into the city, and then, if the railway is found not to sufficiently relieve George-street of its traffic, to consider some other means for relieving it. The situation of Sydney is very similar to that of New York, and it seems to me that ultimately we shall have to carry much of our city traffic underground or overhead. The hope of the western suburbs people, for many years, has been to have the railway extended into the city. Although the electric tramway has been made from the Redfern station down George-street, the residents of the western suburbs find travelling more inconvenient now than it was before. George-street is so crowded a thoroughfare that it is dangerous for women and children to cross it in order to use the trams.
962. Do you say that the western suburbs people think themselves worse off now than they were before the George-street tramway was running? I believe they do. They lose more time now than they used to lose. The trams are so overcrowded that the drivers have hardly enough room to work in. Then the crossing of George-street, near the Benevolent Asylum, is an absolutely dangerous one, because of the tram-lines coming in there from all directions. Castlereagh-street and Pitt-street are now almost the only main arteries in the city for goods traffic. My firm handles every week at the Darling Harbour railway station between 300 and 500 tons of produce, and we ship a lot of stuff to Woolloomooloo Bay and other parts of the harbour. The stuff has to be brought to the city, and I can quite understand reputable men like Mr. Budd and Mr. Gillham, who have had great experience in carting, objecting to the blocking of more of the city streets by the construction of trams in them. My main objection to the proposal before the Committee is that the tramway would not be required if the railway were brought into the city; that it would be dangerous to traffic, and would entail great delay; and that it would do great injury to shopkeepers and property-owners in Pitt-street. If people are dropped within 200 or 300 yards of the place to which they want to go, they can very easily walk that distance, and the George-street tramway drops its passengers very close to the Pitt-street shops. I have no interest in property in Pitt-street. I have come forward to give evidence simply because I regard the proposal before the Committee as a dangerous one, and one which should not be carried out.
963. The shopkeepers in George-street do not dislike the trams there, because they bring customers to them, and the Pitt-street shopkeepers would probably not complain if a tramway in Pitt-street brought more traffic into that thoroughfare, though the carters and people who drive vehicles through the streets would complain? I think that a shop like that of David Jones & Co., or any of the shops in Pitt-street, owe more to their central position than they owe to the tramway; and, as I have already said, it is not necessary to drop people immediately in front of the shops to which they wish to go. If they are dropped within a block of a shop they can easily walk that distance. Pitt-street is altogether too narrow for a tramway.
964. The Railway Commissioners are pressing the construction of the proposed tramway upon the Government quite apart from the city railway; they find that they have overloaded George-street with traffic, and that that street must be relieved before they can add any more traffic to it? Why do they not run some of the electric cars down Elizabeth-street.
965. They are of opinion that people would not now use the Elizabeth-street line; but that they might use a tramway running down Pitt-street? There is no room in Pitt-street for a tramway, and the construction of a line there would only create delay, danger, and difficulty.
966. Formerly the traffic used to go down Pitt-street, because there was no other line open, but when the George-street line was opened the traffic deserted Elizabeth-street? If all the railway trams were taken down Elizabeth-street, the railway passengers would have to go that way, and that would greatly relieve George-street.
967. The Railway Commissioners seem to think that, even if the railway trams ran down Elizabeth-street, most of the passengers would prefer to walk to George-street, and to take the George-street tram? Well, in my opinion the scheme before the Committee is a very crude one, and I think that the inquiry into it will bring about the reopening of the city railway proposal.
968. The Railway Commissioners say that they think the Public Works Committee made a mistake in regard to the city railway, but they say at the same time that, apart from the city railway, they must as soon as possible take the railway traffic from George-street? To take the railway traffic from George-street would mean to take away about 60 per cent. of the traffic from George-street. To do that would make the street much safer for vehicular traffic. The city traffic going west goes out through a narrow neck at George-street, much as the railway traffic goes through a narrow neck at Cleveland-street. The working of the George-street tramway has proved that that line does not satisfy the railway passengers, and

and the only way to meet their wants is to extend the railway into the city. I object altogether to the construction of a tramway in Pitt-street. J. S. Branton.

969. The Commissioners could restore the old state of things in a week by turning the electric trams out of the station yards, and running the old steam trams down Elizabeth-street;—to do that would relieve George-street? It would to a great extent, and it would be a great convenience to the people who wanted to connect with the eastern suburban tram system. 10 Sept., 1900.

970. *Mr. Watson.*] The evidence given before the Committee in February last by Mr. Kneeshaw, of the Railway Department, was to the effect that only 13,000 railway passengers travelled by the electric trams; at that time about half of the passengers carried by the George-street tram came from the railway, while the balance were picked up in the street;—since then, however, the Newtown and Dulwich Hill traffic has been brought into George-street, and, later on, it is intended to bring the Leichhardt, Annandale, Glebe, Balmain, and other western suburban tram traffic into George-street;—if that is done, the railway traffic will form only an inconsiderable portion of the whole traffic, and to divert it will not sufficiently relieve the George-street line? I think that if the railway traffic were diverted from George-street the trouble would be very considerably got rid of. At the present time, people living at Dulwich Hill are often unable to get seats in the George-street trams, because of the overcrowded state of those trams, and the blocking of the trams through the congestion of traffic in the streets makes their progress a very slow matter. It seems to me that if some of the traffic were brought down Elizabeth-street it would greatly improve things. I feel inclined to challenge Mr. Kneeshaw's figures about the railway traffic.

971. He gave those figures after a very careful counting of the traffic for a considerable period. Just how much traffic would be taken away from George-street by the extension of the railway into the city would depend largely upon the point to which the railway was taken? Yes; but I think that the extension of the railway into the city would relieve George-street of fully one-third of its present traffic.

972. Mr. Oliver informed the Committee, when the city railway proposal was under inquiry, that it would be necessary to construct these relieving lines in Pitt and Castlereagh streets even if the railway were brought into the city? I think we should give the extension of the railway into the city a trial before going any further with the construction of tramways. If, afterwards, it were found necessary to construct more tramways, the advisability of constructing underground or overhead lines might be inquired into. Pitt-street is so narrow, and is so crowded at the present time, that it would be almost impossible for the trams to make their way through it.

973. Has the number of 'buses running in George-street been materially reduced since the tramway there was opened? Yes; but I am surprised that so many 'buses have been kept on. I thought that the effect of the tram in George-street would have been the same as in Melbourne, where the 'buses were all taken off the street almost in a night, and the streets there are much wider, and give more facilities for vehicular traffic than George-street gives.

974. If the eastern suburban lines are brought down to the Circular Quay, as is proposed, do you not think that it will give the trams a better opportunity to compete with the 'buses, and that the 'buses will disappear? No doubt the number of 'buses will be reduced. I see that the Edgcliffe-road 'buses are about to be sold.

975. Do you think that a reduction in the number of the 'buses would compensate for the space taken up by a single line of tramway in Pitt-street? No. Even if the 'buses were driven out of Pitt-street, that thoroughfare would still be crowded, because it is the main vehicular thoroughfare of the city.

976. Does not the 'bus traffic form a very large proportion of the vehicular traffic in Pitt-street now? Yes, a good proportion.

977. Which would be more economical of street space—a tramway system or a 'bus system? A four-horse 'bus would take up about the same superficial area of roadway as a tramcar.

978. But, for each passenger carried, a tramcar would occupy less space than a 'bus? Yes, that is so.

979. Then, would there not be a saving in street space if we had trams instead of 'buses? I do not think so, because the trams run at regular intervals, whereas the 'buses accommodate themselves to the other traffic in the streets.

980. With regard to your suggestion that the trams should be underground, would it be necessary to put them underground for the whole distance, or only in the more crowded parts of the city? I think that in years to come it will be necessary to have underground trams in the city itself, though the trams need not run underground all the way. At places like Belmore Park, for instance, they might run overhead, and, if there were an extension to the North Shore, no doubt they would run overhead. Our street traffic is very difficult to deal with, because the city lies on such a narrow peninsula.

981. *Mr. Hyam.*] Do you think that the extension of the railway as far as the Supreme Court would serve the suburban traffic? I do; but ultimately there must be an extension to the North Shore. I advocated the giving up of one side of Hyde Park for railway purposes, having the entrance to what would be the main suburban station opposite the Queen's Statue.

982. Where would you run the country trains from? From the central station at Devonshire-street. People going into the country have always a lot of luggage, and have to use cabs, so that it would be as easy for them to go to a station at Devonshire-street as to go to a station at King-street.

983. You would have the city railway for suburban traffic only? Yes.

984. An extension of the railway into the city would not serve the passengers from suburbs like Leichhardt and Annandale? It would not serve the passengers from suburbs which are served by the tramways, but it would relieve the city trams of a very great deal of traffic.

985. You do not think that a railway station on the site of the old Devonshire-street burial ground will meet the purpose? No. No doubt that is a good site for a grand central station, and will give accommodation for the shunting and making up of trains, which could not be obtained elsewhere, because of the objection the public have to the taking away of the whole of Hyde Park. The suburban traffic, however, should be brought into the city, and, to my mind, the Hyde Park scheme will yet have to be carried out.

986. Do you think that it will be necessary to have a central station at Devonshire-street, and to extend the railway from that station into the city? Yes.

987. Do you think that the suburban traffic should be diverted into Elizabeth-street? Yes, if we cannot get the city railway.

- J. S. Brunton. 988. Are you aware that the Railway Commissioners propose to convert the eastern suburbs tramways to the electric system? Yes.
- 10⁸ Sept., 1900. 989. They are of opinion that they will require Elizabeth-street wholly for the eastern suburban traffic? Well, if Elizabeth-street cannot be used for the railway traffic, you must carry out the city railway.
990. I suppose you know that there is a great objection to the taking of any part of Hyde Park for railway purposes? Yes, I am aware that there is.
991. The cost of bringing the railway into the city would be enormous? I do not remember the figures, but I favour the Hyde Park scheme, and if I could not get that I would take the Park-street scheme.
992. The bringing of the railway into the city would also entail a considerable annual loss in working expenses and interest? I understood that the undertaking would be a profitable one. The Railway Commissioners advocated the extension mainly on account of the dangerous condition of the present Redfern arrangements. No doubt the Devonshire-street scheme will get rid of that danger, but the extension of the railway into the city is necessary to relieve George-street.
993. *Mr. Levien.*] You want the railway to come right into the city? Yes.
994. For suburban passenger traffic only? Yes. The railway travelling public are not benefited to any extent by the present George-street tramway. There is a great loss of time in moving from the train to the trams, and the trams travel very slowly in George-street.
995. In America do the trains run right into the heart of the cities? They do at Chicago, they do at New York, and they do in a lot of big cities there. In San Francisco the trains run through the streets, at the rate of 8 miles an hour, ringing a big bell, and I have often wondered why they could not do that here. In London the trains come right into the middle of the city at various points—such as St. Pancras and Paddington. I think that to carry a tram down Pitt-street would be highly dangerous, and that it would be a cruel thing for the Committee to recommend it when they can see another way out of the difficulty.
996. You do not think there should be a tramway down Pitt or Castlereagh streets? The tramway should not be taken down Pitt-street.
997. Or Castlereagh-street? If it were impossible to divert the George-street traffic into Elizabeth-street, I might agree to the construction of a tramway down Castlereagh-street, but I think that it would be unnecessary.
998. If the railway were brought down to King-street, would you object to the construction of a tramway in Pitt-street? Yes.
999. *Mr. Shepherd.*] You do not believe in making any addition to the present tramway system of the city? I decidedly object to the construction of a tramway in Pitt-street, but I should not be surprised to see trams taken in other directions. A tram might be taken out across the new Pymont Bridge towards Pymont and Ultimo, for instance.
1000. The proposal referred to the Committee was the construction of a double line of tramway in Castlereagh-street;—would you object to that? Yes.
1001. What would you recommend? I would make use of George-street and Elizabeth-street for the tramway traffic. Elizabeth-street and Castlereagh-street are very close together.
1002. *Mr. McFarlane.*] How would you deal with the traffic so as to relieve George-street? One-third of the present traffic would be taken away from George-street by the extension of the railway into the city, and part of what was left might be diverted into Elizabeth-street.
1003. You could not run trams in Elizabeth-street if the city railway were made? Yes, I think so; because the railway would run through Hyde Park.
1004. Do you think that a city railway and tramways down George-street and Elizabeth-street would deal with the whole of the western suburban traffic? Yes.
1005. The Railway Commissioners do not appear to be of that opinion. Mr. Oliver, when under examination in regard to the extension of the railway into the city, informed the Committee that the Commissioners had—
- Already recommended that tramways should be constructed down Pitt-street and Castlereagh-street. That is considered to be necessary for the ordinary tram traffic, which must always be carried by trams, and the increasing pick-up traffic which will follow on the introduction of the system of penny sections.
- ? I do not know why the Commissioners should want to put tramways in Pitt and Castlereagh streets, and thus block the only arteries now open for vehicular traffic.
1006. The Railway Commissioners were, until recently, running steam trams to relieve some of the western suburban tram-lines; but it was found that hardly anybody would use the steam trams, and that the traffic continued to be carried by the electric trams? No doubt George-street is more central than Elizabeth-street; but if all the traffic from a suburb were diverted into Elizabeth-street, the passengers would have to use that street.
1007. Do you not think that the construction of new wharfs on the eastern side of Darling Harbour, and the extension of the railway to those wharfs, will greatly relieve the vehicular traffic of the city? It may relieve it somewhat; but the construction of such a railway will not have as much effect upon the traffic as some people imagine. The goods which are brought by over-sea ships must nearly always be taken from the wharfs to bonded stores for delivery to the importers; very little will ever be unloaded directly from the ships into the railway trucks, unless they are heavy goods, such as galvanized iron and wire. The railway, of course, will be a great convenience in taking goods alongside out-going vessels. A line such as you speak of would be a great convenience in bringing produce down to the intercolonial steamers.
1008. The railway, too, would be used for bringing down shipments of wheat? Yes, where full cargoes of wheat were being taken; but where part cargoes of wheat were being loaded by steamers lying at the Circular Quay or Woolloomooloo Bay, the wheat must, of course, be carted. Besides the delivery to the ships or from the ships, there is a great deal of carting from place to place in the city and suburbs, and that traffic must be considered.
1009. What streets does the heavy traffic from the wharfs use now? Pitt-street is generally the most convenient street, because it has a better grade than the other streets, and comes out on to the Circular Quay. The Government are spending so much in improving Woolloomooloo Bay that it is becoming a very popular shipping place; and, of course, anything brought down by railway for shipment from Woolloomooloo Bay must be carted from Darling Harbour to Woolloomooloo Bay. The space at Darling

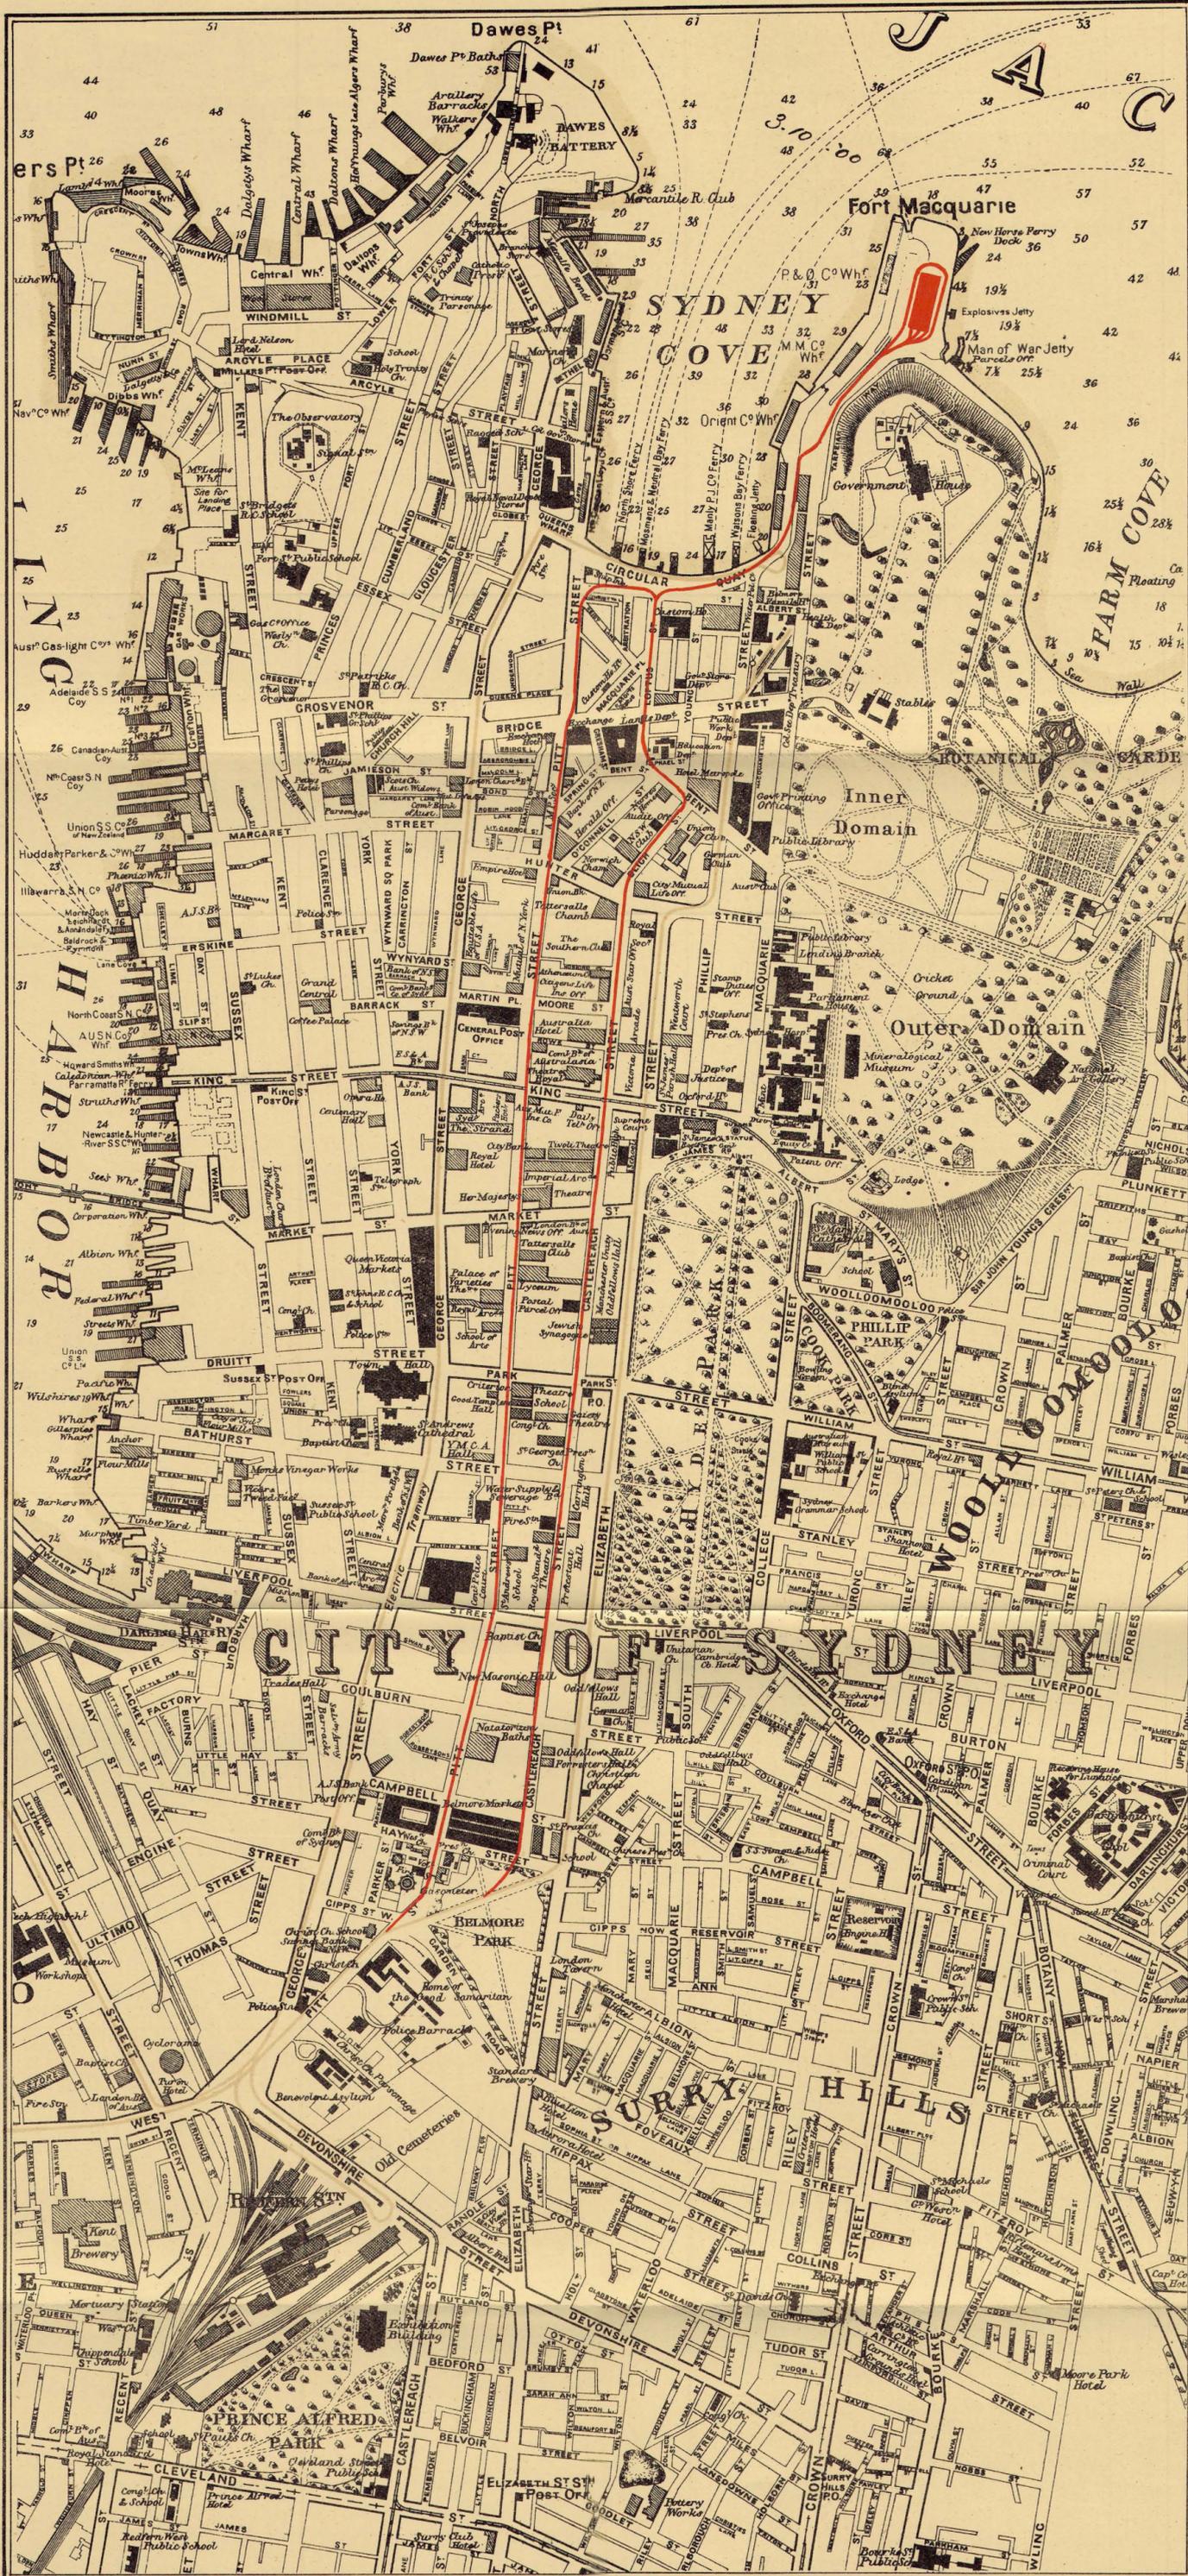

Darling Harbour is pretty well all required for intercolonial boats, and I do not think that the over-sea shipping will go there. In my opinion, the over-sea vessels will keep to the Woolloomooloo Bay, Circular Quay, and Miller's Point wharfs. J. S. Brunton.
10 Sept., 1900.

1010. If it were decided that either a double line of tramway in Castlereagh-street, or a single line in Castlereagh-street and a single line in Pitt-street, must be constructed, which would be the better to construct? If I had to choose between the two I would prefer a double line in Castlereagh-street, because that is the widest street, but as Castlereagh-street is so near to Elizabeth-street I do not think that a tramway in Castlereagh-street would be much more convenient than a tramway in Elizabeth-street, where you have already every facility for conducting tram traffic.

1011. It is said that Elizabeth-street will not carry all the traffic? It carried it all for many years without complaints.

1012. But the tram traffic of the city has largely increased of late? I do not think that the population of the city and suburbs has increased very much, but no doubt the introduction of penny sections has made tram travelling more popular with the public. I should think that fully 40 per cent. of the traffic in George-street is pick-up traffic.

[One plan.]

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

ELECTRIC TRAMWAY ALONG PITT-STREET, SYDNEY.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing a double line of electric tramway along Pitt-street, city of Sydney," have, after due inquiry, resolved that it is not expedient the proposed tramway should be constructed; but they recommend that the suggestion of the Railway Commissioners, by which a single line would be constructed from Belmore Park through Castlereagh, Bligh, and Loftus streets to Fort Macquarie, returning by single line through Pitt-street, be adopted; and, in accordance with the provisions of sub-section (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

REASONS FOR THE PROPOSAL BEING SUBMITTED.

1. This proposal, the Committee are informed in the official statement put before them, was referred to them sooner than was originally intended, in consequence of the Railway Commissioners suggesting to the Minister for Public Works that the original proposal to construct a double line for an electric tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets, should be varied to one by which a single line would be laid along Castlereagh-street, with a return line along Pitt-street.

But the reference was also made to remove any doubt which might exist as to the legality of carrying out such a work without further inquiry, should the Committee recommend it in connection with the Castlereagh-street scheme. Under the present reference, the proposal for a new electric tramway is again altered, the Minister having deemed it advisable to ask Parliament to refer a scheme whereby a double line of electric tramway would be constructed along Pitt-street to Circular Quay.

THREE SCHEMES BEFORE THE COMMITTEE.

2. The Committee have, therefore, had before them three schemes—two referred to them, and one suggested, as follow:—

- (1.) A double line for an electric tramway, from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets, with single lines down Loftus and Young streets.
- (2.) The suggestion of the Railway Commissioners, that there should be a single line from Belmore Park through Castlereagh, Bligh, and Loftus streets to the proposed terminus at Fort Macquarie, returning by a single line through Pitt-street.
- (3.) A double line of electric tramway along Pitt-street to the Circular Quay.

DESCRIPTION

DESCRIPTION OF THE PITT-STREET PROPOSAL.

3. The double line in Pitt-street would branch off the existing steam tramway in that street, at a point near Gipps-street, and traverse Pitt-street to its intersection with the Circular Quay, the whole of the length from Gipps-street being a double track. Along the Quay the main lines would be extended until they joined the double-track extension of the existing tramway to Fort Macquarie.

The permanent-way would consist of 83-lb. rails, which would be laid on sleepers between Gipps-street and Bathurst-street in macadamised road; from Bathurst-street to the Circular Quay they would be laid on concrete, the permanent-way being wood-blocked. The poles, for supporting the electric wires, would be erected on each side of the street.

ESTIMATED COST OF THE PITT-STREET SCHEME.

4. The total cost, exclusive of land and compensation, is estimated approximately at £76,672, comprising—road construction, £31,835; outside electric work, £7,087; power plant, £12,750; and rolling-stock, £25,000. Land resumption at the corner of Pitt and Alfred streets, near Change-alley, would increase this estimate by between £5,000 and £6,000. To this should be added the cost of the extension to Fort Macquarie and of the car shed, £39,950.

RAILWAY COMMISSIONERS' REPORT.

5. With respect to the statutory report of the Railway Commissioners on the proposal, their report upon the Castlereagh-street scheme, and their minute suggesting the single line along Castlereagh and Pitt streets, are taken as complying with the requirements of the Public Works Act. In the former document they say that the construction of the proposed tramway is rendered necessary by the conversion of the steam trams to electric trams, and the consequent inability of George and Elizabeth streets to carry the traffic, and that they, therefore, cordially support the proposal. The only additional revenue derived from the line would be due to increased traffic, and although it is not possible to foretell with any degree of accuracy what this will amount to, they have no hesitation in stating that it will fully justify the construction of the line.

SCHEME FAVOURED BY THE RAILWAY COMMISSIONERS.

6. The scheme favoured by the Railway Commissioners is that by which a single line would be laid from Belmore Park through Castlereagh, Bligh, and Loftus streets to the proposed terminus at Fort Macquarie, with a return single line through Pitt-street. This they consider to be the most suitable for dealing with the railway traffic, and also for securing in Pitt-street a large proportion of the pick-up traffic which now goes to the George-street trams.

THE COMMITTEE'S INQUIRY.

7. The inquiry into the proposal for a double line of electric tramway in Pitt-street being really part of that relating to the proposed tramway in Castlereagh-street, the Committee have dealt with the two schemes together, and the evidence taken with reference to one should be read in conjunction with that taken concerning the other. The Committee's Reports upon the two proposals should also be read together, as the Pitt-street scheme, and the evidence relating to it, are very fully dealt with in the Report upon the Castlereagh-street proposal. In the present inquiry the witnesses examined were the Engineer-in-Chief for Railway and Tramway Construction, the Secretary to the Railway Commissioners, the Traffic Superintendent of the Tramway Department, the Town Clerk of Sydney, the proprietor of the Hargrave-street and Point Piper road omnibuses, and one or two other persons.

OBJECTIONS TO THE TRAMWAY.

8. Objections to the proposed tramway, as they appear in the evidence in both inquiries, were chiefly urged by several master carriers whose horse teams use Castlereagh-street; by the Registrar of the Metropolitan Transit Commission, who explained to the Committee that Castlereagh-street was needed for traffic driven out of George-street, and that Pitt-street, from its narrowness and the number of vehicles passing through it, is the most congested street in Sydney, but who admitted that if George-street is to be relieved there is no alternative to using Castlereagh or Pitt street

street for the purpose; by the proprietor of the Hargrave-street and Point Piper road omnibuses, who protested against the Pitt-street proposal on the ground of its interference with omnibus and other vehicular traffic, and the risk to life and limb which a greater congestion of traffic than at present exists in the street would cause; and by the Town Clerk of Sydney, who, appearing on behalf of the City Council, objected to the construction of the proposed or any similar tramway because— (1) the Council is of opinion that any such enterprise as a tramway is essentially a municipal undertaking, and should be constructed and managed by the municipalities concerned; (2) the streets should not be used without payment to the Council, or taken over without compensation; (3) the Railway Department, who have charge of the tramways, will pay no rates to the Council for any properties concerned, nor for the use of the streets over which the trams will run; and (4) because tramways have been constructed in the city without regard to the Council's convenience.

REASON FOR THE PROPOSED TRAMWAY.

9. As stated in the Committee's Report on the Castlereagh-street scheme, the reason for proposing to construct an electric tramway in Pitt-street is the necessity for relieving George-street of some of its present tram traffic, particularly that portion of it passing from and to the Redfern railway station. The first step towards relieving George-street, after the construction of the proposed new tramway, would be to take the railway traffic from the George-street trams, which would be done by putting an end to the practice of running those trams into the Redfern railway station, and by running the Castlereagh and Pitt street trams into the station instead. At present a large proportion of the passengers who travel in the George-street trams do so from and to the Redfern station; with the new lines in operation all passengers wishing to travel from or to the station would require to do so by the Castlereagh and Pitt street trams. The George-street trams would stop in George-street opposite the station, as the trams from the Western Suburbs do now, to take up or set down passengers; but, in view of the advantages offered by the Castlereagh and Pitt street trams, it is thought by the Railway Commissioners and the tramway authorities that very few railway passengers would travel by way of George-street, and that the diversion of the railway traffic will give immediate relief, while further relief will be afforded by diverting a portion of the Western Suburbs tram traffic into Castlereagh and Pitt streets.

PITT-STREET AND ITS TRAFFIC.

10. It is admitted that Pitt-street is a narrow street, with a very considerable vehicular traffic passing through it; but it is contended that, with a single line along the street—which is the scheme favoured by the Railway Commissioners—interference with vehicular traffic would not be great. No more traffic would be taken from the George-street trams into Pitt-street than is absolutely necessary to relieve that service; the poles for supporting the electric wires would be on each side of the street, which would allow of the single tramway track being placed sufficiently far from the kerb to give plenty of room for vehicles; and, as the trams would always be travelling in one direction, the risk of accident would thereby be greatly minimised. The chief difficulty is the omnibus traffic to and from the Eastern Suburbs. As many as sixty-three omnibuses, the Committee are informed, pass through Pitt-street daily, making altogether 600 trips each way. This extensive omnibus service appears to be due principally to the inability of the steam trams plying between Sydney and the Eastern Suburbs to meet public requirements sufficiently. With the conversion of the Oxford-street steam trams to the electric system, it is believed the omnibus traffic would mostly disappear; and the Committee endeavoured to press upon the attention of the Railway Commissioners the necessity for converting these trams as soon as possible, so as to reduce the traffic in Pitt-street. It appears to be impracticable to have electric trams running to the Eastern Suburbs by the time the tramway in Pitt-street would be constructed and in operation; but it is pointed out that as fast as the Western Suburban trams are changed from the steam to the electric system—a work the Commissioners are now engaged upon,—the steam trams released from the Western Suburban lines could be placed in the Eastern Suburban service, and in that manner facilitate vehicular traffic generally. Further relief to Pitt-street in regard to omnibus traffic could be obtained by diverting the omnibuses into Castlereagh-street.

HORSE-TEAM

HORSE-TEAM TRAFFIC IN PITT AND CASTLEREAGH STREETS.

11. The horse-team traffic which passes through Pitt and Castlereagh streets, principally the latter, should be reduced to some extent before long, by an alteration about to be made in connection with the goods traffic at the Redfern Railway Station. At the present time, the general goods business in truck loads is conducted at the Sydney goods shed, adjoining the produce shed, at the Redfern Railway station, and the Railway authorities are about to call for tenders for additional accommodation at Darling Harbour for the purpose of dealing with it there. By this change, Redfern station will be relieved to the extent of 1,000 tons of goods per week, and the team traffic in Castlereagh and Pitt streets correspondingly lessened.

DECISION ARRIVED AT.

12. In view of the evidence before them, and for the reasons stated in their Report upon the proposed Electric Tramway from Belmore Park to Fort Macquarie, the Committee have decided to recommend the adoption of the scheme suggested by the Railway Commissioners, by which a single line would be constructed from Belmore Park, through Castlereagh, Bligh, and Loftus streets, to the proposed terminus at Fort Macquarie, returning by single line through Pitt-street.

RESOLUTION PASSED.

13. The resolution passed by the Committee is shown in the following extract from the Minutes of Proceedings:—

Mr. Watson moved,—“That, in the opinion of the Committee, it is not expedient the proposed double line of Electric Tramway along Pitt-street, as referred to the Committee by the Legislative Assembly, be carried out; but they recommend that the suggestion of the Railway Commissioners, by which a single line would be constructed from Belmore Park through Castlereagh, Bligh, and Loftus streets, to Fort Macquarie, returning by a single line through Pitt-street, be adopted.”

The motion was seconded by Mr. Hyam, and passed on the following division:—

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC
WORKS.

MINUTES OF EVIDENCE.

ELECTRIC TRAMWAY ALONG PITT-STREET.

TUESDAY, 18 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.

The Hon. SOLOMON HERBERT HYAM.
JOHN CHRISTIAN WATSON, Esq.

JOHN MCFARLANE, Esq.

The Committee proceeded to consider the expediency of constructing a line of Electric Tramway along Pitt-street, City of Sydney.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you any statement to make in reference to the proposal before the Committee? I have the Under-Secretary's statement, as follows:—

H. Deane.
18 Sept., 1900.

ELECTRIC TRAMWAY FROM GIPPS-STREET, *via* PITT-STREET, TO CIRCULAR QUAY, CITY OF SYDNEY.

THE proposal before the Committee was referred by the Legislative Assembly for the Committee's consideration on 6th September, 1900, in the following terms:—"That it be referred to the Parliamentary Standing Committee on Public Works to consider and report on the expediency of constructing a line of electric tramway along Pitt-street, City of Sydney."

This proposal has been brought before the Committee sooner than was originally intended, in consequence of a suggestion made to the Minister by the Railway Commissioners.

It will be remembered that when the proposal to construct an electric tramway from Belmore Park, *via* Castlereagh-street, to Fort Macquarie, was submitted to the Committee, it was stated that for the purpose of relieving the congested traffic in George-street, two ways of solving the problem had presented themselves, namely, by laying a tramway (a) along Pitt-street, or (b) along Castlereagh and Bligh streets to Circular Quay. Both schemes, it was stated, would likely be required ultimately; but as Castlereagh-street afforded more facilities for traffic than Pitt-street, that route was referred to the Committee as the first instalment.

The Railway Commissioners in their Statutory Report thereon had cordially approved of the Castlereagh-street scheme; but they have now been led to modify their views, and have suggested a variation from that route in the following terms:—

Office of the Railway Commissioners of New South Wales, Sydney, 25 July, 1900.

Proposed line of tramway from Belmore Park to Fort Macquarie, by way of Castlereagh and Bligh streets (double track) and Loftus and Young streets (single track).

SINCE writing our report of the 10th instant, we have looked further into this subject, and now desire to suggest, for the favourable consideration of the Honorable the Minister for Public Works, the desirability of varying the proposal originally submitted by constructing a single line from Belmore Park, through Castlereagh, Bligh, and Loftus streets, to the proposed terminus at Fort Macquarie, and returning by single line through Pitt-street.

We are constrained to recommend this alteration in the original proposal because the experience gained since the George-street line was opened strongly indicates that it will best meet the public convenience.

The congestion which is now taking place in George-street impels us to point out to the Honorable the Minister that the work is of great urgency.

W. M. FEHON,
Deputy Chief Commissioner.
DAVID KIRKCALDIE,
Commissioner.

In consequence, therefore, of this strong recommendation from the Railway Commissioners, the Minister deemed it advisable to ask Parliament to refer to the Committee the proposal to construct a double line of electric tramway along Pitt-street to Circular Quay, so that the Committee might have fully before it the two schemes originally suggested—that is (a) the Castlereagh and Bligh streets route and (b) the Pitt-street route. The

H. Deane.
18 Sept., 1900.

The official description of the second proposal is as follows :—

Gipps-street, via Pitt-street, to Circular Quay Electric Tramway.

This tramway branches off the existing steam tramway in Pitt-street at a point near Gipps-street, traversing Pitt-street to its intersection with the Circular Quay, the whole of the length from Gipps-street being double track.

The main lines are extended along the Quay until they join up the double track extension of the existing tramway to Fort Macquarie.

The permanent-way will consist of 83-lb. rails, which will be laid on sleepers between Gipps-street and Bathurst-street, in macadamised road; from Bathurst-street to the Circular Quay the rails will be laid on concrete, and the permanent-way wood-blocked.

The total cost is estimated approximately at £76,672.

With respect to the required Statutory Report of the Railway Commissioners on this proposal, their report of 10th July, 1900, relating to the Castlereagh-street route, read in conjunction with their subsequent minute of 25th idem, as quoted above, are intended to be taken as complying with the requirements of the Public Works Act on this point.

I put in the plans—a map of Sydney, showing the route to the S-chain scale; a plan to the 40-foot scale; and a book of reference. I have prepared an estimate for a double track tramway along Pitt-street. I have also, in view of the suggestion of the Railway Commissioners, prepared estimates for a single line along Castlereagh-street, and a single line along Pitt-street, so that the Committee will have before them, not only the complete schemes of both tramways, but the proposal of the Railway Commissioners in regard to a single line down each street, before them.

2. What is the estimate for a double line along Pitt-street? I put in the estimate as follows :—

GIPPS-STREET TO CIRCULAR QUAY, via PITT-STREET—Double Track.

Approximate Bill of Estimated Quantities and Cost.—Summary.

| Item. | Amount. | Total Amount. |
|-----------------------------|------------|---------------|
| | £ s. d. | £ s. d. |
| Road construction | 31,835 0 0 | |
| Outside electric work | 7,087 0 0 | |
| Power plant | 12,750 0 0 | |
| Rolling-stock | 25,000 0 0 | |
| | | £76,672 0 0 |

| | | | | £31,835 0 0 |

GIPPS-STREET TO CIRCULAR QUAY via PITT-STREET.—Double Track.

Approximate Bill of Estimated Quantities and Cost—Outside Electric Work.

| Item. | Quantity. | Rate. | Amount. | Total Amount. |
|---------------------------------|------------|-----------|------------|---------------|
| | | £ s. d. | £ s. d. | £ s. d. |
| Bonding | 251 chains | 6 12 6 | 1,661 0 0 | } 7,087 0 0 |
| Overhead wiring and poles | " | 8 0 0 | 2,098 0 0 | |
| Feeder cables | | 13 0 0 | 3,268 0 0 | |
| Telephones, &c. | | | 150 0 0 | } 37,750 0 0 |
| Power plant | 510 h-p. | 25 0 0 | 12,750 0 0 | |
| Rolling stock | 25 cars | 1,000 0 0 | 25,000 0 0 | |
| | | | | £44,837 0 0 |

3. *Dr. Garran.*] Where would the line join at Circular Quay? Just before you get to the loop. I may point out that this estimate, compared with the Castlereagh-street tramway, is a little more expensive for that portion of the work which corresponds. The total cost of the Castlereagh-street proposal comes to £70,150. The double line along Pitt-street, comes to £76,672—that is, as far as Circular Quay. The reason of that is that the tramway is slightly longer, and there is more wood-blocked street to go through.

4. Would the Department require to block the whole of Pitt-street? No. We have a macadamised road to deal with at the southern end.

5. Would you require to wood-block for a certain distance from the outside of the rails? I propose to lay that part of the road on sleepers.

6. Would you require the consent of the Corporation to do that? I think not.

7.

MINUTES OF EVIDENCE—ELECTRIC TRAMWAY ALONG PITT-STREET.

7. Can you do as you like with the road? I think so. We always inform the Corporation what we are going to do.

8. *Mr. Hyam.*] Are we to understand that you propose to block a certain distance from the rails at the southern end? We do not propose to block it at all there. We shall give the Corporation just as good as we take from them. They have a macadamised road there now. We shall have to excavate for the purpose of laying down the tramway, and we shall put down the best materials, and leave a road-surface at least equal to what a city road ought to be. It will certainly be better than it is now.

9. *Dr. Garran.*] Do you think a macadamised road with rails is as good as one without rails? Quite as good.

10. *Mr. Hyam.*] You would have to keep a great part of the road in repair? Yes. The Commissioners will have to keep it in repair, and they will keep it in far better repair than does the Corporation. If we take over the strip of road, and lay down rails, and make a macadamised road, it will be kept in good repair. It will not be allowed to go into holes similar to those we see in streets about Sydney. I now put in the estimate for a single track along Pitt-street:—

If the estimated cost of the single line along Pitt-street, £41,562, and of the single line along Castlereagh-street, £37,572, are added together it will be seen that the total is £79,134, and that has to be compared with the double-line proposal down Castlereagh-street for that portion of the proposal which is concerned, namely, £70,050. In other words, the making of the tramway in the way in which the Railway Commissioners suggest will lead to an increased cost of £9,084.

12. *Chairman.*] To what is that difference mainly due? It is partly due to there being a little longer length of line, to there being more wood-blocked street, and to the cost of certain of the work for a single line being more, in proportion to a double line. The piecing up, for instance, and the joining up with the existing wood-blocking has still to be done. There are two sides to join up whether we have a double or single line. Then we require the poles on each side of the streets. One line of poles will not be suitable.

13. *Mr. Watson.*] Then you have abandoned the idea which you held for some time in regard to the Mosman's Bay line, namely, to have poles on one side of the road only? That would not do in this instance, because we cannot bring the tramway near enough to the kerb. It will have to go in its proper place near the middle of the street.

14. *Chairman.*] Will the construction of a single line down each street bring about any economy in regard to the items of "Outside Electric Work," "Power Plant," and "Rolling Stock"? No; I have assumed that, with the exception of poles, they will be exactly the same.

15. Have the Commissioners definitely decided in which direction, on the single-line system, the trams will go—from the railway station down Castlereagh-street, and from the Quay up Pitt-street? Yes. They would like the left-hand side of the street to be taken in each case. They consider that people coming from the station could be carried with advantage along Castlereagh-street, inasmuch as, to go to the centre of the city, they would have to walk down-hill, and the trams returning to the railway station would pick them up in Pitt-street. If the arrangement were reversed, they would be landed in Pitt-street in the morning, and they would have to walk up to Castlereagh-street in the evening to take the trams to the railway station. There is no doubt that the method suggested is the best—to take the trams from the railway station along Castlereagh-street on the left-hand side of the road and to return *via* Pitt-street.

16. It was suggested when the single-line idea was first placed before the Committee that the work might be so carried out as to admit later on of easy duplication,—has that element entered into the calculations which you have placed before the Committee to-day? Yes, that is embodied. The proposal is so designed that a second track can be laid down later on.

17. Far more cheaply, I suppose, than the first single track? No; there will be very little difference. What will be saved will be chiefly in regard to the poles, and some of the work at Circular Quay.

18. Do you know whether it is considered that the necessity for duplication would speedily arise? I know that the Commissioners look upon the duplication as a necessity in the early future. Therefore, it is most desirable that the line should be laid in such a position that a second track can afterwards be put down.

19. *Dr. Garvan.*] The people who use the streets ought to distinctly understand that, even if we begin with a single line, a second line will follow very soon? That is so.

20. *Mr. Watson.*] I notice from the plan that a resumption is outlined at the corner of Pitt and Alfred Streets;—will it be necessary to resume that land if a single track only is carried out? You might save it to a considerable extent, but the question is whether it is not desirable to make a good job of it whilst

- we are about it. Of course, we could put in a sharp curve and take less of the property, but I think it would be better that a clearance should be effected there. There are only a few temporary buildings there, and it would make a much better job. H. Deane.
18 Sept., 1900.
21. It involves the resumption of a strip, diminishing in width towards Loftus-street? Yes.
22. Would it be necessary, with a single line, to resume that portion near Change Alley, which is shown on the plan as being affected by the loop? No; it would not be necessary to do that. I have marked the loop on the plan to show how, eventually, if there is a double line down Pitt-street, a loop might be placed there for convenient working.
23. You would not interfere with the "Ship Inn" under that proposal? No.
24. Can you say whether the resumption outlined on the plan would be expensive? I have no estimate to submit. The resumption for the greater part of the length—the setting back of the frontage—cannot possibly be expensive, because it will take up a very narrow strip of land. No buildings will be affected. It will simply reduce the depth of the land a little—in fact, we shall really do no more damage to the land than is involved in taking a little bit off the back.
25. At present the frontage in Alfred-street is not of any value? No; not on account of its being used. There would be no interference with business.
26. Is it not a fairly large block of land? Yes; it is in one block, unbuilt upon.
27. So that if any additional value were given to it by the tram running up Pitt-street, it would be taken into account in the resumption? Yes; the value now would only be comparatively small. The value afterwards, when the frontage is set back and a slight curve is given to the street, must necessarily be increased, so that if the betterment principle were applied, there would, indeed, be very little to pay.
28. Do you think it would cost less to resume it now than later on? Yes; I would strongly recommend that it be resumed, because it will be certainly necessary to do it at some time or other. I should strongly recommend for the consideration of the Committee the question of the resumption of the trapezoid block between Alfred-street and Change Alley.
29. At present that is occupied mostly by advertising boardings? I do not think there is much upon it. It would be a great improvement to Circular Quay.
30. The block you speak of has a lane between it and the "Ship Inn"? Yes.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and examined:—

31. *Mr. McFarlane.*] The Commissioners have made a slight departure from their previous proposal to construct a double line of tramway along Castlereagh-street;—can you explain what led them to suggest a single line down Castlereagh-street and a single line down Pitt-street? The original proposal was to make a double line along Castlereagh-street. The Commissioners reported that that was desirable; but after further looking over the matter, they thought it would be more convenient, seeing that the streets are so narrow, if one line were laid along Castlereagh-street and the other up Pitt-street. One reason which influenced them was that it would be more convenient for the general public. As I explained on a former occasion, it is found that George-street was getting overcrowded, and it was thought that if we turned additional traffic routes into that street the traffic would become too heavy to conduct satisfactorily. The first idea was to run a double line for the railway business along Castlereagh-street. The Commissioners, however, after again looking at the matter, thought that it would be better to have one line along Castlereagh-street and the other along Pitt-street. To some extent they were guided by this consideration: that the greater part of the traffic would, no doubt, be about George-street and Pitt-street. From George-street to Castlereagh-street is a fair distance to walk, up hill; and many people, no doubt, rather than go from George-street to Castlereagh-street—if the tram were in that street—would utilise the local services going past the railway station, and would get out at the railway gates, in which case George-street would not get that relief which is looked for. It was thought, however, that if a tramway were in Pitt-street, between which and George-street, the ground is level, and the two streets are no great distance apart, they would utilise the railway trams in Pitt-street, so as to get to the railway station. H.
McLachlan.
18 Sept., 1900.
32. The object of the alteration, then, has been with a view to meeting the convenience of the public travelling by the trams? Yes; and there is also the consideration that both streets are comparatively narrow—Pitt-street being much the busier. The Commissioners thought there would not be the same hindrance to business if they ran a single line along both streets. The public will also always know how the trams are running, because they will always be moving in one direction. For instance, a man going down Castlereagh-street will know that the trams are behind him, and that he will not have to face one in front of him. Again, in Pitt-street, people travelling in one direction will always be facing the trams. In this way the risk of accident to street traffic would be minimised.
33. Do you think it would be better to have two single lines, as suggested, instead of a double line in Castlereagh-street? The Commissioners think so. The Commissioners have noticed that a number of the team people have given evidence. These people have referred to the fact that the traffic is increasing. To some extent we shall relieve the streets of some of the traffic by an alteration being made in regard to the conduct of our goods business. At the present time, the general goods business in truck loads is conducted at the Sydney goods shed, adjoining the produce shed, at the Redfern Railway Station. The full truck loads go from that place. We shift from there about 53,000 tons of goods per year—that is, taking last year as a basis—or, roughly speaking, 1,000 tons per week. We shall shortly be calling for tenders for additional accommodation at Darling Harbour, and it is proposed to deal with that particular business at that place. Redfern station will thus be relieved to the extent of 1,000 tons of goods per week. Of course, I do not say that the divergence of that traffic will entirely relieve Pitt-street, because, no doubt a good deal of it comes from Sussex-street, along George-street. A certain amount of it, however, comes up Pitt-street.
34. Do you think that arrangement will have a material effect in relieving Castlereagh and Pitt streets? It will have some effect. No doubt the greater portion of the business comes, *via* George-street, from the Sussex-street side of the city. I mention the matter as illustrating what was said by some of those people with respect to the increase of the street traffic. To the extent to which I have referred we are going to relieve the street traffic, and that should make room for a fair extension of business.
35. How long will it be before the alteration is carried out? About twelve months.
36. Would that be before the trams could be running in Pitt and Castlereagh streets? I daresay it would.
- 37.

H.
McLachlan.
18 Sept., 1900.

37. With regard to the grain traffic for export, would that principally go to Darling Harbour for shipment? I think so. We do not look upon that as affecting this business. Darling Island, of course, is supposed to be used for the export business.
38. You do not think that much of that traffic would come through the main streets? I think not.
39. Can you say what progress has been made for increased shipping facilities at Darling Island? I think the sheds have been erected, and the wharfs are pretty well finished. The Works Department carried out the works.
40. Do the Commissioners anticipate that a single line, as suggested, will be sufficient to cope with the large traffic of the trams? Of course, it would be equal to a double line in one street, because it is a run round.
41. Mr. Oliver, in giving evidence some time ago, said that the Commissioners thought that a double line in each street would be necessary to cope with the traffic? I cannot speak in regard to Mr. Oliver's evidence.
42. Do you think a single line in each street would carry the traffic for some time to come? Mr. Fehon and Mr. Kirkcaldie—Mr. Oliver being away—considered this matter, and that is their opinion.
43. The Commissioners favour single lines in two streets, rather than a double line in one street? Yes.
44. Do you think there is anything in the contention of the dray contractors as to the stoppage of the street traffic and the obstruction of the tram line? Necessarily there must be something in it. Of course, the question is, whether that is sufficient to outweigh the convenience which we think will be afforded by carrying out the proposal.
45. Do you think that some of the street traffic will leave Pitt and George streets if the tramways are constructed? Yes, I expect that some of the omnibuses would leave.
46. Would there be any considerable decrease in the street traffic if the omnibuses were removed? As a matter of fact omnibuses are not running to the railway station. I would not like to say that, by carrying out this proposal, we are going to reduce the omnibus traffic, because, at present, no omnibuses are running between George-street and the railway.
47. Do you think that the construction of the proposed wharfs on the resumed area of Darling Harbour will cause a lot of the shipping traffic to be carried on there instead of at Circular Quay and Woolloomooloo? I am not aware. Personally, I do not see that it will affect the tram business very much.
48. Is there any likelihood of the railway being extended from Darling Harbour along the wharfs? That is a matter for the Government. The Commissioners have no idea of doing anything of that kind. As a rule, there is no direct business from the city to the country; nearly all goods break bulk. They go into store, and have to be carted. Therefore, I do not see that a railway along Sussex-street would be of immense advantage, considering the great cost which certainly would be incurred.
49. The land resumed would be Government land? I do not know whether the land resumed would enable the line to be constructed. There would certainly be a great deal of work to be done. I should lay it would be an expensive line to construct.
50. *Dr. Garra.*] Are you aware of the nature of the documents Mr. Deane has read to us this afternoon? No.
51. We really have before us three proposals:—One for a single track along Castlereagh and Pitt streets, another for a double track along each of the two streets, and another for a single track in Pitt-street, and a double track in Castlereagh-street. Do you know whether the Commissioners have any preference? Their proposal is for a single line down Castlereagh-street, and a single line up Pitt-street. I am not aware of any other proposal.
52. Do the Commissioners prefer a double track in each street to the present proposal? No. The Commissioners' preference is for a single line in Castlereagh-street, and a single line in Pitt-street.
53. Are we to infer that there is a little difference of opinion between the Department of Works and the Railway Commissioners? So far as I know the Railway Commissioners are not aware that such a proposal has been made by the Works Department. The original idea was to make a double track in Castlereagh-street. The Commissioners, however, thought that that might be improved by making a single line along Castlereagh-street, and a single line along Pitt-street. So far as I am aware those are the only proposals which the Railway Commissioners have had before them.
54. So far as your Department is concerned, your chief anxiety is to dispose of the railway business? Yes.
55. You keep your minds upon that? Yes.
56. And you do not study the general problem of accommodating the Sydney public? As a matter of fact, the railway problem must be associated with the general problem. We desire to relieve the general business by catering for the railway business.
57. You have a water-log, so to speak, in George-street, and you want to relieve it? Yes.
58. And your opinion is that one line down Castlereagh-street, returning by way of Pitt-street, will sufficiently relieve it for your purposes? The Commissioners think it will be a great relief.
59. And you do not want to suggest anything more than that at present? No.
60. Mr. Deane has told us that if we construct a single line in Pitt-street, a double line is sure to follow pretty quickly? Of course the Commissioners would not like to say that a double line might not follow. They would like to see the lines constructed in such a way that, if found necessary later on, a double line could be laid.
61. But you do not wish to impress too distinctly upon the minds of the people the fact that a double line will very likely follow? The Commissioners would not like to say that it will certainly follow, but there will always be that prospect.
62. You think, then, that it will be time enough to talk about that when the necessity arises? Yes; at the same time the Commissioners recognise that it is only right to bear it in mind.
63. The more you contemplate this proposal, do you become the more convinced that the two single lines will meet the crush traffic morning and evening? The Commissioners think such a scheme is necessary, in order to deal with the business.
64. Do you think that it will adequately deal with the business? The Commissioners think that it will, to a large extent, for the present.
65. And they think that, as an expedient, it is right to adopt it? Yes; and as a permanent arrangement, because we know, from the experience of others, that it is unwise to run all the trams in one street. That has been the experience of America.

H.
McLachlan.
18 Sept., 1900.

66. Have you any idea whether the crush in George-street has originated mostly on account of the frequency of the trams or on account of the cheapness of the fares? I should say that it has originated, to a large extent, on account of the cheapness of the fares, as well as on account of the convenient traffic arrangements.
67. If you had adhered to the old two-penny fare, do you think there would have been such a press of traffic? I think not. At the same time, I think the net result might have been better. For instance, since we reduced the fares on the Ocean-street tram from 2d. to 1d., the loss is very considerable. The working expenses have gone up considerably, and the traffic returns have gone down considerably in net results.
68. I notice that, excepting at the crush times, you have much more accommodation on the William-street line than is wanted? Yes.
69. Therefore, you have over-supplied the needs of the public? Yes.
70. Has that been done to run the omnibuses off, or merely for the sake of the experiment? No. We anticipated that when we reduced the fares we should get considerably increased business. Consequently, we prepared for it by putting on additional trams. The Commissioners did not wish to reduce the fares and then to find that the existing stock was not sufficient to carry the traffic, so arranged to provide additional power, additional rolling stock, and additional men, and then brought the cheap fares into operation.
71. Is it not wise, when you can do it, to experiment gradually? There was no option in that instance. It was either one thing or the other. The fare was 2d. We had made penny sections on all the other lines; and brought the Ocean-street charges practically on a level with the others.
72. I understand that there was an outcry, because you charged 2d. in William-street, and 1d. in George-street? Yes. At the same time the fact had to be borne in mind that the profits from the Ocean-street trams were fairly large, and there was room to give the public a little concession.
73. If, for two or three months, you had multiplied the number of trams, and had kept the prices up, do you think the mere number of trams would have brought you increased custom? Yes, I think we would have got a little more business. We certainly would have got a better net result.
74. If, on the other hand, you had reduced the fares without increasing the number of trams, would the trams have been too crowded to be comfortable? That would have happened, perhaps, in the busy times.
75. Do you mean to keep up the present plan of running more carriages than the traffic requires? I do not think there are more trams than the traffic requires, because we reduced the service when we found we had a little in excess of what was reasonable.
76. You are not running so many trams now as you did at the beginning? Not so many as we ran the first day or two.
77. On the whole your experience goes to show that people think more of saving the penny than of saving the time? It looks like it.
78. If a line is constructed in Pitt-street, you are not likely to get the present George-street traffic along it, unless you give accommodation equal to that which you now give in George-street? That is so.
79. And yet you do not want to run as many trams in Pitt-street as you are now running in George-street? It must be remembered that we require other services in George-street. For instance, we are ready to turn the Glebe Point service into George-street.
80. *Mr. Hyam.*] What about the Leichhardt service? I do not quite know what the Commissioners have decided to do in regard to that service. I cannot say at present whether they will or will not bring it along George-street.
81. *Dr. Garrahan.*] If there is room in the cars, a man can jump into a George-street tram, and reach the railway station once a minute? Yes.
82. And you want him to go to Pitt-street to do that? Yes.
83. But he will not do it unless you give him equal facilities? It will be necessary to run along Pitt-street the same number of cars as we are now running to the railway station, and the Pitt-street trams will run into the railway station, while those in George-street would land passengers at the railway gates.
84. If you give him minute trams along Pitt-street to the railway-station yard, you will give him a better service than he gets now in George-street, he will not be so crowded? I would not say that you would give him a more frequent service than you give now; but you could give a better one to this extent; that it would be subject to less interruption. There would be a clearer road, and the track would be limited to one business.
85. And you would take him to the station yard, whereas you would turn the George-street trams out of the station yard? Yes.
86. Do you think that would be enough to induce a great diversion of the tramway traffic from George-street to Pitt-street? I think so, because George-street and Pitt-street are comparatively close together, and it is a level walk between the two. For the sake of getting to the railway direct, people would walk to Pitt-street rather than take the local tram in George-street, which would land them at the station gates.
87. If the transfer from George-street to Pitt-street does not take place, you will have spent your money in vain? Yes; but still, for the considerations I have mentioned, I think the business would follow. In any case, it would relieve George-street very considerably, and make room for other services.
88. Do you think it will relieve it enough to justify the expenditure? That is the Commissioners' opinion. The expenditure upon a single line in Castlereagh-street and a single line in Pitt-street is not very much greater than a double line in Castlereagh-street, and the Commissioners are strongly of opinion that the latter would not meet the public convenience so well.
89. *Mr. Watson.*] Do you anticipate that there will be any falling off in the eastern suburban 'buses when you get the eastern suburbs connected with the Quay? I should certainly say so.
90. The 'buses to those suburbs now go up Pitt-street? Yes.
91. You do not think the proposal before the Committee will have much influence on those 'buses? I should not think so.
92. It has been admitted by some of those who have been objecting to the proposal to run a line down Pitt-street, that if the number of 'buses was materially reduced the trams would not be so objectionable. How soon do you think the Commissioners would be able to extend the electric system to the eastern suburbs, and so permit of the eastern suburbs trams running to the Quay, thus relieving Pitt-street of a number of 'buses? I am afraid it will be some considerable time.
93. Do you think it is possible for the Railway Commissioners to have the eastern suburban trams extended to the Quay coincidentally with the starting of the proposed tramline up Pitt-street? I think not; if the proposed tramway were approved of at once and put in hand.

H.
McLachlan.
18 Sept., 1900.

94. If the 'buses were reduced in number about the time the tramway commenced running, the result would be a material difference in the traffic facilities in Pitt-street? Yes. I should like to know whether Mr. Deane has given any idea of the time it would take to complete the work.

95. Judging by the time that was taken over the George-street scheme, it will be over twelve months? In connection with the George-street scheme, a power-house had to be built.

96. The power-house will have to be extended in connection with the Pitt-street scheme? Yes; that is why I say that some considerable time will elapse before the conversion of the eastern suburban tramways will take place.

97. Could not the Commissioners make a special effort to extend the eastern suburban lines to the Quay, in view of the desirability of relieving Pitt-street of some of the 'bus traffic, so as to meet a portion of the objections which are put forward against this line? It will necessarily take a considerable time to get the additional machinery erected.

98. Will it be necessary to put up additional machinery in connection with the scheme into which we are now inquiring? I think that Mr. Brain has stated that the present power-house, unless additional business is thrown upon the existing system, will be sufficient.

99. We have a pretty big estimate for additions in the shape of electric equipment in connection with the line? That is to provide for the eastern suburbs and extensions.

100. I am speaking of the estimate for this particular work, which includes a considerable amount for electrical equipment? I do not know what estimate Mr. Deane has made; it may be for shed accommodation.

101. The power-plant for a single track along Pitt-street is estimated at £6,375? I take it that that will be for the overhead material, wires, and poles.

102. The estimate in regard to outside electric work, which I understand to be the poles, &c., is £3,295; the estimate for "Power-plant" is £6,375; I understood Mr. Brain to say that we would require additional power for this line; on page 11 of his evidence he was asked the following question:—

With respect to the increased traffic that the fact of placing a tramway in Castlereagh-street would bring about, what increase of power would you require for that line, leaving out of consideration the western suburbs idea? Accepting the opinion of the Traffic Officer, Mr. Kneeshaw, on that matter, it would take about 400 kilowatts, or about 540 horse-power.

It is evident, therefore, that for this proposal there will be an increase in the power provided at Ultimo? I would not say that, because at the present time we have 5,000 horse-power at Ultimo. We have four engines of 1,250 horse-power each. We are at present working two engines, and are putting in a number of additional boilers so as to be able to work another engine. It is thought that the boiler power at present can only be safely worked with two engines. They are putting in additional boilers so as to work another engine, and have one to spare. I think Mr. Brain's idea is that, unless there is any new business thrown upon the power-house, the additional boilers, which we hope to have finished about the end of November, will be sufficient for the western suburban business, and I think for the Castlereagh-street line.

103. In any case, we are led to believe, from Mr. Brain's evidence, that additional power will be required at the Ultimo Power-house? I think he considers that there is sufficient power already, unless there is some extension beyond what is at present contemplated in regard to the western suburban system, and the Castlereagh-street system.

104. How do you reconcile that answer with the answer to Question 209, which I have read? At present we are not working anything like the full power we have at Ultimo. As a matter of fact, we are putting in additional boilers at the present moment, so as to enable us to work an additional 1,250 horse-power.

105. Question 240 is as follows:—

What horse-power do you anticipate it will be necessary to provide at Ultimo for something like a completed system of tram-lines;—have you made any approximate estimate of that? Yes; 6,000 horse-power of electrical output.

That is in addition to 5,000 horse-power, as his subsequent answer shows, making a total of 11,000 horse-power altogether. What I want to get at is whether it would not be possible to put in sufficient power, whilst making the alterations, to bring the eastern suburban traffic to the Quay coincidentally with the opening of a line in Pitt-street, so as to meet the objections—which have a good deal of force in them—which some people urge against the line? Mr. Brain's answer to the question referring to the total horse-power shows that additional horse-power is required for the eastern suburban and other tramway extensions. For instance, a number of them are going on at North Shore and other places. Of course it will be some time before we can have that additional electrical power at work.

106. Would it be possible to delay the conversion of some of the western suburban lines, in view of the special need for meeting this objection, so as to transfer that power? I should not think so. The Leichhardt and Glebe Point 'buses carry a good deal of traffic which we could get if we could run in George-street. I do not think the Commissioners would care to depart from the scheme they have laid down of converting the western suburban trams.

107. There is no conversion on that side of the city which will help to reduce the number of 'buses in Pitt-street? No.

108. And whilst those 'buses remain in Pitt-street there seems to be a grave objection to a tramline there? Yes; but the number of 'buses running along there is small.

109. Mr. Hyam.] You say that you have a 5,000-horse-power house at Ultimo? Yes.

110. And you are not using the whole? No.

111. How much are you using? About 3,000 horse-power.

112. And the additional 500 horse-power required for the Pitt-street and Castlereagh-street scheme would be merely a use of the power which is lying dormant? That is, I believe, Mr. Brain's idea. Unless we take in additional extensions there will be sufficient power.

113. Then you have sufficient power at Ultimo to work the existing lines and the lines under consideration? Yes.

114. Chairman.] Two proposals have been specifically referred to the Committee by Parliament; the first is for a double line of tramway down Castlereagh-street;—is it a fact that the Commissioners prefer a single line down Castlereagh-street and a single line up Pitt-street? Yes; the report of Mr. Fehon and Mr. Kirkcaldie, which I submitted on the last occasion I was before the Committee, shows that that is their proposal.

115. A second proposal remitted to us was for a double line down Pitt-street;—you think it is more advisable to have a single line down Castlereagh-street, returning by way of Pitt-street, than a double track down Pitt-street? Yes; that is the Commissioners' idea.

THURSDAY,

THURSDAY, 20 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDSAY CRAWFORD SHEPHERD.
 The Hon. ANDREW GARRAN, LL.D.
 The Hon. SOLOMON HERBERT HYAM.

JOHN CHRISTIAN WATSON, Esq.
 ROBERT HENRY LEVIEN, Esq.
 JOHN MCFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Electric Tramway along Pitt-street, City of Sydney.

Robert Murray McCheyne Anderson, Town Clerk, Sydney, sworn, and examined:—

116. *Chairman.*] Will you give the Committee the benefit of your views upon the proposals before the Committee for the construction of electric tram-lines in Pitt-street and Castlereagh-street? I am directed to appear on behalf of the City Council to protest against the construction of tramways in those streets, because, (1) the Council is of opinion that any such enterprise as a tramway is essentially a municipal undertaking, and should be constructed and managed by the municipalities concerned; (2) in no city in the world that the Council can discover is any constructing authority allowed to come in without reference to the municipality concerned to use its streets without payment, and actually to take them over entirely, if considered necessary, without compensation;—that matter, of course, has been fought out between the New South Wales Government and the City Council, and we have been beaten in the Privy Council; (3) the Railway Department, which will have the charge of this tramway, in whom it will be vested, and who will presumably derive profits therefrom, will pay no rates to the Council for any properties concerned, nor do they at present, for any properties they use, nor will they pay rent for the use of the streets over which the trams will run, and which have been constructed and maintained at a very large cost by the Council; (4) the tramways have been constructed in the city without regard to the Council's convenience;—for instance, in George-street the levels of the street were actually altered without reference in any way to the Council, and this will necessitate an expenditure on the part of the Council of £8,000, in addition to £4,000 already spent, to remedy it. Meantime, of course, the Council has been subjected to adverse criticism, because of the disreputable state of George-street, which is admitted, and which they claim, was entirely caused by this alteration of levels.

R. M. McC.
 Anderson.

20 Sept., 1900.

117. Can you say where the levels were altered? Right along the street. You can see them every few yards. It is very bad about George-street North, where I understand the level has been altered to the extent of about 6 inches. It was also extremely bad opposite the Markets; but we have remedied that. We have remedied portions as we could afford. £12,000 will have been spent altogether; but £8,000 has yet to be spent. (5) In the opinion of the Council the construction of the tramways in those particular streets will be a serious menace to the public safety, because of the enormous traffic in them, which cannot be diverted. The peculiar configuration of the city throws the bulk of the traffic on the streets running north and south, as by that route the main business of the city must be conducted from the railway to the water. Reports have appeared in the public Press to the effect that the Government are taking the opportunity, under the new traffic regulations, to divert the heavy traffic from George and Pitt Streets; and if it is so diverted, where is it to go, but through Castlereagh-street. Elizabeth-street is already monopolised by the tramways, and only Castlereagh-street remains. It is a fairly open avenue down to Circular Quay. If you put a tramway in Castlereagh street, the Council ask you to ponder the question as to where the traffic is to go, and it is the main traffic, not only of the city, but of the Colony. (6) The streets in which it is proposed to construct these tramways are narrow—36 feet wide from kerb to kerb; and in Pitt-street especially it is necessary—so we find from inquiries from the Police Department—to have a constable at nearly every intersection of that street, and the tramways that are proposed to be constructed will not be of such a nature as to do away with any traffic of that street. True, at present, it is only sought by the Commissioners to have a single line; but they admit that they wish it to be placed in such a position that they can duplicate it when necessary. In Pitt-street nearly 100 'buses run every day, and they pass 1,000 times during the course of each day.

118. Do you mean 1,000 times each way? No, both ways.

119. I take it that the two main objections of the Council are—1st, that they think the tramway construction should be in their hands? No, in the hands of any Council interested. They would not say, for instance that a tram running to Dulwich Hill should be conducted entirely by them; but by the city and suburbs through which it passes.

120. Has the Council ever made any effort in that direction? I do not know.

121. Your second objection is that the streets through which the proposed tramways are to run are too narrow; with respect to Pitt-street, the Railway Commissioners inform us that as soon as the conversion of the eastern suburban trams from steam to electricity takes place the whole of the 'buses will practically be run off Pitt-street;—do you think that with traffic eased to that extent the street will be congested with a single line of tramway down it? I should require to know what they intend to do about Elizabeth-street. Are they going to take all the traffic off Elizabeth-street.

122. When the eastern suburban conversion scheme is carried out, the trams from the eastern Suburbs will be run right to the Quay, from which the 'buses at present start; the Commissioners say that the result of that will be that the 'buses will be run off Pitt-street; they say that the construction of a single line of tramway, under those circumstances, will not be a serious disadvantage? I am afraid that question is too hypothetical for me to answer. There is no assurance that the 'bus traffic will be run off.

123. We also have the evidence of Mr. Edward, the Registrar of Traffic, who is of the same opinion? The traffic will have to be eased somehow. It is necessary that it should be eased, or the result will be serious. In the busy hours of the day you cannot get along Pitt-street now. It will have to be eased apart from putting a tramway in it at all.

124. From the point of view of the Council, which would be the least objectionable—a double line of tramway down Castlereagh-street, or a single line in Castlereagh and Pitt streets? I am not authorised to say. It would be merely my own opinion if I stated that.

125. We also have a statement from the Secretary of the Railway Commissioners to the effect that within twelve months they intend to ease the streets of Sydney of about 1,000 tons of traffic per week, through

E. M. McC.
Anderson.
20 Sept., 1900.

a rearrangement of their goods business? Why not wait until they do that before you construct the tram. Many promises are made before a work is carried out, and after it is carried out there is not the same pressing necessity to fulfil them.

126. The new idea will be brought into operation at about the time the tramways will be constructed—if it is decided to construct them; so that the streets will be relieved of a 1,000 tons per week of heavy traffic, and also of a large amount of 'bus traffic which now goes down Pitt-street? 1,000 tons per week is not a very appreciable amount. I should think its proportion to the whole is very small.

127. *Dr. Garran.*] Do you appear to-day free to express your personal opinion, or are you merely the mouthpiece of the City Council? Merely the mouthpiece of the City Council.

128. Then you express their opinion, and not your own? Yes.

129. Suppose the Government were to adopt your view, and hand you over the tramways, do you think you could run them with the same degree of convenience to the public as do the Railway Commissioners who have the control of both railways and tramways? Certainly we think so, based upon experience elsewhere.

130. Can you mention any large city in which two similar separate powers exist? In the cities of Great Britain the railways are owned by companies apart altogether from the companies which own the trams. Certain persons own the railways, and the municipalities for the most part own the trams.

131. Do you know of any instance in Australia where the railway authorities run the trams, or are we the exception? We are the exception.

132. Looking at the unity of management, does it not strike you that in some respect our plan is the better? I do not think there has been great public satisfaction with the way in which the trams have been run. I do not think there has been such tremendous satisfaction as to make people think that the Commissioners have been entirely successful.

133. Do you think that in the matter of fares our people have anything to complain of, as compared with the Melbourne people? Not now, since the fares have been reduced to 1d.

134. Prior to that, was not the fare to the railway station 2d.? By ticket, 1½d., as in Melbourne.

135. Except in regard to a small section of Melbourne, is not the fare 3d. per journey? The Melbourne Company have to pay large assessments, of which the citizens get the benefit. Again, at the expiration of the lease the whole of the Melbourne trams become the property of the Melbourne Corporation.

136. Do not the municipalities at present contribute towards those trams? That is hardly a fair question. It is all a matter of sinking fund, based on date of redemption.

137. Do not the municipalities around Melbourne at present pay a subsidy towards the trams? No.

138. Do not the people pay it in the shape of extra fares, although there is no direct payment? No; because they get heavy assessments.

139. Then, to a certain extent, the present generation in Melbourne is paying for the benefit of a future generation? I think the lease falls in in about fourteen years.

140. Is not the fare in Melbourne 3d. per journey, except in regard to a short section from one station to another, upon which the fare is 1½d.? I was there last week, and it seemed to me that everywhere I went the fare was 1½d.

141. Do you think that if the Corporation had had the management of our trams we should have had penny fares in George-street? I can hardly tell you that. As Melbourne has been referred to, I may say that the Tramway Company there pay a heavy assessment at the expiry of every year. At the expiry of the lease the trams,—the power-houses, the lines, and everything but the rolling stock—come into the possession of the Corporation absolutely free of all cost. The sinking fund per annum would be a considerable amount, and to that extent our tramways benefit.

142. Under the terms of its lease, the Company has to pay principal and interest, and in order to enable it to do that it keeps up 3d. fares? I should like to know if the fares are really 3d. I do not think they are.

143. They have been 3d., if they are not now? So they were here.

144. But upon the whole of our lines we have now, and have had in the past, penny sections? I may state that I travelled for 5 miles in Melbourne for 3d.

145. But, on the whole, our steam tram-fares are cheaper than those of Melbourne? I do not understand so, but I speak subject to correction.

146. Do you think that, on the whole, the Sydney people have had cheaper tram transit than have the Melbourne people? By robbing Peter to pay Paul, perhaps.

147. Then, in Melbourne, they are robbing the present generation to benefit a generation fourteen years hence; whereas we are allowing the present generation to get the full benefit of our enterprise? I do not think it will pan out in that way.

148. Do you think the public would have been as well served by the Corporation as they have been by the Railway Commissioners? I think so, if the Corporation had had the powers they ought to have. They have had no powers, and that is where the trouble has come in.

149. You think that the Railway Commissioners have done no better than you could have done? No. The municipalities in other parts of the world have shown better results than have been shown here.

150. We had evidence the other day from an engineering witness to the effect that the streets where there are trams are better kept by the Commissioners than are the streets where there are no trams;—is that so? I could not say, but I do not think so.

151. Take Macquarie-street North, from Hunter-street to Bridge-street, do you know of any trammed street which is kept in that condition? A contract has been let to improve that street.

152. But how long has it been in a bone-shaking condition? Only since the beginning of this year. Extremely wet weather followed upon the previous disrepair of the street. People have been let off taxation. They have been charged low rates, and, therefore, they have got low value.

153. That is to say, that the Corporation is controlled in what it can do for the city by the amount of taxation the aldermen will agree to impose? Of course it comes to that.

154-5. The Corporation cannot spend the money if it does not get it; whereas the Commissioners are not so restrained;—the Commissioners say they have kept the streets in better order than the Corporation? Yes; but to them our streets at present are free assets, to the Corporation they are liabilities.

156. Can you tell me of any way by which the traffic can be managed—other than by bringing the railway itself into the city—except by constructing additional tramways in the streets? An expert opinion would be required for that.

R. M. McC.
Anderson.
20 Sept., 1900.

157. You are asking, practically, that the whole problem should be handed over to the Corporation; if it is handed over to you, you will have no power to bring the railway into the city, and, short of that, how are you going to deal with the growing passenger traffic? I cannot answer that question at present. What the Corporation say is that until something has been done to obviate the enormous traffic which is congested in the streets it is dangerous to public safety to construct trams in them.

158. Can you tell me how much expenditure in street-keeping the tramming of Castlereagh and Pitt Streets will take off the shoulders of the Corporation? It would not be a great deal per annum, because the traffic would be thrown upon other streets which would be so much more torn about by it. Since the George-street tram was opened there has been much more traffic in York, Clarence, Castlereagh, and Pitt Streets; so that it comes to about the same thing.

159. Do you mean to say you have spent more on York, Clarence, and Castlereagh Streets since the George-street tram was opened than you did before? The expenditure has been rendered necessary.

160. Have you spent much more? I cannot say that; but those streets are so much the worse by reason of the extra traffic.

161. Then, you do not think you would save very materially by the Commissioners undertaking the maintenance of the larger part of the streets in which they construct tram-lines? Our opinion is that we save nothing.

162. Is that the deliberate opinion of the Corporation? Yes.

163. Then, the Commissioners take no burden from your shoulders, but they undertake a large expenditure themselves? Yes; a very profitable expenditure, which we would like to undertake.

164. Now that you find that it is a very profitable thing, you would like to have the business? Yes.

165. Before the tramways were constructed, did the Corporation ever petition Parliament to let them have the business? I understand that they did. I believe that before the tram-lines were constructed in Elizabeth-street the Corporation wanted to undertake them.

166. The old Omnibus Co. wanted to undertake them, but I never heard of the Corporation wanting to do so? I cannot tell you definitely.

167. *Mr. Watson.*] In view of the request of the Council to be given control of the trams, how long is it since they obtained power from Parliament to initiate lighting on their own account? Some years ago.

168. Do you know whether anything has been done since? Yes; a good deal has been done.

169. We do not see any electric lighting of the city? You must blame the Government for that.

170. Is it not a fact that the Council had full power under the Bill to proceed at once with electric lighting works? Yes.

171. How are the Government to be blamed? We got out the most eminent expert from England, who reported on the subject.

172. But that is only a month or two ago? It is over a year ago—at any rate, it is over a year since we made arrangements for him to come. He came out at a high cost to the Council. He took the levels, and made plans, and advertised in London for the construction, and all that kind of thing. The Government have stepped in and taken the property—the wharf property, upon which he was basing all his estimates and calculations; and when we asked for the use or lease of that or any other property in its place, we are told that the Government do not think it necessary to give it, as they have a scheme in view themselves. That is in spite of the fact that we have gone through all this expenditure.

173. I presume that the Government scheme merely has reference to the resumed properties and wharfs? No; they are going to bring the power from the Grose Valley, according to the letter we have received.

174. Even allowing that the Council may have been hampered by the recent resumptions, a period of some years has elapsed before anything has been done by them in connection with the Bill which passed through Parliament? I do not know the particulars. It occurred before my time.

175. Is it not a fact that for some years, whilst they were ostensibly asking for powers to light the city themselves by electricity, the reason the Bill did not pass was the inclusion in it by the Council of a clause under which they could hand over such powers to a private company? I know nothing of that.

176. Did the Council with regard to electric lighting powers, desire those powers for the purpose of handing them over to a private corporation, or for the purpose of running the business themselves? For the purpose of running the business themselves. There is no reason to think otherwise.

177. *Mr. Hyam.*] You say that you think the City Council should have the power to construct and control the tram? The Council think a tramway is essentially a municipal undertaking. In no other place in the world are the trams run by the Government.

178. Do you consider that you should have the control of the tram inside or beyond the city? The City Council do not think that they should have the control of trams outside their borders. They think the different Councils should be interested in them, as they are in Melbourne.

179. Supposing the outside municipalities did not wish to incur the expense of constructing trams to those municipalities, the City Council's system of tramways would only extend throughout the city? If they did not the City Council should be paid something for the use of their streets. The Council do not think that is arguable. The Council contend that they should be paid for the use of their streets if they do not run the trams themselves. We could make arrangements with the other Councils if the trams went outside the city.

180. Is it not possible that the other Councils might not agree? It is hardly reasonable to suppose that they would not agree; but still, it is possible.

181. Are you aware that the whole of the trams of Brisbane, Melbourne, and Adelaide, are run by public companies? Yes; and they are run at a very profitable rate to the municipalities in each case.

182. What about the profit to the citizens? The tramways there will eventually come into the possession of the citizens.

183. Do you not consider that a municipality gains considerably by trams going through its streets; at present you have not more than one-third of a street through which a tramway runs to keep in repair? But the traffic is thrown upon other streets, which we have to keep in repair.

184. As soon as the electric trams commence to run to the eastern suburbs, will not Pitt-street be relieved of the 'buses which at present make 1,000 trips a day? There is no reason to think so.

185. Have not a large number of 'buses been run off George street? In George-street the tram has been constructed with very little regard to our convenience and comfort. It will cost us £8,000 to put it in proper order.

- R. M. McC. Anderson.
20 Sept., 1900.
186. I suppose that altering the levels of a street is not an unmixed evil? From a municipal point of view, it is.
187. *Mr. Shepherd.*] Have you noticed whether accidents in George-street have increased in number since the trams have been running? Naturally they would increase, on account of the congestion of traffic.
188. The question has been put to you whether you think a double line in Castlereagh-street or a single line in Castlereagh and Pitt Streets would be the least objectionable? It is quite clear that the Commissioners intend to duplicate the line afterwards. They say they are going to lay the rails in such a way that another set of rails can be constructed when necessary.
189. Will not the fact of these lines being constructed do away with a good deal of vehicular traffic? But that vehicular traffic will go into other streets.
190. Will not a good deal of the 'bus, cab, and carriage traffic be served by the trams? It all depends on how the trams are going to run. The George-street tram has created a demand of its own which it cannot supply, and the new trams may do the same. The George-street tram was to have carried the whole of the west-end traffic: but it has not done so. It takes all its time to deal with the city traffic.
191. At present George-street is completely overburdened with traffic? Yes; with local traffic.
192. The opening of lines in other streets would largely relieve George-street, and if there is not a large increase in the number of accidents on account of the terribly congested state of George-street, it would imply that accidents would not be multiplied to any extent by the construction of other lines? No; the trams have gone along George-street, and the street traffic has gone somewhere else—to Pitt and Castlereagh Streets. Now you propose to construct trams in Pitt and Castlereagh Streets. Where is the traffic to go then.
193. Do you not think that a single line always running in one direction would be much less liable to cause accidents than a double line, in which the trams run in opposite directions? I think an expert opinion is necessary on that point.
194. Does the Municipal Council object to the trams in any of the streets? They object to more, because of the public safety. They do not know where the traffic is to go if it is run off Castlereagh and Pitt Streets.
195. And they are of opinion that the trams ought to be under their control? Yes; or that they should be paid for the use of their streets. They think that is a reasonable request, which does not admit of argument.
196. *Mr. Levien.*] Supposing the streets are broken up, at whose cost are they put in repair? By the railway people in the tramway area—for 4 feet on each side of the outside rails. Our experience has been that it costs no less to repair the streets—say, from north to south of the city—since the tramways have gone into them. Of course, the traffic has been relieved for those streets, and has been thrown upon other streets. The result has been that there has been more wear and tear in the other streets.
197. *Mr. McFarlane.*] Has the George-street tram interfered with business houses along George-street? I suppose it has done good to some and harm to others. The people complain bitterly of the dust they make. The drapers and other people who have perishable goods complain bitterly that there is more dust. We have more sweeping and watering of the streets to carry out, for which we get nothing.
198. Evidence has been given to the effect that if trams are constructed in Pitt and Castlereagh streets they will interfere with the dray traffic of the business houses of those streets? It must be so in narrow streets.
199. Has that occurred in George-street? George-street is much wider than the other streets. George-street is not a street in which the business people require drays very much. Most of the shops are retail shops.
200. In which of the streets are most wholesale houses to be found? York-street, Clarence-street, and certain parts of Pitt-street.
201. Are there more wholesale houses in Pitt-street than in Castlereagh-street? Yes.
202. *Mr. Hyam.*] Where are the wholesale houses in Pitt-street? From King-street to the Quay.
203. Are there not very few wholesale houses in Pitt-street, between King-street and Hunter-street? There are large blocks occupied by Hunter's, Dalton's, Perry's, and Hoffnung's. They have an enormous traffic in and out, and the street is very narrow.

Albert Christopher Brownen, licensed victualler, sworn, and examined:—

- A. C. Brownen.
20 Sept., 1900.
204. *Mr. McFarlane.*] Do you desire to make a general statement with regard to the proposal before the Committee? Yes: I want to show how we can knock the 'bus traffic out of Pitt-street. In the first place, I am opposed to the construction of the tramway in Pitt-street, because the street is too narrow. Again, it is the most aristocratic thoroughfare of the city. Recently an extra outlet has been made from the Post Office for the mail-carts. I have, however, on many occasions been outside the Post Office when I have seen the mail carts, in going in and out, take up the whole of Pitt-street, and if, under those circumstances, there was a tramway in Pitt-street it would be an enormous obstruction.
205. Do you refer to a single or a double line? To either. Of course a single line would not be so much of an obstruction as a double line. I think a double line is impossible, unless you clear the whole of the other traffic out of the street. In the better-class thoroughfares in London and other large cities there are no trams. My opinion is that there should be a double line of tramway from the railway station along Castlereagh-street—that is, if the new station is built on the Benevolent Asylum ground. The street is very wide, and it is straight, and there is plenty of room for a double line of tramway, at any rate as far as the Hôtel Métropole. It seems to me that the eastern and western traffic coming into the city must be divided. I think it would be wrong to bring the western traffic into the city along George-street. We ought to preserve George and Harris Streets solely for the railway traffic. I think we should bring a portion of the western traffic down Kent-street, and the other portion along Castlereagh-street. It could be divided at the railway. You would have, of course, to come down George-street as far as Liverpool-street with a portion of the western traffic, in order to get into Kent-street. That portion of George-street is wide, and there would be plenty of room to carry a portion of the western traffic in addition to the railway traffic as far as Liverpool-street.
206. The portion of the western traffic which you suggest should go along Castlereagh-street would have to cross the railway traffic? Yes, it does that now. The only thing in connection with the crossing is that

A. C.
Brownen.
20 Sept., 1900.

that you would require proper signals, and a man to supervise them. The greater portion of the western traffic would, I presume, go down to Castlereagh-street, because that is the best side of the city. I think that is the only way of relieving the congestion of George-street. Then we come to the eastern, or the Oxford-street, traffic. There is just as much congestion from Darlington to the Hyde Park, as there is now in Pitt-street or George-street. I understand that the Commissioners think of continuing the Elizabeth-street line, and running the eastern traffic to the Quay. That is an easy thing to do; but as long as they take the eastern traffic down Elizabeth-street, they will not be able to wipe out the 'bus traffic, because Elizabeth-street is too far from the centre of the city. People will get in the 'buses at Pitt-street. They will not take the trouble to walk up and down King-street to get into the trams. I cannot see that the continuation of the Elizabeth-street line to Circular Quay will run the 'buses out of Pitt-street. The only time they would do it would be on a Sunday, when there is no one in the city. Most of the people who come into the city from the Eastern Suburbs on a Sunday afternoon go upon the harbour. My suggestion is that we should do away with the Elizabeth-street line altogether, and bring the eastern traffic into Liverpool-street, and thence along Castlereagh-street.

207. Would you bring the whole of the eastern traffic into Castlereagh-street? No; only a portion of it.

208. Where would you take the other portion? I would take it along Liverpool-street to Kent-street

209. You would then have to cross the George-street tram? Yes; as is done now with the cable at King-street.

210. Would you run along Kent-street? Yes, as far as Miller's Point; and thence to Circular Quay.

211. Do you not think that Kent-street is further from the centre of the city than is Elizabeth-street? No, not so far; some people might grumble, because they could not be brought from the Western Suburbs along George-street, but there is sure to be grumbling whatever is done. Castlereagh-street, on one side, and Kent-street on the other, are quite near enough to George-street. I walked from the Post Office to Kent-street the other day, and the journey only occupied three minutes. From York-street to Kent-street the journey only occupies a minute. A large number of people are employed in Clarence and York streets, and the tram would be close to them. I consider that if the scheme I have outlined were carried out, there would be no congestion of traffic for the next ten years. We require a circular railway line round the city to feed the station which it is proposed to build on the Benevolent Asylum site.

212. Do you think the traffic of George-street is very much congested? It is congested morning and evening—about an hour each day.

213. Would it be able to carry any more traffic than it carries at present? I think it is pretty well occupied now during the busy parts of the day.

214. Do you think it is necessary to relieve the present traffic in George-street? I do not think so. It is of no use constructing tramways in the streets if the cars are to be running empty half the day.

215. In the event of its being considered necessary to construct tramways in other streets, which of the two streets—Castlereagh or Pitt—would be the best? A double line in Castlereagh-street. I have a great objection to a tram-line in Pitt-street.

216. Which street of the two at present carries most local traffic? Pitt-street.

217. Do you think it would be better for the traffic to have one street free than to have a single line in each of the two streets? Certainly. If you have a double line in Castlereagh-street and none in Pitt-street, all the light traffic will get out of the way of the trams. Heavy drays, however, do not care much about the trams. If the trams run into them they do not do much harm. There will be plenty of room in Castlereagh-street for a lot of heavy traffic, even if a double line of tramway is constructed.

218. If a double line of tramway were constructed in Castlereagh-street, would it reduce the omnibus traffic to any considerable extent? No; it cannot do so unless you deal with the eastern trams as I have suggested.

219. But there are plenty of omnibuses which do not come from the eastern Suburbs? The largest number of omnibuses which run down Pitt-street come from the eastern Suburbs, and they are causing all the present congestion.

220. The Railway Commissioners have stated that it would be more convenient to the travelling public if there were a single line down Castlereagh-street and another along Pitt-street to the railway station? Railway trams could run down Castlereagh and Kent Streets as well if necessary. Pitt-street is very much crowded at present. If you construct a tramway along there the people will block the pavements and cause an obstruction. Then there would be the ordinary traffic in the streets, and, in my opinion, a number of accidents would be caused. The street is crowded enough now without a tramway.

221. In the event of a double line being constructed in Castlereagh-street, would it not divert the whole of the local traffic from that street? No. It might do away with the light traffic, because there would be a clear run for it in Pitt-street.

222. Would there be much room in Castlereagh-street if a double line of tramway were constructed? Plenty of room.

223. It is stated that the trams in George-street have diverted a considerable quantity of the local traffic to other streets? There is no doubt that it has driven some of the traffic out, but not a great deal. Three parts of the omnibus traffic have been wiped out of George-street, and that has left room for our vehicular traffic.

224. The evidence of some of the lorry-owners goes to show that a large portion of the heavy traffic has gone into Castlereagh and Pitt Streets? Some has gone into Pitt-street; but I do not think much has gone into Castlereagh-street.

225. How would the business people in Castlereagh-street view a double line in that street? I think they would welcome it.

226. Would they have a stronger objection to a double line than to a single line? I do not see why they should, because it would bring a considerable amount of business into the street. Again, more important buildings would be erected in the streets, and improvements would be made.

227. Do you think there is anything in the contention of the business people in Pitt-street against the construction of the tramway in that street? Everyone I have spoken to seems to object to it. They seem to think it will be entirely out of place.

228. Then what would be good for Castlereagh-street would be bad for Pitt-street? Yes; bad for the traffic, and bad for the tradespeople and everyone else.

Orlando William Brain, Acting Electrical Engineer, Department of Railways and Tramways, sworn, and examined:—

O. W. Brain.

20 Sept., 1900.

229. *Mr. Watson.*] We have before us a proposal to construct a double line of tramway in Pitt-street; we have also before us a proposal to construct a double line in Castlereagh-street, with an additional suggestion from the Railway Commissioners that a single line might be constructed in each street, in lieu of the double line proposal; can you tell the Committee how the electric power question is affected by the suggestion now put forward, with respect to the double line down Pitt-street;—does it increase the difficulty, or in any way affect it? I understand from the traffic officers that it would necessitate about the same additional number of trams as the Castlereagh-street project.

230. Will the amount of power required for single lines in Castlereagh and Pitt Streets be about the same as that required for a double line in either of these streets? Yes; assuming that the extra number of trams due to pick-up traffic is the same in each case.

231. It is probable that the pick-up traffic in Pitt-street will be a little greater than that in Castlereagh-street? Yes; but I understand that it is not estimated to require an additional number of trams.

232. When giving evidence on the Castlereagh-street proposal, you stated, in answer to Question 209, that, after consulting Mr. Kneeshaw, the additional horse-power required would be about 540? Yes.

233. When Mr. McLachlan was giving evidence on Tuesday, he seemed to have a different view from that held by the Committee on account of your reply; the Committee understood that that additional horse-power was to be provided at the Ultimo station on account of the Castlereagh-street proposal; Mr. McLachlan seemed to have the impression that it simply meant utilising a portion of the reserve power now at Ultimo;—can you inform us which is the correct view? I meant that that amount of additional power would be required;—that is to say, that it would take that much more extra power on the line, owing to the fact of running the extra pick-up traffic.

234. What we wish to get at is whether you will require to put in additional machinery to generate that 540 additional horse-power, or have you already sufficient machinery to generate the additional horse-power? We have hardly sufficient power at the present time to deal with that, together with what it is supposed to deal with on the western suburbs within the next twelve months; but within the next twelve months we shall have additional assistance in the form of batteries at sub-stations, which will put us in a position to deal with it. It will not be additional generating machinery, but it will really be by means of storage of the power during the part of the day when the engines are not so heavily loaded.

235. In the estimate put before us, there is a sum of £6,375, which includes the proportion of power for twenty cars of 25 horse-power each;—will that money be devoted to equipping this particular line with power? I had nothing to do with that estimate.

236. Have you been asked, as the electrical expert of the Railway Department, to give any information with respect to what additional expenditure is required to provide sufficient power for this line? Not for this particular line. We have a certain amount of power now, and I have been dealing with the particulars of the extra supply of power to which reference was made in the previous inquiry. So that I dealt with the matter as a whole; but I have not been consulted in any way with reference to the power for this particular line.

237. In regard to the double track down Pitt-street, we have before us an item of £12,750 for a 510 horse-power, at the rate of £25 per horse-power; it does not seem clear, however, from the evidence so far given, whether that amount is going to be credited to the works already in existence, or whether it is going to be expended in the creation of new works or additional power in the Ultimo power-house; can you say in what manner that money will be expended, leaving the estimate, as an estimate, out of account altogether;—we understand that it is proposed that some of the money shall be spent in that way, and I want you to tell us how it will be spent? As the provision for power required for supplying that extra power referred to will really be made out of the new plant which is being erected, it would seem to me that it would follow that it would be charged against that new power.

238. So that it will not mean a utilisation of any of the reserve power which you now have at Ultimo? No; it does not mean that. Perhaps it is a little difficult to make the matter clear to you. It really means utilising the steam plant we have there at the present time; but that plant itself would not be equal to it were it not that we shall be putting in accumulators, and that we shall charge these accumulators with the plant already there. Of course, those accumulators were never by me associated in any way with this line. It only happens that that is a part of the new scheme which will be pushed on, and which can be put into operation within twelve months, and can therefore be utilised for this line.

239. Can you inform the Committee what reserve you have at Ultimo, either in boilers or generating plant, carrying the present traffic; for instance, I understand you have engines there capable of developing 5,000 horse-power;—are you using all those engines? No; we are using two out of three.

240. I thought there were four? You always count on one spare one.

241. Then you are using 2,500 horse-power at present? Yes; that is the nominal horse-power. If you have four engines you can only reckon on working three of them, because you must sometimes have an engine under overhaul.

242. Then, as a practical working reserve, you have one 1,250 horse-power engine? Yes.

243. Does it require all the boilers you have in use now to generate sufficient steam for the two engines you are working, or have you a reserve of boilers also? There is no reserve of boilers at present.

244. Would this work, irrespective of the general extension, be important enough to necessitate the erection of additional boilers at Ultimo? I understand you have been informed that new boilers are being erected now.

245. Mr. McLachlan said something about it, but he preferred to leave the matter to you to explain? It is necessary, in order to avail ourselves of the power which is there now, to erect eight additional boilers, which are now being built.

246. How many boilers have you there now? Fourteen.

247. Will the additional eight boilers be sufficient only to give steam to the set of engines which are not utilised? That will be sufficient, with a fair margin for overhauls.

248. Does the proposed line necessitate, apart from the general scheme, any additional generators and other electrical plant? No; not apart from the general scheme.

249. So that it would seem that you are proposing to debit this scheme with a proportion—according to its power necessities—of the general expenditure which is being made in connection with the conversion? I have had nothing to do with the financial aspect of the matter.

250. Were you consulted with regard to the estimates for the Castlereagh-street proposals? Not as to the cost of the power. O. W. Brain.
251. Would you cast the whole of the work of carrying this particular line on the set of accumulators you are providing, or would they be used to relieve the engines occasionally? They would assist in supplying the additional current. That would be the temporary arrangement until the general scheme came into operation. 20 Sept., 1900.
252. *Mr. Hyam.*] Do I understand that you have four engines of 1,250 horse-power each? Yes.
253. And of those four you are using two? Yes.
254. I suppose there is always one being overhauled? It is not always so, but you must be able to have one under overhaul.
255. I suppose that if the necessity arose you could use the four at one time? You could do it if there was not one under overhaul at the time.
256. One set of engines is always in reserve? Yes.
257. Have you enough power now to cope with the electric trams which are running? Yes.
258. Have you enough power to supply this electric tramway as well? We shall be able to provide for that in the manner I have indicated.
259. But not until you get the new boilers? No.
260. *Mr. Shepherd.*] Have you sufficient power now to work the two additional lines in the event of their being constructed, or would you require to secure more power? When we have the additional boilers we shall be able, by means of the accumulators, to which I have referred, to supply those lines without additional machinery.
261. Would the same power work a single line in each of the streets as it would work a double line in one street? Yes; unless the fact of the line being in two streets necessitated further cars being supplied.
262. *Chairman.*] I believe the power plant was originally provided for the George-street electric tram? The four engines provided for more than the George-street traffic.
263. What was the amount of traffic which was provided for in the first estimate;—was it for the George-street traffic alone, or for future developments of a somewhat uncertain nature? It was for further traffic besides that of George-street.
264. Do you know whether a detailed estimate was made for that further traffic? Yes.
265. Was the whole scheme of conversion considered in making the estimate for the amount of power required? I could not say how the figures for the present plant were made up. They were made up by Mr. Elwell. I have reported to the Commissioners on the general conversion scheme, exclusive of the two proposals before the Committee.
266. Did you provide for any estimate of the amount of power required for the total conversion? Yes.
267. Will that estimate leave you any margin for a single line down Castlereagh-street and Pitt-street? I am informed by the traffic officers that it will. Of course, my estimates are based upon a certain number of trams estimated for by the Traffic Superintendent. He allowed what he considered was a reasonable margin for contingencies, and I understand that this can be considered as one of the contingencies provided for.
268. What total horse-power do you mention as being sufficient for the full scheme? Eleven thousand; that is, 6,000 in addition to the 5,000 at present in use.
269. In that 11,000 horse-power you have a sufficiently wide margin to cover the 550 horse-power required for the scheme under consideration? Yes.
270. Of the 11,000 horse-power, how much would you consider to be reserve power which is not likely to be called up for some time? That has been expressed in the form of trams. I got from the Traffic Superintendent an estimate which will cover all the trams he considers likely to be used for some years to come, and as long as he has allowed the margin I provide the power for that margin.
271. At present you keep one engine out of four in reserve? Yes.
272. Of 11,000 horse-power, what proportion of your power would you keep in reserve? Two out of seven.
273. Would that represent the same proportion of electrical power? It is rather larger.
274. Then, you will practically have any amount of power to cope with the 550 additional horse-power required for the two tram-lines? Yes.

Edward Johnstone Sievers, Government Land Valuer, Department of Public Works, sworn, and
examined:—

275. *Mr. Watson.*] In connection with this proposal, it has been suggested that, in order to provide for the purposes of the line at the foot of Pitt-street, it will be necessary to resume the small piece of land at the corner of Pitt and Alfred Streets, near Change Alley? That is so. E. J. Sievers. 20 Sept., 1900.
276. That is part, at present, of a fairly large block of land, which has not been built upon to any extent? The buildings are of a temporary character, probably worth £500 or £600.
277. Can you offer any opinion as to what the probable cost of resumption would be? The lands will probably cost between £4,000 and £5,000.
278. Would that make an allowance for any increased value which might be given for the remainder of the area by affording it a better frontage? I am inclined to think that there would be no betterment to the balance of the resumption. The mere fact of bringing the tramway down Pitt-street will not better it. It will not cause any increased foot traffic near the property.
279. At present that property has only one good frontage to Pitt-street;—I should imagine that, the street being so narrow, the frontage to Alfred-street is not of any value? It is narrow, and the ground in front of it is Government land. Probably the area required will be less than is shown on the plan.
280. Do you not think that the additional width given to Alfred-street, behind the "Ship Inn," might have some bearing on the value of the remaining block? I do not think it would add materially to it. I scarcely think that the bringing of the tramway close up to the property there would increase the value of it.

FRIDAY, 21 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.
The Hon. ANDREW GARRAN, LL.D.
The Hon. SOLOMON HERBERT HYAM.JOHN CHRISTIAN WATSON, Esq.
ROBERT HENRY LEVIEN, Esq.
JOHN McFARLANE, Esq.

The Committee further considered the expediency of constructing a line of Electric Tramway along Pitt-street, City of Sydney.

Henry Alexander, proprietor, Hargrave-street and Point Piper road omnibuses, sworn, and examined:—

H. Alexander. 281. *Chairman.* Have you any statement to make to the Committee? Yes. The earnings of the 'buses on the city portions of their route is a very considerable item in their maintenance, and as it is impossible to run 'buses profitably in any of the suburbs to connect with trams, the 'buses must of necessity be withdrawn, and a very large number of the public would be deprived of the conveniences they now have through the 'buses running to places where trams are unable to run. The Government obtain a monopoly of the streets, and interfere with existing rights to a very great extent. Those who own 'buses are very considerable losers, and yet no recompense is made; whereas, if a private company were granted such privileges, there is no doubt but the 'bus-owners would receive reasonable compensation, which, in my opinion, they are fairly entitled to. I am of the opinion that even if all the 'buses ceased running in Pitt-street, the ordinary traffic would be such as to make it extremely dangerous to run trams in that street. There is nothing to prevent the tramway authorities, once they get a single line along the streets, placing a double line there, their only consideration being the conveyance of tram passengers; but the general public using the streets will be the great sufferers. There cannot be any doubt that, no matter what is done in the way of tramway additions, the whole of the suburban traffic cannot be conveyed. I understand it is proposed to run a single line of electric trams down Castlereagh-street on to Circular Quay, and return *via* Pitt-street to the present lines near the Railway Station or Haymarket. I am the owner of the largest number of 'buses now running to and from the Circular Quay; My 'buses ply *via* Pitt, Park, Elizabeth, and Oxford Streets to Paddington and Woollahra. My opinion is, that the running of trams along Pitt-street even by a single line in the centre of the road would be most dangerous and attended with great loss of life; the number of lives lost and serious injuries inflicted by, and caused through the electric trams in a comparatively wide street like George-street, is an index of what may be expected in such a narrow and heavily trafficked thoroughfare as Pitt-street. The space which would be available for vehicles between the tram-line and the kerb would be altogether insufficient for safety, and unless a 'bus or other vehicle pulled close into the kerb, which is often impracticable owing to stationary vehicles, it would be impossible for the trams to make any headway. I do not think it is reasonable to ask the driver of any vehicle, be it 'bus or otherwise, to sacrifice all his rights to the public highways. By taking up Pitt-street and Castlereagh-street for tram purposes, the Government practically take every available thoroughfare running in that direction, and force the people to use the trams whether they like it or not, as 'bus proprietors would be afraid to run their 'buses in what would then be highly dangerous streets in a satisfactory manner to the centre of the city. Our streets are not suitable for tramway purposes on any extensive scale, and in a very short time it will be found absolutely necessary to reconstruct the whole system. The public can only be served in a satisfactory way by a system of city railways.

21 Sept., 1900.

282. How many trips per day do your 'buses make up and down Pitt-street? 220 each way. I may add that there are forty-four 'buses besides my own running from Paddington, along Pitt-street, to Circular Quay. The average number of trips they make is about 400. That makes 600 trips per day each way for the lot.

283. Presuming a single line of tramway is constructed in Pitt-street and Castlereagh-street, could you so alter the routes of your 'buses as to run them along the free side down Pitt-street, and along the free side up Castlereagh-street? Yes; if the road were clear, but not otherwise. You could run parallel with the tram provided there was no other traffic on the line.

284. How far from the nearest point of the terminus of the tramway do you run your 'buses? One and half mile—that is, on the Hargrave-street line.

285. Do you find that a fair number of passengers still remain in the 'buses after you leave the nearest point of the tram-line? Yes.

286. Would there be sufficient traffic for your 'buses to act as a feeder to the proposed tramway if it were built? There would not be sufficient. They are really on the line of the tram, and yet away from the tram.

287. Do you maintain that the eastern suburban public would sustain loss and inconvenience if, by the construction of a tramway in Pitt-street, the 'buses were run off? Undoubtedly.

288. Which of the proposals before the Committee would you favour if you had to make a selection? I am not favourable to either; but if I were asked which would be the safer for vehicular traffic I should say a double line in Castlereagh-street.

289. Would a line along Pitt-street mean a serious interference with your business? Yes. In a short time there would not be a 'bus in Pitt-street. It would be dangerous to life and property to run them.

290. *Dr. Garran.* How wide is Oxford-street? About the same width as Pitt-street.

291. Your omnibuses run up Oxford-street on a hill? Yes.

292. Do you find difficulty there? We find it fairly difficult, but the trams do not run so very frequently. We are able to get out of the way, or wait until they pass. With an electric tram you would not be able to do that, as the cars follow each other in such rapid succession.

293. You have the Crown-street, Randwick, Waverley, and Bondi trams coming in? Yes; but there are not so many of them as there are in George-street—not one-third of the number.

294. Nor will there be in Pitt-street? I cannot see that.

295. I want to know how much your difficulty in Pitt-street would be greater than it is already in Oxford-street? One can only assume that the trams will run in Pitt-street in the same way as they run now in George-street. You could not compare the present running in Oxford-street with what it would be in Pitt-street,

Pitt-street, unless you took into consideration the fact that there would not be such a large traffic in Pitt-street. There can be no comparison between the present traffic in Oxford-street and that which will eventually be in Pitt-street. H. Alexander.
21 Sept., 1900.

296. Apart from the 'buses, have you noticed whether the traffic in Pitt-street is increasing? Yes, considerably. No person, if he can possibly avoid it, will drive down George-street. The general traffic has gone, to a large extent, into Pitt and Castlereagh Streets.

297. Is the traffic which is natural to Pitt-street increasing? I am not prepared to say.

298. If you were driven off Pitt-street, could you run branch omnibuses from your terminus to the nearest tram? Yes.

299. Would that accommodate your customers? Yes.

300. Would it give you as much return as you are getting now? I could not say.

301. Your expenses would be less, and you would have a shorter distance to run? Yes.

302. And you would probably charge a penny fare? I presume so.

303. Would the Hargrave-street and Woollahra people get into business 'buses at the nearest point? I should say not, because you ask them to pay 3d. for that which their neighbours are only paying 2d.

304. Where does the traffic which used to be taken by the Woollahra tram go now? Partly in the tram. Some people walk and others go in the omnibuses.

305. Part of it goes to the Ocean-street tramway, and part to the Point Piper Road 'buses? Yes.

306. Do the Point Piper Road 'buses or the Hargrave-street 'buses carry most traffic? There is not much difference. I have more 'buses on the Hargrave-street route than on the Point Piper Road route, but, in proportion to their numbers, they carry about the same amount. I am not the only proprietor of 'buses running to Point Piper Road.

307. Do you run the Edgecliffe-road 'buses? No. Since the 'buses have stopped running I have had requests made to me to run a 'bus there for the convenience of the public. I went into the matter, and found that it would not pay. Thus a considerable number of people are inconvenienced.

308. How long have those 'buses ceased running? Only quite recently—since the cable tram service has been so much quicker.

309. Have any omnibuses been run off William-street? Yes.

310. Have any been run off the penny section from the top of William-street? Yes.

311. Has that service ceased? I think it has. If it has not, I think it will do so next week.

312. Then no omnibuses can compete with the trams? Not if they run at the same fares, and cover the same ground.

313. *Mr. McFarlane.*] Are you aware that George-street cannot carry the whole of the electric tram traffic? Yes.

314. Do you think it would be possible to put any more trams in George-street? I do not think it would be safe.

315. How would you deal with the increased traffic without utilising Castlereagh or Pitt Streets? You could not deal with it. There is no doubt that this is the only way in which you can give some sort of a tramway system; but, in view of the way in which some streets are constructed, you will never be able to carry the passengers in the trams.

316. What is the best way of providing for the passenger traffic? The construction of a city railway.

317. Do you think a city railway, along with the present tram service, will carry the whole of the traffic? Yes.

318. The Railway Commissioners state that, even if there is a city railway, they will have to utilise Pitt-street or Castlereagh-street, and perhaps both, for an electric tram service? It may be so from their point of view. I daresay they want to go along every thoroughfare where there is a chance of picking up a passenger.

319. Do you think that, if Pitt-street or Castlereagh-street were taken for tram purposes, one of those streets would be sufficient to carry the 'bus traffic? Yes; because it is doing so at the present time, and there are likely to be less 'buses there than there are now.

320. Which street, in your opinion, would be the best, in view of the local traffic, to take for tram purposes? Castlereagh-street. You would then leave Pitt-street for vehicular traffic, and would thus have one open street as near the centre of the town as you can get it.

321. Do you think that would be better than a single line in each street? Yes.

322. *Mr. Shepherd.*] Are the whole of your 'buses running to the eastern suburbs? Yes.

323. What streets do you traverse when you get into town? We run from Moncur-street, through Hargrave-street, Glenmore-road, Oxford-street, Liverpool-street, Elizabeth-street, Bathurst-street, and Pitt-street, to the Quay.

324. Do you use Castlereagh-street? No; except to cross it.

325. Have you noticed any falling off in the number of passengers in the omnibuses since the electric trams started? Yes; a very big falling off.

326. Have you been obliged to knock off any omnibuses since then? No; they have not interfered with me. I do not think there will be any difference between the carrying capacity of the present trams and the electric trams. If you extend the electric system to the eastern suburbs, the people will still have to use the 'buses where the electric trams do not serve them any better than does the present system serve them.

327. Could you propose any other plan than that which has been suggested for the relief of George-street? No. You might relieve it for the present, but you will have the same difficulties staring you in the face again immediately.

328. Of all the suggestions which have been made, you prefer a double line down Castlereagh-street? Yes; I think that would be the safest for vehicular traffic.

329. I suppose there is less traffic in Castlereagh-street at present than there is in George-street and Pitt-street? Yes; a great deal of the heavy traffic could be taken along Castlereagh-street, even if there were a double line of trams.

330. *Chairman.*] Do you find that the traffic in and out of the big wholesale stores in Pitt-street interferes with your 'buses? Yes; it makes a lot of difference. You have to creep your way very slowly at times on account of the business houses. There is always a certain amount of traffic standing about such places as Lawson's, Harris and Ackman's, and Inglis' sale-yards.

H. Alexander. 331. Would a space of 9 ft. 6 in. clear between the tramline and the footpath be sufficient for you to work your 'buses? Yes, provided there was nothing else in the road. The chances are, however, that after travelling a short distance you will be blocked by a cart or cab. The intersections would be very dangerous. Traffic would be almost unable to move across George-street. At the present time people are almost afraid to cross the intersections of George and King Streets.

21 Sept., 1900.

332. *Mr. McFarlane.*] Would not the traffic be relieved a part of the distance if the 'buses were run along College-street and Park-street, and thence to King-street? Even then you would get into Pitt or Castlereagh Streets.

333. Some of the 'buses from the eastern suburbs go that way and along King-street now? Yes; they go straight down William-street. Others come along William-street, and pass College-street into Park-street.

334. If more 'buses went in that direction, would it not make a difference? It would not minimise the difficulty. It would only relieve that portion of the street between Bathurst-street and Park-street.

335. Suppose a number of the 'buses came down King-street? That would be more dangerous, especially at the intersection of Pitt-street. You would have to cross the tram at Elizabeth-street, Castlereagh-street, and Pitt-street, and King-street is a very awkward street for traffic, as it is hilly from Elizabeth-street to Pitt-street. Besides, the people living in the eastern suburbs do not want to be carried a roundabout way if they can avoid it. That route would take them away from the places to which they want to go. For instance, they might want to go to George-street, and to do that they would have to leave the omnibuses at Liverpool-street and walk.

MONDAY, 24 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

| | | |
|--|--|-----------------------------|
| The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | | JOHN CHRISTIAN WATSON, Esq. |
| The Hon. SOLOMON HERBERT HYAM. | | ROBERT HENRY LEVIEN, Esq. |
| | | JOHN MCFARLANE, Esq. |

The Committee further considered the expediency of constructing a line of Electric Tramway along Pitt-street, City of Sydney.

John Kneeshaw, Traffic Superintendent, Tramway Department, sworn, and examined:—

J. Kneeshaw. 336. *Mr. Watson.*] It has been suggested that some objection, urged against the construction of the Pitt-street line, might be removed if it could be assured that the extension of the eastern tramway system to the Quay could be carried out before the line in Pitt-street is opened;—do you think that extension could be carried out before the opening of the Pitt-street line? The Department would scarcely manage to convert the eastern system by the time the Pitt-street line was opened; but it would not be long after that. In any case, we should not put any more traffic into Pitt-street than is absolutely necessary to relieve George-street from congestion. As we stand at present, we really cannot convert any more western lines until we have some other outlet. If the Committee approved of another outlet—say a single line in Castlereagh-street, returning by way of Pitt-street—we should not put more traffic into those streets than was absolutely necessary.

24 Sept., 1900.

337. I understand that the Commissioners intend to convert the whole of the western system before they touch the eastern system? That is the present scheme.

338. Would it be possible to convert the Bondi and Waverley sections of the eastern system before completing the western conversion, so as to ensure that the 'bus traffic in Pitt-street would be subtracted? Not very well, because they have already got the Leichhardt and Glebe lines ready for the wire, and in some cases the track is bonded. Similarly, arrangements have been made with the Balmain conversion. It is not good policy to have the steam motors running on any portion of the electric lines, because the sulphur fumes affect the overhead wire and corrode it. It would be a more business-like thing to carry out the whole of one system first; but as soon as the necessary power is available it will not take very long to convert the eastern side.

339. How soon do you anticipate that the eastern conversion can be commenced? I think we ought to be running on the eastern side under eighteen months from date.

340. How soon do you anticipate the Castlereagh-street and Pitt-street single line would be ready to be opened, assuming the work received approval shortly? I could hardly answer the question, but I do not think it could be managed under eight or nine months.

341. So that it would probably be another eight or nine months before the conversion on the eastern side could be made, and before you could look for any great subtraction of 'bus traffic from Pitt-street? About that. Of course, with the conversion of the western system, we should have steam rolling-stock released, which would enable us to give a much better service on the eastern side, even before the conversion. That, in itself, will have a tendency to reduce the 'bus traffic in Pitt-street.

342. Has your department made any attempt to ascertain the number of 'buses going through Oxford-street during a day? Yes; but I have not the information with me. We always get that from Mr. Edward, the Superintendent of Traffic.

343. Approximately, I suppose it will be the same as the number of eastern 'buses which go through Pitt-street? Of course, some of the 'buses from the eastern suburbs run to the railway station direct.

344. Then there will be more 'buses, really, in Oxford-street than in Pitt-street? Yes.

345. The other day Mr. Alexander, omnibus proprietor, estimated that the eastern suburban 'buses made 1,200 trips a day in Pitt-street? It sounds a large number, but it is not so many when you remember that we have 2,300 tram trips in George-street per day.

346. Do you think that the construction of a single line in Pitt-street and Castlereagh-street would mean less blocking of general vehicular traffic than a double line in one or other of those streets? I think it is very clear that it would mean less blocking of traffic. We should keep on one side of the street, and allow the other side for vehicular traffic.

347. Do you think there would be any difficulty in adding your tram service to the present traffic of Pitt-street? I think not. People thought we would not be able to run trams in George-street, but the traffic soon accommodates itself. J. Knoeshaw.
24 Sept., 1900.

348. We have been informed that a great deal of the traffic which previously went along George-street has been diverted to Pitt-street on account of the running of the trams? Probably; and I think there is still room for some of the Pitt-street traffic, particularly the heavy traffic, to be diverted. If we get the heavy traffic out of Pitt-street there will be very little difficulty with the trams and omnibuses. It is the walking-pace traffic which is the trouble. I have had a consultation with Mr. Edward on that point, and I understand that when the regulations are issued they will provide for the walking-pace traffic to go into Castlereagh-street.

349. What room would there be between the body of the tramcar which overhangs the line and the kerb? About 8 feet 4 inches. Of course, with a single track, there would be twice that room on the other side.

350. Would 8 feet 4 inches be sufficient for one line of vehicles? Yes. In giving evidence the other day, Mr. Alexander referred to the danger of centre poles; but there will be no centre poles in Pitt-street. The trolley wires will be carried by span wires running from poles along the side; therefore, we can keep the tracks close together. Instead of having 12-foot centres we shall have 9-foot centres—that is, assuming we have a double track.

351. Assuming that there are two tracks in the centre of the street, what space will they take up? Fourteen feet 6 inches. That will give 10 feet on either side of the street. The overhang of the tram will reduce that about a foot.

352. That will give a greater width than Mr. Edward anticipated would be the case in connection with the Castlereagh-street line;—he put it down as 9 feet 5 inches clear? Yes. He has evidently assumed that we are going to have poles, as we have in George-street; but by using span poles we can have a much narrower centre. I desire to point out that we cannot go on with more conversion until we get some other outlet on the western side.

353. Even with the traffic you are working now in George-street, you think it would be an advantage to have some of it diverted to Pitt-street? It would be an advantage. At the same time we should not think of easing George-street by crowding Pitt-street.

354. It has been suggested that George-street would be sufficiently relieved, and the traffic requirements well enough served, if a double line were constructed down Castlereagh-street, leaving the Pitt-street line out of consideration;—do you think that with that line you would be able to catch the railway traffic? I do not think the railway passengers would be satisfied with Castlereagh-street. Having been in George-street so long, I think, in preference to walking up to Castlereagh-street for the purpose of joining the trams to the railway station, they would crowd the Newtown or the other western suburban trams, and walk up from the railway gates. As risky as it is they would do it. On the other hand, if we had the return line in Pitt-street, I think they would join the trams there. I do not think we should have that measure of relief with a double line in Castlereagh-street which we would have with a single line in each street.

355. I should imagine there would be a better chance of pick-up traffic being obtained in Pitt-street? Yes, to a far greater extent.

356. Do you think that any fair proportion of the pick-up traffic now obtained by the George-street line comes from the vicinity of Pitt-street? Some of it does? On the other hand, there is still a large pick-up traffic to be obtained on its own account.

357. I presume the pick-up traffic is rather a disadvantage to the western suburban passengers in George-street? It is. It has the effect of crowding them out.

TUESDAY, 25 SEPTEMBER, 1900.

Present:—

WILLIAM THOMAS DICK, Esq. (CHAIRMAN).

| | |
|--|-----------------------------|
| The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq. |
| The Hon. SOLOMON HERBERT HYAM. | JOHN MCFARLANE, Esq. |

The Committee further considered the expediency of constructing a line of Electric Tramway along Pitt-street, City of Sydney.

Hugh McLachlan, Secretary to the Railway Commissioners, sworn, and further examined:—

358. *Mr. McFarlane.*] Have the Railway Commissioners given consideration to the desirableness of converting the eastern suburban tram traffic before carrying out the proposed electric line in Castlereagh and Pitt Streets? Yes. The Commissioners recognise the importance of having the conversion of the eastern suburban service carried out at the earliest possible date; but they cannot, after full consideration, approve of part of the western suburban conversion being postponed so as to enable the Paddington line to be dealt with. All arrangements have been put in hand, and promises made as to the order of the changes, and the Commissioners cannot see their way to now amend them. It will only be, in any case, a matter of temporary inconvenience. The necessary machinery has already been ordered from America, and although it may take some time to complete after the proposal now under consideration is finished, if approved, it will only be a question of time, and the Commissioners will push on with the work as much as possible. If it were a vital point to get the omnibuses out of Pitt-street, in view of a tram being made in that thoroughfare, it might be considered whether that traffic could not be diverted into Castlereagh-street. In any case, they would have, almost of necessity, to go there if the tramway is approved, and whilst it is being constructed in Pitt-street. H. McLachlan.
25 Sept., 1900.

359. Could you say how long it will take to carry out the conversion as far as Paddington? Of course, it would not take a great deal of time if you had the power; but the conversion of the western system will absorb the power we have got. Consequently, the Commissioners have had a contract let for much additional machinery, and that will necessarily take some time to get into position and in working order.

360. Can you say how long? I think the contract time is nineteen months.

361. I suppose it will take some considerable time after that for the tram to be got into working order? I do not know that it will; but that is the contract time for the completion of the machinery. 362.

- H. McLachlan.
25 Sept., 1900.
362. It will probably take two years? I suppose so.
363. How could the Commissioners arrange, in the event of a single line being constructed in Castlereagh-street: would they stop the traffic whilst the line was being completed;—would they carry out the construction of single lines in both streets at one time? That is a matter with which we do not deal. The Construction Department carry out the work. I believe that in America they finish one street at a time, and practically close the section of the street upon which they are working. I should imagine that, when working in Pitt-street, the vehicular traffic would have to be diverted. The omnibuses could be diverted into Castlereagh-street, and the question is whether we might not keep them there, pending the conversion.
364. How do the Commissioners view the carrying out of a double line in Pitt-street, thus leaving Castlereagh-street free? They prefer their own proposal.
365. Would not a double line in Pitt-street answer as well? As a matter of convenience, I should say yes—that is, as far as the public are concerned; but still the Commissioners think a line down one street and up the other would be the least inconvenient; and if a city railway were made—and it probably will be made, some day—it would be a question as to whether those lines would require to be duplicated.

- R. A. Setright.
25 Sept., 1900.
- Robert Alexander Setright, importer of typewriting materials, Pitt-street, Sydney, sworn, and examined:—
366. *Mr. Watson.*] Will you state your opinion with regard to the proposal before the Committee? I have been about Sydney and suburbs for the last twenty years. To commence with, I think it would be impossible to run a double line of trams in Pitt-street. I understand that the Railway Commissioners are more eager to have a tram in Pitt-street than in Castlereagh-street. There is only one way in which a double line can be run along Pitt-street, and that is by cutting down the pathways. Sydney possesses narrow streets and wide pathways, and I think the only way of constructing a double line in Pitt-street is by cutting 3 or 4 feet of the pathway on each side. At present the pathways are more than wide enough for ordinary business purposes. They are, however, taken up by the people who are out, not on business, but for the purpose of strolling about. As a rule, when business people are in a hurry, they have to walk along the roadway in order to get along quickly. I daresay that an Act of Parliament would have to be passed to enable 2 or 3 feet to be taken off the pathways, and if that were done there would still be plenty of room for the pedestrians. That, coupled with the exercise of strict regulations in regard to the drivers of the general traffic, would enable a double line to be run through Pitt-street. At present there is ample space between the two lines of tramway in George-street. I think we could do with 6 inches less in Pitt-street, and that would make still more room at the sides of the road.
367. In connection with Pitt-street, it is proposed to place the poles at each side of the street, instead of in the centre as in George-street, which will reduce the width between the two lines? I would suggest that the width between the lines should not be as narrow as it is between the steam tram-lines. There should be sufficient width to enable a person to stand, with a certain amount of safety, between two trams passing in opposite directions. It would be a mistake to have the same space between the electric line, as that which we have between the steam lines. Personally, I hailed the approach of the trams in George-street with delight, knowing that they would be a means of doing away with the incessant rattle of the 'bus traffic. A person going along George-street between a quarter to 6 and half-past 6 in the evening, could, formerly, no more talk to a friend in his usual tone of voice than he could fly. One had to yell out like a commanding officer to make himself heard, and that, together with the continual rattle of the 'buses, not naturally gave one a headache. The trams have done away with that. When it was proposed that the poles should be placed in the centre of George-street, I laughed at the idea of them, thinking that the Commissioners should have gone in for what is known as the storage system. It seems, however, that the Commissioners tried the storage system for over a year in Elizabeth-street, and found that there was something wrong in the working of it. I also thought that the placing of poles in the centre of the street would make a "holy show" of the city. When they were first put up, I did not like them, but afterwards I came to the conclusion that they would divide the ordinary traffic in such a way that there would be no more racing amongst the 'busmen. That sort of thing has been stopped. Apart from that, they are a haven for women and children, who are as safe upon the basalt or trachyte ovals at their base, as they would be upon the pathway. They are very useful in that respect, but I do not think they could be used in Pitt-street. It has struck me that it might be wise to run a double line of tramway from the railway station along Pitt-street as far as Bathurst-street. If the 'buses which come down Bathurst-street and turn into Pitt-street could be done away with, the double line along Pitt-street could be extended as far as Park-street. From that point there should be a single line in the centre of the road as far as the Post Office. At Martin-place there should be a loop for the accommodation of the trams going north, and there should be a single line between that loop and Circular Quay. That line could be kept running until the 'buses were driven off the street. At the same time, I do not think they would be driven off, because the tram service along Pitt-street would only accommodate the western suburbs; whereas, the 'bus traffic along Pitt-street is to the eastern suburbs. That traffic would continue, unless the Railway Commissioners commenced to run branch lines when they started the electric service along Oxford-street, to Glenmore-road and other places. My idea is, that upon the branch lines they could use small storage battery trams to take the place of the 'buses. I think they would be used in preference to the 'buses. Personally, I never travel in a 'bus if I can get a tram. The public are in the hands of the drivers, and if, on account of some carelessness, an accident occurs, and a person gets his neck broken, his family can obtain no recompense; because if an action is brought and is won, the owner of the 'buses can go insolvent and clear himself of all liability.
368. Do you think that the suggestion of the Railway Commissioners to construct a single line down Castlereagh-street, and a single line up Pitt-street, can be carried out without any great interference with traffic? I think so, provided the drivers have proper control over the car. At present their business seems to be simply to start and stop the cars. I suggest that at each end of the trams a mirror, about 6 inches by 24 inches, should be fixed, so that the drivers could see behind them as well as in front of them. The mirrors could be constructed so that they would not interfere with their side view to any great extent. The drivers should then be responsible for the working of the tram from the time the guard blows his whistle. In my opinion, the trams running to and from the Railway Station are too high from the

the road. A new cow-catcher has been invented—an ordinary frame with a net—which could be easily fixed on the back of trams. The electric trams should have a board fixed to them, as have the steam-trams, which is let down at the sides, and it almost touches the ground, the result being that if a person falls from them, it is impossible for them to get underneath. The railway cars are simply Juggernauts. When a person is knocked down by them, he has nothing to throw him away, and he is generally run over. If the drivers have proper control over their cars, and if they become possessed of the knowledge that the street does not belong to them, there would be no danger in running a single line along Pitt-street.

R. A.
Setright.
25 Sept., 1900.

369. How do you think it will affect the business people in Pitt-street? It would not affect them at all. It would do them more good than harm.

370. You do not think it would be objectionable to the majority of them? No; and it would be more convenient to the customers. Hundreds of customers who travel by the 'buses would prefer to travel by the trams.

371. Have you noticed any great increase in the traffic of Pitt-street since the George-street line has been constructed? No; I think there has been a slight decrease. At the same time, there are more 'buses, and it is they which take up so much of the room. I believe that when the electric trams are running from Circular Quay to the eastern suburbs, they will do away with a lot of the 'bus traffic. Of course, they will not do away with the Glenmore-road and Woollahra 'buses.

372. Have you any evidence to add in regard to the construction of a tram-line in Pitt-street? My argument is that the tram would not interfere with Pitt-street. There is no necessity for the tram-cars to stop at fixed stopping-places, but only when called upon to stop. In that case, there would be no necessity for them to rush along. They would have to feel their way until they got to Bathurst-street, and then there would be nothing to prevent them going as fast as they liked. If the Railway Commissioners gave the drivers £200, they must go carefully and slowly along Pitt-street, they would not interfere with the traffic.

373. Would not time be saved by having specified stopping-places? I would not like to express an opinion; I have only made a suggestion. As for the Castlereagh-street tram, that is a simple matter; there is nothing to stop a tram going along there. There is only one obstacle, and that is the hotel opposite the "Métropole," which would have to be done away with, so as to cut off the corner. Compared with the steam trams, the accidents in connection with the electric trams are very numerous. My explanation of that is that the steam trams make such an awful noise that they frighten the people in time; whereas the electric trams come along so silently that people are unable to hear them and get out of the way.

1900.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ACCIDENTS ON THE GEORGE-STREET AND NORTH SYDNEY ELECTRIC TRAMS.

(RETURN RESPECTING.)

Printed under No 14 Report from Printing Committee, 11 October, 1900.

[Return prepared in accordance with promise made by the Honorable the Minister for Railways in answer to Question No. 11, in Votes and Proceedings of the 28th August, 1900.]

(1.) *Question.*—Will he have prepared a complete return showing the number of fatal accidents on the George-street and North Shore Electric Trams respectively since the date of opening?

Answer.—George-street Line, 13; North Shore Lines, nil.

(2.) *Question.*—Also the number of accidents reported by the officials in charge of the trams, but which were unattended by fatal consequences?

Answer.—George-street Line, 105; North Shore Lines, nil.

(3.) *Question.*—Likewise the number of fatal accidents, and accidents unaccompanied by fatal results, on the steam and cable trams during the last twelve months?

Answer.—Steam lines—fatal, 13; non-fatal, 83. Cable lines—fatal, nil; non-fatal, 8.

(4.) *Question.*—Will he also state in detail the respective amounts paid on behalf of the Government Tramways Department to the victims of tram accidents, or their representatives, by way of compensation since the inauguration of the electric system, and on the steam-motor lines, during the past twelve months?

Answer.—

RETURN showing amounts paid on behalf of the Government Tramways Department to the victims of tram accidents, or their representatives, by way of compensation (without legal costs), from September, 1899, to August, 1900, both months inclusive.

NEWCASTLE-ADAMSTOWN TRAMWAY.
(RETURN RESPECTING.)

Printed under No. 13 Report from Printing Committee, 27 September, 1900.

[Laid upon the Table of the House in accordance with promise made by the Honorable the Minister for Railways in answer to Question No. 4, Votes and Proceedings No. 42, of the 13th September, 1900.]

(1.) *Question.*—When was the Newcastle-Adamstown Tramway opened for traffic?

Answer.—13th August, 1900.

(2.) *Question.*—What has been the gross revenue received from this line?

(3.) *Question.*—What have been the working expenses?

Answer.—(2 and 3.) The figures cannot be given exactly, as the extension forms part of a section; but the estimated figures of the revenue and working expenses from 13th to 31st August inclusive are as under:—

| | £ | s. | d. |
|-------------------------|-----|----|----|
| Working expenses | 106 | 9 | 5 |
| Earnings | 34 | 14 | 8 |
